I have, for years, materially reduced the consumption of coals in the fire-places in my house, by putting fire-clay over the bottom bars. It is introduced in a moist state, and can be carried to any extent in reason which the operator can desire, and moulded in any form he may prefer. I have it placed in a sloping form, like the roof of a house, in which shape it fills up the bottom and back of the fire, where it cannot be seen when the coals are in the grate. By this contrivance, a very small quantity of coals is made to produce, apparently, a large fire, and the mass of clay becomes red-hot, and throws a great heat into the room. The consumption of coals will be found to be much lessened by this practice, and the clay, when once put in, will last for years.

I may observe here that much heat from fire-places is often very needlessly lost by placing the grate far back in the chimney. I had a fire-place in which the grate stood in a deep recess in the chimney, merely, as it turned out, to save the trouble of cutting the front iron of the grate, to reduce it to the size required for placing it in front.

While on the subject of the mode of warming houses, I wish to state some ideas that have occurred to me, as to a mode of economizing fuel in houses. This may not be thought inappropriate now, when we are reminded that the supply of coal is limited in amount, and when it may rise in price from the increased exportation.

In most houses the kitchen fire is a large one, and always lighted during the day. May not the heat from this fire be made to warm the whole house? I think it might, by very simple means. A large chamber should be left, at the back of the kitchen fire, lined with fire-brick, to retain the heat. To this a pipe should lead from without, so as to admit the external air; then pipes, made of iron or earthenware, should be laid on to either of the passages or rooms desired to be heated; such pipes to be fitted with taps, so as to allow of being opened or closed at pleasure. Might not, in this way, a sufficient current of pure heated air be led on to any part of the house, and be allowed to flow, or be turned off at pleasure? Of course, in the summer, it would not be required. On the other hand, if laid on, in the winter, to passages and rooms not in use, the inmates, of delicate health, might be protected from much illness, by keeping up an even temperature throughout the house. A. B.

\*\* Modifications of such an arrangement as that described are not uncommon.

#### PUMPS FOR SEWAGE.

**SIR,**—On reading the description of the pumping machinery in the *Builder* of the 18th ult., and the plan of pumps intended to be fixed for the raising of the sewage from the main drainage on the south side of the Thames, at Deptford-ereck, it appears to me the mode will be very expensive. According to my long experience as practical engineer in pumps, I think the more simple the construction of pumps the better, by doing away with all unnecessary friction and raising the water at the cheapest rate. In 1855 my pumps were recommended to Mr. T. Jackson, by the Inspector General of Fortifications, at the Board of Ordnance, for raising the sewage from the deep tunnel sewer, on the north side of the Thames, from a shaft 80 feet deep. The description of my invention is as follows:—A non-suction gravity force pump, made with three open working barrels, as simple as possible, three plunger rods attached to the crank axle of the fly-wheel of the steam-engine, with rods at the lower end, work through the top of the plunger, which hangs on the end of the rod; thus opening and shutting the passage through the plunger that will swallow any descending substance of its own gravity that is not larger than the opening, which may be made 50 feet smper. It will then be

rammed up the rising main or hydrant a considerable height, to prevent the many noxious gases that rise from the sewage from affecting the public. These pumps can be made of gigantic power, and do not require the use of leathers, that are always wearing out; they are to be made of iron, gun-metal, steel, and all working facings, to be lined with a metal that is incombustible, and not likely to be out of order, thus doing away with all stuffing-boxes, slings, a number of complicated valves, and friction, in exhausting the column of air, air vessels, and all impediments to the raising of water. Sir, I beg pardon for intrusion.

JOHN WILSON.

#### BISHOP AUCKLAND TOWN HALL AND MARKET COMPETITION.

**SIR,**—In your notice of the above, in last week's *Builder*, you say that "the secretary states the Northern Architectural Association (which lately protested against the terms of the competition) was represented by five of the members, among whom was one of the highest officers of the association."

I beg to say that the secretary is in error in making this statement, as I am in a position most distinctly to deny that any officer of the association sent in a design; and, moreover, that the two or three (not four or five) members of the Northern Architectural Association who did send in designs did so without being fully aware of the nature of the protest. That only two or three, out of a society numbering upwards of thirty members, should respond to the invitation, to offer designs for a public building in their own more immediate locality, goes rather to show the general unamity of the profession in the North, on the matter in question, than otherwise.

THOMAS OLIVER, Hon. Sec.

#### COTTAGE IMPROVEMENT.

I AM glad the subject of "Cottage Improvement" is likely to be again ventilated in your valuable columns, especially at this time when cottages paying 6l. rent are about to be admitted to the privilege of the franchise. I need not advert to this subject in a sanitary point of view, this matter having been so often and so ably set forth. All must agree that the larger proportion of cottages in this country are so small and inconvenient, that it is impossible to preserve in them the common decencies of life. How often we find a man and his wife, and several children, some fourteen and fifteen years of age, sleeping in one room, and oftentimes in one bed; some at the foot, others at the top; or some members of the family sleeping in the living-room, where cooking, washing, and eating are performed. I have seen several instances where there is but one sleeping-room in a cottage in which from six to eight or nine persons rest at night. Education must be in a great measure useless where the children return home to such wretched hovels; where vice, disease, and death are too often found associated in one small apartment. An impression seems generally to prevail that "money spent in building cottages for the poor is a bad investment." I know by personal experience of suitable sites left for years unoccupied rather than that cottages (although in urgent demand) should be erected thereon. I was lately requested to look over some cottages with a view to their repair: they had been lately occupied, but I imagine the poor inmates had died off. More wretched hovels could scarcely be imagined: they were surrounded with stagnant water. One room below (in each) was paved with flint, and one room above approached by rotten steps. The roofs and windows were full of holes; no ceilings,—consequently the floors were rotten and unsafe, from being constantly saturated with wet. I strongly advised the removal of these hovels, and suitable cottages to be erected in their stead. I was at once met with the universal answer, "It does not pay." My object in addressing you is to endeavour to show the utter fallacy of this conclusion.

Sir George Nicholls justly observes, "It is not a highly ornamental cottage that the labourer needs. What he really requires is a habitation sufficiently roomy and substantial for the comfortable accommodation of his family." Landed proprietors and others generally have the means in their own hands of obtaining the weekly rents, and I am prepared to show that suitable cottages can be erected to realize a remunerating profit for the capital employed for such truly benevolent purposes. Taking an average of sites and localities, a double cottage, each one containing two living-rooms, with oven, wood-house, pantry, and three bed-rooms, can be built for 140l., the interest of which at 5 per cent. would be 7l., adding 1l. for in-

\* This is a smaller sum than our own experience would justify assertion. We shall be glad to have our correspondent's plan and specifications, as we hope before long to give a selection of examples. —E.

surance and annual repairs: in all, 8l.; or 4l. per annum for each cottage; being about 1s. 6d. a week for each family, instead of 2s. or more per week now so often paid for one single room!

How often do we find the absence of home comforts driving the artisan and labourer to seek the excitement of the ale-house; thus engendering those habits of intemperance unhappily so prevalent around us. Nothing can be plainer, that under these circumstances it will be impossible to carry into effect lessons concerning morality, cleanliness, and personal respect, if the domestic habits be such as we too often find them, and the natural result of cramming the sexes promiscuously together in one common sleeping apartment may be easily imagined. HENRY BARNES.

#### THE GREAT CHIMNEY AT GLASGOW.

**MR. DUNCAN MACFARLANE**, of Glasgow, C.E. and Architect, has published a description of the colossal chimney recently completed at Messrs. Townsend's Chemical Works, Crawford-street, Port Dundas. It is described as being not only the largest structure of the kind, but the loftiest building in the world, excepting the Great Pyramid of Ghizel, the spire of Strasburg Cathedral, and that of St. Stephen's, Vienna. It is circular on plan.

Total height from foundation.....	468 feet.
Height above ground level of ground.....	454 "
Outside diameter at level of ground.....	32 "
Outside diameter at top.....	14 "
Thickness at level of ground.....	7 bricks.
Thickness at top.....	13 "

In a report on its probable stability, Mr. W. J. Macquorn Rankine said, "From previous experiments on the strength of the bricks used in the chimney, I consider that their average resistance to crushing is 90 tons per square foot. I calculate that, at the level of the ground, the pressure on the bricks arising from the weight of the chimney will be about 9 tons per square foot, or  $\frac{1}{10}$  of the crushing pressure. I consider that, in violent storms, the pressure on the bricks at the leeward side of the chimney may sometimes be increased to be about 15 tons per square foot, or  $\frac{1}{6}$  of the crushing force. On these grounds, I am of opinion that the chimney, if executed as designed, will be safe against injury by crushing of the bricks." On the 9th September, 1859, however, after a hurried construction, a violent storm swayed it from the perpendicular, the deflection produced extending to 7 feet 9 inches. On the 21st of the same month, and subsequent days, it was restored to the perpendicular by twelve separate sawcuts, as recommended by Mr. D. Macfarlane, architect, who afterwards reported, as did Mr. Rankine, that it was then perfectly safe. The highest cut was 128 feet from the top, and the least distance between any two cuts was 12 feet.

#### THE ARCHITECTURAL MUSEUM.

OFFERED PRIZES TO ART-STUDENTS AND ARTISAN-WORKMEN. 1861.

**Prizes for Modelling in Clay.**—The Council of the Architectural Museum offers three prizes of 5l., 3l., and 2l. (given by Mr. S. C. Hull) as first, second, and third prizes, for the competitors who shall show themselves most successful in designing and executing a model for a circular or a vessel-shaped medalion, to be executed in stone, of the head of the late Duke of Wellington, enclosed in a border of foliage or mouldings of the First or Middle-Pointed styles. The medalion, including the border, to be not more than 1 foot 6 inches, nor less than 1 foot 3 inches, in its largest diameter, and to be executed in high relief.

**Prizes for Metal-Work.**—The Council offers two prizes of 5l., 3l., and 2l., as first and second prizes for the best specimens of a key, either Medieval or Renaissance in style, hammered, pierced, or punched, and not filed, and not more than 12 nor less than 8 inches in length, with an ornamental handle. Each specimen must be designed by the competitor.

**Prizes for Wood-Carving.**—The Council offers two prizes of 5l., 3l., and 2l., (given by Mr. S. C. Hull), as first and second prizes for the best specimens of a carved oak panel, for one side of the binding of a Church Bible. Each panel must be designed by the competitor, and be 1 foot by 8 inches in size.

**Prize for Cartoon for Painted Glass.**—The Council offers a prize of 3l., 3s. for the most meritorious cartoon of a trophy-hall for painted glass, supposed to surmount a figure. The cartoon to be original in design, First or Middle-Pointed in style, in chalk without colour, and on paper, 2 feet 6 inches by 1 foot 8 inches in size.

**Prize for Coloured Decoration.**—The Committee of the Ecclesiastical Society of London offers through the Council of the Architectural Museum a prize of 5l., 3s. for the competitor who shall show himself most successful in colouring, according to his own judgment, a cast of a group of figures from the great hollow moulding in an arch of the Porte Rouge, Notre Dame, Paris. Mr. Beresford Hope will give 3l., 3s. in one or more extra prizes, any work being deserving of such reward. This being a special prize, of same cast for competitive colouration is proposed to all competitors. The candidate may adopt that medium for applying his colours which he is expected to treat the panel as if forming a portion of an architectural composition, and not as a cabinet piece. The original is in stone. Casts

from this panel will be supplied, on application to the honorary secretary of the Architectural Museum, at 55, each, of the Museum, or by payment of 2s. extra for packing and case. Duplicate casts will be allowed. The Committee of the Ecclesiological Society will itself adjudicate.

DECISIONS UNDER METROPOLITAN BUILDING ACT.

STAIRCASE, PUBLIC BUILDING.—FEES.

At the Wandsworth police-court, on the 29th ult., Mr. George Myers, builder, of Lambeth, appeared to a summons at the instance of Mr. A. J. Hiscocks, district surveyor, to show cause why he had not complied with a "notice of irregularity," served on him, directing him to build a stone staircase instead of a wooden one, at the Royal Victoria Patriotic Asylum, on Wandsworth common.

The case was heard by Mr. Ingham, who made an order for it to be done within the space of two months, and to pay the costs and expenses. A summons for fees was also heard at the same time for three separate buildings on the same premises, of one story in height, and ten squares in area. The objection urged was, that the fees were not rightly charged. Firstly, that they were only additional buildings to the main building, and should only be charged as half fees. Secondly, that one story buildings, not exceeding four squares, were to be charged 15s. and not 30s., and therefore that the charge for one-story buildings, which do exceed four squares, should be 15s., with 2s. 6d. for every additional square.

Mr. Ingham decided, as to the first objection, that it was absurd to say they should be charged only at half fees, as they were distinct and separate buildings; and as to the second objection, the lowest scale of fee appeared to be limited to buildings within four squares; and, when exceeding the four squares, the higher scale of fee was to be paid. The fees were rightly charged, and must be paid, with costs.

It was stated that Mr. Myers did not raise the objection, but acted under orders from the architect of the building.

THE PROGRESS OF BIRMINGHAM.

For the first time during the last eight years, building operations in Birmingham show a tendency towards increase on previous years, as appears from the following return, quoted in the local *Journal* :—

Houses Erected.			
1852	.....	3,000	
1853	.....	2,764	
1854	.....	2,219	
1855	.....	1,253	
1856	.....	893	
1857	.....	612	
1858	.....	605	
1859	.....	689	

Over-speculation is thought to have had something to do with this, and a depressed state of trade is partially involved in it; but the principal cause, it is said, is the growing desire to build in the suburbs, and beyond the limits of the borough. In fact, on several sides of the town, pretty large towns—such as Handsworth or Harborne, and away by Aston—are rising into existence; and in almost every direction workshops, manufactories, and dwellings, which are not included in the borough surveyor's return, are either erected or in course of erection. The details for the last three years are as under:—

Houses	.....	1857	1858	1859
Churches	.....	612	695	689
Chapels	.....	1	0	1
Schools	.....	1	2	4
Manufactories	.....	7	4	7
Warehouses	.....	16	5	12
Workshops	.....	26	24	32
New Shop Fronts	.....	54	46	23
Stables	.....	0	8	6
Malshouses	.....	0	0	2
Miscellaneous	.....	21	3	0
Alterations and additions	.....	29	23	43

Books Received.

*The Pilgrim in the Holy Land; or, Palestine, Past and Present.* By the Rev. H. S. OSBORN, A.M. London: James Hogg & Sons.

MR. OSBORN is an American "pilgrim," being professor of natural science in Roanoke College, Salem, U.S. The present cheap and handsome little volume is a condensed reprint of his recently published work on Palestine. The narrative, it appears, has only been divested of such portions as are more immediately interesting to the man of science and the Biblical scholar, or references to parts of the tour unconnected with the main subject. The substance of a large volume, published in America, at a high price, is thus brought into an accessible form. A variety of views from photographs and good drawings also illustrates the new volume. The hallowed associations of the Holy Land naturally sway every Christian imagination, and more especially, if we mistake not, that of many of our American cousins, who even regard "the old country" itself in which their forefathers dwelt as a place for pilgrimage. It was to be suspected, therefore, that Professor Osborn might be even too enthusiastic in his

reversion for many questionable antiquities with which Palestine is studded. So far from this being the case, however, an intelligent discrimination and moderation seem to be observed throughout; and we find little here of that thick and thin excrement which many doubtful memorials of sacred history sometimes receive from "pilgrims" to the Holy Land. The narrative is well and pleasantly indited, and is likely to become popular.

Miscellaneous.

THE WORTHING SURVEYORSHIP.—The Local Board of Health have reappointed Mr. Charles Hyde surveyor to the board. There were twenty-three applicants for the office.

PROPOSED BRIDGE ACROSS THE MERSEY.—The Board of Admiralty have presented to Parliament a report against the plan of constructing a railway bridge across the river Mersey, near Curdley, between Warrington and Runcorn, which forms part of the London and North-Western Railway Bill, No. 3. The line of road which at present crosses the Mersey lowest down the river is that of the London and North-Western Railway Company, near Warrington, about seven miles above Runcorn. The Admiralty state that the line of railway now proposed is to cross the river Mersey about four miles below the present crossing of the main line, with a headway of only 18 feet above high-water mark. They recommend the constructing of a lofty bridge over the Mersey at Runcorn. On this subject the report says: "It has, however, been pointed out to their lordships, that if another crossing of the Mersey be required it might be effected at a site near Runcorn, where the banks of the river are high, and where a railway bridge might cross without the necessity of opening spans."

GAS COMPANIES.—In the United Kingdom 911 cities and towns are furnished with gas. Of these ninety-five are supplied by municipal corporations or private individuals, and 896 by trading companies. In Scotland 143 towns are lighted without, and eight with, special Acts of Parliament. In Ireland fifty-two towns are lighted without, and four towns with, special Acts of Parliament. In England 533 towns are lighted without, and 150 with, Acts of Parliament. The sum expended by the 896 gas companies in England, Ireland, and Scotland, amounts to 25,041,309*l.*, and by the private individuals and corporations on the remaining ninety-five gas works to 2,114,505*l.*, being a total of 27,155,814*l.* A ton of English gas coal will yield 9,000 cubic feet of gas, 14 cwt. of coke, ten gallons of tar, and ten gallons of ammoniacal liquor, while the light from each ton is equal to 320*lbs.* of sperm candles. A ton of Scotch coal will yield 11,500 cubic feet of gas, 10 cwt. of coke, 14 gallons of tar, and 14 gallons of ammoniacal liquor, while the light is equal to 820*lbs.* of sperm candles; and a ton of Boghead cannel (the Torbane mineral) will give, when manufactured into gas, light equal to 1,950*lbs.* of sperm candles. The quantity of gas manufactured annually exceeds twenty-five thousand millions of cubic feet.—*Platt's Statistics of Gas Lighting.*

STAINED GLASS WINDOWS.—At the last meeting but one of the Liverpool Architectural Society, Mr. Frank Howard made some observations as to the applicability of stained glass windows to the buildings in which they were erected. He was desirous of having an architectural opinion as to how far figures represented either on glass or in sculpture were to be reduced to an architectural character, as if they were built in bricks and mortar. He should like to know the opinion of the architectural profession as to whether the character of the subjects delineated on stained glass windows should accord in style with the structures in which they were placed; and he therefore asked for criticisms of a cartoon which he had prepared, and which he maintained was suited to an ecclesiastical edifice without reference to the style of architecture in which that building might be erected. He referred to the most severe style of architecture, the Parthenon, admitting of the most life-like sculpture, the Elgin marbles, the Eleazar crosses of the most graceful statues, the sepulchral monuments down to the time of Edward III., the most exquisite angels, supporting the heads of the knights and ladies thereof. He might also refer to the paintings on the walls of St. Stephen's Chapel, called the "Painted Chamber," and the general freedom admitted in Gothic ornament; and asked why the designer of stained glass should be limited to a greater degree of stiffness and less living character than was required in any other instance.

DAMAGE TO THE SOUTH-WESTERN NEW STATION.—The new railway station attached to the terminus in the Waterloo-road was partially destroyed by the gale of the 7th. The workmen engaged in the erection of the new station (in Vine-street) which is intended as the terminus of the new Leovill and Exeter line now in course of construction, had been obliged to suspend labour, and most of them had left the works. About half an hour afterwards a tremendous crash was heard, and it was discovered that the whole of the framing, which had been erected only about a week, had come down, carrying away with it in its fall four or five lofty portions of the brickwork: it was at first feared that the arches upon which it was erected were also coming down.

PROPOSED ART GALLERY FOR MANCHESTER.—Touching the proposition to erect an Art Gallery in that city, a meeting was held on Monday to consider the ways and means. The idea is to raise a sum of 100,000*l.* for the erection and maintenance of a free institution which shall be furnished by private donations of works of art, and by the loan of such pictures, marbles, &c., as can be obtained from the Government. The great landowners of the county, including Lord Derby, Lord Ellesmere, Lord Wilton, and Lord Egerton of Tatton, have promised their support for the institution, which has been inaugurated by Mr. Thos. Fairbairn, who at the meeting read the following laconic letter from a friend whose name he did not disclose:—"My dear Tom,—I have read your letter, and I am going to do it. Put me down 1,000*l.* for the honour and glory of my native town."

THE GLASGOW ARCHITECTURAL SOCIETY.—An extraordinary meeting of this society was held on Monday before last, in the Scottish Exhibition-rooms, Bath-street, Mr. T. C. Gregory in the chair. The minutes of last meeting having been read, and several new members elected, Mr. Salmon, president of the society, after a speech of considerable length, moved, "That a committee of the Architectural Society be appointed to examine and report upon the stained glass which has recently been fitted up in the great west window of the cathedral of Glasgow, as to its merits as a work of art, and also to its suitability in design, character, and colour with the building; and also as to the manner which they may consider best for making it, and the other windows when they are put in, a means of professional study and instruction, if found worthy of such a high position." The motion having been seconded, a lengthened discussion followed. An amendment was moved that, in the present state of our information on the subject, Mr. Salmon's motion is premature. The motion was carried; after which the following gentlemen were appointed as the committee:—Messrs. Charles Wilson, James Graham, John Burnet, Alex. Thomson, James Boucher, Thomas Gildart, Alex. Watt, Campbell T. Bowie, David Haire, John Honeyman, Thos. McGuffie, and James Salmon.

THE DUDLEY ASYLUM FOR THE BLIND.—The new "Earl of Dudley," late Lord Ward, has inaugurated his new earldom by the building of an asylum for those persons who may lose their sight while employed in his collieries. Over the cavity of the chief stone was placed the following inscription, engraved on a brass plate:—"The corner stone of this building, erected for the collecting together under one roof, and for the comfort and consolation of those who have lost their eyesight in the working of the Dudley limestone caverns, was laid by the Earl of Dudley, Dudley Castle, William Baron Ward, of Birmingham, the 28th day of February, 1860. Richard Smith, mine agent of the Dudley estate, to whose suggestion the institution owes its origin. William Bourne, architect; J. Hartland, W. Walker, builders. *Dindimus capti qui bene capit habet.*" The institution is intended to accommodate 26 families, each family being furnished with a suite of five rooms and out-houses. There will also be an infants', boys', and girls' school, capable of accommodating together about 150 children. A school-master's residence will be attached to the school, and at a little distance a chapel and minister's house will be erected. A laundry, sickward, and conveniences for a surgeon, form part of the scheme. The block of buildings occupies three sides of a quadrangle, and the whole is enclosed by a low wall and ornamental palisades, the entrance being through an iron gateway, to which is attached a porter's lodge. In the centre of the east side is a tower, in which is constructed a large tank for supplying water. The material of the various buildings is red and white sandstone, supplied from his lordship's quarries, and the style is Early Decorated Gothic.

**LIVERPOOL ARCHITECTURAL SOCIETY.**—At the fortnightly meeting of this society, held on Wednesday evening, the 7th, the chair was occupied by the president, Mr. H. P. Horner. A letter was received from Mr. McGowen, clerk to the Health Committee, acknowledging the receipt of the society's communication on the proposed by-laws, and expressing the readiness of the committee to do all they could to meet the wishes of the society, consistent with the interests of the public. The paper for the month was read by Mr. J. Justen, being a continuation of his paper "On the Romanesque of Germany," illustrated with diagrams and plates.

**NEW BAPTIST CHAPEL AT OLDHAM.**—The Baptist church and congregation worshipping in Manchester street, Oldham, under the pastoral care of the Revs. John Birt and J. W. Ashworth, are about to erect a new chapel in King-street. Several architects were invited to submit designs in competition, and the committee have selected the design of Mr. H. J. Panll, of Burnley, who was the architect for the new college at Rawdon. The chapel will be in brick, with stone dressings, and the front will face Union-street. It is designed to accommodate 1,000 persons, and the works are to be commenced forthwith.

**FIGURE WEAVING BY ELECTRICITY.**—This remarkable invention is attracting increased attention. A long description of its peculiarities was given to the Society of Arts, by Mr. Le Neve Foster, the secretary, and from the discussion which followed it appears that practical men, though differing as to details, view it as one which will effect a great change. The inventor claims the following as the results of his invention:—1st. The great facility with which, in a very short time, and with precision, reductions of the pattern may be obtained on the fabric by means of the varying velocity with which the pattern may be passed under the teeth. 2nd. That without changing the mounting of the loom or the pattern, fabrics thinner or thicker can be produced by changing the number of the weft, and making a corresponding change in the movement of the pattern. 3rd. The loom and its mounting remain unchanged, the design may be changed in a few minutes by the substitution of another metallised paper having a different pattern. 4. The power of getting rid of any part of the design, if required, and of modifying the pattern. M. Bonelli gives calculations by way of comparison between the old and the new systems, showing an immense saving of expense by means of his invention.

**FALMOUTH DOCKS.**—The chief trusts of the new docks for Falmouth has just been laid. "The works now actually in progress," says the *Cornish Telegraph*, "comprise a breakwater running out from Bar Point (1,100 feet in length) in a north-easterly direction, defending the harbour within from the sea. This breakwater is to have a white light at its end. Call this the eastern end. From the point leave a wide channel for entrance and you get to a northern breakwater, 1,520 feet long, with a white light also at its extremity. Thus, on each side the channel leading to the basin, is a white light. These breakwaters, with walls on the land side and on the western side, enclose an area of forty-two acres, with a uniform depth of 18 feet at low-water spring tides. On the land or Pendennis end of the 1,100-feet breakwater there will be transit sheds, workshops, and stores; and stretching along the south side of the harbour (its most sheltered side) will be a gridiron, 400 feet by 60 feet, and five graving docks from the west, or Falmouth side, towards the east, or St. Anthony Point side. An entrance, 80 feet wide, conducts into a floating dock of fourteen acres, which lies on the west or Falmouth side of the tidal harbour. This is to be 700 feet from west to east, and 880 feet from north to south, with transit sheds on its northern and southern sides, and a jetty running out from the middle of the south end, dividing the floating dock for half its length of 880 feet into halves. The total length of the works from east to west is 2,200 feet."

**ALL SAINTS' CHURCH, NOTTING-HILL.**—Sir: A few weeks ago it was stated in your columns that this church would be opened in the course of a few months. At that time there was some probability of the consecration taking place at an early date. We regret, however, to state that the negotiations then pending have from some cause or other since been broken off, and it is more than probable that, owing to the indifference of the inhabitants of the locality on this matter in particular and on church matters generally, All Saints' will not be finished at an early date, unless the West London Protestant Institute takes the matter in hand.—  
A and B.

**WORKMEN'S INSTITUTE.**—On Thursday evening, the 8th, a lecture was delivered at 34, York-road, Lambeth, in connection with the Workmen's Institute and Benefit Clubs, by the Rev. E. Monro (incumbent of Harrow Weald, Middlesex), on "The Life of John Howard, with the Present and Past of our Prisons in England." Mr. St. Ledger Glyn occupied the chair.

**RASCALS AMONG THE READERS.**—A remarkable trial has just been concluded, in Leipzig, says the *Morning Herald*, namely, that of a Dr. Lindner, professor in the university of that town, who has been convicted of the crime of stealing and mutilating some of the books and MSS. in the public library. The sentence passed upon him is a severe one, but not disproportionate to the aggravated nature of his crime—six years imprisonment, with hard labour! Let the delinquents in the British Museum Reading-room take warning in time by this example, since the law in this country is quite as severe as that of Saxony with respect to such offences.

**THE PUBLIC INSTITUTIONS OF THE METROPOLIS.**—The select committee appointed by the House of Commons to inquire into the best means of throwing open the public institutions of the metropolis to the working classes, and extending their usefulness, have met. Sir J. Trevelyan was in the chair. Sir Roderick Murchison was called. He spoke of the advantages which the delivery of gratuitous lectures to the working classes, by the professors connected with the Geological Institution in Jernyn-street had produced. Professor Huxley gave similar evidence to that of Sir R. Murchison. Dr. Gray, of the Natural History Department of the British Museum, was next examined. He recommended the opening of a Museum of National Duplicates in the east end of London. Mr. J. Whitmore, machinist, gave evidence as to the desirability of opening the public institutions in the evening, with illustrated lectures of a simple and popular kind.

**THE AMERICAN OIL SPRINGS.**—An exceedingly plentiful and profitable spring of petroleum, or "rock oil," as it has been called, has been got by artesian boring, as a venture, in Oil Creek, Philadelphia. Under a lease in May last, a Mr. Drake commenced sinking an artesian well for salt, oil, or anything which might turn up. Boring through 47 feet of gravel and 22 feet of shale rocks, with occasional small apertures in it, he struck, in August, a large opening, not yet explored as to depth or area, but filled with coal oil, somewhat mixed with both water and gas. A small pump on hand brought up from 100 to 500 gallons of oil a day. An explosion soon blew it up. One of three times its size and power was put in its place, and during the first four days threw up 5,000 gallons of oil; 1,250 gallons per day, or one gallon per minute for twenty hours fifty minutes per day. The oil, as raised, was worth 80 cents a gallon, which produced the large income of 1,800 dollars per day for four successive days, and so the matter goes on, yielding about one gallon per minute during working time. A large company, called the "Consolidated Rock Oil Company," with a capital of 1,000,000 dollars, has been formed in New York, to buy and work the oil lands.

TENDERS

For alterations and additions to the Town Hall, Salford. Mr. James Evans, Borough Surveyor. Quantities supplied by Mr. Thomas Taylor, Manchester:—

Bramall, Edwards, & Foster	£ 5,175 0 0
Howdon	5,097 0 0
Parry	5,814 0 0
Dalton	5,838 0 0
Statham & Co.	5,790 0 0
Fairclough	5,740 0 0
Sutcliffe & Co.	5,625 0 0
Bramall (Samuel)	5,538 0 0
* Accepted in consequence of allowing a larger sum for old materials.	
For mansion house, Cheswick, near Berwick-on-Tweed. First-estimates for carcass. Mr. P. R. Wilson, architect, Alnwick:—	
J. & W. Wilson, Newcastle	£3,400 0 0
J. Bryson, Suttill Stn.	3,314 0 0
Russell & Fairbairn, Berwick (accepted)	3,138 0 0
Chamberlain & Renton, Tweedmouth	3,121 0 0
G. & W. Craik, Tweedmouth	2,433 0 0

For enlargement of Ranby House, Notts. Mr. Goddard, architect, Lincoln:—

Liller & Son, Retford	£1,125 0 0
Young, Lincoln	1,100 0 0
Fox, Lincoln	910 0 0

For villas at Thorpe, near Norwich, for Mr. G. Clapham. Mr. John Daymond Ellis, architect, Norwich:—

R. W. Leyton	£1,625 15 0
J. W. Lacey	1,618 0 0
Simms & Foyson	1,600 0 0
Plummer & Bloom	965 0 0
Thos. Brooks	961 0 0
James Worman (accepted)	898 0 0

For the erection of two houses in Cradle court, Red-Cross-street. Messrs. Wigg, Son, & Oliver, architects. Quantities not supplied:—

Mustoe	£399 0 0
Ring & Stanger	875 0 0
Pritchard	815 0 0
Henshaw	619 0 0
Scott	759 10 0

For farm-house at Puteham, near Tring, for the Rev. James Williams. Mr. Frederick Gotto, architect:—

Geo. Cooper, Aylesbury	£679 18 0
James Andrews, Tring	617 0 0
Messrs. Hanover, Tring	905 13 0
Edwin Smith, Tring	545 0 0

For alterations and repairs to No. 61, Red Cross street, Essex, for Mr. Kenneth Mackenzie. Mr. J. H. Rowley, architect:—

Davey	£195 0 0
Milson	199 0 0
Estall	188 0 0
Burrows	186 0 0
Bird	180 0 0
Salter (accepted)	175 0 0

For the re-instatement of Park House, Backhurst Hill, Essex, for Mr. Kenneth Mackenzie. Mr. J. H. Rowley, architect:—

Davey	£195 0 0
Milson	199 0 0
Estall	188 0 0
Burrows	186 0 0
Bird	180 0 0
Salter (accepted)	175 0 0

For constructing a Swiss rifle butt for the 16th rifle corps (Middlesex), Whitton Dean:—

Peckham	148 10 0
Perman	145 0 0
Hill	142 10 0
Beauchamp	141 9 0
Hancompton	137 17 0
Whit	131 7 0
Baker	125 0 0
Sims	115 0 0
Estall	106 4 0
Taylor	101 0 0
Burchett	99 17 0
Edlis	99 17 0
Brandsen	99 0 0

For rifle butts, &c. for 5th company Warwickshire Volunteer Rifle Corps (Warwick and Leamington). Mr. T. Robinson, architect:—

Quantity	per yard	Estimate for work if commenced immediately.		Reduction allowed for delay of two months.

TO CORRESPONDENTS.

F. M.—Bishop of E.—E. T. B.—Mr. P.—R. E. (Buck.)—F. H. B.—H. B.—Bishop of R.—W. B.—W. B.—E. T. B.—The Editor.—E. M.—Sir C. M. G.—Observer.—Voice from the Bench.—C. and D.—H. C. (mother would answer).

**ERRATA.**—In quotation as to Smeane from "Memorial of Workers," p. 143, read:—"the hall" for "the streets"; for "the Government" read "the King's exchequer"; helped by Sir Charles Barry, have special notice.

**NOTICE.**—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent-garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

ADVERTISEMENTS.

Just published, price 6d. or 1s. in boards, **MEMORIALS OF WORKERS:** the Past to encourage the Present. By GEORGE GODWIN. Author of "Seven Sermons on the Bridges," &c. "Memorial of Workers" is a meritorious address, and is well-timed by the author, especially to encourage every man who is toiling to improve himself, and to benefit others. "Zetland" is a valuable tract, and Mr. Godwin's little volume, small as it is, will worthily take its place in that class of practical literature to which it belongs.—*Illustrated Review.* "Such information is contained in a very narrow compass"—*Critic.* "Look like this put into the hands of a youth with any aspiring impulses could not fail to do good: its influence on any reader would be no glazing only—a great thing."—*Christian Advocate.* London: H. K. BAYLY, 7, and at the Office of "The Builder," 1, York-street.

**MR. WILLIAM ELLISON,** CONSULTING SURVEYOR, late of STAINSVAY, has taken Office at 33, FENCHURCH BUILDINGS, & FENCHURCH STREET, E.C. Where he continues to receive BUILDERS. On BRACKLES & CONCRETE, DISPUTED ACCOUNTS, &c.

**PLANS, WORKING DRAWINGS, SPECIFICATIONS, &c. PREPARED** (or copied) for the PROFESSION, or executed with assistance rendered by Mr. WILLIAM MARSHALL, Architect and Surveyor, 5, Chancery-lane, W.C.

# The Builder.

VOL. XVIII.—No. 894.

The Serpentine Question.

ITNESSES before the Parliamentary Committee continue to confirm the correctness of the views on this subject which have been expressed in this Journal, and we may hope there is still a chance of rescuing the fine piece of water in Hyde Park, known as the Serpentine, from the goodly experiment of continual filtration, and continual return of the purified liquid to its dirty bed, again to take up a dose of filth, to be again eliminated; the process bearing a not very remote resemblance to the task of the daughters of King Dauidas.

The inquiry is most simple—how first to purify a piece of

stagnant and fetid water, and next how to keep it supplied with a perennial flow.

We have before given free expression as to the best modes of dealing with the matter; and we have done it in the way that might occur to the agrestic proprietor of a ten-acre piece of ornamental water. We said, first clear it out—cut drains in the mud—leave it one or two months, say from September or October to December, to dry or drain off,—then wheel away or utilize the mud; and when you have formed the basin at the desired level, pour in your supply of fresh spring-water, if possible; if not, then such stream-water as the locality most conveniently offers.

A correspondent, "T. S.W.," who has overlooked the fact that the suggestion has been already made in our pages, says:—

"It is very well known that exposure on the surface of the soil to the action of sun and wind very rapidly purifies all offensive matter, so that on walking through a field which has been dressed with even the most unsavoury kinds of compost, it is found in an incredibly short space of time to have become quite free from unpleasant odour. My plan, then, is this. Let the whole of the water be at once drawn off, and if in parts it is below the level of the outlet, then pump out the remainder by a hose and portable steam-engine, and take the necessary means to divert into the sewers whatever water would otherwise find its way into the head of the Serpentine at Bayswater. Having got rid of the water, let the mud lie still and get dry during the summer. About the end of next autumn the mud will have become sufficiently hard and dry to remove—not to cover up only, as has been proposed, to ooze out again at some future time."

He then goes on to urge that this consolidated mud should be spread over the surface of parts of the Park, and says:—

"This I would do, not by the tedious process of wheeling in barrows or carts, but having first dug down to the firm bottom for a sufficient space, I would then lay down a line of rails on longitudinal sleepers, which sleepers should themselves run by means of small wheels on other short transverse wooden sleepers, to be taken up and laid one beyond the other as the work proceeds. On these rails should run two or more lines of ballast-waggons, drawn by the requisite number of locomotives, and the work might be accomplished in a very short time. Having thus dug out all the mud, the banks of the lake at each side are to be cut away and thrown into the middle, until the whole

is brought to a uniform depth, sloping from almost nothing at the edge to 5 or 6 feet in the middle. The sides are not to be cut away in a straight line, but so as to preserve the clumps of trees, which should be allowed to remain on promontories or islands, wherever they occur."

Going back to our previous observation, the reason wherefore we prefer spring-water is that being harder, it is less liable to feel and favour the germination of aquatic vegetation; and that being heavier, its tendency is to form a lower current, and thus assure a more thorough confluence with the hoarded pool; but, above all, on account of its greater freedom from organic matter, such as a continuous supply must, as in cases of natural lakes, preserve the purity of the basin; water-springs *de profundis* being in part the cause.

How many lochs are there in Scotland, Ireland, and Wales, receiving scarcely the tribute of a 6-inch bore, that continue always pellucid and wholesome? But, then, they are deep. Yes; and their very depth preserves them.

It is impossible to discover whether there are springs in the Serpentine or any other lake until it be drained off; or unless such springs be powerful enough to gurgitate at the surface. Swimmers may suppose that when they get into cold water, such change of temperature is occasioned by springs; whereas deep water being less influenced by solar heat, will have a lower temperature.

Many are the suggestions made as to the mode of supply: some advising the purchased tribute of a company; others, a conduit from the Thames; the Colne being also pointed to as a suitable source; and whilst the majority seem rather to prefer the well at Duck Island, as having been proven to be sufficient in quantity; and of quality, so far as the observation and opinion of ordinary inquirers extend, not to be excelled. The abstruse and unaccountable analysis of chemists has, however, involved this latter point in an extricable mystery,—some accounting it pure, others as containing one or two grains of organic matter to the gallon; and one professor reporting it as unfit for use, because of a suspected infiltration of Westminster sewage. Now viewing the fact, that this well is sunk through the close and deep gravel bed of the London basin; that it is far removed from sewers, and that the filtering medium, unlike the beds of water companies' reservoirs, is of great extent; but, above all, that the element is intensely cold and of crystal clearness; no person other than an alchemist would condemn it.

It would appear that the natural supply which can be had on the spot is the best; more particularly as it is by far the cheapest, and also because it is under Governmental control.

As to the preparation of the bottom, the regulation of its depth, and the formation of the lake, these points have been treated just according to the taste or philanthropic feelings of the various consults. There is, however, but one proper mode of adjustment, and that, as we have ventured to pronounce before, is to preserve a good depth in the centre—say 10 feet at the west end, inclining to 5 feet at the east end; and to maintain this channel full 30 feet wide below bridge, and 20 feet above. From this centre channel the slope ought to be graduated to 18 inches, or 2 feet at the borders.

For the bottom, when once relieved of the mud, and supplied with 1,000,000 gallons daily, there can be no occasion for other material than clean gravel, unless, from philanthropic views, the Chief Commissioner should direct that the portion set apart for bathers (and this need not exceed one-third of the length of the south side) should be laid in concrete throughout; and here it may be observed that, in order to provide for the safety of the millions who bathe in these waters, the shallows might be extended, so as to reach 60 yards from the shore of ingress. The water is 150 yards wide at this part, and a slight deviation of the central channel at this part could be of no moment, for there would remain scope enough to graduate the opposite side, and, if precaution were thought requisite, why not moor boys, ornamental if you like, to demarcate

the greater depths? Three or four on each side of the deeps would suffice to admonish both swimmers and skaters.

Assuming that the quality and quantity of spring water from Duck Island are all that need be wished, then comes the question of assuring a confluence and commixture throughout the lake; and it would appear from a letter lately published in the *Times*, by Mr. Chester, that St. James's reservoir is little benefited, since "the clear water is suffered to escape quite near the point at which it is delivered at Buckingham Palace end!" Now, in the works executed by Messrs. Easton & Amos, ample provision was made for directing the outflow to any desired side, or at the Horse Guards end of the canal, so that advantage might be taken of every current of wind to drive the scum and surface impurities to leeward. Penstocks, with pipes and stopcocks, were arranged for this purpose; but on the secession of Sir B. Hall, a new administration and altered management left these provisions in disuse.

As a matter of course, a drain was cut nearly round the lake, tending towards the main sewer of the parade, this part of the plan having originated from Mr. Mann. The main pipe was laid down under the concrete bottom throughout the whole length of water to supply the canal, and also as the first step of a system to be afterwards extended to the round pond, thence to the Serpentine, and after feeding the Hyde-park cascade, to return through St. James's-park. Such was the plan of Lord Llanover. It would have given us a living current of pure water, and an incessant cascade. A double quantity of water could be had from springs, at less cost than that supplied by water companies.

The suspended plan for daily filtration of the Serpentine bath, could not add one gallon to the supply, whilst it must cause loss by evaporation just in proportion to the sun's heat, and, consequently, in proportion to the public requirement for refreshing streams: the filtering works would cost as much as those for the supply of well-water, and the appearance of the Park be greatly interfered with.

With respect to the formation of islands, in order to get rid of the mud, that is wholly a matter of fancy: if one island were necessary as a depository for the contentment of mud that now seethes beneath the waters, in an artistic point of view, there can be no objection to it; on the contrary, such a disposition might be rendered excessively pleasing and ornamental. Men of Atlantic ideas might be offended; but ladies and amateurs of varied landscape, would feast upon the friendly isles, more particularly if judiciously shrubbed and purpled with rhododendrons.

It has been objected that dirty people crowd in here to make ablution; that lepers dare to congregate with the multitude in their lustrations. Well, if so, and it seems to be attested, the greater is the necessity for enlarged space. It is the only pool free of access to the metropolis, the river being no longer endurable. What a boon to the public would these *balnea* present: none but Easterns, or Furks, with whom ablution is religion, can appreciate it.

But for the speculative island, such a depository for the mud is not necessary, however large may be the quantity *in situ*, or even, although it amounted to the conjectural estimate of 160,000 cubic yards; the form of the present Serpentine is unpicturesque, at least at one point, and that is, at its western base, which is nearly flat or square; and here it measures 165 yards across. The form of the whole lake is exactly that of a Tyrolean powder-horn; broadest at the flat base, upon which it stands: the pool was made stagnant with a similar base.

To give a landscape finish to this portion it is only necessary to fill in the angles; and here abundant space is afforded for the storage of all the mud deposited throughout the expanse. Let the present sluices and overfall remain, and from them on either hand, form the bank in a wavy or segmental line, so as to imitate the fashion of a natural lake. Nature, ever free, forms no acute angles, save only in crystallization. Here there is room for more than the mud of the

Serpentine; but if it be requisite to extract gravel from beds in the Park, then let those chasms be filled in with the waste which it is so desirable to get rid of.

One plan of disposing of the mud has been mooted,—to dry, and burn it! Well, this is ingenious; but any one who has observed the process of combustion of clays in the suburbs—at Camden-town, at Islington, and elsewhere,—who has been obliged to breathe the surcharged ferid atmosphere, by day and night, and that for many months,—may pronounce at once as to what would be the excitement of Kotten-row, or the Drive—not to speak of the residences near Prince's Gate, nor of Knightsbridge. Although a legion of navigators were employed in collecting the ooze, and in hastening its desiccation, four months must elapse before the dried residuum could be reduced to ballast. But crotchets such as these must dissipate themselves, and hardly need confutation.

In a picturesque aspect, few pieces of water are more effective than the Serpentine—the forest mass of Kensington Gardens; the park glades and timber, and even the bridge, soften and improve it: distance, too, lends its enchantment, and the heights of Sydenham, as well as the old Cathedral and St. Stephen's towers, bestow an unwonted richness, which even the grotesque caricature of the giant horse cannot destroy. It only remains that *blemishes be removed*; and that the landscape gardener (and there is one upon the committee) step in, to give a tone and character to the whole. If the marginal bounds of roadways can be diversified with unbragous and floral walks, such as Kensington Garden or the Park borders, what cannot be effected where nature and art are concurrent in the elements of beauty?

The value of the Parks to all classes of the population is inappreciable: they feed the health, improve the morals, and elevate the taste of the whole community. Therefore the subject is of national importance; and the treatment of those plans under consideration, which offer the most obvious security for a good, wholesome, and perennial supply of water, and for the purification of pestilential pools, must be preferred. High engineering competitors are engaged in the conflict for election; but he who has exemplified his capabilities by works of this nature already accomplished, must be accredited.

In the lucid evidence of Mr. Page, he stated that in the railway works at Paddington, which are less than half a mile distant from the Bayswater end of the Serpentine, a spring was tapped, which now fills a 6-inch bore. If such be the case, and that it is thought better to draw from that higher source, then the engineers who produced the Trafalgar fountains, and the increased supply of 2,000,000 gallons daily to the St. James's Canal, can surely find any quantity desired in the Paddington basin.

#### SYMBOLISM IN REFERENCE TO ART.\*

The earliest architecture with which we are acquainted is that of tombs and temples; and the earliest sculptures and paintings are found associated with them.

This art, taking its origin from a sacred source, and having an especial reference to sacred things, partook of their representative character, and became essentially symbolical.

Symbolical representations of things sacred were coeval with religion itself as a system of doctrine appealing to sense, and have accompanied its transmission to ourselves from the earliest known period of monumental history.

Egyptian tombs and statues exhibit religious symbols still in use among Christians. Similar forms with corresponding meanings, though under different names, are found among the Indians; and are seen on the monuments of the Assyrians, the Etruscans, and Greeks.

The Hebrews borrowed much of their early religious symbolism from the Egyptians, their later from the Babylonians, and through them this symbolical imagery, both verbal and objective, has descended to ourselves.

The Egyptian priests were great proficient in symbolism, and so were the Chaldeans, and so

\* Read by Dr. Barlow, at the Royal Institute of British Architects, on Monday evening last. Report of proceedings will be given hereafter.

were Moses and the Prophets, and the Jewish doctors generally,—and so were many of the early fathers of the Church, especially the Greek fathers.

Philo of Alexandria was very learned in symbolism, and the Evangelist St. John has made much use of it.

The early Christian architects, sculptors, and painters drank deep of symbolical lore, and reproduced it in their works.

Their successors Nicola Pisano, and his scholars; Giotto the painter, and his pupils; artists in Italy and in Germany; the Van Eycks, Albert Dürer and his followers, and the great masters of the Italian schools down to the time of Raffaello and Titian inclusive, were all, more or less, influenced by symbolism and its principles.

There are certain associations of ideas, and conceived correspondences between things intellectual, or pertaining to the inner life, the life of the soul, and objective existences in nature, of which mankind have in all ages perceived the relation, and felt the analogy. This, in fact, is the origin of SYMBOLISM, and in this is the secret of its agreement among nations.

All primitive language is figurative, and more or less symbolical; and so were the earliest written characters. All ancient religious writings, including the Bible, relate sacred things symbolically; and mythologies may be thus explained.

All sacred mysteries and rites were symbolical, and had a meaning, taught to the initiated only, which it was held infamous to divulge. In modern times masonry has its minor mysteries and its multitude of symbols, and its secrets are carefully confined to the craft; nor is Christianity entirely without them. But symbolism is not limited to the expression, by natural or other forms, of the same essential ideas common to most, if not to all ancient religions; and indicative in them of one and the same origin: it enters fundamentally into the very principles which should regulate the practice of art, and especially of architecture, bringing into one harmonious whole its forms, proportions, dimensions, and decorations.

It is not merely that certain natural objects, as the sun, the moon, luminous ether, fire, &c.; certain animals, as the lion, the ox, the eagle, the peacock, the dove, &c.; certain trees and plants, as the palm-tree, the oak, the sycamore-tree, the horn, the lotus, and the lily, play pretty much the same parts in all religious systems, in virtue of that established relation between mind and matter, or the soul and nature, which never changes; nor that in dogmatic theology certain conventional figures are put to signify certain specific things, and thus come to influence architecture and her sister arts; but that the very designs of sacred edifices—their forms, arrangements, and ornamentation,—all have their origin in a significant symbolism, and were conceived and carried out in accordance with it.

Thus, besides the use of symbols in art for the expression of a specific meaning, either natural or conventional, there is the application of symbolical principles; and there is also a third sort of symbolism of a more general and æsthetic character, which appeals to our sensibility and to our understanding, and takes a wider range than either of the former—a symbolism as universal as reason, and that is conversant with higher aspirations of human nature than verbal doctrines and dogmas.

The noblest efforts of the Greeks, both in architecture and in sculpture, are in this latter sense symbolical, though no especial recouite meaning be conveyed by signs and marks.

The Greeks, who spiritualized art, transforming its elements or primitive forms, which they borrowed from Egypt and Assyria, into new creations, and infusing into whatever they touched their own subtle and refined intelligence, produced in their buildings and in their sculpture outward and symbolical expressions of an inward and divine beauty. They sought in their temples to set forth their intimate convictions of the required canons of architectural form and proportion, so as to produce grandeur, dignity, gracefulness, beauty, and harmony, according to the purposes required,—qualities in which all their best examples partake in a certain degree, with especial illustrations of one or more of them.

The proportions of the Greek orders and their general symbolical æsthetic characters may, I think, have been suggested by consideration of that most perfect of all well-proportioned forms, the human figure, which is also the most admirable example of constructive skill with which our great teacher Nature has furnished us. Thus we may recognize in the Doric order the symbolism of manly dignity and strength; in the Ionic, that of maiden grace and modesty;

and in the Corinthian, of matured womanly beauty and regal grandeur. The introduction of Caryatides in Ionic architecture shows that the association of the female figure was considered in character with the columns.

In their sculpture the Greeks exhibited still more evidently the symbolical principle on which they wrought. They sought to impress on their sculptured figures an ideal character and form more than human. They did not, like the Egyptians, adopt symbolical animals to express their meaning, but, with a full conviction of the dignity of human nature, and of its relation to the divine, they sought to set forth what they felt after the most perfect pattern.

The art of the Greeks was the offspring of a highly-cultivated intelligence, which saw the divinity that is in nature in everything around, and felt his influence working in themselves. In this respect the Greeks were an inspired people, and their works declare it. The grand, the beautiful, and the true, are words of deep import in art. The Greeks were the first to show what these words mean.

Emblems, symbols, types, all have this in common: they are the representatives of something else for which they stand. Emblems and symbols often differ only in their mode of application: thus the *zalm-branch* is an emblem of Victory, but taken in a Christian sense it is a symbol, significant of the victory of our faith, and is given to all Christian martyrs who have thus overcome death. The anchor may be a mere emblem of hope, but when it is put for the hope of a Christian it becomes a symbol. So, also, the equilateral triangle may be nothing more than the emblem of three united in one; but as significant of the doctrine of the Trinity, it is a symbol of the highest order.

A symbol is of the highest order when it expresses a religious dogma or philosophical doctrine, but of the lowest when it is put for a received fact, either real or legendary. Thus the anchor, as a symbol of St. Clement, is of the lowest order; and so are all those particular symbols of saints by which they are distinguished from one another: as the sword of St. Paul, the keys of St. Peter, the knife of St. Bartholomew, the tower of St. Barbara, &c.

Types are different both from emblems and symbols, and have a sort of antecedent parallelism to the objects for which they stand: thus Moses is regarded as the type of Christ; the manna which fell in the wilderness, as the type of the true bread of life that came down from heaven; the water from the rock in the wilderness, as typical of the water of life from Christ, the living fountain; and so of other types.

The earliest Christian sculptors and painters were very partial to the employment of types, but their successors seem to have preferred symbols.

It is difficult in a few words to give an adequate definition of the meaning of the word *symbolism* that shall comprise the use of symbols, symbolical treatment, and the application of symbolical principles in design; perhaps it may be called an outward expression in art of an inward sense, meaning, and purpose. The first of the series of drawings to illustrate the history of Christian sculpture, up to the time of Nicola Pisano, is taken from the very interesting early Christian urn in the Campo Santo, at Pisa, described by Ciampini. Many types are here introduced: there is the sacrifice of Abraham, the passage of the Red Sea, Moses striking the rock, the gathering manna in the wilderness, Daniel between the lions, and other subjects.

In the second we have the Saviour within an ornamental oval frame between the symbols of the four Evangelists. It is in the Campo Santo, at Pisa. In the third, a drawing of the funions urn of the Baptist in his chapel in the cathedral church of Genoa, we have subject and symbolism mixed up together, as was the constant practice of sculptors at that period, about the eleventh century. This urn is of Byzantine, or rather Alexandrine work. I call this style *Greco-Christian*, in contradistinction to the style of the first of this series, which is *Roman-Christian*. We cannot fail to recognize Roman and even Etruscan motives in this, while Greek motives are evident in the other. There is the head of Jupiter, within the equilateral triangle, between two lions, &c.

In the fourth we have a very symbolical nativity, from the bronze door of the Duomo at Pisa, date 1206. The fifth is a nativity nearer to the time of Nicola Pisano. It is from the Duomo at Siena, and much might be said about it.

Many of the subjects of Christian art, as the Nativity, the Baptism, the miracles, the Cruci-

fixion, would appear to have been originally almost entirely symbolical; they next became conventional, and lastly pictorial, in the ordinary sense of the word, losing almost entirely their religious character. This was especially the case with the most frequent representation in religious life—the Virgin and Child,—which at first was a symbol only, introduced after the condemnation of the Nestorians at the council of Ephesus, 431, as an evidence of holding the orthodox faith. (See "Legends of the Madonna," p. 22.) The dogma of the Mother of God was of Egyptian origin; it was brought in, along with the worship of the Madonna, by Cyril and his monks of Alexandria, in the fifth century. The earliest representations of the Madonna and Child have quite a *Greco-Egyptian* character, and there can be little doubt that Isis nursing Horus was the origin of them all. The Chinese also recognize this old pagan notion in *Tien-hou*, the Queen of Heaven, nursing her infant Son, who is usually represented holding a lotus-bud as the symbol of the new birth. The pictures of the Madonna and Child, commonly called Byzantine, I have long thought to have more correctly named *Alexandrine*. At Alexandria there was an established school for their production from an early period. The very colour of the flesh in these holy pictures is sufficient to establish their maternity: the Madonna, if not "comely," is at least nearly "black."

A complete history of religious symbolism should embrace all the religions of antiquity no less than the Christian, and would require as thorough a knowledge of their tenets as of our own, to explain satisfactorily its influence in regulating the practice of art.

The broadest basis on which to raise a superstructure of religious symbolism in art, not peculiarly Christian, will be found, I think, in the universally received doctrines of LIFE and LIGHT.

That mysterious agent, the vivifying power of nature, the vital energy in man and in all living things, has in some systems been regarded as the divine productive power, or principle itself, and having received deification, became the object of religious worship.

We have an evidence of this in the ancient religion of India, and in the veneration of the mystical symbols, the *Lingam* and *Yoni*,—a worship which would appear to have made the tour of the globe, and to have left traces of its existence where we might least expect to find any.

The sexual principle which rules the animal kingdom, and was long suspected to rule the vegetable kingdom also, before the fact was shown, and had even been extended to the stars; in Milton's words,—

"Communicating male and female light,  
Which two great sexes animate the world,"—

this principle came to be symbolically set forth as the foundation of a religious creed; but in a conventional way, that divested it of any indecency.

One form, and that the most prevalent, by which the sexual origin of all things was indicated, was the *equilateral triangle*. M. Guignaut, in his "Religions of Antiquity," a translation, with additions, from Creuzer's "Symbolik," has the following passage from the popular myths of the Hindus: "Sur la montagne d'or, Caïlusa, habite le dieu Siva. Là est une plateforme sur laquelle se trouve une table carrée, enrichie de neuf pierres précieuses, et au milieu le lotus, ou *Padma*, portant dans son sein le triangle, origine et source de toutes choses. De ce triangle sort le *Lingam*, Dieu éternel, qui en fait son éternelle demeure."

In the Hindu mythology, Siva is described as "the father and master of nature, everywhere distributing life under thousands of varied forms which he renovates incessantly."

In the Hindu Trimurti, or Trinity, consisting of Brahma, Vishnou, and Siva, the latter is the recognized deity, or principle of reproduction from dissolution, one of whose forms, or symbols, was fire, and who has been represented by it.

In India, all conical rocks are regarded with veneration as *Lingam* symbols of Siva, and caves and caverns are considered to be significant of the *Yoni*, or the womb of nature, out of which all things were produced.

Obelisks were *lingam* signals; pyramids, which consisted of four equilateral triangles inclined to each other, and meeting in an apex, combined the *lingam* with the *Yoni*. The former was the vivifying principle, the latter the producing principle. They were symbolized by a short, straight line, surmounted in the centre by another straight line at right angles to it, like a  $\perp$  square; also by a boat-shaped symbol with a mast, in which the boat was put for the world, the mast for the vivify-

ing power, making it productive: this became the mystical boat of Isis, which Bryant and his followers mistook for the ark of Noah. A third form is a triple mount. Amulets of these shapes are still worn, I believe, by the Sivaits.

The  $\Gamma$  square symbol, with a handle attached to it, became the *crux-ansata*, the symbol of eternal life among the Egyptians.

The *lingam-yoni* symbol of life, reversed, becomes the famous *tau*, or cross, which was the symbol of life among the Greeks, as  $\Theta$  was of death, being the initial letter of *θάνατος* (death).\*

The earliest form in which this letter *tau* occurs is that of a cross, and such was the meaning of *tau* in our ancient customs. In the primitive Hebrew, Numidian, and Greek alphabets, it was represented both as a diagonal and as a rectangular cross. In the later Greek alphabet it was the rectangular *lingam-yoni* symbol reversed ( $\Gamma$ ).

The *tau*, or cross, is believed to have been the mark which the children of Israel made on the door-posts of their houses, by order of Moses, that in the destruction of the first-born of the land of Egypt, the angel of death might see it, and pass over them.† It is also supposed to be the mark of salvation, spoken of by the Prophet Ezekiel (ch. ix. 4), to be set on the foreheads of the men who were not to be slain.

We often see this symbol on Etruscan ornamental borders; there are several such in the museum of the Vatican, occurring as the *tau* and as the *lingam-yoni*, that is, alternately upright and reversed.

As all the objects in this Etruscan museum were taken from tombs, it is probable that this also had a sacred meaning.

Sir Gardner Wilkinson has remarked that he cannot precisely determine the origin of the *tau*, or *crux-ansata*, among the Egyptians. Now, I think, there can scarcely be a doubt but that the *crux-ansata* was derived from the *lingam-yoni*, with a handle attached to it. The Coptic Christians still use it for the Cross of Christ.

The crescent moon was also supposed to symbolize the female principle; the sun, the male: something of this doctrine may occasionally be seen in Christian churches. In Santa Sabina, at Rome, over the arches of the nave, and frequently repeated, in green and red porphyry, or their imitation, is a symbol which may be explained on this supposition: there is the sun in the embraces of the crescent moon, and a little cross is stuck over them, perhaps to sanctify their union, and they are placed on a stem which rests on the triple mount, sometimes called the *monti chigiani*, because a similar device, surmounted by a star, constituted the stemma, or arms of Alexander VII.

Kieker in his "Prodromus Coptus sive Egyptiacus" p. 246, has some learned remarks on this subject, to show that the union of the sun and moon had reference to Osiris and Isis; and the Gorman Ewald, in his "Emblemata Sacra," vol. i. p. 40, has a dissertation to the effect, that the moon was a symbol of the church. If this be so, we can understand the meaning of the sun thus embraced by it, although the crescent moon would rather suggest the boat of St. Peter, itself symbolical of the church, and used in this sense both by poets and painters: thus Dante causes St. Peter to exclaim,—

"O navicella mia com' mal se' carca!"—*Purg.* xxxii. 129.

But this very suspicious-looking symbol, so full of profound Pagan meaning, would after all seem to be a very innocent thing, and merely meant to signify the Virgin Mary, among whose many symbols were those of the *sun* and *moon*, according to the mystical sense of the 9th verse of the 6th Canticle:—"Que est ista, qua progreditur quasi aurora consurgens, pulchra ut luna, electa ut sol!" ("Who is she that looketh forth as the morning, fair as the moon, clear as the sun?") At least this is the most Christian sense in which the symbol can be received. The sun-crowned figures of the Virgin Mary are, however, mostly taken from the woman seen by St. John in Heaven "clothed with the sun, and the moon under her feet, and upon her head a crown of twelve stars;" (Rev. xii. 1.) Such Petrarcha has described the Virgin Queen of Heaven in his exquisite hymn—"Vergine bella che di sol vestita," &c.

A triple mount supporting a cross would be significant of Calvary.

The Buddhists of India and of China had a cross

\* See Stephens and others. Visconti, Mus. Pio. Clem. vol. ii. p. 37.

† Compare Ezekiel ix. 4, 6, with Exodus xii. 7, 13. See Didron and other authorities. Of the wonderful influence of the cross, as a sign of power, and its exercise, see Durandus, Didron, &c.

of this sort in use among them, most probably from the earliest known epoch of their religion.

The remarkable conformity between the religious inscriptions and forms of the Buddhists in China and those of the Roman Catholic Church, has often been noticed. A recent writer (Journal Asiatique, 5th series, tom viii. August, 1856), remarks that it would seem as if the latter had served as a model to the former; but this can hardly be so, for Buddhism existed in India previously to the Christian era, and it is not probable, admitting the existence of Christian missionaries in China during the third or fourth century, that the Buddhists then for the first time copied their institutions and usages.

The Kelts, who were a more ancient people than the Greeks, were also well acquainted with the use and meaning of the cross. Our Druids were accustomed in their religious usages, as is well known, to construct a cross from the noblest oak they could find, and over the top of it to write the word *Thau*, for the supreme God, which was the sound of the Greek *Tau*, in the Hebrew alphabet, whence it was derived. This word *Thau* was precisely the same in sound as the Scandinavian *Thor*, the mighty one, the Jupiter Tonans of the northern mythology, who with *Oden* (Mars), and *Balder* (Apollo), constituted the Scandinavian Trinity, as *Thau*, Hesus, and Belinus, corresponding deities, did that of the ancient Britons.

There can be no doubt that our Druidical circles had a symbolical meaning, and were in accordance with Oriental usages of very early times. Their *tri-lithic* details were also in all probability symbolical, and are suggestive of the *Tim*, two uprights supporting a cross-piece over, which was the most simple constructive form in stoue.

Among the Chinese, that wise and wonderful people, the barbarians, so called, of the nineteenth century, who have contrived to preserve their antiquity and their institutions from the prehistoric period to the present, from the days of Noah, by some regarded as the founder of their empire, to our own, the sexual system of nature, if it did not take its origin, was at least adopted from the most remote time. The celestial principle was male, the terrestrial female; they were called the *Yang* and the *Yin*, the active and the passive. The Heaven was *yang*, and the earth *yin*, the sun *yang*, and the moon *yin*, and independent of these principles nothing was believed to exist. Numbers also had their genders: one and every odd number was masculine, two and every even number feminine.

But we must not suppose that the Chinese, though they may, symbolically, have worshipped the Host of Heaven, believing the stars to be material deities radiating male and female light, did not, like other nations, in process of time, arrive at the abstract notion of an intelligence higher than the visible heavens, and greater than any power that might be lodged in the stars. The transition, in fact, was marked by the name which they gave to this Being, as "*Shang-teen* 'Supreme Heaven,' or one higher than the sky, *Avang-teen*, 'august heaven;' 'te 'God,' and *Shang-te* 'Supreme God.'" (See "Morison's 'Chinese Dictionary,' Chrs. 100,095 and 95,432; Thornton's "History of China," vol. i. p. 52.) After this came the religion of the *Tao-tee*, or the sect of Reason, whose principles M. Klaproth refers to the earliest historical traditions of the Chinese. *Tao*, in the early Chinese language, signified intelligence and the Supreme Reason: it does so still, though it also corresponds with the *Λογος*, or Word.

The Buddhists in China, were originally called the *Tao-jia*,\* which corresponded with the meaning of *Buddha*, enlightened, learned, from the verb *Buddh*, to know. (See an article on Buddhism, in the "Revue des Deux Mondes," March 1, 1860.) The Buddhists were the reformers, or rationalists, and worshipped the *intellectual light*.

In India the Buddhists had also been the reformers, and for a considerable time their religion prevailed over that of the Brahmans, until they were expelled by the latter, and took refuge in China and Ceylon. It has, however, been the opinion of many who have given much attention to this subject, that certain notions, if not institutions, similar to those of the Buddhists, existed in India anterior to Brahminism.

The correspondence in form and arrangement between the Buddhist cavern temples, the *Chaitya* caves, and our early Christian churches, has been

\* The word *jin* means man, people possibly we may trace the word in the *Ginn* of the Arabs, an intermediate class of beings between angels and men, who correspond with "the little people," or "fairies" of our Saxon forefathers.

a frequent subject of remark; and what is still more remarkable is the evidence that these excavations are in imitation of structural edifices of which no traces have hitherto been found. I think this is in favour of the high antiquity of Buddhist principles. The earliest of these caves, according to our best European authority, are those at Bahar, the *Lomas Rishka cave*, and the *Sat Gurhka cave*.

They consist of a body or nave, connected with a head or sanctuary by a neck or passage, and have a singular resemblance to the plan of a French church, said to be at Blanc, and dedicated to S. Genitor (see the fifth volume of the *Eccelestologist*, in a paper on "Lychnosopes, or Vulne Windows").

Mr. Ferguson considers these, caves in the syenitic granite of Bahar, as the germs of what are found so fully developed at Ajunta and Ellora. I would suggest that their forms and situation have reference to that very early Oriental doctrine of *regeneration* which, like the lingam, has gone the round of the globe.

Over the daghopa (or shrine) in the Buddhist temple caves is placed a structure called the *Tee*. It received the umbrella of state, symbolical of the royal presence, and analogs to the royal canopy, the *baldachino*, in some metropolitan Catholic churches. The meaning of the name given to this structure may possibly be explained by that of the Chinese word *TE*, already alluded to as expressing a sovereign lord or ruler, or one who judges the world.

Two thousand years before the birth of Christ, *Osiris* was universally worshipped in Egypt as the saviour of souls (Rougé); he was also regarded as the incarnation of the goodness of the Deity, and as the giver of life. *Osiris* corresponded to *Siva* in the Indian theology, and one of his symbols was the equilateral triangle (see Paterson in "Asiatic Researches," vol. iii.), the same was a symbol of *Siva* (Iliad). *Isis*, the sister and wife of *Osiris*, corresponded to *Parvati*, the sister and wife of *Siva*.

*Parvati*, like *Isis*, was the universal mother, the goddess of a thousand names, veiling herself in every living form.

In Egypt, the resurrection from the dead, or the re-creation of the body, was an established article of faith, and always had been: the ritual of the dead, the monuments, and paintings on tombs, and designs on sarcophagi, show this: there is a collateral Biblical evidence, taken in conjunction with other matters, which may prove it to have been so, and we have the assertion of St. Augustine that it was so. The statement will be found in his 361st sermon, on "The Resurrection of the Dead." The words, "Egyptiisoli erudunt resurrectionem," &c. are quoted in vol. iii., "Dei Ilii Funebri," by Rossellini, who was of opinion that the extraordinary care taken by the Egyptians of the bodies of the dead had reference to this received dogma. The Pyramids of Egypt, which were, as their forms indicate, Osiridian monuments, as well as tombs, were, I think, intended to attest the firm belief in this fact, and to transmit its memorial to the latest posterity.

Possibly the moderns have not been able to comprehend the meaning of these monuments, from not having considered them from an Egyptian point of view.

It has been remarked that it is singular the Hebrews, in their sacred books, take no notice of these creations; but the Hebrew books make no mention either of the resurrection from the dead; it is only in the book of Job, an Arab in all probability, that there is any reference to this; and there it is so fully and perfectly expressed, that even among ourselves we could not enunciate it with more sincerity and certainty: it looks like some stupendous fact that has come down to us from a much earlier revelation than any which we now possess; it stands out from the Hebrew Scriptures as the unexpected attestation of an immense truth, the greatest of all truths; nor could it have received a more appropriate and durable memorial than that of the great Pyramids on the plain of Memphis.

The religion of the Hindus was, in all probability, originally a nature worship, and nothing more.

The Indian Trinity was simply a personification of the three great operations of nature manifested in *creating, preserving, and transforming*.

The Chinese had a similar formula; but in the Chinese language, as in many others, words have a double meaning—material and intellectual, physical and metaphysical; and what the people received in one way—like the *gentes grossa* of all countries—the learned understood in another. But the Egyptians were more advanced in religion,

and recognized a *Saviour* in *Osiris*, who was the type of the regenerated soul, and of the resuscitated body, through whom and in whose name every Egyptian hoped to obtain a blessed immortality in heaven.

The transmigration of the soul, as received by the Egyptians, appears to have been one through the heavenly mansions, passing from glory to glory. The *Heron*, which was a symbol of *Osiris*, was also a symbol of the first transformation of the soul in his paradise. (M. Rougé.)

The deceased, on admission to the heavenly state, was supposed to be born again, and to commence a new life, cleansed from all the impurities of earth. To die was only to assume a new form, and, as nothing was annihilated, dissolution was merely the forerunner of reproduction: such was the prevalent idea among the Egyptians. (See Wilkinson.) Now, this was precisely what was meant by *Siva* and his operations, and which was symbolically set forth by the equilateral triangle, and monumentally by the pyramid. Since *Siva* and *Osiris* were in this sense identical, can we doubt, then, that the Egyptians, by their sepulchral pyramids intended to signify the same thing, that the soul of the deceased had ascended on high, while his body remained below, protected from the injuries of time, at some future period to be reanimated by its spiritual partner. The great number of tombs about the Pyramids would seem to strengthen this exposition of their meaning.

The Greeks believed the soul to be a particle of divine etherial fire,—at least this was the doctrine of Heraclitus, to whom Plato and others were subsequently much indebted,—which particle on being released from the body, sought to return again to the sphere from whence it had descended, and they regarded the pyramid as a symbol of the soul. The pyramid was, in fact, the form assigned by Plato to the particles themselves of elemental fire; and fire, from the days of Moses to our own, has been held symbolical of the divine presence: hence in the name which the Greeks gave to this geometrical figure, *πυραμς*, from *πυρ*, fire, we may perceive that they recognized in it a sacred symbolical meaning.

*Osiris* was also the judge before whom the soul appeared on its separation from the body. Representations are frequent of this final trial, in which the actions of the deceased are weighed in the divine balance. The scene transpires in the Hall of Ameniti, or Hades. *Osiris* is seated on his throne, *Horus* and *Anubis* superintend the process, and *Thoth*, the recorder, or, as his legend denotes, "the Lord of the Divine Writings," inscribes the result on his tablet for presentation to *Osiris*. In one scale is a vase containing the actions, or the heart, of the deceased; in the other, a figure, or the symbol, of truth, an ostrich feather. If the individual, on being thus weighed, was found wanting, which rarely happened, he was sent back again to earth in a degraded form; if not, after a purgation by flame, he was admitted to the celestial abodes; but if incorrigibly bad, was condemned to eternal fire.\*

A similar representation is occasionally met with in Christian churches, where, in place of the Egyptian ministers, we have Michael the Archangel and the Devil, who is introduced among the *dramatic persons*, artfully endeavouring to deceive him.

There is a very elaborate and interesting example of this over the portal of the cathedral of Autun dedicated to St. Lazare: M. du Sommerard, in his great work, "Les Arts du Moyen Age," has given a plate of it (Plate xxi., Part iii.), and M. de Caumont has also given a representation of it in his "Abécédaire," p. 146, 2d edition.

The lizard, which a Satanic assistant is about to toss into the scale, to weigh it down in his master's favour, is a symbol of sin, and reminds one of the crocodile, which with the Egyptians had this signification.

A fresco of the same subject is said to exist on the south side of the chancel wall of Preston Church, Sussex; in this the sinner is saved by the timely intervention of the Virgin Mary.

The fundamental religious doctrine of the Egyptians, teaching the Deity, was *His unity*—when this unity became active it received different names, and these operations being personified, in objective forms, gave rise to the popular gods of the Egyptians.†

In the formation of these figures, mostly human bodies with the heads of various animals, as that of the *ibis*, for *Thoth*, to whom that bird was

sacred; that of the *shakal*, for *Ammbis*; of the *sparrow-hawk*, for *Horus*, of whom these were symbols; it is obvious that they were purely ideal representations, and that it was never intended that they should be taken for realities—they were symbolical figures, and nothing more. But Moses, who followed the Egyptian learning in many things, very wisely prohibited all images; had he not done so, the Hebrews might have had as many gods as their neighbours, for the Deity received from them, also, many names, according to his various operations.

The primitive temples of the Egyptians were in harmony with the monotheistic character of their early religion, and consisted of a small quadrangular chamber, or sanctuary, containing the sacred image and the altar; it was entered by the priests only, the people assisting without the entrance in front. Subsequently, a porch was added, and the inner chamber then became the *adytum*.

When triads were introduced, instead of one inner chamber there were three, and the ante-room, or porch, which had been in part thrown open by the substitution of columns, with a low screen between them, instead of the wall, was replaced by a transverse corridor: an avenue of sphinxes, composed of a lion's body and a human head, the symbol of force combined with intelligence, led from the temple to the *pylon*, or gateway of the enclosure, which was planted with trees, and became the "sacred grove," or *temenos*, in imitation of man's primeval places of worship, and possibly in accordance with a universal primitive tradition. The direction of these temples was usually east and west,—according to Dr. Kitto, at least more frequently than not.

To these elements of a complete temple additional halls and avenues might be added, as we know that they were, from time to time, by thekings, the symbolical derivation of whose authority was set forth over the principal portico in the winged sun with the Eurus, the symbol of the supreme ruler.

This general arrangement was very like that adopted by Moses for the Tabernacle in the wilderness. There was the oblong inclosure, in length about twice its breadth, the entrance to which was from the east; and at the western extremity of this sacred court was the sanctuary, in length three times its breadth, which was only ten cubits, or 30 feet; the interior was divided unequally into an antechamber, two-thirds of the length, called the *holy*, the front of which had only a curtain and no boarding, as on the sides and back; and an inner chamber, or *adytum*, called the *holy of holies*, separated from the former by a drapery, called the *inner veil*, made of the richest materials of blue, and purple, and scarlet, embroidered with figures of cherubim. The curtains for the sanctuary were also of blue, and purple, and scarlet, in which we may recognize the Egyptian taste for colour in architecture, with which the Sydenham court has made us all familiar.

It is not my intention to show the correspondence between "the ark of the covenant," the "cherubim," and other matters touching the Hebrew ritual and rites, with similar symbols and usages among the Egyptians: what Selden and others intimated long ago has now been satisfactorily proved, and can no longer be doubted: the correspondence shows that Moses deemed the profound symbolical lore of the Egyptian priests, by whom he had been carefully educated, their forms, dresses, processions, with the sacred ark, and all the pomp and circumstances of the sacerdotal order, not unworthy of imitation in the religious services and ceremonies of the Jews. The general arrangement of the Egyptian temple was followed by the Greeks, and to a certain extent by the Romans, and from the Romans passed into Medieval Europe, and so has descended to ourselves, modified by elements derived from the far East, and by a symbolism of earlier origin. The state ceremonies of the Latin church retain much of the ancient Oriental pomp; nor can we, I think without the high functions enacted in St. Peter's at Rome without being struck by their resemblance to what we see on Egyptian monuments of the triumphal bearing of the pontifical king. It has always appeared to me, in contemplating the architecture of different countries, that there is a certain analogy between the prevalent forms therein used and those of their alphabetic characters. Architecture is undoubtedly the expression of the intelligence, science, mode of thinking, and imagination of a people; but I think it is also more: it is in a manner symbolical of themselves, their habits, customs, &c.—and that quite as much, if not more so, than their literature and their language. Some very discriminating persons can determine the characters of people from

\* See a plate of this in Wilkinson's second series, plate 56. See also "The Egyptians in the Time of the Pharaohs," p. 139. See Rougé, Rossellini, Lepsius, and others.

† Wilkinson's "Popular Account of the Ancient Egyptians," vol. 1, pp. 227-8; Spineti's Lectures, &c.

their handwriting; the characters of nations may be distinguished by their architecture, to which their alphabetic forms hold a certain analogous relation. This is a subject I cannot now go into, but it must occur to every one that in the straight-lined Greek letters, avoiding all curves, we have a characteristic of Greek architecture; while in the B's and C's and swelling D's of the Romans we recognize the introduction of those rounded forms, the arch and the entablature, and, if I may so say, a certain heaviness, eluminess, and want of taste, which the Greeks carefully avoided. In the angular Gothic characters of the German race we see the type of their architecture; and in the flowing, fanciful, curved, and interlacing letters of the Arabs, not only may we discern the florid style of their literature, but the highly imaginative character of their architecture also. The Egyptian architecture would, I think, indicate a people of grand ideas and of confirmed religious convictions. In the series of Egyptian orders symbolism is obvious. The papyrus plant, no longer indigenous, was an emblem of Lower Egypt. Here architecture and the arts first flourished in that recently formed alluvial tract of land, for the civilization of Egypt ascended the Nile. The papyrus column is the earliest distinctive Egyptian order we can now recognize; the square pillar and the polygonal or fluted shaft have no especial Egyptian character in their forms, though they might have had in their ornamentation. To a people so symbolically disposed as were the Egyptians, and among whom the equilateral triangle was a sacred conventional sign, the triangular form of the stem of the papyrus may have recommended it to their special notice, and we find the imitation of this plant, or of four such plants bound together, the earliest of the symbolical series of orders. The capital represents the flower in the bud. In the next, the fourth of Sir Gardner Wilkinson's arrangement, we have what he calls the full-blown papyrus capital. In the following we have the palm-tree capital. At one time the palm-tree was the sacred tree in the Paradise of Osiris, and the palm-tree, surmounted by an ostrich feather, was significant of Lower Egypt, or the happy West. It occurs in this sense in the zodiac of Dendera.

The other orders are those with the Isis-headed capital; the fall-blown lotus-headed capital, sometimes surmounted by the head of Isis and her symbol; the Osiris order; and that with the Typhonian monster; the symbolical meaning of these no one can doubt.

This Typhonian monster was, however, I suspect, a somewhat Greek and satirical version of *Seth*, the evil principle, in contradistinction to *Osiris*, the good principle. Seth appears to have been considered by the ancient Egyptians as Satan was by John—one who could present himself among the sons of God, and be rejected along with them,—a very different personage from the *Diabolus* of modern times, whom the middle ages metamorphosed into a very discreditible being, with whom it was best to have nothing to do. The *Typhon* of the Greeks probably holds the same relation to *Seth* as the scorpion of the monks does to the *Satan* of Scripture. The symbol of *sin* among the Egyptians was the gigantic snake *Apophis*.

The lotus plant was as sacred with the Egyptians as with the Indians. According to Kongs, it was the symbol of the new birth; but Lepsius considers that it was the symbol of inexhaustible life; Rossellini regarded it as symbolical of the female principle among the Buddhists. The bodies of the saints are reproduced from the lotus, pure and holy; it may therefore be held symbolical of the womb of Nature, and, in a spiritual sense, of regeneration.

No plant was so great a favourite with the Egyptians as was this.\*

### ICNOGRAPHIC DISTRIBUTION.

#### THE ALTERATIONS AT THE JUNIOR UNITED SERVICE CLUB.

WERE houses to be built with the due regard to health and comfort, the planning of an ordinary house would be a test of professional skill such as is not in any similar degree afforded in the case of the greater number of public buildings. In town-houses, of course, the difficulty of providing for a variety of matters of convenience is greatest; and the means of getting sufficient light and ventilation to back rooms and to the basement, have to be the subject of careful study. Many of the recently-built first-class residences in London are

creditable works in these respects: we may allude to four or five houses that have just been completed, close by St. Paul's Church, Knightsbridge.

The means by which difficulties of lighting are overcome or moderated, are now generally made subservient to internal effect. In some details of decoration there is less to admire; and ready-made plaster enrichments that are both poor in design and badly cast, are constantly to be seen even in a cornice which otherwise is well designed and would be suited to the room. Much improvement also has to be made in chimney-pieces. Most of the marble chimney-pieces, and the pier-glasses over them, considered separately, one from the other, are very inferior to those features in the seventeenth century, which grouped together and were executed generally only in carved wood; whilst harmony and architectonic character pertain to the latter, in place of the discord between the manufacturer's and upholsterer's work of the other. The French still manage these parts of an interior better than we do,—simply because they regard them together, or in an architectural point of view. The same short-coming in art-manufacture as at present, is observable in houses of the class we speak of, where colour is introduced in glass: with this exception, however, recent improvements in the manufacture and application of glass have had a more important connection with the improved planning and decorative character of the interiors of houses, even than that which is commonly attributed to them. Not only is the ornamental uncoloured glass, much of it, in very good taste; but the use of large sheets, whilst subservient to the principal object, admission of light, enlarges the resources for effect. Dust-collecting small panes are no longer used in skylights and lanterns; and double frames of glass are not required—at least decoratively: the large sheet of each division of the bars or frame, with a pattern upon it, as generally treated, being in every respect decorative in force and expression, and readily kept clean.

We did not intend, however, now to dwell upon the domestic architecture of modern London, further than was necessary to gain some illustration of the niceties in planning, with reference to the two separate objects for attention, convenience, and taste. Of buildings requiring the technical skill, probably the London Club-house may be taken as first,—combining as it must, the convenience of the mansion or hotel, with decoration, and much besides that belongs to the public edifice. It is to be hoped that some day, there may be undertaken by one competent to the task, a critical examination of the structures of the class, with the view to a demonstration of the comparative advantages of particular features in plans, such as position of the kitchen, and to the advancement of professional attainments in this matter of icnographic distribution.

Some alterations now in progress at the Junior United Service Club, in Regent-street, serve to illustrate the difficulties alluded to. We gave a representation of the exterior of the building, and a plan of the ground-floor, in our volume for 1857. The plan will assist comprehension of the nature and extent of the present works. These, however, relate in great part to the offices of the basement; and in the floors above, if we except the smoking and billiard rooms, scarcely affect the arrangement of the principal part of the house, or towards Charles-street and Regent-street. In the parts in question, however, the alterations extend to a large quantity of work, and make great difference in the plan. The whole plan of the building as erected takes the form of the letter (reversed) J; the longer dimensions being next Charles-street and St. Alban's-place respectively. It will be seen that the original arrangement, however defective it has been deemed, involved a considerable amount of ingenuity in contrivance. The main defects discovered were in the basement, which, besides being inadequately lighted, was found inconvenient in the general distribution, and wanting as regards the kitchen, in ventilation. That portion of the plan which is next to Regent-street, and in which in the basement are the baths, has not been touched, unless for ordinary repairs and painter's work. Next St. Alban's-place, or east, the whole of the basement, and in the floors above, the portion of the plan at the top of the figure (J), or north of the position of the members' coffee-room, have been altered,—the arrangement of the smoking-rooms having been found to interfere with the communications, and otherwise inconvenient.

Provision had been made in the plan now being displaced, with a view to the ventilation of the

kitchen; and the supply of air was intended to be obtained by communication with a descending shaft at one corner of the building. But there were two channels for ventilation joining into that which communicated with the shaft; and the channel, not that to the kitchen, was subject to the action of a greater extracting force than what operated at the kitchen, so that the whole current went in the direction of the bath-rooms, and not in that in which it was expected to travel equally with the other. The kitchen, moreover, was not large enough; the principal roasting-grate and the stoves were too near together; and great complaints were made on the part of the denizens of the lower regions. Again, it was found that the position of the men-servants' dressing-rooms next to the servants' hall, at the south, gave certain facilities for pecculation; whilst the *boucherie* and larder, which should have been near the cook's room, south, were north, on the opposite side of the kitchen. The circular staircase, for the service, was found inconvenient; wine brought into the building had to be taken a circuitous route to the cellar; and the closeness of a steam-boiler to the latter was injurious to the wine. Therefore, in the alterations, greater space has been given to the kitchen, and the stoves are placed farther from the range and from one another: some additional space has been got in the vaults under St. Alban's-place, and in the area thereat—the light to the kitchen being at the same time increased; the *boucherie* is now at the south, where it can be well ventilated; and the larders adjoin it; whilst the servants' rooms are to the north: the butler's pantry has been enlarged; a staircase has been constructed; the wine can be taken by a shorter course; and the steam-boiler has been removed to the base of a large ventilating shaft, which contains some of the principal flues—iron pipes. Inlet openings for fresh air have been provided in the floor of the kitchen, in several places, communicating with the front area; whilst apertures near the ceiling, and under the hood of the roasting-grate, into the large ventilating shaft, will, it is expected, afford sufficient means of escape. The ventilating arrangements are being carried into effect with the assistance of Messrs. Haden, of Trowbridge; and Mr. Adams, of the Haymarket, manages the alterations in the kitchen fittings.

In the ground-floor, the space along the northern extremity of the plan, formerly appropriated to the smoking-room, has been converted into a still room and bar, and housekeeper's room; whilst the smoking-room is removed to the first floor, and is turned north and south. On this first floor, to gain space for the different arrangement of the smoking and billiard rooms, the lantern-light over the visitors' coffee-room has been dispensed with; and a borrowed light is provided at the end, next the waiter's serving-room. The alteration in this respect of course is a loss. There are now on the first floor, besides the principal rooms, the smoking-room, billiard-room, and "smoking billiard-room," adjacent to which are a bar and various other adjuncts. To the conveniences of one description, with mechanical contrivance for flushing, however, so many objections on the score of offensiveness have been made, at the clubs where they are introduced, that the members of the Junior United Service have decided to have nothing of the particular kind. The works in the first floor also include arrangements for the ventilation of the smoking-rooms, and widened passages.

Appearances are already to be observed in the lead of the flats, which would suggest that modes of preparing for laying, and dressing, in some respects different, might be adopted with advantage in similar cases. The boarding is placed transversely to the direction of the sheets, whereby the tendency is for hollows to be formed for retention of water rather than channels for delivery of it. Also in the rolls, by sawing the lower ends off square, instead of rounding them, the lead has to be stretched in the dressing more than is desirable; and thus, as noticeable in this case, it is either left cracked or soon gives way. The love of making a neat job is not too general: therefore it is to be regretted that it should lead at any time to defects. The best features decoratively in the original building, are those of the staircase,—in particular the caryatid figures, which, rather grouped with the piers than themselves supporting the arches, afford all the addition which sculpture gives to architecture, and without the objection which not unreasonably is made to the reputed best examples of caryatids. The pattern of the halustrade also has both novelty and good taste.

\* To be continued.

LIGHT, ITS INFLUENCE ON THE PROPER ARRANGEMENT IN THE PLANS OF BUILDINGS.\*

The chief beauty of a building consists in the proper adaptation of all its parts for the use and purpose for which it is designed. Plans may be arranged with due regard to proportion and harmony of parts, with all the scientific knowledge of the properties and value of building materials, yet fitness of purpose cannot be obtained unless the subject of light is carefully considered, and thoroughly considered, and the quantity as well as quality of light necessary for the purpose included be provided.

Both the internal and external proportions of all buildings are dependent for their beauty and fitness on the amount of light which they receive, and the amount of shade, and great has been the influence it has exercised on the buildings and architecture of all nations, as well as upon the minds and habits of their inhabitants. How different is the treatment required for tropical climates to that of our northern countries, and how often have errors been committed by the thoughtless in transplanting the building designs of one country to that of another, the result showing that different degrees of sunlight power can produce from the same edifice an impression of beauty and delight in the one instance, and many of gloom in the other. Would the Parthenon receive the same influence upon the mind it seen in our own climate surrounded with the London atmosphere as when viewed in all its simplicity and grandeur at Athens? or again, would our northern Gothic cathedrals and palaces, with their crisp and playful details, harmonise with the sunny land of Egypt? We might indeed obtain the dim, religious light effect in the interior for the same cathedrals, but the brilliant exterior be viewed with equal pleasure in the one country as in the other? How many otherwise beautiful buildings have we not seen marred, and in some instances ruined, by this subject, some parts possessing too great a glare, so as to distract attention, and others too much shade, rendering them gloomy, inconvenient, and unhealthy.

Let us proceed with an equal arrangement of the edifices of our own country, and the influence light has upon the general health of man.

In how few buildings do we find all the apartments, halls, corridors, passages, stairs, and other parts properly and efficiently lighted for the purposes intended.

It may be easy, and we often have to resort to artificial and borrowed light to overcome an apparent defect, but this is only a poor substitute, - in fact, a shadow, and is either great liability of principle or mental application in the art of designing with truth.

We must not suppose that the action of light upon the general health of man is immaterial, for the result of the investigations on the subject has proved that a close and intimate connection exists between it and the performances of the higher functions of the animal and vegetable existence.

Plant a seed, for instance, in a dark cellar, giving it every advantage but that of light: what is the consequence? It takes root and grows, but the seedling is weak and throws out, are they vigorous, and possessed of that healthy green colour, the effect of the existence of the healthy juices? No: pale and sickly, the plant droops, grows ill, but never arriving at fruiting maturity. As with vegetable so with animal life.

The natives of the deep dark forests of North America attest this by their inability to live as much as the blanched plants of the parisher. That the very nature of the life evolved by plants is altered by the absence of light is known to almost every one. That small animals are often perceptibly affected by its absence, is also well ascertained. It is known that if tadpoles are nourished with proper food, and exposed to the constantly renewed contact of water, so that their beneficial respiration may be maintained, but are entirely deprived of light, their growth continues, but their metamorphosis into air-breathing animals is arrested, and they remain in the form of large tadpoles.

It is also noted that persons who live in caves and cellars, or in very dark and narrow streets, are apt to produce deformed children, and that men who work in mines are liable to disease and decay, and that the more simple closeness of the air would be likely to produce it. In many of our large towns are dark cellars, rooms, alleys, and lanes, in which the direct rays of the sun never enter, and which are inhabited by the poor, who grow pale and sickly, their young stunted and deformed. An instance of the value of sunlight, Dyphtren, a celebrated continental physician, mentions the case of a French lady, whose disease baffled the skill of the most eminent medical men. This lady resided in a dark room, in which the sun never shone, in one of the narrow streets of Paris. After a careful examination he was led to refer her complaint to the absence of light, and caused her to be removed to a more cheerful situation: the change was attended with the most beneficial results: all her complaints vanished.

It is remarkable that Lavoisier, writing in the last century, should have placed light as an agent of health even before pure air. In fact, where you can obtain abundance of light, it is also generally possible to obtain a constant change of fresh air.

If we look to the principles, at present so strongly advocated, for the construction of medical hospitals, we find that they consist in giving the largest possible amount of external wall space to the wards, whereby both sunlight and fresh air can be admitted with the utmost facilities and to the largest extent. For examples I allude to the so-called "Pavilion plan," with windows facing each other on the opposite side walls, as adopted in the hospital at Bordeaux, the Lariboisiere and Beaujon hospitals at Paris, St. John's at Brussels, the new hospital at Malines, and many others.

I remember reading, some short time since, evidence in reference to one of our military barracks, in which strong and convincing proof was afforded that the soldiers, whose day-rooms and dormitories were exposed solely to the north light, the eye removed from any sun influence, were affected with illness and decline to a very considerable proportion beyond those inhabiting the same barracks, but dwelling in rooms having a more southerly aspect.

These several instances have been brought forward, not as means of many people to listen to and see one or more persons, that the light they are each acquainted with several that have come under your own inspection.

In churches where a large amount of light is not required, coloured or stained glass windows, and without necessarily staining, the amount of light unaltered: a question whether the light might not be more equally diffused if the light from the windows were brighter and cheerfulness the southern should never be omitted. Care should be taken in designing any building for the purpose of a school, or for any other public or private persons, that the light they are each acquainted with several that have come under your own inspection.

where no sun enters: the shading also of rooms, by large trees, suffered to grow too near our houses, is an evil much to be deplored.

In our domestic buildings, windows should be arranged according to the purposes for which the rooms are to be used, whether to be used for morning or evening, winter or summer, with some reference also to the direction of the winds, to encourage the admission of the most healthful breezes, and to avoid, as far as possible, those of an opposite quality. Let us place the morning or breakfast-room towards the east; the drawing-room, south; and the dining-room, west. To commence with and follow the sun day, by this arrangement, the sun in the autumn and spring months, supercedes for a time the necessity of large fires from the general warmth it gives to the entire apartments, as well as promoting ventilation, rendering them wholesome and agreeable.

I need scarcely suggest that the eills of all windows should not be more than 2 feet 6 inches, or 3 feet high above the floor level, and that to all dwelling-rooms, to lights or skylights should be avoided, if possible. On the northern sides of dwellings should be placed all those rooms for the storage of provisions and other articles requiring to be kept in a cool and equal temperature, free from sun influence; but care must always be taken to provide for a free current of air, so as to prevent the rooms becoming damp and unwholesome. On the upper floors the bath-rooms, water closets, and other rooms may have the same aspect, but on no account let the bed-rooms receive light only from the north side. If it be asserted that it is necessary in all dwellings there should be some saloons or sitting-rooms having a southern aspect, in summer use, or to take refuge in during the hot season of the year, I should say, however tempting such apartments may appear, by all means avoid them, for in an substantial buildings, that is, with moderate thick walls, an equal as well as a more beneficial amount of coolness can be obtained by a judicious arrangement of ventilation and blinds. In the former case you render yourself liable to receive a damp chill, while in the latter you can produce a cool, vivifying, fresh atmosphere.

In the lighting of halls and galleries for the display of paintings and coloured pictures, the northern aspect is considered the best, as being the most equal in its light power, and more free from colour: the sunshine, as it is called, varying either the colours yellow, blue, or red in proportion to its intensity, and the effect of the sun is constantly varying in its intensity, would interfere with the due appreciation of the delicate tints in the paintings. In such a case, the most judicious arrangement for these purposes the light is admitted from the top of the gallery, either a horizontal or vertical shaft, that is the more essential in a picture-gallery that the window or source of light by which the picture is seen and the picture itself, should both come within the range of vision at the same time. Where a light is allowed to pass through a horizontal opening care must be taken to equalize the rays of light by the introduction of ground glass or neutral medium.

A custom prevails amongst the sellers of Manchester goods and other coloured fabrics, to partially line the windows and west windows of their sale-rooms with blue paper, so as to produce a neutral grey effect. It will be remembered that light, with very rare exceptions, is compound or heterogeneous, producing two or all of the primary colours, - red, yellow, and blue, and when them in such ratio that the eye perceives a neutral medium, reflected or transmitted, they neutralize each other, and produce white or neutral grey (which is merely a shade of white) of a predominant colour, and light producing them in such ratio is often called bright. In the northern aspect, the same as we obtain from the northern aspect, in 10 parts of white light there appear to be about 1 part of yellow, 22 of red, and 1 of blue, and the intensity, or nearly as 3 - 5 - 8. When only two of the primary colours occur - yellow and red, yellow and blue, or red and blue - they form secondary colours, orange, green, purple, and white, which they occur in the medium in which they are produced by white light, they form perfect or normal secondaries. Perhaps it may not be too didactic to mention that in ordinary artificial light, such as is produced by gas, &c., the rays of red and yellow occur nearly in the same ratio in which they occur in the white light; and as there is an excess of them over the rays producing blue, all the rays of the medium produce white light is to interpose a transparent medium of such depth of blue as to absorb that excess, allowing such a portion of them to pass as is necessary to neutralize the rays producing blue, all of which have been allowed to pass.

It is questionable what effect light passed through coloured glass or other mediums might have on the health of animals; but in reference to plants, botanists sometimes use for glazing their conservatories glass having a slight green shade, upon the impression that it tends to arrest the decomposing effect of the red rays, but with what success I have never ascertained.

Many beautiful effects are to be produced in our buildings by the judicious use of coloured light, not only variegated, as that passing through painted or stained windows of several colours, but also with masses of monochrome. I can instance to you the Chapel of the Invalides, at Paris, where, to the best of my recollection, a cool grey light is admitted from the windows in the drum of the dome, whilst over the high altar is thrown a rich sun light from the orange-coloured windows at each side; and at the rear is the white light of the large ball.

I can also refer you to an instance nearer home, viz., the monument to Princess Charlotte, in St. George's Hall, Windsor. The recess in which this monument is placed having on one side a purple-tinted window, casting a cool shade, whilst the other side is lit up with a golden light from the yellow glass of a corresponding window - the effect is quite magical.

Many other examples might be produced, but it is more probable that you are each acquainted with several that have come under your own inspection.

In churches where a large amount of light is not required, coloured or stained glass windows, and without necessarily staining, the amount of light unaltered: a question whether the light might not be more equally diffused if the light from the windows were brighter and cheerfulness the southern should never be omitted. Care should be taken in designing any building for the purpose of a school, or for any other public or private persons, that the light they are each acquainted with several that have come under your own inspection.

for lectures, concerts, and in theatres, where strong lights are required, they are carefully removed above the general eye line, or so shaded as not to interfere between the audience and the operators.

For example, in churches and large halls, lighted from the roof, I could refer you to many which might be studied with considerable advantage - St. Stephen's, Wallbrook; Madeleine, at Paris; Pantheon, at Rome; the interior of the churches in British Association and most others are familiar to most of you; but I still advocate the introduction of side lights as at St. Stephen's, Wallbrook, as an additional means of light and ventilation, and as in the Pantheon, at Leicester-square.

We must not overlook one very important duty which we may be called upon to perform, - that is to lay out new districts for building purposes, - nor forget that we not only have to arrange the roads and streets to the best advantage, to obtain the best views, the best drainage, and the largest pecuniary returns to the owner of the soil, but that each house, whether detached or otherwise, shall have ample share of air and sunshine, to avoid placing one side of a street always in shade, and the other monopolising the whole of the sunlight. This duty is too often forgotten, neglected, or evaded, causing an irreparable loss both to health to the occupiers, and interest to the owners.

With the Building Acts, local and metropolitan, of the present century, it is not at all likely that the same errors will be committed, by allowing of narrow courts and streets to be erected often without other means of access, than small arched openings at either end, and with our improved medical health laws, and the more judiciously regulated, and more healthy have become hotbeds of disease and vice. Nor can we ever suppose that the tax upon light and air, called the window tax, will agree to be proposed or admitted, in any form, in 1860, to say the least, and it is not likely to have an extensive clipping of the coin of the realm. This general clipping of the coin having necessitated its re-coining, a new reduction of the amount of tax has been proposed, having existed only seven years, and it expired only in 1851, having been continued for a space of 155 years. Every one has some experience of the injurious effects of this tax, and it is not likely to be continued during the present time. In the houses of the nobility lights in passages and corridors had been blocked up to avoid excess of taxation. In the houses of the middle classes, staircases, passages, and water closets, and other parts, have been completely deprived of all external light for the same reason; in fact, it to a great extent prevented the introduction of the best light, and the best air, and, however, scarcely wonder at the disinclination of the Government to repeal it, when we find that for one year, say 1847-8, it produced £,911,742, upon 435,143 houses.

It is not necessary to allude to the superficial area of the light surface required for the necessary proportion of light to any room, due consideration must be given to the medium through which the light passes, as it is well known that a certain proportion of light is absorbed in its passage through different kinds of glass or materials usually employed, such as rough plate, fluted, embossed, ground, coloured, and other glass: the light surface area of the medium used, and the proportion to the absorbing properties of the medium used.

The strength of the light in a given space depends upon the intensity of the light, the distance and the angle of the incidence of the light, and the nature of the medium of the shaft through which the light must pass: touching the last, other things being equal, that room is the best lighted into which the light falls through the shallowest shaft.

Mr. Hesketh, in a paper on the Admission of Day-light into Buildings, read at the Institute, in 1852, observes that in forming an estimate of the light to be derived in any place, variability in the sources of light must not be taken into consideration, but provision must be made, especially in our climate, for sufficiency under ordinary unfavourable circumstances. For this reason, a southern aspect must be treated as a northern, and the zenith as the horizon. The hemisphere of the sky will therefore be considered as an equable source of light.

Professor Leslie, in a lecture at the Royal Academy, used to state that a skylight yielded four times the light of a window of the same area, but upon what authority he has not stated, and it is not likely that such a statement should be given in favour of skylights, in consideration of the light falling at angles of incidence more favourable to the reflection and due diffusion of light in the apartment, as a skylight produces a more direct light, and ought to guide in either instance as previously mentioned.

In the measurement and proper distribution of light, several rules have been laid down by various authors, but scarcely any of a satisfactory nature. Falstaff, in a lecture that it appears to him proper, in conformity to the doctrine of Vitruvius, to divide the height of the side of the room into 3 parts, and to give to the height of the window two parts, and to the width one of these parts, less 1-6th. In another part he states that the window space should not be wider than 1-4th the width of the room, nor narrower than 1-8th, and that the height of each width should be 1-8th more than three times its width, but there does not appear to be any rule or suggestion for the number of windows in the side of a room, or the width of window opening in proportion to length of room.

Mr. James Morris, who in 1734 published his "Lectures on Architecture," &c., observes - "Let the magnitude of the room be given. Multiply the length and breadth of the room together, and that product multiply by the height, and the square root of that sum will be the superficial contents in feet of the light space required."

In alluding to the effect of light in a room, it is found that the distance at which light passes into a room after admission, though it makes no difference as to quantity (because exactly as the intensity of the light diminishes, so the area of the surface lighted increases, viz., as the area of the distance of the opening is the same, when it falls, yet in practice a room is found much better lighted when the light passes far into a room than when only to a short distance. This effect is caused, perhaps, first by the rays of light passing in parallel to the surface by a slight alteration in their form, and thus, if a room be partially lighted, they adapt themselves to the steeper partial light, and the other parts appear more gloomy; or could be improved, should the light be more uniformly sent long as compared with its width, windows of the same collective area at the narrow ends will light it much more effectually than if the same area of light were admitted from the eye level, a very good illustration is the ball-room at Windsor Castle, which is 90 feet long, 34 feet wide, and 32 feet high. This room is lighted from the

\* Read by Mr. Capez, at Architectural Association, as elsewhere mentioned.

northern narrower side by a window nearly occupying the width, and is supplied by an abundance of light; but, had the same quantity of light been admitted from either of the long sides of the room, so many masses of shadow would have been introduced through the interposition of piers that its effect would have differed most widely from the airy aspect it now bears. This leads me to remark that no pier ought to exist, if possible, in the centre of the side to the room from which the light enters, as nothing more contributes to gloom and dark shadow.

I had wished to have obtained some statistics with reference to the superficial amount of window surface to the cubic contents of some well-known building, but it appears, so far as I can ascertain, that there are scarcely any published statements connected with this matter, and, consequently, being unable to make the necessary measurements for myself, I cannot found any new theory for determining the proper amount of light space required for different proportioned rooms, or to judge upon the relative merits of Morris's or Gwilt's rates for the distribution of light. Any information, therefore, that you can offer will be a valuable addition to a subject upon which very little has been given for our aid. The following may be found interesting:—Paulsen, exclusive of side chapels, proportion of area to light surface, 3,309 to 1; British Museum reading-room, 212 to 1; Panopticon, Leicester-square, 385 to 1; but deduct, say 25 per cent. for stained and coloured glass, 113 to 1; Sheepshanks Gallery, Braunton, 56 to 1.

These buildings show so wide a difference in their proportions of cubic contents to light space, that I have preferred Mr. Morris's rule, and have placed the result in the following, side by side with that suggested by Gwilt, and the actual amounts in these buildings:—

	Cubic contents.	Actual light, or glass area.	Required by Morris's rule.	Required by Gwilt's rule.
	Feet.	Feet.	Feet.	Feet.
Pantheon . . . . .	1,889,870	472	1,374	18,898
British Museum Reading-room . . . . .	1,175,000	5,209	1,684	11,750
Panopticon . . . . .	500,000	1,369	....	....
Allowing 25 per cent. for stained and coloured glass, 175 to 1			707	5,000

From which you can draw your own conclusions. It is in this paper I have been unable to inform you of anything with which you were not previously acquainted, I trust that it will tend to fix an impression more firmly in your minds of the necessity of giving due importance in all your designs to the subject of light in all its bearings.

THE ART-TREATMENT OF GRANITIC SURFACES.

At the Society of Arts on Wednesday, March 14th, a paper on this subject was read by Mr. John Bell, sculptor. In the course of it he said:—

Although granite has occasionally been worked in this country locally, it did not come largely into use in our national and large structures until within the last hundred years, old Westminster, and Southwark and London bridges, by the Romans, being nearly the earliest of these public works in which it was the main material. The style of workmanship adopted in these cases has been in blocks, large, simple, and massive; and whether in connection with large engineering works, other public structures, or pedestals for public statues, this appears the treatment proper for it. The Egyptians treated it in the same manner, but with this difference, that they also added, to the broad surfaces thus attained, a variety of decorated and illustrative incised ornament.

This has not been our practice up to the present day, but it appears to me that we might adopt it with advantage; that is, not of course by copying the Egyptian figures and hieroglyphics, but by only following occasionally that incised method of sculpture which may surely be held as proper for British granite as for Egyptian, and the illustration of this idea forms the main object of this paper.

The hardness of this class of material is one of the considerations that render the vast architectural and sculptural works relieved by the ancient Egyptians so great a marvel. Although modern research has told us so much about Ancient Egypt, and its greatly by the lamp of that invaluable Rosetta stone in the British Museum, has so well deciphered the hieroglyphic writing, that an invitation to dinner and a reply might well pass between two "savans" in that character,—although we have found out so much about the history and manners and even domestic customs of ancient Egypt, we do not know how she worked her granite.

The use of emery powder, and of the drill and wheel, has been suggested as having aided in cutting the incised work on granite, and any one who has witnessed the rapid manner in which this process cuts our hardest glass, hardly to be scratched even by anything but a diamond, will acknowledge the unexpected power of this process.

It has also been conjectured that emery powder was used in sawing Egyptian granite. No doubt it was in polishing it, of which we have many representations. This, however, does not

assist us much, as to the more general fashioning of the great granitic structures of Egypt. One element of workmanship the ancient Egyptians possessed in profusion, under their despotic system, namely, that of labour and time.

In our own country machinery has been applied to turning granite pillars, to working mouldings, and to polishing, but not as yet, I believe, to cutting decorations. Were there, however, sufficient encouragement for this class of work, we should no doubt soon see the strong arm of steam fashioning granite into art forms as readily as arresting our larger operations in planing iron like wood, and rifling steel guns. As it is, however, modern times have never as yet reached to the achievements of ancient Egypt, either in the works of granite or the decoration of its surface.

The Egyptian, besides his other obligations to the Nile, was also greatly indebted to it for his art, as thus it was chiefly from the flowers and plants with which it abounded that he drew his more prevalent types of architecture. Of course I do not suggest that all the Egyptian art-forms were floral. The pyramid, for instance, is not floral, nor the obelisk. The temple, also, in itself is not a floral form; but no one can regard its façade, and view its more decorative architectural parts, as the capitals of the columns, without perceiving that they are floral forms. The shafts, also, are bundles of stems bound together, and the bases have the character of roots. The two great types from which most of these and their decorations arose are the papyrus and the lotus.

Most of my hearers are probably well aware of the usual treatment of relieve, or relief, in sculpture, as in the Greek and Roman relievi in the British Museum, and as usually practised in the present day. This consists of a flat surface or background, from which the sculptured figures project more or less. This has been the practice of this class of art among most nations, but it was not the practice of the Egyptians. Their figures in relieve did not project, but were rather impressed, being tacked in, as it were, round the edges, into the surface, the highest part of the figures being only level with the surrounding plain face into which they were cut, and this is called incised relieve, in contradistinction to projecting relieve.

I am, however, only of course, suggesting the use of this kind of relieve, occasionally, in addition to that which is the general practice, and this only in reference to certain features of architecture wherein an unbroken general line of contour is desirable. Also, as regards material, in reference to granite, metal, and such hard stones as would retain the sharp lines of the bounding incision. I conceive, however, that on a large scale, it is suitable to granite surface specially, and this probably also more for the introduction of cubsens and floral decoration than for any elaborate treatment of the human figure. For instance, I conceive it might occasionally be well introduced on the granite pedestals of our public statues, as calculated to give them interest, and as relieving the surface without disturbing their simplicity. In consequence, I am myself using it cautiously, and in small degree, on the sides of the granite pedestal of the Guards' memorial, in Waterloo-place. On each of the two sides of this, in incised ornament, are being worked, besides the names Alam, Inkermann, Sebastopol, a pair of bayonets crossed, a wreath, and three stars, according to the outline you see on the walls, which is a working drawing, full size. Of course this is but a small instalment of this method, but I hope it will meet with favour.

The whole gist of what I would suggest amounts to this, that whereas we have now for the last 100 years begun to use our native granite largely in public structures, yet we have not (except in some isolated instances, in which the Egyptian architectural style and details have been followed in the decorations themselves—which is not what I suggest—as well as the method of incising) applied this facile method nationally; that is, using the method, but applying it to forms and decorations of our own time and country. I conceive that it might be well if we did, and that in that case it would open up a fine fresh field for design.

The modes of working the granite in all the British quarries are, I believe, much alike. Holes are drilled, or jumped, as it is called, into the rock; these are supplied with gunpowder and fired, and thus the great masses are blasted out, which are afterwards split into blocks with gear consisting of steel wedges, and "feathers" as they are called. This block, in which you see these inserted, is partially split, the crack being started. They are afterwards fashioned with a large hammer, called a muckle, and pitching tool, and various picks, points, and chisels, such as you see

on the table. If a fine surface is required, it is axed.

When holes are to be made, they are frequently, as I have said, jumped. The tool with which this is done consists of a long bar, thick in the centre to hold by, with a chisel edge at either end. It is used thus, by being raised and let fall with a jumping motion, whence its name; and, being turned partially after each blow, thus wins its way through the hardest block. Polishing, when required, is now done greatly by steam. This process much enhances the appearance of most granite, but is, from the hardness of the material, necessarily costly. In a general way the cost of polishing may be set down as an addition of one-half the previous price. Thus, if a column costs 20*l.* fine axed, it will cost 30*l.* or something more, polished.

With reference to the use of granite for drinking-fountains and the adoption of incised floral ornament, Mr. Bell said, it is a fact, which affords a pleasant proof of the influence of the agreeable in art over the mind, that people will stop and drink at an agreeable-looking drinking-fountain, who would not think of refreshing themselves at a pump with an iron handle. Observation has fully tested this. Especially, therefore, does the making these features of public utility pleasing, as well as enduring, appear an appropriate subject of art. If they are to be made enduring, we may allow that no materials are better than granite and bard marble. Also, as they are, especially during the summer months, in much use, that kind of decoration which is least likely to be injured by the touch is that which may be thought frequently appropriate. And the incised decoration which we have been considering has this advantage, that there is nothing to knock off, it being protected by being sunk. It also leaves the outer surface so as to be easily polished.

I am not saying, by any means, that these are the sole materials suitable for drinking-fountains. On the contrary, there are cases and situations where metal or other materials are preferable, and perhaps essential. Nor am I saying that incised ornament is the only kind of decoration suitable for such purposes. Quite the contrary: I only suggest it as one of the suitable methods. In whatever way, however, these objects of utility and social benefit are designed, it is important that they be designed suitably in each case in reference to their site, and so as to enhance and never to detract from the surrounding features already existing, especially as, for public utility, they naturally occupy prominent situations.

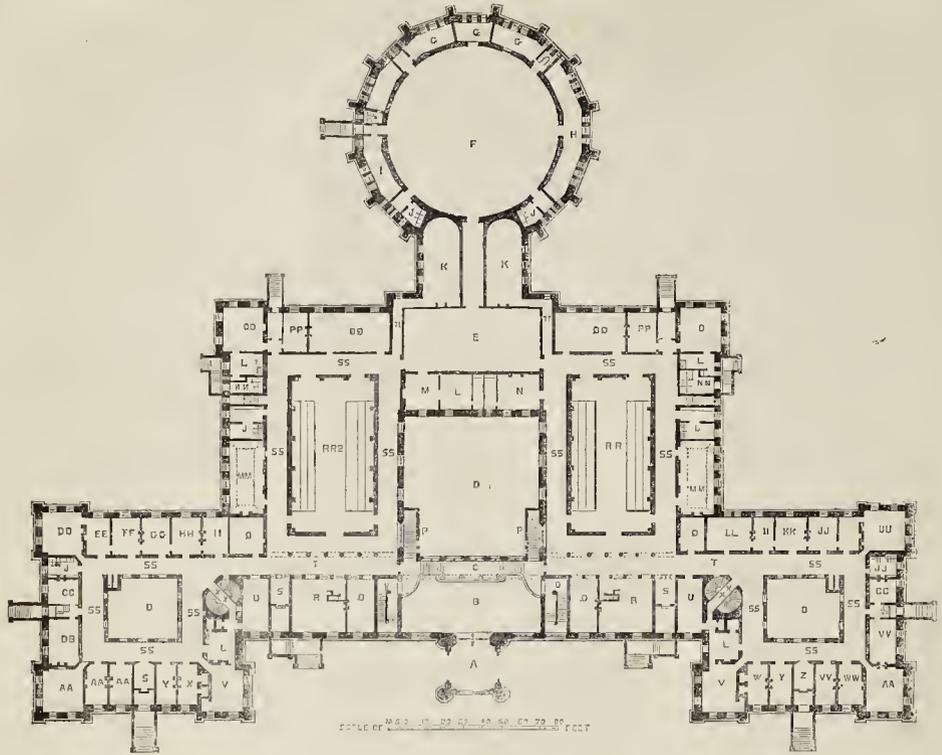

In accordance also with the impression that in all cases, when possible, decoration should tell some true tale;—and in this respect, in the way of art suggestion, it is pleasant to know that our Flora is quite as graceful as that of any other country; old England being quite as fruitful in such suitable natural types as old Egypt;—there are our beautiful ferns, with their feather-like fronds, easily traced on the granite or marble, so many of which delight in the margins of pure water. There is the Phyllitis, or hart's tongue fern, either the plain or the fingered, which loves to hang from rocks which distil hot water. "Les rochers qui pleurent," as the French have it—the rocks which weep.

Then there is our well-loved forget-me-not, the *Myosotis palustris*, which delights in the sides of brooks. This, however, cannot be said of the iris, *fleur de luce*, or white flag, which loves the shade of willows.

Of all the British plants, however, of which the names, even as casually repeated, transport us, in imagination, to charming country haunts, none are so inviting, perhaps, for the present purpose as the beautiful white and yellow water-lilies of our waters—the *Nymphaea Alba*, or white nymph, and the *Nymphaea Lutea*, the yellow or golden lily:—

Oh, Thames of many waters!  
See on thy placid breast reclines  
The fairest of thy petal'd daughters,  
That pure white nymph that melts and binds,  
In rapt five forms, her flowers and leaves,  
In flukes upon her glass-y bed;  
And with her gold hair'd sister weaves  
A chaplet for thy head.

As regards, however, the whole question of floral decoration, I trust I shall not be misunderstood. No one would take exception more than myself to direct "natural ornament," as it is called, forming the staple of art-decoration at all times. On the contrary, I only conceive it may occasionally be used with effect, and that the incised method we have been considering to-night affords one agreeable opportunity for the introduction of it in certain cases, on the surface of granite and other hard stones.

PROPOSED PARLIAMENT BUILDINGS, OTTAWA, CANADA.—Ground Plan.

NEW PARLIAMENT BUILDINGS,  
OTTAWA, CANADA.

In our last volume\* we gave a view and some particulars of the selected design by Messrs. Fuller & Jones, for the proposed Parliament buildings in Ottawa, the new capital of Canada. A commencement has been made, and we now add to the former illustration a plan of the principal floor.

It will have been seen that the intended visit to Canada of the Prince of Wales, on the occasion of the opening of the Great Victoria-bridge, called in the despatch "the gigantic work which is a fitting type of the successful industry of the people," has been officially announced to the Colonial Assembly.

**GAS.**—The price of gas at Uxbridge is to be reduced to 3s. per 1,000 cubic feet. The *Windsor Express* wishes he had the same thing to say of gas at Windsor.

\* Vol. XVII. p. 395.

AN AMERICAN LANDSCAPE.

THEY who know the aspect of nature in the autumn in England only, have no notion of the glorious garb she elsewhere puts on at that time. In America, the woods are all ablaze. America's own poet, a great one, has sung the glories of the season —

"There is a beautiful spirit breathing now  
Its mellow richness on the cluster'd trees,  
And from a beaker full of richest dyes,  
Pouring new glory on the autumn woods,  
And dipping in warm light the pillar'd clouds."  
The gentle wind, a sweet and passionate wooer,  
Kisses the blushing leaf and stirs up life  
Within the solemn woods of ash deep crimson'd,  
And silver beech, and maple yellow-leaved,  
Where autumn, like a faint old man, sits down  
By the wayside—a weary."

Mr. J. F. Cropsey, of Kensington-gate, one of the best of the American landscape painters, has just now completed a large picture, which conveys truthfully the aspect of "Autumn on the Hudson River," and this, therefore, is the title he gives to it. The scene depicted is about sixty miles from New York City, and in the neighbourhood of the West Point. Close by lives Mr. N. P. Willis, and did live Washington Irving,—genialist of sketchers. The sun, on the descent, has flooded the river with light on the horizon. In the foreground on either side, and elsewhere, are trees of great richness, showing the Indian summer,—the singular maple, hemlock, scarlet oak, and birch. On the left is a pool of water amongst the stems; and near it a party of sportsmen, who have been shooting blue jays, repose beneath a tree. In the middle distance is seen Cornwall. The sky is finely painted, and the whole picture is pervaded with a delicious calm, soothing to tired minds, notwithstanding the startling brilliancy of some of the foliage, showing how—

— "When the silver habit of the clouds  
Comes down upon the autumn sun, and with  
A sober gladness the old year takes up  
His bright inheritance of golden fairs,  
A pony and pegasus fill the splendid scene."

Mr. Cropsey's picture should take its place in one of our collections as a truthful and charming

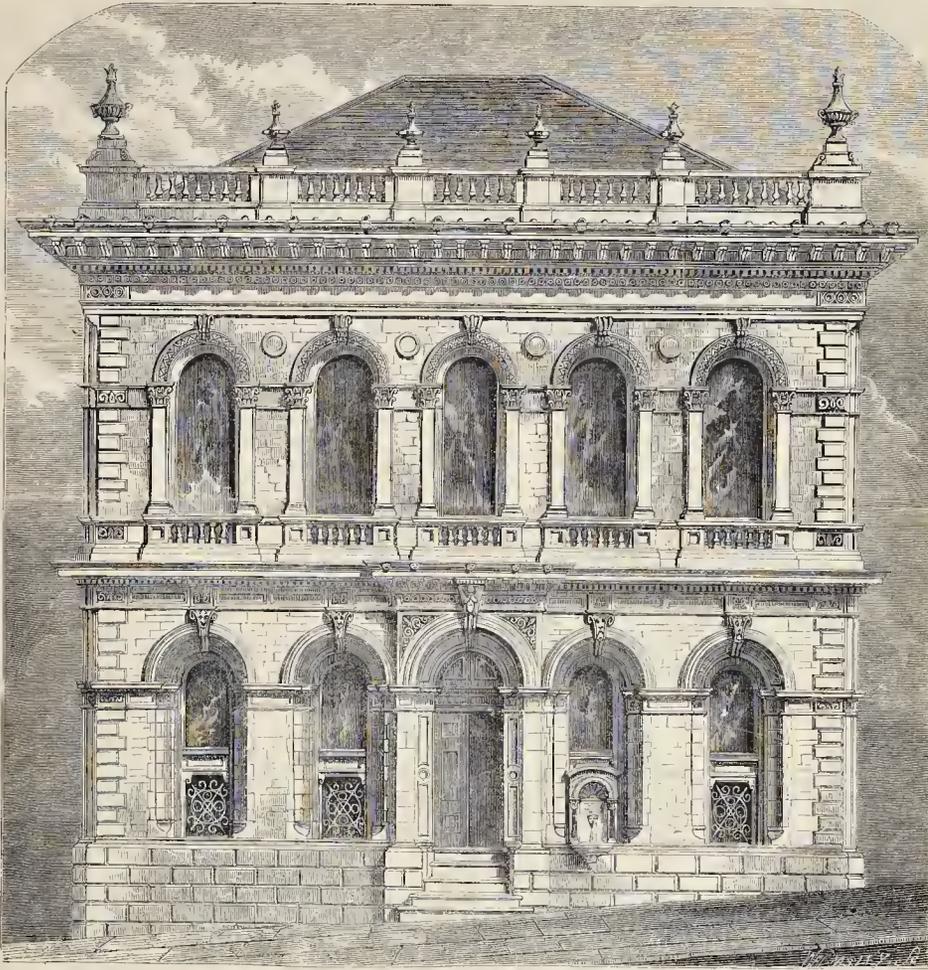

transcript of Transatlantic Nature, and, moreover, it would make an admirable engraving.

THE FRENCH AND FLEMISH GALLERY.

ALTHOUGH the collection of pictures by artists of the French and Flemish schools, now exhibiting in Pall Mall, had the advantage, on the private-view day, of contrast with the Portland gallery, and, undoubtedly, contains several most admirable pictures, it does not give a very lofty notion of the condition of art abroad. There are specimens of good drawing, plenty of grace, and examples of clever manipulation, but we find little to touch the feelings or elevate the thoughts. We can, nevertheless, promise visitors a pleasant hour there. Edouard Dubufe has two excellent pictures, 90 and 91, "the Departure of the Consort," and "the Return of the Soldier." Meissonier, the minute, in 170, "Rembrandt in his Study," gives greater breadth of effect, so to speak, in the small face, than usual, though 500*l.* is a large sum to ask for it. His pupil Ruiperez does credit to his teaching, in 206, "Vandermeer showing his first Picture to a Commoisseur." Of Rosa Bonheur there are two small works.—No. 26, "Mare and Foal," the landscape very low in tone, exhibits the artist's power, but the mare is an ugly animal, in an ugly position. Edouard Frère's "Boys Sliding," 101, though wanting in fun and life, has much beauty; and Henrietta Browne's "Sister of Mercy writing," 48; Plassan's "Prayer," 196; Dubasty's "Naturalist," 84; his "Young Beggar," 85; Trayer's "Housekeeper," 229; and some others, are satisfactory and charming productions.

INSTITUTION OF THE FINE ARTS;  
PORTLAND GALLERY.

THE thirteenth exhibition of "The Institution of the Fine Arts" consists of 483 pictures and drawings and one piece of sculpture. The collection, as a whole, is not a good one. Some of the pictures, indeed, are atrocious. Mr. R. S. Lauder exhibits several of high intention, such as "The Breaking of Bread" (232), "Christ denied by Peter" (263); but they fail to touch us. One of

TEMPERANCE HALL, TEMPLE STREET, BIRMINGHAM.—MR. YEOVILLE THOMASON, ARCHITECT.

the pictures, of a quite different class, that most pleased us was 95, "The Dover Straits from the French Cliffs," by H. W. B. Davis. Messrs. Williams & Percy have several of their always pleasing but too mannered landscapes; Mr. James Peel sends several of the best things he has yet exhibited; and Mr. H. B. Gray some of the most agreeable in the gallery. "Too Clever by Half" (61), by Mr. Robinson; "The Little Messenger" (78), by J. S. Cavell; "Evening" (80), by B. W. Leader; "The Lost Friend" (287), by J. A. Fitzgerald; and 292, "Controversy," by Jas. Hayllar, are amongst the most satisfactory. Mr. J. G. Naish, in 261, "Angling for Rock Fish," suggests more than one *hook*.

Amongst the water-colour artists, Mrs. Elizabeth Murray holds sway; see "The Irresistible Beggar" (218), for proof. Miss Florence Claxton's water-colour drawing, "The Choice of Paris" (178), though a caricature, displays much cleverness, and is one of the very few works in the collection which offers something to be found out.

**REDUCTION IN THE PRICE OF COPPER.**—The price of manufactured copper has been reduced one half-penny per pound. The present price is, tough cake or ingot, 112 $\frac{1}{2}$ ; best selected, 115 $\frac{1}{2}$  per ton. There will be a reduction of a half-penny per pound in wire, tube, and sheets. Brass wire, tube, and sheets, will be reduced a farthing per pound.

#### THE TEMPERANCE SOCIETY'S HALL, BIRMINGHAM.

THIS building, for the meetings of the Temperance Society, erected mainly by the instrumentality of the late Joseph Sturge, is situate in Temple-street, Birmingham. The plan of the hall may be described to be a square with half an ellipsis attached to the platform end, necessitated by the boundaries of the site. The extreme length is 70 feet, and it is 48 feet wide by 35 feet high, and has seats, exclusive of the platform, for about 800 persons. There are galleries on three sides, of three rows of seats only, it having been a requirement of the building committee that the area of the floor should be free of impediments of any kind. The end gallery being continued over the entrance lobbies, &c., the platform is so arranged as to be available as an orchestra, and, following the outline of the main wall, is therefore elliptical in plan. The walls are divided by pilasters into a series of panels, supporting a coved and panelled ceiling. The ground of each ceiling panel is filled in with diaphanous glass, to admit the light. The acoustical effect of the elliptical plan of the platform is pronounced by those who have had occasion to address an audience therefrom to be excellent, both as regards the audience and the speaker, the voice being distinctly heard in all parts of the building without any undue exertion on the part of the speaker.

Externally the building is of white Rugby brick,

with dressings of Bath stone and Portland cement. The height is 50 feet from the pavement to the balustrade. The fountain, shown on the right side of the entrance, was the gift of the late mayor, Sir John Ratcliffe. It is executed of Darley Dale stone, the columns being of polished Aberdeen granite.

The whole was executed, from the designs and under the superintendence of Mr. Yeoville Thomason, by Mr. Job Browning, at a cost of 2,300 $\frac{1}{2}$ .

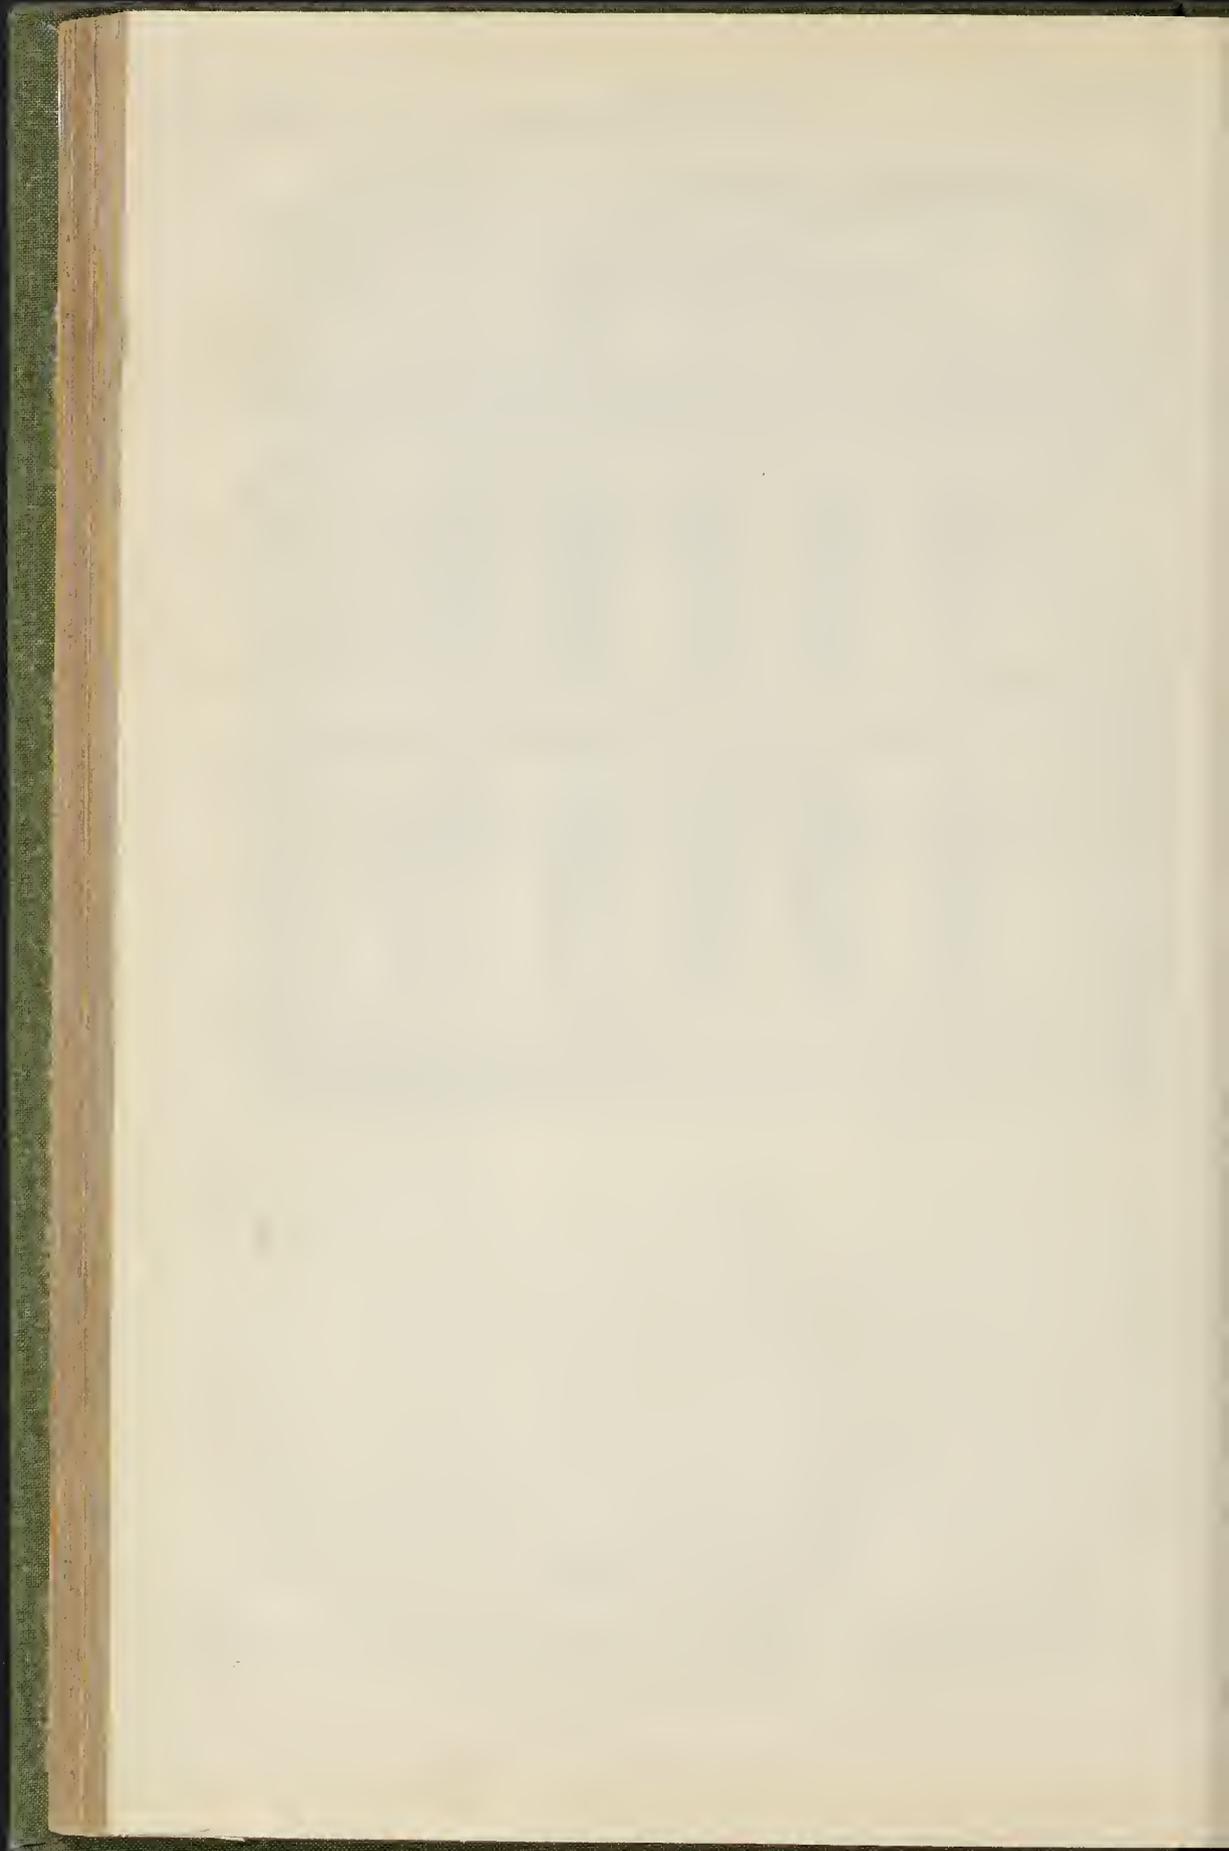

#### THE ARCHITECTURAL ASSOCIATION.

THE ordinary fortnightly meeting of this Society was held, on Friday night, the 16th, in the rooms, 9, Conduit-street; Mr. C. H. F. Lewes in the chair.

Mr. S. C. Capes read a paper on "Light: its Influence on the proper Arrangements in the Plans of Buildings," which we give elsewhere.

An interesting discussion ensued on the properties of light, and the respective advantages afforded by a sky light and side window in the construction of buildings, in which the chairman, Mr. Herring, Mr. Pugh, and Mr. Capes, took part.

The Chairman announced that Mr. C. F. Hayward would read, on the next night of meeting, a paper on "Modernism in Art," and the Society, having passed a vote of thanks to Mr. Capes for his able paper, then separated.

LECTURES ON ARCHITECTURE.  
OXFORD ARCHITECTURAL SOCIETY.

On Tuesday, March 6, Mr. Parker read his fifth lecture, comprising the Early English style of the thirteenth century. He gave an account of the principal buildings of the time of King John and Henry II., both ecclesiastical and secular, and the choir of Lincoln, the work of St. Hugh, of Burgundy, to whom he also attributed the north aisle of St. Giles's and the Chapter-house, Oxford, showing the similarity of the mouldings and other details to the choir of Winchester, the work of Bishop Geoffrey de Lucy, and the Gallie Porch, at Ely, of Bishop Eustace, at the same period, agree also in their architectural details. Salisbury Cathedral, the type of the style, was more fully described, and its exact history given by extracts from the account left by the contemporary Dean Wanda, which also showed the customs of the time, and the manner in which the money was collected, which was, in fact, by public subscription, and amounted to about half a million of our money. Each of the members of the Chapter gave a fourth part of his income for seven years, and many noblemen and others pledged themselves to annual gifts for the same time. It was begun in 1220, and the choir completed in five years, the nave not until 1268. Nearly all the persons who were assembled at the opening of the choir were kindred spirits, each of them being engaged in building elsewhere, at the same time, or shortly after.—Bishop Joceline at Wells, the finest work of the day, and the sculpture of it unrivalled in Europe at that time.

Ralph Neville, at Chichester, built the vault and clerestory. William of York, Provost of Bevelley, was most probably the builder of that magnificent choir. Westminster Abbey was chiefly built at the expense of King Henry III., and differs from the fabric relics lately found in the Record Office. The Italian workmen employed there on the shrine of Edward the Confessor were the first to give to the thirteenth century the style of their work is exactly the same as Roman work of the thirteenth century, and the English people did not like it, and did not follow it.

The transepts of York he considered as the work of Archbishop Walter Gray, who was buried there. Skelton Church, Yorkshire, is said by tradition to be built of the stone that was left, and an entry on that archbishop's tomb seems to confirm this.

The Presbytery of Lincoln, built between 1256 and 1282, is the latest and richest specimen of pure early English. Of secular buildings mentioned were, the hall of the Countess, and the hall of the Countess, the hall towers of Windsor Castle, with a vaulted chamber, having a central pillar; similar towers and a chamber at Somerton Castle, Lincolnshire; the Bishop's Palace at Wells, with its vaulted hall, and a series of windows, with detached shafts; and St. Bravel's Castle, Gloucestershire.

On Tuesday, March 13, Mr. Parker gave his sixth and concluding lecture, comprising the fourteenth and fifteenth centuries. He enumerated the noted examples of each reign, briefly described their architectural character, and exhibited engravings or photographs, both of general views and of details, such as windows, doors, and mouldings, showing the gradual change of style and the decline of the art. He considered the reign of Edward I. as the period of the highest perfection, but that for a century afterwards there were hardly any falling off. The characteristics of the decorated style of the Edwardian period is window tracery; geometrical under Edward I.; reticulated or net-like under Edward II.; flowing under Edward III.; gradually changing into the perpendicular style under Richard II. Many examples of the transition from the decorated to the perpendicular were shown. He also mentioned that in the time of Edward III. the earlier forms of tracery were used along with the latter.

The characteristic ornaments of the Edwardian period are the ball flower, the four leaved flower, and the scroll moulding. The ball flower was introduced into England by the French, and used most abundantly under Edward III., but it had been used long before in the English Provinces of France, and came to us from them. Its origin he was inclined to attribute to the small round rosettes used on French tapestries, similar to those now commonly used on the Continent on horse collars.

The Edwardian castles and the houses of the period were referred to almost as often as the churches, and it was pointed out that the style of architecture took place simultaneously in all. The chief features of the fourteenth century were compared with those of the thirteenth and of the fifteenth; and the buildings in Oxford and the neighbourhood were especially used to illustrate all the points mentioned. The distinction between ecclesiastical and domestic windows was pointed out. The windows of halls are frequently mistaken for those of chapels or churches; on the exterior there is no distinction, but inside of all domestic windows, whether of halls or other chambers, there are always two seats facing each other, formed in the sill of the window, side ways to the light.

The Perpendicular style began in the latter part of the reign of Edward III., but was chiefly introduced under Richard II. The earliest example known of this transition is Eddington Church, in Wiltshire, where William of Wykeham was clerk of the works to Bishop Edington, the founder of that church. The new style was then introduced into Winchester Cathedral, first under Bishop Edington, and afterwards carried on by Wykeham himself, who also adopted it in his colleges at Winchester and Oxford. The roof of Westminster Hall is of the same period. These fine characteristics are peculiar to England, and a very remarkable feature. The fine tracery building of the fifteenth century is also peculiar to England; the most celebrated examples of it were mentioned, such as King's College Chapel, Cambridge; Henry VII.'s Chapel, Westminster; St. George's Chapel, Windsor; the Cloisters of Gloucester; and in Oxford, the Divinity School and Wolsey's vaults over the choir of the cathedral, and over the lay windows of Christ Church Hall, Church Hall.

Gothic architecture had greatly declined, but still was grand even in its last stage. Bath Abbey Church is still a very fine building.

At this time the science of architecture retrograded three or four hundred years, and the Roman buildings which had been badly copied in the eleventh and twelfth centuries, were again badly copied in the sixteenth and seventeenth. This retrograde had made no progress, even in its own style: the finest buildings of the revived Roman style are still those of Italy in the fifteenth century.

A comparison of the buildings of the three last centuries—the sixteenth, seventeenth, and eighteenth, with those of the three previous, the thirteenth, fourteenth, and fifteenth, will show which style has the most

real life in it. The Gothic style had obtained so firm a hold in England on the affections of the people that it was very difficult to supersede it. The mixed buildings of the Elizabethan and Jacobean periods have more of the Gothic elements of flexibility and reality than of the stiffness and formality and regularity of the Classical. The dome is not properly a Classical feature—it is Byzantine, and belongs to the Gothic quite as much as to the Classical. The Gothic dome of St. Peter's is one of the grandest buildings in the world. The Classical facade of St. Peter's, at Rome, and St. Paul's, in London, are only masks to conceal the real construction. The lecturer asserted that the Gothic is the only style in which the real construction is displayed and made ornamental, and this must always give it a superiority in principle over every other style.

## KYLÖE.

The church of Kylöe, which is commandingly situate on one of the finest sites on the border, overlooking Lindisfarne and the adjacent coast, is to be forthwith enlarged and restored. It is a prominent feature of the landscape, seen from the railway between Deale and Berwick, besides doing double duty as a landmark at sea. Kylöe, mentioned in the old writings as Kyllhove, and sometimes Kyal, was one of the chapelries into which the monks of Lindisfarne subdivided their parish of Holy Island. A church was built there by them as early as A.D. 1145, which interesting relic was ruthlessly pulled down in the last century, and a square box-like structure erected in its stead. In the restorations now about to be commenced, an entirely new chancel will be built, and new windows, porch, and roof placed to the body of the church; in addition, a new lantern will be erected on the upper part of the tower. The plans and designs have received the approbation of the Dean and Chapter of Durham, who have made a grant towards the sum necessary to carry them into effect. The Squire of Haggerstone has also made a grant for the same purpose. It is understood that the new chancel will be decorated by a lady, under the direction of the architect, Mr. F. R. Wilson, Alwrick.

NEW NOTES ON CHIBBURN, NEAR  
WARKSWORTH.

At a meeting of the Society of Antiquaries, at Newcastle-upon-Tyne, on March 7, Mr. F. R. Wilson, of Alwrick, laid before them a delineation of the buildings at Chibburn, known formerly, it is believed, as the hospital of St. John de Chibburn. In some notes accompanying the drawings, Mr. Wilson said all mention of Chibburn, in any of the works on Northumberland, is bare and scanty; and more than once incorrect. McKenzie merely says, "Chibburn is a very old strong building which has been moated round; and the rivulet which passes it could easily be diverted into the ditch in times of danger." Hodgson goes so far as to say, "it is a massive, old-fashioned stone building, with a chimney like a huge buttress projecting from its south gable. I see no ground to believe that the building now occupied as a barn here was ever a chapel belonging to the Established Church, either in papal times, or since the Reformation, as some have supposed." But in Turner's valuable book on "Domestic Architecture," the subject is treated at greater length. Finding that the conclusions drawn in this more modern and important notice are not quite correct, and knowing also that the opinions expressed in it are likely to be consulted for ultimate decision in any contested point, I deemed it would not be uninteresting to the society to hear the evidence of the stones themselves.

The passage referred to is as follows:—But the preceptory of the Hospitaliers at Chibburn, existing now almost as it was left by the brethren, affords too curious and interesting an instance to be passed over.

The building formed a hollow square into which there was no gateway, and in all probability all the entrances to the building were from the courtyard. The principal dwelling-house, which was at the west end, is still almost perfect. It is a long, low building of two stories, having external chimneys at the south end, and others in the centre. The windows on the second-floor were built with corbels, probably to attack assailants who were beneath.

The ceiling of the ground-floor is of oak, moulded, upon which are laid narrow oak planks, having their under sides smoothed and a reed ornament on them, so as not to require plaster. The south side was formed by the chapel, which is of excellent ashlar work. At the east end is the great window; and the chapel has this peculiarity,—there is an upper floor of about two-thirds its length from the west still remaining, with the fireplace at the proper level. This has

clearly been part of the original plan, and is a good example of the domestic chapel as described in previous chapters, and it communicated with the dwelling. There is a similar instance of this in a chapel within the keep at Warkworth Castle. The east and north sides are missing. They doubtless contained the inferior dwelling-rooms, stables, &c."

That part of the building called in the foregoing account "the principal dwelling-house," instead of being part of the fourteenth-century edifice, as conjectured, is clearly indicated by the character of the masonry to be post-reformation work.

The story of Chibburn is thus told by its stones. The hospital, situated a seven-mile stage from Warkworth, on the road between Holy Island and Durham,—a welcome sight, no doubt, to many a weary pilgrim,—was in decay when the dwelling-house now standing was erected. But the remains of the chapel were in such preservation as permitted additional accommodation to be obtained by throwing a floor across it, and converting both stories into chambers. A fireplace above stairs, and another below stairs, were inserted for the convenience of this arrangement; and the original windows, now inconveniently situated with regard to height, for both stories, were filled up for the sake of strength and snugness, and others made in more suitable positions.

The present state and prospects of the buildings are most lamentable, and needful of the Society's attention. A few years ago they were used as a kind of farmstead, which occupancy, rough as it was, afforded some protection. But now the farm buildings are removed to a great distance, and the sole occupant of the dwelling-house is a herd. The chapel, dismantled of its oak for the benefit of the new farm buildings, is floorless, roofless, and uncared for, save by the bats, jackdaws, and starlings. The ancient roads are obliterated, and there is every reason to fear that this quaint old place which should be sacred to the memory of the Hospitaliers, and subsequently to that of the dowager ladies of the house of Widdington, who made it their pleasant home in Elizabethan times, will as completely disappear, to meet the exigencies of additional cow-hyrc requirements.

## AMERICAN INSTITUTE OF ARCHITECTS.

The American Institute gave their annual dinner on Wednesday, 22nd of February. Mr. Richard Upjohn presided, and there were present, amongst others, Messrs. R. M. Upjohn, Hunt, Vaux, Mould, Warner, Rich, Diaper, Auchmuty, Hamilton, Petersen, Dudley, and others. The *New York Architects' and Mechanics' Journal* gives a report of papers read and speeches delivered. The prevailing sentiment of the meeting was, in the words of Mr. Renwick, who sent a communication,—“Let us then, having formed this association, render friendly assistance to each other: let us defend each other's reputation as our own; and, throwing aside that jealousy which is too often engendered among those in the pursuit of the same art or science, let us hasten to crown the victor in a fair and honourable competition. Let us, in a word, to use the language of a great and inspired man, 'be kindly affectioned one to another, in brotherly love.' For by so doing we will gain each other's good will, the respect of the world, and may humbly hope to obtain the approbation of our Master, the Great Architect of all."

Such kindly sentiments will suit either side of the Atlantic. We shake hands with our brethren across the great Water.

## YORK CATHEDRAL.

The magnificent subscription of the Dean of York, mentioned in last week's *Builder*, gives hope of an inestimable boon being conferred on the admirers of Medieval Art. York Cathedral, justly regarded as our king's minster, is unquestionably the grandest production of the Middle Ages in this country, whatever detrimental comparisons may be made with Westminster Abbey, Lincoln, and others, in some particulars; and, if we do not allow the soaring heights and the more delicate finish of the French cathedrals to absorb every other consideration, it may fairly contend for the supremacy throughout the whole sphere of Gothic architecture. At Beauvais, the choir only can be put in competition; and Amiens, though one-third loftier in its roof throughout, is beaten by the superior length and the sublimer and higher centre of York, to say nothing of its variety, the peculiar richness of its sculptured walls, its windows, and other features. Yet this magnificent edifice, in

which we, as Englishmen, have so much reason to pride ourselves, has had half its glory veiled from our view by surrounding obstruction: no part of the exterior has been seen to advantage for many centuries, if perhaps we except that imposing centre tower, as seen from the north-west. What an acquisition, not to York only, but to the nation, would it be if the south-east view of the old building could be shown as at Lincoln! It is to be hoped, however, that the effort to widen the western approach will be rightly appreciated, and made effectually successful. No doubt the ecclesiastics and citizens of York will do their part; but, unaided, they may feel that to do justice to the Minister is out of the question: the public therefore should be awakened to make a national effort for the full recovery of this our greatest æsthetic treasure. Were the matter duly brought before the public, and smothered by the leaders of the profession, a sum sufficient for anything might possibly be raised. At all events it is hoped that, before the limits of the improvements are decided, the scheme and the commencement of the subscription will be given to the public as a challenge for ampler support. Should the display of the west front alone engage attention, it will be well to bear in mind that it comprises the most elegant window in the world, set as a jewel in the midst of univalued ornamentation expressly adapted for it; and according to the years in which it has been in a manner entombed should be the pleasure to be realized by the completeness of its disclosure.

#### CONDITION OF WAREHOUSES.

At a recent meeting of the Manchester Statistical Society, a paper, entitled "A Model Warehouse," was read by Mr. John Robertson. He gave a lengthened description of the internal, social, and other arrangements of an extensive warehouse belonging to Mr. Adams, of Nottingham; after which he described the awful state of some of the warehouses, in Manchester, used as manufacturing warehouses, principally old dwelling houses, the rooms of which, never having been altered, are ill adapted for their present purpose. They are also insufficiently ventilated, and occupied by such a large number of hands (especially where females are employed) that the cubic space allowed for each person is too limited to admit a sufficient supply of air to keep them in moderate health. Mr. Robertson dwelt upon the injurious effects of the system of irregular and late hours which at present prevails in the shipping houses generally, and mentioned some instances where such a practice had been discontinued, in consequence of the merchant or employer feeling satisfied that, in an economical point of view, his business was less efficiently conducted than if carried on during the usual daily office hours. A conversation followed, in the course of which the speakers urged the necessity of ventilation being considered when buildings are designed, the architects feeling it as much their duty to provide the shafts for ventilation, as it is to arrange fireplaces and chimneys for heating, soot-ways for drainage, gas pipes for light, and services for water. The importance of gas as a motive agent in ventilating was spoken of, and many of the improvements in the new warehouses of Manchester were described.

#### SLAVERY AMONG THE BLEACHERS AND DYERS.

SOME time ago attention was drawn in our columns to the shocking overwork, especially among young children, girls as well as boys, in bleaching and dyeing works. We are glad to observe that a forcible "Appeal to the Women of the United Kingdom, by Women," on this subject, has been published by Houlston & Wright, of Paternoster-row. In this small pamphlet some of the Blue-book evidence is quoted, which proves but too clearly the fact, that a most merciless and heart-rending system of overworking children prevails amongst these "bleachers, dyers, and finishers," or butchers, killers, and finishers, as they ought to be called. We hear much in this country of negro-slavery in America; but the negro's treatment, as a system, is enviable by comparison: let us pluck the beam out of our own eye that we may see all the more clearly how to take the mote out of our neighbour's. Mr. Crook, M.P. for Bolton, has succeeded in bringing a bill on the subject of the poor bleaching and dyeing children into Parliament, and in the printed "Appeal" a "plan of operation" is suggested, with the view of aiding in the attempt to overcome the selfish and mercenary interests which will be brought to bear upon the Legislature to induce them to dis-

believe the evidence of their own blue-books, and to throw out the Bill for the amendment of such a crying evil. In a form of appeal, similar to a form of petition, both proposed to be addressed to members of Parliament, it is narrated that a vast number of women and young children employed in bleaching, dyeing, and finishing works throughout the United Kingdom, are in the habit of working, for many months in succession, at the rate of seventeen and eighteen hours a day, not infrequently increased (even in the case of children of ten years old, nine years old, and younger) to twenty hours, four-and-twenty hours, or more, and even four days and nights in succession, and "in a temperature exceeding by some twenty or thirty degrees the general temperature of an Indian summer;"—the memorialists, therefore, "most earnestly implore, as women, as wives, as mothers, that your Honourable House will take these terrible wrongs into consideration at the very earliest opportunity."

#### COMPETITIONS.

*New Congregational Church, Staley Bridge.*—From the designs submitted for New Congregational Church, Staley Bridge, that by Messrs. Poulton & Woodman, architects, Reading, has been selected.

*New Congregational Church and Schools, Charlton-road, Manchester.*—For the New Congregational Church and Schools, Charlton-road, Manchester, a design by the same architects has been selected.

*Design for Villas.*—In reply to advertisement in *The Builder*, "J. R.," a correspondent, says, upwards of one hundred designs were received, and that of Mr. John Giles, of Lincoln's-Inn-Fields, was finally selected; the second premium was awarded to Mr. James Tolley. The works are to proceed at once under the direction of Mr. Giles.

#### DRINKING-FOUNTAINS.

*Bradford.*—A design, prepared by Mr. E. Milnes, for a public drinking fountain, to commemorate services rendered to the borough of Bradford by Mr. Alderman Bennett, has been accepted. The design consists of a basement of two octagonal steps (the lowest about 13½ feet across), and a granite curb or plinth, moulded and forming the outer rim of a small reservoir for dogs. From this plinth spring four arched buttresses, supporting the fountain proper, which has four sides with niches, three of which have carved shells, the lower ones receiving the water from pipes in grotesque masks. At each angle of the fountain is a detached shaft of polished granite with moulded plinth and carved capital, from which springs a semicircular archivolte. Above the four arches thus formed the fountain becomes octagonal. The height of the whole, from the pavement to the extremity of the lamp, is about 26 feet. The style of architecture is Italian renaissance.

*Langrivation of a Drinking-Fountain at Bath.*—The public drinking-fountain, near the end of Fountain-buildings, at the entrance to Lansdown-road, has been publicly inaugurated. The structure is in the Early Pointed style, and has been erected from the designs of Mr. C. Phipps, of this city, architect. Its form is that of a trefoil arch, with marble basins on each side for the public, surmounted by the exhortation "Be thankful," a large pennant basin in the centre for horses, and a small trough at the base for dogs. The structure is mainly of Combe Down stone, with pillars of Devonshire marble. Colour has been used in various parts, and, encircling the arch in front, is the accompanying inscription in Miltonic tiles—"Let thy fountains be dispersed abroad, and rivers of water in thy streets." A plate at the back states by whom it was erected, together with the name of the architect. The mason's work has been executed by Mr. I. J. Treasure, the metal apex and spouts by Mr. Colley, and the plumbing by Mr. Trewolla. The local *Gazette*, in reporting the proceedings at the inauguration, remarks that "the horse, in a state of nature, drinks from rivers or ponds, the surface of which is on a level with or below his feet; the water is sucked up slowly, that every part of the throat may be lubricated as the useful liquid passes into the stomach;" and he is of opinion that "ponies and donkeys can never drink with enjoyment, if at all, from the newly-erected fountain. The Longhorns, from Devonshire," he remarks, "will smell the water, and long for the refreshment they are panting for; but, alas! the lips of cattle can never reach the coveted luxury."

#### PROVINCIAL NEWS.

*Worcester.*—Mr. Hardwick, of London, according to the local *Herald*, is preparing plans for the erection of lodgings at the Beauchamp's almshouse for thirty-two almshouse, with chaplain's house, board-room, matron's house, porter's lodge, and the necessary offices. If the advowson of the hamlet of Newland be obtained, the chapel of the almshouses will become the parish church of Newland, and the old structure, which is little more than a patchwork of timber and plaster, will be pulled down. The chapel or church will be close to the almshouses, and connected with them by a covered passage or cloister.

*Liverpool.*—The new workhouse for Toxteth-park is now so far completed that it has been occupied by paupers from the West Derby workhouse. The site of the new workhouse is in Smithdown-lane, immediately beyond the new cemetery. It is calculated for the accommodation of about 700 paupers. Except a clock-tower, it presents no architectural feature calling for special notice. The architect, remarks the *Journal*, has very wisely eschewed the pet idea of the Poor-law Board as to the construction of such establishments, so that the place, in all its arrangements, has less of the prison about it and more of the home. It is, in brief, a plain brick building, stone dressed, two stories high, with wings on each side, and with the clock-tower in the centre. Somewhat removed from the public road, it presents a frontage towards the cemetery of 428 feet, and runs back to a depth of not less than 358 feet. The two wings project forward about 35 feet; and, unlike most modern workhouses, the schools, washhouses, baths, workshops, and other conveniences are all detached, in the respective yards at the rear. The tower, which is square, and about 120 feet in height, is of an ornamental character. Beneath is the main entrance, together with the private apartments of the governor and the offices belonging to his department; whilst, behind these, again, shooting out in a straight line to the eastward, and serving to separate the building into two divisions, are the kitchens, store-rooms, dining-hall, bakery, and engine-house. All to the south of this range forms the middle portion of the building: the north is the fumble part of the house. The comfort of the inmates has been so far considered that in wet weather they can approach the hill by means of an interior corridor. In a like spirit, covered play-sheds have been provided in the children's yards. The cooking is done by steam; but the place is warmed by open fires in every ward. The whole of the building may be said to be completed with the exception of the hospital and a few interior fittings. This is situated 10 yards from the main building of the south end, and is quite detached from the other portions of the house. The guardians have secured a good deal of land in the immediate vicinity, and about four acres of this will be immediately brought into cultivation by the youths in the establishment, and the able-bodied men. Nearly the whole of the yards attached to the establishment will also be laid out, more or less, as gardens, and it is contemplated to offer prizes to the lads for the neatest kept plots. Mr. Culshaw is the architect, and Mr. Newton is in charge as clerk of the works. The original contractors for the building were Messrs. Kilpin & Montgomery, but after the disastrous fire at their premises they were obliged to relinquish the contract, and Messrs. Holme and Nicol are completing the brickwork and joinery. Mr. William Thornton is the mason: Messrs. Knight & Son, of Renshaw-street, have done the plumbing, painting, and glazing; Messrs. Callaghan & Arowsmith, the slating and plastering; and Mr. William Tyson, of Waverley, is the contractor for the interior fittings. The cost of the building, as per the original contract, was to have been 2,126½; but it is believed that the actual cost will exceed that amount.

*Manchester.*—The plans for the enlargement of the Post office in Brown-street, by adding to it that portion of the building now occupied by the corporation as the City Court, with its annexed offices, &c., have been fully determined upon. The money-order office will be removed from King-street to Brown-street. Amongst the improvements will be the opening a passage to the box-office into Barnes-street; the provision of a lobby for the private box-renters; the removal of windows and the substitution of open counters, as in banks; while considerable improvements will be made in the general appearance of the offices both within and without. The front to Brown-street will be considerably altered for the better, and extended to the Clarence Hotel. The designs have been prepared in London; and the alterations will

he superintended by an architect from the Board of Works.

**Edinburgh.**—The Scottish Widows' Fund Insurance Institution purchased lately the new building in St. Andrew's-square, erected by the Western Bank. Since then the business has been removed into the new premises, which have undergone a complete interior renovation. According to plans prepared by Mr. David Bryce, architect, every accommodation has been provided for the various offices of the establishment. The decorative department, according to the *Edinburgh Post*, is of a good character, without attempts at gaudy demonstration. The second story is gilded in cinnamon colour, and the main-door floor in green relieved with burnished gold. The designs and colouring were under the superintendence of Messrs. Macfarlane and Wallace.

#### STAINED GLASS.

**Cranbrook, Kent.**—Messrs. O'Connor have recently completed a four-light window to be set up in the church at Cranbrook, "in memory of Betsey, wife of Thomas Webster," the Royal Academician, and in which they have been aided with the advice of Mr. Horsley, A.R.A. Each light contains a large single figure, Faith and Charity (or Love) in the centre two, and St. Paul and St. John as representing these virtues, outside. The borders and filling in are from designs in the church. The figures are very well painted, and the whole work, when in its place, will doubtless have an excellent effect. The shields for the inscriptions are the least satisfactory part of it.

**London.**—Messrs. Lavers and Barrard are fixing the east window of St. Sepulchre's, Snow-hill.

**Rochester.**—Messrs. Clayton & Bell have just fixed, in the large triplet lancet-windows of the lower range in the north transept of Rochester Cathedral, a stained-glass memorial of the late venerable Archdeacon Walker King, M.A., 32 years archdeacon of the diocese of Rochester. The central lancet contains a canopied and crowned figure of our Lord habited in Kingly jewelled vestments. Beneath this figure, which is to a very large scale, is a subject in which is shown the trial of St. Stephen at the moment of the saint's ecstatic vision of our Lord. In the side lights are figures respectively of Saints Stephen and Philip the Deacon, and in the predellas beneath, the subjects of the Ordination of St. Philip and Stoning of St. Stephen.

#### CHURCH-BUILDING NEWS.

**Newcastle-under-Lyme.**—The foundation stone of a new Wesleyan chapel has been laid at Newcastle by Sir John Radcliffe, P.S.A., of Birmingham. The style of the new building will be Gothic, with some Continental features. The material will be red brick, with blue introduced into the arches and strings, and with stone dressings. The interior will be divided into nave and aisles, with iron columns and arches of coloured bricks. The sittings will consist of pews, accommodating 1,100 persons. The dimensions of the structure are to be 88 feet by 50 feet, the central ceiling being 45 feet from the floor line. The estimated cost of the building is 2,400*l.* The architect is Mr. H. Fuller, of Manchester; the builder, Mr. E. Matthews, of Hanley.

**Wednesfield Heath.**—The building recently erected as a chapel, to supply the rapidly increasing wants of the Methodist congregation at Wednesfield Heath, has been formally opened for divine worship. The edifice has been erected by Mr. Palmer, at a cost of about 1,150*l.*, from designs furnished by Mr. Billake, architect. The exterior of the edifice is of brick, stone being sparingly used. The plan is cruciform in outline, though the transepts have but a slight projection beyond the side walls. The roof interiorly is open, framed and ceiled between the rafters, all the carpenters' and joiners' work throughout being stained and varnished. The arrangement of the seating is central, the space adjoining the side walls being divided and approached from aisles continuing the entire length of the chapel, and will accommodate about 600, of which 250 sittings will be free. Future galleries have been considered. A west gallery, capable of holding 200 children, is built over the main entrance. There are three vestries provided at the rear of the chapel, giving collectively about 625 superficial feet of class and vestry room. The building is lighted from a central triple-light window in the main gallery, two triple-light windows in the transept, and two small windows in the body of the chapel. The organ (by Messrs. Whieldon & Roberts, of Manchester) has been erected at a cost of 200*l.*

**Stirling.**—Funds are being raised for the restoration of the High Church, embracing two places of worship. The pile was reared in the fifteenth century, in Gothic architecture, the eastern portion having been constructed by James Beaton, archbishop of Glasgow, and uncle of the Cardinal James VI, the first Protestant Sovereign of Scotland, was baptized in the choir, when a discourse was preached to the lords of the congregation by John Knox. The restoration of the transept has been entrusted to Mr. Roched, of Glasgow, the architect of the Wallace monument.

**Kirkcubbin.**—The parish church of Kirkcubbin, one of the most ancient of the ecclesiastical edifices of Scotland, and possessing a specimen of the Norman style of architecture, has just been renovated in the interior, and improved. The walls have been painted, and all the woodwork stained. A more convenient site has also been provided for the pulpit, which is new, in the Norman style. It occupies the centre of a raised platform, in front of which is a railing corresponding to the style of the pulpit. Immediately behind the pulpit is a large window, and on either side a circular one, all filled with stained glass. The expense of these improvements has been provided for by the resident heritors, aided by subscriptions from the Earl of Hopetoun as the principal proprietor, and others. The work has been executed according to designs prepared by Mr. David Rhind, architect.

#### FALL OF THURSTON TOWER AND PART OF THE CHURCH.

The *Bury Post* announces the total destruction of the fine tower of the above church, with a large portion of the roof and arches of the edifice, which took place shortly before midnight on Sunday last. At that hour the inmates of a cottage adjoining the churchyard were alarmed by a sudden crackling noise, and almost immediately after by the loud crash of the steeple falling almost perpendicularly, but with a slight inclination to the west, bringing down at the same time the roof of the nave and aisles to the extent of 35 feet, with three pillars and arches on one side and two on the other, and burying in the ruins the peal of five bells, shattering the pews and the great door, and much injuring the organ (nearly a new one), which had been placed at the west end of the north aisle, close to the tower. The cost of rebuilding has been roughly estimated at 1,000*l.*

The tower was 75 feet high, built of rubble, the lower part of the fourteenth century, like the church; the part above the church probably two centuries later. It had a doorway in the west front, with a small decorated window in the ringers' loft over it, and four perpendicular windows in the belfry. In the year 1857, some serious fissures having been for some time observed in the upper part of the tower, Mr. Johnson, architect, of that town, was consulted; and, under his direction, the fissures were closed and the walls secured by iron ties; the west entrance, which had been bricked up, was re-opened; the faces of the angle-brutresses, which had been fractured, were restored; and other repairs were done to the tower and church roof, at a total cost of 600*l.* or upwards. A contract was recently made with Mr. Thomas Farrow for the execution of the repairs, the commencement of which was fixed for—just thirty hours too late.

#### CITY OF ELY WATERWORKS.

Mr. LEE, the superintending inspector of the General Board of Health, in 1850, recommended the water-supply of this city to be taken from gathering grounds: the local Board ignored this sound advice, and derived the supply from the muddy river Ouse: the engine and pumps being too small and badly contrived, the supply has for some time past been very deficient. After large sums of money had been uselessly spent in experiments and alterations, and considerable ill-feeling had been engendered between the Board and the rate-payers, it was at last deemed advisable to consult a qualified engineer, and Mr. Joseph Glyn, C.E., was called in to suggest a remedy. Under his direction, a new hoiler and engine have been recently erected, at a cost of 1,000*l.* It now appears that the filter-beds are also too small; for, when the engine has been working six or eight hours, the filtered water is used up, and the river-water, in its normal condition, is pumped into the mains, or the steam is blown off till next day.

The present surveyor, Mr. Latham (who has been but recently appointed), has recommended the purchase of two acres of land from the Rail-

way Company, for the construction of proper filtering beds. As this land is valuable for mercantile purposes, there is little doubt but that the company will ask a "fancy" price for it.

The original estimate of the consumption of coals was 90 tons per annum: the actual consumption is nearly 300 tons: this, it is alleged, is owing to the absence of any smoke-consuming arrangement, as evidenced by its nuisance to the neighbourhood, and to the small size of the engine chimney, which originally had a flue 2 feet 3 inches square; but the inside lining was soon burned out, and replaced with firebricks, so as to contract the aperture to little more than 1 foot square: it has, therefore, been in contemplation to take down the chimney, but the gale of Tuesday, the 6th, saved the board this expense, for it carried away the whole of the stalk that was above the eaves of the engine-house (15 feet in height): in its fall it broke in the roof of the hoiler-house and the roof and walls of the hotel stables adjoining.

As something may always be learned from an accident, we give the following particulars of the chimney. It was 60 feet high, of perforated bricks, one brick thick, square on plan, the flue 2 feet 3 inches square. The sides were built quite perpendicular, without any batter inside or outside, and capped with a heavy brick cornice to give it the so-called appearance of an Italian campanile. A side and end were hounded into the walls of the hoiler-house, and, from the unequal settlement thus caused in the work, the chimney had for some time been 9½ inches out of the perpendicular.

It was constructed without a scaffold, but was carried up from the inside, the materials being hoisted by the pole and cross-bar known as the "Devonport column derrick." The vibration caused by this contrivance jurred and disturbed the key of the mortar in the new brickwork, and tended very much to make the chimney permanently unsafe. It has been proposed that a site be purchased, and a new chimney constructed thereon, of the following dimensions:—90 feet high, 9 feet 6 inches square at the base, changing to a circle, 7 feet 6 inches exterior diameter, which will regularly taper to the top, with a circular flue, 3 feet diameter, at the base, which will expand a little as it ascends, so that the diameter of the flue at the top will be about 3 feet 9 inches. The damage, new chimney, and incidental expenses, are estimated at nearly 300*l.*

It is a question, however, if Ely can be really furnished with an unlimited supply of potable water so cheaply or well as by laying a main along the railway, to the upper green sand formation of the waterworks at Cambridge.

VIATOR.

#### THE "BED-WAY" OF BUILDING-STONE.

It has long been the custom to attribute the decay of stones to a careless indifference in placing them in a building without regarding their natural bed; and, therefore, to suppose that, if thus fixed, with their bed exposed to atmospheric influences, they will rapidly decay. We are told that "even unpractised eyes can detect the bedding of the majority of London building-stones," and that "a good workman will hardly ever be mistaken in his judgment." Now I do not wish to characterize myself either as a good or bad workman, although during many years of my early life I was daily occupied as an operative stonemason; and it will probably be admitted that I have, since then, had considerable experience in all matters relating to building-stone; but when a specimen of good Anston, Portland, Bath, or Caen stone has been removed from the rock, I cannot yet discover any means of detecting which way it lay in the quarry. I make this statement generally; at the same time admitting there are many exceptions. If this precaution is so very important, and the "bed-way" of a stone is so easily determined, how is it that during so long a discussion amongst architects and others, and after page after page being printed, about the decay of stone, some practised individual, who feels himself confident to point out the bed-way, does not explain his mode of detection, and show a few simple rules, to instruct those who are less learned in such matters? If this subject is all important, what a valuable lesson would be given to the architectural profession, and more especially to clerks of works, if some learned gentleman, experienced mason, or other person with "practised eyes" would collect a few young or old students, at a building in progress, such as Montague House, at Whitehall, recently commenced for the Duke of Buccleuch, and give a lesson where blocks of stone might be observed fresh from the quarry; others being worked by

the masons, and many just fixed in the building. This would afford a good practical opportunity for the instructor to explain to the inexperienced his means of detection, and enable them to avoid such mistakes in future works.

The foregoing remarks have no reference whatever to sandstones.

C. H. SMITH.

#### COTTAGE IMPROVEMENT.

I CONSIDER we shall be only avoiding the material question of how to improve the labourers' cottages, if we admit the hyperbole that landowners will be benefited by losing sunk capital, but having a better class of labourers. I fear greatly you will hardly convince the British landlord of the force of this theory. However, suppose landlords do build cottages for all the labourers on their own farms,—may, more, build cottages for all their tenants and labourers,—there still remains a large proportion totally unprovided for, independently of some landlords being unable to erect cottages without a fair per-centage. I quite agree 4*l.* a year, or 1*s.* 6*d.* per week, is a fair rent; but, like you, I am very sceptical that a double cottage can be built for 140*l.*: nor do I think a proprietor would rest satisfied with a smaller per-centage than 7 per cent.

With the great talent that pervades your columns every week, I feel sure many will come forward on so Christian a mission; and I believe such combined talent would meet every point, and save the peasant and satisfy the landlord.

That our architects may, and will, is the sincere prayer of

NEMO.

P.S. The Lands Improvement Company charge 6*1* per cent.

#### REPORT OF SUB-COMMITTEE OF THE CENTRAL ASSOCIATION OF MASTER BUILDERS ON BENEFIT SOCIETIES.

The following is appended to the report read at the meeting of the Central Association, reported in a recent number:—

"Your committee beg to report that, on examining the details of management and the objects of existing institutions of a similar nature, they find that each branch of the building trade has a society, and that in some a benefit fund is attached thereto.

The masons have a trade fund to meet the expenses of strikes and minor objects, a sick fund, and an accident fund, the latter being obtained by levies.

The bricklayers have a society to provide for payments when on strike, and an accident and burial fund.

The joiners have societies with similar objects. The plasterers have an accident and burial society.

The smiths, plumbers, and painters have societies which have trade and benefit objects combined. The labourers have also an accident and burial society.

None of these, however, are pure and simple benefit and sick clubs, where the savings of the workmen are certain to realize them aid in sickness, and a provision for the contingencies of old age.

Some workmen belong to various provident societies, such as the Odd Fellows, the Foresters, &c.; but were it not for the private sick-clubs attached to the establishments of employers, the majority would be without provision against illness and its consequent calamities. Being principally in large firms where private sick-clubs are adopted, and these only providing for the men while in such employ, it is evident that the workmen require a thoroughly sound provident club, whose rules may be in accordance with the wishes and requirements of the workmen, whilst the subscriptions should be the lowest that may be compatible with securing, with certainty, the stipulated benefits. Were the committee to encourage and assist such a society, we believe that it would be fully appreciated by great numbers of their workmen, and enable them to derive the benefits they seek for themselves and their families without becoming, as they now must do, members of trade societies.

We beg leave, therefore, after mature consideration, to recommend to the committee the recently established Workmen's Institute. The promoters of this undertaking, adopting many of our suggestions, have originated also a benefit club, which will be opened in a few days. They have given this subject great consideration: able advisers have been consulted; they have studied the rules of existing societies, and have taken opinions

of the workmen themselves, and embodied many of them in their rules, which have been certified by Mr. Tidd Pratt, the registrar of friendly societies in England.

One important feature the promoters have in view, is to obtain a guarantee fund through the subscriptions of those who desire the welfare of the working man; and as the principal offices have been undertaken by gentlemen distinguished for their public and commercial eminence, and in whom, it is believed, the workmen would have the fullest confidence, your committee anticipate that this would assure the men (who will themselves take part in the arrangement) of the soundness and security of this benefit society; and if the interest of the guarantee fund was also appropriated in cases of accident or sudden distress, much good would be done to the working classes, and kind feelings engendered between the employed and their employers.

#### Books Received.

*A Comparative View of the Human and Animal Frame.* By B. WATERHOUSE HAWKINS, F.L.S. London: Chapman & Hall. 1860.

MR. HAWKINS is popularly known as the builder of the big beasts at the Crystal Palace, or at least as the architectural restorer of their outward forms from their remaining skeletons. His purpose in the present volume is to give a comparative view of the variations in form of the bony skeleton or framework of those animals most frequently required by the artist, designer, or ornamentist.

English art-students cannot be expected to obtain that facility in design which was so evident in the ornamental works of our Continental neighbours at the Exhibition of 1851, without a more intimate knowledge of animal form than can be obtained in London while we are without a collection of animal skeletons accessible to the mere artistic student; and yet we have a national collection of them which few know anything about, as they are at present almost impossibly buried in the crypt of the British Museum, where, from want of space, they lie almost useless, awaiting better accommodation.

In addressing the art-student through the medium of his eye, by presenting to him pictures in lieu of words, the author's desire "is to impress him with a strong sense of the unity of design and oneness of plan upon which all animals are constructed,—a unity always so apparent and important to the naturalist when comparing and collating any one of the great classes of the animal kingdom." It has also been his endeavour to show, by repetition of forms, as he has most successfully done, "that one primary pattern was created and fixed by the Almighty Architect in the beginning, and persistently adhered to through all time to the present day; and so perfect," he adds, "was this classic pattern (designed in foreknowledge by omniscient wisdom) that slight modifications of secondary parts, fit and adapt the whole to all the changing circumstances that have been, or may become, specific conditions of life to the various groups of beings which constitute subdivisions of the animal kingdom." Slight indeed are these modifications! The lengthening out of a little bone an inch or two here, the drawing in of another there, a third a little away, and the drawing of some well-known genus of animals, is forthwith changed into the form of some other of a totally different class. And this process of change is one which actually goes on in the embryotic development of all animals, the human inclusive, whose forms progress through fishy, reptilian, and mammalian typical forms, till the creature transcends and is born as it were beyond them all. The idea of born monkeys being developable into human beings is an absurd one, inconsistent with all the known laws of animal nature, unwise though the wonderful plan of the whole be; but here are facts which no one can gainsay. It does not appear to be Mr. Hawkins's idea that different species, or genera of animals, were brought into existence by different and special or successive acts of creation; and, indeed, he speaks of "the apparent extremes of external difference," all untravellingly subscribing "a unity of plan, without any evidence of a necessity (either for the continuous succession of new creations or for the opposite grotesque theory of development." His

ideas on the subject, however, are not here traceable at all, to any extent, and neither do we propose to enter on it. But there is one very curious fact to which we may just advert for a moment while we think of it. Few are aware, we dare say, that the doctrine of Lamarck and the "Vestiges" is as old as the time of Plato and the ancient Egyptians; yet the fact is easily proved. Let us first of all just glance at what the "Vestiges" theory comprises. In the first place it comprises the idea of a progression from lower to higher animal forms, not ending, probably upwards, even with man, but ascending to some god-like shape not yet "developed." Thus the author speaks of "preparations for, and causes of, the possible development of higher types of humanity," the mundane economy being "very well as a portion of some greater phenomenon, the rest of which has yet to be evolved," the present system being "but a part of a whole, a stage in a Great Progress," and "the Redress is in reserve." Again, the "Vestiges" doctrine comprises retrogression as well as progression: thus the author speaks of certain facts indicating "an unequivocal retrogression towards the type of the lower animals," adding that "we see nature alike willing to go back and to go forward." Keeping these points in view, and also what is said generally of man—of "the adult Caucasian, the highest point yet attained in the animal scale,"—that "his organization passes through conditions generally resembling a worm, a fish, a reptile, a bird, and the lower mammalia, before it attains its specific maturity,"—let us now turn to the ancient books ascribed to Hermes Trismegistus, which the sages of the Thebais, of Egypt, possessed, and which Plato not only speaks of having seen, but appears to have been indebted to for some of his ideas in relation to the hermaphroditic, or twofold nature of man, human and divine. An English translation, of old date, of some of these small books, exists in the National Library, and it is from one of these, on "Regeneration," that we quote:—

"They which are of creeping things [worms] are changed into those of watery things; and those of things living in the water to those of things living upon the land, and dry ones, and are changed into men and human souls, that by hold of immortality, and are changed into daemons [genii, not 'devils']. And so they go on into the spheres or region of the fixed gods, . . . . And this is the most perfect glory of the soul. But the soul, entering into the body of man—for from one soul of the universe are all these souls,—if it continue evil [if it do not progress into the region of the fixed gods, and there abide], shall neither lose immortality, nor be partaker of the Good; but, being drawn back the same way, it returneth into creeping things. And this is the condemnation of an evil soul. And the wickedness of a soul is its ignorance."

Here is much more than a mere disjointed trace of an ancient doctrine of metempsychosis, more vast in its comprehensiveness than any other we have ever yet seen or heard of.

To return to Mr. Hawkins's volume, we cannot conclude without expressing our opinion of it as a highly instructive and suggestive work, and especially useful to art students.

#### Miscellaneous.

SEWERS AND THE UNDER-GROUND RAILWAY.—We hear talk of some great mistake in the level of the sewers, now being diverted in St. Pancras, for the Under-ground Railway. It is stated that, after a large expenditure, the new sewer will require to be lowered six feet, and that the works are stopped.

INSTANTANEOUS DECOMPOSITION OF FIRE-DAMP.—The recent explosions of fire-damp in Northumberland and Yorkshire have naturally reawakened the anxiety to discover an effectual preventive of these fearful calamities. A series of experiments has of late been gone into for proving the efficiency of the process invented by Mr. A. Wall for instantaneously decomposing fire-damp. *The Mining Journal*, speaking of these experiments, says,—"The crude fire-damp was forced through a screen of lut 4 inches in thickness, and although no further provision whatever was made for rendering the explosive gas incombustible, it would not ignite on the outer side of the screen, nearly the whole having apparently been decomposed. If this discovery can be applied on a large scale with equal facility, its success both as a preventive of explosions, and in a commercial point of view, will doubtless be complete; and we understand that Mr. Wall is about to conclude an arrangement with a large coal-master, for applying his screens in one of his mines. It is not, of course, to be supposed that Mr. Wall hopes to remove the necessity for adequate ventilation, but he confidently expects to be enabled to prevent explosions under any circumstances."

**ELECTRO-TELEGRAPHIC PROGRESS.**—The first private telegram from India and England, *via* the Red Sea route, was received at Lloyd's, dated Calcutta, March 10, reducing the communication between the chief presidency of India and the capital of England to a period of six days. The line is laid from Kurrachee to Alexandria, and when the entire line has been laid, the period of communication will be reduced to two days.

**A NEW LINE OF TELEGRAPH.**—As some time since intimated, has been projected, to proceed from Scotland and Denmark, *via* the Faroe Islands, Iceland, Greenland, and Labrador, to Canada and the United States, and which will consist of comparatively short links of submarine cables, the longest part submerged not exceeding 450 miles. The route has been recently surveyed by Colonel Schaffner, who lately gave evidence, at great length, upon the subject, before a committee of the House of Commons. An exclusive concession, for 100 years, has been granted to the promoters by the Danish Government, and the requisite caution money of 100,000 dollars was remitted to the Danish minister of Finance at Copenhagen, by Messrs. Croskey & Co., who are interested in the concession.

**THE RUINED CHURCH IN DOVER CASTLE.**—It is stated that the ruined church in Dover Castle, the condition of which we brought prominently before the public some months ago, is about to be restored by the Government under the direction of Mr. Scott. Every part of the old work, it is said, will be carefully preserved and shown as far as is practicable, a new roof will be put on, and the church restored to use for divine service as a chapel for the garrison.

**BRICKMAKING IN ADELAIDE.**—In the last "Summary for England," the *South Australian Register* speaks of the progress of brickmaking in the colony, and gives a description of the most extensive and the longest established of its brick-yards,—those of Messrs. Cox, Brothers, of Norwood. These brickyards are situate on seven and a half acres of ground which lie between the north end of Sydenham-road and Osmond-terrace. Here the whole process of converting the natural soil of the ground into hard bricks has been for the last ten years actively carried on, so that many of the best buildings in Adelaide may be said to have been dug out of Norwood—a city sprung from its own suburbs. On entering Messrs. Cox's yard, the first thing which arrests the attention is a yawning chasm, in the midst of which the first process of brickmaking is going on. In this valley, which is 20 feet in depth, and half an acre in extent, churches, chapels, and dwelling-houses beyond number have no doubt taken their origin, and fresh material for other structures is still being raised from the same spot. On the seven and a half acres of land there are two pug-mills, four moulding-sheds, and drying-ground enough for 150,000 bricks at once. It is estimated that the land need not use would give stuff enough for 100,000 bricks a week, over a period of ten years. The next largest brickyards in the colony are those of Mr. Combs and Mr. Drury, at Bowden, and of Mr. Westrop, at Stoney.

**THE PROPOSED NEW PUBLIC OFFICES AT LIVERPOOL.**—The plans for those projected buildings, prepared by Mr. Newlands, are not yet fully decided on, their further consideration having been adjourned for a month. They are intended to concentrate and to afford accommodation for the transaction of all business connected with the municipality. Dale-street has been selected as the site. The buildings will be erected after the Romanesque-Italian style of architecture, and the façade will consist of a colonnade, 120 feet long, with wings of 50 feet each. The base of the entire building will occupy a space of 250 feet square. The plan, as well as the skyline of each of the four fronts, is broken by two quadrangular towers, rising to the height of 80 feet from the ground. Each of these towers contains an entrance-hall and staircase, and, taken in connection, the four may be said to afford access for the working or every-day purposes of the different departments. On the top of each tower is placed a large cistern or water-tank, capable of containing many thousand gallons of water. The council chamber is approached by an inner vestibule, to which access is obtained by the colonnade surrounding the courtyard. The exact details of arrangement in the council chamber have not yet been fully determined on, but it is to be an oblong parallelogram of large dimensions. All the principal corridors are 14 feet wide and 20 feet high, being arranged so as to afford ready access to the numerous offices which open from them. The minor corridors are all 10 feet wide, and, like the principal ones, 20 feet high.

**TOWN-HALL OF YPRES.**—The *Athenæum* says the restoration of the old beautiful town-hall of Ypres, formerly the capital of West Flanders, is now complete. The pictorial ornaments of the stately building, the statues of thirty-one sovereigns who bore the title of Counts of Flanders, from Baldwin Ironarm to Charles V., have been replaced in the façade.

**CURIOS DISCOVERY.**—At Carlow, some workmen were lately employed on the estate of John de Montmorency, esq., of Knockleer Castle, county Kildare, in removing the remains of an old castle in the demesne, when they came upon a walled chamber containing the skeleton of a man, in perfect preservation, in a recumbent position. In his hand, says the *Carlow Sentinel*, was a sword with a handsome jewelled hilt, and beside him was a breastplate and helmet, together with a drinking-cup. A box was found near him, containing some coins of the reign of King John, a small cross, and some parchments, with writing not yet deciphered.

**THE GLASGOW CATHEDRAL WINDOWS.**—The new Chief Commissioner of Works, the Hon. W. F. Cowper, it appears, has refused to permit Mr. Houldsworth's window to be put up in its allotted place, although the late Chief Commissioner, Lord John Manners, had sanctioned the design, which was prepared by Mr. James Ballantine, by whom, also, the window was executed, for the late Mr. Houldsworth. The present Mr. Houldsworth had also "offered to remove the window, if, after it was placed, the Government, or any other competent party, found it mar the general harmony of the decorations, or destroy the sequence of illustration." The refusal of Mr. Cowper is attributed, by the *Citizen*, to the influence of the local "Munich party" among the committee.

**CORRUGATED PAPER ROOFING.**—Last week, while speaking, in the Commons, on the paper duty, the Chancellor of the Exchequer read the inventor's account of this substance, in which he said,—"Nearly four years ago, I took out a patent for the application to various purposes of corrugated sheets of *papier mâché* or other analogous material; one of the chief purposes being house-building. By this process we might literally live in paper houses. I take the liberty to send you a specimen of the material, in order that you may be able to judge of the great strength it acquires by the process of corrugation. It can be made perfectly unflammable; it is quite impervious to moisture; it is uninflamed by temperature; it is a non-conductor of heat, and therefore perfectly free from the disadvantages of iron; and, on account of its lightness and extreme portability, is admirably adapted for emigrant houses and for military huts. Yet simply and solely in consequence of existing excise regulations, I am unable to manufacture it. If those excise regulations were removed, there are hundreds of thousands of tons of raw material now considered perfectly useless which could be utilized in the manufacture of these fibrous sheets."

**ACCIDENTS.**—While two men were engaged in hoisting up a stone, weighing about five and a-half tons, at the Plymco railway-bridge, suddenly the beam-railway came down, burying the unfortunate men underneath. They were extricated as soon as possible, and conveyed to St. George's Hospital, where they shortly expired. The inquest jury returned a verdict, "That the two deceased men had come by their death through the breaking down of the machinery, caused by the accidental jerking or surging of the chain."—Two men have also been killed by falling from a scaffolding erected in the large hall of the Corn Exchange at Northampton, in consequence of the breaking of one of the bearers which supported the plank on which they were standing while engaged in the repairs which the Exchange is now undergoing. A verdict of "Accidental death" was returned, the foreman stating the jury wished to add to their verdict a recommendation to Mr. Banks that he would have all the scaffolding and planks examined, or would substitute poles, as recommended by Mr. Pideock.

—A young woman has been killed by the fall of a shop floor at Tontine-street, St. Helens. The floor was loaded with forty sacks of corn. It appeared that a previous tenant had removed a pillar from the centre of the shop, and a pillar placed there would most likely have prevented the accident. As it was, a large cross beam had been mapped in two about the middle, and this was the principal support of the flooring, the cross beams being only just placed in the walls, and being a slight stay for such a building. The jury viewed the premises, and after hearing the evidence returned a verdict of "Accidental death."

**THE LATE MR. LAPIDGE.**—We announce with regret the death of Mr. Edward Lapidge, architect. Mr. Lapidge was the county surveyor for Surrey. Amongst the candidates already in the field for this office we hear of Mr. Heskeith, Mr. Barry, and Mr. Lett.

**BARCELONA.**—On the 3rd instant the first trial took place of the new machinery for the cleansing of Barcelona port, in presence of the district engineer, the civil governor of the province, the provincial deputation, and the Chamber of Commerce, with many engineers; and the result was highly satisfactory. In 1857 the Government contracted with the firm of Hodgson, in England, for a complete dredging-machine, with accompanying lighters, &c. The dredge-boat had a machine of 50-horse power, and can raise 120 tons of mud or sand per hour. A steam tug of equal force, and twenty lighters containing each fifty tons, are provided: all the above are in wrought-iron, and of the best construction.

**ECCLESIOLOGICAL SOCIETY.**—A committee meeting was held at Arklow House, on Thursday, March 1, Mr. Beresford Hope, the president, in the chair; when numerous architects, about a dozen, submitted to the committee their designs for various new buildings and restorations. The Rev. G. Williams spoke of the unsatisfactory decision of the judges in the competition for the new Town-hall at Cambridge; and the committee agreed to publish the protest of the Cambridge Architectural Society on the subject. Mr. W. Slater spoke of the bardship of the interference of the Ecclesiastical Commissioners in all architectural works in Ireland.

**MULTUM IN PARVO.**—A firm not a hundred miles from Sunderland represent themselves as "Builders, joiners, contractors, architects, surveyors, and valuers, house and estate agents," with "workshops," "offices," and "residence." They likewise furnish funerals, and do the following:—house and ship work; monumental stones, tombs, and tablets; marble chimney-pieces and ball slabs; stoves and kitchen ranges; all descriptions of stoneware pipes, sinks, &c.; Roman and Portland cements; bothouses and vineries fitted up complete; *plans and estimates* prepared for buildings and alterations; repairs, in town and country, punctually executed on the most reasonable terms; inventories and valuations made under probate of wills, &c.; arbitration cases settled with promptitude; and fire insurances effected. These are the men who need no diploma.—A. B.

**PUBLIC IMPROVEMENTS.**—The following are among the chief provisions of a bill brought in by Mr. Slaney and Mr. Cowper.—1. It shall be lawful for the ratepayers of any parish maintaining its own poor, the population of which exceeds persons, to purchase or lease lands, and to accept gifts, grants, and devises of land, for the purpose of forming any public walk, exercise or playground, and to levy rates for maintaining the same, and for removal of any nuisances or obstruction to the free use and enjoyment thereof, and for improving any open walk or footpath, or placing convenient seats or shelters from rain, and for other purposes of a similar nature. 4. It shall be lawful for the ratepayers in meeting ascribed to rate such parish to a separate rate, to be called the "Parish Improvement Rate;" provided that such rate be agreed to by at least a majority of the ratepayers. 5. Provided always, that previous to any such rate being imposed a sum in amount not less than at least one-half of the estimated cost of such proposed improvement shall have been raised, given, or collected by private subscription or donation.

**CAMBRIDGE ARCHITECTURAL SOCIETY.**—On the 8th instant, Mr. C. H. Cooper in the chair, Mr. Pawcett read a few notes on the churches of Basingbourne, Abington Pigotts, and Guilden Morden, explaining some curious parts about them. Mr. J. W. Clark then read a paper on the history of All Saints' Church. He spoke strongly against the proposed removal instead of restoration of the church, on historical grounds. A church of the same name had stood there for eight centuries. There is a tradition that it belonged to the Priory of St. Albans in 1007. At any rate it was given in 1180 to the nuns of Greencroft, by Sturmi, of Cambridge. No part of the existing building is very ancient. The tower is Early Perpendicular; and the nave later in the same style. The chancel was rebuilt in 1726. In conclusion, he urged that if the church is to go, all care should be taken to make the new one as good as possible. He spoke in favour of brick, a material easily obtainable here; instancing the churches of Italy and north Germany, where brick is proved to be susceptible of very fine treatment, and was used because placed by nature ready to the builders' hands.

NEW ASSEMBLY-ROOM AT DARTFORD.—A new and commodious public assembly-room has been recently erected by Mr. Bray, adjoining the Bull Hotel. The room is approached from the Corn Exchange, being 60 feet long by 25 feet wide, and 30 feet in height. The architect is Mr. Bray, of Chelmsford, father of the proprietor.

METROPOLITAN BOARD OF WORKS.—At the weekly meeting of the Board, tenders for the construction of the pumping-works, Earl Outlet, were examined, when the tender of Mr. Aird, of 8,566*l.* was accepted. Mr. Doultou moved a resolution to the effect that previously to taking a credit for 20,000*l.* to defray the cost of perchloride of iron, for the purpose of deodorizing the Thames, during the hot summer months, a report from Doctors Hoffman, Frankland, and Miller, be obtained, as to the expediency of using that chemical in preference to lime. After a long conversation, the motion was put and carried by a majority of 21 to 2.

ENGINEERS AND THEIR RISKS.—We have heard with great pain of the death of Mr. Wilker Croude, a very young engineer, who was one of an exploring party in Brazil, with a view to the extension of the Bahia railway. We published two letters from him in our last volume, to show the difficulties engineers sometimes encounter, and regret much the further verification of this in his untimely death. He was grandson of Mr. Vignoles, engineer-in-chief of the Bahia railway, and of the Tudela and Bilbao line; and, as a young man of great promise and most kindly disposition, is much regretted by his colleagues, and those who knew him.

THE NORWICH CITY SURVEYORSHIP.—A special meeting of the town council was held on Wednesday, for the purpose of electing a surveyor for the city, in the room of Mr. E. Finest, resigned. On the 1st inst. the names of fifty-five candidates were laid before the paving committee; various names were then voted out, and the remaining names were submitted to the council in the order in which the committee considered they were entitled by their merits to stand, viz.:—1. Mr. Barry; 2. Mr. Parfitt; 3. Mr. Matthews. The committee in their report also recommended the council to make the appointment during pleasure, and that the salary of 350*l.* per annum be paid—150*l.* by the municipal council, and 200*l.* by the Board of Health. The report was received by the council, and on the motion of Mr. J. O. Taylor, seconded by Mr. Youngs, Mr. Thomas D. Barry was unanimously elected to the office.

LIGHTHOUSE ILLUMINATION.—We have already alluded to the quarrel between these gentlemen as to the illumination of light-houses. An "Answer to Sir D. Brewster's Reply to Messrs. Stevenson's Pamphlet on Sir D. Brewster's Memorial to the Treasury, by D. and T. Stevenson, Engineers to the Commissioners of Northern Light-houses, &c." has been published by Blackwood & Sons, of Paternoster-row. The subject has become too much broken up into separate points and questions for us to be able to enter into any further detail as to it, but the following relates to one of the chief points in the misunderstanding. In the Edinburgh Transactions for 1827, according to the "Answer" now published, Sir D. Brewster, "says, 'In revolving lights, where two or more lenses are combined, this light may be very advantageously employed; but in fixed lights, or in lights where only one lens is to be used, it requires to be combined with smaller lenses, and with plain and spherical mirrors, in order to enable us to throw into the parallel beam all or most of the rays which flow from the lamp. The contrivance which occurred to me for this purpose, and which I published in 1812, has been recently adopted in the new system of illumination introduced into the French light-houses.' These extracts state absolutely that Sir D. Brewster, in his article in 1812, made suggestions for lighthouse illumination. Whereas that article contains no suggestion for illumination of any kind. Sir David now, indeed, admits that it contains no such suggestion; but, unfortunately, this admission has come too late, as the statements we have quoted, as well as others made in his 'Memorial to the Treasury' and elsewhere, to the same effect, have misled many authors. \* \* \* The same misstatement misled Mr. T. Stevenson. On discovering this mistake, he communicated to Sir D. Brewster his determination to correct it, and it is this exposure of an error into which many people have fallen that has given rise to Sir David Brewster's unfounded attacks, and to the present controversy. Sir David did not correct Mr. T. Stevenson's error any more than he did that of Lord Brougham, but specially thanked him for the manner in which he had spoken of his labours."

TENDERS

For erecting a boys' school and twenty-four almshouses at the Elm, Tottenham, for the Worshipful Company of Drapers; Mr. Herbert Williams, architect. Quantities supplied by Mr. W. T. Randall:—

Table with 2 columns: Name and Amount. Includes Barmley & Sons (£21,498 0 0), Ashby & Horner (20,615 0 0), Lucas, Brothers (20,190 0 0), Wm. Hill (19,757 0 0), G. & R. Ashby (19,719 0 0), Piper & Sons (19,450 0 0), J. Wilson (17,561 0 0).

For works to be done in the erection of wash-houses, work-rooms, &c. in Silver-street, Wood-street, for Messrs. Vyse & Sons, Messrs. Tiltot & Clambourian, architects:—

Table with 2 columns: Name and Amount. Includes Lucas, Brothers (£15,731 0 0), Cahill & Co. (15,650 0 0), Holland & Hannen (15,128 0 0), Piper & Son (13,973 0 0), Jay (accepted) (13,731 0 0).

For Industrial Training Schools, Portsea Island Union; Mr. George Nake, architect:—

Table with 2 columns: Name and Amount. Includes Gosler (£10,500 0 0), Dushby (9,795 0 0), Light & Roberts (9,599 0 0), Rogers & Booth (9,119 0 0), Absalom (9,188 0 0), Hodges (9,180 0 0), Chinnock (8,688 0 0), Backhurst (8,700 0 0), King & Sons (accepted) (8,650 0 0).

For a central hall and wing, for the male prisoners, Nottingham Borough Gaol, from the plans of Messrs. Wood & Son, architects:—

Table with 2 columns: Name and Amount. Includes Willmott (£10,300 0 0), Acton (10,160 0 0), Wright (10,119 0 0), Fish (9,770 0 0), Ferguson (9,725 10 0), Bennett (9,495 0 0), Evans, Brothers (8,987 0 0), Halloway (8,940 10 0), Ward, Ansell, & Co. (8,737 0 0).

For the erection of ten houses at Basford, for Mr. S. Smith; Mr. R. C. Sutton, architect:—

Table with 2 columns: Name and Amount. Includes Cargill (£2,798 0 0), Bennett (2,460 0 0), Claremont (2,195 0 0), Haw & Wool (2,599 10 0), Baker (2,095 0 0), Bececk (2,000 0 0).

For house and stabling, at Eastbourne, for Mr. Robert Colgate; Mr. Henry Curry, architect. Quantities not supplied:—

Table with 2 columns: Name and Amount. Includes King (£2,385 0 0), Crocy (2,350 0 0), Downs (2,306 0 0), Pearless (2,075 0 0).

For new buildings and chimney-shafts, at the Grange, Bermondsey, for Mr. Walter Smith; Mr. Geo. Elkington, architect:—

Table with 2 columns: Name and Amount. Includes Brown (£2,780 0 0), Wood & Hunt (2,705 0 0), J. J. & F. Coleman (2,745 0 0), Martin (2,389 0 0), Wells (accepted) (2,279 0 0).

For building parsonage-house, for St. Matthew's, City-road; Mr. B. White, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Macey (£2,159 0 0), Butterbony (1,530 0 0), Rutkin (1,893 0 0), Harding (1,837 0 0), Stevenson (1,754 0 0).

For alterations and additions to the Crystal Palace Hotel, Sydenham; Messrs. Morpue & Green, architects. Quantities by Mr. Bloomfield:—

Table with 2 columns: Name and Amount. Includes Hockin (£1,340 0 0), Adams (1,215 0 0), Littlejohn (1,150 0 0), Wells (1,135 0 0).

For building a warehouse, offices, and stables, for Mr. Houghton, Bunhill-row, St. Luke's, Mr. Hammond, architect. Quantities by Mr. Brombridge:—

Table with 2 columns: Name and Amount. Includes Jay (£1,395 0 0), Lawrence & Sons (1,342 0 0), Maers (1,330 0 0), Hockin (1,312 0 0), Maers (1,295 0 0), Ashby & Sons (1,295 0 0), Gutteridge (1,199 0 0), Stephenson (1,094 0 0).

For works to be done in rebuilding premises in Queen's Head-passages, Newgate-street, for Messrs. Faudel & Phillips; Messrs. Tilt & Chamberlain, architects:—

Table with 2 columns: Name and Amount. Includes Jay (£1,170 0 0), Browne & Robinson (1,162 0 0), Conier (1,131 0 0), Willis (1,029 0 0), Cannon (940 0 0), Rider (accepted) (868 0 0).

For new Congregational Chapel and School, at Milton-next-Sittingbourne, Kent; Poulton & Wood, architects. The old materials of present chapel are calculated to belong in each case to the contractors:—

Table with 2 columns: Name and Amount. Includes Clother (£1,385 6 2), Neaker & Hodgkin (1,265 11 0), Bowes (1,212 3 0), Spler (1,207 0 0), Wood (1,184 18 0), Wond (1,183 2 0), Bennett (1,167 0 0), Alderman & Jones (1,157 0 0), Strubsole (1,127 5 0), Young & Co. (1,080 11 0), Jennings (1,062 6 3), Naylor (accepted) (1,055 0 0).

For Armoury, Sheen-common, for the Richmond Volunteer Rifle Corps; Mr. W. Hudson, architect:—

Table with 2 columns: Name and Amount. Includes Goodale (£1,170 0 0), Bowling (1,100 0 0), Nicholson & Son (1,097 0 0), Long (1,049 0 0), Sims (1,040 0 0), Aviss & Son (1,022 0 0), Adamson & Son (999 0 0), Sweet (964 0 0).

New tower and spire to parish church of Morcton-in-Marsh, Gloucestershire; Messrs. Poulton & Woodman, architects, Reading. The old materials of the present tower are calculated to belong in each case to the contractor:—

Table with 2 columns: Name and Amount. Includes Grove (£290 6 6), Clarke (913 0 0), Beavers (852 0 0), Young & Co. (775 0 0), Gill (735 13 5).

For building a new chancel and other works for the parish church of St. Clement, Ipswich; Mr. F. Barnes, architect:—

Table with 2 columns: Name and Amount. Includes Ringham (£665 0 0), Whight (652 0 0), Bell (625 0 0), Chisnall (625 0 0), Godbolt & Sons (620 0 0), H. B. Smith (606 0 0), Worswick & Morley (598 0 0).

For building a National School at Bramford, near Ipswich; Mr. F. Barnes, architect:—

Table with 2 columns: Name and Amount. Includes Worswick & Morley (£753 10 0), Whight (753 0 0), Bell (725 0 0), Luff (697 0 0), H. B. Smith (665 0 0), Elliott (663 0 0), Gilring (638 0 0).

For a cottage, to be erected at Old Ford, Bow; Mr. J. H. Rowley, architect:—

Table with 2 columns: Name and Amount. Includes Page (£290 0 0), Webb (247 0 0), Goodman (195 0 0), Waterson (195 0 0).

For alterations and repairs at the Old Baptist Chapel, Guildford; Mr. H. Peak, architect:—

Table with 2 columns: Name and Amount. Includes Strudwick (£194 15 0), Mrs. W. Mason & Son (188 16 0), C. Smith (177 18 0), Lee & Sons (175 0 0), Pearce (173 10 0), Stables (165 0 0), Bristow (163 0 0).

Accepted for new buildings at Aldershot, for Mr. Thomas Taunton; Mr. Peak, architect:—

Table with 2 columns: Name and Amount. Includes James Smith (£1,360 0 0).

For new music-room, and alterations at No. 61, High-street, Guildford; Mr. Peak, architect:—

Table with 2 columns: Name and Amount. Includes Lee & Sons (£276 0 0), Strudwick (215 0 0).

For the erection of new class-rooms, at the Congregational Chapel, Sherborne, Dorset; Messrs. Haggart & Pocklington, architects:—

Table with 2 columns: Name and Amount. Includes Down (£173 10 0), Stegales (154 8 0), Sarell (150 0 0), Guppy (accepted) (140 0 0).

For carpenter's and joiner's work to a house at Reading, for Mr. Staveley; Mr. Joseph Morris, architect. Quantities supplied:—

Table with 2 columns: Name and Amount. Includes Woodroff (£265 10 0), Matthews (350 0 0), Sheppard (345 0 0), Laker (343 10 0).

For practice range, markers butts, and ricochet butts, for the Norwich Volunteer Corps; Messrs. Benest & Newson, and J. D. Ellis, architects:—

Table with 4 columns: Name, Ra, ge., Ricochet Butts, Total. Includes Ling & Ball (£208 0 0, £160 0 0, £368 0 0), Bachel (190 0 0, 99 19 0, 289 19 0), Sexton (198 14 0, 78 0 0, 276 14 0).

TO CORRESPONDENTS.

G. D. P. (it probably depends on the nature of the case. Was a good used?)—Captain Reader.—P. H. B.—Capt. T. W. O. (consult patent agent).—A Clerk of Works.—O. R.—W. P.—J. M. (there are several parties. Any fixtures or goods will explain).—T. G.—Middle-aged Man desiring pure Air (there are few nights when a window, open at the top, is not beneficial; but the practice should be commenced in mild weather, and exercised judiciously).—Messrs. W. & C. J. H.—R. E. (in type).—M.—A Reader (the case as to 1545 of Limitations is to be found in full in the Law Times of 25th February, 1859).—J. W. & Son (should inquire at Institution of Civil Engineers).—J. C.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to 'The Publisher of the Builder,' No. 1, York-street, Covent-garden. All other Communications should be addressed to the 'Editor,' and NOT to the 'Publisher.'

Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

# The Builder.

VOL. XVIII.—No. 895.

A Few Facts relative to the Fall of Rain.

**W** RONG notions about rain, how it falls, in proportion to seasons and time, and how it flows off the ground, must be of the utmost importance to young engineers and architects. Parliamentary committees are capital schools in which to study human nature, as various forms of evidence may be listened to, and much truth may be learned; but the student must possess patience and perseverance to continue his researches over many sessions.

The evidence of 1840 is modified before 1850, and almost reversed in 1860. Howard had studied, written, and published his works "On Climate," and Dalton had given the results of his experience in meteorology before 1840; but few of our then young hydraulic engineers had learned fully the truths taught. Rain-gauges were put up, water-gauges were put down, and independent results obtained during one or more

years (seldom exceeding three), and then "averages" were struck to form data to work from. Compensations, in water, were demanded by mill-owners, and enforced by rival engineers, and were granted by Parliament, far greater than can be given. Nature, it is true, is one grand system of averages, but on a scale so colossal as to set at defiance the puny efforts of the engineer to equalize her differences for human purposes. Man cannot control Nature in her grand modes, and can only slightly modify her in her minor operations.

If we look at this world as a whole, we have, year by year, the same amount of sunshine and heat, the same extent of evaporation and cloud, and the same volume of rain falling back to the earth. If there is any modifying influence within or beyond the range of the earth's orbit, we, as yet, know nothing of it. The moon, the planets, and comets, are not thought now to regulate seasons: the influence of the moon on tides is allowed: its influence on the weather is disputed. The world has known many changes of climate during former geological periods, when a different arrangement of land and water prevailed. Area and elevation of dry land control climate, and modify the fall of rain; but the sublime "law of chance" gives difference to the seasons,—that is, given a number of elements which allow of variety in combination; and perfect regularity would be much more wonderful than variety. We have the light and heat of the sun, for anything we know to the contrary, constant quantities; the areas of the oceans and other waters much the same, and the equatorial currents of air; mountain ranges and vast plains, uniform and fixed, so far as concern man. Vapour rises over the entire area, acted on by the sun's rays: clouds are, however, local; the products in vapour of large areas being condensed over much smaller areas. The greatest storm only covers a mere speck of the earth's surface, as compared with the whole; and, during the time foul weather prevails in any place, fine weather also prevails over a much larger area. Universal fine weather, or universal foul weather, cannot exist; but there may be continued storms over a small section of the earth's surface, out of proportion, for a time, to that which is due to area and climate alone; but we may rest satisfied Nature does not suffer. There may be great falls of rain and vast

damage from floods in parts of America during one year, and at the same time great drought and heat over Europe. Portions of Africa may suffer from too much wet, and other portions from too much drought. The south and west of England may be dry, the north and east wet, and so of smaller areas: weather is ever local, and rain singularly so. All excesses have, for a time, a sustaining power. The explanation would be a long story, but we may accept the fact. Wet years and seasons generally follow each other, and so of dry years and seasons. Unreflecting people jump to a conclusion that Nature has become permanently wrong, and set about guessing out some trifling infinitesimal cause: they are not aware that the grand and solemn operations of Nature throughout the world are going on evenly and equably, and that it is only poor puny man who observes an infinitesimal microscopic difference in small places. The plains of a portion of Europe may be deluged, and portions of America may be scorched, during one year, but there is no such thing as a general deluge or a general drought over all parts of the earth at the same time.

But to return to local falls of rain, there probably never has been a perfect rain gauge, and probably there never will be one which is perfect: the best rain-gauges give, however, results near enough to the truth for practical purposes. Elevation above the sea-level gives different results as to rain, and places, a few miles apart, may have not only casual but important permanent differences. As to years, Howard, by observations near London over forty years, found that the first six months of the year must be considered "dry months," the last six months "wet months." April is the driest month, October the wettest month; the old proverb as to "April showers" is, therefore, wrong in one sense. The fall of rain in years varies about as 1 to 2.

*Fall of Rain near London.*

1802, annual fall,	13-916 inches.
1810, "	27-510 "
1812, "	27-240 "
1816, "	32-370 "

We see by these figures that the proportions betwixt 1802 and 1816 are much more than as 1 to 2. How is an engineer to strike averages for water-works compensations in such cases?

*Proportions due to Seasons.*

Winter .....	5 808 inches.
Spring .....	4 813 "
Summer .....	6 682 "
Autumn .....	7 411 "

24-804 annual.

The mean of rain-fall near London is 25 inches: the mean for all England, 31½ inches. It is important to know "the mean" rain-fall and the mean temperature at any place, but it is much more important to know the extremes, and to study these. Extremes are actual: means serve for purposes of comparison.

In Keswick the average fall of rain is 67½ inches; in Upminster, Essex, the average fall is 19½ inches. There is said to be no month in England without some rain, but there are several months continuously without any fall of rain available for water supply. More rain may fall within one hour than is due to one month, and more water will flow off the ground in a few hours than flows off the same ground during an average of months. If the flow of water in English rivers and streams, during dry seasons, is taken to represent one, in volume, then the wet weather volume is ordinarily 300, and an extreme excess mounts up to 500, taking time into account. How is an engineer to average such excesses? Some of our rivers in England are raised, vertically, by floods, the result of rain, as much as 23 feet. In South Africa and in America some of the rivers are swelled 60 and 70 feet vertically during wet seasons. To average the flow of water down such rivers for engineering purposes would be most fallacious. For water-works we must know the minimums; for bridges, culverts, and river embankments we must know the maximums, and guard against such. "Averages" are of no use in such cases.

The flow of water from any surface is modified by previous weather, and by the fall of rain. A dry surface absorbs and evaporates; a wet surface passes almost the whole fall of rain to the streams. There are parts of England in which, during twenty months continuously, no rain fell which was available for water supply; that is, upwards of 600 continuous days. How is an engineer to average such seasons?

In 1847 several important Water Acts were passed,—Manchester, Liverpool, and some others. Two-thirds of the rain-fall were supposed to leave the ground, and one-third of this was said to be due for water compensation. An "average of seasons" was considered equitable; and, under these false notions, works have been executed (we dare not say completed). In the cases of Liverpool and Manchester, the amount of compensation promised is found, in practice, to be more than is due, and an intolerable burden upon the ratepayers. We have shown that years and seasons vary in a proportion as one is to two, and yet Parliament secures to mill-owners, at the cost of the towns, a fixed and constant volume of water several times (four or five times) in excess of the dry-weather flow of the streams; and this has been done by the aid of the engineers, who now find that they are "hoist by their own petard" they are victims of their own want of experience and reflection. "Averages" seem so fair in theory, but are found to be so unfair in practice. The driest year and season, and the driest period of such year and season, are the only true tests for any waterworks burdened with water-compensations. "Averages," to be equitable, must be based on data so obtained. It is monstrous to fix ruinous penalties on town communities for failure in such cases as we have instanced. Water is the great necessary of life: there cannot be health without a constant and full use of it; and the comfort, health, and lives of vast communities ought to receive more consideration from Parliamentary committees in settling water-compensations than they have hitherto had. There are several large towns in difficulties by being over-burdened with excessive water-compensations: rights have been, however, granted to mill-owners; and, in the case of Manchester, large sums of money have been paid in lieu of water, and larger sums may have to be paid. If engineers and architects deal in "averages," it behoves them to know and fully to understand what it is they are averaging.

**PROGRESS OF THE METROPOLITAN MAIN-DRAINAGE.**

From recent inspection of the works of the Northern High-level Sewer, both at Old Ford and along the line, we are able to state that fully three-fourths of the contract work are completed, and that there will be no difficulty in finishing the remainder within a period of about two months after the time originally named. The work appears, in every respect, creditable to Mr. Moxon, and to the officers of the Metropolitan Board, of whom we shall do right to name the resident engineer for this portion of the Main-drainage,—Mr. Edmund Cooper, who is District Engineer for the Eastern Division of London. The works at Old Ford, comprising the overflow and penstock-chambers, and four channels therefrom to the Lea,—that is to say, two upper lines for the High-level and Middle-level Sewers, which will cross the Lea by an aqueduct, and two lower lines for the storm-water-outfalls into the Lea, have been completed, with the exception of one portion of the length of the upper channels, and a short portion of that of all four channels at the point where the line of the railway crosses that of the sewer or sewers. The ground near the Lea—was very bad, and large quantities of concrete have been required for durable foundation. Fortunately, the apprehensions we expressed, at the time of the strike, respecting the influx of water from upland floods, have not been realized. There have been several high tides; but the coffer-dam, constructed with a less amount of material and labour than works of this kind are generally thought to require, has stood well. Having, in our last year's and the previous volume, given particulars of the works, it is necessary here to do little more than add that the original drawings and specification have

been adhered to, with some exceptions not affecting the accuracy of chief dimensions or the general description.

The most important division of the works near Old Ford is that at the commencement (just west of the railway) of the four channels already mentioned, and point of junction of the Middle-level line with the High-level sewer. The provision here in the penstock-chambers and overflow-chambers, is made for contingencies which will probably not arise for many years to come; and the quality of the brickwork in Portland cement, and the massiveness of the blocks of Bramley Fall stone in copings, cut-waters, and other parts exposed to wear, are as well calculated for endurance as they are perchance for the astonishment of that New Zealand antiquary who in the year two-thousand and odd, may pursue researches into the sewerage contrivances of the Romans of the nineteenth century. Our readers may do well, if they can procure permission and a light, to anticipate these researches by their own; for, before many weeks have elapsed, we should say, the waters of the high-level may be purging in and on, and like "the king of dykes," Fleet Ditch,

"... than whom no slice of mud,  
With deeper sable blots the silver flood,"

rolling,—

"... with disembogging streams,  
The large tributals of dead dogs to Thames;"

or, like the clonca as described by Pliny, "sometimes huge pieces of stone and timber" carried in the current without detriment to the fabric; and saying haply in the music of their waters,—

"Here strip, my children, here at once leap in,  
Here prove who best can dash through thick and thin,  
And who the most in love of dirt exceed,  
Or dark dexterity of groping well,  
Who flings most fitly, and wide pollutes around  
The streams, be his the weekly journals bound;  
A pig of lead to him who dives the best,  
A peck of coals a-peace shall glad the rest."

Without repeating other particulars, it may be well to mention here that the overflow chamber, 138 feet in length, is about half of it formed with a peculiar arrangement of weir-walls, parallel with the length of the sewer, over which veils the water will fall into the storm-water outlet channels below, should it rise high enough—an event, as we have said, not likely to occur till some years hence, when a larger area of drainage in northern London will have its outfall by way of this sewer. Of the length, 70 feet, where the particular arrangement occurs, the breadth, 40 feet 6 inches in the clear, is first to be considered as divided and arched over in two unequal spans, namely, one of 25 feet 3 inches, and the other of 15 feet 9 inches: then, the latter portion of the double chamber, or that opposite to the line of the Middle-level sewer, has a weir along one side, whilst the former, or larger portion, opposite the line of the High-level, has four such weirs, by reason of a division of the line of sewage-flow into two trough-shaped channels, and arrangement for overflow along the middle as well as both sides. Each trough-shaped channel, in the High-level portion, is 5 feet 6 inches in width and 9 feet in depth, with the sides of 14-inch brick work coped with the Bramley Fall stone, and which flooring like that of the storm-water channels below, of a double course of 3-inch York stone landings, neatly fitted with rubbed joints, and laid, breaking joint, in Portland cement. The space along the centre of this overflow-chamber of the northern line, for the fall of the water, is on plan 2 feet 6 inches in width between the weir walls, and about 60 feet in length, and the spaces along the sides are of similar dimensions, the required counterforts being formed across in brickwork; and the arrangement of the weir along one side of the chamber for the Middle-level sewage is precisely similar. There is a junction between the Northern and Middle-level sewers, at the penstock chambers, immediately above the chambers we have been describing, and also below them, in order that there may be the best mutual provision against the larger volume in one case, of the sewage, and the more sluggish flow in the other. The Wick-lane Branch, which forms part of the same contract, though belonging properly to the Low-level sewage, is only commenced. It has a dyke under the storm-water outlet channels; and into these there will be an escape in storms. Thus, the relief for storm-waters will be in the case of the Northern and Middle-level sewage, downwards, the ordinary flow being forwards; whilst in the case of the Wick-lane Branch the reverse will be the arrangement, as in the case of the Southern High-level sewer at Deptford.

The completed portion of the main line of the Northern High-level now extends across Victoria Park and Hackney, and along Amherst-road and

Rectory-road to Stoke Newington. But the works commence again from Stamford-hill, where High-street crosses the Hackney-brook; they are completed up to the private property, and also for some distance on the other side along Manor-road: they are again resumed from the Green-lanes, and are being extended towards the New River; whilst farther on, the tunnelling under the Great Northern Railway is in progress, as well as that near the Junction-road, Kenish-town. Thus, much of what remains to be done is little more than an ordinary barrel-sewer of 6 to 4 feet, in 9-inch brickwork, instead of one 12 feet in width and 9 feet 6 inches in height, with arch and invert of two bricks and side-walls 2½ bricks thick.

The works having been commenced at several points, great care of course has been required to keep the gradients and in checking the levels from time to time. To get the permanent foundation, the ground, where good, is first dug out to the form of the invert as nearly as possible, and then made up as required accurately, with concrete, to a mould or frame, moved as the work advances—additional concrete being needed where the foundation otherwise would be bad. The difficulties of the work of this sewer, however, are slight compared with those which will shortly be apparent in the construction of the lines through central London, or through the Low-level districts. The worst ground yet met with for work in trenches, has been that in the Rectory-road. Here the trenches were perhaps 30 to 40 feet in depth, the upper portion through running sand, and opened no greater width than that of the sewer, with perpendicular sides, held up in the usual manner, by closely set boarding and cross-strutting. Much of the timber in such cases has to be left in, when the trenches are filled up. For this the contractor here is allowed 2s. 7d. per foot cube for fir, 3d. per foot super for 1½-inch deal, and 3s. 9d. each, for 12 feet planks.

In getting out the ground in deep trenches, and at the excavation for the overflow chambers at Old Ford, excellent use has been made of a form of scaffold and hoist for which Mr. Moxon has taken out a patent, and by which a score of barrows can be raised from the trench at once. The utilization of horse-power to raise materials, by connecting a chain or rope from the head of course is not new; it was made with great effect, at the Triage cutting on the London and Birmingham Railway; but the method applied by Mr. Moxon may have some features of principle and detail peculiar to it, which will appear on description. A trestle frame or scaffolding, formed of several pairs of "legs," spanning the line of trench, and carrying a longitudinal head to sustain the main pulley-wheels, is erected. Along one side of the line of the intended trench, in the positions required, short screw piles are fixed in the ground, for the attachment of pulley-blocks to correspond with the wheels, one for each barrow, above. Each chain, to which, at one end, a barrow is attached by slings, passes over the pulley-wheel and round the block, and is fastened, at the other end, to a chain running alongside the trench, and to this latter the power is applied. The screw pile has a friction roller fixed on the head, to ease the passage of the main chain or barrow chain. Wire or heupen rope may be substituted for chains; and the power, of course, may be that of steam or men, as desirable. The line of horse-power is most conveniently placed at right angles to that of the trench, through the intervention of a pulley; and arrangements may be made by counterbalance weights, to assist the working. The chain commonly is drawn back by the weight of the descending barrows; but, as these are heavier than required for the purpose, the surplus is made use of, says the specification which is before us, "as a counterbalance, to assist in bringing up the loaded barrows, and is about 12½ per cent. in favour of the power applied." This is scarcely comprehensible; and recollection of what we saw does not serve us. In the working, the loaded barrows being brought to the surface, and taken out of the slings, empty barrows, made to take their places, are lowered, with the aid of a break or break-wheel; then, loaded barrows are again attached, the power is applied, and the lot of barrows is again raised the 40 feet, in half a minute. One great advantage from the contrivance is that each man, having to keep time with his neighbours, is held only as 50 to 100 horses in working what is termed a "horse-swing road." The apparatus has been found to answer well commercially, where trenches are over 12 feet in depth, and the alternative would be that of lifts by a succession of stages. Labour-saving contrivances, for raising

materials, have been employed in works of a different character, in London, to a greater extent since the strike than previously. Amongst the number is one for raising materials up the line of a contrivance resembling a ladder placed perpendicularly on the top of which are fixed pulley-wheels for ropes of ascending and descending cages or carriages. The latter are worked by a windlass at the ground, each cage being furnished with wheels to run on rails fixed opposite to one another inside the ladder. It is surprising that, although there are numerous contrivances, the work of labourers has continued to be used uneconomically, in many of the lofty London buildings, longer than might have been expected.

The Northern High-level Sewerage Works have been easy as compared with those about to be commenced, in other particulars than those we have mentioned. The sites of only four houses were crossed by the sewer in such manner that it could be necessary to rebuild them. Of these houses some were purchased by the contractor. One in Church-street, Hackney, by the railway station, though in dilapidated condition, has been kept up cleverly. The house is now carried on iron girders, over the sewer.

Besides the resident engineer and the engineer-in-charge to the Board of Works, there are two clerks of works at each point where work is going on—one, principal, above ground, and one below in the trench. Thus there were just lately, six principal clerks of works; and these report weekly on a carefully devised form, particulars, such as those of the number, situation, and depth of ventilating shafts and gullies; of existing drains left into the sewer, and places for future junctions; the description of strata as exhibited by the trench, and the average thickness, which is marked to a scale; particulars of the side enclosures, even to the number of steps; of the quantity of sewer built, and cutting opened beyond; of the number and time of men employed in the several kinds of work; and of the description and quantity of the timber used or left in the work, with the situation where left, and depth in the trench below the surface; and with a sketch-plan of the place or street, and of the portion of sewer, with houses numbered and distances marked, as well as positions of gullies and gratings.

As regards other portions of the Main-drainage, we may mention that the statements in some of the newspapers, as to the commencement of the works eastward of the Lea, are not strictly correct. The drawings are only now in hand. This division of the drainage, described as the Northern Outfall Sewer, will, however, be the next portion for which tenders will be required. The work going forward about Stratford and Barking Creek, has been merely the preliminary boring, to ascertain the nature of the strata. As in previous cases, the results will appear in the drawings.

The Middle-level Sewer, north side, and the Outfall Sewer, south side, will be commenced immediately. The tenders for the Deptford pumping machinery have been sent in, as our readers know.

The High-level sewerage, south side, is progressing at several points. In the Broadway, Deptford, whence the two sewers, the main line and the Effra branch, extend side by side, as described in a previous notice, for a considerable distance, there is just now a great open cutting; running sand has been met with, and a large quantity of timber is used in shoring. We have not, however, made an inspection. Portions of the work of the main line, we learn, are in hand towards Stockwell; and on the Effra Branch much has been done at Nunhead, and in commencement of the Dulwich tunnel. At the tunnel there is much to interest geologists, and fossils are met with.

Mr. Grant is the resident engineer for the High-level sewerage.

Pending the completion of the plans and works for the sewerage of the low-level, south side, a pumping station for the relief of the Earl Sewer by discharge into the river, is to be formed. The lower portion of this sewer for about one-sixth of a mile in length, is to be diverted to a somewhat different place of outfall, at St. George's Stairs, Grove-street, Deptford; whilst the tidal flaps will be reconstructed, and the arrangements for the outfall as much as possible improved. These several arrangements will probably remain after the completion of the main drainage works, for use on emergencies. A tender has been accepted, as mentioned in our last number.

In the western division, which includes Hammersmith, Fulham, and Chelsea, and the district of which the West London Railway may be taken as the central line, extending to the London and

North-Western line, sewerage works have been some time in progress, about Acton and Shepherd's-bush, to form a connection, temporarily at least, with the present Coventry-creek sewer, and ultimately with the arrangements for outfall which may be settled. The principle, however, of the sewerage of this district may be considered as decided upon by the Board of Works. The outfall will be into the Thames,—the sewage being disinfected or deodorized.

The material which appears likely to be employed for the deodorization is perchloride of iron. Tenders are to be sent in on the 12th of April, for the supply of quantities not exceeding 5,345 gallons a day, at certain stations, at times to be appointed between the 1st of May and the 31st of August next, besides further quantities on receipt of notice. These arrangements are designed first to combat the evil of the stench of the river which is expected to recur from year to year till the Main-drainage works are completed. The deodorizing stations are chiefly those which were in use last year. There will be thirty-nine of them, for an estimated quantity of 4,095 gallons daily, together, on the north side of the river, and fifteen of them (whereof five belong to the Earl Sewer alone) for 1,250 gallons on the south side. The Duffield Sewer is expected to require as much as 414 gallons. The outlet of this sewer is in a district of Bermoudeuse where the deaths from cholera in 1853 and 1854 were 201 per thousand, nearly the largest number on that side the river. On the north side, the Fleet Sewer may require 718 gallons daily, the London-bridge Sewer 514 gallons, the King's Scholars' Pond Sewer 407 gallons, and the Ranelagh Sewer 382 gallons. The quantities contracted for are to be subject to diminution or discontinuance on fourteen days' notice being given by the engineer. The perchloride delivered is to be tested by a chemist for the Board. It may be either in the solid or the liquid condition; but the tenders are to state the minimum number of ounces of iron in the form of perchloride, per pound or per gallon, and the maximum number of ounces per gallon of free acid. The perchloride was decided upon in accordance with the report dated August last (and printed in full in our last volume\*), in which, after the examination of a large number of proposals, Dr. Hofmann and Dr. Frankland recommended the perchloride as markedly superior to lime, or to chloride of lime, with quantities of equal value; or, in other words, as costing least for the deodorization of equal quantities of sewage. The perchloride was found especially advantageous for permanency of effect produced. Limed sewage, it would seem, becomes offensive in less than one-third the time of the sewage treated with the perchloride. At the last meeting, however, of the Board, as our report has shown, the question of perchloride against lime was again referred to the same parties, and Dr. Miller. In any case, however, should the putrefaction have been allowed to commence before getting rid of the deposit, the process could be arrested only by quantities of the material which it would be almost impossible to obtain. It may be useful to add that the present daily discharge of sewage of the western division is 4,616,875 gallons, which, in future, might be doubled. Dr. Hofmann and Dr. Frankland stated that the deodorization of this, required all the year round, would not entail a greater outlay than that of 2,821l. 3s. for the disinfectant. We cannot but think, whilst their report is favourable to the desired view, and in a degree not previously anticipated by its authors, so far as the immediate disinfection is concerned, that it discloses apprehensions as to success of the mechanical arrangements of filtration, or deposition, for the separation of the residuum. The temporary storage of the sewage, and the removal of certain quantities of deposit, may possibly be found harmless for the limited quantity of sewage of the western district; but we should be better pleased with the principle of the scheme of the Metropolitan Board, had not an important deduction from the conclusions, to be made.

#### THE ARCHITECTURAL EXHIBITION.

ALTHOUGH the Architectural Exhibition, in the Conduit-street Galleries, will not be open yet for a few days, most of the drawings are hung, and lead us to hope that the collection will be interesting; though it is not all that could be desired. The smaller gallery is almost wholly occupied with competition drawings. Thus, for the Manchester Assize Courts, we have the designs sent in by Messrs. Garling, Truettitt (a clever flank), Crossland (in the Missal style as it may be

termed), E. M. Barry (with a Covent-garden Opera House treatment), Norman Shaw (some of the details very clever), F. H. Pownall, Roger Smith, Allam, Green & Deville, and Phipson. For the Cambridge Guildhall there are the designs by Messrs. J. P. Jones, P'anson, Deville Green, &c. There are some of the designs sent in for Heigham Church, one or two of those for the church of St. Peter and Paul, at Cork; and Mr. Morgan's design for the Jews' Hospital, mentioned by us at the time, as was the case with many of those previously alluded to. The design by Mr. Ernest George, to which the Royal Academy gold medal was awarded, is also here. In the chief gallery there is no *tour de force*. The larger, and in some respects most noticeable contributions by one individual, are six frames sent by Mr. F. R. Wilson; three of them rough groupings of the buildings of Athens, Rome, and Mediaeval England, under the title, "Gothic or Classic?"; and one, a very elaborate plan of Alnwick Castle, showing all the new Italian ceilings, and which ought to be nearer to the eye. Looking hastily round the rooms, we see, prominently, a view of offices recently erected in Mincing-lane by Mr. Whitehead; designs for fountains by Mr. Stapleton (elsewhere there are some by Mr. Burgess); proposed schools for St. Philip's, Bristol, by Mr. E. Godwin; shops at Folkestone, by Messrs. Walton & Robson; restoration of part of the high altar, Westminster Abbey, made under the direction of Mr. Scott, who himself sends some photographs of parts of his Foreign Office; cemetery chapels at Ledbury, by Mr. E. P. Cockerell; besides sketches for fountains from him; a collection of fourteen Northamptonshire towers, and spires from churches restored by Mr. W. Slater; the church and other buildings at Boyne-hill, by Mr. Street, who also sends views of St. Giles's Church, Oxford; a frame containing buildings recently erected by Mr. Truettitt; and a number of sketches and designs by Mr. N. Shaw, in decorated deal frames. Next week, however, we shall be able to view the exhibition more carefully, and speak of it more fully.

#### SYMBOLISM IN REFERENCE TO ART.\*

ALONG with Egyptian architecture, some notice should be taken of Egyptian lions. In Egypt the lion was symbolical of the overflowing of the Nile. When the sun was in *Leo*, the greatest rise took place; hence *lions' mouths* came to be a speciality of water-spouts, as lions themselves were of fountains of water; but it is chiefly with the sun that their connection lies. Horus, as the sun-god, had his throne supported by lions (Rougé).

The child Horus, seated on a lotus-flower, expanding as it rose to the surface of the water, was symbolical of the sunrise, and of the eternal youth of the divinity. Lions were also associated with the worship of Mithras, or the sun.

The lions at the gate of Mycene are supposed to have been connected with Mithras; but, I think this is a mistake. Lions, oxen, and cherubim—a rather singular fellowship, were among the hieroglyphs of Solomon's temple (1 Kings vii. 23). Two lions stood at the side of Solomon's throne (1 Kings x. 10). So they did also at the sides of the throne of the king of Egypt; as we may see on monuments; and possibly the son-in-law of the Egyptian monarch may thence have taken the idea; but the symbolical meaning of lions in this situation had reference to the administration of justice. It is probable that the Romanesque architects derived their lions from the Bible record; and their position at church doors, frequently with the columns of the porch resting on their backs, had a reference to the custom of administering justice there, and the rendering of certain public acts, so that the porch, with its lions, became a tribunal, and hence the formula which many public acts and documents bear, "*inter leones*." M. de Caumont has some interesting remarks on this subject. The lions over the gate of Mycene had probably a similar meaning; they were there as symbols of justice and judgment; for the gates of cities in the oldest time were often made the places for administering the law. I once thought that the lions of Daniel—so frequently seen on early Christian sarcophagi—might have had something to do with those at church porches; but I believe the association of lions with places of justice is of much earlier date than the days of Daniel. It is true, Shylock exclaims, "A Daniel, a very Daniel, come to judgment;" and Daniel himself might be put for the perpetual symbol of all righteous judges; but the poets, to whom we are often in-

debted for preserving the popular vestiges of nearly worn-out usages and exploded lore, and to no one more so than our immortal Shakspeare, have occasional reference to the lion as the symbol of clemency, and of generosity combined with power. Thus Troilus, upbraiding his brother Hector for sparing the fallen Grecians, bidding them rise and live, says:—

"Brother, you have a vice of mercy in you,  
Which better fits a lion than a man."  
*Troilus and Cressida*, act v., sc. 3.

The aspect and noble bearing of the lion is expressive of dignity and power. Unlike all other members of the *Felis* family, he holds up his head and looks you full in the face, and has appropriately enough been called the king of animals. Lions draw the ear of Cybele, the Earth, or the great mother, possibly by the Assyrians, Belis, the female form of Baal, or the lord, and consequently the queen of heaven, was represented standing on a lion. The lion is an emblem of solitude as well as of royal power. In Christian symbolism, lions are associated with Paul the Hermit; and, according to the golden legend, they dug the good man's grave. A lion is given as a companion to St. Jerome; and a unicorn is put by the side of the fair St. Justina, to signify her purity and virtue. The lion and the unicorn meet together as supporters of the royal arms of England; but here the British lion is rather an equivocal character, placed *vis-a-vis* his spotless associate, and their union savours of a Persian myth; for, while the unicorn is the first of the pure animals of Ahirman; and so the royal authority in England, or its symbol, is upheld by supporters of opposite principles.

Having said so much of the royal lion, I must, in justice, say something of the imperial eagle, not that this bird has to do with architecture, as the former, nor has it been made a sign in the heavens; it only stands by the side of Jupiter, the lord of the sky, and its personification, whence come lightnings and the bolts of the thunderer; but Apollo, or the sun, claims the eagle, no less than Jove, or the sky; and with an equal right, for while the eagle soars aloft in the upper regions of the atmosphere, and builds its nest in high places, it has a wonderful sight, and could, from time immemorial, look steadfastly at the sun. Dante notices this (Pard. l. 48) on Beatrice gazing intently at that luminary; he exclaims:—

"Aquila si non gli s' affice unquanco."

Possibly the wonderful eyesight of the eagle may have had something to do with the bird becoming the symbol of St. John, who, in his vision, looking up steadfastly, saw an angel standing in the sun. The history of the eagle as an imperial ensign will be found in Canto VI. of the *Paradise* of Dante, to which I must refer you. Considering the character of this bird, we cannot be surprised that the Aigle Français should long have had its eye upon the summit of Mont Blanc.

A history of animals in reference to their symbolical characters, while it would show much that is interesting in their habits and manners, would at the same time throw considerable light on the theology, mythology, and art history of the ancients.

The Greeks, by not caring to ascertain the symbolical value of animals' heads, came to treat the gods of the Egyptians with very little respect. Wit here took the place of wisdom, and they sought to turn into ridicule what they did not care to understand.

#### THE TREE OF LIFE.†

The art history of the Tree of Life is curious: it had its origin in the far East, where the life of nature and of man was combined in one poetic and symbolical whole; its most unmistakable form occurs among the Hindus; it is described as having first appeared on the mountain of Paradise (Himavet or Merou), as the antique Phallus of Siva, which the god divided into twelve ligatures radiating light, and afterwards caused to be transported into different parts of India (see Gulistan).

Dr. Layard, in his "Nineveh," has an engraving of a cylinder, on which is a tree of the form shown in drawing V. (coloured), between two winged bulls (here omitted). It would seem to be a conventional form of the palm tree, the branches ending in terminal buds, and might either have suggested the Indian myth, or might have been derived from it. There are two tripartite trees in a similar style on one of the tablets in the British Museum.

The winged bulls, with human heads, are analogous to the Royal Sphinxes among the Egyptians, and symbolize intelligence united with force and power, an attribute to the great Assyrian monarchy.

Every country has had its sacred tree, and some countries have had more than one. Egypt had several; the earliest was the palm tree, the date palm (*Phoenix dactylifera*).

\* We may observe the eagle, as a symbol of Apollo, on an altar to that leader of the Muses, in the Museum of the Capitol.

† This part was not read, but we have thought it better to make the subject complete.

that they do not project beyond the surface like the *reliefs* of other styles. The figures represented are, as it were, tacked into the surface, impressed beneath like a seal on wax, so that no part of the subject is above the adjacent surface. This treatment decorated the surface without disturbing its breadth and massiveness,—the character of Egyptian architecture.

The Egyptians were great in their knowledge and practice of the union of the arts. Their whole manner was archaic, no doubt; but it was most impressive, and has been most enduring. A treatment of incised *relievo*, analogous to that they so much used, might well, I conceive, take part in our own granitic architecture, which idea has lately been favourably discussed at the Society of Arts.

The Egyptians also used vast figures attached to their temples and tombs, not infrequently rock-hewn; also ranged in avenues. Between Luxor and Karnak, a distance of about two miles, stretched the most renowned of these avenues of statues, composed of repetitions of colossal recumbent sphinxes, lions, &c. With colossal of this character, and a profusion of incised and storied *relievo*, most of the Egyptian edifices were enhanced within and without.

We will not, however, linger longer in the valley of the Nile, but proceed to Greece *videlicet* the Euphrates.

By the banks of the broad Euphrates, and between that and the Tigris, dwell of old the Assyrians, and they also united intimately their architecture and sculpture.

On the outside of the lower story of their public structures, and in the very blocks of limestone which formed the walls, were hewn colossal images of their kings, warriors, and spirits, and other emblematic figures, from whose very backs the structure seemed to arise.

Among these figures the most remarkable are those colossal winged sphinxes, of which you may see examples in the British Museum. These were placed usually as guards at the entrances, either opposite the person entering or sideways, or both, according to the restorations of Mr. Ferguson and Mr. Layard. Between colossal sculptured symbols of this kind did Sennacherib re-enter his palace on his return from his discomfiture before Lachish.

These figures highly enhanced, decoratively, the appearance of the architecture with which they were associated, and also meant a great deal. The sphinx, as the old author, Clement, of Alexandria, says, signified "the combination of force with intellect." The lion's body with the man's head; that is, the androleone sphinx, from "aner," Greek for a man, and "leo," Latin for a lion. But the Assyrians had another variety of the sphinx, viz., the androtaurine sphinx, from "aner," a man, and "taurus," Latin for a bull,—in which the bull's body was substituted for that of the lion. As the former personified military force, so might the other probably have had a more pastoral significance. The Assyrians also added eagle's wings, to typify swiftness and extent of power. These two remarkable emblems of force, together with other colossal forms at the base of the Assyrian structures, appeared as supporting the whole edifice. So you see they had a meaning, and were not merely decorations. They were mental as well as sensuous.

When these sphinxes appear on the walls, back to back, their wings, together, form a fine structural embellishment of an arched form.

Within the walls, in the interior, the sculptures of the Assyrians were of a much smaller scale, illustrating a great variety of subject. In the British Museum an additional apartment for these works has been lately opened, which will well reward a visit. Among them are *reliefs*, as fresh as if they came from the hand of the workman yesterday, although 2,400 years have elapsed since that period. Here, for instance, is the cast of a horse's head just sketched in with the chisel, the original of which looks as if left off this morning, to be gone on with to-morrow.

Besides, however, the great historical interests of these works of the Assyrians, and also their frequent excellence, these lesser figures are peculiar as being of a style of very flat, and yet effective, *relievo*, half-way between the incised principle of the Egyptians and that of projection adopted by the Greeks. In modern times Donatello's method resembles this more than perhaps any other examples.

We will now proceed to the Greeks. As your time and my space will not allow of any extended discussion of each phase of our subject, it may be well to restrict ourselves as to the union of Greek architecture and sculpture to the one example of

the Parthenon, which, however, is a host in itself.

Nowhere can the union of the two arts be more justly illustrated than in this example of Classic temple structure, in which they were so evenly combined that it would appear a doubt, whether the sculpture were more evidently a decoration to the architecture, or the architecture a pedestal projection and frame for the sculpture.

This far-famed edifice was commenced on the Acropolis of Athens, 450 years before our Saviour, and, therefore, 2,310 years ago. It was about 100 feet wide by 225 feet long; was built of white Attic marble, and was, within and without, most elaborately illustrated and decorated with sculpture.

In the most retired interior was the statue of the goddess "Athene," herself, 60 feet high. This, however, having been made, by the decision of the priest, of ivory and gold, contrary to the wishes of the sculptor himself, Phidias, has long since perished, not a pinch of dust remains of the daughter of Jove.

There were various other smaller statues doubtless within the walls of this edifice, as attendants on the divinity, and as illustrations of the object of the temple; but of these it was deprived by the Romans when they finally vanquished Greece, and despoiled her at once of her freedom and her works of art.

It is, therefore, to the exterior sculptures of which we have record, and to those cherished remains which we possess in the British Museum, that we must turn. In these also we shall find that not only did they decorate the temple exquisitely, but they told its story.

The Parthenon was, as you know, erected in honour of the goddess whom the Romans called Minerva, but the Greeks Athene, and after whom Athens was named. She was fabled to be the daughter of Jupiter, or Zeus, the supreme god of heathen mythology, and to have sprung ready armed from his head. She was worshipped as the goddess of wisdom. It happened also that she always remained a maiden. Parthenos is the Greek for maiden,—hence Parthenon, the house of the maiden, or, in other words, the Temple of the Virgin.

The spaces on the front and sides of this temple were chiefly decorated with figure sculpture on the east and west fronts, as in the tympana, and the metopes between the triglyphs over the columns, which were continued at the sides as well as in the frieze which ran round the cella—or body of the building beneath the colonnade,—of these the most important are the tympana.

Within the triangular space of the east tympanum, which was in reality one gable of the roof, was represented, in sculpture, the birth of Minerva or Athene, and the council of the gods on Olympus, the figure of Jupiter or Zeus occupying the centre.

Within the west tympanum, on the opposite front, was represented the contention of Athene and Neptune, or, as the Greeks called him, Poseidon, for the honour of giving the name to Athens. Athens, the capital of Cæropia, or, as it was afterwards called, Attica, was situated on the sea coast, connected at some distance with her port, or harbour, called the Piræus, just as Edinburgh, our northern capital, often called the modern Athens, possesses her Leith harbour. The Athenians were in great measure a warlike maritime people—sea-robbers in fact originally,—and yet they claimed to furnish the favoured abode of wisdom and the arts of peace. Thus the myth arose naturally that originally there had been a contention between the god of the sea and the goddess of wisdom for the privilege of naming the city.

This is the old story:—These two deities having seriously disagreed on this subject, the assembly of the gods arranged the dispute by passing the resolution that that one should have the preference who produced the most useful presents for the inhabitants of the earth.

Upon this, Neptune struck the rock with his trident, and immediately a horse issued forth.

Minerva then waved her hand, when, full in leaf and fruit, from the teeming earth, sprang up the olive. On which she was immediately congratulated by the unanimous voice of the gods as having obtained the victory, who observed, as Hesiod says, that the olive, as the emblem of peace, is preferable to the horse, the emblem of war and bloodshed,—a remark in which probably we shall all coincide in spite of our rifle corps! The representation of this contention, in connection with groups of those various personages which figure in the tableaux of Greek mythology,

formed the subject of this tympanum. Thus did this composition voice the west front of the temple, and image forth how the daughter of Jove came to be the patroness of Athens and the goddess of the temple. This was the mental part,—it thus told the tale of the edifice.

As to the sensuous part, as an achievement of art decoration, doubtless nothing also could be more complete, according to the data that remain to us. Without crowding or confusion, the triangular space afforded by the tympanum was occupied by fine rich masses of sculpture, carefully adjusted as to projection, and light and shadow, and on a plan of geometric balance and flow of line, on the principle of which I shall presently offer a few remarks.

Along the sides of the temple, above the columns, were arranged between the triglyphs, the metopes, which were chiefly of groups of warriors contending with centaurs. This is a very common subject in Greek sculpture. Probably its frequency arose from the Greek traditions of the early incursions of the Thessalians, who were horsemen, upon the Greeks, who were foot-soldiers. The old myth of the centaurs—a compounded form of a man and horse—arose from the appearance of a horseman in the distance, when they might to those to whom horses were unknown present the idea of a single animal. This was not confined to the Greeks. When Cortez and Pizarro invaded America, and for the first time introduced horses into that country, each mounted Spaniard was taken for being all of one piece with his horse—together one animal—which, as you may conceive, proportionately astonished the natives. Just so it might have been when the Thessalian cavalry made the great incursion into Greece. The Greeks successfully resisted them and drove them out; and thus, probably, the sculptured fights of men and centaurs, the record of this early triumph, became a recognized and staple part of the decoration of their public buildings. The collection of ancient marbles in the British Museum will afford you several examples of this, besides those of the Parthenon.

So much for the tradition they recorded. In their quality of bold art decoration within the square spaces they occupied they were highly effective, as we see by the remains we possess, and the androecine bodies and forms came in finely to give variety and surface to them as architectural compositions.

The figures we have spoken of in the tympana of the east and west fronts were all more or less colossal, or considerably above the size of man, and they represented divinities of different grades. These were all figures on the round. These, separate or in groups, however, were yet so arranged near the wall behind them that they presented the combined effect of a very bold high relief.

On the other hand the metopes, although projecting much from the background, were only in high relief, being wrought out of the same block of stone with the background and attached to it. They were of a scale less than that of life, and represent the actions, not of divinities, but of heroes.

We now come to the frieze, in which the same consistent principle of gradation in subject, scale, and treatment, from the gods to men, from the tympanum to the frieze, is preserved. The frieze of the Parthenon was a nearly continuous equable band of low relief running like a zone round the whole solid of the temple beneath the colonnade. It represented an Athenian procession in honour of Athene and the other gods. This frieze is composed, almost without exception, of mortal figures,—of men, women, youths, maidens, cavalry, and sacrificial victims, &c., as we may see in the British Museum. Although less in scale than the metopes, they are equally beautiful as sculptural works and architectural enhancements.

We have not time to consider now any other Greek examples of the union of architecture and sculpture, or to dwell longer on the charms of this building, which we have taken as their type. Had we time to do so, the more we should recognize how thoughtful, logical, and just were the inventions and art treatment of the Greeks in the union they produced. As regards the Parthenon, the sculptural theme and art moved in unbroken harmony with the structure, which it enhanced to a degree which has never probably been elsewhere attained before or since.

From Greece we naturally proceed to Rome. The Romans, in their architecture, adopted in many respects the practice of Greece, but added many inventions and additions of their own, or drawn from other sources. Rome, indeed, was even more lavish of sculptural enhancements than Greece, and works of this art were used in connection with her architecture in the greatest pro-

fusion. For this purpose, not only did they ransack Greece, but had very many copies made of Greek statues, as well as new ones of their own to decorate their baths, fora, gymnasia, or places of exercise, as well as their temples and public arena.

The magnificent tomb of the Emperor Adrian, built prospectively for himself, which is now the Castle of St. Angelo, was among other buildings magnificently enriched with statues; and in the ruins at its base was found the well-known dancing faun restored by Michelangelo.

The Roman triumphal arches, also, as those of Titus and Septimus Severus, were profusely enriched with sculpture, illustrative of the victories of which they were the record. They also, like the obelisks, were records in stone of the events they celebrated; and this not only by means of illustrative statues and reliefs, but also, they usually contained a long inscription decoratively arranged in the front.

No feature of architecture, however, can be adduced in which sculpture has taken a greater part than in the Trajan's column, the whole of the surface of the shaft of which is occupied by reliefs of triumphs of that emperor. These appear in one continuous band, running specially round the surface from the base to the capital, like a ribbon round a staff, and containing many hundred figures. It was a bold thought, and effective decoratively; but it is deficient in clearness and mental effect. The compositions cannot be seen in sequence at any point, and are not distinguishable without a glass, except just at the base of the shaft.

Although it has been copied in Paris, it may rank rather as a clever, novel, and vigorous conception, very well for once, than as among examples to be followed of the union of the arts.\*

#### THE EXHIBITION OF THE SOCIETY OF BRITISH ARTISTS.

Nor entirely is it class of subject, and less is it the manipulation, that constitutes a work one of high art; and, of such art the inventive and intellectual attributes present, are more nearly than is supposed, the same, in one walk of art as in another. Portrait-painting in the hands of a Reynolds or a Van Dyke, or landscape in those of a Claude or a Turner, may fairly rank higher than painting of subjects allegorical, religious, or historical, when these, however excellent as studies from the life, contain nothing more, imparted to them, originated from the producer or resultant from observations before made and then filtered through his mind. Each branch of art, fine art, or called only *decoration*, can be constituted by the treatment, art such as may be entitled, almost if not altogether, to the designation, *high art*: for, whilst one branch may from subject be fitted for location in the halls of the Houses of Parliament, and another to a boudoir, and one may afford greater opportunities to the producer than the other,—but whilst making extraordinary demands,—no work is one of *art* at all, properly speaking or in the sense in which we should understand "art," unless it have the attributes which in the fact of their presence, go to constitute the equality of merit or parallelism. We have frequently felt called upon to state, both to architects and others, the view of what should be regarded as art; but it is equally necessary to insist upon what is needed in portraiture and landscape painting, to constitute the distinction between what might be done by the camera or a certain sleight of hand, and what involves something further. Mere drawing, or the use of colours and brushes, would be scarcely art; yet even objects in still life, or a very dingy hill, may be, whilst accurately represented, made also that which is required, and which goes far beyond. This statement of a difference between one kind of aim and the other is not the less correct, though the qualifications for representing and for originating exist together, and though one may assist, and may come to results—those of one kind such as are not distinguishable from those of the other. What is accidental, or imparted,—as the expression of face or passion in a portrait, or the effect of light in a landscape,—it is this which constitutes the *art* domain.

There is no occasion to show an excellence of the British school which has now been recognized by Continental nations, and is at length more apparent by the treasures that are the property of the nation. But, looking at some of the many exhibitions of pictures which are open every year, there has been cause to apprehend that the public desire for the advancement of art was not being

seconded by the artists of works of a particular class; though, from the category referred to, we may do well to except such works as a large number of those in the exhibitions of the Societies of Painters in Water Colours. Whether in exhibitions consisting chiefly of works of landscape art and subjects from domestic life, or in the exhibition of the Royal Academy, there must be in future manifested both the utmost art that can be expressed in a particular subject, and, to speak truth, a greater amount of it than we have lately discerned in some cases. The purchaser can play his part only when he has the meritorious work offered him, and after having been taught by the frequent exhibition of such works.

With these views, we are glad to find that the exhibition just opened, of the Society of British Artists, without any special application to it of the remarks we have made, is a considerable advance upon recent exhibitions at Suffolk-street. There are in the galleries, this year, works in landscape of the highest order of excellence, some capital bits of domestic life, and a few works of historical painting, some of them highly commendable; and generally the collection consisting of 633 paintings in oil, 236 in water-colours or other vehicles, and ten in sculpture or plastic art, is the best of several years. In the landscape department, we may instance the rock and waterfall scenes, chiefly Norwegian, by W. West, as Nos. 373, 422, and 554, some of which seem to us not inferior to anything of the kind that has been produced. The same artist has some scenes in Wales, one "On the Leant, Carnarvon" (39), also good, though not equally remarkable as the subject. Of the same order of merit is the "Scene on Egton Moors, Yorkshire," by E. J. Niemann (17), where, besides an excellent representation of twilight, a story is suggested, and interest is given to the scene, by the manner in which the most-troopers "in ambush" are discoverable in the picture, and amongst the rocks, or stealthily following the water-course. Mr. J. B. Pyne exhibits but one picture (74), "Wrecks and Wreckers, off Beannaris," a succinct piece finely treated, with stranded vessels and figures, helping by grouping and incident to make the picture, and to add to the atmospheric effect and inanimate matter represented, the interest of a different kind.

Every landscape-painter recognizes the value of figures as an accessory; but it is not every one who perceives that it is necessary they should be correctly drawn, however sketchily, and that it is desirable, however small, they should be doing something,—though they should not detract from the main subject, the landscape. Even in Turner's works, the later productions, the figures operate absolutely to the disadvantage of the effect intended: whilst, in some of the works of Claude, Wilson, and others, figures made to give the title of the work, have so little force in the picture, that the latter would be judged a failure, were the "work of art" observed according to strict rules of criticism, that is, in the spirit that it was entitled, and that which the painter set forth as the "end" he meant to "compass." Many of the works in Suffolk-street are, however, very good examples of the proper treatment. Mr. W. Shnyder's are of the number, and may be instanced all the more advantageously, because not characterized by much else than what we have named: at least they have become mannered, and lacking results derived from recent and frequent going to the observance of nature. The "Lone Scene, Isle of Wight" (229), is about the best of eight pictures by this artist. Mr. H. J. Bodington, also a large contributor, is one who has become remarkable for a manner not quite the best; but in the landscape "On the Hills, North Wales" (145), of good colour and an excellent effect of sunlight through a haze; and the "Welsh Stream, painted on the spot" (314), as well as No. 418, have merit. Mr. Vicent Cole's six pictures are all of them good as landscapes with figures. Nos. 16, and 106, a very fine work, are the best. Mr. G. Cole, who is also prolific, devotes himself to subjects of a different class, and with much success, as in "A Home-stall in Caernarvonshire" (30), and (203) "A Welsh Interior, with Sheep and Donkey." He also exhibits (627) "A Quiet Pool on the Machno, North Wales" a good picture. The "Tantallon Castle" of Mr. J. Syer (57) is a large and finely painted work, especially in the representation of the sea foaming about the wreck, and the action of the groups of figures on land. Mr. J. Zeitter, though always sketchy, is one of those who are particularly successful in the treatment, of the kind referred to above, of the figures in a general scene; though some of his works are to be regarded as figure-pieces rather than landscapes. In "A Passage-bout on the Lake at

Füed, Hungary" (96), each group, and the balance of the different groups, and the relative force of figures and landscape, are well managed. Amongst the works of superior excellence of a similar class, may be named "The Rush Gatherers on Loch Corrib" (204), J. J. Hill, who is the painter of a work of a very different kind, and having some of the highest qualities of art,—"The Gleaner" (481), a half-length female figure, with good management of colour, and of the shadow on the face of the neck. The treatment in some respects calls to mind that of similar subjects by Reynolds. We may mention at this time, the "Roman Peasant Girl" (161), "Shepherd Boy of the Abruzzi" (193), and "Jacinta" (207), by the late T. Y. Gooderson, as well-painted half-lengths in a low tone of colour; the "Rachel" (86), by J. Stevens, and Mr. J. E. Collin's "A Little Romp" (224), a good rendering of girlish playfulness. Observation of nature modified in domestic life is shown in the works, with a smaller scale of figures, of W. Heusley, T. Clater, J. Collinson, E. J. Cobbett, J. E. Walker, and others; and minute study in the abandoned ship represented in No. 37, "Off the Foreland, Studland Bay, Dorsetshire," by C. B. Hue, and in the "Summer on the Thames" (234), "A Pool" (578), and other works by W. W. Gosling; and fine effect in those of A. Clint and J. Dauby. Mr. A. J. Woolmer exhibits eight works of the manner which he has made so well known, to which it is impossible to deny the merits of poetry of conception and colour, or to avoid noticing errors against probability, and some errors of drawing. "The Flower on the Window-sill" (73), T. F. Roberts, and "Stray Thoughts" (284), T. F. Dicksee, resemble works by the same hands seen before, but deserve to meet with purchasers; and there is much careful painting in the "Prayer" (17) of Mr. Chester Earles, though the face has not altogether a pleasing expression. Mr. J. T. Peele's "A Moment of Suspense" (117), and "Girl with Blackberries" (531); Mr. J. Nolle's "The Young Agriculturist" (97); the works of T. Earle and J. F. Herring, like others, well known for merit; and Mrs. Rimer's flowers belong to very different classes, but are equally worthy of notice. The department of historical painting, with works of the largest scale of figures, is most prominently represented by the president, Mr. F. Y. Hurlstone, and Mr. W. Smiter. The latter artist's "The Union of the Rose and the Lily—first interview of King Charles and Queen Henrietta Maria" (119), though the more ambitious work, and one well painted in parts, is not so satisfactory as is the male figure (though not a Jew) in the group from the Merchant of Venice (225). Mr. Hurlstone, we think, succeeds better in his other subjects than his portraits; though in one of the former, the "Margaret of Anjou, Queen, and Edward Prince of Wales, in the Wood on their flight after the fatal Battle of Hexham" (179), it is necessary to get rid of some of the colour, or other peculiarity, to realize the breadth and truly grand conception and drawing which are embodied in this work. The same excellence of manner, however, is observable in the portraits (58, 118, &c.), in one of which, the portrait of Captain Hopwood, the dogs are by Ansdell. We should also not omit to mention "The Three Ages" (134), by Mr. M. Claxton, which though not successful, according with the intention, in presenting a picture of human life,—for, it wants other figures to represent infant life as distinct from childhood, and matronly beauty from simple girlhood or womanhood,—manifests technical skill in the drawing, and in the separate figures, as in that of old age.

In the Water-Colour Room, there are a good drawing of a stranded vessel (666), by G. Whitaker; a "View of Moel Shtafod" (698), by J. C. Reed, accurate in the mountain tints; and works by J. C. Schetky, R. P. Leitch, G. Wolfe, and C. S. Varley, which should be noticed, besides a small group in marble by E. G. Physick; busts, "The Lily," by R. Physick, and the other, "Wildflowers," by G. Halse; and three minute works in *alto-relievo*, creditable to the artist, Mr. J. Holt. Amongst the lady-artists in this room are Mrs. Oliver, Miss Macrone, Miss Bayner, Mrs. Duffield, Miss Baines, Mrs. Valentine Bartholomew, Mrs. Withers, and Mrs. Croudate, who has made a considerable advance in her art.

A DEPUTATION waited upon the Under Secretary at the Home Office, on Saturday, 24th, for the purpose of explaining the plans proposed by the corporation of the City of London for the erection of a new metropolitan market and poultry market, to be connected with the projected metropolitan railway.

\* To be continued.

THE MEANS OF COMMUNICATION IN BRAZIL.

INSTITUTION OF CIVIL ENGINEERS.

At a recent meeting, the paper read was "Upon the Means of Communication in the Empire of Brazil—chiefly in reference to the Works of the Mangaratiba Serra Road, and to those of the Mauá, the first Brazilian Railway," by Mr. E. B. Webb.

It was stated that, until a recent period, no roads, in the English acceptance of the word, existed in Brazil. Yet its area was equal to twenty-three times that of the United Kingdom, and it had a coast line of about 3,000 miles in extent. The sea-ports were frequently far distant from each other, and the communication between them was by sea. Inland, bridle paths were, to within these last few years, sufficient for the necessities of the inhabitants. These were occasionally improved, by some wealthy proprietors, by the avoidance of a terrific ascent, by the erection of a wooden bridge, and even by the building of a stone culvert. The increase of the population, and the development of commerce, led to augmented traffic; and, as the troops of laden mules grew more numerous, the yielding paths became more unserviceable. The provincial governments then took the matter in hand, taxing the troops of mules, and repairing the paths by contract. But being unpaired, and for the most part extending over a clayey surface, they were still, at certain seasons, impassable.

The province of Rio de Janeiro was stated to consist of two distinct regions. A small portion along the coast was but little raised above the sea-level, whilst the greater part was at an elevation averaging 2,800 feet. The sea-face of this elevated land had, however, a much greater altitude. It was precipitous and rugged, presenting granite peaks from 5,000 to 7,000 feet in height. This was called the "Serra do mar."

The first attempt at real road-making was the formation of a carriage road up the face of the *serra* to Petropolis, a small town at the head of the gorges leading towards the Bay of Rio de Janeiro. This road was not well laid out, nor were the works upon it considerable. It had an average gradient of 1 in 16, and had only recently been macadamized. Its summit level was about 2,800 feet above the sea. It was stated to have cost 40,000*l.* per mile, although there were no disbursements for land, or legal or parliamentary expenses.

Over the sandy plain lying between the head of the Bay of Rio and the foot of the *serra*, the Mauá railway had been constructed. This line presented no difficulty, excepting where a deep unhealthy swamp, from one to two miles in breadth, had to be crossed. The mode in which the ordinary excavations were carried on was not at all satisfactory, although an improvement took place, when English barrows and shovels, and small trucks and rails, were introduced. Slave labour alone could be depended upon; the native poor Brazilian not being inclined to work hard. The wages of the slaves were about 5*d.*, and the cost of their food about 7*d.* per diem. In the year 1857, after a lapse of four years from the time alluded to, the price of labour and food had doubled. The cost of skilled labour was generally about double that of the ordinary description. With one exception, all the bridges were of timber, with the certainty of a not very distant renewal. There was great difficulty in obtaining sound and durable timber, owing to its being almost impossible to collect in any single district a supply of one description, and also to the expense of transport to the place where it was required.

An examination of a timber pier, which had been constructed for the southern terminus of this railway, in the Bay of Rio, showed that not one pile, and very few pieces of the superstructure, had remained sound, after being in place about four years and a half. All the wooden bridges had suffered in like manner, and they had been replaced by works of either iron or brick. The rails used were double-headed, weighing 65 lbs. per yard, seated upon Greaves's pat sleepers, laid on clear quartz ballast. The gauge was 5 feet 6 inches. The rails did not appear to oxidize more than was customary in similar positions in England, nor had the cast-iron of the sleepers deteriorated. It was a single line, 11 miles in length, and the cost of the works, with the rolling stock, might have amounted to 15,500*l.* per mile.

Soon after the opening of the Mauá railway, which was completed by the author, he was appointed engineer to the Mangaratiba Serra Road, which was completed by the author, he was appointed engineer to the Mangaratiba Serra Road.

The route of this road was through a gorge, 100 miles to the west of Rio, descending to the port

of Mangaratiba. On the summit it passed, in a northerly direction, to the great river Paraíba, at a distance of 55 miles from the coast. Over the original track about 22,000 tons of coffee descended to the port, and about 10,000 tons of general merchandise were conveyed up the mountains. The work was commenced in May, 1855, by a body of Chinese, who proved utterly useless as labourers. But, as of late years, many thousands of Portuguese working men had emigrated to Rio, the works of the road were supplied with them. At one time there were as many as sixty-eight petty contractors, each employing from fifteen to sixty of his countrymen, so that in a few months upwards of 2,000 men were at work. At first they refused to use the barrow and the shovel. The hoe, their only tool, was not, however, so objectionable along the steep sides of the Mangaratiba mountains, as it was on the plains of Mauá. For a great portion of its length, the road was cut out of the solid rock, chiefly gneiss, or mica-schist. Immense rounded masses of pure granite were met with on the *serra*, and occasionally on the plains. Trap dykes were frequent in the ravines, and, dispersed throughout the cuttings, decaying masses of basalt and amygdaloid. The cuttings stood safely at  $\frac{1}{2}$  to 1, in most cases. The slopes of the embankments remained firm at 1 to 1. A thick-leaved grass, of rapid growth, protected the slope from the destructive action of heavy rains. The macadamized surface was 23 feet wide. A flugged drain, 3 feet in width, ran on the mountain side, and on the outer side a similar drain of 18 inches. The surface consisted of a pavement 9 inches deep, covered with a layer of granite metal 7 inches in thickness. A dry stone parapet, 3 feet high by 2 feet 2 inches thick, ran throughout the whole length of the road. With the exception of one arched bridge and some storehouses, none of the masonry contained lime. All the walling, the parapets, and the culverts were built dry. The abundance of stone, and the great cost of lime, in its purchase and carriage, led to its rejection. The masonry proved more satisfactory than almost any other branch of work. The Portuguese masons would make a good dry wall out of inferior materials, and with considerable celerity. The same could not, however, be said of stone work in mortar. If left to themselves, they spent as much time in filling the outer interstices as in building the wall itself.

On the Mangaratiba road there was only one work worthy of note in dressed masonry, and this was notable only on account of its cost. Although the Portuguese dressed stone very fairly, their work, as compared with English stone-cutters, proved, in this instance, four times more costly. In a locality far removed from the shore, and at first difficult of access, a bridge, with a chord of 52 feet, and a versed sine of 9 feet, occupied nineteen months of incessant labour. The coal, steel, iron, and lime, with the supplies of food, were carried to the spot, during many months, on the backs of mules. Timber had been shown to be unadvisable in Brazilian bridge building; at all events, in Central and Southern Brazil. The enormous cost of this cut stone bridge, amounting at least to 24,000*l.*, notwithstanding the most unwearied exertions to diminish expense, proved that stone was not economical. Without doubt iron was the best material for bridges in similar situations.

The works of the Mangaratiba road had cost, about 12,000*l.* per mile.

Allusion was made to the railways now in progress, or in contemplation, which were said to be destined to work a commercial and social revolution in Brazil. But, notwithstanding the stability and prosperity of that country, its public works and its agricultural operations were yearly becoming more and more embarrassed, on account of the scarcity of labour. Hitherto the supply of labour and the means of colonization had been considered separately. The author had suggested, in a document he had the honour lately of placing in the hands of the emperor, a means by which public works might be made the instruments of populating the districts in which they were undertaken. This system, it was believed, would be adopted to a considerable extent on the San Paulo railway.

In conclusion, the author referred to the important question of guarantees. Two distinct methods of guarantee were in operation. The shares of the Don Pedro Segundo Railway appeared only in the Brazilian market. Upon a stated capital, an interest of 7 per cent. was guaranteed conjointly by the General and Provincial Governments. Only a small portion of this capital had been paid up, and one-third of

the whole had been raised by loan in London, in the name of the General Government, at 4½ per cent. The difference in the two rates was to form a sinking fund, to replace the sum borrowed. The other method, that of guaranteeing foreign shareholders, as in the case of the two English companies managed by boards in London, did not offer much encouragement, for the shares of each company were at a discount. It might have been expected that investments in such undertakings, with a guarantee of 7 per cent., would have been largely sought after. It was felt that, perhaps, it would be more advantageous in future for the Brazilians to raise all railway money on loan. It might fairly be hoped, that ultimately Brazil, upon a calculation of the preponderance of good and evil, would not have to regret the epoch when English capital, energy, and engineering skill, assisted her in utilizing her own internal wealth.

NEW WORKHOUSE, DEANHOUSE, NEAR HUDDERSFIELD.

THE first premium in this competition, we are informed, has been awarded to Mr. Kirk, of Huddersfield. The second premium to Mr. Littlewood, of Manchester.

BELGIAN RAILWAY WORKS.

THE Belgian Minister of Public Works has just published an official "compte-rendu" of railway works in that country during the year 1858. It appears from this document that the total length of railways existing in Belgium (not including those for private enterprise, whose lengths have not as yet been precisely ascertained) was 1,691 kilometres 693 metres at the close of the year 1858, composed of 567,024 metres constructed by the State, and 1,124,609 by companies. The State railways are as follows:—The Northern, 53,477 metres; the Western, 205,229 metres; the Eastern, 145,081 metres; and the Southern, 163,234 metres. At the above date, the number of railways constructed by companies was twenty-two. The working of the several lines is thus classified:—

	Mètres.
A. Lines constructed and worked by the State.....	567,024
Lines constructed by companies and worked by the State .....	188,534
	745,338
B. Lines constructed and worked by companies.....	936,975
Lines constructed by the State and worked by companies.....	10,220
Total A .....	946,296
Total B .....	745,338
Total .....	1,691,633

The area of Belgium is 2,945,593 hectares (about 7,268,991 British acres), and on the 31st of December, 1858, the population was 4,623,059 inhabitants; thus giving a kilometre of railway to every 1,741 hectares of area, or for every 2,733 inhabitants. Of those lines worked by Government, 693,268 metres have a double line, and 52,070 metres single line of way; the former being 93.01 per cent., and the latter, 6.99 per cent. of the whole, which we have stated above to be 745,338 metres. For sidings and spare lines we have a length given of 225,000 metres. The total length of railway line, in main lines, sidings, and all accessories, is 3,311,860 metres. The expenses of the construction amounted in January 1, 1859, to 183,776,365 francs 30 centimes. A surplus of work not paid for amounted to 910,367 francs 67 centimes; and 15,961,400 francs were required to place the group of State railways in satisfactory working order.

The average cost of construction is 334,627 francs, 86 centimes per kilometre (or about 21,540*l.* per mile statute), but it varies considerably according to the nature of the works. It is only 119,519 francs 79 centimes, for the section from Gand to Courtrai; it amounts to 585,122 francs 17 centimes, for that of the Mense to the Prussian frontier. For that portion of line between Ans and La Mense, it is one million 588,145 francs 72 centimes, including the workshops and stationary engines for the inclines. The expenditure of the State for the construction of railways since their commencement has been, as above stated, 189,776,365 francs 30 centimes; including the value of the Mons and Manage section, which figures at 13,235,505 francs 51 centimes. The total sum will be 303,011,870 francs 81 centimes. The deficit which, on the 31st December, 1857, was 16,654,092 francs 93 centimes, was reduced in 1858 to 12,515,293 francs 67 centimes.

A SUBURBAN HOSTELRY.

## LONDON OF THE PAST.

## SUBURBAN HOSTELRIES.

In the memory of many not yet past the prime of life, the "Mother Redcap," at Camden-town, the "Mother Sbjpton," at Highgate-hill, and some other well-known signs, were far removed from town, and to go to them required a journey through meadows and green lanes. These places have now become surrounded with a vast population, and their characteristic features are fast disappearing. In place of the quaint-looking resting-places of other days, large and showy buildings, bright with all the glories of gas and compo, have been raised. One of the most picturesque of the old establishments was the "Bell and Horns," at Brompton, near the museum, where the more modern inn with that sign now is. The "Hoop and Toy," close by, was altogether a rural retreat. In Islington there were several with the old-fashioned sign-post and seats in front nicely shaded, for weary travellers or pleasure seekers in summer time. The large water-trough was a conspicuous object, and served as a means of affording refreshment to cattle and horses. There were several of these quaint farm-like inns in the Old Kent-road: amongst them was the "Half-Way House," so called, we presume, in consequence of its being half-way between Greenwich and London. This used to be a famous halting-place, particularly in the hop season, when it was thronged during both night and day by waggons and other travellers resting on their way to town. This once rural spot is now surrounded by buildings, and the "Half-Way House" may be passed by with little notice as hundreds of other spirit establishments in the central parts of the metropolis. In the Holloway road—in the main street of Islington—nearly all traces of the old style, except the names of the signs, have vanished. The "Angel," behind which there was a galleried yard, in which the players were wont to amuse the dwellers in this "merrie" village, has now the matter-of-fact appearance of the present day. Some of the houses northward, which are traditionally associated with Dick Turpin and other exalted scoundrels of the road, have cast off their heavy tile roofs and are resplendent with plate-glass and vulgar decorations. In one or two instances it may be noted that attempts have been made, without going to the extent of entire reconstruction, to disguise the appearance of antiquity: the practised eye, however, soon detects the portions which have been overlooked.

The spread of new buildings has much affected the style of the old suburban taverns. When a new neighbourhood has been planned,—almost as soon as the turf has been skinned off, a hole dug for sand if there be any, and if not, a huge mound of black mould provided for the mortar, before, indeed, the roads are made,—a lofty building is reared, doomed to be, for some time, a solitude, but which is expected, in due course, to be a prosperous public-house. The style and appearance of these sink into insignificance the older buildings which are within sight, and soon a wonderful change is made in them, and the ancient tavern is put into a shape more in keeping with its young rival. In the old "Queen's Head," in Islington (which had once a front older than Elizabeth's reign),

although it has been rebuilt, care has been taken to preserve the dark oak panels of one of the rooms, a ceiling, and some of the carving of early date; and it is desirable to follow this example as much as practicable, for in most of these places there is something worthy of preservation, which will become of greater interest as time passes on.

We have engraved a characteristic example of one of the wayside inns which were once so common, with its tiled roof, cattle-trough, and sign-post in the road. Viewed from a large waggon in front (the horses decked with scarlet and blue fringes), hay-carts and rustic figures, with a background of trees, the time-worn building covered here and there with ivy, it was a scene which will ere long have vanished from the outskirts of the metropolis.

## STRASBURG CATHEDRAL.

In one of the niches of the south-eastern tower of Strasburg cathedral, now under the workmen's bands for restoration, a fourth equestrian statue has just been placed, forming a portion of the design for adorning the principal facade of this structure, that of Henry I., surnamed l'Oiseleur. The other three, erected in 1859, equestrian also, are of Otho the Great, Charlemagne, and Pepin le Bref. These works have been undertaken on the exterior of the cathedral for some time past with a view of completing the decoration of this facade and replacing, in the numerous niches, the statues which were removed during the revolution and filling other niches with statues which had never been provided for them at any period.

This has been restored, by degrees, the grouping of the statues representing the Last Judgment, and subsequently the statue of Christ surrounded by angels, which is above those of the Apostles over the grand "rosace." At present the works are extended to embellishing the niches of the counter-forts of the towers.

It appears from the architect's researches that in 1291, when the western facade of the cathedral, commenced in 1277, had risen to the height of the gallery which surmounts the grand rose, three equestrian statues were placed,—those of Clovis, Dagobert, and Rodolphe of Hapsburg. Erwin himself then superintended the construction of the cathedral (1277 to 1318).

On the pinnacles, surmounting these niches for equestrian statues, are to be placed the statues of the bishops. They existed formerly and a few remain to the present day, leaving eight to be restored. The statues, thus numbering twenty, twelve for the monarchs and eight for bishops, are to be designed and prepared in the "Ateliers de Sculpture de l'Éuvre, Notre Dame," under the immediate superintendence of the architect, who has proved that one of the nineteenth century can powerfully contribute towards the restoration and completion of a grand architectural idea of the thirteenth century.

ART-UNION OF LONDON.—We would direct the attention of our readers to the circumstance that the subscription list will be closed at nine o'clock, this Saturday evening. The amount promises to be satisfactory.

## ST. PAUL'S CHURCH, HAGERSTON.

THE first stone of this church was laid on the 5th of May, 1859, by the Bishop of London, and the consecration took place on the 31st of January last. The building would have been completed and consecrated before Christmas but for a delay in the works occasioned by the strike. The site was secured by the Metropolis Churches Fund in 1849, but until last year sufficient funds could not be raised to commence the work of building. The plot of ground lies at the intersection of Broke and Marlborough roads, Dalston, on the estate of Sir William Middleton, Bart.

The church, which is built of brick, consists of nave and aisles, a spacious chancel terminating in a polygonal apse, a recess for the organ over the vestry on the south side of the chancel, and a bell-turret at the west end not yet completed. Externally the general face of the building is of Cowley stocks, with horizontal bands of Bath stone and red and black bricks. The jambs and heads of the windows and doorways are of Bath stone, set in a 9-inch reveal, with arched heads of red and black brick. The doorways throughout are square-headed, having stone lintels and relieving arches of red and black brick. It is intended ultimately to decorate the tympanum of each of the three west doorways with an incident from the life of Saint Paul, sculptured in the stone at present left rough for that purpose. Internally the aisles are divided from the nave by cast-iron columns standing on Portland-stone bases, and carrying arched ribs of timber. These bear the plates of the main roof, which is continued down to the external walls at a flatter pitch. Each bay of the aisles has a separate gabled roof intersecting with the main roof. The character of the load from the intermediates will be best understood from the illustration. The ceilings throughout are boarded on the under side of the rafters, and divided into panels by a moulded rib, those in each bay of the aisles following the form of the arch. The gallery trusses are carried on corbels in the wall, and small iron columns standing clear, behind the principal ones: the soffit of the galleries forms a flat boarded and panelled ceiling. A separate staircase is provided for each of the three galleries. The chancel arch is of stone, with a band of red and black bricks, forming one member of the arch mould; it is carried (as are also the principals of the chancel roof) on small shafts of red Mansfield stone, with bases and carved corbels, and capitals of Bath stone, by Mr. Tolmie, of Belvedere-road, Lambeth. The chancel is paved with red and black tiles; within the altar-rail the pavement is of encaustic tiles, presented by Messrs. Minton. The font is the gift of the architect; it is in the form of a spherical bowl encircled by a repoussing, bearing three medallions with symbols of the Trinity. The material is Caen stone, the supporting shaft being of red Mansfield stone. The whole of the sittings, the pulpit, reading-desk, altar-rail, and altar-table, are of deal, lightly stained and varnished. The pulpit and reading-desk have stone bases.

In adopting the peculiar method of construction employed in this church, the architect has been actuated by a conviction that the generally received Medieval type, is *not* (as every modern church ought to be) the building best adapted to the ritual of the Church of England, which seems to require for each individual in a congregation a view and hearing of the officiating minister, as uninterrupted as possible. An attempt has accordingly here been made to produce a building meeting these requirements, without sacrificing ecclesiastical character, or the many associations connected with the division of nave, aisles, and chancel. The church will accommodate nearly 1,100 persons, including children; and there is no sitting in the church, it is stated, from which the preacher cannot be well seen and heard. The building is lighted by three corone and by brackets, under the galleries, by Messrs. Hart, of Wych-street. The corone hang from the pendants of the principals, but are omitted in the illustration, in order to give an uninterrupted view. The whole expense, exclusive of gas, warming, and architect's commission, has been 5,467*l.*, but the fence-wall and the bell-turret yet remain unfinished, and there is at present a deficiency of 700*l.* Mr. Arthur W. Bloufield is the architect. Messrs. Holland & Hannen are the contractors. The church is warmed by air passing over a heated coker, the apparatus being supplied by Mr. S. E. Rossler.

ST. PAUL'S CHURCH, HAGGERSTON.—MR. A. W. BLOMFIELD, ARCHITECT.

## RIFLED CANNON.

THE CANNON MAKERS.

FOR four weeks in succession, each Tuesday night, the Institution of Civil Engineers, Great George-street, Westminster, has been crowded; the lecture-room has been full to overflowing; many members having had to leave the building on each night in consequence of there being no room, the regular seats, the aisles, the doorways, and the back stairs even having been crowded. The paper read was by Mr Longridge, "On the Construction of Artillery and other Vessels to resist great internal Pressure;" but the subjects discussed have been the Armstrong and the Whitworth rifled cannon, actual working samples of these rivals (twelve-pounders) having been placed on the table, open to the inspection of all the persons present. If there was a secret one, there is no such thing in this case now. On one evening Sir William Armstrong explained the mode of manufacture, the make, the method of working, loading, sighting, and firing, in the simplest and clearest possible language. Few men possess the enviable gifts of Sir William Armstrong. With a gentlemanly presence, a musical voice, a fluent delivery, a powerful and cultivated intellect, Sir William Armstrong is a man any nation ought to be proud of; and Lord Derby will have the honour conferred on Sir William long reflected lack on himself and on his government. But to the rifled cannon subject. The gun invented by Sir William Armstrong is in appearance light and even elegant: in use it is indestructible, and in its effects tremendous. A dozen such guns at Sebastopol would have shortened that terrible contest, as every ship and steamer afloat in the harbour must have been sunk within the first week of opening fire, and the most distant buildings would have been rendered untenable. All this, and more, was explained during this interesting lecture. Sir William answered all questions put to him, and gave clearly and fully all explanations required. There was the gun, there was the inventor, with his hand upon it; and there, within arm's length, sat Mr. Whitworth, listening to all that was said, for, against, and in explanation. Sir J. Burgoyne was in the second row of seats, in the front occupied usually by the members of the Council of the Institution; and generals, admirals, and officers of lower grades, with scientific Englishmen, and many foreigners, were also present. George Parker Bidder, the wonderful calculating boy of former years, as president, occupied the chair. Sir William Armstrong explained how his gun was made, the reasons why it was so made, showed its several parts, manipulated the breech, explained the mode of loading, the several parts of solid shot, hollow shot (shell), their mode of bursting, and their effects.

The Armstrong shot is coated with lead, to allow of its passing the rifle grooves; and this, we think, the objectionable feature in this otherwise most admirable cannon. A solid iron shot cannot be turned, or, rather, returned, to its offensive use, unless it happen to fit the bore of any hostile cannon most exactly. Hundreds of tons of round shot, and fragments of shells, lay about in front of Sebastopol, and on the plain of Bismarck and Balacava, perfectly unuseable; but if these had been fired from Sir William Armstrong's rifled cannon, the lead would all have been useable for rifle bullets; and, if ever fired against semi-savage nations, the lead from Sir William's shot will most certainly be so returned to us. This feature of the question may have excited the notice of the Tight Barnacles at the War Department, but it deserves to be considered before the next Caffre or Indian war commences. A leaden jacket, or coating, is necessary to Sir William's plan of rifling, and in this necessity is the weakness of his invention lies.

On the Tuesday night following Sir William Armstrong's exposition, Mr. Whitworth had a full table, and one of his wonderful 12-pounder rifled-guns was on the table before him. Mr. Whitworth has neither the presence, the power, nor the fluency of his rival. Mr. Whitworth said his remarks, but neither fluently nor clearly, and this never tells with an audience. The crowd was, however, all attention and patience, and continued so to the end. The matter was interesting and absorbing, though the manner was quaint. "The gift of the gab" is of great value—well used. Whitworth does not possess it. Sir William Armstrong makes his guns of cast-iron bars and flat rings of wrought-iron twisted and welded together. Whitworth makes his guns out of homogeneous iron or steel,—that is, a run from crucibles into moulds, so that it is a solid, compact, homogeneous mass. Both guns

are breech loaders, both have a direct passage through, from breech to muzzle, and both breeches open and close by means of levers and screws. In the Armstrong gun, the breech piece is small and moveable, and there may be any number ready to replace a lost or damaged one. In the Whitworth gun, the breech piece is heavy, and opens clumsily on a hinge, so as to be sadly in the way during loading, and liable to accident. Injury to the breech would be for the time ruination to the gun. This hinged breech is a weak point: in all besides, the Whitworth gun has a decided advantage. Homogeneous iron is better than welded iron bars, and the even bore and solid shot are far better than the lead-coated shot of Armstrong. Any enemy must possess Whitworth guns of the exact calibre, to return any of his shot, as each solid shot is a power of many tons weight to force one of Armstrong's lead-coated shot through from breech to muzzle; but any child may easily push one of the Whitworth shot through his guns, the fit is so true, even, and easy. The Armstrong gun cannot be used as a muzzle-loader: the Whitworth gun can be so used, if required. The Whitworth material and form of bore and mode of rifling, with the Armstrong breech and mode of sighting, would constitute a perfect weapon in every respect. With such guns Great Britain will fight her next great battles, and we be to whatever may be brought within the range of such terrible weapons:—wrought-iron plates, the thickest and strongest that can be made for any vessel to carry, as plate-mail, will be punched and perforated as if only of the consistency of cork. Shells and hollow shot of the most destructive character will pierce shells and scatter annihilation around, either above or below the water-line. No material will be able to resist the direct action of such engines. A Whitworth ball will pass through 40 feet of sand, and continue in a direct line at any angle through water. A Whitworth rifle bullet has a range of 2,000 yards, and spins on its axis at a rate of 10,000 revolutions per minute. Rope mantlets, sand-bags, or other known means of protection hitherto used, will be of no avail against such a spinning, direct, and insinuating projectile.

Monsieur Raymond may disparage the British rifled cannon as much as pleases himself and his egotistical countrymen. Sir William Armstrong—and we hope we may soon write "*Sir Joseph Whitworth*"—have made guns which require more than assertion to be proved inferior to any of French invention and make. Gunpowder cannot burst either the Armstrong or the Whitworth guns: this is about all which need be said on strength, and as to range and accuracy, these have been proved.

## THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The ordinary general meeting of members was held on Monday, 19th inst., at the house in Conduit-street. Mr. Hassey, V.P., presided. After routine.

Mr. Penrose (honorary secretary for foreign correspondence) introduced to the meeting Mr. Kleantes, an Athenian architect, who was, he said, the proprietor of the Parian and Verd Antique marble quarries. Mr. Kleantes wished it to be known that the Italian marbles could be introduced in any quantity, although at some expense, in consequence of the depth of the old workings. There were in the room several specimens of Verd Antique marble, but they were not equal to those of the ancients, although if there were a sufficient demand for the article the very finest specimens could be produced. Some years ago a report had been circulated that the true Verd Antique had been found, and Mr. Burgess had brought home a specimen, which, although good as far as its green colour was concerned, still was not so good as to enable him (Mr. Penrose) to pronounce it to be the veritable marble used by the ancients. The marble of which Mr. Kleantes was the owner could be procured in columns 14, 15, or 16 feet high if necessary. The price would depend very much upon the demand, but Mr. Kleantes was of opinion that it could be produced for 30s. a cubic foot: at all events, he was ready to receive orders at that price.

Mr. C. H. Smith said as to the Parian quarries it might perhaps be interesting to know one difference between Parian and Carrara marble for out-of-door works. The Carrara marble did not stand the weather in this country, and there was scarcely a clureyard in London which did not present examples of it in decay. Mineralogists were of opinion that Parian and Pentelic marble

were of aqueous origin, but the Carrara appeared to have been subjected to great heat, and to have become a metamorphic rock. This was perhaps one reason why it would not bear the weather. An instance of the perishable nature of Carrara marble had come under his own personal notice. Some time during the reign of George the Third a statue of his majesty was put up in a niche in the arcade of the old Royal Exchange. It was taken down to be cleaned thirty years ago: it was conveyed to the premises of Mr. Bubb, the statuary, and then it was found to have a crust over it of rotten surface so extensive that it was impossible to repair it. It remained in his yard for many years. Being anxious to know what had become of it, he questioned Mr. Bubb the last time he met him on the subject. Mr. Bubb said that it had laid in his yard for many years, until a careless carter drove his cart against it and it fell to pieces as if it had been made of sand. Even the far-famed Marble Arch had not escaped the general decay, for on examining it lately he found that it was gradually perishing by the action of the atmosphere. This was not the case with Parian marble, as, with the exception of slight decomposition on the surface, the stone was perfectly sound even in buildings which had been erected 2,000 years ago.

The Chairman then announced that the next meeting would be held on the 23rd of April, on which occasion the president, if sufficiently recovered from his recent accident, would present the gold medal of the Institute, and Mr. Penrose would make some observations upon the designs for the Wellington monument exhibited at Westminster Hall.

Dr. Barlow next read a paper on symbolism in art, with especial reference to Christian art and architecture, with which our readers are being made acquainted.

In the discussion which followed,

Mr. W. White said he was anxious to testify his sense of the value of the subject to which Dr. Barlow had called their attention that evening. In his opinion, the study of Christian symbolism, as a science, was of the utmost importance, for he held that symbolism was as essential to architecture as poetry to literature or music in common life to the well-being and happiness of society. He was aware that all might not take this view of the subject, but it was his impression that symbolism was the very poetry of architecture. If this were so, the first step towards following it out was to obtain such a concise history of it as that which Dr. Barlow had given. He looked upon symbolism, not as a fanciful theory, but as the only means of conveying abstract religious truth in a form comprehensible by man. It seemed to have been universal in all ages and countries, and to be derived from antediluvian sources. He believed that in all symbolism, from the earliest period down to the present time, there were three essentials, namely, the symbolism of the divine essence, the symbolism of ritualism, and the symbolism of teaching, which all nations in all ages had carried out. The first symbolism, described by a triangle, had been so defined in all ages. One remark which had fallen from Dr. Barlow reminded him that there was a tradition in addition to the written word which was forbidden to all but the priests and keepers of the written word. This was, first, a bond of union among Christian churches; and, secondly, it was a means of preventing others from intruding; for if they could not give an explanation of the signs and symbols they would not be admitted to union. The sign of the cross was one of these symbols: it was the sign which our Lord referred to when He spoke of the sign of the Son of Man appearing. He believed that the proportional arrangement of a church,—a porch, a nave, a sanctuary, an altar, or a choir, had an effect upon those who might enter the building, although their attention might never have been called to the symbolism itself. He recommended the study of symbolism as a science, although he would not degrade it by carrying it to a fanciful extent.

Mr. Papworth was inclined to think that the paper read by Dr. Barlow contained a large amount of what they were bound to protest against—namely, an extraordinary quantity of assertion without proof. The early portion of the paper was what they would find repeated by the pseudo-philosophers of an earlier period. He protested against the manner in which an assumption started by one man was taken up by another, while a third declared that it had the general assent of mankind, and a fourth asserted that it had always been so.

Dr. Barlow said that his assertions were based upon the highest authorities, and had no reference

whatever to Mr. Higgins, whose *ipse dixit* he had in no case relied upon. Mr. Papworth said he believed all good buildings depended upon geometrical combinations, but he asked why should the triangle be taken and not the square? He was inclined to think it was the square that ought to be taken. There were various ways by which a bobby could be ridden to death, and this was one.

Mr. Beresford Hope said that symbolism was necessary for originality. In the broad domain of symbolism, the truth, life, and originality of all architecture was to be found, and therefore discussion upon its theory never could be useless, although it might not lead to the point which it was most desirable to obtain.

Mr. Gilbert Scott said he was no symbolist: he thought it desirable not to lay down such strict laws as Mr. White had enforced. Many ancient buildings were found to have been built on the square and others on the triangle: Westminster Abbey and other English cathedrals were specimens of the former.

Mr. G. E. Street said that some years ago, when he worked upon Mr. Scott's plans, he used to prove (not, perhaps, with the knowledge of that gentleman) that they were all based upon a scientific principle of proportion! The most common symbolism was the unconscious expression of some common object. The nave and aisle were the most convenient form that could be built, and he believed that their adoption was altogether incidental.

Mr. Penrose said he had examined both Bruges and Lincoln Cathedrals: the first was founded on the equilateral triangle, and at Lincoln the proportions were determined by squares. The ancients appeared to have been of opinion that all that was required was size and effect, and that proportion or symbolism were but secondary objects.

Mr. Godwin, V.P., moved a vote of thanks to Dr. Barlow. He had brought together a vast amount of information on the subject; and whether they were prepared to admit it all or not, as matter for thought, it entitled him to their thanks.

Mr. White seconded the motion, which was carried by acclamation.

The following gentlemen were, on ballot, elected Fellows of the Institute:—Edward Salomons, Associate, of Manchester; Edward C. Robins, Associate, of 19, Arundel-street; James Murray, of 4, Agar-street, Strand, and Coventry; and George Trefnit, of 5, Bloomsbury-square.

#### THE CASUAL POOR.

FROM time to time in various parts of the metropolis observers are pained with cases of distress, which, if not fortunately attended to and relieved, lead to deaths, from downright want and destitution, which ought not to happen in this the richest capital city in the world. We have before referred to this matter, and mentioned that in ten years, from 1848 to 1857, 3,292 persons perished in the London district from absolute want. It is lamentable that 400 persons on the average died yearly of starvation. Various causes lead to this sad result: one is, an unwillingness on the part of many to make their distress known; but, undoubtedly, a great deal of the mischief is occasioned by the manner in which the poor are relieved by many of the officers of parishes, who, in their zeal to save expense, forget the claims of humanity, and so with little consideration persons in the greatest need, who cannot prove their claim upon a particular parish, are sent hungry away without assistance or relief. In the poorer districts of the metropolis, the inhabitants are so migratory that there are thousands who cannot say to which parish they belong, and are in consequence sent without help from one part of London to another. These cases are frequently reported in the newspapers; but even from these accounts little idea can be formed of the extent to which this evil presses upon a large and struggling class. Bad as this is for those who have for some regular shelter for their heads, it is worse for those without fixed habitation; and it unfortunately happens that many, both male and female, in consequence of illness, the falling of employment, perhaps from improvidence, or the commission of some offence, are prevented from readily getting work. We have met with discharged soldiers, sailors who have lost the outfit which would enable them to go to sea, and many others, who from sheer misfortune are driven to the streets, and exposed to hardships which can scarcely be conceived. These characters, bad and good, are driven by the police: the eyes of other officers are

upon them: they must not beg: their condition soon becomes so bad, that even the cheap lodging-house keepers refuse them admission: hundreds of instances might be given, but two or three may be sufficient to show how the present system works.

"I met a man," says an informant, "so ill in the street, on a wet dreary night, that he seemed scarcely able to wander along. He had been engaged on a railway in France, but had been discharged in consequence of ill health: he was sent to England, and with difficulty reached London, where he had endeavoured, without success, to get into an hospital. He was hopelessly afflicted with consumption; and those in charge of the hospitals to which he applied said that it was their duty only to admit those whom they might hope to cure—that he must apply to the workhouse. This he did, but was like to drop in the street,—having gone from place to place, but only met with refusal." Whatever might have brought this man to the condition he was in, there could be no mistake respecting his illness and destitution. The writer endeavoured to get him a lodging; but, seeing that the man was almost at death's door, he was not taken in. No better success was met with at the workhouse. Then the police were applied to: they could do nothing; and, but for the interest of a friend who was in charge of the Westminster Hospital, where he was admitted late at night, this man might have been left to die in the street.

We will not at present mention the workhouse gate (it is not in good repute), at which we saw a man clinging to the knocker, evidently in great distress and sickness. The circumstances were much the same as in the case above stated. He had slept in a damp bed, which had been the means of almost depriving him of the use of his limbs. He had made application at St. Bartholomew's Hospital, where he was supplied with a bottle of medicine, but he could not be admitted into the house. The man had the medicine in his pocket, but, as he said, what was the use of it when he had no place to rest in? He had made application to the officers of the workhouse, and been denied admission. Servants who have no relations in London, and who have been seized with illness, and have no legal claim on the metropolitan parishes, are often discharged from the hospitals in a weak condition. Some even afflicted with incurable complaints are sent away after the means of medicine have been tried, but without avail: if even able to undertake the duties of the situation they have left, it will be found, in nine cases out of ten, that it has been necessary to employ some one else. Without money, without friends, their slender store of clothes, &c., is soon exhausted; they are unable to pay for their lodging; and, half clad and penniless, they are obliged to take to the street. Such is the history of several of those who may be seen crouching as if to hide from their fellow-creatures, in dusky portions of Farringdon market and elsewhere.

Experience has shown us that the duties of a relieving officer to a poor and populous parish is one of great responsibility, and beset with difficulties. The attempts at imposition are many, but it will be admitted that those who are the most troublesome have been for years accustomed to idleness, and to make the workhouses a home when the weather or other circumstance does not make it agreeable to roam abroad. Most of them have been actually reared in workhouses, and in a great measure, owing to the want of better training and more enlightened management, they have failed to become industrious and useful members of society. We have it, however, on good authority, that more than ninety in the hundred of those who apply for relief are really in circumstances of distress, and deserving of assistance. It unfortunately happens that in the poor districts there is the greatest pressure for help, and the ratepayers are there but ill able to meet the enormous poor-rate which is necessary. Some parish officers are more humane in the relief of applicants than others. Some have casual wards provided for the homeless; others, even in wealthy neighbourhoods, have none: this causes a heavy pressure upon those who are willing to do their duty. This important matter evidently merits the consideration of the congress of delegates from each of the numerous parishes which form this vast population; and in case of this body not making arrangements, the Parliament should interfere.

We ought not in these days to have cases of death from starvation. If those in dire distress have no claim upon a particular parish, there should be some means of assistance obtainable until their claims can be set forth effectually in the right quarter. In order to effect this, we would, as has

been before proposed, have four or more places of refuge in London, presided over by persons of humanity and intelligence, to which persons found in the street in conditions such as have been alluded to, and who have failed to meet with attention from the authorities of the parishes in which they reside, might be directed by the police and others. Here should be provided shelter and food until the cases could be inquired into. Some might be recommended into hospitals; others put into the way of escaping from further evil by helping them to admission into reformatories: others might be cared for until friends at a distance could be communicated with. Servants, when it was found that their character would bear inquiry, might be helped to situations. Much good might be done, and such places of refuge would, to a great extent, prevent those idle persons to whom we have referred from making a trade of the imposition on many parishes. Impositions should be duly punished. Such a public institution as is here hinted at should be supported at the cost of the united parishes. Thus the jealousy and striving would be avoided, the number of deaths from starvation would be materially lessened, and numbers would, by these means, be restored to health, honesty, and usefulness. This is not a thing which ought exactly to be made a matter of money consideration; but, in our opinion, if all the expenses which are incurred by the present system were to be taken into consideration, an annual saving would be found to result.

#### THE STEPHENSON MONUMENT.

MR. LOUGH is making progress with the monument to George Stephenson, intended for Newcastle. Our readers may remember the group that was determined on: Stephenson, in ordinary costume, and wearing his plaid, on a central pedestal, with four figures on sockets at the angles below,—representing the navy, the miner, the smith, and the engineer. This step towards reality is an admirable one. The figures will tell their own story to the multitude, and require no gloss. Two of the figures are now nearly finished. One, the miner, with "the Geordie" in his hand, is in clay; the other, the engineer, is in plaster, ready for casting. Both have fine heads and considerable nobility. The lower limbs of the miner, however, seem to us scarcely long enough or large enough for the colossal body of the figure, and as it is still in clay, we may hope that the excellent sculptor will give this point further consideration.

Mr. Lough has bravely fought his way upwards, and many will be surprised, on visiting the studio, at the large amount of ideal sculpture which has been executed by him. They will see, too, a fine bust of Sir John Lawrence, the hero of India, and one of Robert Stephenson, made since death. Robert Stephenson had the power of attaching others to him to a remarkable extent. He had a heart as well as a head, and while his intellect and knowledge commanded respect and admiration, his fine social qualities made captive the affections. Mr. Lough is amongst his worshippers.

#### MEMS. FROM PARIS.

THE greatest activity reigns in the works of the Zoological Garden of Acclimation of the Bois de Boulogne, which is to be open to the public next spring. The gardens have been designed and laid out; the principal buildings indispensable to an establishment of this nature have been erected; and the interior arrangements of the dwellings for the numerous species of animals belonging to the society are to be commenced forthwith. Every day their collection receives augmentations.

A gold medal of the value of 400*fr.* has been offered by the above society in its annual meeting of the 10th ult., to be presented on the same day in 1862 to the American or African traveller who will have rendered the greatest service to the institution by his discoveries, especially as regards human food. This prize has been given to the society by Madame Guérineau in the name of her late brother, Pierre Delhaude, travelling naturalist of the Museum of Natural History in Paris, one of the principal explorers of Brazil, and also of South Africa, whose death took place on his return from the Cape, which he left in a complete state of prostration from fatigue and illness.

The Mazarin Gallery of the Imperial Library of Paris has been undergoing some improvements. Since a few days has in part the upper portion of the small staircase leading to the manuscript-room has been suppressed, and the remainder still serves for the department of maps and geographical collections at the entrance. The Mazarin

Gallery (communicating now directly with the manuscript study-room) is open every day to the public, who can admire the vast proportions, the noble architecture, the painted ceilings by Bonanelli, and form an idea of what this grand saloon must have been in all its former splendour, adorned with paintings, sculptures, &c. the property of Cardinal Mazarin. In the first hall, in a glass case, were several precious manuscripts remarkable for their binding in sculptured ivory and tortoise shell and silver, with figures in relief, and surrounded with stones formerly of great value. In the second room figured the important collections of Colbert, Mesmes, and the Freres Dapny, &c. The third chamber contained Chinese books. The origin of this collection was the sending of forty-nine Chinese books addressed to Louis XIV. in 1697 by the Chinese emperor, on the demand of the Jesuits. In the library of Cardinal Mazarin there were only four Chinese books.

EXETER BRANCH BANK COMPETITION.

THE Directors of the Devon and Cornwall Banking Company, having determined in December last to erect a new Bank House in the Cathedral close, Exeter, proposed to the following architects to send in designs in competition for the same:—Mr. E. C. Robins, London; Mr. Walter Dament, Plymouth; Mr. John Hayward, Exeter; Messrs. Hine & Godwin, Plymouth; Mr. Edward Appleton, Torquay; Mr. G. Melnionell, London; and Mr. W. H. Reid, Plymouth.

The plans were required by the 1st of February. There was no limitation as to cost. The premiums offered (quite inadequate to the occasion) were respectively, ten guineas and five guineas.

On receipt of the drawings, three designs were first selected from the nine submitted, viz.:—"M. I. B. A.," to cost 5,070l.; "Avisé le Fin," to cost 4,200l.; and "Use," to cost 4,000l.

The design to be followed in the execution of the work was next to be determined on. The voting-papers being opened, it was found that an equal number of votes were in favour of the first-mentioned two designs; but eventually it was decided that the design marked "Avisé le Fin," by Messrs. Kennedy and Rogers, should be carried out; that the first premium should be awarded to the design marked "M. I. B. A.," by Edward C. Robins, of London, and the second premium to that marked "Use," by Walter Dament, of Plymouth. We give these particulars as they have reached us, but do not understand the transaction. If Mr. Robins was entitled to the first premium, why is he not employed?

TEMPERATURE OF EUROPE.

THE following was the temperature (Fahrenheit) at the hour of 8 a.m., on the 18th inst., in the principal towns of Europe:—

1 Dunkirk, 46° 4'; Mèzières, 44° 1'; Strasburg, 40° 9'; Paris, 46° 4'; Havre, 45° 6'; Brest, 50° 4'; Amoges, 45° 1'; Montauban, 47° 8'; Bayonne, 41° 8'; Avignon, 45° 6'; Lyons, 43° 2'; Besancon, 41° 8'; Brussels, 47° 5'; St. Petersburg, 6° 8'; Copenhagen, 35° 2'; Lisbon, 55° 3'; Rome, 44° 6'; Stockholm, 33°; Madrid, 39°.

From this it appears that the temperature of Rome was inferior to that of the towns in France, except four, viz., Strasburg, Mèzières, Lyons, and Besancon.

On the 17th, we had at Turin 44° 6'; Haplands, 11° 48'.

On the 16th, St. Fernando, 46° 6'; Florence, 40° 9'; Moscow, 11° 7'; Kief, 14° 36'; Warsaw, 10° 0'; Helsingfort, 15° 8'.

CITY OF ELY WATERWORKS.

WE have received several replies to the statement of "Viator" in our last, all agreeing that the public works at Ely, whatever the shortcoming in certain respects, have conferred a great blessing on that city. One writer, "X. Y. Z.," with reference to obtaining water from a gathering pond, shows that the reservoir would have cost an immense sum. As to laying a main along the way to the waterworks at Cambridge, he contends "the distance from Ely to the Cambridge waterworks is eighteen miles, and pipes eighteen feet long, capable of supplying Ely with 330,000 gallons per day, would cost at the very least 1,000l., and we would have to pay the railway company and others something like 100l. per mile to lay the pipes on their land, which would be an additional 1,800l., and the pipes could be liable to pay parochial rates in Cambridge to the tune of 500l. a year, and the Cambridge waterworks company charge 1s. 6d. per

1,000 gallons for their water, which would amount to 9,033l. a year. . . . Ely can be supplied with filtered water from the river at about 13d. per 752l. a year."

A second writer says, as to the assertion that the old engine and pumps are badly contrived, "If so, the new engine and pumps must be worse, for it costs 65l. per cent. more money to pump the same quantity of water with the new engine and pumps than with the old engine and pumps. The duties of the two engines stand as follows:—

To pump one million gallons 140 feet high the old engine consumes—	
Four tons of coal, at 16s. per ton	£3 4 0
Oil, tallow, and packing	0 12 0
Wages	0 9 0

Total cost of pumping one million gallons £1 5 0 which gives 1d. per 1,000 gallons pumped 140 feet high (not a very high price).

The new engine requires—	
Five and a half tons of coal at 16s.	£8 8 0
Oil, tallow, and packing	1 10 0
Wages	1 2 0

Total cost of pumping one million of gallons 140 feet high £7 0 0 which is 65 per cent. more money than the old engine requires.

The old engine has been at constant work for ten years (reckoning ten hours' work equal to one day) without anything materially going wrong with it. The new engine has been at work only a few weeks and several of the cogs have broken, and all the cogs are worn through one-third already.—DAX.

THE ARCHITECT OF CLOTHWORKERS' HALL.

AT the banquet given on Tuesday evening last to inaugurate the new Hall of the Clothworkers' in Mincing-lane (illustrations of which have appeared in our pages), the Prince Consort was present, and closed the proceedings by proposing as a toast, "The architect of the new building." Sensibly drawing the difference between the two functions of an architect, that of man of business and artist, his Royal Highness said, it was evident, at any rate, in the latter capacity, Mr. Angell had happily discharged his duty. Mr. Angell briefly thanked, and was loudly and deservedly cheered.

THE SERPENTINE.

WE have every reason to believe that by the time of our issue the Parliamentary Committee will have put an end to the unwise filtering scheme,—though not soon enough to save much money, it is to be feared. We had drawn out some facts touching the sewers and springs in connection with the Serpentine, but it is unnecessary now to print them. A recommendation to be made to the Metropolitan Board of Works on this, Friday:—

"That about 1,000 feet of brick sewer, 9 feet in diameter, and 4,700 feet, 8 feet 6 inches in diameter, be constructed across Kensington Gardens and Hyde Park, at an estimated cost of 23,000l., the Commissioners of Her Majesty's Works, &c., to contribute 2,000l., provided the work be carried out in the manner proposed, and the Legislature sanction the estimate to be submitted to them,—has in view the future purity of the water.

CHURCH BUILDING NEWS.

Lincoln.—The west front of the cathedral, according to the local *Chronicle*, is about to be thoroughly restored, the Dean and Chapter having given directions to that effect. The scaffolding has been already erected, and the work will be immediately proceeded with.

Fordham (Cambridgeshire).—The restoration of Fordham Church has been commenced: the lead from the roofs has been raised, and as much of the former timber and masonry will be preserved and shown as is practicable. Mr. G. E. Pritchett, of London, is the architect; and Mr. Martin, the builder. A bequest of 600l. started the restoration.

Southampton.—The new Unitarian "Church of the Saviour," erected in Bellevue-park, has been opened for Divine worship. The edifice occupies a conspicuous position at the junction of the Above-bar, Bellevue, and Winchester roads. The interior of the church is 70 feet long by 32 feet wide: it is open-timber roofed, and has vestries and offices on the south side. There is an arrangement in the front of the pulpit for the deaf: in addition to the appliances for the conduction of sound, the book-board itself is constructed so as

to collect and convey the sound into the sound chamber; and the pulpit canopy or sounding-board is contrived with a special view to intensify the power of the preacher's voice. The seats are arranged for the present to accommodate 300 worshippers; but the whole church can at any time be thrown open and seat 600. The warming is on a double system, and has been carried out by Messrs. Lunkester. All the other contracts have been taken by Mr. G. W. Chinnock. The style adopted is Early English. The architect is Mr. P. Brannon. The carvings have mostly been executed in stone by Mr. R. C. Baker, assisted by Messrs. Grashy and Abbey; and in wood by the Messrs. Elmes, and are all designed with a special significance in relation to the great truths of the Christian religion. The symbolic expression is chiefly derived from the natural qualities of plants and animals. On the east the references are to the Redeemer as the Sun of Righteousness arising with healing on His wings, and the bright and morning star. On the north the trials and temptations of life are symbolised with the effects of the experience of the cross in the heart of the believer. On the west are references to death and the promises of a future life; and on the south the triumphs of the Church and its extension over the world. In the tympanum over the west door is an alto-relief of the sermon on the mount; and in the interior are various symbolic emblems.

Gloucester.—The Roman Catholic Church in Northgate-street, having been so far completed as to permit of the performance of Divine service, has been publicly opened. The edifice was designed by Mr. Gilbert Blount, of London, architect, and is in the Gothic style of the second period of the pointed arch. The parts at present completed are the chancel, lady chapel, sacristy, and about two-thirds of the nave and aisles; and there are still to be added, before the design will be complete, two bays of the nave and aisles, and tower with spire, and a porch. The total internal length will then be 101 feet; width, 39 feet 6 inches; and height, 41 feet. The frontal of the altar is divided into three panels, the centre containing a representation of the Crucifixion; and on either side are representations of the sacrifices of Aaron and Abraham's. The artist is Mr. Farmer, of London.

Bristol.—The intended alterations in the cathedral will be commenced on the 16th of April. —The whole of the light tracery work which enriched the summit of St. Stephen's tower has been removed, in furtherance of the restoration: its removal, says the *Mirror*, has greatly changed the appearance of the structure. The restoration of the south side of St. Maryleport Church is progressing, and it is to be hoped that some means will be devised for lowering the churchyard wall, so as to throw the edifice open to view.

Sunderland.—The foundation stone of a new Roman Catholic chapel was laid here on St. Patrick's Day. The site is in Church-street, and the edifice will be dedicated to "our Lady and St. Patrick." It is to be erected from designs furnished by Mr. James Gilles Brown, of this town, architect. The building will run north and south with Church-street, covering an area of upwards of 650 square yards. The elevation next the street will be the only ornamental one, built of stone, snick-pointed, and with chiselled dressings. The style adopted is Early English. An octagonal sacristy, lighted from the roof, enclosed in a pointed arch, is designed at the south end, together with vestries and other adjuncts. At the north end, enclosed in another arch, spanning the whole width, will be placed an end-gallery, to seat 600. The benches on the ground floor will be arranged to seat 600. The roof will be open, and stained of an oak colour.

PROVINCIAL NEWS.

Newark (Notts).—The execution of the interior fittings and finishings, comprised in the second contract, for Kellam Hall, the new residence erecting for Mr. Manners Sutton, from the designs of Mr. G. G. Scott, has been entrusted to Messrs. Ruddle, of Peterborough.

Sutton.—The foundation-stone of new National schools has been laid in this village. The building contains two large school-rooms, class-room, master's residence, and offices, &c. It is of Gothic design. Mr. Robert Hutchinson, of Huntingdon, is the architect, under whose superintendance the works are being carried out by Mr. G. Bunting, of Llanystanton.

Liverpool.—The project for building a new Exchange News-room goes on with promising activity, according to the *Courier*, and the support it has met with is evidenced by the fact that upwards of 200,000l. have already been subscribed to

the capital of the proprietary. The company is incorporated by Act of Parliament, and will have a total capital of 450,000. The present Exchange-buildings and the Sessions-house will be purchased, and materially improved and beautified; while an Exchange News-room will be erected on the site of the Sessions-house and the intervening street, which will be more than double the area of the present news-room, and will contain four times the cubic capacity.

#### LIVERPOOL ARCHITECTURAL SOCIETY. THE NEW PUBLIC-OFFICES.

At the fortnightly meeting, on 21st inst., Mr. Barry presiding, Mr. L. Hornblower exhibited and proceeded to explain the plans prepared by him for the Corporation Public-offices. He said the building was in the French-Italian style, with a granitic rusticated basement; in fact, he had tried as much as possible to retain the appearance of the old Town-hall in the centre of the building. It had ground-floor windows, carved and moulded dressings, and keystones, surmounted by Corinthian coupled columns detached, carrying a Corinthian entablature with balustrade and dormer lights. In the centre was carried up another series of columns carrying an entablature and square dome, with ornamental and enriched crest. The front was enriched with panels charged with carving, showing the shields of the various mayors of the town of Liverpool. The plan of the building was a parallelogram of 225 feet by 175. In the centre of the building there was the council-chamber, 80 feet by 40, and 40 feet high, with an entrance from it to the mayor's room, and five committee-rooms, 38 feet by 21 feet 6 inches, and 32 feet high. Above had a space of 800 feet, and had arranged the rooms 22 feet high and 22 feet wide, as a picture-gallery (in the centre of the town), with lights suitable for pictures. The cost of the entire building was estimated at 80,000. Mr. Hayes, after a few general observations, asked why the borough engineer should be overloaded with duties of this sort, when there were men in the profession, living by that profession, quite able to stand on the platform of the borough engineer upon an architectural matter? He was of opinion that the designs for the public offices ought to have been put out to general competition, or at least a competition limited to the profession in Liverpool. He moved, "That a committee be appointed by the society to memorialize the Town Council at once on the point that, if public offices are to be built, the designs should be thrown open to general or private competition." This, with the understanding that the council would prepare a resolution to be laid before them at the next meeting, was carried unanimously. The paper for the evening was on "Measurement and Quantities."

#### MODERN CONSTRUCTIONS.

It surely is not necessary, where strength is required, to have ugliness as a co-partner.

What are we to say of the iron railway bridges that positively disgrace and disfigure the outskirts of London in every direction? Surely no scientific man will tell me that in order to make a bridge sufficiently strong to carry a railway train, or two together, if necessary, over a span of some 40 feet, it is necessary to have a heavy, monumental, dead weight of dismal-looking iron, with apparently a sufficient quantity of metal to make a gun-boat or floating battery impregnable. I say "apparently," to give the benefit of the doubt to all who may have had the misfortune to be in any way concerned or responsible for the erection of such unsightly structures, because although I feel quite confident that they contain far more metal than was necessary, still it is also a great fault to have the appearance of being too heavy, even if it can be proved that a building is sufficiently light.

What should we say to a tower or steeple that looked top-heavy, although there might not be the least fear of its falling down?

We often rail at those who went before us for the enormous excess of material used in building, and we boast that, enlightened by the aid of science, we can calculate pretty nearly the quantity of a given material which it is necessary to employ to do any particular duty. This is true; but how have we availed ourselves of it in the cases I am alluding to? Be that as it may, I cannot help saying that anything more frightfully ugly than these bridges I have never seen.

In a recent trip which I took to London, I was greatly horrified by many *disimprovements* which our metropolis has undergone during the last ten years, so I resolved to write to you on the

subject, taking my text from the changes that had taken place in the town, just as Shakespeare did, in the country: find "tongues in trees; books in the running brooks; sermons in stones; and good in everything."

I had lately seen the Sitter Bridge, which I gave you a description of some years ago. It is a high level bridge near St. Gall, in Switzerland. It is a most beautiful thing—light, airy, and fantastic, but, nevertheless, strong and substantial. It beautifies the beautiful scenery round about it. There are various other bridges of the same kind in Friburg, in Savoy, in Italy, and in France. We have some fine bridges ourselves. The Menai-bridge, built by Telford, is light and elegant: Southwark-bridge deserves to be praised for the taste of its design; and Canova said that Waterloo-bridge was a most perfect work. Why, then, should we be hemmed in by such wretched rumparts of cast-iron, designed in worse taste than the most monstrous Egyptian mummy-houses?

Again, our constructions in iron and glass are not good.

I am not going to make a sweeping objection to such buildings: on the contrary, I think them a very suitable style of building for certain purposes; and you may remember I once proposed to have our flagways covered in with glass roofs supported upon iron columns, so as to form covered ways on each side of the streets, thus to shelter the passengers from rain and snow in winter, and, by covering the glass with brown holland in the summer, to form continuous porticos as a protection against the sun. What I object to in what has been done is the complete absence of all taste.

I see now that there is to be a Great Northern Palace, or People's Palace, and I hope to goodness that this time we may have something pleasant to look at. All materials may be lawfully used. The world is not to be restricted for ever to stone and mortar, nor to the "original orders" of the ancients. Glass and iron may be legitimately used occasionally, and can be made as ornamental as they are useful: *but let them be put together with taste or not at all.*

I see that the view of St. Paul's Cathedral from Cannon-street is being shut out by a horrible pile of buildings erected to economize the value of a triangle of ground: could no body, or guild, or corporation, in wealthy London, be found to indemnify the proprietors, and save the view *pro bono publico*?

Really, when we look at Paris, and many other Continental towns, where so much more taste is exhibited, we are tempted to ask, what is the value of our boasted wealth if we do not know how to employ it?

The miser that locks up his gold, and lengthens out his wretched life by a bare subsistence, neglecting to provide proper nourishment and necessary raiment out of his hoarded and useless treasure, is not more to be pitied than those who for want of taste expend large sums of money for themselves and others, in perpetuating their own incapacity in the shape of huge monuments, devoid of æsthetic beauty, elegant proportions, or correct style. To such an architect one cannot help saying again, and again,—

"Lie heavy on him Earth, for he  
Laid many a heavy load on thee."

It is good there is a journal like yours by way of a "safety-valve," or I do not know what I should do. WM. H. VILLIERS SANKEY.

#### THE CONDITION OF ARCHITECTURAL CARVING.

A CORRESPONDENT, who writes from the cathedral works at Hereford, has addressed some observations to us on the circumstances under which much of our carving is done (a subject before now referred to by us) and the results that follow.

"The intolerant usages of barefaced competition," he writes, "are carried to fearful excess, and are the very rock on which art in general is foundering. Architects oftentimes forget that the solidity and beauty of their buildings are the very basis of their reputation: they make a design for this or that: it is contracted for generally; and the contractor, a man of business, not often knowing or little caring how the decorations should be done, refers the carving to him that will do it cheapest. It is proceeded with, the price scarce permitting time for thought;—the architect and the carver, perhaps, never seeing each other during the progress of the work. Thus the original design, if any, is entirely lost sight of. The carver is poorly compensated, the architect when he has seen the work is chagrined, and the public are disappointed of good work.

Should Englishmen, in their pride of rivalry with other nations, allow the boasted arts of their forefathers to dwindle into insignificance,—should the glorious examples of the Greeks, the Romans, the Mediaevalists, be allowed to go for nothing, while the pockets of contractors are being filled with the profits of the public loss, and the deserving artist becomes the tool of ignorance?

We earnestly appeal to architects to assist us in rescuing genius from the fetters of ignorance and folly, and to have their carving better done and by competent men.

Men of little skill suit the builder's ideas best, and find employment, while clever men are half their time idle: the consequence of the system is, the public become so accustomed to indifferent work, that they do not like to pay more for better. We have those whose souls are wrapt in the beautiful studying old examples, and searching among hedges and gardens for the truth of nature. But until the hand of liberality is stretched forth to welcome them, and until architects hold more approximate conversations with carvers for the interpretation of ideas, and the baneful custom of so much per cubic is entirely abandoned, we shall have no improvement in our works. C. J. HERLEY."

#### THE STONE OF THE NEW HOUSES OF PARLIAMENT.

SIR,—I cannot permit the remarks of Mr. C. H. Smith, in your journal of the 17th instant, with reference to the decay of the stone used in the erection of the New Houses of Parliament, to pass unnoticed, lest it might be inferred that his charge of neglect, in the selection of the stone in the quarries, was justified by my silence on the subject.

Mr. Smith is pleased to justify his selection of the Auston stone, as the stone of all others best calculated to withstand the effects of the London atmosphere, because it has resisted for some centuries the atmosphere of Yorkshire, its natural element, in several of the old churches in the neighbourhood of the quarries; and, consequently, it would have stood equally well in London, had greater care and supervision been used in its selection.

If that be so, and if this especial supervision be considered necessary, how comes it that Mr. C. H. Smith and the commissioners did not recommend, at the onset, that a practical chemist should be resident at the quarries to determine which beds of the stone would resist the London atmosphere, and which would not? For I deny that any practical mason, even Mr. Smith himself, had been the party selected for the purpose, could have undertaken to decide this point.

For myself I have no hesitation in saying, that the greatest care and anxiety were evinced by all concerned in the quarry, that no stone of an inferior quality should be sent to London. My own character and reputation, and that of my late partner, as builders, were at stake; and it is not likely, after an experience of some thirty years, that we should be disposed to jeopardize them in so important a building as the New Houses of Parliament.

It is a satisfaction, however, to know that during a period of upwards of fourteen years, during which I had the honour to be concerned in these works, I am not aware that Sir Charles Barry, or his numerous assistants, had occasion to reject any of the stone as inferior or unfit for the work. To all outward appearance the stone which has failed was, before being fixed in the building, as sound and as suitable as that which remains sound; and up to the period when I ceased to be concerned for the Government, about seven years since, the only stone which had showed symptoms of decay was that which had been used in the under surfaces of string courses and cornices, while that which had been thoroughly exposed to wind and weather, particularly the plain surface, was perfectly sound.

I may state also, that the stone supplied for the Museum of Economic Geology, and the Amicable Assurance Office, to which Mr. Smith refers with some exultation, came from the same quarry as the Houses of Parliament stone, and without any greater care, or particularity of selection; and the stone supplied to the buildings in Lincoln's-inn, which it seems has suffered most, was expressly selected by a practical mason, sent from London by the authorities who had charge of those buildings.

In conclusion permit me to say, that I think it would have been more becoming in Mr. C. H. Smith, had he adopted the reasoning of Professor Ansted, who says, truly,—"So long as these stones

were crystallized, they were the best stones that could be taken, and the specimens examined in the churches in the neighbourhood of the quarry selected went to prove this; but, unfortunately, the quarry from which the churches had been taken was not found to be in such a state as to supply so large a quantity as was required for the Houses of Parliament, and they were obliged to go to another quarry in the same neighbourhood, which was not of the same quality of stone as that which had been experimented upon by the commissioners, and no doubt this was the correct history of the matter,"—instead of endeavouring to shift the responsibility from his own shoulders to those of the quarrymen and contractors, who know well, and as everybody else knows at all conversant with building stone, how extremely difficult it is, if not impossible, in this country, to discover any stone which will, under all circumstances, resist the effects of time and atmospheric influence.

Palace Gardens.

T. GRISSELL.

#### PATENTS CONNECTED WITH BUILDING.\*

**LOCKS AND KEYS.**—*R. A. Brooman*, Fleet-street, London. A communication. Dated August 17, 1859.—This invention cannot be described without reference to the drawings.

**BRICKS, TILES, &c.**—*H. Wilson*, Glasgow. Dated August 18, 1859.—This invention relates to the manufacture or production of bricks, tiles, and other articles of earthenware, according to a novel system or principle as regards the primary preparation and subsequent treatment of the clay used in the manufacture, and to the arrangement and construction of the preparing and moulding machinery used in the actual preparing and moulding or shaping processes. According to this system the clay-pit, or field, whence the raw material is to be obtained, is covered over with a temporary roof or house, so as to defend it from the weather. The top or useless crust of the clay stratum being removed, the clay itself is dug up in blocks, and turned over to allow it to dry, the mass being merely roughly disintegrated. In this condition the clay is allowed to remain until it is wanted, or is ready for use, being kept free from the action of rain and frost. And to improve this preparatory treatment hot-air flues or pipes are passed through the clay-house, such flues or pipes being in communication with the waste beat discharge-flues of neighbouring brick-kilns or furnaces, or other sources of heat. By adopting this system of primary preparation, bricks are made in the way described in the patent both in winter and summer.

#### Books Received.

*Memoirs of Early Italian Painters, and of the Progress of Painting in Italy.* By Mrs. JAMESON. A new edition. London: John Murray. 1859.

The lamented death of Mrs. Jameson, to whom Art and Social Science owe much, chides us for delaying notice of this much enlarged edition of her "Memoirs of Italian Painters," first issued about fourteen years ago. It commences with Cimabue, who died about 1302, and runs on to Paul Veronese, who died in 1588, and Bassano, who lived till 1592. Mrs. Jameson in her introduction properly says, that the first question on looking at a picture should be—What does it mean? What is it about? We should first endeavour to understand the work, and have delight in it for its own sake. When this is done we may inquire the name of the painter, the school of art to which he belonged, and so derive the most various delight from the associations connected with this extended knowledge. To enlarge this sphere of rational pleasure these memoirs were projected, and the task has been carried out with elegance and taste. The story deals with great names, a Leonardo, a Michelangelo, a Titian, a Corregio, and greater than all, a Raffaele, who, as "Pamela"—Richardson says, "was one of the politest, best-natured gentlemen that ever was, and beloved and assisted by the greatest wits and the greatest men then in Rome." Of Leonardo, Mrs. Jameson writes,—

"Leonardo da Vinci seems to present in his own person a résumé of all the characteristics of the age in which he lived. He was the miracle of that age of miracles. Ardent and versatile as youth, patient and persevering as age; most profound and original thinker; the greatest mathematician and most ingenious mechanic of his time; architect, chemist, engineer, musician, poet, painter. We are not only astounded by the variety of his natural gifts and acquired knowledge, but by the practical direction of his amazing powers. The extracts which have been pub-

lished from MSS. now existing, in his own handwriting, show him to have anticipated, by the force of his own intellect, some of the greatest discoveries made since his time."

When Raffaele died at the age of thirty-seven, he left behind him 287 pictures, 576 drawings, and a fame that has filled the universe. Of this great and harmonious genius,—

"His heavenly face, the mirror of his mind;  
His mind, a temple for all lovely things  
To flock to, and inhabit."

Mrs. Jameson is never tired of talking; nor can she find any language too strong to express her admiration.

The book is intended for young travellers, young students in art, and young people generally, and will be found delightful by all. It contains numerous illustrations, but some of them are not worthy of the work. Looking at the first impression, from a metal plate, the Pax of Maso Finiguerra, 1452, of which a copy is given in the Memoirs, it may be asked: What real advance have we made in the art of engraving?

#### VARIORUM.

"STEAM Boiler Explosions," by Zerah Colburn, of New York (Weale, 59, High Holborn), is an extension into the form of a thickish pamphlet of a series of leading articles in the *Engineer* journal. "All our knowledge of boiler explosions goes to show," remarks Mr. Colburn at the close of his pamphlet, "that however possible it may be to accumulate an excessive pressure within the boiler, the actual explosion results, in the majority of cases, from some defect, either original or produced, and either visible or concealed, in the materials, workmanship, or construction of the boiler;" and "public safety," as he observes, "requires the frequent and systematic examination of all boilers, so that, as under the system of inspection which is in operation with such excellent results at Manchester and Huddersfield, defects may be discovered and remedied, in most cases before actual danger has been incurred."

On the subject of Metropolitan Tolls, a "Memorial presented to the Right Hon. Sir George Cornewall Lewis," the Home Secretary, by 107 public companies, merchants, tradesmen, and other metropolitan residents, has been printed for the Toll Reform Association, 19, Strand. The Home Secretary, we are glad to observe, has promised to bring in a bill to abate the nuisance of toll-gates and side bars, by which the metropolis is hemmed in, and its inhabitants made to "stand and deliver," on all sides. It is so long since the Government promised to do something in this matter, however, that we should like to see the "Act" which is to put an end to the evil before we believe in its advent. The threatened visit from "Rebecca" may be requisite to jog them on to act in earnest in the matter.—

"Beeton's Book of Household Management, edited by Mrs. Isabella Beeton" (Beeton, Bonverie-street), appears to be an excellent compendium for the instruction and guidance of the young housewife: although a considerable portion, doubtless, is compilation, the editor must be possessed of good practical ability. The work is nicely got up, with many good little cuts, to illustrate the various subjects treated of. It will comprise from fifteen to eighteen monthly parts, at 3d. each.—Beeton's "Dictionary of Universal Information" (Beeton, Bonverie-street) has reached about the close of letter F. So far as regards names of persons and places chiefly, this work contains a good deal of condensed and useful information; but those who expect "universal information" from it, as its progress more clearly reveals, will be sadly disappointed: its leading title is a decidedly misleading one, which the underlying acknowledgment that geography, biography, mythology, and so on, comprise what it is made up of, certainly does not justify.—The "Boy's Own Magazine" (Beeton, Bonverie-street), Nos. 1 and 2 of vol. vi., is an attractive-looking little twopenny magazine of instruction and entertainment, which seems to be very well adapted to please the boys.

#### Miscellaneous.

**CAMBRIDGE ARCHITECTURAL SOCIETY.**—On Thursday evening, March 22nd, the rev. the president in the chair, Rev. H. R. Lunt, Trinity College, made some remarks concerning the Congress which it is proposed to hold in Cambridge at the close of the Easter term. Mr. J. W. Clark then read a paper upon "The Roman Catacombs." Illustrations were shown of the curious chapels found in them; but the description of the decoration and colouring of these was left for a future lecture.

**ASPHALTE ROOFING.**—At the last quarter-sessions for Gloucestershire, the subject of the asphalt roof of Cirencester armory caused some discussion. It appears that the roof was constructed of asphalt or "mineral lava," at a cost of about 300*l.*; but, having been a constant source of trouble and expense, the firm by whom it was laid was consulted as to its renewal, and their estimate of the expense was about 200*l.*, for which sum they guaranteed to keep it in repair for four years. The chairman said asphalt was used against his wish, as there was great difficulty in making it act satisfactorily, unless the roof overhung the side walls of the building, owing to the asphalt shrinking at its junction with the walls. The subject was referred to the police committee.

**ARBITRATION.**—**CUTHBERT v. ATKINSON.**—This action, the *Northern Counties Advertiser* says, which has long been pending, and created a considerable degree of interest, has been settled by arbitration. The dispute arose as to the right of the defendant building on the party-wall and on the ground behind his house, situated in the village of Tynemouth, and adjoining that of the plaintiff. The arbitrators were Mr. George Rippon, J.P., of North Shields, on behalf of the plaintiff, and Mr. J. E. Watson, architect, Newcastle, on behalf of the defendant, the third arbitrator chosen by them being Mr. Green, architect, Newcastle. After examining a number of witnesses on both sides the award has been made in favour of the defendant, the plaintiff to pay all costs, both of the arbitration and the action.

**WORKS AND PUBLIC BUILDINGS.**—The accounts of the receipt and expenditure of the Commissioners of Works and Public Buildings for the year ended March 31, 1859, have been published. The receipts for the year were 1,168,964*l.* 17*s.* 6*d.* and the expenditure 639,662*l.* 19*s.* 6*d.*, leaving a net balance of 529,301*l.* 17*s.* 6*d.* Of the money expended, 47,298*l.* 19*s.* 11*d.* was paid for the maintenance and repairs of royal palaces; 100,131*l.* 9*s.* 5*d.* for public buildings, which includes such items as 9,210*l.* 1*s.* 6*d.* for gas, oil, soap, candles, and other house articles, and 9,436*l.* 16*s.* 2*d.* for coals and firewood. The royal parks and gardens absorbed 90,031*l.* 11*s.* 10*d.*, and the new Houses of Parliament, 87,210*l.* 10*s.* 9*d.*, of which latter sum 5,315*l.* 3*s.* 11*d.* was for warming, ventilating, and lighting; 6,673*l.* 13*s.* 11*d.* for gas, oil, lamps, and fuel; 8,758*l.* 11*s.* 4*d.* for supply and repair of furniture, fittings, &c.; 2,315*l.* 12*s.* 10*d.* for commission to Sir C. Barry, and 2,257*l.* 6*s.* 8*d.* for payment on account of the great bell and four quarter-bells for the clock-tower. The new building works, fittings, &c., of the British Museum cost 32,924*l.* 8*s.* 4*d.*, of which sum 9,446*l.* 0*s.* 11*d.* represents the amount required for the new reading-room and library. Last, but not least, come the expenses of the Office of Works and Public Buildings itself, including salaries, &c., amounting to 26,666*l.* 12*s.* 4*d.* The above expenses, with other smaller sums too numerous to mention, make up a total of 639,662*l.* 19*s.* 6*d.*

**A BATH AMATEUR.**—Mr. Empson, of Bath, writing of the death of his townsman, Dr. Richard Taylor, in his ninetieth year, says:—His father, John Taylor, esq., was one of the best amateur artists in the kingdom. His house, in the Circus, was very popular, from the number of works of art, which the proprietor's taste had rendered especially attractive by their elegant arrangement. The house was freely shown to strangers visiting Bath, on condition, however, that no money should be given to the servants: if this rule were ever violated, the privilege hitherto granted was to cease. A member of the royal family, during the time when Queen Charlotte lodged in Sydney-place, gave a guinea to the butler. This the master heard of, and put his orders into force so stringently, that from that time none but personal friends saw the gallery. Mr. Taylor was a very intimate friend of Gainsborough, and once, for a considerable wager, painted a picture in competition with that great artist. The judges were selected from amateurs and professional artists; the subject, a composition with landscape and architecture. The committee decided that the foreground of Mr. Taylor's picture was the better, and that the background of Gainsborough's painting claimed preference. So the result was a drawn wager. We know not what has become of Gainsborough's picture; that of his rival is bequeathed, we understand, by Dr. Richard Taylor, to her Majesty. Some of Mr. Taylor's subjects have been admirably engraved by Lornipine, from pictures now at Windsor Castle, presented to King George III., by Mr. Taylor, on whom his Majesty wished to confer the honour of knighthood.

\* Selected from the *Engineer's* lists.

**OPERATIVE BUILDERS.**—The operative builders of the Wigan district have addressed their masters, requesting an advance of wages of 6d. per day, which they allege is necessary to place them on an equal footing with the workmen of other towns. They ask that it may be granted them from the 2nd of April next.

**FALL OF A RAILWAY ARCH.**—On Saturday, about one o'clock, one of the newly-formed arches for the Exeter and Yeovil line of railway, in the York-road, Lanneth, fell in with a tremendous crash. The laborers, about 200 in number, were at dinner at the time, and this fortunately their lives were saved. The recent damp weather was the supposed cause of the accident.

**ARCHITECTURAL DISCOVERIES AT WARRINGTON PARISH CHURCH.**—The work of restoration has gone on rapidly. A few days since, on sinking the floor of the nave for the introduction of the apparatus for heating the church, four very interesting stone capitals of pillars were discovered at the depth of 2 feet from the surface, and along with them a grotesque stone corbel-head. These remains are said to be of the date of the middle of the twelfth century.

**CHURCH-NEWS FROM INDIA.**—At Hosangabad, the small civil and military station at the western frontier of the Sogor and Nerubudda territories, a church is now to be built, by private subscription. A considerable sum has already been collected for the purpose, and a design, not after the Indian order of architecture, has been furnished by Mr. Whittaker, one of the contractors for the new railway. For the Memorial Church, which is to be built at Cawnpore, upwards of Rs. 30,000 have been collected.

**ST. MARTIN'S SCHOOL OF ART, CASTLE STREET, LONG-ACRE.**—On Monday evening an exhibition of the drawings of the students of the school was opened. The school inspector has awarded twenty-four local medals, and nine drawings have been selected for the national competition. The following are the names of the competitors:—Miss Von Hurmer, Mr. Trego (two drawings), Mr. Drew, Mr. Romel, Mr. Glenny, Mr. Willison, Mr. Parker, and Mr. Dixon.

**ROYAL INSTITUTE OF BRITISH ARCHITECTS.**—Mr. C. C. Nelson having expressed his intention of retiring from the office of honorary secretary in May next, it has occurred to various members that some testimonial should be presented to him, to mark the obligations of the members for the very efficient manner in which he has discharged his responsible duties for some years, and the many advantages which have resulted from his services. A meeting is to be held on Tuesday evening next, the 3rd of April, at 8 o'clock, at the rooms of the Institute, to consider the proposition, when Mr. Sydney Smirke, R.A., will take the chair.

**THE CONSERVATIVE LAND SOCIETY.**—The thirtieth quarterly general meeting of this society was held at the offices, in Norfolk-street, Strand, on Tuesday, the 27th inst., Viscount Ranleigh in the chair. The report of the executive committee, read by the noble chairman, showed a large increase in the business returns; the receipts for the quarter being 17,834 l. 9s. 9d., making an increase for the half-year of 1860 over 1859 of upwards of 13,000 l. The total receipts amounted to 112,870 l. 1s. 1d., and the sale of land to 237,173 l. 18s. 11d. The allotment of the Roman-road estate, at Old Ford, had resulted in the sale of all the higher-priced plots.

**MONUMENTAL: THE BUNYAN MONUMENT.**—A meeting has been held at the Freemasons' Tavern, Great Queen-street, Lincoln's-inn-fields, under the presidency of the Earl of Shaftesbury, to consider as to raising a metropolitan monument to John Bunyan. The meeting was attended by many gentlemen of influence in the Established Church and Dissenting congregations, and a resolution was agreed to unanimously, to the effect that a statue to the memory of Bunyan shall be erected by public subscription in one of the leading and most public thoroughfares in the metropolis.

**MASTERS AND OPERATIVES.**—The select committee appointed by the House of Commons to inquire into the best means of accommodating differences between masters and workmen met, on the 21st March, for the first time; Mr. Mackinnon in the chair. The other members of the committee are Lord Robert Montagu, Sir J. Ferguson, Sir J. Penton, Sir S. M. Peto, Mr. Waller, Mr. W. Beaufort, Mr. Buxton, Mr. Colquhoun, Mr. Hunt, Mr. Ingham, Mr. P. Erskine, Mr. Slaney, Mr. Trevelyan, and Mr. Arden. Mr. Humphreys, of Kentish Town, financial secretary to the National Association of United Trades, was the first and only witness then examined, and gave his evidence in favour of courts of arbitration.

**SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.**—The second *conversazione* of the season of this society was held last week at the Portland Gallery. Mr. J. Herard opened the evening's proceedings with a paper on "The Ideal in Art," after which a performance of music took place, conducted by Dr. James Peck. The vocal department included Madame Enderssohn, M. Depret, and the London Quartet Glee Union.

**DURHAM CATHEDRAL.**—A discovery has been made during the restoration of the great central tower of this edifice, now in progress. The corners of the tower finish at the top with solid masses of stone, which are believed to be the lower portions of large pinnacles that were never built; and, on removing the covering of cement from the inner surfaces of these masses, certain incisions have been found, which have led to the supposition that the tower was originally intended to be terminated by a lantern.

TENDERS

For alterations to Wraitham Park, and New Lodge, for Viscount Eddell; Mr. H. Clutton, architect:—  
Mansfield ..... £4,535 0 0  
Myers ..... 4,825 0 0

**NOTICE.**—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Coleridge-garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."  
Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

[ADVERTISEMENT.]

THE CHARGE AGAINST MR. HEATH.

"Union Dock, Limehouse, March 21, 1860.  
Sir,—We beg to assure you that it was entirely without our sanction or knowledge that you were taken into custody upon the charge of receiving timber which had been stolen from us, knowing it to have been stolen; and we quite concur in the remark made by Mr. Selge, the police magistrate, in dismissing the case, that the transaction leaves no imputation whatever on your character.

We sincerely regret that you should have been subjected to a charge of the kind, and we are ready to testify our exoneration of your character by the permission to publish this letter.

Understanding from our solicitors that the costs incurred in procuring your discharge amount to 25*l.*, we herein enclose a cheque for that amount.—We are, sir, your obedient servants,

HENRY FLETCHER, SON, & FEARNALE,  
To Mr. George William Heath, of Bishopsgate-street, London, Builder."

ADVERTISEMENTS.

**MR. WILLIAM ELLISON,**  
CONSULTING SURVEYOR, late of STAINBY-ROAD,  
Is taken Office at  
13, FENCHURCH-BUILDINGS, FENCHURCH-STREET, E.C.  
Where he continues to receive applications  
ON BEHALF OF CONTRACT, DISPUTED ACCOUNTS, &c.

**TO ARCHITECTS, CIVIL AND MECHANICAL ENGINEERS, &c.**—Mr. C. B. RICHARDS begs to intimate that he has removed his OFFICES from Trafalgar-square to IMPROVED BUILDINGS, FENCHURCH-STREET, E.C. The very many applications made within the past few years, and the general satisfaction expressed in the selection for Government, Public and Private Office, induce him to solicit his continuing to render to the profession such grateful services as he can.

**TO ARCHITECTS, CIVIL AND MECHANICAL ENGINEERS, &c.**—Mr. C. B. RICHARDS begs to give notice, that he has REMOVED his OFFICES from Trafalgar-square to IMPROVED BUILDINGS, FENCHURCH-STREET, E.C. The very many applications made within the past few years, and the general satisfaction expressed in the selection for Government, Public and Private Office, induce him to solicit his continuing to render to the profession such grateful services as he can.

**PLANS, WORKING DRAWINGS, IMPROVED BUILDINGS, &c.**—Mr. W. G. MARSHALL, Architect and Surveyor, 5, 1, 3, 5, 7, 9, 11, 13, 15, 17, 19, 21, 23, 25, 27, 29, 31, 33, 35, 37, 39, 41, 43, 45, 47, 49, 51, 53, 55, 57, 59, 61, 63, 65, 67, 69, 71, 73, 75, 77, 79, 81, 83, 85, 87, 89, 91, 93, 95, 97, 99, 101, 103, 105, 107, 109, 111, 113, 115, 117, 119, 121, 123, 125, 127, 129, 131, 133, 135, 137, 139, 141, 143, 145, 147, 149, 151, 153, 155, 157, 159, 161, 163, 165, 167, 169, 171, 173, 175, 177, 179, 181, 183, 185, 187, 189, 191, 193, 195, 197, 199, 201, 203, 205, 207, 209, 211, 213, 215, 217, 219, 221, 223, 225, 227, 229, 231, 233, 235, 237, 239, 241, 243, 245, 247, 249, 251, 253, 255, 257, 259, 261, 263, 265, 267, 269, 271, 273, 275, 277, 279, 281, 283, 285, 287, 289, 291, 293, 295, 297, 299, 301, 303, 305, 307, 309, 311, 313, 315, 317, 319, 321, 323, 325, 327, 329, 331, 333, 335, 337, 339, 341, 343, 345, 347, 349, 351, 353, 355, 357, 359, 361, 363, 365, 367, 369, 371, 373, 375, 377, 379, 381, 383, 385, 387, 389, 391, 393, 395, 397, 399, 401, 403, 405, 407, 409, 411, 413, 415, 417, 419, 421, 423, 425, 427, 429, 431, 433, 435, 437, 439, 441, 443, 445, 447, 449, 451, 453, 455, 457, 459, 461, 463, 465, 467, 469, 471, 473, 475, 477, 479, 481, 483, 485, 487, 489, 491, 493, 495, 497, 499, 501, 503, 505, 507, 509, 511, 513, 515, 517, 519, 521, 523, 525, 527, 529, 531, 533, 535, 537, 539, 541, 543, 545, 547, 549, 551, 553, 555, 557, 559, 561, 563, 565, 567, 569, 571, 573, 575, 577, 579, 581, 583, 585, 587, 589, 591, 593, 595, 597, 599, 601, 603, 605, 607, 609, 611, 613, 615, 617, 619, 621, 623, 625, 627, 629, 631, 633, 635, 637, 639, 641, 643, 645, 647, 649, 651, 653, 655, 657, 659, 661, 663, 665, 667, 669, 671, 673, 675, 677, 679, 681, 683, 685, 687, 689, 691, 693, 695, 697, 699, 701, 703, 705, 707, 709, 711, 713, 715, 717, 719, 721, 723, 725, 727, 729, 731, 733, 735, 737, 739, 741, 743, 745, 747, 749, 751, 753, 755, 757, 759, 761, 763, 765, 767, 769, 771, 773, 775, 777, 779, 781, 783, 785, 787, 789, 791, 793, 795, 797, 799, 801, 803, 805, 807, 809, 811, 813, 815, 817, 819, 821, 823, 825, 827, 829, 831, 833, 835, 837, 839, 841, 843, 845, 847, 849, 851, 853, 855, 857, 859, 861, 863, 865, 867, 869, 871, 873, 875, 877, 879, 881, 883, 885, 887, 889, 891, 893, 895, 897, 899, 901, 903, 905, 907, 909, 911, 913, 915, 917, 919, 921, 923, 925, 927, 929, 931, 933, 935, 937, 939, 941, 943, 945, 947, 949, 951, 953, 955, 957, 959, 961, 963, 965, 967, 969, 971, 973, 975, 977, 979, 981, 983, 985, 987, 989, 991, 993, 995, 997, 999, 1001, 1003, 1005, 1007, 1009, 1011, 1013, 1015, 1017, 1019, 1021, 1023, 1025, 1027, 1029, 1031, 1033, 1035, 1037, 1039, 1041, 1043, 1045, 1047, 1049, 1051, 1053, 1055, 1057, 1059, 1061, 1063, 1065, 1067, 1069, 1071, 1073, 1075, 1077, 1079, 1081, 1083, 1085, 1087, 1089, 1091, 1093, 1095, 1097, 1099, 1101, 1103, 1105, 1107, 1109, 1111, 1113, 1115, 1117, 1119, 1121, 1123, 1125, 1127, 1129, 1131, 1133, 1135, 1137, 1139, 1141, 1143, 1145, 1147, 1149, 1151, 1153, 1155, 1157, 1159, 1161, 1163, 1165, 1167, 1169, 1171, 1173, 1175, 1177, 1179, 1181, 1183, 1185, 1187, 1189, 1191, 1193, 1195, 1197, 1199, 1201, 1203, 1205, 1207, 1209, 1211, 1213, 1215, 1217, 1219, 1221, 1223, 1225, 1227, 1229, 1231, 1233, 1235, 1237, 1239, 1241, 1243, 1245, 1247, 1249, 1251, 1253, 1255, 1257, 1259, 1261, 1263, 1265, 1267, 1269, 1271, 1273, 1275, 1277, 1279, 1281, 1283, 1285, 1287, 1289, 1291, 1293, 1295, 1297, 1299, 1301, 1303, 1305, 1307, 1309, 1311, 1313, 1315, 1317, 1319, 1321, 1323, 1325, 1327, 1329, 1331, 1333, 1335, 1337, 1339, 1341, 1343, 1345, 1347, 1349, 1351, 1353, 1355, 1357, 1359, 1361, 1363, 1365, 1367, 1369, 1371, 1373, 1375, 1377, 1379, 1381, 1383, 1385, 1387, 1389, 1391, 1393, 1395, 1397, 1399, 1401, 1403, 1405, 1407, 1409, 1411, 1413, 1415, 1417, 1419, 1421, 1423, 1425, 1427, 1429, 1431, 1433, 1435, 1437, 1439, 1441, 1443, 1445, 1447, 1449, 1451, 1453, 1455, 1457, 1459, 1461, 1463, 1465, 1467, 1469, 1471, 1473, 1475, 1477, 1479, 1481, 1483, 1485, 1487, 1489, 1491, 1493, 1495, 1497, 1499, 1501, 1503, 1505, 1507, 1509, 1511, 1513, 1515, 1517, 1519, 1521, 1523, 1525, 1527, 1529, 1531, 1533, 1535, 1537, 1539, 1541, 1543, 1545, 1547, 1549, 1551, 1553, 1555, 1557, 1559, 1561, 1563, 1565, 1567, 1569, 1571, 1573, 1575, 1577, 1579, 1581, 1583, 1585, 1587, 1589, 1591, 1593, 1595, 1597, 1599, 1601, 1603, 1605, 1607, 1609, 1611, 1613, 1615, 1617, 1619, 1621, 1623, 1625, 1627, 1629, 1631, 1633, 1635, 1637, 1639, 1641, 1643, 1645, 1647, 1649, 1651, 1653, 1655, 1657, 1659, 1661, 1663, 1665, 1667, 1669, 1671, 1673, 1675, 1677, 1679, 1681, 1683, 1685, 1687, 1689, 1691, 1693, 1695, 1697, 1699, 1701, 1703, 1705, 1707, 1709, 1711, 1713, 1715, 1717, 1719, 1721, 1723, 1725, 1727, 1729, 1731, 1733, 1735, 1737, 1739, 1741, 1743, 1745, 1747, 1749, 1751, 1753, 1755, 1757, 1759, 1761, 1763, 1765, 1767, 1769, 1771, 1773, 1775, 1777, 1779, 1781, 1783, 1785, 1787, 1789, 1791, 1793, 1795, 1797, 1799, 1801, 1803, 1805, 1807, 1809, 1811, 1813, 1815, 1817, 1819, 1821, 1823, 1825, 1827, 1829, 1831, 1833, 1835, 1837, 1839, 1841, 1843, 1845, 1847, 1849, 1851, 1853, 1855, 1857, 1859, 1861, 1863, 1865, 1867, 1869, 1871, 1873, 1875, 1877, 1879, 1881, 1883, 1885, 1887, 1889, 1891, 1893, 1895, # The Builder.

VOL. XVIII.—No. 896.

London of the Past.

ONDON is changing in a very remarkable manner.

In all the older parts rebuilding is actively going on, and in all the outskirts, street upon terrace, and terrace upon terrace, are springing up, and enlarging its size to an extent that is marvellous if not alarming. In some cases where simply speculation is at work, preparing houses for the market, the commonest type is followed, and the whole construction is cut to a shaving; but in others, as in the new roads about the proposed Horticultural Gardens in Brompton, and mostly where houses are being rebuilt in town, substantial and well-arranged structures contrast forcibly with the less recent buildings remaining

around them. To estimate rightly this change and this increase in London, it is desirable occasionally to look back, as we have done on some previous occasions, and to examine the aspect of the metropolis at different periods. We have opened a map, dated 1600, of the neighbourhood on which now stands the British Museum with rows of houses and public buildings. If we compare it with what we know of the district in 1860, we shall see how circumstances have altered. Eastward our map extends to Little Turnstile, on the south side of the country road, marked Holborn. Passing along this road westward, we come to a street lane which is now represented by King-street, running northward, and another lane (now Little Queen-street), which is met by cross footpaths through the fields, at the corner of Great Queen-street, just where the printing-office of Messrs. Cox & Wyman now stands. Lincoln's-inn-fields are marked, and are crossed by footpaths. The map does not extend so far as the old Inns of Court and Chancery-lane. From Great Queen-street a lane in the map passes across Drury-lane, and continues to St. Martin's-lane: this is the site of Long-acre.

Returning, however, to the Holborn corner of the present King-street, it is seen that no houses had been built in the now great thoroughfare, so far as the map extends, on either side. Except at the bottom extending for a short distance, there are no houses on the east side of Drury-lane, until we reach the part now called the Sand-yard, near Broad-street, St. Giles's. On the opposite side of the lane here, a building or two are marked on the site occupied by the wooden houses that were recently engraved in the *Builder*, and wherein, it is reported, the great plague of 1665 first made its appearance. Lower down are rows of trees, broken here and there by houses: some of these may at the present day be readily distinguished from those of a more modern date. Great changes took place in this direction during the sixty-five years between the time of the publication of the map and the great plague. Lincoln's-inn-fields and Great Queen-street had been squared up, and partly built upon with houses designed by Inigo Jones; and in other directions the brick-makers might be seen at work; and there were notices set up, here and there, of land to let on building

leases. Notwithstanding this, drainage was a matter not much considered. Houses were planted in parts here as at Agar-town and Lambeth, to prepare the land for human habitation, as it were; but this process was attended with a fearful loss of life. The dwellers in the new districts felt like those conducting the "forlorn hope" in a siege. Long even after the plague and the Great Fire of London, the vacant spaces here, in the absence of any sufficient police, were the chosen spots for dog-fighting, and other scenes of riot.

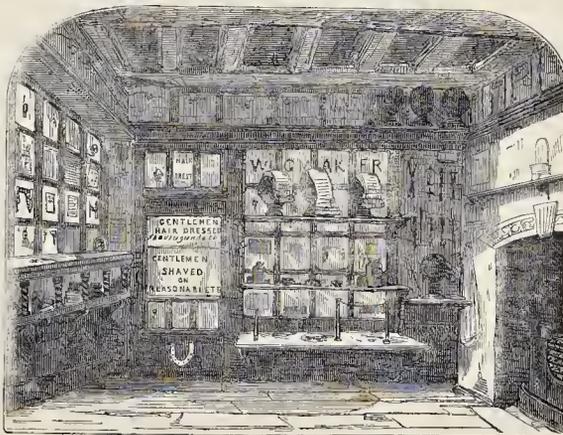

South of the present Long-acre is the Convent Garden. The details from this to the Strand are not filled in. Farther west, however, "The Mees" is marked, and thence runs a wide road going north to the junction of the Broad-street of St. Giles's, and we see St. Martin's-lane, with hedges and trees on each side; the still-called Tottenham-court-road, and the Oxford-road. Passing up St. Martin's-lane we find the Cock and Pie Fields, now covered with the swarming, bustling, and not too fastidious population of the Seven Dials. A road leads along the side of a wall from St. Martin's-lane to Broad-street, St. Giles's. This is marked Lc-lane, but became Monmouth-street. Beyond the fence is the picturesque little church, St. Giles's-in-the-fields, with one or two houses close by embedded in trees. Northward the green fields are intersected by several paths, one of which is now represented by a side of Bloomsbury-square. Eastward from St. Giles's, but a little to the west of the present King-street, in the midst of gardens, is Southampton House. From this some of the streets take their name. No houses appear on the site that afterwards became the notorious Rookery and surrounding dens of St. Giles's. Long after this map was made dwellings of a good description were built, and declined into terrible lodgings for human beings. Demolitions and alterations have taken place: model lodging-houses, schools, chapels, and churches have been reared, which form a new stratum in the section of progress. Montague-lane is not marked: the wondrous antiquities of Egypt; the rare works of Greek and Roman art; the great rooms filled with miles of books, were not thought of in the days when this map was made: the valuable objects now there were then scattered in all parts of the world.

But for the writings of Fitz-Stephen, patient John Stow, and a few others, the early condition of London would have been a matter of as great obscurity as is that of the lost cities of antiquity. In the "Antiquarian Repertory," a translation is given of a book published in Paris, in 1672, which contains accounts by one Jorevin, of his travels in England and Ireland. During this tour the writer visited the chief towns of the kingdom, and his notes show the wonderful changes which have taken place in

many of them in something less than 200 years. The mistakes are ludicrous, but he seems to have been a good topographer, and to have described well the things which came under his own observation. After mentioning Westminster and the Strand, he says, "We may now go to see the Conan Giardin [Covent-garden], a royal market-place. In the middle of this market-place is the king's statue on a pedestal, and a church, the frontispiece of which is sustained by many thick columns, like the Pantheon at Rome. There are five or six great streets described by a line that leads to Lincoln's Infields—the fields of Lincoln,—which is a square larger than the Place Royal at Paris. The houses that encompass it are all built in the same style. The king has given them to the nobility for their residence. The middle is a field filled with flowers, and kept in as good order as if it was the parterre of some fine house. The college of the University is here to be seen [probably Lincoln's-inn], which has a garden, with a fine terrace, from whence there is a view of this fine square, which is the ordinary walk of the citizens. The college of Greze [Gray's-inn], is a handsome building. It stands in the street of Holborne, which is one of the largest in London, since it crosses it from end to end, only it changes its name in the different quarters through which it passes.

"As to what remains of the walls and ditches of London, they are scarcely to be perceived; they do not enclose a fourth of its extent. This centre of the town was burnt some years ago, with a very considerable loss of rich merchandize, the ruin of many palaces, and more than fifty churches. It is an astonishing thing to hear how this general conflagration happened, which, at the distance of more than ten leagues, seemed like a deluge of fire coming to burn the whole earth. Nevertheless, by an order from the king, all the proprietors of houses which had been burned were obliged to cause them to be rebuilt within the space of three years, in default of which their sites were to be forfeited, so that when I arrived in London, almost all was finished, when, in some measure, they attempted to make the streets straighter and wider. There was a man who laid a wager, that he would cause his house to be built up, from the foundation to the roof, in two days, which wager he won. It is true, all these houses are built only with bricks, one upon the other; they have, however, something so handsome in their architecture that they seem like little castles.

"It is certain that if there are as many houses in London as in Paris, London is the most populous, principally from the number of hands employed in the silk and linen manufactures, and other works of that kind, not to speak of the scaffolding people, who are here as numerous as the manufacturers. In walking through the great street of Solborne [Holborn] one may

London of the Past: a Shop in Clare-market.

observe many things. In beginning to leave the suburbs you pass a small river, which formerly served to fill the ditches of the city, where there are still to be seen her ancient gates, garnished with large towers; these are at present the city prisons. There is a cross-way, ornamented with a fountain, after passing the bridge, to which adjoins the great street leading to the hay-market [Smithfield]. This is one of the largest markets in London, and here is the ancient church of St. Bartholomew, which at present serves as a kind of exchange for tradesmen, who have their shops therein; and near it is the church of St. Jones [John's], which was formerly a commandery of the knights of Malta. It is not far from the palace, or court of justice, where public affairs are regulated. The street of Holborne begins at this cross-way to take the name of Chispyade, which is the handsomest street in London, enriched with many fountains, and with the Great Exchange. This was entirely burnt down, but at present is almost re-edified, and handsomer than it was before: it has a great court, surrounded by galleries, and great halls supported by columns, with all the figures of the kings of England carved in marble.\*

He visits the India House, and is surprised at the riches here displayed, and acknowledges "that the English well understand the maritime art, and that they are the true merchants of all seas."

"The Castle of London, called the Tower," its broad ditch, filled with water; its magazine and stores; the armour of William the Conqueror, and that of the jester of that monarch, with horns fitted to his casque; the place where the coin is struck, are all noticed. He also sees the royal wild beasts, the treasury, in which is the crown of England, &c., and more than 2,000 large cannon, ready to be conveyed away, for the defences of places at home and abroad.

Along the river side of the castle runs a quay, and, beyond, a long suburb, which shelters,—along the Thames, and in the residue,—the seafaring people, waiting for a wind, and the loading and unloading of ships "which arrive in this fine river in such numbers that one may call London the most famous port in the universe. What displaces me in London is that there are so few quays along the river side, owing to which we cannot have a view of all those vessels, there being only some small stairs and platforms, for loading and unloading the merchandise into and from the vessels."

"Besides the great depth of the Thames, the water rises here more than two fathoms, which affords a subject for admiration how they have been able to build London Bridge, which is of stone, and in length upwards of 400 paces, with nineteen arches. The houses which cover the bridge had been burnt down and rebuilt: they are inhabited by rich merchants. At the entry on this bridge there is a machine like the Samaritan of Paris, which raises a quantity of water to furnish the fountains in the squares and cross streets of the City, from whence by the bridge lies the passage to Sodorik [Southwark], which might pass for a great city were it encompassed with walls."

Here our French friend visits the "Bergardin" (Bear-garden), and was delighted with the battles of the beasts, but still more with some human combatants, who with swords mutilated each other. The visitor regrets that he was not able to attend some other exhibitions of a similar kind at Hockley-in-the-Hole and in other parts of the town. There were at one end of this suburb, not far from the "Bergardin," two large hospitals for the poor, built, as some of our readers will be surprised to learn, "near a field where St. George with his lance killed the dragon which devastated the whole country." In the environs of this place are several beautiful pleasure-houses: that of "Pringardin" (Spring-gardens) is a place of pastime and diversion for the youth of both sexes. Near it is the little village of Lambemark (Lambeth-marsh), in which stands the great castle of the Archbishop of Canterbury, and the house of a gentleman, filled with curiosities (the museum of the Tradescants). Re-crossing the bridge, a handsome street is

visited near a church, in which stands "Londonchton," which is a stone in the middle of the street, raised about a foot and a half from the ground. "This, it is said, was placed by William the Conqueror as a boundary to his conquest: others say it grew there spontaneously: be that as it may, the coaches by striking it in passing have much diminished it. One must not forget to observe it well, for it is said that he has not seen London who has not seen this stone." In these days one might go and walk in Moorfields, where are certain meadows where there are always jugglers and Merrie Andrews. A mile from them, towards "Common Gairden," was a little river called "Nieu River," a part of whose waters were conveyed by subterraneous pipes into the fountains in the City. When in this neighbourhood, we have a strange account of a pit or gulf to which no bottom can be found, and of a spring said to yield the best water that can be found in London, and that the king regularly drinks it at his meals.

To come, however, to evidences of great change remaining to us.

In the neighbourhood of Clare-market, Drury-lane, and some other now unfashionable parts of London, shops still remain which are so peculiar in their proportions that all endeavours to alter them, to a corresponding appearance with the now light and elegant places of business which adjoin, fail. We are thus enabled in a measure to judge what was the appearance of many of the shops in the metropolis in which a former generation quietly and comfortably carried forward their trades, and so were able not only to obtain the good things of this world, but to leave considerable fortunes to those who succeeded them. Some of these shops which so obstinately defy change have for more than half a century been occupied by hair-dressers. One of these, near the bottom of Drury-lane, on the west side, is a characteristic example. Two others, which bear the once well-known title of "wig-maker," are still within the precincts of the Temple. More might be mentioned, but, passing them over, we walk to the streets near Clare-market, once a place of gaudy resort, but which is now in the possession of a dense and very poor population.

In those streets the dignified calling of the wig-maker has fallen into contempt, and in all directions poles of great length, brightly emblazoned, denote the changes which have taken place: the quiet hair-dresser has given way to the "easy shaver," who with striking display announces his calling. In some instances, fluttering banners catch the eye; large illuminated announcements denote the great ability of the various artists. In some windows it is advertised that this is the "only easy-shaving shop;" another, in still bolder letters, informs the passenger that this is the "original shop;" and close by is the "real original." It is advertised by some that gentlemen can hesplendidly shaved for "one penny," and by others, that the operation can be performed for "a half-penny." At first sight one might tremble for the existence of the professors on such low prices; in the next place, for the safety of those who are under the necessity of submitting themselves to such a cheap operation. It will be found, however, on inquiry, that these tradesmen now consider it a very poor day's work if they do not, at 1d. for each sitor, earn from 10s. to 12s. on a Sunday morning, and on other less busy days a proportionate sum. To earn even 10s. requires, of course, 120 customers. If such a feat had been mentioned to hair-dressers thirty years ago, when 3d. was charged for shaving, they would have looked upon it as little less fabulous than the idea of the locomotive travelling at the rate of sixty miles an hour. However, by the assistance of apprentices, who systematically perform the least difficult parts of the business, leaving the finishing touches to the master, row after row are finished with fewer sanguinary effects than might be expected. At one of the half-penny shops, the cheap artist stated that his income was as much as that of those who charged the higher price: increased activity and better management make up for the difference of charge.

We have sketched the old shop near Clare-market to which we have referred. The small size of the windows speaks of dear glass: in some of the least important parts of the glazing may still be seen the central "knot." The wooden window-frames are of great thickness. In the windows there are not any waxwork figures, gay with artificial jewellery and flowers, but in their grim-looking wooden blocks, with out human features, most of them worn-eaten. On some are wigs of different orders, in sooty and decayed condition: there are blocks on which the foundations have been cunningly laid in order to be ready for expected commissions: there are other wigs, not of legal shape, and of various hues: on others are singular bunches of ringlets and other mysterious matters, the use of which can scarcely be guessed by the passer-by. The pole is of very modest size, and the tints upon it are subdued and harmonized. In plain Italian letters, which have once been yellow shaded with black, is "—, Wig-maker and Hair-dresser." Few things can look more out of date than the whole exterior of this London shop. With the exception of improving the low, narrow doorway, there has evidently been little effort made to keep up with the age. Here a desperate attempt has been made: plate glass of moderate size has been introduced, and in modest type it is announced that "Gentlemen may be well shaved on moderate terms. Ladies' and gentlemen's hair dressed."

On entering, the dingy dimness of the place has a remarkable effect. You drop down at once to the early part of the reign of George III. With that old-fashioned politeness which has given place to a less ceremonious manner, the wig-maker discoursed on the changes of the times and his own decay. The oil-lamp had not been superseded by gas: on the shelves were rows of wig-boxes, on which could be dimly traced the names of "Serjeant —," and others who are no longer toiling and trampling in the law.

On the door, conspicuously placed, was an old horse-shoe, and some "holy stones," fastened together with a string; the first for the purpose of ensuring good luck, and the latter to keep away witches.\* In parts were numerous pincers and other instruments and tools already rusty, but which in future days may cause contention amongst antiquaries. The heavy rafters and panelling marked the ancient date of the premises: the quaint fireplace, the limited space, and other features, showed the difference between the past and the present.

The shop of the wigmaker is now closed, and the history is instructive. At one time, he said to persons who casually called for that purpose, "Sir, we do not shave." At last necessity obliged the condescension; but the worthy wigmaker was slowly driven. He could not be induced to write up, "This is the easy shaving-shop. Only 1d.," and so business departed, as it has done from many others in different trades and occupations, who will not adapt themselves to the times, and avail themselves of the facilities which are at hand.

There are many in higher places who might take a useful lesson from the fall of the wig-maker; and we thus get a moral out of our gossip about London of the past.

#### MODERNISM IN ART.†

It might seem desirable, in commencing the few remarks I am about to make on "Modernism in Art," to define the term before I proceed to discourse upon it. But I prefer to leave the preface till the last; or, if you have not perfectly comprehended all that I mean by the term at the conclusion, we will discuss the matter, and endeavour to obtain some definitions of it.

M. Montalembert, in his celebrated pamphlet, speaks somewhere of the study of "contemporary archeology;" and this I cannot help fancying is a phrase intended to convey such notions of the

\* About twenty years since horse-shoes nailed above the doors were not uncommon in Monmouth-street and other neighbourhoods.

† Read at the Architectural Association, Conduit-street, on Friday, the 30th ult., by Mr. C. F. Hayward, A.I.B.A. The discussion of it was postponed; and the chairman, Mr. Penfold, stated that the committee had determined to postpone the *conversazione* which had been announced for Friday evening, 13th of April, until some future day, to be afterwards announced.

value of the observation of daily life and present circumstances and living history, which I would endeavour to include in the term I have chosen.

The study of antiquity is enforced in a variety of ways at the present time: although the period chosen is somewhat changed—Classic to Medieval lore,—societies in every county, and amateurs without number, devote themselves to the collection and contemplation of the minutest relics, often overlooking in the study of a detail the more broad and comprehensive objects of research, and caring less for the beautiful and suggestive than for the more curious and aged.

It has, however, been reserved for a French idea to form a political society for the sole purpose of studying and contemplating ruins,—renouncing any interest in the present, acknowledging one only duty, and that, the support of an effiee piece of archæology which happens to be contemporary.

To the artist, however, and especially to the architect, the study of antiquity is necessary, not only to form his ideas, but to stimulate them; not only to awaken his enthusiasm, but to feed the fire of his genius; not only to afford fit subjects for contemplation, but to give him instruction and advice, and to offer suggestions for his daily labours.

Archæology is a necessity with him if he would excel, but its true use is like the study of history—of which, indeed, it is only a branch,—to teach lessons of wisdom, of warning, and of hope.

But to study ancient art for the purpose of reproducing it, without reference to altered circumstances and times, is the same as studying costume for a fancy ball, or the fables of heathen mythology, for the purpose of setting up the worship of Isis or Jupiter.

Moreover, it is quite contrary to the spirit of the arts in any age, for no art can be art (paradoxical as this may seem) which subsists on bygone talent, and has no power of its own but that of copyism.

Your antiquarian is not generally a surpassing genius of originality, but he lays up stores of valuable lore for those who have the wit or the wisdom to turn them to account.

Now it surely is a matter of surprise, that living in the present with all the associations and connections of modern life, and feeling all the force of passing events, and the attraction of the present times around us, that this spirit of antiquarianism should so often override and overrule our artistic notions, stifling the aspirations of genius, cooling the enthusiasm of youth, and distorting even those inevitable lines of beauty which are traced by the hand of the true artist.

Yet that it does so affect the fine arts generally at the present time—and especially our own branch of them—I think few will deny. None can be more ready than myself to admit that its influence is considerably less than it was even a short time ago, and to rejoice in the hope that its cramping and hampering influence shall entirely give way before the genius of nineteenth-century art; that its effect shall be recognized only in the curbing and restraining of too wild and sportive fancies, which, by substituting mere conceits for high art, often in the best periods bring down ridicule and contempt upon art and its professors.

Now, let us inquire how, in the history of our own branch of the fine arts, the wants of the period and the capabilities of the times were met,—how far ancient architects were modern in their day.

In Egypt, as far as we know or understand their works, they seem to have had their eyes open to the works of nature around them in the form of their columns, and the floral and other ornamentation they introduced, and even did not disdain to copy in enduring porphyry the tailors' work of the period. Then look to the use of the noblest materials in the noblest proportions. Of Assyria we know at least this—that their houses and their temples were suited to their circumstances and their purposes, and that their ornamentation and their sculpture commemorated their modern events.

Who shall say that the great Greeks were antiquarian architects? Slight evidences of Egyptian studies, indeed, are to be found; but how great must have been the originality and inventive power of their architects,—but infinity of design, what amount of careful thought and study have been gone through before the simplicity of grandeur in their forms and the delicate magnificence of their decoration had been achieved. We hardly appreciate this inventive power in the Greeks sufficiently. Gradual, doubtless, but throughout original, and in the end perfect, was the architecture of this wonderful race; but it was also

essentially suited to themselves, their worship, and their climate, and the materials around them.

The Romans were a progressive people, and I would give them the full credit of appreciating Grecian works, which is often denied them; while at the same time they were essentially modernists. They had different works to erect, and were masters of more science, though less delicacy of taste, and, let us add, less noble materials than the Hellenes.

Far from copying alone, they went on originating and adopting till at last their originality overcame their antiquarianism, and they produced their grand basilicas with vaults or domes such as Grecians never dreamt of.

Were they not modern? When a circus to hold half the city seated was wanted,—how was the difficulty overcome? Certainly not without reference to precedence, but with unprecedented boldness and success was the problem solved. Who was the Benjamin Edgington of the period who made the velarium? and what were the cushions that these things were not built to be mere picturesque ruins for an English traveller to contemplate on a moonlight night, but were once modern works to serve the wants of the time.

Then, as to the Early Christians, I am disposed to fancy that a good deal of art we consider modern to them was ancient, inasmuch as they probably adapted many common pagan notions and symbols in their churches, &c. Yet what they built was most essentially different, and had a different purpose to serve from the pagan art around them, and when, as ages rolled on in the darkness or rather twilight of art, church after church was erected east and west, no slavish copy of former types, was held, but here a dome, there a round vault, and elsewhere a flat ceiling, all referable to former phases of art, but at the same time all modern in their day, gave a character and a distinctive individuality to the building.

And when at last this darkness rolled away, and the glorious power of the sun of Gothic art was felt, did the art traditions of antiquity or the originality of modern genius stand out as the vital spark of all this blaze? Step by step can we trace the path of this noble development of art, each piece in advance of the other spurning any backward movement for three centuries and more. One period, feeling its own power, disclaiming to continue its previous design if it had been stopped in its fulfilment, and taxing its own genius to find a fresh (at that time at least considered an improved) design for the remainder,—artists at one time overstepping the limits assigned by the endurance of their materials, then repairing their error by a fresh and perchance even a holder experiment, triumphing over material, submitting to every variety of circumstance, and improving every opportunity and every local advantage.

Was brick to be obtained and stone not, the baser material was not despised, but shown to be capable of bearing the impress of the artist's mind.

Was iron available, it was welcomed by the designer, and wrought out with care, fashioned by the tongs by the smith into forms of beauty.

Was glass manufacture established, the painter touched it with his brush, and the architect made way for it in his walls, cutting out of his stone graceful forms of tracery to set the most precious jewels in.

Foreign marbles were scarcely wanted when men could find at home alabaster, Parbeck, and serpentine.

Antiquity need not be searched for subjects to sculpture when the truths of Christianity were deemed worthy the noblest efforts of the sculptor's chisel. The painters of plaster walls were at no loss how to decorate, whether a flat ceiling or a vaulted roof was to be the subject of their labours. The workers of tapestry or stamped leather, the makers of furniture or armour, were all imbued with the same spirit, keeping up to the knowledge and requirements of their day, and being, perhaps, as ignorant of, as unable to copy, any art but their own.

And here is the gist of the whole matter: they had not to produce a Grecian work or a Roman, or a Romanesque, or an early this or a late that, but to do something modern, of their own time and period. Their employers would not have been satisfied with an Egyptian house, a Norman church, a Grecian museum, a Roman exchange, a Romanesque warehouse; but house, church, museum, exchange, or warehouse, would have been designed of one date and in the style of the time, embodying the best art which was to be had, each and all being individual artistic emanations, and

no more to be confounded one with another than the individuals who built them.

Living art must be at unity with itself, and when so it must progress. A house divided against itself must fall; and so is art degraded when its professors are intent on producing archæological specimens instead of real designs, in the art of their own day.

Then, as to what is called Renaissance, or Italian revival of the antique: at the same time that we object to the inordinate reverence for everything of a former period in this phase of architecture, so that art was not valued with reference to its own intrinsic worth, but according as it embodied former notions in every detail, we must admit that the great element of modernism was not wanting in many of its arrangements. Indeed, under the hands of the great surpassing genius of the time, it was impossible that it could be.

And it seems to me that it is owing to this very circumstance that its influence in our modern times is to be attributed. When men shook off the trammels of precedent, behold what was produced in Florence,—buildings which embody the spirit of their times in every stone. See at Venice what was the effect of Palladio's cold but correct tabular architecture, and read how his proportions are described in all students' books, as if it were a table of some Building Act, showing how the proper thickness of a wall was to be found by the rules of arithmetic. The finest buildings of this period are those least of all correct, and perhaps one of the wildest of all—the church of Sta. M. della Salute, in Venice—has, in my opinion, as fine an outline as any building of any date. Yet, as I said, the necessary element of life existed in the style, viz. its sympathy with the wants of the age, and the requirements of the period. I cannot help, however, stopping to remark the great individuality of the artist, his personal ascendancy over the style, not, as in the preceding Gothic period, when the workman was lost in the grandeur of the style and the great art spirit of the period seemed to pervade all grades alike. I do not desire to lower our estimation of the fifteenth-century artists, but simply to point out this significant fact, that they seem more prominent than their art.

To come to more recent times—the seventeenth and eighteenth century,—how did architecture adapt herself to the wants of that age? Has she generously accepted the altered circumstances of the times—made the popular requirements her own, and so popularized her art? Has she adopted every new scientific improvement, and clothed it in robes of beauty, adding all the loveliness of grace to mere constructive requirements, and moulding every form of pure workmanship into a shape of artistic excellence? In short, has she been worthy of her high mission?

Nay, is it not rather true that, through pride or incapacity, she has held aloof from the great work of the times,—that of infusing the spirit of her art into everything about her? Despising this her true mission, she disdained to touch any but great works, and so in turn was not permitted even to direct those, till at last architecture herself seemed dead, and all appreciation of her seemed confined to pure archæological students; and when at last she began to show signs of life, it was in this archæological direction she began to move, and the antique school for a long time endeavoured to keep up this backward tendency. The architecture which is to endure beyond the fashion of half a century must be the art of the day—modern in its appliances, its arrangements, and its tastes—like all the great developments of art before it in every age.

In the foregoing remarks on periods of architecture, I am speaking, of course, very generally; otherwise I might have referred to many illustrations of the truth, or to the exceptions which may be found in the works of some individual artist—our own Wren for instance.

I might, I think, show where he is essentially modern in his designs for Protestant churches, although he sometimes based his notions on Gothic, partially learned, as well as on Italian architecture, most profoundly studied. I might show that his greatness is exhibited more in his departures from "correct" Classic proportions and arrangements than in his adherence to them; that his genius is greatest where it is least indebted to antiquity; that where he has been most blamed by *distant* architects he has shown most his high appreciation of the circumstances and necessities of his work; in fact, that the chief reason of their influence, and the chief value of his works is, that they contain, in a great degree, that necessary element of all true art,—modernism, or adapt-

ability to the wants, and sympathy with the feelings, of the times in which they are wrought.

I believe St. Paul's churchyard is the first space which was enclosed by east-iron railings, and I never hardly pass by them without recollecting this significant fact.

Now, had Wren been properly supported by men of his own profession, had his followers been imbued with his spirit of true art, united to his love of science,—had his mantle of modernism fallen on any of his pupils, or rather had it descended upon the members of his school, instead of being partially caught by a few, what a noble position might our art have been in at this time. What an amount of noble work might have been found in our cities, and what a mass of ignoble and base erections might we have been spared. If he had been allowed to plan London afresh and been followed by true men, our city might have rivalled any in the world, and we might have taken the lead of all nations in art as we have done in science, instead of labouring day by day—pushing back a house here and there to get space enough to move along our streets—hencecching now and then some Board of Works to grant us a few feet more room to get a sight of what architecture is left to us by that great man! But the real state of the case will serve to show that an individual, however great, has but limited influence, and, therefore, how vain to hope of any great permanent artistic change, except from a whole generation of artists!

Of course other circumstances had their influences, but I do attribute to the school which Wren founded—to their want of sympathy with their great master's principles—the dearth which followed. It seems to me that had they perpetuated his principles and carried onward the work of revival which he, in a measure, may be said to have recommenced, the public would have learnt to confide in them, and would have entrusted to architects, not only their churches, hospitals, and public buildings, but their warehouses, shops, business works, and private dwellings.

Instead of this onward march, we have to note retrograde movement—less modernism, more antiquarianism—till the building public learnt to believe that architecture was a mere toy, or at best a sort of conventional dress which was proper to be used on state occasions; that it was meant only for display of wealth, or to please the fancies of some learned nobleman.

Thus, when a house was to be built, if it were substantial it must be plain,—if it were to be good it must have no gimerack ornament,—till at last, your Harley-streets, Baker-streets, and Portland-places were produced, and not only built, but, worst of all, considered the right thing.

Thus, when a public building was to be erected, the folio of the works of Palladio, or the wonders of Athens, measured and drawn by Stuart and Revett, had to be appealed to, or again the remnants of Rome as delineated by Desgoetz; and nothing could be done without the sanction of the great god of architecture—Vitruvius. A portico was a necessity, and the originality of a novel intercolumniation, of say an Ionic or two more than usual; or, perhaps, an Ionic capital with two balustr sides next each other, so as to show the curls on the outside angle, was the subject of discussion and sufficient artistic capital for a lifetime.

So it came about that an architect must travel to Athens and pick up sufficient nussed "antiques" to form novelty at home, and the art of design was mere tact in picking out suitable hits to fit in given positions.

To come to even later times, have we not to lament that sort of censorship which has been set up over the early workers of our Gothic revival—by amateurs and others learned in Medieval archaeology—nay, is this over yet? Must not an architect be prepared with precedent, chapter and verse—for his design—be it from Italy, France, or at home.

Has he ever to defend the principles of his designs; or, if he has not been successful so far, are they admitted without his being able to point to some building or other, being very near relationship to his work?

If these remarks are considered as applicable to a few years back, but not to the present moment, so much the better. So much are we nearer what this generation, I hope, may yet see a rational and national modern nineteenth century architecture—based on the wants combining the resources—appealing to the sympathies and embodying the sentiments of these glorious days of prosperity and content.

Of style, I do not intend to say much, but this I fully believe, that had our seventeenth and eighteenth century architects been all minor Wrens—looking to his almost at the time isolated,

though perhaps cold, appreciation of some of the beauties of Gothic architecture, noting that more than once he built in that style, with, we may say, partial success;—I say, observing all this, I believe that our own noble examples of Medieval architecture must have made an impression on the minds of the seventeenth and eighteenth century architects, had they been worthy to tread in Wren's footsteps.

We should, I believe, have long ago taken up our national style, and wrought it out into something as superior in power, at least, if not in beauty, as our scientific works are superior to our materials, and appliances more varied than those Medieval times.

So we should have saved a whole century; and not only this, but, without having progressed, we might at least not have retrograded altogether, nor been compelled to lose further time in picking up lost ideas in experimenting to find the lost path.

And again, the nation would not have lost all appreciation of architecture as a modern art, nor looked so coldly and suspiciously on its professors.

We should have had nothing like the National Gallery, purely archaeological in all its associations. We should have had a decidedly different British Museum, where all the ideas are referable to Greece, and our churches would have probably contained some allusion to their sculpture or their design to the Christian religion, other than the simple reminder that Paul preached at Athens, from whence also the architectural details were borrowed. Look how Wren rendered the pediment of a Classic building interesting to the people for whom, and illustrative of the object for which, it was erected. Was he right in making St. Paul and his followers usurp the place of Jupiter and his? Then have we been wrong ever since till our Gothic revival.

I put forth the broad statement not with reference to pediments only, but to ornamentation generally; and I use it as an illustration of my remarks.

No doubt, the hard study of Gothic has been necessary to ground us in its principles. No doubt, the buildings which have been erected in this style were necessary reproductions of ancient Gothic forms, to give confidence to ourselves and those who employ us; so gaining liberty for our own artistic emanations. No doubt, the spread of archaeological study of the Medieval age among amateurs has led to the formation of a body of the public deeply interested in, and capable of appreciating, the efforts of modern as well as ancient architecture.

But still it is time we began to build modern churches without always taking ancient churches as our models for every arrangement. It is time we showed the public that Gothic architecture applied to public buildings is not a mere affair of mullions and lead-lights; that a warehouse can be of true modern architecture, and yet accord with the ancient principles of Medieval art, which was, in fact, the greatest common-sense architecture of the time; and that iron girders, and plate-glass, and gas burners, are not inimical to true art, and only a difficulty to a mere archaeological architect or church restorer.

An amusing illustration occurs to me.—Some fifteen years ago, a gentleman, looking at the restorations then going on at a church of Bury St. Edmund's (being more of a business man than an artist, and decidedly rather modern in all his notions than antiquarian), spoke to some one in the church who seemed connected with the works, and suggested the introduction of the Bude light, then a favourite patent method of lighting used in St. Pancras, and a few other great London churches, in some of which even now a sort of inverted glass umbrella remains to testify to its adoption.

Fancy the horror of the architect, who turned out to be the gentleman addressed, at this bright idea:—"Sir, if I had my way, nothing but wax candles should be used, and few of them."

Yet, though my friend was wrong, we cannot admit that the architect was right, or was working in the spirit of the old Gothic men. The church itself was a mass of window space, which was doubtless filled with gorgeous colour; and yet, a century and a half before, perhaps not more than a hundredth part of the light would have been admitted into the church. Why? Because they had not the glass to use.

Shall I be told that Medieval enterprise would not have used gas in their churches had it been invented, or plate glass either? And yet we have men, even to-day, lamenting over railways, and gas, and telegraphs, as if the advance of mind in one direction were antagonistic to its progress in another. Rather let us imitate the spirit of

Gothic art by refusing to copy even its sublimest efforts, lest we end by spoiling for ever the effect of the original.

Would our churches be the worse for being warmed and ventilated and used, instead of being shut up and preserved? Rather would it tend to the breaking down of the idea that architecture is a mere abstract idea, and not a living art for daily use and everywhere.

If we are true to ourselves—such is the rising spirit of the art in the public, I believe, such the increase of intelligent, independent judges, such the opportunities of seeing examples of good modern art everywhere, and such the resources at our command—that nineteenth-century art has only to be cultivated, to grow into a flourishing and wide-spread tree. It is already planted; there are those capable of guarding and protecting its tender years; and it only depends upon the rising generation to do their duty, and it will bring forth fruit to perfection.

Let us not forget the magnitude of the work; for it is not only here, but in Australia, in Canada, in India, and Constantinople, as well as on the Continent, our architecture is demanded,—not only ecclesiastical (for some would fain persuade us that our art is only fit for religious purposes), but large secular buildings,—universities, museums, Parliament-houses, at home and abroad are rising, and will show in after ages what we were capable of in the nineteenth century.

I question then if there will be much care as to whether the early part of the twelfth century, the middle of the fifteenth, or the late fourteenth, or the too late fifteenth century, was the basis of the design, if only loveliness of form, fitness of purpose, hearty sympathy with the work, and true artistic power be discernible in all.

Then shall we have praise for our modernism, and not blame for our want of it, and though our individuality be lost, what matter, if only the great flow of artistic genius envelop it, instead of its being overwhelmed by the ignominious cloud of inequity. In a generation of artists, few names, and those are of surpassing power, will survive; but, if we have all done our work in elevating the art of our day, we may feel satisfied in leaving the result to futurity, and rely on the fair judgment of posterity.

It would take a long time to discuss,—but I believe it is intimately connected with my subject,—the divorce of science—*par excellence*, the "science" of construction—from the "art" of architecture. It might have been necessary for the onward course of mighty modern inventions, such as railway viaducts and bridges, and so it might inevitably have come to pass even had the followers of Wren been worthy of him. But still, when I recollect what a man of science Wren was himself, when we see what the artistic men of the fifteenth century did,—what the priestly architects of Medieval times,—what the Roman, or Grecian, or Egyptian architects achieved,—I am constrained to believe that artists must have in a measure voluntarily resigned their position, leaving engineers to build bridges, aqueducts, railways, and docks,—speculative builders to houses and hotels, and shops, and stores, gardeners and iron-founders to do crystal palaces and railway stations, and retaining to themselves only the few public buildings which admit of pure aesthetic (?) treatment, and a few private works which their friends may wish to put in their way.

Who built the bridge at Narni 1800 years ago, and who spans rivers and streets, miles in width, in the present day? The architect or the civil engineer?

It may be right that our Leonardo da Vinci should confine their attention to canvas or fresco; but surely architects should not have lost all control over the chief civil and domestic buildings of their country.

It seems to me that it is in the power of the present generation to regain it in part, and I commend this notion to your consideration.

In the foregoing observations I have confined myself to our own branch of the fine arts, but I believe the same remarks will hold good, in a modified form, with respect to the sister arts of sculpture and painting. Why have we Nymphs at the Bath without end, and so few embodiments of the most stirring incidents of our own history, our own religion, and the events of the present period? Vacant pedestals seem to be our chief advances towards the statuesque decoration of our cities; invitations to young England to achieve something worthy of a hoist up, as if no one yet had done anything for the country but Nelson and Wellington. But there are signs, I hope, of something better in time.

Painting, too, does not disdain to represent the

events, the costume, the emotions of the present day, and some of the noblest art is applied to perpetuate scenes which will be hereafter identified with the nineteenth century. But it is as impossible for one branch to flourish without the rest, as for a good tree to bring forth evil fruit. Frescoes have begun to enliven our blank walls, and sculpture to adorn our empty niches.

Let sculptors and painters look to it—the game lies in their own hands.

And now for a few illustrations and I have done. I have referred to the British Museum as a piece of archæology; now let me speak of the reading-room as a piece of real modernism. Here is the Pantheon dome translated into modern language;—suitable to all its purposes,—light, solid, fireproof, convenient for readers, yet wanting somewhat in decorative finish; though this is not the architect's fault. The new Museum at Oxford was in many points not so successful at first; I mean as regards its constructive roofs of iron and glass: what it may be as a work of scientific art we hardly know yet; but of this I am sure, it will be a source of wonder to many who could not conceive the artistic value of metal-work, or who believed our smiths incapable of producing artistic forms in it, and who, when iron was mentioned, had only visions of tubular bridges and wrought-iron girders, studded over with little dots called rivets. Railway engines and tenders have been made highly decorative, and gorgeous metal-work pavilions have been sent after them to the luxurious East.

Our own Crystal Palace does not pretend to be artistic, except in its mighty covering of space; but the Floral Hall is a combination of science and art on a smaller scale, which, as a sign of the times and a great stride onwards, is very valuable. St. James's Hall is another example of the use of modern appliances artistically worked out.

But time would fail me if I were to enumerate the great and small churches, warehouses, mansions, clubs; and, indeed, I must not attempt so great a task as to criticise them even as a whole.

This I will leave to your own suggestions, and shall venture to hope that you will be urged to consider some of the points I have brought before you.

Crude, and perhaps erroneous, may these few observations be; but they have this in them,—that they emanate from one sincerely anxious for the best interests of his profession, and ready in any way in his power to advance the study of all true art.

WAS THE CEILING OF THE PARTHENON FLAT OR CURVED?

MR. EDWARD FALKENER is about to publish a new work, entitled "Dædalus; or, the Causes and Principles of the Excellence of Greek Sculpture." As a frontispiece he gives his restoration of the Parthenon, with the statue under a curved roof, to which we referred some time ago, and prefixes an introductory essay headed as above. From this we make the following extracts without comment. The work itself, we have no doubt, will be valuable.

"It is due, both to myself and to the subject, both to myself and to my readers, to offer a few remarks on the frontispiece to this essay. A vaulted ceiling to a Greek temple is so repugnant to one's ideas of Greek taste or Greek knowledge, that few critics will be independent enough to pause in their opinion, when they find that the great majority of persons, learned and unlearned, unhesitatingly condemn it as an absurd anachronism. These few people I invite to follow me. If it can be shown that the traditions of art as to the non-employment of the arch are only of modern date,—it necessarily can be shown for its introduction, and history confirm its usage, then, and then only, can I expect my readers to agree with me.

Of evidence from actual remains we have none. We have not, in any of our museums, a single specimen of a Greek ceiling. Those which are pointed out to us are the ceilings of porticos, not of rooms. These porticos do not exceed 10 feet in width. Nothing could be easier, or more natural, than to cover these porticos with stone. Argument would be unnecessary to prove it, for experience shows it in the remains of every ancient temple. It is from these ceilings of the outer porticos, the stone or marble lacunaria, overlaid with gorgeous colouring and gilding, that architects have too rashly presumed that the interior also of the temple was covered in a like manner. But this opinion is unsupported by any proof, or any confirmation.\* Nevertheless, the opinion has been

SECTION OF THE PARTHENON.

received and adopted, and modern buildings, as, for instance, our National Museum, which are erected after the Greek manner, have their ceilings, it may be, of cast-iron girders, or lath and plaster, painted to imitate, what it would be impossible to execute,—a marble roof. Such, then, is the tradition of the so-much-talked-of trabeated ceilings of the ancients. So little do we know of the interior of the Greek temples, that we cannot even decide upon their arrangement. Some have supposed that the hypæthron consisted of a range of skylights on either side, ignorant of the sacred significance of a hypæthron. Some have supposed that there was only one order of columns within the temple; others that there were two, and that the second reached the ceiling. Some have supposed that there was indeed an upper gallery, but that this gallery was void and unadorned, a receptacle for dust and cobwebs; others that there was not even a gallery, but that the two orders of columns went round the cella like a screen or scaffolding. With this ignorance as to the internal plan, can it be wondered at that we were unable to discover the nature of the ceiling? It has been asked, how is it, if such vaults existed, that no mention of them has been made by ancient writers? With the like reason we might ask, how is it, if such galleries existed, that they are not described? We have assumed the fact without allusion to the second point.

Perhaps there is no temple, with the exception of the Temple of Jupiter Olympius, at Agriguntum, of which so many attempts have been made to restore the interior, as the Temple of Minerva, at Athens. Of these projects two deserve attention. The one, entitled to consideration from the celebrity of its author, carries up the columns to the line of rafters, and makes the line of ceiling to correspond with that of the line of roof; the other gives a less altitude to the columns, but covers the cella with a horizontal ceiling. In the former case the architect could only succeed in his object of reaching the line of rafters by employing imaginary Corinthian columns, and elongating them at pleasure, while his line of ceiling, from being angular, could never have looked well. The hypæthron of such a ceiling, exhibiting a double notch, must have appeared most awkward; and, indeed, the form is more like that of an Etruscan tomb than that of a Greek temple.

In the other design the hypæthral opening likewise constitutes an objection; but in this case it resembles a well, the depth and narrowness of which precludes the admission of a sufficient body of light, while from its peculiar form the upper part of the interior must have been in continual gloom. But a more fatal objection arises from the fact that an interior so constructed would not have been sufficiently lofty to contain the celebrated Minerva of Phidias.

The statue is represented as being 26 cubits in height, while her spear touched the ceiling. She stood upon a pedestal on which was sculptured the birth of Pandora, attended by all the gods of Olympus. The plan of the pedestal may still be traced on the pavement, by which we find it to have been 21 feet 6 inches long by 8 feet 6 inches wide, with a railing round it extending nearly 3 feet more on every side. This must have required a height of about 10 feet to be in pro-

portion, which, added to the 39 feet, or 26 cubits, gives us a total height of nearly 50 feet. This height of 50 feet requires the utmost limits of the temple: so that the horizontal ceiling must be rejected, were it only from this evidence. Of these two projects, therefore, the one is inadmissible from the loftiness of its colonnades, the other from the lowness of its ceiling. The only alternative, then, is a mode of construction somewhat similar to that exhibited in the frontispiece.

We now come to the third point of consideration, how far such theory is in accordance with historical data. Much has been written regarding the antiquity of the arch; and the general impression is, that it was not invented, or at least not commonly made use of, when these temples were erected. M. Dutens, on the other hand, insists on the remote antiquity of its invention, and M. Quatremère de Quincy believed in its employment by the Greeks at the highest period of their history. The last-named writer based his opinion on the description of the Temple of Jupiter Olympius at Elis, where, it is said, 'The statue of Jupiter was of so great magnitude, that though he was represented sitting, his head seemed to touch the summit of the roof; and if he arose and stood upright, he would have broken through the covering of his temple.' M. Quatremère suggests, from the words τῆ κορυφῆ τῆς ὀροφῆς, the summit of the ceiling, that the central part of the temple had a circular ceiling which can have a summit.\* This opinion Kinnard strongly opposes, without offering any other interpretation, perhaps without having any. He contents himself with saying, "So gross an anachronism as the introduction of the representation of a type or principle then unknown can scarcely be contemplated with gravity."† M. Quatremère supports his theory by imagining that the arch which is shown on many Roman coins of Grecian buildings represents the vault of the temple; that the artist endeavoured to show in one view, the front portico, and the interior of the temple, with its statue and vault over; a conjecture which is perfectly reasonable when we recollect that the ancient medalists were frequently in the habit of giving conventional representations of the objects which they wished to portray.‡

M. Quatremère believes that Pausanias, where he says λίθον καὶ ἀντὶς ὀροφῆς, in speaking of the temple of Apollo at Phigalia, is describing a stone vault; and he further goes on to remark that Pausanias tells us that in the city of Megalopolis, near the portico Philippeon of the Forum, is the Temple of Mercury Acaecus, of which nothing but the stone vault (χρυσῶν) remains;||

\* Q. de Quincy, "Mémoires de l'Institut—Hist. et Lit. Anc.," tome iii. p. 212; "Le Jupiter Olympien," Part IV. par. xii. p. 267.

† Kinnard, "Stuart's Athens," H. 31.

‡ A distinguished architect has just published a most interesting and valuable work on numismatical architecture ("Architectura Numismatica; or, Architectural Medals of Classic Antiquity.") By T. L. Donaldson, Ph. D. London: Day & Son, Gate-street, Lincoln's Inn fields, in which he propounds a new theory. He supposes that these conventional types of temples are mere baldachios, instead of temples, as has always been supposed by the learned. I leave the subject for numismatologists to decide, and merely refer to it to show that I have not adhered to the general opinion without consideration. Animated, as all antiquaries should be, by the like zeal for truth, and love of art, a difference of opinion in details must yet always be expected.

§ Paus. viii. 41. || 16. viii. 30.

\* Unless the temple were very small, or the cella of diminished width, as in the temple of Apollo at Bassæ; the roof of which Pausanias expressly mentions was of stone.—Paus. xli. 5.

while Pliny informs us that Diocretes began to vault (consecrate) the temple of Arsinoe in Alexandria.\* Vitruvius, in recording the names of artists who wrote on their work, says, "Theodorus Phocæus (scripsit) de tholo qui est Delphis,"—on the vaulted (temple) which is at Delphi. Roman temples, we know, were sometimes vaulted, as at Nismes, at Baalbe, and the temple of Honour and Virtue at Rome. \* \* \*

We have evidence of the arch existing in the time of Alexander, it having been used by Diocretes in the temple of Arsinoe: we have seen it attributed to Democritus, one century earlier, while a conjecture has been raised that its origin was of a still earlier epoch, the opinion seeming to be based on monuments the antiquity of which could not be disputed.

It is well known, however, that the Greeks were in the habit of appropriating to themselves the discoveries of other nations, and we must therefore go back to a far earlier date for the discovery of this important principle. It has been found that the arch was very generally made use of in Egypt 1400 years before the time of our Lord, as is proved by the monuments of Thebes and paintings at Beni-Hassan, while a still earlier use is shown by the brick pyramids, which were built several centuries earlier.

Thus it must be acknowledged that, were the question even about a vault, it is far from improbable but that a vault might have been employed; but the frontispiece does not show a vault, it merely represents a wooden ceiling of a circular form: the one is an arch of masonry and construction, the other of mere form and semblance. It is unnecessary to say that there is a vast difference between the two. I do not show a vault,—not that I doubt the antiquity of the vault, but because I believe that most of the temples were culled with wood.

\* \* \* \* \*

Having restored the colonnades as described, I found that there was yet remaining a considerable space to account for, while, on the other hand, I required the utmost altitude, in order to admit the statue. This space being just sufficient for a semicircular arch, and the arch being the form which filled up the angular lines of walls and rafters with least sacrifice of room, I did not hesitate to adopt it, particularly as I considered that this was the only form capable of admitting the colossal image, and that it was the only form in which the hyæthral opening could partake of a graceful character. As regards effect, I consider that the arch-form gives greater height and magnificence to the building than any other, and that it best harmonizes with such a statue."

#### COPPER AND ITS RELATIONS.

It is to the dark and obscure periods of our prehistoric annals that we must look for the origin and development of the art of working in metals. Next in order, and standing in bold relief to the barbarous usages of the stone period, followed a step so gigantic in the march of civilization, that history itself will scarcely afford another instance so remarkable. The discovery of the method of working in metals—and copper was among the first of these—constituted a memorable triumph of mind over matter; and was of such importance in its results, that the Bronze Period of the archeologist will ever be regarded as an era in the social existence of our race.

The antiquity of copper is thus possessed of no common degree of interest. Its relics, indeed, form the best and most connected link between the minds of this generation and of those that have long since passed away. The tombs of Memphis, the cemetaries of Etruria, the disintegrated treasures of Pompeii, or the relics of Scandinavian superstition, bear testimony alike to the universal applications of copper, and bring to light the same glimmering indications of human progress. The bittern intractable boulders of granite, or the softer limestone rocks, were fashioned into square blocks, and at length applied to all the purposes of building. The gregarious and social habits of our race, even in its ridest stages, led to the formation of communities. Coinage was established, and the principles of currency originated. Spade husbandry—if the miserable flint and wooden implements permitted anything deserving of the name—was changed for that of the plough. Men began to practise the humanizing usages of interchange and commerce; and not only that, but they also—after a time and time-honoured principle in political economy—improved their warlike instruments.

\* Plin. xxiv. 14.

The pages of sacred history abound with minute accounts of the early acquaintance of the Jews with the arts of metallurgy. But with regard to their mines, and their mode of working the ores, the same accuracy is not preserved. "Report states," observes Bishop Horne, "that there was anciently a copper mine at Aleppo, which, however, must long since have been abandoned; but the fact substantiates the accuracy of Moses in his description of the Promised Land, as 'a land whose stones are iron; and out of whose mountains thou mayest dig brass' (or copper, as the word should be rendered)." Egypt furnishes some of the most interesting relics of copper which have yet been brought to light. From the indelible paintings on the tombs of Thebes we likewise derive a very complete and accurate knowledge of the modes of casting bronze practised by the ancient Egyptians; and what is very remarkable, the same methods, and, with but little improvement, the same implements, are still employed by the Arab and Chinese workmen of the present day. The early inhabitants of Etruria and Central Italy were particularly skilled in the arts of mining and smelting copper. They possessed a bronze and a copper coinage from the earliest times; and the singular application of the copper ploughshare, to mark the boundaries of a city—as Romulus ages afterwards did at the foundation of Rome—was one of the superstitious purposes to which the metal was put among the ancient Etruscans. The Greeks were, also, at a very early period, familiar with the uses of copper, and with the art of smelting its ores. Their chief supply of minerals was first obtained in Attica, and from the island of Cyprus (from which place the metal derives its name); but in process of time they sought for and discovered it in Western Asia, in the south of Italy, in the Alps, and in the mountains of Spain. The Greeks and Romans were profuse and even prodigal in their consumption of this metal. Enormous quantities of copper were consumed in the production of their colossal bronze statues, the ornaments of their temples, their instruments of art and war. The scholar, the antiquary, and the admirer of ancient art, will alike regard with interest this period in the history of copper, on which, however, it is beyond our present purpose to dwell.

The origin of the art of alloying copper with tin to form bronze is lost in the obscurity of the mythological period. But we cannot fail to perceive, at a single glance, the exceeding value of this discovery, which, in all probability, was made by accident. Copper is, comparatively, a soft metal, and of itself altogether unfit for the fabrication of the sharp and cutting instruments of art and war, which the tastes or necessities of mankind desired; but mixed with tin in proper proportion, it forms an alloy so singularly hard and dense, as to be equal almost in these respects to tempered steel, and certainly far superior to the softer kinds of iron. Bronze implements are also possessed of a much more imperishable character than those of iron. A small bronze knife, dug up at Thebes, was found to have preserved its edge as perfect and entire as it could have been 2,000 years ago, when it was first cut. The proportions of this alloy seem to have been ably and almost scientifically investigated by the ancients. Indeed, it has been held—and Dr. Priestly was of this opinion—that they were acquainted with some alloy, or possessed some mechanical means of hardening copper to a degree much greater than the bronze of modern generations. Bishop Watson, however, controverts this view; but the point is of small importance, since it is indisputable that the ancient metallurgists were, either from observation or experience, remarkably skilled in the proper proportions of its manufacture. It is very singular, moreover, that all the specimens of ancient bronze which have been analysed correspond closely in those relative proportions which are known to produce an alloy of maximum hardness. Some bronze nails, for example, and some ancient coins of Corinth, a very ancient Greek helmet, now in the British Museum, and an antique sword found in France, have been shown to contain respectively from 86 to 88 per cent. of copper, and from 12 to 14 per cent. of tin.

Of copper mining in England we have no authentic history. It seems probable, from certain rude indications in old and abandoned mines, that copper was worked at a very remote period in the mountains of North Wales by the ancient Britons. It is also probable that in the county of Cornwall the early workers of tin—whose traffic in that metal we read of with the Phœnicians—could scarcely fail to make the discovery of copper,

since the ores of the two metals are sometimes found in intimate contact. But however this may be, we know that this immense source of mineral wealth was almost neglected in that county until within a comparatively recent period. We have also evidence to show that the Romans worked copper mines in England; and, from the existing remains of these mines in Anglesa and Cumberland, together with their extensive applications of the metal, we infer that mining by them must have been pursued with their characteristic skill and with their accustomed success.

It was not until the middle of the last century that copper mining in Cornwall received its greatest impulse. Mines were sunk to greater depths: new hydraulic engines were constructed; the machinery improved; and the operations generally systematized and reduced to method. Hence it was not long before this important branch of mining enterprise assumed its true position in the valuable produce of the country. Sir Charles Lemon has computed that for fourteen years previous to 1758 the yearly value of Cornish copper was 160,000*l*. Half a century later the same annual produce had increased to 550,000*l*. and now the copper works of Cornwall and Devonshire are undertakings of enormous magnitude.\* They are sunk in some cases to the enormous depth of 300 fathoms, and are drained by means of the celebrated Cornish engines which for size and power are unparalleled in any country in the world. They are generally worked by companies of adventurers. If the mine be on waste land, it belongs to the revenues of the Duchy of Cornwall, and the lease is obtained from the Crown. If on private property, it is let from time to time on special terms, and these consist of a payment in kind, varying from 1-25th to 1-10th part of the produce. It is proper to state, however, that these rates, or "lord's dues," as they are termed, are modified with the facilities of the difficulties of working the mine. Some copper mines pay thousands of pounds sterling of rent to others, again, pay no rent whatever. The profit arising from them, however, are occasionally very large. Sir Henry de la Beche mentions a copper mine,—that of Wheal Alfred, in Cornwall,—having afforded at one time a net profit of 140,000*l*.

But we could not, perhaps, select a better illustration of the enormous extent of these copper mines than what is comprehended in the statistical tables of Mr. Burri's valuable paper, in the *Mining Review*, respecting the celebrated consolidated mines in Cornwall. These mines are situated about two miles east of Redruth, and they form one of the remarkable chain of important mines existing on the great mineral vein which traverse this district in an easterly direction, from the Land's End in Cornwall to the Dartmouth hills in Devonshire. They are, or at all events they were recently, the richest mines in Cornwall; and they are still by far the deepest mines in England. They consist of four distinct mines,—Carhurruck, West Wheal virgin, Wheal-virgin, and Wheal-fortune. The nature of the rock is chiefly clay-slate, resting upon granite; and the metalliferous veins are from two or three to seven or eight feet wide. The depth of the vertical shaft in one case exceeds 1,300 feet. The underground workings extend to upwards of seventy miles of linear measurement! The ore raised are chiefly copper; and of these the blue and green carbonates predominate. Nine steam engines are employed in the drainage; and their probable equivalent in actual power is 4,500 horses. The annual expense of this drainage is 12,700*l*. The quantity of ore produced is, on an average of ten years, 16,000 tons of copper and a little tin; the value of this, 119,800*l*. The total cost of the mine annually amounts to 93,500*l*. exclusive of lord's dues; and, with these, to 98,500*l*. clear profit to the proprietors, 21,000*l*. per annum. Amount of capital invested, 75,000*l*. In interest, after paying back the original capital 200 per cent! Number of men, women, and

\* The total quantity of copper ore raised from the Cornish and Devon mines during the year 1858 realises 1,957,534*l*.; the value of the copper and copper ore imported into the United Kingdom during the same period amounted to 3,099,916*l*., making a collectively amount of 4,157,351*l*., while the export of wrought and unwrought copper for the same year represents a sum of 2,032,217*l*., thus leaving an amount of copper to the value of 1,224,134*l*. for home purposes for that year. The average price per ton of copper ore was—

Cornwall and Devon	£5 14 8
Australia	20 4 0
New Zealand	14 0 0
Chili	18 10 3
Cuba	13 3 0
Spain	9 6 0

\* *Wheal* is a very old Cornish word, signifying pit or mine. It is met with at every turn of mining phraseology.

children employed, about 2,500, of whom about 1,400 work underground.\*

Such are the plain matters of fact connected with a Cornish copper-mine in the nineteenth century. This, however is only one, though certainly it is a remarkable example of profitable adventure in copper mining. The celebrated Barra Barra mines, in South Australia; the Santiago and Cobre mines, in Cuba; the Copiapo mines, in Chili, and others might be named that are equally startling in their amazing richness. But the picture has its dark side. A copper-mine is not always such a profitable adventure, as some of our readers may know to their cost.

We may add here, that although Cornwall and Devonshire are so remarkable for the produce of copper ore, not a particle of it is smelted there. From the great poverty of coal in these districts, it is found better to transport the ore to the coal districts of South Wales, chiefly to the extensive copper works of Swansea and its neighbourhood. The propriety of this will be very apparent from the fact, that for every ton of pure copper produced from average ores, about twenty tons of coal are required.

It is very surprising how poor an ore of copper may be profitably mined. Mr. Allan, speaking of one of the Cornwall ores, observes: "Though copper pyrites occurs in vast profusion, it is by no means a rich ore; what is picked for sale at Redruth rarely yielding twelve, generally only seven or eight, and occasionally as little as three or four per cent. of metal. In the latter case, such poverty of ore is only made up by its facility of transport, the moderate expense of fuel, or the convenience of smelting." The copper slate of Mansfeldt, which has long been celebrated for its copper-mines, is also a remarkable instance of this. Here there has long been pursued a scientific system of mining; "and such," says Dr. Ure, "is the influence of a wise administration on the economy of mines, that the thin layer of slate in this formation, of which 100 lbs. commonly contain but 1½ lb. of copper—occasionally argenticiferous—has been for several centuries the object of smelting works of the greatest importance to the territory of Mansfeldt and the adjoining country. The frequent derangement which this metallic deposit experienced, led skilful directors of the underground operations, at an early period, to study the superposition of the accompanying rocks. From their observations, there resulted a system of facts, which have served to guide miners, not only in the country of Mansfeldt, but over a great portion of Germany, and in several other countries where the same series of rocks occur."

Copper ores are abundant in Sweden, Russia, Persia, Japan, Cuba, Chili, Colombia, Australia, and many other countries, where, however, mining is not pursued to a large extent. Some of the mines in Cuba were worked in the seventeenth century by Spanish adventurers, but were subsequently abandoned by them. They have only recently been reopened, and were found to be of great value. In Sweden, the celebrated copper-mine, in the province of Dalecarlia, is supposed to have been wrought for 1,000 years; and Gmelin, the celebrated German chemist, has traced the remains of mines on the southern and eastern borders of the Ural mountains, which, it is conjectured, must have been the work of a nomadic people, ages before the conquest of Siberia by the Tartars.

The mechanical treatment of the ore at the mine, preparatory to its sale, is effected in a variety of different ways. It may receive a first sorting either in the mine or at its mouth. It is first separated into small pieces, and then picked, or sorted, into heaps of relative richness by children, who soon become surprisingly expert in the selection. It is then pounded, crushed, washed, separated as much as possible from impurities, and finally sampled and sold by public ticketing to the smelters. This last transaction has continued to exist in Cornwall, without change, for upwards of 100 years. The sales of the ores take place weekly, at one of the principal hotels in Truro, Redruth, or Poole. Samples of the different lots are procured by the buyers' agents—and every

copper-smelter has such a functionary constantly in Cornwall—who, on the day of sale, attend and procure their offers. On these ticketing-days, dinners are or used to be given, like City feasts, to the purchasers, at the expense of the mine.

Copper is distinguished from all other metals by its beautiful and characteristic red colour. This fact could not have been stated so explicitly some years ago; for the metallic substance known as Titanium, long classed by chemists as a pure metal, was also possessed of a splendid red colour. But Wöhler has since shown this substance to be a compound. Copper is frequently met with in nature, sometimes beautifully crystallized. In Siberia and the Farøe Islands, arborescent groups of native copper are disseminated throughout the amygdaloidal rocks of these districts. It has also been found in Cornwall; and in the red sandstone region of the United States it exists in fine crystalline masses. But the largest specimens of native copper known to exist have been found in the district of Lake Superior. One remarkable mass, recently discovered there, has been estimated to weigh upwards of eighty tons.

Mineralogists know of about forty different minerals containing copper. Of these many are associated with sulphur, selenium, arsenic, and antimony; others with oxygen, and chlorine; and carbonates, phosphates, and sulphates are very frequent in their occurrence. Commercially speaking, the most valuable minerals of copper are copper pyrites—the yellow sulphuret of copper, the blue and green carbonates or malachite; the oxide, phosphate, silicate, and some others. The first of these—the copper pyrites,—is by far the most common ore of copper, and constitutes, indeed, the chief supply of the mines of Cornwall, and those of Mansfeldt. Malachite is a very beautiful mineral. It is found abundantly in Siberia, and some localities in the north of Europe; and an almost inexhaustible field seems to exist in the copper districts of Australia. It admits of a high polish; and when large enough is cut into vases, book-plates, and other ornaments. The beautiful and costly malachite doors, from Russia, in the Great Exhibition,—which were purchased by Mr. Hope at an enormous expense,—must be fresh in the recollection of our readers. The Museum at St. Petersburg contains a *monstrous* block of this mineral, weighing upwards of forty tons, and valued at 20,000*l.* The phosphate, and some others of the copper ores, are likewise very beautiful minerals.

Indeed, the characteristic feature of copper and its minerals is that of extreme beauty. The salts of the metal are especially remarkable for the delicacy of their blue and green colours. Blue vitriol is a "gorgeous azure," and the sulphate or nitrate of copper with ammonia constitutes the fine blue coloured solution through which the chemist loves to transmit the rays of his gas-lamp. The alchemists of old were so alive to the rare beauties of this metal, that they called it after the planet Venus; and this signified, in their fantastical creed, the essence of everything that was beautiful and fair to look upon. Some salts of copper are employed in the arts as pigments. The neutral acetate of copper, the sub-acetate, or common verdigris, and the Schiœnfurt or Vienna green—a combination of copper, arsenic, and acetic acid—constitute the splendid mineral greens of commerce. All these compounds of copper are poisonous; the verdigris which forms on copper cooking utensils is dangerously so. On that account, copper should never under almost any circumstances be employed for this purpose, particularly when brought into contact with substances containing fat or vegetable acids, in which case a peculiar and most energetic chemical action occurs to produce the poison.

#### ARCHITECTURAL COMPETITIONS AND SPECULATIVE BUILDING: THEIR EVILS AND REMEDIES.

I THINK these subjects are closely connected; certainly they are allied in a money point of view. First, with regard to competitions.

"We call it a society," says Carlyle, "and go about professing openly the best separation— isolation. Our life is not a mutual helpfulness, but rather, cloaked under due laws of war, named 'fair competition,' and so forth, it is a mutual hostility."<sup>1</sup> How true is this respecting architectural competitions! Few occur but what the competitors quarrel with the judges, being, at the same time, so jealous of one another, that they have never been able to settle the proper regulations. The judges, also, are often at war,—two

factions contending for the mastery. And "fair competition,"—who does not fear the uselessness of sending in, without having a friend on the committee? Then, again, more especially with reference to recent Government competitions, the barracks and public offices, principles of equity are totally disregarded. True, the merits of some of the competitors were acknowledged; true, the premiums were paid; true, few architects would have made any drawings were it not for the implied condition that the successful competitor should be employed; but true it also is "We have profoundly forgotten that cash payment is not the sole relation of human beings; we think, nothing doubting, that it absolves and liquidates all engagements of man. . . . Did I not hire them fairly in the market? Did I not pay them, to the last sixpence, the sum covenanted for? What have I to do with them more?"<sup>2</sup>

Then there is the reprehensible proceeding of men setting themselves up as judges, well quite unfit for the office, for few competitions have taken place in modern days in which the judges were qualified to decide. Were they familiar with the principles of art; acquainted with its true scope; unswayed to false systems; able to separate in a design what is the designer's own from what belongs to others; and that which is appropriate to the present age from that which was suitable only to races long since passed away? For mark, the judges should have all the above qualifications. How was it in ancient times? Winckelmann observes of the Greeks, "The reputation and success of artists were not dependent upon the caprice of ignorance and arrogance, nor were their works fashioned to suit the wretched taste or the incompetent eye of a judge set up by flattery and fawning; but the wisest of the whole nation, in the assembly of united Greece, passed judgment upon and rewarded them and their works; and at Delphos, as well as at Corinth, contests in painting, for which judges were specially appointed, were instituted in the time of Phidias."<sup>3</sup> So Ferguson remarks, "Had Pericles and Leo X. not been as familiar with the processes and exigencies of art as any of those that surrounded them, and had the artists of their day not been gentlemen in feeling and education, and treated as such, the arts of their respective ages would never have risen to the elevation that marks them." Now, as the same author continues, "In almost every competition that has taken place for a public monument, it has, either from ignorance or unfairness on the part of the judges, degenerated into a job; and no man of gentlemanly feelings could subject himself to the trickery and chicanery that are requisite to get a design accepted. If he did so, he would soon cease to be either a gentleman or true artist; and although those in the humbler walks of art can, in the mass of the public, secure some patrons, they must descend to their level, and flatter their feelings and prejudices to secure a verdict in their favour and a remunerating price for their works, for it comes to that after all."<sup>4</sup> We have lighted on the brilliant discovery that, because a man is a peer, a millionaire, a member of Parliament, or of the parish vestry, he is qualified to decide momentous questions of art, and to pronounce what rewards are to be assigned to those who have devoted their lives to the subject. It may be said that people who pay ought to have a voice in the matter. The question, however, is, whether they want the best that can be had for the money, and are competent to choose for themselves.

Looking at competitions with purely monetary considerations, the present system is founded on gross injustice. Whatever certain benefits there may be rests with the public; the consequence of this ignorance of the true artist's certainty of reward being that the public rarely, if ever, receive any real and lasting benefit. The individual artist has only a chance of remuneration; while numbers of meritorious practitioners are sure to lose their time. There is also the erroneous supposition that architects are men of fortune; the members of other callings not being presumed to have that leisure which comp-tee gives, enabling them to devote their time and money to a given purpose, with only a probability of remuneration: they will not gamble.

Speaking of the competition for barracks, the *Builder* justly observed:—"There were 114 sets of drawings; and if we take 50*l.* per set, which will be a low figure, the account will stand as follows:—

\* Ibid.

† "The History of Ancient Art among the Greeks."

‡ "An Historical Inquiry into the True Principles of Beauty in Art."

\* Some years ago, a party of Cambridge philosophers undertook, for a scientific object, to penetrate into the vast depths of this mine. The venerable Professor Faraday, who made one of the number, used to relate with infinite gusto the following startling incident of his visit. On his ascent in the ordinary manner, by means of the bucket, and with a miner for a fellow-passenger, he perceived, as he thought, certain unmistakable symptoms of frailty in the rope. "How often do you change your rope, my good man?" he inquired when about half way from the bottom of the awful abyss.—"We change them every three months, sir," replied the man in the bucket; "and we shall change this one to-morrow, if we get up safe!"

\* "Past and Present."

114 sets of barrack plans at 50l. per set. . . . .	£5,700 0 0
Premiums paid for same . . . . .	600 0 0
	£6,300 0 0

In other words, the architects who have entered into competition give 5,100l. to the country, exclusive of professional knowledge. And this sum of 50l. does not represent more than one-third the actual money-cost paid to assistants for some single sets of plans.\* The Government retained the whole of the designs, whether premiated or not.

None who refer to the premiums usually offered can be surprised that competitions fail to elicit worthy results. It may be stated, as a general rule, that no one has the slightest conception of the data on which these premiums are fixed. We find one fortunate architect actually getting 5l. for a design for a church. The committee of the Mechanics' Institute, at Alford, asked for designs for a building to cost 600l., offering three premiums of two guineas, one guinea, and half a guinea. For laying out, &c., four acres, on which a dwelling-house, a lodge, offices, and stables were to be erected, and providing a specification and estimate, "a 10l. prize" was advertised; with, however, the advantage of inspecting a plan by the talented and munificent proprietors. The guardians of the Blandford Union required a workhouse for 250 inmates, "the drawer of the plan" to receive 10l., "provided that he should not afterward become the contractor for the work." These are not solitary, but common instances of the parsimony and ignorance of people; who, nevertheless, find architects too degraded, or too poor, not to spurn their offers; nay, they are often willing to pay for particulars.†

As to the time allowed, the present manufacturing system has led to the idea that architects can produce elaborate results at the slightest notice. Mature thoughts, originality of conception, and truthfulness, are not, however, now required; and an architect would lose all chance of ascertaining what he judges best, instead of ascertaining what is most likely to please a committee, who know little or nothing of the subject. When Michelangelo was asked by Julius II. to design his sepulchral monument, he brooded over the subject for months, without touching a line; but the result was worthy alike of the artist and of the pontiff.

These, then, are the evils of competitions. The judges are usually incompetent; being no more qualified to give an opinion on art than on the technicalities of a lawyer's or doctor's vocation. Impartiality is rarely observed, it being continually settled beforehand who is to do the work, which is sometimes put into the hands of a favorite protégé, instructed to gather what there is of value in the competitors' productions. Numbers throw away their time, in order that one may have a chance of employment. Leading architects will not compete, unless for an extensive production, or the competition is limited. The premiums are nearly always inadequate, considering the risk of total loss, and sufficient time is rarely allowed. For a single case in which the best design is carried out, in fifty, one of the worst is adopted. Altogether, the system, as now practised, is unsuited to the present constitution of society.

How is it to be reformed? The celebrated competition for the reconstruction of the gates of the Baptistery at Florence teaches a valuable lesson to artists and to the public. "From amongst a great number, seven were selected by the *consoli* as worthy to compete for the work, upon terms not merely just but munificent. Each competitor received, besides his expenses, a fair indemnity for his labour for one year (the time for competition). . . . There were thirty-four judges, principally artists, some natives of Florence, others strangers: each was obliged to give his vote in public, and to state at the same time the reasons by which his vote was justified." The works of Brunelleschi, Donatello, and Ghiberti being selected from the rest, "the suffrages seemed divided; but, after a short pause, and the exchange of a few whispered words, Brunelleschi and Donatello withdrew, generously agreeing and proclaiming aloud that Lorenzo had excelled them all, that to him alone belonged the prize; and this judgment, as honourable to themselves as their rival, was confirmed amid the acclamations of the assembly. . . . The great artist was not hurried into carelessness by their impatience or his own; nor did he contract to finish it, like a blacksmith's job, in a given time. He set about it with all due gravity and consideration, yet, as he describes his own feelings, 'with infinite diligence and infinite love.' He

began his designs and models in 1402, and in twenty-two years from that time—that is, in 1424, the gate was finished. . . . Such was the glory which this great work conferred, not only on Lorenzo himself, but the whole city of Florence, that he was regarded as a public benefactor.\* I know it will be long before these suggestions can be adopted. There are too many important committees and vestry men in the way; very estimable in their counting-houses and shops, but who would feel insulted not to be able to help their friends.

Next, with respect to the system of "speculative building," i.e., building not for convenience, durability, and bounty, but to obtain the utmost amount of money, in oftentimes, the most unprincipled manner.†

In England, says Hassenfratz, writing in 1804, "Il est rare qu'on achète le terrain où l'on veut bâtir; mais on l'engage pour 20, 30, 40 ans, et on paie une rente; cet article seul est une grande économie de capitaux; et quoique au bout du terme prescrit les édifices reviennent au propriétaire du terrain, l'art de bâtir pour un temps déterminé a été si perfectionné qu'il est rare que le propriétaire en retire le moindre avantage." Rare method, by which the interests of freeholders and builders are rendered so perfectly antagonistic! But who is really benefited? Not the freeholder; not, certainly, the occupants of such houses; and, as to the enterprising, speculating builders, ruin commonly overtakes the most astute.

Happily our Continental neighbours have avoided a system which goes far to account for those long rows of ugly houses,—one propping up the other, with rectangular holes for windows, flat arches, settlements in all directions, and not the slightest aim to beauty, except, perhaps, by means of flimsy cement work, "hiding with ornament the want of art," and which are peculiar to a country where it does not pay to build otherwise than for a very limited time. So long as the English public are content to live in houses run instead of built up; so long as people consent to build on leaschold, instead of freehold ground, and encourage "tendering" for work, in place of measuring it when done, and paying fair and current prices; and so long as competent and honourable professional men are excluded from the supervision of builders, so long shall we continue to have houses as they now are, but not as they ought to be. EDWARD L. TARBUCK.

#### THE SERPENTINE BLUNDER.

THE Select Committee, as we last week stated would be the case, have reported against the mistaken course that has been adopted, and on which thousands have already been wasted. After describing the condition of the Serpentine as given to them in evidence, the various plans at different times submitted, and the arguments used in support of the course adopted, the report thus concludes:—

"If a supply of fresh water sufficient not only to replace the waste, but to provide for a continual charge, were impossible to be obtained, in the absence of another alternative, filtration might be justifiable; but your committee believe that such a supply of fresh water may be obtained from the springs within or contiguous to the Serpentine, from an enlargement of the water shed of the park and Kensington-gardens, and from other sources which have been pointed out to the committee. Some of this supply may be obtained by means of simple gravitations at a small expense.

Conflicting evidence has been given as to the quantity and quality of the water that can be pumped from the well in Duck Island, but Mr. Hawksley states in his evidence that he entertains no doubt that a considerable supply of water can be procured in the neighbourhood of his works, and that an increased amount of water could be drawn into the Serpentine by an extension of the surface drainage of the park and Kensington-gardens.

We have had, however, a more embarrassing task than to decide merely whether Mr. Hawksley's plan is the best for effectually cleansing the Serpentine. We have had to consider whether that plan, recommended by great engineering authority, adopted by the Executive Government, sanctioned by Parliament, and nearly approaching its completion, is so unsatisfactory in its object and means that it ought to be arrested, even in its present stage of advancement, and the work which has been performed diverted to other purposes. After much patient investigation, we have arrived reluctantly at the conclusion that the proposed filtration will not be effectual for the desired object, and that this cleansing process ought not to be carried on in one of the most beautiful of our Kensington-gardens. We recommend, therefore, that the project of filtration be abandoned, and that the best available

\* Mrs. Jameson's "Lives of the Italian Painters."

† "In an account of a bankrupt's final examination, recently published, it appears the petting creditor, who was the mortgagee of nearly all the bankrupt's property, had agreed to leave some land to the bankrupt, had induced him to expend 4,000l. of his own money on it, to get largely into debt in covering the land, and had proposed to the bankrupt to assign the whole of his property to him, and then to go through the Bankruptcy Court, promising him, after he should have obtained his certificate, to give him 1,000l. to 'begin again' with."—The Builder, no. 710.

‡ "Traité de l'Art du Charpentier."

supply of fresh water be poured in to such an extent as to produce some continual flow.

Whenever the Metropolitan Board have completed their works for the diversion of sewage from the Serpentine, measures should be taken for rendering the bed of the lake clean and hard. We have not come to any conclusion as to the extent to which the mud ought to be removed, hardened, or covered, nor as to the relative merits of gravel or concrete as a covering, nor as to the expediency of burning it, nor as to the depth which would best promote the convenience and safety of bathers and skaters, and the purity of the water; but we are of opinion that the present condition of the bed of the Serpentine absolutely requires amendment."

Of course it must not end here. Having got out of the wrong road, the Government must now at once get into the right one.

#### ARCHITECTURAL INSTITUTE OF SCOTLAND.

At a meeting of the Architectural Institute of Scotland, in George-street Hall, Edinburgh, on the evening of the 2nd day of April, the report of the council upon the drawings sent in, in competition for the prizes offered by the Institute, was read, and the prizes were delivered to the successful competitors, viz.:—

1. For the best geometrical drawing. Medal.—Alexander C. Beattie, apprentice to Mr. David M'Gibbon, architect, Edinburgh.
- Second Prize.—Thomas Bryson, apprentice to Messrs. Poddie & Kinneir, architects, Edinburgh.
2. For the best series of drawings of architectural details, measured and drawn from the originals. Medal.—Francis D. G. Stanley, apprentice to Messrs. Brown & Wurdrop, architects, Edinburgh.
3. For the best original design: Subject—an ornamental public fountain. Medal.—John Alexander Hamilton, apprentice to Mr. David Rhind, architect, Edinburgh.
4. For the best model in clay of an architectural ornament, being an original design. —George M'Callum, apprentice to Mr. William Brodie, R.S.A.

Afterwards a paper was read "On the Domestic Architecture of Italy and France during the Middle Ages, and the period of the Renaissance," illustrated by drawings, by Mr. Robert Anderson, architect, Edinburgh.

#### BISHOP AUCKLAND TOWN HALL, ASSEMBLY ROOMS, AND MARKETS.

We have already mentioned that the first premium offered for the best design for Town-hall, Assembly-rooms, and Markets, for Bishop Auckland, Durham, was awarded to Mr. J. P. Jones. The accompanying engraving illustrates the selected design.

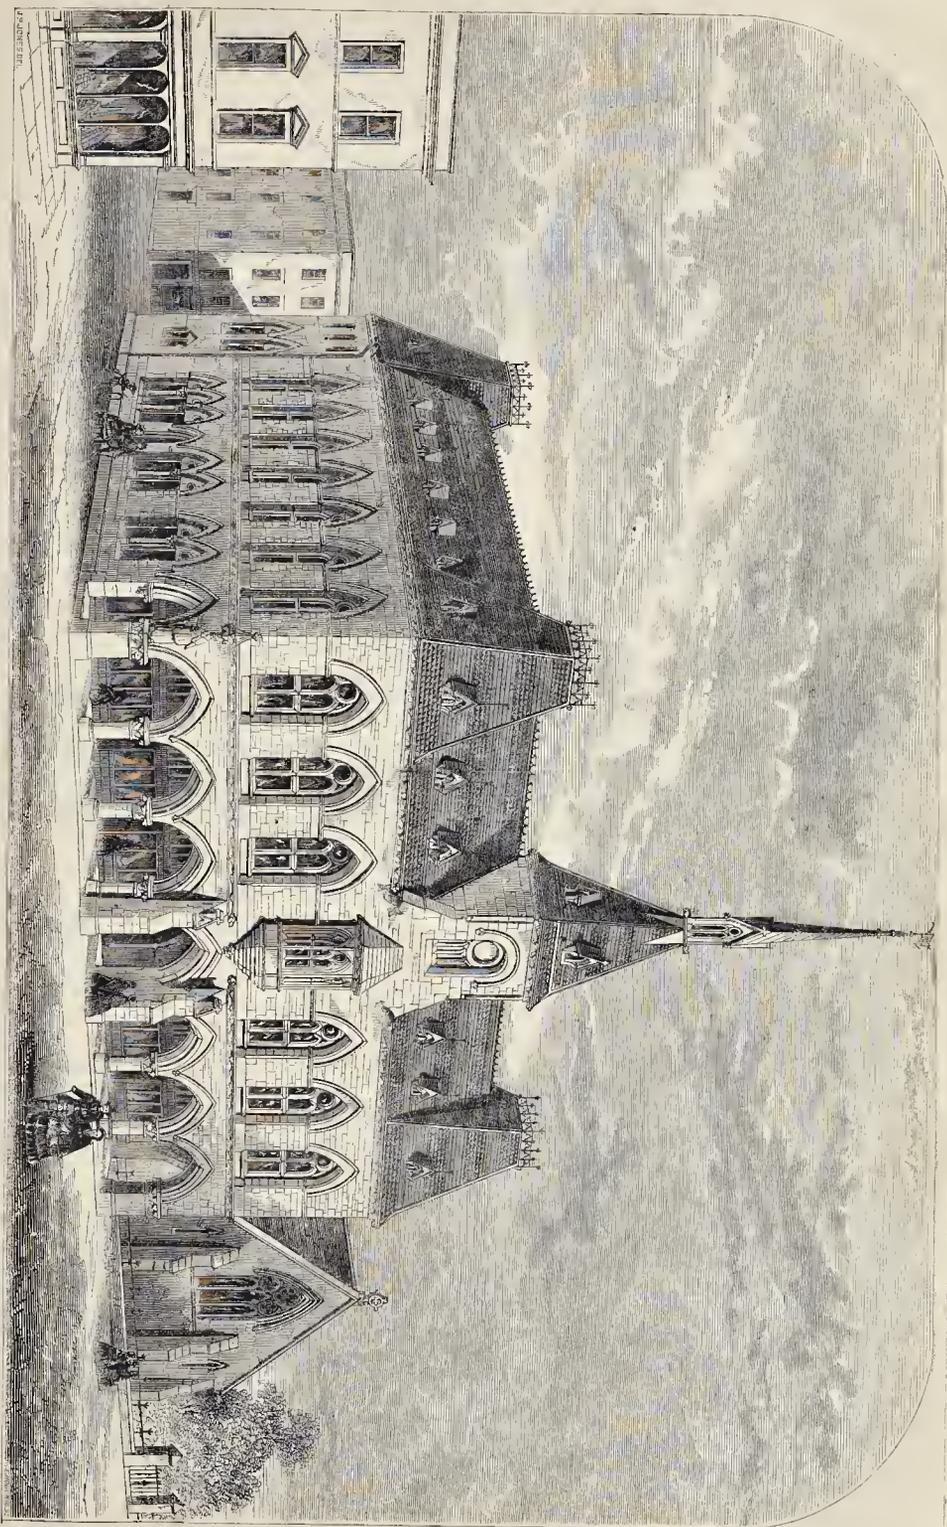

On the ground-floor is placed a large room for Mechanics' Institute, with ante-room, news-room, offices for Town-hall Company, and Board of Health. These are approached from the entrances at the side facing north. On the west, a principal front, under the arcade are shops, with living-rooms over; and in the centre of this front is the principal entrance to the covered market, and also to the Assembly-room, over the rooms above mentioned. The market is in the rear of the front building, and open to the roof, with a gallery for butter, poultry, and other dairy produce, the butchers' stalls being on the ground-floor. The gallery and the roof are to be constructed of iron, and the whole of the roof is to be covered with glass; the spandril of arches to be filled in with ornamental scroll-work, and coloured in blue and white. There are three entrances to the market, one for the north, west, and east, leading into three different streets.

On the first floor is the large assembly-room, 86 feet by 40 feet, with vaulted ceiling, divided into compartments by moulded ribs, resting on foliated capitals and shafts, the whole to be decorated with colour. At the end is a recess for an orchestra and organ. The assembly-room is approached by two large staircases, one at each end of hall, 20 feet square. A smaller public room is attached to the larger one, facing the west, or principal front. Retiring-rooms are also provided, 35 feet by 30 feet, with coved ceiling.

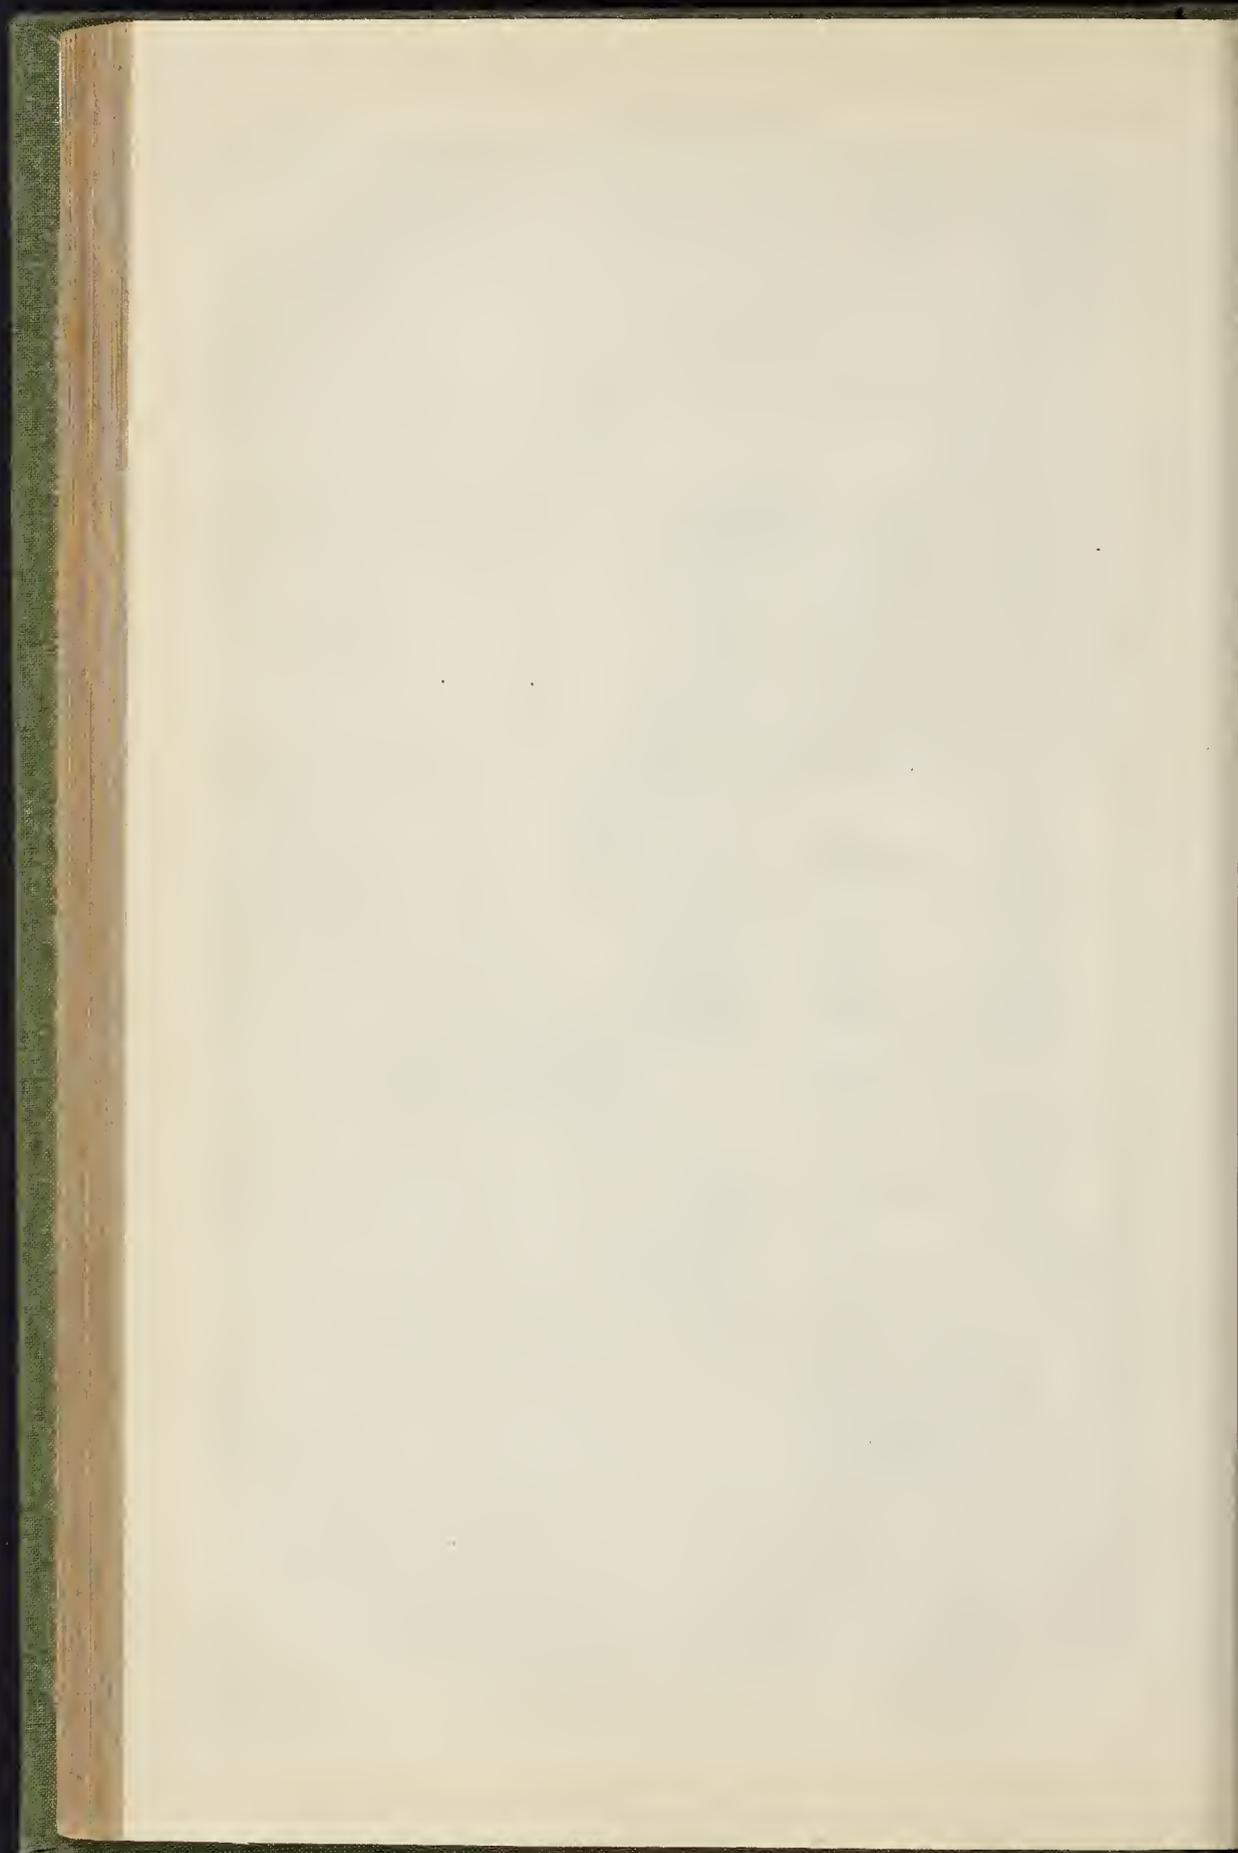

On the south side is a Gothic chapel, so that it was thought best to design the building so as not to interfere with it by placing an Italian building close to it. The architect sent in both a Classic and a Gothic design, and the directors, on his recommendation, adopted the Gothic as most suitable; it also afforded the best accommodation, it is stated, and was the most economical; effect being aimed at by outline alone. The stone of the neighbourhood is the material indicated for the buildings.

SELECTED DESIGN FOR BISHOP-AUCKLAND TOWN-HALL, ASSEMBLY ROOMS, AND MARKET.—MR. J. P. JONES, ARCHITECT

THE UNION OF ARCHITECTURE AND SCULPTURE.\*

HAVING touched cursorily on some phases of the union of sculpture and architecture in the ancient days of the Egyptians, Assyrians, Greeks, and Romans, I will proceed to those of modern times. I will, however, my space will restrict me to a still less adequate mention. But I would, previously, make a few remarks on some principles which are practically in the union of sculpture with architecture.

The geometric decorator, or sculptor of decoration, as distinguished from the sculptor on stately proper of the human figure, is well aware, when he has to fill a space in harmony with the surrounding features, that he must set out with selecting a geometric skeleton of just device, or scheme of general guiding lines, on which to construct his composition. I do not, however, notice that this principle is always equally or adequately recognized in the profession of sculpture proper—in which, nevertheless, it is equally essential to good effects.

In the arrangement, for instance, of the sculpture for a classic tympanum, this consideration, after the choice of the subject, has the first claim for attention. In this case of the tympanum, no scheme of general arrangement, perhaps, is superior to that of the circle in the centre, pretty nearly tangent to the base line, and to the apex of the roof, and then flowing off in waving and harmonious lines towards either end. On this the composition would be conducted invariably, like a circle, or conventional forms, as regards balance and play of line, and yet informed with the variety of human form and vital action. I would, however, by no means intimate that this special scheme of guiding lines, in the centre, with wavy lines waving off on each side, is the only one applicable to the sculpture of a tympanum. On the contrary, I merely put it forward as one of which the effect is harmonious, and consonant with the spirit of the space it occupies—as thus:—

The mission of a roof is to cover over, as it is the mission of the pillars beneath to support. Thus the pillars, by their fluting, support the tympanum, and, on the other hand, is the gable of the roof, and shows its spread, and therefore the forms which occupy it should partake of the same spreading character in their composition and arrangement, as the pillars, beneath, have that of the evil effects of confining the pillar lines upward, and we have good reason to accept as the case with the sculpture of the tympanum of the Parthenon.

Also within the tympanum, the metopes, the Parthenon treatment affords examples of a perfect harmony between the groups as sculpture and their decorative effect, as regards the architecture.

The frieze also encompasses the temple beneath the colonnade with a zone of perfect architectural decoration, at the same time that it is unsurpassed as relief sculpture.

In all these several cases there is no compromise. The two arts moved on hand in hand with perfect ease and pleasantness, like two young and loving sisters. I will now say a few words as to statues and groups in relief sculpture, as regards architecture.

By statues and groups in relief, I mean those so intimately bound to stand by themselves and apart, in contradistinction to those in relief, which are attached to a background, or those statues which, being arranged as in a tympanum, partake of the nature of relief.

All such statues as I speak of now, as in the round and apart, may be regarded as final in architectural form. One of the most common of these is the vase, not in direct connection with architecture, and also in gardens of geometric plan.

Vases are of various proportions: some of these are tall, and some wide, which fits them respectively for different situations.

Now we shall find that various of the best statues, in different situations, afford the noblest contours. Let us instance as one example the Venus of the Medici. This, in the principal view, as regards general arrangement, takes the contour of a long ovate or egg-like form with a top and base—or in other words, that of a tall vase.

From this we may turn to its antipodes in human form—the Hercules of Glycon—or as it is commonly called—the Hercules Herculeus. This statue is a geometric contour, somewhat like a cone, but still like a vase, only wider at the foot than the Venus, so as to give the look of geometric quality.

Both these statues, diverse as they are in character, may be considered architecturally as having a common quality—as being both statuettes, vases, or vase-like statues; and this quality no doubt had a large part in obtaining for them that wide popularity which they have ever enjoyed. In ancient art they were more rare than any other statues, greatly no doubt because they came in so comfortably as final and architectural elements, came in so comfortably as final and architectural elements, as to recollect this when designing a figure, that a pleasant geometric contour is one passport to fame.

In modern art, the well-known group of the Rape of the Sabinas, by John of Bologna, yields a good instance of a vase-like form with a serpentine line of decoration round it, like a vase with a wreath of flowers.

As regards, however, tall vase-like forms produced by sculpture proper, perhaps no better example exists among Greek or modern works than the well-known classic group of Cupid and Psyche. You may turn it round in all directions, and yet in each does it preserve that taper, all directions, which renders so elegant a figure, and so apt as an architectural enhancement, and this without transmuting or fettering its grace and action.

Do not for that taper, statuettes vase-forms: now in relief sculpture, the Sibyl, and other figures, are highly desirable in connection with architecture, is most generally gained in sculpture by seated statues. The Lorenzo made by Michelangelo, and seated, is a fine example of this. Also the beautiful work of the Pisa, and so on, and so on, as an architectural enhancement, and this without transmuting or fettering its grace and action.

Another of the most important and valuable geometric forms for sculpture is the pyramid, instanced in the Laocoon, and also in groups on the summit of triumphal arches, which are somewhat of the tympanum form of group, freed from the bounding architectural lines at the top. This was attained in Roman art by the group of four horses, and the general or imperator standing super-eminently in the centre, as also is supposed to have been the case with the occupying the statue of that king there occupying the case.

A great deal more remains to be said on this subject, for which I have not space now. However, it may be

safely accepted, even as regards sculpture *per se*, that a statue is ever the better for geometric symmetry of composition, and for more useful architecturally.

I have already, as you have recognized, brought in one or two modern instances to assist as illustrations of the general question; nevertheless, take it altogether, dating from the time of the construction of modern art has not been so thorough-going in the union of the arts as in previous periods. The brevity therefore forced on me by my short remaining time will be the more excused in treating the question in more modern days.

The monstrous abuses of the late Roman Empire especially, brought vast discredit upon statues, and in the fourth and fifth centuries, there arose in the Greek Church, a sect of enthusiasts, called emphatically, Iconoclasts, or Image-breakers, from "eikon," an image, and "klasto," to break, who, founding their indignation upon a false reading of Scripture, went about smashing every statue they could by their hands on, and of course did not have any made. These, therefore, as you may conceive, were not very good times for sculptors, whose profession, for some centuries, was depressed in consequence. Eventually, however, the intellect of Europe saw through the falsities of these ideas, and sculpture arose and attained great perfection in the Italian school.

The Mohammedan portion of those who lit their "lamp of architecture" in the modern art, have never got over their prejudices. Their prophet had told them they could make no statues except under the penalty of having to find souls for them at the day of judgment, and a sufficiently ludicrous and absurd story, and yet, nevertheless, one which has proved sufficient to frighten sculpture out of Islam to this day.

Pope's law, however, however, "The noblest statue of mankind is man," is especially applicable to art, and assuredly no style of architecture can be of the highest rank which does not amicably and cordially unite with painting and sculpture of the human form. Thus Mohammedan and Saracenic styles which ignored it altogether, and even, never, in dignity and expression, take rank beside those which welcome it in the fullest degree, as the Greek and Italian.

Byzantine architecture was not much enhanced with sculpture originally, because of the prejudice I have already mentioned; nevertheless, our own grand and broad Norman and Gothic arches, like the Durham Cathedral, which is an offspring of that style of the early church we call Byzantine, this style is, I conceive, full of undevoted harmony, with the highest class of sculpture and sculpture, in its simple, grand, free, stable, and Anglo-Saxon, and offers a large scope to combined art.

Having now no time for the just consideration of the Italian combination of the arts, we will proceed to Gothic,—that exquisite, varied, and picturesque style, so dear to landscape, which, when produced with most felicity, seems more like coral spires and stalactite caves, wrought by gnomes and faeries, than the work of men's hands, and which has enriched modern Europe with so many picturesque and charming compositions. Elegant picturesqueness is indeed its great characteristic; and this is by no means confined to its youth and freshness, but is at least equally striking in its age and decay. One loves, indeed, Gothic in all her phases,—in her cry-talline completeness, and in the gray rain, in her sculptured vaults, tremulous with music, and streaming with rainbow tints, from her storied windows, and in the mouldered base, beleeked with ivy and wild grass, and must, save the voice of the owl.

Also, may peculiarly say, that no country surpasses these isles in the beauty of Gothic architecture. Yet we must not, when it is tested by a question such as this of to-night, allow our enthusiasm to run away with us.

This style has received great accession of force of late, by having been adopted by various men of great talent of this day, and adopted exclusively, yet we must not allow this accession to carry us too far. Gothic has its great and varied beauties, yet, as it is, and as it has existed, up to the present time, it has also its great shortcomings.

When a question like this of the union of the arts, comes before us, so important to their advance in this country, it is essential to treat it openly and without reserve, and it were duplicity on my part, invited as I have been by the Architectural Committee, to treat the subject, if I were to belie my convictions, or shrink from expressing them, even if what I say may not in all quarters be acceptable.

The whole course of our argument teaches us the propriety of the union of the arts. Do we not all believe that they should meet and be a mutual aid like sisters? For my own part I believe in the perfect harmony of the arts on the same level, and as a direct consequence, that no style of architecture cannot be of the highest class, unless it will unite cordially with the highest class of painting and sculpture.

I believe the different arts thus afford a mutual test of excellence, and that the proof of high excellence existing among them, is when they are perfectly free and unrestrained in each other's company. Now comes the important question,—can Gothic architecture offer this unconstrained welcome to the sister arts? or, in other words, "Is Gothic architecture in harmony with the highest class of painting and sculpture?"

This special question has been pretty well winnowed during the latter part of the year in an architectural periodical. On September the 9th, I first asked this question in the terms I have just used.

The result of this was, as you understand, a variety of correspondence, for not one-half of which the Journal could find room.

If it may be alleged that judgment was allowed to go by default, I could not help that. For my own part, I simply gave on asking my original question in various ways,—"Is Gothic architecture in harmony with the highest class of painting and sculpture?"

At first there was some indignation expressed at my asking such a question at all, and it was replied to, point-blank, that Gothic architecture was in perfect harmony with the highest class of painting and sculpture. Examples, however, seemed to be all on investigation, and a retreat was sounded into Upper Italy; among examples, however, in which it was evident that neither the painting, sculpture, nor architecture were of the highest class. Some of the instances attempted to be brought in answer to my question were peculiarly unfortunate, as those of the Angels of the Lincoln spandrels, which were, as sculpture, highly laudable, but as architecture, were certainly here in the Architectural Museum open to the close view of the public, when we heard no more about them.

That there are some fine examples of Medieval Gothic sculpture is undoubted, and this is especially the case with recumbent figures on tombs, which by being less closely connected with the structure, are less constrained by it.

Also it must be acknowledged that the earlier and simpler styles of Gothic are more favourable to the introduction of high art than those which are most elaborated. Yet it is equally certain, and without going into details, I am sure it will be allowed, that there are no specimens of Gothic sculpture at all equal to the sculpture which grew up in consonance with the art of other styles,—as the Greek, Roman, and Italian. Now, what is the occasion of this? I do not think difficult to reply.

In these styles—Greek, Roman, and Italian, architecture is a "Lady Bountiful" in her hospitality to her relations. "Come in," she says, "my dears; make yourselves quite at home; do as you like; sit here; stand there; do not stand upon ceremony; be quite unconstrained; the house is your own; follow your own inspirations." This is what architecture says on welcoming her sisters at the door of her Roman, Italian, or Inigo Jones's mansion. But it is a very different thing at the door of her Gothic house; her note is quite changed then. Then it is, "I am very glad to see you indeed; but you must behave yourselves; you must be staid and demure; you must stand upon ceremony; or you must bend your neck so to accommodate an arch; and you must be highly pre-occupied and even on gold grounds if you wish to be quite in the way of the house. And you (speaking to Sculpture) must be an English and architectural, which is pretty nearly the same as saying you must be constrained, archaic, and unattracting.

Indeed, as a general rule, it may be said, that in the purest and most characteristic, and most thorough development of Gothic, the paintings go into the windows of the sculpture into the niches, where the one is transparent and the other in duration; and where, in consequence, instead of vital and individualized works, they become only secondary,—not on a level with the architecture, but quaint, cramped, and conventional.

Even with a recollection of various of the sculptures of the Cathedral of Wells, Lincoln, Ely, and Westminster, I think I must acknowledge that the best examples of Gothic sculpture I know, are modern. Those of Gertrude of Louvain, but a few years deceased, various of the casts of whose excellent works were at the Crystal Palace at Sydenham, and are now at a stockport, some of which, especially as I love fairness, and that both sides should have their best illustrations, I have been lately, to my regret, unable to see. I am, however, in vain, to get up a subscription and buy for the Museum.

These works, however, excellent as they are in spite of difficulties, most clearly evidence and illustrate the efforts of a great genius working under circumstances which will ever be the case while Gothic continues what it is, and sculpture tries to work to its phase.

This is a blot on the escutcheon of Gothic, and it behoves the Gothicists to strive to wipe it out. I admire Gothic architecture, I do not hesitate to affirm that if that style, as at present constituted, were to come into being exclusively,—for, mind you, it is only its exclusiveness I object to,—in this country, it would be to the vast and direct disadvantage of the higher qualities of the sister arts. It behoves all art-lovers of extended views to regard this attentively, and the architect and artist especially to look to it.

The adoption of the Gothic style—now many years ago—for the new Houses of Parliament, admirable as a work of genius as that elaborate structure is, has already been a great injury to art. How different would have been the result, to painting and sculpture had those houses been, instead of some broad, simple, enduring style, like that of Inigo Jones or Sir Christopher Wren, whose styles are quite as much beloved to this country as any other style, and the elements of which are the common heritage of man, especially of European man. How far nobler and more congenial would then have been the scope afforded to the sister arts!

I am telling a truth,—a truth which finds its response, I believe, in the mind of every painter and sculptor who has worked for that building, which, in its way, nevertheless, is one of the finest in the world. I believe it an correct in saying that the architect himself is not answerable for the adoption of the style, but that it was imposed on him.

But now let us take another and a more agreeable phase of this subject in considering, merely for the time, what might be the best for the interests of Gothic, *per se*. We have heard much of late of a new Victorian style of Gothic, which is to be, of this, the nineteenth century, fresh, new, and which is to surpass all others. The prospect is pleasant, hopeful, and inspiring, and in regard to it I would venture to submit a proposition—whether there could be a better clue towards originality than that which Gothic has never as yet thought it worth while to trouble herself about, viz., the seeing if it cannot be thoroughly fair, and liberal, and cordial to her sisters?

I would, indeed, take this opportunity of again putting publicly this important question to the art lovers and workers of Britain. If Gothic architecture is at the present day really to advance, would not one of the best inspirations of her fresh career be to try and see whether she cannot welcome and foster the highest development of the sister arts with the same perfect freedom, scope, openness, heartiness, and cordiality, as the styles of Greece, Rome, and Italy have already done? For then, and not till then, do I conceive, will she prove herself to be of the highest class of her own art.

There is one other point in which I wish to call attention before I conclude. A point also, I conceive, of great importance to the progress of the arts considered in its mutual relation, and that of their union: I mean that of a universal Museum of art.

This may, from its wideness, appear at first a vague term, but I will explain what I mean. I mean by it a museum in which should be set forth clearly how man has built in all ages and climes.

This might be well effected by means of a collection and exhibition, on a grand scale, of drawings and models of completed edifices, arranged sectionally and chronologically, beginning with Egyptian, Cyclopean, and so on, and coming down through all the styles of ancient and modern time, to the present. These should be set forth with suitable explanations and illustrations of the most varied kind as the museum advances.

It has, fortunately, now become the fashion, and I hope something more, the sentiment and feeling of the people to discuss architecture, its style and meanings, and yet of those who discuss in the drawing-room, and in the portion who could stand even a school-boy exaltation on its history and details!

\* See p. 198, ante.

As regards the workman also, what opportunity has he of gaining this knowledge at present? Yet this Universal Museum of Architecture, which I sincerely trust will be such information so easily before him that he would be able, within the hour or two he could spare, on one visit to attain, so as to carry away with him a general knowledge of "how"—as I have said, "men have built in all ages and climes."

Thus all classes would be benefited. I have spoken, at various times, myself, to some of all classes nearly, on this subject, and the answers have been, with almost exception, to the same effect, that "it was what would be individually most welcome to each person."

Also, it is a great gratification to me to be able to acknowledge here, the ready indulgence that this view received at once from the committee of the Architectural Museum, who have already endorsed it with their distinct approval. Also, I may add, that the Department entertain the proposition with favour. Nothing, however, has as yet been done practically, except as regards the Gothic part of the subject.

But the very soul of the idea, and the value of its realization, exists in its universality, which would rest on the fact of each style of architecture being represented clearly and fully under equal advantages of location and light; and that each style should be illustrated with photographs, &c., of details and examples of such paintings and sculptures and decorations as are proper to each, or copies in small of them, so that the visitor might compare the advantages and qualities and beauties of the different styles fairly and freely.

The history of architecture has been said to be almost the history of the world. It must also be recollecting that architecture is, as it were, the very backbone of art, on which so much of its form depends. Painting and sculpture are directly affected by architecture, and even pieces of metal work or majolica porcelain depends in degree on the time when it was made, and the apartments to which it was to be an adjunct.

Wherever, therefore, this Universal Museum of Architecture were erected, it is evident that it should be in close connection with the arts of painting, sculpture, and decoration, and that art-education to which it will be the best guide.

It is true that the realization of this idea requires space and funds. There is, however, space around to build, if Government and the public would fund the funds. I would desire to say here, by way of parenthesis, that I am in no way connected with the Department of Science and Art, or with the Architectural Museum, and am only speaking as one of the public. To resume, even if it is also that this idea of a Universal Museum of Architecture is one which has not hitherto been carried out in any other country, and that it remains for Britain to do first, as she did the first great international Exhibition of the world, Britain is slow to move—proverbially so—yet, when she does move, she generally does things well. I hope this will be the case with the Universal Museum of Architecture.

To conclude: at the commencement of this address I spoke of architecture, painting, and sculpture as having voices. Perhaps it were by closer simile, and more of the former as the symphony, and of the latter as the vocal accompaniment—architecture as the instrumental music, and painting and sculpture as the human voices that accompany it and give it speech. Let there, at any rate be harmony between the arts—if possible on the highest level—but at any rate let there be harmony; and when in presence of a grand triumph of architecture, painting, and sculpture combined, let us regard it, and listen to it, and drink it in, as we do the storied strains of Handel, Haydn, Beethoven, or Mozart—

"Music married to immortal verse."

Nothing at least can illustrate and emphasize better to the true and Catholic love of art, of all the arts the advantage of their Harmony. — JOHN BRILL.

#### THE ORNAMENTAL SCULPTOR, HIS PATRONS, AND THE PUBLIC.

Of all the decorative arts the one with which the people of this country are least acquainted is architectural sculpture. This may appear strange from the fact that there are voluminous specimens in our principal thoroughfares, crowning in playful grace, inviting the gaze of the curious, but they are not regarded. City gentlemen, in their breathless haste, have no time for works of art. The consequence of this apathy of taste is, that buildings are finished, the carvings executed, criticised and admired by a few concerned, and soon forgotten as things without existence, except by a few of those unknown individuals whose livelihood depends on the production of similar works, who for their own instruction or pleasure stroll occasionally to those spots in their artistic researches.

There are gentlemen who delight in the great masters, talk of the antique, admire exquisite wood carvings, and revel in periods of architecture; who can give you accurate dates of all transitions from the Egyptian through all styles, and who have learned by rote all the changes from the Early Saxon to the fifteenth century, and yet are perfectly ignorant of the works of modern times; men who talk of Grinling Gihbons, and never bestow a glance at the beautiful sculptures of St. Paul's. Then there are architects, professors, and critics, the latter whose business it seems is to

\* Mr. Bell is probably aware that the desirability of such a museum has been long urged in our pages; and even earlier, that is before the foundation of the present Architectural Museum, by Mr. Godwin in a correspondence with the late Lord Northampton, the desire then being to induce the trustees of the British Museum to commence such a collection. Mr. E. B. Lamb, too, if we recollect rightly, wrote on the subject. The architect who reported to the Government Department of Art, in 1857, took the same view: see their report in our volume for 1859, p. 614.—Ed.

find fault with all artists and artistic productions, without imparting instruction to any one. The former, instead of pointing out the faults or beauties of existing modern works, for the information of the public, are continually engaged in controversies on the different styles of architecture,—a subject to which there can be no conclusion unless by annihilation of Gothic or Classic, one having as much right as the other to be used and admired.

In order to make the position of the ornamental sculptor understood, it should be stated that these seeming patrons of art retard the growth of talent by their feeble efforts to promote it. Before our national artists can be made to shine, it must be the province of gentlemen who practise architecture or lecture on sculpture, either by profession or for pleasure, to instruct the public in the practical parts, so that they might better judge; for one-half of the people of this country have not the slightest notion how the works of art in question are produced. There is scarcely a carver who has not in his time been asked, when producing a piece of work, if it can possibly be in the solid, or how the projecting leaves or other ornaments are stuck on.

Even gentlemen of the Architectural Museum, in their laudable desire to promote this branch of art, make great mistakes by being too narrow in their limits, and too much confined in the scope they allow to art-workmen. Instead of teaching him by an elementary process, they should discover his present capabilities, which can easily be done by reference to modern sculptures, such as the Assurance Office, King street; the Bristol Bank, and other sculptures recently executed in the City. They may then know that there exist many men with far greater talents than any who have yet competed for prizes at the Museum, and who, if a wider field were open to them, would be glad to contribute specimens of their art which would be worthily so excellent a place of exhibition, and alter the opinion of the public, who take for granted the specimens there to be the best modern art of its class the country can produce. If those gentlemen were to offer prizes for the best pieces of architectural carving, without confining it to any style, period, or subject, there would no doubt be a ready response from a number of men who would submit works of an original and probably superior class.

That there are many horrid abortions amongst the modern works must be granted, but the existence of such works as the carvings at Badmister Church, Margaret-street Church, Greenwich Catholic Church, Bourne-street Church, new church and other works at Halifax, Ely street, Shadwell Court, and hosts of other specimens in the metropolis and provinces go far to prove it is not entirely the fault of the carver (and that at least there are some architects who manage rightly), but the negligence or incapacity of individuals in authority in not putting the work into the hands of real or competent artists. The practice of giving the work to any applicant who will do it cheapest, without requiring a guarantee of his competency, is amongst the grievous wrongs which affect the ornamental sculptors of England. And until architects consider the sculptural portions of their designs important enough to be reserved for their own disposal, instead of connecting them with the builders' contracts, we shall continue to have masons, and the drones of the profession, that are only fit to follow and assist, supplanting the legitimate carver, and bringing into disrepute his works, the result of which is a prevailing opinion, that the English are far behind in works of art, and the frequent employment of foreign artists.

The above being a statement of the position of the English ornamental sculptors, I beg that in justice to them you will insert this letter.

CHARLES GRASSBY, Carver.

#### CITY OF ELY WATERWORKS.

In addition to the communications of which we spoke in our last, we have received one signed "Baldwin Latham, Surveyor of the local Board, Ely," wherein the writer says:—

"The works there are so constructed as to be supplied with water from natural gathering-grounds, the catch-water drain of Caudle Fen forming the boundary of one side of the works, from which a pipe is laid to the filters; but it has been found by experience that the water is of a quality very inferior to that taken from the river Ouse, and consequently is but seldom used. There can be no doubt that the local Board only abandoned the idea of supplying this city exclusively from gathering grounds, from a thorough

conviction, after due experience, that Mr. Lee's scheme was altogether insufficient for the purpose, and from necessity took themselves to the river as the best and most abundant supply that could be procured in the neighbourhood at the least expense to the rate-payers.

The original estimate of 25 gallons per day for each inhabitant, for every purpose of public and private use, giving 170,000 gallons per day for the whole population, has been found here as in many other places very far below what is actually required,—a fact now well known to most engineers; and in this city, a quantity of not less than 900,000 gallons per day has to be pumped up by steam power for the general use of the place. This increased demand has, of course, increased the consumption of coals, and will necessitate some material alterations and additions to our works.\*

#### COMPETITIONS.

*South Myton, Hull.*—We are informed that Mr. R. Blessley's design has been selected in competition for St. Luke's Church, South Myton, Hull, by the Committee of the Hull Church-Building Society, and is to be carried out under his superintendance.

*Croydon.*—The first premium for the Croydon burial-ground and chapel has been awarded to Mr. E. C. Robins, architect.

#### A FOREIGN COMPETITION.

A CORRESPONDENT says there is a competition open to all countries, for a new Palais de Justice, in Brussels: first prize, 10,000 francs, second, 6,000—any style! It was mentioned officially in the *Independence* of the 50th of March. Designs are not to be full-size sketches, and are to be sent in to the Ministère de la Justice, Brussels, before the 1st of August next.

#### MASTERS AND WORKMEN.

If properly and fairly managed, much valuable information will be gathered by the Parliamentary inquiry which is at present going forward on this important subject. There is, however, one thing which we hope will not be omitted: this is the examination of a few intelligent and practical working men belonging to various trades. Without doubt the secretaries of trade societies are well fitted to supply a vast amount of useful information. Still, without the perhaps rough and homely expression of the views of the actual workers, this subject will not be properly placed before those who have the power of forming, or at any rate suggesting, Courts of Conciliation, which may be the means of improving the feeling between the employer and the employed, and preventing strikes, which are so injurious and destructive to all, not only those immediately concerned, but many others connected with various interests.

#### SCHOOL-BUILDING NEWS.

*Cley (Norfolk).*—The new British schools recently erected in this town were opened on the 29th of February. They have been built from designs prepared by Mr. John J. Davken, of Ilott, architect, and under his superintendance. They are in the Elizabethan style. The walls are of rubble, 20 inches thick, faced with stones gathered from the beach, having bands of red brick-work, with moulded brick ashlar work round the windows and door frames, and to every internal and external angle of the building. The accepted estimate was 453l., with the old materials. The schools accommodate 110 children. The principal school is 45 feet 6 inches, by 18 feet wide in the clear, with a class-room attached, 13 feet 6 inches by 12 feet, fitted with gallery. The infant school-room is 18 feet square, with gallery to ditto 12 feet by 11 feet. The walls of both schools are 13 feet high. There are also three porches to the several schools, 6 feet by 6 feet. All the main timbers of the roof are exposed to view, and are wrought and stained. The desks and seats, with all the joiners' work, are stained and varnished.

*Farnham.*—The new national schools here are now completed. They were erected to hold, according to Government measure (6 square feet for each child), 150 boys and 120 girls. Mr. J. Colson, of Winchester, was the architect. Messrs. Chinnocks, Chichester, were the builders. The total cost, including fittings, apparatus, &c., amounts to 2,305l.; the builders' contract, 1,890l.; the grant from Government, 1,050l.; voluntary subscriptions, 777l. 17s. 6d.—The

\* A second letter from the same gentleman, in reply to "Dan," was too late for attention this week.

National school-rooms at the village of Wreckham, about one and a half mile from Farnham, are nearly finished. The cost of building them amounted to about £900, towards which the Government granted 500*l*. The remainder was made up by voluntary subscriptions. The rooms will hold 210 pupils, by the Government measure, 6 square feet for each child.

**Worcester.**—The new additions to the school-rooms in St. Paul's, the Blockhouse, says the local *Herald*, are nearly completed, and, together with the church to which they are attached, form an important nucleus for the rapidly-increasing population and newly laid out streets of that district. The principal school-room adjoins the old one, from which it is divided by a movable partition, so that both may be thrown into one, or kept separate, as the requirements of the school may render necessary. It has an open roof of stained wood, with a steep pitch, and is lighted by three-light windows, with trefoil heads, the south window having freestone mullions and alternate coloured brick in its arches, which is also the case with the heads of the doors. There is a room for the infants' school, and class-rooms up-stairs, besides a residence for the mistress. A large play-ground has been enclosed, and its iron railings were presented by a firm in the city. The exterior effect of the buildings, however, is very far from complete: the bell-turret is not yet erected, and the old schools, which are particularly ugly and badly proportioned, are not yet made to harmonize with the new buildings. This want of completeness is chiefly owing to the small sum granted by the National Society, and partly to certain red-tape restrictions. It is hoped, however, that some day the plan, as designed by Mr. Hopkins, the architect, will be thoroughly carried out. The present addition to schools, alterations of old schools, land, walling, &c., have cost about 940*l*.

**Holmer (Hereford).**—New national schools have been erected and opened in the parish of Holmer, near this city. The edifice is in the Elizabethan style. The cost of the land, building, fences, &c., was 450*l*. The school has been erected from the designs of Mr. J. H. Evans, of Hereford, architect. The contractors were Messrs. Morgan & Price, of Hereford.

**Great Horton (Yorkshire).**—The Wesleyans have just completed the erection of some school-buildings in Paternoster-row, Horton, and the Episcopians are employed in completing another building for the like purpose, near the Episcopal chapel. The Wesleyan schools were publicly opened on Shrove-Tuesday. The schools, from the designs of Mr. Samuel Jackson, architect, will accommodate 500 scholars, and comprise an infant school for children of both sexes under seven years of age, a mixed school for children above that age, with a sewing department for girls, and four class-rooms. The schools are one story in height, and are built in the Italian style of architecture. The residence of the master and mistress, two stories in height, is detached. The cost of the building, including the land, is 2,500*l*.

**Clun.**—The trustees of the Clun Hospital intend erecting schools for that district, together with residences for master and mistress. The building will be erected with stone of that neighbourhood, and is to be commenced immediately. The designs are by Mr. Edward Haycock, of Shrewsbury, architect; and the contract is taken by Mr. John Millington, of Oakengates.

**Tranmere (Cheshire).**—The foundation stone of new national schools, in connection with St. Catherine's Church, Tranmere, has been laid. The Catherine's Church, Tranmere, has been laid. The site is on the Holt. The schools are designed in the Tudor style, and will consist of rooms for boys, girls, and infants, so as to accommodate in all from 300 to 400 scholars. The material will be of brick, with stone dressings. The roofs will be of open timber work, dressed and varnished. Mr. Walter Scott, of Liverpool, is the architect; and Mr. Hogarth, of Rock Ferry, is the builder.

#### PROVINCIAL NEWS.

**Windsor.**—The new roads round Windsor, according to a western paper, are going to ruin in consequence of an unfortunate misunderstanding between the Windsor surveyors and the agents of the Crown. They are said to be now becoming dangerous, and injurious to conveyances of every description.

**Cardiff.**—The following tenders were received for the erection of the new station-house:—J. Griffiths, Newport, 2,751*l*. 10*s*., or with some alterations, 2,551*l*. 10*s*.; W. Smith, Roath, 3,528*l*. 13*s*. 6*d*.; A. Cbambers, Cardiff, 8,898*l*. 17*s*. 6*d*.; James & Price, 3,501*l*., if stone used instead of brick, 3,275*l*.; if Portland cement used

instead of Bath stone, 3,107*l*.; J. Webb, Cardiff, 3,696*l*.; R. Hughes, Bristol, 3,947*l*.; D. Jones, Cardiff, 3,589*l*. Mr. Winstone held that the tender of Messrs. James & Price was inadmissible, as it was hampered with so many conditions. The tender of Mr. John Griffiths was accepted.

#### EXCAVATIONS FOR THE CITY RAILWAY IN THE YORK-ROAD (MAIDEN-LANE).

The works here are steadily progressing under the hands of a numerous band of workmen. From the upper part of the King's-cross station an excavation is being made through the centre of the road, which, as the opening is dug of sufficient size, is arched over and then covered with hot pitch and the materials of the road. The crown of the arch the day crops out to within about 18 inches of the present surface; on this is a layer of red baked clay, and then broken granite. On the east side the quantity of granite and other materials extends to a depth of about 5 or 6 feet: in parts below this are the brick foundations of buildings, then black, poisonous-looking soil, and indications of sewers of an imperfect description. The labour of getting through this material is very great.

In the centre of the road, at a considerable depth, it is necessary to remove the large sewer which has been for some time in use, a new one having been made down the east side of the road close to the foot-path. The removal of this sewer seems to be anything but a wholesome process: a heavy, deadly smell comes from the opening, and the workmen seem to be oppressed with the gases amongst which they work. Although the day is clear and bright on the surface, the breath of the workmen may be seen below in the same manner as on a foggy November morning. The proper ventilation of underground railways ought to be an important consideration. The polluted condition of the soil shown in parts of this work,—and it is nothing here in comparison with some other quarters,—points out one of the causes of the ill-health of towns, and shows how necessary it is, in the formation of new neighbourhoods, to provide by proper drainage and by careful scavenging that what may be called the skin of London may be kept clean and wholesome.

So far as we have been able to learn, nothing of any great curiosity has been brought up. Several ragged workmen examine anxiously the throwing up of each spadeful: they rake amongst it, and break up pieces of concrete, &c., and are rewarded for their pains by the discovery of bones, rusty nails, and fragments of iron; should they light upon matters of greater curiosity, it is to be hoped that a careful chronicle of them will be kept.

#### CAST-STEEL BELLS.

We have been asked more than once where steel bells can be obtained. Such questioners we are forced in ordinary cases to refer to our advertising columns; but as this branch of industry is comparatively new, we depart from our rule and mention Messrs. Naylor, Vickers, and Co., of Sheffield,—the more readily too, because this firm desire to make an offer through our columns. The cast-steel bells, which are described as being much cheaper than bells of the ordinary composition, are at present little used in England: the consumption as yet is confined to the United States; and Messrs. Vickers, desiring to have an opportunity of placing a peal or a single bell (of not less than 1,000 lbs. weight) in some church in a central position in London, are willing to sell, at a reduced price, and subject to approval when hung, a single cast-steel bell, or a peal, for a London church in a central position, to the first person that will order from them.

#### ARTISTS' GENERAL BENEVOLENT INSTITUTION.

The anniversary dinner held on Saturday last was more numerously attended than has been the case for some time. The Right Hon. W. E. Gladstone presided, and advocated warmly the interests of the Institution. He was a little too metaphysical in his speech, but made one or two happy points. To the toast of the "Army and Navy," Sir Roderick Muroison responded. The Earl of Stanhope proposed the health of the chairman, pointing to him as an instance of what ability in even a younger son would do. "The Royal Academy" was replied to by Sir Charles Eastlake. "The Societies Established for the Promotion of the Fine Arts," proposed by Mr. Godwin, was responded to by Mr. Hurlstone;

"The Artists' Annuity and Benevolent Funds," proposed by Mr. Creswick, R.A., and replied to by Mr. David Roberts, R.A., and several other toasts followed. In addition to those already named, the assembly included the Hon. E. Stanhope, Mr. Charles Landseer, Mr. F. R. Pickersgill, Sir Charles Barry, Mr. S. Smirke, Professor Donaldson, Mr. T. H. Wyatt, Mr. Hardwick, jun., Mr. Egg, Mr. Frith, Mr. Elmore, Mr. Horsley, Mr. Millais, Mr. O'Neill, Mr. E. W. Cooke, Mr. W. F. Pollock, Mr. John Murray, Mr. Farrer, &c. The subscription list, read by Mr. Phillips, the honorary secretary, was a large one.

#### THE LATE MR. ROBERT STEPHENSON AND THE NEWCASTLE HIGH LEVEL BRIDGE.

SIR,—While the scientific world has to mourn the loss of two of the greatest practical engineers whose works have ever contributed to the glory and improvement of the whole civilized community, it is certainly much to be regretted that the mistaken attempts of injudicious friends and admirers of departed greatness should seek to invest their memory with false claims to which they themselves never pretended, thereby detracting from their real merits, and depriving humbler aspirants to public favour of the small share of honour justly due to them.

In the month of October, 1840, I was engaged by Mr. T. Storey, engineer to the Great North of England Railway, to assist his son, Mr. Storey, jun., in laying out the line of railway from Darlington to Newcastle, and preparing plans and estimates for the works of the same. I had been previously engaged for nearly two years under Mr. G. Stephenson, on the North Midland Railway, from Derby to Leeds, and while there one of the gentlemen of Mr. G. Stephenson's staff, under whose orders I was for some time acting, was Mr. A. Ross, at present engineer to the Victoria-bridge, at Montreal.

I joined Mr. Storey's staff, at Rusby Ford, Durham, October 29, 1840, and assisted Mr. Storey, jun., and Mr. Sowth, of Newcastle, in laying out the line to Newcastle. During the progress of the survey, Mr. Storey, sen., met us once at Chester-le-Street, and asked me if I thought myself competent to design several large bridges for the projected line, more particularly the High-level Bridge across the Tyne. This was about the 12th of November, 1840. Mr. Storey showed to me a design for this bridge by Mr. Green, of Newcastle, architect, the main feature of which was the adoption of laminated timber-ribs, a novel mode of timber construction, introduced (I believe) by Mr. Green himself, but which Mr. Storey did not approve of. This fact will serve to show that the project for crossing the Tyne upon the high level was no new idea, but had been for some time past in contemplation.

It must also be observed here that Mr. Storey himself belonged to that class of old-fashioned engineers who considered bridge building the duty rather of an architect than an engineer, and never attempted to design the larger works upon his own railway: in proof of this I may mention that the large bridge over the Tees, at Croft, on the line of the Great North of England Railway from York to Darlington, was designed by Mr. N. Welch, of Newcastle, and his name was engraved on the stone parapet of the bridge.

I readily undertook to prepare the designs in question, having for many years made bridge building my chief study, and when with Mr. G. Stephenson had opportunities of copying the designs and specifications, and witnessing the construction, of many large works of this character, although none equal in magnitude to the proposed High-level Bridge.

After the survey was finished, I commenced at Mr. Storey's office, St. Helen's, Auckland, designs for the following works, viz.:

One large timber viaduct, of one large and two smaller spans, across Shindliffe Grange.

One ditto, of three equal spans, across Chester Burn, at Chester-le-Street.

One ditto, of one arch, across the river Wear, at Durham.

Three ditto across the river Tyne, at Newcastle,—namely, one of stone; one of timber, with stone piers; one of cast-iron, with stone piers.

The main features of all these three last were the same: each design was intended to convey the railway across the river Tyne at a sufficient height to allow vessels of moderate size to pass under, and they were all intended to accommodate carriage as well as railway traffic.

Upon my completing these designs, Mr. Storey, mistrusting his own individual judgment, sent

them to Edinburgh, to a professional gentleman whose opinion he appeared to value highly: his name, I believe, was Byrne, but he was quite a stranger to me.

On the 21st of January, 1811, Mr. Storey, in consequence of some dispute with the directors of the Great North of England Railway, resigned his appointment as their chief engineer. Some disputes occurred between Mr. Storey and the company, relative to the delivery of his plans, papers, &c.; but this was ultimately arranged, and the whole given over as a temporary measure to a young engineer, formerly one of Mr. Storey's pupils. His name was H. Whitwell: he was a member of the Society of Friends, and nephew to Mr. Bachhouse, the banker, of Darlington.

Shortly after this, Mr. L. Stephenson was appointed the chief engineer to the railway company, in place of Mr. Storey, and the entire office at Darlington delivered over to his care: this was about the end of February, 1811.

As, however, the company, from want of funds or some other reason, was induced to postpone their works for an indefinite time, I left their employ on April 29th, 1811; and came to London, where I got an engagement under Mr. W. Cubitt, of Gray's-inn-lane.

From this date all connection with the Great North of England Railway ceased, and I had forgotten all about my designs, until I saw, many years afterwards, in the *Illustrated London News*, a large drawing of the Newcastle High-level Bridge, then just completed under Mr. Stephenson's direction, and I at once saw that it was an exact copy of one of the designs I had furnished to Mr. Storey many years before, and resembled it in every particular, even to the very foundation, as I afterwards learnt, when working drawings of the bridge were published.

The reader may form his own opinion upon this subject, which is merely a statement of facts; but, were Mr. Stephenson still alive, I feel certain that he would never have attempted to deprive one of the humblest professors of our noble science of the small amount of merit due to his exertions.

Upon a future occasion I shall have a few remarks to make upon the Tabular Menai Bridge.

EDWIN E. MERRALL, Civil Engineer, Madras.

#### CHURCH-BUILDING NEWS.

**Diss.**—The New Baptist Chapel recently erected here has been opened. Mr. Spurgeon preached in a tent on the opening day; and on the ensuing Sunday the architect preached two sermons in aid of the chapel fund. The new edifice, which is calculated to hold 650 persons, has been erected at a cost of about 2,000*l.*, between 500*l.* and 600*l.* of which remain to be liquidated.

**Stroud.**—The premium of 20*l.* offered for plans for the new church at Stroud has been awarded to Mr. Bland, of Birmingham. Some delay has arisen, it is said, from the difficulty of making a selection, on account of the excellence of one or two other plans.

**Bristol.**—The committee for the restoration of St. Mary Redcliff Church, in an advertisement in the Bristol papers, draw attention to a letter from S. W. Lucas, esq., of Birmingham. It will probably be recollecting that in a former letter Mr. Lucas offered to give 500*l.*, provided nine other persons would contribute a similar amount. The committee were not successful in obtaining the required number, and on informing Mr. Lucas of the fact he not only sent 500*l.*, but offers to contribute a further sum of 100*l.* annually for five years, on condition that the promise of a further sum of 800*l.* per annum is obtained. The committee, therefore, solicit the co-operation of those who can afford to help them. Four persons have already, we are glad to hear, intimated their willingness each to contribute 100*l.* for five years, and several others have promised smaller amounts.

**Plymouth St. Mary.**—The church of Plymouth St. Mary, Devon, has been re-opened, after having undergone a thorough restoration and repair. Of the sum required for re-roofing, re-paving, and general restoration, 1,000*l.* were levied by a rate of 2*d.* in the pound, two-thirds of which were borne by the owners and the remainder by the occupiers of the lands, the rest being made by subscriptions and special donations.

**Over (Cheshire).**—The foundation-stone of the new church at Over, which is to be erected almost entirely at the cost of Lord Delamere, by whom it will also be endowed, and which is intended as a memorial to the late Lady Delamere, was laid on Friday, 23rd March. The church will be of Geometrical Gothic design, and will consist of nave, chancel, north and south aisles, with a chantry and vestry on the north side of the

chancel, and a tower and spire (110 feet high, to receive six bells) erected at the south-west angle. Accommodation will be provided for 550 people, and sittings mostly free. The erection of a parsonage-house is said to be also contemplated by Lord Delamere. The total cost of the church, everything complete, is estimated at from 5,000*l.* to 6,000*l.* It is expected to be roofed in, and the tower and spire erected before the end of the present year; and it will be completed and ready for consecration in the spring of 1861. Mr. John Douglas, jun., of Chester, is the architect; and Mr. R. Beckett, builder, of Hartford, has received the contract.

**Stoke Bishop (near Bristol).**—The church of St. Mary Magdalene, Stoke Bishop, has been consecrated. The building is in the First Pointed Gothic style, from the designs of Mr. Norton of London, and consists of a nave, south aisle, and chancel, with sitting accommodation for 336 persons, about 90 free. Additional accommodation can be provided for 100 persons. The nave is 54 feet 6 inches in length, by 22 feet wide, the south aisle being of the same length, and 13 feet 6 inches wide. The chancel is 24 feet 6 inches by 17 feet, and terminates at the east end in the form of a polygonal apse. On the north side, and immediately behind the organ (which is by Mr. Bevington, of London), is the vestry-room. The chancel arch windows and the principals of the nave are throughout carried by columns of polished slate. The clerestory is formed of coupled lancets. The roof is in open timber work of stained deal, varnished. The cost of the building, according to the contract, was 2,300*l.* The three apse windows of the chancel are filled with stained glass by Messrs. Clayton & Bell, of London, and represent nine scenes in the life of our Lord. One was presented by Mr. Phippen, one by Mr. Penny, and the third by subscription. Two more stained windows for the south aisle are promised by two ladies of Stoke. Over the altar is a piece of sculpture, representing the supper at Emmaus, and executed by Mr. Farmer, of London. The floor of the chancel is ornamented with tiles, inlaid with Paisleywax stone; and the altar standards are by Mr. Singer, of Frome. The pulpit, font, capitals, corbels, &c., were carved by Mr. White, of Bristol. The whole of the work has been carried out under the superintendance of Mr. Wilkinson, the clerk of the works. When the necessary funds are forthcoming it is intended to erect a spire, of the height of 150 feet: the present windows, also, will be superseded by lights of stained glass.

**Barnsley.**—At a recent meeting of the local Board of Health, the tenders for the erection of a new cemetery were considered, and the necessary work let as follows:—Mason's work, Mr. T. Richardson, of Bretton West, at 1,390*l.* 14*s.* 9*d.*; joiner's and carpenter's work, Mr. Henry Harrison, Barnsley, 435*l.* 13*s.* 7*d.*; slating, 139*l.*; plumbing and glazing, 8*l.*; ironwork, 50*l.*; Mr. W. Brown, Barnsley; plastering, Mr. W. Barker, Leeds, 7*l.* 14*s.*; carving, Mr. Mawer, Leeds, 80*l.*; painting and staining, Mr. Chas. Rogers, Barnsley, 30*l.* 8*s.* There was a difference of upwards of 700*l.* between the highest and lowest tenders for the mason's work. Lightning conductors, &c., and extra excavations were not included in the tenders. The estimated cost for these is about 140*l.* The total for the whole of the works amounts to 2,437*l.* 10*s.* 4*d.*, being considerably lower than the Board calculated upon. The foundation stone of the above building, according to the *Leeds Intelligencer*, is to be laid on Easter Monday.

#### THE PAINTER-STAINERS' COMPANY AND DECORATORS.

The *Leader and Saturday Analyst*, which has commenced a new career, restricting itself to original papers, urges that there is life yet in the City trade Corporations, and thus notices one effort that is being made to revive it.—The able and intelligent master of the Painter-Stainers' Company, one of the most ancient of the City guilds, has put forth a plan which is certainly likely to arouse the attention and excite the efforts of the operatives engaged in house-painting and decoration, which he very properly styles art. He seems to have thoroughly mastered his subject, and has not forgotten, with any antiquarian *diletantisme*, to revive obsolete ceremonies or forms, or even usages, but comes at once to utilizing the powers and means of the Guild to modern requirements. We cannot better show his plan than by his circular addressed to his own trade.—The powers of the various Guilds are not maintainable under their

by-laws, and it must be acknowledged they have fallen into desuetude, and operate in restraint of trade. I consider, however, by substituting emulation for coercion, that the Guilds (especially those where skilful handicraft is required) might yet maintain as bodies a firm and useful position in society; and my suggestion for effecting this, as relates to this company, consists in inviting the workmen, artificers, and artists, connected with painting and decoration, to submit their works annually to public inspection; their merits to be judged by competent persons. The public exhibition of such works would take place at the company's ancient hall."

#### DECISIONS UNDER THE METROPOLITAN BUILDING ACT, 1855.

"NECESSARY REPAIRS."

**Marborough Street.**—Thomas Roberts, of New Ormond-street, Queen's-square, builder, was summoned before Mr. Bingham, by Mr. Charles Sliegh, surveyor, under the Metropolitan Building Act, "for that he did put up and erect a shop-front to the east wall of the house or building, No. 4, St. James's-street, which street is of a width greater than 30 feet, and which said shop-front projects more than 10 inches, to wit, 2 feet and  $\frac{1}{2}$  inch, whereas the said Act doth enact, that no such shop-front is to be erected, and the cornice thereof should not project more than 18 inches, and the defendant had not amended the irregularity, as required by notice, given by the district surveyor."

Mr. W. W. Donalson took the case on the part of the district surveyor; and Mr. Sliegh defended.

Plans of the building were laid before the court. Mr. Donalson stated, that by the 26th section of the Building Act, clause 1, a shop-front was not allowed to project, in a street wider than 30 feet, more than 18 inches, and the cornice not more than 18 inches, from the external wall. Said shop-front was wider than 30 feet. The shop-front complained of projected 2 feet and  $\frac{1}{2}$  inch, which was contrary to the express provision of the Act. He thought the case so clear that, unless he had seen the plan and counsel taking to defend, and a surveyor also, he should not have supposed there was an answer to it; but as it was so, there must be some points which had escaped his attention. He however, understood that the 8th paragraph of section 26 was relied upon, and that it would be contended that the shop-front did not extend beyond the general line of fronts in the street; and a plan had been prepared by the defendant's surveyor, which showed how he considered the general line of fronts to be, and to prove that the shop-front did not extend beyond that general line. He (Mr. Donalson) would call the attention of the master to the fact that shop-fronts were excepted out of this 1st clause, and it applied only to porticoes and other projections not being shop-fronts. Perhaps the defendant might think that he might bring his case within the 8th section of the Act; but here the whole front wall and the original shop-front had been pulled down and removed, and he would not contend that the 8th section of the Act brought any relief, unless it could be shown that the work done was a necessary repair not affecting the construction of any external or party wall. Here it was not a repair, but a reconstruction,—a new external wall altogether, and he submitted that an order should be made for amending the irregularity. Mr. Mayhew proved the re-erection of the new front wall, after the total demolition of the old, from the roof to the ground, and the fact that the shop-front with the brackets for the cornice 2 feet 2 inches, he submitted, was greater than the limits in the Act, which expressly lays it down that the greatest width shall be 30 feet the maximum of a shop-front projection shall be 18 inches and no more, and the cornices or brackets 18 inches and no more, unless it could be proved that the external wall, in consequence of the re-erection of the provisions of the Building Act, he had called on the defendant, and wanted patiently to have the same properly altered, but nothing was done, and hence the present proceedings.

Mr. Sliegh said that in the absence of the Legislators who framed the Metropolitan Building Act, with all its intricacies and anomalies, it was a very difficult task to get a correct elucidation. It had been truly remarked, that no man, with all its inconsistencies and absurdities, was able to define its own Act; but of that part of it, bearing upon the present case, he would take a common-sense view.

Mr. Bingham observed.—A common-law sense view, which would clearly establish that this was not a case contemplated by the Act. It was satisfactory to him to hear the learned gentleman, in his opening remarks, instance the very clauses which would supply the answer for the defence, though in his doing so he had somewhat misapprehended, as the adage had it, "the cart before the horse." He had referred to the 26th section before considering the preceding sections 9 and 10, of necessary repairs. The question really was, whether this particular building was still the old one with repairs, or now a new one? To him it was a new one, and he submitted, notwithstanding the fact that the premises secured and the fabric was not a new building, and no such amount of pulling down had taken place as would make it so. He would refer the learned gentleman to read *pari materia*, and the context borne in mind, particularly in this case, the 9th, as to the exception of necessary repairs, and then the 10th may be altogether ignored. That section defines what extent of pulling down and rebuilding he deemed a new building, but there the exception in the 9th section steps in as "necessary repairs."

Mr. Bingham said, "Occupants of premises sometimes take down one-half a building for purposes of ornamentation."

Mr. Sliegh.—But in this case it was not so, but alterations were made for the safety of the premises, which warranted the course pursued by the defendant, and "necessary repair" was the fully answer to the summons. The front wall was of precisely the same nature as the old one, new material only being substituted

for that which was dilapidated. Nor could it be said that the new facade, or ornamental finish of the stall-board or shop-front, exceeded the general hue of similar buildings...

Mr. Marsh Nelson, in evidence for the Defendant, stated that it was intended originally to alter the roof only, but the front wall was found so defective, that it was necessary to pull it down. The foundations remained, but the wall had been reconstructed in the same form as before.

Mr. Bingham delivered on the following day this judgment:—"I have carefully considered the various clauses of the Act, and have viewed the premises with a brother mason-trader, and we have agreed that, it having been satisfactorily proved that the work objected to was the rebuilding of an external wall for the purpose of necessary repairs to the structure, and that such repair did not affect the construction of the external wall, inasmuch as the apertures for door and windows were in the same position and of the same size as in the old wall, and the projection of the new wall was not more than half an inch, if at all, beyond the projection of the old wall, and, in fact, as nearly as possible, the same space,—the work objected to falls, therefore, within the exception in the 9th section of the Metropolitan Building Act, 18th and 19th Viet. c. 122, and the summons has not been satisfied, at all events, to a greater extent than half an inch, which, in strictness, ought to be planned off."

THE STONE OF THE NEW HOUSES OF PARLIAMENT.

THE remarks I made at the meeting of the Society of Arts, on Wednesday, 29th February, about the decay of stone at the Palace of Westminster, were not intended to make a charge of neglect against the contractors. I am really, with all my anxiety to admit that on all occasions, at every meeting on the subject of the quarries, or on the supply of Auston stone, both Mr. Grissell and I have evinced the utmost desire to assist in procuring the highest qualities, as met by working them about to commence; therefore I regret exceedingly that my observations should have been construed as a charge of neglect against those gentlemen, who no doubt possess the highest qualities, as met by business generally, although they may not be the best judges of the most suitable kind of stone to be used for the exterior of an elaborate edifice. I sincerely believe that, as far as lay in the power and judgment of all concerned with the supply of stone, there was a desire that none of an inferior quality should be sent to Westminster. Mr. Grissell and the public should be informed that Mr. C. H. Smith, and the other commissioners, who strongly recommended, "at the onset," not only that some fit person should occasionally inspect the quarries, but also that a properly-qualified individual should frequently, perhaps two or three times a week, examine the stone at Westminster, with full power to admit or reject any of the blocks. But such recommendation was entirely discarded by the Government authorities at Whitehall-place. There might have been some difficulty in finding a more qualified man to undertake such supervision: no mere chemist, mere practical stonemason, nor mere anybody else, could have performed the duties creditably to himself and advantage to those who employed him; it must have been a man possessing a certain amount of general practical attainments, conjointly with long practical experience in the selection of the kinds of stone, and in the actual handling of the mallet and chisel. No doubt of such persons were to be found, had they been sought for.

By far the greater portion of the stone appears to be of a good and durable quality; and it is worthy of especial notice that the carvings show scarcely a trace of decay, although the whole length of the river front there is a series of heraldic sculptures, executed in stone originally weighing perhaps five tons each, with rampant animals as supporters, carved in a very bold relief, consequently, more exposed to the varieties of frost and thaw, rain and sun-shine, than mouldings or plain surfaces; yet all these large stones are as free from decay as when they were just cut by the carvers. This may seem to infer that the workmen, or the principal carver, exercised considerable discrimination in the choice of the blocks; that is, to take such as would cut and work freely, or appear to be of one uniform quality throughout their entire mass; and we now have the best possible quality. In one of Mr. Grissell's paragraphs he states "that the stone supplied for the Museum of Economic Geology, and the Amicable Assurance Office, came from the same quarry as that of the House of Parliament, and without any greater care or particularity of selection." This surely is quite in favour of my view of the case, namely, that most excellent and durable stone is to be obtained from the same quarries, and all that is requisite is a properly-qualified person to select it. And further, he says that "the stone supplied to the buildings in Lincoln's Inn was expressly selected by a practical mason sent from London by the authorities who had charge of those buildings." In this case we have positive proof that the mere practical stonemason was thoroughly afit for the important mission entrusted to him, and the working used was not so much to blame for want of discrimination as the authorities who gave him the appointment.

Mr. Grissell thinks it would have been more becoming, had he adopted the recommendation of Professor Auston, that the best stone being always the most crystallized. Mr. Grissell will refer to our Parliamentary Report of 1859, which was long before the appearance of Mr. Auston's writings, he will find that we repeatedly, and strongly, recommended the use of those stones which are most crystalline. Mr. Auston also stated that we were desirous to go to another quarry in the same neighbourhood, which was not of the same quality of stone as that which had been experimented upon by the commissioners. In answer to this assertion, I can state that after our first report of inspection, in the autumn of 1858, which was referred to the Order of Works in March, 1859, I again accompanied Sir C. Barry and Dr. William Smith, in the month of August following, to examine and report upon

the newly-discovered quarries in the neighbourhood of Bolsover-moor. I likewise, in August, 1853, proceeded with Sir H. T. De la Beche, to examine and report especially upon the Auston quarries. On each of these occasions, fair average sample blocks were procured, forwarded to London, minutely examined, and mechanically and chemically experimented upon, in order to compare their physical properties, with samples from other quarries, and from old buildings in the neighbourhood, in a manner precisely similar to the mode adopted on all former occasions connected with the Parliamentary Commission, in its researches and investigations for good stone. C. H. SMITH.

Books Received.

Lectures on the History of England, delivered at Chorleywood, by WILLIAM LONGMAN. Lecture II. London: Longman & Co. 1860.

THE series of lectures of which this forms one was prepared by Mr. Longman for delivery to the "Chorleywood Association" of workmen and laborers, near Watford. The association is in itself an interesting one, of which some account is given on the cover of the book. The author has greatly extended the two lectures already published, beyond the limits to which they were restricted in delivery. The matter is very ably put together, in a way which could not fail to prove both intelligible and interesting to the particular audience to whom it was addressed, as well as to the general reader. The lecture before us gives an account of the feudal system, and the origin of the laws and government of England. It is illustrated by some pertinent engravings, the largest being one of an ancient tournament, in colours, from one of the Cotton MSS. in the National Library.

A House for the Suburbs. By THOMAS MORRIS, M.L.B.A. London: Simpkin & Co. 1860.

To sketch "A House for the Suburbs," "socially and architecturally," was a good idea; but Mr. Morris has not made as much of it as it was capable of. However, we will not be exigent, but contenting ourselves with this gently-urged objection, will speak of what the book is, rather than of what it is not. Its staple consists of plans and a view of a family house, with its out-buildings and accessories; and the author also gives a block plan of a house and ground near Wimbledon-park, Surrey. In connection with this he says—

"Houses of medium size in London, though of considerable pretension externally,—such as those in Regent street, for example,—occupy less on an average than the twentieth part of an acre. Semi-detached houses near the metropolis, of the yearly value of a hundred pounds, have seldom more than a quarter of an acre allotted to each; and the engraved block plan of a house near Wimbledon Park, Surrey, is put forward to show the scope afforded by a site of 100 feet wide by 220 in depth, and containing therefore 22,000 superficial feet, or just about half an acre.

I invite attention to these statements the more earnestly, from a conviction that many people, proposing to reside in the suburbs, demand an extent of land very much greater than their actual objects necessitate; and, when they come to count the cost, think there must be some league to keep up the price. They may thus be able to define their wants more exactly, and will do well to bear in mind that the occupation of unnecessary land is a positive evil, entailing endless expenditure, and inducing slovenliness.

The style adopted for the house is Jacobean. In the plan the kitchen adjoins the dining-room, an arrangement which would be found objectionable, especially in summer.

The volume, which is well got up, is inscribed to Mr. William Railton, architect, with whom, for many years before Mr. Railton's recent retirement from practice, Mr. Morris was connected.

VARIORUM.

"LONDON at a Glance: an illustrated Atlas of London" (Hodgson, Paternoster-row) is a very useful novelty. It comprises thirty-six maps in sections, a key map of all London, an alphabetical index of 7,000 street references, and a general index of public buildings, hotels, places of amusement, &c. By making reference to the street-index, the name of any street wanted may be readily found, together with the number and even the portion of the plate containing it, so that all hunting through one large map (often very indistinctly lettered) is completely obviated. The names of the streets on the plates are plain and distinct; and, so far as we have seen, the maps or plates are correct.—Book the third of "The Graded Series of Reading-Lesson Books for all Classes of English Schools" has been issued by Messrs. Longman & Co. The lessons appear to have been well selected; they comprise descriptive travel, natural history, historical narrative, and miscellaneous matter; and the whole forms what we might almost call an interesting story-book for youth.—"The Friend of the People" appears to be prospering. The number

for the 31st of March, we observe, contains an article on Operative Associations, in which some account is given of the "Rochdale Equitable Pioneers' Society," which has been fifteen years in existence, and therefore affords a good criterion of what can be done with such associations when discreetly managed. The Rochdale began with a capital of £251, and a shop rented at 10s. In 1859, the funds were 27,060s., and the profits 10,730s.—this, too, be it observed, all the while that both members and the public are provided with good wholesome articles of food, &c., at wholesale prices, with the addition only of a small profit to represent the interest on the capital employed, expenses, and depreciation of stock. The Association met with strong opposition from "the trade" of shop-dealing middlemen, who everywhere consider that they have a vested right in a portion of every mouthful consumed by the poor as well as by the rich; nevertheless, by prudence and good sense on the part of the members and their management, all such opposition was overcome at Rochdale, as it, doubtless, may be everywhere else. The Association, we may add, have now a library of their own, a large four-mill, &c., and lately they erected a drinking-fountain, after the design of that in Regent-circus, London. The establishment of such an association offers a lesson to the working classes generally, and shows how much more profitable a use they might make of their spare cash than in throwing it away in thousands of pounds upon strikes.—Two interesting "Reports" have been forwarded to us from Bristol,—one the "Fifth Report of the Red Lodge Girls' Reformatory School, Bristol, with the Rules and Principles of Management;" and the other, the "First Report of the certified Industrial School, Park-row, Bristol." The latter has been opened under Mr. Adderley's Industrial Schools Act of 1857, and has special difficulties to cope with; but it is to be hoped it will speedily meet with the success it so well deserves. The presiding genius of both appears to be a business-like and liberal lady, named "Mary Carpenter, Superintendent," who not only prepares the able reports themselves, but squares the accounts like a skilful book-keeper, as she must be.—The April number of the Gentleman's Magazine contains, with much antiquarian and biographical intelligence, a continuation of Mr. Scott's "Gleanings from Westminster Abbey," fully illustrated.

Miscellaneous.

PROPOSED FOOT-BRIDGE AT RICHMOND.—Some time ago we expressed a strong opinion against the policy of the Office of Works in refusing assent to the landing on the Crown lands. After a tedious negotiation, the Government have given in, but only on condition that the promoters purchase up the Crown ferry at Isleworth (half-a-mile distant) for the modest sum of 1,200l. Thus, this ferry-right will cost very nearly three times as much as the bridge itself. A public meeting has been held in Richmond to raise subscriptions for the purpose, the Hon. Robert Bourke taking the chair. Addresses were delivered, and resolutions were unanimously passed that the proposed foot-bridge, as a work of general utility, was deserving of the financial support of the population both on the Surrey and Middlesex sides of the river. The entire cost of the undertaking will be under 2,000l., the greater portion of which will be absorbed by the Crown for the ferry-rights, and thus end a long discussion on a vexed question.

VALUATION OF NEW BRENTFORD.—At a meeting of the vestry on Friday last, to name a professional man for the survey and valuation of the new docks recently constructed at Brentford, and also the contiguous portion of the branch of the Great Western Railway from Southall, the appointment was given to Mr. John Davis Payne, who surveyed the parish of Isleworth, Hounslow, &c.

MONUMENT TO BISHOP BLOMFIELD.—It is stated that this work in marble is to be executed by Mr. Richmond, the miniature painter. The Art-Journal, with just indignation, says,—"We imagine the next fact to startle the art-world will be a tender from Mr. Fribb to build the new Foreign Office, or perhaps one from Sir Charles Eastlake to construct the new docks in the Isle of Dogs. Such circumstances would be scarcely less astounding than the employment of a portrait-painter to erect a monument, during the lifetime of Mr. Foley, Mr. Calder Marshall, and a few other 'capable' sculptors of Great Britain." It seems to be a delight to some in authority to insult English sculptors.

**LECTURES IN THE BROMPTON MUSEUM.**—A course of lectures, addressed principally to teachers, on the best methods of acquiring and communicating knowledge in various branches of science, will be delivered at the South Kensington Museum on the following Mouday evenings—16th, 23rd, 30th April, 7th, 14th, and 21st May, 1860. The first will be on "Practical Plane and Descriptive Geometry, and their application to Mechanical and Machine Drawing, and Practical Architecture," by Professor T. Bradley.

**ADVERTISE!**—Sir: I am convinced, if persons who manufacture materials used in erecting buildings would advertise their wares, a much larger business would be the result. I have been seeking information for some weeks about the various kind of tiles made for covering flat roofs, and for the best method of making flat roofs water-tight at a cheaper rate than lead. I have also wanted information as to the best principle for fire ranges, and the heating or warming of rooms. I visited, a fortnight ago, the exhibition at the Architectural Museum, in London, expecting to see everything used in the building trade, but, after paying 1s. for admission and 6d. for a catalogue, I was surprised to find little more than the Photographs, which, no doubt, were good, but not what I wanted. Cannot you give a few hints on this matter that will be useful?—ENGINEER.

**THE BIRKENHEAD DOCKS.**—The works committee of the Mersey Dock board have recommended the construction of two graving docks at Birkenhead—one of 85 feet, to cost 70,850*l.*, and one of 50 feet, to cost 52,120*l.* The committee also recommended that 10,000*l.* should be expended on engines and pumps, and 9,600*l.* on walls and sheds; the total cost being 142,000*l.* After a lengthened discussion, on the 20th ult., the recommendation of the committee was confirmed.

**CAST IRON IN CHINA.**—At the last meeting of the Manchester Literary and Philosophical Society, Mr. Wm. Fairbairn, the president, exhibited two large pans of cast iron, procured by Mr. Worthington from China, where they are used for boiling rice. The metal, which was, at the strongest part, only one-tenth of an inch in thickness, possessed considerable malleability. The president remarked that the art of making such large castings of thin metal was unknown in England. There are still things we cannot do, and more we do not know.

**SIX-FEET VOLUNTEER GUARDS (32ND MIDDLESEX).**—We are asked to mention that this corps will drill at Allen's Riding-school every Monday evening until further notice. It is established with a view to meet the requirements of men whose stature, being above the average height, renders their appearance in the ranks of ordinary-sized corps somewhat awkward, and who might therefore be disinclined to fall in. Since the return from Hythe of the captain commandant, the Hon. T. C. Brasco, the corps has made rapid progress to efficiency. The uniform is of the national colour, and, at the review by her Majesty, will present a striking contrast to the greens, greys, and drabs. Such of our readers as are of the standard height, and want a corps, should join the "Six Footers" forthwith.

**PARTIAL DESTRUCTION OF A RAILWAY STATION.**—On Tuesday morning, a portion of the iron roofing over the Victoria Station of the London and North-Western Railway, at Manchester, fell in, through a train coming in contact with and breaking one of the cast-iron pillars supporting the north-west corner of the roof. This pillar was exceedingly near to the line of rails, and, in shunting a train, one of the carriages got off the rails, and came in contact with it. The loss to the company, it is believed, will be about 1,000*l.*

**ROYAL ITALIAN OPERA HOUSE.**—Mr. Gye has issued a very attractive programme for the coming season, embracing all the old favourites and many new names of reputation. "Fidelio," "Stradella," "La Favorita" (with new scenery), "Le Nozze di Giannetta," are announced, in addition to the repertory of last season, and "Le Prophète" is to be revived. In addition, four grand concerts, one, if not more of them, to be given in the Floral Hall, are promised, to which all subscribers to the Opera will be entitled to admission.

**IMPROVEMENTS IN ABERDEEN.**—We learn from the Aberdeen papers that the directors of the Aberdeen Town and County Bank have resolved to erect a handsome building for carrying on their business in Aberdeen. It will be erected in Union-street, opposite Market-street. Designs were submitted from five local architects, and those sent in by Mr. Mathews, of Aberdeen and Inverness, have received the first premium. The building will cost from 12,000*l.* to 13,000*l.*

**RAILWAY TRAFFIC RETURNS.**—The traffic returns of railways in the United Kingdom for the week ending March 17, amounted to 457,980*l.*, and for the corresponding week of 1859, to 416,120*l.*, showing an increase of 41,860*l.* The gross receipts of the eight railways having their termini in the metropolis amounted to 190,955*l.*, and for the corresponding week of last year to 176,593*l.*, showing an increase of 14,362*l.*

**A REMARKABLE PROPERTY OF IRON.**—In 1856, says a contemporary, Mr. March, an able chemist connected with the Royal Arsenal, discovered that it was an invariable rule with iron which has remained a considerable time under water, when reduced to small grains or an impalpable powder, to become red-hot. This he found by scraping from a gun some corroded metal, which ignited the paper containing it, and burnt a hole in his pocket. The knowledge of this fact may account for some spontaneous fires and explosions. The tendency of moistened particles of iron to ignite was discovered by the French chemist, Lemary, as far back as 1670.

**THERE IS NOTHING NEW UNDER THE SUN.**—I think the following facts will be interesting to your readers at the present time, when the rifle is the topic of the day. The carbine with which Hamilton of Bothwellhaugh shot the Regent Murray, in 1570, is preserved at Hamilton Palace. It has a brass barrel the same length as the Enfield rifle, and the bore is of the same diameter, and, what is most singular, it is rifled nearly in the same manner as the Enfield. The power of this rifle appears to have been great, for "the ball, after passing through the body of the regent, killed the horse of a gentleman who was riding on the other side."—WM. BURNS.

**SCIENCE AND ART DEPARTMENT.**—The Lords of the Committee of Council on Education desire to afford the greatest facilities to teachers of science and navigation schools in obtaining the best instruments, apparatus, &c., for giving instruction in science and navigation, towards the purchase of which the Science and Art Department is authorized to pay 50 per cent. of the cost; and they consider that the fullest opportunities should be given to manufacturers in all parts of the kingdom for supplying such apparatus. At the same time it is necessary that the Science and Art Department should have some guarantee that the apparatus and instruments are of good quality and moderate in price, and they have therefore laid down certain rules and conditions, which have been published and circulated.

**PRESERVING WOOD.**—All fence-footings, gate-posts, garden-stakes, and timber that is buried in the earth, may be preserved from decay by the following simple process:—Take 11 lbs. of blue vitriol to 20 quarts of water; dissolve the vitriol with boiling water, and then add the remainder. The end of the wood is then put into solution, and left to stand four or five days; for single, three days will answer; and for posts 6 inches square, ten days. Care should be taken that the saturation takes place in a well-pitched tank or keyed box, for the reason that any barrel will be shrunk by the operation so as to leak. Instead of expanding in an old cask, as other liquids do, this shrinks them. Chloride of zinc will answer the same purpose, but is dearer.—*Manchester Courier.*

**NELSON COLLEGE, NELSON, NEW ZEALAND.**—The chief stone of this building (in fact, the only one, for the edifice is to be of wood, on account of liability to earthquakes) was laid on the 7th of December last, by the governor of New Zealand. The architect is Mr. Beaton. The building will form two sides of an inner court or quadrangle, 117 feet by 60 feet, on the south-west side of which will be ranged the domestic offices. All the roofs will be covered with galvanized iron tiles, and have leaden guttering. The contracts for the whole building, exclusive of the foundation, amount to a sum a little beyond 7,100*l.* A tower will project from the centre of the principal front, and, rising above the main roof, will give additional prominence to that portion of the building, while large bay windows will give character and projection to the wings. The principal front will be 142 feet in length. An open corridor or loggia will screen the chief apartments from the sun's rays, and afford depth and shadow to that portion of the structure. The return elevation, or that towards the north-west, which will be 82 feet in length, will correspond with the wings in the north-east front, and have a similar bay window in the centre. The end elevations will be of the same character. The three principal entrances will have open archways and recessed porches with semicircular arched windows, projecting on corbels above. The style adopted is the Elizabethan.

**SALFORD TOWN HALL EXTENSION.**—At the meeting of the Salford town council, on the 28th of March, the town hall and markets committee, with reference to the alterations and extension of the Salford Town Hall, reported that the contract of Messrs. Henry Southern for carrying out the proposed work amounted to 5,625*l.*, which they recommend should be accepted. The committee hoped to realize 400*l.* by the sale of the old materials, so that the sum necessary for the work would not exceed 5,500*l.*; and this would cover any alterations they might in the future think it necessary to make on the proposed plan. The contract of Messrs. Southern was accepted.

**ARCHITECTURAL EXHIBITION.**—The exhibition will be opened next week. We have been asked to postpone further notice till then, and of course comply.

**"MACHINERY FOR OBTAINING AND APPLYING MORNY POWER."** A patent taken out by Mr. John Coates, of Lower Shadwell, engineer, after specifying certain central pillars, working-beam, fly-wheel, oscillating cylinder, &c., states that "the hollow-centre pillar or main support is connected at bottom with a ram, the plunger kept regulated by a suitable weight attached to a chain passing over a pulley, and a crane may be applied to draw back the plunger, that water may be admitted without pumping. The opposite or solid end of the working beam has a balance weight attached as a counterpoise to the weight of the cylinder. The cylinder, the tubular portions, and the trough are filled with water, and the working of the piston causes the alternate admission and expulsion of the water, thereby putting the engine into motion." The specification states that there may be two rams, "so that, while one is at work, the other charges the ram cylinder with water to obtain the power."

**TENDERS**

For New Warehouses and Drying-Sheds, White's-gardens, Bermondsey; Mr. Geo. Elkington, architect:—

Wilson	£7,463 0 0
Rider	7,190 0 0
Myers	7,189 0 0
Coleman	6,985 0 0
Wells	6,980 0 0
Willis	6,705 0 0

For New Warehouses, Houndsditch; Mr. T. C. Clarke, architect:—

Jauch	£5,996 0 0
Lucas	5,995 0 0
Paterson & Fotheringham	4,939 0 0
Brown & Robinson	4,709 0 0
Payne	4,666 0 0
Brown	4,619 0 0
Lawrence & Sons (accepted)	4,320 0 0

For a Vestry-Hall and Offices for the parish of St. George's, Whitechapel; Mr. Andrew Wilson, architect. Quantities supplied:—

Wood, Gravesend	£5,580 0 0
Hocken	5,319 0 0
Wood, Mile-end-road	5,309 0 0
Hack & Son	5,287 0 0
McLennan & Bird	5,000 0 0
Widlen	4,999 0 0
Hill	4,892 0 0
Blackburn	4,984 0 0
Wilson	4,974 0 0
Hart	4,829 0 0
Ennor (accepted)	4,675 0 0
Raby	4,631 0 0
Glenn	4,590 0 0

For Great Queen-street Schools; Mr. W. W. Pocock, architect:—

George	£3,293 0 0
Clematis	2,574 0 0
Sutton	2,540 0 0
Fish	2,511 0 0
Porter	2,496 0 0
Todd	2,476 0 0
Piper & Son	2,100 0 0
Smith	2,399 0 0
Coswold	2,384 10 0
Downes	2,399 0 0
Richards	2,314 0 0
McLennan & Co.	2,283 0 0
Batterbury	2,279 0 0
Rudkin	2,109 0 0
Glenn (accepted)	2,109 0 0

For the first part of a House of Mercy, Wolverhampton, for Mr. Wearing; Mr. E. Wehby Pugin, architect. Quantities supplied by Mr. Marples:—

Branston and Gwyther	£2,134 0 0
Beveringham (accepted)	1,909 0 0
Smith (without fittings)	1,895 0 0

For a House and Stabling at Rochampton, for Mr. P. Penley; Mr. C. Lecy, architect. Quantities supplied:—

Avis & Sons	£2,032 0 0
Nicholson	1,930 0 0
Adams & Sons	1,874 0 0
Evans, Brothers	1,800 0 0
400 0 0	2,380 0 0
399 0 0	2,273 0 0
...	2,260 0 0

For a Lecture-hall at Wreatham, Suffolk; Mr. George Glover, architect. Lowest:—

Hubbard & Co.	£1,034 3 0
Woodruff & Co.	938 0 0

Hillyard & Artis (accepted)	865 12 10
Smith (received too late)	768 10 0

# The Builder.

VOL. XVIII.—No. 897.

*Metropolitan Communications, and Street Railways.*

THE Metropolitan Board of Works being now, pending the experiment, relieved from some of the duties of that great undertaking which was most pressing, it may be well to draw attention to certain objects for which the Board was constituted, that are scarcely less important even than the sewerage, to the improvement, or, we might say, the preservation, of London. Facilities for inter-communication are more needed for this than for any other capital; but they are here probably, the most out of proportion with local requirements and

those of business; whilst the disposition of the routes and streets of London generally, is as unfavourable to effect, and to the beneficial results on health and mind which come from external impressions, as to the first-named objects of the planning of any accumulation of buildings. We are, of course, aware that the efforts to secure timely attention to the subject are not only those which we ourselves have made, and that the Metropolitan Board have under consideration a considerable number of new lines, such as had been proposed at various times; as well as that they have now commenced works like the new line of street on the Southwark side, and completed others, as the short street from King-street, Covent-garden, which may prove of great value in relieving the present crowded thoroughfares. That they are not actively doing what is sufficient to stop the pressure of difficulties and increasing evils, however, we conceive is admitted by themselves; and they have achieved in preliminary arrangements, comparatively speaking little beyond printing a schedule of requirements, and items of estimate for streets, and expressing regret at their want of funds. That the whole work of improved metropolitan communications is multiplied in costliness at every year's delay, and that it must be done, or the effects become at last very serious, or in a national point of view, has been said again and again. It is fully perceived by those who have thought on the subject. The efforts of the Board, however, appear in print,—or, may we say, are as plans,—whilst companies are able to proceed towards the formation of railway stations, in the centres of London, which may be useful as represented, in diverting traffic from particular lines, but which have never been considered in relation to the plans spoken of, nor the latter with the stations, and which, to say the least, will introduce in central localities a condition of things beneficial to the companies, but that may not be understood by the public,—that is to say whether prospectively advantageous, or unfortunately the reverse. It would require constant attendance at committees to know what is the actual state of the several schemes for absorbing large areas in London, as these lines and stations: we know only that the Metropolitan Railway, chiefly an underground line, is in progress, that the Charing-cross Railway

is a substantive undertaking, and what else of the same character may have been to be learned from the ordinary channels; and that on the other hand, the appropriation of about fifty-three acres of land, and the stopping up or absorption of about forty-two public ways, besides the spanning of about seventy such ways with arches, offer themselves to the Surveyor to the City Commission of Sewers as reasons for a report which he presented at the beginning of the year, recommending the commissioners to dissent from the whole of the projects causing these changes; and that similar objections to two of the schemes, one of which proposed a terminus near the Bank, and the other a viaduct across Ludgate-hill, obstructing the view of St. Paul's, have procured an adverse report from the Improvement Committee, to the Court of Common Council. As to the Charing-cross Railway, we know that the line is to cross the river by a bridge,—which, if the view in the *Illustrated London News* be correct (though, as to the number of openings, we believe it is not so), will be a tasteless structure,—whilst we do not know how adequate approaches can be obtained (and having regard to the slight ascent at the western extremity of the Strand), without the removal of Northumberland House, much less without there be more than a widening, by removal of the houses on each side, of Hingerford-street. The "limits of deviation" would allow the removal of the whole of the houses in the Strand from Villiers-street up to and inclusive of those on the west side of Craven-street, and, therefore, inclusive of buildings which are now being erected. Let us however, assume this railway to extend, for the Kent lines, to the station at London-bridge, or generally to lines southward of London, and include the line for which a station is being formed at Pimlico, as serving the object desired,—which is that of dividing the traffic of each line over several metropolitan stations, rather than the opposite principle—the junction of the traffic of several lines at one station, which seems to be that of the Metropolitan Railway. Even in this view of those which will remain probably for some time chief lines for suburban and pleasure traffic, the lines southward of the Thames, there is much reason to apprehend that the station at Charing-cross will cause inconvenient crowding in the streets at that point, and to believe that generally a system of large central stations in towns, in lieu of feeding lines converging from many quarters to the main depot of each line beyond the town, would not be the best for the street communications, or the cheapest and best, having regard to the interests of shareholders. The only difficulty in the way of extension of the principle shadowed forth in the two stations of the Brighton company, is one, whatever it might be, affecting passengers in a change of carriages; but this, added to the first conveyance to the district station, would probably be preferred to a long drive to a central station, with the intolerable inconvenience and delay of existing streets. We believe that, whilst it is perfectly correct to view the system defective, which makes the getting from some parts of London to the London-bridge or the Eastern Counties station as long a business as getting to Brighton itself or Cambridge, the object desired would be best served by confluent or feeding and by girde lines; and that the original plan of having great stations, with the depôts and workshops, beyond the limits of towns, was in the main correct. Would it not be possible to remove now much of the business carried on at such stations as those at Euston-square and Camden-town, or even that which has been often thought too distant at Paddington, to localities where ground is less in demand for houses, unless those of the workmen, as in the case of Wolverton and Crewe, and so to benefit both the town and the company? Even at New-cross the ground occupied has become valuable. But the confluent and girde lines both would require to be designed with special reference to localities of the town; and thus far, the wants of London by any confluent lines southward, and by the North London railway in the opposite direction, are insufficiently served. In principle, then we may say, a much greater

number of termini of lines confluent to the one to the place of destination would be needed, whether lines for locomotives or of a different character. Whatever conclusion may be made as to the obligations and interest of the companies, the reader will agree with us that a system which leaves the positions of railway stations to be fixed on without reference to the ordinary streets, or leaves the streets as they were before they became the feeders to the trunk line, must be wrong.

There ought to be, therefore, on paper, a comprehensive plan of London and its suburbs, with the sites marked of all such stations of railways to the country, as are likely to be needed for some time to come, and with required street improvements suited to these centres, and to those of the markets, theatres, and other resorts of the ordinary carriage traffic. If such a plan exist, it is much to be regretted that the means have not been found for one of the improvements that must surely be indicated on it—the street so often proposed to connect Old-street and the Bethnal-green-road; and which would be so nearly the same as the chosen line of the Middle-level sewer. Other most important improvements, long suggested, however, remain in abeyance whilst opportunities go by; we may name the improvement of Chancery-lane, the removal of Middle-row, Holborn, and the formation of the street from the west end of Cheapside, starting from a spot where new buildings have been allowed to be raised. We speak not of the obstruction, moderated though it be, which has, after all exertions, been allowed to the view from the south-east, of St. Paul's, except that it is one for which somebody assuredly should "hang."

It is clear that however we divert a portion of the traffic from one station to another,—by a new line and termini partly, and partly by a new street,—there are wants of intercommunication daily growing in London, which require to be grappled with in a different manner. The existing routes east and west are all too narrow, and others north and south are wanting; and the tendency that there is to convergence and a crash of traffic as in Cheapside, should be moderated by well-devised plans to secure the objects meant to be obtained by Cannon-street and Gresham-street, but not served by the tortuous course and narrowness of, and the turns from Holborn and Newgate-street to the one, and the want of regulations for the course of the London-bridge Station omnibuses in the case of the other. Be it assumed, however, that these latter points are settled, the confluence of much of the traffic over London-bridge, and the crowded state of that thoroughfare, must continue until plans are matured, and all the works completed, having for object the provision of streets and railways directly from western London to the Kent and Surrey lines. It was this view which led us to see the necessity for preservation of the route of Westminster-bridge, and for a still further provision of crossings of the river. Any plan would be defective which did not go to equalize and connect the opposite shores of the river; Southwark with Belgravia and the most distant localities, or others where obstacles intervene; and this we have shown is needed, as well on grounds which are those of social equalization and pertain to morals and police, as on those which are most considered by men of business.

A radical change is required in the plan of London, both as regards the lines of route, and the width of those which are principal. New bridges and railway branches, and the lines by the side of the river when the embankment is completed, will effect much; but many alterations are wanted at the areas of the great centres; and we mention those of the theatres amongst the number. No building like any of the theatres or Exeter Hall should be allowed in future unless completely isolated, not only in order that there may be the proper number of doorways to it, but that the inconvenience which there is for carriage traffic may be avoided. Fortunately, Covent-garden and Drury-lane theatres are placed in a quarter where there is not much traffic except in connection with them, at night time; otherwise the inconvenience would be intolerable with what-

ever efficient control of the police-force. As it is, it is to be regretted that Mr. Sydney Smirke's plans,<sup>9</sup> followed elsewhere in many particulars, have not also been followed by the removal of buildings lying between Bow-street and Little Russell-street, where Mr. Smirke proposed a quadrant space and piazza—the theatres then to be in sight of one another. The general plan only falls short of the present requirements, and inasmuch as it does not meet our principle of dealing with the whole area of London. The same short-coming was characteristic of the application to architects for the street plan to accompany the designs for the Government Offices. In all the designs in the several cases, including those of Gwynn and of Sir Christopher Wren, as also those of Mr. Penethorne, we perceive, leaving out of consideration the new element of the railway stations, that there were the same objects thought of; some of which, like the opening of Lincoln's-Inn-fields, remain to be made; and others, like the prolongation of Bow-street, and the line of Gresham-street, in intention the same as one of the lines of Wren's plan, have been completed in a bungling manner. What is wanted to prevent the perpetuation of the same fatality, or dominance of private interests to obstruction of improvements is the acceptance of their obligations by the Metropolitan Board. Let this be followed by the publication of plans to which general assent could be looked for, as desirable improvements; and we think with this condition, and some slight assistance from the national exchequer, which perhaps is due to a metropolis, as for the general advantage, Londoners would bear the infliction of a rate meant to remove the serious inconveniences which they are under, and to prevent those looming in the distance. Let the Board then, having the *mens conscia recti*, or that their plans are well devised, and will attain the end, proceed not on their present principle, which, for example, would involve a certain cost in maintaining houses in a case like that of the course of the Piccadilly branch of the Middle-level Sewer through Great Turnstile, whilst a street for carriages there has been constantly asked for, but with spirit and determination such as that of a railway company. It is due, however, to the Metropolitan Board to ask for them both the favour of Parliament which is shown to a company, and the active support, scarcely yet manifested in many cases, of the Government. Whether the best system will be one contemplating to treat for premises that are in some cases of enormous value, or to form new lines and gain some return, may be left to the judgment of surveyors. The direct lines required most would probably be found to run through property of inferior value, and with judgment might repay the bulk of the expenditure. In the case of New Oxford-street, the comfort of the previous inhabitants was not cared for; and, therefore, as we know, evils have been retained in the neighbourhood of the new buildings, which have been since unfavourable to the rents and property; moreover, in our opinion, the external character of buildings could now be made, whilst productive of effect, conducive to the importance of the street in financial returns. The mistake of Endell-street, both as to the line and the retention for many years of one side with low-class houses, would hardly be repeated. Supposing the embankment lines be viewed as those of new communications, east and west, has it ever been considered how much property might be improved in the streets which would lead out of these lines? It may be too much to expect that the waterside property would be improved; though we think it has been clearly shown that goods could be craned into the warehouses, or wheeled across the carriage-ways, without interruption to traffic, and that therefore the property would not be deteriorated. We have little more to add respecting the portion of the plan wherein would be made provision for railways such as are worked by locomotives. Girde lines at a sufficient distance from London,—say the Croydon and

Epsom line might form part of one, or that through Reigate and Dorking, should such be the distance,—would be very important in the defence of London, as would be a general coast line, natural obstacles not intervening, in the defence of the country.

But it is beginning to be understood that great as is the development of the system, there is still much to be done to extend the uses of the railway mode of communication in districts which lie out of the main routes, as well as in the streets of towns themselves; and into this part of the question we shall enter in a subsequent article.

#### ON ARCHITECTURE AS DEVELOPED BY THE VARIOUS RACES OF MAN.\*

THE subject to which, on the invitation of the committee of the Architectural Museum, I propose to invite your attention, is "The Ethnology of Architecture," that is, architecture considered according to its development among the characteristic varieties of the human race; in other words, the modes in which some of the various races of man have expressed themselves in architecture.

You have had many proofs, in the discourses delivered here, that this art of architecture has been studied chronologically, historically, geographically, nationally, but scarcely yet by the aid of ethnology. On the other hand, ethnology, the study of the varieties of the human race, has been viewed by the light of physiology—the science of the structure of man; by the light of philology—the science of language: it has yet to be studied by the light of art.

After a few prefatory observations on the scope and complexity of the subject, the lecturer proceeded.—

In the first place, then, I propose to notice how art is calculated to aid ethnology, and what art is best able to render said.

Next, to bring forward a few facts respecting the distinction of the types of mankind, and to show the permanency of some of these types.

And next to group the varieties of man in such a manner as to exemplify what I have called the ethnology of architecture.

The science that, under the modern name of ethnology, investigates the varieties of the human race, that marks their permanency and their influence on human destiny, and seeks to explore their origin;—this science has, as I have remarked, summoned, first, physiology to its aid, and scrutinized, with laborious care, the peculiarities of the structure and of the external anatomy of man. It has next appealed to philology; and, as speech is the primary and characteristic product of the human intellect, it has sought alike, in the delicate refinement of civilized expression—the magnificent instrument of social intercourse employed by *Bachylus* or *Demosthenes*,—and in the uncouth tones of the naked savage, to gather materials for generalization, and for the establishing of great and interesting truths.

It appears to me that there is yet another path by which to explore the domains of ethnology, and that a path peculiarly interesting to us—it is the path of art. Here truly there is much, almost everything, yet to be done, and doubtless much that will repay our labour.

Many considerations unite in making art a most efficient guide in ethnological investigations. I believe that in art man strives to express his relations to external nature, to his fellow-men, and to his creator.

Art is also, let it be noted, especially *human*. In instinct man is excelled by the lower animals, in intellect by higher orders of created beings, but in art he is alone. If, then, it be acknowledged as a vehicle of human thought, it must also be an index to the peculiarities of the mind that shapes the thought.

Now, these mental peculiarities are marks of distinction of race: by the records of art, then, we may justly reason in ethnological inquiries.

I have purposely used the term art in the general sense, meaning all, not merely mechanical, that we ordinarily include in that expression; but it must be obvious to slight reflection that the more directly art emanates from human thought, the better will it be fitted for my present argument. Now, of the three commonly known as the fine arts, viz., painting, sculpture, and architecture; painting finds its materials in the de-

lineation of form, of action, and passion, that actually exists, or in the conception of such as might exist in life, in the exhibiting the harmonies of colour, or in the interpretation of the aspects of external nature; sculpture, though more abstract, yet deals with forms that are conceivable in life; not so architecture,—it alone has no archetype in external nature—it is therefore more directly the emanation of man's own individuality, either the product of his necessity—even of his fears,—or of his luxury, or of his religion. Architecture, then, among the fine arts, is that best fitted to tell us somewhat of the peculiarities of the races of man.

In the ordinary or popular sense it is not then an imitative art, but in the higher and truer sense, in which the greatest authority, Aristotle, uses *mimesis*, embracing poetry and music, it is also contained, as being the embodiment of a mental conception, the changing a brain-image to a tangible reality.

It would be beside my present purpose, even did time permit, to enter on any detail of the peculiarities and distribution of the varieties of the human race; but I must bring forward briefly a few facts respecting their present occupation of the face of the globe.

If you will turn with me to the map of the world I can more readily indicate the prevalence of the characteristic types of man.

[The lecturer showed the distribution of the chief varieties of man, and by means of diagrams and casts pointed out their distinguishing peculiarities, mentioning the classifications of Blumenbach, Cuvier, Pritchard, Zeune, &c. He then noticed the permanency of some of these types, and traced them to very remote epochs, from the evidence of ancient authors and monumental records. He then continued:—

It thus appears that the lapse of 4,000 years has not produced variation in those types which, happening to be the subject of art record, are still recognizable by us. We might justly infer that many other of the types now existing could then and previous to that remote period have been found, but in default of artistic record, of which you will perceive the paramount value for this purpose, we cannot make the assertion positively.

I do not mean to enter on the question of how or when these great distinctions of race which we have seen to be durable originated. I am not yet prepared to state it as my belief that the primeval races of men were placed on the earth at various epochs and under various conditions of existence. Our present knowledge, although pointing to some such conclusion, is perhaps not quite sufficient to establish it, but I may in passing remark that such a conclusion, should it be established on scientific evidence, would no more militate against the truths contained in Scriptural revelation than do the acknowledged facts of astronomy or geology against Biblical statements with which at first view they may not appear to coincide.

Were it requisite for my present purpose, I should not hesitate to beg some attention to this weighty question respecting the primeval inhabitants of the earth, though it be vexed by infidel sarcasm on the one hand and well-intentioned theological opposition on the other, for I find that we have a right to claim for science a public and patient hearing if her assertions while opposing commonly received impressions are made for the sake of truth.

But it is for the present sufficient that I have exhibited a brief sketch of the argument which appears to me to establish the antiquity, and so far the permanency of the chief varieties of the human race, and having done so we may advance to our next point—the grouping these races in such a classification as may best aid our present inquiry respecting their artistic capacities.

I propose to distinguish into three groups, marked by characteristics of mental organization, three principal developments of the human race.

1st. Those races in whom the sensuous faculties prevail.

2nd. Those of higher organization in whom the intellectual powers begin to exert a greater influence.

3rd. Those of the highest organization in whom the moral faculties have gained their full energy, and the balance of the three powers is just.

The object of my classification is to inquire more conveniently whether these groups have severally recorded themselves in the art of architecture, and if so, with what comparative success; and thence to draw some conclusions as to the nature of the faculties employed in the service of the higher arts.

1st. The group I have named sensuous. This includes the whole of the Nigritian family, the

\* "Suggestions for the Architectural Improvement of the Western Part of London," 1841.

\* Read by Mr. R. H. Smith, B.A., at the Architectural Museum, Wednesday, April 4th.

African, excepting Egyptians and Nubians in the north, and Caffres in the south.

It includes also the Polynesian races, and, as a distinction based on mental characteristics, it should, perhaps, truly, embrace all who have sunk to the degradation of savage existence.

The question before us is, what architectural art has been developed by this vast and ancient group of the human race.

Art of a certain character they have: an art of surface decoration—an art that works by a seeming instinct, and which I therefore propose to name *sensuous* or *instinctive*. It is well shown in these carved paddles from New Zealand: it pervades the art of all nations whom we call *savage*: it has none of the hesitation incident to reflection: it seems to be guided by some such law as controls rather than guides the operations of the lower animals: yet it is absolutely true in principle, and can, as we shall see, unite with the highest effort of art, and contribute to the perfection of the latter. But in architecture this group have effected nothing.

The art which emanates from the nobler faculties is above their organization: they are incompetent for it: they have existed without it; and, according to all evidence, no myriads of years would so alter their nature as to create in them the power to produce it.

Let them blend with other races: let them come, as we shall presently observe, into association with a higher type; and they can learn somewhat and imitate a little, and contribute another and distinct quality, which is capable in due subordination of enhancing the higher art; but of themselves and from themselves no work of the great art of architecture can arise.

Pass, then, in the second place, to the group whom I have marked as exhibiting the power of the intellect to control the sensuous nature. In some, the majority, the balance between the two powers seems ever to vibrate—the animal nature ever *sensu* the intellectual. Yet, as a group, I mark in this division the chief section of the yellow races,—the Turanian, the Mongols, the mixed Turkish race; also the Arctic types, the Samoiets, the Esquimaux, the Tchukki, the Laps—not the Finns; also the American group and the Aztecs; also the Thibetans and the Chinese.

Widely indeed differing in intellectual vigour and in progress towards civilization; some, perhaps, more properly falling within my first group; but yet having certain characteristics in common.

One of the most remarkable phases of civilization that the world has known—the Chinese—comes within this group: the Japanese, subject, perhaps, to some external stimulating influences, are also included within it. I do not ignore the advance in certain kinds of art which these people have made,—their admirable skill in surface decoration, their innate sense of colour, their appreciation of certain harmonies of design, whether in form or in flat ornament; neither do I disregard their discoveries, long before any western efforts, of much that we are apt to arrogate to ourselves as proofs of European invention,—their knowledge of the compass, of printing from wood blocks, of the use of gas for lighting, their manufacture of gunpowder, of paper, &c.

Yet what has this second vast group accomplished in architectural art? The reply may seem almost paradoxical: their nature is beneath the power needed for the invention and development of great art: they have done almost nothing.

Yet I shall be reminded of the vast structures of the Chinese, their mighty towered walls, their forts, their bridges, &c.

These erections I take to be proofs of my argument; evidences of the inherent distinction of race and the incapacity of vast groups of mankind, despite great mechanical ingenuity and considerable intellectual power, of attaining true architectural art.

They are indeed builders, and in the working of stultish material are altogether unsurpassed since the days of the Egyptians; but their building is but an evidence that the heart of the people is not in their work; their heads and their hands, their busy brains and dexterous workmanship may be there; but architecture, the living art that tells of the sense of beauty and fitness, and the majesty of the conceptions that start from the kindling imagination,—this is absent.

They have their palaces, a sort of monumental gateways, often elaborately decorated: they have the tee or pagoda, at times a striking and most picturesque structure: these are architecture, but these are borrowed; neither are indigenous—they are of Indo-Iranian origin, and therefore come from a higher type of the human race. Moreover,

in Chinese bands they have been so far modified as to depend for their effect mainly on that surface decoration which, as I have observed, is an instinct among the less highly organized races of man. The great nine-storied Tee, called the Porcelain Tower, was the most notable example of what I mean. Pieces of its material which I have seen show that it was faced with a terra cotta coated with a stanniferous glaze; and, though more than 400 years old, these fragments exhibited an uninjured surface. As the building was upwards of 200 feet high, the effect of this brilliant glaze was, as I have been assured, very striking. This surface ornament is the *chaou de bataille* of Chinese builders. The museum here contains some extremely interesting illustrations of their use of these various coloured and effective glazes.

It is needless for me to mention other sections of this the second great group of the human race:—their scale is descending, till they blend in common inferiority of organization with the races that preceded them.

The last group we have to consider is that in which the highest organization is exhibited by the just balance of the sensuous, the intellectual, and the moral or spiritual powers.

We have noted that the types in whom the lower faculties exert a chief control are incapable of the art for which we seek: we have seen that even in a higher organization, when the intellectual nature begins to sway the instinctive, indigenous architectural art is scarcely found: we must now look further, and discover a power that can command the intellectual nature to its service, and strengthen itself for its efforts by the vigour of the sensuous instincts also. This power is alone found in the moral, the spiritual, the religious tendencies of man's nature.

I would guard myself from the appearance of asserting a dogma respecting what under the present conditions of human thought is scarcely conceivable,—a system of so-called natural religion: I merely desire to keep in view the distinction that is ever durable between the three powers of man's nature; and, as different degrees of relative prominence belong to each of these in different types of mankind, I look for results in proportion.

As we approach, then, the highest development of human faculties, it might become us to pass, as it were, in review, the architectural expression which man's nature has found for itself in all ages and countries where its powers have been adequate to the effort; but, besides that this would be manifestly beyond the limits of many dissertations, it is here also the less necessary while addressing an audience who have had the advantage of attending the course of lectures of which this paper of mine is the conclusion.

This last group of the varieties of men includes the Iranian type, embracing, mainly, the Caucasian of Blumeimbeck.

It comprehends the Arian races, Hindoos, Persians, Armenians; also the Semitic races, the Arabs, Jews, &c.; also the European races, excepting the Laps.

Thus the sources of the civilization of the world are now before us. From the Semitic race has come religious civilization: from the western branches of the Arian type has emanated material civilization. The forms of physical structure that are deemed most perfect are among these races. The moral and mental energies that have left the deepest and most abiding tracks across the path of time have come out from them,—whether the Hebrew, the Greek, the Roman, or the sudden enthusiasm of the Mahomedan.

We have now to consider whether these races, in whose original organization the higher faculties have been given the fullest sway, have sought in their architectural works an expression of their nobler nature, and how far they have succeeded.

We must in this inquiry be prepared to keep in mind that, if human nature be at all truly, as I conceive it to be, reflected in art, we shall not discover any instance of its higher powers expressing themselves without some alloy of the baser faculties; but where the effort can be traced, and a tendency towards such expression is marked, there we are justified in an acknowledgment of the more noble motive.

We shall also see that the dominant nature of those types possessing higher organization, having subordinated to its will the other lower races, has yet almost unconsciously yielded somewhat to their instincts, and allowed a trace of their nature also to betray itself in art, the original conception of which would have been utterly beyond their powers. It will be, therefore, convenient to bear in mind the classification of all art-effort, no matter by what type of man developed,—under sensuous or instinctive, moral or spiritual,—as ethnology hears a re-

markable witness to the prevalence of these motives, mingled even through and through this last group that I have proposed.

The first witness we summon is the Egyptian. And it may well seem strange to us that the most ancient architecture on earth should be that which, among the Christian styles, bears the most remarkable witness to the prevailing sway of man's spiritual nature. The characteristic which separates the Egyptian from all other ancient architecture—a characteristic the grandest that architectural art can possess—sublimity,—has never been surpassed, never perhaps been equalled elsewhere in any age or in any country.

We have seen that this art of architecture, if it have any life in it, is the expression of the heart, the mind, even the instincts of the nation, at the period. What, then, in Egypt, led to this marvellous art of theirs? They were, beyond all other people of past ages, swayed by three motives,—the conviction of futurity, the certainty of judgment, and the hope of immortality.

Their religious system, their government, their social habits, their daily life and occupations, are more or less known to us chiefly by monumental records, and such evidence illustrates the testimony of their architecture. It is needless for me here to enter into detail respecting the extraordinary monuments that remain in Egypt, and upon which our reasonings are based. Diagrams, photographs, &c., have made you familiar with their general character; but I am assured by those who know them well that no description, however vivid, and no illustration, however graphic, can realize the effect that these marvellous works are capable of producing.

Their gigantic scale has doubtless much to do with this; also their material, most durable in its nature, and difficult of workmanship. A sense of stability and of repose, then, is among their characteristics,—“by their own weight made stand fast and immovable, looking tranquility.”

This effect of repose is also partly produced by the use of the massive lintel instead of the arch, by the sloping jambs, by the skill with which sculpture is employed without breaking up surfaces, by the large proportions of the columns, and the general simplicity of the forms.

Beauty of design, as we commonly estimate it, was not the object of these architects, though it be often wonderfully secured by them; but they built to appeal to deeper things than mere external beauty—they seemed to defy time, and measure the strength of their structures against eternity,—and truly, when we reflect on their works, the revolution of centuries and the flight of ages seem to be put aside like a very little thing.

Minds of a low type of organization could not have thought such thoughts of futurity and immortality. Had we, therefore, no evidence of what the race was, or any knowledge of its physical characteristics, we should be able, by a sort of comparative anatomy of architectural art, to form at least some conception of what it must have been: we should, at least, have known, without hesitation, where to class it as a type among the three groups I have proposed. The sensuous, deficient in intellectual and spiritual nature, could not embrace it: something beyond the coarseness of sense is wanted. The intellectual, still deficient in the moral and spiritual, could not reach it: something beyond the address of a mere intellect is needed. The third alone, where the balance of powers is fully adjusted, could be sufficient for such a race; and great, indeed, might such a nation be, could the human heart be preserved incorrupt.

But the majesty and sublimity of the forms of their architecture are not alone to be noted: the ornament with which it is enriched seems to me to convey another ethnological truth; this ornament is perhaps the truest in principle that ever adorned architecture. I allude not alone to the sculpture which Mr. Bell so skillfully explained in his lecture, but also to the system of coloured decoration and conventional treatment of natural forms.

To enter into detail would carry me too far, and would not be very requisite here, where materials to justify my assertion, as far as books and illustrations can do so, are at hand.

Now this completeness of surface decoration has been always found, as I have already observed, among that first division of the human race which I have designated as the sensuous group: a sort of instinctive sense of colour and adaptation of form to flat treatment is their art-possession.

Since, then, we find these qualities so remarkably combined with the grand conceptions of Egyptian architecture, could it be that they were

the art-inheritance of another type, a lower organized race, who gave way before the greater vital energy of the superior, but who, with the true persistence of race distinctions, continued to exist as a substratum and have left, on the imperishable records of their conquerors, a memorial of their nature also? I think this is so; and were there time now to extend the inquiry, I feel that curious illustrations at least, if not proofs, might be brought forward.

Ethnology at least tells us this, that three distinct types of race, two of them going to my third group and one of them to my first group, existed from remote antiquity in Egypt.

We require, as I have endeavoured to show, representatives of the highest group to realize by any possibility Egyptian architectural art, but we have also seen that there is evidence of the working of a lower type in the character of the surface decoration. This lower type the ethnology of the country also supplies us with: it is the Nigritian type,—capable of executing in great measure the coloured ornament for which their instinct, as it were, fitted them, but incapable, as we have seen, of rising higher.

The nobler art was supplied by the two other types; the Semitic giving the religious aspirations, and the other, an Arian (?) form, giving the amazing mechanical and constructive skill.

[After some further observations on Egyptian art, the lecturer regretted that his time would not permit him to enter on the curious questions that arise with regard to the ethnology of Greek architecture, and also stated that it had been his intention to have brought forward as an illustration of his views,—as a chief architectural witness,—that style, the greatest that had arisen since the Christian era, and, in truth, the greatest among all as an exponent of man's higher nature,—the Gothic,—and to have shown how deeply seated in the distinctions of race, and how profound are the springs from whence it has drawn its sublimity and glory,—he continued.—]

To follow in detail the questions that arise from the various developments of architecture under this third and chief group of the human race would carry me beyond my prescribed limits. I may, however, be allowed, before I conclude, briefly to recapitulate my argument, by concluding you that, having first indicated this almost untrodden path of architectural ethnology, having touched on the variety, number, and distribution of the types of mankind, and having shown the permanency of some at least among them from periods antecedent to history, we then classed these types under three primary divisions, according to their mental organization, and showed that it was not null, in the combination of mental characteristics, the moral or spiritual element began to exist as a controlling power, that architecture properly so called was developed.

If I have ventured to assert the supremacy of art in the region of human thought more decidedly than is wont to be done, I think an audience here may well be disposed to receive such statement with indulgence; and if any think that my view implies an undue exaltation of the art of architecture as an expression of man's mental being, I can only say that had time permitted, I think I could have shown further cause why this chief art, the parent of decoration and the nursing mother of painting and sculpture, should be so regarded; and I am persuaded that any earnest consideration of this subject would lead to the conviction I have stated, that architecture cannot develop its highest efforts except among those races of mankind in whom not alone the greater qualities of the intellect are exerted, for this is obvious, but among whom also there is an effort to give expression to the aspirations of man's moral and spiritual nature.

Thus it is, as has been often noted, that architecture's greatest efforts have been in the service of, or associated with, religious belief; and, where the characteristic of a nation is the absence or the feebleness of such conviction, there, as in the vast Chinese empire, architecture is almost powerless.

What are the aids at present offered to those who think and work towards the study of this art? It must be confessed that at present there are scanty efforts, very earnest efforts, have been made with excellent result by the gentlemen by whom I am surrounded; but something more than individual effort is needed. I am one of those who trust to see established a national institution,—a Museum of the Architectures of all Nations,—where this art, so long left to be comprehended by accident or inspiration, may be worthily taught and nobly supported.

True, a museum, however rich or comprehensive, cannot supply the majesty of the Egyptian

the symmetry of the Grecian, the beauty of the Indian, the solemnity of the Gothic; but it can supply vast stores of knowledge respecting them. The reproducing of ancient works, the illustration of detail, and the example of ornament,—these can aid us to realize, can make the dim shadows in our minds take substance, can make our images feel more palpably before us, can clothe the dry bones of our skeleton thoughts with flesh and blood, can breathe upon them the spirit of that intellectual and spiritual life of which I have spoken, and make them arise an exceedingly great army.

#### THE ARCHITECTURAL EXHIBITION.

THE *conversations* of the Architectural Exhibition was held on Tuesday last. The rooms were not so crowded as last year on the first opening of the galleries,—about 600 persons, including ladies, being present; but the formal business being judiciously curtailed, the evening passed very agreeably for those who were of the company, amongst whom, however, we did not see more than a small proportion of the heads of the profession. Professor Cockerell, in the chair, called the attention of the visitors to the works exhibited and to the contrariety of character as regarded style, and referred to the death of Earl de Grey, who had taken the chair in previous years. Mr. Edmeston, one of the secretaries, for the treasurer, reported a satisfactory state of the finances, inasmuch as the expenses of last year had been in great part met by proceeds of the Exhibition itself; and the period was evidently approaching when the subscription fund might be dispensed with. He also referred to those advantages not of a financial character which are derived through the sale of season-tickets, in the interest taken by the public in the exhibition and lectures; and then mentioned the intention of the Society for the Encouragement of the Fine Arts, to award a premium for a work of architectural design in the present Exhibition or that of the Royal Academy. Mr. Lamb proposed a vote of thanks to the chairman, and the visitors proceeded to the refreshment-room, or to inspection of the drawings.

The drawings exhibited this year are about 350 in number, fewer than there have been in previous years; and in the number mentioned, there is scarcely the amount of interest that might have been looked for. Not only are leading architects, as heretofore, barely represented, but the younger men do not appear in the usual quantity and importance of their contributions. It is true, now, as it has been previously, when we have endeavoured to prevent misconception on the point, that the Architectural Exhibition cannot fairly represent the actual condition of architecture, much as it could be desired that it should do so. Those who are most engaged in making the condition, are those who are least able to give attention to the preparation of finished perspective views. Much more, however, might be done than we have evidence of, or have had; and this more must be done if the Exhibition is to be maintained and made to foster, as we have always urged it might, powerfully, the advancement of our art in public estimation. Towards that aim, the display of showy, coloured, drawings is not essential; we are not sure, indeed, that it may not operate in the reverse direction to that desired; and if architects could be induced to see the serviceableness to themselves, of a record of each of their executed works, in the form of a sheet of small-scale plans, elevations, and sections, with sketch-view, as key to the whole, they would be able to contribute to the educational objects of the exhibition, with reverse of harm to themselves, and in the form from which the public may derive most of the particular information needed and chiefly desired to be conveyed. Whilst perspective representation of whole buildings, however, should never be deficient in the galleries, there should be not wanting drawings of details, as doorways and cornices. The exhibition has not advanced sufficiently of late in any of these directions towards its objects, though we are glad to find, as before, in many cases, means of gathering the information which can be conveyed by small plans.

It is, perhaps, rather hard upon the committee, who have exerted themselves much hitherto, to ask them for further exertions; but there must have been something defective in the management of this year, which there has not been before, and which must be corrected, if the Exhibition is to continue. The resident secretary has been, unfortunately, taken ill. Erroneous impressions, as we have often said, are apt to reach the public through the notices in the newspapers, of architectural drawings. Few but those in the constant

habit of examining such drawings,—few architects,—we might even say few who are asked to adjudicate professionally in competitions,—know how great is the difference between gathering the impression from the representation of an architectural design, and receiving one from an historical or landscape painting. One object, the painting, is before the eye,—albeit it may deserve dwelling upon long; the other, the design, may be truly considered as realizable only in the mind, after a laborious process of collecting and putting together. It is impossible, therefore, that a number of architectural designs can be done justice to critically, in the same time as would be given to the number of pictures, and we have therefore argued this with our contemporaries of the daily press, and have striven to give the attention ourselves. We do not, however, this year, find the committee working with us thus for the advancement of the art, and public education, in the manner desired. Contrary to the custom of former years, the representative of this journal has been refused admission which he required previous to Tuesday last, for that deliberate examination that we say is needed for architectural drawings; and the results of which in the case of the annual exhibition, are meant by us to be such as form part of the advancement of our profession and art. Though every year, with the approval of the committee, as we have understood, and to the advantage of the undertaking as we know, we have given a short preliminary notice, like that given the week before last, the notice this year has only resulted in the course to ourselves which we have spoken of. We need only add, after an explanation which was due to our readers, that if the committee think that by placing difficulties in the way of our duties, they are promoting interests of their undertaking, and of the profession, we are of a different opinion.

Before noticing individual works in the galleries, there is very little in the way of observation on the general features of the art displayed, that we need repeat or that could be held applicable more to the present collection, than to the exhibitions of previous years. That novelty is an absolute desideratum in art, and yet that novelty is one of the easiest procurable things; that *velut* (never more required than now), are "not the fetters of genius;" and that they are "fetter only to men of no genius;" that caprice and whimsicality are not taste; that eccentricity is not beauty; that mere style is not art; that polychromy is not architecture; that any separate features, however good, cannot produce the result without grouping; or that the presence of one or two of the attributes of good architecture, such as truth of construction, render not less needful the rest;—these and other points have been put forward, and we have perceived have produced some effect,—though more in opinions expressed in papers read, than in designs which are sent to Conduit-street. Our readers also know both the value which we attach to exhibition of drawings sent in architectural competitions, and that the few contributions to the exhibition in Conduit-street, or allowed by limits of the galleries, can in no degree be taken as a substitute for the complete exhibition in each case. Our professional friends, we might say, would gain a better notion of the designs for the Manchester Assize Court and Cambridge Guildhall from the extended notices which we gave, than they can in either of the cases from the small proportion of the drawings in the exhibition, are those which are least explained by plans. We plead guilty to a constant iteration of the importance of careful *planning*; because we know the matter requires to be dwelt upon yet more, both for the end of convenience and that of taste itself. We will, however, leave the competition drawings which there are, with one or two others, in the first room, and notice such works as the restricted time afforded has allowed us to examine,—not precluding ourselves from filling up any important omissions afterwards. The east gallery, we should state, does not this year contain any drawings, but is devoted to manufactured articles, some of which have been before exhibited. Similar repetition occurring in other parts of the galleries devoted to the manufactured articles, the interest in the general exhibition is reduced by the circumstance. It would be well to think of this, as also of the fact that the importance of the special exhibition of materials and inventions in the later part of the year, is reduced by having the same objects on both occasions. This department of the present exhibition, however, will deserve a separate notice.

The work to which we are attracted first in order, is perhaps that which most claims inspection of the drawings shown. We named it, with others, in our former short notice. It is (95) the "Offices and Sale-rooms, 9, Mincing-lane, City," by Mr. John Whitehead. The drawing is a very good one, by Mr. R. Dudley, though the building is shown necessarily differently to what is the appearance in the narrow street. It has four stories of windows; and these windows are coupled, or have a mullion formed of architraves, and are crowned by cornice mouldings. The windows of the first-floor have in the centre over the cornice, a peculiar feature somewhat resembling a small semicircular broken pediment, combined with ornament of foliage and a bird. The carving, which appears unusually good, and includes work to the central doorway, and to all the windows above, is by Talmie, from the architect's designs. It is shown by photographs in No. 187. The front is divided, too equally in the height for view from a distance, by a cornice above the first floor; and the whole is terminated by a *cornicione*, with trusses, and by a balustrade. The chimneys are carried by piers, the lower half rusticated, between the windows.—Passing over a score of drawings of various buildings, or decorative works, of old date, on the Continent, or merely naming their authors, Messrs. Vaughan, Christopher, and Eastlake, we come to a "Design for a Church in the neighbourhood of London" (118), which is by Mr. J. H. Brown. Though the garish effect of the drawing is as unfavourable to the effect of the design, as is the coldness of certain other drawings to the designs in their cases, the design here displays a good treatment of the materials, red brick, with dark-coloured bricks, and stone coims, weatherings, and tracery, the brick being very properly used in the spire as well as elsewhere. The plan has a very wide nave; and narrow aisles only provide the space for alleys or ways to the seats. Mr. Street, in a design which we may be able to speak of, seems disposed to adopt a similar arrangement; and it would be well to take it into consideration in future church-planning, to get rid of the objection of obstruction by the nave piers, which results from the copyism of the general Medieval plan.

There are one or two designs for churches near at hand, but we take the next drawing in order (119), "Works in Progress, Caterham, Surrey," by Mr. R. M. Drew, designs of the red brick and stone, picturesque, Gothic class, and which are good of their kind. In one of them the red brick is used for coims, and the filling in is of the Nutfield stone, as in the mode of building common in southern flint districts. The stone of the neighbourhood mentioned, like the better known material of Godstone and Reigate, might be more used in London, at least in undressed work.—Mr. W. C. Reed's "Proposed New Offices of the National Provident Institution" (120 and 121), is full of matter from the Italian and French styles, but is wanting in combination; and Messrs. Ford & Meyer's "Design for the Proposed Alterations and Additions to the existing Town Hall at Newcastle-under-Lyne" (122), is very inferior to another of their works (288), a "Design for the Wedgwood Institute proposed to be erected in Burslem." In the first design, which is of red brick and stone, Italian character, the tower at the end is too much like that of a church, and one of the worst periods, as that of the City churches after Hawksmoor's time; and the interruption of the entablature of the pilastrate in the flanks, so that the arches of the upper windows are within the attic, is not pleasing. An alternative arrangement for the attic, in the other design, with semicircular openings without dressings, and stripes of colour, however, is not altogether in harmony with the other portions; probably from the want of perpendicular lines. Otherwise, or with exception of some details in the culminating feature of the main front (the sort of feature which architects not unfrequently mismanage), the design last instanced is not a bad one. The details, many of them, like the cornice of the attic, are good in intention; and the portico, with internal columns, is in some respects well planned. In the title to a design (39), in the west gallery, for "Public Rooms and Baths with private Residences at each end," made for the Lytham competition by the same architects, but not submitted, an alteration in the instructions, which made the design useless, is very properly adverted to.—Mr. E. C. Robins, besides his design (318, in the west gallery) for "The Tabernacle," which we engraved after it had been selected by the competitors, and a design (68, in the same room), one of the three selected "for Croydon Public Hall and Literary Institution,"

which at least is equal to that in progress, has two designs. The first (123) shows the "Premises of Messrs. Hunt & Tanner, No. 215, Upper Thames-street." More might have been done in this case with the materials used. The other, the "Design for the Exeter Branch of the Devon and Cornwall Bank, to which the first premium was awarded" (347) is amongst those of which we have been unable to take note.

The "Studio and Residence of J. R. Swinton, esq., Warwick-square, Belgravia" (124), by Mr. George Morgan, has a plain but effective general character resulting from the outline developed from the plan, which has an angle of the ground cutted off, the area being enclosed by a balustrade; whilst the portion of the building thereat, which in the ground story provides a room with ends of semi-octagonal form, is carried up to a roof lofty and square on plan as to the part over the centre, and having the roofing over the octagonal portions butting out. The materials are red and yellow brick and stone; the window dressings, Italian, being of good character. The porch at the side would have been better without the duplication of square piers or ante, or with columns in one or more of the same positions; for, the form square on plan can never have the elegance of the circular shaft, even elongated as it is here,—a defect which the Greeks generally endeavoured to overcome by having the ante different in the faces, and which a great authority on classical architecture said should be concealed by coupling with the ante, a column.—Mr. E. P. Anson, who has several sketches, and a design one of those of the competitions already referred to, is the author of the design of the "Almshouses in the Wandsworth-road," of which a drawing (125) is exhibited by Mr. A. Blake. They are red brick and stone, and Gothic, with mullions to the windows, and relieving arches over the heads.—The house at "Sennoville, Bushey-heath, Herts" (126), by Mr. J. Candy, completed last autumn, is not remarkable for any particular feature of the design; but the catalogue supplies particulars of materials and cost which may be useful, and would have been more so had a plan been afforded or had only cubical contents been stated.

The works by Mr. J. K. Colling, of which drawings and photographs are exhibited, are of a middle merit. The most important of the works, forming portions of a building already known as from his hand, are the sculpture-gallery and picture-gallery at Hooton Hall, Cheshire. In one of the photographs (185) there appears a perspective of 200 feet of central arcade—the arches rising from columns; and in the other, there is a segmental ceiling with bold ribs springing from trusses, and with coffers and lunette spaces filling in at the sides. The ornament about the archivolts and architraves; the sculpture over the doors, and the scroll friezes, are altogether excellent; and Mr. Naylor, along with his architect, deserves praise for the contribution to the good art-work of our day which has been made. Mr. Colling's Alterations and Additions at Rangemoor Hall, Staffordshire, for Mr. Bass, M.P., shown in No. 127, resemble in style the Italian work of Hooton Hall; but they have merits of their own; though the features, in red brick and stone, can only be described as those of a two-storied house with a Mansard roof and highly decorated dormers, and a balustraded terrace, Roman Doric porches, and a square tower having a leaded ogee-capping.

Here, having broken the ice of our labour, we must leave off to resume in a future number.

RAINFALL IN ENGLAND.

FACTS FOR ENGINEERS.

THE thoroughly sound and practical character of the article on the above subject in your last impression but one induces me to think that the following tables will be acceptable. They are prepared from statistics in my own possession, and are, I believe, at least as free from error as is possible in so extended a series. It is much to be desired that those who possess "complete years" observations should publish the results, especially in those localities where the annexed tables are most deficient.

In furnishing the table of "Total Rain for 1859," I have only used one place of decimals, as I believe that is quite near enough for practical purposes; the means for the districts have, however, been computed from the true values. The divisions are the same as adopted by the Registrar-General. It has always appeared to me (as an outsider) that the most important point, as far as engineer-

ing interests are concerned, is to determine the probable *maximum fall* in the *minimum time*. In questions of water supply averages come into play; only let "average" imply at least twelve years' observations, for there are many cases in which the rainfall of one year is nearly double that of the next.

I am sorry that it is not in my power to give more information respecting heavy falls; perhaps, if you urge the point, this matter may be more attended to in years to come.

Heavy Falls of Rain during 1859.

Wandsworth.—June 12th, 2.17 inches fell during a thunder-storm (say in about 2 hours).

Camden-town.—June 12th, 1.009 inches fell during the same storm, of which .855 fell in 1 hour and 20 minutes. September 26th, 1.655 inches fell between 4 p.m. and midnight.

Tottenham.—September 26th, 3.30 p.m., to September 29th, 9 a.m., 1.616 inches.

Helson.—September 12th, 1/2 an inch fell in an hour.

Truro.—October 26th, during the day, 2.40 inches.

Bridport.—Largest amount on any day, August 10th, 0.9 1/2 inch.

Clifton.—March 11th, 2 p.m., to March 13th, 2 p.m., 3 inches.

Gloucester.—June 5th (in 1 1/2 hours), 1.6 inches. Southampton.—September 26th, 2.15 p.m., to 4.30 p.m., 2.05 inches.

Aldershot.—September 26th, 3.30 p.m., to 27th, 3.0 a.m., 2.8 inches.

Uckfield.—October 25th, in the afternoon, 0.9 inches; between 9 p.m., November 5th, and 8 a.m., November 6th, fell 1.25 inches.

Manchester.—March 11th, total fall, 1.016 inches; between 8 a.m. on 7th of August, and 8 a.m. on 8th, there fell 1.894 inches.

Silloth.—April 2nd, total depth, 1.749 inches.

Carlisle.—Largest fall in any 24 hours, 0.33 inches (in March). G. J. SYMONS.

THE BUILDINGS AND THOROUGHFARES OF PARIS.

THE first pavilion of the secondary block of the Halles Centrales, on the side of the Rue des Bouvaires, is at this moment completed and surrounded by lightning conductors; and the flagging and asphalted of the pavements are to be commenced forthwith. The course of brown Vosges stone, on which a brick plinth will rest, the only portion of the building not in cast or wrought iron, is being laid.

The scaffolding which masked the view of the Fountain of the Innocents has been just removed, and notice can be taken of the intelligent manner in which this graceful specimen of the Renaissance has been restored. There only remains to be completed the lower basin of the monument, on

which, the Naiads and has-reliefs, by Jean Goujon, have been replaced with all the care possible. At the same time the works of the square, in the centre of which stands this fountain, are being pushed forward actively. Already the ground is enclosed by an iron railing, and has been partially levelled and filled in with vegetable mould for the different plantations.

The Western Railway of France, having applied to the Government authorities for the suppression of the atmospheric system now employed on the Saint-Germain Railway, has ordered that an *enquête* shall be instituted, to ascertain whether the ordinary mode of traction by locomotives may not be preferable.

As to the railway thoroughfares through Paris, the following is a short account of what has been proposed from time to time during the last few years and lately. One plan consisted in the establishment of a railway on a level with the principal streets, with an up and down line of rails, level crossings, &c., and in every respect conformable to the general arrangement of railways as now constructed. It is easy to perceive that the continual traffic of vehicles of all sorts rendered this project very difficult, if not impossible, of execution. A second plan was proposed (though more rational), more expensive, and attended with many inconveniences. This was the underground system of railways in line with the principal thoroughfares, worked by locomotives in all directions. Other schemes were brought forward, among which was one, some time ago, of laying down a system of rails upon the principal streets, such as now exist on the "American," so called, railway from Paris to Versailles, by the side of the Seine, and to St. Denis and St. Cloud. This fourth plan uses horses instead of locomotives, and succeeds admirably in a deserted thoroughfare; but, where circulation is more active, these carriages, it is urged (necessarily of large and unwieldy bulk), would block up the streets and cause much loss of time, especially in bad weather, when stones, macadam, and mud would lend their aid in choking up the groove, and render them impracticable in crowded thoroughfares.

A railway on colonnades was next proposed, on each footpath or pavement of the large streets, on cast-iron columns, and travelling in different directions on each side of the thoroughfares, so as to avoid points, or crossings, &c. The damage likely to accrue to the houses by this last project is difficult to be repaired, especially as they are not calculated to bear the incessant vibration of passing trains.

A last proposal was to carry the lines of railway on retaining walls, or viaducts, in the middle of the large streets, leaving the sides free for the ordinary traffic, and crossing streets, &c., by bridges, as is usual, to avoid impediment to circulation.

The jury of expropriation have been lately occupied in valuing and purchasing the lands and houses, for the extension of the Boulevard de Sebastopol, on the left bank of the Seine, starting from the Rue neuve de Michelieu and the Lycée of St. Hyacinth—St. Michel.

As to the awards of the jury within the last few days, they were in three classes or sections:—First, nine proprietors of houses, who could not treat amicably with the municipal authorities. The total amount of offers was 557,100 francs; 1,065,600 francs were claimed, and the awards amounted to 510,000 francs. The shopkeepers, who suffered by the sales, and were the best recompensed, were:—A *Marchand de nouveautés*, No. 131, Rue de la Harpe, with an unexpired lease of twelve years, at 7,000 francs a year; offered by the town, 55,000 francs; claimed, 275,000 francs; awarded, 175,000 francs. In the same house the proprietor of an eating-house was awarded 25,000 francs, having only five years and a half of lease to run; the offer being 6,000 francs, and the demand 70,000 francs. A pork butcher, in the Place St. Michel, asked 70,000 francs (lease to run seven years and nine months); offered 20,000 francs by the town; awarded, 45,000 francs.

In the second section there were six cases, amounting for offers to 1,105,500 francs; claims, 1,943,200 francs; awards, 1,405,000 francs. Among those sufferers were:—an apothecary, Place St. Michel, with a lease to run twelve years and a quarter; rent, 5,000 francs a year; offered, 40,000 francs; demanded, 150,000 francs; awarded, 100,000 francs;—a porcelain dealer, with seven and a half years to run, at 2,500 francs a year; offered, 15,000 francs; demanded 80,000 francs; awarded by jury, 40,000 francs. The same sum was awarded to a bookseller, who demanded 92,000 francs; the offer being 14,000 francs.

THE VALUE OF FEMALE LABOUR.

THE FEMALE SCHOOL OF ART IN GOWER STREET.

I HAVE been looking forward unsuccessfully to see some champion of woman's rights take up the cudgels for the Female School of Art in Gower-street. When one hears of an institution being threatened with immediate dissolution, such an institution having faithfully and effectually performed the purposes for which it was established, and still carrying on successfully the object which led to its origination, there appears to me to be a *prima facie* reason for regret at the period which is apparently about to be put to such a career of usefulness.

The Female School of Design, which originated in 1847, is now one of the most successful schools of art in the kingdom. It has always had for its teachers a singularly talented set of ladies, whose pupils have won for themselves highly honourable positions. By means of this school, Miss Gann (the present head mistress) tells us, that many young ladies, whose circumstances necessitated their seeking remunerative occupations, have not only been able to find such occupations, but, by means of the skill acquired in the school, have been enabled to contribute to the wants of those who were dependent on them for support. If this be the case, and there is no reason for doubting it, in the operation of the school a step has been made towards the solution of a very great problem, viz., in what channels and by what occupations young females of the middle and lower classes may exercise their faculties and their talents with advantage to themselves and the community.

It is, therefore, with some astonishment that I hear of the edict having gone forth from "My Lords of the Committee of Council on Education," through the authorities at South Kensington, that this school must be closed unless some individuals come forward and supply the necessary funds for its future conduct; the annual grant towards its support from the Department of Science and Art being about to cease.

We all know that the Department of Science and Art had, and still has, for its object, the making of schools of design self-supporting schools of art; so that in withdrawing the grant to this school, with a view to its becoming self-supporting, the Department is only following its instinct. If this school cannot provide for its own continuance and support, as well as other schools of art, it should, according to the Department's rules, cease to exist.

But now comes the question, "Do other schools of art provide for their own continuance and support without direct grants from the Department of Science and Art?"

I will take the schools of art in the wealthiest towns in the kingdom, where, if anywhere, schools should be self-supporting.

In 1859, the amount of aid afforded by the Department to—

Birmingham was	£438 0 9
Glasgow	549 2 0
Manchester	703 0 0
Sheffield	567 13 0

£2,257 15 9

Is it in fostering a spirit of self-support, that the Department awards 2,257 15s. 9d. to the four towns above mentioned, which are perhaps the wealthiest in the kingdom, and withdraws a slight grant from the Female School of Art in Gower-street? I am ready, if necessary, to prove by the Department's own returns, that the Female School is more successful than any of the four schools to which the national funds are so largely contriuted. There is not, then, in withdrawing the grant from the Gower-street school, the plea of want of success: its only crime seems to be that it has succeeded too well.

I observe that before the edict of "My Lords" was transmitted to Miss Gann, Mr. Burchett, who was the director of the classes in Gower-street, and the head master of the school at Kensington, was withdrawn from the first office, and it was conferred upon Miss Gann. It is evident that this was part of the plan; so that on the shoulders of defenceless women should rest the task of getting out of the difficult position which "My Lords" had placed them in. I suppose "My Lords" thought that the cry for help would reach the public ear in a tender chord, and be more effective in its results when coming from these defenceless ladies, with the acknowledged claim of great success in previous work. It would at any rate have been only decent to have allowed the head master at South Kensington to continue with the Gower-street school in its distress, and not to have

withdrawn him when evil was about to come upon it.

The Gower-street school has great claims on the public. There is something supremely noble in the work of these ladies, who seek to conduce to the general welfare of society by using for its refinement and prosperity those great talents with which God has endowed them. We are indebted to them for a great and glorious example of patient and persevering study, of practically demonstrating that there are branches of industry where females may find a fitting employment. This is a problem which has vexed society much, and, in one department of industry, by the courageous example of the ladies in Gower-street, it has been solved,—solved by those who are now deserted and abandoned by "My Lords."

In bringing this matter before the public, I hope you will understand that I am actuated by no personal motives. My information on the subject has been drawn solely from the statements which have appeared in the public press, and from the Department's own blue-books. I do not know one individual at Gower-street, or of those who, under the name of "My Lords," have left them to their fate. I am not in the slightest degree connected in any way with any one concerned in the matter; but perhaps I know more of the circumstances of the case than many of your readers who may feel interested in the subject, and who may wish to see it in a straightforward light.

It seems to me that the public is always greatly interested in a question involving the solution of a difficulty. It has seen a great difficulty triumphantly solved in the case of female labour by the pupils of the Gower-street school. By the withdrawal of the grant to the latter (which certainly does not amount to half that which is given to any of the four schools before mentioned), the opportunities of affording useful employment to young females may be withheld, and certainly will be, unless the Department reverses its decision, or the public comes forward with liberality, and with subscriptions.

But it seems to me that the public has a right to do what it likes with its own money; and I ask, is it consonant with public feeling that the Gower-street school should be abandoned for the sake of 200l. per year, whilst four of the richest towns in England are drawing public money to the extent of 2,257l. 15s. 9d. for the same purpose as that for which the school in Gower-street is refused a fraction? If the latter be deserted on the self-supporting principle, *à fortiori*, the former should be.

I believe if "My Lords" considered the matter in this light, they would not now break up and destroy one of the best schools of art in the kingdom. If the people of England, who pay the taxes and provide the public money for the support of schools of art,—if all the taxpayers of England—were polled to-morrow, I believe that the majority would be in favour of abandoning Manchester and Birmingham to its own millionaires, and in awarding part of the public money thus saved to the noble little band of females in Gower-street, who are now consigned to their fate. Will the public allow this?

I feel that this is not a personal but a public question. Government offices are too apt to regard such a matter in the former spirit. But, instead of pool-pooling the question, and calling it impertinence in any one to bring it up, let them answer it.

WALTER SMITH.

ANCIENT HERALDRY.

SYMBOLISM having reigned in Egypt to the extent known to us, it is somewhat surprising that it was not earlier adopted in the Middle Ages as a means of expressing individuality, more especially as it was so freely laid under contribution as a means—if not the end—of ecclesiastical decoration. Heraldry was not called into practical use till the twelfth century, although there were certain instances of particular families bearing devices as early as the Conquest. The Crusades are generally supposed to have been the exigency which brought the system to perfection, for it was imperative that the various leaders of a marching army, composed for the most part of volunteers, should be easily recognized. In an age when scarcely a man in a thousand could read, what means were so distinguishable as symbols? It is not exactly known by what process of thought or custom arms came to be considered hereditary; but at the commencement of the thirteenth century we find them descending, with the owner's estate, to his heir; and from that time down to the reign of Henry VIII, they indicate the pre-

cise possessions, whether acquired by inheritance or dower, of the bearer. In this respect, modern heraldry has departed from its ancient meaning, inasmuch as it now shows descent only; whereas, in older times, it denoted territorial possessions.

This subject has been most agreeably brought before us by Mr. W. H. D. Longstaffe, in a paper written with much learning and evident research, entitled "The Old Heraldry of the Percys," in which the writer has, with careful hands, outspred to the light of day the banners of that martial race. It is something to see, even in print, fac-similes of the badge and arms of Hotspur; and more, to find after "young Harry Percy's spur was cold" that his "gentle Kate" gartered his severed limbs, and was permitted to bury them in York Minster. His badge was a locket, not the receptacle of a tress of golden hair, as we would fain have believed, but a kind of clasp or fastening. Terrible to many a Scot was the sight of the pennonelle bearing this simple device; and satisfactory to us to know that, when Douglas surprised the Percys at Newcastle, and rode away with Hotspur's banner, vowing to hoist it on the highest tower of his castle, it was pursued and regained with his famous war-cry, "Percy! Percy! Espérance, Percy."

The treatise throughout bears evidence of great labour. The banners of a race of chieftains were not to be found chronologically arranged, covered with must and dust, in a carved oak chest. The various arms were to be sought on tombs, on stained glass, on seals, and in more than one instance, on fonts; or descriptions of them were to be searched for in monkish chronicles, MSS., and pipe rolls. The evidence at once gives us a glimpse into quaint old Stow's cabinet of historical curiosities. At the end of a history of the early Percys in the Harleian MSS. is the following note:—"All this I took out of a fyre rowle conteyning a pedigree of the kings, and of other noble men. Which rowle bath John Stowe of London. Which as it should seem was made by a monk of Whithy." Another time we have a transient view of a similar martial spirit possessing the country to that by which it is now animated, in the incidental mention of the various standards, banners, and pennons, prepared for the siege of Turwin. It is curious to note the minuteness with which the proper colours and devices were considered. "Two coats of arms for my lord, of satin, viz, crimson, blue, and green, with his arms beaten upon it, in fine gold, in oil colours; thirty scutcheons in metal, wrought in oil colours upon buckram, with my lord's whole arms in a scutcheon to be set upon my lord's tents when set up; 300 scutcheons in metal, within the garter, wrought upon paper, to set upon my lord's own lodgings. . . . . White cressants, set upon red and black paper, for my lord's servants' lodgings. . . . . 11 yards of red cloth, for three gowns for three chaplains that went over with my lord; 3 bends of white saracen and green, with 6 cross, 6 rose, and 6 cressant for the said three chaplains," &c. Other evidence calls before us tender and more touching scenes. A true-hearted lover relinquishing his mistress, Anne Boleyn, that she might be Queen of England; and after devising his lands to the king for some heart-lacerating reason, now ward for all time unfathomable, dying broken-hearted the same year that saw her beheaded; then a great armed crowd before Wressel-gates, shouting, "Thousands for a Percy," and soon after a sadder crowd at Tyburn, when the Pilgrimage of Grace was avenged. The result is an interrupted series of armorial ensigns, fully made out from the William de Perel, companion of the Conqueror, and founder of Whithy, who dying at Jerusalem, "his heart was brought into England according to his request; for, in the abbey of his foundation, he had willed it to rest,"—from the "Field azure five mill pykes or," of tibi staunch and pious knight, to the shield of the modern Percys boasting its 392 quarterings. The main interest of the family thus illuminated is centred in the north, although the Percy crest, the lion on the parapet of Northumberland House Strand, is an object of familiar interest to Londoners.

The poetry of the Tudor period is sufficed with heraldic allusions, and most of the prophetic revelations of the numerous professors of sorcery were couched in terms made still more ambiguous by their heraldic disguise. The poets of those days sang of the nobles, whose deeds they celebrated, not so often by name as by their cognisances:—  
"The Westmerlande hall and man in the Moone,  
The beare (Dadley) hath brought their braveris down."  
Again:—

"The six blouddy axes in a bare feilde,  
Sheweth the creste of the red man,  
Which hath devoured the beautiful swan (Buckingham),  
Mortall enemy unto the white lion" (Surrey).

The manner in which religious enthusiasm expressed itself by heraldic means is too characteristic of the times to be passed unnoticed. The principal monasteries possessed banners on which were stitcheb holy reliques, and which with much ceremony were carried into the field of battle to ensure victory. When the Earl of Surrey marched to give James IV. of Scotland battle at Flodden, he led his army through Durham, and, after attending mass at the cathedral, received the banner of St. Cuthbert from the hands of the prior. This banner was "a yard broad and five quarters deep, and the mether part of it was indented in five parts, and fringed and made fast all about with red silk and gold; the said banner cloth was made of red velvety on both sides most sumptuously embroidered with flowers of green silk and gold, and in the midst of the said banner-cloth was the said holy relique," i. e. the corporax cloth which St. Cuthbert had used to cover the chalice when he performed mass in his lifetime. As early as the reign of Stephen the banners of St. Wilfred of Ripon and St. John of Beverley were displayed on the field, and in the time of the Edwards and Henrys the banners of St. Edward the Martyr and Edward the Confessor were frequently unfurled.

The national banner had a religious origin. It was the custom of nations, as of individuals, to place themselves under the protection of a particular saint. St. George was invoked for England, and his white banner bearing a red cross was always foremost in the field. When Scotland and England were united under the government of James I. he directed that the cross of St. Andrew should be amalgamated with that of St. George; and when Ireland was annexed at the beginning of the present century, the cross of St. Patrick was added. Hence our "Union-Jack" is composed of an ordinary cross and two saltier-crosses; that of St. Andrew, white upon a blue ground; that of St. Patrick, red upon a white ground. Long may it "scatter our enemies."

So long as the army continued to be made of feudal contributions, heraldry continued to remain an art of vital importance. It is easy to imagine how next to impossible it would have been to tell one knight from another when cased in armour, had each not displayed a device on his shield or a crest on his helmet. When no longer a necessity the study of heraldry declined, yet its influence is felt in common parlance still. People say of a *parvenu* that he does not know who his grandfather was,—a statement that would lose half its pugency without its heraldic interpretation. The son of the first possessor of arms is but a gentleman of second coat armour, the grandson merely a gentleman of blood; but the great grandson is a gentleman of ancestry.

VICTORIA CROSS GALLERY.

MR. DESANGES has added a number of pictures to his gallery, in the Egyptian Hall, Piccadilly, and has opened it again to the public. The additions are mostly records of brave deeds in connection with the Indian mutiny. The earlier paintings, it will be remembered, illustrated actions in the contest with Russia. England has reason to be proud of her sons who participated in these doings, and there must be thousands who will be gratified at seeing these deeds represented. Mr. Desanges has confined himself to no aims, but represents alike the slinking private who "abouts" a man about to drive his bayonet into his officer, and afterwards charges the enemy "singly;" an officer in command directing an attack; or a dandy, with glass in eye, who walks coolly across the open under heavy fire to bring in a wounded private. Devoted to the graces, as Mr. Desanges had previously been, he had here an entirely fresh walk to follow; and, though criticism would not be difficult, and there is, notably, a want in some of the pictures of forcible expression, the devotion and ability displayed deserve the approval of the public, and will, we hope, gain for the artist tangible reward.

FALL OF A CHURCH BELL.—During the ringing of the bell of the church of Chitenu Male (Ile-et-Vilaine), recently, for divine service, a creaking noise was heard, and immediately the bell fell heavily into the church from a height of about 40 feet. In its fall it struck the head of a young woman, who, with her husband, had just entered the church, and so injured her that she died in a few hours.

An East End Tea Garden: with Salubrious Outskirts.

### HIDDEN DANGERS.

AN EAST-END TEA-GARDEN.

The risks that people run every day, without knowing of their existence, are often much greater than those which give them the greatest uneasiness. They are frightened by a squib that cannot hurt them, and sit contentedly week after week on a barrel of gunpowder with a lighted fuse within an inch of the lung-hole, not believing in the danger till they find themselves blown into the air.

Some years ago, when looking to the state of the banks of the Thames near the outlet of the Fleet-ditch, we met with an artist, whose business kept him employed in the City, walking along the dirty margin; and on asking what could have led him to such a locality, we were answered, that he had "just stepped out to get a breath of fresh air." You may see other artists among the willows overshadowing the luxuriant docks and other herbage on the banks of stagnant brooks or ditches. Pent-up Londoners seek recreation in most unwholesome places, without reason or consideration of the risk they run. Children not long ago were taken regularly to be aired in the reeking graveyards of the metropolis; and people of rank and fashion still overcrowd certain ill-ventilated theatres and concert-rooms. Old-fashioned tradesmen still visit nightly for recreation the coffee-rooms and parlours of antiquated "publics," where, while discussing politics and parish affairs, through the want of ventilation and space, the atmosphere is little short of poisonous.

Some rush to Boulogne for the sake of health; others to sea-side towns and fishing villages, where ventilation or drainage has not been thought of, and where the shore is strewn with putrifying fish and other refuse. Without, however, going further just now, let us glance at one of the suburban "tea-gardens," where, on Sundays and holidays, Londoners, with their wives and families, may be seen evidently taking a great deal of enjoyment and moderate refreshment. On the roofs of taverns where a view can be had over green trees and fields, large numbers assemble to enjoy the air. From Baginbode-wells the tea-gardens of the north of London have marched to Islington, Camden-town, and Kentish-town; thence to Hampstead, Hornsey, and elsewhere; and now they are springing up in more distant parts. Rosherville and many other places are now made almost as convenient by railway as Hampstead and Highgate formerly were. In these tea-gardens the caged Londoners and their children take their pleasure in bowers and arbours: they walk in shady places, and amongst beds of flowers; in some instances minstrelsy and singing enliven the scene. We will not severely criticize the artistic taste displayed in the decoration of some of these places, but would consider how well or ill they are adapted for the purposes of health. Some are properly situated, and removed from offensive matter; but in others, sanitary care has been so much neglected that health must suffer rather than be improved by a visit. Look at our picture of an East-end Tea-garden: view the black stagnant ditch, which, hidden by trees from the view of the pleasure-seekers, girdles the bowers, arbours, and grounds, and stretches away like a huge black serpent towards newly erected buildings. Avoid such tea-gardens, and the proprietors will find it to their benefit to provide healthful arrangements, and perhaps advertise not only the pic-

turesque beauty and other attractions of their domain, but that "every care has been taken to make the sanitary condition of the ground complete, drainage having been carefully attended to, and all offensive matter removed from the neighbourhood."

It is not surprising that we should find the multitude ignoring sanitary laws when we see a body like the Metropolitan Board of Works, supposed to represent the intelligence of the metropolis, permitting flagrant violations of these laws and of the teachings of experience for long periods of time, apparently without any attempt even to limit their endurance. Some weeks ago we gave expression to complaints of the time during which the sewers were kept open in parts of the Fulham-road, to the great annoyance and danger of the inhabitants. We now hear bitter and most just complaints of the inhabitants of the Paddington district, where similar operations are going on. Before some of the houses in Hyde-park-square, for example, the sewer has been open more than a month, and the air has been poisoned by most pestiferous gases. We can speak of our own knowledge, of the occurrence of a violent outbreak of diphtheria in one of the houses so situate, sacrificing most dear life and the happiness of survivors. A heavy responsibility rests on the officers of the Board of Works, who allow of such perilous proceedings without more stringent precautions, or permit the slightest delay in such works.

How long must we wait for the teachings of dire experience to have effect?

Next year, 1861, the results of the census will show the effects of the sanitary improvements which have been made since 1851. We shall find that in certain districts the duration of life has been greatly extended, and that throughout the nation, in consequence of beneficial changes, a large per-centage of deaths has been prevented, and that the people, the great strength of the nation, have much increased.

The census, which can occur but a few times in the life of any man or woman, is a sort of national stock-taking of materials, which are more precious than fine gold and jewels, whereby we see the advance or decline of various classes, and the growth of intelligence.

In the palaces of royalty, in the halls and castles of the nobility, in the snug homes of the middle classes, and in the cellars and garrets of squalid rookeries, the army of numerators will take their notes. In hospitals, in prisons, in overcrowded barracks, in lunatic asylums, in workhouses, on ship-board, in hives, in barns, under the shelter of hay and corn stacks, under arches, and in other strange places, the people will be sought out, and arranged in a proper position in the startling pages of the registrar-general. Although knowledge is making progress, there are still unfortunately widely-spread masses of ignorance wherein the task of collecting the information for the purpose of giving a faithful account of the extent and peculiarities of our population is difficult; and, viewing strongly the importance of obtaining full and correct particulars, it seems to us that increased powers should be given by Parliament to those employed.

We look with anxiety to the forthcoming report, which will enable us to compare, with those of previous years, the rates of mortality in districts where changes have been made, and which will show how human life can be saved, and so gain increased attention to sanitary laws.

### MONUMENT IN ST. GEORGE'S CHAPEL, WINDSOR, TO THE LATE DUCHESS OF GLOUCESTER.

This memorial, erected by her Majesty as a tribute of respect and affection to her beloved aunt, as the inscription records, forms an interesting addition to the various attractions of the ancient royal chapel in Windsor Castle. It has the advantage of an excellent situation in the south aisle of the choir, immediately at the back of the Medieval painted screen behind a portion of the stalls, and which is shown above the monument in our engraving.

The new design, which is the production of Mr. Scott, consists of an altar-tomb projecting from a kind of retable with sculptured panels. These latter represent the four acts of mercy, viz., "Clothing the naked," "Feeding the hungry with bread," "Relieving the wearied traveller on his way," and "Visiting the sick bed;" the first of which is the least satisfactory, and the last the most so. The whole of them, however, show much refined feeling, and are creditable to Mr. Theed, by whom they were executed. Like most of the tombs they are of very pure statuary marble. The borders round and separating the sculptures are filled with mosaic patterns in various materials, but principally choice marbles, such as Lungueloe, Broccadillo, Sienna, Bardillo, &c.; intermixed with green and red serpentine, and light Irish green marbles. The slab and plinth of the tomb are of dark reddish serpentine, which has a mahogany aspect in contrast with the white marble, not altogether pleasing. The slab is inlaid with a floriated lily cross in brass; and also a scroll border in the same material, which is again employed in the two inscription panels on the front of the tomb. This portion of the work was entrusted to Skidmore, of Coventry. The sculptured panel between these inscriptions exhibits the family arms of the late duke and duchess, while the sides of the tomb, and the retrous under the bas-reliefs, are filled with lozenge-dispersing, containing, alternately, the heraldic luges of England, Scotland, and Ireland.

The following is the inscription on the edge of the marble slab forming the top, occupying the sides and front:—

"This tomb has been erected by Queen Victoria, as a tribute of respect and affection to her beloved aunt, Mary, Duchess of Gloucester, Anno Domini, 1859."

Within the panels already described are the following inscriptions. In the first:—

"In the vault below are interred the mortal remains of William Henry Duke of Gloucester, born 25th November, 1743; died 23rd August, 1805. Maria Duchess of Gloucester, born 3rd July, 1739; died 29th August, 1807. The Princess Caroline Augusta Matilda of Gloucester, born 24th June, 1774; died 14th March, 1775."

The second panel contains the following:—

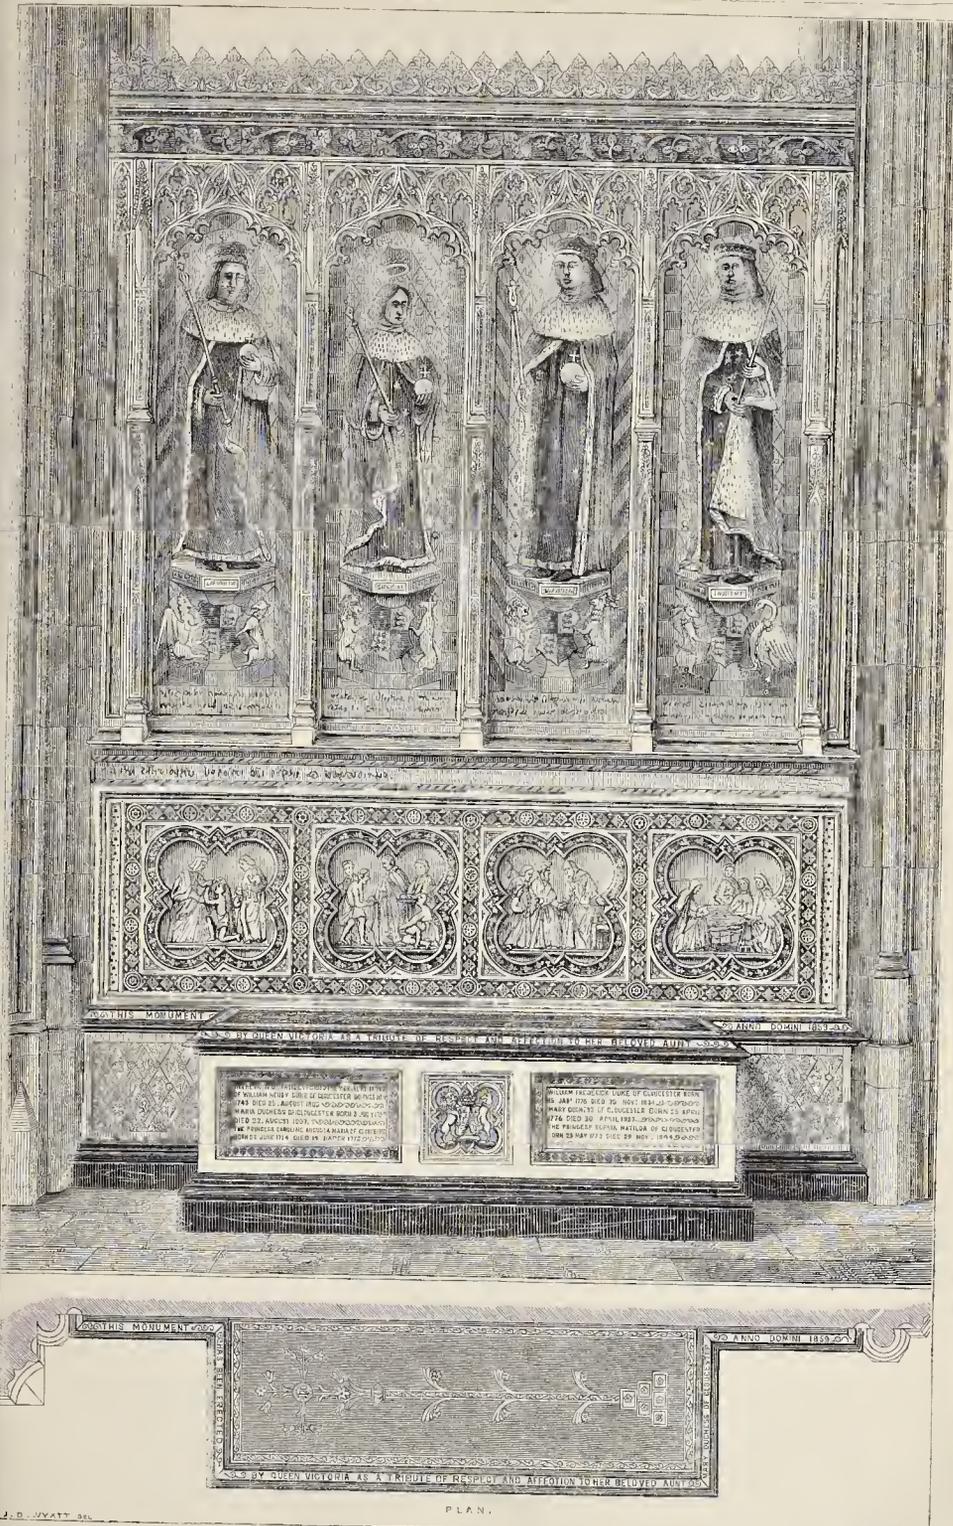

"William Frederick Duke of Gloucester, born 14th January, 1775; died 30th November, 1837. Mary Duchess of Gloucester, born 25th April, 1776; died 30th April, 1857. Princess Sophia Matilda of Gloucester, born 29th May, 1773; died 29th November, 1811."

On the screen behind the tomb, the paintings are as follows, beginning on the left hand:—King Henry VIII., King Edward V., King Edward IV., and Prince Edward, son to Henry VI. This latter is reported to be the only portrait of the prince extant. Along the foot of the panels runs this Latin inscription:—"Orate pro Dno Olivero Kyng, juris professo, ac Illustris Edwardi principis Regis Henrici Sexti, et Serenissimorum Regum Edwardi Quartii, Edwardi Quinti, et Henrici Septimi, principii Secretario," &c., with the date 1492.

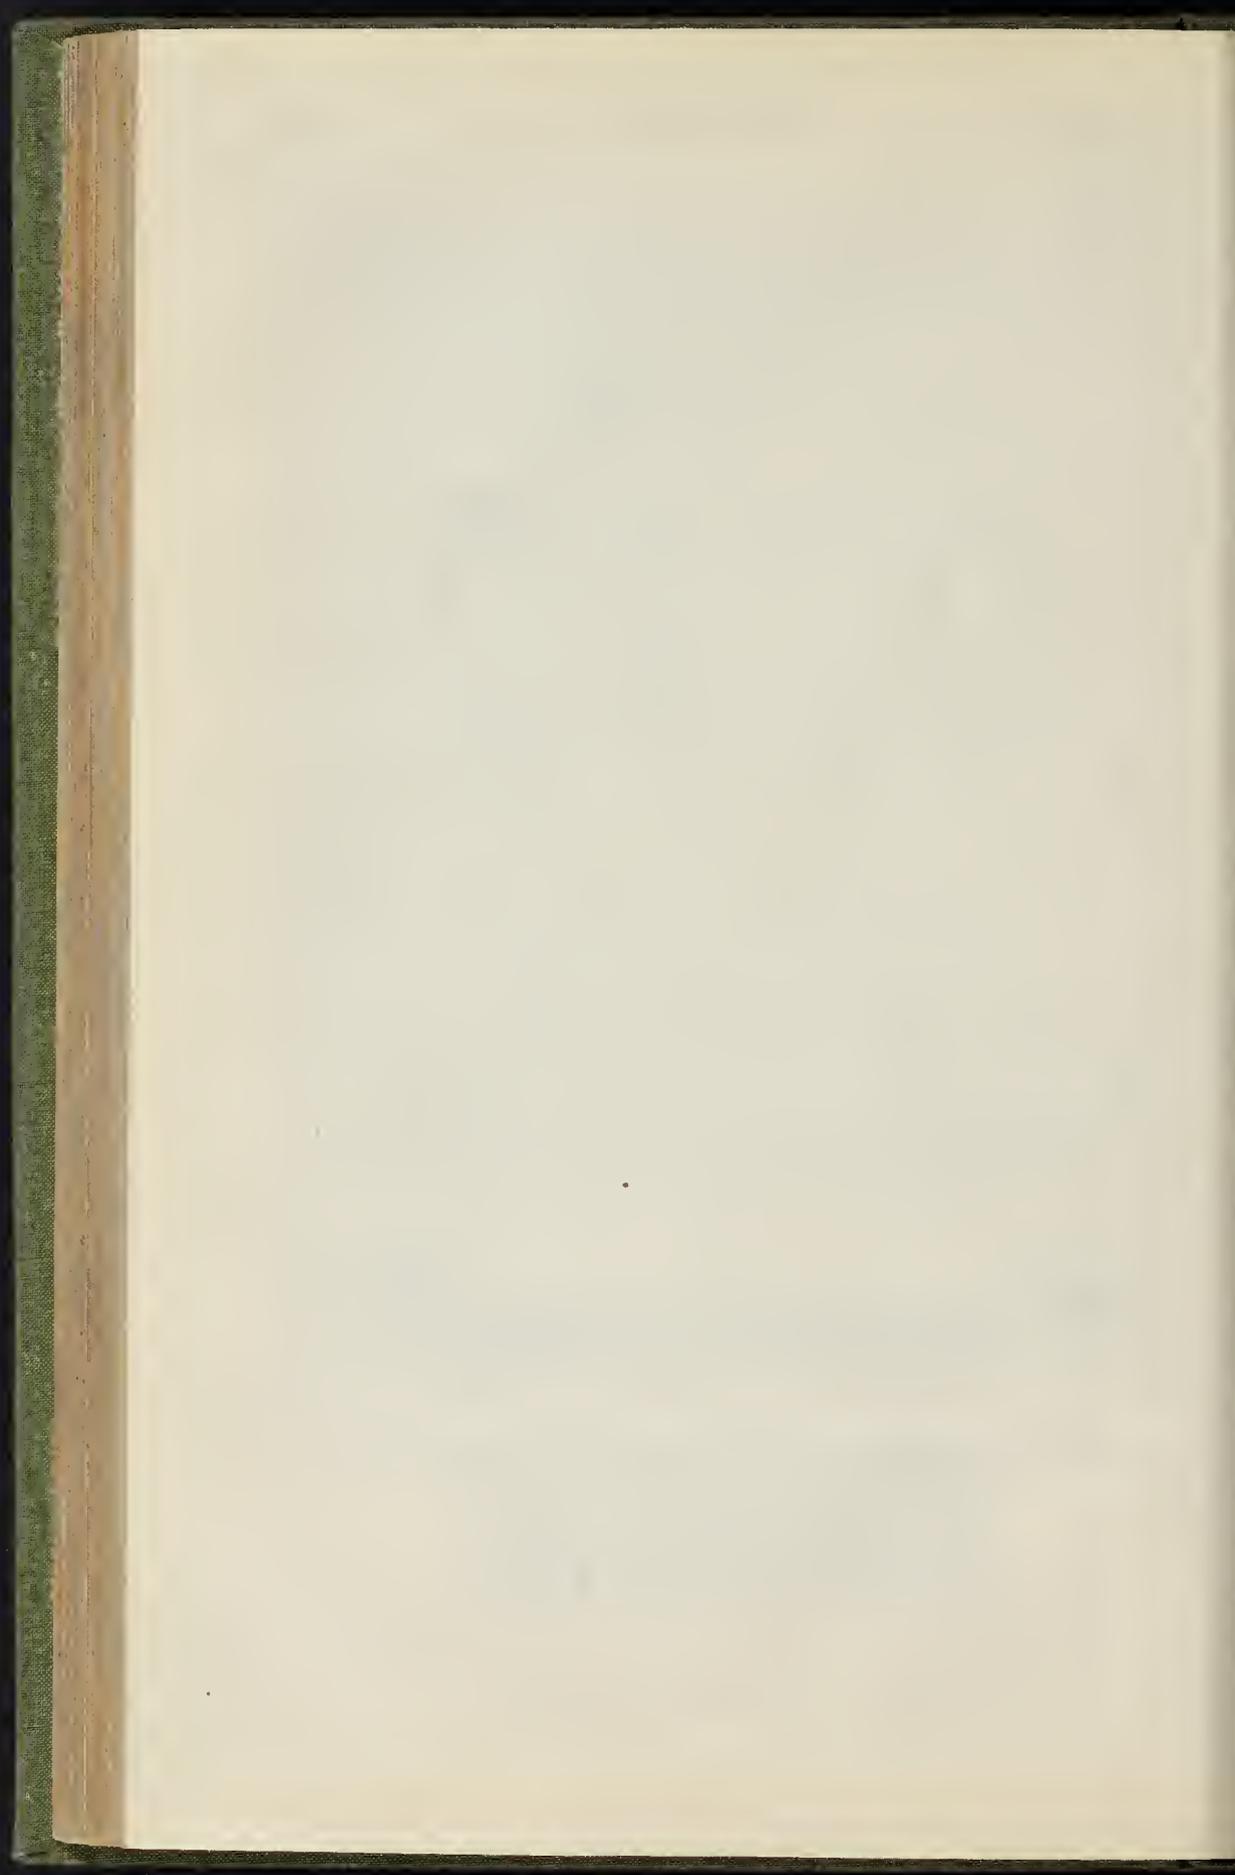

### LIVERPOOL CEMETERY COMPETITION.

AMONG thirty sets of designs, we understand, were sent in. At the last meeting of the Burial Board, the following were named as the successful designs:—First prize, 100*l.*, "Industry;" second prize, 50*l.*, "Sydenham;" and third prize, 30*l.*, "I try to win." On opening the sealed envelopes, it was found that the first premium had been gained by Mr. T. D. Barry, 47, Bedford-street North, Liverpool, and 10, Lincoln's Inn-fields, London; the second by George Henry Stokes, 7, Pall-mall East, London; and the third by John Wimble, 11, Union-court, Old Broad-street, London. It was next moved by Mr. Jackson, and seconded by Mr. Thornely, "That there are many points of excellence in the following designs, viz., 'Charon,' 'Utinam ut obtineam,' 'Perseverando,' 'Gottesacker,' and 'Spero Meliora,' which, in the opinion of this Board, are deserving of high commendation." Carried *nem. con.*

The cemetery comprises an area of 97 acres.

MONUMENT IN ST. GEORGE'S CHAPEL, WINDSOR, TO THE LATE DUCHESS OF GLOUCESTER.  
 MR. G. G. SCOTT, A.R.A., ARCHITECT.—*Mr. Theal, Sculptor.*

**SYMBOLISM IN REFERENCE TO ART\***

**Light.**—From the consideration of **Life** in its general and special, animal and vegetable forms, as sources of symbolism, we pass to the consideration of **Light**. Here, also, we must begin with the Orientals. The subject of light, even carry us off from this world into those poetic and theological regions, where life, and light, and love are eternally and inseparably united; but we must leave alone for the present the Heavenly Hierarchy and the Kingdom of Angels, which have little or nothing in common with the orders of archangels, other than a rising scale from the lower to the higher, from the more humble to the more elevated, and are especially associated in the mind with places of prayer, and often appear among the pictorial and plastic ornaments of ecclesiastical edifices.

In the worship of intellectual light, or reason, the *aurora*, as the visible source of light and life, came to occupy an important place in religious raptures; temporal rulers, regarded as the delegates of Deity, came to receive the titles of sons and descendants of the sun. Thus the kings of Egypt were called "Sons of the Sun," and the kings of Persia were styled "the children of the sun." The Emperor of China is *Tien-tse*, the Son of Heaven; and the imperial family are called *Tien huang*, significant of their celestial descent. (See \* Morrison's Dictionary.)

The *light* steps in to confirm the idea of a rising scale to the West, through the Christian emperors of Constantinople, who are occasionally represented with a celestial globe, or orb, as also several of the German emperors, who were styled "the sons of the sun," and the Emperor of Russia, who is called "the son of the sun."

The fathers of the Christian Church, who are named in the "New Sun." In the Roman Church, the *ostensorium*, containing the *hostia*, or sacred wafer, appears as a radiating sun, and the outer portion of it is so called.

Philology leads us to confirm the idea of a rising scale from symbolism, and shows that all divine persons are very properly distinguished by glories, since the word *divine*, in Latin *divus*, is derived from the Sanscrit root *div*, to shine.

Dr. Durandus has a remark on church windows that they symbolically transmit the light of the true sun—that is, God—into the hearts of the faithful.

Our pointed Christian architecture, with its clerestory windows, is here symbolical of the truth that "Light has come into the world." A symbolism is shown still more in some cathedrals in France.

This subject, as associated with the saints, that it may be referred to the next chapter, which treats of them and their symbols.

The light was held to be symbolical of love, is shown, by the conventional use of the symbol of the dove, which, figured by a dove, was associated with it by the sacred writers, and the Holy Spirit, so aptly distinguished by the agents in nature, *Life* and *Light*, when separately combined, and that their influence through architecture, sculpture, and painting, as also through the sister art of poetry, has descended from the most remote antiquity, to a tolerably connected series of representations, down to our own day, it remains only to point out how our national Christian architecture derives its forms and proportions from the principles already laid down.

The symbol of life, even of life eternal, has been traced from the earliest period of monumental history, along with the equilateral triangle, the symbol of the generation of all things, of the source of all life, of Siva, of Osiris, and of all truths in nature.

Nor has their union been confined to the earth; man, whose life, derived from sensible objects, are reflected to him from the heavens, as the subject of his speculation, has transmitted these images also to the stary firmament, and, in the southern hemisphere, the constellation of the cross shines with surpassing splendour along with the equilateral triangle.

But it is in reference to that intellectual and Christian heaven of the soul, to which the Church on earth is the type and prefigure, that we must now consider the symbol of life, and its ancient confirmation of the equilateral triangle. And surely nothing can be more in harmony with nature and revelation than, in Christian temples, where the great doctrines of life and immortality are taught, not as mysteries to the initiated only, but as the plainest of facts are preached openly to all, that the architecture of these sacred edifices should in its forms and details be regulated by those symbols which from the earliest times have been used to express them—the cross and the equilateral triangle.

In Christianity there is a gathering in, as it were, of all truth that has been scattered through the world from the day when first man left the planet, and went spilling on its course, the habitation of human beings, rejecting in its light and in that style of architecture to which the growth and development of Christianity in its palmy days gave rise, we recognize in its structure confirmation of the fact in the principles that prevailed and regulated the whole.

Our cathedrals, and the great Christian temples in France and Germany, and some in Italy, are built in the form of the cross, and the equilateral triangle has regulated the general proportions of the elevation, and often of its details. This has been shown by Cæsar Casarianus in his translation of Vitruvius, of whose ingenious observations Mr. Hawkins, in his History of Gothic Architecture, has given an account.

Brown Willis, in his preface to the second volume of his "History of Architecture," p. 8, has noticed that in most of these stately edifices the height was equal to the breadth of the body and side aisles. Arguourt, also, has mentioned this in reference to certain Gothic façades (Tav. xlvii, figs. 21, 22). The cathedral of Salisbury and Westminster Abbey are certainly designed, says Mr. Hawkins, on a system of triangulation; and there cannot, I think, be a doubt that the triple ratio has regulated the principal features no less than the details of our most perfect examples of Christian architecture.

These principles have been tested and successfully applied more recently by various architects. The best account I have met with of them is in a paper read by Mr. White, at the anniversary meeting of the Ecclesiastical Society, June 2nd, 1853, and printed in the fourteenth volume of the *Ecclesiologist*. Mr. White states, "The figures applicable to the setting out of Medieval buildings are these—1st, the square; 2nd, the equilateral triangle; 3rd, certain arcs described upon diagonals and bases of the same. We are chiefly concerned here with churches;—now the length of the nave being given, we can, by dividing it into bays, and setting up upon each bay equilateral triangles, or certain subdivisions of the same, show an accurate method of setting out its breadth, the length and breadth of the chancel, and other proportions of the ground plan. Upon the ground plan thus obtained we can, by the employment of certain angles, set up points for the heights of the several windows and arches, the roofs of the several parts, the stages of towers, and every thing else; and, when all these heights have been set up, we can then, and not till then, proceed to work out the relative widths of the windows and other minor parts, with every detail, even to the plan of the jaubs and mullions, and the section of mouldings." In fact, as Mr. White observes, "the equilateral triangle appears to be the basis of the proportions employed in the most beautiful of all our styles,—the intricate and traceried first pointed." The paper is well illustrated with drawings and diagrams.

Since these remarks were written, I have seen a paper in the *Builder* (March 3rd) on the application of harmonic angular proportion to Gothic architecture. The remark to the effect that the equilateral triangle appears to control all the proportions of the ground plan in Medieval buildings, and especially their choirs, corresponds with the result of my own observations on paper; the same principle may be applied to the choirs of some other cathedrals not in the Gothic style. But it would seem from the statements of Mr. Hay that this triangulation forms only a part of what he calls "the harmonic law of Nature."

On this subject I cannot enter, but he affirms, and I dare say he is perfectly right, that it has been to the satisfaction of many gentlemen here present, that this law is as applicable to the finest Doric temples of the Greeks as it is to our Gothic cathedrals—for the canons of beauty in art are, no doubt, as fixed from as fixed principles as are the phenomena of Nature, although it is the reward of patient study and industry alone to discover and appreciate them.

The united Christian architecture thus becomes itself a symbol, and a very significant one, with which its sculpture, paintings, and ornamental features all conspire to create a consistent and edifying whole.

The inspiring of a Christian philosophy, and of Christian feelings, light, air, and heavenward in its tendency, rises up with a spirituality entirely its own, and, though we cannot subscribe to the dreams of Durandus, we cannot withhold from it the entire credit of that symbolism it so perfectly conveys.

The enlightened Greeks in their sacred edifices combined, to the utmost of their ability, on philosophical principles, the *grand*, the *beautiful*, and the *true*.

The *grand*, as displayed in form and arrangement.

The *beautiful*, as manifested in form, proportion, arrangement, and colour.

The *true*, as shown in the construction, in the character of the building, its materials, and workmanship, in which nothing false, nothing meretricious, nothing unmeaning, found a place.

Our pious forefathers, with a conscientious integrity, and fully carried out these principles of the Greeks, and in the noble monuments they have left us of their Christian magnificence, have shown how the *grand*, the *beautiful*, and the *true* may receive from Christian motives their highest development.

H. C. BARTON, M.D.

These principles have been tested and successfully applied more recently by various architects. The best account I have met with of them is in a paper read by Mr. White, at the anniversary meeting of the Ecclesiastical Society, June 2nd, 1853, and printed in the fourteenth volume of the *Ecclesiologist*. **PROPOSED OFFICES IN LIVERPOOL AND THE LIVERPOOL ARCHITECTURAL SOCIETY.**

The following is a copy of the memorial forwarded to the Liverpool Corporation from the Liverpool Architectural Society. The interest of the question discussed is general.

Mr. Mayor and Gentlemen.—The Liverpool Architectural and Archaeological Society desire very respectfully to draw the attention of your honourable body to a matter immediately within your control, directly affecting the interests of the members of the architectural profession practising in this town, and, as it appears to the Society, also bearing on the interests of the ratepayers and general community, viz., the employment of the officers of the corporation upon public works, particularly such as are of an architectural character, other than those for the direction and conservancy of which they hold their appointments. While recent occurrences with respect to the proposed public offices have led the consideration of the Society strongly to this subject, they desire that it may be understood that the present representation has reference also to the matter at large which has been the subject of frequent comment in the profession for some time past. The course objected to appears to the Society to be impolitic, as depriving the town of a choice among the general body of architects, either by selection or competition, and unfair towards the architects resident in the town and contributing to the local taxation and the expenses of the local establishments, as it not only excludes them from many opportunities of legitimate practice, but fixes on them an implied stigma of professional incompetence, by the selection of those not in architectural practice for the direction of works towards the cost of which the resident architects, as ratepayers, contribute, and for the execution of which they may justly claim to be entitled at least to compete.

The practice seems unfair towards the ratepayers of the borough, as it deprives them of a part of the services of the officers so employed, as preventing the proper and exclusive employment of the latter to the duties for the performance of which they receive liberal salaries, and further, as it renders most improbable the proper execution of such additional work, if the special duties of the officers be duly discharged, and obliges much of it to be deputed to other and probably very inferior hands.

It seems far more impolitic on the ground of economy, as such additional employments are often made a plea for oblations to the employment of the officers engaged on them; such additions being likely to take the shape of permanent increase of salaries, while the cost of the additional assistance necessarily employed bears a considerable

\* See p. 195, ante.

† See the leuconographie of M. Didron—either the Paris edition, in quarto, or Bohn's translated edition.

able proportion to the charge for commission in ordinary architectural engagements.

It appears unfair towards the officers so employed, as placing them in an illudious position towards the members of a profession with which they are in frequent and intimate communication, and whose respect and esteem they possess in their official positions, and as likely to occasion them discredit in a professional light, by obliging them to erect buildings to which it is impossible for them to devote the time and ability necessary to render them creditable to themselves, the profession, and the town. It would appear either that the emoluments of the corporation officers are too great for the duties they have to discharge, or the diversion of a large part of the emoluments of the officers from those duties must be injurious to the public interest. The salaries attached to these offices are liberal, and seem to authorize a claim for the devotion of the whole time of the officers to their special duties, and there appears no reasonable ground either on the score of their insufficient occupation by those duties or of the impossibility of obtaining other efficient architectural aid, for the employment of such officers on works palpably foreign to those for the direction of which they are engaged.

Entertaining these views, the Liverpool Architectural and Archaeological Society desire in conclusion most respectfully to present to the deliberate consideration of your honourable body their decided opinion that the buildings required for the public service of the town, or erected under the control of the corporation, should be made the subjects of selection of competition among the architectural profession, and that the resident architects should in such cases receive at least the consideration due to them as contributors towards the burden of the necessary local taxation.

I have the honour, &c. &c.,  
On behalf of the Liverpool Architectural and  
Archaeological Society,  
H. F. HARRIS, President."

The subject, as we intimated would be the case, has again been under the consideration of the Town Council; and after much discussion it was finally resolved,—

"That the Council, whilst adhering to the opinion repeatedly expressed, that the concentration of offices for municipal business is desirable, do not feel themselves competent, with the information now before them, to decide that the plans now submitted are the best that could be devised—resolved, that therefore those plans be referred to a special committee, the said committee to consider the same, with power, if desirable, to call for other plans, either by competition or otherwise; and to recommend to this Council, with the least possible delay, such plans as they may think will best afford the required accommodation, and secure the efficient and economical discharge of public business."

In course of the discussion, it was stated by Mr. Pictou, architect, that the Corporation had spent on the site, up to the present time, the sum of 141,000*l.* for an area of 17,936 square yards, being 7*l.* 18*s.* 4*d.* per square yard; and that deducting 2,553 square yards for streets, there were left 15,383 square yards for which they had paid at the rate of 9*l.* 3*s.* 3*d.* per square yard. Of this area, he added, 5,983 square yards would be available for sale, and he estimated the price which the Corporation would obtain for this land at 4*l.* per square yard. Mr. Jeffrey, however, who moved the amendment which was finally resolved on, dissented from Mr. Pictou's mode of estimating the cost and disposal of the site.

#### CHELSEA CONGREGATIONAL CHURCH.

A CHURCH for the congregation of the Rev. C. Hooper has been built in Markham-square, King's-road, Chelsea, and with the vestries occupies the whole of the northern side of the square. It is in the style of the second period of Gothic architecture. The plan is slightly cruciform, having transepts projecting about 5 feet from the body of the building. A prominent feature of the exterior is a tower with spire rising from the west side of the southern transept to the height of 133 feet from the ground.

The ground-floor of the tower has a stone groined ceiling, and is the principal entrance to the church, being formed into an open porch, protected by wrought-iron gates.

The walls of the building are constructed of Kentish rag-stone, with bricks inside. The joints of doors and windows, their mullions and tracery, as well as the spire, and all mouldings and ornamental work, are of Bath stone. The roof is open-timbered, in one span, plastered underneath the rafters; the plaster being tinted to harmonize with the stained work throughout the buildings.

The pulpit projects out from the organ gallery, situate at the east end, in an arched apsidal recess.

The organ and organ front have been supplied by Messrs. Bishop & Co.

The walls are stuccoed inside with blue-lime lime, the finishing coat being prepared with sand obtained from the Lee Moor China Clay Works, Devonshire, by the architect. This sand (which is decomposed granite) contains a large quantity of mica mingled with the quartz and a small proportion of felspar.

The windows are glazed with cathedral glass.

The church is lighted at night by means of gas jets and lamps, executed by Mr. Rotwell, of Cleveland-street, Fitzroy-square.

The building is warmed with hot water supplied by Mr. Smith, of Teater-street, Finsbury; and ventilation is provided by means of dormers in the roof, and also by the windows.

Accommodation is provided for 618 persons on the ground-floor and 502 in the gallery, making a total of 1,120 adult persons. Below the church arrangements are made for a girls' and boys' school, with class-rooms, &c.

The building has been executed by Mr. Myers, under the direction of Mr. J. Tarring, architect. Mr. Acornb was the acting clerk of the works. The total cost, including approaches and enclosures, is about 5,000*l.* The carving was done by Mr. Ruddock.

#### BRITISH WATER-COLOUR PAINTINGS BELONGING TO THE NATION.

THE commencement of a permanent collection, to illustrate the rise and growth of water-colour painting in this country, has been made in the Government Museum at Brompton, under the superintendence of Mr. Redgrave, R.A. The number of such works belonging to this country is at present but small, and they are chiefly by the earlier masters of the art, including specimens of what is called stained drawing. Mr. Redgrave says of this branch of the art, in his introduction to the "Inventory,"—

"Its nature and quality will be understood by examining the drawing No. 417, by Mr. A. Rooker, executed in 1729; No. 449, by Wm. Hearne, executed in 1724; and that by Wm. Payne, No. 381, probably about the same date: all these works are more or less topographic in character, and are wrought precisely as I have described. If we, at the same time, compare with them the figure drawing No. 118, by Julius Cæsar Ibbetson, executed in 1795; No. 439, by N. Pococke, executed in 1794; that by Webber, No. 446, executed about the same date; and that by Alexander, No. 453, executed in 1796, we shall have a fair idea of water-colour drawing as it stood just before the great movement that was to raise it into a national art."

In our last volume\* we spoke of the foundation of the Water-Colour Society, and gave the names of the original members. The works of some of these will be found in the present collection. Several drawings of more modern masters have been kindly lent by Mr. Lewis Pocock and other collectors. We shall return to the gallery hereafter.

#### HALIFAX.

THE building of the new town-hall was commenced on the 2nd instant. The contractors are as follows: masonry and bricklaying, Mr. Thos. Whiteley, of Leeds; joiners' and ironmongers' work, Mr. Joseph Bedford, Horton-street; the founders and smiths' work, Mr. Henry Grissell, of London; plastering and slating, Mr. A. Bancroft, Winding-road; plumbing and glazing, Mr. George Walsh, Northgate; and painting, Mr. James Farrar. The above works have been contracted for at an aggregate cost of 23,320*l.*

We learn from the local Courier that for the proposed cemetery nine sets of designs were received. Mr. Milner, the designer of the Halifax People's Park, obtained the first premium of twenty guineas. The corporation was unable to decide as to the superiority in the merits of the plans submitted by Mr. Gay, of Bradford, and Mr. Barry, of Liverpool, and ten guineas were voted to each, the design to become the property of the corporation.

For designs for six shops proposed to be erected at the top of the New Market Place, three sets were sent for inspection, and two awards were offered. The first, ten guineas in amount, was given in favour of Mr. Ralph Nicholson, Southgate; and the second, three guineas, to Mr. Chas. Horsfall, of Albert-street.

#### BUILDERS' HOIST.

INVENTIONS AT THE SOCIETY OF ARTS.

THE contrivance for raising materials mentioned in our last notice of the progress of the "Machinery Works" (p. 194), is Johnson's "Builders' and Contractors' Hoist." One of these machines, it is stated, will raise in general works 20,000 bricks in a day, at a cost of 6*d.* per thousand for every 50 feet rise, saving about one-half the usual cost of labour. A hoist 40 feet high, complete, costs about 26*l.* A model may be seen in the present exhibition of the Society of Arts, No. 497. The "windlass at the bottom is fitted with patent waded wheels," or sheaves, which play off the rope as fast as it is taken in.

The collection of articles recently invented, or

patented, now on view in the Society's House, seems somewhat smaller than it was last year, but contains many items deserving attention. The room is not well adapted for anything like a classified exposition, and is, moreover, dark. It is to be hoped that, before long, the Society will take steps to obtain premises better suited to their objects and now high position.

#### MARBLES.

IN the report of proceedings before the Institute of British Architects, references are made to the Parian, Verd Antique, and Carrara marbles. May I be permitted to observe that the Parian may be regarded as a different material from any of the marbles found in Carrara. The Parian is of coarse granular formation, likely to be durable in any atmosphere; and the Carrara being of a finer grain, is susceptible of a polish for chimney-pieces, and other internal decorations, for which it is not likely the Parian would be so suitable.

The marble of the arch to which Mr. C. H. Smith alludes is Sicilian, and not generally identified with Carrara.

With reference to the Verd Antique, the prominent difference between that of the ancients and any specimens produced in modern times is, that the former, in the intersection of colour, is so blended that the line of demarcation between the beautiful green and the adjacent colour is not perceptible; they shade into each other; whilst the modern greens show a distinct line, through which neither of the colours passes. This may be seen in the green marbles from Monna and Galway, as well as in the Egyptian green occasionally brought into use.

READER.

#### STAINED GLASS.

Covey.—Two new windows have been erected in the old parish church of St. Michael. The one at the east end of the north chapel is not a memorial window. The balance of the fund raised for the Queen Dowager memorial windows has gone towards this window; but the amount was not sufficient, and has been made up by donations. The three principal subjects are: The Women at the Sepulchre on the morning of Easter Day; The Resurrection of our Lord; and His appearing to St. Thomas and the other Apostles. There are also the Angels and the Roman soldiers. Over the north door a window has been put in by Mr. Henry Masters, of this city, in memory of his late wife. The subjects are four angels holding scrolls, with inscriptions from the *Te Deum*. At Holy Trinity Church, a parishioner has supplied the funds for filling the tracery of the window at the east end of the north aisle. The window contains St. Matthew, St. Mark, St. Luke, St. John, and the tracery is filled with the symbols of the Evangelists. The whole of the above glass is from the works of Messrs. Heaton and Butler, of London.

#### PROVINCIAL NEWS.

Weymouth.—The drawings and plans for the erection of a new building for the purposes of the Weymouth Middle School, says the *Dorset Chronicle*, have been completed by Mr. G. Crickmay, who has been entrusted with the preparation of the architectural designs. The building will be of the Elizabethan period, and constructed of red brick, with Bath stone dressings. It will also be furnished with a bell-turret. The lower story will comprise an entrance-hall, a staircase, and two class-rooms, 23 feet by 16 feet, and 30 feet by 23 feet respectively. The school-room, 60 feet by 30 feet, will occupy the upper story. The tender of Mr. C. E. Semman, for the execution of the works at 1,350*l.*, with 60*l.* for old materials, has been accepted. The remaining tenders were—Mr. S. Brown, 1,408*l.*; and Mr. A. Williams, 1,400*l.*, each allowing 50*l.* for old materials.

Marlborough.—Proceedings have been taken towards building a new wing to Tottenham-park House, Marlborough, the family residence of the Marquis of Ailesbury, the cost of which will not, it is said, be under 40,000*l.* A chapel of ease is likewise in progress for the use of the household.

Elvaston Castle.—Extensive alterations are in progress at Elvaston Castle, the seat of the Earl of Harrington. The works consist of a remodelling of the east wing to correspond with the south front. The entire wing is to be raised an additional story. The works were commenced by the late Mr. Robert Bridgort, of Derby, and are now being carried on by his son, under the direction of Messrs. Giles & Brookhouse, of Derby, architects, who have also been entrusted with the restoration

of Wasingley Hall, Huntingdonshire, a seat lately purchased by the Earl of Harrington.

**South Shields.**—The new Mechanics' Institution, erected in German-street, at the end of King-street, South Shields, is now nearly completed. The new institution, as described by the local *Gazette*, is in the Italian Romanesque style, built of red brick, having a frontage of dressed stone. The first floor is the hall, 80 feet in length, by 40 feet in breadth, and 32 feet in height. At one end it has a gallery, elevated 12 feet above the floor of the hall, and supported upon ornamental iron columns. The hall, which will hold 1,000 persons, will be lighted by two of Pierce's solar lights, each of which has eighty-two jets. The want of a hall to accommodate a large meeting has long been felt in South Shields. The access to the gallery of the hall is by a staircase, ascending from the landing of the main staircase. At the top of this staircase, on the left, opposite to the gallery door, is a room, 80 feet by 24 feet, running the entire length of the building, above the class-rooms and staircase. This room is intended for a museum. The building has been erected by Mr. Joseph Wright, of South Shields, from plans drawn by Mr. John Wardle, jun., architect, Newcastle-upon-Tyne. The cost of the building will be about 3,000*l.*

#### ARCHITECTS AND BUILDERS.

I AM a tradesman who supplies materials to that class of builders who are not rich enough to pay the whole of their accounts without first receiving certain portions of the money due for work done at buildings undertaken by them. I am, consequently, much interested in the dealings and relations between builders and the architects, from whose hands all certificates for payments must first come. I may, it is probable, be somewhat prejudiced through the inconvenience I frequently suffer from, and which I shall presently allude to, on the matter. But as I am confident I am right in the main, and as I know for certain that nearly every middle-class builder in this part of the country agrees with me, I venture to ask you to permit a few remarks on the subject to appear in your columns, which are well known to be devoted to the service and welfare of all classes of persons connected with building operations.

My complaint is, that architects seem to be prejudiced against their property due to the tradesmen under them. They do not treat builders with the highest and courteous consideration which is their due, when they have fulfilled their contracts and engagements with honourable fidelity. Architects do not, apparently, regard prompt payments to builders to be an important part of their duty; and gradual neglect seems, at length, to have led the profession to lay down the breach of duty as a permanently wise rule, and to deem it not only prudent, but really right, to delay as long as possible the granting of certificates for work done. Time, they appear to think, will test the work, and save them from much risk in passing it quickly as properly and efficiently done. Time saves the exercise of judgment; and architects gain as much profit as it is possible for their own safety, but at the expense and frequent ruin of the builder. At this present moment I know of half a dozen instances of downright injustice and hard-heartedness on the part of architects. One of the profession in London, of highly-respectable standing, has surveyed and passed some buildings in this neighbourhood (Chester) as quite satisfactory, and requiring nothing further to be done at them by the contractor; yet, since before Christmas, he has not only neglected to write out the certificate for which he has been applied to by letter above a dozen times, but he has actually not had the courtesy to acknowledge receipt of the unfortunate builder's communications, and appears to have no conception of the misery and loss he is unwittingly inflicting upon the victim of his position. The builder in question cannot travel a couple of hundred miles to personally dun him; nor has he the wish to do so, because he has been informed that more work is proposed to be done upon the same estate, and he desires to keep in favour with all officials concerned, in order to secure it for himself if possible. In another case, a provincial architect has measured work, and expressed satisfaction with it, above three months since, yet has not calculated it up, or granted certificate to the contractor, though pressed nearly every day for it, and a law-suit seems to be the only resource left for the unlucky builder to recover his money through. In another instance the architect says, he has had no time for many weeks to examine work completed. And so on in

numerous cases within my knowledge, architects evince a callous indifference to the just claims of builders and contractors against whom they advance no charge of inefficient or bad work. If any dispute existed, or any difference of opinion, readily admit some justification might be reasonably given for delay or inattention. I do not, however, refer to these instances, I allude exclusively to cases wherein no dispute is in existence, and wherein no other cause for delay can be observed, save pure laziness, arrogance, or negligence.

My own opinion is that this apathetic negligence of architects, to give it as charitable a term as possible, arises from the too great an idea they are fostering within their minds of the exalted, theoretical, high-art nature of their profession. They are so keenly intent upon looking up into and studying the high heaven of speculative art and theory, whereat they are straining their eyes and imaginations to discover the true lines of beauty, strength, and style, that they have nearly forgotten the importance of the common business portion of their duties. They pore over learned works, listen to refined and speculative lectures, discuss with acumen the claims of rival styles of architecture, until, like many lawyers and ecclesiastics, they become dreamy students and enthusiasts, fonder and prouder of theories and principles than of the rude practice and adaptation of them to the living wants of their day. When lawyers are more wrapt up in worship of the beautiful principles of law than in pleasure of settling mean worldly disputes, poor clients are sacrificed for illustration of the grand principles. So when architects are too devoted to theory, they forget in the pride of their profession their everyday duties to society; and I think if they would exchange to a certain extent the speculative study of books for a direct, honest attention to the practical portion of their duty, they would fulfil their office between the employer and the tradesman with much greater advantage to all concerned with building operations. A thorough initiation at the beginning of their lives into the theories and mysteries of their profession is absolutely needful; as much so as with doctors; but afterwards, I think they ought to be as practically wise as doctors, and devote themselves to the full application of their knowledge to the service of life, to gain a thorough business conception of what is required from them, a precise apprehension of the characters of contractors engaged under them, a resolute habit of getting work done well and quickly, a rapid way of deciding correctly upon the merits of works when done, and a steady resolution to bring about a speedy and business-like conclusion of any matter under their charge. Conduct after this nature would not only highly gratify gentlemen and builders, but would bring the profession into good repute with tradesmen generally. As it is, however, architects are regarded more as obstacles than helps, and I am sure are losing ground in the estimation of the public. The eternal discussion ever going on in the body concerning fundamental principles and styles does not tend to generate a high opinion in the minds of spectators of the value of their theories; and I therefore see nothing but genuine, practical, business-like service and benefit, to sustain the profession in the high estimation it deserves to be held in. Perhaps some of your readers may take a hint from my humble suggestions, and, by hastening on the common business of life, do good service to tradesmen like myself, to builders, to employers and proprietors, and to the profession of architects generally. I am sure I write honestly, and state conclusions drawn from my own trade experience.

A TRADESMAN.

#### MASTERS AND WORKMEN.

THE remarks in last week's *Builder*, upon the propriety of other workmen besides secretaries of trade societies being examined before the committee of the House of Commons, must, one would imagine, receive the assent of every thinking person. Without a doubt there are many intelligent men, unconnected with trades' unions, competent to give an independent and unbiased opinion upon the proposed councils of conciliation. Whether, however, such men will be called upon to express their views, appears to me to be very doubtful. Although one of the foremost social reformers of the age has declared that "none could tell so well what would suit, and serve, and please a class, as men of that class themselves," yet we know that so far as a practical recognition of the truth thus enunciated is concerned, very little has been done. Committees of inquiry investigate, social science conferences discuss,—but

how rare to find the originators and conductors of such inquiries seeking information from thinking, observant men in the humbler walks of life, whose common-sense practical views, formed amidst the toils, trials, temptations, and contingencies of industrial life, deserve the most careful and candid consideration of those who are professedly striving to benefit their poorer brethren!

It is to be hoped, sir, the day is not far distant when working men generally shall take a more prominent part, not only in the discussion, but the practical realization, of measures calculated to benefit their own order. I hope this, because of a conviction, strengthened by every-day experience, that all the efforts, schemes, and organizations of our would-be-elevators, will avail but little unless this *self-helping* element be introduced. In this conviction, as a member of the great industrial community, I claim more than the *propriety*,—I claim the absolute right of the working man being heard upon a topic so pregnant with results to himself, his family, and his class. If these councils of conciliation have been the means of averting strikes with their thousand evils, if they have preserved reciprocal feelings of respect between employer and employed amongst our more excitable brethren across the Channel, surely the same means would be as applicable to the far more thoughtful and less impulsive Englishman. We boast of our civilization and social progress; but is it not high time the barbarous and irrational mode of settling disputes by strikes were superseded? These councils of conciliation appear to me to be just the thing we want; therefore I hope the conservative spirit of employers will not stand in the way of a fair trial of this peaceful principle.

WILL JACKMANE.

#### CITY OF ELY WATERWORKS.

MR. LATHAM, in his letter mentioned in our last, denies the statement of the correspondent who signed himself "Dan," and gives figures to show that the cost of pumping one million gallons of water with the old engine is *4*l.* 18*s.* 8*d.**, and with the new engine, *4*l.* 10*s.* 7*d.**

If "Dan" be wrong, it must be intentionally, as his position is such that he must have the command of correct information. We cannot attempt to balance the statements, and must leave the matter in the hands of those who are locally interested.

#### "BEDWAY" OF BUILDING STONES.

BATH STONE.

IT has been my lot to have some experience with Bath stone, and I believe that the genuine article from Combe Down quarries will not decay rapidly when exposed to atmospheric influence.

The upper part of the tower of this church was rebuilt a few years ago. The battlements and embrasures are coped with the usual projecting mouldings (there is also a string course) wrought at Combe Down. Not an arris of it has yet been affected.

Stone from the same quarries has been extensively used about some new schools and master's residence in this village, where there are many projecting mouldings. Though the work was only finished just before the late severe and early winter set in, and of course was in a green state, yet I do not find that the frost has had the slightest effect upon any of the projections, nor on the pointing, done weathered fashion, with fine blue lias lime and coal-ash mortar.

I believe every stone is properly bedded; they were handled by experienced workmen; and the work being done under my own superintendence, I would not allow a stone to be laid on its wrong bed, if perchance its dimensions otherwise suited the required purpose.

The dark veins cross the bed at right angles; and, by observing these, the bed is easily detected, and should be insisted upon when Bath stone is used.

There are many lovers of beautiful design and workmanship in the oolite localities, as you, sir, must know, though built say 400 years ago, which still retain much of the sharpness almost of new work. To instance one, Biton, Gloucestershire, built of the hard and coarse lower beds of oolite from Lansdown. The projections of the carvings and noses of the moulding are still in a state of comparative perfection. But the atmosphere of the country is very different from that of the smoky metropolis. Besides, we may be pretty sure that the stones were well selected, and the work undertaken without the modern marring system of *competition*, and without any undue letting, hurrying or driving the workmen (which

only makes the matter worse), or entrusting it to the cheapest hands, who are sure to scamp the work.

H. T. ELLACOMBE.

Rectory, Clyst St. George.

Portland-place was the first building in London where Bath stone was used: there any one may see how it has stood the weather, and how it is bedded. The work was done by Bath masons, and bystanders were astonished to see stone worked with carpenters' tools; so I have been told by old men. I believe the stone was supplied from Combe Down.

H. T. E.

I believe Mr. C. H. Smith's observation on the bed-way of building stone to be perfectly correct, and that it is no easy matter for the most experienced person to decide offhand which is the proper bed of the stone as it comes from the quarry. If the proprietor of a quarry would instruct his quarry-man to put a chisel mark on the stones as they are quarried it would obviate many a mistake which is now made, and a foreman of masons should pay equal attention when the stones are wrought and worked.

A SUBSCRIBER.

#### THE STONE OF THE NEW HOUSES OF PARLIAMENT.

Sir,—I am quite willing to accept Mr. C. H. Smith's remarks in your impression of last week as an *unavoidable* but, says Mr. Smith, "I am not disposed to consider Sir M. Peto and Mr. Gristell as the best judges of the most suitable kind of stone to be used for the exterior of an elaborate edifice." I beg to assure Mr. Smith that neither Sir M. Peto nor myself ever presumed to exercise any judgment in the matter. The quarries having been selected by Mr. Smith and his honorable coadjutors, our duty was simply to execute the work entrusted to our care, and in this respect we believe we have faithfully and creditably performed our part of the engagement.

Mr. Smith goes on to say, that by far the greater portion of the stone appears to be of a good and durable quality, and he instances the large blocks of carving throughout the whole of the river front, as strongly evidencing the least sign of decay, and which he thinks arises from the workmen, or the principal carver, having exercised a considerable discrimination in the choice of the blocks, selecting such as would cut and work freely, and were of one uniform quality throughout.

In the above reasoning Mr. Smith is entirely mistaken, as the whole of these large blocks were obtained from various parts of the quarries, where the sizes could best be obtained, and were in no case selected by the talented carver Mr. John Thomas, who had charge of that portion of the work, but were got invariably more with regard to size than to quality. The result of which goes to prove that the more thoroughly the stone is exposed to the action of the wind, rain, and sun-shine, the less liable it is to decay. I may add also that all these stones are fixed the reverse way to the bed, and I believe had they been used in more sheltered situations, would not so strongly have commended themselves to Mr. Smith's kind notice and consideration.

T. GRISSELL.

#### THE "BUILDER'S" LAW NOTES.

**Railway Shares.**—A person bought railway shares and deposited them with a broker, who afterwards became bankrupt. Proof was at first admitted, allowing the value to be estimated by the price paid by the purchaser; but this was subsequently reduced to the value of the shares at the time when the owner demanded possession of them.—*Be Morgan*.

**Land-Tax and Rent-Charge.**—When a tenant agrees to pay a rent "free of all out-goings" he is not entitled to deduct land-tax and title-commutation rent-charge, although these are landlord's burdens.—*Parish v. Sleeman*.

**Bonus on Shares.**—A person bequeathed shares in a company and died between the time of the declaration of a bonus on the shares and the time appointed for its payment. This bonus was held not to go to the legatee of the shares, but to form part of the testator's general estate.—*Loch v. Venables*.

**Patent.**—A part of a patent may be assigned, separately from the other parts, and the assignee may sue in respect of the infringement of such part without joining as plaintiffs those whose interests are confined to the other parts.—*Dunnell v. Mallett*.

**Building Land.**—*Mortmain*.—A lady made a grant to trustees of two acres of land for the purpose of there being built thereon a church, parsonage, schoolhouse, and residence for schoolmistress. The deed was duly enrolled, but it remained in the lady's possession until a short time before her death, and the possession of the land had not duly changed. The lady made a will reciting this deed of gift, and bequeathed sums of money for the erection of the buildings and the endowment of the church. The deed of gift has been held void under the Mortmain Acts, and as the legacies were connected with the deed they were also held to be invalid.—*Fisher v. Brerley*.

**Banking Company.**—A joint-stock banking company cannot legally commence business until all the shares are subscribed for and half the amount be paid up. A bank commenced business without complying with the law in this respect, and a person took shares understanding that all

had been rightly done. On the winding-up he was held liable to be bound as a contributory, it being held down that the law is for the protection of customers, not of shareholders.—*London and Eastern Bank, re Longworth*.

**Directors of Companies.**—Directors of companies cannot enter into contracts with the company; but a mere advance of money is not against the law. Contracts with a director are valid, however, if sanctioned by a general meeting of the company.—*Re Baker*.

**Allowance to Insolvents.**—A creditor at whose suit insolvent was imprisoned, having omitted to pay the allowance ordered to be paid, the insolvent was discharged from custody.—*Re Guy*.

#### HOUSE AGENCY CASE.

*Stevens v. Daniels*.—Messrs. Stevens & Sons, of Upper King-street, Bloomsbury, summoned the defendant to the County Court in St. Martin's-lane, for commission for letting his house in Gower-street. They stated that, on seeing bills in the windows, they had applied to know whether they would be allowed commission if the house were let through them, to which defendant replied in the affirmative. They, thereupon, took down the bill in one window, on which was printed "inquire within," and substituted one of their own, leaving the "inquire within" in the other window. Observing afterwards that the house was let, they called and asked the tenant whether she had not received one of their cards to view, to which she had said yes, and that she had called at their office. The tenant, on being called on plaintiff's behalf, denied having said so, and stated that she did not know where their office was. She went into the house from seeing the bill "inquire within," and produced the correspondence which resulted in her taking the house. In this Messrs. Stevens did not appear at all. This was plaintiff's case. The judge said there was no case at all, and dismissed the summons.

#### MAGISTRATE'S DECISIONS UNDER THE METROPOLITAN BUILDING ACT.

*The St. James's-street Case.*—The absurdity of referring *Building Act* matters to police magistrates has long been fully apparent; they are wholly incompetent to deal with questions requiring professional knowledge. The Act itself is defective in every particular, badly drawn, stringent and lax, indeterminate in point of law, and absurd in being capable of any amount of modification.—nothing defined, nothing clear.

Whether the district surveyor had any *locus standi* or not; whether the work constituted a projection extending beyond the regular line of front; whether such regular or defined line existed at all,—I am not about to argue.

The matter in question went off upon an issue which can only be considered as ludicrous in the highest degree. The magistrate decided that a wall taken down, reconstructed in every particular, rebuilt in fact, was only a repair, *not affecting the construction*, although it was in evidence that the wall was wholly reconstructed.

This decision would provoke to laughter even a committee of builders anxious to evade and defeat the Act as far as they could. We must have a competent tribunal to decide vexed questions in building matters, such as a Metropolitan Building Court or *Jurés de bâtir*, we had better fall back upon the very clear and able Act of 1844. Repair is not rebuilding or reconstruction, but, as clearly stated in the committee of the House of Commons, applies only in cases of superficial or surface repair, not affecting the construction; repairs affecting the construction, such as rebuilding, being in no way exempt. Then, cases taken to police magistrates decide nothing, nor have they any weight; they are the crutches of unskilled men, who might as well be called upon to decide Admiralty cases. Police magistrates deliver wholly conflicting decisions: what other result was to be expected?

A SUBSCRIBER.

#### WAVY WINDOW-GLASS.

As this is the age of improvement in everything connected with the building of houses, both as to comfort and also appearance, I should like to draw the attention of your numerous readers to the subject of *window-glass*, for in this we seem quite at a stand-still. Formerly, when sashes were made in twelve lights, we could get crown-glass put in, but when the duty came off glass, and cheapened it, the public taste ran for larger sized squares to look through, and consequently crown-glass had to give way to sheet. It is true we now have large squares, but a very bad appearance; and it matters not whether the glass is made in this country or in any other, it is all alike having a hammer-looking surface, consequently driving us to the expense of *plate-glass*. Now, sir, what I should like to know is, cannot manufacturers give sheet-glass the even appearance of crown-glass; and if not, cannot they make crown-glass larger, so as to enable us to get the squares we want for the present style, namely, squares about 46 by 30, or 40 by 32? This is a subject well worth the attention of window-glass makers;

such glass would command a most extensive market; for the complaints of the sheet-glass are universal, whether it is 21 oz. or 16 oz., no matter, the surface is always wavy when the light falls on it.

W. F.

#### THE POLITICAL ECONOMY AND TENDENCY OF STRIKES.

MR. H. FAWCETT, Fellow of Trinity Hall, Cambridge, delivered an address upon this subject, last week, in St. Martin's Hall, to an audience composed for the most part of members of the working-classes. He was introduced to the meeting by Sir J. Kaye Shuttleworth, who presided on the occasion. He expressed his dissent from the opinion that strikes ought to be regarded as producing effects entirely bad, and his belief that their tendency was to bring about social relations between the employer and the employed very different from those which at the present day existed. The terms "capital" and "wages" he briefly explained, remarking that it was impossible to raise the general average rate of the latter throughout the country unless the former were increased, or the number of those competing for employment was by emigration or some other means diminished. Touching then upon the question whether the number of hours which the recipients of wages should work were simply regulated by custom, or the will of the capitalist, or by laws which could not be arbitrarily set aside, he stated it to be his opinion that, although it might be quite possible for a number of labourers entering into a sudden combination to procure for a short period the same amount of wages for nine hours' work as they had previously done for ten, yet, inasmuch as the accumulated fund from which the remuneration for their labour was drawn would in consequence be diminished, they must not hope to succeed in obtaining permanently the same amount of wages for less work. Capital and labour were no doubt opposed to one another as things at present stood, but identity of interest between them might, he thought, be effected by making the labourer a participator in the improvement in his master's trade,—a result which the power to combine, he thought, irresistibly tended to bring about. The lecturer then proceeded to dilate on the advantages which the existence of co-operative establishments such as those at Leeds and Rochdale was calculated to confer on the labouring-classes, and the great benefit which giving them increased interest in their employers' success by the means which he had indicated would be likely to produce.

#### PATENTS CONNECTED WITH BUILDING.\*

**STOVES AND FIRE-PLACES.**—*J. Taylor*, Stream-hill, Surrey. Dated July 13, 1859.—The patentee combines with stoves and fire-places, constructed in a manner similar to what is described in the specification of his patent, dated the 2nd of May, 1858, air-passages or flues through which air is caused to pass. The air, in passing through these air-passages or flues, becomes warmed, and in this state is allowed to escape into the room, as described. The patentee remarks that stoves or fire-places combined according to other systems, with air-flues for the purpose of supplying warmed air to rooms, may advantageously be set as described, with ornamental slabs having perforations formed in them, through which the air, when warmed, is admitted to the room.

**APPARATUS FOR CURING SMOKY CHIMNEYS AND PREVENTING DOWN-DRAUGHTS.**—*C. Hagan*, Tower of London. Dated July 6, 1859.—This invention cannot be described without reference to the drawings.

**CONSTRUCTION OF WALLS.**—*J. Taylor*, Roupell-park, Stream-hill, Surrey. Dated August 8, 1859.—The patentee introduces into the wall, at a short distance above the ground line, two layers of tiles made of non-absorbent material. Each of these tiles is made of a length equal to the thickness of the wall, and of a width equal to the length of an ordinary brick: it is thickened at the edges on each side, so as to form a thickened border or flange projecting up from the general surface of the tile. The first of the two layers of tiles is laid with the thickened flanges projecting upwards, the length of the tile being in the direction through the wall, and the second layer of tiles is laid with its length in the same direction, but with its thickened flanges projecting downwards, and so that the plane surface between the two borders of each tile of the upper course rests on the flanges of

\* Selected from the *Engineer's* lists.

two adjacent tiles of the lower course. The width of each of the flanges is made somewhat less than one-half of the width of the space between the flanges, so that when the tiles are built together, as already explained, spaces are left between the flanges of the tiles, which effectually prevent the passage of damp along the joints between the tiles, and they also serve to admit air underneath the floor, to do which air-bricks are commonly employed.

**APPARATUS FOR HEATING AND WARMING BUILDINGS.**—*H. J. Newcombe*, Shenley, Herts. Dated July 30, 1859. This invention cannot be described without reference to the drawings.

**BUILDINGS OR ERECTIONS TO BE USED FOR HORTICULTURAL OR OTHER PURPOSES.**—*T. G. Messenger*, Loughborough. Dated August 1, 1859. This invention relates principally to hot-houses, and other erections constructed of glass and wood or metal, or with roofs and sides of glass and wood, and other erections constructed of glass and wood, first, in the use or employment of light rafters in lieu of strong ones, the same being supported by a tensile rod; secondly, in making the entire length of the building or erection without a division; and, thirdly, in the use or employment of apparatus for opening any part of a building or erection the entire length at once.

**SELF-ACTING WATER-CLOSERS.**—*J. Hewitt*, High-street, Sheffield. Dated August 3, 1859. The patentee proposes to introduce two levers with fixed or adjustable fulcra, both of which levers are actuated by the seat, and act upon the ends of a cross-bar as rigid as may be consistent with lightness. This bar acts upon the lever-wrunk or piston connected with the flushing apparatus. The invention cannot be fully described without reference to the drawings.

## Books Received.

### VARIORUM.

1. "The Principles of the Working of Vulgar and Decimal Fractions and Duodecimals familiarly Explained," by the Rev. John Eynns, M.A. (Fenny, Lincoln's-in-fields), the object is to enable learners, however young, to become familiar with the principles on which the rules for working vulgar and decimal fractions are constructed. For this purpose an easy and homely method of illustration has been adopted, which appears to be very suitable to the object in view. — In "The Elements of Geometry Simplified and Explained, with Practical Geometry and Supplement," by V. D. Cooley, A.B. (Williams & Norgate, Hendon-street, Covent-garden), an attempt is made to reduce the 173 propositions of the first six books of Euclid to 36 propositions, and so to form a short road to a knowledge of the elements of plane geometry, more likely to be traversed with actual interest and benefit, in the midst of a multiplicity of other pursuits, in this fast age of ours, than the more compendious and circuitous route of Euclid, through which "the Greek philosophers used to beguile many long hours." — "Observations on the Best Means for Cleansing the Sewage of Large Towns, and a Description of his Patent Plan of Subsidizing Pool," by Thomas Walker, of Birmingham, is a tract urging the preference of such a subsidizing pool as that described to any mode of filtration. The patent pool has a sloping bottom, and the sewage enters on a level with the bottom of the deepest part, and passes up the inclined plane while the subsidence is going on, and it reaches the shallowest edge, where it has sufficient exit. Mr. Walker speaks of three hours as sufficient to clear the water in a pool of proper dimensions. — An endeavour is being made to procure the means of restoring the church of Great St. Mary's, Cambridge, the principal town and University Church, as appears from a tract entitled "Remarks on the Present Condition and Proposed Restoration of the Church of Great St. Mary's," by H. B. Luard, M.A. (Maenillan & Co., Cambridge). This church, in its present state, is regarded as "a model of everything a church ought not to be" and it is to be hoped the endeavour to render it what it ought to be will prove successful.

## Miscellaneous.

**LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.**—A general meeting of this society was to take place on this Thursday, in the Middle Temple Hall, and papers were to be read. The Parliament Chamber, Library, and Church were to be visited, and afterwards Bridewell Hospital, Stationers' Hall, and the Public Record Office, for the purpose of seeing "Domesday."

**FURTHER FALL OF THURSTON CHURCH.**—The disaster to this church on the night of the 18th ult. has been followed by a further demolition; and the necessity for rebuilding the whole edifice, except the chancel, is now placed beyond a doubt. Since the fall of the tower and western arches, Mr. Farrow had been engaged in removing the ruins and shoring up the remaining walls and arches; but Mr. Hakewell, the architect, on examining the masonry and timbers, had come to the conclusion that it would be necessary to take down the whole body of the church, when his opinion received a decisive verification on Wednesday before last, when the remaining arches of the south aisle fell, bringing with them the roof of the aisle and nave, and crushing the pulpit, desk, and seats beneath the ruins. All that now remains of this church is the chancel, with three arches of the north aisle, and the outer walls as far as the porch, with the porch itself. About 6000 were recently expended in an attempt to prevent this catastrophe, and 2000 more were about to be laid out, partly in undoing what had been done. It is said the tower was considered, sixty years since, to be in an unsound state.

**LUNATIC ASYLUM FOR THE CITY OF LONDON.**—The proposed asylum is to be built at Stone, near Dartford, Kent, from the design of Mr. J. B. Bunning, the architect to the corporation. The building is to contain 154 male and 168 female lunatics. According to the *City Press*, the main building will consist of a centre and two wing buildings, with communicating corridors, three stories in height, except the extreme ends, which are to be occupied as infirmaries, and will be two stories high. The centre portion of the building will contain an assembly and dining hall, chapel, committee-room, reception and waiting rooms, matron's and assistants' rooms, kitchen, sculleries, store-rooms, servants' bed-rooms, and the warming and ventilating apparatus. The eastern wing is to be appropriated for the males, and will contain, on the ground-floor, a day-room, and single rooms for twenty inmates, with exercising corridors and lavatories, and other requisite accommodation. The one-pair floor will be arranged in the same manner as the ground-floor, and will accommodate the same number of inmates. The two-pair floor will contain associated dormitories only, and will accommodate forty-six inmates. The western wing is to be appropriated to the females, with similar arrangements as to the eastern wing, and is intended to accommodate one hundred inmates.

**THE NEWCASTLE-UNDER-LYNE SCHOOL OF ART.**—The annual meeting of the friends of this school has just been held in the Institution Lecture-hall, Newcastle, under the presidency of Mr. William Murray, one of the members for the borough. The attendance was so numerous and respectable, says the *Staffordshire Advertiser*, in reporting the meeting, that it was hard to believe that so valuable an institution had to contend with a paltry debt of less than 300*l.*, and that the amount subscribed in the town in aid of the pupils' fees had not averaged more than 17*l.* during the last two years. The report stated that the master as having received instruction in connection with the school in 412, being an increase of 112 on 1853; at the Central school, 89, showing an increase of 29; Grammar, Orme's, National, and British Schools, 323. The number of medals awarded by the Department during the past year amounts to 15,—3 national and 12 local medals. The meeting was addressed by the chairman, and by Mr. Hammersley, head master of the Manchester school, also by Mr. Smith Child, the president of the school, and various others; and the prizes were distributed by the chairman.

**BATH ABBEY CHURCH.**—Certain alterations and improvements in the Abbey Church are contemplated, with the view of providing increased accommodation and convenience for the congregation. With this view the rector consulted Mr. Scott, who suggests the screen which at present divides the nave from the choir should be removed and re-placed at the west end. The organ to be removed to the north transept, the pulpit to be placed against the north-west column, which now supports the tower, and the desk at the south-west. The galleries to be altogether removed. The font to be placed near the south-west door, and the communion rails to be extended as far as the west end of Prior Bird's Chapel.

**ARTIFICIAL STONE.**—Messrs. Pavin de Lafarge, Viviers, Ardeche, propose to employ a compound of quartz and clay as a substitute for sandstone. The dry portion of the compound is finely-powdered quartz, and the wet of aluminous earth. The mixture is cast in moulds, and then subjected to the requisite pressure.

**OPENING OF AN INDUSTRIAL SCHOOL IN HOLBORN.**—The West Central Day Industrial School was opened last week in Titchbourne-court, Holborn. The Rev. Emilius Bayley, rector of St. George's, Bloomsbury, presided. The Rev. S. H. Parkes, one of the honorary secretaries, in a short summary of the object and plan of the institution, said:—"The object we propose to attain is to afford industrial training, food, and instruction, both religious and moral, to the destitute though not homeless lads that throng about the west central postal district of London. We propose to receive them between the ages of 10 and 15, and to give them work and wages, which will supply them with money for clothes, and to train them to some industrial occupation. They will receive two meals a day, a substantial breakfast and dinner. The boys will all be recommended by the superintendent or secretary of the ragged schools in the district, and they will further be compelled to attend the night and Sunday schools, from which they are recommended, and thus the connection already existing between the boys of the ragged schools will not only be unbroken, but more strongly cemented." The Institution should have the warm support of the district.

**THE LOCH KATHINE WATERWORKS: A DECEPTIVE CONTRACT.**—An awkward verdict has been returned by an Edinburgh jury against our water commissioners (says the *Glasgow Gazette*). It seems a Mr. Adamson, one of the contractors, was either unable or unwilling to proceed with his contract, in consequence of the ruination which he saw it would bring down upon him. He therefore threw it up; but he did so on this special ground, that he was deceived or misled, and he repaired to the Court of Session to seek a large sum of damages, or a large amount of money he alleged to be due to him for work performed. The commissioners resisted this action. They toughly contended that Mr. Adamson entered into this contract—about the Mugdock Tunnel, we think it was—with his eyes open, and that they owed him nothing, or next to nothing. He re-asserted his plea that they had deceived him; and on that plea an issue was made up on the following fact:—"Whether by fraud, or wilful misrepresentation, or essential error, the pursuer (Adamson) was induced by the defenders (water commissioners) to enter into the said contract, to the loss and damage of the pursuer," &c. The jury returned a verdict for the pursuer or plaintiff in the action.

**THE LATE SCAFFOLD ACCIDENT AT HANOVER-SQUARE.**—A lengthened investigation into the cause that led to the death of Jacob Brightman, and serious injuries to Henry Cooper and John Maloy, workmen in the employ of Mr. Foxley, builder, King-street, Golden-square, took place on Saturday before Mr. Bedford, the coroner, at St. George's Hospital. The circumstances attending the accident were shortly these:—On Tuesday morning four men, including the above named, were at work on a scaffold, erected at the top of a well-staircase, at 22, Hanover-square, when a pole 12 feet long (the ledger) suddenly snapped, causing that part of the scaffold on which the men stood at once to give way, and precipitated them, one of whom miraculously escaped, from the great height on to the floor of the hall beneath. It appeared that Maloy, one of the sufferers, and Patrick Moran, both labourers, erected the scaffold, under general instructions from their employer (Mr. Foxley), without any overseer over them, and that the pole which broke and caused the accident was very much decayed, and cracked to have been previously broken, it being examined all the way through, and a nail driven in as if to hold it together. The jury returned the following verdict:—"That deceased met his death by falling from a scaffold, one pole of which was unsound." The coroner severely animadverted on the conduct of Mr. Foxley, for allowing such inexperienced men to erect a scaffold, without proper inspection from a more experienced person, thereby jeopardizing human life, and remarked that very great carelessness had been shown in the choice of such a pole.

**IRONMONGERS' CIRCULAR.**—Sir: As your journal has more to do with ironmongers than any other periodical, I beg to point out the inconsistency of a circular published in the City. The proprietors are only warehousemen, selling brushes and mats: they never weighed up or sold a thousand nails in their lives, yet their great feature is to criticize and use the most insulting language to those who differ from them. Ironmongers in general are a gentlemanly class of men, who would scorn such language out of mere wanton mischief and because they get a few to advertise in their journal.—AN OLD IRONMONGER.

**THE GLASGOW CATHEDRAL WINDOWS.**—A large and influential meeting has been held in the Trades' Hall, Glasgow, relative to filling the windows of the Glasgow Cathedral with stained glass manufactured at Munich, to the exclusion of home enterprise and genius. The meeting resulted in a unanimous vote that a memorial should be sent to Her Majesty's First Commissioner of the Board of Trade, petitioning against the unpatriotic treatment which has been shown to native talent in this anti-national scheme. A long correspondence of the Committee for the Decoration of the Cathedral has been published in several of the local newspapers. Mr. James Ballantine, of Edinburgh, as we some time since stated, has finished a large window to the order of the late Mr. Houldsworth, and insists upon his right to erect it. On the other hand, the Duke of Hamilton, who has had his window completed, will not allow it to be erected, unless the committee guarantee that the original agreement to have only Munich windows be faithfully carried out. The Messrs. Baird, of Gartscherrie, who have erected the west window, also protest against any departure from the original agreement. Mr. Ballantine and the committee both appealed to the Board of Works, and a letter, of 16th February, from the Office of Works to Mr. Ballantine thus closed the correspondence.—In all the public proceedings of the subscribers, a universal consent appears to have prevailed that the windows should all be printed in the same style; and the decision of the committee that they should be ordered from the royal factory at Munich seems to have been generally accepted as a condition under which subscriptions were offered. Under these circumstances, the First Commissioner considers that there is just ground for maintaining that the admission of the window in question would be a breach of the general understanding, and that he must decline to give the authority demanded.

**PLASTERERS' STRIKE.**—A movement has been on foot at Hastings and St. Leonard's for some weeks past among the plasterers, who have been trying to induce their masters to lessen the hours of labour on Saturdays without reducing their wages. The project having failed, between thirty and forty of the men made a "strike" on Saturday last, and are now walking about out of employ. The rate of wages which has been paid is 6d. an hour, and the men applied to leave off on Saturdays at four instead of half-past five. Matters to this effect had been nearly arranged at some places, but the principal builders, including Messrs. Howell, Parks, Pattenden, and Kenwood, have strenuously declined to accede to the proposition, and the above is the result.

**MONUMENTAL.**—The model of the intended statue of General Sir Henry Havelock, in Trafalgar-square, has been completed by Mr. Helms, the sculptor, and has been exhibited in his studio. The figure stands about 12 feet high. The statue is expected to be placed on its site, the eastern side of Trafalgar-square, in the month of August.—The Durham monument to the late Marquis of Londonderry will shortly be completed. The pedestal is constructed of stones from Penser Quarry, some of them weighing between seven and eight tons. It is said that Signor Monti has been successful in delineating the features of the late marquis, who is represented as colonel of a Hussar regiment. The horse is twice the size of life, and the horse and figure are about 15 feet high, which, taking the base as 15 feet, will make the statue 30 feet high. The work is of copper, formed by the galvanic plastic process.

**BLACKBURN EXCHANGE COMPETITION.**—Pray, Mr. Editor, would it be a fair question to ask the Blackburn Exchange committee why they advertise for designs for their proposed new buildings? Do they really mean to not honourably? If so, are the designs which have been submitted to them to be paid for in any way? Or may we expect a second edition of the Over Darwen affair? If this could be known it might be a saving of some 500l. or 600l. to the profession, as well as of a great deal of vexation. I should advise my brethren of the T-square to wait till some more definite promise is given before moving in the matter.—ON DR.

**BRUSSELS PALAIS DE JUSTICE COMPETITION.**—Since last week I have obtained a copy of the *Independence* of 30th March, and in which I find, further, that the programme of specifications is to be had on application to the Department de la Justice, Brussels. As I said, "On ne demande aux concurrents que des *avants-projets sans métrés dessin, ni détails d'exécution.*" There is also a third prize of 3,000 francs. Designs are to be sent in before 1st August next, without names, but with notices and letters accompanying as usual.—W. T.

**CROYDON CEMETERY COMPETITION.**—We mentioned, last week, that the first premium for chapels, lodges, gates, and walls, was awarded to Mr. E. C. Robins. The second premium was awarded to Mr. H. Dawson, of Dupree Hill, Croydon; the third to Messrs. Carter & Evans, of Philpot-lane, London. The first for laying out the ground was awarded to Mr. Robins. The second to Mr. C. H. Mann, of Croydon-common.

**NEW MATERIAL FOR CHURCH FLOORS, &c.**—An invention which, it is said, seems likely to come into general use for the floors of churches, is mentioned in the Paris journals as having been discovered by M. Duchatel, of Granville. It is hardened by some chemical composition without fire; it is not likely to crack, nor will the colour on the surface be liable to be worn away, as it will take any colour, green, blue, &c., quite through its entire thickness.

**PHOTO-ZINCOGRAPHY.**—A *fac-simile* of a manuscript of the time of Edward I, copied and printed at the Ordnance Survey Office, under the direction of Colonel Sir Henry James, R.E., by means of the photo-zincographic process, has been presented by the *Photographic News* to its readers. One of the most important practical applications of photography yet made is that of the reduction of manuscript plans of the Ordnance survey of Great Britain and Ireland. The results obtained, in the economy both of time and money, are said to be as remarkable as they are important. Previous to the application of photography to the reduction of the plans to the several scales required, the only means available were the pentagraph, worked by a staff of skilled draughtsmen. The photo-zincographic process possesses a signal advantage over the anastatic process, inasmuch as by the latter only printed documents, &c., could be copied; whereas, by photo-zincography, written documents, maps, plans, logarithmic tables, &c., may be reproduced by a process at once simple and inexpensive.

**STREET ARCHITECTURE OF MONTE VIDEO.**—A set of plans for a corn exchange and other buildings, forming a block of about 50 feet broad by 140 feet long, has just been despatched, a coding to the *Birmingham Gazette*, to the city of Monte Video, in South America, by Mr. Emspon, of Birmingham. Provision is made on the ground-floor for a range of lofty shops, above which are placed an hotel, entered from a passage between the principal shops, and an exchange, the entrance to which is placed in front of the building. The exchange, which is to be fitted up as a music-hall, is 60 feet by 40 feet and 40 feet high, is decorated, and is lighted by a range of lofty windows. Two elevations accompany the plans, the one Classical Italian, intended to be worked in stone or cement; the other Romanesque, with Italian details, to be carried out in white, red, and blue bricks, inlaid with bands of encaustic tiles, and finished with a cresting of metal-work. A main feature of both elevations is a campanile to be used as a clock-tower; this rises to a height of 105 feet.

**DIRECTIONS FOR LETTERS.**—In 1854 I exhibited at the Society of Arts Exhibition of Inventions a system for the more expeditious direction of letters. I proposed that each county should have a number, and each post-town in the county a number also; therefore, instead of directing Mr. Jones, High-street, Bradford, Yorkshire, you would simply write Mr. Jones, High-street, 15, 6; 15, being the number for Bradford, and 6, the number for Yorkshire. The advantage would be in rapidity of directing and facility of sorting for transmission.—A TIME-SAVER.

**TRAFFIC RECEIPTS.**—The receipts of all railways in England and Wales, for all sources, for the half-year ending June, 1859, was 9,989,459l., of which 4,168,417l. was derived from passengers, 3,276,622l. from passengers' luggage, &c., 168,182l. from the mails, 3,476,328l. from general merchandise, 1,601,658 from conveyance of minerals, and 219,998l. from live stock.

**PRESERVATION OF POSTS.**—W. Howe, of Alleghany Co., relates, in the *Genesee Farmer*, an experiment made to test the comparative durability of posts set as they grew, or top end down. He says:—"Sixteen years ago, I set six pairs of bar posts, all split out of the butt cut of the same white oak log. One pair I set butt down, another pair one butt down the other top down; and the others top down. Four years ago, those set butt down were all rotted off, and had to be replaced by new ones. This summer I had occasion to reset those that were set top down. I found them all sound enough to reset. My experiments have convinced me that the best way is to set them tops down."

**TENDERS**

For the erection of schools and teachers' residences, for the parish of West Derby, near Liverpool; Mr. H. P. Horter, Liverpool, architect. Quantities supplied by Mr. J. Longrigg, Liverpool:—

Isaac Denton	£4,950 0 0
G. Thompson	4,652 0 0
W. Jones & Co.	4,503 0 0
Thomas Stone	4,284 1 10
J. Robinson	4,960 7 0
J. Huirroughs	4,312 12 0
J. Barber & Jumps	4,137 0 0
R. Barker	4,116 0 0
Wilson & Jones	4,100 0 0
T. Urmon	3,920 0 0
W. Tomkinson	3,823 17 11 1/2
Nicholson & Ayre (accepted)	3,809 0 0

Deductions for materials of old parochial chapel:—  
Reduced Tenders.  
Thomas Urmon . . . £125 0 0 = 23,394 8 0  
W. Tomkinson . . . 145 0 0 = 3,238 17 11 1/2  
Nicholson & Ayre . . . 93 17 0 = 3,213 3 0

For new house at Hampstead, for Mr. E. Bond (of Gilwies), Mr. Farnell, architect. Quantities by Mr. Wallis:—

Extra for white Facings.	
Patman & Potheringham	£2,144 230 14
G. Myers	3,123 90 0 0
Fish	3,640 60 0 0
Clowther	2,984 50 0 0
Jackson Shaw	2,969 00 0 0

For a Farm-house and Homestead at Easton Grey, near Malmsbury, for Mr. G. Aham Smith; Messrs. Money & Son, architects, Newbury. Materials included:—  
Lansdown, Malmsbury . . . £2,200 0 0  
Brown, Tetbury . . . 1,775 0 0  
Watts, Chippenham (accepted) . . . 1,580 0 0

For erecting a detached villa in the Amhurst-road, Lower Clapton, for Mr. T. Naakes; Mr. F. G. Widdows, architect:—

Burton	£1,955 0 0
Brown & Robinson	1,838 0 0
Glen	1,800 0 0
Hill	1,756 0 0
Sargeant	1,767 0 0
Tobey	1,596 0 0
Wheen	1,437 0 0
Raby (accepted)	1,406 0 0

For national schools, three class-rooms, master's residence, outbuildings, and fence walls, St. John's district, Mansfield, Nottinghamshire; Mr. C. J. Neale, architect:—

Dennetts	£1,578 0 0
Sill	1,495 0 0
C. Lindley	1,380 0 0
Valance	1,476 0 0
Frisky	1,461 0 0

For alterations and additions to Summingdale Church, near Staines; Mr. Street, architect:—

Oades & Son	£1,575 0 0
Hardy & Son	1,384 0 0
J. & R. Lawrence	1,468 0 0
Hollis (accepted)	1,095 0 0

For the completion of a pair of semi detached villas, for Mr. R. Hallett, on his estate, Knighton, Birkchurst-hill, Essex; Mr. J. H. Rowley, architect:—

Swell	£932 0 0 1
Grandman	680 0 0 0
Rivett	593 0 0 0
Davey	569 0 0 0
Edwards	460 0 0 0
Burrows	459 0 0 1

For building two houses and shops at New Brompton, Kent, for Mr. Henry Ringe; Mr. J. H. Andrews, architect, Rochester:—

Pankhurst	£689 0 0
Jennings	618 10 0
Elley	615 0 0
Croak (accepted)	598 10 0
Hicks, Jun.	545 0 0

For repairs at All Saints' National and Infants' Sunday Schools, Islington; Mr. Dobbin, architect:—

Kitchener (accepted)	£145 9 0
Whishire & Sadgrove	145 4 0

**TO CORRESPONDENTS.**

Deceiving Builders.—Can any of your correspondents inform me of a simple process to remedy the decay of brickwork executed with bricks insensibly burnt. Can any colourless preparation be obtained?—  
Respectfully,  
W. T.

The Stone of the House of Parliament.—We have received several letters on this subject, some from operative masons who were engaged on the work, but they do not present sufficient fresh information to lead us to return them.

R. E.—O. J.—"Good Words" (shall be looked to)—Dr. H. D. the proposed arrangement is not novel. Mr. John Pary, amongst others, prepared a design on a similar principle. We may, nevertheless, express if an opportunity occurs, F. J. W.—H. T. E.—A. Noddy.—F. G. T.—G. B. M.—T. C.—J. H. M. (certainly not objectionable, quite the reverse).—Ebor.—H. B. & Co. (the cartoon of great window in Alnwick Castle is by Mr. Drew. The glass was painted at the Royal Works in Munich).—J. F.—E. J. P.—A. J.—A. H.—D. M.—G. B. N.—B. H. O.—R. B.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent-garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

# The Builder.

VOL. XVIII.—No. 898.

## Stoneware Pipes, and Stoneware generally.

IN the 11th, at the Society of Arts, Mr. Edwin Goddard read a paper on "Stoneware," with especial reference to Lambeth. Mr. Apsley Pellatt presided; and there was a strong muster of those who have been most active in the manufacture. Of its enormous importance it is scarcely necessary now to speak. Years ago we made

Drain and pave,  
rhyme with  
Raise and save.

One of the speakers on the occasion in question, who said the advance of civilization is in a great measure dependent upon the improved manufacture of earthenware, as applied to sanitary purposes, scarcely exaggerated. Proper drainage lengthens life and lessens sickness, and stoneware pipes are playing a most im-

portant part in sanitary progress, putting on one side, just now, the increased productiveness of land through the adoption of a similar course.

In our volume for 1857,\* we gave some particulars of the Lambeth potteries, the mode of manufacture pursued there, and the extent of the trade that had grown up. Mr. Goddard's paper, and the discussion which followed, supply fuller information. We must content ourselves with some of the leading features, confining ourselves first to the paper:—

"I have been unable," the reader said, "to ascertain with certainty at what date stoneware was first made in Lambeth: it is certain, however, that three generations ago the little trade there was then principally in what is called Delftware; indeed, the last indication in the shape of a Delft signboard, if I may so call it, has quite recently been removed from Mr. Still's pottery in High-street, in building new premises. As far back, however, as 1570, we find potters crying aloud for protection. Stow, in his Survey of London, speaking of the potters, says:—'About the year 1567, Jasper Andries and Jacob Janson, potters, came away from Antwerp, to avoid the persecution there, and settled themselves in Norwich, where they followed their trade, making and galley paving tiles and apothecaries' vessels and others very artificially. Anno 1570, they removed to London. They set forth in a petition to Queen Elizabeth, that they were the first that brought in and exercised the said science in this realm, and were at great charges before they could find the materials in this realm. They beseeched her, in recompense of their great cost and charges, that she would grant them house room in or without the liberties of London by the waterside.'

In the year 1688 two brothers, of the name of Elers, came from Nuremberg, and located themselves in Staffordshire, the then seat of manufacture. Here they stayed for about twenty years, practising their trade with the greatest secrecy, and subjecting themselves to considerable annoyance thereby. With all their precautions of building a high wall around their premises, and employing idiots to do their labour, they could not succeed in keeping secret their manufacturing process, and about 1710 they removed in disgust from Staffordshire to Lambeth or Chelsea. Others affirm that their removal was in consequence of persecution on account of the volumes of smoke emitted from their kilns, and inseparable from the manufacture: if so it may be inferred that Lambeth was more indulgent than at the present day. 'Too often,' says a writer of 1837, 'does research develop instances in which the existence of many of the arts has depended on police regulations;

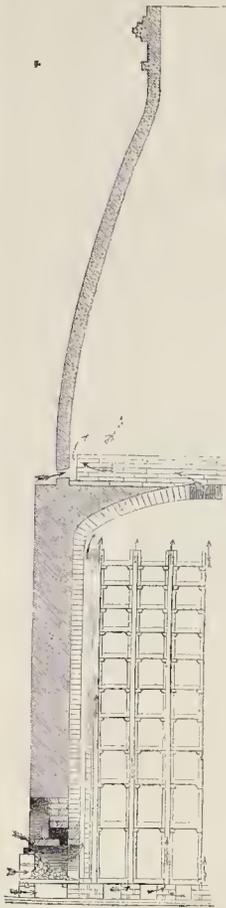

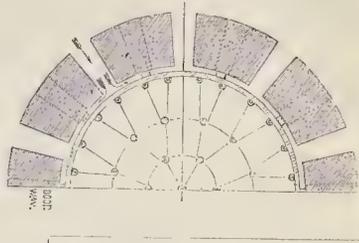

FIG. 2.

the trade prevented. The potters then in Lambeth were in number some six or seven, working some sixteen small kilns of 7 or 8 feet in diameter, the produce of each kiln being under 20l. worth of ware, the principal articles made being blacking bottles, ginger-beer bottles (very extensively made still), porter and cider bottles (not so largely made now), spruce-beer bottles (gone, with the beer, quite out of fashion), ink bottles (more used now than ever), oil bottles, pickle jars, bunting jugs, &c. A few chemical vessels were also turned out well from one kiln belonging to an eccentric individual, whose chief boast was to drink a gallon of beer a day, and do without rest on Sundays. The introduction of new blood and energy, however, induced an active competition, and soon sent them to other fields, and stoneware was found to be just the thing for articles which were previously unthought of, but which now, with others, form standard products. The trade gradually assumed a healthy vigour, and steadily increased up to the period when the Board of Sewers discovered the advantages of stoneware drain-pipes, and the subsequent overwhelming demand for them completed what energy and enterprise had begun, and brought the trade up to its present position."

When speaking of the manufactured goods introduced, Mr. Goddard mentioned filters, the necessity for which is still ignored by the mass of the public. Their introduction to any extent is due to the celebrated George Robins, and the quantity made for him and scattered broadcast through the land is surprising. The utmost means of Messrs. Stephen Green and Doulton & Watts were insufficient for a time to meet his requirements. The filter trade is still a very important item in the Lambeth potteries, and large numbers are annually exported. He referred to a company, upon the point of forming, to supply a cheap filter at a rent of a few shillings annually, to be placed in the cisterns of the house to be supplied. It is a vessel of stoneware, of a simple form, having a pipe attached, with tap to draw over the side: it is filled chiefly with animal charcoal, arranged to filter quickly.

"The clay best suited for making stoneware is brought from Devonshire or Dorsetshire, and recently a deposit has been found at Farnham, in Surrey; the main supply, however, is from the two first counties. Cornwall sends a small portion of prepared clay, which, though principally used for chinaware, is, nevertheless, in a degree, employed in Lambeth. The best quality of stoneware clay is found at depths varying from 20 to 50 feet from the surface. After cutting through an upper deposit of waste mould, &c., 10 to 40 feet thick, we reach a very aluminous bed of clay, about 3 feet thick, called 'Tough Tom;' beneath this is a bed of a very useful clay for the common kinds of ware, from 5 to 10 feet thick: to this succeeds 4 to 5 feet of 'domestic' clay, used in the north of England very largely for whitening stone steps, &c., which brings us to the stoneware clay proper, from 10 to 16 feet thick. Beneath this is the tobacco-pipe clay, formerly used for the same purpose as the best white clay is now, until about some forty-five years ago, when, at the suggestion of Mr. Duggan, the London proprietor of the stoneware clay, Mr. Stephen Green's father introduced it as a substitute for the tobacco-pipe clay, which it has now quite supplanted. I may here add that to Mr. Stephen Green is due the introduction of the string wheels, the moulds for bottles, and the turning lathes before alluded to."

After describing the pug-mill and the mode of working the clay, he said,—

"At the commencement of this paper I stated

and manufacturing industry, also the manufacturer's welfare, has been rested on the frail basis of the caprice of a magistrate. Driven by ignorance, prejudice, jealousy, to a distance from materials, workmen, or market, some manufacturers continue to endeavour to surmount the obstacles which oppose their progress, and maintain a disadvantageous struggle with the difficulties of their situation.' To the brothers Elers is ascribed the introduction of the salt glaze. How long they practised in Lambeth or Chelsea: whether they were the founders of the trade, or whether the before-mentioned Andries and Janson were there before them, I have been unable at present to ascertain. A backward flight of forty years, however, will suffice to show how rapidly the trade has since been developed. I am sorry that the little time which successive snatches from business really amounts to has not sufficed to allow me to fill up the intervening century.

Forty years ago commerce had not received those aids and appliances which steam was destined to bring it: railways were only looming in the distance: the cheap postage might have been an embryo in the brains of the suggester, but no more: conveyance of all kinds was very slow and expensive, and necessarily operated strongly against so cheap an article as stoneware: raw material was not so readily obtained: salt, an important article to the stoneware potter, was taxed to an exorbitant extent—it then cost more pounds per ton than it now does shillings:—a tax, moreover, was upon all goods of a certain size, and free trade had in no way blessed the land. In the face of these impediments it is not to be wondered at that the market was limited, and a healthy expansion of

that my remarks would chiefly, if not exclusively, apply to stoneware, or salt-glazed ware. As, however, the more fastidious taste of late years has almost ignored the use of salt-glaze for articles of domestic use, the present appearance of Lambeth ware is not of stone, but of a dipped glaze. This kind, called 'double-glaze,' from being glazed by two processes, one inside and one out, ensures a uniformity of colour which cannot be produced in the salt-glaze; and whilst the latter, from its being part and parcel of the vessel itself, is the best, the former is thought to have a better appearance. It is secured by dipping the article into a composition of glass, Cornish stone, and other ingredients, fusible at a high degree of heat. For large vessels, this is, of course, impracticable; nor is it adapted to resist the action of acid to the same extent. Now the heat to fuse these ingredients is about the same as that required to convert salt into a glaze,—hence the simple plan of throwing salt into the kiln.

The constituents of the clay being about two-thirds silica and the remainder alumina, with a little alkali, when the kiln is at the highest (suppose about 1,900 deg. Fahr.), the ware is in the condition requisite to take up a certain amount of the soda contained in the salt vapour. The two combining, not only deposit a surface of glaze on the vessel, but the glass thus formed permeates the interstices of the fine particles, thus becoming incorporate with the body, as is easily seen under a lens."

In describing the kilns used in Lambeth, he mentioned a recent invention, being patented in 1858, by Mr. John Cliff, of the Imperial Potteries, Lambeth. The invention has for its objects, firstly, great economy of space; secondly, economy of fuel; and thirdly, the more thoroughly consuming of the smoke than by kilns of the ordinary kinds.

In the accompanying woodcuts, figure 1 is a vertical section of half a kiln of this kind, and figure 2 a plan.

To effect the economy in space there is built within the lining proper of the kiln, and at various distances from it (according to circumstances), a second lining from the floor to the level of the commencement of the arch of the kiln, leaving an annular space round the entire kiln (supposing it to be circular), from the base or floor line to the spring of the dome: at the base of this circular flue, and at intervals, are holes to connect it with a hollow chamber under the floor of the kiln, in which floor are left a number of holes at proper distances, over which are erected a series of perpendicular flues, terminating on a level with the before-mentioned inner lining, or slightly above it by the means of variable lengths of hollow pillars and collars of larger diameter, as shown. These variable lengths of pillar and collar allow of constructing quarry floorings across the kiln at any desired height, and thus utilize a large amount of space hitherto impracticable. The floor of the kiln and the top tier are fitted close, so that during the burning no flame, smoke, or draught can approach the ware, thus effecting a rapid accumulation of heat within the kiln to the point required, and by the removal of one quarry opposite the door or entrance to the kiln, and four or five slabs from each tier of the middle row (supposing the kiln to be circular), the kiln can be filled and emptied with an amount of ease and rapidity not attainable in the ordinary mode.

To effect the combustion of the smoke, cold air is introduced by means of an opening from the front of and on the top of each fire arch, behind the burning fuel. The smoke in its passage up the narrow annular flue, and up the hollow pillars, by being so much divided, and having to travel over so much more than the ordinary heated surface, is more efficiently consumed, and is again met at its exit into the funnel by streams of atmospheric air passing in at openings through the base of the same.

A kiln of this description, 14 feet in diameter, will burn 100L worth of ware with about eleven tons of coals, whilst a man, with four boys in turns, may set, burn, and draw it once every week, at a breakage loss of about 9 per cent.

"The improvements in machinery, &c., made to meet the increasing demand for stoneware, have of course helped its extension; and in the laboratory,

for sanitary improvements, or domestic use, it plays an important part. I before remarked on the impetus the trade had received when drain-pipes in stoneware were adopted; now, as these have to conduct sewage containing the strongest elements of decaying and decayed matter, it becomes a primary necessity that the conduits should neither absorb, nor in any way retard, the flow. Accordingly, the first object of the Lambeth potters is to secure a thoroughly vitrified body with a perfectly smooth internal surface. Their system of glazing by salt had the advantage of securing these desiderata, inasmuch as no glaze could be formed if the heat was insufficient, therefore a pipe deficient in glaze would show that it was short of burning also. However, the mistake, which in the trade is too likely to be made, of considering low-priced goods as cheap goods, has been the means of bringing inferior pipes into the trade, so that many with partial burning and common clay are little better than a common red-ware pipe. Mr. Northen is admitted to be the original maker of pipes in Lambeth, and Messrs. Doulton, at the present time, are the most extensive. At one time there were forty kilns in Lambeth burning pipes; and allowing them to be filled with 9-inch, 6-inch, and 4-inch pipes, to the value in gross of say 50L, these kilns would be turning out nearly 600 miles per annum.

The present state of trade in Lambeth, when contrasted with its position at the period I commenced, affords a satisfactory picture. In place of some sixteen kilns, turning out each under 20L per kiln, we have now about seventy, turning out each perhaps on an average 50L. They consume upwards of 20,000L tons of coal, paying a corporation tax of say 2,100L per annum. The law requires this quantity to be burnt without smoke, and, after immense cost and labour, this difficulty may be called surmounted. Twenty-three thousand tons of clay are annually changed into useful articles, giving employment to more than 800 persons. The returns of the Lambeth potters cannot be estimated at less than 140,000L."

The paper concluded with the expression of an opinion, that every potter should be his own chemist, so far as his trade is concerned. He should have at his fingers' ends the qualities and actions of each element he has to use, composed and decomposed; and, when he is as perfectly *au fait* with his chemistry as he is at present with other branches, he will have added a new dignity to his ancient calling, and will enjoy his success all the more by having deserved it.

In the course of the discussion which ensued,—

Mr. Stephen Green said he thought the outline given of the trade as it at present existed, and as it had been developed during the last quarter of a century, was quite correct. There were various kinds of pipe-squeezing machines, but that most in use and most in favour, he believed, was the one patented by Mr. Spencer. Several of these machines were in use at Lambeth and elsewhere. The apparatus he rather preferred was something like an Archimedean screw, divided into several parts, and did its work very well. The advantage of that plan he considered to be, that the operation was continuous. There was no stoppage to fill the machine with clay. The screw carried the clay down, and the machine worked as fast as the clay was put in. He, however, believed it was not generally considered to be so good a machine as that patented by Mr. Spencer.

Mr. John Doulton addressed the meeting at some length, and amongst other things said the question had been started, what was stoneware? Mr. Goddard had adopted the definition given in the official catalogue of the Great Exhibition, which said, "Stoneware is a dense and highly vitrified material, impervious to the action of acids, and of peculiar strength." He thought that might be taken as a just general definition of stoneware. But it went on to say, "It differs from all other kinds of glazed earthenware in this important respect, that the glazing is the actual material itself fused together." That referred to the glazed stoneware,—one section only of the manufacture,—and he thought it wrong to call that only stoneware which was fused, in which a portion of the silica on the surface of the clay was fused by the salt. Stoneware was, in fact, a dense, impervious, sonorous material, and might be glazed or unglazed. With regard to the date of the introduction of this ware, although pottery was of most ancient date, he thought this particular description of ware was of modern origin. Formerly our pottery was of a porous nature, and

he believed, until within the two last centuries, no ware had been made in England except of that character. The rough description of ware was glazed with lead for a red colour, or with manganese for black; and no ware superior to that was made until the year 1788, when the brothers Elers came from Nuremberg, and settled in Burslem, in the Staffordshire Potteries. He thought the individuals previously referred to by Mr. Goddard brought the knowledge of debt-ware into this country, but the first introduction of salt-glazed stoneware was made by the brothers Elers, who commenced their manufacture at Burslem. It was true they met with difficulties in their manufacture, through the jealousy and suspicion of the people, and, perhaps, naturally so, for during the salting process the dense mass of white smoke was suffocating and hurtful to the chest, and the people, not being acquainted with the nature of the glazing, supposed it to be deleterious; consequently the brothers Elers left the neighbourhood, and came to London; but before this their secret of glazing had been discovered, and the trade was continued in the Staffordshire Potteries, and advanced in an important degree. He agreed with Mr. Goddard that a rapid advance, in this salt-glazing stoneware in London, had been made within the last thirty or forty years. He, however, did not think that Lambeth had always been the principal manufactory of salt-glazed ware. It thrived in Staffordshire for a long period, and he believed that the brothers Elers had made their ware at Chelsea and Fulham, before it was made in Lambeth; but that locality had now become the centre of the salt-glazed ware, although it had been but little developed until within the last twenty-five years,—in fact, only since the above-mentioned regulations had been removed. A duty was placed upon articles of a certain size, and it cost more to collect the duty than it realized to the Government. When these restrictions were removed, the trade made rapid advances. But there were other reasons for its advance. There was not only the introduction of spring wheels and lathes, but a great impetus was given to the trade by the manufacture of stoneware drain-pipes, as mentioned by Mr. Goddard. As to the kiln patented and used by Mr. Cliff, there was one remark made by Mr. Goddard with respect to that kiln, which he thought would not make his brother potters anxious to use it, and that was that there was about 9 per cent. of breakage. He thought they would prefer a kind of kiln which had not been described in the paper, which had slabs or cupboards throughout the kiln, from bottom to top, and which was the kind of kiln now principally used in Lambeth. As to Mr. Goddard's statistics. He had stated 20,000 tons of coals per annum as the consumption of the Lambeth potters, but he (Mr. Doulton) found that his own firm used 9,000 tons, and considering there were eight or ten other firms, it was reasonable to suppose that they used more than 11,000 tons between them. Thus as to the quantity of clay used, it was stated that 23,000 tons were used at Lambeth. His own firm used more than a third of that amount, and he thought that Mr. Goddard must have underrated the amount of trade carried on.

Mr. G. F. Wilson would add one word to the remarks which Mr. Stephen Green had made upon this branch of manufacture. As a neighbour of that gentleman in the "hud of darkness," he had the opportunity of hearing the opinions of two of the greatest chemists in Europe, Chevreul and Ebelmann, who went to this "dark" Lambeth with the object of going over Mr. Green's manufactory, and who stated to him (Mr. Wilson) that the perfection of the arrangements and the beauty of manipulation there put to shame the foreign manufacturers.

Mr. Robert Rawlinson said, having paid a good deal of attention to this subject, not as a manufacturer, but as a user of stone ware, he would offer one or two remarks. With regard to the method of mixing the clay, he had been through Staffordshire officially and non-officially, and he had observed what he considered the bad method of mixing the clay, and he was told that it could not be improved upon, and that no description of machinery would get the clay into so good a condition as the old-fashioned mode of slicing and wedging. With regard to socket-pipes, he dared say many people claimed to be inventors of earthenware socket-pipes; but he had been surprised, during his stay in Asia Minor, in 1855, to find Turkish and Greek workmen repairing an aqueduct leading to a hospital on the banks of the Bosphorus with this very description of socketed earthenware pipes, about 4 inches in diameter and 13 inches long. He found that de-

scription of pipe had been made there from time immemorial for water, and they were buried to the extent of thousands of miles in that part of the East, and probably in India. These pipes were exactly similar to the socket pipes now in use in this country. With regard to the use of pipe-making machinery, he thought they were upon the eve of great improvements. He did not know why architects should care about having fret-work in perishable stone when they had a material like stoneware, in which they could get ornamental forms, which, at the end of a thousand years, would probably be as perfect as they were at the present time. He also thought a great deal might be done with this material in Gothic tracery. He believed architecture had injured itself materially by the use of stone for purposes to which stone ought never to have been put; and one of the greatest mistakes of modern times was to be found in the use, in the Houses of Parliament, of stone cut into elaborate tracery, and exposed to the action of the elements on all sides, for it was already crumbling away. In reply to an inquiry whether any gentleman could inform him about what date the first earthenware drain-pipe was introduced,

Mr. Northern replied that, on the 9th September, 1845, he sent the first drain-pipe to the Board of Sewers.

Mr. Rawlinson added, that the form and quality of drain pipes had been a battle-ground with engineers. The Higginsons and the Little-endians of Lilliput were as nothing to the wars respecting earthenware pipes for sanitary purposes. He had laid, or caused to be laid, between 100 and 200 miles of pipes, and he believed the advance of civilization was in a great measure dependent upon the improved manufacture of earthenware, as applied to sanitary purposes. To show the extent to which this manufacture had grown, his friend Mr. Doulton told him, some time ago, that his make of pipes could not be less than from 6 to 12 miles per week, whilst some thousands of ordinary soil-pans were turned out from his manufactory in the same time. From this statement they might imagine what an extent of work was done. He held that, by the proper use of 30 or 40 yards of this material, they had one horse properly drained. He considered the proper drainage of one house was the lengthening of one life perhaps ten years, and a saving of an amount of sickness which he would not attempt to estimate.

Mr. Newton remarked that attention had been called by the last speaker to the question who was the first maker of earthenware socket-pipes. He believed that to Mr. Northern that honour was due. But Mr. Goddard having alluded to the fact that machinery had not been applied to this manufacture to the extent that might have been anticipated, he would refer to the name of Spencer, which had already been mentioned in this discussion. That gentleman had introduced a machine for socketing the pipe at the time it was made. By means of machinery the pipes were made of uniform size and fitted accurately one into the other; consequently they were much superior to those made upon the mandril. By the same patent, an improved quality of flower-pots was manufactured, and pipes 3 feet in diameter were turned out by it, which had never been obtained by any other process.

Mr. Goddard replied to some of the points raised, and said, as to the 9 per cent. of breakage in the patent kiln, that was perhaps an incorrect expression; he should have included bad and useless articles. He questioned whether Mr. Doulton turned out a 100% kiln of goods with less than that amount of breakage and had articles.

The Chairman, in winding up the discussion, and proposing a vote of thanks to Mr. Goddard, which was carried unanimously, said, looking at the price of coals and labour in London, and the price of the clay from Devonshire, the manufacturers of Lambeth must have a large amount of intelligence, industry, and machinery, to enable them to compete with those parts of the country where they obtained coals so much cheaper.

#### STREET-RAILWAYS AND TRAMWAYS.

At the close of our leading article, last week, on Metropolitan Communications, we arrived at the point of considering whether the railroad system, which in the country ought, if possible, to be extended to districts at present not served by it, could under some form be adapted to streets of London, so as to promote the object of getting rapidly from one part to another of the metropolis.

The whole question has been frequently taken up by us, and in letters which we have printed,

and in our volume for 1857 (p. 639), we noticed a pamphlet by Mr. Edmund Sharpe, architect, wherein the subject was lucidly examined chiefly in relation to the system for the country.\* The same question, with that of details of street-railways, having in the interim, been again taken up in our pages, another and a forcible statement of the points has just now been published in the form of a pamphlet by Mr. Charles Burn, civil engineer, which contains besides some useful calculations of cost, several illustrations of different forms of rail and way, designed by the author and others, adapted for streets †

It would be admitted by those who have heard anything of the street railways and tramways of New York and Philadelphia, or who have seen the use which has been made both by railway carriages and the omnibuses, of the rails along the line of Liverpool Docks, that rails or iron tramways for vehicles drawn by horses, may be laid in streets with great advantage to the traffic of the ordinary kind. An apprehension has prevailed in London that they are inapplicable unless with widened streets; and the objection seems to have led to the failure of the attempt made by a company to introduce a line on the New-road. The Marylebone people opposed; and their member, then Sir Benjamin Hall, procured the rejection in Parliament of what, with proper restrictions, might have become an important measure of improvement. It follows, however, from the success of the regulation of the traffic over London-bridge, that similar regulation which would be effected by the provision of rails, would be beneficial rather than otherwise in the narrow streets, provided the rails were not raised above the street level so as to interfere with traffic across them, and beneficial as now may be observed on the new Westminster-bridge. In New York, narrow streets as well as the wider streets, are made the route of the railway; though in some cases where the width does not suffice for two lines, one street serves for the line one way, and the next street for the return line. In narrow streets some provision of the kind is most useful to prevent noise and vibration, as well as splashing; and we may just direct attention to the fact that, whilst such lines make less dirt, and some are more readily kept clean than ordinary pavement, dust, with other finely divided matter from the streets, filling the air and respired by every one in towns, is a great source of disease.

The provision, whether of confined lines for locomotives, of street railways of any kind, or of iron or stone tramways, is not to be taken as rendering unnecessary the opening out and the widening of existing thoroughfares; but the railway principle, for horse-draught, should enter into the planning of all main streets, if not of every street. The horse-power even has an advantage in its favour over the locomotive, namely, that it is exerted on a different surface to that of the rails, and consequently has greater effects proportionate to it. Knowing the importance of the subject, we are glad to see that it is at length receiving the attention not confined to the pamphlet or our own pages. It has been discussed from time to time in the *Engineer*, in which journal many forms of rail suited to streets have been engraved. We lately noticed Mr. Haywood's Report to the City Commission of Sewers on Mr. J. B. Redman's scheme for iron tramways in lieu of those of granite which have been used in many streets, and in the Commercial-road since 1829-30, and are not found sufficiently durable. Mr. Redman's proposal, indeed, is merely for broad, flat, wheel-tracks, not for narrow rails suited to grooved wheels; but on all such surfaces, a horse can draw at least twice as much as upon an ordinary pavement. The advantages of duration and cost appear to be in favour of iron as compared with stone. At Liverpool, the omnibuses along the line of the docks have been some time furnished with flanged wheels, which, by a peculiar contrivance of India-rubber seating, adjusted themselves so that the carriages could be driven either along or off the line of rails. Some interference by those exercising control over the line having been made with the proprietors of the omnibuses, a scheme has been devised applicable to the principal streets of the town. The case of Liverpool is not alluded to by Mr. Burn; but we believe the proposal

is for a single line in the centre of each street, the omnibuses to move off it to pass one another or when required by the other traffic. If this be correct, it affords better answer to the objection sometimes made against the rails in streets than any we could otherwise find. Mr. Joseph Kineaid, in a report to the Messrs. Busby, proprietors of the omnibuses, speaks of the practice of the ordinary wagons, whilst on their proper side of the road, to keep one wheel on the rail when they can, to ease the draft. A similar practice exists in the city of London, as to the use of the stones or tramway next the kerb of a footway; but by the practice as in Liverpool, it appears neither kind of traffic is interfered with, and the drivers of wagons are induced to keep to their proper side. It is thought there would be advantages found on taking up the pavement to lay pipes, from the division of space by parallel lines.\*

The tramway on the new Westminster bridge is of the simplest kind, as required for the variable gauge of wheels. Should rails become general, a gauge would be chosen, and vehicles would be built with their wheels to fit it, as at New York. The bridge-way has the horse-track slightly above the level of the wheel tracks; but the whole must be regarded as temporary only. Mr. Burn has figured about a dozen different forms of rail, including one the same as that just mentioned, but nearly all are laid to be flush with the surface. The form which he himself proposes has a thick top flange of  $\frac{1}{4}$ -inch breadth, as the wheel track; whilst there would be no groove formed, as in all the other cases in the rail; but the groove would be cut out of the metalling or pavement of the roadway—the flange of the wheel being considered sufficient to keep the groove clear. Broad wheels, without flanges, would, we suppose, run on the narrow rail easily.

Although tramways are to be divided into two classes, those for ordinary vehicles, and those for flanged wheels, and it is essential that the ordinary vehicles should be, if not served, not interfered with by the system chosen, the object to be attained is that of horse-railways in streets, with all the advantages of a rail of the best description for such special purpose. Into the question both as regards streets, and the lines throughout Great Britain and the colonies, the author enters fully,—indeed, however, in one branch of the argument, to Mr. Sharpe, as he acknowledges. He begins by remarking the low rate of interest paid by English railways, resulting in great degree, from expensive branches; whilst there is want of railways, both in populous districts and those which are some distance from a main line. In one case, such as that of the London suburbs, the existing stations and branches are not sufficient; in the other case, construction of an expensive branch does not pay. Therefore, feeders, are required, which, with the carriages on them, may involve much less expense than ordinary railways per mile,—be those branches for locomotive, or as here chiefly proposed, for horse traffic. By using the common roads, on which to lay the rails, only deviating where there might be extraordinary activities, the chief expenses would be avoided. The lessening of weight by disuse of the locomotive engine, alone involves great gain.

Horse-railways have been carried out to a small extent in several European countries. There is a line from Paris to Versailles. We may add to the instances which Mr. Burn gives of street railways, that there is one at Genoa which is worked by locomotive engines. In the United States, more than 250 miles of the horse-railways in streets have been laid down, our author says. They have been often described lately. There are 90 miles in Philadelphia, and 70 miles in New York and Brooklyn. Gross receipts are three times more per mile than on the Eastern Counties line, and half as much again as on the London and North-Western. Working expenses are 70 per cent. of the receipts. Notwithstanding there is waste of capital, the companies pay from 10 to 14 per cent. An article in a recent number of the *New York Times*, after going into statistics, says,—“Now, we affirm, and we do not believe there is a single person who may read this article who will not agree with us, that the annual gross earnings of the city railroads exceed their cost, and that their annual net earnings equal 40 per cent. of their cost! Here, then, is a *place* exceeding any ever yet opened in California.” \* \* \* “The city railroad is as much an improvement, almost, upon the former mode of city locomotion, as were railroads over the old highway.” On one of the New York lines

\* A letter on Branch Railways, addressed to the Right Hon. Lord Stanley of Alderley, President of the Board of Trade, containing suggestions for the creation of a system of secondary railways for the agricultural districts.

† On the Construction of Horse Railways for Branch Lines in England and the Colonies,” 8vo, pp. 59. Six plates. London: John Weale. March, 1860.

\* “Remarks on Omnibus Railways,” by Joseph Kineaid, Jun., Civil Engineer. 8vo, pp. 16. Liverpool, February, 1860.

they carry passengers at the rate of 10 miles per hour; and the charge seems to be under 4d. per mile. The vehicles carry fifty or a hundred passengers; and are preferred to the ordinary omnibuses.

An experiment might first be made on one of the London roads to the suburbs. A Bill (which, from mismanagement that we have before complained of, we were not able to procure on sending for it) has been introduced in Parliament, by Sir Robert Ferguson, for facilitating internal communication in Ireland by tramroads; and we rather think there is some similar measure for this country, promoted by the "Anglo-French Improved Tram Railway Company," whose operations, however, appear to be intended mainly for France. Mr. Sharpe argued in his pamphlet that it was not necessary, and would not be judicious, to adopt the gauge of the main line in the feeders to it. This may be noted by those who have felt the difficulty we spoke of in our last article, the change of carriages; but that difficulty Mr. Sharpe will consider, and perhaps meet. Mr. Burn would have the gauge 3 feet 6 inches for country roads, and 5 feet 6 inches for the streets, having regard to the gauge of the new omnibuses, 5 feet 6 inches, and the requirements for horses' tread.

The central line might be all that could be accomplished in the present London streets. The necessity for allowing the ordinary vehicles space to set down next a footway, is not noticed by Mr. Burn. The expense of permanent way, stations, horses, and rolling stock, with compensation and contingencies, our author calculates as 2,250*l.* to 2,737*l.* per mile, according as one or another form of rail be adopted,—his own appearing to be the cheapest of three which are estimated. But this would be for single and country lines. For double lines in towns, the cost would be 5,000*l.* per mile; and he thinks that such lines might pay at least the highest dividend of those in the United States, or 15 per cent. For the interests of shareholders of existing companies, it would certainly be well to attempt the provision of these horse-railways as feeding lines.

When it is found that the accidents caused by vehicles to persons, in the City of London, are, in about one year, 223 in number, of which forty-nine have been of persons run over, and 118 those knocked down and injured, there is here sufficient reason for considering the subject of improved metropolitan communications, further than it has been pursued. The danger, however, is one thing, though it is itself cause of loss of time to pedestrians; but the state of the carriage traffic is a constant source of inconvenience in other respects. The whole subject of metropolitan communications should have at once the attention of the Metropolitan Board and the City authorities, as well for the reasons which we have alluded to, as with a view to the residence of the workman in districts that he might reach in the country, at lessened cost than on the present system, and under less deprivation of time. Mr. Pearson has seemed to think that the Metropolitan Railway would give the benefit, to the working man, for about 1*s.* per week. But much more than this new line, or than the availability of Charing-cross for half the number of the London-bridge passengers as computed, that is to say, something different, is, by London, required.

#### SANITARY PROGRESS.\*

SANITARY progress cannot possibly be either explained or discussed within a limited space. I can tell you some little of what has been done, of what is now in hand (within my knowledge), and of the vast amount of work to be done. As you are aware, I have taken part in the sanitary movement; but my desire is not to speak of myself, but rather to direct your attention to sanitary questions, and, if possible, to convey some practical information. Like all questions, the sanitary question presents its white and its black side, according to the point of view from which it is first seen. Like the knights in the fable, engineers have cried out "black," "white," and the war has been carried on to a most unwarrantable length. If the evil only fell upon the disputants, we might leave them to fight the question out, but much mischief is done to the general public. I was never an advocate for an exclusive use of earthenware pipes for sewers, neither have I been so foolish as to repudiate their use. Whoever can lay claim to the invention of earthenware pipes for sewerage and drainage purposes may justly feel proud; few

inventions are likely to prove more beneficial in the sanitary progress of the age. Earthenware pipes, true in form, thoroughly burned, and well laid, are far superior to bricks for sewers and drains, up to the capacity of the material. I do not use earthenware pipes beyond 18 inches diameter, rarely beyond 15 inches. I do not, however, say that pipes of larger diameters are not to be used. This must depend upon the material (clay), the make and the relative cost, as compared with brickwork. Small towns and the largest houses may be sewered with earthenware pipes far more effectually than with brick sewers, and earthenware pipes may be so laid as to make choking impossible.

A large amount of work has been executed in sewerage, drainage, and town improvements during the last ten years, and works of a similar character are quietly progressing in many districts. Town sewerage works may have failed in some places from defective design, from inefficient management, and, in certain cases, from natural obstacles,—quicksands, subsoils,—&c. There has also been some blundering in outlet works for disposing of sewage; as at Leicester, rivers and streams have been fouled; as at Croydon, Mitchin, Birmingham, Bradford, and manufacturing towns generally. One great good is, however, gained where sanitary works are properly carried out: the poor are more comfortable in their dwellings, and the public health is certainly improved. Those who repine at the tainting of streams and advocate "a judicious return to cesspools" should fairly weigh the sewerage question as affecting human life where human life is of most value. Foul rivers are no doubt a great evil, and inflict serious injury on property; but foul cesspools are a much greater evil, inasmuch as they destroy health and shorten human life. The Sewage Commission, it is hoped, will find a practical way of escape. This must not, however, be by returning to any practices which are proved to sacrifice life in towns. In proportion as cesspools have been abolished health in towns has improved and life been prolonged. Hot summers and a foul Thames have not seriously increased the mortality in the metropolis, but for the last ten years there has been a marked and recorded improvement, as may be seen by reference to the Registrar-Generals and City Officer of Health's returns. Some recent remarks in the *Revue Municipale*, Paris, require an answer, because the inferences intended to be conveyed are certainly erroneous and may mislead. It is truly wonderful how much may be written and said on any subject before any practical benefit is developed, and how plainly a fact may be presented to the mental vision and yet not be seen. The question is now discussed, whether the Paris of 1760 was more or less salubrious than the Paris of 1860, and the writer in the *Revue Municipale* comes to the conclusion that, in a sanitary point of view, the former was greatly superior to the latter. I am not going to deny the correctness of the conclusion that the proportionate mortality may be higher in the Paris of 1860 than in 1760, because this is a question of figures; and, if the annual returns are reliable, and if they show this to be the case, I accept the fact. But now for the statements and inferences of the writer in the *Revue Municipale*:—

"In 1760 Paris covered less ground, and did not contain more than 600,000 souls. There is now a population of 1,800,000,—that is, three times as many. Numerous gardens and open spaces of old Paris have been covered with buildings. In the new Paris, 103 narrow and dirty streets and lanes have been erased from the map, crowded churchyards have been closed, private slaughter houses within the city no longer exist, the streets are swept much better, the mud and filth removed both speedily and regularly, the supply of water is infinitely superior, the sewerage has been immensely improved, the houses which were built on the bridges in 1760, obstructing the passage of air and light, are now gone."

And yet Paris has retrograded in health and chances of life. If an enemy had said this, how terrible would have been the wrath of the Parisians! That it can be said with truth, is a fact so astounding and so momentous as to require further investigation, and, in some form or other, a sanitary work or works of real improvement. Englishmen have been told to look at Paris to learn how city improvements ought to be carried out; and Englishmen have looked and have admired, and wondered; but it now appears a wild sepulchre, and not an improved city, has been the object of "the world's gaze." The Parisian writer infers that the spread of building over the seventy-eight parks within the fortifications prevents the sweep of the pure country breeze. Then there are gas-works and leaking gas-pipes, exhaling a suffocating stench. "The water in the wells, not fit to drink, because it filters through the cemeteries and sewers of the city, is yet used by the bakers to make bread; and rich wines are weakened by it

for the market" (comfortable news, this, for the lovers of Parisian bread and wine).

"In 1760 there was not a single manufactory in Paris. Now there is nothing to be seen from the heights that overlook the city but a forest of high chimneys, all emitting volumes of a thick, pungent smoke," &c. And so the writer sums up that "the conclusion in favour of the salubrity of Paris in 1760 compared with that of the present day, need, therefore, excite no surprise." So much for the account in the *Revue Municipale*. To my mind, a most lame and dangerous conclusion, which, in itself, excites great surprise. But now for a few facts more on this momentous question. Paris has increased in its superficial area, in its population, and in its trade; but not more than London and many other towns in England; and, as to gas-works, leaking gas-mains, foul subsoil, and smoke-tainted atmospheres, we can more than match Paris in these nuisances; nay, we can fairly challenge, not only the capital of France, but all the world. Have we not London smoke and London fog? Look, also, at Swansea,—coal, smoke, and copper smoke; at Birmingham, and at the coal and iron district of Staffordshire, at Manchester, at Newcastle-upon-Tyne, and at the surrounding coal district. Then, have we not the foul Thames, and the far fouler river Tame at Birmingham, and rivers Medlock and Irwell at Manchester? In all these places, areas, once country, have been turned into town. We have also spent vast sums on street-widening, on new sewers, and on gas-works, and the Registrar-General says we are greatly superior in health and longevity in 1860 than in 1760, and that year by year, since 1845, the mortality in all our great towns has been reduced in proportion as improvements (abolition of cesspools) have been carried out in England. There has been this one important difference in the sanitary works of the two countries, and this has been mainly owing to the correct judgment of Edwin Chadwick. Cesspools have been established and are retained in Paris, but have, in thousands of instances, been abolished in England. Let any one glance over the early sanitary reports issued by the much and wrongly maligned General Board of Health, and they will find this doctrine over and over again enforced, namely, the cleansing, disinfecting, and filling up of cesspools; and, the immediate removal of all solid and fluid soil-refuse, from the vicinity of dwelling-houses by sewers and drains. The French sanitary practice has been the reverse of this. In Paris vast sewers have been made, but only to remove surface water, and vast cesspools have been constructed, and now exist, in full use, in which all the soil and urinal refuse is stored, to be emptied at intervals. But, fermentation and evolution of the gases of decomposition go on continuously, and the most perfect known means are used to concentrate these gases, by "hermetically sealing the cesspools." In a report on the cesspools of Paris, made in 1818, we learn that in early times the excavated cesspools, or pits, were constructed in the rudest manner, and cleaned out more or less frequently or utterly neglected, at the discretion of their owners. In 1819, a strict ordinance was issued on the subject, laying down stringent regulations both as to the structure of cesspools, fixed, and movable, and their mode of emptying. The execution of this ordinance is entrusted to the prefect of police. The fixed cesspools are masonry constructions, water-tight and air-tight. The cesspools vary considerably in fullness, evolving sulphuretted hydrogen gas: soap-suds are said to add materially to their offensiveness: ammoniacal vapours are given off—sometimes produce temporary blindness in the men employed to empty them. Such is a brief abstract relative to the Paris cesspools. The writer in the *Revue Municipale*, as quoted, does not, however, name them in the list of improvements effected.

All these cesspools are connected with closets, and the closets with the houses; the gases force a way into court, closet, corridors, and rooms, as most strangers find out when they visit Paris. The grand sanitary secret and sanitary blunder rest here, in these vast *pseudo-hermetically* sealed cesspools. An open cesspool may be dangerous to health; or, it may be merely a nuisance, because there cannot be concentration of the injurious gases; but the breath of a closed cesspool is most certainly death. There is, probably, something more in it than mere stink,—something electric. Who has not suffered from the terrible sensation in a Parisian hotel? The suffocating odour, which open windows and doors do not drive out, nor even perceptibly diminish; and, at some points, there is an invisible stream or ray of smell, which cuts the nostril, as it were, like a knife. Woe to the un-

\* By Mr. Robert Rawlinson, civil engineer, read before the Liverpool Architectural Society, April 14th.

fortunate individuals doomed to breathe in such an atmosphere: the year 1760 had nothing so pernicious.

In the narrow streets and foul gutters of the old city, the solid and slop refuse were thrown out to be dried by the sun, to be washed by the rain, and to be exposed to continuous dilution; so that, although sight and smell might both suffer, there could not be any gas so subtle, strong, and dangerous as that from the modern closed Parisian cesspool.

There are many opinions on sanitary matters at present, and probably no individual who has thought much on the subject is altogether right, or altogether wrong. One man asserts that putrid matter and foul smells are injurious to health, producing fevers and cholera; another boldly and stoutly denies these assertions, and points to many workers amongst nuisances, and recently to our foul rivers,—the Thames especially,—as proof that bad smells do not generate diseases in excess.

I have, during the last twelve years, examined many places in England, and I never found disease in excess without finding sufficient local cause. I have since then seen a British army, in hospital and in the field, suffering under the most terrible and fatal mortality on record, and chiefly from like causes. Last autumn I traversed a considerable portion of the north of Europe, visiting several of the capitals and towns,—Stockholm and Copenhagen, Gottenburg, Hamburgh, Cologne, and Hanover. These places have, like Paris, been vastly improved above ground since 1760; but with little, if any, advantages to health and longevity. I have no doubts as to some of the causes of the high rates of mortality,—they are cesspools and defective ventilation. Fresh air is dreaded as a mortal enemy. Man is a wonderful compound of animal and spiritual, and an infinity of things may tend to disarrange his marvellously refined, delicate, and complex organism; but he appears to require three things for the enjoyment of perfect health,—pure air, pure water, and wholesome food. Pure air and pure water are seldom obtained, and much food is eaten which is not wholesome, and yet men live; but they do not live out half their days. The "threescore and ten" of the Psalmist is cut down, for the mass of mankind, more than half. There are, however, many causes for this premature mortality. We may point to some of the most palpable; but who shall even indicate the whole? We can show that, as cesspools have been abolished in London, the public health has improved, and we can point to Paris for a contrary result.

The French writer to whom I have alluded should, however, take in a wider range for sanitary observation than the last century,—go back to "the good old times," the "middle ages." I remember reading of plague, of sweating-sickness, and of other forms of disease which swept, at times, more than a moiety of the population of Europe to premature graves; I have also read of the dreadful mortality which took place in hospitals and in goals in all the kingdoms known to civilized man, and have not only read of the improved condition of these places, but have seen something of these improvements. Cannot a city be made, approximately, as healthy as a goal? Cannot some portion, at least, of the improved health found in these places be assured to honest men? Fresh air, pure water, and wholesome food work sanitary wonders in hospitals and in goals,—why not in cities and in towns? I have long since learned that it is far safer to have no sanitary works in a town than to have cesspools and sewers full of fermenting debris. I have also learned that, in most cases, excessive disease is more due to foul air within the dwellings, and to the degraded habits of men, than to climate or to seasons. The causes of excess of sickness and mortality are within the dwelling—let it be neat, hut, room, house, or palace—rather than without. An atmosphere foul and offensive, but unconfined, may be breathed with comparative impunity, when a confined atmosphere will produce sickness and premature death. Nature and health require full freedom and endless motion. Sunshine, fresh air, and good water are the great requisites to health; overcrowding, tainted water, and hermetically sealed cesspools, are most to be dreaded.

We may notice some of the towns in England in which cesspools have been abolished, or in which a complete system of sewers and house-drains has been carried out; we do not care to parade a reduced death-rate as the result of such works, because many causes besides sewerage affect health; but we are assured that in all cases where such works have been wisely carried out, and are properly attended to, there is vastly

increased physical comfort, perceptible moral improvement, and a reduced death-rate.

**Berwick-upon-Tweed.**—This old town has been sewered and drained, and to a large extent, cesspools have been abolished. During a late extraordinarily dry season the waterworks ran short of water; but since the change in the weather, water has been in abundance, and sewers, drains, and water-supply go on satisfactorily.

**Birmingham.**—The town council of this important borough have, by resolution, determined to complete the main sewers, to channel unformed roads and streets, to cause courts and yards to be paved, and to enforce and regulate house and yard drainage. 100,000*l.* are required, and voted, to complete public sewers and outlet works. Within the town, portions of the rivers' beds are to be deepened, and intercepting lines of sewers, with storm-water overflows, are to be made. A new Improvement Act is to be obtained, to enable the local authorities to devise and execute sanitary works generally, as also to regulate new streets, new buildings, and to prevent any street or court arrangements which may impede ventilation.

**Brighton.**—Reports and estimates have been made for systems of sewerage for this important town. The town council are seeking to obtain a new Improvement Bill this session, so that the public may hope to find the entire sea frontage freed from sewage. Half measures will only add to existing evils. The town council, "by resolution," have adopted the Local Government Act (Public Health Act).

**Buxton, Derbyshire.**—A local board has recently been formed in this important sanitarium; E. W. Willott, esq., is chairman, and supported by his grace the Duke of Devonshire. Important extensions and improvements are about to be made: railways are in progress which will bring the town into connection with Manchester, and Lancashire generally, on one side, and with the Midland lines and branches on the other side. Large areas of land are laid out on the most liberal scale for building purposes: new streets are formed, ornamental grounds are laid out and planted, and moderate prices are asked for building sites. The local board are working in earnest: roads are being repaired and footwalks formed: seats are placed at convenient intervals, and the celebrated baths are undergoing alterations, enlargements, and repairs: plans and estimates have been obtained for a complete system of public sewers: the contracts have been let on favourable terms, and the works are to be completed in the streets by May next. Last summer Buxton was full to overflowing: in a few years the town will, no doubt, be much increased, and the duke will have the pleasure of seeing a thriving community, and, at the same time, will be adding considerably to his rent-roll. We may expect to see Buxton become a place of villa residences,—fashionable all the year round.

**Blackburn.**—The sewage question remains far from settled in Lancashire: the rivers and streams of the manufacturing portion of this county are little better than main sewers from their sources to their estuaries. Print-works, dye-works, cotton factories, gas-works, chemical works, bleach-works, foundries, and many other manufacturing works using water, abuse these streams without let or hindrance. The waters are fouled, and hoiled, and pumped, and puddled, until they are the colour of ink and the consistency of pea-soup. Town-sewers and road drains have direct communication, and, on the banks, ashes and rubbish of all sorts are tipped at will. Each man owning any portion of the stream claims "to do what he likes with his own." The loudest hawler for local self-government will not deny that the streams and rivers of Lancashire are a prime source of wealth to this vast community, and yet, for lack of a wholesome conservative authority to protect, regulate, and repair, there is great danger of realizing the fable of the goose and the golden egg.

**Bridgenorth.**—At this out-of-the-way seat of antiquity sanitary works have been carried out—sewerage and drainage and public water supply. Water is pumped from a well near the river Severn, but the demand has outrun existing means of supply. A new engine and pumps are to be erected, and water is to be drawn direct from the river Severn, because the water is softer and purer. There is some local taint of common salt in the existing well, sufficient to act injuriously in use. A sum of 5,000*l.* is to be borrowed, to repay sums taken up at large interest, and to execute the necessary works.

**Carlisle.**—Complete works of sewerage were carried out in this city, and have been in use

several years. Although the district is flat, and the outlet sewer and low parts of the city are liable to be flooded, the works answer their intended purpose, and every sewer and drain can be flushed out and preserved clean. The outlet sewer is upwards of a mile in length, having a fall of one in seven hundred. Land-floods rise 20 feet vertical above the invert. There are flood-valves and overflows, so as to relieve the low portions of the city. Mr. McDougal has arranged with the corporation for a use of the sewage, and with the agent of his Grace the Duke of Devonshire, for land on which to pump the sewage. There is no doubt as to the results proving beneficial.

**Cardiff.**—Extensive dock works are in progress near Cardiff; public sewers were commenced, but have not been completed. The sewers are large, and have comparatively flat inverts: several men are constantly employed within them to remove sediment and refuse. A new cattle-market and slaughterhouses have been established at Canton, near Cardiff, under the powers of a private Act of Parliament.

**Lea Hurst, Derbyshire.**—Miss Nightingale and her friends have recently erected schools at this place, which deserve especial notice. The schools are on the most approved plan, and can accommodate about two hundred children. In a separate building there are baths and lavatories, with the most complete sanitary appliances. The girls will be taught washing, ironing, and other home work, and each boy and girl will be encouraged to exercise personal ablution at short intervals. The fittings are by Messrs. Lamhart, of London, and give satisfaction. These schools, with their baths, lavatories, and sanitary arrangements, will no doubt serve as examples to others, and lead to general improvement. No expense has been spared in this case.

**Liverpool.**—Liverpool is not at ease with her waterworks: the supply is found to be deficient. Additional parliamentary powers are sought; to make new reservoirs to supply excessive water compensation. The main sewers have never been completed: there are outlets into dock basins, and there are large areas of land in the immediate suburbs in sadly neglected condition. Some of the out townships have obtained sanitary powers, and have executed sewerage works; but there are large and important areas covered with houses in which there are no public sewers. But if houses have drains, they also have cesspools. In Liverpool proper there are some thousands of cesspits, which have to be emptied over the surfaces of the yards, courts, and streets, causing fearful nuisances for the time, as any one may verify who will make a midnight inspection.

**Manchester.**—The waterworks in Manchester have not been completed. The sites of the reservoir embankments have proved unsound, and, consequently, water cannot be stored as was expected. The corporation are, in Parliament this session, to obtain powers to purchase certain water compensations, and for other matters. Manchester, like Liverpool, is a city of cesspools: they are emptied at an annual charge of about 17,000*l.*, but the sale of the manure brings back about half this amount, so that the cesspools cost near 8,000*l.* per annum, plus the extra deaths caused, and excessive sickness.\*

HEREFORD CITY IMPROVEMENTS.

THE works have been commenced here of the new general markets, for poultry, butter, butcher's meat, vegetables, and other miscellaneous articles, comprising also new warehouses for hops and wool, and a large room to the Guildhall for public city meetings. The market will be upwards of 200 feet long, and is to have a roof formed with curved and enriched wrought-iron principals, with skylight down the centre of each division.

Mr. John Clayton is the architect, and Messrs Beavan & Bowers, of Hereford, are the contractors. The amount of contract is 4,650*l.*, including value of the old materials. The following is a list of the tenders delivered:—

Welsh .....	£5,116
Beavan & Davies .....	4,698
Beavan & Bigglistone .....	4,620
Nihlett, Gloucester .....	4,587
Evans, Brothers, London .....	4,495
Beavan & Bowers (accepted) ...	4,341

SOUTH KENSINGTON MUSEUM. — In Easter week the visitors were, on free days, 17,772; evenings, 10,336; total, 28,108.

\* To be continued.

THE MONTHLY RETURNS OF THE METROPOLITAN DISTRICT SURVEYORS.

The superintending architect of the Board of Works has published his annual report on the examination of the monthly returns by district surveyors. He shows that the fees received in twelve districts vary from 57l. to 196l.; in nine districts they are from 207l. to 276l.; in eleven districts they are from 310l. to 399l.; in five districts they do not exceed 42l.; in eight districts they reach from 500l. to 600l.; and in ten districts the fees vary from 647l. to 1,079l. The total of these fees is 22,385l., received in respect of

15,558 works, of which upwards of two-thirds have commenced during the year. He says:—"The expenses of district offices amount to 4,902l., being a little in excess of those of the previous year. The fees remaining due for all arrears amount to 12,276l., and the sums abated and lost show a total of 1,755l. In former reports I have remarked that this state of matters is not satisfactory, as it indicates a large amount of unremunerated supervision; but, as those most interested have not apparently found a remedy, I can only repeat that the present result differs not much from previous periods."

List of Totals of Fees received by the Surveyors, arranged according to value.

THE ARCHITECTURAL ASSOCIATION.

The ordinary meeting of this society was held at the rooms in Conduit-street on Friday evening, the 13th; Mr. T. Roger Smith, vice-president, in the chair. The Chairman, in introducing the subject of discussion for the evening "Modernism in Art," a paper on which had been read by Mr. Hayward, at the last meeting of the Society, said that the paper might be more correctly styled one on the truthful expression of architecture at the present day, inasmuch as the writer, avoiding the excesses and distortions, had looked only at the wants and requirements, of modern times. A person who now sets about to design had at once peculiar advantages and especial disadvantages. He had the disadvantage of different styles being ever before him, the production of former times, which, by presenting an inducement to copy, tended to destroy originality. He had the advantage of being able to judge by the experience of past ages, and enlarge his ideas therefrom. A new spirit had undoubtedly crept into art, literature, and architecture, which he would term the Romantic. He believed that Goethe, or, perhaps, more certainly, Scott, had introduced it into literature, and the ecclesiologists into architecture. The result of the constant struggle between the several schools was that features of different styles were being combined, out of which we would form one of our own, a style singularly beautiful and harmonious. Gothic would probably be the basis, but we would draw from Continental Gothic, Italian, and even Grecian. New materials were at command; and the progress, though slow, would, however, encourage us to expect a modern

style, such as would correspond with the requirements of our day. Mr. Druce remarked that the idea was apparently in general forgotten that the architects of each style worked upon that one which was modern to them. Each of us in our designs should study the bent of his mind, and adopting that style to which he had a peculiar leaning, adhere to it: by this means he would be more likely to attain to eminence than if he worked from several styles. Painters set the profession an example in this, for the most successful of them, adopting the principles of a particular school, rigidly followed them throughout; and some architects had, by working out the geometric, for instance, attained to more success than they could have arrived at had they taken pieces from all of them indiscriminately. The men of the nineteenth century should recollect that the style which they were introducing into buildings would impress the writers of a future day in the same way as the edifices of past ages had worked upon the imagination of those whose writings charmed us, and should be induced accordingly to design such structures as would delight a coming age. But instead thereof we had fallen into distortions and affectations which tended to retard the progress of art; for the ignorant and the prejudiced, pointing out as models the buildings which bore this depressing, founded thereon arguments by which to depreciate modern architecture, though the truth was that the profession had long ceased to recognize such deformities. The approximation of the present period to a style of its own was to be seen in a plain bold building, such as are now put up, with natural foliage, and pointed and Gothic arch used

indiscriminately, and Classic details closely resembling the Early Renaissance. Mr. Johnson said that he almost despaired of a style peculiar to the present time arising in England whilst there were so many previous ones from which to copy, and that much could not be accomplished of an original character, as long as the battle was hotly carried on about the merits of older styles. A compound of English and of foreign Gothic with an absence of expensive moulding seemed most adapted to modern times, and afforded opportunities for colouring, the introduction of which into buildings he thought of much importance. Mr. Herring remarked, that a style which would be likely to prove successful at the present time must be of a utilitarian and naturalistic character. All previous ones were applicable to the buildings of their own times, but inapplicable now. A quantity of ornament was at the present day unsuitable; but if getting rid of superfluity, we adopted such natural decoration as would catch the eye and be suited to the materials at our disposal, we should accomplish something. Iron and glass, for instance, have lately come into use, and are procurable at a cheap rate. If we adhered too rigidly to the styles of older times, we must lay aside such suitable materials in designing buildings. In the introduction of ornamentation we should look to the purpose for which the structure was intended, nor should the nature of our materials discourage us from attempting decoration; as oven slating could by the judicious intermixture of slates of a red and of a blue hue be arranged to produce effect. Iron had not as yet been used to advantage in construction, so far as decoration was concerned; for, instead of being shown as the main material from which the building was raised, it was concealed from sight, and covered over with wooden pilasters. Thereby Nature was set at naught who delighted in showing the means whereby she effected any result. He thought that the only sense in which a style peculiar to the nineteenth century would be attainable was to use everything in its proper place, and with its proper decoration. Mr. Lewis observed, in opposition to Mr. Herring's remarks on the manner in which Nature carried out construction, that she delighted in concealing from the eye the materials and the way whereby she effected her operations. The Chairman remarked, that Gothic had in England the advantage over every other style, as it alone had grown in this country to perfection; we had outgrown the others which had been introduced, but this one had taken root and become indigenous; it had, moreover, shown an aptitude in drawing to its aid foreign elements, and incorporating them with its system. With regard to the introduction of modern materials into architecture, he might be allowed to adduce, even at the risk of discussion, the utility of Portland cement as a surface to cover over brick-work in the London climate. When sensibly applied, it reflected more light than even white bricks,—a point worthy of consideration in narrow streets; it prevented damp from penetrating the other porous wall, and it avoided the expense and trouble of pointing, which the brickwork would otherwise require. There was, however, a serious drawback, that it encouraged bad brick to be inserted in buildings. Mr. Druce objected to cement being thus introduced, as the natural light seemed to have no effect upon it. Wherever stone broke and varied the rays of light, there was a dreariness and monotony of surface about the former; and the sun never seemed to catch it, as it did other materials. Mr. Herring thought that a good brick front would last much longer without pointing than a cement front would without colouring. Colouring must be put on in London within two years, and pointing every three years; whereas pointing would not be necessary for at least ten years. Mr. Johnson expressed a hope that the success of the discussion of the evening would encourage the Society to set apart separate nights for this purpose, on which particular papers, such as the committee should select, would be examined; perhaps a summary of the essay would be read in the outset and serve as a starting point. The proceedings then terminated. At the next meeting Mr. Norton will read a paper on "Mediæval Scripture." DRINKING FOUNTAIN MOVEMENT.—The new drinking-fountain, opposite the Eagle Hotel, City-road, Winchester, is approaching completion. The architect is Mr. Coles, of that city.

## SCULPTURE AND GOTHIC ARCHITECTURE.

In Mr. Bell's lecture on architecture and sculpture, delivered on the 28th of March at the Architectural Museum, and since printed in your columns, that gentleman pronounces the opinion that Gothic architecture is not in harmony with the highest class of painting and sculpture! I had hoped to see before this some authoritative reply to so injurious a statement,—a statement or opinion made without a shadow of argument or proof in its support. This being my view of the case, whilst more powerful advocates are silent, I feel bound to endeavour to call attention to the subject.

Mr. Bell, when he arrives at the province of Gothic architecture, does not find anything to indicate the application of the highest art of sculpture to that style in the works of the past, and, what is still more important, if his view is correct, does not think that any advance in the style will afford any more favourable result. He starts with the question, "Is Gothic architecture in harmony with the highest class of painting and sculpture?" and then, confining himself to some very general assertions in favour of Greek, Roman, and Italian architecture, the sum of his answer amounts to this;—that Gothic sculpture and painting have been and will be (in his own terms) inferior to that of the other styles, archaic and unnatural, quaint, cramped, and conventional.

Obviously it would be desirable to have it defined for us what is the highest style of art in painting and sculpture; probably time did not permit Mr. Bell to do this. There might be a very wide difference in such a definition from different quarters, and, therefore, in connection with the opinion pronounced by the lecturer, his definition would have been valuable.

The fallacy of the conclusion at which he arrives is evident, if we compare with the examples which his representative and well-known example of the Gothic. It was a deficiency in the lecture, perhaps unavoidable, that no example of Gothic architecture was described. Only two particular instances of the mode of application of sculpture were given. The Roman "Lady Bountiful," it appears, can show no subject "where sculpture has taken a greater part than in Trajan's column," and yet this design "is deficient in clearness and mental effect," and, he tells us, cannot be distinguished at all by the naked eye except just at the base of the shaft, nor is it an example to be followed. Rather unfavourable his for the greatest example of Roman architecture and sculpture in union. The other instance of the lecturer is from the Grecian, nor has he overestimated its value. The Parthenon, "a host in itself," he has so well described that we fully perceive the extent to which it is indebted to sculpture and the arrangements which the architects made for their brother artist; if, indeed, it be not the fact, as some say, that the sculptor designed the building, and, therefore, controlled the whole; which would make it probable, at least, that sculpture had a very free choice of her ground in this instance. The chosen arrangement placed one colossal and magnificent statue in the most important position within the temple, with, perhaps, other attendant statues of smaller size (the whole internal available space, divided into two unequal apartments, was only about 160 feet by 65). At either end, externally, a not very convenient form of frame in the tympanum was filled with colossal sculpture: in the external architecture, framed between the triglyphs, the metopes were filled with numerous subjects in the whole circuit of the building; and, within the peristyle, a narrow band of sculpture, confined between the mouldings of the entablature of the cella, completed the work allotted to this art. I draw attention to the fact that the sculpture was actually confined, and the unbounded profusion of which Mr. Bell boasts is not to be found in the example of his own selection.

If this had been its characteristic, it never would have attained the celebrity and homage which its real merits command. Profusion of ornament was never a characteristic of Grecian art. Having observed the extent and the mode of the application of sculpture in this celebrated building, let us turn to our own country; and who shall be found with hardihood sufficient to deny that in our cathedrals, and parish and abbey churches, we have buildings whose name is legion, affording in any single example far more space and opportunity for the introduction of sculpture than the Greek masters obtained in their most celebrated and favoured example. Out of our abundance we select for consideration Westminster Abbey. We are all so familiar with it, that the comparison I have proposed is readily understood. Certainly, in latter times, there has been some

belief in a "Lady Bountiful" here—her later guests would furnish, in number at least, all the temples and groves of Athens; but was ever hospitality more most outrageously abused? Let those imagine who can its noble walls as originally rich with every appropriate form of design, its stones teeming with sculpture, combining its simplest forms with most ingenious elaborations and subtle effects, cleared of the fearful barbarities with which the followers of Italian art (the men whom we are asked to regard as our masters) have desecrated them. Let them think of the pristine beauty and awe-inspiring effect of the noble array of monumental sculpture, the heroes and saints, kings, statesmen, and churchmen, with forms wanting in no accessory of marbles and precious metals, and shadowed by canopies devised to receive every form of grace which sculpture could conceive or art enhance, every attribute which mere cost could furnish, abundant and free to the artist's use, every effort of the most unwearied and patient labour lavished without stint. Let them imagine all this, and think of the dignity of the space, and the array of hands and minds employed to fill it, and then say where shall be found a more favourable opportunity, or a more gloriously successful instance of the union of the highest art than is presented in a true picture of the now obscured glories of this wonderful pile. In this and in a hundred other instances, daily within the reach of English artists, who shall venture to separate Gothic architecture from the sculptor's art?

There is yet another view to be taken of the subject. If Italian or Classic art (it is difficult to name it) be so much more favourable to sculpture than our native style, as Mr. Bell would have us think, how is it that its followers are now so justly lamenting the small measure of its accomplishments? Surely opportunities have not been wanting, not to mention important buildings of Italian style in our own day, and merely alluding to one of the last century, Somerset House, where, certainly, if ever invited, sculpture has not obeyed the call,—let us pass St. Paul's, architecturally alone one of the noblest works ever executed; but where is the sculptor's art, and where the painter's? What has the "Lady Bountiful" done here, why such cold hospitality? Strange that whatever there has been of Italian art has sought the Gothic shrine!

For myself, I blame not Italian art for deficiencies for which we ourselves as individuals, and as a people, are answerable. When sculptors study to produce what they really believe in, and when the people sympathize with the belief of the sculptors, we shall not want in the highest art, which assuredly no amount of repetition of Fames and Victories, of Neptunes and Tritons—in which no one believes, and which few care to understand—will ever produce.

GORDON M. HILLS.

## LONDON AND MIDDLESEX ARCHÆOLOGICAL SOCIETY.

The meeting was held in the Temple, as we mentioned last week would be the case, and various papers were read, including one by the Rev. T. Hugo, on the Domesday Book, to see which was visit was afterwards paid. Mr. Hugo said,—“The sources from which my information is principally derived are, besides some considerable knowledge of the record itself, the works of Bishop Kennet, Sir Harris Nicholas, and Sir Henry Ellis, the last of whom, in his most excellent introduction to Domesday, has presented us with a vast amount of information, derived from a study of many years of the precious original, and whose words I shall use on several occasions, from a consciousness that no better could be employed. Domesday was commenced about the year 1084, and was completed in 1086. It was formed by a transcript or abstract of the breviates, which were in the first place compiled from local information in the different counties, and subsequently forwarded by the justices to Winchester, where they were copied, rather, as it would appear, in a more contracted form than the retarus actually furnished, and placed in a consecutive series. The justices or commissioners had been appointed with full powers to collect information. Those for the Midland counties were—Remigius, Bishop of Lincoln; Walter Giffard, Earl of Buckingham; Henry de Ferers, and Adam, the brother of Eudo Dapifer. Before I enter into the mode by which these commissioners obtained the matter of their returns, a word may be necessary respecting the name of the record itself. It has at various times borne various appellations, as 'Liber de Wintoniâ,' 'Rotulus Wintoniæ,' and

'Liber Regis.' Its English name of 'Domesday' has been variously interpreted. By some it has been held to allude to the day of doom, from the minuteness and unsparring nature of its details,—“Quia nulli parcat sicut hec magnus dies Judicii;” while by others it has been said to derive its name from the fact that it was deposited in the king's treasury in the church of Winchester or Westminster, and in a particular place in one of those churches called 'Domus Dei.' It was greatly valued and kept under three locks and keys in the custody of the auditor, chamberlain, and deputy-chamberlain of the Exchequer. Soon after its completion it was removed to Westminster, was, in 1696, placed in the Chapter-house, and, down to a very recent period, remained there, till it has found a better and a safer place of deposit in the new Record-house attached to the Rolls Chapel.”

In the Temple Church Mr. E. Richardson, sculptor, pointed out the few remaining examples of Early English sculpture in the choir and "Round," viz. the heads of Henry III. and his queen, gilt, over the great east window, quite hidden. Two Saracenic and two Christian heads, *vis à vis*, at the springing of mouldings high up between the two churechs. They had received glass heads in the eyes and colour. He alluded with regret to the loss of all the original grotesque heads in the spandrels of the "Round," removed during the repairs of 1827, and the very inferior substitutes for them, executed by a quarryman, the originals being used up in the builder's yard for cart-wheel crushers. To show that the great restoration of 1812-3 was not faultless, he cited the removal of the effigies into a damp shed in Hare-court, for the six winter months of 1841, where they received much injury; and the re-interment of a beautiful incised Purbeck marble cross memorial, which, till Elizabeth's reign, adorned the pavement of the church.

## "CHRIST IN THE TEMPLE."

THOSE who are interested in the career of Mr. Holman Hunt, the painter of "The Light of the World," have known that he has been engaged for some years past on a picture of that incident in the life of the Saviour wherein Mary and Joseph, seeking him, found him disputing with the doctors in the Temple,—and when they saw him, they were amazed." This is now completed, and is exhibited in what is known as the German Gallery, New Bond-street. It seems to us to be matter for regret that it was not sent to the Royal Academy Exhibition, as well for the maintenance of the reputation of the British School of Art, as for the spread of the painter's own. Fear, however, of a bad light, the neighbourhood of damaging colours, or the regulations as to frame which would have prevented what the artist has considered it needed in this respect, may have prevented that step.

A picture like this, which, comparatively small though it be, has been thought over for years, demands at the hands of those who would criticise it a corresponding amount of consideration. Having seen it but once, hastily, on a "private view day," we restrict ourselves at this moment to the expression of an opinion which, indeed, may be deduced from what we have already said, that it is a work of very remarkable merit and great interest. The head of the third sitting doctor, the child, the beggar at the gate, the colour of the Saviour's robe, and the initiative skill shown in the painting of the marble floor, are the points which spectators will most readily admire, while the size and coarseness of the Saviour's feet and legs are the blot which will be to them the most obvious.

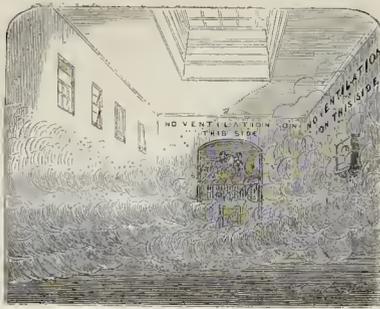

The course which, in lieu of simply providing pictures for the market, Mr. Hunt is taking,—devoting himself to produce the best work in his power, without reference to the time occupied, the travel and study necessary, or the probably small results in a pecuniary point of view,—claims our admiration and applause.

## VENTILATION OF THE METROPOLITAN POLICE COURTS.

BOW-STREET OFFICE.

AN old proverb says that "the shoemaker's wife often goes the worst shod;" and this will apply as regards sanitary matters: those who make the laws and others who administer them are often placed in the position of the shoemaker's wife.

In the police courts sanitary laws are enforced, and perhaps there are not many public establishments in which so little provision is made for the

The Condition of Bow-street Police Court made visible.

preservation of the health of those who are required to attend them. Let us, for instance, look at the old police-court of Bow-street—which is apparently little better than it was in those days when Sir Richard Birnie was often wrathful with the representatives of the public press, and in other ways allowed temper to exceed the bounds of discretion.\* The metropolitan magistrates are now very different from those of Sir Richard's days, and are distinguished generally for their sound judgment (hating always their decisions on building matters), patience, and kindly feeling to the unfortunate and miserable. Such men are valuable, and, with those who are engaged with them in carrying out important functions, should not be exposed unnecessarily to danger.

In winter the sanitary condition of Bow-street is bad, but in the heat of summer it is perfectly abominable. To those who have not visited this court, which is so generally known throughout the whole country, it may be necessary to mention that the entrance is not wider nor higher than the ordinary street-doors of the neighbourhood: very often round the entrance a crowd stops a portion of the small quantity of air which would pass that way. Inside the long passage which connects the clerks' and other offices are seats, and these, as well as the standing-place, are generally thronged by those who are called to attend cases or who have friends in trouble. Here may at times be seen congregated the very dregs of a great city, and a had sight it is. From one part of this passage leads a room in which the more select of the waiters are accommodated; another is the chief clerk's office; further on is the entrance to the court, in which the magistrate sits; a little to one side are the prisoners and those in attendance upon them. In these passages and rooms there is actually no practical mode of ventilation, and the consequence is that the most poisonous gases are generated by the pent-up crowd clad in dirt. The very approaches of the court are thus, for want of a little right management, so loaded with bad gases that no one can pass through with impunity.

The door of the inner court is kept jealously barred, and on knocking for entrance a small square hole, which is provided for the purpose of making a reconnaissance, is opened, and then, according to circumstances, the bars of the doorway are withdrawn or not. Enter, and you will find that if the approaches to the court are bad, they are salubrious in comparison with this important London interior. We have looked into the dwellings of the poor and careless, and noticed other neglected places, but are bound to say that nothing much worse than the condition of the atmosphere of this court of justice comes to recollection. At the time of our last visit a case of terrible crime had caused the court to be crowded. In the court are four small windows on one side, near the roof, and on the three sides there are no windows; in the centre of the roof is an opening which serves for light and ventilation.

As we have remarked, the door of the court is kept carefully closed. There are two other doors, one leading from the room in which the prisoners are detained, and another from an apartment generally crowded. These doors are also kept almost constantly closed, nor are there any gratings or open-

\* In some of the police-courts recently constructed the arrangements are better.

ings in the lower part of the court which would assist in passing the bad air through the opening in the roof. As the arrangement at present is, the temporary opening of the doors referred to serves simply to carry in portions of the heavy gas which loads the passages and rooms. The windows of the court have but little effect in clearing the room of the poisonous gas, which in such places is produced in large quantities. Carbonic acid gas is much more dense and heavy than the atmosphere: consequently, without proper arrangement for its escape at once when heated, it collects in dead corners, and near the floor. Every one knows of the "Grotto of the Dogs" in Italy, where carbonic acid gas, coming out of fissures, lies in layers near the ground, with the other and lighter air on the top, in the same manner as oil floats on water, so that a dog being near to the ground would die while a man could breathe.

The fumes of charcoal contain a large proportion of carbonic acid gas, and this causes the burning of charcoal to be so dangerous as it is in closely confined places. A case is related of a woman who was ironing in a confined room, and using a charcoal stove. As the charcoal burned the carbonic acid gas settled down towards the ground. Owing to the want of other air, the heavy gas accumulated higher and higher, until it reached the mouth of a little child, who grew giddy, and fell down almost lifeless. The mother stooped down to take up the child, and inhaling the poisonous gas, became giddy, and fell also. Fortunately assistance soon came, the windows and doors were thrown open, or mother and child would have died.

The poisonous gases in the Bow-street police-court are easily to be felt; and if we had, as we may one day have, the power to see the air which destroys life when in sufficient strength, and injures health when even in a diluted form, it would be observed in the ill-ventilated parts in thick layers, which decrease in density in proportion as pure air is forced amongst it.

The sanitary arrangements of the present court are most insufficient. The magistrate who sits here many hours of each day, fulfilling an important and difficult duty, is subjected to both inconvenience and injury, and so are all who attend. Surely the continuance of such a fever nursery in a public office is not creditable, in the face of our sanitary knowledge. The court might, doubtless, be improved; but the whole is so faulty that the building requires to be entirely reconstructed.

REFORM IN THE ROYAL ENGINEERS' DEPARTMENT.

THE Secretary at War, Mr. Sidney Herbert, has just issued an important paper, which we feel assured that many of our readers of some years' standing will peruse with a decided impression that it must be a leaf torn out of the *Builder's* pages. We would merely point to two of our leading articles, of date 26th July and 27th September, 1856, to go no farther, in order to refresh the memories of others on the subject. For these and other articles we met with no little obloquy at the time, but the Secretary at War's present despatch to the Royal Engineers' Department not only justifies all we have said, and shows that such defects as we pointed attention to actually exist in that department, but gives a well-grounded hope that the

time has arrived for the realization of adequate remedial measures. Whether these measures will take the shape of a thorough architectural and engineering education of young military officers, or the establishment of a responsible and recognized department of civil architects and engineers, remains to be seen. We have already expressed our opinion on that subject, and need say no more as to it at present.

The following are a few separate passages from a long despatch in a similar strain addressed by Mr. Secretary Herbert to the Department of Royal Engineers, and signed "B. Hawes:"—

"There is reason to fear that there are engineer officers who consider the duty of designing beneath their notice, and who are too ready to place in the hands of subordinates duties which engineer officers in most other services in Europe perform unassisted, and which are really among the highest functions of the architect or engineer, be he military or civil."

"Mr. Herbert wishes that the designs for new works should, whenever it is practicable, be prepared by an engineer officer, whose name should be attached to the design. When it is necessary to employ a civil member of the Department, he also shall sign the plan, and have the full share of responsibility which attaches to the designer."

"When the proper plan and dimensions are arrived at, care and judgment are required in selecting the most suitable material, and applying it in the mode best calculated to attain solidity at as little cost as possible. It is often bad economy to build in too temporary a manner, but the converse is also true. It may be cheaper to build every ten years in wood than to sink a large sum in stone. The best materials should be provided where they are required, but it is quite proper to use inferior materials when they will answer the purpose as well."

"Engineer officers should endeavour to make the case their own, and do for the public service what they would do for themselves had they to find the funds."

"Mr. Secretary Herbert feels confident that many officers of engineers do give him the assistance he requires, and all can if they will only make the attempt."

HOLY TRINITY CHAPEL, KNIGHTS-BRIDGE.

THIS chapel, formerly attached to a hospital belonging to the Dean and Chapter of Westminster, is about to be entirely rebuilt and enlarged, according to designs prepared by Mr. Raphael Brandon and Mr. Henry M. Eytton. The plan is a simple parallelogram, the internal dimensions being about 70 feet by 33 feet. The roof of the new chapel deserves attention, as being entirely new in its construction, introducing an entire range of clear-story lights on each side, to compensate for the want of lights in the side walls; the building being adjoined, on each side, by ordinary houses. These lights can be approached by external passages, so as to admit of their being opened, to afford ventilation, without having corridors hanging down internally. The height of the chapel, from the floor to the ridge, will be 65 feet. The new chapel will afford accommodation for about 650 adults, and is contracted for by Messrs. Dove, Brothers, of Islington, at the sum of 3,250l. The present incumbent is Dr. John Wilson, Head-master of St. Peter's Grammar School.

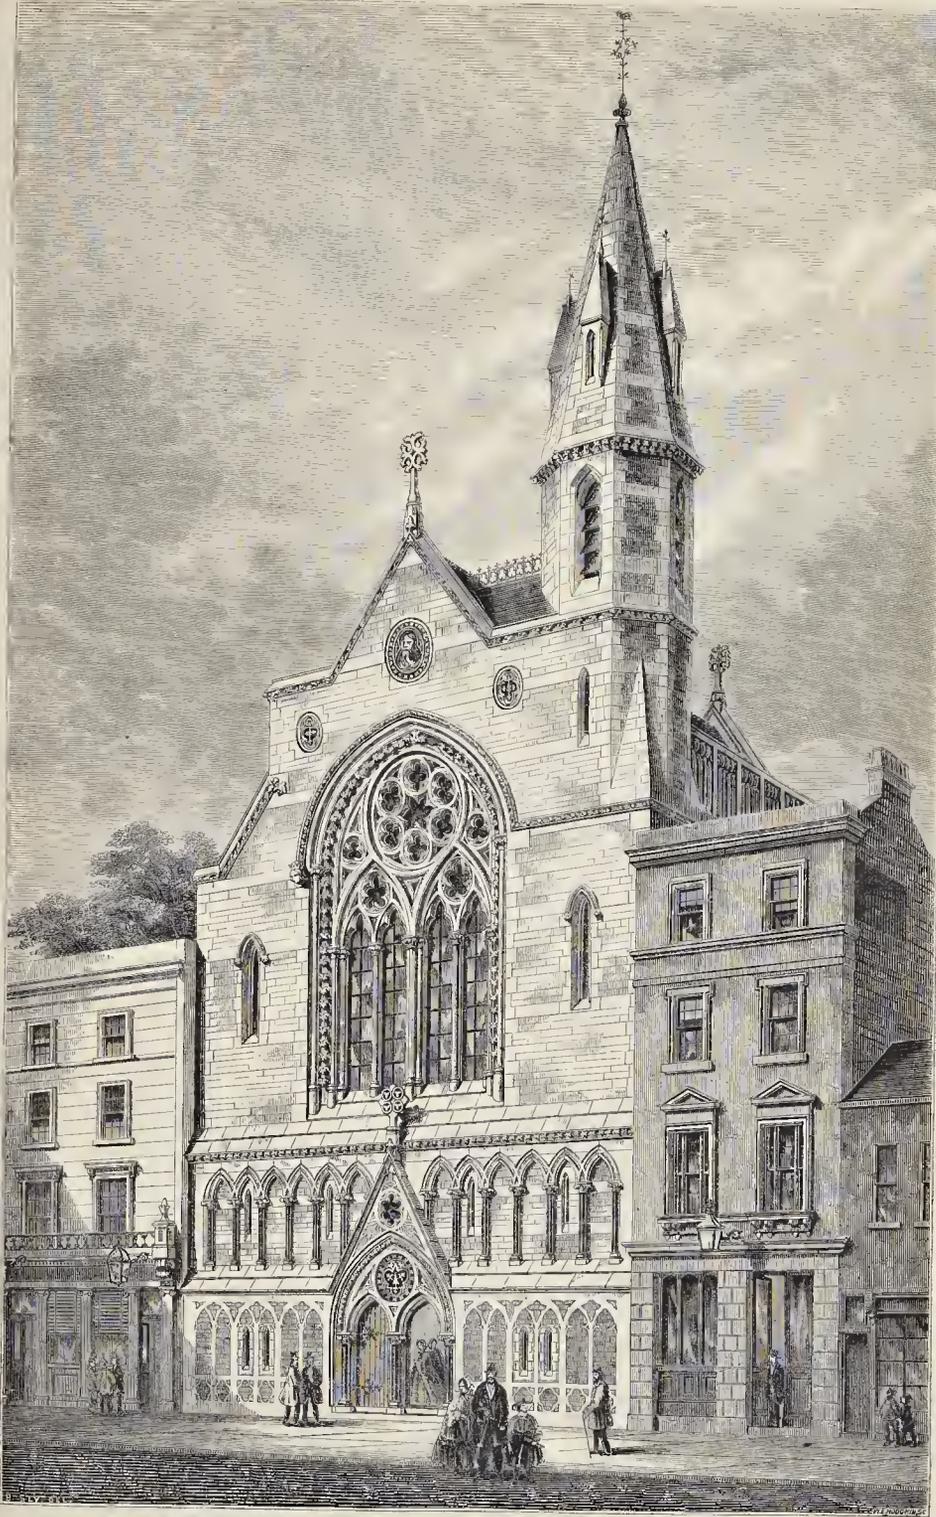

The chapel is of ancient foundation, and was rebuilt in 1699. The structure which has been taken down was for the most part of that period, but the front had been extended in 1789. Many of our readers must have noticed the quaintly-inscribed stone slabs under the upper windows, one bearing the words, "Rebuilt by Nicho Birkhead, Goldsmith, of London, Anno Dom. 1699;" and the other (the westernmost), "Capella Sanctæ Individuæ Trinitatis."

YORK MINSTER ORGAN.—The following appears to be an authentic statement of outlay connected with the restoration of this instrument, now completed:—

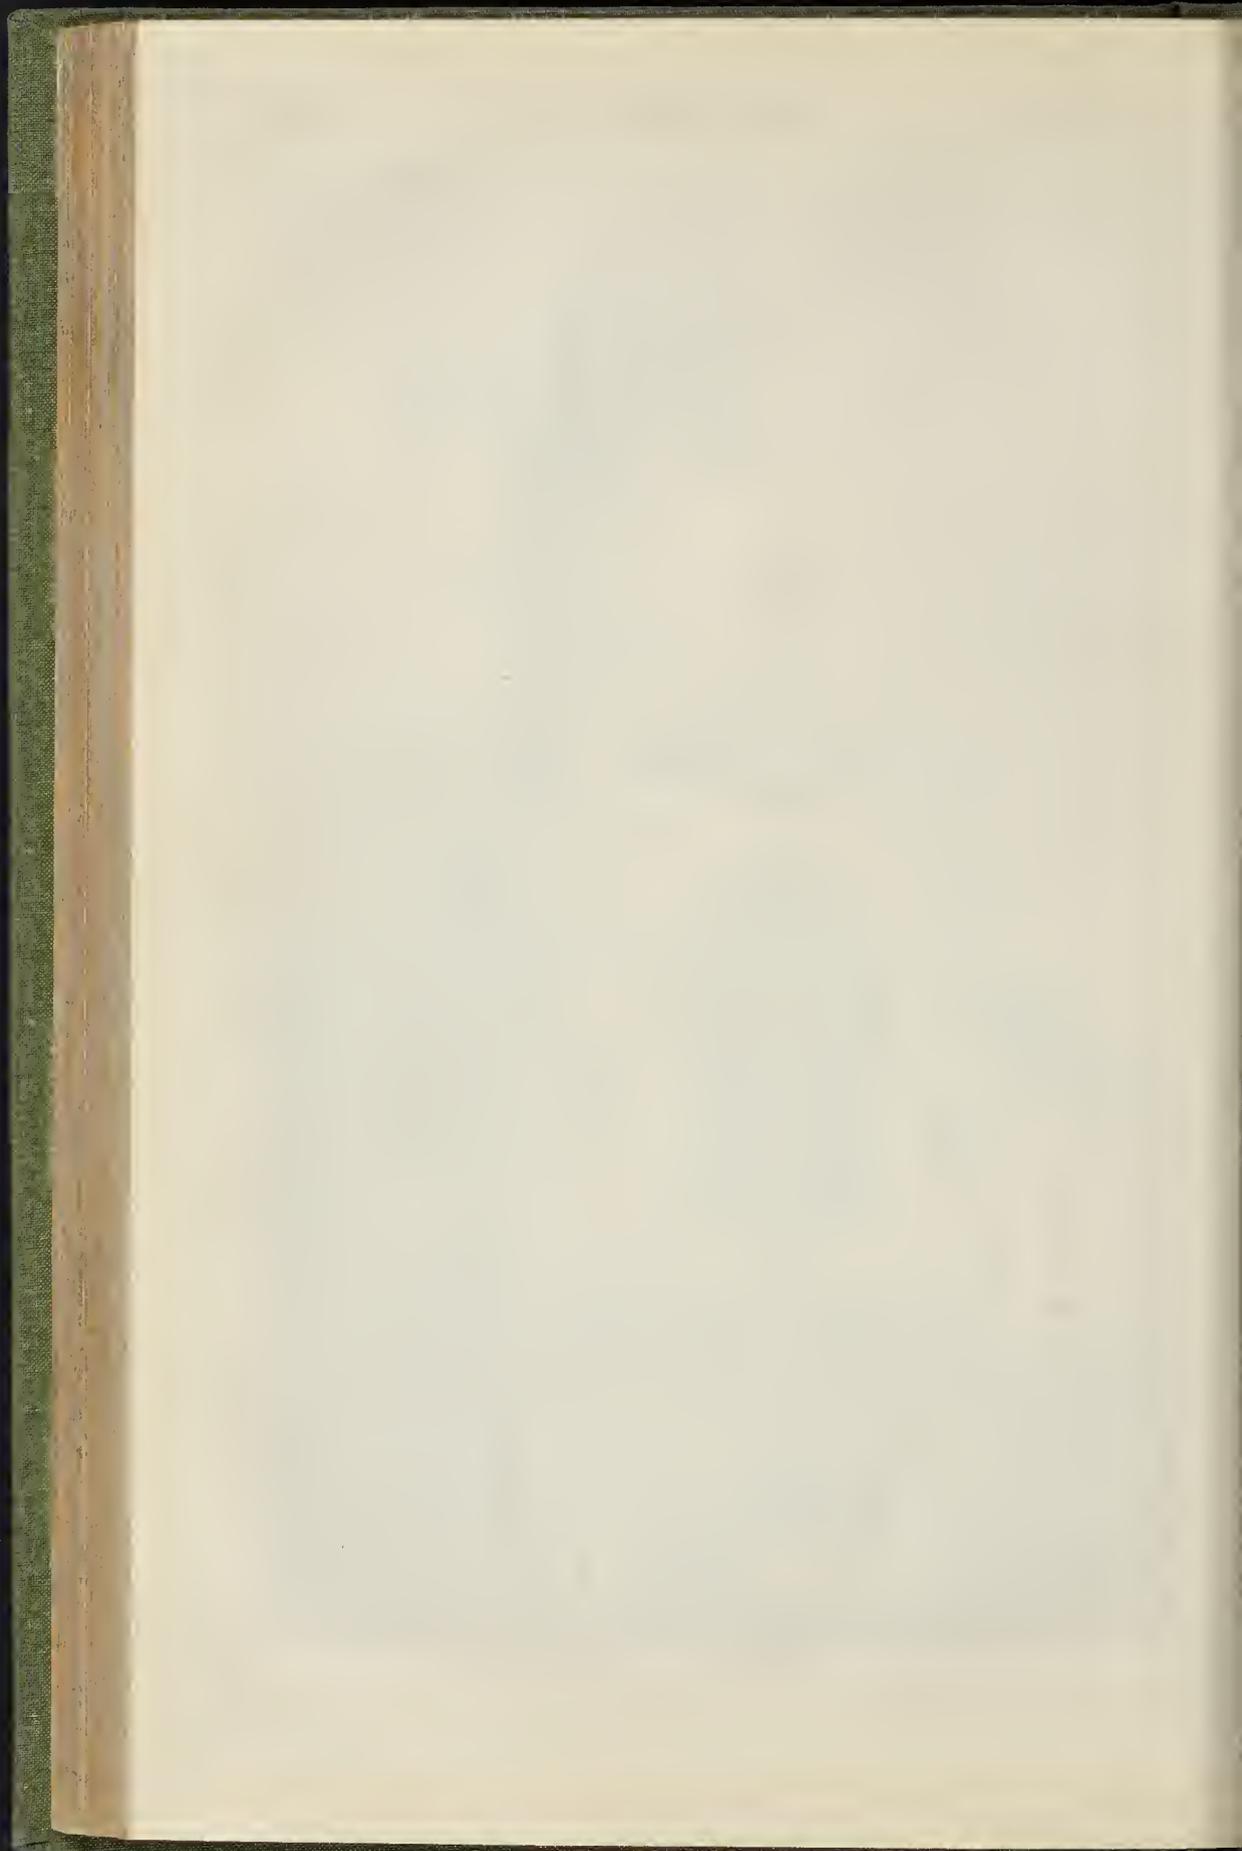

Messrs. Hill.....	£1,240	0	0
Messrs. Joy, for hydraulic engines....	178	0	0
For supply pipes from Water Works	69	3	0
Expenses at opening, Nov. 10, 1859	113	4	6

£1,600 7 6

\* A sketch of the front of the building will be found in Davis's "Memorials of the Hamlet of Knightsbridge."

HOLY TRINITY CHAPEL, KNIGHTSBRIDGE.—MR. R. BRANDON AND MR. H. M. EYTON, ARCHITECTS.

## THE ARCHITECTURAL EXHIBITION.\*

RESUMING our notice of the Exhibition in Conduit-street, we come to the "Public Hall Building, recently erected at Maldon, Essex" (129), by Mr. T. Rorer Smith. The drawing shows a structure of yellow brick, with white brick dressings, with window openings having semicircular heads, splayed eills, and shafts. The design pretakes a manner, in these features, which is too prevalent, namely, the repetition merely of short arch-headed windows; the effect of which is, in place of that from grouping, one of general heaviness. Perhaps the observer instinctively suspects darkness of rooms. Mr. Smith succeeds better in his competition designs, as well as in his "Stratton-Audley Park, in course of erection near Bicester, Oxfordshire," of which there are two views (256, 257), showing a stone-fronted Gothic mansion, with gables, mullioned windows, and a square tower with a wooden belfry-stage, and a slated roof capping.—Messrs. Banks & Barry's "Industrial Schools for the County of Middlesex," recently completed at Feltham (130), and illustrated in our pages some time ago, has defects similar in their nature to those of designs of the class of that first named in our notice; though they appear through another character of detail. Had the quantity of stone or other light-coloured material used as dressings with the red brick in the Feltham schools, been in less force here and greater force there, parts of the design intended to be prominent, and now dependent for the force solely on their bulk, would have operated in the effect as intended. The whole effect would have been taken up by the eye with greater satisfaction; would have followed from the principles which should regulate every work of design, especially one having many parts; and would have been pleasing rather than in some respects the reverse—from the lack of emphasis, and of the ordination and subordination of parts. The same architects also exhibit (131) a View of Schools proposed to be erected at Halls-ville, for the Plaistow and Victoria Docks Mission, a plain Gothic building, with belfry and porch of cupped arches.—Some meritorious designs for schools are exhibited by Mr. John M. Hooker. No. 134 is the "National Schools, Marden, Kent," erected, with the master's house, for 240 children, at a cost of £2400. This design, like the others, is Gothic. Red brick here is used, with thin bands of dark-coloured brick at regular distances, and duly subordinated; and roof principals appear externally, on the gables, in the place of hareboards. The "Design for National Schools, Charlton, Kent" (136), shows a stone building in the "Decorated" Gothic manner, with gables and a bell-turret. The design for the "Ariel Smith Memorial School, Hertford—selected in competition" (178), has yellow brick with bands of red, and is a good composition—the tower with spirelet only excepted, so far as resembling the distinctive character of the same feature of a church. Mr. Hooker also exhibits (185) "Parsonage House for the District of St. Andrew, Paddock-wood, Brencley," similar in style and in merit.

It is difficult to make a fair comparison between the designs for schools which there are in the Exhibition—amounting to a considerable proportion of the drawings; for, materials, locality, and size involve wide distinctions, which are generally made apparent in the result. Satisfactory is it in point of art, that the result is so. Mr. Edwin Nash's "Penge School for Infants, now erecting" (150), and Mr. Colling's "New Schools erected at Haslington, near Crewe, Cheshire" (128), are good specimens of the plain red brick class; and Mr. John Norton's "School-House and Teacher's Residence, Stoursey, near Bridgewater" (158), is equally successful in Gothic detail and grouping, for a stone building of a more enriched character. The drawing last named is cleverly coloured, without the appearance of much labour.—Mr. F. Warren's "Freeman's School, Wellingborough, re-erected 1859" (163), has more variation of colour, but not a better result; and the list of buildings includes the "Monk Bretton Schools, Church and Master's Residence—cost 5000," Gothic, Early "Decorated," of grey stone with white dressings (171), by Mr. J. G. Stapleton; and the "School at Weston-super-Mare" (176), of similar materials and style, but better in effect, by Mr. Hans Price. Also near the drawings mentioned, is a view (172), of the "Walsall Blue Coat and National Schools," by Mr. H. Cooper, a large group of buildings erected at a cost of 5,000; in the same style, but of red brick with dark-coloured bands, with stone dressings, gables with crosses and finials in ironwork,

and a tower with a lantern stage and a slate covered spirelet.—Mr. E. W. Godwin's "Design for proposed National Schools, St. Philip's, Bristol" (152), is a three-story building, suitable for a town, and it is marked by considerable skill in the grouping and originality in the details. A basement of closely-set and plain, narrow openings, concealed in the flank by the enclosure wall; a principal story of two-light windows as subordinate in a continuous range of arches with enriched archivolts and parti-coloured vousoirs; a top story of square-headed windows under the eaves, and a gable of low pitch with peculiar finial, and a cusped window, circular, under an arch, together with the contrasted rough walling and dressed eaves, are the principal features. A square tower, with plain stone pyramidal capping is at the side. The same architect exhibits a drawing (153) of "Portion of the New Works, Stavertown Church, Devonshire," wherein the native marbles have been used in shafts to the new windows, which are of "Decorated" character, and the external walling of loose material has been covered with rough-cast,—a description of finish which it is well to note, is to be found of old date, more frequently than some archaeologists may be aware of. He has also a cleverly designed elevation for a carriage manufactory (310). To the execution of this work, or that substituted, some passages in professional experience are attached, if we may judge from the entry in the catalogue and the photograph (311).

In the arrangement of the drawings on the walls, that of grouping the works by the same author together, has been adopted (as the numbers we have given, have shown) to a considerable extent: and it might with advantage have been followed universally. It would, however, be a good plan in future exhibitions, to group the designs in classes according to the subject; or should that be not feasible, from the practices of different classes in the same frame, there might be a division of the catalogue, secondary to that of the order of numbers, which would assist the study of the exhibition, and promote those educational results which we have so often adverted to as the best objects of an annual gathering of drawings. Indeed, it would be possible, by attention to the catalogue, and to the regulations for exhibitors, to make the Exhibition of immense service to the profession, as well as to the public. We are by no means complaining of what has been done since first we adverted to omissions and requirements. On the contrary, information of the most useful character is now supplied by exhibitors in response to the "regulations." The printing of the catalogue, however, might be further improved in points which are within the duty of an ordinary reader for the press. Authors' names, or explanatory matter, are sometimes arranged on the page, so that it is not immediately observed which number of a drawing is referred to. Also, architects might be asked to state cubical contents, and of each part of their design involving difference of work. Sections not being given, plans and the statements of total cost, are comparatively of little service for certain objects.

We have admitted that the grouping of subjects would, for various reasons, be useful only to a limited extent in chronicling the architectural progress of the year: it would, however, be of value sufficient to be worth the trouble, and would be the nucleus or precedent for such an exhibition as we hope ultimately to find in Conduit-street. We cannot supply the want ourselves in the time allotted to us. We may, however, group together one or two of the drawings of churches designed, or lately erected. Mr. Dudley Male exhibits (137) "North Pickenham Church, Norfolk; as proposed to be rebuilt," a very ordinary "Decorated" structure of grey stone, with light stone dressings. Mr. G. Goldie has "Six Studies for the new Roman Catholic Church, recently completed at Lanark" (143), and "Six Sketches for Works in Progress" (144). The Lanark Church is Geometric "Decorated" in style, and has a prominent bell-gablet at the east end of the nave; whilst there is also a square pyramidal-capped tower at the west. The interior is most deserving attention; the piers have slender shafts attached on the face, to carry statues; the arches are chamfered for the ball-floors; and the baptistery, inclosed by a dwarf screen, is well treated. The dwarf screen, of masonry, to a chancel, is now generally adopted in place of the rood-screen; and we certainly think, with as much propriety in point of art,—art which should not adopt forms where there is no longer the use or the symbolical meaning,—as

in the view of what is distinctive in the Protestant ritual. Of Mr. Goldie's "Works in progress," Ballymunt Church, Mayo, is of that Geometric "Decorated" character, or that before the advent of tracery, which is in favour with an increasing number of church architects—not only for plain churches, but those which admit a considerable amount of decoration by colour and in furniture. The Priory Church, Bergholt, Suffolk, however, is Romanesque, with square tower. The church at Yarm, Yorkshire, is Early English, of red brick and stone, and has an apse, and a peculiar, but effective, slate-capped bell-turret at the side. The sketch of the interior of this church shows that the dwarf-screen, or inclosure, is found suitable even for the Roman Catholic ceremonial. The best of the designs is that of the church at Ipswich. It is of red brick and stone, with a *flèche* on the roof, marking the junction of the nave and chancel; and internally has stilted arches, and a timber roof, with the trusses coupled and boarded over, and ornamented with quatrefoils.—The building which is shown in No. 154, "Markham Square Congregational Chapel, Chelsea, now erecting" (154), by Mr. J. Tarring, was described in our last number. It is a cross church of Late "Decorated" character, with tower and spire, buttresses, and pinnacles. The design sadly wants crosses or something to terminate the gables; and generally it is one of those which "slunning faults" would only drive to "sleep." Works of this class now, indeed do want something of the often-spoken-of novelty. May we not hope for the result of mental effort, divest of the eccentricity and *biarrierie*. Our Mediaevalists have much to learn yet, to escape each born of the dilemma on which they are apt to cast themselves. We take this opportunity to name (155) "Tingewick Rectory, near Buckingham," a Gothic, stone, mullioned, and gabled building, by the same architect. The "Mausons in Gore-road, corner of Prince Albert's-road, Kensington" (146), also by Mr. Tarring, with Italian details, are more pleasing in the drawing than in execution, probably, in the latter case, from the use of cement and the defects of some of the details,—as the trusses in the *corniches*.

We were speaking, however, of churches; and near the drawings last named are two designs which will not fail to be contrasted, both having octagonal lanterns and pinnacles at the springing of the spire, but treated very differently. Of the two, the one, No. 157, "St. John's Church, Bedminster, Bristol," by Mr. J. Norton, and the other (173) a "Design for the proposed Rebuilding of St. John's Chapel, Bedford-row, on the old foundation," by Mr. Garling, we prefer the latter, because the octagon is made to serve the union of the tower and spire; whilst the former design has the octagon rising too high, or not high enough, for the tower pinnacles, and has the spire merely set on the octagon. In Mr. Garling's design, the finials, or spirelets of the pinnacles, and the spire, spring from the same level: whilst, in the other design, the cornices or mouldings do not range. Mr. Norton adopts gables to the bays of the side aisles: Mr. Garling has a different arrangement without buttresses, and has circular cusped window openings over the main windows of the aisle. A polygonal apse with tall windows, the tower flanking it, plays an important part in the effect.—"St. John's Church, Lamsford, Herts" (179), by Mr. D. Brandon, shown in a clever sketchily coloured view, groups well, and has some good features of detail: but it might pass for an old church; and, so long as that is by far the most prominent attribute of a building, we hold the design cannot be accepted as in every respect satisfactory, or indeed, as at all the illustration of art architectural. In a like category we are compelled to include Mr. Burgess's "Proposed Cathedral to be erected at Brisbane, South Australia," shown in photographs from the drawings: nay, this design seems to us to go farther in a wrong road, being treated as though the use of windows were not to admit light. The proportion of aperture to enclosing arch is so small that the mouldings and other parts of the arch do not preserve their desired "semblance of use." The elevations appear as if copied from an old manuscript; still there is much in the design which, could our objections be got rid of, would go to constitute a very suitable building for a locality where elaboration of detail would, from costliness or difficulty of execution, be out of place. The building has a square tower, with saddle-backed roof, placed at the south-west angle of the plan. The interior is by far the best portion of the design. There is a passage-way, all round, in the thickness of the

\* See page 228, ante.

walls, at the level of the window sills of the aisles, and a similar way, guarded by balcony rails, to the clerestory. The rear-arches of the clerestory are coped, the windows themselves being chiefly crenel.

We have not named many of the drawings of old buildings, attention having been given chiefly to those designs which we have thought useful for some point or other of suggestion to new matter or new train of thought; but visitors to the gallery should not pass by Mr. P. R. Wilson's "Interior of the Church of Saints Peter and Paul, Breuckelbourn Priory, Northampton, as supposed to have been decorated in the olden time" (197). The shell of the building only is existing. The "Restoration of the Centre Panel of the ancient Retinulum of the High Altar at Westminster Abbey,—the Figures by H. S. Marks; the Architectural Portions and Decorations drawn by R. Edgar, under the direction of G. G. Scott, A.R.A." (195), will likewise be interesting in the antiquarian point of view—from which we are not disposed to exclude an appreciation of what is beautiful, and is also useful towards fresh combinations. How far our art has gone wrong by the way in which the polychromy of the Middle Ages has been revived, with sometimes excessive use of gold and inharmonious combinations of the primary colours, is a question suggesting itself from time to time, and which some day will have to be disposed of. Judging from the attention now given to church-furniture, however,—as in manufactured articles, and in the designs of architects of the Mediaeval school,—the elaboration and the colour, and the demand, continue, albeit contrasted with severity in the forms of masonry, as also of roof-timbering, which has hitherto been spoken of. We are not condemning use of colour, but only modes of its use.

We are not sure that Mr. Street's designs, to which remarks above might apply, do not, like several others on the walls, owe some effect to the cleverness of the drawing with pen, which could not be due to the architect. Certainly the student cannot be too careful in judging of effect from drawing alone,—whether the drawing be in tinting artistic or so only in ink,—or even though the drawing be at first appearance discouraging. Of Mr. Street's drawings, the first on the list is the "Bird's-eye Prospect of the Church, Parsonage-house, and Schools, recently erected at Boyne-hill, near Maidenhead, with Design for the proposed Steeple" (220). This large group of buildings, however, externally is remarkable for the judicious use of the darker-toned materials, or the harmony of general effect made consistent with use of materials of different characters. The tower is detached, and is crowned with the low lucarned haunch which Mr. Street uses frequently. St. Giles's Church, Oxford, now erected by the same architect, shown in two views (221 and 223), belongs to the same style of Early "Decorated" as the work last mentioned. Here the lucarne openings are enriched with tabernacles. The plan, we spoke of in our last as remarkable for the narrowness of the aisles. It is also remarkable for a gathering-in of the eastern bay of the nave next the chancel. The tower is placed over the western extremity of the chancel, from which the transept project, the north transept being appropriated as the organ-chamber. Distinctive character is given by the short massive nave-piers,—circular shafts with capitals and bases; and by the treatment of the wide rear-arches of the clerestory. There is a semi-circular apse; and the ceiling is wagon-headed, with a tie and king-post (slightly moulded and carved), without struts. The foliated ornament in capitals, and the reredos and other church furniture are tastefully designed, and, as we have said, skillfully drawn Mr. Street's "Grammar School and Vicarage House at Bloxham, Oxon, recently erected," of which portions are shown under No. 222, are in the same style. The former building has a cloister in which the openings are effectively treated as a range of arches with the shafts coupled in the thickness of the wall; and the latter has some of the windows square-headed with shafts in place of mullions, and a wide-projecting sill on corbels or blocks. —(The Chapel, St. Mary's Cemetery, Kensal-green" (224), by Mr. S. J. Nichols, has a porch of which the front is formed by an arch carried on detached columns, and in the western end there is a novel combination of a large floriated cross with the window.

—Mr. E. W. Pugin's churches for Northampton and Cork, are the best works we have seen from his hand; and if carried out as shown, they will be very elaborate. The view, of the exterior, of the Northampton Church (291), shows a lofty building, "Decorated" in style, having a tower and

spire joined in a cluster of pinnacles, and a polygonal apse with tall windows. The view, internal, of the church at Cork, of St. Peter and St. Paul (292), for which there are designs by other architects in the West Gallery, has a rich open-timbered roof with side spaces over the clerestory windows, groining in a peculiar manner. The chancel and apse are very effective; though, as a chancel arch is omitted, there is not sufficient framework to the vista or picture which is presented.

—Mr. W. Slater's "Church of St. John, Mozgerlangen" (303 and 309), is one which resembles an old church. It has an apse, and a square tower, with slate-covered spire over the western portion of the chancel. A similar character pervades the interior of the church of St. George, Bassterre, St. Kitt's (306), erected from the same architect's designs, unless in the arrangement of the chancel, which in its plan advancing into the nave, and the use of the dwarf screen, reverts somewhat to the original type of the Church of San Clemente, at Rome. Mr. Slater also exhibits an interior (307), and an exterior view (308), of Sompthing Church, as restored by the late R. C. Carpenter. The sheet, with fourteen Northamptonshire towers and spires from churches restored by Mr. Slater (305), at first conveys the impression that the restorations have been general, and have included the towers, which in some of the cases, we have reason to believe is not exactly the case.

We have not yet finished.

#### A WORKMAN'S WORDS TO WORKMEN.

At Salford there is a Lodge of Operative Carpenters, and an attempt is made at mutual instruction. One of the members, Charles Barnett, a young carpenter, a member of the Trade Union, but who does not agree as to the way in which it is conducted, read a paper to his fellow-members not long ago, from which we make some extracts:—

The destiny in life of the skilled mechanic is much more influenced by his *second education*, that of his apprenticeship, than by his *first*, that of the school, and yet it is to the school that the importance is regarded as attaching, and we never hear of the other. But it is in this latter and most important part of our education that it is to be feared we, as a body, are deficient. This may be a hard and unpalatable statement to many; but I would ask you, is our position such as becomes the followers of such a handicraft as ours? Are we held in that high estimation by our fellow-countrymen which the nature of our daily employment would warrant us to expect, or them to place us?

In a word, are we, as a body, art-workmen, or merely men getting through our work? If we answer from our own experience, we shall be compelled to say, however reluctantly, that, as a body, we fall far below that standard to which it is our bounden duty to aspire, and to which the public have a right to expect us to arrive.

And with whom does the fault rest? In answering this question, it may be I shall stand almost alone among you. But I most solemnly declare I believe it to be with ourselves individually.

It is to be feared that the remarks of one of the first architects of the day is too true when he says that it is possible to point to individual workmen, of an intelligence and of aspirations not inferior to those of the workmen of any other country, and perhaps of more indefatigable powers of application; but, as a body, I fear we must admit that our building artizans are not eager to shorten their hours of labour than to improve their hours of leisure.

It seems to me that we look too much to external power to raise us, instead of heartily receiving, and each for himself, having a lively apprehension of the truth that no application of external power alone can raise a man, or any body of men; that power must proceed from within.

The utmost that laws can do, whether enacted by an imperial legislature, municipal authority, or voluntary associations, is to remove external obstacles from our path: progress in that path must be the result of our own efforts. You know the old saying, "That one man may lead a horse to the water, but a hundred cannot make him drink." So it is in our own case; laws may smooth our path, but it is beyond their power to make us walk in it, save by our own will and effort.

If we wish our trade to occupy its proper position, and our handicraft men to be rightly esteemed, we must take care that each member is estimable.

This should be the great principle on which the education of the workshop should be founded. That the honour of the craft does not depend on the laws by which it is protected, but upon the intelligence, the skill, and the manly bearing of each individual craftsman. Let but these qualities be developed in our brethren, and no laws could be made, either by Parliaments, by masters, or by ourselves, that could oppress us; and, simply because we take away the will to do it.

Intelligence, skill, and manly bearing are the levers which must raise us (if we are to be raised), as they have been the means which have raised every other profession that is high in public estimation.

Hitherto it is to be feared that we have depended too much, for our protection and progress, upon laws and regulations of the common body, instead of individual effort; mistaking, as it seems to me, the removal of obstacles for actual progress.

In what has been advanced, many of you may perhaps think that I have spoken severely, but is it true? And if there be any lack of that intelligence, skill, and manly bearing so necessary to render any body of men respectable and respected, what can we do towards developing in ourselves and training our younger brethren in the qualities upon which we rely so much stress?

The matter seems entirely in our own hands; and in our trade societies there is an apparatus admirably fitted for the purpose, and this adaptation to our wants will be found, not in changing the purpose for which our societies were intended, viz., mutual protection, but by adding to them the far higher object of so assisting in the training their members as to render each one self-respecting. Not only would I have our trade societies use their influence to protect us in our privileges, with reference to the masters, but also add to that moral and intellectual training.

It should be the care of the trade that every apprentice should have the means and opportunity placed before him of acquiring those habits of industrious and persevering application which are necessary to the attainment of a sound knowledge of his business in all its parts. He should have the means of associating with the older members of his craft, that by their example he may continually be incited to labour to acquire that skill in his craft which would enable him in his turn to become an honour to his trade and an example to others.

Our society should have, at least in every large town, its public room open and known to the world as ours. This should be the trade home of the young artisan. There should be class rooms in which should be taught, by members of our own body, every branch of a sound English and technical education. There should be rooms for reading and conversation, with convenience for lectures and public meetings of our body. There, also, we should have opportunity of being assisted by our wives, our children, and sweethearts, to join us in our festivities.

Our society would thus be before the public; the objects which we sought would commend themselves to the approbation of the public, and in just such proportion as we attained the object in view, in just such proportion would the trade rise in public estimation.

Our society thus being brought openly before the public would be freed from the suspicion with which, however we may think the fact, it is now regarded by so large a portion of our fellow-countrymen, and then no longer should we see in public advertisements, "No society man," as a recommendation for the higher positions of our trade.

Being thus public we should be freed from the danger and temptation of using the society for other purposes than those its publicly avows.

No longer should we have large bodies of our fellow workmen standing about our doors, each would see that in joining his fellows he would best advance his own interests, and most effectually assist the progress of his fellows, not by coming to the society would soon come to be a mark of disgrace, not only by ourselves, but the public generally, as it would be evidence that the man was deficient in those qualifications which would render him worthy of being a member of the society. While thus acting in accordance with the liberal principles of the age, we should secure a great measure of the advantages of the old trade guilds, which, according to the time in which they were founded, had fulfilled the purposes for which they were instituted.

Thus kindly feeling and charity would be diffused among us. We should pursue men to whom beneficence would be a pleasure, and we should be having made their first step with us.

To be united with us would be an honour,—to be separated from us a disgrace.

There is much good sense in these observations.

#### SERPENTINE WATER SUPPLY.

The committee which suspended the works in progress for filtration and perpetual revolution of the identical element now contained in the basin, has come to the conclusion that the plan adopted by the late Government, and now so near completion, was in error, but they have left the question open as to the mode of treating the bottom, as to the source from which the fresh supply is to be derived, and as to the no less important consideration—who is to carry out the project.

It is suggested that a copious supply may be had by gravitation, from a spring accidentally tapped by the contractor of sewers, near the Great Western Railway Terminus, and that from a point only 300 yards distant from the repudiated filtering beds; and of this there seems to be little doubt, since the strong current which issues into the sewer at that point would fill a 4-inch bore. This water at present runs to waste, and might be much increased if such measures were taken as produced the enormous quantities in Orange-street, or in Duck Island.

The surface elevation in Spring-street (so called) is 80 feet, the source being 20 feet lower, and immediately over the clay stratum; and the level of the Serpentine being 50 feet above high-water mark, a fall of 10 feet would remain. So far the facts are proven, but the task remains, how to win the fullest supply from the Paddington bed, and how to conduct it to the site of the new abortive works.

Wasted funds, and the suppression of a contract for 17,000*l.* drew forth some animadversion, and might have occasioned regrets. The works must be paid for, and the engineer's commission also; but any new project or altered plan can be carried out only upon the same provisions, whoever the engineer or contractor may be. The materials on the ground,—the filtering beds, and even the scum-pans, need not be wholly lost; but the execution of the amended system ought to be entrusted to the most practised and approved of professional experts; and, in this unhappy case of all others, *detur digniori*.

If, as seems probable, the desired supply is obtainable at the point indicated, a very large amount would be saved in conduit pipes from St. James's, as well as in mechanism to force the water a distance exceeding two miles; but of the sufficiency and expediency, the best judges must judge those parties who have already exemplified such professional skill by drawing forth from untried repositories those fountains and streams which have stood the test of years and of searching investigation.

What portion of the works now unfinished may remain incomplete, or whatever the expenditure or a bootless object, is of little weight. To finish had design would only create further obstruction, therefore, the sooner the right one is commenced the better.

As to the condemned works, there can be little doubt but that they originated in a predilection of the late Chief Commissioner in favour of Mr. Hawkley's ingenious scheme; and it is only right to correct here an inference formerly given to the *Builder*, "that the devastation of the river borders was caused by some underling," by stating that the express order was given by the Chief Commissioner himself.

#### NEWS FROM DUBLIN.

THE report of the Collector-General of Rates probably the best statistical authority extant, clearly testifies the rapid progress of the Irish metropolis within the boundary; and the southern suburbs are considerably extending. With exception of Arran Quay and Rotunda wards all Dublin is stated to be "improving." The Four Courts new (extension) buildings cause "a considerable addition to be made to the city," although the assessment is proportionately affected owing to the demolition of old business houses. Trinity Ward is much improved, and "the attractions of new buildings, such as the Kildare-street club, and the Turkish baths in Lincoln-place, are very remarkable." More dwellings have been raised in late years in Church-road and the vicinity of Minions-street than could have been anticipated from the nature of the site, it being not long since considered an *irreclaimable swamp*. Various English residents—traders—have erected dwelling houses and offices (for the majority of which Mr. Lyons was the architect) in this locality, and other works are projected. As an evidence of the increasing value of house property, which at the north side had fallen to a low ebb, the collector states that "a tenant in Mountjoy square, who let £600, to be relieved from the responsibility of his lease, now feels it an advantage to be allowed to remain in possession from year to year at his old rent of 110*l*." Further, "a house in Rutland-square (at end of Sackville street), purchased in the unnumbered Estates Court for 400*l*, has been sold for 1,100*l*." A furnished house in Merrion-square was lately let for six months for 350 guineas.

We may add that the streets are being newly paved, sewered, and spacious footways of granite gaggings substituted for the narrow and irregular lanes hitherto in vogue. The unoccupied houses in 1859 were fewer by 101 than those of 1858. Old-fashioned and dilapidated structures are giving way to the modern architects and builders. There is hope that the filthy lanes and alleys, so numerous *still*, may disappear, and that the sanitary requirements essential for common decency will receive immediate attention.

The Spring Agricultural Show, at the Royal Dublin Society, was held last week, and bore a favourable comparison with those of preceding years. Numerous English and Scotch manufacturers exhibited agricultural, mechanical, and engineering appliances, amongst whom we noticed Messrs. J. B. Brown & Co., Cannon-street; Clayton, Shuttleworth, & Co., Barrett, Exall, & Andrews; Perry & Sons, Bilston; Haywood, jun., Derby; Morton, Liverpool; Morton, Leeds; Hornsby, Grantham; Fry, Bristol; Hernulewicz, London; Smith, Brothers, Glasgow, &c. The prize bull, Dr. McHale, is said to have brought 1,100*l*.

Messrs. Powis, James, & Co., of Watling-street, patentees of endless band saw machines, have had an important action tried at Dublin before the chief baron and a special jury, for 34*l*,—the price of a machine alleged to have been purchased by Johnna Boag, proprietress of saw-mills at Belfast. Plaintiff's case was substantially that the machine was *bona fide* sold to defendant, through her son as agent, conditional that it should remain on trial for one month, and, if not approved of, to be returned. The machine was retained for four months in a store-case unopened,

and defendant refused to pay. Defendant traversed the sale, and alleged that the machine was merely sent for exhibition, to induce purchasers. Verdict for plaintiffs. Counsel for plaintiffs, Messrs. Armstrong, Q.C., Hemphill, Q.C., and Sidney; for defendant, Sergeant Fitzgibbon and Mr. Faulkner.

The water supply question is solved, and the canals are to be the source; terms having been arranged with the Grand and Royal companies.

The project of connecting the North-wall quay with the southern thoroughfare of Great Brunswick-street, by means of a bridge across the Liffey, at the Custom-house, is assuming a tangible shape. A new patent balance rolling bridge, with longitudinal motion and double carriage ways, has been constructed over the George's Dock, by Messrs. Turner & Gibson, of Hammersmith Iron Works. Mr. M. Kenny, patentee. Width of water way, 47 feet. There are twelve rollers, or four to each of three main girders; also three cast-iron carriages, and bearing centres, one under each main girder, resting on lubricators, presenting on the elevation a parabolic curved form. Girders, 4 feet deep, 6 inches wide, with 15-inch flanges, top and bottom. At one end of bridge there is a counterbalance of five tons weight, and the opening is effected by lowering deflecting cams at one end, by a tilting apparatus at opposite extremity, and a driving gear nearly central. Mr. Forsyth is civil engineer. Cost, including masonry, &c., 4,000*l*.

We learn that new jetties, for shipping purposes, are increasing in numbers; that a second new graving-dock at North-wall point is in contemplation; and that the quays will be prolonged considerably beyond the light-house, and the river despoised.

#### SCAFFOLDING IN BELGIUM.

The following may prove useful, and tend to diminish the number of scaffold accidents. In this capital (Brussels), and generally throughout Belgium, all building is performed *overhand*, no matter what may be the nature of the material employed, whether cut stone, brick, or rubble. As the building progresses, the flooring joists are put in, and, by means of trestles placed on them, the work proceeds from story to story, all materials being carried up short ladders, and so on planks, to wherever they may be required. The results of this are threefold: first, it prevents any obstruction to the flagway, or street of a town; second, it reduces the expense of scaffolding materially; and, last not least, it almost entirely prevents the possibility of accidents, and the wholesale loss of life or limb which so frequently occurs: the work can also be quite as well executed, as the well-built houses in this city most fully testify, more particularly in the new part, where they are constructed with great regard to architectural appearance and ornament. Another particularly good and practical method pursued in this country is the universal plan of hanging scaffolds. In all houses and buildings, whether public or private, holes are left 5 or 6 inches square, or round, according to fancy: these are cased with cut-stone, or very frequently cut out of the solid, and placed at a distance of 8 or 10 feet from each other round the outside walls, between the ceiling of the top or attic story and the roof, a space which in this country is made very useful, being boarded, and serving for drying clothes, holding lumber, &c. These holes are either left open, which is most useful for ventilation, or are stopped by a plug of wood, on the head of which is usually placed some ornament according to taste. When it is required to point, clean, or paint the outside of the house, which, by the way, is most generally the custom here every summer, small beams which fit these holes are pushed through, and made to project some 6 feet, or more according to the width of scaffold required, leaving about as much inside the loft, or "grenier," as it is called, where the end is firmly secured to the floor or joist by a cramp of iron screwed down for the purpose. From these beams frames 5 or 6 feet wide, and 15 or 20 feet long, indeed, as long as may be required, are hung. These frames seem to be only ladder poles, sawed down the middle, and connected by means of cross-pieces of timber mortised through, and pinned outside to prevent them from spreading. These are placed at distances of 6 feet, and across them planks are laid, on which, sitting or standing, the workmen, beginning at the top, continue their work to the bottom, shifting the planks from cross-bar to cross-bar as they proceed. Access to these scaffolds is obtained from the windows of

the house, as there are no ladders or other communication with the ground used, which is another great advantage derivable from these hanging contrivances, as it quite prevents the possibility of robbery. All materials which may be required as the work proceeds are either pulled up from the ground, or obtained through the windows. To avoid risk to the passer-by, it is commonly the custom to hang a cross bit of timber to within a few feet of the ground to give warning of what is going on above. By means of these hanging scaffolds, the expense of long scaffold-poles, ropes, put-logs, and ladders, are avoided, to say nothing of a very great saving of time in their construction, as they can be hung out in a few hours. When I was mentioning the various uses to which the "grenier" is subjected, I forgot one whose great importance will, I trust, excuse my adding to the length of this already too long protracted letter. Access to all the floors of the house is attainable from it; and in each floor an iron frame is firmly built, in which a door is hung, more frequently double ones, the inside one being hung so as to shut down tight across the flue, prevent all draft, and with the help of a wet blanket at the bottom, extinguishing any fire in a few minutes. These doors also assist much in the sweeping of the flues, and quite prevent the necessity of going out on the roof, and the consequent frequent breaking of slates, as well as danger to the persons employed. I trust these few observations may be of use to our builders and contractors, and may prove the means of saving many lives. I would just remark that the holes for these hanging scaffolds can be made easily, and at little expense, in existing houses, and would greatly facilitate the cleaning and painting the fronts of our metropolitan houses, adding thereby much to the freshness and cheerful appearance of our towns. L. H. KING HARMAN.

#### PROPOSED TESTIMONIAL TO MR. C. C. NELSON.

At the meeting which was held on the 3rd inst., at the Rooms of the Royal Institute of British Architects, Mr. Sydney Snirke, R.A., in the chair, letters were read from thirty-two members of the Institute, expressing their warm approval of the object proposed, and agreeing to assist in carrying it into effect. On the motion of Professor Donaldson, seconded by Mr. Godwin, it was then unanimously resolved, that a testimonial be presented to C. C. Nelson, esq., as a grateful expression of the high appreciation entertained generally of his very valuable services, the time and constant attention that he has bestowed upon the responsible duties of his office, and of the honourable and courteous manner in which he has, with his colleagues, conducted for ten years the affairs of the Institute. It was further resolved, that each subscription should not exceed one guinea. A committee was appointed to carry out the objects of the meeting, and since then about sixty guineas, we believe, have been subscribed.

#### PROVINCIAL NEWS.

*Romford*.—The various improvements in drainage, &c., so long required, are now, says the *Cheshamford Chronicle*, to be proceeded with by the Local Board of Health; and, to enable them to do so, they intend borrowing between 6,000*l*. and 7,000*l*.

*Maldon*.—The new public hall here has been opened. A public hall, mechanics' institution, and private dwelling-house are embraced in the undertaking. The edifice has been raised for the Maldon Public Hall Company by Messrs. Spurgeon & Sons, of Maldon, from the designs and under the superintendance of the company's architect, Mr. T. Roger Smith, of London. The new building occupies a site on the north side of the High-street, near the Town-hall: it is of brick, has a frontage of 43 feet 6 inches, and the total depth from the front wall to the back is 115 feet. Each side of the hall has five windows. The dimensions of the hall are 36 feet wide, 66 feet 9 inches long, and 32 feet 6 inches high. It will seat upwards of 400 persons, independent of the accommodation on the platform.

*Clifton*.—Another project has been broached for completing the suspension-bridge across the Avon, which will unite the two counties of Somerset and Gloucester. The matter, it is said, has been taken up with spirit. This structure was commenced, as many of our professional readers may remember, by the late Mr. Brunel more than twenty years ago, and upon it upwards of 40,000*l*. were expended up to 1843. The roadway of the proposed bridge is 550 feet in length, and 220 feet above high-water mark.

**Liverpool.**—The local papers give an account of new business premises named Compton House, which have been enlarged so as to extend over a site of about 3,222 square yards in Church-street, Leigh-street, and Bassett-street. The new buildings have been erected from a design by Messrs Haigh & Co., builders. Mr. Dempster was the stonemason; Messrs. Smith & Son were the bricklayers, Messrs. Lingard and Merrick the painters, and Messrs. Goodall & Son the plasterers and decorators. The style adopted is a free adaptation of the Italian, and comprises a frontage of 55 feet, which is carried up five stories, or 60 feet above the level of the street line, the whole being executed with stone from the Grinshill quarries in Shropshire.

**Gloucestershire.**—There is going to be a lighthouse erected on the Ilanors, says a local correspondent. There are some dangerous rocks on our south-west coast. The stones are brought on the E. in the town. The Trinity Board has the management.

#### CHURCH-BUILDING NEWS.

**Threekingham.**—A restoration of the church here has been effected under the direction of Mr. E. Browning, of Stamford, architect. The freestone of the nave, pillars, and arches has been cleaned, and the windows of the south aisle have been restored. The porch has been restored, with a new open-timbered roof. The ancient bench ends of the church have been reproduced in English oak. The floor of the church is of encaustic tiles. The recumbent figures of "Lambert de Trekingham" and his wife have been partially restored, and set on a plinth of plain stone. The outlay on these and other restorations up to the present time, has not exceeded 500*l*. Much, however, remains to be done to the bell frames and the tower and spire.

**Braintree and Bocking.**—The chancel of the church has now been restored by the trustees of the Felsted Charities. The sum of 240*l*. was at first voted for the work, but the roof was found in so dilapidated a state that it had to be entirely removed, a great portion of the cast wall pulled down, and the whole of the east Perpendicular window taken out. Under the superintendence of Mr. Chancellor, of Chelmsford, a new oak roof has been put upon moulded trusses, supported on oak corbels, with purlins and braces,—the whole having been worked out of English oak. A five-light Geometrical tracery window has been put in. The walls have been scraped down and restored, in the course of which some curious old mural stencillings were discovered. The whole of the works in the chancel have been carried out by Messrs. Parmenter & Son, of Bocking, at a cost of about 400*l*.

**Newport (Essex).**—The church of Newport, the tower of which was entirely rebuilt about two years ago, has now been renovated. The south porch was restored at the sole expense of W. C. Smith, esq., at a cost of 220*l*. The new works also included the insertion of a south window and doorway and windows at the sides,—all of Caen stone. Mr. Smith was likewise at the expense of re-flooring the church with deal where the seats are usually placed, and the laying down a pavement of red and black in the aisles—repairing all the interior stonework of the pillars and arches at a cost of 139*l*. All the old deal pews have been cleared away, and forty-six new open oak benches placed in the transepts and aisles, at an expense of 106*l*., also paid by Mr. Smith. The central area of the church is occupied by 150 chairs, free to all. In the chancel, the old pews have been removed and stalls of carved oak, with poppy heads, substituted,—six on each side. The Early English octagonal font of Barnack stone has been restored at the expense of Mr. Brown, of Lynn, the contractor for the works, and placed, according to the original plan, on six black marble columns. A decorated window has been inserted in the south aisle, the gift of Mr. Shirley, one of the churchwardens, and Mr. David Skipper, of Newport. A new roof has been put on the north aisle, at the expense of the Rev. J. Chapman, vicar of Newport, and Mrs. Chapman; and since the rebuilding of the tower the parishioners have entirely roofed the nave of the church with oak (a *fac-simile* of the old roof), and rebuilt the clerestory walls, inserting eight new stone windows of three lights each, with cusped heads,—the work, including the Westmoreland slates for the roof, costing 657*l*. 10*s*. A new stone pulpit, supported on marble shafts, from a design by Messrs. Jekyll, of Norwich, architects, has been given by W. C. Smith, esq., at a cost of 45*l*.

**Chelmsford.**—The small memorial chapel at the New Church Cemetery is now completed. The

design was by Mr. Chancellor, of Chelmsford. The chapel, which stands at the head of the long walk leading to the main part of the cemetery, is in the Early Decorated style of the Geometrical period, and is built of Kentish rag with Bath stone dressings. A gabled bell-turret, surmounted by stone foliated cross, rises over the centre of the doorway at the southern end, and contains a bell, 21 inches in diameter, by Messrs. Warner & Son. The interior is only 30 feet by 17 feet, the height 26 feet. The contract of Mr. Hardy, the mason, was 650*l*.; and the total expenditure has been little less than 800*l*. Over the door is a stained-glass window, with three quatre-foils. At the northern end is a three-light Decorated window, with shafts, foliated caps, and laces, filled with stained glass, representing the Resurrection, executed by Clayton & Bell. The inscription is "In memory of Haratia Louisa Glyn." The chapel has been reared at the cost of the her sisters, and the father of the deceased, assisted by her sisters.

**Kettering.**—A contract has been entered into with Messrs. Lewis and Hibbert, of Manchester, for a lightning conductor; and with Messrs. Taylor, of Loughborough, to re-cast the third bell.

**Over (Cambridgeshire).**—The foundation-stone of the new church at Over, which is to be erected almost entirely at the cost of Lord Delamere, as a memorial to the late Lady Delamere, was laid on Friday, the 23rd of March. The church will be of Geometrical Gothic design, and will consist of nave, chancel, north and south aisles, with chantry and vestry on the north side of the chancel, and a tower and spire, 140 feet high, at the south-west angle. Accommodation will be provided for 500, most part free. The total cost of the church, everything complete, is estimated at from 5,000*l*. to 6,000*l*.

**Milton.**—A new stained-glass window has been lately placed in the south side of the chancel in the parish church. The artists were Messrs. Hardman & Co., of Birmingham. The subject is the "Marriage in Cana of Galilee." The window was presented to the church as a marriage offering by a nephew of the rector's, and after the latter had been officiating at the wedding.

**Saundridge (Kent).**—A new church, parsonage, and schools are about to be erected at High Wyke, an outlying hamlet in this parish. A site has been presented, and the designs have been prepared by Mr. G. E. Pritchett, architect.

**Wolverhampton.**—The erection of Blakenall church is now about to be proceeded with, the necessary sum having been raised within about 200*l*. It will make the ninth church in the town of Wolverhampton.

**Liverpool.**—The foundation-stone of a Reformed Presbyterian Church (the first of the denomination in Liverpool) has been laid in Shaw-street, on a site of land opposite the Collegiate Institution. The site is 39 feet wide by about 120 feet deep, the whole of which area is covered by the church and vestries at the back; and, being close up to lofty houses on the south side, with the prospect of having similar houses, ere long, on the north side, the church, with the exception of large windows in the east and west gables, will be lighted entirely by a range of windows on each side of the roof. All of the edifice that will be exhibited to the street is simply the end elevation or gable, flanked by octagon piers, terminating in crocketed pinnacles, and pierced in the centre with a six-light window. The whole of the front will be executed in Minera stone, the quoins, mouldings, and other dressings to be polished, the walling to be in thin courses, pitched on the face. The interior of the church will be one apartment, 73 feet long by 35 feet wide, divided into seven bays, with arched principals of laminated timber, resting on stone corbels. Accommodation will be provided for 600, and the cost of the building is contracted for at 2,200*l*., by Mr. Morris, mason and joiner; Mr. Thomas Jones, slater and plasterer; and Mr. Thomas Holt, plumber, painter, and glazier. The Messrs. Hay are the architects of the structure.

**Eccles.**—On the 6th inst. the new Congregational chapel at Eccles, near Manchester (Messrs. Poulton and Woodman, architects), of which we gave views and a description on 17th December last, was opened for divine service. The side windows are to be filled with ornamental glass, of a delicate green tint, having a running pattern, in oak and ivy leaves alternately, and surrounded with stained crocketed borders. The principal window will be of stained glass, of geometrical design, with labels and shields at intervals, on which passages of Scripture are emblazoned. In each gable is also a small window, coloured. The windows have been designed and executed, under

the direction of the architects, by Messrs. Edmundson and Son, of Manchester. Both the exterior and interior of the church are heightened in effect by the introduction of a considerable amount of carving.

**Manchester.**—The work of restoring and renovating the cathedral and old parish church of Manchester, says the local *Courier*, proceeds satisfactorily. The improvements have been effected chiefly in the body of the church, or the parish portion, as distinct from the choir or chancel, over which the churchwardens have no authority. The chief improvement, in regard to comfort and use, consists in re-seating the whole of the church with oak benches, in place of the ugly and inconvenient pews. The new seats are all open and free, having carved bench-ends. The next great improvement is the removal of the unsightly western gallery, which extended the whole width of the church. This clearance has opened to view the three western windows, and in the time, when the organ is removed, the great archway and entrance will be also opened. Temperature and ventilation have received the attention of the churchwardens, and great improvements have been effected. The lighting has also been amended by the erection of gas standards, with brass branches and foliage, the burners being in triplets of three on each of three branches. In addition to the removal of window-obstructing galleries, the lighting of the cathedral by day has been considerably aided by a thorough cleaning of the pillars and wall surfaces, which had become very dingy. The pillars of the nave have had their thick disfiguring coats of whitewash removed, and are coloured in distemper; while the pillars of the side aisles have had stripped off about 2 inches of plaster. The pillars appear to be many feet higher since the large disfiguring pews were removed. The dangerous lath-and-plaster ceilings received early attention, a warning having been given some time since by the fall of several cwt. of sham plaster ornament during divine service. About fifteen tons' weight of this unsafe ceiling have been removed from its position over the people's heads, where it was suspended only by old wood and rotten nails. The oak beams of the roof, moulded into form, look well, and are safe, the mouldings, bosses, and varnishing adding to the effect. The roof lights in the side chapels, or aisles, have been improved and filled with rough plate glass, ground on the inside, admitting abundance of light. The whole of the roofing has been newly lathed, and new planking placed underneath. All the carving throughout the church, whether in stone or wood, has been done by Mr. J. H. Banks, of Hulme. The pulpit, reading-desks, and choristers' seats, were made by Messrs. Hulme & Heron, of Cheetham-hill. The open seats were mostly placed by Mr. J. Marsden, of Bolton. Mr. Winder executed the plumbing; and Mr. Walker the heating apparatus. The coloured tiles, in geometrical patterns, with which the floors are laid, were made by Messrs. Maw & Co., and have been laid by Mr. T. W. Graham, who was also the contractor for the whole of the masonry. To his care the general superintendence of the whole work, under Mr. J. P. Holden, the architect, has been committed. Other alterations for the better might be mentioned, both inside and outside.

**Bradford.**—The committee appointed to make arrangements for the rebuilding of the chapel and schools for Little Horton-lane, says the *Bradford Observer*, some little time ago issued invitations for plans to architects in different parts of the country. Thirteen designs were submitted in response to this invitation, and the unanimous decision of the committee was in favour of those marked "Experientia docet," which proved to be the designs of Messrs. Lockwood and Mawson, of this town, architects. The second premium was awarded to Messrs. Poulton and Woodman, of Reading. The new chapel will be capable of accommodating upwards of 1,500 people, with school-room for 300 scholars, and class-rooms immediately adjoining.

**Newcastle.**—Newcastle, says the *Gateshead Observer*, is about to add to the number of her churches. The congregation at whose head is the Rev. J. H. Rutherford, now occupying on Sundays the lecture-room in Nelson-street, was, on Wednesday, the 4th of April, to proceed to the erection of a church (with schools), in the Bath-lane, where a suitable site has been obtained. The foundation-stone was to be laid by Sir Samuel Morton Peto, bart., M.P. The style selected is Gothic. Number of sittings, 1,200. There will be a tower and spire about 130 feet high, and a large west window of elaborate design. The architects are Messrs. Oliver & Lamb; and Messrs. Scott & Reed, the

builders, will, it is expected, have the church completed before the close of the year.

**Channel Islands.**—A chapel in the Channel Isles (Alderney), belonging to the Wesleyans, is suffering from that dangerous malady, "dry-rot," and if accounts be true, it will have to be in part rebuilt. The Guernsey Methodist New Connection Chapel is in progress. We spoke of it some time back as being laid by the Rev. W. Cooke, of London, editor of the *Methodist New Connection Magazine*.

#### HARTLEY INSTITUTION COMPETITION.

THE council, after a careful consideration of Professor Donaldson's report and examination of the plans, suggested to the town-council that the plan, No. 19, with the motto, "Comme ça," was the one most deserving of selection by the town-council, subject to such necessary modifications (if any) as might be requisite to bring the cost within the amount limited by the scheme.

At a meeting of the council of the borough held on the 11th inst., it was resolved that the report of the council of the Hartley Institution be received and adopted.

The sealed envelope having been opened, the authors of the design "Comme ça" were found to be Messrs. Green & De Ville, of Great Ormond-street, London.

#### HER MAJESTY'S THEATRE.

THERE is a peculiar talent required for theatrical management which shall endure, otherwise, it is said, and Mr. E. T. Smith has certainly shown possession of a considerable share of it. He is a more arduous task before him at Her Majesty's Theatre than he has yet essayed, but he has begun very well, and we may augur for him success. London has become so rich and so large, that it is brought by railway so near to all England, that we see no reason why both opera houses should flourish.

Considerable improvements have been made in the approaches, staircase, and lobbies, of Her Majesty's Theatre; carpets, mirrors, and plants, adding their aid to impart an aspect of comfort and carefulness. Within, the stalls have taken the shape of chairs with great advantage, and the whole has been cleaned and brightened. Madame Borght's first appearance, in *La Favorita*, was a complete success; and Signor Everardi, up to this time little heard of in England, made a decidedly good impression. Many would have been glad to find him in the *Travatore*. Little has yet been done in the way of scenic effect, but preparations are making to produce *Oberon* with great splendour and completeness.

#### Books Received.

*Practical Treatise on the Turbine, or Horizontal Water-wheel; with seven plates.* Specially designed for the use of Operative Mechanics. By WILLIAM CULLEN, Millwright and Engineer. London: E. F. Spon, and John Weale.

It was told of the first Napoleon, that observing the perpetual annoyance and trouble his soldiers suffered in the hand-grinding of corn, and knowing that scarcely any district they might pass was totally devoid of streams of water, however small, he ordered one of his engineer officers, named Fournreyron, forthwith to invent some easy means of making use of such streams as they might meet with for the purpose of grinding the soldiers' corn. M. Fournreyron accordingly waited on his superiors chief next morning with the plans and other drawings of a small water-wheel, to be laid horizontally in the path of the stream, which was to be conducted through the axis or centre, and to pass off by the circumference, turning the wheel, and attached machinery of simple construction, by its force thus made centrifugally operative. The invention was found to fulfil its purpose admirably; and this was the origin of the turbine.

The anecdote is well known, and we ourselves recurred to it on a previous occasion.

Mr. Cullen, of Armagh, in the little treatise under notice, gives an intelligent account of the various forms which the turbine has assumed, together with modifications of it adopted by himself in his own practice. He went to France, and was allowed to examine various turbines either at work or in model; but the *raison* with which he explains of M. Fournreyron's unwillingness to be understood by a rival manufacturer of his trade seems rather amusing. Mr. Cullen appears to think it rather laudable than otherwise to circumvent a Frenchman in such a case. M. Fournreyron

(the inventor of the turbine) had told him "that it was the practical determination of the curves, derived from experience alone" (italics, Mr. Cullen's), which led him to the solution of the question? yet," adds Mr. Cullen, "he has taken good care to reserve to himself the plan for forming those curves." Mr. Cullen accordingly "found it impossible to effect any satisfactory arrangements with him." Being determined, however, he continues, "that my journey should not, if possible, prove abortive, I ascertained the address of his model-maker, Monsieur Clair, and visited his establishment, where I had an opportunity [Mr. Cullen having, apparently, kept "the object of his inquiries or the purport of his mission" to himself] of inspecting a model turbine on Monsieur Fontain's principle of construction, and was informed that this model was made to represent that of a large wheel now driving a saw-mill at St. Maur. I subsequently visited the foundry of Messieurs. Pihet & Co." he adds, "where Fournreyron had his wheels manufactured; but information was there scrupulously [and very properly, we think] withheld; and it was stated to us that the important portion of the constructive drawings could not be seen without the special leave of the inventor." Mr. Cullen, in short, found, as he tells us, that, notwithstanding "that easy and polite style so peculiar to a Frenchman," he "had to encounter that annoyance which is inseparable from the refusal of a favour," as the Frenchmen were "inclined to procrastinate, and require, particularly from a stranger [such as Mr. Cullen of Armagh], the favour of a second call," that they might in the interim ascertain, if possible [cunning dogs that they were!], the object of his inquiries, or the purport of his mission."

An inquisitive spirit such as that of Mr. Cullen, however, was not to be foiled in its object and mission, and he returned to the charge by a second visit to France, and accordingly has reaped a pretty good harvest of practical details, which he has turned to good account in the present volume, reserving, doubtless, some little touches of experience to his own business advantage as a millwright and engineer, by taking a leaf out of the French book which he has so diligently perused.

Notwithstanding the uncommunicative politeness of M. Fournreyron, his model-maker, and his manufacturer, Mr. Cullen has managed to give an account "of the manner in which M. Fournreyron's curves may be constructed," and even presents drawings of these and of various other turbines which other French inventors, not so suspicious, explained, "with marked courtesy," to the author; and on the whole he has produced a very instructive and practical little work on that most useful invention the turbine, a piece of ingenious mechanism which ought to be better known and more in use than it as yet appears to be; for it possesses various advantages over the more usual perpendicular wheel, such as the simplification of mill machinery attached to it, and the comparative smallness of the wheel itself, the economy of water-power, and its use in cases where no other known wheel could be worked, at least to such advantage.

#### Miscellanea.

**TOWN IMPROVEMENTS AT LIVERPOOL.**—The Improvement committee have submitted to the town council a recommendation to carry out an extensive scheme of town improvements at an estimated cost of 300,000*l.* The plan comprises the widening of many old streets, and the construction of new ones, and embraces the improvement of the approaches to the landing stages. The committee recommended that application be made to Parliament for power to borrow 300,000*l.*, the interest upon which would, it was estimated, be met by a borough rate of 3*l.* in the pound. It was stated that, if the scheme was postponed for ten years, the cost would be ten times the amount. The consideration of the subject was adjourned until the report of the special committee, appointed to consider the plans for the proposed public offices,—which, exclusive of land, are to cost 100,000*l.*,—should have been submitted and approved by the council.

**MASONS' STRIKE IN CORK.**—Undeterred by the sad lessons taught by the late strike in London, the masons of Cork are preparing to "turn out" for an increase of wages. A local paper says:—"The masons of Cork—a trade that more nearly approaches the class of unskilled labourers than any other—receive at present 2*s.* a-week. Not satisfied with the amount, they have given notice of an intended strike for 3*s.* a-week additional."

**THE ENGINES OF ELY WATERWORKS.**—Mr. Latham having denied my statement on the duty of the engines in to-day's *Builder*, I will now give the authority from which I made the statement. For the duty of the old engine, I took the average of a whole year's working, from Lady-day, 1856, to Lady-day, 1857, from the accounts laid before the Board and the public, and passed by the auditor, and the average of that year is under 4*l.* 5*s.* per million gallons. For the duty of the new engine, I took the average from the accounts for coal, oil, &c., laid before the Board for the last four months, and I find that 7*l.* is under the average for that time. The last year's accounts will be laid before the public in the course of a few weeks, when the ratepayers can make the calculation for themselves.—DAN.

**THE RESTORATION OF ST. ALBAN'S ABBEY CHURCH.**—A public meeting of the subscribers to the Abbey Restoration Fund, convened by the Earl of Verulam, the lord lieutenant, has been held at the Shire Hall, St. Alban's, to consider the steps to be taken with reference to the appropriation of the funds some time since subscribed, and a portion of which were contributed conditionally on St. Alban's being created an episcopal see. The following resolutions were agreed to:—"That there being no immediate prospect of obtaining for St. Alban's Abbey the dignity of a cathedral, a circular be sent to the subscribers of 1856, inviting them to allow a part or the whole of their subscriptions to be applied to the repairs and restoration which are now reported to be essential to the sustentation of the building;" and "That the money which has been contributed, and shall not be withdrawn, be at once expended under the direction of Mr. Scott, in necessary repairs, always keeping in view the prospect of the Abbey becoming a cathedral."

**FALL OF A PLATFORM AT WORTHING.**—While about 200 children were seated on a platform erected at the Davison School, the whole gave way and fell to the ground. The erection, which covered an area of about 25 feet in length by 14 feet wide, was formed by placing at intervals six pieces of deal board about 16 feet long, 4 inches wide, by 1 inch thick in a sloping direction, the top end pitting against the wall 8 feet 6 inches from the floor, and extending at the bottom point about 14 feet from the wall into the room: on to these six pieces of board were fixed upright and transverse pieces or strips of deal to lay the seats and foot-boards upon: these seats, of which there appeared to be about eight or ten, were about 25 feet long. Most fortunately, the entire injury was confined to a few scratches and bruises. It would seem that the gallery was overloaded, or, in other words, the main timbers were of insufficient size. They had greatly deflected before finally breaking, and appeared to have splintered into layers, like coach-springs. The erection first gave way in the centre, where the mass converged, the two extreme strings remaining unmoved, although not a single seat remained not thrown down.

**GAS.**—Ninety-two towns in England have adopted the Sales of Gas Act.—At the last half-yearly meeting of the Lincoln Gas Company a dividend at the rate of 10 per cent., "with a bonus of 5 per cent. in addition," was declared.—The Dewsbury Gas Company have just paid a dividend of 10 per cent., and a surplus of between 500*l.* and 600*l.* was carried over at the annual meeting of shareholders.—At a meeting of the Oldham Beersellers' Association, it has been unanimously agreed that no candidate be supported at municipal elections who will not pledge himself to adopt every legal means to effect a reduction of the price of gas to 3*s.* 9*d.* per thousand feet to small consumers.

**TYE AND ANDREW'S PATENT SINK TRAP.**—Messrs. Tye & Andrews have adopted the dip trap to sinks, with the advantage of carrying the waste water off with a good flush. According to their own description, "the traps are made of iron galvanized, and the mode of fixing is most simple, the joint having been made connecting the waste-pipe and trap, the lined and flanged grate is removed when the trap is passed through the hole of sink from the underside, when the lined grate is replaced, and by turning ditto slightly round, the clips of grate grip the flange of trap, and being lowered, the brass flange takes a bearing in rebate of sink, when it is either soldered or cemented round in the usual way." If it be intended, as we infer, that the grate should be soldered in, there would be the risk of the trap "sitting up." The grate might be left loose with less risk than with the ordinary bell trap, and is in other respects far superior to it.

**WORKMEN'S INSTITUTE AND BENEFIT CLUB.**—On the 11th inst. Sir F. H. Goldsmid, Bart., M.P. for Reading, delivered a lecture on "The Health of Towns," to the members of the institution, established in the Euston-road, to provide, as we have before said, for workmen of all classes a reading-room, library, house-of-call, and benefit club, enabling them to make provision for sickness and old age. Mr. Jervoise Smith occupied the chair. The lecturer was listened to with much attention, and touched upon the various subjects of food, drink, dress, cleanliness, pure air, and wholesome recreation; and under each of these heads made suggestions for promoting the public health. The lecturer concluded by observing that, according to Dr. Gny, monarchs, noblemen, the gentry, and professional men, had a slight advantage as regarded length of life over workmen in towns, but they were decidedly less long-lived than agricultural labourers. As a general rule, however, death entered the palace first, the castle or mansion next, and last of all, the humble cottage, if it were only blown upon by pure air; because health was improved, not by wealth and luxury, but rather by moderate toil of body and mind.

**PHOTOGRAPHIC ETCHING AND MULTIPLICATION OF DESIGNS, PLANS, &c.**—An ingenious and simple mode of preparing and printing copies of plans, &c., has been invented by Mr. William Stridwick, of Bolton-terrace, Newington, according to a printed description now before us in the form of a tract, titled "The Art of Photographic Etching." Essentially the process consists of etching or drawing on the opacified surface of a glass plate, and printing from that upon sensitive or photographic paper, whereby the light of the sun or course blackens the lines traced through the opaque coating, the copies being developed and fixed in the usual way. By this means, as the inventor remarks, architects and surveyors may copy their plans *ad infinitum*, by simply making an original drawing on the plate. We may here suggest, too, that the same process might do very well for the multiplication of circular and other graph letters, or other literary matter.

**THE WESTMINSTER CLOCK TOWER A MONSTER GIGANTAR.**—Very odd suggestions are occasionally made by our correspondents. "A Nobody" suggests that, as the construction of a bell fitting for such a clock as that at Westminster Palace appears to be an insurmountable difficulty (which is a mistake, to begin with), "an excellent substitute for a bell might be constructed in the clock-tower by stretching from its summit to its base metallic cables (such as those patented by the company in the Strand), upon the principle of the strings of the pianoforte [much more *forte* than *piano*, we suspect], and having them struck by a broad-faced hammer. The present striking power of the clock being sufficient to attain the desired effect, there would in such a case be no superincumbent top weight, no oscillation, and very little expense in construction." The latter part of this quotation seems to imply the idea that the tower is not strong enough for "the superincumbent top weight" and the oscillation, which no one avers; but is the writer aware that the force operative even on an ordinary pianoforte, by the tightening of its strings, is equivalent in itself to many tons weight? Our correspondent's suggestion, however, reminds us of a remark of our own in reference to Big Ben the second,—that its tone very much resembled the boom of American or Slick clocks provided with a volute of brass rod instead of a bell,—and this suggests the question whether such rods, made on the great scale, might be not unsuitable for town clocks in place of bells. No strain whatever, nor even oscillation, would here tend to pull down a tower or break its beams.

**COMPETITION DESIGNS FOR HOUSES OF PARLIAMENT, SYDNEY.**—With reference to the advertisement on this subject that has appeared in our pages on several occasions, we may mention that the general conditions and contour plan may be seen at our office by any who have not succeeded in obtaining a copy for themselves.

**MONUMENT IN STANBROPE CHURCH, DURHAM.**—Within the last few days a monument in memory of her grace the late Duchess of Cleveland has been erected by Mr. Physick, sculptor, of London. It is of Carrara marble, and consists of a recumbent figure of the deceased reclining upon a Gothic altar-tomb, while behind, in basso-relievo, is an angel conducting the departing spirit to the realms of bliss. The whole is surmounted with a Gothic canopy.

**FIXING CRAYON DRAWINGS.**—Mr. G. B. Moore, who advertises the discovery of a method of fixing crayon drawings, so that they may be kept in a folio, has sent us a specimen, wherein certainly the object aimed at is achieved.

**NOTHING NEW UNDER THE SUN.**—In our Miscellaneous, recently, a correspondent gives an interesting account of the early dawn of an Enfield rifle. Another well-known modern destructive agent was foreshadowed nearly a century ago, as may be seen in the Annual Register, A.D. 1768 (p. 103):—"They write from Paris, that a curious fowling-piece of a new invention, weighing only seven pounds, has been presented to the king at Choisy. The piece discharges itself twenty-four times in two minutes, only by laying hold of the barrel after the first shot, and then permitting it to make a semi-circle from left to right, and then right to left: by this operation it re-loads and is ready again." Surely, with a steel spring and an enlightened public, we might have had Colt's revolver long ago.—J. CUNDY.

**HOW TO PLEASE A COUNTRY SQUIRE ENSCONCED IN A HIGH PEW.**—In a church in Gloucester, which has been lately refitted, and where the squire objected to the reduction of his high pew, as he wished to see all the sittings of equal height externally, in order that he might be screened by his accustomed height of breastwork, he allowed the floor within his space to be lowered, and was satisfied with a descent of a step or two towards mother earth! Is this an emblem of his humility?

**LIGHTNING RODS.**—The conductor or lightning-rod was long since known and employed by the wild peasantry of Lombardy. According to the writer of "Recreative Science," the Abbé Berthollet, in his work on electricity, describes a practice used on one of the bastions of the Castle of Duino, on the shores of the Adriatic, which has existed from time immemorial, and which is literally neither more nor less than the process which enabled Franklin to bring lightning down from the clouds. An iron staff, it seems, was erected on the bastion of the castle during the summer, and it was part of the duty of the sentinel, whenever a storm threatened, to raise an iron-pointed halbert towards this staff. If, on the approach of the halbert, sparks were emitted, the sentinel was made sure that a storm indeed, and he tolled a bell, which sent forth the tidings to the surrounding country.

**CHINESE NAVIES.**—An astute contractor has for some time past, says a contemporary, employed Chinese navvies upon the railway works in North Wales, and professes himself perfectly satisfied with the experiment. Did he impart them direct himself from China?

**MENDING CRACKED BELLS.**—In your No. 891 you have given an account of a process for mending a cracked bell, as exhibited by Mr. Varly at the Institution of Civil Engineers. Allow me to call attention to the method described in the "Pyrotechnic," by Biringuccio, first published 1510. The sixteenth chapter is upon the subject of soldering cracked bells, wherein he gives instructions to bury the bell, or cover and fill it with earth so much as to leave the broken part exposed, and to be acted upon by the fire of a furnace, and, when at a certain heat, to pour in a sufficiency of the same melted metal, which he says will make a sound job! There are several editions of Biringuccio in the British Museum.

H. T. PELLACOMBE.

**TENDERS**

For erecting a house in Bishopsgate-street, for Messrs. Soames, Son, & Page, Mr. Wilkinson, architect. Quantities supplied by Mr. Merkin:—

Cubitt & Co.	£3,000 0 0
Mansfield & Son	8,850 0 0
Myers	7,662 0 0
Lacey, Brothers	7,730 0 0
Wilson (accepted)	7,597 0 0
Piper & Son	7,554 0 0

\* Unwilling to comply with the conditions of contract.

For residence for Mr. A. Bowman, at Edenbridge, Mr. Horace Jones, architect. Quantities by Mr. Reddall:—

Wheeler	£4,250	240
Carruthers	3,997	140
Thompson	3,967	132
Reston	3,250	99
Lawrence & Sons	3,780	not sent.
Scott	3,497	230
Fritchard & Co.	3,472	200
Cowder	3,477	150
Edwards	3,295	183

For a warehouse in the Belle Sauvage-yard. Messrs. Tress & Chambers, architects:—

Deards	£2,960 0 0
Nixon	2,877 0 0
Wood & Son	2,740 0 0
Macey	2,700 0 0
Lawrence & Son	2,640 0 0
Axford & Co.	2,628 0 0
Gander	2,625 0 0
Brass & Son	2,594 0 0
Brown & Robinson	2,550 0 0
Coleman & Son	2,530 0 0

For five houses in Carter-street, Houndsditch. Messrs. Tress & Chambers, architects:—

East	£2,700 0 0
Fowler	2,614 0 0
Candler	2,613 0 0
Tarrant	2,598 0 0
Elston	2,513 0 0
Dealis	2,450 0 0
Coleman & Son	2,388 0 0

For Cornwall-buildings, Little Sutton-street, Clerkenwell, for Mr. Joseph Ferris:—

Branson	£2,500 0 0
Carter	2,499 0 0
Health	2,289 0 0
Nash	2,198 0 0
Ring & Stanger	1,640 0 0

For the restoration of St. Mary's Church, Ashford, Kent. Mr. Joseph Clarke, F.S.A., (Boscan architect.—

Edwards	£3,370 0 0
Smith	2,195 0 0

For Pinfold Parsonage, Rochdale. Mr. Joseph Clarke, architect:—

Farrell	£2,260	£170
Nield	2,140	250
Stone	2,110	95
Stones	2,035	140
Hughes	1,925	

For alterations to the premises of the Pharmaceutical Society, Bloomsbury-square. Messrs. Lansdown, architects:—

Mansfield	£2,112 0 0
Axford & Co.	1,962 0 0
Patman & Fotheringham	1,962 0 0
Piper & Son	1,930 0 0
Myers	1,800 0 0
Hocken	1,802 0 0
Pollard & Haunch	1,840 0 0
Macey	1,746 0 0
Baterbury	1,719 0 0

For new schools at Orford, near Warrington, Lancashire. Mr. Joseph Clarke, architect:—

Pierpont	£1,955 0 0
Hughes	1,833 0 0
Pennington	1,790 0 0
Stone	1,719 0 0

For new house at Boston-Road, Brentford, for Mr. W. P. Griffith:—

Nicholson	£1,635 7 0
Donnison & Moultrie	1,839 0 0
McCallow	1,790 0 0
Adams & Sons	1,692 0 0
Nye	1,692 0 0
Chamberlain (accepted)	1,697 0 0

For building new aisle and spire to St. Thomas's Church, Golborne, Lancashire. Mr. Joseph Clarke, architect:—

Eaton	£1,873 0 0
Farrell	1,862 0 0
Hughes	1,859 0 0
Farelongh	1,490 0 0
Pennington	1,390 0 0
Stone	1,252 7 3

For new buildings at Writtle Mills, Chelmsford, Essex, for Messrs. Beach. Mr. G. Elkington, architect:—

Wells	£1,793 0 0
Brown	1,630 0 0
Saltmarsh & Beaumont (accepted)	1,520 0 0

For a pair of semi-detached villas at Croydon. Mr. John Berry, architect. Quantities supplied:—

Farrell	£1,736 0 0
Ebbutt	1,730 0 0
King, Burton, & Co.	1,618 0 0
Keley	1,616 0 0
McLennan & Bell	1,568 0 0
Rice	1,572 0 0
Hollidge	1,555 0 0
Clements	1,389 0 0

For alterations and additions to Dunster House, Rochdale. Mr. Joseph Clarke, architect:—

Taylor	£1,360 0 0
Fogget	1,254 0 0
Hughes	1,073 0 0
Farrell	924 0 0

For two houses at Enfield, for Mr. Draper, exclusive of carpenter and joiner's work. Mr. Reddall, architect. Quantities not supplied:—

Fritchard & Son	£1,130 0 0
Stubb	1,038 0 0
Clarke	1,097 0 0
Rieg & Stanger	1,095 0 0
Patman	998 11 0

For fitting up a warehouse in Cannon-street West, for Messrs. Murricks, Slater, & Nephews. Mr. F. G. Widdow, architect. Quantities supplied:—

Browne & Robison	£2,998 0 0
Ashby & Sons	895 0 0
Wm. Lawrence & Sons	882 0 0
Brass	878 0 0
Ashby & Horner*	832 0 0
When	819 0 0
Sargeant	815 0 0

\* Accepted, as they undertook to do the work in a month.

For the restoration of the church of St. Margaret, Topcroft, Norfolk. Messrs. Beust & Newson, architects, Norwich:—

Ling & Balls	£2,530 0 0
Mumford & Jackson	229 10 0
Botwright	59 0 0
J. Brooks	468 0 0
Spinks & Burrell	455 0 0
Gedbolt & Sons (accepted)	399 0 0

And the old lead and materials.

# The Builder.

VOL. XVIII.—No. 899.

The Medal Night at the Institute.

THE members of the Royal Institute of British Architects mustered strongly on Monday evening last, at the house in Conduit-street; and Mr. C. R. Cockerell, R.A., the president, took the chair. In the course of the routine business first transacted, Mr. T. H. Lewis announced, amongst other donations, nine volumes of "Le Pire Antiche D'Ercolano," the gift of Mr. Lockyer.

Professor Donaldson, in proposing a vote of thanks to the donors, referred to this work, which, he said, was not only illustrated with engravings in the first style of art, but contained essays of the deepest interest with regard to the learning of the ancients in architecture, manufactures, and decoration.

Mr. F. C. Penrose (honorary secretary for foreign correspondence) submitted the programme of the forthcoming architectural congress, to be held in Dunkirk, and stated that the presence of any members of the Institute would be most acceptable.

Professor Donaldson reminded the meeting that Dunkirk was now within a few hours of London, and that it contained a beautiful church of the Corinthian order, various statues, and many public monuments of very great interest.

The President after this called upon Mr. Lewis to read the report of the council upon Architectural Examinations, not for the purpose of discussion, but in order that the members present might be afforded an opportunity of considering the subject. This report we have given separately on another page. It will be regarded as a document of serious import. When it had been read,—

Mr. Charles Barry inquired whether it was proposed that a paper of such great importance to the profession as that just submitted should be circulated among the members of the Institute: what, in fact, was the course which the council proposed to adopt with reference to the matter?

The President said that the intention was to send a copy of the report to all the members of the Institute, and afterwards to fix an early day for the discussion.

The President, then addressing Mr. Sydney Smirke, R.A., before handing him the royal medal of the Institute, said,—Mr. Smirke, I have the honour to present you with the gold medal which has been unanimously awarded to you by the Institute, whose recommendation has been accepted by her Majesty, and which has been universally approved by the profession and the public. We consider that you are the inheritor of that remarkable school founded by Sir Robert Smirke,—a school which we so much admire, and which has done so much to improve and elevate the taste for architecture. Professionally we are all aware of the great accession, not only of talent, but of high character and respectability which your brother and yourself have conferred upon our common art. Many of us are old enough to remember how much he laboured to improve the character of the profession which his talents and assiduity did so much to adorn. We delight to think that you are of a race of artists

remarkable for ability, and that you are so closely connected with one whose name is never mentioned among architects without the respect which should attach to it. We consider that you have well sustained the reputation of the name you bear, and that independently of your eminent professional character, you have, by your exertions on behalf of the Architects' Benevolent Society, promoted to assist our brethren in distress, established claims, which it is impossible for us to overlook. These considerations, and others, to which I will not now refer, entitle you to our utmost respect and regard, and it is with the greatest pleasure that I present you with this medal, and, I am sure, all who hear me, join in the expression of a hope, that you may have many years' enjoyment of the reputation which it carries with it.

Mr. Smirke (who on rising was very warmly received) said, if under ordinary circumstances I am not competent to express my feelings, how difficult must it be for me to speak at a moment like this, when I have to give utterance to emotions so strong and contradictory. I cannot but feel proud of the honour which has been conferred upon me, but at the same time my gratification is alloyed by my consciousness of my own insufficiency and by my sense of those deficiencies which make me diffident in accepting so high a distinction. I feel most grateful to the Institute for this sterling proof of its kindness towards me, for I am convinced that there are many members of the profession far more competent and deserving of it than I am. I shall, however, endeavour to banish those doubts, and indulge in the pleasing thought that the Institute has in its wisdom deemed me worthy of this proud distinction. There are many considerations which give peculiar value to this medal. I cannot but feel that I have been a very negligent, cold, and indifferent member of the Institute. My written communications have been few and insignificant, and my personal attendance but too rare. Indeed, as a personal attendant, I may say I have been a confirmed delinquent. I must not, however, intrude upon your attention the personal circumstances which are the real cause of this apparent negligence, nor speak of the pain and suffering which attendance in a hot and crowded room entails upon me. These deficiencies ought, I know, to preclude me from expecting any favour from the Institute; but you have kindly and nobly overlooked these short-comings, and as long as I live I must feel deeply grateful for the generosity which I have experienced from the Institute. And, sir, I am bound to say that if one thing more than another gives value to this medal, it is that it has come to me through your hands. You have spoken in feeling terms of what you were pleased to term the qualifications which entitle me to this distinction; but I myself am persuaded that you have rated me far beyond my deserts. I know full well the kindly dispositions by which you are animated, and I fear that your kindness of heart has on this occasion led you to a departure from that strict and undeviating line of truthfulness which has ever been one of the most distinguishing traits of your character. I am therefore compelled to attribute this exception to the general rule to the partiality of an old friend. We were both pupils of the same master, by whose example you have so much profited, and whose virtues you have touched upon with so much delicacy and truth. We are indeed old friends, and from our earliest acquaintance I have never received anything from you but acts of kindness and friendship. I feel that I cannot say more on this occasion. It is not in the multitude of words that the emotions of the heart invariably find expression. So I shall conclude by thanking the Institute for this crowning act of honour, and by expressing my hope that it may enter in its new home upon a long course of continually increasing prosperity.

### The President's Address.

The President then said he had the honour to announce that the season was approaching when the election of a president was to take place. He would be proud to offer himself for so highly honourable and distinguished a position if he thought that the state of his health and the advanced age at which he had arrived would enable him to discharge its duties with efficiency. But there was a time for all things, and when some of those present remembered (as his friend Mr. Smirke who accompanied him, no doubt did), that fifty-two years ago he had witnessed the rebuilding of the new theatre, they would readily appreciate the motives which induced him to express distrust of his own powers to serve the Institute. Among the qualifications necessary for a president, were good health, vigour, punctuality, and the ability to attend the meetings when required. It would, he thought, be a great misfortune if by any oversight the person to be elected president should neglect or evade the important duties which he owed the Institute. In his own case he would regard it as a great sin, and as the failure of a long professional life extended over nearly sixty years. But for a sense of his own inability to discharge the functions of president with efficiency, it would have afforded him gratification to offer himself again for the office. But before leaving this portion of his subject, he could not refrain from alluding to the obligations which the Institute was under to their late illustrious president, who for twenty-four years had exerted himself so much in their welfare, and in all that tended to the elevation and improvement of their art. He believed he was justified in saying that the leading inducement in the mind of her Majesty to give the gold medal, was to be attributed to the exertions of the late Earl De Grey, who never for a moment neglected the interests of the body, and whose tact and ability, guided by the high breeding which distinguished him, had kept in the back-ground his own singular merit as an artist. He was, indeed, a nobleman among artists, and an artist among noble men; it was under his guidance that the Institute had risen to repute and importance, and had secured for itself a position which would endure for the honour of the country for many years to come. They must not forget that they owed to their late noble president not only the patronage of her Majesty, but also that of the Prince Consort, to whom the artist world owed more than it was perhaps willing to admit. He felt that the more he considered what should be the qualifications of their president, the more he felt himself bound to point to the high breeding and the urbanity of Earl De Grey, whose tact and knowledge of the world so eminently fitted him for the position he occupied. The selection of a future president was attended with many difficulties. If they were to select an architect for the office, they would have to deal with the question of professional rivalry. If they selected a young man in the enjoyment of a large practice, he would have his own affairs to attend to, for they all knew how much private engagements engrossed the time and attention of professional men. There was a further consideration to be borne in mind, and that was the absorption of time incidental to such an office. They were all no doubt aware that the president of another, and what might be termed a rival society, had upon his election given up his profession as a painter, in order that he might devote his whole time to the Royal Academy. He ventured to mention this circumstance, because it was his duty to put such reflections before the Institute, so that its members, when electing a president, might arrive at correct conclusions on the subject. In advertising more particularly to the institution of which they were members, he thought they had reason to rejoice in its establishment. In such an Institute they had the advantage of a guild without its faults—a bond of union without restriction of pedantry or craftmanship. Its object is to raise the standard of the profession, to unite the necessary qualities of mathematics and art in due proportions. What were the means to this end? He regarded the proposition to institute honorary diplomas as most important. But how, he asked, were they to raise education to the level of this examination? Schools of their own were impracticable, from the condition of the Institute and want of Government patronage, as in other countries. Their sphere was, therefore, not to educate, but to direct education, by making use of existing institutions. Their own institution would raise the standard of their common profession. No such society existed in his young days, for the architects of his time were without any bond of union, and had no connection with any public body having corporate weight and authority. Indeed, it was matter of surprise to him how the architects could have dispensed with such a society, for although no record remained of the fact, it was but reasonable to suppose, from the uniformity of practice in the works of the Greek architects, that they had, like the Romans, their *Collegia Fabrorum* long before the great benefits of freemasonry were known in Europe. These advantages the British architect was now enabled to enjoy in a spacious house, which included a library and museum, and which was able to afford accommodation to the several kindred societies connected with architecture. A great deal, as they were aware, had been said about enlarging their sphere of usefulness. They

had heard that night the outline of a scheme of examination recommended by the council, which was calculated to improve the *status* of the profession and increase its value and importance before the public. He regarded the proposed examinations as the means of obtaining degrees, not only in science, but in art also. It had been, he thought, too much the habit to overlook the value of the litter in connection with architecture. They would now be able to indulge in their love of art, and to advance to the knowledge of it by rapid and interesting steps. It was true they had no funds, but they would be supplied by public liberality and spirit. It was a vulgar idea to suppose that wealth was absolutely necessary to command success, for it sometimes occurred that it was but a drug which retarded the development of talent. But after all, to raise the standard of education was the aim which they had in view, in order that this country might take its proper place among the great nations of Europe. The Royal Institute of British Architects was, as they knew, uncrowned. They were in fact orphans; they had no Government assistance to aid them in the encouragement of art and science. The Institute was in fact left to do that which the Government could not do. This ought to be, and he had no doubt was, an honourable incentive to action. But although they had no endowments or no academies or schools, there was a large field in the metropolis from which mental improvement might be derived. There was the London University, the Royal Academy, the South Kensington Museum, the Schools of Design, and other institutions, all intended as auxiliaries in the work of education. This being the case, if they had not the means of their own they might honourably take advantage of those institutions to bear upon their art. If they had no funds of their own they could take advantage of the funds so liberally supplied elsewhere. They knew of a certain institution which was really in want of a sufficient number of candidates for their honours; and the Architects' Institute might be able to offer them suggestions, with great advantage to their utility. At all events, let them, as the *ars regina*, pursue their course with dignity, and not quarrel with any one. If they thought other institutions were in fault let them advise them, and they might possibly accept a hint given in a friendly way. They would invite the co-operation, and not incur the hostility, of any other society, more especially of that particular society which might say to them, "We have three arts to look after—painting, sculpture, and architecture—while you have only one." He would now venture to add a few words on the subject of education in architecture. There was a natural rivalry of science and art in the profession of the architect. It was notorious that from the earliest to the most recent times art and taste had stood professionally before science. Very few architects united the qualities of science and art. Sir Christopher Wren was perhaps the only illustrious example in this country of the union of the artist, properly so called, and the scientific mathematician. He feared they would have great difficulty in getting a supply of those gifted, or as they were sometimes called, "diabolical personages," uniting science and art, and showing how usefully they could be combined in public buildings and monuments. Upon this subject Rondelet said:—"The true cause of the word architecture indicates a science, the object of which is to direct the operations of every sort of building, so as to unite convenience, solidity, and beauty of forms. Architecture is not, therefore, only the art of delineating and profiling the orders, Greek and Roman, and others, as many authors presume, but a vast science, the purpose of which is to obtain the security, the convenience, and the magnificence of nations, and to give them that lustre and prosperity which true civilization implies. Most modern architects are rather decorators than constructors, miming, like the painter and the sculptor, chiefly to please—indulging in capricious but often impracticable designs, induced by their association with the imaginative arts of painting and sculpture, and patronized unduly by governments, attracted by splendour and ostentation rather than by the graver merits of solidity, convenience, and durability." Thus again said Rondelet:—"Would it not be profitable to distinguish equally the three branches of our art,—convenience, solidity, and decoration,—by encouragements of rewards and honours, and consequently, by professors of each separate department, for the culture of the several talents on which the success and merit of a work ultimately depend?" On the other hand, "Drawing," said Q. M. de Quincy, "under

which name we understand, not *simple delineation* only, but the *study of the forms* of the human body, and of nature in general, and which constitute the base of painting and sculpture,—drawing should enter as an essential study into the practice of the architect. Some authors have asserted that *no one can be a good architect* without having been a *good painter* or a *good sculptor*; and if we look into antiquity we shall find many authorities in favour of that association of studies or professions of architecture, painting, and sculpture. In Italy, especially during the finest ages of art, we find the union of these arts in the most celebrated architects. Witness the names of Giotto, Orcagna, Mantegna, Michelangelo, Raffaello, Giulio Romano, Polidoro, Vasari, Tibaldi, Daniel de Volterra, John of Bologna, Domenico, Cortova, Bernini, Algardi, &c. But confining ourselves more particularly to architecture, we find excellent in the sister arts also, Brunelleschi, Alberti, Annibaldi, Sansovino, San Gallo, Bramante, Vignola, &c., whence it results that the finest works in Italy are the fruits of the combined arts of painting and sculpture, and architecture at the same time. France and England furnish abundant instances of the same argument, viz., that these three fine arts are so many dialects of the same language, which expresses the laws and the effects of unity, variety, and harmony of contours and proportions in works of architecture." The French were mindful of this. Always aiming at method in every study, and essentially academic, they had ever produced the best exemplars of academic institution, and in their school of architecture they were no less exemplary. In the establishment of the Royal Academy, the French model was adopted by Sir J. Reynolds and the council. The laws were drawn from their example, and the institution took their general orders and features from the Academy of Paris. Many changes and modifications in the French academy had taken place since that time. By the system adopted in France the student was led through a course which fitted him for the various and the multitudinous claims upon his attention, and his genius would find all the elements which were calculated to bring forward his especial and peculiar faculty, by consulting the professors who could best furnish his peculiar propensity, and he was taught the great and fundamental truth, as Pope says,—

"To one thing only is one genius fit,  
So vast is art, so narrow human wit."

Thus we had the architect engineer, the architect of taste, the architect decorator, the architect surveyor or estimator,—all requiring distinct talents, contributing to the great ends of art and the glory of a country. It was true that genius would supply the elements which made up success without these exact academic studies and courses, and nothing would supply the wants of that genius which was inspired from heaven. To establish and to maintain by this Institute a standard of good taste and judgment in architecture, to lay down and appreciate the right principles and the right epochs of fine art, was the especial duty of this Institute. For this they invited travellers and accomplished men of thought to give some fixity of principles to their noble art, and to save it from the wreck of chance, the caprice of fashion, and the decline of judgment. He did not wish to offer any criticism, but he believed that in the course of time they would become the arbiters of everything that was sound in architecture. To lay down the true principles of art ought to be their mission, and he believed that their Institute would in time achieve it, and thus ultimately become the centre of intelligence for every information, the arbitrium of professional practice, and a court of appeal in professional questions without assuming dictation. Great would be the future estimation of those enterprising and enlightened spirits amongst them who had originated the Institute of British Architecture; great the obligations of the country for the substantial benefits and the glory to their skill and genius, from the humble cottage to the lofty temple. He believed the Institute would increase and flourish, and that in the fulness of time it would do all that was expected of it. Vulgar funds would come in by and by, and they would have legacies and other sources of income to enable them to extend their sphere of usefulness. Let them, therefore, rejoice in this growth of their time, and cultivate their advantage by labour, by union, and by every loyalty of heart and zeal to the advantage of their noble art and science, and the glory of their country. He deemed it to be his duty to offer these observations (which he did very humbly), to the better judgment of those who heard him,

and he should be glad to entertain the subject at a future meeting.

Professor Donaldson said that the address which the president had just delivered embraced a great number of subjects,—the condition of the profession, the course of study, the position to be occupied by the Institute, and the probable effect of the educational scheme, the outline of which they had heard that night. But there was one topic upon which he (Professor Donaldson) would wish to offer a few observations. It had reference to the selection of a president for the ensuing year; and as the subject was one which was foremost in their minds, he thought he would be excused for venturing to allude to it. He thought he could say on behalf of all present, that the excuses which the president had advanced against serving in the ensuing year had not that force which he himself appeared to attach to them. The members of the Institute did not think that the health of their respected president, nor yet the number of his years, could be accepted as a valid excuse for not continuing in office, because the efficient manner in which he had discharged his duties was opposed to any such conclusions. He hoped, therefore, that Professor Cockerell would consent to give them his valuable services during the ensuing year. The president had said that there was a time for all things, but the Institute felt that the time had not arrived for his retirement. The reference which the president had made to the irksomeness incidental to attendance on many meetings, would indicate that he wished to retire; but he hoped that this objection would be removed by the council preparing such a list of vice-presidents to assist the president, that his attendance at the ordinary meetings might not be imperative. It would, he thought, tend materially to the harmony of the profession if the president would reconsider his views upon the subject, so that he might feel called upon to vindicate his position as the most fitting person who could fill the post of president of the Institute. It would be, he was sure, a source of general regret if the president were not to consent to act during the ensuing year.

Mr. Peurose, in calling attention to the models for the Wellington Monument, lent to the Institute by the Government, observed that the finer sepulchral monuments of antiquity were of an architectural character, and he believed it would be found that it was the forgetfulness of architecture by the sculptor which had led to the very undecided and equivocal state of monumental sculpture at present. The Mausoleum at Halicarnassus was an example of a fine combination of architecture and sculpture. The small monumental works of the ancients were very much in the manner of ordinary Gothic head-stones. The architectural monuments of antiquity appeared to have given rise to the attempts of Byzantine and Norman kings to exhibit the union between architecture and sculpture. These Norman and Byzantine forms gave rise to the Gothic tomb, of which the finest samples in this country were to be found in Westminster Abbey. The best examples of Gothic monumental art, however, which had come under his notice were those of Naples. It was not until the schools of the Lombard bogu he felt that sculpture of the highest order was applied to the tombs of Italy. There were groups paying homage; recumbent figures with angels drawing the veil from the features of the recumbent; but there was nothing ponderous to blot out air and light in the building in which the tomb was raised; neither was there any appearance of extravagant action: everything was solemn and in order. These tombs gave rise to the architectural combinations created in Rome and Venice. Mr. Peurose then called attention to drawings of favourable examples of architectural tombs. These included the tombs of Doge Andrea Vendramio and Doge Giovanni Morozzino, at Venice, the work of the Lombardi; that of Adrian the Sixth, by Peruzzi, at Rome; and that of Thousso Vico, at Verona, by San Michele. The action of the sculpture or grouping in these cases was all of a quiet character, and in strict keeping with Nature and the purposes of an ecclesiastical building. It was, he thought, extremely difficult to fix the period at which the practice of block monuments arose. They might have had their origin in a mistaken attempt to follow Michelangelo, but it was not the practice of that great artist to indulge in block studies, and his fine tomb to Julian the Second was a monument which might be described as being of an architectural character. The earlier monuments in Westminster Abbey presented a suitable union of architecture and sculpture, and he remembered having seen in a country church in England two beautiful monuments by Gilhons,

designed so as to combine architecture and sculpture. The great objection to block monuments was that they encumbered a building, whether placed against the walls or on the floor. An architectural monument might be built in the centre of a building, for though the people might not be able to pass through it, the eye could pass through the openings, and thus remove any appearance of heaviness. The models exhibited in the room included those for which the first, second, and third prizes were awarded. The first prize was awarded to Mr. Calder Marshall, and the second to Mr. Woodington. When the designs were first submitted to public view in Westminster Hall it was intended to place the monument under the nave in St. Paul's Cathedral, but it was now proposed to place it in the Consistory Court, the business of which had been removed. The court would, in fact, be converted into a mausoleum; but in order to judge of the effect, a model the size of the original would be erected in the first instance. This duty had been entrusted to Mr. Stevens, who was essentially a sculptor, and Mr. Marshall and Mr. Woodington were engaged to fill the semicircular space with bas-reliefs in marble representing appropriate subjects from Scripture. Mr. Barry, in moving a vote of thanks to Mr. Penrose, for his interesting remarks, said,—It occurred to him that the so-called failure in the Wellington models might perhaps be attributed to the great difficulties imposed upon the competitors, by uniting in one work two dissimilar subjects,—a monument and a tomb. The idea of a tomb was to convey a lesson of mortality, to show that in the grave all men are equal,—while that of a monument was to perpetuate the remembrance of the great deeds of the person who had passed away, in order that those who succeeded him might endeavour to emulate his example, and be, in their turn, national benefactors. The difficulty of embodying these two objects might account for the moderate success which had attended some of our public monuments.

Mr. Penrose said he had prepared a paper upon the Greek marbles which had been exhibited at the last meeting, but that as the hour was so advanced, he would postpone it until a future and more convenient opportunity.

The following gentlemen were on ballot elected fellows of the Institute:—Mr. Wyatt Papworth, Great Marlborough-street; Mr. Charles Hennan, Millan-street, Bedford-row; and Mr. Charles Gray, of Southampton-street, Strand. Mr. John Wilson Walton, of Adam-street, Adelphi, and Durham, was elected an associate.

The proceedings then terminated.

ART-UNION OF LONDON.

On Tuesday morning last the annual general meeting of the Art-Union of London was held in the new Adelphi Theatre. The Right Hon. Lord Montagu, president, having taken the chair,

Mr. George Godwin read the following—

REPORT.

The Art Union of London has now been established for twenty years. Exclusive of the current year's subscription, and of the thousand added by prizeholders, it has raised and distributed the sum of 254,143*l.*, of which 138,622*l.* have been paid to artists, and for the production of statues, bronzes, and other prizes; and 64,822*l.* to engravers and for the supply of impressions to the subscribers. It has sent some hundreds of thousands of engravings over the world,—to the gold-diggers of Australia, the buck-woodmen of Canada, to New Zealand, China, the Indies, Egypt, the United States; in fact, to nearly every corner of the globe where there is an English settlement, as well as to every city, town, and village of the United Kingdom; and it finds itself, on the present occasion, with a subscription of 14,187*l.* Its supporters may, therefore, fairly believe that the principles on which it is carried on, the principles on which it was founded, are sound, and generally approved.

The print of last year, "Life at the Seaside," has been long in the possession of every member. This was a large and costly work; but that its selection and distribution were a judicious step, is proved by the singularly great subscription which followed,—a subscription of more than 3,500*l.* above that of the previous year. The production of so important a work necessarily trenching largely on the funds available for prizes, and the expense of framing it was considerable. For these and other reasons it would be undesirable to give a work of such magnitude and cost very frequently. It has not escaped the notice of the public that complaints have been made by a certain section of artists as to the amount expended on this print, and as to the production of bronze and porcelain statues and other works, to the diminution of the funds available for the purchase of oil paintings, assuming that it was for the promotion of the latter class of art-productions that this society was especially instituted. Into any controversy on this matter the council do not consider it necessary to enter. The very terms of the prospectus, which state that the society "was established to promote the knowledge and love of the fine arts and their general advancement in the British empire," sufficiently indicate the wide field originally proposed for its labours.

It is sometimes forgotten, moreover, by those who would criticize the proceedings of the council, that it has not merely to distribute the funds, but to collect them.

The total sum which has been expended by the Art-Union of London on painting, exclusive of the further large amount added by the prizeholders themselves, is 118,765*l.*, while for bronze and porcelain statues, medals, works in iron, enamels, lithographs, and other productions given as prizes, the sum of 19,897*l.* has been paid.

It may be interesting to state the number of bronze and other statues which have been distributed. The eagerness with which such works are always sought is the best proof that their production meets the full approval of the members.

Bronze statues and busts .....	313
Porcelain and other statues and busts ..	2,553
Tazas and vases in iron .....	230

It may be fairly assumed that the above list would be even much larger, but for the circumstance that in the early years of the Society medals were awarded and the art of casting statues in bronze, were almost unpractised in this country, while statues in Parian were scarcely known.

The Art-Union of London may claim the largest share of the credit of fostering a branch of art-industry, to which there is scarcely a household that is not indebted for one or two reproductions of some beautiful work of an ancient or modern artist.

Subscribers of the current year have mostly received the volume of wood engravings, prepared for them from pictures thirty increased British artists, and an engraving by Mr. F. Hall from the picture by Mr. J. J. Jenkins, called "Come along!"

For the ensuing year every subscriber will receive for each guinea paid, an impression of Mr. Willmore's engraving, after Turner's celebrated picture, "Caldwell's Pilgrimage," described in last year's Report, and which engraving is now at press.

Mr. Abscon's water-colour drawing, "Boulogne," has been reproduced in chromolithography by Mr. Vincent Brookes. All may not know that each colour in a work of this kind requires a separate printing, so that in the production of this picture, for example, twenty stones are used. Framed copies will be distributed to-day.

The council have recently offered a premium of one hundred guineas for a series of designs in outline, or outline slightly shaded, illustrative of Mr. Tennyson's poem "The Lily of the King." The advertisement points out that simplicity of composition and expression, beauty of form, and correct drawing, are the qualities which they are anxious to see exhibited in the designs. The drawings are to be sent in by the 30th of June next, and they will be publicly exhibited.

The selected series of the engraving of the council have fulfilled, will be engraved for distribution. They have further offered a premium of seventy guineas for a group or statuette in plaster, representing some subject from English history, to be subsequently executed in bronze or Parian, and thirty guineas for the work as executed in metal. The various models submitted will also be exhibited with the drawings. They propose hereafter to invite designs for a vase, a tazza, or other similar articles. Competitions fairly and honourably conducted, and adjudicated on by those who have proper knowledge of the subject (for ignorance is often as unjust as chicane), stimulate to exertion some who would otherwise remain inert, and afford opportunities for unskilled talent to develop itself and become known. Amongst those who, in early days, received awards offered by the Art Union for artistic works submitted in competition, the names of Mr. F. B. Pickersgill, R.A.; Mr. W. Calder Marshall, R.A.; Mr. Foley, R.A.; Mr. Noel Paton, R.S.A.; Mr. Henry Selous, Miss Pistrucci, Mr. Lawley, and other well-known artists.

The duties of the council in one year are very similar to those in another, and in the record, therefore, there can scarcely be great variety. Much time is given to the consideration of works of art submitted to them which do not meet their views or wants. During the past year a greater number of such works have been sent to them than usual.

Our medallic series, illustrative of British artists, is increasing, and has come to be regarded as an important and interesting feature; the more so because of the small encouragement otherwise given to the art of metal engraving in this country. The value of such memorials, as your council have long urged, is great. Medals, for example, which were produced by the ancients in commemoration of the completion of noble buildings, with only sufficient representation of striking characteristics to enable identification, have long outlasted the buildings themselves, and give us the only information we possess of the structures. A member of your council, Professor Donaldson, has recently shown, with much credit, taste, and industry, how "the medals and the antique remains explain each other, and enlarge our acquaintance with the manners and customs of the classic periods."

The Lawrence medal has been completed very satisfactorily by Mr. G. G. Adams, and will form part of the works to be now distributed. By the course pursued in the selection of a work by the artist commemorated for the reverse of the medal,—a second worthy to whom the count is indebted, is, in some cases, honoured. Thus the Chantrey medal records Watt; the Bacon medal, now in the hands of Mr. Joseph Wyon, Johnson; and the Lawrence medal, Wellington.

A medal in commemoration of Wilkie, confided to Mr. Leonard Wyon, is being proceeded with. In respect of bronzes, the council have arranged with Mr. Foley, R.A., to make a reduced copy of his fine statue, "Caracacus," executed by him for the corporation of London, and now in the Egyptian Hall at the Mansion House.

The arrangement which gives to every member who has subscribed ten consecutive years without gaining a prize of any sort, the Parian bust of Clytie, or some similar work, will be continued. To form a companion to this, the most exquisite of the antique busts, the council have commissioned Mr. Delpech to reduce the bust of the Apollo Belvedere:—

"—The lord of the merriment bow,  
The god of life, and poetry, and light,—  
The sun in human limbs array'd, and brow  
All radiant from his triumph in the light.  
The shaft hath just been shot,—the arrow bright  
With an immortal's vengeance; in his eye  
And nostril beauty's power, and might  
And majesty, flash their full lightning by,  
Developing in that one glance the Deity."

\* "Architectura Numismatica." Day & Son.

The reduced copy will be reproduced in Parian, and will doubtless be as popular with the members as the Clytie is. The Greek ideal is—

"—Not yet dead,  
But in old marbles ever beautiful."

It remains, after more than 2,000 years, to delight and better the world, and to establish the power of art. Who shall define beauty? All worship it in some shape: all struggle for it. It is a necessity of our nature, evidenced as well in the untutored savage who would carve his bow, but, or decks himself with feathers, as in the man of highest finish, who lines his house with the works of Michelangelo and Raffaele. Honour, then, to those who whether with the pen, the pencil, or the chisel, produce it for hungering seekers, or teach them to find it in nature. By the study of it, some say, as Spencer says,—

"—Lift themselves up higher,  
And learn to love with zealous humble duty,  
The eternal fountain of that heavenly Beauty."

Returning to our proceedings, it has to be stated that vacancies in the council have been caused by the regretted death of Jacob Bell, esq., to whom the country is indebted for a magnificent collection of pictures, and by the retirement of Dr. Mortimer, Aiternan Selousman, and Aiternan Wire. These have been filled by the election of the Dean of St. Paul's, Munckton Milnes, esq., M.P.; J. B. Baring, esq., and Joshua Battersworth, esq.

It must be noted, as usual, that the council continue to appoint local honorary secretaries and agents in all parts of the world, and that to the exertions of those who are connected with the association in that capacity much of its continuing prosperity is due. Recently several of the local honorary secretaries have expressed their annoyance at being solicited to receive subscriptions on behalf of various new schemes set on foot under the name of art-unions, and have suggested that some steps should be taken to put a stop to them. As to the expediency of attempting to effect this the council do not here propose to speak. They would express their regret, however, that the local secretaries should be annoyed by applications arising from the circumstances that, this society having succeeded in establishing relations with gentlemen best calculated to advance the interests of the fine arts in each locality,—every speculator in art matters connected with art has recourse to the list to further his own ends.

The following is a condensed statement of receipts and disbursements, particulars of which will be appended to this report, when printed—

Subscriptions received .....	£14,138 13 6
Printing, advertising, salaries, and other expenses, including reserve of 2 <i>l.</i> per cent.	3,393 16 0
Amount set apart for print and engravings ..	4,489 19 6
Amount allotted for prizes .....	6,255 0 0

The reserve fund now amounts to the sum of 9,337*l.*

The accounts have been audited by two members of the general body of subscribers, Mr. F. Milson and Mr. Barriet, and three members of the Finance Committee.

The following is the allotment of the sum set apart for prizes to be selected by the prizeholders themselves:—

36 works at .....	£10 each.
25 "	25 "
20 "	25 "
20 "	25 "
10 "	30 "
8 "	40 "
6 "	60 "
5 "	75 "
3 "	100 "
1 "	150 "
2 "	200 "

and one Oil Painting selected by the council, "Sardin," by Mr. Johnstone, 12*l.*

To these are added:—  
30 Porcelain Groups of "Venus and Cupid,"  
30 Silver Medals of Lawrence,  
50 Chromolithographs,  
300 Sets of Photographs,  
making in all 1,012 prizes.

Porcelain statues and medals will be allotted to the first fifty names drawn consecutively, at the close of the general distribution. The chromolithographs and photographs will be allotted to the names standing one-hundredth and two-hundredth in the list, preceding and succeeding that of each of the first 200 prizeholders, determined as above stated, with a proviso that a prize has not fallen to that number to-day, in that case the prize will pass to the next succeeding number. The prizeholders entitled to select works of art will be informed of the result by to-night's post. Notice will be sent to the other prizeholders in the course of two or three days.

The prizeholders of last year purchased from the various exhibitions of the season 105 works of art, to the following amounts, viz:—

From the Royal Academy .....	£248 10 0
The Institution of Fine Arts .....	533 0 0
Society of British Artists .....	789 5 0
British Institution .....	243 5 0
Royal Scottish Academy .....	20 0 0
Water-colour Society .....	103 5 0
New Water-colour Society .....	307 18 0

The prizes were exhibited as usual in the galleries in Suffolk-street, with the permission of the Society of British Artists, and were visited by a very large number of persons, without, to make out the list, a nevertheless important observation, the slightest damage or impropriety.

Concerning the photographs of Rome, mentioned in the list of prizes, a few words are necessary. It was stated in the last report that Mr. Lake Price had arranged to supply the Society with photographs of some world-famous pictures in the Vatican, and that he had proceeded to Rome with great facilities for obtaining what was desired. The difficulties in the way, nevertheless, proved too great to be overcome, the Pope refusing to allow the pictures to be taken down. Under the circumstances Mr. Price proposed to supply instead a series of views of the Eternal City, and the members will doubtless think now that the council did right in accepting the proposition. The views may be distinguished as *Pagan Rome*, wherein the ruins of the Temple of Saturn form the most prominent feature; the Temple of Antoninus and Faustina, the Coliseum, the Arch of Titus, and the three columns of the so-called Temple of Jupiter Stator, coming also into the picture; *the Capital*, which is a continuation of the same view, and shows other ancient ruins; and *Rome Christian*, wherein of course St. Peter's,

"The vast and wondrous dome, To which Diana's marvel was a cell," is the principal object.

In previous reports your council, seeking to set forth the various agencies in operation to aid the progress of the fine arts in the United Kingdom, or to open to wider circles the enjoyments afforded by them, have spoken of the increase of the National Gallery, the steps taken by the Government Department of Art at Brompton, and the proposed International Exhibition, wherein the fine arts, it may be expected, will play a prominent part, which is now fixed to take place in 1862. Pursuing the same course, it may be noted that in the Museum at Brompton a collection of British water-colour paintings has been commenced, having in view an historical illustration of this national art. Already are the names of some of its first professors being lost for want of record, and their works dispersed and forgotten, and those who think on the subject will say with Mr. Redgrave that while such efforts are being made and such expense is properly incurred to trace, step by step, the history of the revival of art in Italy, it is surely right to illustrate the labours of our own countrymen who have founded a new art, and to treasure up the incontestable proofs of its origin and progress.

The Architectural Museum, located under the same roof, requires extension, and should take the shape of a National Gallery of Architecture, with proper schools for art workmen and others. Some of our national collections are not well cared for, and are not made use of for progress to the extent they unquestionably should be. The Museum of Armour, in the Tower of London, for example, which should be most useful to artists, is in a condition not creditable to the country. It is without an intelligent direction: palpable forgeries have been purchased, and fine specimens required to make the collection complete, as it should be, are allowed to leave the country.

Your council have again and again urged that our large corporations and governing bodies should enlist the powers of art in the decoration of their buildings, to teach as well as to adorn, and so also assist in developing the powers of artists, who would thus be led to direct their attention to the decoration of the public edifices. The forth important truths and noble feelings, "to set in marble the great deeds of our noble forefathers." The fine fresco recently completed in Lincoln's inn Hall, by Mr. Watts, may be held to be a promise of what would be done if opportunities were taken, and means and inducements offered. The halls of some of our city companies are visited for the works of art they contain placed there centuries ago. In the hall of the Carpenters' Company, for example, will be found some interesting paintings, paintings of the time of Henry IV., and in Barber Surgeons' Hall, one of the best of Holbein's work shows us Henry VIII. and men of his time, in their habits as they lived. In how few cases have the citizens recent days added to the collections left by their predecessors? Around London have recently arisen halls for the transaction of parochial business, the broad bare walls of which offer admirable fields for the display of the painter's art. The expenditure of a few hundreds of pounds in each parish, properly applied, would set up things of beauty, silent teachers, lasting encouragements, and make these now for the most part vulgar rooms, objects of attraction, and it might be, shrines for pilgrims in future years. It would be a profitable and noble course to take. Which parish will have the honour to be first? In the gallery of the wealthy proprietor the pleasure given, or the lesson inculcated by the cabinet picture of the painter-teacher, is confined to a few, while set up broadly on the walls of the public meeting place, his work becomes the enjoyment of thousands, a common delight, a universal good.

Your council witness with gratification a gradual progress towards the fulfilment of wishes and suggestions expressed in earlier reports. Years ago, and often since, when showing the means afforded in France and elsewhere for the artistic education of the masses, and the development of taste, they pointed out the want of public galleries in our provincial towns for the reception of works of art purchased by the governing body of the locality, or presented by individuals of the State. They urged that the provision of such rooms would be greatly beneficial on the style of our painters, and materially influence them in the choice of subjects, and that the collections thus formed would exert an important influence on the population, and play an elevating part in the great work of national education. To remedy in one district the want complained of, a meeting has been initiated by Mr. Thomas Fairbairn, to promote a Free Gallery in Manchester. At a public meeting convened for the purpose, he propounded his scheme, a wide and good one, and called on his fellow citizens to provide 100,000l. to carry it out. He was fortunately not to be influenced by a noble duke who replied to him, when asked to contribute to the art-gathering held there in 1857,—"What on earth do you want with art in Manchester?" "Art and commerce," says Mr. Fairbairn, justly; "have always gone hand in hand. It was two illustrious merchants of Florence who, in the fifteenth century, afforded protection to the polite arts, and gave them a permanent foundation in Italy. In the present day, too, art fails its most liberal patrons among the trading and the manufacturing communities."

Numerous valuable and instructive donations will not be wanting in Manchester, by the erection of a suitable building, show that the earnestly desired to bring intellectual and rational enjoyments within the reach of her population. Let it be our duty," he continues, "to provide theasket, and the reward for the adornment will soon be forthcoming." The speakers at the meeting all admitted that there are subtler agencies acting upon us than we can measure by our chemistry or mathematics, that by surrounding a people with objects of refined beauty and skillful ingenuity they will surely, though it may be very slowly, imbibe something of the elevated spirit in which the true artist has always worked; and that you cannot bring the best cultivated of men into the presence of works of art, into the presence of beauty, without thereby improving them. Nearly 40,000l. have already been promised, and it seems every year, reason to believe that the scheme will be carried out nobly. The other large towns will not be long behind.

Your council, in concluding their report, feel themselves justified by this and other occurrences, in congratulating the members of the Art Union of London on the spread of right feelings in respect of the importance of the fine arts, and of the desirability of opening to all the elevating pleasures they afford.

GEORGE GODWIN, a Honorary Lewis Pocock, Secretaries.

The Chairman said it now became his duty—and he never had an easier one imposed upon him—

to move that the report just read be adopted, because though he had often presided at these anniversaries, he had never before heard a report which was more instructive or interesting. It was a pleasing, an honourable, and a creditable account of their stewardship, which offered the best claim on public sympathy and encouragement, and presented a brilliant prospect for the future. He alluded to the proposition originally made by a right hon. friend then at the Board of Trade, that annually a sum should be retained to enable the society to erect a gallery which should give it a local habitation, as they already had a name, and it was satisfactory to know that that movement was going on. This would enable them to give a better model of architectural beauty than our great city often presented to us. The noble lord congratulated the society on the progress which it had made and was still making, and especially to the fact of his hon. friend, a distinguished man in the literary world, Mr. Monckton Milnes, having joined the council, and also of the accession of the Dean of St. Paul's. Having alluded to the course pursued by the society in reference to many works of art, the gladness with which he heard of the intention to illustrate "The Idyls of the King," and the objections there were to schemes which took the name of the Art Union without being conducted similarly, the noble lord concluded by moving that the report be now received.

The proposition having been carried by acclamation,—

Mr. Monckton Milnes, M.P., said he felt much honoured by the selection which had connected him with this society. He was delighted with the progress made by the society, and he hoped it would continue till they met in their own hall, which he trusted would be raised with skill and taste. He looked upon the Art Union with great interest, because it was raised on the true English basis of self-government, and because it had already contributed more to the cause of art than any government. He forgot at the moment who the old rhetorician was who said that the gambling-table was the high altar of hope. Now, there could be no doubt that was an immoral principle as applied to that case. But on this occasion he might fairly use the expression. He believed those present would engage in the distribution with as little alloy of envy as was compatible with the weakness of human nature. In conclusion, the hon. gentleman moved the thanks of the meeting to the council, and especially to the two honorary secretaries, Messrs. Godwin and Pocock.

The resolution was carried unanimously.

Mr. Godwin returned thanks, and in doing so alluded to the progress made in the arts, during the last thirty-six years especially, and to the different position in which artists were now placed from that in which they formerly stood. In illustration of this fact he adverted to the immensely enlarged prices which works of modern artists had recently commanded, and mentioned especially pictures bought by prizeholders in early years. The deduction from this, of course, was the desirability of a good selection by those who on the present occasion gained the right to select. He concluded by moving the thanks of the Art Union to Benjamin Webster, Esq., who had most ungrudgingly lent the theatre on this occasion; and he begged to include in that acknowledgment Mr. Smith, the stage manager. He further incidentally alluded to the services of Mr. T. S. Watson, the assistant secretary of the society.

Mr. Lewis Pocock seconded the vote of thanks, and briefly expressed his own acknowledgments.

Carried with acclamation.

Mr. Webster rose amidst much applause, and said he was greatly flattered at the compliment which had been paid him. He felt delighted to facilitate such a society, seeing that the very culture of his own profession naturally included the love of painting, sculpture, and the drama; they were the graces of our nature. He should at all times be happy to lend the theatre for the same purpose.

Lord Montagu being obliged to leave,

Professor Donaldson then took the chair. Miss Emily Pringle and Miss Muir having consented to draw the prizes, and Captain Shea and Mr. C. J. Atkinson to act as scrutineers, the distribution commenced.

The following is a list of the principal prizeholders:—

- 200l.—Hopkins, Commodore, Merthyr; Yallop, T., Albert road.
- 150l.—Elphinstone, Mrs., Regent street.
- An Oil Painting of "Sardin," by S. Johnson, 120l.—Parry, W., Old Broad street.
- 100l.—Dunn, Miss E., Thornaby; Fian, J., Ramsey; Wright, C. Barnsley.

- 75l.—Allison, Miss R., Connaught-square; Dutton, —, Nantwich; Holden, Jas., Manchester; Falconnet, L. de P., Constant; Oldry, R., Finch-hale.
- 50l.—Barnes, J., Brompton; Doyle, J., St. Vincent; Everet, J. G., Creek; Harrison, S. J., Braintree; Llewellyn, Mrs., Westbourne-crescent; Robinson, John B., Whitehall-square.

- 40l.—Coates, J. A., Customs; Cross, W., Botesdale; Suffolk; Godley, W., Sloane-street; Hunt, W., Yarmouth; Moore, W. P., Isle of Man; Shand, A., Liverpool; Sealey, H., Stanhope-street; Soule, T., Seymour-street.
- 30l.—Aytoun, J. P., Kirkcaldy; Blandy, J. J., Reading; Byron, J., Westworth; Coles, A., Dover; Cole, Rev. D., Grantham; Church, J., Walworth; DeLafosse, P. J., Cleveland-square; Farthing, —, Chesapeake; Gibbon, Mrs. M., Bishop Auckland; Harrison, J., Belper; Harrison, J., Wandsworth; Hariaud, J., Huster; Heath, R., Brampton; Newnham-on-Line; Hitchen, F. W., Margate; Langley, Robert, Liverpool; McKewen, W., 94, Lombard-street; Newport, J., Waterford; Pasmore, J., Port Elizabeth.

- 25l.—Aston, F., Birmingham; Carling, W., Denmark-hill; Flagdale, Col., Queen-square; Fradley, J., Bank of England; Godfrey, D., Abingdon; Howes, Rev. J., Belton; Hamilton, Col., Kilmarnock; Milne, Geo., Brompton; Morison, W. Y., Hatton-garden; Pamflet, J. R., Driffild; Rees, —, Merthyr; Robson, M. Jun., Sandridge; Rogers, J. C., Blackford; Shakespear, J., Carnarvon; Sewell, G., Upper Thames-street; Toovey, J., Salisbury; Turner, G., Wing; Williams, Russell, J., St. Bees; Wilson, C. T., Chichester; Wiggin, J. K., Boston, United States.

- 20l.—Aylmer, F., Bessborough-street; Baily, H. St. John's-wood; Besant, W., Portsea; Broadwater, R., Bulter-square; Canning, A. P., Bishop's Stortford; Eve, J. B., Louth; Falconer, W., Hackney; Gariand, C., Leeds; Grant, W., Kilmarnock; Gordon, Jas. A., Weymouth; Ker, W. W., Waltham; Lay, T., King's Arms-yard; Lester, M., Clonmel; Martine, Dr., Haddington; Muntings, W. G., Old Change; Perry, Miss, Tyndale-hill; Procter, Wm. Bristol; Riddell, J., Glasgow; Smith, S., R.A., Grosvenor-street; Thorpe, W., Harefield-street; Vasey, D., Huntingdon; Waring, Dr., Gresham-street; Webster, J. G., Boston, U.S.; Westrop, R. F., Montreal; Robinson, R. L., Robinson; Litch; Sheau, John, Halifax; Ness, J., Stead, A., 55, Old Broad-street; Thompson, C., Seignior; Tuke, H., Conservative Club; Wyndar, Major, 583 Regiment.

THE ARCHITECTURAL EXHIBITION.\*

THE BUILDING MATERIALS, AND MANUFACTURES.

THE department comprising specimens of materials and building contrivances, has been referred to in a previous notice of the Exhibition, as somewhat inferior in interest to the similar division of former exhibitions. Not only is the number of specimens much less; but of the number, the greater portion have been seen by us in Conduit-street, before. Two or three of the articles named in the catalogue as amongst the contributions of exhibitors, are not found in the galleries. Several of the exhibitors, however, have substituted for

\* See pp. 228, 231, ante.

their previous specimens, others which are superior both in design and workmanship; and many of the works, we are glad of the opportunity of seeing again.

In the "lobby," or entrance of the North Gallery, Mr. Vincent Bellman has five pedestals in scagliola of his manufacture. One of these, in the form of a candelabrum, includes imitations of porphyry, and of the Siena and verd-antique marbles. The others, in the common form of *frusta* of shafts, represent the Gallio-Antico, Favonozzo, Babbacomb, and verd-antique marbles. Opposite to these are specimens of Martin's cement, exhibited by Mr. J. C. Part, the successor to Messrs. Stevens & Son. A small panel with scroll in relief, and a capital, both from the screen exhibited in 1851, show the cement as used for scagliola, or painted and gilt, and in the original colour,—the scroll, or tracery, white, being in the superfine quality of the cement. There are also shown, a specimen that was "rendered" in the room in which it is exhibited, and painted in "twenty hours" afterwards; one of a surface prepared for papering or painting; one of equal parts cement and sand, for internal work, as representing ashlar; a specimen of "Part's improved cement," recommended where it is not desirable to paint or paper the work immediately it is finished,—the colour a light red; and one of inland work, executed in cement twenty years ago, and which subsequently for five years has been "laid in a floor over a steam boiler." The specimen painted on in the room, it should be understood, is on lathing. The manufacturer's printed particulars, state that "when put upon dry brick-work, or lath," the cement "may be painted on in three or four days afterwards" &c. The discrepancy requires explanation. For inland work, the material is scarcely suited to chimneypieces and exposed situations; the advantages of durability and polish, though great, are not those of marble, or *pietra dura*, or of the glass-protected decorations that are in use. The appearance of all the specimens, however, warrants the reputation which the cement has for compactness and hardness, and even more than that reputation. We merely offer a suggestion to manufacturers generally, to ascertain the special attributes of their material or improvement, and not to claim for it advantages that cannot belong to it,—and which claimed, can only be followed by disappointment that will prove injurious to what may be really a valuable thing. We have now before us a specimen of a marble cement, which has been lying with specimens of marble, since it was furnished to us some years ago; and though difference in the present appearance might have been calculated upon, the cement now, on comparison, does not in the least deserve the name given to it; and we well recollect that when the material was used as a skinning by ordinary workmen, it was impossible to get the marble appearance to it, at all. These items of experience show that manufacturers would do well to revise the wording of their directions, and of their claims,—the latter, where, especially, they speak of saving of labour as well as material, from use of their invention, a saving which might be claimed properly enough were workmen the same or apt at learning.

These specimens are all that we find under the class of "plasters;" but there are a considerable number in other descriptions of plastic material for the building and decoration of walls, and for paving. First, we may mention Messrs. Ransom's "Patent Imperishable Siliceous Stoue," which has been growing steadily in importance, and of which some fresh particulars are submitted in a letter printed in the catalogue, from Mr. George L. Purchase, architect to the patentee. From experiments on 2-inch cubes, Mr. Purchase finds that the material will bear a pressure on such cubes, of 20 to 22 tons, which makes equal to 600 and 750 tons on a square foot, or 10,780lbs. and 13,154lbs. on a square inch. Expressing the strength of the Patent Siliceous stone by 100; the strength of Darley Dale stone is found to be 81; that of Portland stone, 83; of Aubigny stone, 31; of Bath, 13; and of Caen stone, 12; and the resistance to transverse strain is greater than in hard York stone, and Park Spring, as well as the other stones named. With regard to durability, Professor Ansted reports the artificial material as "theoretically and practically superior to all natural grits, being subject to no injurious action from frost, exposure to acid vapours, soot, ammonia, or other impurities present in large towns;" but we are not aware if the efflorescence of the salts of soda, calculated to give an unsightly appearance to large surfaces, has been remedied; though, it is fair to state, similar appearance is characteristic of several

kinds of brick and stone. The material has been exposed to the weather, as stated, for twelve years, without appearance of decay; it is spoken of as superior to marble in hardness, and equal to glass in durability; and certainly it has been used in forms in which stone cannot advisedly be carved. The specimens exhibited include a chimney-head, trusses, balustrades, garden decorations, head-stones, and others. The applicability of the material to dressings of brick-built houses in the London district, deserves consideration. Trusses, which of the specimens shown are best in design, are priced from 2s. each; balusters, 12 inches to 24 inches in height, are from 1s. each. The floral ornament attempted is deficient in the sharpness of stone-carving; perhaps the effect may in part be due to deadness of the colour. More interesting than the material, just now, is the process for preserving stone or stucco. We are, without such aid, still far from dependence upon the duration in London, of the stones lately used, selected from whatever beds; we are not nearer to the prevalence in buildings, of ornamental accessories executed in material wherefrom effect would be the best, and wherein labour of carving would be cheap; and the chalk, and stones of the green sand formation, within easy reach, are not used for decorative work. If these impediments to architecture in London can be got rid of, and buildings now in rapid decay can be preserved by the process which has been some time before the public, and has been tried at the Baptist Chapel in Bloomsbury, the Pavilion at Brighton, and the Custom-house at Greenock, and is in course of trial at the Houses of Parliament, its author will deserve a national recompense. Mr. Robert Hunt has reported that the stone of the chapel is now actually repellant of water; and that the process will not merely protect new stone, but stop decay, and prevent the same in future. Colour and grain of stone are spoken of by the same authority, as unaffected: but there are tinting solutions for the several shades of the colours of stone, which are directed to be added to the chloride of calcium. We regret that the associated societies in Conduit-street have not space such as we asked for in writing of the Museum in Jermyn-street, for trying all inventions of this kind, where indeed they should be exhibited, in the open air. The prices of the solutions are 5s. 6d. per gallon for the silicate of soda, 4s. 6d. for the chloride, and 3s. 6d. per pint for the tinting solutions; and it is said that under ordinary circumstances, about four gallons of each solution will be required for each hundred yards of surface. The specimens include pieces indurated of chalk and Bath stone.

The Architectural Pottery Company, of Poole, Dorset, are to be praised for the attention which they have given of late both to design and manufacture of the peculiar article for pavements,—Bale's Patent Mosaic Tiles;—though we are not quite satisfied they were right in starting with an imitation of small tessera, or that both design as on paper, and effect as in pavement, have not suffered in consequence,—in the latter case from the contrast which there is between irregularity in the tiles as laid, and regularity in the tesserae of which they are manufactured or faced. A pavement at the foot of the steps entering the galleries, laid with their tiles hurriedly, last year, has been relaid according to a design by Mr. Raphael Brandon; and it is creditable to the manufacturers to the designer. Mr. Brandon and Mr. J. M. Lockyer have contributed several of the designs exhibited by the Poole Company. One of the principal works by the Company is a pavement at Wilton House. Their manufactures include coloured and glazed bricks, which are 6d. per thousand at the works, as well as materials smaller than their tiles, for tessellated or mosaic pavements proper. The pavements may be laid in London for 9s. 6d. or 10s. up to about 21s. per square yard. The "patent mosaic" is the more expensive. The difference of effect hardly accords with the difference of cost.

The productions of Messrs. Maw & Co., Bentall Works, Broseley, Salop, occupy their old positions in the East Gallery, and are, we believe, without alteration; and near them are some of the tiles and tesserae, longer known, of Messrs. Minton, Hollins, & Co., of Stoke-on-Trent. The latter productions include tesserae of small size for pavements, and tiles for wall decoration. Mr. M. Digby Wyatt, Mr. George Goldie, Mr. Benjamin Ferrey, Mr. Garling, and Mr. Owen Jones, have been the designers of the pavements and tiles,—especially the first-named architect, for both manufacturing establishments. We may mention in this place that amongst the drawings, there are exhibited by Mr. Wyatt, two (232, 233)

of "Practical Suggestions to Messrs. Maw & Co., now in process of being worked out by that firm, for the application of the principle of mosaic to roofing." The ingenuity with which a dozen patterns of tiles, of five or six colours, are worked together, is considerable; and it extends even to the mode of representation; but it might be well to inquire whether roofs are not best treated as at present, namely, as a breadth of cool blue, or of green, or reddish colour, altered only as by the weather, or at most by a tile-cresting, or an unobtrusive pattern in bands, whether in form or of colour, rather than treated as mosaic. Contrast is wanted to the architectural features of those parts of a building which support and surmount the roof,—as relief is needed to wall-decoration, by plain surface; slight alternations of colour, as in horizontal bands, or darker lines at considerable intervals, may be exceedingly happy in result; but the mosaic species of decoration, as of walls externally, which draws attention from main lines and structural forms to itself, has not been happy where attempted; and we apprehend that if patterns and colour are introduced in roofing, there should be much less variation, or contrast, than is allowable in pavements. According to the present decoration of roof coverings,—whether by cut slates, or tiles as formed—the whole number,—or by placing the ornamental forms in bands, or having bands in material only slightly differing in colour,—more is contributed to the general result of the building than by the diagonal arrangement of lines, and other patterns attempted in some of the drawings in the Exhibition where there is an approach to the idea of mosaic. Amongst the drawings is one (177), exhibited by Messrs. Maw & Co., of the pavement of Wood Walton Church, showing in full, the combination of plain and encaustic tiles, numbered 16 in the specimens of their manufacture. The whole of the display of this branch of surface-decoration in the rooms in Conduit-street, deserves more attention than it usually receives; and there is much to be learned from it.

Analogous decoratively to the works last mentioned, though very different in the material, are Messrs. Arrowsmith's specimens of their Solid Parquet Flooring, also a manufacture of which the merits are appreciated by architects, as shown by an increasing number of their designs for its use. For bordering of rooms it is excellent, as for flooring of rooms in general where carpeting, along with the depth and richness of colour belonging to woollen fabrics, can be dispensed with. The flooring has been used with propriety, in chancels of churches. The designs and specimens in the North Gallery correspond with flooring which has been laid at Keele Hall, Staffordshire, for Mr. Ralph Sneyd, Mr. Salvin, architect; at the Hall, Little Aston, Birmingham, for the Hon. E. S. Jervis, Mr. E. J. Payne, architect; at Tapton Hall, Sheffield, for Mr. E. Vickers, Messrs. Flockton & Sons, architects; at the Manchester Assembly-rooms, Messrs. Mills & Murgatroyd, architects; at Pipbrook House, Dorking, Mr. G. G. Scott, A.R.A., architect; at Dorchester House, for Mr. Holford, Mr. Vulliamy, architect; at the Leeds Town Hall, Mr. Brodric, architect; at the house of the Earl de Grey and Ripon, in Carlton-gardens, Mr. P. C. Hardwick, architect; and other works which we need not again name. Drawings which there are in the Exhibition, showing works in which the material has been or is proposed to be applied, are not all of them favourable to an idea of the good effect of parquetry, of whatever manufacture. The "Design for Library" (180) for Sydney, is a bad drawing of execrable Gothic and sadly inharmonious colour. The gallery at Hooton Hall (185) has general merits which have been referred to. A "Portable Swiss Chalet, as fixed in Newsham-park, Brocklesby, Lincolnshire," for the Earl of Yarborough, is shown in No. 290.

Returning to the plastic materials, we may name the moulded bricks, plain and ornamental roofing tiles, ridging with crest-ornaments, red, black, and white paving tiles, and trusses, of Messrs. R. & N. Norman, of the St. John's Works, Burgess-hill, Hurstpierpoint, Sussex. The white facing bricks of Messrs. Fayle & Co., of Newton Works, Dorsetshire, and the moulded blocks for quoins and other dressing in lieu of stone, to which the material approximates in colour and texture, are again exhibited by Messrs. Messon & Boys, engineers to the company. The blocks have been used in the school at Feltham, represented in the drawing (130), of which we have already spoken. Blocks may be ordered of any pattern; and the material is both less costly than stone, and, doubtless, as asserted, "much more durable than most stones." The specimens include blocks as used for sills and mullions in the Harrow Schools; parapets and

finials, as in other buildings; fire-bricks and materials for grates and furnaces, said to have proved equal to Stourbridge clay, at less than two-thirds the price; and paving tiles, which, it is stated, are superior in hardness and durability to Portland paving. A sheet of designs shows different available applications of the blocks and bricks, as in cornices and window arches.

Progress of design and manufacture in metal-work, is well sustained by some of those who have exhibited on previous occasions. Messrs. Johnston, Brothers, have made a considerable advance; and we should be glad to think that any observations of ours have contributed to the general merit which now characterizes their works. Messrs. Hart & Son equally are remarkable for attention which they are paying to design in works of many kinds for ecclesiastical and domestic use. Their designers, if we may judge from what is shown, are abandoning the attempt at direct copyism of nature, and are bringing into service all that is characteristic of metals as distinct from other materials. We should, however, like to see more attention paid to the production of articles of good design, suited to persons of very limited means. There is no reason why a fender of good design should not be obtainable for the 7s. 6d., which is the advertised price of the "spear and scroll" article, sold by most of the furnishing establishments. The mimicry of work which the latter has in lieu of real ornament, is tolerated only because manufacturers such as those who exhibit at Conduit-street, and Messrs. Hardman and Mr. Skidmore, do not offer the plain article of good taste that equally would be appreciated, and because they choose to aim for the wants of a different class—a class not numerically large. The articles this year shown are in brass-work chiefly. There is a large field open for designs in iron, using other metals and glass as enrichment. This course indicated would lead to better results than does the somewhat gaudy decoration of iron-work with blue and red. The best effect of colour we are inclined to think is seen where the iron is painted in cool-toned colour, as in many of the works of Mr. Skidmore, and in some of those of Messrs. Johnston. The latter have used a sage-green tint with advantage, parts only being heightened by brasswork; whilst glass balls or drops, white or coloured, are introduced in some of their standards, as also in candlesticks by Messrs. Hart. These manufacturers, and exhibitors generally, should affix prices, to make their display of service to all parties. The ornamentation with colour, by Messrs. Hart, is generally good. Their latest works include a monumental brass, a standard for a moderator lamp, to be fixed to the newel of a staircase, and a time-piece. The last of these is not so satisfactory as other works.—Messrs. Cox & Son have made less attention; and their wood-work is more worthy of commendation than their metal-work. The machinery for carving, of which they are now the proprietors, is either known to all architects, or it ought to be.

In the East Gallery, various specimens of paper-hangings are displayed by Messrs. Williams, Cooper, & Co., and Messrs. Harland & Fisher. The works of the latter firm please us much. They are treated as diaper or "on the flat," without shadows. Otherwise they are in good taste: we may, however, remark, that those who wish to foster the appreciation of design, must give attention to the harmony of colour; and this attention does not consist in offering every possible combination, if it be good or bad.—The works in his plaster casting, of Mr. Deschely, remain in their old positions.—Specimens are exhibited of "Smith's Patent Ornamental Wood," which is put forth as "suitable for panellings and other architectural decorations for the embellishment of ships' cabins, railway carriages, and as a substitute for the inlaying of piano-forte cases and cabinet-work generally," also as a mode of ornamentation, which can be adapted "at a price little exceeding that of plain polished woods," and one in which coats-of-arms and any other designs can be executed with facility. The work is said not to be affected by damp or heat. We have no means of saying whether these statements are borne out; but if so, the method might deserve attention, though it could hardly be deemed a substitute for inlaying, the outline of forms being indistinct or blurred.

Near these are specimens of the green marble, called Vert Antique, lately exhibited at the Institute of British Architects by Mr. Kleanthez, the proprietor of the quarries in Greece. The price is 30s. per foot cubic, for usual sizes.

It is scarcely necessary to do more than name the remainder of the articles in the North Gallery, which have been before exhibited. Wetterstedt's Patent Metal, for roof-covering and other purposes,

should be more in use than it is, if found to justify the claims by the manufacturers. Messrs. W. W. and R. Johnson & Sons, of Limehouse, as to resistance to rust, and action of the sun and acids, and greatly reduced expense from lessened weight of metal and strength of framing.—Messrs. Charles Botten & Son, besides their Regulator-closets, and High-pressure Valves in great variety, exhibit a "patent direct-action compensating gas-meter," constructed for the requirements of the Sale of Gas Act. But little variation in the water-line being allowed by the Act,—in this meter "there can be no variation of water-line, and it will continue to work correctly for years without attention to the supply of water."—Wright's Self-acting Closet, manufactured by Messrs. Hewett, Allott, and Walker, of Sheffield, is shown; and it has been favourably reported on of late.—Chantrell & Duteil's "Patent Economic Self-acting Closet and Water-Waste Preventer" combines a stone-water-cistern with measuring-box and other apparatus at a prime cost of 2*l.* 10*s.*, in Liverpool. The cistern contains water enough for flushing seventeen times.

The contributions of Mr. Jennings are less numerous than usual, and by accident are not described by him in the catalogue. Besides air-bricks of stoneware, and one or two of his best-known inventions, they however include a new "lift-up basin," intended for use in hospitals, and to avoid the nuisance of soapy deposit as in the basin with ordinary plug, which deposit might be means of communicating disease. A small quantity of water always stands in the basin. The basins have been fixed at the Guards' Hospital in Rochester-row, the barracks at the Regent's-park, the Crystal Palace, and the Holborn Union Workhouse. After washing, the basin is tilted according to direction by the words "lift-up" on it; a certain quantity of water passes from the upper into the lower compartment of a feed-cistern; and when the basin is again lowered, the lift acting on the spindle of a simple valve allows the measured quantity to flow into the basin. Mr. Jennings also shows a new form of cock, which he calls "twist cock." In this, amongst its features, there is a contrivance for resistance to almost any amount of pressure, by means of the strength obtained from twisting a tube half-round.

Specimens of his stoves and grates are exhibited by Mr. Pierce, in the North Gallery and the East Gallery. His different forms of cottager's grates, which may be arranged so as to heat two rooms by the same fire, deserve to be widely known, and his fire-clay backs to grates may be readily combined with ornamental accessories.—Messrs. Crichley, Wright, & Co., of Burton Weir, Sheffield, exhibit "Wright's patent Gill Chlorifier," consisting mainly of metal plates, as distributors of the heat, and not different in principle from what we have seen before.—Mr. William Jones exhibits "Cole's Patent Smoke Exhauster and Down-Draught Preventer," of which the title must suffice.

Messrs. Pugh & Co.'s locks and lock furniture are known to former visitors to the exhibitions in Conduit-street. Their knobs of carved or brass-ornamented wood, deserve notice: for drawing-room doors, Messrs. Hart & Son's furniture is best in design and execution.—Messrs. Hobbs, Ashley, & Co. repeat the exhibition of their locks,—as the "new mortise lock" wherein, by a double spring, the latch is made to work independent of the crank, and necessity for slamming the door is avoided, whilst, by the form of the "frictionless follower and crank," a rolling instead of a rubbing motion is produced, preventing friction and conducing to durability.—In the North Gallery, also, we find specimens of the application of the "Hard-drying Tackless Varnish," of Messrs. Mauder, Brothers, for seats of churches, and the "White Coburg Varnish," which last has scarcely the appearance that we should have expected; specimens of Moore's Moveable Glass Ventilators; Moore & Son's Clocks; and Rees & Co.'s Glass Letters, and their Pressed-Glass Clock Dials, to be illuminated by night, and having a solid opaque appearance by day. There are also some models in plaster, cast from gipsy moulds, by Mr. R. N. Hanwell, modeller. There are several designs for decorative works, or articles of ornament, amongst the drawings; but these we will not name in the present place.

Considerable interest will be taken in the contribution just made to the Exhibition, by Messrs. Devaux & Co., of models showing the methods of laying zinc on roofs and in gutters, in France, and specimens of different applications of the material ornamentally,—as in "marquises" for shop-fronts, with stamped ornament; in rain-water-pipes of decorative character; and in mar-

gins to incense-lights. In many of these, the flatness of the ornament (at least without the accessories of colour and gold, as in Paris), appears bad as anything we English have done in manufacture. Decorations of zinc, to lucarnes, were introduced at the Surrey Music-hall. In the models of roofing and guttering, the care taken to prevent contact of nail-heads, and to allow every-where freedom for expansion and contraction in the sheets, may be noticed. Workmen should carefully examine the models with the aid of the sheet of drawings published. The real difficulty standing in the way of use of the material in England, will be doubt as to the invariable purity of the article supplied.

On the table may be found a model of a window-frame and sash, showing improvements recently patented by Mr. W. H. Elkin. The main object is to allow the sashes to be taken out for cleaning, inserting glass, or repairing lines, without injuring the paint or woodwork. The contrivance also keeps the sashes steady and free from rattling noise. The improvement consists in forming the pulley-stile, one side, loose, but pressed against the edge of each sash by springs at the back, top and bottom of the stile against the pulley-stile, which gives way sufficiently to allow the sash to be disengaged from the opposite side of the frame; the sash then being no longer held by the head, is easily taken out. The lines, which are hooked, can be disengaged; or the sash can be turned upside-down, if convenient for cleaning. The pulley-stiles can be lifted out of the frame to repair weights or lines. The principle, according to the inventor, can be applied to windows, new or old, at a cost of ten shillings a window.

The Exhibition of Materials and Inventions is capable of being turned to further account; and perhaps it would be well to consider whether articles should not be classified and divided over several exhibitions, so as to get from time to time a better view of each department of practice than the Exhibition as at present can afford. Also, exhibitors should consider the best form of presenting succinctly the nature and advantages of their inventions in the catalogue, tabulating the particulars as much as possible, and not as now, too often omitting such important information as that concerning price.

#### ARCHITECTURAL EXAMINATION.

The following paper is submitted to the members of the Institute of Architects, as already mentioned. It will be discussed by them hereafter:—

It has now become an established rule, both with the Government authorities and with the heads of the learned professions, that candidates either for admission into any branch of the public service, civil, naval, or military, or for participation in the rights and privileges enjoyed by the several denominations of private professional men, should undergo an examination to test their capability to discharge the duties of the positions they may desire to occupy. In divinity and in medicine this rule is of long standing, but the application of it to the branches of the legal profession is comparatively recent.

So far in the public interest has this spirit of affording a guarantee of capacity been carried, that the Universities of Oxford and Cambridge now periodically offer, in their "voluntary middle-class examinations" to numbers, not graduates, about to enter on commercial or other ordinary avocations, the means of obtaining a certificate of their progress in the usual branches of modern education. Cognisant of these facts, the Council of this Institute have felt the imperative necessity that the architectural profession should no longer continue the only one, open to be assumed, at any rate nominally, with all its heavy responsibilities, by the more ignorant, though bold pretender. It is with this feeling they have taken into consideration a scheme which has been laid before them for establishing an architectural examination, of which they now submit an outline for the consideration of the members of this Institute.

The question of founding such an examination has already been discussed at meetings of this Institute; and the Council do not profess to do more than recommend the initiation of a scheme to be cautiously and gradually developed and brought into working order, in which too much should not be attempted at the onset; but of which, in accordance with the rule now established in other professions, the ultimate should, in their opinion, be the establishment of a system of con-

pulsory examination extended to all architects, whether members or not of this Institute.

Should the scheme be carried into operation and meet with the desired success, some alteration in the rules which now govern the admission of Fellows and Associates would become necessary.

The Council submit the outline of the scheme in the form of propositions, adopted after due consideration by themselves, aided by the valuable advice of the Board of Examiners of candidates under the Metropolitan Building Act, and of the Professor of Architecture at University College, London:—

Proposition 1.—That it is desirable to afford an opportunity for a voluntary professional examination to the present Associates, and to the future Fellows and Associates of the Royal Institute of British Architects. That an elementary examination be established for the students and Associates of this Institute under the age of twenty-five years; and a higher examination in the theory and practice of the profession for Associates above that age, and for future Fellows.

Proposition 2.—That the rules as to students and their prizes be reconsidered by the Council so as to lead educationally towards the last-named more important examination.

Proposition 3.—That the elementary examination embrace pure and applied mathematics, land surveying, mensuration, geology, ordinary construction and materials, drawing, the styles of architecture, the history of architecture, languages, and chemistry. The examiners to define the subjects absolutely necessary; the marks to be appointed to each; and the aggregate number essential to entitle each candidate to a certificate.

Proposition 4.—That the chief subjects for the higher examination be such as occur in professional practice, with the general theories on which the detail of such is based—*e. g.*, languages, architectural jurisprudence, the Building Act, sanitary requirements, the history of architecture, the theory of the beautiful, the analysis of the styles of art, architectural composition, the literature of architecture, the theory of the higher subjects of construction, *e. g.*, of arches, bridges, and domes, and the application of iron, &c.

That the subject for the higher examination may also be a development of those enumerated for the elementary examination to an extent commensurate with the information on other subjects expected from the person examined.

Proposition 5.—That a curriculum be prepared and circulated, giving a general outline of subjects for examination.

Proposition 6.—That the examiners be authorized to take into consideration any diplomas or certificates of competency that may have been obtained elsewhere, *e. g.*, from the Universities of Oxford and Cambridge, the Professor of Architecture at the University College, and at King's College, London.

Proposition 7.—That the examinations be carried on by means of writing as well as orally, and that they take place in the months of July and October.

Proposition 8.—That the examiners be chosen by the president, the vice-presidents, the past vice-presidents, and the Council for the time being, from among the members of the Royal Institute of British Architects, so far as may be possible, and that they receive fees for their attendance.

Proposition 9.—That the following fees be paid by the candidates on entering their names for examination, *viz.*—

For the elementary examination . . . . 2 guineas.  
 „ higher . . . . . 3 „ . . . . .

LECTURES IN CONNECTION WITH THE ARCHITECTURAL EXHIBITION.

The first lecture of the course in connection with this Exhibition was delivered on Tuesday evening last, by Professor Donaldson, “On the Arrangement of a Roman Consular House, and the Life of a Roman Patrician.”

Mr. G. E. Street occupied the chair.

The Chairman, in introducing Professor Donaldson to the meeting, said that this was the third time on which that gentleman had done the Society the honour of delivering the introductory lecture of the course.

Professor Donaldson said that, in selecting the subject of this lecture, he had been anxious to adopt one which would allow him to make some observations in reference to the drawings which his audience saw around them. These drawings indicated the development of the human mind as represented in architecture; and, though not a perfect collection, served to carry us back to the most distant periods. The Egyptians, at an early stage in the world's history, had erected monuments of enduring solidity, which continued unimpaired by time to the present day. The Greeks, at a more recent period, developed another style, the principal character of which was beauty. The Romans, pursuing a different principle, had followed in a new sphere of mental development. Then came the Medievalists, who wrought out the sentiments of religious feeling. The subject of Roman architecture, which was the topic on which he was about to dwell, should have special charms for an English audience, when they recollect how intimately the early history of Britain had been affected by the conquests of that mighty people. He might be allowed to recall them to the times when Julius Cæsar had attempted to conquer this island, and had met with too warm a reception to induce him to establish his permanent residence here. When they considered that

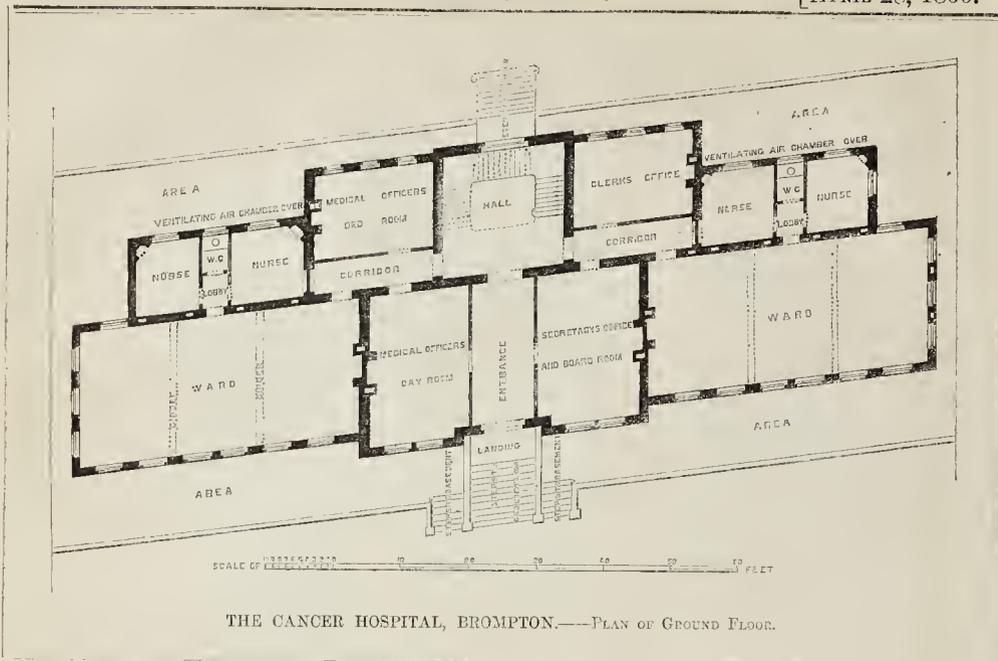

the Romans, whom the rich mines of copper and gold had tempted to return and take possession of this island, had held it for a space of 450 years, during which time they had provided it with military roads running north and south, and branches extending in an easterly and westerly direction, and had fortified camps (*castra*), which afterwards grew into towns (*municipia*), they would see what a civilizing influence the introduction of the manners and customs of Rome must have had upon a people who had hitherto been little removed from barbarism. The names, Chester, Colchester, Manchester, Cirencester, indicated points where these *castra*, or stations of importance, had been established. Indeed, the Romans, when they had permanently settled in any part of the country, constructed houses of convenience and magnificence, theatres, amphitheatres, and circuses, and carried on the same sort of government as in Italy itself. A history of Britain during the Roman period would be interesting, as showing how these civilizing influences had spread; and perhaps the day was not far distant when such a history would be published, as the materials for drawing it up were becoming daily accessible. For instance, at Leicester, mosaics of great beauty had been discovered under the house of a tallow-chandler; and at Cirencester he had seen the other day some mosaics which showed a development rivaling the Greeks for beauty. He might here be allowed to express his regret that there were not in the British Museum any mosaics polished so as to represent their original beauty. In the Vatican there are some laid in the floor, protected from being walked on, which were polished to the highest perfection. As a means of showing the civilizing influence which Rome must have exercised in this country, he would now proceed to lay before them a description of a Roman house, and show all the things that occurred therein during a day at Rome. The house which he would select was one of an ordinary size, which contained all the comforts and conveniences such as a Roman patrician might be expected to provide himself with. Of the arrangements of such a mansion (*domus*) we had accurate information, as we could see them in a perfect condition at Pompeii, unmodified by the ages through which they had since passed, and judge of them from a plan which had been discovered in one of the temples at Rome, and was now in the Capitoline Museum, and which corresponded with these Pompeian dwellings. To take a house of the Augustian period: it was surrounded on all sides by streets, and represented thereby an island; hence it was called *insular*. Part of this house was appropriated to the exclusive use of the noble possessor, and part fitted up in small shops, which were let for revenue, or served to sell the products of the farm or vineyard of the noble. At the present day you can see illustrations of this latter practice in Italy, in the little wickets attached to the nobleman's house, at which you can purchase, for a trifling sum, a bottle of pure wine, the produce of his own vintage. In Pompeii some of these shops can be seen, with their counters, and jars for oil or wine thereon: on the pilasters are inscriptions and characters denoting the commodities sold therein. The streets which surrounded the Roman house were narrow, not exceeding 15 feet in width. This was of especial advantage in a sultry climate, as the passer-by was sheltered from the extreme heat of the sun. There were, however, special streets on which their chariots (*bigæ*) travelled, and which were of sufficient width to allow two to pass one another. This *domus*, or place, to which he would now return was entered by the vestibulum, which was protected from draughts by the inmates of the dwelling. At the end of this porch, next the house, a porter (*janitor*) stood, and a large dog to warn the doorkeeper of the approach of strangers. Sometimes, instead of the living animal, a representation of it was cut into an adjoining column, and over it the words, “*Cave canem*,” written, which he might be allowed to translate familiarly into “No admittance except on business.” The pavement was decorated with mosaic; and on the step of the door of admittance was inscribed the word “*Salve*,” “welcome,” over the door of egress, “*Vale*,” “glad to see you again,” both which words served to indicate the genuine hospitality which characterized the Romans. The vestibulum led into the entrance court (atrium): this latter was surrounded by columns, and open in the centre; and was the place where the Roman nobleman received his dependents (*clientes*), a class of persons whom the peculiar democratic institutions of Rome rendered necessary to every patrician who sought senatorial honours. The patrician received them at six or seven in the morning, and until such time as he was ready to

give them a reception they awaited in the wings (*alæ*), which were adjoining to the atrium. To enable the patrician to receive his clients properly, an officer was in attendance on him, who whispered to him the name of each as he approached. From the atrium you passed into the tablinum, in which were preserved the statues of their ancestors: these were of marble, wax, or terra cotta, and brought forward in public processions. Next adjoining the tablinum was the peristylum, or colonnade, which was reserved for the private use of the family, and to which the intimate friends only were admitted. This contained a garden and piscina, or pond, in which were gold and silver fishes. To the right of the peristylum was a passage leading to the posticum, or back-door, which afforded a means of escape to the proprietor when harassed by the importunities or business of his dependents. By this back-door dependents used to enter; and near it were the apartments for cooking, and the stabling. Closely adjoining the culinary department were the dining-rooms (*triclinia*), the couches in which were sloping, so as to allow guests to recline, and occupied three sides of a square: they were arranged to accommodate three guests or nine, according as the host was attached to the number of the graces or muses. In the centre of the building was the basilica, a noble hall, in which the patrician was wont to hear and decide on such state questions as in his incapacity of quastor or consul might be laid before him. On the opposite side from the Triclinia were the balneæ, or baths, which the climate of Rome rendered indispensable to every citizen. (The learned lecturer, to explain a Roman bath, gave an amusing description of one which he had enjoyed in Bergamo, in Asia Minor, and which must have corresponded in most points to the Roman plan.) Nor were the Roman nobles forgetful of religion in the arrangements of their houses; for, attached, was a small temple in which their gods were placed, and to which the family were wont at fixed times to resort, and, though under superstitious form, invoke an ever-present Providence. The patrician generally spent till eight in the morning, with his clients: he used then to repair to the forum and ascertain what law cases concerned him: thence to the Basilica, to watch over the interests of his clients. This occupied till two o'clock in the day, when he returned home and took his bath. At three or four he used to betake himself to the court set apart for those athletic sports which had especial charms in a Roman citizen's eyes, or to the Xystus a covered space adjoining, if the weather was unfavourable to out-door sports. In addition to the public, private, profitable, and religious parts of the house which he had mentioned, he would call their attention to one portion which was set apart to the ladies of the family. The halls and *soirées* of the present day seemed then unknown, but, instead thereof, ladies used to receive their private friends in these apartments, where, no doubt, they spent many pleasant hours together. Then, there were gardens attached to the house, which contained arbours and fish-ponds, and in which all the elements of art in full perfection were to be found. The floors of the dwelling were inlaid with mosaic; and the walls showed the development of the artist's mind, sentiments which would elevate taste, and not common-place decorations put on by a mere paperhanger.

The Chairman in moving a complimentary vote of thanks to Professor Donaldson, for the interesting lecture which they had just heard, expressed a hope that as he already on three occasions had favoured them with an opening address, he would confer an additional favour next year, by adding another lecture on the discoveries at Wroxeter, and thus exhibit, as it were, a Roman house as it existed in Britain fourteen centuries ago.

Mr. Robert Kerr will deliver the next lecture on May 1, and has selected as the subject of it, “The Battle of the Styles: its Past, Present, and Future; from a favourable point of view.”

WHEN WERE HOUSES NUMBERED?—I have with much perseverance searched for particulars in connection with the numbering of the houses in the metropolis, the exact time at which this took place, &c.; but have been unsuccessful in finding any, although it is a matter of very moderate age. I mention this in the hope that one of your readers may be able to throw some light upon this important event, for without this improvement Sir Rowland Hill must have been driven mad with letters addressed to John Smith, near the “Three Legs and Bible” in the Poultry; or over against the “Blue Balcony” in Little Queen-street. A LONDON ANTIQUARY.

THE CANCER HOSPITAL, BROMPTON.—PLAN OF GROUND FLOOR.

## THE CANCER HOSPITAL, BROMPTON.

The new hospital for cancer, at Brompton, nearly opposite the Consumption Hospital, and now in course of erection, is intended ultimately to accommodate 300 patients. The building consists of a central compartment (capable of holding sixty patients), with wings; but the central portion only is now being proceeded with. It presents a frontage, next the Fulham-road, of 130 feet, and a depth of about 40 feet, surrounded by an area of 10 feet, securing to the building means of external communication and ventilation. The elevations are constructed of white Suffolk bricks, with bands of red bricks, ornamental cornices and terra-cotta medallions. There is a sparing use of stone dressings.

The lowest story, 10 feet high, contains the ward for out-patients, with surgeons' rooms and dispensary; the remainder is devoted to the usual domestic offices.

The principal or ground-floor, 14 feet 6 inches high, approached by a flight of steps, contains the hall, staircase, 18 feet square, secretary's offices, apartments for the medical officers, and two wards for patients, each 42 feet by 20 feet.

On the first story, 13 feet 6 inches high, there are three wards, 42 feet by 20 feet, with rooms for the matron, nurses, &c. These will communicate with staircases and corridors, the whole of which throughout the building are of stone.

An additional story in the central portion will also afford further accommodation for patients.

The building is being erected by Messrs. Lawrence, of Waterloo-bridge, at a cost of about 7,000*l.* under the superintendence of Messrs. John Young & Son, architects, of King-street, Cheapside; the consulting honorary architect being Mr. David Mocatta.

The reason given for the unfortunate arrangement of the plan is, desire to use to the utmost hereafter the ground behind. The mistake will be long regretted.

The charity appeals strongly to the good feelings of society.

## SIR THOMAS BODLEY, FOUNDER OF THE BODLEIAN LIBRARY.

ONE is so accustomed to associate public munificence with private benevolence, that any facts, which tend to throw discredit on the private character of a man who has proved himself a national benefactor, are not unaturally regarded with considerable prejudice and suspicion. The world was astonished and grieved to find shortcomings in the case of Howard, the prison philanthropist, a man whose reputation was European, and whose

untiring exertions and active benevolence earned for him the admiration of his fellows and the gratitude of posterity.

The following extracts, taken from the correspondence between John Chamberlain and Sir Dudley Carleton, preserved in the State Paper Office, though they give another example of the fact that a public character for benevolence is by no means incompatible with a neglect of domestic virtue, may interest our readers.

They relate to Sir Thomas Bodley, whose name has been for generations connected with one of the most noble and most valuable institutions of this country,—the celebrated Bodleian Library at Oxford. His time, his means, and his energies, were for years devoted to the founding and maturing of this great work; he obtained an order from the Government of the day, that a copy of every book printed in London should be sent to his library; and, having placed the establishment on a firm footing, he was attacked with ague, and, after a few days' suffering, closed his literary labours, and left the result of his arduous undertaking as a splendid and munificent legacy to that seat of learning of which it is now the honour and the ornament.

In a letter of the 4th February, 1613, John Chamberlain, writing to his friend at Venice, says, "Sir Thomas Bodley died on Thursday last, between four and five in the afternoon, having lain speechless, and without knowing anybody, almost thirty hours. His executors are Sir John Bennet and Mr. Hackwell, a young lawyer, Sir Ralph Winwood and Sir Henry Saville; his overseers and supervisors over them, the Archbishop of Canterbury, the Lord Chancellor, and the Lord Cooke, to each of these last bequeathing a cup of gold of the value of 50*l.*; whereas to his brothers he bath left very little, and to his brothers' sons, who are his heirs and must hold up his house and name, scant anything." To Mr. Gent and William Allen, like a couple of almsmen, he bath left his best and second best gown, and his best and second best cloak; but to cast a colour or shadow of somewhat upon Mr. Gent, he makes a clause that he forgives him all he owed him, which Mr. Gent protests to be never a penny, and bath much ado to withhold from blazing how much and many ways he was beholden to him in former times, and indeed indebted; but howsoever it be, his being so obsequious and servile to him so long a time deserved a better recompense and reward. But his servants murmur and grumble most, with whom he bath dealt very meanly. Some of them bath served him and her very painfully above two-and-twenty years, others nineteen, others fourteen, and the best not reaping after so long expectation above 20*l.*; the

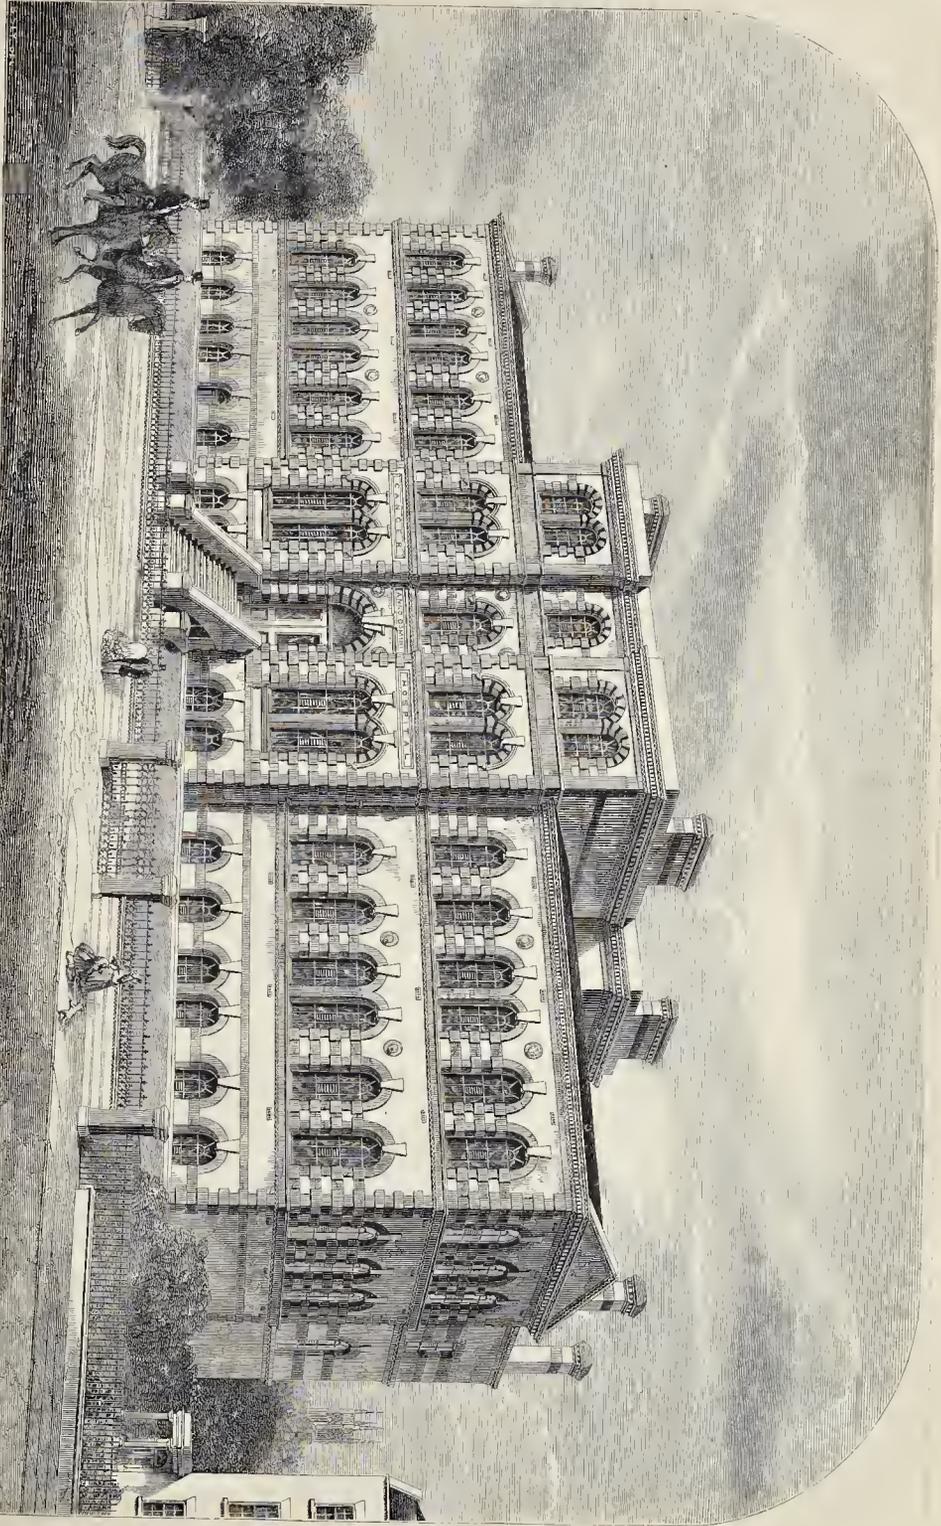

rest ten, and those not past two or three neither. He makes no mention of any friend he had, nor so much as for a mourning garment, nor will not allow it his servants unless they go to his funeral at Oxford to fetch it. But let goodnature go, if he had had regard of conscience towards his wife's children, by whom he had all his wealth; but in truth he bath dealt hardly with one of them, who bath many children, and is in need and distress, and by his means; the story whereof is too long for a letter. And all this for a valuing and shew of good deeds, for he bath given about 7,000*l.* to his library at Oxford, and 200*l.* to Merton College, besides mourning to all the students of that house, from the highest to the lowest. This, and such like, make me," says the vivacious writer, "know and esteem the world, as it is, nothing but vanity."

In a subsequent letter, dated the 25th of February, he reverts to the same subject, and says,—

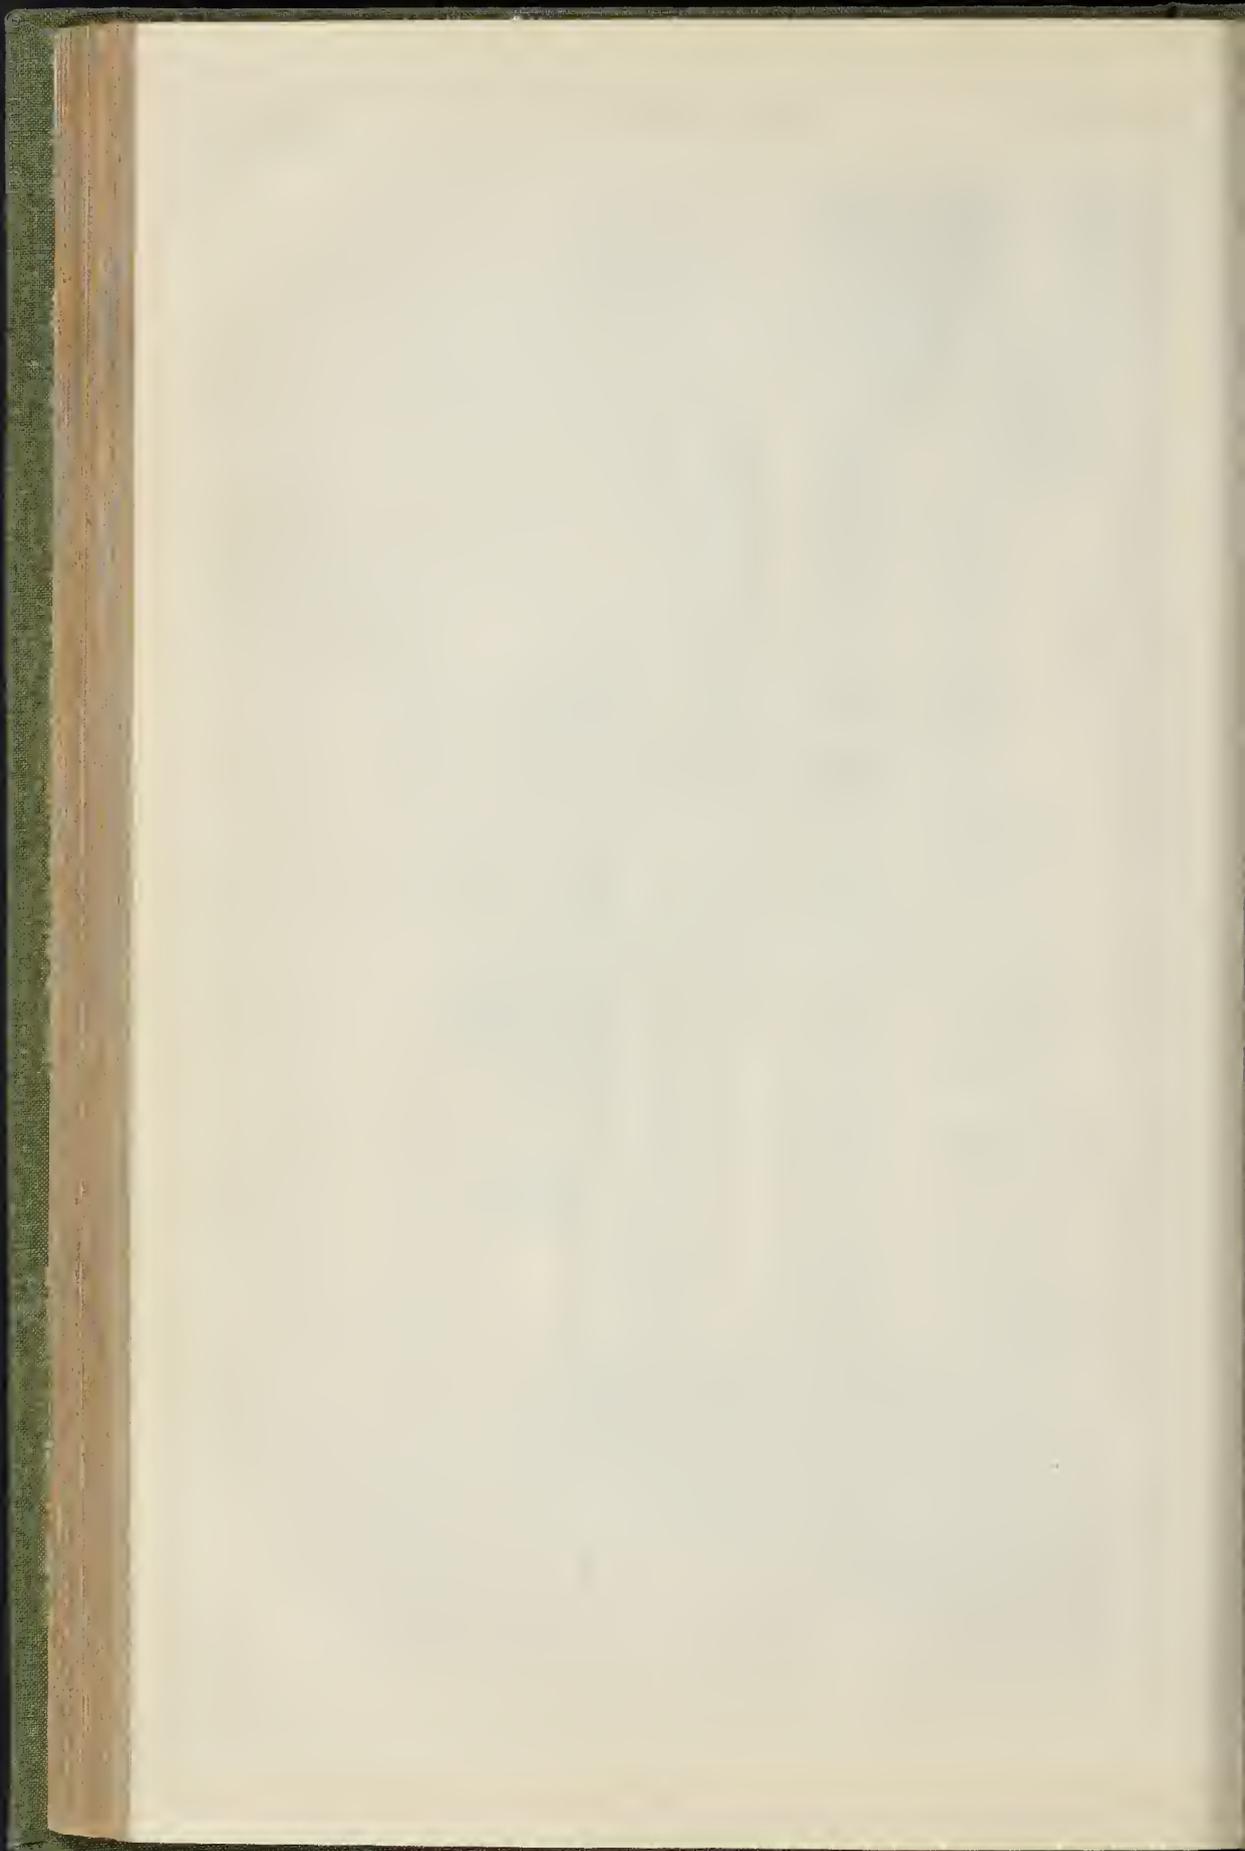

"Sir Henry Saville showed me the last week his notes taken in the reading of Sir Thomas Bodley's life, written by himself in seven sheets of paper, with vanity enough; wherein, omitting not the least minutiae that might hurt to his glory, he doth not so much as make mention of his wife, nor that he was married, nor of Secretary Walsingham, nor the Earl of Leicester, who were all his main raisers, whereby may be seen what mind he carried to his best benefactors."

But, however much his vanity and ingratitude may have caused his friends to be disgusted and his servants to gumble, they do not appear to have had upon either the same effect as upon poor Mr. Gent; for, in a letter of the 23rd of June, I find the following paragraph:—

"I perceive, by your letter of the 28th of May, that you had heard of Mr. Gent's decease, which I make no doubt was hastened by Sir Thomas Bodley's unkindness, to whom, besides all other reckonings, he had been as it were *perpetuus servus*. But the other's unthankfulness towards his kindred and friends might be the better borne, if he had not dealt unjustly with his wife's children, which I have not spared to make appear, even to his executors, who have no other defence, nor can make no better answer for divers manifest wrongs and palpable dissimulations, but that if he were alive, no doubt he could excuse himself better than they can. But the truth is, he was so drunk with the applause and vanity of his library, that he made no conscience to rob Peter (as they say) to pay Paul, for the which he bath his reward in verses and orations which the University heaps upon him for the present, though I make no question but they will quickly vanish, and in short time come to stop mustard-pots."

THE CANCER HOSPITAL, BROMPTON.—MESSRS. JOHN YOUNG & SONS, ARCHITECTS.

## ART AND BUILDING IN FRANCE.

The decorative works of the Église Saint-Eustache, Paris, have just received a fine addition in the shape of paintings, sculptures, carved works, and enamelled porcelains, with which the two arms of the cross of this vast edifice have been enriched. It is well known that, a few years ago, in making preparatory works for paintings ordered by the town of Paris for the decoration of the two chapels, a discovery was made, under the plaster which concealed them, of ancient subjects surrounded by arabesque ornaments, extending beyond the limits of the chapels which they, as it were, framed in with a border. This discovery served as a key to a general system of restoration, which, under the direction of M. Victor Baltard, has led to an ensemble of the most happy effect and one full of harmony; the researches of this architect having proved that, out of twenty-four chapels, six were so decorated shortly after the completion of the church. The church of Saint-Eustache has become once more the sanctuary of former days—the *paroiſſe des artistes*: under its arches there assembled in solemn rites the ancient Academy of Painting and Sculpture, founded under Louis XIV. The chapel of St. Andrew in the church retains still the *blason*. At the present day the walls of this church have afforded full scope for the display of paintings and sculptures by modern artists, while they echo, from time to time, in sacred concerts, the grandest themes of musical composition. Among the works now completed in this church we may notice one of considerable interest, that of the transept, where M. Sigoul, with his usual talent, has executed four grand compositions, accompanied by figures of the Evangelists and the four cardinal virtues. Six remarkable statues of the apostles on the right arm of the cross are due to M. Debay. Those on the left are by Husson and Crauck. One interesting detail deserves the attention of artists, viz., four bas-reliefs, of a striking originality, representing those personages of sacred history who loved and taught the harmony of sound, David, St. Cecil, St. Gregory, and St. Ambrose, executed in enamelled terra cotta, by M. Devers, in the style of Lucca della Robbia. On Thursday, the 12th inst., the inauguration of the new chapels took place, in presence of the Prefect of the Seine, the municipal council, and the Committee of Fine Arts of the Prefecture of the Seine. The Archbishop of Paris, Cardinal Morlot, distributed medals to all the artists who had contributed to the restoration of the paintings. During the ceremony the following pieces of music were executed:—1. Prelude, by S. Bach, for violin and orchestra. 2. "Tantum Ergo," of Rossini. 3. The "Ave Maria" of "The Pilgrims" (fifteenth century). 4. "Domine Deus," composed by Bonetti, and adapted for the occasion by Tamberlick.

A great number of workmen have just taken possession of the grand nave of the Palais de l'Industrie, to make preparations for the spring exhibition of the Imperial and Central Horticultural Society. As in the case of the preceding meetings, all the ground of the grand nave, in extent nearly two acres and a half British, is to be transformed into a vast "jardin Anglais," with grass plots, filled with exhibitors' shrubs and flower-pots, to receive smaller and more delicate specimens. On this occasion a radical modification is to take place as to the disposition of the small river supplied annually to the herbage of the garden. From the plains of Autenil, Issy, and elsewhere, the necessary soils are being extracted, the quantity of turf required not being less than 5,000 metres superficial.

Outside they are not less busy in forming a flower garden on the opposite or right side of the Grand Avenue des Champs Elysees: already the grass-plots and flower-beds have been traced out, forming an exact reproduction of those on the left or exhibition side of the road, and disposed so as to include in the most picturesque manner the fountains, and other works already established. Meanwhile the theatre of the Bonifies Parisiens is being cleared off to make room for a structure more fitted for the season during which it is open to the public. The copper galvanizing of the remaining fountains and statues will complete this important change to the Champs Elysees.

The new constructions of the Palais des Beaux Arts, in course of erection, proceed rapidly. The frontage is towards the Quai Malaquais. There are two saloons, the lower one on the ground floor being reserved for the exhibition of productions of the Roman schools, and the upper one for works of competition by the students. At either extremity of the former, which is thus rendered of smaller dimensions than the latter, are rooms devoted to

divers purposes. A large circular-headed doorway, fronting the quay, gives access to the public to the new "palais," or, as we may call it in English, repository, of Fine Arts,—such as it is, perhaps, the best in Europe. A double staircase of stone leads to the upper gallery, which is lighted from the north by twelve windows and three large skylights. A spacious gallery, like the arcade of the library of St. Genevieve, is at a future period to connect these buildings with those of the ancient *école*. This, it is said, will be reserved for the permanent collection of the casts now kept in the Louvre, while the two other side galleries will be reserved for paintings. The *École des Beaux Arts* now occupies all the space upon which stood the convent of Les Petits Augustins, founded by Margaret of Valois, first wife of Henry IV.

The Fountain of Saint Michel, on the Boulevard de Sebastopol, on the left bank of the Seine, continues to employ a number of sculptors, decorators, and workmen of all sorts behind the canvas screen which hides it from the gaze of the curious. Meanwhile, in the *ateliers*, busy work is going on at the colossal group of St. Michael overthrowing the Demon; also other groups and figures in bronze, which are to decorate this vast composition. Four columns of red Languedoc marble have just been placed in pairs on each side of the central niche, surmounted by white marble capitals. These are to support four bronze statues representing the four cardinal virtues.—Prudence, Force, Justice, Temperance. The whole structure is expected to be finished by the end of this year.

An Exhibition of Industry, Horticulture, and Fine Arts is to take place at Troyes the 1st May next, and is to last two months. There is every reason to expect that it will prove one of the best and most interesting of the French provincial exhibitions held up to the present. The demands for space have been so numerous that the authorities of Troyes have been obliged to enlarge the space originally designed by constructing a *vaste annee* upon the largest public thoroughfare. The last day for receiving paintings was the 14th instant. Troyes, of 31,000 inhabitants, is the chief town of the Department of Aube, whose population is 262,000 inhabitants.

## IRISH BUILDING NEWS.

The church of Knockany, Co. Limerick, is to be rebuilt by the Ecclesiastical Commissioners. The appointment of architect to this board (in the room of the late Mr. Joseph Welland) has not yet been filled, but we are informed that there are numerous candidates, including practitioners in England, Belfast, Cork, and Dublin, and amongst them some Roman Catholics. The office is said to be worth about 700l. per annum. The decision will be come to on the 3rd May.

The shell of the intended new church of St. Mary, Granard, is to be proceeded with, and tenders are sought for. Mr. J. Bourke, architect. The plan is cruciform with nave, aisles, transepts, chancel, side chapels, sacristy, baptistry, &c. A handsome tower, with broached spire attaining a height of 170 feet to top of cross, is included in the design. The length of the building will be 120 feet; the width across nave and aisles, 54 feet; and breadth across transept, 86 feet.

A church at Lenamore, 80 feet by 22 feet, in the Early Pointed style, and to cost 650l., and a large convent, schools, laundry, &c., for the Sisters of Mercy, at Newry, are about to be built after designs by the same architect.

Mr. Hawkshaw, C.E., has reported relative to the subsidence in the piers of the Boyne viaduct, substantially to the effect that no apprehensions for public safety need be entertained at present. The same engineer is building the bridge across the Foyle, for the Londonderry commissioners. The Newtonards and Donagadee proposed line has been let to contractors, and must be completed against January, 1861.

The Portpatrick harbour works are estimated to cost 20,000l.; Mr. Abernethy, C.E.

A new church, 120 feet in length, by 55 feet in width, Mr. McCarty, architect, is to be built at Clonca, Co. Waterford; also a convent at Kilrush, same architect.

The foundation-stone of the Cork Protestant Hall was laid by the Earl of Bandon, and the building is now progressing; Mr. R. R. Brash.

Mr. J. McCurdy, architect, has been declared the successful competitor for the new Masonic Female Orphan School at Dublin.

At the new mansion of Mr. Phineas Ryall, Bray, near Dublin, Messrs. Lanyon & Lynn, architects (already described in the *Builder*), some of the floors are laid in Arrowsmith's patent solid parquetry. The same style of flooring has also

been adopted at Colonel Taylor's, Ardgillan, Balbriggan, &c., and numerous other places in Ireland.

The Rathgar Presbyterian Church competition has been decided in favour of Mr. Heiton, of Perth, architect.

The Royal Hibernian Academy Exhibition is to open on 7th Proximo, and it is expected that the display will exceed in excellence those of preceding years, chiefly owing to the inducements offered by the Art Unions, whose prizes are to be selected therefrom.

Alterations and additional buildings are to be erected at the Royal Hibernian Military School, Phoenix-park, Dublin.

The Clones and the Tuam Gas Companies are about having the necessary works executed for the introduction of gas into their respective towns.

The Cottagers' Society, established by Lord Fitzwilliam, at Coolatin, Co. Wicklow, is said to have been successful.

A superintendent engineer, to take charge of waterworks and gas, is required by the borough of Cork: an appointment of a somewhat similar character is vacant at Belfast.

The Midland Great Western Railway Company are about having important works executed at their Dublin Terminus, completely reversing the present arrangements of arrival and departure. Mr. Wilkinson is the architect; Mr. Crew the contractor.

## LIVERPOOL ARCHITECTURAL SOCIETY.

The fourteenth meeting of the session was held at the Royal Institution, Colquitt-street, on Wednesday, the 18th; Mr. Wm. Weightman in the chair. It was suggested that the society's annual excursion should this year be to the Menai Bridge, Bangor, and Penryn Castle. The secretary (Mr. Stubbs) said he should be happy to receive any suggestion on the subject of the ensuing excursion, prior to the holding of the annual meeting of the society, when a decision would be come to. Mr. Bonit suggested that, at the next *conversazione* of the London Architectural Exhibition, the society should be represented; for at the recent meeting he heard disparaging remarks made with reference to Liverpool not having sent any specimens of art thereto. The paper for the evening was read by Mr. Huggins, and was entitled "The Path of Progress of Modern Gothic, involving a Comparison of English Medieval Architecture with that of the Continent, and other Styles."

## NEW WATER COLOUR SOCIETY.

The New Society of Painters in Water Colours opened their twenty-sixth exhibition to the public on Monday last. It consists of 372 pictures, and, notwithstanding that the principal members of the society, tried by their previous works, are not in great force, is a very agreeable and interesting collection. Two new associates, G. Simonau and Carl Werner, are decided acquisitions. No. 1, "On the Way Home," and 109, "Bernacle," both by the first-named, are solidly and effectively painted. M. Werner's works are known to a considerable circle. His "Venice as it is" (169), is more satisfactory than "Venice as it was" (128). "The Young Nun: Monastery S. Saba, Viterbo," pleases us more than either. Mr. Louis Haghe sends six works, all noteworthy. The chief two are, "An Improvisatore in the Forum, Rome" (28), and "the Murder of Riccio" (78). In the latter, the artist has been more successful in human expression than usual; but how does he reconcile the arrangement with the quotation he gives, showing that Riccio was "slayne goinge downe the stayers?" Mr. Edward Corbould exhibits but one picture, "Saul at Endor" (250). Mr. Vacher is a valuable contributor of Italian scenery, prominently, "Sorrento, Monte St. Angelo and Vesuvius" (234). There are several charming specimens of Mr. Edward Warren's peculiar art; and Mr. Rowthorn (always pleasing, though usually too pretty), Mr. Mole ("Eccleshourne Glen, Hastings") Mr. McKewan ("A Peep at Naworth Castle"), Mr. James Fahey, and others, have works to be looked at. Mr. Bennett's chief contribution, "View from Heaven's Gate, Longleat" (204), with a sly reference to "Hark, the Lark," is a fine landscape, with the effect of considerable extent. Mr. Fidey's principal picture is a very elaborate work, illustrative of Shelley's "Queen Mab":—

"Sadden arose  
Innate's soul;  
Upon the couch the body lay,  
Wrapt in the depth of slumber."

It does not succeed in telling the story, but is

remarkable for its manipulation. Mr. J. M. Topping has made a considerable advance, and exhibits, amongst other things, a large female head under the title, "L'Italia" (143). An assertion has reached us that the fifteen pictures, contributed as the work of the late S. Cook, are not the *bona fide* property of his family, but belong to a dealer. This should be inquired into by the Society. The number of pictures sold is very considerable: irrespective of those which were so before the private view day, thirty-eight received tickets on that occasion.

#### EXHIBITION AT THE FEMALE SCHOOL OF ART, GOWER-STREET.

THE Exhibition, which is now open, of the drawings by the students of the Female School of Art, should aid in obtaining for it from the public that assistance which the withdrawal of the Government grant necessitates. Ninety-two drawings were submitted in competition for medals. To twenty-six, medals were awarded by the Government inspector, and of these, seventeen have been selected to be sent in competition with the other Schools of Art throughout England for national medals to be awarded.

The names of the students thus marked out are Harriette Bradford (some clever heads), Anne Bartlett, Rosa Le Breton, Anna Maria Browne, Eliza H. Bryant, Margaretta Clarke, Selina Eckett, Susannah Fryer, Mary E. Julian, Sarah McGregor, Charlotte Pursey, Isabella Piggott, Theresa Smith, Isabella Fox Smith, Frances Von Stifmmer, Philippa Stevens, Fanny Stock, and Augusta Wells.

Besides the drawings sent in competition, there are some by ladies connected with the school, which are very excellent, as, for example, a work by Miss Charlotte James.

It is to be hoped that manufacturers and others will afford facilities for the profitable employment of the skill here acquired. The number of students at the present time is 118, and the daily attendance averages seventy. The Royal Academy, we are glad to hear, has unanimously voted 50*l.* to the school.

The subscription up to this date amounts to 361*l.* The public should be made acquainted with the fact that in July next the school will be finally closed, unless sufficient funds be raised before that time. Miss Gann, the superintendent, will give any information that may be desired.

#### STONEWARE PIPES.

A MEETING that took place at the Society of Arts on this subject, as set forth in the *Builder* of 21st inst., and which was attended by the principal manufacturers of the ware, entered into a review of the rise and progress of the art in this country; showing the great extent of the Lambeth factories, the amount of capital employed, and the immense importance of the recent introduction of iron-stone pipes, as respects town populations and in a sanitary point of view.

It was asserted that this adaptation of pottery ware had never been used in London until the 9th September, 1845, when Mr. Northern stated that "he had sent the first drain-pipe to the Board of Sewers."

That drain-pipes had been largely used before this period, in the wide improvement of wet lands, is perfectly palpable: they were so used, in all forms; principally lapped, or doubled tiles; and also small tubular perforated articulations: therefore, it is the more strange that pottery ware had not been applied to carry out the system of metropolitan sewage: such, however, is the fact.

In England this description of manufacture has wondrously progressed since 1846; but that a tubular conduit in terra cotta is no novelty was sufficiently illustrated by Mr. R. Rawlinson, who, during his stay in Asia Minor in 1855, saw very ancient earthenware socket-pipes dug up from an aqueduct on the banks of the Bosphorus. That gentlemen might, however, have gone further; for they were made in the Potters-field at Jerusalem; and evidences of a similar kind exist in China, which prove that they were used centuries prior to the foundation of the Holy City.

Wondrous advances in the ceramic art have within the last twenty years fully kept pace with the refined progress of other manufactures. At present, the models in porcelain, as well as in porcelain, rival, if they do not surpass, the extravagantly over-estimated productions of Berlin and Sevres; and the more utilitarian objects of iron-stone pottery or tiler, as now required for the improvement of agriculture, or for the health of towns, have made a corresponding progress.

The question was asked, by Mr. Rawlinson,

"At what date was the first earthenware drain-pipe introduced?" Mr. Northern replied, "On the 9th September, 1845," and by him!

Now, Mr. Editor, I beg to state the fact that early in the year 1845 I laid before Mr. Leslie, the most energetic and practical member of that Commission, samples of ironstone tubes: that gentleman exhibited them to the Board of Commissioners; and the first large quantity of this ware (upwards of 2,000 pieces) was bought of me, and paid for by cheque of 100*l.* 5*s.* on 3rd April, 1846. These tubes were manufactured for a wholly different purpose, namely, for chimney-flues, to be built up in solid brickwork or masonry,—having taken out a patent early in 1842 for that invention: I ordered large quantities (several barge-loads) from Messrs. Haywood, of Burslem: I took a wharf at Belgrove-lane for the sale thereof, and, having published the matter by pamphlet and advertisement, held it open until 1845, when finding that the sale did not pay a manager, or the rent, I offered the whole to the Commissioners of Sewers: in fact, the principal sale was made to the Messrs. Bird, of Hammer-smith, who used those flues in the Consumption Hospital, in 1844. This was the first public building in which the new principle was applied; but having myself, in 1842, used the smoke flues in three houses of mine in Regent's park, I also applied the same material (of 9 inches diameter) as drains; and having found them to answer perfectly, I put forward the system before the Board of Sewers.

As to the fate of the chimney-flues, it turned out that in 1848 I discovered extensive applications had been made of the invention: in Mr. Hope's mansion, Piccadilly; in Lord Ellesmere's palace, Stable-yard; in Mr. Suth Smith's new houses in Belgravia; in Buckingham Palace; and in Wind-or Castle, where old chimney-flues were demolished and the ironstone tubes introduced!

I had taken out the patent in the name of Wm. Denley, a bricklayer in my employ. I therefore applied in his name to the gentleman and magistrates before named for some moderate remuneration of the patent right, but without success! In this predicament, an action was brought against Mr. Flore, the royal architect: here, however, we took the wrong man, and were noused, and told to sue the builder, Mr. Cubitt. accordingly we did sue him, but the lawyer in the case was offered a sum as his costs, he threw up the case, and so the rights and flues vanished in smoke.

The loss on this question, comprising cost of materials, rent, clerk's salary, and law expenses, much exceeded 1,000*l.* However, if there is any credit to be derived from the utilization of a simple but really valuable appliance, let it fall to those who, however inadvertently, have really introduced it.

To be defrauded of a legal right, and that by the wealthiest and greatest of the community, is a sore grievance: added to this, the usurpation of a valuable merit but reiterates the poet's plaint, now 2,000 years old, "Tullit alter honores."

T. H. HARDINGE.

#### LONDON AND COUNTY BANK COMPETITION.

THE directors having recently purchased additional premises in rear of their chief banking-house in Lombard-street, the whole of which are now in progress of demolition, have selected two architects to furnish them with designs for the new structure, with the understanding that each will receive an honorarium, and that the best, if approved of, will be carried out. The competitors are Messrs. Francis, who recently erected the National Discount Company's house in Cornhill, and Mr. Henry Baker, architect of the London and Westminster Bank, Bloomsbury, and of the Australian Chartered Bank in Cornhill.

#### THE CRYSTAL PALACE.

PROMISING arrangements have been made for the new season. It will open on Friday, the 4th of May, with a festival for the inauguration of the bronze statue of Mendelssohn, lately executed by Mr. Charles Bacon. The festival will include the oratorio of "Eljibab," on a scale far exceeding any on which it has ever before been attempted. The band and chorus will consist of nearly 3,000 performers. The unveiling of the statue will be followed at dusk by a torchlight procession. There are to be flower-shows in May and June, a series of opera concerts, a performance by the "Société des Orpheonistes" of France—a very extensive association for the promotion of vocal part-music, which has its head-quarters

at Paris—and a variety of other arrangements, including a school of art, science, and literature, for the instruction of classes by eminent professors and teachers, concerning which we have not at present any very precise knowledge, beyond the fact that Mr. Edward Goodall is named to teach drawing (landscape, architecture, flowers, &c.); Mr. W. K. Shenton, drawing from the figure, and modelling; and M. A. Roche, French, with history, geography, and astronomy.

#### THEATRES ABROAD.

THE Minister of State, in a letter of the 11th inst., has announced that the construction of the new Opera House in Paris has been decided upon, at the end of the open space on the Boulevard des Capucines, at the starting point of the new Rue de Rouen, and of the branch street to be opened between this Boulevard and the Rue de la Chaussée d'Antin. The plan for the purchase of the ground had been deposited at the Mairie of the ninth arrondissement, on the 15th, and is to remain for twenty days for public examination. It contains three indications:—1. The site of the new theatre and its dependencies, occupying the space between the projected "place" and the Rue Neuve des Mathurins; 2. The trace of the two separating streets (15 inches wide), bordering the new edifice on either side; 3. The map of the lots into which it has been deemed convenient to divide the various frontages, so as to render the houses as symmetrical as possible, due attention being paid to salubrity. A design of the façade is annexed, obligatory for all constructions.

The Nannur Theatre was destroyed by fire on the 15th March last. During the preparations for a *bat masqué*, which was to take place at *Mi-carême*, an escape of gas from leakage took place: this being ignited, communicated to the decorations, and spread the flames throughout the building so rapidly, that in a few minutes the roof was consumed. At seven o'clock in the evening the fire first broke out, and at nine o'clock nothing remained but the walls. The surrounding houses were with difficulty saved from destruction.

At Nismes the theatre had a narrow escape on the 11th ult.: under the same circumstances as at Nannur, the decorations took fire about eleven a.m., from escaped gas becoming ignited in some way or other. Owing to the exertions of the soldiery the fire was extinguished, with the loss only of some scenery and furniture.

#### THE DOCTOR FOR THE POOR.

EXPERIENCE, in the working of the present system of applying medical relief to the English parishes, both in the metropolis and in the provinces, induces us to make a few brief remarks on the subject which is now before the public.

The duties of a district parish surgeon, if justly performed, are most arduous, and we gladly bear testimony to the ability and devotion with which many gentlemen, who hold this important position, discharge them. In the midst of poverty and wretchedness, terrible disease and the most sanitary conditions, it is known that district surgeons carefully attend the sick, and, by means of their influence, in a variety of ways improve the condition of their neighbourhood. They have the encouragement of knowing that they are conferring a blessing on their fellow creatures. This is, however done for a most insufficient remuneration,—a sum ridiculously small,—and this smallness of remuneration, in some instances, leads to carelessness, which has often caused death and suffering amongst the poor. Nor is this a matter to be wondered at, for all men are not enthusiasts, and they find themselves unable to provide medicine, and give sufficient time for the payment allowed, perhaps 1*s.* or 1*s.* 6*d.* for each case, on an annual receipt of perhaps less than 50*l.*

We could mention cases where death and the most distressing circumstances have resulted from the difficulty of obtaining medical assistance. It may be worth while to state that in many parishes it is a regulation that no persons, when the weekly income is above 1*s.*, is entitled to the help of the parish surgeon. This operates badly. In many instances the circumstances are such that the hospitals are of no avail. Fully admitting the benefits derived from them, and from dispensaries and other excellent institutions, we have no hesitation in asserting that *hundreds die in the metropolis alone from the want of sufficient medical assistance.* It demands consideration, whether it would not be found an advantage even to the parishes, to extend the scope of free medical relief, particularly in large towns, where rent is expensive to those with families, whose income is larger than the sum above mentioned.

In many instances, so populous is the district, and so great the need of the district surgeon, that it is impossible for any man, however anxious, to attend properly to the duties of the office. The extent and peculiar condition of districts should be considered, and the masses of the poor not left neglected: the payment of the surgeon should be such that he might not make that an excuse for inattention: proper remuneration would command improved skill and more careful consideration; and those who have seen, both in town and country, in certain instances, how the poor are still treated, will consider the provision of the extra expense as a duty. Independently, however, of that, it might be the means of restoring many to strength and usefulness, and, by saving lives of the heads of families, prevent expensive pauperism.

#### STAINED GLASS.

**Whitchurch.**—The parish church of St. Mary, Whitchurch, Oxon, has been adorned with another window, by Hardman, in the centre of the north aisle. It consists of three lights. In the centre light our Lord is represented as subject to his parents and working as a carpenter; the dexter is occupied by the figure of King David playing the harp, and seated on a Gothic throne: the sinister is filled in by an angel bearing a scroll. A large south window has been painted by Messrs. Clayton and Bell. The upper portion of the centre light comprises the figure of our Lord, to which are brought the maimed, the halt, and the blind: the under part is composed of medallions, illustrating acts of mercy. The legend, "Come unto me, all ye that labour," &c., interests the design. In the geometrical openings above angels are shown bearing scrolls. The window has been erected to the memory of the wife of Admiral Fowler, of Wallisot House.

**Knighton.**—A stained glass window has been placed in the chancel of the parish church here by Mrs. Breeze, in memory of her late husband. The window is from Messrs. Chance & Sons, of Birmingham, and its erection was entrusted to Mr. Edward Minton, of Knighton. It consists of three lights, the centre one representing the Saviour upon the cross, and the others the Apostles St. Peter and St. John.

#### MODERN CONSTRUCTIONS.

In the letter you inserted from me in the *Builder* of March 31, I should have said, the bridges I spoke of are of wrought iron for the most part, not cast, and I am well aware that the system of construction upon which they are framed was probably adopted from motives of economy; *but economy and taste are not necessarily antagonistic*, and I do think that the public have a right to expect engineers and railway directors to pay some attention to the beauty of our metropolitan streets, instead of stopping up the view everywhere by an ugly mass of heavy metal, like Malomet's coffin, "poised between earth and heaven."

On the Continent, even in the country parts, far removed from any village or town, we see beautiful bridges, finished up in the most expensive manner, and so carefully elaborated in every detail that they appear worthy of a place in some museum of fine arts rather than to be left exposed to all the fury of the elements in the midst of wilds and water-courses, where the taste and skill that have been expended on them can be rarely seen and hardly ever appreciated. This is wrong in the other direction, because it is a waste of money that might have been usefully employed to extend the road or to make branches to it. But surely, in a great city like London, the emporium of the world, the metropolis of the universe, we should not grudge the expense of a little decoration: on the contrary, we must insist upon it, for the sake of accustoming our people to refined forms.

Taste.  
"Emollit mores nec sinit esse ferus."  
Besides, it is a duty we owe to ourselves and to others to show that, while we can do great things, we have also an eye for beauty; that we have a soul capable of admiring the glorious monuments of antiquity, which are the embodiment of the thought, the experience, the joys, and the sorrows of centuries; and likewise, that we are able to transmit to posterity this hieroglyphical history of the past, together with some pages of our own, stamped with the impress of our own thoughts, our own aspirations, our own imaginations; enriched by the results of independent industry and immense improvement. They are our own treasures: they are the heir-looms of posterity. Let them not be imbued with the

spirit of parsimony or vulgarity, or devoid of feeling and taste; but let them be so designed as to raise similar feelings in the breasts of those that come after us as inspire us when we gaze in raptures upon the wondrous works of the old masters,—the chasings of Benvenuto Cellini,—the splendid structures that decorated the world in times long gone by,—the stained glass enshrouded in mystery and bathed in light; when our hearts are filled with emotion, and we taste in a few short moments the concentrated essence of sublime, soul-stirring, century-spirited symbolism.

Not that I am an advocate for "building castles in the air." We are a practical people, and it is our glory to be so; besides, the building art is essentially practical; but good taste is to be found in simplicity as well as in luxury, and can be manifested with economy as well as with lavish expenditure.

The fact is, that men who have been gifted with true taste show it in everything, no matter how small or inexpensive; while those who have not *feeling* innate in their nature can never introduce it even from a copy, although they may have millions at their disposal.

Therefore it is that we must cultivate the taste of the general public, and educate the eye of the amateur, so that art of every kind and degree may in time be estimated at its proper value. Your journal will do much towards this object by holding up for admiration whatever is truly deserving of merit, and by fearlessly denouncing, as you do, all that is calculated to vitiate public taste.

W. H. V. S.

#### MASTERS AND WORKMEN.

##### COURTS OF CONCILIATION.

THE Parliamentary Committee on the subject of masters and operatives has had occasional sittings. On the 20th it reassembled, Mr. MacKinnon in the chair, and the other members present being Lord Robert Montagu, Sir J. Paxton, Sir M. Peto, Mr. Alderman Cubitt, Mr. Slaney, Mr. Egerton, Mr. B. Cochrane, Mr. Pollard, Urquhart, Mr. Ayrton, and Sir E. Buxton.

Mr. George Potter, the secretary to the operatives during the late strike, was called and examined.—Having been informed by the chairman that the committee wished to ascertain the best means of framing a bill for the prevention of strikes, he said, in reply to questions put to him,—I believe the late strike might have been averted if the men had been enabled to meet the masters in council. I believe the principle of the bill before Parliament to be right, and that it would tend to effect the object which it contemplates.

Questions were put by various members of committee to the witness, and amongst others by Sir M. Peto, in reply to whom he said, I think there is hardly anything in the present law, as it affects the relation of masters and workmen, of which the workmen have to complain. The last Act passed on the subject has been a great boon to them. I agree with the principle of the bill now before Parliament, but think its machinery might be improved. I think it would be better to allow the council to elect a referee than to leave the appointment with a magistrate. I think the selection of the council for the men should be left to the registered men, whether they are in unions or not. As a permissive bill, I think it a step in the right direction, and believe the workmen generally approve of it.

By Mr. Pollard-Urquhart.—If it had been in operation last autumn, I think the strike might have been prevented.

Not long ago Mr. Blanchard Jerrold read a paper "On the French Courts of Conciliation," in the Temperance Hall, Townhead-street, Sheffield. The Master Cutler occupied the chair.

The chairman briefly introduced the lecturer, stating that the subject of the lecture was of great importance to all, and that if Mr. Jerrold should be the means of introducing into this country any scheme by which the frequent misunderstandings between employers and employed could be prevented, he would, indeed, deserve the thanks of every portion of the community.

Mr. Jerrold said, in opening the subject.—The object of my reading is to set before you the value of an institution which has flourished for nearly half a century among our neighbours, to the great advantage of both employers and employed. It will be for the employers and employed of this country to decide whether this most useful and flourishing French institution shall be copied, with certain modifications, in the great centres of British industry. I

offer you the results of my visits to the Conciliation Courts of Paris, because I think that a close acquaintance with the operation of these courts will raise them in your esteem, and stimulate you to demand that conciliation courts shall be forthwith established in this country.

The lecturer then entered very fully into the subject, and in conclusion he made a statement which, if wrong, ought to be contradicted by those interested. The firm of Peto, Brassey, & Betts, railway contractors, he said, had passed regulations requiring all their men to contribute 5d in the pound on their earnings as a sick fund, but so that their interest in the fund should cease immediately they ceased to be employed by the firm. They even went so far as to exclude the sufferers by chronic disease from the benefit of the fund, and to render the presentation of a card containing the rules to each workman sufficient to make him a member, any law or usage to the contrary notwithstanding. "Is it possible," he said, "to conceive anything more tyrannical, or more openly against the law of the land than these regulations, by which a large firm, I understand, yearly put 4,000, or 5,000, into their pockets?" That this is erroneous, we have no doubt.

#### THE ROYAL ENGINEER DEPARTMENT.

Sir,—The publication of the War-Office circular, addressed to the military officers of the Royal Engineer Department, only proves the urgent necessity for the reform in that branch of the public service which your journal has hitherto advocated. I say it *only proves* this fact, for it provides no remedy: to direct the attention of the military officer to the rudimentary principles of architectural composition cannot supply that practical knowledge the acquisition of which costs the civil architect years of earnest toil, and without which it is impossible to successfully design or economically construct; and it is because this indispensable quality constitutes no part of the professional education of our military engineers that the works upon which they are engaged invariably prove so enormously expensive; and, however gently the Secretary for War may touch this rotten portion of the Department's present constitution, however earnestly he may endeavour to shift the blame upon the Department's only prop—the civil branch,—nothing can remove the wide-spread opinion long since arrived at by all who have had any contact with the Department, viz., that the military officers are not competent for their present position.

It is rather unfortunate for the consistency of the circular, to find it condemning the practice of the Department in allowing the *civil* branch to design the civil works, while it recommends the *military* officers to perform that duty; and though "Mr. Herbert does not allude to the works of fortifications" in support of the necessity of his proposition, he selects several instances which cannot be considered otherwise than "works of fortification," they being outside the ordinary practice of civil architecture.

Taking these instances, therefore, the argument is not against the civil branch, but rather should be stated thus. If the instances referred to, which are solely within the special duties of the military engineers, are inappropriate and expensive, what must the civil buildings be, which are but indirectly connected with the practice of military engineering? And we can only arrive at a proper answer to this question by a thorough inquiry into the past working of the Department, which I trust will soon take place. C. E.

#### BUILDERS' ACTIONS.

**Ormes v. Beadel.**—In the Vice-Chancellor's Court, the question in this case was whether a letter, which had been signed by the plaintiff abandoning a contract to build a house at Chelmsford for Mr. Copland, had been signed by him under such circumstances of pressure on the part of the defendants as entitled the plaintiff to be relieved from the consequences of such letter. In August, 1858, the plaintiff entered into a contract with Messrs. Beadel, Son, & Chancellor, of Chelmsford, "auctioneers and architects," to build for Mr. Copland, their principal, a house at Chelmsford for 1,400l. By the fifth condition of the contract it was provided that if the works did not proceed with such progress as the architects (Messrs. Beadel & Co.) might consider necessary, they should be empowered to purchase such materials and employ such workmanship as they might consider necessary, and deduct the cost of the same from any moneys due to the contractor on account of the works undertaken by him, and

that with the exception of a sum to be received by the architects for keeping the premises in repair for six months after their completion, the whole of the money should be paid to the plaintiff during and upon the completion of the works according to the architects' certificates. During September and October, 1858, the plaintiff received 225*l.* in respect of work done under the contract, and in accordance with certificates given to him by Mr. Chanceller. On the 20th, and again on the 27th of November, 1858, the plaintiff applied to Mr. Chanceller for certificates of work done by him, but they were refused, and a dispute arose between those gentlemen. On the 11th of December, 1858, the plaintiff signed a letter, addressed to Messrs. Bendel, Son, & Chanceller, whereby, in consideration of 50*l.* then paid to him by them, he gave up the contract for building the house for Mr. Copland, and agreed that the value of the work approved by Messrs. Bendel & Co. should be estimated by Mr. Gardiner. The plaintiff's case was, that his signature to the above letter was obtained under such circumstances of pressure on the part of the defendants as entitled him to be relieved from it.

The Vice-Chanceller said that the proper decree to make would be to declare that the signature of the plaintiff, to the letter of the 11th of December, 1858, was obtained under such circumstances as that he was not bound thereby; that the contract of the 22nd of August, 1858, had been put an end to, and was no longer binding on the parties thereto, and that an account should be directed of all sums of money paid by the plaintiff for labour and materials used in the construction of the house mentioned in the suit, and if it should appear on such account that the amount so paid by the plaintiff exceeded the sum of 487*l.* 7*s.* 3*d.*, admitted by the different parties to have been received by the plaintiff, the balance should be paid by the defendants to the plaintiff: costs to be paid by the defendants, with liberty to apply.

#### ARCHITECTURAL INSTITUTE OF SCOTLAND.

At the last meeting of the Architectural Institute for the present session (Mr. Lessels presiding), a discussion took place upon the paper read at the meeting on the 2nd inst., by Mr. Robert Anderson, "On the Domestic Architecture of Italy and France during the Middle Ages and the Period of the Renaissance." Mr. Anderson gave a brief résumé of his paper, in which various arguments were brought forward in support of the superior adaptability of Gothic or Medieval architecture over either the pure Classical or the Renaissance styles to the requirements of modern civil and domestic buildings. According to the *Scotsman*, Mr. Cousin asked whether Mr. Anderson controverted the statement recently made by Lord Palmerston, in reference to Mr. Scott's design for the Foreign Offices, that Gothic architecture, except for ecclesiastical buildings, was not a national style in this country; and, if he did so, whether he could adduce any examples in Britain of Gothic or Medieval architecture in civil buildings? Mr. Anderson replied, that for a lengthened period Gothic was the only style of architecture used in this country, either for ecclesiastical or civil purposes, though the greater part of its remains applied to the latter purpose had been destroyed, especially in Scotland. Taking these facts into account, and considering that the ecclesiastical branch of the Gothic was still admitted to be the national style, he thought that the same term was applicable to it when applied to civil buildings. Mr. Cousin rejoined that Gothic was quite as much national in France and Germany for ecclesiastical purposes as in Britain, notwithstanding that there were slight differences of feature in some of the details adopted in the three countries appreciable only to professional eyes; and he could not comprehend, therefore, on what grounds the Gothic style could be claimed in this country more than in others as exclusively national. Mr. Shiels spoke strongly in favour of Gothic architecture as giving free scope to the inventive genius and constructive skill of the architect, and therefore happily adapted for every description of structures; while the Classical styles permitted little or no departure from their conventional forms, and in their forcible adaptation to domestic purposes necessitated the most deceptive expedients—such as blind windows, false fronts to hide the indispensable form of the building behind. Mr. J. D. Peddie said if the question to be decided were whether or not Gothic architecture was suitable for civil and domestic buildings, he would answer in the affirmative; but he also thought that the Classical styles could un-

questionably be used with perhaps equal advantage. He thought there was exceedingly little interest in the discussion whether Gothic was the national style in this country or not: the great question was, what was the best and most suitable style? He thought it a mistake to suppose, as some had asserted, that the Classical architect was little more than a mere copyist, while the Gothic edifices required originality of invention, as well as of arrangement. On the other hand, he would say that he had never yet seen a Gothic building, and he never expected to see one, in which he did not find quite as much copyism as in structures modelled on the Classical and Renaissance styles.

#### UTILIZATION OF TOWN SEWAGE.

EXPERIMENTS AT CARLISLE.

IMPORTANT experiments are now being made in the neighbourhood of Carlisle, according to the local *Journal*, which states that the town-council have granted upon very liberal—indeed, nominal—terms to Mr. McDougal, of Manchester, the use of the sewage of Carlisle for fifteen years. Mr. McDougal has now commenced his operations upon the Wilow Holme, which he has leased from the Duke of Devonshire for the purpose. The area of the Holme is about eighty acres. The outlet of the main sewer of Carlisle is in the lesser portion; and near the entrance from Caldwgate to the larger holme an engine-house has been erected, and a tank has been constructed by the side of the main sewer, with a sluice so arranged that as much of the sewage can be diverted into it as may be desired, as it flows down in its course to the river. Adjoining this tank a smaller receptacle is constructed, in which is mixed a strong disinfecting fluid, which is allowed to run through a small pipe into the larger tank, and there disinfect the whole of the sewage as it accumulates. A powerful pump worked by the engine then forces the sewage thus disinfected and deodorized through an iron pipe about 10 inches in diameter, which carries it to the holme, where a mode of irrigation is adopted by means of sewage canals. The fluid used as the disinfectant is one patented by Mr. McDougal, and manufactured by him at his chemical works at Chadderton, in Lancashire. It is estimated that one gallon of the concentrated essence as it leaves the chemical works will be sufficient to disinfect from 10,000 to 20,000 gallons of sewage.

#### OUR POLICE COURTS.

Your remarks will have found an echo with many whose misfortune it is to attend these dingy abodes.

They form a stinging disgrace to our legislature and criminal law jurisdiction. Take the most important,—the wretched den in Bow street—approached by a narrow single outlet, and occupying the space only of a dwelling-house. An impressive libonial tray in which foreigners may form a proper conception of the beauties of our police legislation, and the manner in which criminal and civil law elbow one another.

The recent part of the community shrink from them, and the characters they are necessarily brought into collision with,—the dregs of humanity. To them, therefore, the doors are as if barred.

But, to consider modern legislation has imposed a host of additional duties, of which often the bare name of the act involved is known only to the unfortunate adjudicators. Criminal and civil law can never be ought not to be so little considered in their varied aspects as they now are.

Commodious new police courts are much wanted,—planned with a central hall and waiting-rooms, and with not less than four distinct means of approach and egress. The comparatively new police courts are ill planned, and public convenience is in no way considered or cared for.

Some classification is also desirable, and means should be taken to separate the bad characters who swarm in these congenial spots from those who attend in the furtherance of duties having no reference to criminal law.

SOUTH CIRENCE.

#### SCHOOL-BUILDING NEWS.

**Bristol.**—The foundation-stone of the Infant and Sunday Schools about to be erected, in connection with St. Clement's Church, has just been laid. The building, consisting of school and classroom, with teacher's residence, will be in the Early Decorated style of architecture, from the designs of Mr. S. B. Gabriel, of Bristol, architect. The expense of erection, including ground, will be about 1,400*l.*, part Government grant, and the rest subscription. About 1,200*l.* have been obtained. The contractors are, Mr. John King, builder; Mr. John Lawrence, carpenter; and Mr. H. Nelson, plasterer.

**Ironbridge.**—A National School has been inaugurated at Ironbridge, according to the *Shrewsbury Chronicle*. The building, which has been erected according to drawings by Mr. Samuel Nevett, is in the Elizabethan style. It comprises a boys' school-room, 57 feet by 29 feet, and class-room, 11 feet by 14 feet, and a girls' school-

room, of the same dimensions, with teachers' residences. The building is constructed of blue brick, with Bath-stone dressings. In the centre of the front is a bell turret and vane. The windows to the west are surrounded with a plain border of stained glass, of ruby colour. The roof is an open one, of stained lead, and covered with blue tiles. The builders are the Messrs. Nevett, of Ironbridge, under the superintendence of Mr. T. Smith, of Madeley. The cost of the building, with the school furniture, is about 2,000*l.*: of this sum, 1,194*l.* 12*s.* 6*d.* has been raised by voluntary subscriptions.

**Manchester.**—The foundation-stone of Christ Church new schools, Moss Side, has just been laid, according to the local *Advertiser*. A sum of 1,700*l.* has been subscribed, and there remains a further sum of upwards of 300*l.* to be raised to complete the cost. The architects of the school are Messrs. Robert Goldsmith and Son. The building is of the Decorated order, has two floors, and an open timbered roof. The length will be 72 feet by 32 feet; the height of the lower room 41 feet and the upper 31 feet. On the ground floor are boys' and infants' school-rooms, with class-rooms, and rooms containing boiler and other conveniences. The room on the second-floor is set apart for girls, and runs the entire length of the building. In the roof there will be provision for regulating the heat and cold. In the principal front there will be four gables, in which are three-light windows, with tracery heads. On the south end will be erected a bell-turret. The schools are to be built of brick, and faced with Yorkshire pier-points and Hollington dressings. The contract for the work has been taken by Mr. Mark Forgett. When completed, the schools are expected to accommodate 640 children.

**Sheffield.**—The chief stone of the new schools about to be erected in connection with the Wicker Congregational Church, has been laid. The site is at the rear of the church, and on the same plot of land. The principal front, towards Gower-street, is 138 feet long, and the flanks at either end, forming the gables, are 36 feet wide. The schools are arranged to fit the peculiar shape of the ground. On the basement story is the lower day-school, for 300 children. Immediately over this room, and approached by an entrance-hall leading from Gower-street, is the principal school-room, about 60 feet long, with accommodation for 400 children in classes. From the same entrance, and also from the porch, the other school-room is approached, which, like the last named, is 25 feet high, and for 250 scholars. There are also four class-rooms for about 150 scholars. A house for the chapel-keeper is situated between the schools, with a frontage towards Gower-street. The outer walls are of Dunford-bridge stone, with ashlar dressings, similar to the church. The woodwork is stained and varnished, and the windows are glazed with leaded panes. The estimated cost is 1,500*l.*, exclusive of warming apparatus, gas, and other fittings. Messrs. Joseph & Alfred Craven, of Sheffield, are the contractors; Mr. Wm. Abbey is the clerk of works; and the architects are Messrs. Hadfield and Goldie, of Sheffield, under whose superintendence the work is now being carried out.—The chief stone of St. Stephen's Church schools has been laid. They will be closely adjacent to the church, and will be of two stories, of stone, and in plain Gothic style: near them will be the residence of the schoolmaster. The estimates for the whole erection are about 2,200*l.*, including the site and the master's house. The architects are Messrs. Flockton & Son, of Sheffield.

#### Books Received.

*The Book of Ornamental Alphabets, Ancient and Modern.* By F. DELAMOTTE. Third Edition. Spon, Bucklersbury. 1860.

In this new edition the errors we pointed out in the first have been for the most part rectified, excepting in the case of the numerals, which are still altogether erroneous. The date given as an example between the words ninth century and twelfth century is in truth 1554. Bating this, however, Mr. Delamotte's book will be found very useful by a large class unable to obtain more costly works.

*The Engineer's Handbook.* By CHAS. LOWNDES, Engineer, Liverpool. London: Longman & Co. 1860.

THIS is a very useful little book, containing principles to guide in the construction of machinery, and many valuable rules and tables concisely stated.

## Miscellaneous.

**BAILLE'S TABLE FOR GLASS CUTTERS AND BUILDERS.**—What Mr. Baille calls his "Magic Roller Measurement Table," shows at once the contents of any size of glass, from 7 by 5, to 70 by 37, half an inch at a time, "effecting a calculation in a few seconds, which would require upwards of twenty figures by the ordinary method." It is very cleverly arranged so that the required dimension may be found with rapidity. In country places it will be found more useful, probably, than in large towns, where the glaziers and many builders by their glass cut into squares; while in the country they are obliged to keep crates of glass to meet the various sizes wanted.

**MORTALITY AMONGST MOUNTAIN SHEEP: A WARNING.**—We hear that the weather has destroyed a number of sheep, not only on the hills, but on the low grounds, a Cart-load of skins have been forwarded to Penrith, and other towns and villages in the neighbourhood of the hills; and they still, nearly daily, keep arriving from the fells. Never, in the memory of the oldest shepherd on the hills of Westmoreland, can be remembered so fearful a mortality. Throughout Ireland, and North and South Wales, there have also been great destruction and loss amongst cattle, sheep, and lambs. Our town agriculturist and our Government should look in time to the future. Most of the great plagues and pestilences have been preceded by elemental disturbances, continued through several seasons, heat, drought, and cold. Any one, or all, in excess, may destroy or injure plants. Animals suffer next, and then man. Cholera is raging in North Africa at present. We would most earnestly appeal to our Government and to all Local Boards, Guardians of the Poor, and others having charge over the public health, to commence sanitary operations in time. If any cleaning away of foul refuse be required, this should be done immediately: closed rooms should be ventilated, and there ought to be a most liberal use of the limewash bucket and brush. Meat inspectors should be on the alert, and Government ought more narrowly than usual to watch over salt and preserved meat contracts. The old proverb of "a stitch in time," should be attended to in sanitary matters.

**THE EARL OF AIRLIE ON "THE LIFE OF STEPHENSON."**—A lecture in connection with the Glasgow Athenæum was recently delivered in the City Hall, Glasgow, by the Earl of Airlie, on "The Life of George Stephenson," to a numerous, though not crowded assemblage, the audience being partly composed of the working and middle classes. Sir Archibald Alison introduced the noble "Head" of "The Bonnie House o' Airlie" to his audience.

**THE BUILDING TRADE AT REDDITCH.**—Within the last week or two the builders in this neighbourhood have raised the wages of their bricklayers and labourers. But for the scarcity of bricks just now an unusual amount of building would be going on: houses are scarce and much wanted, more especially for the humbler class of operatives, many of whom are living in tenements scarcely eligible for dog-kennels. Thirty or forty tenements, it is said, will shortly be erected in this town upon an improved plan.

**MONUMENTAL.**—Dr. Watt's memorial scheme is progressing. Mr. Lucas, of Chilworth Tower, according to the *Hampshire Independent*, has the work in hand. The statue is composed of Sicilian marble, and the figure will stand 8 feet high. The height of the whole fabric will be 19 feet. The committee propose polished grey granite for the pedestal.

**THE ABBEY GATEWAY, READING.**—After more than once being threatened with removal, the corporation, it is now stated, have determined to attempt to raise a subscription for the restoration of the Abbey gateway, and will vote a certain sum for the improvement. It will be remembered that the British Archaeological Association, when they met at Reading last year, expressed a strong opinion against its possible destruction. Reading should preserve all its memorials of the past: the expenditure would be amply repaid by the increased attractiveness of the town.

**KENT.**—A county police-station has just been completed at Seabrook, between Folkestone and Hythe, containing six cells, and reception-room for prisoners; petty sessions room, and residences for the superintendent of police, the lock-up keeper, and the groom constable, with stabling, &c., and other offices. The works have been executed by Mr. J. Edwards, builder, Folkstone, under the direction of Messrs. Whitehead & Blandford, architects, Maidstone.

**PAINTERS' STRIKE AT GLASGOW.**—A large body of journeymen house-painters are on strike in Glasgow. It appears that the men are accustomed to make up a price of wages list at this season of the year, which they present for the approval of the masters, to be binding for twelve months. The employers state that they have no objections to pay the wages which the men demand, and which they have of late been in the habit of receiving, but they decline to be bound in writing for a year. Upon this, the Union has at once ordered a strike. A number of the masters, according to the local *Gazette*, have agreed to the terms of the journeymen, but the largest firms, or masters who employ 500 out of the 700 men in Glasgow, have resisted.

**THE BOYNE VIADUCT.**—Mr. Hawkshaw, in a report on the safety of this structure, says,—"I am quite sure that the care you have bestowed on this subject ought to assure the public against all apprehensions, nor are there, in fact, any grounds for alarm, as the viaduct is now perfectly safe and secure."

**HOSE RAILWAYS IN BIRKENHEAD.**—At an adjourned special meeting of the Birkenhead Commissioners, the surveyor reported, with reference to the laying down of horse-railways along the roads in Birkenhead, that he did not see any reason for opposing the plan, but should rather recommend it, as deserving of favourable consideration. Eventually the appointment of a committee was agreed to. Mr. Train was in attendance with a model of the carriages and section of rails. A committee meeting was held after the general meeting, and it is understood that the committee agreed to leave the engineering details to be arranged by the surveyor with Mr. Train, and the legal questions to their law-clerk and Mr. Train's solicitors.

**INDURATING THE HOUSES OF PARLIAMENT.**—A return published of all sums paid for indurating or preserving the external stonework and the iron roofs of the Houses of Parliament since the year 1853 shows that 3,517l. 10s. 11d. have been devoted to that purpose. The works appear to have been undertaken by Mr. G. B. Daines and Mr. N. C. Zerelmeij. The former gentleman received 1s. per yard superficial for stonework and 1s. 10d. per yard for the iron roofing. Mr. Zerelmeij was paid 2s. 2d. and 2s. per yard for the roofing, and 1s. per yard for the stonework. Referring to the decay of the stone used in the new Houses of Parliament, Sir Charles Barry says:—"The decay which has taken place in the stone employed in the new palace seems to be confined principally to the parapets, where the stone is exposed on two faces; also in the water-tables, cills, cappings, bases, and plinths, and the courses of stone above and below them, within the influence of the drippings and splashing of showers of rain (particularly where opposed to the south and south-west winds), and to a very limited extent on the plain faces of the ashlar, owing probably to soft varieties of the stone. A fruitful source of decay is also due to the unusual and extensive use of water externally, for purposes of ventilation, by which a considerable portion of the masonry is constantly rendered alternately wet and dry; which should be prevented, if possible, as it is the severest test to which any stone can be subjected. Experience has fully satisfied my mind that in proportion as stones are absorbent, so in proportion is the extent of discoloration and decay which ensue in a smoky and impure atmosphere like that of London."

**THE LIGHT ON WESTMINSTER-BRIDGE.**—I am not an individual who discovers something very consulting in finding fault with everything, but I really do think the lime-light (as I believe it is called) on Westminster-bridge is too brilliant. I fancy it would be better if surrounded by ground glass. If it is brought into general use, and permitted to blaze away as it now does, one half of the inhabitants of London will go blind; and that you will own is a consideration. I remember when gas was first used in London, and a very excellent light it was that was provided (if my memory does not play me false), much better than the miserable stuff now in general use in our streets; so that this light, being a decided improvement, should be applauded rather than condemned, and will, I have no doubt, prove a great boon, if rendered useful without being injurious.—**PRO BONO PUBLICO.**

**LIVERPOOL CEMETERY COMPETITION.**—In our paper of the 14th inst. it was mentioned, in a resolution passed by the Burial Board, that the plans sent in under the motto of "Gottesacker," were among others deserving of commendation. We are asked to say that the design under the motto "Gottesacker," was by Mr. Charles Turner.

**A NEW MODE OF REMUNERATING ARCHITECTS.**—In a recent number of the *Builder* appears an advertisement from the Burial Board of the parish of Ealing, Middlesex, inviting "tenders from competent persons to fill the joint offices of architect and surveyor to the board. Candidates to submit plans for two chapels, entrance lodge, and gateway, to be erected upon the proposed burial-ground, at a cost not exceeding 1,400l.; and also to state the terms per day for the necessary duties as surveyor."—Z.

**INSTITUTION OF CIVIL ENGINEERS.**—At the meeting, April 17, Mr. Bidder, the president, announced that the late Mr. Joseph Miller, for many years a member of the council, had bequeathed to the Institution 5,000l., of which 3,000l. would be receivable immediately, and 2,000l. on the demise of a gentleman resident in the West Indies. The funds of the Institution would thus be materially augmented, as there would also be soon receivable the bequest of 2,000l. from the late Mr. Robert Stephenson. To these amounts must be added the sum of nearly 5,000l. bequeathed by the first president, Mr. Telford; of 200l. presented by Mr. Charles Manly; and of 1,000l. which had recently been invested out of income. The total invested property would thus ultimately become 13,094l. 12s. 4d. The paper read was "On the Efficiency of various kinds of Railway Breaks, with experimental Researches on their retarding Powers," by Mr. W. Fairbairn.

**THE PROPOSED LONDON PAUPER LUNATIC ASYLUM.**—At a recent meeting of the Common Council, Mr. Deputy Dakin brought up a report from the special Lunatic Asylum Committee, with plans and estimates for the erection of a pauper lunatic asylum for the City, at an expense, exclusive of furniture, of 65,000l. The report stated that, upon the resolution of the court, to defray the cost out of the City cash, the committee entered into communication with the justices relative to the site at Stone, near Dartford; that they found that site to consist of 33 acres, at 100l. per acre; that a deposit of 250l. had been paid; and that the site had been approved of by the Commissioners of Lunacy. That the committee directed the comptroller to complete the purchase, which he had done; and that they then instructed the City architect to prepare plans for a building suitable for 310 patients. That the plans so prepared were approved by the committee, but amended, so as to provide for 328 patients; that the cost of carrying them into execution, according to the estimate of the City architect, would be about 65,000l.; and, finally, the committee asked that the report might be referred back to them for execution, after approval by the Secretary of State. The report was ordered to be printed, and circulated among the members of the Corporation, the committee, at the same time, being empowered to submit plans for approval to the Secretary of State.

**ROYAL ITALIAN OPERA, COVENT-GARDEN.**—In Madlle. Cellig, who made her first appearance here last week, in Beethoven's "Fidelio," Mr. Gye has an artist of more than common ability and power. The opera, noble and beautiful as it is, is not popular in England; and admirably as it suits the singer, many will probably wait till she appears in some other part. Her acting is as good as her singing, and in a popular part, such as the sorrowing mother in "Le Prophète," we anticipate for her a striking success. For the re-appearance of Grisi and Mario in "La Favorita," on Tuesday last, some new scenery has been painted, but we have not yet seen it.

**A COVERED MARKET FOR MALTA.**—A contract has been taken by Messrs. Emmerson and Murgatroyd, of Stockport, for the erection of a covered market in Malta, to be constructed of iron and glass. The structure will be temporarily erected in a large field in Heaton Norris prior to its shipment.

**COTTAGE BUILDING.**—The new number of *The Quarterly* (Murray) contains an article on Labourers' Cottages, illustrated with some plans. The writer gives the preference to a cottage designed by Mr. C. W. Strickland.—An elegant volume, called "Country Cottages," by Mr. John Vincent, architect, has been published by Messrs. Spott, Bickersbury, to which we shall refer in due course.

**THE ARCHITECTURAL EXHIBITION.**—Sir, — Will you kindly permit me to remind the writer of the critique on the Architectural Exhibition that Brisbane, South Australia, possesses the advantage, or disadvantage, of a tropical climate, and that therefore, in designing a church for such a locality, the great object is, of course, to exclude the light by means of very small windows?

W. BURGESS.

**STEAM TRAIN FOR THE INDIAN RIVERS.**—A train of barges, built by Messrs. John Reid & Co. of Port-Glasgow, for the Oriental Inland Steam Company of London, has been tried on the Clyde with satisfactory results. The train consists of a steamer and five barges, of the collective length of 900 feet. The breadth of the train is 30 feet, and the depth of the hold about 7½ feet. The draught of the barges, when light, is about 10 inches, and it is reckoned that, on a draught of about 2½ feet, the train will carry about 2,000 tons of cargo. The engines, which are on the high and low pressure principle, have been constructed by Messrs. Fawcett, Preston, & Co., of Liverpool. The different barges of the train are articulated to one another by means of circular joints, so as virtually to constitute a long flexible vessel presenting only one bow to the water.

**ROYAL DRAMATIC COLLEGE.**—The first brick of this institution was laid on Monday, by its master, Mr. Benjamin Webster, assisted by several of the officials connected with the project. The site is at Maybury, near the Woking station of the South-Western Railway.

**DRINKING FOUNTAIN MOVEMENT.**—The Bath City Act Committee have given permission for the erection, by a private individual, of a drinking fountain in Ladywood, at the back of Paragon-buildings. The proposed fountain will be composed chiefly of Bath freestone, the architrave and arabesque groups of white lias, the columns of red and gray polished granite, and the capitals of white veined marble. It will comprise a drinking-basin, a trough for cattle, and one for dogs.

—The Town Council of Brighton some time since gave leave for the erection of a public drinking-fountain in the Queen's-road. The fountain is now nearly completed. The site chosen is the centre of the open space at the top of Gloucester-lane, opposite the Colonnade Hotel. The design has been furnished by Mr. E. E. Scott, architect. The structure is 12 feet in height, and is in the Italian-Gothic style. It comprises two drinking-taps,—one facing the terminus, and one on the south side,—which are placed under stone canopies, so as to secure the coolness of the water. There are also two water-toughs,—one for horses, and another below it for dogs. On the eastern side there is a raised platform for resting handens on. The material of the fountain is Portland stone; but it is relieved with a tablet of polished red granite, which bears this simple inscription, "Erected by an inhabitant, with the co-operation of the Town Council and the Water Company."

**AN ELECTRIC TARGET-INDICATOR.**—We find the following paragraph in the Liverpool Daily Post, of Tuesday last:—The Electric Target.—This ingenious invention was tested yesterday, on the practice-ground of the Cheshire Volunteers, at Leasowe. The target is a massive iron frame, divided into three segments, centre, upper, and lower divisions, and these segments are connected with electric batteries and a galvanometer, which instantaneously indicates the portion of the target which the bullet has struck. All need of signalling, &c., is thus done away, and any danger to life prevented. The marksmen may all stand close to the indicator, and the firing continue uninterrupted during the whole time of practice, a faithful record being presented of the number of hits; and the target may be so divided that spaces of a few inches can have each a separate wire and needle in the indicator. In the shooting, the full advantage of the target was perceived. One of the electric targets, it is added, has been fitted up at Hythe, and the time and danger-saving result has given the greatest satisfaction. General Hlay having expressed his opinion of the invention in very high terms. The cost is moderate.

**MALLEABLE IRON CASTINGS.**—A new method of malleablizing iron castings is announced in the New York Tribune to have been discovered by Professor A. R. Eaton, of that city. It consists in exposing the castings to the contact of oxide of zinc, as a substitute for the oxide of iron in the furnace. It is stated that the employment of the oxide of iron which combines with the excess of carbon in iron castings when long exposed to red heat, leaves a spongy residuum on the castings, which is obviated by the zinc oxide, because the zinc is volatile and passes off, leaving the oxygen gas to combine with the carbon in the iron; although, were both metals equally fixed, the zinc would rather deprive the iron of oxygen than the iron the zinc.

**"HEARNS OF OAK."**—Sir: Can you inform me if Mr. Evans has furnished a list of the competitors, or the names of the three successful artists, to any publication where it could be read in the provinces?—**"ONE OF THE UNSUCCESSFUL."**  
\* \* \* The names have not reached us.

**BLACKFRIARS-BRIDGE.**—The Bridge-house Committee reported, at a recent meeting of the City Common Council, that from June, 1850, when the defective state of the pier of this bridge was first discovered, to the end of 1859, the expense of providing and maintaining temporary supports had amounted to about 6607. a-year; that these supports, besides being very unsightly, were a great obstruction to the navigation of the river; that no other pier had sunk, and there had been no further subsidence since the supports were applied. The committee were, therefore, of opinion that the time was come for permanently repairing the bridge by rebuilding the defective pier and the two adjoining arches, and they asked authority to inquire and report upon the subject. After some discussion the report was agreed to.

**PROPOSED IMPROVEMENT OF JANSEY HARBOUR.** The Harbour's Committee, according to the Jersey Times, recommend the deepening and making into a wet dock the old harbour, widening the old North Pier to 150 feet, thereby giving increased accommodation along the east side of Albert Harbour. The breadth of the new quay will allow room for the construction of warehouses. A landing jetty will also be run out from Victoria Pier to low water.

TENDERS

For taking down and re-building the Episcopal Palace at Gloucester. Mr. Ewan Chalmers, architect. Quantities supplied by Mr. T. W. Goodman and Mr. J. A. Banker:—

Williams	£11,652 7 0
Bectonell	10,038 5 11
Clark & Son	10,834 0 0
Holland & Hammen	10,790 0 0
Estcourt	10,350 0 0
Lilley	10,182 11 0
Wingate & Son	9,750 0 0
Moore	9,991 17 0
Jones & Son	9,379 0 0

For Romford Drainage. Mr. Edward Gotto, engineer. Quantities supplied:—

Robson	£8,054 6 9
DeBick	6,957 7 8
Taylor	6,413 6 11
Harcourt	6,342 7 10
Hill	6,342 0 0

VOL. XVIII.—No. 900

The Post-Office.

**S**WIFT as a post, is a comparison that has been used from the Scripture times, to express great speed and activity. In Great Britain in recent years, when the genius of Macadam and the spirit of the coach proprietors had raised the speed of travelling to the rate of from eight to twelve miles an hour, the Royal Mail was the surprise of all, and only a few thought that the rapidity of the English post could be increased; but George Stephenson, and those who worked with him, showed, that it was "not a tempting of Providence" to travel by the help of the locomotive at the rate of thirty, forty, and even sixty miles an hour.

It is worth while just to glance at the historical summary of the postal service.

Letters, for both public and private persons, were originally sent by especial messengers only, and more recently by common carriers, who began regularly to ply with their "pack-horses" about the time of the Wars of the Roses. Government posts, in the shape of relays of horses, were not established until about two centuries later; but as early as the time of Edward II., horses were kept by private individuals for hire, so that a person might travel post, that is, by relays. In 1481, Edward IV., then at war with Scotland, is said to have established a system of relays of horses, the post stations being twenty miles apart, so that despatches were carried 200 miles in three days. In 1548, the charge for post-horses impressed for the service of the Crown, was by statute (2 & 3 Queen Elizabeth; Edward VI., c. 3), a penny a mile. Camden says, that Thomas Randolph was chief postmaster of England in 1581; and it appears that in Ireland, the first horse-post was established during O'Neill's wars, for the purpose of bringing military intelligence.

The first establishment of a letter post by the Government was in the reign of James I., who, as is stated by a proclamation of Charles I., set on foot a post-office for letters to foreign countries, "for the benefit of the English merchants." It was not till the reign of Charles I. that a post-office for inland letters was established. This new establishment was entrusted to Thomas Witherings, who had before been appointed Foreign Postmaster, but in 1640 he was suspended for alleged abuses in both offices. Philip Burlamachy then became postmaster and the superintendence of the principal secretary of state. About this time the conveyance of letters by the new method excited opposition, and in 1642 a committee of the House of Commons was appointed to inquire into it; but the utility of the institution was too great to permit of its abandonment. In 1644, Mr. Edmund Prideaux was appointed by both Houses of Parliament to be Chief Postmaster; under the management of this official, a saving of a public charge of 7,000*l.* a year in maintaining postmasters was effected.

In 1649, the Common Council of London set up a post in rivalry with that of the Government; this, however, was not approved of. At the beginning of the system, the postmaster was allowed to take the profits, in consideration of his bearing the charges. Afterwards, however, as the revenue increased, the office of postmaster was farmed, and this practice of farming was continued, as regards the hy-

posts, till almost the end of the eighteenth century. In 1649, the amount of the revenue derived from the posts was 5,000*l.*; in 1657, under the authority of Cromwell and his Parliament, the post underwent considerable changes. The ordinance under which this was effected, gives as a motive for the establishment of posts, "that they will be the means to discover and prevent many dangerous and wicked designs against the Commonwealth."

At the Restoration, the settlement of the Post-office was made the subject of a fresh enactment. In the year 1663, the revenue of the Post-office was settled by an enactment on James, Duke of York, and his heirs male in perpetuity. At this time it had increased to 21,000*l.*, that being the sum at which the office was farmed. In Scotland, at that time, no inland post was in existence, and it was only in the time of William III. that, in 1693, the Scotch Parliament passed an Act for the general establishment of a letter post.

In 1683 a penny post for the conveyance of letters and small parcels about London and its suburbs was set up by Robert Murray, an upholsterer, who assigned the same to William Dockwra; this was opposed, but, nevertheless, the undertaking was so successful that it excited the jealousy of the Government, who seized this the first district London post, though a pension of 200*l.* a year was afterwards granted to Dockwra. At first there appears to have been no limit to the weight of a packet sent by the district post, but its value was ultimately restricted to 10*l.* In 1685 the revenue of the Post-office, which had been conferred on the Duke of York, now that the prince had succeeded to the throne, was settled on the king, the amount being estimated at 65,000*l.* a year. In 1698 Dockwra was removed from his office on a charge of mismanagement and misappropriation.

In 1708 an attempt was made by Mr. Povey to establish a halfpenny post, in opposition to the established penny post, but that was suppressed by a law-suit. In 1710, in the reign of Queen Anne, the old enactment respecting the Post-office was repealed, and a new one made providing for a General Post-office for the three kingdoms and the colonies, under one head, who was to bear the style of Her Majesty's Postmaster-General.

In 1720 Ralph Allen was granted the lease of the cross posts for a life rent of 6,000*l.*, and carried out various improvements, and gained profits of 12,000*l.*, which he continued to receive for upwards of forty-four years, spending it mainly in works of charity and in hospitality to men of learning and genius. In 1764, on the death of Allen, the cross posts were put under the management of Mr. William Ward, who, for a salary of 300*l.* a year, undertook to hand over the profits, which then amounted to about 20,000*l.* a year. This branch rapidly increased, and in 1799, when it was transferred to the General Post-office, the annual profits amounted to 200,000*l.*

In 1784, a great reform was made in the Post-office, by Mr. John Palmer. Up to that time the mail-bags had been carried by post-boys on horseback. In many instances these were idle boys without character, mounted on worn-out hacks, and who, so far from being able to defend themselves, or escape from a robber, were much more likely to be in league with him. Mr. Palmer, who was the manager of the theatre at Bath, had observed that when the tradesmen of that city were particularly anxious to have a letter conveyed with speed and safety, they were in the habit of enclosing it in a brown-paper cover, and sending it by coach, though the charge of that conveyance was much higher than the postage of a letter. He, therefore, proposed that the mail-bags should, as far as possible, be sent by the passenger coaches, accompanied by well-armed and trusty guards. He also suggested other important alterations; for example, that the mails should be so timed as to arrive in London, and as far as it might be at other places, at the same hour, so that the letters might be delivered altogether, and that they should be despatched from, and arrive in, London, at a time convenient to the public, the mails having hitherto left London

at all hours of the night. This plan met with great opposition, but Mr. Pitt saw the merits of the improvement, and under his auspices an Act of Parliament was passed, authorising its adoption.

Mr. Palmer was appointed under the Controller-General of the Post-office, to superintend the carrying out of the scheme, at a salary of 1,500*l.* per annum, together with 2*l.* per cent. upon any excess in the net revenue, over 240,000*l.* The speed of the mails was at once increased from 3½ to more than 6 miles an hour, and subsequently a swifter rate was effected. In 1792, although Mr. Palmer had ably performed the duties of his office, he was suspended from his functions, and an allowance of 3,000*l.* a-year (a sum much below the emoluments to which he was entitled by agreement) was assigned to him in lieu of it. He memorialized the Treasury against this arrangement, but without success. However, he petitioned Parliament, and in 1813, after a struggle of many years, a Parliamentary grant of 50,000*l.* was made to him. In 1792 a Money Order-office was first set a foot. In 1796, the rates of inland postage were raised to a scale, varying from 3*d.* to 9*d.*, and they were afterwards raised much higher. In 1799, an Act was passed, authorizing the Postmaster-General to send bags of letters by any private ships, such letters being charged at half the packet rates. This is the origin of the ship-letter system, under which the postal communications, are conveyed to every part of the world by private ships. In 1814, measures were taken to provide a new General Post-office, the old one in Lombard-street having become too small for the business to be transacted. It was not, however, until 1829 that the present building in St. Martin's-le-Grand was opened for use. Year after year the speed of the mails was increased, and in 1830, upon the opening of the line between Liverpool and Manchester, the mails were for the first time conveyed by railway. In 1835 Lieutenant Waghorn commenced transmission to India, by the direct route through the Mediterranean and over the Isthmus of Suez, a line of communication subsequently extended to China and Australia.

Early in 1837 Mr. Rowland Hill broached his plan of penny postage, which was adopted in 1839, and carried into effect in the beginning of the following year.

Such is the history of the progress of our post-office system, which has led to the establishment, as its chief centre, of the great building in St. Martin's-le-Grand.

In this monster establishment there are now employed about 1,700 persons of various grades; this, however, is but a small portion of the army of more than 2,000 men who are engaged in delivering letters to the ten districts of the metropolis. The whole number of persons employed in the Department of the Post-office in 1858 was 24,372.

Those acquainted with the General Post-office will have remarked that a covered arcade passes through the centre of the building towards the Goldsmiths' Hall. Here are letter-boxes, offices for inquiry, notices, and a place for the delivery of the letters of those who have arranged to leave them to be called for. Here, too, the vast number of newspapers are brought which require to be passed through the post; we will, however, without particular notice, leave this, and enter the portion of the building to the northward, where, in passages of no great width, are hung at short distances leathern water-pipes, fastened to other pipes ready for immediate use. Numerous doors—marked and numbered—belong to various offices; one of which is apportioned to the Vice-Controller of the Circulation department. Here we are introduced into a room in which many gentlemen are busily engaged in writing and other business; and, in a separate room, find the head of this important department, who has kindly consented to place us under excellent guidance for the purpose of viewing the wonders of the General Post-office. First, then, let us peep at the Library, which, although but recently established, contains between 3,000 and 4,000 well-selected volumes, many of them presents from the Prince Consort, the Bishop of Exeter, eminent

authors, and others of rank and position. This is managed in the same way as the excellent library at the Bank of England, and is already found most useful to upwards of 500 clerks and others who are engaged here. Adjoining the library is an airy and well-lighted reading-room, in which are to be found the leading periodicals, globes, maps, and chess-boards. In another apartment interesting lectures have been given from time to time, by gentlemen belonging to this office. Besides the library just mentioned, there is another, which is unfortunately not so extensive, for the use of the letter-sorters, &c. Let us, however, leave this pleasant feature of the Post-office, and walk to a room of large size, in which a sound is heard like the rustling of a ripe corn-field, together with a curious hum of voices. Here, seated at a table, are more than a hundred persons, most of them intently engaged in opening and redirecting letters which have not got into the hands of those to whom they were addressed. At first it seems surprising that such a large staff should be needed for this purpose. It is not so, however, when we learn that in one year there were about 1,700,000 letters, being equal to about 1 in 300 of the whole number, returned to the Post-office, in consequence of failure in the attempts to deliver them.

Owing to the same cause about 570,000 newspapers were also undelivered in a year, being 1 in 124 of the whole number.

With great activity the clerks carry forward this work, and evidently no time is allowed as has been supposed, to pry into the secrets of correspondents. This department was formerly called the Dead-letter Office, but is now known as the Returned-letter Office. It is a marvellous sight to see the vast mass of letters of all kinds, and the large amount of trouble which is caused in a great measure by the carelessness or want of thought of writers. In many instances, letters, containing valuable property, through hurry or inadvertence, are dropped into the letter-boxes without any address at all.

More surprising still is the appearance of the great room in which the chief part of the English letters are sorted and placed in positions from which they can be readily tied together and put into bags at the time appointed for the conveyance of them to their several destinations. In this room, which is of good proportions, and with the exception of the deficiency of light, a fine apartment, in the busy parts of the morning, about 467, and in the evening 378, persons are engaged in stamping, sorting, and arranging the letters, which, in countless multitudes, meet the eye in all directions, having been brought to this and the other sorting-rooms from the places where they are delivered into the General Post-office. By means of steam power, baskets-full of letters are continually being raised by lifts similar to that which is in use at the Colosseum in the Regent's-park. As rapidly as they arrive at the different mounts of the office from various quarters the huge baskets of letters are emptied on large tables, from which they are carried by armfuls to be stamped with the date, and, at the same time, have the postal stamp partially obliterated. This is still, to a certain extent, done by hand, at the rate of about sixty a minute. There has, however, been an ingenious method of stamping invented by Mr. Pearson Hill, which enables one person to stamp, in the usual manner, 140 letters in a minute. From end to end of this room are counters, along the centre of which run raised partitions, fitted with spaces for the reception of sorted letters. These spaces are labelled with all the towns and places for postal delivery in the United Kingdom. One table on each side affords accommodation for six or seven sorters, who, each in his allotted space, arrange their letters in "roads." Take, for instance, one of the number, and we find the letters for Bedford and six other adjoining towns labelled. At this table there are six or seven places for Bedford letters, and the same as regards other towns,—each in charge of one sorter. The mail for Bedford will not depart until the evening; but as the letters for this road drop in, they are collected and carefully arranged under their proper label, and, when necessary, the six or seven packets are gathered together. The letters are divided into groups for the different parts of the kingdom; then each of them is divided into districts, and these again into "roads" similar to the arrangement just mentioned. The visitor to the Post-office will note that in addition to the labels of the names of places, there is one division

\* A marked improvement has taken place in this respect, for in 1857 the number of returned letters was 2,400,000, or 1 in 230.

† 155 gas-lamps are needed to light this department.

marked "Blind." This is for the reception of letters the direction of which cannot easily be deciphered, and which are placed there to be forwarded to the "blind readers," a name which gives a very wrong notion of them, for it would puzzle the most painstaking antiquary accustomed to the study of time-worn inscriptions, or faded and cramped manuscripts, to discover the meaning of the directions on many of the documents which these "blind readers" yet contrive to make out. In this office the gas-light seems to be needed even in the middle of the day. In a part of this room is a raised seat for the gentleman who has the superintendence of those who are engaged in the operations which are here busily carried forward. Communicating with this large room by open arches are a series of offices for the various London districts, ten in number. In connection with the whole of London and the separate districts, the same process of division and sub-division is carried forward, and certain metropolitan streets and squares are classed and lettered as a particular "road."

In each of the postal districts of London the sorting of letters is, to a certain extent, carried forward in a special central post-office, which has been provided in ten central situations; for instance, if a letter is posted to any part of the northern district, addressed "Mr. ———, No. ———, street, N."—that letter will be almost immediately delivered, and not passed through the General Post-office at all. This relieves the central establishment, and it cannot be too well known that the marking of letters with the district initials not only facilitates the operations at the General Post-office, but causes letters to go more quickly into the hands of those to whom they are addressed. This will be readily understood when we consider that all the metropolitan letters which come to the General Post-office are, in the first instance, grouped together, and then sorted for the various district offices in the General Post-office. It would, of course, be much more easy to divide the letters with rapidity if legibly marked S.W., or N., as it may be, than if the street and neighbourhood were simply mentioned.

There is no arrangement in this vast metropolis which is more surprising to a stranger than the collection and delivery of the London district and inland letters. In 1859 the distance over which mails were conveyed by mail-coaches, railways, foot-messengers, and steam-packets was about 133,000 miles per day, this being about 3,000 miles more than in the year ending 1857. In the year 1859 the whole distance traversed by the various mails was thirty-seven millions, five hundred and forty-five thousand miles! In 1858 the number of letters passed through the post-offices of Great Britain amounted to 523,000,000. The average to each person in England was twenty-two letters; and each person in London it was forty-six.

Heaps of letters here meet the eye. What mingled notes of joy and sorrow, what wonderful surprises, weighty business, and valuable property are here sealed up! Letters of love and hate, of births, marriages, and deaths,—words to delight and words to undo. Their contents, by the way, are at times curious; and it has been necessary to forbid the carriage by this means of glass bottles, razors, scissors, needles, knives, leeches, game, fish, vessels containing liquids, gunpowder, and similar sweetmeats.

If we look into the rooms set apart for the management of the foreign mails, the arrangements show, in a forcible manner, the wonderful extent of British commerce and relationships. Here are departments for Austria, Baden, Bavaria, France, Norway, Denmark, and the most northern latitudes; the Brazils, Chili, the Equator, Spain, Sardinia, Switzerland, United States of America, North America, the various districts of India, Australia, and other places too numerous to mention.

Here arrangements are made for the overland Indian and other mails. The letters, newspapers, and books are collected in the same manner as in the other parts of the General Post-office; then they are secured in cases of sheet-iron, which, when full, are carefully soldered up and inclosed in wooden chests, which are branded with crosses of red or black, and marked with the name of the district, city, &c., at which its arrival is awaited. Some idea of the extent of these mails may be formed when it is mentioned that each of the boxes referred to weighs, when filled with letters and papers, about 86 lbs., and that the ordinary Australian mail, exclusive of the portion sent overland, generally consists of 480 boxes of books and newspapers, and 100 boxes of letters,—in all 580 boxes. These would weigh altogether 49,880 lbs., equal to nearly twenty-two tons and a half. The other mails are of like

colossal proportions; and the preparation for each is constantly going on.

Large as the area of the General Post-office is, in consequence of the increase of business it is becoming much too small for its various purposes. Hundreds of foreign mail-boxes are stowed in all available places, in somewhat picturesque confusion. As the time comes for the departure of a particular mail, the hustle in that department increases, and the numerous boxes or baskets, when ready, are collected together, and lowered by cranes into the waggons which are to convey them to the railway depôts or on ship-board. The business of this part of the office is much increased by the immense number of letters which are sent from many parts of the Continent for transmission over sea by the English Post-office. The management of the rates, the necessary amount of prepayment of those packets, must cause a great deal of trouble, and requires much skill. Leathern bags for ship letters are crowded around, and amongst the group of communications we notice letters for the fleet and for our soldiers in various climates.

In the upper portion of the building, the newspapers, both inland and foreign, are arranged in a manner similar to the letters below. They are hoisted in surprising quantities by the steam-lifts in the same way as the letters. The light and certain other sanitary arrangements here, are better than in most of the parts below. A large room, with a circular roof supported by iron girders, is well adapted for its purpose. When the bags for inland districts are prepared, they are fastened, sealed, and shot down wooden spouts to the places where the carriages are in waiting; and with a swiftness to which the most rapid of the old posts bears no comparison, the news of the metropolis is wafted far and near.

The book-post has, too, become an important institution, and a source of profit and a great convenience to the public. It would not, however, have suited the authors of other days, the issuers of ponderous folios; for no hook exceeding 2 feet in length, width, or depth, can pass by the post.

If a book weighing less than four ounces be sent according to the Post-office regulations, it will go for a penny to any part of the United Kingdom; and one weighing from 1 lb. to 1½ lb., for 6d.

For years past, particularly since the commencement of Sir Rowland Hill's penny postage scheme, constant alterations have been needed in the General Post-office. At the present time extensive works are in progress, and it may be observed that these have improved many defects in the original structure.

Besides the offices in which the letter and newspaper sorting is carried forward, there is a considerable number of offices in parts of the south portion of the building. Offices for the secretary, managers of departments, and other heads of the establishment, the solicitor, and others, occupy much space, and new buildings are like to be commenced; for the General Post-office, like the British Museum, has become too small for its present purpose.

Looking at the lower parts of the building, you find underground chambers and arched passages of massive brickwork, which promise to last for many centuries yet to come: these subterranean apartments are in some instances tolerably well lighted, and are used for various purposes, but are not fit for human occupation for any length of time. In one part accommodation is provided for the letter-sorters and some others who may wish to take refreshment there: here they may at leisure time avail themselves of the library which has been provided for them. Hot air is dispersed throughout the whole place, and means are taken to carry off the vitiated atmosphere.

This has been done with good effect in the Returned-letter Office, and it is to be hoped that the same plan will be adopted in other offices, particularly in that for sorting the letters, in which a considerable number of persons are at different times of the day employed; for, as Dr. Waller Lewis, the medical officer of the establishment, remarks, the gas used for lighting, "mixed as it is with carbonic acid, carbonic oxide, and sulphurous acid (the latter by absorption of atmospheric oxygen quickly becoming oil of vitriol), cannot be otherwise than injurious to the delicate breathing organs of those exposed to its fumes; it has been found that the thickest and toughest leathers, when subjected to the action of those gases in libraries, become in a short time destroyed."

The establishment ought to find an advantage, and doubtless does so, in having a resident medical officer, who, besides attending to the general health of those engaged in the department, looks with care to ventilation and other sanitary pro-

visions. We have not the means of comparing the amount of sickness and death here with that of other Government offices, such as the Treasury, Admiralty, or Somerset House, in which considerable numbers of persons are engaged. This might be very usefully done. In any investigation of this kind for the purpose of testing the effects of the sanitary condition of buildings on health, it should not be neglected to note the previous employments of those engaged. As regards the General Post-office, it appears that out of 451 candidates for the situation of letter-carriers or sorters, the greater number had been engaged in sedentary employments, and as many as 132, or 29 per cent, of these were found to be physically disqualified.

The various improvements, in ventilation and otherwise, which have been made from time to time, would seem to have had a beneficial effect upon health. It should be borne in mind that the greater number of letter-sorters are exposed (when not here) to all the evils of the dwellings which other workers with moderate means are obliged to occupy who are engaged in the City. It is to be hoped that a plan which has been shadowed forth by the Post-office authorities for providing suitable dwellings, properly arranged, in a convenient neighbourhood, for such as desire them, may be carried out and properly appreciated by those who would, with their families, derive a very great advantage from improved residences.

**SANITARY PROGRESS.\***

**Swansea.**—Swansea is the seat of copper smelting; new docks have recently been opened, and building is going on rapidly. The corporation purchased certain waterworks, but they are not sufficient for the existing and rapidly-increasing population. A bill is now before Parliament to bring in the waters of three streams, by a covered conduit, nine miles in length. There will be three storage reservoirs for purposes of compensation and supply. The conduit will be so arranged as to have sufficient fall at the lower reservoirs to drive hydraulic apparatus to pump portions of water for higher service. By these means, the entire area within the borough will be supplied with fresh and soft water. The estimated cost of these works is 75,000*l.* Public sewerage works are being carried out under the superintendence of the borough surveyor, Mr. Cousins.

**Sunderland.**—At Sunderland works of public sewerage have been carried out by the local surveyor. Earthenware pipes have been used most extensively, and with great advantage.

**Wigan.**—At Wigan public sewers have been carried out by the borough surveyor, and some 4,000 houses have been drained. This work is in progress. The corporation have undertaken the public water supply, and obtained an Act of Parliament to purchase some works in existence, and to establish new works. There has been some difficulty at the storage reservoir, in consequence of old coal workings, and the corporation have a bill in Parliament to obtain more extended powers. They wish to complete the reservoir, and to add additional storage room.

**Workop.**—At this comparatively small town complete works of public sewerage have been devised and executed; and outlet works to prevent fouling the river. Private works of house-drainage are going on as rapidly as possible, so that by the end of summer most of the houses in the town will have been placed in a good sanitary condition.

**Waltney.**—Works of sewerage and drainage have been devised and executed by the local surveyor, Mr. J. Thomas Lea. New gas-works have been partially completed, and water-works are in progress. The Local Board are also in treaty for the purchase of the ferries. This place is, therefore, in a healthy state of transition.

**West Ham.**—This is a suburb of the metropolis in which are situate the new Victoria Docks, a considerable portion of the area is some 10 feet below river Thames high water, and yet house building is progressing rapidly. Works of public sewerage are being carried out over the entire area, a considerable length of sewer has been constructed at a dead level. The outlet is at low water of a spring-tide, and the leading main sewers have only a fall of 3 feet to the mile. The inverts to the sewers, in the low district, are of cast iron, and have had to be laid in water. The whole of the subsoil being affected by land-springs; as, also by the river water. The sewage and subsoil water is to be pumped. The Messrs. Galloway, of Manchester, are making duplicate steam-engines,

with four pumps 48 inches diameter. Two pumps to each engine. The sewage must be disinfected, and the effluent water will be passed to the Thames. The pumps are so arranged as to deliver against the tide, rising and falling with it, so as not, at any time, to expend unnecessary power. The public sewers have manholes and ventilating shafts, in which sewer gases will be disinfected by passing through charcoal.

Sanitary progress has not been very rapid, if we consider the question in reference to the whole country. The Public Health Act, 1818, and the Local Government Act, have been applied to some 314 cities, boroughs, towns, and places in England. There are, however, upwards of 12,000 parishes in England and Wales. Many cities and towns have not yet adopted the Public Health Act, nor carried out any proper sanitary works. Liverpool and Manchester have only commenced: the local authorities regard sanitary works with some suspicion, and play the step-father's part rather than work from conviction, and with a hearty goodwill. So long as there is one undrained street, or one foul cesspool, the work will be incomplete. At present cesspools are enumerated by thousands both in Liverpool and in Manchester.

I may give the Society one complete example, which, having stood the test of time, may be deemed more satisfactory than dry speculation. I therefore lay before you the following particulars:—

**ALNWICK AND CANONGATE.**

**Particulars of Sewerage and Water-Supply.**—The drainage area of the district dealt with, is about 980 statute acres; population in 1851, about 7,000; number of houses and tenements, 947; rateable value, 12,681*l.* 10*s.*

Inquiry under the Powers of the Public Health Act, was held in Alnwick on Wednesday, the 24th October, 1840.

The Local Board elected by the ratepayers at once took up the question of works, and entered into arrangements with the Ordnance authorities for a survey. This having been completed, the Board requested myself to devise schemes of water supply and sewerage for the district; and, after preliminary arrangements, the works were commenced early in 1853. The public portion of the work was completed early in 1854, and has been successful operation up to this time. The cost stands as under:—

<i>Cost of Public Works in Alnwick:—</i>	
Water-works.....	£6,129 0 0
Sewers.....	4,327 18 11
	£10,457 18 11

N.B. Some additional works and payments have raised this amount to nearly 11,000*l.*, or about 1,500*l.* within a year's rental, as per rate-book.

The whole of the sewers and drains (with one exception) have been formed with earthenware pipes, supplied principally by Messrs. Doulton from the pottery works at Lambeth. The largest diameter of pipe is 18 inches; the smallest 4 inches, internal measure. The lengths laid are as under:—

	<i>Pt. in. diameter.</i>	<i>Lineal yds.</i>
Earthenware pipe outlet sewer.....	1 6	1,540
Brick arch & stone invert.....	1 6	66
Earthenware pipe sewer.....	1 3	933
Do. do.....	1 0	1,433
Do. do.....	0 9	6,166
Do. do.....	0 6	about 1,600
<b>Total.....</b>		<b>11,138</b>

Or 6 miles and 578 lineal yards. There are also 54 man-holes, 28 lamp-holes, and 140 street gullies.

**Water Works.**—The water is collected from springs rising in land belonging to His Grace the Duke of Northumberland, and is conveyed by earthenware pipes into a covered service reservoir. From this point it is conveyed into the town by cast-iron mains, varying from 9 inches to 3 inches diameter. The lengths are as under:—

	<i>In. diameter.</i>	<i>Lineal yds.</i>
Earthenware main from springs to covered reservoir.....	9	4,000
Do. do.....	6	1,500
<b>Total earthenware mains....</b>		<b>5,500</b>

	<i>In. diameter.</i>	<i>Lineal yds.</i>

Do. do.....	4	600
Do. do.....	3	4,800
<b>Total of cast-iron mains....</b>		<b>7,100</b>

<i>ABSTRACT.</i>	
	<i>Lineal yds.</i>
Earthenware pipes laid from springs.....	5,500
Cast-iron main through the town.....	7,100
	12,600

Or 7 miles and 250 lineal yards. There are also

45 sluice valves, 8 wash-out valves, and 90 fire cocks or hydrants. Covered reservoir, 60 feet by 48 feet by 13 feet 6 inches deep, containing about 240,000 gallons of water.

The service reservoir is about 100 feet above the highest part of the town, and nearly 300 feet above the lower parts. The service is constant. Water can be thrown by means of hose fixed to any fire-cock over the highest building by the pressure in the mains. After hose has been taken to the site it can be fixed and in work within thirty seconds,—a ½ inch jet being in full play. One, two, or more jets may be in action at the same time, with full effect.

The outlet sewer delivers its contents at about one mile distant from the centre of the town, and remote from any houses. The refuse is being turned to use by one of the farmers of the district. Since the completion of the public works, private works have been carried out. Common privies and open middens, covered cesspools, &c., have been abolished, and soil-pans substituted. Yards and houses have been drained, and water taken into the yards and tenements. The extent of private works up to the 28th of September, 1855, is as under:—

**PRIVATE WORKS.**

**Drains, &c.**—The private drains are of earthenware pipes, varying from 9 inches to 4 inches in diameter. There are now laid 23,160 lineal yards, or sixteen miles.

There are 640 soil-pans fixed and in use, and upwards of 1,000 yard-grids and sinks properly trapped.

**Water Supply.**—The private supply of water is by galvanized iron pipe, from 1½ inch to ½ inch diameter:—

Galvanized iron pipe laid, say.....	10,650 lineal yards,
Lead pipe laid, say.....	5,300 ditto,
<b>Total.....</b>	<b>15,950 yards;</b>

or nine miles of service-pipe now in use.

There are also 744 bib-cocks, 464 stop-cocks, 600 kitchen and other sinks, and 20 public traps for general use.

The daily consumption of water is about 80,000 gallons, or nearly 11½ gallons per head. This includes street-washing, &c. Private works are progressing at present.

Private drains may require about 4,840 lineal yards of earthenware pipe, or 2½ miles; soil-pans, 107; sinks and yard-grates, about 250.

**House Water Supply** may require about 2,610 lineal yards of galvanized iron service-pipe; bib-cocks, about 124; stop-cocks, 77. N.B. These lengths have been laid.

**Private House Works have cost:—**

<b>First-class house, rental 40<i>l.</i> per annum,</b>	
Sewerage.....	£15 3 3
Water.....	11 18 11
<b>Total.....</b>	<b>£27 2 2</b>
<b>Second-class house, rental 15<i>l.</i> per annum,</b>	
Sewerage.....	£7 11 1
Water.....	4 11 10
<b>Total.....</b>	<b>£12 2 11</b>
<b>Third-class house, rental 7<i>l.</i> per annum,</b>	
Sewerage.....	£5 4 4
Water.....	2 17 7
<b>Total.....</b>	<b>£8 1 11</b>

**Abstract.**—Supposing the entire town to be completed, the particulars may be represented thus:—

<b>Sewers and Drains—</b>	<i>Lineal yards.</i>
Public sewers.....	11,138
Private sewers.....	23,160
Additional private sewers laid.....	4,840
<b>Total.....</b>	<b>41,138</b>

or, 25 miles and 138 lineal yards of sewers and drains, being an average of 6½ lineal yards of sewer and drain to each individual of the community. Therefore, if an average of six persons be taken to each house, 35 yards of sewer and drain will be required for each house.

**Water Supply—**

<b>Public Works—</b>	<i>Lineal yards.</i>
Earthenware mains from springs.....	5,500
Cast-iron mains.....	7,100
Galvanized iron and lead service pipe now laid.....	15,840
Ditto to be laid.....	2,540
<b>Total.....</b>	<b>31,080</b>

or, 17 miles 1,160 lineal yards.

**Works, when completed—**

<b>Sewers and drains, public and private.....</b>	<i>Lin. yds.</i>	<i>Miles.</i>	<i>Lin. yds.</i>
Public water-pipes and house service.....	41,138	or 25 138	
	31,080	or 17 1,160	
<b>Grand total.....</b>	<b>75,218</b>	<b>or 42 1,298</b>	

Nearly 43 miles. There are also 740 soil pans; 1,250 yard

\* See p. 244, ante.

rates and sinks; 868 bib-cocks; 511 stop-cocks; 800 kitchen sinks and slop-stones.

On the sewers, 54 man-holes, 28 lamp-holes, 149 street gullies.

On water-mains, 45 sluice-valves, 8 wash-out valves, 90 fire-cocks or hydrants.

Covered reservoir, holding 210,000 gallons of water.

Total cost of the whole—  
Public works, about.....£11,000 0 0  
Private works, about.....10,000 0 0

Total cost.....£21,000 0 0

or about once and two-thirds the annual rental for complete works. That is, the total cost to the owner of a house of 21l. per annum, will have been 35l. But as the law allows the rates to be mortgaged for the public works, and the principal and interest to be repaid in thirty years, this reduces the direct money payment, so that for the private works alone, which, as a rule, amount to about half the whole; or, in this case, to 17l. 10s.

The rates at present are—To repay principal and interest on the sum borrowed for public sewers and waterworks, 1s. in the pound; for water alone, that is, salaries of clerk, superintendent, turncock, and collector, 2d. in the pound. For the next thirty years, therefore, a house rated at 21l. per annum, will pay:—

Rate to repay principal and interest on money borrowed for sewers and waterworks, 1s. in the pound.....£1 1 0  
For water, 2d. in the pound.....0 4 4½

Total rates for sanitary works and water,.....£1 5 4½

A house at 7l. will therefore pay 8s. 5½d.; and houses at 3l. 10s. will pay 4s. 2½d.

There are many houses at the lower rental, and the poor have water without stint within their houses, drains to remove it, a soil pan, kitchen sink or slop-stone, all as complete as the house of highest rental. At the end of thirty years, the debt on the public works will have been repaid, and consequently the cost of management will alone have to be provided for; that is, a rate of 2½d. in the pound.

Remarks.—The sewers and drains in Alnwick have been laid on a new principle. The pipes are in straight lines, and uniform gradients throughout. At any change of line or gradient a man-hole or lamp-hole has been formed, having a movable cover. This allows of complete inspection. At the man-hole there are flushing arrangements, so that the whole of the sewers and drains can be cleansed. The outlet-sewer pipe has a fall of 1 in 400 for two-thirds of a mile in length. This can be flushed from the river, and is preserved free from deposit.

#### ALNWICK CASTLE.

The castle has been sewered with earthenware pipes from 12 inches to 6 inches in diameter. The total length is about 1,760 lineal yards, or one mile. Old drains, cesspools, and privies, have been taken up and soil-pans put down. The whole of the castle sewers and drains can be flushed from tanks formed at the head of the drains.

The practical engineer will notice that the outlet sewer at Alnwick is exceedingly small for the drainage area (480 statute acres). The fact is, this area has not been considered with reference to the dimensions of the sewers. All existing surface and other outlets for storm waters have been improved, and these take off such excesses. The street-gullies, yard-sinks, and down-spouts are carried direct into the new sewers and drains, there being overflows at several points to relieve them of any surplus water; ordinarily there are not more than four or five inches in depth of sewage in the main outlet, and it is rarely full. The system has been in action six years without detriment, public or private.

When cholera broke out in Alnwick several cases occurred in houses of a superior class, without any apparent cause beyond this, the subsoil was damp. On opening this street for new sewers, the ground was heek and fetid for 10 or 12 feet in depth. The old moat, or town ditch, had traversed this line, hence the foul state of the strata.

In advocating sanitary works and sanitary regulations, the promoters of such measures must not be charged with being egotists and visionary dreamers. On the plea of comfort alone these necessary means of cleanliness should be insisted upon, because evidence proves that a filthy people are nearest to dumb brutes in feeling, habits, and conduct. Nay, they are worse than many brutes by the amount of intellect they possess.

All preventive means of disease in excess do not reside in sewerage, drainage, and a water supply. There must be surface cleansing and ventilation, both of streets and of houses. The interior of all houses must not only be well ventilated, but they

must be preserved clean and sweet. Wall papers, carpets, window-hangings, and bed-curtains, have much to answer for. Fever has been known to break out in houses the rooms of which have been newly papered, when bad or sour paste has been used. A floor entirely covered with carpet, unremoved, accumulates dirt, and heavy curtains impede ventilation.

Many persons persist in maintaining a fever apparatus about or near their houses,—pigsties, cow-sheds, stables, fowl-pens, or refuse-heaps of one sort or another: sinks and water-closets drain into covered cesspools: water is drawn from wells only a few feet deep, the water being contaminated by surface infiltration, or rain-water, stored in lead cisterns and collected from lead gutters, is used. New sewers and drains may be faulty in construction, and if so they will become a cause of mischief. The end of all sanitary works and regulations should be to remove impurities without atmospheric or terrestrial contamination, and to preserve the subsoil, water, and air pure without and within dwelling-houses.

Sanitary progress has as yet been confined to certain parts of England. On the continent of Europe the question is not understood, and the disputes in England as to the proper mode of severing and draining towns have retarded progress. Paris remains a city of cesspools, and where sewers have been formed they have been made on the plan of admitting men to walk and to work in them. American engineers have visited England to see for themselves, and I believe with beneficial results. We have brick sewers and earthenware-pipe sewers to point to in actual work, and the make of earthenware pipes is steadily increasing. Some short time back the weekly make of earthenware sewer-pipes was not less than twelve miles, and the make of soil-pans about 1,000 per week.

Those who know the sanitary state of England will acknowledge that, as yet, there is no room for boasting: our towns, in too many instances, remain with defective waterworks, and the streets have foul sewers, and the houses foul cesspools. Noblemen's mansions, and country houses, are in the worst possible sanitary state. If there are sewers and drains to houses, they are square in form, large in dimensions, and allow all the foul refuse to saturate the ground beneath the basement. Water is drawn from wells sunk into a tainted subsoil, and is retained in leaden cisterns, and is drawn through pipes of lead. The houses have no proper means of ventilation, many rooms have no direct light from the sun, and yet people wonder when they lose their health in such places. The smaller and ruder abodes of the Middle Ages possessed some advantages, inasmuch as the wide fires and open fire-places allowed of ventilation, rushes for carpets, and surface filth, might work less injury than covered drains and closed cesspools.

Those who know, by experience, the sanitary state of the Continent, will think we in England possess some advantages. The dread of ventilation is general over the whole of Europe.

To aid "sanitary progress," architects and engineers have duties to perform of the utmost importance to the welfare of the community: houses must be so planned, so built, and so furnished as to enable the inmates to secure shelter from the elements and to enjoy health.

The site for the foundations of any house must be effectually drained.

Sewers must be external to the main walls of the house; there must be full means for inspecting and cleaning them by water. They must be fully ventilated, and the gases disinfected.

Drains within the house must be water and air tight. At junctions with the sewers there must be means to prevent any in draft of air from the sewers.

Water-closets must, in all cases, be in situations of easy access, but against an external wall, and having full means of permanent ventilation to the open air.

Sinks, slop-stones, and waste-water pipes, should also be placed in rooms or spaces, against external walls. The waste-water pipes should communicate with drains formed outside the walls, rather than with drains within the house.

Cisterns to contain water for domestic use should not be placed over water-closets, nor over nor near dust-bins. The waste or overflow-pipe should not communicate direct with sewers and drains, but should have such means of connection as to render any back draught of sewer gases to the water impossible.

Lead should not be used for cisterns, or for conduit, or for service-pipes, if the water acts on it. Soft waters generally, and some hard waters, act

on lead, and poisoning by lead is far more common than the public imagine. Wrought-iron tubing with screw joints, may be used from house-service pipes to the exclusion of lead.

Where water is drawn from wells, great care should be taken to avoid subsoil contamination: sewers should be so constructed as to be beyond suspicion. No amount of mechanical filtering renders foul water pure. If, therefore, sewage and cesspool fluids filter through the subsoil, and mingle with the water of a well, and this water is used for drinking, health may be injured. There are thousands of cases in this country where wells are poisoned by such means.

Halls, corridors, and staircases should be fresh-air chambers, or reservoirs to any house. There should be means of full, free, and constant ventilation at all times during all seasons, communicating with the external air, and letting in fresh air. If there is any apparatus for heating air, there must also be a constant and due admixture of natural air, whatever the external temperature may be, and the more of natural air the better. In this climate persons in health may breathe external air all the year round with advantage, to the extent of sleeping with an open window. Let a thermometer be placed in a bedroom, and if the temperature is raised during the night by the animal warmth of the inmates, mischief has been inflicted.

Houses may be too large on plan. This is always the case when there are rooms, halls, or corridors, without full external light. These remarks are applicable to public buildings also.

The basements of buildings should be fully ventilated. There should be no chance for emanations from subsoil, sewers, or drains, rising into and through the inner rooms. Buildings exert what may be described as a pumping power; that is, a power of drawing in air with considerable force from beneath and around. This is the case when the temperature within the house is higher than that of the external air.

Let those who object to means of external ventilation consider the problem. There must be circulation of air in any house or room or suffocation would ensue. To have circulation there must be change and expulsion of air, and if air flows out of any room other air will flow in. If the sewers and drains offer the readiest means of inlet, then these foul and injurious gases will find their way in. The only safe means to prevent this is to provide liberally for a permanent inletting of pure air.

All dwelling-houses, and all rooms in such houses, should have means of ventilation suited to the varying uses of houses and rooms in modern life. Every room should have means of ventilation, independent of the door, at or near the ceiling. If all inner-door spaces were formed from floor to ceiling, the space above the door arched away may be made to open independently of the door. Large parties and crowded rooms are seldom provided for in modern houses.

Sunlight is of the utmost importance: any plan which renders sunlight impossible is defective. Architectural grandeur cannot compensate for such defect.

As to Sewerage and Drainage.—There are sites, generally sand and loam, constituting a sort of quicksand, which sewers and drains cannot render dry. The sources of wet may be beneath, and water is raised and held by the power of capillary attraction. Such sites should be avoided, or the foundations and basement should be raised, by means of concrete or other dry material.

The external subsoil should, in all cases, be isolated from the basement walls. This may be done by dry rubble walls, or by open or fly closed area walls. In any case, such external spaces should have full means of ventilation.

Public buildings are generally too large on plan: this is the case also with many private houses. Enclosed courts, long corridors, double rooms—that is, rooms on each side of internal passages—and all rooms having borrowed lights, form objectionable plans. Separate pavilions, with corridor connections, covered or open, may probably prove the best form of plan even for private establishments. For asylums, hospitals, and such-like buildings, the pavilion plan is alone allowable. The New Houses of Parliament might have been broken into pavilions with advantage.

The extent of the civilization of Egypt is seen in massive granitic ruins, in mysterious pyramids, and in countless myriads of mummies. In India we find vast ruins of cities, and huge tanks for irrigation and water supply. We have the ruins of ancient Rome, attesting to her former grandeur and greatness, but her amphitheatres and aqueducts do not measure the extent of the Roman

empire, or any works remaining above ground, but rather, the buried pottery, found at intervals, attest the former extent of Roman arms and Roman civilization. The apparently frail vessel, turned from the Roman potter's wheel, outlives even history, and comes to a resurrection long after the cloud-capped towers and gorgeous palaces have crumbled to dust, and their sites have been returned to the uses of the husbandman. Etruria is the name of a nation older than the Roman; Etruscan is now chiefly applied to the products of the Etruscan potter's art. In our modern sanitary progress, we are writing an enduring history with the most humble material,—earthenware sewer pipes and agricultural drain pipes. The brick and cement of London will moulder into irretrievable decay. There may not be even the fragment of a broken arch of London Bridge for Macaulay's New Zealander to stand upon; the sands of the sea may have filled up and buried your noble docks; desolation may reign supreme over the entire surface of this land;—how brought about, I will not argue: civilization is ever changing the seats of commerce, and, if the had passions of man can be curbed, there are natural and elemental changes and causes of inevitable decay. In this world nothing is but what is not: there is no permanence, but one continuous round of birth, growth, maturity, decay, and death. The pure religion of Christ will endure: all that constitutes Great Britain may have passed into oblivion; and her power and extent of empire may be known best by buried sewer and drain pipes, laid during the days of her sanitary progress.

ROBERT RAWLINSON.

#### THE ARCHITECTURAL EXHIBITION.\*

In our last notice of the drawings at the Architectural Exhibition we named some of the designs for churches and chapels, and hinted at the question which has at other times received attention in these pages, of appropriate form and character for edifices of the class. We cannot pursue this most difficult question fully at present; but we advert to it as capable of receiving elucidation from such drawings as there are in Conduit-street.

It is only clear that the architecture for churches and chapels has still to undergo great change. To preserve what may be valuable in the associations of old structures which have been long used, and yet to produce the suitable form for seeing and hearing, is the problem that is being worked out slowly for each form of ritual, and under many disadvantages from the too dominant influence of precedent and absence of definite conclusions as to the ritual requirements themselves. It is to be regretted, however, that there should be, as still, a wide severance between convenience, use of old details, and true art. All these should be present or concurrent; but seldom do we find a design remarkable for attention to more than one of them. Putting together the buildings which best admit of comparison, small churches with dissenters' chapels, considerable improvement in the former, certainly is noticeable; whilst the latter, though designed even more frequently for their use, decoratively either fail altogether, as regards the æsthetic impress for the religious use, or they still caricature the Gothic detail.

Some of the principal designs for churches are amongst works in the West Gallery, which we have yet hardly mentioned, and comprise chiefly designs belonging to two competitions—those for the building of the church at Heigham, Norwich, and the Roman Catholic Church of Saint Peter and Saint Paul, Cork. The latter competition was the subject of much controversy, after the award. We have already named a drawing (292) of an interior according to the design which we presume is to be carried out at Cork. That the Mediæval associations should be preserved in the Roman Catholic Church, at special disadvantage even, as might be supposed, to a form of worship in which seeing the altar is essential, is at least more comprehensible than is the retention of all the defects of the form as in many of the chief edifices erected for the Protestant ritual. It is noteworthy as fact that whatever defect there was in the plan of the more prominent examples of the early Christian church, by the massiveness of piers, and their number arising from repetition of aisles, the chancel was never "well developed" as in the Mediæval plan followed by the modern Gothicists; while in the well-known old example, lately referred to by us, it consisted in the rilling-in of a portion of the body of the church. The abbey churches, like the church of Westminster, had, for special reasons, a

similar arrangement in the nave, to that of the *cancelli*, or rails, but combined with the development of the eastern arm of the structure. The somewhat analogous arrangement in parochial churches where there are aisles or chapels to the chancel, was always combined with the length in an eastern direction, which the further it is extended, becomes thereby the more unfavourable to use of the aisles—since the altar would not be seen from the greater portion of those aisles, even with arches opening from the nave and chancel into the aisle or chapel, or whatever devices of hælioscopes. Considering the unfitness of the Mediæval plan, therefore, it is not surprising that it should be in course of abandonment. Its acceptance was part of the belief imposed upon the profession, that architecture consisted in symbolism. The tentative efforts that have been noticed by us, at bringing the chancel area within the structural nave, or of narrowing the aisles, and the disuse of the lofty screen, are steps in the direction favourable to the ultimate prevalence of true art and good church architecture.

The designs for the church at Cork, whilst made specially for a restricted site, indicate the same tendency in the churches of the Roman Catholics, as we have recognized generally. In all the more important of these designs, the dogma of the "well-developed" chancel is virtually abandoned, and the church takes nearly the plan that would be best for the view of the altar from all parts. There is a peculiar similarity in the decorative features of the principal designs, as in those of the ceilings and roofs; and these features have great merit. We have referred to those of Mr. Pugin's interior; and it would be difficult to find finer features of detail, or a better manner of their combination, than we see in Messrs. Hadfield & Goldie's interior view (52) of their design, the "promiated." In it Mr. Goldie's power of drawing has served him towards production of a design which belongs to the highest class of art. The exterior (61) has a noble "decorated" window of eight lights; but the canopy over it is close under the mouldings of the gable, so that the objection which there is to pediment over pediment in classical architecture, is suggested. The angle tower, with tall, deeply-recessed openings in the principal stage, has good points. The flanks of the church, which, in the drawing, contrast harshly with the front, would probably be concealed by neighbouring buildings.—Mr. S. J. Nicholl's design (64) is not so successful in the open roof and ceiling; but is, in most other particulars, deserving similar terms of praise. There is distinctive character in the tower, with its crocketed capping—as throughout the design.—Mr. G. J. Wigley's design (68) differs from these, inasmuch as it has a South-European character in its Gothic, or what is as much Eastern as Italian. The front has breadth rather than height; and gables and other features are subordinate to the general mass.

We should mention, whilst speaking of Roman Catholic churches, that besides the sketches by Mr. Goldie in the Great Gallery, and already named, the Exhibition contains an "Interior View of Holy Cross Church, Standish-street, Liverpool" (38), remarkable for its good western window and porch, but defective as to the form or proportion of the finials which crown the buttresses.—Mr. T. Goodman has in the Great Gallery (278) a "North-west Prospect of the Church and Presbytery of our Lady of the Immaculate Conception, Aspall, Wigan," a picturesque group, whereof the nave, aisles, porch, and sacristy of the church have been completed; and Mr. Pugin's contributions include a considerable number of photographs (320, 321) of churches erected or about to be erected from his designs. We may also mention as in the Great Gallery, a design which, indeed, has merits beyond those of drawing, but attracts attention first from the ornament of the mounting and the polychromed frame, for which we named it some weeks ago. We greatly question the advantage of this practice of embellishing drawings, whether to the effect of a design or upon the mental capacity of the designer. Even drawing should be regarded as the means to an end; and the clever pen-work, which is becoming general, should not be allowed to take the attention of the architect from the important thing, his design, or take that of the observer firstly and chiefly. Some architects, no doubt, employ other hands in this class of work; but young men, who work with their own, are most likely to be injured by the practice. The manipulation of the brush and colours, on the other hand, may be valuable, educationally, in design. However, it would be well to inquire

into the comparative results of methods of different schools, in drawing from sculpture. Too much time may be spent on cross-hatching with a point. The despotism of the delineative process leads to exaggeration in finials, crockets, and other details, from which the "Monuments about to be erected in the Cemetery of Bruges, Belgium" (270), from Mr. Shaw's designs, are not free,—excellent, however, as these designs are in many respects; though all ponderous masses over graves may be not according with the most approved sanitary views. The design by Mr. Shaw which we first had in view is that for the "Priest's House about to be erected at Droogenbosch, near Uccle, Belgium," which is certainly *pitiful* in the features of the library and the "balcony," and the circular conical-capped staircase turret, and has a very clever chapel interior, the roof timbers of which are ornamented, and wherein effect is produced by simple means, such as we have ourselves always pleasure in finding out where the result to which they conduce is great in proportion to them. Whether the entire building would be equally successful in execution, unless as an imitation, we are inclined to doubt.

On the table are to be found photographs of designs by Messrs. Evans & Pullan, for Lille Cathedral, which obtained the third silver medal, and of Mr. Pullan's design (specially mentioned) for Constantinople Church. The latter design we spoke of when it was exhibited at King's College; and the other we have found too recently to allow of examining it with due care.

The designs for the church near Norwich do not manifest the same originality with other attributes of art, as may be found in some of the designs for churches named in our former notice, or found in those for the church at Cork. The Roman Catholic will thence, perhaps, reason or infer, as some have, that there is hope for art only through his particular religious views. We are not called upon to inquire into, or controvert, such an impression; but there must be some advantage in having the force of tradition settled,—so that the artist may work from an understood point. It is at least curious that the art or invention in structures of the ecclesiastical class, should now appear to prevail most where we might least have expected it, in designs for Roman Catholic churches, or in the works of architects nurtured under circumstances wherein there has sometimes been asserted as involved a preference for the Roman Catholic form of ritual. The preference may be said to exhibit itself chiefly in church furniture as represented in the views of interiors, or seen in some of the manufactured articles which were the subject of our last week's notice. It is observable, also, in designs, of which we may mention those by Mr. E. Sedding, one (259) "for Reredos and Embroidered Frontal, for the use of the English Church," and the other (260) "for portion of Furniture for Altar." In both of these we recognize good drawing and good art; yet, as in the former work there is the representation of angels swinging censers, there must either be an association of ideas inconsistent with the ritual of the English Protestant church, and which therefore cannot but be a defect in the design and art, judged whether by Protestant or Roman Catholic; or the Protestant ritual must be held different from what we have been in the habit of considering it. The merit throughout, of a design, must be impaired by the misconception primarily of what is the end. Of the designs for Heigham Church there are several in the West Gallery. Mr. R. M. Phipson's design (54 and 57), proposing to leave the tower for after-erection, is scarcely like a church externally—from the excessive length, as the building appears in the drawing. Mr. J. G. Bland's design (55 and 56) has the advantage in the drawing, of a lofty spire; and is good, of the imitative "decorated" character: but the *louvre*-like feature over the intersection of the cross, were it to be permanent, would be not sufficiently ecclesiastical. Mr. J. M. H. Hahn's design (58, 59) is plain "decorated" and Early English, with spire. In Mr. E. Wallen's drawing (66), we have a "decorated" design, with walls of brick with white bands, and with red colour to the roof-covering in the form of diagonal intersecting bands. There is also a design by Mr. J. D. Ellis (88).

There is a clever drawing in the room with these works, "of a Church designed in 1858, for competition" (71), by Mr. John Bentley, also the producer of a drawing equally clever (196), "Design for a proposed Clock-Tower and Drinking Fountains." These productions have originality, and, indeed, profusion of note-worthy features; but they are of the class which aim at more than is built with ordinary funds, or more structurally

\* See pp. 195, 228, 251, 260, *ante*.

than sometimes is practicable. The design, 196, is for a diminishing square tower, ornamented at the top with facets, gables, and pinnacles, surmounted by a belfry stage, with a tiled and lead-covered capping. Lamps project from the base, and a fountain appears on one of the sides; but these features have little association with the tower, except the accidental connection. Those designs which display the greatest wealth of detail are not necessarily the best, though the details be individually good, and available funds ample. A now common vehicle of this wealth is iron-work. The improvement made in the manufacture was indeed wanted; but it should not be forgotten that metal-work can give little to architectural effect in works which are of masonry or brickwork; that it is best applied where there can be no harsh contrast between mass and tenacity; and that, like every other manufacture, it should be the servant of architecture, and not contend with other competitors for mastery over it. That there is this tendency is shown in many designs, even of architects, and in one (201) "for a Bracket Clock for a Church Tower," by Mr. G. R. Harbottle.

The question of appropriate character for churches may derive illustration from the design No. 90, in the West Gallery, "for Chapel of the Holy Trinity, Knightsbridge," by Mr. Charles Gray. It is interesting chiefly from the effort made to harmonize the introduction of galleries with internal effect, and at the same time to avoid obstructive nave piers. Two designs with this object are shown: in the principal one, twisted columns of iron, in two tiers, are used; whilst, in the other design, support appears to be given to the open-timbered roof by struts from the gallery front, but a section is wanting to explain the proposal. The exterior design, which is elaborate and clever, is labelled "Italian Gothic," an impolitic course, to say the least, as standing in the way of appreciation of what there really is here, of art. We look forward hopefully to a time when no other style will be recognized for use except one of the time, and when the public will cease to demand an old name as voucher for the claim preferred.

Perhaps we might be deemed wrong in looking for ecclesiastical character in a synagogue; we can, however, call to mind buildings of this class that do not entirely want a character which is special and appropriate. The Synagogue in Upper Bryanstone-street, Bryanstone-square, is not likely to add to the number. Mr. G. Low's design for it (302 and 313), internally at least, is of the class of poor Italian productions; and Mr. Collins's "First Sketch" for the building in course of erection from his design, is externally (160), an unfortunate mixture of styles, some of them like the Saracenic, unfitted by association for the uses of the particular sect, and internally (161) has the very questionable arrangement of an upper range of arches, the massive piers of which are carried by slight iron columns. Mr. J. G. Stapleton exhibits in the same frame with a drawing already noticed, several views of congregational chapels, works on which he has been engaged. The chapel at Wandsworth, Gothic "Decorated" (160), accommodates about 900 persons, at a cost of 2,300l. In the interior of the chapel at Cobham, Surrey, there seems a want of a collar, or tie, to the feet of the rafters resting on the head of the range of dormers.

We are better satisfied with the sort of design that there is in the small churches of which views (anastatic prints) are exhibited by Mr. R. J. Withers. Variation of outline and details, and adaptation to different circumstances of materials, have here been attended to;—albeit, a nineteenth century character is not wholly attained in the stone-built churches. "Narraghmore Church, Ireland, as altered and remodelled" (203), has a massive bell-turret carried on corbelling and a buttress; and "Warrington Church, Surrey" (204), has the timber belfry carried on the roof. "Little Cavorthorpe Church, Lincolnshire" (208), perhaps the best of the designs, appears to be of red brick, with dark-coloured bands, the square reveals being filled in with Decorated tracery: there are no buttresses; the separation of nave and chancel is but slightly marked, and there are no aisles,—the arrangement in all the latter particulars being in accordance with the tendency in church architecture that has already been spoken of. Mr. Lamb's designs also deserve commendation amongst the number of those for small churches. There may be somewhat too much repetition of forms and details peculiar to this architect, but we prefer that to the other practice that has been common, of repeating with little variation old models. The "Design for Bagley Church, Yorkshire, about to be rebuilt" (271), is at once recognizable by its moderate height combined with cruci-

form plan, and its square lantern at the intersection of the cross. The "Design for re-erecting the District Church of the Parish of Ham, Surrey" (272), however, is different. It has a peculiar form in the tower at the junction of the square with the octagon lantern stage: the angle has, instead of the ordinary weatherings, a species of roof covering, the effect of which is not so satisfactory as that of other details of the design. Mr. Lamb exhibits four drawings of recently erected buildings, in Gothic style of one character or another. The Rectory House, Copdock, near Ipswich (264), has a singular effect from the differing height of the walls, and the treatment of the whole roof apparently as a "lean-to." The "Station Inn, Pevensh" (265), resembles many of the old houses of the district, in the tile-faced overhanging upper story. The "Entrance Front of Newton Hall, near Dunmow" (266), best exhibits what, however, is common to all the designs in some degree, the good grouping. Projections, with corbie-stepped gables in the chief buildings; a plain doorway; a lantern on the main roof; a square kitchen building, with lantern or louvre; other offices helping the effect of the centre; and the use of materials in stripes; are the simple elements which conduce to very successful effect. In the "Vicarage House, Great Kimble, Bucks" (267), the roof-covering is brought down over the bay window, in a common but effective manner.

In the course which our remarks have taken, we have been as yet content with the mention made in our preliminary notice, of some of the drawings in the Great Gallery, which may first attract attention. The works referred to, however, should be more particularly described. The most prominent of them are the five or six large drawings and sheets of drawings exhibited by the author of a work that we have already named, Mr. F. R. Wilson. The sheet numbered 226 displays plans and views of six or seven buildings recently completed in the north of England; the drawings 227 and 229 are views of the Forum Romanum restored, one looking towards the Capitol and the other towards the Colosseum, to illustrate the question as put—"Is it to be Classic?" whilst another large sheet (228) shows "A Cluster of Ancient Cathedrals, Churches, and Domestic Buildings existing in England;" for the alternative, "Or is it to be English?" Various views of Alnwick Castle, "a Building recently enlarged, externally Mediaevalized, and internally Italianized," appear under No. 230. Mr. Wilson had in the Exhibition, when we first visited it, a sheet of plans, which we mentioned, to exhibit the merits or demerits of the Italianized interior. This lot of elaborate drawings was withdrawn, under an idea that an exposition of Signor Montrolli's work might not be agreeable to him until completion of the work. The immediate direction of the operations, those due to the English architect, Mr. Salvin, and those due to the Italian, has been from the commencement, nearly five years ago, in Mr. Wilson's hands, and has involved much labour in drawing, directing, and interpreting. Every stone was as far as practicable reset in its old place—to retain the peculiar character of the ancient masonry. Mr. Wilson's intention is to show by the whole series of his drawings, the respective merits of two styles, which he regards the one as exotic and the other as native; and to show, as in his drawings of the "Mansion House and Lodge, erecting at Cheswick, near Berwick-upon-Tweed," from his designs, pliability of the Gothic, as in the admission of plate-glass, and of decorations internally, as of ceilings corresponding with the external architecture. Whilst in the Alnwick cellars, the beams are concealed, and height is sacrificed and extra labour incurred, his own designs show that the beams may be made to form part of the ceilings. But we do not see that his designs, clever as they are, and his elaborate illustration of Alnwick, or his way of stating the case of Gothic against Classic, will help quite as he supposes, to settle the matter at issue. One of his designs, is mainly Italian; and the house at Cheswick, would be called Florentine or Byzantine, rather than Gothic. It is a combination from many styles, the Elizabethan amongst the number. Gables, each pierced with small circular lights, grouped so as to resemble the cusped circle; bays in two stories, crowned by a parapet formed of small arches; a central portion of the front, carried up and covered by a flat roof; wide balconies on cantilevers; the windows of the lower story arch-headed, without mouldings, and grouped three together; and the upper story windows similar, except that the head is filled in as solid, with a cusped perforation; and a penthouse to the lodge, all round it, boldly projecting on cantilevers; these are the features of a design which is very clever, but shows certainly not the pliability of Gothic. Were we to look at his designs to find the bent of the author's mind, we should discover it to be towards Mediaeval Italian, but castellated Florentine rather than a more defined Gothic; and this is shown in his buildings at Almouth-by-the-Sea, of which drawings were also in a former exhibition. It is impossible not to be delighted with the matter which the author has so laboriously put together in the three drawings, 227, 228, and 229,—scene-painter's work, though the colouring for the marbles in the Roman Forum is, and exaggerated. The cluster of English Mediaeval buildings ought to be carefully redrawn, and engraved for publication. In the Forum we should be disposed to ask whether the monumental columns, with plain shafts, are not too numerous, and whether all the structures and objects are not too much crowded together. But taking the representation as correct, the comparison of any actual group of buildings with an ideal group is not a fair one: the Mediaeval picture should have been one of a market-place with town-hall and cross.

Mr. Truefitt is doing something towards the settlement of the question put by the author last-named, and to hasten other good ends. His several works recently erected at Holloway, and others designed (243 to 253), are nearly all of them of that class of suburban house-buildings wherein generally fresh art is most needed in the structure, and mistake, whether as to decoration or as to styles, has been most complete. The avoidance of all imitative material; the use of stone in the manner which combines the utmost effect with the smallest expenditure of that expensive and perishable substance; the dexterous use of breaks and sets-off, to get effect and harmonize the internal and external decorative features; the attention given to the enclosure walling, a feature so much neglected in buildings of the first class; the use of features of the Gothic which are serviceable, as the gable, and yet the avoidance of window-mullions and of all prominent Mediaeval character, are evinced in the designs, whether they be sometimes inclining slightly towards one style or sometimes the other. Whatever the architecture of the future may be, it will and ought to be an architecture indebted to the Gothic; whilst it should not be in character Mediaeval; and good architecture of this kind, we say, is now about being produced in the class of buildings where it is most wanted. There is only one serious difficulty that we see in the way of such efforts as those of the author of these designs: it is in the prejudice against brick.

The London brickwork often has really the mean effect imputed by the public, and one which makes the general appearance of a building very different from that which is shown in drawings. Those who can compare the house lately erected at the corner of Bond-street, and Burlington-gardens, designed by Mr. Truefitt, with the drawings (253) will be sorely satisfied with the effect that the new brickwork temporarily has; and the whitewash efflorescence, to nine house-proprietors out of ten, and to most surveyors of London estates, would be so offensive that it would lead to the cementing of the front. This difficulty at the threshold of art is one which we should be glad to know how to get over. Cement may doubtless be used, not in imitation of stone-work, and so as to be the vehicle of some degree of art; but there are objections in the lifeless appearance of the surface, or in the dirt which soon becomes offensive enough to induce an application of ochre colour or glistening paint. "A Pair of Cottages at Toppersfield, Essex" (249), shown with the works we have mentioned, may give some hint towards the provision in labourers' cottages, of the accommodation required including three bed-rooms, for a moderate sum. Our present author provides the third bed-room of one house on the ground-floor, in the centre of the front portion of the plan, and the room of the other house in the same position on the upper floor.

Never was a valuable chance so thrown away, as that there has been for art in the design of street frontages. We cannot say that the designs in the Architectural Exhibition, all are what might have been expected from architects. But those nine in number, of Mr. F. P. Cockerell (297 and 300), show how much might have been done had the work been consigned to proper hands. The amphora form, with a hole pierced in it for the water to escape, is a mistake, and contrary to first principles of our art; and perhaps the urn form in others may be fairly objected to; but there is a grace and beauty in the designs generally, and in the accessories of their sculpture, such as yet

should contribute to the adornment of our streets and parks. The "Fountain erected at Spilsbury, Oxon" (301), by the same author, is treated as an archæol. recess, surmounted by a wide projecting roof; and may be classed with many road-side examples equally plain, though not of the same merit. Mr. W. G. Smith's designs (318) are amongst the best of the Gothic class; but there are conceits in them, such as the excessive channelling, and the form given to the labels in one case, and errors against first principle in the arrangement of the water spouting from the mimicked rocks. The best Gothic fountain appears in one of Messrs. Shaw & Nesfield's drawings, in their design for the Manchester Assize Courts; but it is almost too elaborate for probability of execution. The fountain just "inaugurated" at Bath, designed by Mr. C. J. Phillips (344), is only injured by the lightness of their iron-work finial to the massive stone; for, as we have said, relative harmony is to be studied, as well as the expression of fitness of each material.

We must wind up our series of notices by merely naming a selection of the other works that we have examined, but cannot now describe. The designs for the Manchester Assize Courts, by Messrs. Crossland, Garling, Green & De Ville, Truefit, Kirky, E. M. Barry, Lamb, Powell, Shaw & Nesfield, T. R. Smith, Morgan, J. M. H. Hahn, and T. Allom, were, however, all of them, unless with some one exception, described by us with other designs when they were exhibited a year ago; and the designs for the Cambridge Guildhall, by Messrs. J. P. Jones ("Floreat Cantabrigiæ"), E. J. Anson (with a device), and De Ville & Green ("Suum Cuique"), were in like manner spoken of in our exhibition at Cambridge. It cannot be too frequently mentioned that, whilst the names of those who exhibit at Conduit-street are but a small proportion of those who competed, the designs found are scarcely any of them shown sufficiently for the purposes of comparison with others.

Mr. W. G. Habershon has several drawings of lodges (215 to 219), brick and half-timbered buildings now erecting at Bedwell-park, Herts, for Sir Culling E. Burley, Bart.; and a view (287) of a half-timbered house which he is building for Lord Lilford, at Warrington, Lancashire. Mr. Edmeston has drawings (312) of stone doorways from houses at Norwood, erected from his designs, one of the number being better in effect as built than as shown in the Exhibition. Mr. G. R. Clarke, Mr. Morgan in his design for the Jews' Hospital, Mile-end, and Mr. G. G. Scott in photographs of his Government offices, have contrived works differing much, but which each deserve to be looked at. We have omitted to name several works of decorative art, and amongst them the photographs of Mr. M. D. Wyatt's designs for engine and carriages for the vicery of Egypt, excellent as surface-decoration; the cartoons for stained glass by Messrs. Lavers and Barrand, some capital designs for decorations by Mr. E. Agnelli, and the drawings of old buildings and details, many of which are very interesting.

TERMS OF CONTRACTS.

BEFORE IN ROYAL ENGINEERS' DEPARTMENT. SINCE our previous reference to this subject, Mr. Sidney Herbert has issued a second document, with the view of correcting the expenditure of the public money in the Royal Engineer Department's building operations. We are not certain that the present efforts of the Secretary of State for War, patriotic as they are, will, without further steps, result in any permanent improvement in the Department. The existing organization (with its double set of officers, whose interests can never be made identical, together with their triplicate and quadruplicate system) makes it a very difficult branch of the public service. The two branches should be divided,—one taking the military portion of the duty, and the other the civil; and each should be responsible for what it does.

The directions and suggestions given are nevertheless very valuable, and, if they were acted upon by engineers, architects, public companies, and employers generally, would considerably reduce the cost of buildings. Great expense is now often incurred in consequence of the very limited time in which buildings are required to be completed under heavy penalties, which are often enforced under very stringent clauses of contracts.

Mr. Herbert urges the necessity of consulting the customs of the country in fixing the terms of contracts; that when terms are agreed on they should be enforced, in fairness to rejected candidates; and goes on to say:—

"3. The following are a few of the numerous instances

in which the terms originally fixed may enhance, and, indeed, in cases which have come under Mr. Herbert's notice, have really enhanced, the cost of public works, without any corresponding advantage.

4. A specification may provide for a description of brick which, however good in itself, is little, if at all superior to that which is made in the neighbourhood of the proposed work.

5. One description of brick, stone, or timber may be insisted upon when a choice of several might be given.

6. The time for the supply of materials may be so short that it is not possible for a dealer to get a consignment from the source of supply; and he is obliged, in fixing his price, to calculate upon having to purchase the material in a limited market.

7. The time for the completion of a work may be so short that the contractor has to calculate for unusual expense of all kinds, not only in the supply of materials, but labour.

8. Workmanship and fittings may be insisted upon to which the inhabitants of a country are not accustomed, and which few will undertake, or, if they do, at extravagant prices only.

9. No bond should be required, except when it is absolutely necessary, and the payments should be made as frequently and the reserves as small as possible.

10. No contract should be made except with those who are known to be competent to perform it; but at the same time the most extended competition should be resorted to among all that are competent.

11. In consequence of the modifications made by Circulars 411 and 526 in the system of contracts for large works at home stations, Mr. Secretary Herbert has reason to believe that the public have obtained better terms, and he trusts that officers commanding the troops at foreign stations will co-operate with the controllers of army expenditure and with commanding royal engineers in adopting these principles.

12. It is most desirable that the commanding royal engineers and controller of army expenditure should, from time to time, consult those persons who generally tender for engine works or supplies, including unsuccessful candidates, as to the nature of the terms which are most advantageous to them, and that every facility compatible with the interests of the service should be afforded to the contractor in carrying out the work.

13. Whenever it is found by actual experience at foreign stations that work may be carried on by the hire of workmen and the purchase of materials at a cheaper rate than by contract, the former system may be adopted in place of either periodical or special contracts."

THE COMPETITION DESIGNS FOR SAINT ANDREW'S CHURCH, DUBLIN.

STEPPING out of the old path followed by committees in Ireland generally, the committee in this matter have, by exhibiting the designs before announcing their decision, courted opinions upon their merits.

It is stated there is a unanimity amongst the committee upon the super-excellence both in design and draughtsmanship of one set contributed by an eminent provincial firm, though a paragraph in the accompanying description by the authors themselves proclaims one fact, that the design as exhibited cannot be executed for the limited amount. Honour already attributes an injustice to the committee, but we must decline listening. "Dum spiro spero" has a composition of some merit, both as regards exterior and interior—perspectives, in many colours, of each being given, with cruciform plan, attributed to an official of a certain local establishment. "Excelsior" displays a design in his usual style, though his perspectives are of a less pretentious character—hardly emanating from a southern clime,—probably all the better for artists' eyes? "Resurgam" the first—by the way, there are three "Resurgams"—is happy in his plan—in features, cruciform, with nave, transepts, and chancel—and equally so in his elevation. The authors of a design marked with a shamrock in a ring, the A 1 design hinted at above, evince an ability in grouping, in richness of detail, and in general effect to be admired. "Dunce Templæ retereis" deserves and requires investigation, to appreciate the designs which are admirably wrought out. The plan is very peculiar, perhaps the simplest in the exhibition, comprising chiefly nave and aisles, but the latter are mere passage-ways, and their usual width is thrown into the nave, that no optical impediments might be offered to the seated portion of the congregation. "Templa quæ delicta" is A 2, but we cannot expect to see it carried out in its integrity. "In fide et in bello fortes" contributes two designs, one to cost 9,600*l.*, and another 10,200*l.* (sharf to the limited amount), but the former is preferable, save in the weakness of the spire. The perspectives are tinted by the same English band whose colouring of prize drawings in a recent competition was noticed.

"Delta" has four drawings. The manner is palpable. Monogram, T in a circle. Has ten drawings, including an effectively etched perspective, with many meritorious points, but a glaring defect in the flatness of the transept roof, and the banding of the upper part of the tower and the spire.

Gothic is the style adopted by all the competitors.

LECTURES IN CONNECTION WITH THE ARCHITECTURAL EXHIBITION.

ON Tuesday evening the 1st of May, Mr. Robert Kerr delivered a discourse on the "Battle of the Styles; its Past, Present, and Future; from a favourable point of view."

Mr. Godwin having been called to the chair, said it was a particular pleasure to him to introduce the lecturer of the evening, because it had been his privilege, some years ago, first to make Mr. Kerr's writings known to the public, in the shape of a series of papers afterwards collected as "The Newleaf Discourses." Mr. Kerr had a right to be considered amongst the first of those who urged upon the public, in our time, the necessity of recollecting that architecture is a fine art, and upon the profession that those who practice it should be artists.

Mr. Kerr then delivered his discourse, tracing the history of architecture in modern times, and showing the variations which had taken place in public opinion. We will give a report hereafter.

The Chairman, at the close of the discourse, in proposing a vote of thanks to Mr. Kerr (which was afterwards unanimously carried), said that if the public could be made to know that seven interesting lectures could be enjoyed there, together with the right of coming at any time into the exhibition of drawings and inventions, for half-a-crown, the gallery would not be large enough to contain the visitors. Knowledge of the art, too, would spread; one of the results of which would probably be the growth of an opinion that, as Mr. Cockrell had said fourteen years ago, he who would really become an architect must leave the special discussion of styles, and steadily look to the true end and aim of his art. The chairman afterwards announced, that on the following Tuesday, Mr. J. H. Parker (of Oxford) would deliver a lecture on the comparative progress of English and French architecture.

On Saturday last the Prince Consort paid a quiet visit to the Exhibition to see the works there displayed. The door-keeper, not knowing the Patron of the Society, asked for the usual shilling for admittance, when, as we are told, it was immediately handed to him with evident good humour.

THE OLD WATER COLOUR SOCIETY.

For the fifty-sixth time the Old Society of Painters in Water Colours has opened its exhibition. On the present occasion it consists of 281 works, mostly excellent, though of specially remarkable pictures there are perhaps fewer than on some previous occasions. Mr. Carl Haag sends some of the results of his recent travels, including an admirable and striking drawing of the "Ruins of the Temple of the Sun, Palmyra," 105. Amidst the wonderful assemblage of ruins constituting the ancient Tadmor in the Wilderness, Mr. Haag was located a week. Amongst his smaller drawings, 224, "The Cave beneath the Hully Rock, Mosque of Omar, Jerusalem," will be looked at with great interest. Mr. F. W. Burton appears to have sent but two small heads, but these are of extreme beauty, especially 228, "Am Schutzpatronentage; in der Procession." Mr. A. P. Newton's principal picture, 69, "Mountain Gloom: the Pass of Glencoe," is powerful, truthful, and large. It is a noticeable incident that this excellent picture, the price of which was 250 guineas, has been purchased by a prizewinner of 20*l.* only, in the Art-Union of London. Mr. Struwell, of the Edgware-road, he paying the difference.

Mr. Duncum has a fine work, badly placed, "The last Man from the Wreck," 14; Mr. T. M. Richardson, a capital view of Durham, 119; and Mr. W. Hunt, several of his unapproachable studies. The latter varies his contributions by sending a pair of miniatures in one frame, 240, which might be called, "As I was and as I am."

Mr. John Gilbert comes out strongly; his "King's Trumpets" (21), is a remarkably good specimen of his powers. Mr. F. Snullfield, too, has some very interesting pieces of expression; and Mr. Naftel (see particularly 4, one of the watch towers in Bay of Salerno); Mr. S. P. Jackson ("Sunset before a Stormy Night, Widmouth Bay," 75); Mr. Davidson ("Eelesbourne Glen, Hastings," 44); Mr. Samuel Read ("Tomb of Rubens," 65); Mr. J. D. Harding ("The Forest," 70); Mr. Rosenberg, 107; Mr. Bicket Foster ("View in Holmwood Common," 208); Mr. Samuel Palmer ("The Ballad," 112; a powerful sunset effect); Mr. Joseph Nash, several capital interiors; Mr. T. M. Richardson, Miss Margaret Gillies, Mr. J. J. Jenkins, and some others, call for special admiration.

BRINKBURNE PRIORY CHURCH, NORTHUMBERLAND.

## BRINKBURNE PRIORY CHURCH.

THIS building, justly esteemed as the choicest ecclesiastical ruin in the county of Northumberland, is in course of restoration. For three hundred years it has remained untouched, and, compared with the fate of our parish churches, unimpaired. The spires of the gables have fretted away; the south-west angle has fallen; and, when we add that the roof has disappeared, and the flooring consequently perished, we have summed up the only finger-marks time and decay have left upon it. The secluded and sheltered situation of the building accounts in great measure for its fortunate preservation. It is built in a valley, upon a nook of green sward, on the brink of the river Coquet; and is hemmed in by steep banks as high as the tower of the church, which is therefore scarcely visible from the adjacent country. On the high land around there is still a great deal of wood; and we learn from old charters and surveys of other buildings, recommending the use of timber "from Brinkburne wode," that it was once a dense forest. The smoke from the priory fires was hidden by surrounding foliage: the only clue to its situation, possessed by the pillaging Scots, was the sound of the church bell. Local tradition informs us that a foraging party, intent upon the well-stocked larders of the inoffensive canons, had given up their search for the priory in despair, when the bell, summoning the community to a thanksgiving for their escape, revealed its position, and guided the enemy to the spot.

Brinkburne or Brankburn Priory Church is a remarkably fine specimen of the transitional period between the disuse of the Norman and vigour of the Early English styles. The excellence of the ashlar work, the use of clustered columns and lancet windows, point to the best period of Early English; but the doorways, the clerestory, and the third tier of lights at the east end, possess the Norman characteristic of the round arch. Yet this erection was the design of one mind, for there is no evidence of any alteration: the whole scheme was doubtless carried out as at first laid down.

The plan of the church is cruciform. The nave has a north aisle, and both north and south transepts have eastern aisles. The total length of

the interior is, 30 feet 10 inches. On the south side of the nave the presence of a beautiful arcade of trefoil arches, springing from slender shafts, indicates the site of the cloister. At a great height above this arcade were five lancets, one of which had fallen with the south-west angle. Their altitude was rendered necessary to catch the light from the south, which would have otherwise been intercepted by the nave. The north side of the nave has a clerestory and a triforium, the arches of both of which are round. The East end is lighted by three tiers of triplets: the two lower sets are pointed-headed, the upper plain and round. The long slender lights of the transepts are also round-headed. The doorways are all of Norman outline, but decorated with Early English ornaments. The north-west doorway, in particular, stands slightly forward, as in a porch, and is very richly ornamented. In the gable over the doorway is a triplet of trefoil arches. The tower also partakes of the same intermixture of styles apparent in every portion of this interesting edifice. The Norman features are not always capped by the later style: in several instances they surmount it; and the character of the masonry also unmistakably proves that the building is of a uniform date.

Of the domestic buildings of the priory nothing is visible. The site is occupied by the modern mansion of C. H. Cadogan, esq.

William Bartram, Baron of Mitford, founded Brinkburne Priory. He granted the site, in the reign of Henry I., to Osbertus Colutarius, for the purpose of founding a priory of Black Canons. Besides the site the pious baron gave the monks lands and woods, and his descendants gave them permission to cut timber out of their forests, to take fish out of their river, and to kill game. When we consider that the Coquet is a famous salmon stream, and that the moors, with their grouse, were close at hand, to say nothing of larger game in the forests, we shall see that these were no mean privileges. The monks had also a license to buy and sell in the town of Alnwick,—a good assurance of their prosperous condition.

The restoration has been undertaken in a purely

Mediaeval spirit by the unaided exertions of the family to whose possession the edifice has fortunately devolved.

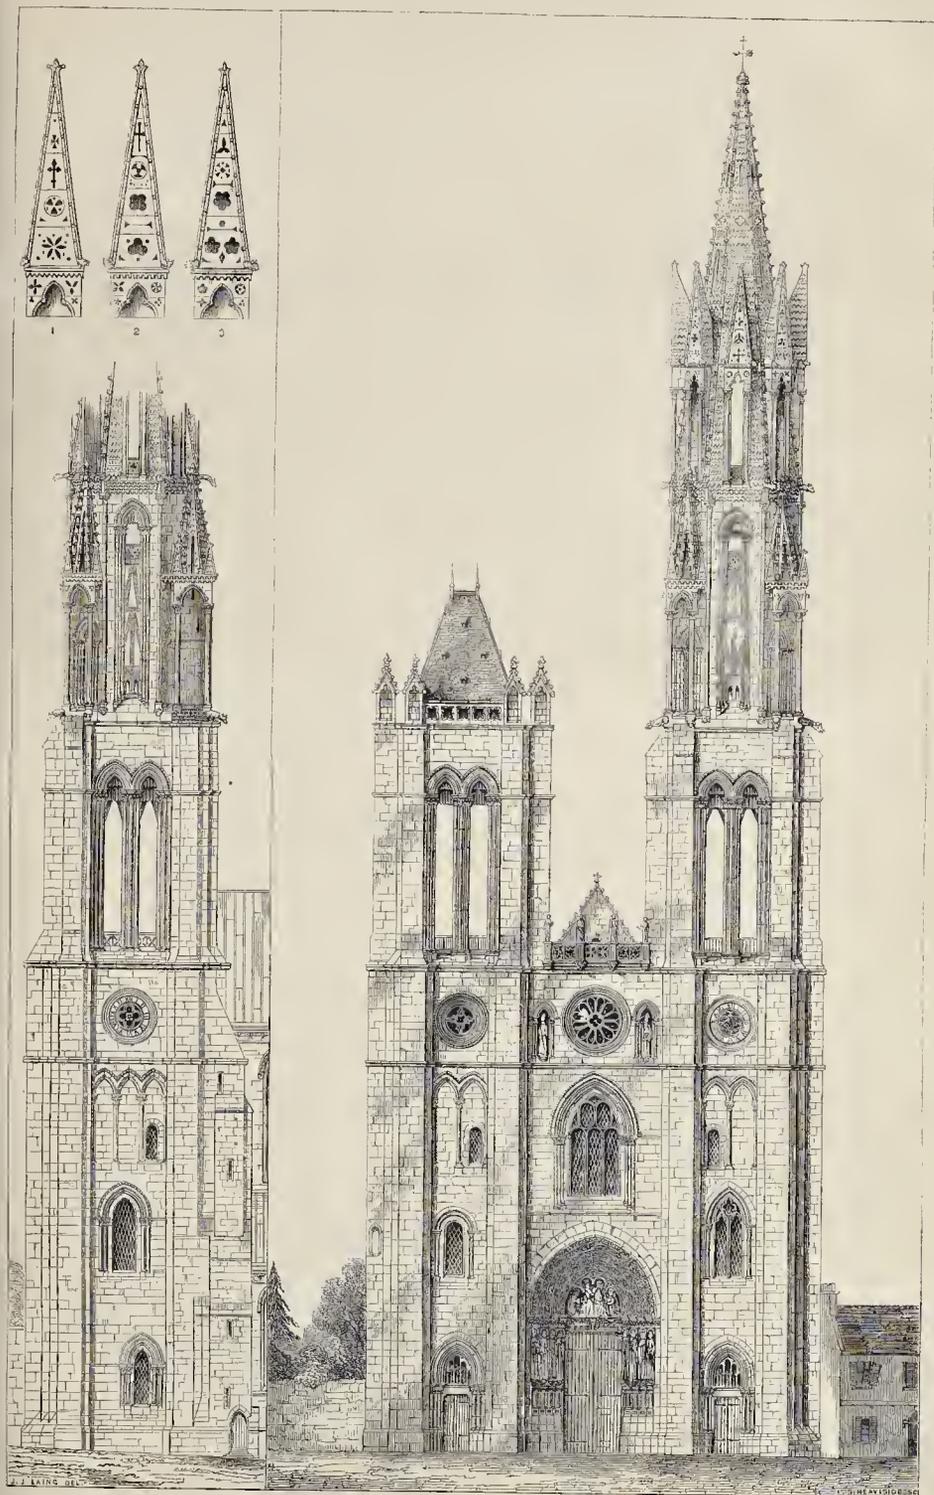

The building has been covered in with a timber roof, which is coated with small red tiles, of a hue quiet enough to harmonize with the weather-faints of the old masonry. A wheel window has been inserted in the gable of the south transept. The south-west angle, which was occupied by a staircase turret, the greater part of which had fallen, has been built up, and here, we believe, is the only deviation from a strict restoration. The staircase, which led through passages in the splayed pillars of the western triplet to the triforium, has been built up with solid masonry, and the characteristic passages through the pillars themselves have also been filled in.

The restoration of the church has been under consideration for many years, and a fund was collected for the purpose in the last century which is still in the hands of the archdeacons of Northumberland, unappropriated. We understand an attempt is about to be made to render it applicable to the payment of a clergyman.

Various objects of interest have been found at different times in the building and its vicinity. On one occasion a bronze vase was found, containing nearly three hundred gold rose nobles. A large stone, roughly hollowed out, had been placed in an inverted position over the hidden treasure. On removing an accumulation of rubbish in the interior of the church a coped stone coffin-lid was discovered. It was sculptured with a trefoiled cross, having a mitre to the right of the shaft of the cross, and to the left a pastoral staff. An inscription describes it to be the tombstone of one of the priors. These and other relics of the past have been carefully preserved.

RAILWAY TRAFFIC.—The traffic returns of railways in the United Kingdom for the week ending April 14, amounted to 498,960*l.*, and for the corresponding week of 1859 to 443,310*l.*, showing an increase of 51,750*l.* The gross receipts of the eight railways having their termini in the metropolis amounted to 215,582*l.*, and for the corresponding week of last year to 189,566*l.*, showing an increase of 25,996*l.*

SEN LIS CATHEDRAL, FRANCE.—GEOMETRICAL VIEW.

South Side of Tower.

West Front.

## SENILIS.

SENILIS, a small, quiet, interesting French town, in the department of the Oise, and near to the Forest of Chantilly, is situated a few miles from Creil, a junction-station of the Northern line of railway to Amiens. At Creil, there remains but little of its ancient importance: from its peculiar situation near the river it was held as a strong point of military defence, and is referred to particularly by M. Viollet le Due, in the part of his admirable Dictionary of the Architecture of France treating on military architecture, wherein he gives a choice illustration of it. The principal remaining ancient edifice of Creil is the church, a most peculiar one in shape, partly owing to its position, and, perhaps, from a great portion having been destroyed, and other work substituted by restoration. There is nothing very interesting in its general features. Not far distant from it are the remains of a small chapel of the eleventh century, or even earlier: it is very much defaced, and desecrated to the utmost extent that the French could devise in using it as a cow-hyde and loft for old bones and rubbish, the whole being surrounded by manure heaps. A part of its side wall may be seen in an illustration in M. V. le Duc's work, vol. iv.

On the road to Senlis there is nothing of any interest, save the curious dwellings of the poorer peasants near Creil, cut out of the solid, soft red stone; but on approaching Senlis the country looks fairer, with the lovely slender spire of its cathedral sparkling in the day-light, or glowing in the sunset. No geometrical drawing can render or tell the charming effect of the heautous spire of Senlis, esteemed by French and English judges as one of the gems of France. One cannot help thinking that in that age of geometric design the architect must have had a thorough conception of true artistic and perspective effects. Apart from its excellent construction and lovely decoration, and piercing with stars and rosettes,\* time has so worked his artistic tincting on it, that its mellow warm-coloured stone glows like old gold in a rich sun-set.

A view is given of the south side of the spire and tower, to show the varied and interesting construction connected with the turret staircase, which, although different from the west side, gradually rises into complete harmony, and unites all with the most mastery and delightful effect. The corresponding turret staircase, at the back of the north tower, is worthy of examination, which, although requiring the same construction as that on the south side, the architect, in his love for variety, treated differently, yet remembering in it, as in all parts, what was due to the whole conceived design. For more enlarged details of a part of south spire, M. V. le Duc's work must be referred to again, in his article "Clocher."

It will be seen that there have been some changes made in the west front, particularly with regard to traceries in windows. The greater part of the nave and transepts of the cathedral are of Romanesque character. Round the choir are small chapels, some containing good painted glass and coloured decoration. A sort of gallery is formed over the vaulting of the aisles, thus giving greatly increased accommodation. Throughout the edifice, especially in the façades of transepts, additions of Flamboyant work have been introduced, such as traceried balconies, &c., constructed with the *Heur-de-lis* as a prevailing form. The principal entrance doorway is most exquisitely carved; the draperies of the tall statues of saints and kings being well arranged and richly embroidered. Remains of ancient colouring still exist, especially around the auriols of the saints in the niched mouldings of arch.

Senlis contains, besides its small cathedral, ruins of the ancient castle occupied for some time by St. Louis, and around the town a great part of the massive fortifications may be seen. There are also two fine churches in tolerable preservation, but, like other sacred edifices, in this quarter especially, they are in a state of horrible desecration,—that of St. Frambourg being used as a builder's depot, and quarry if he choose. This imposing, lofty church, is of thirteenth century date, and has a fine circular apse and entrance doorway, with richly-carved foliage in its mouldings and graceful capitals. It has had a central pier in the doorway, containing probably a statue of the Virgin, or of St. Frambourg; but has been despoiled of this, and of the sculpture contained in the arch. The other church (St. Pierre), of the richest and

most Flamboyant, is used as the cavalry barracks—the aisles being occupied below for stalls for the horses, whilst above are the vaulted ward-rooms of the men. Little remains of another church of very early date, that of St. Aignan, which is converted into a theatre. There are remains of others, but they have become gradually so small by degrees, that scarcely anything can be traced of them.

Near to Senlis are the ruins of the important "Abbaye de Chaly," having an exquisite little chapel, of thirteenth-century work, in good preservation.

The illustrations are drawn on the wood by Mr. J. J. Laing, from sketches made by him some years ago, for Mr. Ruskin.

## ANOTHER NINE-HOURS MOVEMENT.

It is greatly to be deplored that a renewal of the late disastrous struggle is threatened by the leaders of the workmen in the building trades, who have recently been calling meetings and endeavouring to obtain the co-operation of non-society men towards the end in view. At a meeting on the 21st ult., at the Mitre Tavern, St. Martin's-lane, the chairman explained the new tactics to a numerous assemblage, chiefly of carpenters and joiners. The "Conference of the United Building Trades," he said, had determined upon adopting a different course of organization, by the formation of a system of branch houses all over the metropolis, and for that purpose London had been divided into fifty districts. By the above means they believed that the nucleus of an organization would be formed that would carry the movement in a few months, and prevent the masters from being able to learn that the men belonged to the union. Several branches had already been established. After addresses from others, several names were enrolled.

If Courts of Conciliation are to be of any use in the settlement of disputes between masters and men, now is the time to set them going and give them a fair trial; and we trust the Government will not "massacre" this "innocent," but on the contrary urge on the projected measure and pass it into law without a moment's delay.

The building trades' workmen are in an unsettled state elsewhere than in London.

## MASTERS AND MEN.

Before the Parliamentary Committee on this subject, mentioned in our last, Mr. Thomas Piper gave evidence on the 24th of April, as master-builder, and hon. secretary for twenty-five years of the Builders' Society. In reply to the observation of Mr. Potter, that the late strike might have been prevented if the men could have met the masters in council, he showed that thirteen masters and nine men discussed the question of nine hours as a day's labour. After full deliberation the masters declined to concede. Subsequently the masons and bricklayers, and afterwards the conjoint trades, sought an interview with the masters. The masters replied that they would be ready to receive a deputation if any new matter and stronger reasons could be adduced, but it would be useless to go over the same ground again, as the masters could only give the same character of reply; he said the masters would decidedly welcome any measures for friendly adjustment of differences; cordially agreed with the principles of the Bill, but great practical difficulty was apparent to the masters in the working of the proposed Courts of Conciliation,—first, because the men who might be appointed would be unacquainted with the masters,—with their personal character; secondly, because of the extreme variety of questions arising in the building business, and the extremely technical character of such questions.

Sir J. Paxton asked what character of questions could come before the Council of Conciliation, if all the men worked by the day, as he understood the vast majority did in the building trade?

The witness stated,—Of course the number of questions would be much more limited than in trades working piecemeal; but still there would be many minor questions which could be brought before such a council. He doubted the practicability of dealing with such a wide question as the nine-hours question, because it invaded great fixed principles, which custom and expediency had established. Did not agree with the witness (G. Potter), who stated that if the tenth hour of labour was omitted, it would make only 7½ per cent. difference to the master. It should be borne in mind, the deputation did not assign, as a reason for the demand of nine hours a day, "rise in

wages;" but the only reason alleged was desire for relaxation and opportunity for improving themselves; and the argument which the masters alleged as to the practical advance in labour was,— "Then you must increase your price to the public."

The master builders of London conceded the one hour and a half on Saturday, and this was an important practical advance of wages; but it was felt there was some ground for the concession, and that the spirit of the age was in favour of such a boon to the workmen. Sub-letting is practised to a very limited extent by London builders, and certainly not in the largest establishments. It is important that the building workman, as well as every other workman, should have a free labour market. The present system he thought injurious. The real market value of labour, and the distinctions of quality and skill, were destroyed, which was an injustice to the able workman.

The committee are now determining on their report.

## THE MERITS OF PERCHLORIDE OF IRON AS A DEODORIZER.

In a report, on the practicality and probable efficiency of the plan proposed by the Metropolitan Board of Works, for deodorizing the sewage of London by means of perchloride of iron, presented to the Improvement Committee of the City Commission of Sewers, by Dr. Letheby, their medical officer of health, the reporter not only questions the advisability of using such a deodorizer, but asserts that, two years ago, he found it to be "the least effective, and at that time the most expensive of all the deodorizers known;" and, in fact, that "it has in every instance most signally failed as a practical deodorizer." We have thus assertion and counter-assertion opposed to each other, and it remains to be seen which is right,—the Commission of the Metropolitan Board or the medical officer of the City Sewers Commission. As for the cost, Dr. Letheby admits that it is now only a twelfth part of what it was two years ago; but nevertheless maintains that the cost would still be enormous, from the quantity requisite to make it an effective deodorizer of the London sewage and purifier of the Thames. Dr. Letheby has his own favourite deodorizer, but the question in the meantime hears exclusively on the merits of perchloride of iron. Dr. Letheby, we may add, attributes the summer nuisance on the river to putrefactive decomposition of organic matter in the sewage, and not to the cause to which Mr. Spencer ascribes it.

## PUBLIC BUILDINGS IN THE PROVINCES.

*Steyning (Sussex).*—The tender of Mr. R. Pink, of Eastgrinstead, has been accepted for erecting a new police station at Steyning, at a sum between 1,700*l.* and 1,800*l.* It will be built at the back of the Chequers Inn.

*Manchester.*—About twelve months ago the erection of a branch free library in Livesey-street, Rochdale-road, was commenced. From the laying of the foundations the building has gradually progressed until it now, according to the local *Advertiser*, only requires the finishing touches previously to being opened. The plans and designs were prepared by Mr. Lynde, the city surveyor, and the contractor was Mr. Thompson, builder, Chetnam-hill; the clerk of the works being Mr. S. Taylor. The façade of the building, which is about 45 feet in length, is of dressed stone, in the plain Italian style of architecture, and in place of windows has a raised panel in the centre of each of the three bays into which it is divided. The parapet consists of open stone work. The library room is in length 44 feet, by 31 feet, and 26 feet in height. It is lit by a lantern roof, and the ceiling is coved and panelled, some of the panels being of open work for the purpose of ventilation. The plan for heating and ventilating the library was by Mr. Lynde. A shaft or chimney about 50 feet high is, from a chamber over the entrance-hall, fed with air which passes through a screen. The screen is for two purposes: it catches all the "blacks" which rush in at the louvres, and by turning upon it an artificial shower, it will, when need is, refrigerate the air before it passes down the shaft. The air on passing down the shaft is carried by means of tunnels under the library room floor, through which, by means of grids, it rises into the library, and passes out through the perforated panels of the ceiling into another shaft. From all the grids of this kind the rush of air creates an almost unbearable draft, but here it is said the draft is imperceptible. Under the floor, and in the tunnels, hot-water pipes are laid, over which the air from the shaft

\* Figs. 1, 2, and 3, show some examples of the piercings of the eighth pediments above spring of spire, all being different in design. These may not be faithfully correct, but give the appearance, as well as the eye can make them out from below, by hasty sketches in adverse weather.

passes. Air so passing over heated pipes is, however, liable to lose its hygienic or healthy breathing qualities, and, in addition, air so heated is injurious to the binding of books. With the view of restoring the qualities of the air, here, by means of several stop-cocks, small streams of water can be emitted out of the pipes, so as to produce a kind of imperceptible vapour. In the evenings the library will be lighted with four sun-light gas pendants, of fifteen jets each. The building will be opened early in June, when 3,000 volumes will be placed on the shelves.

**Hulme (Manchester).**—It has been resolved at a public meeting that a new town-hall should be erected for Hulme. The cost is estimated by the city surveyor at about 7,000*l.* The building, as designed, will be of stone, with the principal front towards Jackson-street. The frontage will be 71 feet, the plot having a depth of 84 feet; the whole containing 665 square yards. The erection will be in the Italian style of architecture,—the elevation consisting of two stories. The main entrance will be in the centre of the front, with the township offices on the left-hand side of the hall, and the overseers' offices on the right. On the further side of the hall, a staircase will give access to the second story, which, besides ante-rooms, will contain a large room in the direction of the frontage, 66 feet long, 32 feet broad, and 30 feet high. This will be as nearly as possible the same size as the principal room in the Manchester town-hall. It will be lighted by five windows, looking towards Jackson-street. The greatest length of the building (also of stone) will face City-road, and on the ground story will be the police offices, with the entrance towards City-road, as at present, and also a parade-room.

**Leeds.**—It is proposed to erect a new corn-exchange near the White Cloth Hall. At a meeting, in the town-hall, of corn-factors and others, the markets committee exhibited a plan of the corn-exchange at Edinburgh, and it was explained by Mr. Filler, the borough surveyor. That building, which is of the Italian style of architecture, is 150 feet long and 80 feet wide. It contains a large open space in the centre, in which both the factors and farmers transact their business, and there are factors' offices on each side of the building. After the plan had been inspected, a good deal of discussion ensued, and a general opinion was entertained that it was desirable that the farmers and the factors should meet in the same building, but that there should be separate accommodation for each. A resolution to that effect was unanimously adopted. Mr. Alderman Gill assured the factors that the committee were anxious to meet their wishes, and make the exchange in every way a suitable one. He also requested all gentlemen who wished for accommodation in the exchange to communicate with the borough surveyor, in order that the committee might be enabled to decide what extent of accommodation to provide. Plans for the proposed building are about to be advertised for.

**Hull.**—The prospectus has been issued of a new dock at Hull, to be called the Hull West Dock; the Company to have a capital of 400,000*l.*, in 20*l.* shares. It appears that the old docks, which were founded in 1774, have yielded enormous returns, but that there has been no adequate expansion of them to meet the growing trade of the port, and that the steam-ship owners are especially dissatisfied. The promoters have subscribed a third of the required amount, and the municipal corporation and Hull Trinity-house have, it is stated, resolved to contribute largely. An Act of Parliament is to be applied for, and 4 per cent. is to be allowed on calls during construction. The monopoly of the existing company expires in 1865.

#### CHURCH-BUILDING NEWS.

**Edlington (near Horncastle).**—The Church of Edlington has been re-opened by the Bishop of Lincoln. The edifice has been rebuilt, except the tower, to which a new upper story has been added. The edifice, which is in the Geometrical style, except the tower arch, which is Norman, consists of a nave, south aisle, chancel, south porch, and tower at the west end. The two windows on the south of the chancel are of stained glass, a present from the vicar's wife. The rest of the windows are of a rough deep-tinted glass. The floor is paved with Minton's tiles. The architect employed was Mr. James Fowler, of Louth.

**Bishop Stortford.**—A new Independent chapel has been opened here. The edifice is in the Italian style. The form of the building is oval. The galleries, of which there are two, one above the other, are carried about three-fourths round the building. The front of the galleries is of open

ornamental ironwork, painted grey. The stairs leading to the galleries are carried up spirally in the towers in front of the building. The roof spans the whole width between the walls, and is divided into panels. In the centre is an ornamental skylight, and the windows are filled with rough plate-glass. The seats are all open, stained, and varnished, and are circular, to adapt them to the shape of the building. Colour has been very sparingly introduced, the object being to avoid showiness. The edifice is built of white bricks, with Bath stone dressings. The architects were Messrs. Poulton and Woodman, of Reading; and the builders, Messrs. Young & Co., of Oxford. The building is seated for 1,050 persons.

**Kegworth.**—The restoration of Kegworth Church has been progressing under the superintendence of Mr. Garland, of Nottingham, at a cost of about 1,400*l.*, and is now nearly completed. The floor is of encaustic tiles. The new seats are of Russian pine and English oak; the pulpit, reading-desk, &c., are of oak. The vestry, formerly the abode of an anchorite, is being restored. The edifice has been repaired.

**Waltham Abbey.**—The committee for the repair and restoration of the Abbey Church, Waltham, have announced that the church will be opened on the 3rd of May. The new gallery is almost completed; so is the decoration of the ceiling, 1,000*l.* more is required to complete the chancel end of the Abbey.

**Malden.**—The foundation-stone of a new church about to be erected by the Earl of Romney, in the Motte-park, has been laid. The architect is Mr. Blandford. The church will consist of nave, chancel with apsidal end, vestry on the north, and organ chamber on the south, north porch, and campanile at the west end. It is designed in the Early English style of architecture, and will contain accommodation for 200 persons.

**Dover.**—The foundation-stone of the new parish church of St. James, Dover, has been laid, in a field known as Tinker's close, at East-brook. The style is Decorated, of the fourteenth century. The edifice is to consist of a nave, 93 feet long by 24 feet wide, with side aisles, each 78 feet in length by 20 feet in width. The chancel is long by 23 feet 6 inches, into which an organ-chapel opens on the south side, and is in extent 20 feet by 16 feet. The vestry is at the east side of the north aisle. The principal entrance to the church is by the tower, which is situated at the north-west angle of the building. The altitude of the tower and spire will be 140 feet, and the top of the gable of the west front will be 60 feet high, and will contain a traceried window of six lights. The other entrance to the church is by a porch on the south side. At the west end a gallery has been provided for children; while, with the view to increase the number of sittings, galleries have to be introduced over the north and south aisles, with staircases at the entrance end of the building. The number of sittings which the church is intended to hold is 1,400, being an increase of more than 800 over that in the present building. The architect is Mr. Talbot Bury, and the builder Mr. W. Moxon, of Dover. The estimated cost of the whole is about 7,000*l.*

**Netley Abbey.**—It is in contemplation to restore the chapel of Netley Abbey, situated on Southampton Water, for the purpose of performing Divine service in it. The ruins of Netley Abbey are now surrounded by a large population, owing to the military hospital which is erecting in the neighbourhood, and which will be the largest building in Europe.

**Ventnor (Isle of Wight).**—The foundation-stone of the Church of Holy Trinity, Ventnor, has been laid. The architect is Mr. C. E. Giles, of London. The building will be a Gothic one of the Geometrical period. The ground covered is 110 feet by 48 feet, and at the north-west angle is a tower surmounted by a lantern and spire, about 160 feet in height. The contract for the works has been taken by Mr. James Bull, and the entire cost of the building will be about 5,000*l.*

**Publow (Somerset).**—The church here has been restored under Mr. Ferrey, of London, architect. The contract was entered into with Messrs. Hughes & Son, of Bristol, builders, for 12,000*l.* The work of re-construction has been almost completely carried out. New roofs have been built in the side aisles, buttresses erected against the decayed walls, new clerestory windows constructed, new mullions to all the windows, the interior completely renovated by the removal of all the old wooden pews and the construction of open seats. The entire floor of the church has been repaved, and the whole drained.

**Newport (Wales).**—The Bishop of Llandaf has opened the Church of St. John the Evangelist, at

Maindee. The edifice consists of a nave and a south aisle, with a tower over the westernmost bay of the same. The aisle is divided from the nave by an arcade of four bays (including that of the tower), and it is continued eastward so as to form a chancel aisle of one bay. There are western and southern porches, a chancel, and a vestry. The tower has as yet only been carried up to the level of the ridge of the aisle roof, but will, when completed, with the proposed spire, rise to a height of 180 feet. The church is designed to accommodate 500 persons. The site is upon the slope of Maindee-hill, which is being rapidly covered with villas and forms a pleasant suburb to Newport. The church has been executed by Mr. Logan, under the superintendence of Mr. Biggs, from the designs of Messrs. Pritchard & Seddon, the diocesan architects. The walls are of thin Pennant sandstone. The dressings are of Combe Down Bath stone; the timber of Memel, but all the furniture of pitch pine with pine figure. The roof is covered with boarding felt and Ladies' Delabole slate. The windows are traceried. The chancel arch and the capitals of the arcade columns are, or are to be, carved; this work has been entrusted to Mr. Earl, of London. The style of architecture is Geometrical.

**Bristol.**—A number of curious carvings have been discovered at Bristol Cathedral. The designs of many of them are of grotesque character, and they are generally in a good state of preservation, but some have been considerably mutilated. They were brought to light by the removal of the stalls in the progress of the work for the restoration of the interior of the cathedral.

**Stourbridge.**—W. O. Foster, esq., M.P. for South Staffordshire, has erected and presented to the neighbourhood of Wollaston a church, schools, and master's house, at a cost of nearly 10,000*l.* The church, which has been opened, will accommodate about 650 persons, and consists of nave, side aisles, transepts, chancel, sacristy, south porch, organ-chamber (adjoining the chancel), and tower at the north-west angle of building. The materials used for the walls of the whole of the buildings are blue brick and dressings of Bath stone. The style adopted by the architect is that of the fourteenth century Gothic. The church has a tower, surmounted with trefoiled battlements and pinnacles. The interior woodwork of roof, seats, reading-desk, screen to sacristy, and children's gallery at the west end, are of deal, and stained; the roof and stalls in the chancel being more elaborate, and containing appropriate tracery. The organ has been supplied by Mr. Walker, of London. The east and west windows were painted by Messrs. Clayton & B. I.; and the building was heated by Messrs. Haden, of Trowbridge. The whole of the buildings were designed and carried out under the superintendence of Mr. G. Bidlake, of Wolverhampton; Mr. Elliott, of the same town, being the builder.

**Manchester.**—With reference to our notice recently of the works of restoration in Manchester Cathedral we are asked by Mr. T. R. Williams to state that he executed a considerable portion of the carving.

#### WORKS ABROAD.

On the 28th ult., on the Baden side of the Rhine, took place, with perfect success, the launch of the enormous caisson destined to receive the concrete of the foundations of the abutment of the new Rhine Bridge. It is 16 metres long by 12 metres wide, and 10 deep; thereby containing 1,920 cubic metres. The depth of the cavity excavated by dredging in the bed of the river is 15 metres, so that a second "story" of 5 metres has to be added to the monster box, increasing its capacity to 2,780 metres cube. This is the last great hydraulic work required for the fixed bridge, the similar one on the French side being so far advanced that the masonry will be commenced in fifteen days, by which time the foundations are expected to have sufficiently set. The Baden abutment will require two months longer. The imposts of the piers are ready for the lattice-work of the girders, which, along with the swing bridges, are in a very forward state. It is calculated, at all events, that the French and Baden lines will be thus joined together, and trains continue without interruption next August, and afford the opportunity of charming trips from Paris to the heart of Austria.

The demolitions undertaken between the quay of the *Mégisserie*, opposite the *Châtelet*, and the *Rues Jean-Laudier* and des *Lavandières-Saintes-Opportunes*, are completely terminated; not a vestige rests of the numerous houses that were standing on this vast space. In consequence of

his clearance, a considerable portion of the Rue Saint Germain l'Auxerrois has vanished. The foundations for the new Théâtre Lyrique, to be built on this spot, will be laid at once: the plans, &c., have been just completed.

Paris masons are not more careful than any others of their class, either of their lives or the buildings they are erecting. A few days ago, in the Rue des Vertus, during the erection of a house of considerable height, the usual dangerous system was carried on of loading, with dressed stone, the upper floors of the building before the works were in a measure consolidated. The consequence was the falling-in of the upper one, by the parting of the walls, carrying the whole of them, with the workmen, down to the cellar. Two were taken at the rubbish dead: five were wounded.

The lava from the extinct volcanoes of the Puy-de-Dôme, hitherto only used for architectural purposes in the basin of the Limogne, has been now extensively employed in Paris for foot pavements, street inscriptions, and panels for the rich enamels of the process of M. Mortelouque. The Count de Chantrol has, by the useful instructions and indications published by him, been one of the chief promoters of this branch of decorative art. He is, moreover, in order to develop further the lava works of the Puy-de-Dôme, founded at the Polytechnic school of design and architecture, which, strengthened by aid from the funds of the department, as well as by the private liberality of the Count de Chantrol, has already gained a wide reputation in furnishing the country with skilled workmen. Other schools have been founded of this description by private persons: at Semur, M. Larrivé has instituted a school for workmen, with the valuable addition of a museum.

#### SELECT COMMITTEE ON PUBLIC INSTITUTIONS.

THE select committee of the House of Commons, appointed to inquire whether it is in the power of Parliament to provide further facilities for promoting the healthful recreation and improvement of the people, by placing institutions supported by general taxation within the reach of the largest portion of the taxpayers, have made their report. They have considered the question submitted to them under the two following aspects:—"First, whether facilities can be afforded to the people at large for visiting public institutions on week-day evenings, without injury to the buildings or their contents; the evenings being ordinarily the only time when they could in any numbers find leisure to do so? Secondly, whether, provided such facilities were afforded, they would avail themselves of them in sufficient numbers to justify the increased expenditure that would be incurred thereby?" and they ultimately submit,—"that institutions such as the British Museum and the National Gallery should be opened on week-day evenings to the public; and that, as the opportunity thus afforded of bringing the instruction and pleasure to be derived from visiting them within the reach of those who are occupied during ordinary working hours would be appreciated by them, it is desirable that they should be thus opened, under due regulations, between the hours of seven and ten in the evening, at least three days in the week. Monday and Saturday appear to be the most convenient days to the public at large."

#### THE ARCHITECTURAL ASSOCIATION.

THE ordinary meeting of this society was held in the rooms in Conduit-street, on Friday evening, the 27th April: Mr. Deaford, president, in the chair.

Mr. Bunker begged to be allowed, before the regular business of the evening began, to ask the secretary whether the committee had communicated with the council of the Royal Institute as to the plan proposed for granting diplomas and degrees in connection with the profession of architecture. As far as he had an opportunity of judging from the statements which had appeared in the *Builder* and elsewhere, the scheme, as laid down, was of an exclusive character, and immediate steps should be taken to obtain correct information on the matter. He might here remind the society that they had been the first to suggest such tests of proficiency for the profession, and that it was their duty not to allow the matter to pass away without some notice.

The Secretary said that the committee had taken no steps; indeed, on that day the matter had appeared for the first time.

The President fully concurred in the remarks of Mr. Bunker as to the advisability of communicating with the secretary of the Royal Institute. A com-

mittee meeting would be held that day week, before whom he would undertake that the matter should be regularly brought. The secretary would correspond with the Royal Institute, and the whole subject might be suitably discussed at the next meeting of the society, which, fortunately for their purpose, was a special business meeting.

Mr. Bunker said that no time should be lost: the final decision of the Royal Institute would be made, he feared, on Monday, 7th; and the rules, as now laid down, would exclude the members of this society from the advantages proposed.

Mr. Norton read a paper on Medieval sculpture, to which we shall return. The observations were illustrated by casts of diptychs from the second century up to comparatively modern times.

#### THE LATE FIRE IN REDCROSS-STREET, NEAR BARBICAN.

THIS portion of old London has much to interest the antiquary, for here and in adjoining streets there are vestiges of the old metropolis as it was before the time of the Great Fire of 1666. Nearly opposite the old church of Cripplegate is one of the most picturesque groups of houses now to be found in the City, and of which we have given an engraving. At the end of Red Lion-street, next Barbican, there were on each side some buildings faced with the dark-coloured red brick, moulded in cornices, which was much in use about Charles the First's reign. One of those clumps of houses nearest to Smithfield has been destroyed, leaving just enough to show that behind the facing there was work of far greater antiquity.

The ruins present a singular appearance, and show how the buildings have been patched and altered from time to time. In a portion of the brick house of Charles the First's days part of the timber framework has been left, which is probably upwards of 500 years old, including barge beams of oak, some of which are of great length, and about 18 inches square. Part of this wood is remarkably sound, in spite of the action of time and fire.

A sight of these ruins serves to give some idea of the action and effect of the Great Fire of 1666. Throughout the space swept by the recent conflagration there were no sufficient party walls, and it is only where these modern works are placed that the raging of the flames on the present occasion was stopped: but for this, notwithstanding the immense power of the water engines now in use, it would have been no easy matter to have limited the damage. Throughout the whole of the premises the brick and stone work has been nearly levelled with the ground.

Although the frontage was of substantial-looking brickwork, the back portion was chiefly of wood, and hundreds of the houses which escaped the Great Fire are of the same dangerous construction. Year by year, however, these remains of past times are vanishing, and fires, alterations, and the slow but sure effect of time, will, ere long, destroy all traces of the city of the past. Several very large fires have happened in this neighbourhood within the last twelve months.

It is worth noting that the old-fashioned houses, formed of massive timber, resist the action of fire for a much longer time than dwellings of the modern kind. At Bermondsey a fire demolished extensive warehouses and several houses: an ancient wooden house which stood in the midst of the fire escaped with trifling damage. It is only the introduction of party walls which prevents the spread of fires amongst modern buildings to the extent of those of former times.

#### DECORATION OF ST. PAUL'S CATHEDRAL.

AMETTING of the committee regarding the above was held on the 19th ultimo. The Very Rev. the Dean in the chair. A statement of finance was read, by which it appeared that, altogether, the public had, up to that time, contributed to the joint purpose of the special evening services and the internal decoration of the cathedral about 7,000*l.*; that about 5,000*l.* of that amount to speak in round numbers had been already expended in furthering both purposes. The fixing of the organ in one of the north bays of the choir, in preference to restoring it to its old place above the screen at the entrance of the choir, was reported to have been satisfactorily accomplished.

A report of the cathedral surveyor was then read, accompanied by plans and drawings of the alterations in the choir contemplated by the sub-committee. The *City Press* says, Mr. Penrose stated, in answer to an inquiry, that 10,000*l.* would make a very good beginning of the entire decorations indicated in his drawings,

but that many times that amount would be required to complete the whole interior worthy of the building itself and of the national importance it represented. Mr. Penrose supplemented his remarks by stating that he had discovered in the archives of the cathedral an original drawing of Sir Christopher Wren, wherein was portrayed one of the bays of the choir with an organ introduced. This he stated was as satisfactory as it was interesting, for it thereby evidenced that in the alteration of the site of the organ, the committee were only following out the original plan of the great architect in his noble work, the cathedral—a plan, however, in which he was at the time so shamefully frustrated, as he was in too many particulars with respect to it. Mr. Cotton moved a resolution proposing the removal of the organ-screen from its present site to the entrance of the south transept,—it being understood that it was placed there as a suggestive site or substructure for the proposed new and additional organ for the special use of the popular evening services, and for such other public ceremonies requiring musical adjuncts,—which was then carried.\*

#### COMPETITIONS.

*Ripley Chapel, Derbyshire.*—The committee of this chapel have selected the design of Mr. R. C. Sutton, architect, of Nottingham, under whose superintendance the work is to be carried out.

*Chester.*—The committee for the restoration of Holy Trinity Church examined the several competing designs sent in by local and other architects; after which it was determined to select two plans, one for a restoration of and the other for rebuilding the church, both plans to be submitted to the final choice of a future vestry meeting. Mr. James Harrison's designs for a restoration of the church, says the *Chester Chronicle*, were unanimously adopted; but, with respect to the rebuilding, considerable difference of opinion was expressed. Dr. Waters proposed that the plans of Mr. Murray, of Coventry, for an entire rebuilding and extension of the church, should be recommended to the vestry by the committee. Mr. T. Hughes proposed that no plans should be recognized by the committee which in any way interfered with the present foundations of the church, or with the interments therein, or in the burial-ground. After a lengthened discussion, the motion that Mr. Murray's plans, along with Mr. Harrison's, should be submitted to the vestry, was agreed to.

#### PROFESSIONAL EXAMINATIONS.

In your last number is a programme of a scheme for that great desideratum, a professional examination and certificates.

I wish, however, on my own behalf and on that of many of our brethren whose practice is similar to mine, to claim the extension of the proposed examinations to a class, who, without being members of the Institute, are most desirous of some mode of distinction from the herd of quacks.

If it is asked, "Then why not enter the Institute?" I reply, the Institute discourages measuring and quantity-making, on which my practice is based, and requires its members to sign a declaration, which no man can honourably subscribe whose charges are usually made to the *builder* and not to the *client*.

It is again urged, that "the proposed examinations do not apply to measurers and quantity-makers?" To this I answer, that I (and many like me) have a practice which, whilst based on surveying, is partly architectural, and I cannot afford to throw away either my T-square or my measuring rule.

Therefore please permit the appearance of my humble petition, that the great men of Conduit-street would be pleased to extend their proposed voluntary examinations to a class of men, whose opinions many of the said dons themselves do not disdain to ask on matters of construction and detail, and your petitioners, as in duty bound, will ever pray.

A SURVEYOR AND ARCHITECT.

\* A correspondent writes,—

"SIR,—It is painful to notice the ill effect produced by the hangings which have been placed in St. Paul's, to enclose the space for the Sunday evening service, and which entirely interfere with the right effect of Wren's glorious building; from no point can a proper view be had of the whole interior. Admitting that sacrifices must be made in order to promote so much good as has been done by these special services, it is, notwithstanding, a pity to disfigure one of our finest examples of architecture. Visitors from the country, foreigners, and even the dwellers in the metropolis, must be disappointed at this. It is not possible, therefore, to devise some plan by which, during week days, these curtains may be drawn aside, in order that, without such interruption, visitors may be able properly to view the interior of St. Paul's."

## EXETER BRANCH BANK COMPETITION.

STR.—We are reluctantly obliged to address you on the above competition. We allowed the paragraph in your impression of March 31st to pass unnoticed, as the object of the writer was too patent, and our interests thereby not affected. But when we find this Mr. E. C. Robins, with the most unblushing effrontery, parading a design at the Architectural Exhibition, as a "View of the Design for the Exeter Branch of the Devon and Cornwall Bank, to which the first premium was awarded," patience has its limits, and we are compelled to expose his conduct. To do so we have only to call your attention to the annexed extracts from correspondence in our possession.

KENNEDY &amp; ROGERS.

Extract from Instructions, &c., to Architects invited to compete.

"The architect whose plan is preferred and adopted shall have the superintendence of the building on the usual terms of 5 per cent. on the outlay. The architect whose plan is considered second in merit shall receive 10, 10s., and the third in merit, 5s., &c."

Extract from Letter.

"Devon and Cornwall Bank,  
Plymouth, March 16, 1860.

GENTLEMEN.—I have the pleasure to inform you that the directors of this bank have selected the plan, marked "A seise la fin," for the building the Bank-house at Exeter, &c. &c. &c.

(Signed) DAVID DERRY.

\* \* \* We said, at the time, that we gave the particulars as they had reached us, but did not understand the transaction. It is to be hoped that the competitor who sent us the statement did not purposely withhold the facts now communicated, which makes the arrangement clear.

## DECISIONS UNDER METROPOLITAN BUILDING ACT.

## PROJECTIONS.

*Boher, District Surveyor of St. Pancras, v. Neaman, Builder.*—This was an appeal, in Court of Common Pleas April 23, based on a special case, against a conviction by Mr. LONG, of Marylebone police court. The appellant had erected a shop building of one store over the forecourt of No. 3, Bartholomew place, forming part of the high road at Kenish-town, and had neglected, and indeed refused, to apply to the Metropolitan Board for their permission so to do, either under the powers vested in them by the 26th section of the Building Act, or by the 143rd section of the Local Management Act.

As Bartholomew-place consists of an unbroken range of about twenty houses, although standing back from the public road, the district surveyor conceived it to be his duty to institute proceedings against the builder, under the first-named section, for erecting a projection "beyond the general line of fronts" in the street. The case was ably argued before the magistrate, the defendant being represented by counsel, who maintained that the term "projection" applied only to some adjunct, some appendage to a building, such as a bow window, a verandah, porch, or balcony, and not to a building standing on its own foundation. The magistrate being of opinion that it was a projection, counsel then argued that it did not extend beyond the general line of fronts in the street: in fact abutting immediately on the road, or much nearer to it than the building in question.

Mr. LONG, however, considered that as the projection extended beyond the line of fronts which would be affected by it, namely, the line of Bartholomew-place, it was contrary to the Act, and he issued an order to comply with the requisition of the district surveyor within a month.

Against this order the builder, supported by the owner of the property, now appealed to her Majesty's Judges, who, after hearing Mr. Field on behalf of the appellant, expressed their opinion that the question was simply one of law, which it was in the legitimate province of the magistrate to decide, and that it did not involve any matter of law at all. Mr. Fenwick, the district surveyor's counsel, was not called upon, and the appeal was dismissed with costs.

It should be mentioned that, before the month expired, as given in the magistrate's order, the Local Board of Works sent a gang of workmen and pulled down the building, stacking the materials on the ground; so that the district surveyor was reluctantly brought into court long after his requisition had in reality been complied with, or at all events had been rendered unnecessary.

## BED OF BATH STONE.

A PRACTICAL mason, accustomed all his life to the use of Bath stone, sends us the following remarks:—As to bed, if you look closely into Bath stone, you will see the bed show in a sort of lists, \* of soft and hard, horizontally. The veins, if any, you will observe, run across the bed and up the face of the stone. For all work of heavy nature, and for purposes that require great strength, it is best to put stone bed-way,—say, jamba, cills, arches, columns, caps, and washers.

I have found that coping, plinths, labels, string courses, and cornices, are all better joint-bedded. For this reason, if they lie bed-way, you will see

\* Beds is a Gloucester word, meaning courses or layers. Thus they speak of a list wall, a common mode of building a dell boundary, viz. a foot of dry walling without mortar, and a foot with mortar.

by looking round some of the churches that the soft lists of the beds absorb the damp, and then the frost lifts off the pieces of the work exposed to the weather. I have known many pieces of coping and cornices that in course of years were eaten away. Tracey I have found to be better face-bedded, for this reason,—if it is worked from the bed, the cusps very often drop off; and in some instances I have known them all fall off in working, such is the weakness through the soft lists, always in all freestone.

## THE CHARGE AGAINST MESSRS. PETO, BRASSEY, &amp; BETTS.

STR.—I was so much surprised at the accusation made by Mr. B. Jerrold, against Messrs. Brassey, Peto, & Betts, which appeared in the article upon "Masters and Workmen," in your last number (p. 266), that I felt it my duty—as connected with one of the technical journals—to apply directly to the members of that firm, for the purpose of ascertaining the truth of the accusation. The characters of Messrs. Brassey, Peto, & Betts would almost have warranted the summary rejection of the story Mr. Jerrold told; but as it was made known, I thought it best to take special measures to learn the whole truth with respect to it.

The result of my inquiries has been to convince me that Mr. Jerrold has even circulated to what extent he may in the present excited state of the building trades, to be neither more nor less than a deliberate slander; and I have been requested to meet it with the most distinct contradiction. Unfortunately, the period at which I received the answer to my inquiries has prevented me from noticing the subject with the necessary detail; but, by your permission, I may return to it hereafter.

G. R. BRNELL.

## THE LONDON BUILDING COMPANY.

The first general meeting of shareholders of the London Building Company was held at the Institution, Cleveland-street, Fitzroy-square, on Tuesday evening May 1st. In the directors' report it appeared that the Company had not been supported by the building operatives to the extent they had anticipated, but still that had not deterred them from endeavouring to obtain work, and the opportunity offered of sending in a tender for certain works at Herod Hempstead Church, they had done so. Although there was the lowest estimate for new fittings in deal, it was not the lowest in oak, and the church committee had not yet decided who was to have the contract. The shareholders expressed confidence in the management of the Company, re-elected the directors and the secretary, appointed two auditors to examine the financial statement read to them, and requested that the articles of the Association should be printed and sold at a moderate cost.

## NAVIGATION WORKS ON THE SEVERN.

## INSTALLATION OF CIVIL ENGINEERS.

On April 24, the paper read was an "Account of the Works recently constructed upon the River Severn, at the Upper Lode, near Tewkesbury," by Mr. E. Lender Williams.

The whole of the works constructed, during the past fifteen years, for the improvement of the navigation of the River Severn, between Stourport and Gloucester, were projected in 1841, by Sir William Cubitt.

After a contest, in Parliament, of five years' duration, the requisite powers were obtained; but, owing to the unfavourable state of the money market, the works were not commenced until the autumn of 1856.

The depth of excavation required for the lock-pit was 35 feet, and here some difficulty arose, as was anticipated. Beneath 2 feet of loam, and 16 feet of sound red brick clay, there occurred 14 feet of impure blue limy clay, intermixed with black mud and decayed vegetable matter, in which strong springs of water were met with, and then 4 feet of compact blue limy clay, overlying a thick bed of water-bearing gravel. When the sound upper crust was removed, the semi-fluid mass began to rise in the pit, letting down the clay on each side, and breaking up the whole of the surface. At first it was suggested that the water should be drained off, but the proximity of the river, which surrounded the works on three sides, left little to be hoped for from such an attempt. Relief was therefore sought in another, and, as experience proved, the right direction. Pits were sunk in the line of the east-west wall of the lock forebay, the sides and ends being planked with half timbers, well strutted. As soon as the sound clay was reached, the pits were filled with concrete. The distance between these pits was 20 feet, and the intermediate soil was allowed to remain until the concrete in the adjacent pits was consolidated, when these spaces were also filled with concrete. Thus, the whole of the wall foundations, composed of concrete, 12 feet in width, and 14 feet in depth, were got in. It was expected that this mass would, by its gravity, resist the pressure of the soft soil at the back, especially as the materials lie between the two lines of concrete had not been removed. But as the concrete walls were forced bodily inward, 18 inches on each side, strutting timbers were introduced, to prevent

further movement, whilst an inverted arch concrete, 6 feet thick at the crown, was gradually carried through the whole length of the work upon a similar plan to that adopted in the case of the foundations of the side walls. As the timbers did not seem to be sufficient to prevent inward movement of the sides, during the formation of the inverted arch, counterforts of concrete 10 feet square, and carried 2 feet below the bottom of the side-wall foundations, were introduced at every 12 feet apart. The concrete foundations thus completed contained upwards of 7,500 cubic yards.

## Books Received.

Department of Science and Art: Directory with Regulations for establishing and conducting Science Schools and Classes. London: sold by Chapman & Hall, Piccadilly. 1860.

THIS pamphlet contains a summary of the nature and amount of aid that can be obtained from the Department, with Syllabus of the subjects which certificates to teachers of science are given by the Department, and other useful matter; the whole revised to March, 1860, superseding all former rules, though still subject to revision. It is very desirable that those interested should have precise information on the points here indicated, and this they will find concisely and officially given in the sixpenny pamphlet under notice.

## VARIORUM.

In a tract, titled "The Victoria-bridge at Montreal, Canada: who is entitled to the Credit of its Conception? or a short history of its origin. By Canadian" (King & Co. 63, Queen-street, Cheap-side, printers), it is urged that Mr. Stephenson, though entitled to the credit of executing the bridge, had not the merit of its conception, which is ascribed to the Hon. John Young, of Montreal, and that to Mr. T. C. Keefer, C.E., a native of Canada, is due the merit of demonstrating the entire practicability of accomplishing this great work. The declared purpose of the tract is to enable the Prince of Wales to do justice to all, by his remarks and proceedings as to the bridge when he visits it this summer.—A brief article "On a Carbonate of Lead from Leaden Coffins. By R. V. Tuson, lecturer on Chemistry, at Charing-cross Hospital," has been reprinted from the *Philosophical Magazine*, for April 1860. The interesting points in connection with the substance in question are, that it is anhydrous, contains but a small excess of oxide, and hence differs in composition from other carbonates of lead. It was found, during the search for the remains of John Hunter, that many leaden coffins had been converted, interiorly, all but a thin outer plate or foil, into this carbonate.—In a small pamphlet on the "Advantages of reducing the Hours of the Miner's Labour, and the necessity of Educating the Collier Boys; with Suggestions for the better Inspection and Regulation of Coal-mines, in order to preserve the health and protect the lives of all persons employed in them," printed at the *Leeds Express-Office*, Mr. Richard Bayldon, the author, urges that, on account of the peculiarities and dangers of the miner's occupation, and to prevent all further strikes, lock-outs, and other misanderstandings between miners and their masters, the Legislature ought to step in between them with an Act of Parliament, restricting the hours of their labour to eight hours a day.—English Grammar for the million appears in the shape of "The Penny English Grammar, adapted for the Use of Schools and Private Families." By M. Kavanaugh, author of other grammar-books, and published at 21, Paternoster-row.—Mr. John Plummer, the Kettering operative, has just had published, by Tweddie, 337, Strand, "Some Remarks occasioned by a Pamphlet entitled 'Trades' Unions and Strikes, their Philosophy and Intention.'" The pamphlet referred to is that of Mr. J. T. Dunning, under the title quoted. Mr. Plummer states his views with ability, and remarks that if his fellow-workmen would only strike as determinedly against intemperance, ignorance, and class prejudice, as they do now against any real or alleged grievance, they would be all the better for it.—A third edition of a tract, titled "Plans for the Purification of the River Thames, and the Improvement of the Metropolis. By William White," has been published by Lockwood & Co., Stationers'-hall-court, and others. Two chief features of this plan consist of the deepening of the river

channel with the pavement of its banks; and the engraving of the metropolis by a ring of pipes or canals and reservoirs, for the flushing of the sewers. Cost, the author considers, is a matter of secondary importance, whether it be "three billions or thirteen." He also "considers that he deserves some reward for endeavouring to promote the health and happiness of the 3,000,000 inhabitants of our great city," which reward might assume the shape of "a subscription being raised for him by those whom his plans will benefit, for the talent manifested therein."

Miscellaneous.

THE DUKE OF HAMILTON'S WINDOW IN GLASGOW CATHEDRAL.—The *Glasgow Herald*, in a description of the painted glass window, the work of Munich artists, which has been put up in the north transept of Glasgow Cathedral, as the gift of the Duke of Hamilton, says:—"In artistic style the window harmonizes of course with the great western window lately fitted up by the munificence of the Brothers Baird; but in some important points it is essentially different. In the west window many figures are grouped together in one panel or compartment; but in the transept window each of the six panels into which it is divided by the mullions contains only the figure of an ancient prophet. These are Moses, Isaiah, Jeremiah, Ezekiel, Malachi, and John the Baptist."

MANUFACTURE OF GLASS.—Mr. Balmain, St. Helens, has provisionally specified some improvements in the manufacture of glass and other vitrified substances. The object of the invention is to ensure the removal, from the furnace or pot in which the raw materials for forming glass are placed, of each portion of the glass mixture immediately it is vitrified, and thus to separate it from the unvitrified mass. This object is attained in an open furnace by constructing it with the pots, one horizontal or nearly so, on which the raw material is introduced, and the other tilting it (with an inclination of about 1 foot in 6 feet, more or less), which removes the material as fast as it fluxes, and perfectly vitrifies it at the time it has run from 6 to 8 feet. The advantages gained, it is said, are an economy of fuel and labour, and an improvement in the quality of the glass.

TYE & ANDREW'S SINK TRAP.—The patentees desire it to be understood that the grate is intended to be a fixture (a very desirable thing, of course), and they explain that the bottom of the trap is provided with a screw boss, so that the inside is always accessible to the workman. We have an excellent character of the trap from those who have had it in use.

LONDON AND COUNTY BANK COMPETITION.—With reference to a paragraph last week mentioning the intended rebuilding of the company's premises in Lombard-street, the secretary, Mr. R. P. Nichols, requests us to say that with the exception of a house bought two years since, the whole of the premises has been held by the bank for the last fifteen years, and that although the two buildings named have been invited to furnish designs in conjunction with Mr. C. O. Parnell, the approved plan will be carried out under the superintendance of the last-named gentleman, as the company's architect.

DESTRUCTION OF THE SALOON'S HOME, LIVERPOOL.—This fine building has been completely destroyed by a fire which broke out on Sunday morning, and in the course of a few hours left little more standing than the outside walls.

THE GREAT BELL, ITS SUCCESSOR, AND ITS REPUTATION.—It appears that Dr. Percy has made his report on the composition of the great bell, of which Ben the second,—at Westminster Palace, to the Board of Works, while Mr. Cowper has examined the House of Commons that the bell is cracked seriously in several places. I therefore venture to assert confidently that it is in vain to present any proposals for "doctoring" the hands of poor Ben, for science and experiments are shown, again and again, that there is no possibility of restoring a bell in such a case so as to satisfy the musical ear. The best course to pursue will be to give proper instructions to our eminent founder to produce a new bell from wrought metal, for the quality of which he should be held responsible. In the mean time, as I have before suggested,—the chimes being silent,—let a clock strike the hours upon the heaviest quarter-bell, which ought to emit a deeper note than that of the great bell at the Abbey.

THOMAS WALESBY.

THE DRINKING-FOUNTAIN MOVEMENT.—The Winchester Committee for promoting Drinking Fountains are preparing to set three in operation as soon as circumstances permit—one just erected opposite the Eagle, near the railway; one near the Westgate, erected by the late mayor (Mr. Hutchinson); and one at the south entrance to St. Thomas's Church, Southgate-street, a gift of the late rector, the Rev. G. C. Cubitt.—It is intended to erect a drinking fountain at Mumps (Oldham), in memory of the late Mr. G. Barlow, mayor of Oldham. The fountain is designed by Mr. Wroe, of Messrs. Wolstenhulme & Rye's foundry, Lower Moor, and the principal expense has been borne by him. The fountain is to be a frame 2 feet 6 inches high, and 2 feet 6 inches square, placed on the top of a stone pedestal, approached by steps. Four pillars will rise from the frame. In the centre of the pillars will be placed a Grecian vase, and they will support a dome with an ornamental top.—The Bradford band of Hope Union are about to erect a drinking-fountain opposite the Grammar School, from a design made by Mr. T. C. Hope, architect. The design is the same as the one Mr. Hope made for the Beaumont fountain in competition with Mr. Milnes.—The first drinking-fountain in Duferriem is in course of erection at the corner of Queen Anne-street Church. It is a gift of Dr. Dewar, of Aberdeen. Public wells here have lately been furnished with ladders.

THE WOLVERHAMPTON SCHOOL OF ART.—A public meeting was to be held at Wolverhampton on Friday before last, to determine whether the School of Art of that town should be maintained or be closed for want of funds, but it proved an utter failure: not more than thirteen persons could be prevailed upon to assemble, and it was decided that no meeting could be held. The mayor, however, said he thought it was disgraceful that, in a large town like Wolverhampton, supported as it was by manufacturers, the School of Art should be allowed to go down at a time when it was more than ever necessary, owing to the expected competition with France. The only course he saw open to them was for a committee, as had been proposed, to canvas the town for sufficient funds to keep up the school.

THE CENSUS.—The observations we made in respect of the advantages to be expected from the census, and the increased powers needed by those who are to be employed, have met with general acceptance. The *Covenanter Standard*, after quoting them, adds:—"In taking the census, everything depends on the intelligence and efficiency of the persons employed for that purpose; and unless a better rate of remuneration is offered than the pittance paid on former occasions, we do not believe duly-qualified persons will be obtained for the task. It should be remembered that 'the army of enumerators' are only required for a day or two's employment of a peculiar description, to be promptly and punctually performed; and eligible persons, capable to perform the duty, will not turn out from their ordinary occupations without an adequate recompense for such special services."

ARTISTIC COPYRIGHT AMENDMENT ACT.—A deputation from the Society of Arts, consisting of the Right Hon. S. Walpole, M.P.; Mr. W. E. Wynne, M.P.; Mr. R. Monckton Milnes, M.P.; Mr. W. Coningham, M.P.; the Hon. Aug. Liddell, M.P.; the Hon. Arthur Kinnaird, M.P.; Mr. W. Stirling, M.P.; Mr. J. Walter, M.P.; Sir C. L. Eastlake, P.R.A.; Sir Thomas Phillips (Chairman of Council of the Society of Arts), Mr. Frederick Tayler (President of the Old Water-Colour Society), Mr. H. Warren (President of the New Water-Colour Society), Sir E. Landseer, R.A.; Mr. W. Mulready, R.A.; Mr. S. A. Hart, R.A.; Mr. E. M. Ward, R.A.; Mr. W. Dyce, R.A.; Mr. R. Redgrave, R.A.; Mr. G. T. Doo, R.A.; Mr. A. Elmore, R.A.; Mr. W. P. Frith, R.A.; Mr. J. R. Herbert, R.A.; Mr. J. F. Lewis, A.R.A.; Mr. H. Horsley, A.R.A.; Mr. John Bell, Mr. Jas. Holland, Mr. F. Imbert, Mr. M. Noble, Mr. Edwin Field, Mr. P. Le Neve Foster (Vice-President of the Photographic Society), Mr. J. Leighton, Mr. Jas. Fahey, Mr. G. Godwin, F.R.S.; Mr. F. W. Burton, Mr. J. J. Jenkins (Secretary to the Old Water-Colour Society), Mr. C. Wentworth Dilke, Mr. A. Cluade, F.R.S.; Mr. Alexander Redgrave, Mr. J. M. Dodd, and Mr. W. C. T. Dolson, had an interview with Viscount Palmerston, upon the subject of the amendment of the law of artistic copyright, on Saturday, the 25th ult. The deputation submitted the draft of a bill, and sought to undertake a promise that the Government would undertake to bring it in, or at any rate give it their support. The Prime Minister of course promised consideration.

HER MAJESTY'S THEATRE.—If the new opera of "Almina," by Signor Campana, should be again produced, the scenery and costume should be made to correspond with the intimation that the action takes place in Pisa, "in the twelfth century;" fifteenth and sixteenth century architecture and dresses do not accord with this. We mention it rather for the sake of other operas than of "Almina," which, although it contains several very charming morsels, can scarcely become a permanent favourite. At her Majesty's Theatre, everything that is done should at any rate be synchronous. Preparations are being made for the production of "Oberon," which is to be the grand work of the season, and as this will be brought out under the direction of Mr. Plancké, with Mr. Beverley for scene-painter, we may expect that the mounting will be worthy of the music, and the result, what it should be, a perfect whole.

THE PERAMBUCO RAILWAY.—It is to be regretted that matters seem to be still in an unsatisfactory state with regard to this line of Brazilian railway. On the 26th of November last we alluded to the misunderstandings between the company's engineer and the original contractor, Mr. Furness, and the law proceedings there resulting. Since then agreements have been entered into, it appears, with Messrs. Waring, the present contractors, under which, according to Mr. Daniell, Q.C., the contractors have become managing partners in the company; and the engineer-in-chief, Mr. Penistone, a sub-painter, with, according to Mr. J. Baylis, C.E., "one-half the company's share of the profits." But while the prospective proceeds are thus disposed of, it unfortunately appears, from a printed statement by Mr. Baylis, that the works are in a most unsatisfactory state. Those of the second section, on which, according to this statement, an expenditure of 100,000*l.* has already been incurred on an estimate of 53,044*l.*, are thus alluded to by Mr. Baylis:—"Of ninety-one embankments not more than thirty-four are of the required width; of ninety cuttings, not more than fifty-seven are of the required width; of fifteen river and other bridges, required of the contractor, not more than three permanent bridges have been erected, and the principal one is already failing; of fifty-four culverts (with openings from 2 feet to 8 feet) required of the contractor, not more than fourteen have been constructed; of 16½ miles in length of ballasting, there is no ballast whatever for the permanent way, except on one mile and a half, and this is not finished; of 16½ miles of permanent way, only 8½ miles are laid in any shape. A great portion of this length will have to be altered, or taken up and relaid. . . . Of the tunnel [the key of the position] and 'the heaviest work on the section' not one yard is finished!"

BRISBANE CHURCH.—Sir, Mr. Burges is undoubtedly a far better architect than geographer, or he would not have labelled his drawings in the Architectural Exhibition, as intended for "Brisbane, South Australia," much less have followed to the mistake by his letter in your last number. Brisbane, in about latitude 27° S., is the capital and historic of the newly-erected colony of Queensland, in the north-eastern Australia, and is distant some 1,300 miles from Adelaide, the capital of South Australia. The climate is not, strictly speaking, tropical, but like that of Australia, generally somewhat anomalous, although so much farther north, that is, nearer the tropic than Melbourne and Sydney. Its summer heat is probably less, the country lying high, and being tempered by the sea-breezes, and also from the circumstance that its rainy season is in the summer, and not in the winter, which last season is generally dry and serene. Melbourne I should judge to be occasionally one of the hottest places on earth. I have noticed in late papers that during the past summer, even in a favourable position, the thermometer has repeatedly risen to the almost unparalleled height of 125° in the shade, and in the interior the thermometer has been known to mark even a greater height: such heat, occasioned by the hot winds blowing from a desert interior, is not generally of long duration, and is accompanied by an extraordinarily electric state of the atmosphere. A similar high temperature, and arising from the same cause, has been noticed by travellers in the oases of the North of Africa. Sydney, for the Parliament Houses of which city designs are now required in competition, has a climate resembling that of Naples, or, perhaps, more nearly, that of Algeria. In Sydney, the thermometer rarely reaches the freezing point. All parts of Australia are subject to occasional heavy rains, for which provision should be made in the plans.—AUSTRALIAN.

TEMPORARY CHAPELS, SCHOOLS, &c.—At the annual meeting of the Coventry Archidiaconal Church Extension Society, recently held, some allusions were made, in the report of the general committee, to the subject of temporary buildings for churches, schools, &c. Mr. Robinson, the Society's architect, is therein reported to have stated, as to the comparative merits of iron, zinc, and wooden churches, that "the cost of iron churches would reach the considerable sum of 2*l.* and upwards, per sitting, and would fall but little short of the cost of permanent brick and stone buildings; and that the apparent facility of removal would be doubtful. Wooden churches, on the contrary, might be supplied at the cost of 1*l.* per sitting, while the expense of removal would not exceed 2*s.* per sitting." After the reading of the report, the archdeacon referred to the matter, by stating that their architect had provided a model for such erections, which had been approved of by the Bishop of London, as especially useful in mining, manufacturing, and agricultural, though not in metropolitan districts. For large buildings the cost, according to the archdeacon, would be 15*s.* a sitting.

GAS.—A new gas company is about to be formed in Glasgow, to supply gas at 3*s.* 4*d.* per 1,000 cubic feet. It is incorporated under the Limited Liability Act, in shares of 1*l.* each.

EXETER HALL AND ITS APPROACHES.—The shareholders of this building, at their last annual meeting, passed a strong resolution for the purpose of enabling the directors at once to adopt and carry out the best plan for making more convenient the entrances to the large hall. It was stated at the meeting that nine plans had been submitted, none of which were suitable. Let the directors advertise for plans; they would soon have such a number to select from that the only difficulty would be, of many equally good, to choose the best.—A SHAREHOLDER.

THE BROMPTON MUSEUM.—On Tuesday evening, Dr. Lankester delivered a lecture on "The Animal Product Collection," in the Museum, treating of bone and ivory. He described the nature of the skeleton of vertebrate animals; illustrated the uses of bone, the nature of ivory, and then its various applications.

TENDERS

For Unitarian chapel and schools, Broad-street, Birmingham. Mr. John J. Batemas, architect:—

Briggs	£11,252 0 0
Bartley	19,750 0 0
Smith	10,700 0 0
Cresswell	10,622 0 0
Hartwick	10,362 0 0
Branson & Gwyther (accept)	19,474 0 0

For St. Ann's church and parsonage, Hanger-lane, Stamford-hill. Mr. J. Barry, architect:—

Kelk	£19,970 0 0
Piper	9,750 0 0
Holland	9,715 0 0
Ashby	9,397 0 0
Dove Brothers	8,445 0 0
Myers	8,893 0 0

For block No. 4, Hampstead sewerage:—

Moxon	£5,300 0 0
Dethick	5,100 0 0
Thurst	4,950 0 0
Abbott & Hopwood	4,652 0 0
Clewser	4,598 0 0
Batterbury	4,290 0 0
Hill (accepted)	4,100 0 0

For sewers for the vestry of St. John, Hampstead. Mr. John Douglas, architect:—

Moxon	£5,300 0 0
Dethick	5,100 0 0
Thurst	4,950 0 0
Abbott & Co.	4,652 0 0
Coker	4,508 0 0
Batterbury	4,290 0 0
Hill (accepted)	4,115 0 0

For new church and parsonage at Goff's Oak, Cheshent. Mr. W. G. Habershon, architect:—

Porter	£4,251 0 0
Patman	4,162 0 0
Terrant	3,600 0 0
Secrave	3,834 0 0
Plooyman	3,782 0 0
Howley	3,777 0 0
Croven	3,466 0 0
Crabing	3,498 0 0
Haynes	3,445 0 0
Sanders	3,250 0 0
Clart	3,170 0 0

For additions to factory, new engine-house, &c. to Messrs. Nettifield & Chamberlain's Patent Screw Works, Smethwick, near Birmingham:—

	Engine-house.	Total.
Hardwick & Son	£3,580 0 0	£4,473 0 0
Cresswell	3,420 0 0	4,050 0 0
Pashley	3,470 0 0	480 0 0
Briggs	3,430 0 0	564 0 0
Webb & Sons	3,355 0 0	477 0 0

For the erection of offices and warehouse, No. 93, Hargrave, Great Tower-street, for Mr. Hampshire. Messrs. John Young & Son, architects. Quantities furnished by Mr. Shopper:—

Mansfield & Son	£2,778 0 0
Marsland & Son	2,585 0 0
Lawrence & Sons	2,537 0 0
Little & Son	2,534 0 0
Ashby & Son	2,398 0 0
Corder	2,406 0 0
Asford & Co.	2,482 0 0
Piper & Son	2,458 0 0
Browne & Robinson	2,394 0 0
Hart	2,319 0 0
Knight (accepted)	1,846 0 0

For severage of Conservative Land Society's Kentish-town estate. Mr. James Wylson, engineer. Quantities not supplied:—

Cole	£2,600 0 0
Barnes	2,547 11 6
Mann	2,412 0 0
Pound	2,392 0 0
Abbott & Hopwood	2,340 0 0
Hare	2,306 0 0
Renmore (accepted)	2,250 0 0
Batterbury	2,200 0 0
Rogers	2,085 10 0

For a Baptist chapel, Loughton, Essex. Mr. D'Oyley, architect:—

Richardson	£2,465 0 0
Hill (Winton)	2,387 0 0
Blackburn	2,368 0 0
Rivett	2,093 0 0
Bull	2,064 0 0
Clown	1,960 0 0
Hill (Whitechapel)	1,955 0 0
Pugh	1,645 0 0

For building two villas on the Western Elms estate, at Reading. Messrs. Cooper & Goulding, Reading, architects. Quantities supplied:—

Shooper	£1,662 0 0
Shepherd	1,719 0 0
Wally	1,672 0 0
Orton & Child	1,660 0 0
Woodroffe	1,659 0 0

For dwelling-house and offices on the Town Close estate, Norwich, for Mr. R. White. Messrs. Benest & Newson, architects:—

Boardman	£1,820 0 0
Ling	1,775 10 0

Piper & Son	1,372 0 0
Brass	1,370 0 0

For addition of a chancel and other works to the church of St. Barnabas, West Kensington, for the Rev. Dr. Francis Hessey. Mr. Thomas Johnson, architect. Quantities by Mr. Trege:—

Cowland	£1,447 0 0
M Lennan & Bird	1,370 0 0
Mathews	1,250 0 0
Porter	1,200 0 0
Cooper	1,192 3 0
Harding	1,185 0 0
Rudkin	1,099 0 0
Davis	757 15 0

For additions and alterations and other works at Manor House, Daer Park, Lez, Chichester, for Mr. G. H. Haskeombe. Mr. F. F. Thome, architect:—

Thomas	1,373 0 0
Myers	1,364 0 0
Woodroffe	1,291 12 0
Humphries & Luxford	1,176 18 0
Marsland & Son	1,097 0 0
Pollock & M'Lennan	1,066 0 0
Francis (accepted)	1,069 0 0
Pickard & Co.	995 0 0
Riley	880 0 0

For Rectory-house, Pakefield, Suffolk. Messrs. Benest & Newton, architects, Norwich:—

Nurfor	£1,258 0 0
Johnson	1,250 0 0
Boardman	1,160 0 0
Rix & Sparham	1,115 0 0
Marsland & Son	1,050 0 0
Rix & Frost	1,049 0 0

For altering and repairing premises, No. 66, Welbeck-street, for Mr. H. Hayward. Mr. C. Zalles, architect:—

Clemence	£1,087 0 0
Howard	997 0 0
Hallett	925 0 0
Hanson	894 0 0
Batterbury	882 0 0
Arcey & Bellingham	830 0 0
Macey	818 0 0
Mansfield & Sons (too late)	915 0 0

For villa at Pevalk Park, near Plymouth and Devonport. Mr. Alfred Worman, architect:—

Jenkin	£1,629 0 0
Condy	925 0 0
King	963 15 0
Hosking	904 14 0
Weary	920 0 0
Dugle & Martin (accepted)	860 0 0

For the erection of a detached villa, for Mr. W. Angell, at Backhurst-hill, Essex. Mr. J. H. Rowley, architect:—

Ashton	£860 0 0
Cave	792 0 0
Humphreys & Son	775 0 0

Rivett	730 0 0
Salmon	696 10 0
Goodman (accepted)	653 0 0

For an infant school in connection with the British School, Plymouth. Mr. James Hine, architect:—

Elliott	£469 0 0
Call & Pethick	440 5 0
Clarke	375 0 0
Adams & Son	468 0 0
Stilson	460 0 0
Finch (accepted)	433 0 0

For two new houses in the Woodbridge-road, Guildford, for Mr. Hyde. Mr. Peak, architect. Quantities supplied:—

Nye	£457 0 0
Beagley	438 11 0
Smith (James)	436 14 0
Pollard	433 10 0
Lea, Messrs.	433 0 0
Swayze	429 10 0
Garnett	425 0 0
Bowme & Robinson	410 5 0
Mrs. Mason & Son	413 0 0
Strudwick	394 0 0
Smith (Charles)	367 0 0

For rebuilding party wall at No. 131, Wool-street, Cheapside, for Mr. Rawson. Messrs. John Young & Son, architects:—

Asford & Co.	£456 0 0
Bowme & Robinson	430 5 0
Lawrence & Sons	418 0 0
Lark & Son	398 0 0
Chessum	330 0 0

For alterations at the Government Emigration Depot, at Stonehouse, Devon. Mr. Alfred Norman, architect:—

Comly	£200 0 0
Dugle & Martin	235 0 0
Threveston & Denton	307 0 0
Call & Pethick (accepted)	214 0 0

TO CORRESPONDENTS.

The Granite Composition.—In reply to a correspondent who desires to know the result of the application of the "granite composition" to the roof of the clock tower at Westminster, and to the other roofs of the building, we may say that some who have offered plans there consider it has been perfectly successful. upwards of 40,000 yards have been used there with it, and many works elsewhere. They have found no alteration whatever in the material since its application. *Enlarged Particulars in stone*—I shall be much obliged if one of your readers will inform me of a preparation for filling in wells patented in stone work (similar to those in St. Margaret's Church, Wells street) that will stand the weather.—G. F.

B. F.—W. C.—W. F. (the decay is not in the "less exposed" situation)—Ernest (might get into difficulty by returning better written and get sent)—J. C.—W. G. H.—T. C. B.—J. H. B.—T. L.—Another Correspondent.—J. R. W.—J. C. & C.—H. C. A.—F. E.—K. (write beyond our province). J. P.—A. C.—C. K. (shall be glad to see tracing or photograph). J. M.—H. & H. (shall hear from us).

Stonework from stone.—I shall be much obliged if one of your readers will inform me of a preparation for filling in wells patented in stone work (similar to those in St. Margaret's Church, Wells street) that will stand the weather.—G. F.

NOTICE.—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent-garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher." Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

ADVERTISEMENTS.

In Re Cony, Builder, a Bankrupt, Kilburn. MESSRS. LEREW & LEREW will SELL BY AUCTION, on the PREMISES, Springfield-road, Kilburn, on MONDAY, MAY 7th, at TWELVE, by order of the Assignees, the CAPITAL MATERIALS and JOINERS' WORK, 4000 Reeds, cut and uncut, and ironing, laths, drain pipes, scaffolding, nails, and sundries.—May be viewed the Saturday prior to the sale, when catalogue can be had on the Premises; of W. W. WHITEHEAD, Esq. Assignee, 2, Beaulieu-street; and of the Auctioneers, 2, Cadogan-street, N.W. and 35, Chancery-lane, W.C.

IN BANKRUPTCY.—KENTISH TOWN. MESSRS. LEREW & LEREW will SELL BY AUCTION, on the PREMISES, Crossham-road, close to the turnpike, in the high road, on TUESDAY, MAY 8th, at TWELVE, by order of the Assignees of Henry Cony, Builder, a bankrupt, a quantity of MATERIALS and JOINERS' WORK, about 1000 Reeds, cut and uncut, and ironing, laths, drain pipes, scaffolding, nails, and sundries.—May be viewed the Saturday prior to the sale, when catalogue can be had on the Premises; of W. W. WHITEHEAD, Esq. Assignee, 2, Beaulieu-street; and of the Auctioneers, 2, Cadogan-street, N.W. and 35, Chancery-lane, W.C.

KENSAL NEW TOWN, near the GAS WORKS. MESSRS. LEREW & LEREW will SELL BY AUCTION, on the PREMISES, above, on MONDAY, MAY 14th, at TWELVE, about 1200 Yellow, white, and pine PLANKS, DEALS, and BATTENS; 100 squares of prepared flooring, 5000 feet of ironing, laths, drain pipes, scaffolding, nails, and sundries, and other stores, 1000 pieces paperhanging, scaffolding, painting, and some excellent old materials in long list starting, and sundries.—Auction Office, 2, Cadogan-street, Newport-road, and 35, Chancery-lane, W.C.

GOVERNMENT STORES, WESTMINSTER. MESSRS. EVERSFIELD & HORNE are instructed by the Commissioners of Her Majesty's Works and Buildings, to sell BY AUCTION, on the PREMISES, above, on MONDAY, MAY 14th, at TWELVE, about 1200 Yellow, white, and pine PLANKS, DEALS, and BATTENS; 100 squares of prepared flooring, 5000 feet of ironing, laths, drain pipes, scaffolding, nails, and sundries, and other stores, 1000 pieces paperhanging, scaffolding, painting, and some excellent old materials in long list starting, and sundries.—Auction Office, 2, Cadogan-street, Newport-road, and 35, Chancery-lane, W.C.

# The Builder.

VOL. XVIII.—No. 901.

The Royal Academy of Arts.

Y hanging nearly 300 pictures fewer than usual (the whole number of works admitted this year is 1,006), all that are exhibited are better seen, and the artists whose works are there praise the arrangements. What those artists whose works have been returned say about it,—whose hopes for the year are quenched,—whose prospects, in some cases, of actual subsistence are darkened,—is another matter. Hung, ever so badly, and named in the catalogue, there is just a possibility that a picture may be espied and bought; returned to the artist's own room, the amount of chance, in nine cases out of ten, is reduced to *nil*. The Academicians are doubtless perfectly well aware of this; and, finding that the Government will do nothing in respect of a

new building and increased accommodation, may not be sorry to make the public outcry greater. At the dinner, which took place as usual on the Saturday immediately before the first Monday in May, Sir Charles Eastlake, the president, in proposing "The Health of her Majesty's Ministers," referred to the position of the Academy in this respect:—

"The exertions of the artists," he said, "have been great, and it is only to be regretted that all the meritorious works included in this year's display could not be placed in the situations they deserve. Indeed, some we have been reluctantly compelled to exclude for no other reason than that fit places could not be found for them. I must do the members of the Royal Academy the justice to say that some of their own works have been this year withdrawn to make room for others; and it is satisfactory, amid the disappointments which, under the circumstances, are unavoidable, to see works by contributors occupying those prominent places which by a fair and acknowledged privilege are usually assigned to members. From the experience of the present exhibition alone, it is plain that the additional space which the Academy so much wants would be a boon to the contributors, and it is on this account the more earnestly desired. The members of the Royal Academy are sincerely anxious to render this institution as useful as possible in conformity with the objects of its foundation. They, too, are prepared to set their house in order; but before they can do so it is essential that they should know, without a figure, where and what their house is to be."

Something, it is to be hoped, will be shortly done, and that something be the best thing, to aid the progress of the arts, by placing the Academy on a sounder footing, and providing sufficient accommodation for an annual exhibition of the works of artists. The Academy does not march with the age; it stands too much on its dignity; pool-poos the press; makes no recognition of its real friends, and, as a matter of course, has fewer out of doors than it would otherwise be entitled to expect. It is understood that a different feeling now prevails with many of its members, and that there is a disposition to movement more in accordance with the spirit of the times. We earnestly desire to see this manifested. We are of those who acknowledge on the part of the public a debt of gratitude to the Academy in spite of its shortcomings, and desire to see

it take its proper place in public estimation by a liberal, far-seeing, and enlightened management.

When Sir Charles proposed the health of the visitors, he spoke of the love for art now growing up, and contrasted it with the feeling dominant in a past time.

"A former race of critics," he continued, "might almost seem to have been influenced by a saying of Madame de Staël, 'Taste teaches us what to avoid,' a maxim which might easily lead to universal disapprobation and exclusion. The slightly altered but more liberal form, 'Taste teaches us what to prefer,' which is more consonant to the present disposition of the friends of art, implies, indeed, selection, but at the same time a willingness to select. This reading may be further recommended by a remark of Lord Bacon, though he is speaking of the physical sense. 'Dees,' says that philosopher, 'prefer one flower to another, and therefore have taste.' There can be no doubt that the present impulse, which is taking its own course, requiring neither control nor stimulus, is of a salutary tendency in a national point of view. It may be true that the increased and increasing prosperity of the country, which supposes the demand for superfluities, is one main cause of this favourable disposition; but, granting that the productions of taste are among the superfluities of civilized existence, it may still be admitted that they are among the worthiest and most eligible of that class. Together with abundance, expenditure, justifiable or not, will always exist; and, this being assumed, it is satisfactory to find that a portion of this redundant opulence is employed on so legitimate and so defensible an object as art."

He justly urged, as to the Fine Arts, that both in their material and moral uses they can be, and are, greatly subservient to the work of education, and that their humanizing tendencies are by no means confined to those who can command their productions, but that they exercise an increasing and unmistakable influence on the habits and tastes of the lower classes.

The president, in proposing the toast, spoke of the visitors as "the representatives of all enlightened friends of art, who directly or indirectly contribute to its promotion." It would give a curious result to analyze the grounds on which the invitations are given, and to see how far the principle here suggested by the president is kept in view in sending them. However, let that pass just now, and let us add to this brief allusion to the dinner that the president gave amongst the toasts "The Royal Institute of British Architects, and the health of its president, Mr. Cockerell." The fact, he said, that Mr. Cockerell is a member of the Royal Academy, need not deter me from paying respect to one who has been most worthily selected to fill a distinguished office. Indeed, that selection connects in an honourable manner the two societies, and represents the amicable relation which should subsist between institutions which, in different ways, but with equal zeal, are desirous of promoting the best interests of the Fine Arts in this country.

Mr. Cockerell, in acknowledging the honour of the toast from such a company, said, with feeling, that, equally with the Royal Academy, engaged to record to future times the spirit, the taste, and the glory of our great country in their own day, the Institute of Architects have need of those encouragements which such a distinction implies, and acknowledge it with gratitude.

A few words now as to the general exhibition. It is undeniably good. We should not place it so far in merit beyond those of previous years as some are disposed to do, but it is certain that it comprises a large number of sound and admirable works, and several of very great excellence and beauty. Beginning at the beginning for a mere skin,—No. 8, "St. John leading Home his adopted Mother," W. Dyce, R.A., although a little too much like a picture of a picture, is a work of great merit, growing on the spectator with lengthened observation. The same able artist's (141) "Pegwell Bay, Kent,—a Recollection of October 3, 1858," is exceedingly charming. It should rather be called, "In recollection," Su-

minute a piece (withal so effective), must surely have been painted on the spot. No. 22, "Whose Bread is on the Waters," J. C. Hook, R.A., is one of four by this artist, which, following in the path lately taken by him, will increase the reputation that path has led to. No. 29, "The Black Brunswickers," J. E. Millais, A. (one black Brunswicker seeking to get away from his lady-love who would detain him), is a noble picture, free from eccentricity, and powerful in expression. David Roberts, R.A., is very strong; 49, the first we come to, "The Piazza of San Mark, Venice," is not the best he has sent, but is, nevertheless, very charming. His view of the "Coliseum," No. 286, and the "Interior of the Cathedral of Pisa" (212), though not pretending to the finish of some of his earlier works, are full of grace and beauty. In 58, "The Marriage of the Princess Royal," Mr. J. Phillip, R.A., has achieved a triumph over a difficulty. It is the best picture of its class that has been painted in England in modern times. The bridegroom is made too old, otherwise the likenesses are also very good. His diploma picture (168), "Prayer," is a striking piece of colour. Mr. Ansdell has thrown into 59, "The Lost Shepherd," what is wanting in some of his pictures, sentiment and feeling. It is a beautiful, yet painful work (81) "Die Heimkehr," W. C. T. Dobson, A., is more pleasing than his larger picture; and we should say the same of his "Plough," 234, and 284, "Emilie aus Görwitz,"—a charmingly painted head.

Sir Edwin Landseer's large picture (106), "Flood in the Highlands," is more remarkable when examined in detail than for its general effect. It is spotty and confused. Few would discover for themselves, that the distracted and life-threatened family are assembled on the roof of their cabin. Like many other pictures in the present exhibition, it is powerfully painful. This is the case with Mr. Solomon's "Bridge of Sighs" picture, No. 478, and Mr. Elmore's fine work, 153, "The Tuileries, 20th June, 1792," which with all its excellence would be unbearable but for the one young girl in the centre of the brutal mob, whom the queen's words have softened.

Mr. E. W. Cooke, A., has some beautiful pictures, especially 102, "Bella Venezia," and 248, "H.M.'s Ship Terror in the Ice of Frozen Strait," 123, "Mary," according to St. Luke, J. R. Herbert, R.A., is a noticeable picture. The hands of the mother, in Mr. Cope's "Evening Prayer," are exquisitely painted, but the feet of the child, and perhaps some other parts, are hard and woody. Mr. Frith's picture, "Claude Duval," 162, will be less popular than his "Dearly Day," but is nevertheless a most attractive work of art. The frightened lady essaying to dance the coranto with the highwaymen, as a ransom for her money, is exquisitely treated. The Art-Union of London have arranged to engrave this picture for the subscribers of a future year. Before this is done, however, the fourth wheel of the carriage, at present wanting, should be painted in. 223, "A Volunteer," H. O'Neil, A., shows a sailor going off from a raft to take a rope to shore, so to save if he may be his shipwrecked companions. With much in it to praise, the picture will not achieve the popularity of "Eastward, Ho!" which first gave the artist a real hold on the public. 257, "His only Pair," T. Faed, is full of sunlight and beauty. 275, "Scene from Taming of the Shrew," A. Egg, A., has life and vigour, but is injured by the ugly straight line of the curtain, and the general redness of tone. Mr. Goodall gives one result of his recent travels, 295, "Early Morning in the Wilderness of Shur," doubtless very true in its details. Leighton, from whom much was expected, exhibits but one small landscape, "Capri—Sunrise," 322, a characteristic indication; and Mr. Cropsey sends three excellent Isle of Wight studies, Nos. 394, 479, and 481, very carefully painted. 360, "The Hedger," by J. Brett, is a most elaborate piece of painting. 367, "The General Post-office, One Minute to Six," G. E. Hicks, has much character; and 409, by the late F. Stone, A., is one of the best of his works. "Atop of the Hill," J. T. Linnell, No. 451, is a brilliant landscape.

The ladies are well represented: we would particularly mention the Miss Mutries, for their various exquisite contributions; 256, "Italy," Madame Jerichau; 269, "Peg Wofington's Visit to Triplett"; 334, "The First Step in Life." Mrs. E. M. Ward; and 403, "The Governess," Miss Osborn; and having said thus much, we must content ourselves with mentioning for admiration, 33, "The Strayed Flock," R. Redgrave, R.A.; 71, Vesuvius, and Part of the Bay of Naples," C. Stanfield, R.A.; 87, "Showing a Preference," J. C. Horsley, A.; 88, "A Moorland Queen," and 526, "A Forest King," both by A. MacCallum; 100, "St. Paul's, from London Bridge," H. Dawson; Sant's "Little Red Riding Hood," 552; 251, "The Sword of the Lord and of Gideon," M. Stone; 455, "Never More," P. H. Calderon; and 461, a study of "Serpentine and Porphyritic Rocks," by J. G. Naisb.

In portraiture, Mr. J. P. Knight, R.A., is very strong, having several admirable works. The veteran Pickersgill has also some good heads; and we will not omit mention of "The Duke of Argyll," by G. F. Watts (347).

#### The Architectural Drawings.

Following hard upon our notices of the exhibition in Conduit-street, comes this of the Academy—regarded with less interest than formerly, for the works presented illustrative of architectural art. Whilst giving, as we hope we have given, efficient support to the institution maintained by the profession, we have never ceased to advocate the continuance of the association between the arts, which is the fundamental principle of the Royal Academy. In doing this we have not forgotten that there are some points of distinction between those arts, and that injury may have accrued in our own art at one time, from the practice of architecture by the artist-painter. Seeing, however, that sad injury has resulted through causes that are to be understood, and which, after the modern pursuit of aesthetics, need not again operate; that each other of the arts is different from the rest, in field and language, though there be the general unity of art; and that the fact of architecture being an art, requires to be kept in the mind of the public by every available means, we have reason for the expression of our regret at the position which architecture occupies both in the schools of the Academy and the annual display by which the public mind is to a considerable extent formed on the subject of art in general.

The undemonstrative arrangement of architecture, on the occasion of the exhibition, so much complained of during recent years, is maintained, inasmuch as there is no clearly distinct location of architectural drawings, and no heading in the catalogue for our art, though there is one of "sculpture." But the architectural drawings now are separated from oil paintings. The majority are placed in the room known as the Miniature Room, where they are at least associated with works in, if we may so speak, vehicular harmony with them. Here they occupy one side of the room, and so much of one end as the doorway allows. Therefore, of seventy-three drawings which there are, to be called architectural, in this room, and which include the usual number of representations, and some of them indifferent ones, of old buildings,—more than half are placed where it is impossible to do justice to them or see them. Amongst these are works, perhaps the most important of all from subject. There are, however, this year, on the walls of the corridor at the top of the stairs, thirty-one other works; so that there are 104 drawings in all, which may be considered open to present notice. The architectural subjects by David Roberts, E. W. Cooke, and others, in oil vehicle, should be alluded to here; though they have been named by us, with the works with which they are placed. The drawings in the corridor have some advantages of position for being seen: though an inspection of them, under the circumstances, may be chiefly resultant in a lesson of the difficulty of ventilating, whilst avoiding cold and dust-charged drafts. Ventilation, we should here say, certainly is this year better than usual in the principal rooms; but the dust is excessive, and must seriously injure the paintings. The crowd on Monday was greater than ever: of course it was scarcely possible to see any of the chief pictures; and so long as the Academy continues in its present habitation, neither can architecture be duly treated, nor will any "work of wit," or large picture on the line, be "read" and seen "with the same spirit" that its author painted.

Amongst the architectural drawings there are several, the absence of which from the Architectural Exhibition in Conduit-street must be regretted. Designs for the Manchester Assize Courts are to be found in each exhibition; and a similar dissociation of competition designs for other works exists. Some of the drawings this year in Trafalgar-square, and probably the best, are, we have said, valueless as placed; and works as important as those shown have been rejected, which could have been exhibited and would have been somewhat prized in Conduit-street. Therefore, whilst hoping that the Royal Academy display of architectural drawings may continue, or rather be improved, we trust that some arrangement may be hit upon by which each institution may be maintained without injuring to some extent the other. There is this further defect in the illustration of architecture at the Academy,—that very few of the designs are more than pictorial views; that is to say, there are few plans attached; and the information given in the catalogue is meagre and inadequate. The "getting-up" of this catalogue, which annually is disgraceful to the Academy,—and, must we not add, their printers,—and the numbering of the works, seems to have been specially unfortunate for the architectural drawings.

From the Manchester Assize Courts competition we have views,—one (641) showing the design of Mr. W. Blackett, with a profusely perforated Roman facade—the columns on too lofty pedestals; one (663), the design of Mr. G. Morgan, Gothic; two (673) the designs, Gothic and Classic, to nearly the same plan, by Messrs. H. E. Kendall, jun., & F. Mew; and one (681), the design of Messrs. W. J. Green & L. De Ville. One or two of these names may be recognized as represented at the other exhibition. Messrs. Kendall & Mew's designs have not been mentioned by us, except in our notice of the exhibition in Manchester, where we spoke of their merits at great length, but at the same time remarked upon their short-comings. Through a somewhat unfair method of representation, an effect of grouping was displayed which there could not be in execution.

Recent competitions, however, are not largely represented at the Academy. The Piedmontese prisons competition included designs by Messrs. Green & De Ville, by whom we find in the corridor a view of their design (625) for the prison at Genoa; and one (626) for the prison at Turin. The drawings being "bird's-eye" views, give some suggestion of the general principle of plan, which, for the prison at Turin, was the "Panopticon," built within a fortified *enceinte*, and for the prison at Genoa seems to have been somewhat similar, but quadrilateral instead of polygonal in the external form. The details shown in the drawings are Gothic; and bands of red brick to lighter coloured materials, and red and black bricks to vousoirs of arched recesses and window-heads, give the chief character to the design.—Near to these is one design "for the Royal Dramatic College, Mayberry, near Woking," which is by Mr. W. Webb. The drawing (627), about 10 feet in length, shows a work chiefly Elizabethan in manner, and of red brick and stone, except as to the centre and two ends, which are wholly of stone. The best feature is the lower story of arches, springing from shafts isolated or attached to buttressed piers.—Mr. E. C. Robins exhibits (628) "The First Prize Design for the Croxdon Cemetery Chapels, about to be erected" under his superintendence, which has the not uncommon arrangement, iconographically and decoratively, of two dissimilar "Decorated Gothic" and gabled buildings, united by two archways, over one of which is a tower with broach-spire. The art brought into works of this class ought to have been greater than it is; but in the present instance, it is better than usual.—"The selected Design for the Townhall, Bishop Auckland" (717), by Mr. J. P. Jones, was given by us in a recent number, with the belief that it was to be carried out; this, however, is not the case.—Very recently we gave the design for the Holy Trinity Chapel, Knightsbridge, which is to be executed; and in our last number we mentioned a design for the same building, which there is at Conduit-street. The design, "one of the selected," by Mr. H. S. Legg (718), is at the Academy. The front is lofty, the centre rising to a gable to the clerestory, flanked by gables on the returns so as to give somewhat the character of a tower—the intersection being crowned by a light spirelet, or *flèche*. The principal window is an elaborate one, of six lights, the style of the design being Geometric Decorated; and there are three canopied doorways.

Taking the order of numbers, with modification

admissible afterwards, we start with No. 616, a view of the interior of "Tonbridge School Chapel, Kent," by Messrs. Wadmore & Baker. It is of late "Decorated" character, and has a wagon-headed boarded ceiling, with the main ribs rising from corbelled shafts, and the usual arrangement of seats "stall-wise."—"Opéras, Sweden" (618), the residence of Mr. J. T. Dicksen, now being erected from the design of Mr. W. A. Boulnois, is Italian of the Romano-Florentine school. The chief feature of the design is a low tower, perhaps for the staircase, and octagonal, which stands in a re-entering angle, where the entrance is placed at the angle of a one-story portion of the plan, apparently leading immediately into a conservatory. Mr. Boulnois is the author of another design (711) for a house in the same country, at "Gothenburg," now being erected under his superintendence, for Mr. Oscar Dickson. It is in the same style.—Mr. T. Anson's "Corn-Exchange Chambers, Seething-lane" (622), with less ornament than his other buildings in the City, is distinguished by his manner, and has greater merits than there are shown in the mere elevation. The frame includes details and parts of the interior separately drawn. The building is a structure, brick and stone we believe generally, of four stories, and a Mansard roof with circular dormers, the lower story of stone being treated as a range of arches, and the space of five central, out of the seven openings, being grouped together,—four casements between the windows of the first and second floor helping to give the centralization. The openings are chiefly arch-headed, those of the first and second stories being similar to one another. The external details are not so successful as the general character. The interior is, in many respects, highly successful. A public room is lighted by a range of square windows, close to the ceiling, which is divided by beams, carried by main pilasters; and each inter-pilaster, at the window-stage, is divided by a short pilaster or anta, to form two window-openings. Colour is introduced and well managed. The dado is dark in tone, with relief of red lines; the large spaces of the walls are light green with a diaper; and primary colour in lines and ornaments is used in the ceiling.

Knowledge of right principles of chromatic decoration, similar to that in the design last named, is shown in most works of Mr. R. Beavis, who has one design at the Academy, namely 623, "for the decoration of drawing-room ceiling at Torry-hill, near Sittingbourne,—now being executed by Messrs. Trollope & Sons." The main beams and the margins of panels are ornamented in lines, and interlaced and other patterns, on the flat, partly in red colour; whilst the panels themselves are painted with Buffaloesque ornament and figure compositions. In the corridor is another design for a ceiling (632), by Mr. C. J. Allen,—also good,—whilst scarcely equal to the last-named, though more elaborately in the ornament of architectural character. There is some difficulty in forming opinions of designs of this class from the drawings, when it is not stated whether ornament is to be executed in plaster, or merely as a painted imitation of relief. The design (633) "for painting and decorating a Gothic entrance-hall in Wales," by Mr. C. Pfander, is not very successful in the "Gothic" forms; and the crimson, green, blue, and yellow or brown, are crudely put together.

The "Porch" (630), an addition to the old hall at Halliwell, near Bolton, Lancashire, for Mr. Peter Ormerod, is Tudor or Elizabethan. The angles cut off are pierced with openings, whereby there is an appearance of weakness just where there should be abutment to the arch.

The "Lunatic Asylum for the Colony of New Zealand" (631), by Mr. C. J. Shoppee, is a Gothic building of the many-windowed, half-timbered class, with overhanging stories, and has the roof covering banded blue and red.—"East Tytherley Parsonage, Hants" (634), is brick and half-timbered with large boards, and has a good general effect. The angles of the building are chamfered, without advantage.—The "Design submitted to Mr. Faucon, for his proposed new House, near Rouen" (635), is French Italian, with a roof porch, and accessories to the entrance; but the cornice appears too light, and the oval or circular windows to the lofty roof are much too small. The "Parochial Schools, now erecting at Holbrook, Suffolk" (636), from Mr. R. M. Phipson's design, are Gothic, with the prevalent coloured bays, here blue and red, and the similar particular treatment of vousoirs to segmental arches. The wide projecting caves and corbelled springing of the gable are not quite in harmony, though the same arrangement may be found else-

where: the latter feature usually should cover the projection at the end of the eave. There is another drawing (713) of "Schools just erected at Hovingham, Suffolk," by the same architect, which has the same features, but others of better character, and appears to be generally superior.—"The Hospital at Hensworth," Yorkshire (we correct the catalogue, as elsewhere, though we cannot promise invariably to do so) is shown by the architect, Mr. R. P. Pope, in a clever pen-drawing (637), with plan, and parts sketched on a larger scale. Considerable skill, whilst a recognizable manner in the Gothic, characterizes the design, as in the arrangement of the coloured materials, and the porch of three arches and columns to the master's house. The almshouse porches, with flanking windows, are peculiar. The chapel is in very good taste; there is not, however, so much difficulty in planning these small interiors in the class ecclesiastical of buildings, as those of churches on a large scale.—"West Broyle, Chichester" (638), the residence of Mr. J. J. Johnson, erected 1550, by Mr. W. M. Toulon, is of Gothic design, and stone, with tiled roof; and has an angle window.—"Calthorpe Lodge, Leicestershire" (639), the residence of Mr. J. W. Morrice, was designed by Mr. A. B. Fend, though the catalogue does not say so. It is a large brick and stone Tudor building, with oriels. The halls, trade or enclosure to a space which may be a sunk garden, is the least satisfactory part of the whole, if the drawing be correct.

There is a sheet of drawings (640) illustrating a design by Captain Fowke, R.E., which recent proceedings render interesting. It is entitled "Suggestions for a public road to connect the districts north and south of Hyde Park, without interfering with the Kotten Row ride, the drive, or the walks in the park and gardens." The "Suggestions" refer to the crossing of the Serpentine, and to the distance thence northwards to the Bayswater-road. It is proposed to make use of the existing bridge, by adding to it a superstructure, a double screen of columns, whereby the pedestrians might cross in the new terrace walk—ascended by long inclines; and one-half the width of the bridge could then be devoted to the public road. The northward portion of the road would run for almost the entire length, in the sunk fence between the Park and Kensington Gardens. A section of the bridge is not given; but we apprehend the idea is not to add in height, to more than one-half the width; consequently, if the effect of the bridge from one side were improved, it could hardly be so from the other. In the addition the coupled columns are between piers, placed over those for the arches, and bearing statues. With some slight variation in the details, to unite the substructure and superstructure, and extension of the latter to the full width of the bridge, the alteration would be one to enhance the effect of the scenery, and would be in many respects more desirable than the construction of a bridge adjacent to the present one. Such a public road, however, is wanted, as might be used by omnibuses: the road (and it certainly will have to be made), will speedily become a principal route,—as it will connect each district with an important railway-station on the opposite side of the park—the Great Western Station being north, and the Victoria Station south; and any such route should be planned to admit of tramways. Under these points of view the present proposal would be sufficient. The public cart and omnibus traffic might be noisy and disconcerting to the riders and pedestrians; the width, half that of the present bridge, would not suffice; and sharp curves in the approaches, as shown in the plan, would be very objectionable. A direct line of deeply-sunk road-way, such as we had in view when the improvement desired was first spoken of in our columns, crossed by many and ornamental foot-bridges, would best serve the traffic and the privacy. The difficulty, we must admit, is the crossing of the Serpentine; for, we do not quite like Mr. Tite's idea of a tunnel, unless shafts for light could be constructed. Such shafts to the tunnel, of course would have to be built one or two feet above the water-level, and, therefore, to be made ornamental; and in their construction not only pressure and infiltration of water would have to be provided against, but the greater force of the expansion of ice.

Mr. M. D. Wyatt has two works in the Exhibition. No. 642 is a "View, looking east, of a small Church recently completed at Coedy-pant, Monmouthshire," where he has employed colour with effect, in the form of an imposed band of Scriptural texts to the plain Early English window openings, as well as around the chancel

arch. The chancel is narrower than the nave, which is without aisles. His other work, of which, owing to one of the hindlers spoken of, he does not get the proper credit, is (709) a "View, looking east, of the Military Chapel, Warley Depot, Brentwood, Essex." The design is round-arched, or Byzantine, in manner, the arches red brick (which is the material generally of the interior) springing from stone columns,—the capitals of which, if correctly drawn, we should have preferred different. The chancel-arch and whole perspective are simple, and highly effective.—Mr. W. Burges exhibits a drawing (643) of a staircase lately completed from his design at Gayhurst, Bucks, the seat of Lord Carrington. It is Elizabethan, of very good character. But why does the drawing of a work of the nineteenth century represent figures, supposed to be those of persons resident, in costume "of the [other] period?"—We may name in this place a very good drawing which there is (703) by Mr. T. Bury, of his staircase lately erected at New Lodge, Windsor Forest, the seat of M. Van de Weyer. It is late Gothic in details, but at first sight has the character of an Elizabethan work.—A drawing (644), by Miss Westlake, of the tomb of the late George Gwilt, architect, in the churchyard, Southwark, is interesting chiefly for the subject; but the commemorative production is shown not to be a very elaborate one—unless we are to speak of the railing, which is coloured and gilded.

We have named some drawings of churches, and there are others. Mr. J. Barnett's "St. Stephen's Church and Parsonage, South Lambeth, for the Rev. C. Kemble" (645) "Decorated" Gothic, is not well managed in the tower and spire, but is better elsewhere.—A drawing of "the West End of Landaff Cathedral, as restored, with the proposed south-west tower and spire, as designed by" Messrs. Pritchard & Seddon, is placed almost too high for examination. In the drawing, however, there is no apparent harmony (if any could be expected) between the two western towers. It could not be said that the design of the south-west tower is unsuited to the rest of the church; yet the north-west tower, at least, which has good "Perpendicular" parapet and pinnacles, marking it of the Somersetshire class, manifestly is injured. Truly our church "restoration," when needing to go in the smallest degree beyond conservation, is a hazardous thing. But we have not the means of knowing just now, without a visit to Landaff, what is the character of the alteration intended to be shown by the drawing, or even whether this has been, or is only about to be carried into effect; for, the title of the drawing is somewhat obscure. The same architects exhibit a design (664) "for a church about to be erected at Cardiff." As we have no plan, we can merely conjecture from the view, that the design embodies some alteration in arrangement such as we recently expressed the wish to see, and believed we had evidence was in progress. The clerestory is very prominent in the composition, and is lighted by large windows; whilst the aisles appear to be as we desired to have these parts of a church, narrow; and in the present design they are lighted by very small windows. The design, though plainer than Messrs. Pritchard & Seddon's excellent one for the Constantinople church, calls that to recollection. The tower and spire, "not now in contemplation," appear too big; and when such a tower is placed at the junction of the nave and chancel, it is apt to look out of place when the church is approached from due north or south, unless greater distinction of level or decoration between the nave and chancel, be made, than there is in this design. The defect in question is very remarkable in a somewhat costly church built not long ago for Lord Stamford, at Bowden, Cheshire, where nave and chancel are the same height, and the building is approached by a road exactly at right angles to the church, the tower being seen at the end of the road.—Mr. G. E. Street's "Church about to be built at Cowley, near Oxford" (649, 652), has its authorship pronounced—without reference to execution of the drawings. The plan includes the arrangement of transepts and tower, both, to the chancel, and a sacarium polygonal-apsidal on plan. The external character is that of plain Early English, with few or no buttresses, and coloured bands duly subordinated, and with a broad spire and leuanes. In the interior, there are a roof of massive timbers, short circular shafts as nave-piers, and a sacarium arch as well as the chancel arch; whilst, to further mark a distinction which is recognized by ecclesiologists, the sacarium is gromised, the severe over the altar being enriched with colour, and the ceiling of the western part of the chancel is hexagonal, boarded, and ornamented

in the compartments. The outer mouldings of the chancel arch interpenetrate with an "order," or rim, of cusped ornament. The masonry appears internally. The interior of Mr. Street's church at Boy's Hill, Maidenhead, is represented in a drawing (688) by Miss Hughes, which may serve to show how red brick, relieved by black lines skilfully disposed, can be used for the production of good internal effect. If we assume that the public are becoming satisfied with the use of masonry or brickwork unplastered, for interiors of churches, there is reason to hope that the effects will ultimately be most important on the appreciation of what is most valuable in architecture generally. Mr. Street has in the Exhibition (648) a "Design for the Monument, about to be erected by subscription, in the south aisle of the choir of Litchfield Cathedral, to the memory of Major Hodson," a copied tomb with floriated cross upon it, and the sides chiefly composed of sculpture representing scenes in the life of Hodson, or personifying his virtues. Though marked by the ability of its author, we can hardly say we like the design. The general form is not pleasing; and the monument, whilst too much a tomb, is far too much sculptural on the sides and ends, or is there not sufficiently architectural; and it differs much, without corresponding gain, from the best Gothic monuments, where sculpture is prominent on the slab or lid, and the sides are in details to a greater extent architectural. A markedly Mediaeval dress, besides, or as we think, is adopted in the personifications of the virtues; and this, though it may be deemed, with the general design, appropriate to the Gothic cathedral, is scarcely in all respects to be defended in a monument the tribute of people of this day whose admiration is of the virtues not under the garb of the Middle Ages.

There are several well-known names amongst the exhibitors, besides those we have mentioned. Mr. Ashpitel, Messrs. Halliwell & Goldie, Mr. E. W. Pugin, Mr. J. T. Kuowles, Mr. Penrose (a design for the completion of St. Paul's, internally), Mr. D. Brandon, Mr. T. H. Wyatt, Mr. S. S. Toulon, Mr. W. G. Habershon, Mr. Sydney Smirke, R.A., Mr. Owen Jones, Mr. T. Page, Mr. E. M. Barry, Mr. F. P. Cockerell, Mr. Tite, Messrs. Francis, and others, are represented—some of them by works of high merit; but to these we must return when we have more space.

#### THE VICTORIA BRIDGE, CANADA.

AMIDST the engineering works that rise rapidly and successively around us, there is none so great as the object of our present notice. Though perhaps the circumstances under which it has been constructed may have been hardly so difficult as those which surrounded the "Britannia," on account of the engineer having the disadvantage of less experience, still it is larger in every respect, and, in its influence upon commercial interests, more extensive and important. As a connecting link between the United States and Lower Canada, its commercial importance is immense, independently of the scientific triumph. Imagine this thin line, as it appears at a distance, drawn 60 feet above the level of the rapid St. Lawrence, which brings down the water and ice of two thousand lakes and upper rivers,—a striking and lasting monument of the genius of a Stephenson! It is by means of men like this that the Far West has opened out vast resources, consequently adding so many great links to the lengthening chain of progressive civilization. "It is to men like this that nations (hitherto separated by what may have appeared insurmountable obstacles) owe their union; and such men, independently of their scientific triumphs, have wrought by such means political ones more grateful and permanent than all the treaties upon the record of Time." With such feelings we view the sweeping bridge that spans the far-spreading valley or foaming torrent, wherever they may be, though an unprofessional eye cannot estimate the niceties or complications of construction. Far more difficult is it for such to realize the hours, days, months of laborious anxiety that this has cost the originator, and the one responsible for such an important undertaking. Scientific theories have to be practically solved; the new principles staked to be carried out successfully, or a perhaps already splendid reputation irretrievably ruined, and only a faint idea can generally be formed of the work of brain and hand embodied in those huge masses of stone and iron, that seem as if looking down upon the foaming waters in all the pride of conscious strength.

But of this mighty "iron," this giant innovator of modern times, having so many varied developments in the hands of inventor and adapter! When we view the works of Lancashire, Stafford-

and we found Carter from 1792 protesting earnestly against Wyatt's work, and the Society of Antiquaries from 1795 to 1813 engaging in the publication of Carter's drawings of Medieval buildings. But as actual illustrations of the then public taste in Gothic, perhaps the best examples were the front of the London Guildhall, and the descriptions of Carlton House, which, when remodelled for the Prince of Wales (1783) by Holland, although in Palladian style, was made to comprehend a Gothic dining-room with furniture to match, and a Gothic conservatory said to be "in imitation of a cathedral."

More credit ought to be claimed than was usually accorded to a writer of this period who was the first to attempt classification for Gothic design—namely, Batty Langley. If his suggestion was nothing more than that there were five orders of Gothic architecture, this, however ridiculous now, was the only hypothesis which could be reasonably expected of the age. That there were five orders of architecture in the abstract was held as a principle of almost divine institution. The lecturer himself in his youth was taught to believe, and did believe, that the Greeks had some species of inspiration of taste out of which their perfection came; and he dared to say there were gentlemen in the room who believed so still. Villalpanda had boldly affirmed that the design of the five orders was delineated in heaven, and presented to Solomon to be employed in his temple, the Greeks having afterwards copied the system therefrom. The well-known old lady of the court of Queen Anne had a new garment embroidered with the five orders, as a grand rotunda of authentic decoration, from hem to waist. What, then, was the theory of Langley but one of the most ingenious conceptions possible,—if an error, still the *primæ facie* principle, a fair trial of which was the inevitable first step towards the classification of the style. Fair play was due even to Batty Langley.

**Nineteenth Century Classicism.**—The French revolution and the war divided the Europe of the eighteenth century, lately under discussion, from that of the nineteenth century, now in hand. During the war the Greek taste had slowly advanced. In 1807 appeared Wilkins's "Magna Græcia." After the peace, the then rising men, Messrs. Cockerell, Donaldson, Inwood, and others, employed the new facilities of travel to admirable purpose, and issued the publications which bear their names. In 1825, Gwilt's edition of "Chambers," contained the addition of that Greek style which the worthy master in his own day had so despised. Meanwhile Soane and Smirke had risen into celebrity in Greek practice. Soane was R.A. in 1802, professor in 1808; and from 1800 to 1827, was building the Bank of England. Smirke was R.A. in 1811, and began the Post-office in 1818. Of younger men, Wilkins became R.A. in 1826, and Cockerell in 1836. In 1823, Cockerell built the entrance to Archbishop Tension's Chapel, in Regent-street, and in 1827, St. George's Chapel. Wilkins during the same period built the London University College and the University Club, and Inwood St. Pancras Church. In 1800, James Burton had built the Russell Institution in Coram-street. Greek taste was thus in full practice; and not only had Palladian been cast ignominiously aside, but the Roman works themselves were pronounced corrupt.

Allusion had already been made to the growing disposition to deify the merits of the once triumphant Greek school; but if we pointed to that estimable leader happily still amongst us, Mr. Cockerell, there was no man of the new school who would sit down by his side without sincere respect—respect for that "classicality" of education and intellect which before long it might be our misfortune to look back upon with regret as the attribute of an age gone by.

**Nineteenth Century Gothicism.**—James Wyatt was the first leading practitioner who accepted the revival of the feudal sentiment; but, once in motion, the new heronial style soon progressed apace. In 1801 we had Fonthill, by Wyatt; Cashiohury soon after, by the same; Ravensworth in 1808, by Nash; Louisa Towers in 1814, under the personal inspiration of Lord Shrewsbury; Toddington in 1819, designed by Mr. Hambury Tracey (afterwards Lord Sudeley), and Abbotsoford, by Sir Walter Scott, introduced us to the interposition of amateur feudalists in aid of the movement. Windsor Castle was the then perfection of the movement; and, in 1824, Wyattville became R.A. Archaeology also came forward rapidly; Britton commencing the publication of his "Antiquities" in 1806, and his "Cathedrals" in 1816. Pugin, the elder, pub-

lished his "Specimens" in 1823; "Normandy" in 1826; "Examples" (comprising the first detailed delineations of meritorious specimens) in 1831. Classification had meanwhile advanced to an important position in Rickman's "Attempt," which divided English Medieval architecture, with remarkable detail, into four distinct styles,—Norman, Early English, Decorated, and Perpendicular, a division still found to be so far correct. Cottingham's Museum belongs to the same age, collected chiefly from the destruction of St. Katherine's Hospital to make way for the docks.

In churches there had been now developed a decidedly Gothic tendency. One of the most admired of the earliest works was the Scotch Church, by Mr. Tite, in Regent-square. In 1826, Mr. Poynter built St. Katherine's, in Regent's-park; about 1827 Smirke restored the Temple Church, and built the library, in character with the ancient buildings; at the same time Nash had built Haggerstone Church, and Mr. Barry, in his church at Brighton, followed by those of Cloudeston-square, Ball's Pond, and Holloway, had already exhibited his remarkable artistic power.

Other eminent names of the age were those of Repton, Blore, Hopper, Buckler, and Mr. Ferrey, who was well worthy of the title of the father of the present Gothic list of practitioners.

Tudor was soon the almost universal style for country mansions and public buildings, such as asylums and the like, of rural position.

The first great public triumph of Gothic style was in the case of the Houses of Parliament, 1835. The feudal sentiment (if overthrown in France by the revolution, encouraged in England by the result of the war) had so far gained the ascendancy, that the arguments in favour of genuine old English building for the palace of the English Legislature were readily accepted on almost all hands. The styles for competition were "Gothic and Elizabethan." Barry, in easy triumph, carried off the palm with a Gothic design universally admired. The second premium was adjudged to an Elizabethan work, but that weaker style was indisputably defeated. Up to the present day the Palace of Westminster had been carried on in continual aggrandisement of plan and continual progress of detail. If now by a new class of critics that great work was pronounced imperfect, it was not by any failure in its own promise, but by the introduction of a new spirit of art, namely, that of ecclesiasticism, to be presently treated of. The consideration of the Early nineteenth-century Gothicism could not be more appropriately closed than with a tribute of homage to the transcendent practical sagacity of Sir Charles Barry,—no archaeologist, no black-letter man, no rubber of brasses, no professor, no bookmaker, no speechmaker,—but at the drawing-board a prince. The Houses of Parliament might pass out of fashion, as all human works must; but, as a man eminently safe and graceful designer, Sir Charles Barry deserved to be ranked with Wren, as one of whom future generations of Englishmen would justly be proud.

**The New Italian School.**—In the pseudo-Augustan age of George IV. the tendency of style in ordinary building was towards the increasing modification of Palladian by Grecism of detail. It was so even with Nash, although he could scarcely be called a Greco-Palladian so much as a Cockerell-Palladian; and in the hands of men of better education,—Soane, Smirke, Burton, Cockerell, and others,—public buildings in London and elsewhere began to acquire a character of exceedingly careful proportion and elegant finish, worthy of the utmost admiration. It was reserved, however, for Barry to introduce in the Travellers' Clubhouse the genuine palatial Italian of the sixteenth century. The Reform Club followed. The test of natural style was best to be found in the unaffected work of the mere builder, and it seemed to the lecturer obvious that by this simple rule the fenestral Italian was proved to be the style proper to modern Europe, as that which most naturally applied to every-day building,—the style of the merchant, not of the priest or baron. The success of Barry's Italian was complete, and ever since, the style had been the favourite all over England, and had produced most numerous and varied works of great excellence.

A word might fairly be said in connection with this chapter in favour of Nash, whom it was common to call the king of compo and sham, and a man of execrable artistic memory. It ought to be remembered that his time was peculiar. He did not make the style, but the style him. As the right man in the right place, at that particular day, he deserved credit; his energy was most valuable; better men might have filled in

his position; as it was, better men followed with advantage upon the ground he broke.

**Eclecticism.**—The policy of Wyatt was followed by others, and it soon became the practice to design either in Classic or Gothic, at selection. During the war "Grecian and Gothic" came to be spoken of as in a manner rival styles. Roman, Italian, Louis Quatorze, Tudor and Elizabethan, Castellated, Lombardic, and so on, were added to the eclectic list. As early as 1812 the Egyptian Hall in Piccadilly was erected. The Brighton Pavilion was also worth mentioning,—in "the Turkish taste." The principle of eclecticism was that all authentic styles were on an equal platform of eligibility for adoption, according to circumstances. Copyism and precedent thus enlarged their authority. From 1834 to 1837 occurred the establishment of the Institute of British Architects. This was conducted on purely eclectic principles, and the Institute had been of great service to the art so considered. The Greeks were unquestionably then in the ascendant, but an encouragement of Gothic study was freely accorded. An apportionment of styles soon became recognized,—for churches, Gothic; for mansions and the like, chiefly Tudor; for civil and municipal edifices, generally Italian; for grand monumental buildings, Greek or Roman,—all one happy family, into which no jar was expected to appear for ever. Many practitioners excelled in diverse styles, as Barry in both Italian and Gothic, and after him Scott; and to the present day there were a large body of metropolitan and provincial architects who designed most admirably in all styles alike. This was the triumph of eclecticism. Hosking's essay in the "Encyclopædia Britannica" (1832) was the most complete description of eclectic architecture at that time. Since then Ferguson had developed the same view much more elaborately in his learned, impartial, and most valuable "Handbook" (1855). Mr. Barry became R.A. in 1812, on eclectic grounds. One principle of the eclectic school was a little inconsistent: it was considered that as a rule the best of modern English architecture was inferior to foreign,—French or German. Although we must admit the superiority of the French in instinctive grace, and of the Germans in philosophical abstraction, yet the Paris Exposition in 1855 effectually proved that in practical architectural design the English were before both. The case of Lille Cathedral gave the same result, and, although it might seem inhospitable to say so much, so did the contest in Westminster Hall. It ought not, however, to be overlooked that the excuse for the depreciation of our native merit lay in the unexpected pleasures of Continental travel after 1814, producing a favourable impression on Englishmen generally, which it must necessarily take time to overcome.

Before proceeding to another portion of the narrative, the lecturer could call upon his audience to join him in an acknowledgment of the great services that had been rendered to eclectic art by one gentleman well known there, still happily active and hard at work,—Professor Donaldson. During a long series of years no other man could claim to have done so much for the profession in every way as he. Due credit ought also to be given to another gentleman, then present, for long and arduous services in periodical literature, most impartial, and highly successful.

**Ecclesiology.**—From 1835 to 1810 the sentiment of ecclesiasticism came very decidedly into view, through the means of the well-known movement in the Church, in favour of ritualism, which, of necessity, materially affected church architecture. In 1835, Pugin the younger opened his energetic assault upon Classic practice in his "Contrasts," followed in 1841 by his "True Principles," in which he laid down rules for sound design, and, subsequently, by the "Apology," which treated of the availability of Medieval style for all modern requirements. It must also be mentioned how this individual teacher, by the labour almost of his own hands, had revived the whole circle of the Gothic decorative arts,—carving, glass-painting, metal work, encaustic tiles, embroidery, furniture, &c., to a degree scarcely credible. In 1841 was founded the Cambridge Camden Society: the publication of the "Ecclesiologist" followed; symbolism, in great force, came into request; Pre-Raphaelitism in painting lent its aid; archaeological societies were established in all quarters; the clergy began to take a lively interest in architectural revival; church building and restoration were largely entered upon; and the effect upon the profession was great and rapid. A new school of architects arose, confining themselves entirely to ecclesiastical work, and repudiating the Classical styles

altogether. Mr. Scott soon took the lead. In 1832 we had in his Cumberwell Church a remarkable step in advance, in purity of style: a short time afterwards, at Hamburg, he took the prize for St. Nicholas's Church: since then his success in his particular walk had been the basis, and only of the profession, but of the country, and, at length, as A.R.A., he was the first who had attained that honour on Ecclesiastical merits, Wyattville being his only Gothic predecessor in the Academy.

The great moving agent of modern ecclesiasticism in our art was Pugin. Take him with all his faults, he was one of those rare spirits—Nature could not afford to produce many of them—in whom the very power of intellect was its own destruction. The common record of such men was that they were eccentric, visionary, impracticable; but what cared they for common record? If they lived in turmoil, in storm and cloud, such was the destiny of the heroic; if they even perished in despair, it was genius passing away in a chariot of fire.

*Latitudinarianism.*—As yet it must be remembered that in Classic and Gothic, and all else alike, copyism and precedent prevailed absolutely. The search for novelty under the Palladian régime had expended itself in the endeavour to invent a new "order." The Italians attempted it earnestly: the architects of Louis XIV. did so too; prizes were offered for success: in the time of Chambers the case was the same, and in his "Civil Architecture" he suggested no fewer than six examples,—all were variations of the Corinthian capital. Under Sir John Soane the idea had got into disrepute, so that the professor himself styled it "the philosopher's stone of architecture," and actually sued a critic at law for libelling him by the assertion that he had attempted a new order in certain Regent-street houses. In 1815, Mr. Leeds had for many years been an active writer in favour of abstract freedom. In that year, Mr. Lamb, in his "Examples of Domestic Architecture," ventured upon a very outspoken protest against copyism, and was answered gravely by an eminent practitioner with the assertion, that the art was in a state of utter degradation, and could only be assisted to recover its vitality by the faithful copying of the designs of better days. Other writers followed, laying stress upon the artistic element; but the expression that architecture was a fine art was ridiculed, although, since that time, the principle had gradually acquired the force of a fundamental axiom. The young men and students began to revolt against archaeology and the authority of precedent, and when they formed themselves, in 1817, into a junior society,—the Architectural Association,—the enfranchisement of design was their motto, and there were many amongst the most esteemed designers now who attributed much of their success to the discussions and competitions of that society. Then came Mr. Ruskin. He was claimed by some as an ecclesiologist, but without reason: he was a latitudinarian from first to last. He preferred Gothic for its picturesque and romantic character; but why did he lean so much on Venice? Because, said he, Venice was peculiarly mercantile and non-ecclesiastical. A commonwealth of this kind, existing in the midst of feudalism and ecclesiasticism, would consequently possess in its art the elements of the styles of both conditions, that is, both the old Gothic and the new Classic elements. Mr. Ruskin's first work, in 1813, the "Modern Painters," took the ground that the ancients, instead of being our superiors, were our inferiors,—latitudinarianism the most daring. In 1819 he applied himself to architecture in his "Seven Lamps," and in 1851 he began "The Stones of Venice." In 1819 Mr. Ferguson published his "Inquiry into the Principles of Beauty," in which he also proved himself an extreme latitudinarian. Since that time the principle had been strengthened continually.

But the high priest of all latitudinarians was Mr. Ruskin. Not to speak of his elegance of diction and graceful form of thought, which were but the superficial covering of solid matter beneath, the honest pluck and audacity at the root of all was delightful. He might compare with John Bright. Talk of looking before you leap! he neither looked nor leaped: with one stroke of his penions he was amongst the clouds and winds: a moment more and he had reached the goal of his endeavour: how he had reached it the clouds and winds only knew; but let him shake him in his seat who could.

*Present Position and Prospects.*—In Classicism, of late years, the Royal Exchange (1839), St. George's Hall of Liverpool, and the Town Hall at Leeds were the chief works of the grand monu-

mental class, and, with various others of less magnitude, very successful; while, for more ordinary civil and domestic buildings, the Palladian Italian style had been almost universal, and exhibited by great merit. The present tendency, however, was towards the early Italian manner,—the Gothic germ. The picturesque also was much sought,—a step in the same direction.

In *Gothicism* it might be said that, in the course of a rapid and brilliant career of revivalism, the native English styles had successively gone out of fashion in favour of Continentalism: even Mr. Scott rested upon thirteenth-century French as the great central point of excellence. The tendency, however, was now very strong towards Medieval Italian,—the before-mentioned germ of the Palladian. The use of colour was a step in the same course. The endeavour to adapt the style to common domestic forms was the same. The merit of our Gothic domestic designers could not possibly be overrated. Carpenter, Butterfield, and numerous others might be alluded to; but the remarkable felicity of design and draughtsmanship in Mr. Burges and Mr. Street, as displayed in the competitions for Lille Cathedral and the church at Constantinople, took us by surprise, and led us to look for universal merit in the works of rising men of such great power. In the Government Offices competition, also, the drawings of Mr. Scott and Mr. Street, and, perhaps, more than all, that of Mr. Woodward, were strikingly fine. But Mr. Scott had lately drawn attention to a point which young Gothicists would do well to consider. They were deficient, said Mr. Scott, in grace and proportion. This was undeniably true, and it was really the most important of all present questions affecting the style, whether all spirit of more elegance and refinement of form could not be cultivated. Whether the Gothic style was likely ever to prevail in England for every-day purposes was a point much argued; but, however unsuitable, as at present practised, time and much modification might do a great deal for the style with this view, provided Mr. Scott's complaints were not neglected.

In *Eclecticism* the latest remarkable occurrence was the Government Offices competition in 1857. In that transaction the question of style had been left open as if to promote a settlement of the point; but the result had been most unsatisfactory. The excellence of the Gothic designs had been just alluded to. The design of Mr. Garling might be safely pointed out as one of several equally excellent on the other side.

In *Eclectology*, of late years, theory had become more subdued; but the practice of Continental style and arrangements, if not kept in check, might rouse the susceptibilities of Protestantism, and it was time that some of the Gothic school should take up Protestantism as fundamental ground.

*Latitudinarianism* had served its purpose, so far as theory went; copyism was almost extinct, and precedent a dead letter: clever novelties were the rule, and the drawings then in the Architectural Exhibition would have been considered, some twenty years ago, not merely as extravaganzas, but as the outlandish products of some other sphere. The picturesque, however, was much overvalued, and fantastic design was the bane of both Gothic and Classic efforts. Dashing drawing, also, was much to be condemned, as the most treacherous of all things to the student, causing him to overlook all the delicate questions which constituted the very life of architecture in the solid, but which, in the midst of masterly picturesque sketching, red, blue, and yellow colouring, and artificial *chiaroscuro*, were utterly lost sight of.

In conclusion, the *battle of the styles* seemed thus to be approaching near the end of all honourable and creditable conflict, namely, alliance. If Classicism was tending towards the early Italian, the Gothic germ of the later style, and becoming also more and more picturesque, and, therefore, more and more Gothic (the picturesque being the essence of Gothic taste); and if Gothicism was similarly tending towards the examples of Italy, and becoming more and more graceful and refined, and therefore more Classic (grace and proportion being the Classic essence); then it might surely be said that the rival styles, mutually modified, were approaching one common centre. The result might not be any new style,—for it was questionable whether the phraseology of architecture, except in respect of new materials, was not exhausted long ago (like that of music, and perhaps that of painting and sculpture); but there would be a federation and union of purpose; the *quasi* Classic on one side of the way, and the *quasi* Gothic on the other, although clearly distinguishable in criticism, would display accordance and sympathy, and look

each other fairly in the face. If the impression created by the present argument had been to this effect, exhibiting the battle of the styles as not a party squabble, but an intellectual process, honourable to all engaged in it (and honourable, by the bye, to England as having had little or no help from abroad throughout its whole course), then the least we had at any rate left the world a little better than an hour ago it had found it.

To show that the lecturer's *personal* remarks were not made in an arrogant or unpleasant spirit, we may mention the fact that his allusions to the distinguished architects of past and present time, and also the references to the current questions of the day, were received by the audience with approbation throughout.

#### THE PARIS OPERA.

We mentioned in one of our later numbers, that the plan relative to the construction of a new opera-house in Paris was exposed to public inspection at the Mairie of the 9th arrondissement, in the Rue Dronot. The following history of the French opera will interest some of our readers. The French opera carries us as far back as the poet Baif, who, under the reign of Charles IX., assembled together a musical company, exclusively devoted to religious compositions. They held their meetings in a house in the Rue des Fosses Saint Victor, and were protected by the King. It was not until the ministry of Cardinal Mazarin, that the opera was in earnest introduced into France; at that period the words and music were Italian. The first opera in the French language was produced at Vincennes, and afterwards at the Hôtel de Nevers, in 1659. It was a "Pastorale" in five acts,—the words by Abbé Perrin; music by Gambert, organist of Saint Honoré, and composer to the queen mother. Ten years afterwards the Abbé Perrin obtained letters patent, authorizing him to "establish in Paris, and other towns of the kingdom, musical academies for singing in public, as carried out in Italy, Germany, and England." A theatre was soon opened in the tennis-grounds of the Rue Mazarine; the opera of "Pomona" was represented, but without success; and the establishment was threatened with complete ruin, when Louis XIV., by new letters patent, invested Lulli with the privilege of founding in Paris, on the largest scale, a royal academy of music. It was on the tennis-grounds of Bel-Air, in the Rue de Vaugirard, near the Palace of the Luxembourg, that Lulli placed his theatre: it was opened on the 15th November, 1772; by the first representation of "Les Fêtes de l'Amour et de Bacchus." The death of Molière having left the theatre of the Palais Royal unoccupied, Lulli transferred his opera there. On the 6th April, 1763, a terrible fire destroyed the opera-house; and the 24th January following, the singers took possession of the "Théâtre des Machines," which formed part of the Palace of the Tuilleries. In the meanwhile the reconstruction of that of the Palais Royal proceeded actively, and the inauguration took place on the 26th January, 1770; by the reproduction of Rameau's opera of "Zoroaster." A new conflagration reduced the building once more to ashes. "On the 8th June, 1751," says Mercier, "a rope of the proscenium took fire by coming in contact with one of the lights, set fire to the curtain, the curtains to the scenery, which spread the flames throughout the boxes. All the theatre was consumed."

In seventy-five days a temporary house was constructed on the Boulevard Saint Martin, under the direction of Lenoir (called Le Romain), an architect of some talent. This theatre, actually that of the Porte Saint Martin (in which the "Closerie de Gènes," a *chef-d'œuvre* of the modern French drama, is now nightly represented), was first opened to the public by the first representation of "Adele de Pontieu," an opera in three acts, the words by Saint Marc, music by Piccini.

In 1794, the opera quitted the Boulevard, and was installed in the theatre built by order of La Demoiselle Montansier, in the Rue de Richelieu, opposite the Bibliothèque Impériale, where it remained twenty-four years. On the opening representation in this house, for the first time benches were placed in the pit. The present French Opera-house was built on the spot formerly occupied by the Hôtel de Choiseul, by M. Debret, architect.

*EXAMINATIONS AT THE INSTITUTE.*—The examiners of candidates for district surveyorships under the Metropolitan Building Act 1855, at their meeting on Tuesday last, returned the name of Mr. T. M. Rickman to the council as entitled to receive certificate of competency.

THE "MENDELSSOHN FESTIVAL" AT  
THE CRYSTAL PALACE

The anticipations we expressed, based upon the success that attended the great Handel festival of 1859, seem in course of realization. A year has not expired since that significant event led us to predict a new era in the annals of the chorus, and already another gigantic demonstration has conferred fresh honour upon its projectors, and proved that that success in both instances may be ascribed to causes more legitimate than the mere love of novelty. The musical festival has long been one of the institutions of the land, and Liverpool, Birmingham, Leeds, Bradford, Hereford, Gloucester, and Worcester are amongst the favoured spots where Music alternately holds her court, asserts her supremacy, and receives the homage of her votaries. In London, the "season" may be said to represent the great metropolitan festival in honour of Apollo; and, certainly, if the patronage bestowed upon operas, oratorios, and concerts, to an amount unparalleled in any other city of the world, may be taken as a criterion, it must be confessed the title is not altogether misapplied. The term, however, in its strict meaning, implies a congress upon a large scale, and the want of a building for its assemblage suitable in proportion to the extent of this vast metropolis, has delayed the observance of these monster reunions in its precincts, long after they have conferred an enviable distinction upon certain cathedral and commercial towns with whose names the practice has been now for many years honourably associated. The appropriation of the Crystal Palace, however, to this amongst its many other uses, has supplied a means of assemblage for such orchestras and audiences as the world has never before witnessed; and, in the absence of those acoustical excellences which distinguish some of our provincial music-halls, we may console ourselves with the superior size and singular beauties of a building which, filled with thousands, radiating with sunshine, and overflowing with the richest treasures of nature and of art, confers an *éclat* upon the colossal *fêtes* enacted within its walls which no other structure can supply.

In the Oratorio we imagine all that is sacred, sublime, impressive, and elevating that music can portray, and the appeal to the senses through its medium—such music as the great masters of the modern age have bequeathed to us, and the skill of modern performers presents to us,—will at once strike home to the heart through the medium of the ear, where the picture presented to the eye alone; unaided by the "concord of sweet sounds" which the genius of the painter, the sculptor, and the architect may create, will fall short of that ideal standard of excellence that we have preconceived for ourselves, and fall to create that impression that we expected to receive, in spite of our better judgment. Not a less singular and significant feature, too, of the oratorio, is the fact that the strictest opponents to aestheticism in matters of religion object not to assist at these sublime ceremonies, wherein the religious feelings of the mass are certainly wrought upon more effectually and unanimously by the conceptions of a Handel, a Mendelssohn, or a Spohr, than by those of a Raffaele, a Rubens, or a Michelangelo; and in the sublime choruses of Handel (first of all sacred composers) the sculptured and painted treasures of the world's art seem concentrated, and at the voice of his inspiration scepticism itself for once abandons doubt and is convinced. If, therefore, the appeal to the heart through a particular sense can obtain a response that the most rigid Puritanism may fail to elicit, let us welcome the oratorio as a compensation, or, we should rather say, a substitute, for those æsthetic aids which a prudent restriction denies to Protestantism; and in the humanizing effect produced upon us by clothing the most sublime truths of religion in the most beautiful strains of harmony and melody, believe that there are occasions when religion and the world are not incompatible.

Putting aside, then, that minute section of the public whose scrupulous objections lead them to apprehend danger in a practice so morally elevating and religiously inspiring, we view the progress of public taste for the oratorio as a matter of national congratulation, and regard its establishment as a permanent benefit. The appetite for these magnificent choral demonstrations once roused, it seems to us that nothing short of annual repetitions can appease it; for centenary anniversaries are rare occurrences, and even after embracing those of the lives and deaths of all the greatest writers of sacred music, and again subdividing the same into sections of centuries, a wide vacuum would remain between each. Time,

however, will bring its own suggestions, and experience its own conclusions.

The festival in honour of Felix Mendelssohn Bartholdy, which was held in the Crystal Palace, on Friday, the 4th instant, had no reference either to the birth or death of that gifted composer, who was born in 1809 and died in 1847, but was simply suggested as a fitting accompaniment to the ceremony of the inauguration of his bronze statue, cast by Messrs. Robinson & Cottam, from the model of Mr. Bacon. Shortly after the death of Mendelssohn, a subscription, headed by the Queen and Prince Consort, the Sacred Harmonic and Philharmonic societies, and the leading musical professors, was set on foot to provide a monument to the gifted man whose career was so intimately associated with this country. Unforeseen difficulties as to a site having been raised, the fund remained for years unemployed, until at length it was determined to expend it in a bronze statue, to be placed in some prominent position in the open air; and the result is the memorial in question, at present placed on the lower terrace of the Palace.

The career of Mendelssohn, like that of Handel, Haydn, and Beethoven, was much influenced by the appreciation of his works in this country, and from his success here a new stimulus was given to the exercise of his genius, and a sympathy for England awakened in his mind which he cherished to the last. To his tour through Scotland, in 1829, we owe the splendid overture to "Fingal's Cave," and to the same inspiration may be ascribed the symphony in A minor (called the "Scotch"), though not completed until fourteen years later. With our language and our literature he was as familiar as with his own; and his overture and music to Shakspeare's "Midsummer Night's Dream" have for ever connected his name with us and our immortal dramatist.

To attempt to recapitulate the works of Mendelssohn would greatly exceed our limits. His sonatas, concertos, preludes, fugues, "Lieder ohne Worte," and numerous other compositions for the pianoforte and organ; his symphonies and overtures; his instrumental octets, quartets, and trios; his music to Racine's "Athalia" and the "Antigone" of Sophocles; his "Hymn of Praise," "Lauda Sion," and psalms; his "First Walpurgis Night," his unfinished opera of "Lorely;" his innumerable songs, duets, and choruses; and, lastly, his superb violin concerto, have all become in this country "household words." How much more he would have done had he been longer spared we may judge from his posthumous works, including the "Edipus" of Sophocles, the oratorio of "Christus," and the *finale* to "Lorely."

But his greatest works we have reserved to the last,—his oratorios of "St. Paul" and "Elijah." The first of these was produced in London and Birmingham in 1837; the latter at Birmingham on the 26th of August, 1846, the crowning labour of his life; for he survived its magnificent reception but little more than a twelvemonth; since which it has come to be regarded as a masterpiece only excelled by those of Handel.

A lovely day, and the fame of "Elijah," brought together a concourse of visitors numbering between 17,000 and 18,000. The orchestra, of nearly 3,000 performers, comprised the chorus of the Sacred Harmonic Society, the leading professional choristers, with deputations from the principal metropolitan and provincial choral societies and cathedral choirs, and a band of first-rate instrumentalists, composed of the same materials as that of last year, the stringed instruments of which alone exceeded 250 in number. We thought the Palace had never looked more lovely,—and when, at three o'clock, Mr. Costa entered the orchestra, the appearance of both the building and the audience exactly resembled that of the Handel Festival last year.

The advancement in the art of orchestration since the time of Handel, whilst increasing the elaboration of the instrumentation of the works of subsequent writers, may have detracted from the grand simplicity which renders the choruses in his masterpieces unrivalled. At all events, the effect of the choruses of "Elijah" was not equal to those of the "Messiah" and "Israel in Egypt;" nevertheless, great effects were obtained, and a great success may be recorded.

We abstain from entering into any detail of the performance, as such may be found in any of the musical *critiques* upon the occasion. The first part of the performance, from some cause or other, failed to awaken much enthusiasm in the audience; but in the second part the charge was redeemed, and the choruses "Be not afraid," "Woe to him, he shall perish!" "He watching over Israel," and "Behold God the Lord passed by," were received

with an enthusiasm which only found its climax in the final "Amen."

Mlle. Parca and Miss Fanny Rowland were the principal sopranos; Mlme. Sainton-Dolby and Miss Palmer the contraltos; Mr. Sims Reeves, tenor; and Signor Belletti, bass; Messrs. Evans, Smythson, and Thomas joined in the concerted pieces.

The only *encores* of the day were awarded to Mr. Sims Reeves, in "Then shall the righteous shine forth," and to Mlme. Sainton Dolby, in "Oh, rest in the Lord." The other soloists exerted themselves to the utmost, but the concerted pieces, nevertheless, were coldly received. In conclusion, this first performance of "Elijah," at the Crystal Palace, may be regarded in the light of a trial, upon a grand scale, a large section of both audience and executants who are well versed in the oratorios of Handel being as yet novices in those of Mendelssohn. As such, however, it was a great achievement, and a great success. The unveiling of the statue followed too closely upon the finish of the oratorio to allow more than a portion of the visitors to see the ceremony, especially as regards those most interested in it, the performers. Beyond its moral, however, they did not lose much, as the statue appeared to us deficient in dignity, expression, and symmetry. We had but a hasty view of it, however, and a second one may cause us to modify our opinion.

The torch-light procession was highly successful, and the effect of the coloured lights upon the fountain marvellously beautiful.

ROYAL INSTITUTE OF BRITISH  
ARCHITECTS.

ELECTION OF OFFICERS.

THE annual general meeting of the Institute was held on Monday evening, the 7th instant, to receive the report of the council on the state of the property and affairs of the Institute, and an account of the funds; to elect officers of the Institute, and examiners under the Metropolitan Building Act, for the ensuing year; Mr. C. R. Cockerell, president, in the chair. There was a good attendance of members. Mr. T. Hayter Lewis having read the report, which was mostly congratulatory, and showed a satisfactory state of things.

Mr. Tite, M.P., moved a vote of thanks to the president, embodying a request that he would continue to hold the office, and enforced it by some cogent observations.

Mr. A. Beresford Hope asked permission, as an honorary fellow, to second it, and strengthened the remarks made. The resolution being carried by acclamation, Mr. Cockerell assented, gratefully.

Thanks were then voted to the vice-presidents and other officers of the past year, especially to Mr. C. C. Nelson, on his retirement from the duties of honorary secretary; and the ballot was taken for officers for the coming year. The following were elected:—

*President*.—Mr. C. R. Cockerell, R.A.  
*Vice-Presidents*.—Professor Donaldson, M.A. G. Godwin, and Mr. M. D. Wyatt.

*Honorary Secretaries*.—Mr. T. Hayter Lewis and Mr. James Bell.

*Honorary Secretary for Foreign Correspondence*.—Mr. F. C. Penrose.

*Ordinary Members of Council*.—Messrs. B. Ferrey, F. J. Francis, W. Haywood, G. Morgan, C. C. Nelson, J. Norton, F. W. Porter, R. L. Roumie, I. H. Steveson, and G. Vulliamy.

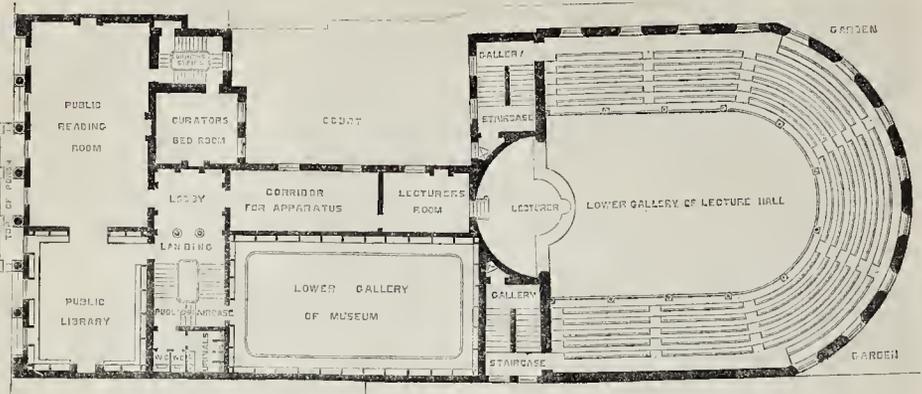

*Treasurer*.—Sir W. R. Farquhar, Bart.

*Honorary Solicitor*.—Mr. W. L. Donaldson.

*Auditors*.—Fellow: Mr. J. J. Scoles; Associate: Mr. J. T. Christopher.

The following were appointed to act as examiners under the Metropolitan Building Act 1855.—The president, the vice-presidents, and the honorary secretaries for the time being, with Messrs. Cole, Fowler, Gibson, Hesketh, Jennings, C. C. Nelson, J. W. Papworth, Pemettorne, Penrose, Scoles, Smirke, and Whitchord, fellows.

THE REPAIRING OF FLEET-STREET.—The repairing of the carriage-way of Fleet-street with new Aberdeen granite blocks, 3 inches wide, was completed on Saturday. The traffic had worn the old stone, which when laid down in 1846 was 9 inches in depth, to 4½ inches. About 6,000 yards of granite have been taken away, and new substituted, and the weight of material removed and replaced amounts to about 7,600 tons. The contract has been carried out by Messrs. Mowlem, Bart, & Freeman, of Millbank, Westminster, under the superintendence of Mr. Mortimer, on behalf of the City Commissioners of Sewers.

PROPOSED HARTLEY INSTITUTE, SOUTHAMPTON.—PLAN OF FIRST-FLOOR.

## HARTLEY INSTITUTE, SOUTHAMPTON.

The design, a view of which is given on the opposite page, was chosen from forty-four sets of drawings, submitted in competition for the building by the committee of the Town Council. Our readers already know something of the circumstances attending the selection. The design, according to present arrangements, is to be carried out at once, at a cost of 9,000*l.* for the building, and a further expenditure of 2,000*l.* for fittings, heating and ventilating, lighting, &c. The frontage is in the High-street, near the port, and is to be built of Portland stone. On the ground floor three doorways enter into an ample hall, for the display of statuary, on either side of which is a large class-room, one communicating with a laboratory and the other with the museum, which, with its two galleries, will afford large accommodation for the collections of curiosities, &c. A central passage on the ground-floor, with a staircase on either side, conducts to the lecture theatre, holding 2,100 persons, on the ground-floor and the two galleries. This lecture theatre is also to be used as a concert-room, the recess for the lecturer being available as an orchestra, and approached on the principal floor by a wide corridor, also used as a store for apparatus, &c. The whole frontage on the principal floor is devoted to the library and reading-room, at the back of which is situated a laboratory and the principal staircase, leading to three large class-rooms on the second floor and two floors of laboratories and two private studies for professors. The features of the design which caused its selection by the committee were the ample accommodation given by the class-rooms and the commodiousness of the lecture theatre, every window of which on the ground floor is available for ingress in case of alarm. Messrs. Green & De Ville are the architects.

## THE PROPOSED NEW ROAD ACROSS HYDE PARK.

SOME years since the great inconvenience to the districts north and south of Hyde-park, from want of a direct route of intercommunication for vehicles and foot-passengers at all times through the park, was started and fully discussed in the *Builder*, and a sunk road with fences and flying bridges suggested, as the best mode of effecting, amongst other arrangements, the object in view.

The subject just now has been revived with additional force, on account of the continued increase in the buildings and population both north and south of the park; the prospect of the opening of the Exhibition of 1862, in this vicinity, the new Museums at Brompton, and the formation of Horticultural Gardens, as well as of streets and squares on the property of the Royal Commissioners.

An association of noblemen and gentlemen for the promotion of the requisite communication between the northern and southern districts has been formed, and meetings are being held in the rooms of the Society of Arts, Adelphi, the council

of which society are desirous of promoting the object in view. At one of these meetings, it was said Mr. Page, the engineer, had stated that the whole work could be done for 30,000*l.* A numerous and influential deputation from the Association had an interview with the First Commissioner of Works (Mr. Cowper), and with the Ranger of the Public Parks (the Duke of Cambridge), urging the necessity of some sort of public road being opened across the park. Mr. Cowper admitted that the subject was well worthy of consideration, and promised that it should receive his best attention. As the road, he observed, to be of any public utility, must be accessible to omnibuses and cabs, and open at night, if such a road were made on the level it would seriously interfere with the comfort of the multitudes who frequented the park for recreation. If, therefore, the road was to be made on the level, he could not hold out much expectation that it would receive the consent of the authorities, but plans had been proposed for sinking a road below the level of the park, and he thought these plans were very well worthy of consideration. It had been suggested that a sunken road could be constructed from the Uxbridge-road to the Kensington Gore-road, along which cabs and omnibuses could pass without being seen by any one enjoying the park, and if such a scheme could be adopted the objection to it would not be very great. Then arose the question of expense. Just now such large works were being carried out in the metropolis, that it was almost hopeless to expect the ratepayers to bear any further taxation, at least until the main sewers were carried out. He would take care, however, that the subject should be considered by those who had the power of accomplishing the object the deputation had in view. He was glad that the deputation had not thought it necessary to propose any scheme of their own; because, in a matter of this sort, it was best to leave everything in the hands of the executive.

The Ranger said the subject was one which would require great consideration, and therefore he could not be expected to give an answer of approval without having first heard both parties interested. It was absolutely necessary that, in places such as London, large open spaces should be maintained for the health and recreation of the general public; and before he could give his assent to any plan for making a carriage-road across Hyde-park, he must see that these objects were not interfered with. The proposed road would also be attended with expense, and he did not think the public would like to spend a large sum of money for the convenience of any given locality. If the road were made, a new bridge would have to be made across the Serpentine, as that in existence would be of no service. However, he should be happy to assist the deputation as far as he could, consistently with his duty to the public. Mr. Fife, M.P. suggested that a sunk road might be made, and that they could go under the Serpentine. His Royal Highness said he would give the subject his best attention.

The road leading from the Marble Arch towards

Knightsbridge, and some of the other footpaths, we may here remark, present a very unsightly appearance, in consequence of the want of a properly-defined margin. In parts, the grass is trodden and withered to a very great width. The route has now become an important thoroughfare, and the number of foot-passengers is constantly increasing; but this should not prevent the careful preservation of the grass. The road should be made sufficiently wide, and then strict measures taken to keep the lines of grass neat and trim. It is this precision which gives so much beauty to all parks and ornamented grounds. In Kensington-gardens, and in the Regent's and Victoria and other parks, we do not notice this defect.

During the past winter, several of the fine old trees have been damaged by the storms; several during the past dozen years have either been removed or else have become shapeless trunks, and the young trees seem to be very slow in taking the place of the old ones. It has been suggested that manuring the gravelly soil to some extent would increase the growth.

The water of the Serpentine is just now clearer than it has been for some time past. It looks beautiful in these bright spring mornings; and it is to be hoped that the failure which has just been made at improvement will not cause the matter to be lost sight of; for it will be noticed that, although at present the water looks comparatively clear, a white murky sediment is stirred up by bathers.

## FALL OF A BUILDING IN LOMBARD-STREET.

THE houses previously occupied by the London and County Bank, in Lombard-street, together with some adjoining premises in Nicholas-lane, have recently been sold, and the work of removing the lots had been actively going on during the last week. On the 5th, while the men were engaged in taking down the old materials, the upper floor, encumbered with brick rubbish, fell with a terrible crash, carrying with it the lower ones to the cellar and basement, and killing one man.

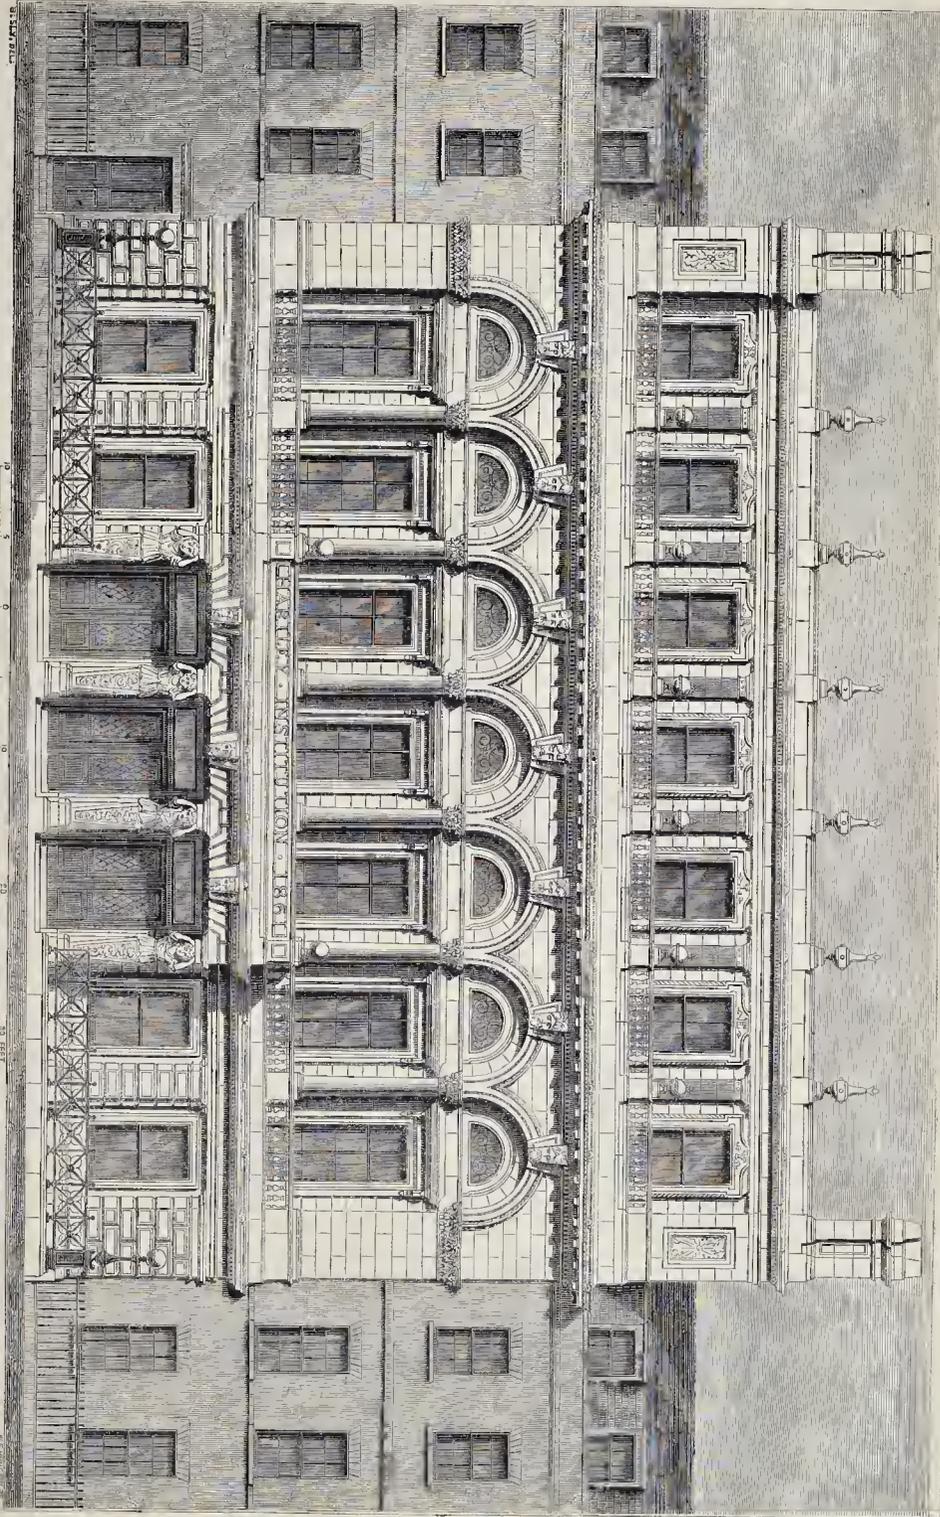

On Wednesday an inquest was held, before Mr. Sergeant Payne, in the course of which Mr. Lightfoot, clerk to Mr. Young, the district surveyor, pointed out that the district surveyor had no authority over buildings in course of being pulled down, unless they had been condemned.

The Coroner remarked that it would be useful if the surveyor would take a cursory view of premises when he saw they were being pulled down.

Mr. Lightfoot.—But if he saw anything wrong he had no power to give any order.

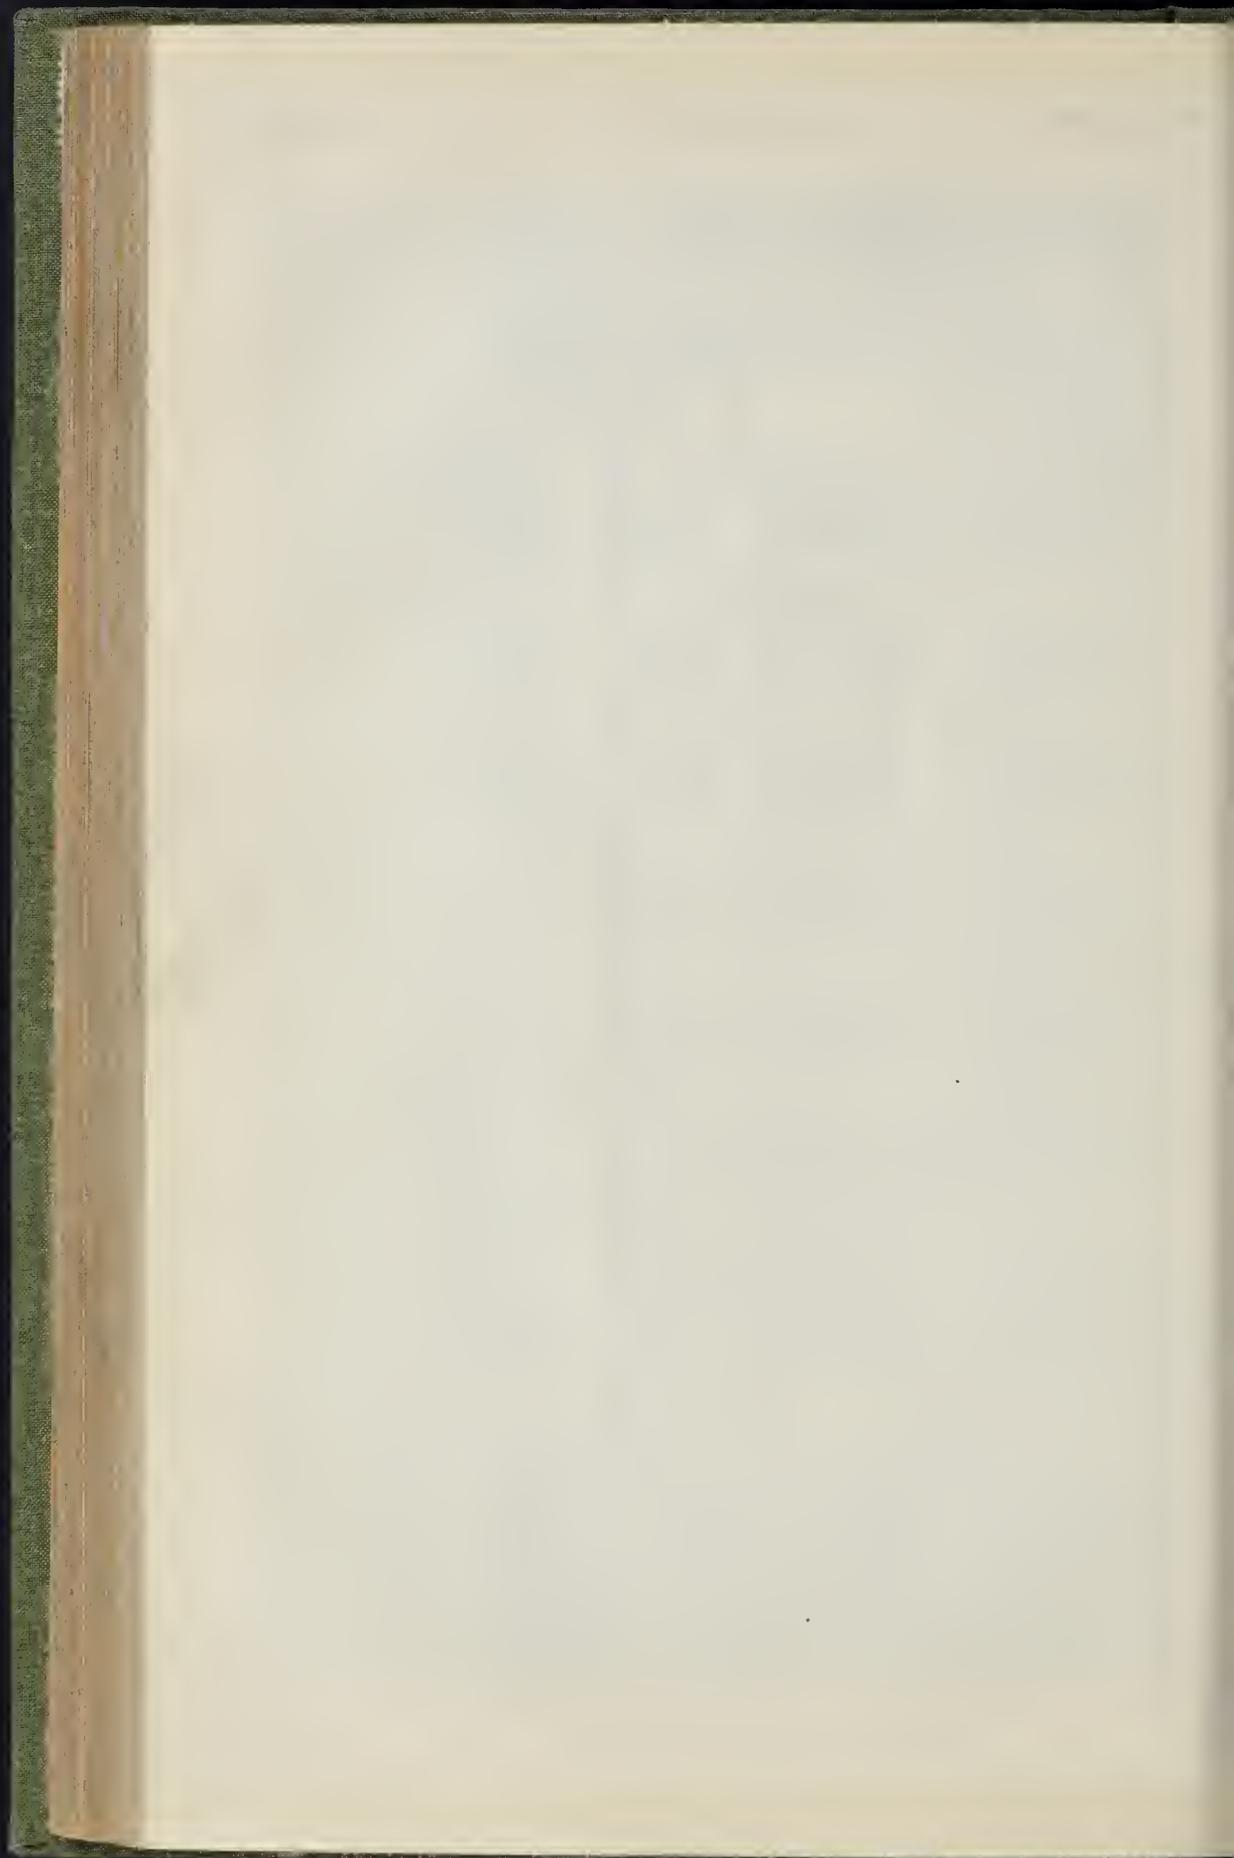

Mr. John Young, surveyor, said he had examined the broken girders of the floor which gave way, and found them to have the dry rot. He attributed the accident to the weakness of the girders and the weight which was put upon them. Had they been sound they would have borne a greater weight than had been placed on the floor. It was the duty of the person who used the floor for the bricks to examine the timber and see that they were in a state to bear the weight.

The jury returned a verdict of accidental death, with an expression of their regret that there was not sufficient protection afforded to the public and the men employed in pulling down buildings in the public thoroughfares, and if there was not adequate power vested in the district surveyor to enforce any order which required that security, that the coroner be desired to communicate with the Secretary of State for the Home Department, urging the introduction of a measure which would give the necessary authority.

LIVERPOOL ARCHITECTURAL SOCIETY.

The concluding meeting of the session of the Liverpool Architectural and Archaeological Society was held on Wednesday evening, the 2nd inst.

The president, Mr. F. P. Horner, in the chair. Mr. Huggins exhibited and explained his diagram, "The Genealogy of Architecture," showing the simultaneous origin of the various known styles practised in the world, from the earliest time to the present century; and which was graduated by horizontal lines representing the centuries before and since the Christian epoch. The Greek, generated by the mingling of Pelasgic with Egyptian and Assyrian elements, and the Roman, originating in the Etruscan and the Greek, and changing in the course of ages into the Christian Romanesque and Romanesque of lower Italy, formed the central and main trunk, from the sides of which flowed out, on the east the Byzantine, on the west the Lombardic. From the eastern side of the Byzantine, again, the Saracenic of Egypt, Syria, and Persia, and other styles were seen emanating in their chronological order, and from the other side of the same style the Sicilian and Venetian Gothic styles; while the development and relationship of the various Gothic styles of the north,—German, French, Spanish, English, Belgian, &c., were indicated. The origin and connection of the styles were shown not by line only, but by colour, which was applied to each style according to its characteristics, the trahéted and severer styles being shown by cold colours, and the arcuated and more ornamented by warmer and brighter.

The chairman then proceeded to criticize the various designs for a villa which had been sent in by student members in competition for the society's prize, and which were displayed on the walls of the room. Mr. Raffaele C. Isaacs, the author of the successful design, "V. A.," was authorized to select his prize.

The chairman then read his closing address to the meeting. In the course of it he said,—

"The question on which I dwell at some length, when addressing you at the opening of our session,—the design for the new Foreign Office,—remains yet in abeyance, and bids fair for some time to continue so. Whether this will lead to any alteration or modification in the views of the architect, or of those who decide on the matter, remains to be seen; but the subject, whenever it may be revived, will scarcely, I think, have lost anything of its primary interest or importance. The main question involved in every case of the kind, is, whether the design proposed is such as to merit the preference to be given to one or other pending buildings for Canada have been designed in a style much resembling that of the Oxford Museum and the Manchester Assize Courts (the two last-named having much in common), and in competition with Parliamentary buildings in Australia calls for the consideration of the style. If one is to have precedence, best adapted as a foundation for modern architectural design, and affords occasion also for duly weighing the question as to the part which circumstances of climate, quality, and available materials should bear in determining in every case the form of design; and, should any of the merits be engaged in the competition last named, or others pending on the Continent of Europe and in the Spanish Peninsula, I would desire to press upon their attention how much they owe to the cause of sound architectural design, and to the reputation of their profession abroad, to throw aside prejudices and give earnest heed to the bearing which the points I have named and other arguments have upon their choice of a style and their mode of treating it. The differences lately existing between the metropolitan contractors and their workmen for the time to have subsided, but as usual have left many marks of their existence, and one most serious and not readily antiquated, in the increased mortality among the working classes of London. The returns of the Registrar General distinctly point out this effect, and arguments were wanting to convince any of the folly of these disagreements in the form which, on the part of the workmen, they now usually take, this grave additional evil should surely weigh with the classes it relates to, so in the end are almost always the losers, and who as a general rule are urged on by interested and designing persons to press demands often utterly incompatible with the true relations of capital and labour, and of the practicability or probable effect of which they are very little capable to form a judgment. The death of the late noble president of the Royal Institute of British Architects has occasioned a vacancy which has, much to the satisfaction of the members of that body, and of the profession generally, been filled up by the election of one of the veterans of the profession and one of its most learned and experienced members. It is to be hoped that this step may mark a new era in the management of this central body of our profession, as, however valuable to a new society the support and continuance of an intellectual and influential person, as its president, may be, such a society as that of ours, whose object is so extensively and variously extending to all experience, be duly advanced and prospered by the direction and exertions of the leading members of the profession it represents.

The question of architectural examinations, not infrequently mooted among us, has been made the subject of grave consideration and of discussion and report, by the members of the Institute, the result of which is published in the minutes. The subject is as undeniably a very valuable one, as tending to insure at least a competent degree of knowledge in those undertaking the profession of architecture, and the Institute of British Architects, being the body of architects in the profession, seem the fittest to understand the responsibility such examinations would involve; but, as regards the higher examination proposed by the Council of the Institute, it seems to me not improbable that men in established practice may often prefer to forgo the honour of that title if it be obtainable

only at the cost of the irksome ordeal which is proposed, and, however desirable the proof that a new practitioner is competent for what he undertakes to direct, others, whose works give them a right to the title which they assure, may well be content if they decline to submit to admission to the leading body of the profession by the temporary negation of their claims implied in their submission to be examined as tyms.

The importance of iron as a constituent in architectural construction—a point I have before dwelt upon—is becoming constantly more obvious, and from time to time new forms of the material, in simple rolled bars, adapted for greater stress than has heretofore been laid on such, are presented to us. These, and the general substitution of wrought for cast girders, will certainly influence design; and it is well worth our thought how these can be best applied to insure constancy of design as well as sufficiency of construction. As I have before taken occasion to say, my own opinion is opposed to the extensive use of iron where architectural impressions of importance are aimed at. Much of this may be the result of habits of thought, but much too, I think, is founded on principles of art; and I touch on the subject, which recent circumstances have recalled to my mind, to draw attention to the necessity of duly weighing such questions if we are to have at once consistent architecture and the full use of our present improved means of construction. Reserving to subjects of local interest, a most liberal offer on the part of Mr. William Brown, to cover in a portion of the new Free Library and Museum, intended to have been reserved for purposes of future extension, and to devote it to matters connected with inventions in practice, has been lately the subject of consideration by a joint committee of this society and others. The matter interests the architectural profession, as opening the prospect of a manna of new materials, and applied science, and the committee at large are much indebted to Mr. Brown for this further proof of his generous liberality.

No buildings of much importance have, I think, been commenced in Liverpool or its neighbourhood during our past session, but many have been carried towards or to completion, and the great business centre of the town gains yearly year in the importance of its architectural features. The subject of the proposed public offices, equalled in interest by that of the projected improvements in the external and internal lines of communication of the town. It is to be hoped that the way may be seen to carry forward these most necessary projects, which have a special interest for our society, as embodying many of the points recommended by the Improvement Committee organized in great part among ourselves, and to myself they have the additional interest, that they coincide in their general tendency, and in several leading features, with what occurred to me when engaging in the competition for town improvements some years ago.

The subject of fire-proof construction, which, perhaps, I should have coupled with that of the use of iron in building, demands more attention generally than I think it has yet received; and I am reminded of it by the recent disaster to one of the leading buildings connected with benevolent objects in Liverpool. I cannot but hope that, in the reconstruction of this and in the erection of future buildings of the same kind, the character of the endeavour will be made to secure greater safety for life than at present generally exists; and in this instance I feel sure that the able architect originally designing the Sailors' Home would second such an object to the heart. The substantial and faithful character of the main building is evidenced by the small external damage it exhibits; and so firm an external frame would seem a most suitable recipient of fire-proof internal construction.

The question of lighting by gas, in my opinion, likely to take a new form, and, consequently, to demand the renewed attention of architects through the economy which seems likely to result from the use of the lime light with mixed gases. We should do well to keep our eyes always open to such questions and their various advancing phases.

An architect may at any time be called to give an opinion upon or to propose some new method or system of lighting, ventilating, or warming buildings; and, unless he take pains to keep his knowledge up to the mark of the continual progress of scientific and practical knowledge, he may find himself at fault when he least expects it.

No branch of knowledge is foreign to our art, and neither the youthful student nor the experienced practitioner can wisely neglect to cultivate in his stores of information on general art, on the various branches of physical sciences, or on the practical appliances at his command; and on the young and the practised alike it is the duty of those who love at heart the interest of their profession—the general community—of civilization and human improvement—to impress the obligation which they are under to make their profession honourable by the services it renders to the comfort, the happiness, and the intellectual enjoyment of their fellow-men."

COMPARATIVE PROGRESS OF ARCHITECTURE IN ENGLAND AND FRANCE.

ARCHITECTURAL EXHIBITION.

On Tuesday last, Mr. Parker read a lecture on the "Comparative Progress of Architecture in England and France during the Middle Ages." He began by fixing the year 1000 as the starting-point, on the ground that in the interval between the fall of the Roman empire and the eleventh century it was the usual habit of the people of both countries to build of wood. There are a few exceptions, such as, in the walls of the crypts of Hoxham and Ripon, and in the walls of churches at Brixworth and Dover; in France several crypts and some churches of the time of Charlemagne; but though of historical interest, they are not of much architectural value, and not numerous enough to preserve the arts of quarrying, cutting, and carving stone, which were lost for want of practice, and had to be learnt again from the study of Roman remains, when the fashion of building in stone was revived, immediately after the year 1000.

The Roman remains were more numerous and finer in some districts than in others, and were at

first freely used as quarries. The provincial character prevailing in different parts of France is partly to be attributed to the style of the favourite Roman model in each district. Thus, in Lyons and Burgundy, fluted pilasters continued to be used throughout the Gothic period, and, in many parts of France, plain round columns, with Classical capitals, were never entirely disused, even in the finest Gothic buildings.

In England there were scarcely any Roman buildings remaining at that time, sufficiently perfect to serve for models; and although the fashion of building in stone soon spread to England, the Anglo-Saxons were obliged to copy their own wooden buildings, for want of any other models. By this means they invented a style of their own during the first half of the eleventh century, which, although rude, is not devoid of merit. The earliest dated example is Deerhurst, in 1056, of which the original inscription is preserved, but there is no doubt that some are earlier and some later. This style was sometimes continued after the Norman Conquest, as at Lincoln and St. Alban's.

In France, much greater progress was made in the art of building in stone, and about 1050, Edward the Confessor sent to Normandy for masons to build his abbey at Westminster, the choir of which was completed and consecrated just before his death in 1066; the dormitory, with the vaults under it, which still remain, were probably built at the same time, as the monks who had to perform the service must have had some place prepared for them to sleep in. This is the earliest Norman building in England, and is probably about as much advanced as similar buildings in Normandy at the same time.

In Aquitaine, from the greater number and richness of Roman remains and the more civilized state of the people, the progress had been more rapid.

In Perigord, which is a part of Aquitaine, the Byzantine style had been introduced; but neither domes nor good masonry, much less sculpture, had then reached Normandy. Accordingly, the work at Westminster is quite plain; whatever sculpture there is was executed long afterwards.

After the Norman Conquest, England and Normandy became one country, and for about a century their architecture is the same. But the south of France was much in advance of Normandy. At Toulouse and Moissac the art of sculpture in stone had attained a degree of perfection to which it did not reach in the north for nearly fifty years afterwards. Gervase distinctly tells us that the chisel was not used in the "glorious choir of Conrad," built between 1100 and 1120; and a careful examination of the remains of that building fully bears out the fact. It is not probable that other churches were in advance of the metropolitan cathedral of Canterbury, and our examination of other buildings of the same period bears out the same fact. Where the capitals were within easy reach, as in the crypt of Canterbury, the cellars at Westminster, and the chapel in the White Tower, London, they were often carved afterwards, and this has tended to mislead inquirers as to the time carving in stone was introduced into England.

During the eleventh century it is clear that France was in advance of England, and some parts considerably in advance. The ruins of Reading Abbey, and the Priory Church of Leominster, in Herefordshire, part of the same foundation, in 1121, are so massive, plain, and rude, that if their history was not perfectly clear, they might pass for fifty years earlier.

Fine-jointed masonry was first introduced into England by Roger, Bishop of Salisbury, a native of Caen, about 1120, and the art of sculpture in stone about the same time.

It is recorded that two Greek priests were present at the foundation of St. Bartholomew's, Smithfield, in 1123, a proof that there was at that time considerable intercourse between England and other parts of the world, and which gives a probability to a certain mixture of Byzantine style in English Gothic. It probably came to us through Anjou. The long peaceful and prosperous reign of Henry II. was very favourable to the progress of architecture, and the great change of style called the Transition took place during this reign.

He held his court frequently at Angers, and the whole of the western provinces of France, nearly one-third of the territory, belonged to his crown, and formed one kingdom with England. The meeting of the bishops and nobles of all these provinces, from the north of England to Gascony, at Angers as a central point, and this at a time when architecture was a subject on which all the

greatest minds of the age were engaged, could not fail to have considerable influence and accelerate its progress.

The style of Anjou and Poitou at that time was a mixture between the Byzantine of Perigord and the Romanesque or Norman. Instead of actual domes forming the roofs, domical vaults were used under timber roofs, and these seem to have led the way to the English system of vaulting, which is different from that practised in the royal domain of France.

The Abbot Suger had there begun the change of style at St. Denis; but his work is so heavy and has so little of the Gothic element that Mr. Parker did not consider it at all in advance of English work of the same period. The pointed arch alone does not constitute the Gothic style.

He considered that the French Gothic of the royal domain and the English Gothic of the English dominions was developed almost simultaneously and independently one of the other, that one is not copied from the other, and it is difficult to say which has the priority of date.

English Gothic was fully developed between 1190 and 1200; French Gothic not at all earlier. The ornaments commonly used in England in the thirteenth century, such as the tooth-ornament and the ball-flower, are frequently, he said, found in the English provinces of France in the twelfth, and are scarcely found at all in the real French Gothic of the royal domain.

Gothic mouldings were freely used in England between 1190 and 1200, as at Lincoln, Winchester, and Ely; at that time they were scarcely used at all in France, and the rich suites of mouldings so common in England are rare in France. French windows have usually no mouldings at all; the opening is merely cut through the wall, and left quite plain. Clustered pillars are also comparatively rare in France; plain round columns, with classical capitals, are used in some of their finest Gothic buildings; and the round abacus is very rare in France.

Plate tracery appears to have been introduced at Lincoln by S. Hugh, of Burgundy, from that province, but this is rather a doubtful question. It was certainly more used, and developed to a greater extent and on a larger scale there than in England; but a complete series may be found at home without going abroad for it.

Bar tracery appears to have been first used in the Sainte Chapelle at Paris, and immediately afterwards in the Chapter-House at Westminster.

English chapter-houses are unrivalled: the octagonal vaults, with a single central pillar, do not occur in France. On the other hand the vestry is a much more important feature in French churches than in English ones. The large doorways and porches of the French churches have no counterpart in England; on the other hand, the whole west front covered with sculpture, as at Wells and Exeter, or the lofty arches of the west front of Peterborough, are unknown in France. The French churches in general have greater height, the English greater length, and a better proportion of the parts to each other. Fan tracery vaulting is one of the great beauties of English Gothic, and is unknown in France. There is a much greater variety of window tracery in the fourteenth century in England. The French Flamboyant and the English Perpendicular show how far the styles of the two countries had diverged from one another; and yet they have many things in common.

There is much to study and to admire in the styles of both countries, and it is not necessary to depreciate the one in order to raise the other.

#### CHAMBERS FOR THE INDUSTRIAL CLASSES.

On the north side of Holborn, once the back part of an old-fashioned hostelry called the Black Bull Inn, some substantial buildings of brick have been raised, with staircases leading to various sets of apartments, something similar to the dwellings erected in Streatham-street for the industrial classes by the society presided over by the Earl of Shaftesbury.

In large towns, where space is expensive, it cannot be doubted that houses on this plan, which may be erected for those who can afford to pay only a small amount of rent, offer an advantage, provided that the ventilation of the apartments is properly considered.

In the "Black Bull Inn Chambers" the houses, arranged in the present manner, although built of more substantial materials and less picturesque in general appearance, remind one of the old London inn-yards in which, in times gone by, many an anxious traveller in search of fortune and

fame had been put down in this great metropolis. Although the Black Bull Inn Chambers have not been finished, all are let to respectable tenants at the rate of 6s. per week for two rooms, and a proportionately larger sum for three apartments. We are told that this place, on which had formerly been stables of but little value, now returns upwards of 10l. a week—more than 5000l. a year—a sum sufficient to give a very good profit on the capital expended. This is a private speculation, and ought to be an encouragement for others to give a careful eye with a view towards improvement to the hundreds of places which, even in the City, are at present waste and unprofitable.

Not wishing to be intrusive, we only examined two rooms, which were unoccupied, and found them rather small for a family; but were told that the others were much larger and more airy. On the west side the apartments have been built against old premises; the other parts are open. On the west side, however, the ventilation of the rooms might be greatly improved at a small cost. As regards the size of the apartments the superintendent said that care had been taken not to let even the sets of three rooms to persons who had more than three children. This is one of the difficulties attending persons of moderate income in London. As the family of a working man increases, his expenses become greater, while the wife, in consequence of household duties, is unable to work at any employment which might improve their means, and consequently to find proper house accommodation, although the used is greater, becomes more and more deficient.

In connection with the Black Bull Inn Chambers there is a washhouse. Water is plentifully supplied on the different flats, where there are closets; and shafts have been provided for the dust and refuse.

In erecting such blocks, an architect conversant with the best arrangement and ventilation of dwellings of this description should be consulted: space might thus be made of greater use and more healthy conditions provided. We hope that what has here been done will lead others to look carefully at dilapidated back slums, and consider if, by careful drainage and the erection of well-planned dwellings, a safe income might be assured, and a comfortable home provided for workmen who are obliged to labour in the heart of the metropolis.

#### EMBANKMENT OF THE THAMES.

A REFERENCE on this subject took place on the 4th instant in the House of Commons, when Sir J. Pakington moved for a select committee on the subject, said that whoever had watched the thoroughfares of London for the last thirty years must have remarked that they were gradually becoming impassable. It took a longer time to go from London-bridge to the Great Western Railway than from London-bridge to Brighton, or than from the Great Western to the terminus of the Metropolitan Board of Works was carrying out a general system of drainage, and had in hand the construction of high-level, mid-level, and low-level sewers. If these plans were executed there would be no open communication between the West End and the City for the space of two years, and the carrying away of materials from the tunnels for conveying the sewage would create a serious nuisance in the principal thoroughfares. The scheme of Mr. Bazalgette for taking the low-level sewer along the bank of the Thames was concurred in by the late Mr. Stephenson; but, owing to the difficulties it encountered, it was afterwards determined to take it along the Strand. It was the more important, therefore, that the subject of the embankment of the Thames should now be taken into consideration. Various plans hitherto framed for that object had been opposed by the wharfingers; but, if the committee for which he had now asked were granted, it would be shown that the execution of so magnificent a metropolitan improvement, so far from injuring, would much enhance the value of the property of the wharfingers. Moreover the railway companies now proposed to cross the Thames with their lines, and the question of the embankment of the river must be settled before these companies obtained their bills, otherwise it could never be carried out. He believed the Select Committee would report in favour of the execution of this great work, and then would come the question of the means to be provided for that object. The Metropolitan Board of Works proposed to expend on the making of the low-level sewer a sum of 2,310,000l., and that would, of course, form part of the embankment scheme. The Board of Conservancy of the Thames were also most anxious that the undertaking should be accomplished, and were willing to consider whether a portion of the revenue to be obtained from the wharves should not be applied to that purpose. In his opinion this was not a local but an Imperial question. Non-members might say "No," but he put it to the House whether the saving of time to the vast number of people in that object, the habit of passing to and fro in London which would be effected by this scheme was not a sufficient reason why the Imperial exchequer ought to contribute to its execution. Large grants were made for the improvement of various parts in the kingdom, and he did not see why there should not also be a grant for improving the navigation of the Thames. Besides improving the navigation the embankment would be extremely valuable in a sanitary point of view, both by supplying a fine public walk and facilitating the cleansing of the river. Sir Joseph then moved for a select committee to be appointed with a view of providing for the increasing traffic of the metropolis by the embankment of the Thames.

Mr. Cowper thought the House would have no objection to the motion. It did not require any argument to show the necessity of free communication between Charing-cross and London-bridge. It was generally admitted that the embankment would be of advantage to the navigation of the river; but the threatened stoppage of the central traffic of the metropolis during the construction of the low-level sewer along the Strand and Fleet-street, undertaken by the Metropolitan Board of Works, rendered it very urgent that the committee should proceed to consider this subject immediately. It was to pass very near to the foundations of Somerset-house, and not far from the foundations of St. Paul's Cathedral. The great weight of the latter and the character of the soil on which it rested afforded a strong reason why a committee should at once be appointed to consider what ground there was for apprehension of danger to that magnificent structure. He must altogether demur, however, to the allegation that this project could be effected in any way upon an Imperial question. It appeared to him more entirely local than almost any other that could be mentioned.

Various other speakers took part in the discussion. Lord Palmerston said he was sure the House would not agree to expend any portion of public revenue on these local improvements of the metropolis. But it might be that the committee might think some fund could be formed and some mode devised of offering a fair remuneration to capitalists who would invest money to works connected with this embankment. The inquiry, therefore, seemed to him to be one very fitting for a committee to undertake, and they were not, in his opinion, superseded at all by the existence of the Metropolitan Board of Works, which had opened to be a member of a committee appointed two years ago to inquire into the state of the Thames, and they had evidence given to them showing what great advantages would arise in every point of view from a good embankment of the Thames on proper principles. It would secure greater purification of the bed of the river: it would improve the navigation; it would be conducive to the general convenience of the metropolis. In every point of view it was a scheme proper to be encouraged.

Mr. John Locke said the inhabitants of London did not care to expend any portion of public revenue to delight the eyes of gentlemen visiting the metropolis from every part of the country, the expense ought to be met, to a certain extent, by the Imperial treasury. Sir S. St. John said the metropolis was committed to the expenditure of 7,000,000l. on the drainage scheme, and the ratepayers were already crying out that they derived no benefits proportioned to the rates levied. They were consequently not likely to contemplate with pleasure the feelings the present proposition. He did not wish to introduce an Imperial *régime* into this country, but he could not help regretting that the Government should have taken the Government shrank from dealing with great questions when he saw the improvements which had been effected in Paris. All that was needed was that the noble lord the member for Tiverton should carry it out in the same firm manner in which he had carried the Snake Bill, which reflected honour upon him.

The motion was finally agreed to, an amendment as to the amount of funds from the district benefited having been negatived.

#### COMPETITIONS.

**Faling Cemetery.**—The Burial Board of the Faling Cemetery has selected the design sent in by Mr. Charles Jones, of Lombard-street; Chambers.

**Exeter Branch Bank.**—With respect to the paragraph which appeared in your last number, I beg to state that I have made use of the same phraseology as that employed by the manager in announcing to me the award, without any intention of misleading any one; and I desire to take this opportunity of expressing my perfect confidence in the uprightness of all parties concerned in this competition.—I am, Sir, &c.

EDWARD C. ROBINS.

*From the Manager to Mr. Robins.*

"DEAR SIR,—The directors of the Bank selected yesterday the design they will adopt for building the Bank-house at Exeter, the motto being 'A wise fan,' and Messrs. Leunedy & Rogers, of London and Bangor, the architects.

The first premium of 10l. 10s. was awarded to the design marked 'M. I. B. A.,' and the second to 'Use,' &c.—I am, Sir, &c.

D. DEBAY, General Manager."

#### NEWS FROM DUBLIN.

The metropolitan churches, so long discredited, with few exceptions, in an architectural point of view, are displaying marked improvement, and Dublin will before long boast of some good ecclesiastical structures. St. Saviour's is now being completed internally, and will contain the last work of a "pieta," of the late eminent sculptor, John Hogan. John-street chapel is to be thrown down, and a handsome Gothic building erected in its stead. We hear that Church-street chapel is likewise doomed.

At Leeson-park, the Molyneux new church and asylum buildings are rising up, and will cost about 12,000l. The church will comprise nave (97 feet by 25 feet 5 inches), aisles, transepts (93 feet 8 inches by 25 feet 6 inches), apsidal chancel, tower, porches, &c.; and he early Gothic in style: the tower and spire placed at north-east angle, attaining an altitude of 132 feet. Material, granite, with chiselled dressings. Mr. R. Carroll is the architect; Mr. Bolton, builder.

St. Andrew's Church, recently destroyed by fire, is to be rebuilt, and several sets of plans sent in competition are before the committee. We believe that Gothic is in the ascendancy.

St. Ann's Church is being repaired, altered, and renovated, internally, with what amount of

judgment we cannot of ourselves say, but accounts are unfavourable to some of the works.

At Rathgar, the foundation-stone of a new Roman Catholic Church has been laid; and new Protestant Presbyterian and Baptist churches are building, or being commenced, in the neighbourhood. A town has sprung up here within the last few years, and building ground formerly disregarded is now valuable.

#### ELLSMERE MEMORIAL, WORSLEY.

On Tuesday, the 1st of May, the top-stone of this monument, an engraving of which was given in our pages, was laid by Mr. Webber, architect. The Rev. St. Vincent Beechey, M.A., rector of Worsley, in a short congratulatory address to the men, made allusion to the fact that not a single accident had happened to any of those employed upon the work, notwithstanding its being carried forward through one of the severest winters known for years.

In a few weeks we understand the whole of the works will be completed, as the carving and iron-work will be proceeded with rapidly. We are glad to hear that, in spite of the severe weather and heavy gales, the monument, though standing 40 or 400 feet above the level of the Liverpool and Manchester railway, has not been disturbed or affected, but has been proved to be perfectly correct and true from base to final point.

#### CHURCH-BUILDING NEWS.

**Kegworth (Leicestershire).**—The works of restoration at Kegworth Church have been carried out on designs by Mr. Joseph Mitchell, of Sheffield, architect. The church will now accommodate 100 persons.

**Wymondley (Hants).**—Within the newly-erected porch of St. Mary's Church, says the *Cambridge Chronicle*, a monument, of peculiar design, has been erected to the memory of the late Colonel Plumley. The style is Early English, and the monument is carved, and so arranged as to occupy the whole side of the east wall. The upper part consists of two small discontinuous arches, with carved spandrels on either side, representing branches of the rose and thistle; in the centre is a pierced quatrefoil, containing a white statuary marble tablet, upon which is engraved the inscription; the whole being supported by four small pillars of Belgian marble, with bases and capitals of stone. Between the two centre pillars is a base, containing a brass plate, enumerating the events of the principal battles in which the deceased colonel was engaged. The monument was designed by Mr. A. W. Blomfield, son of the late Bishop of London; and executed by Mr. Thomas Whitehead, of Royston.

**Ely.**—Ely Cathedral is constantly progressing in ornamentation, through the addition of stained glass and other decorations. The six clerestory windows over the steepled portion of the choir are to be filled by the Sparke family; two are now almost completed. The beams and rafters in the triforium are being painted in the same style as the roofs of the transepts. One bay is finished, the thistle is the predominant ornament; the design in the other bays is to be varied. Mr. Le Strange's task of painting the roof of the nave is progressing. The sides comprise a series of medallions, each containing the head of one of the patriarchs, being united by continuous tracery, and representing on either side the genealogy of our Lord, commencing at the east and terminating in the west end, where, at the words, "which was the son of God," the scroll unites itself with the central portion of the roof. The first fresco is a representation of the creation of man; and then follow eastward subjects taken from the Bible history, supported on either side by figures of prophets.

**Kettering.**—On Tuesday before last a paper kite, constructed for the purpose, was sent up over the church spire, with the view of attaching cords to the top, by means of which the lightning conductor is to be mounted. The workmen succeeded in attaching the cords to the summit of the spire.

**Hanley.**—A new public cemetery for the borough of Hanley, and the first which has existed extra-murally in the Staffordshire Potteries, has just been opened. It is situated on the left of the highway from Stoke to Hanley. The whole area of the cemetery is twenty acres. The cost of the erection is 2,750*l.*; and the total cost, including purchase of land, will approach 13,000*l.* when the cemetery is fully completed.

**Bridgnorth.**—At a recent vestry meeting as to the restoration of St. Leonard's Church, and for the purpose of appointing a committee in this

matter, the chairman opened the business of the meeting by reading a letter from Mr. Griffiths, architect, Quatford, after which a warm discussion arose. The bone of contention was the appointment of architect, the parish being in favour of Mr. Griffiths, whilst the patron of the living, the incumbent, and the whole of the clergy advocated the employment of Mr. Scott. The election of architect will, it appears, be left in the hands of the building committee, which was appointed.

**Worcester.**—The work of restoring the cathedral has been re-commenced. The south side of the cathedral is the point to which attention will first be turned, as being in a state of greater decay and requiring more substantial repair than any other portion. The western end has already been made secure, but it is hoped that the re-opening of the ancient entrance there will form part of the proposed plan of restoration. So extensive are the works contemplated that they will probably be four or five years in hand.—The *Worcester Herald* laments that the fine old relic of Medieval architecture known as the "Guestern Hall," is doomed to be destroyed, unless the friends of ecclesiastical architecture come forward for its preservation. This foreboding appears to have arisen from the fact that the Dean and Chapter property has passed into the hands of the Ecclesiastical Commissioners.

**Lancaster.**—Upwards of 1,000*l.* have been subscribed towards the restoration of Lancaster parish church.

**Stainland (Yorkshire).**—Messrs. John Bailey & Co., of Manchester, have just completed a large clock—now going in the tower of Stainland Church. This clock strikes the hours and quarters upon steel bells, made by Messrs. Naylor, Vicars, & Co., Sheffield. The dials, four in number, are each 6 feet in diameter. The main wheels are each 18 inches in diameter.

**Richmond (Yorkshire).**—The opening of the Church of St. Mary's, at Richmond, after restoration, took place on 10th April. The plans of the new church are by Mr. Scott, who has adhered, as far as possible, to the old ones. The tracery of two of the east windows has been presented, and that of the third has been inserted to correspond with the lancet windows of the south aisle. The arches which separate the chancel from the aisles have been changed into Early English double arches, with a quatrefoil, pierced in the spandrels. The capitals of the shafts are enriched with oak and ivy leaves. The piers of the nave, except the two nearest the tower that have been retained from the old church, are clusters of eight shafts with plain Early English capitals, from which spring two centred arches. The clerestory is pierced by ten windows of the same character as those of the old church—flat-headed perpendicular,—but with deeper splay. The carved roof of the chancel is panelled in squares, which are crossed by diagonal mouldings. The roof of the nave is open. Both are of plain varnished deal. The interior mouldings of the chancel arch spring from a cluster of shafts in each side, which form corbel tables, the bases of which are decorated with leaves and clasping tendrils. The north porch has been restored, and the south altogether rebuilt. The walls are of stone, pierced by trefoil-headed windows. The east windows have been filled with stained glass; that in the chancel—a five-lighted window—is by Mr. O'Connor, of London. The pulpit is of white stone, and of an octagon shape. It contains sound pipes, which are connected with others in the church for the use of deaf people. The seats, of varnished oak, are low, with a plain square moulded head. The church is warmed by hot-water pipes, and fitted up for gas. The dimensions of the new buildings are as follow:—Chancel: length, 41 feet; breadth, 17 feet 3 inches; height, 28 feet; breadth of each of the chapels, 18 feet 5 inches. Nave: length, 86 feet; breadth, 23 feet 3 inches; height, 33 feet; breadth of each aisle, 15 feet 3 inches.

**Hull.**—The committee for the erection of the New Church, Beverley-road, Hull, on the 25th ult., passed a resolution, by which they accepted the design submitted by Messrs. R. C. Sutton & J. L. André, of Nottingham and London, architects. The church will be of red brick, in the Geometrical style. The plan shows a broad clerestory nave, with lean-to aisles, divided from it by arcades of five bays each, a chancel with aisles extending nearly to the east end, and a vestry on the north. A lofty tower and spire is placed at the south-west angle of the nave, forming a south porch; above this entrance, an iron bracket projects from the wall, carrying an ornamental clock-face. The chief portion of both the external and internal decorations will be obtained by the orna-

mental disposition of the brickwork, stone being used for the window tracery and door heads. The accommodation on the ground-floor will seat 800 adults, whilst a west gallery will contain 250 children, making a total of 1,050.

**Carlisle.**—The foundation-stone of a new Congregational chapel has been laid in Charlotte-street, on a triangular plot of ground, where that street joins Milbourne-street. The foundations of the whole building are laid out, and the walls have reached a few feet above the ground. The church will consist of an octagon, in which a circle of 56 feet diameter may be inscribed. There will be school accommodation for children, both boys and girls, to the number of 500, and class-rooms and vestry-room will be attached, together with a residence for a chapel keeper. The site being below the level of the bed of the river Caldew, the architect has endeavoured to raise it as much as possible above the level of the surrounding houses, and at the same time to give it the distinctive character of a religious edifice. The material used will be a white Lazonby stone—a new material, according to our authority, the local *Journal*—in Carlisle architecture. The style adopted by the architect—Mr. Ralph Nicholson, of Halifax—is Early English Gothic, treated freely to allow the admission of as much light as possible. The level of the floor of the church will be raised 11 feet above the surrounding ground, and will accommodate, when completed, about 750. The seats and woodwork will be stained and varnished, and the church warmed by Gurney's stoves. The works have been contracted for severally by Messrs. Armstrong, Robert Creighton, Norman, Ormerod, Blaylock & Pratchitt, Binin, and Tweddle.

#### PROVINCIAL NEWS.

**Cardiff.**—The new gravng dock, built by Messrs. Hill, shipbuilders, is nearly completed at Cardiff. The length of the dock is 408 feet; width, 70 feet at the upper part, and 48 at the entrance. An engine of 26-horse power has been erected alongside, the contract being taken by Mr. Dawson. Messrs. Hemingway, Penson, & Cooper, are the contractors for the gravng dock.

**Hereford.**—A new grocery store in High-town, on the site of the old *Sau Tavern*, is described by the local *Times* as a city improvement. The front of the premises is worked in Bath stone, except the pillars supporting the basement and the surbasses, which are of Gristead sandstone. The ground-floor forms an arcade, an arched doorway separating two plate-glass windows, about 12 feet by 6 feet, with brass-drawn sash-bars. This part of the building is separated from the first floor by a cornice and façade, above which are four pilasters with composite capitals. The windows are enriched with architrave mouldings, surrounded by carved drapes of fruit, flowers, and foliage. The entire front elevation is a little over 30 feet. The architect was Mr. T. Nicholson, and the builder was Mr. Richard Welsh, both of this city.

**South Shields.**—We are requested to state that the solar lights for the large hall of the new Mechanics' Institute here were manufactured and supplied by Mr. James Faraday, of London.

#### SCHOOL-BUILDING NEWS.

**Grantham.**—A new Wesleyan day school, on the Wharf-road, has been opened. The design of the building is simple. The north or principal front is Elizabethan, with mullioned and transomed windows, and has a bell-turret at the north-west angle. On the ground-floor is an infants' school-room, 41 feet by 24 feet, with class-room 20 feet by 14 feet adjoining, and above a mixed school-room 49 feet by 24 feet, with a class-room 26 feet by 14 feet. The building is of red and white bricks, with Ancaster stone dressings. Mr. W. Thompson, of Grantham, is the architect, and Mr. F. Brewin, the builder.

**Long Melford (Suffolk).**—The foundation-stone of new schools was laid on April 27th by Lady Parker. The buildings comprise a school for 72 boys, with class-rooms; a school for 72 girls, with class-room; and school for 100 infants; with residences for master and mistress. Mr. A. H. Parken, of London, is the architect; and Mr. Fordham, of Melford, is the builder. The contract is taken at 1,581*l.*

**Bedford ( Beds ).**—A national school has been erected in this parish. The building is designed in the Gothic style, by Mr. Jas. Horsford, of Bedford, the outside being of white brick, with stone dressings to the windows. A bell-turret of stone rises in the centre. The length is 52 feet; width 20 feet; and the cost about 550*l.* Mr. Cunvin, of Bedford, was the contractor.

**Liverpool.**—The foundation-stone of the new parochial schools about to be erected at the village of West Derly has been laid by Messrs. J. P. Heywood. The site is in immediate proximity to the new parish church, and the land has been given jointly by the Earl of Sefton and H. B. H. Blundell, esq. Mr. H. P. Horner is the architect; and Messrs. Nicholson & Ayre are the contractors. The cost of the erection is defrayed by the grant from the Privy Council of 1,567*l.*; and private subscriptions, 2,450*l.* The schools will be erected in the same style of architecture as the parish church.

**Newton-le-Willows.**—New schools are in course of erection at Newton-le-Willows, about five miles from Warrington. The building will consist of a boys' and girls' school in the centre, with a dwelling at each end for the master and mistress. Government has made a grant of 1,200*l.*

**Manchester.**—The foundation-stone of new Wesleyan schools, to be erected on a plot of land at the corner of Duke-street, Gravel-hane, Salford, has recently been laid. They are to be two stories high, of brick, with stone dressings, and will accommodate 1,000 children. The land has cost 800*l.*, and the estimated cost of the building is 2,500*l.*; making a total of 3,300*l.*, the whole of which sum has been, or is to be, raised by voluntary contributions.

#### MIS-STATEMENTS OF AUTHORS.

SIR,—My attention has fallen on the following paragraph in "Pagan or Christian?" by W. J. Cockburn Mair:—"It is satisfactorily shown by Mr. Watkins Lloyd that the proportions of the entire designs of Greek temples were ruled by fixed ratios, based on the *hecatonpedon*, or 'hundred Attic feet in the breadth of the front,' so that, certain great dimensions being given, the whole of the rest can be supplied. Just as we find all the particulars of a triangle from any three of its elements" (page 73). It is not the fact that I prove, or assert, or furnish grounds for proving against the Greek architects any system so absurd. As my real results are at present on record only as an abstract of a lecture in the transactions of the Architects' Institute, and therefore not in the way of defending themselves, may I request the publicity of the *Builder* for this repudiation?

Surely, when a writer has the large privilege of writing unlimited nonsense in his own name, he might, whether Pagan or Christian, abstain from making free with another's.

W. WATKISS LLOYD.

#### Books Received.

*The Larch Disease, and the present Condition of the Larch Plantations in Great Britain.* By CHARLES M'INTOSH, Garden Architect, &c. Blackwood & Sons, Edinburgh and London. 1860.

The larch tree, upon which so much dependance has been placed by landed proprietors, especially in Scotland, during upwards of a century, appears now to be, in the majority of situations in this country, in a state of decay.

The most opposite views have been held by different authorities as to the cause of disease in the larch. Among these may be mentioned,—degeneracy in the seed; too wet and stagnant soils and subsoils; want of sufficient moisture at the roots; soils and subsoils surcharged with oxide of iron, or other deleterious mineral matters; microscopic fungi; insects; ungenial climate; atmospheric influences; and bad management.

These have all by turns been charged as the source of the disease, and most or all of them, Mr. M'Intosh thinks, contribute their share; but the action of these causes, in many cases, he remarks, remains very obscure, and hence the great variety of opinions that have been advanced on the subject.

As to the value of the larch as a timber tree for the purposes of domestic and naval architecture, the author says,—

"There are purposes for which it can never be put on an equality with English oak in the latter case, or Baltic pine in the former, even had it continued in a healthy state. It is no doubt occasionally used by some architects in house-building, where large unworked timbers are required, as in roofing, joisting, &c. But even for this purpose the tree should be of iron firmity to one hundred years' growth, and even in these it is important that no symptoms of disease should exist, for the fungoid, or what is called the dry rot, attacks are much more likely to be encouraged in the dead than in the living tree. It is a well-known fact that a diseased plank of larch has communicated the fungoid disease to the adjoining timbers, and caused the destruction of the whole fabric; and cases

have occurred where whole roofs have had to be removed in consequence of the warping of the timber by the heat of the sun transmitted through the slates. As regards application to domestic architecture, as a substitute for Baltic pine, unless for buildings intended for a temporary purpose, or those of an inferior description, such as cottages, agricultural offices, and the like, it is quite a fallacy to suppose it economical. On this point architects entertain but one opinion. "The extra expense of working it, and the time and labour bestowed in attempting to prepare it by seasoning, even presuming it growing on the proprietor's own estate, are admitted greatly to exceed the expense of the carriage, under all ordinary circumstances, of the best Baltic pine from the nearest port. For internal furnishings, and the other departments of the joiner, the larch is wholly unfit, in consequence of its great tendency to warp, and the expense of working."

It is no doubt a useful tree for fencing, coal-pit props, telegraph poles, hop poles, and, when it attains a sufficient size, for railway-sleepers, because it is easily converted to such purposes, with no labour being required upon them; and, when sound, its durability is a recommendation. But when we see so many plantations, sometimes of great extent, in all parts of the country, and of all ages and sizes, and of which scarcely one tree in three is found in a sound state, we are induced to conclude that, under its present treatment and condition, it is a tree unfit which by far too much reliance has been placed, and that, if its cultivation is continued to the extent it is, the consequences to landed proprietors will be most disastrous."

*Account of the Lock-out of Engineers, &c. 1851-2.* By THOMAS HUGHES, Barrister. Macmillan & Co., Cambridge and London. 1860.

This pamphlet was prepared for the National Association for the Promotion of Social Science, at the request of the Committee on Trade Societies. The information, however, as admitted, was mainly derived from sources favourable to the operatives, although it was no fault of the author that the masters declined to aid in opening up the subject afresh. Mr. Hughes is of opinion that trades' unions ought to be recognized on all hands as an unavoidable fact, whatever be their merits or demerits, and the most made of them, by legislative enactment, or otherwise, that the circumstances will admit of:—

"For my own part," he says, "after years of watching these societies, and disliking many of their doctrines and doings as much as any man, I am most firmly convinced that we are only mischievously shutting our eyes to the truth when we go on declaring that they have not the confidence of the body of the mechanics and artificers of the nation,—that they are got up on a led, not by good workmen, but by designing and idle men for their own purposes,—that they exercise an unpopular tyranny and surveillance over the trades, &c. &c. The contrary of all this is the truth, and will be found to be so sooner or later; though it is quite possible that here and there a mischievous man may be in office, or a tyrannical custom or rule in force. I believe that there is quite time (if we will only recognize the facts of the case, and treat the unions both in legislation and in the ordinary dealings of life as they have a right to be treated) to render their influence and action wholly beneficial to the great common interests of the nation. I believe that the present disastrous state of feeling between employers and employed can never be improved, will only become worse, while the unions remain unrecognized by the law, and misrepresented, hated, and treated by all classes of society except that great one of which they are exclusively composed, and whose ideas and wishes they do, on the whole, faithfully represent and carry out."

#### VARIORUM.

A BRIGHTON lady having offered a prize of two guineas to working men, married, and members of the Brighton Mechanics' Institute, for the best essay on the questions started by Lord Shaftesbury, at Bradford:—"Whether it is not better for married women to stay at home than to go out to work? Whether the absence from her domestic duties than he gains by her earnings and industrial employment away from her family?" Several were sent in, and the prize was awarded to an essay by Mr. H. Stallwood, which has been published by H. & C. Treacher, of Brighton, under the title of "Married Women at Home." Another tract, on the same subject, titled "A Few Words on Women's Work; showing the paramount importance of Home Duties; with some Remarks on Watch-work, Wet-nursing, and some of the other Fallacies and Evils of the present Day;" by a lady who gives her initials as "M. A. B." (and who, in fact, appears to be the intelligent awardee of the prize alluded to), has been also published at Brighton (Simpson & Co.) and by Tweedie, 337, Strand, London. This latter tract is a reprint of an essay which originally appeared in the *English Woman's Review*, and was quoted at length in the *Philanthropist*. The author's ideas on the interesting and important subject treated of may be gathered from her remark that "the want of domesticity amongst women—of the working classes especially—is a great cause of most of the social evils which are as a plague-spot upon the nation at the present time," a remark involving matter for very serious consideration. —We are glad to see monthly publications, such as "The Welcome Guest" (Houlston & Wright, Paternoster-row), and "The Family

Economist" (same publishers), making their regular appearance, and sustaining their position in all respects, as they appear to be doing.

#### Miscellaneous.

No. 20, CHURCH-STREET, ISLINGTON. — We would advise every one to go and see No. 20, Church-street. A visit to that unpresumpting domicile would at one time have been a very distasteful business. Small as it is, there were once no fewer than thirteen families dwelling in it, and when we say that one of these families consisted of a man, his wife, and their grown-up son and daughter, all living and sleeping in one room, our readers may form some conception of what a nice place No. 20 must at that time have been. A visit now-days to No. 20 will not call up these reflections, for it has now foregone all such bad habits as overcrowding and dirt, and "breeds cleanly" as a house should. Indeed, No. 20 does more. Not only is it cleanly itself, but it is the cause of cleanliness in others. Boys who used seldom to wash, now wash and bathe too within its walls, learn there all manner of orderly and decent habits, and issue thence from day to day armed with all necessary weapons to carry the war of cleanliness up to the very toes of the enemy. Their war cry is "Clean your boots, sir!" and when the combat has been very dire they have been known to carry dismay into the enemy's camp, and often to win a forlorn hope by the semi-sarcastic addition, "They're very dirty, sir." Behind, on one side of the back-yard, is a school-room, with a bookcase in it containing a small lending library, and across the yard are convenient lavatories and a bath-room. The latter, on inquiry, we found to be much valued by the boys, and the former they are of course required to use. We learnt that there is a mutual system growing up between institutions of this kind. The Islington boys' boxes and mats come from the Grotto Passage Reformatory and the Blind School, and the badges are made by the girls at the Lisson-grove Refuge. All this points in the right direction, and augurs well for the practical result of the beneficent agencies of the generation. —*Islington Gazette.*

ST. PETER'S, SANDWICH.—The rector is now seeking to raise funds to restore the chancel of this once magnificent church. The net income of the living for the last seven years has only averaged 79*l.* 12*s.* 8*d.* He therefore appeals to the public to aid him, especially as the parishioners are shortly about to do their utmost towards the restoration of the other parts of the fabric. Contributions will be received by the Rev. Horace Gilder, St. Peter's rectory, Sandwich; and by the London and County and National Provincial Banks, Sandwich, to the credit of the St. Peter's Chancel Restoration Fund. The plans of the present state of the structure, and for the proposed restoration, may be seen, and information obtained, at the offices of the architect, Mr. James G. Smither, 32, Falcon-court, Fleet-street, London.

THE AMERICAN TIMBER TRADE.—Every year there is floated down the Mississippi at least 250,000 feet of pine timber, and the quantity will increase with the demand, since the supply is so great that it cannot be exhausted with the present generation.

ACCIDENTS.—A large proportion of the Easton Hotel, in Easton-square, London, was last week destroyed by fire. Each of the two portions of this hotel contained ninety-three sleeping apartments alone. Of one of these, sixty-two rooms have been partially destroyed, and the roof burnt off. Ninety-three beds had been engaged, but fortunately the fire did not occur through the night.—An accident has occurred at a chapel in course of erection at the corner of Hanover-street and Spring-lane, Sheffield, to a joiner named Lindsey. He and four other men were engaged in putting up the wood-work of the ceiling, and they had all occasion to stand upon one ladder of the scaffolding. The supporting cross hatten broke and let down the plank on which the men were standing. The four men who were at the ends were all fortunate enough to scramble upon the adjoining scaffolding; Lindsey, however, being in the middle, was precipitated to the bottom of the school, under the chapel, a depth of over 30 feet. One of his limbs was broken, and he was seriously injured about the chest, chin, and in other parts of his body.—The roof of an old building at North Washham, belonging to Mr. George Cahill, ironmonger, of that town, fell in last week, but fortunately no one was by it at the time.

**THE NEW HIGH LEVEL EXTENSION OF THE SEEDS WATERWORKS.**—These works, which have recently been opened, were constructed to meet the demand for water in those parts of the borough which the reservoirs connected with the old works are too low in level to supply. This object has been attained by the excavation of a new summit reservoir on the top of Becroft-hill, Bramley, by the erection of a pumping-engine at Headingley, and by laying down nearly 12 miles of iron main-pipes. The reservoir is excavated out of the solid rock, and is made water-tight by lining of stiff puddle clay, half a yard thick, protected by asphalted paving. It is 12 feet deep, and will contain two and a quarter millions of gallons. The pumping station at Headingley is ornamentally constructed and laid out, the engine-house and chimney being in the modern Elizabethan style, faced with stone rustic work, and having ashlar stone quoins and dressings. The main-pipe from the pump to the reservoir is 30 inches in diameter, and upwards of three miles long. In crossing the valley at Kirkstall it dips 70 lbs. per square inch, when the reservoir is full. The railway-bridge at Kirkstall was the source of some difficulty in laying this main, owing to the shallowness of the earth upon it, but this was overcome by putting down two 8-inch pipes in lieu of one 10-inch; and, to guard against accident by fracture, the pipes were made of wrought-iron boiler-plate—these were supplied by Messrs. Whitlam & Son, of Kirkstall-road. The whole of the works, including the engine, were designed by Mr. Filiter, C.E., borough surveyor, and completed under his superintendence. The engine was made by Messrs. Robert Wood & Son, of Hunslet. The engine-house and buildings were erected by Messrs. William Wilson & Sons, of Headingley. The reservoir was constructed by Mr. Silas Abbey, of Leeds. The cast-iron pipes were supplied by Messrs. Cochrane & Co., Mid-esham-on-Tees. The total cost of the works is nearly 15,000*l.*, and they have been completed within the borough surveyor's estimate.

**LONG'S PATENT SCRAPERS AND FILTERING SEWERS.**—A plan "for the profitable conversion of the sewage of large towns" has been put forward, in a lithographed form, with diagrams, by Messrs. James Long & Co. of Great Yarmouth. The scheme is not very clearly or intelligibly described, but it seems to comprise an upper and lower series of filtering sewers, and patent scrapers in run along a rail above the upper series for the purpose of collecting the residuum from the filtration. Surmounting the diagrams is an explanatory note to this effect:—"The following plan is intended to receive the entire sewerage of the town, which is divided into two sections for the supply of the four series of five filtering sewers each—12 in length in number; each sewer being 50 feet in length, by 10 feet in breadth, and presenting a filtering surface of 10,000 square feet in the aggregate, and allowing 50 gallons sewerage to each square foot, capable of filtering 500,000 gallons sewerage per diem; from which, if 5 per cent. of silt is extracted, 223 tons of manure could be collected daily, or 83,208 tons per annum; yielding, at the low rate of 5s. per ton, 8,802*l.*; to which, if we add the cinder and other rubbish usual in a town, the sum in question would prove more than double."

**THE BAND OF HOPE DRINKING FOUNTAIN AT BRADFORD.**—The fountain about to be erected opposite the Grammar School, Manor-row, from a design made by Mr. T. C. Hope, Architect, is the same in design with that made by him for the monument memorial fountain. It is in the Italian style, square on plan, having detached Corinthian columns and angular pilasters at the corners, supporting the entablature and cornice. From the cornice springs a square dome, surmounted by a lantern and ball. Each side of the dome will be embellished, and each angle will have raised flat ribs enriched with a string of convolvulus flowers and leaves carved in relief, and terminating at the lantern in carved scrolls linked together with festoons of flowers. Between the Corinthian pilasters at the angles are dwarf pilasters about two-thirds the height, supporting semi-circular niches moulded and paneled. The structure stands upon a moulded plinth projecting at the angles to receive the Corinthian columns. A stone curb 6 inches high is fixed between the projections, leaving a space of 10 inches on each side of the plinth for dog troughs. The water rises up to the height of 7 feet from a rough natural rock, fixed in the centre of the basin. The overflow runs into the four drinking basins through fan shells, and thence into the dog troughs.

**THE SPIRE OF ST. ALKMUUND'S CHURCH, DERBY.**—A severe gale, which visited Derby on the 27th of February, blew down several feet of the top of the spire of St. Alkmund's Church. The work of restoration has been intrusted to Mr. James Brown, builder, Sheffield, who has commenced his task. The height of the spire from the surface is about 215 feet, and the mode adopted by Mr. Brown, to attain the summit without the erection of scaffolding, is simple and ingenious, but has before been adopted (perhaps it was by Mr. Brown himself). Mr. Brown, says the *Derbyshire Advertiser*, brought with him a number of ladders, each 23 feet long, and these (commencing at the top of the tower) were raised perpendicularly one above another, and secured by holdfasts. Mr. Brown, who is assisted by two men, had occasionally to suspend himself by hooks fastened to a belt round his waist to the ladders, whilst he performed some work requiring the use of both hands, or when he desired to rest for a time. The scaffolding at the top does not appear to occupy much space. The cost of the restoration, including the fixing of a lightning conductor, will be between 200*l.* and 300*l.* It was suggested, adds our authority, that "mine host of the 'Lamb'" (Mr. Marshall) should be clerk of the works, but the latter says he has no wish to a spire to so high a situation. Funds are still required to complete the work of restoration.

**DRAIN PIPES.**—Mr. Blanchard writes to us, stating that he used glazed stoneware socketed pipes for draining some property at the corner of Tower-street, Westminster-road, in the beginning of the year 1845; and says, "these pipes are socketed into each other, and are in 3 feet lengths and 7 inches diameter; they were made for me by Mr. James Stiff, of High-street, Lambeth, in a satisfactory manner, in the latter part of the year 1844."—A long letter has been sent us by Mr. Thos. Lucas, animadverting rather warmly upon a communication which appeared in the *Builder* of 28th ult. The writer, so far as relates to socketed stoneware drain pipes, repeats the claim for Mr. Northern, of being the inventor. Mr. Hardinge's letter set forth, that "having used strong stoneware pipes, manufactured at Burslem, as chimney flues, and also as drain pipes in 1812, finding that they were thoroughly effective, he first brought them under the notice of the Sewers Commission in 1845; and that the first lot purchased (under the sanction of Mr. Phillips) was had of him." He did not pretend to be a manufacturer of pipes, much less the inventor of sockets; therefore the publication of a long and acrimonious correspondence upon this point would be cumbrous, and of no public utility.

**HASTINGS COTTAGE-IMPROVEMENT SOCIETY.**—The sixth half-yearly report of this active and successful society, for the six months ending April 7, 1860, has been issued in a printed form. According to this report, the number of the society's houses now amounts to about one hundred, and the number of tenants to about one hundred and five. The principal purchase made by the committee during the last half-year has been in the Crown-land, in the parish of All Saints. This property had been suffered to fall into a very dilapidated condition. The society's capital has increased during the past six months from 6,650*l.* to 9,450*l.*; the number of shareholders from forty-three to forty-five, and the average amount of each shareholder's investment from 155*l.* to 172*l.* The price of each share is at present 10*l.*, and is to be raised to 105*l.*, when the capital amounts to 10,000*l.* During the past six half-years the society's average total income from all sources has been at the annual rate of 1270 per cent. on the paid-up capital, and the net income has been at the rate of 758 per cent., out of which sum the shareholders have received a dividend of 6 per cent., free of income tax (which is paid on the gross rental by the society), and the remainder has been added to the reserve fund.

**THE TRANSMISSION OF SOUND.**—An extraordinary contrivance for transmitting sound to very great distances, which has just been presented to the Academy of Sciences by the Abbé Laborde, is alluded to somewhat obscurely in *Galignani's Messenger*. As the action of the electric fluid may be transmitted to any distance, "it follows," says *Galignani*, "that, if properly modified and improved, the apparatus we have described may enable persons in Paris to hear a tune played in London, or even at St. Petersburg." Perhaps this means no more than the simultaneous performance of music at distant places by help of electrical (not acoustical) transmission, which was long since suggested in the *Builder* and other journals.

**COATING IRON SURFACES.**—An opinion was published a short time ago by a French gentleman, that red lead used as paint for iron ships was "wrong in principle." From observation and experience, says a correspondent of the *Mechanic's Magazine*, I think his statement quite correct. It has since been recommended by the Dutch royal engineers to use peroxide of iron for that purpose. This may be rather better than oxide of lead, but I think the best paint that can be used for iron ships' bottoms, gasometers, ironwork in railway station roofs, and all exposed ironwork, is oxide of zinc, mixed with oil, and a little patent dryer. It might be tinged with a small quantity of common rose pink, to make it look warmer, or with other colours for different shades. But, where a perfect white is required, white vitriol must be used as a dryer. I might also add that I am of opinion it is equally wrong in principle to use lead for fixing iron palisades into the stone base: by using zinc instead, they would be preserved for a much longer period of time.

**AN INVENTION WORTH QUABRELLING FOR!**—A most extraordinary case was, a few days ago, submitted to the Civil Tribunal of Lyons:—A cobbler, a tinker, and a small tradesman, pleaded each against the other to be declared sole owner of what they all described as a most marvellous discovery, namely, the placing of a lamp in the heel of a boot, with pipes running from it beneath the sole, so as to heat the foot! After examining the different pretensions of the parties, the Tribunal declined to pronounce on the question of ownership, but condemned the cobbler and the trader to pay the tinker 150*l.* for work done.

**SLATERS' STRIKE.**—The journeymen slaters in Falkirk and Grangemouth are this week out on strike for an advance of wages. The increase demanded is three shillings per week, and to work only seven hours on Saturday. One of the masters, we believe, made an overture to his men on Monday week of meeting them half way, but with this they have not as yet thought fit to comply.

**LEAD POISONING.**—Dr. Hassall has addressed a letter to the editor of the *Lancet* on "Unsuspected Sources of Lead Poisoning," a subject which was first prominently brought before the public in the *Builder*. In the course of his observations Dr. Hassall says:—"The whole subject of lead poisoning is one of the greatest importance, and it behoves the public to be thoroughly on its guard against this source of danger to health. For the employment of leaden vessels and pipes, in nine cases out of ten, no absolute necessity whatever exists, and in certain cases they ought, for the better protection of the public health, to be entirely prohibited. From the number of samples of water which I have received containing lead, I am induced to believe that that metal is more frequently introduced into the system in this way than is commonly suspected. Indeed, so many well-ascertained cases of lead poisoning arising from the use of water contaminated with it have occurred, that I am of opinion that the use of lead for the storage and conveyance of water ought to be entirely discarded, especially in the cases of small towns and single houses. Now this may be readily done by the use of slate cisterns for the storage and gutta percha tubing for the conveyance of water. By means of Chatterton's very ingenious invention, an outer coating of lead is drawn over the pipe without any application of heat, the gutta percha being quite uninjured."

**THE TOMB OF JACQUES VAN ARTEVELDE.**—A discovery has been made at Gand of an ancient tomb, in a perfect state of preservation, that of Jacques Van Artevelde, reported to have been destroyed by the iconoclasts of the sixteenth century, and its contents scattered to the winds. In excavating the ground, near the Hospital of Bylogne, for the foundations of a dwelling-house for the director of the establishment, the workmen came upon a flat stone covering a vault containing a skeleton. Extraordinary to say, on exposure to the air the remains did not, as is usually the case, crumble into dust. A rusted plate of metal bore the following inscription:—"Jacob Van Artevelde, Upperoofoeman Hoymaend, MCCCXXXV."—leaving no doubt as to the authenticity.

**HAYMARKET THEATRE.**—A singularly good scene has been painted and built for the opening of Mr. E. Falconer's drama called "The Family Secret," which was produced by Mr. Buckstone with very considerable success on Wednesday evening last. It represents a villa on the Lake of Como. The architecture is very well painted, the water well managed, and the whole scene sparkling and effective. The piece gives an opportunity for some very good acting, and will run, we have no doubt.

**A BOARD OF HEALTH FOR NEW YORK.**—Under this heading, the *American Gaslight Journal* speaks of the endeavours to establish a Board of Health in New York. "Some change," it is remarked, "in the sanitary arrangements of the city of New York seems now likely to be undertaken in earnest. Every one admits that something must immediately be done. Last year a new sanitary measure, appointing a competent Board of Health, was pushed forward at Albany, with promising vigour, and would inevitably have become law, had not a patriotic and high-principled legislator, to whose guardianship the bill had been confided, and to whose energy it owed the success which attended its first introduction into the House, suddenly discovered, at the eleventh hour, as we are credibly informed, that two friends of his would lose office if the Bill passed. We trust the promoters of the measure now before the Legislature will be more discerning in their choice, and more careful in whom they put their trust. Every year the necessity becomes more imperative for the origination of some barrier capable of checking the spread of pestilential disease. In London, Paris, Boston, Providence, and Philadelphia, a safeguard has been found in the establishment of Boards of Health, composed of men skilled in sanitary science, and armed with the powers requisite for efficiency. Under such arrangements, mortality in those cities has diminished. In New York, where no such board exists, mortality is fearfully on the increase. In the tenement house, death has long held an almost uninterrupted carnival." A sanitary report, quoted in the same paper, concludes an exposition of many local sanitary evils, by urging "the imperative necessity of some legislative measure which shall meet the difficulties and correct the evils indicated."

**MIDLAND COUNTIES ARCHÆOLOGICAL ASSOCIATION.**—The annual meeting of this association was held at the Midland Institute, Birmingham, last week, for the election of officers and the transaction of general business. The report for the past year stated that the receipts amounted to 175l. 1s. 4d., and the expenditure to 166l. 18s. 1d., leaving a balance in hand of 8l. 8s. 3d. To the latter would be added unpaid subscriptions for 1855 and 1859, 327l. 15s. 6d., and 1l. 10s. due on excursion tickets, making the total amount available for future operations 422l. 8s. 9d. The report was adopted, and Sir Francis Scott was unanimously requested to act as president during the ensuing year.

**IRON CHURCHES.**—With reference to a statement at Coventry, mentioned in our last, respecting the cost of temporary iron churches, as compared with wood, Messrs. Topper and Co. wish to state that an iron church can be erected in any part of the kingdom, fit for divine service, with pulpit, reading desk, communion table, &c. (exclusive of apparatus for warming and gas fittings), at the rate of 20s. per sitting, allowing for each person the prescribed area of 20 inches by 30 inches.

**CHAPEL ROYAL, SAVOY-STREET, STRAND.**—This ancient chapel has recently been restored by command of her Majesty, under the direction of Sir George Grey, the Chancellor of the Duchy of Lancaster. The restorations were entrusted to the care of Mr. Sydney Smirke, R.A.

**THE STEREOSCOPE FIFTEEN HUNDRED YEARS OLD!**—At the sixth monthly meeting for the season of the Photographic Society of Scotland, Sir David Brewster, president, in the chair, the president read a paper entitled "Notice respecting the invention of the Stereoscope in the Sixteenth Century, and of Binocular Drawings by Jacopo da Empoli, a Florentine artist." Sir David said that, inquiring into the history of the stereoscope, he found that its fundamental principle was well known even to Euclid, that it was distinctly described by Galen 1,500 years ago, and that Baptista Porta had, in 1593, given such a complete drawing of the two separate pictures as seen by each eye, and of the combined picture placed between them, that we recognize in it, not only the principle, but the construction of the stereoscope. Last summer, Dr. John Brown, while visiting the Musée Wicar at Lille, observed two drawings placed side by side, and perfectly similar. These drawings were by Jacopo Chimenti da Empoli, a painter of the Florentine school, who was born in 1554, and died in 1640. They represent the same object from points of view slightly different. That on the right hand is from a point of view slightly to the left of that on the left hand. By converging the optic axes, the pictures could be united so as to produce an image in relief, as easily and as perfectly as with an ordinary stereograph.

**INSTITUTION OF CIVIL ENGINEERS.**—On May 1, Mr. Bidder, president, in the chair, the paper read was, "On Coal Burning and Feed-Water Heating in Locomotive Engines," by Mr. D. K. Clark. The object of this paper was stated to be, to discuss and compare the existing practices of coal-burning on railways.

**FATAL ACCIDENT BY BLOWING UP SAFES.**—At Burnley, last week, a boy was killed, and two men were seriously injured, by fragments from one of Price's patent safes, which the local agents for Milner's patent safes had been induced to blow up by gunpowder, in consequence of a public defiance by Mr. Price to "the fight for the championship in the construction and manufacture of drill-proof and burglar-proof safes." Mr. Price having also previously blown up one of Mr. Milner's.

**TENDERS**

For farm-house, buildings, and cottages, in course of erection, on the estate of Sir Henry M. Vavasour, Bart., at Spaldington, Yorkshire. Messrs. Stevens & Robinson, architects:—

Frost	£5,505 0 0
Adley & Nicholls	4,999 0 0
Stidialis	4,979 0 0
Neill	4,869 0 0
Bullock	4,856 0 0
Lax & Moody	4,803 0 0
Chadwick	4,758 2 0
Tomlinson	4,687 2 0
Brown	4,591 10 0
Fly & Kennett	4,553 9 0
Weatherley	4,544 16 11
Lilley & Smith	4,464 9 9
King	4,257 2 0
Bellamy	4,215 0 0
Meggison & Co.	4,001 13 5
Illingworth	4,004 10 0
Lewis (accepted)	3,952 11 4
Andrews	3,932 1 3

For rebuilding the "Hat and Feathers" and two houses corner of Wilberness-row, Goswell-street, for Mr. Leask. Mr. Finch Hill, architect:—

Dure, Brothers	£4,665 0 0
Lawrence	3,990 0 0
Brass	3,730 0 0
Turner	3,550 0 0
Elkinton	3,500 0 0
Patriek	3,507 0 0
Hill (accepted)	3,492 0 0

For the building of a new church at Stanley end, near Stroud:—

Downing	£2,595 0 0
Reckisall	2,385 0 0
Wicks & Stork	2,550 0 0
Acock	2,325 0 0
Harrison	1,990 10 0

For the erection of balustrade, walls, terraces, and garden-steps, also formation of court-yard and entrance-gates, exclusive of balusters and ironwork, to the mansion at Aithorpe, Northampton, for the Right Hon. the Earl Spencer. Mr. W. M. Peulton, architect:—

Whitby	£2,881 0 0
Smith, Brothers	2,736 0 0
Irons (accepted)	2,244 0 0

For house and farm-buildings, Woodford, for Mr. Macnamara. Mr. Noble, architect:—

Read	£2,567 0 0
Saxelle	2,529 0 0
Hedges	2,457 0 0
Perry	2,442 0 0
Hill (accepted)	2,272 0 0

For rebuilding and enlarging Gilmorton Church, Leicestershire. Mr. Wm. Smith, architect:—

Young & Co.	£2,200 0 0
Ludley & Firm	2,095 0 0
Howes	1,730 0 0
Law	1,748 0 0

For a new warehouse in Great St. Thomas Apostle. Messrs. Tress & Chambers, architects:—

Macey	£2,129 0 0
Hayter	2,008 0 0
Couder	2,026 0 0
Ramey	1,997 0 0
Lawrence & Sons	1,950 0 0
Evans, Brothers	1,967 0 0
Coleman & Son	1,956 0 0
Brown & Robinson	1,914 0 0

For two chapels, lodge, and gate, at the new cemetery, Uttoxeter, Derbyshire. Mr. Benjamin Wilson, architect, Derby. Quantities supplied:—

Burrows	£1,674 10 0
Young	1,613 10 0
Furcaster	1,561 5 0
Thompson (J. W.)	1,549 0 0
Thompson (E.)	1,509 0 0
Cooper (accepted)	1,335 0 0

For building the carriage of a house in the Mortimer-road, Kibworth, for Mr. George Brown. Messrs. Fixman & New, architects:—

Wicks	£1,450 0 0
Cross	1,324 0 0
Foskitt	1,249 0 0
Cowland	1,193 0 0
M'Leaman & Bird (accepted)	1,173 0 0

For chapel at Edmonton. Mr. Laws, architect. Quantities supplied:—

Palmer & Fotheringham	£1,124 0 0
Glenn	1,080 0 0
Butters	1,037 0 0

For repairs and alterations to Nos. 31 and 32, King-street, Covent-garden. Messrs. Nelson & Innes, architects:—

Thomas & Poole	£1,421 0 0
Simpson	1,350 0 0
Howard	1,333 0 0
Senger (accepted)	1,220 0 0

For two new houses and shops at Hounslow. Messrs. Nelson & Innes, architects:—

Read	£1,349 0 0
Adams & Sons	1,290 0 0
Carter	1,195 0 0
Jacklin	1,125 0 0

For repairs and alterations at No. 11, Chatham-place, Blackfriars. Messrs. Nelson & Innes, architects:—

Todd	£933 0 0
Slowman & Dunkley	878 0 0
Fish (accepted)	875 0 0

For alterations to house, Bank plain, Norwich, for Mr. Arthur Preston. John Daymond Ellis, architect:—

Read	£899 10 0
Rump	817 0 0
Minns & Foyson	759 0 0
Lacey	740 0 0

For rebuilding cooperage, Lovat's buildings, Upper East Smithfield, for Mr. Worley. Mr. Law, architect:—

Holland & Hannen	£742 0 0
Mansfield & Sons	730 0 0
Longmire & Budge	714 0 0
Bird	698 0 0
Asby & Horner	635 0 0
Litt & Son	593 0 0
M'Leaman & Bird (accepted)	585 0 0

For additions and alterations to the district church of Bracknell. Mr. Henry E. Coe, architect:—

Holls	£695 0 0
Lawrence	679 5 0
Oades & Son	658 0 0
Gray	545 15 0
Davis	540 0 0

For constructing the roads and planting, under the same architect:—

Cooper	£395 0 0
Thomlinson	385 0 0

The tenders for police stations at Willesden, Southgate, Ilford, and Loughton, according to schedule of prices, were opened last week, and that of Mr. Hill's, of White-chapel, accepted.

**TO CORRESPONDENTS.**

*Concrete Strength of Cement.*—W. G. F. asks to be informed what the cohesive strength of good cement amounts to.

Mr. H. B. (having appeared elsewhere, has been cancelled). W. L.—W. S.—E. P.—T. B. & Co.—W. S.—C. W. H. (the question is not altogether settled, but we should maintain that it belongs to iron architects). J. W.—J. W. C.—Dr. G.—J. A.—H. H.—G. C. F.—C. H. C.—C. W. S.—J. N.—B. S.—W. R. G. (we have already reviewed the *Fish-bowl*). W. B. G.—F. P.—S. H.—W. H. V.—S.—H. & H. (there is no such general rule. The 4' x 6' is given without reference to other matters). A. Suberster.—H. E.—T. D. (we are always thankful for correct information). J. N. D.—Mr. W. (in 1799)—J. B. W. (has been looked to next week).

**NOTICE.**—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent-garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher."

Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

**[ADVERTISEMENT.]**

**CHUBB'S SAFES: BURGLARS AGAIN DEFEATED.**

"9, King-street, Goswell-street, London, May 4th, 1860.

MESSRS. CHUBB & SON.

GENTLEMEN,—During last night a desperate attempt was made to open our iron safe, one of your manufacture. An attempt was made to drill into the works of the lock, which appears to have been prevented by the steel plate. The thieves then endeavoured to drill and prise open the door from the top, which efforts we are glad to say were frustrated by the strength of the safe.

We are, gentlemen, yours truly,

HARHAM & SON."

Complete illustrated price lists gratis and post free.

CHUBB & SON, 57, St. Paul's Churchyard, E.C.

**ADVERTISEMENTS.**

VOL. XVIII.—No. 902.

The late Sir Charles Barry.

THE task we have to perform is a sad one. During this week, our readers have learned from the newspapers the fact of a loss sustained by the profession and our art, in the death of the most illustrious architect of this century. Sir Charles Barry died on Saturday last, the 12th instant, at his residence, Elm House, Clapham Common; and this

day of national festival, on which he might have hoped to crown with the Royal Standard the grandest feature of his greatest work, was named in the first instance as the day of his funeral. He is now to be buried in Westminster Abbey, as mentioned in our report on another page, of proceedings at the Institute of British Architects.

It is difficult to say whether the feelings of personal regard, or of admiration for the talents of one who was eminently the representative man of British advancement in architecture, most prevail to excite the regret with which the simple announcement of the loss is read. Sir Charles Barry was emphatically an architect, and was the artist amongst all; but he was endeared to all who knew him well, and to many who had scarcely the advantage of his friendship, by the goodness of his nature, and the modesty of pretensions that did hardly justice to his remarkable gifts, and to the merit for benefits present and which were to come, of his professional career. Throughout those Estates of the realm whose habitation he built and adorned, having brought to his duty the greatest combination of convenience in planning, skill in construction, business management, and true art, that the world has seen; amongst whomsoever have proudly defended him, or at any time increased the anxiety of his position; throughout all the factions into which our calling is divided, and with the members of the profession in foreign countries as in these isles, and wherever in distant colonies art in building has gained a footing,—with all, there will be one feeling of sorrow or regret, at the sudden termination of a life never inactive, and which seemed to have an important part yet to fill for the national honour and the large development of that progress which it had inaugurated, and to which it had to the last contributed by works, by teaching, and by example. The event which we deplore was unlooked for, and in the manner in which the idea of death should be always present to those in health, up to within the hour of its occurrence. Sir Charles had been at Westminster on Friday last week, attending to his usual avocations; and on Saturday he was so far well that he appeared better than usual; and he spent the greater part of the day at the Crystal Palace, his disease was of the heart and lungs. He was in his sixty-fifth year.

It is scarcely possible, amidst the affliction which has fallen upon the family of Sir Charles Barry, to collect all the particulars that are necessary to the biography of such a man, or to unnerve as we are ourselves by the occurrence, calmly and dispassionately to review the facts and the hearings of his professional existence. We should the record which is due to such a life be consigned to fitting hands, an estimate even

higher than has been derived, whether by the profession or the public, will be formed of the man and of the artist-architect, and of what is owing to the influence starting from the labour of his untiring hand and the fulness of his well-balanced mind. It has been said of many a great man, that he lived some years too soon; and the assertion might be hazarded of Barry, by those who, not irreverently questioning the order of this world, would reason upon what might have been. Could a life so valuable have been prolonged in vigour, to the age of Sir Christopher Wren and of one or two other conspicuous names in our art, what might not such a life have achieved in the future which there is for architecture, and freed from the exaction of a duty which some are now of opinion was delegated to him in error, so far as initiation rather than work of mind was the idea of the basis imposed? Enough that after this, Barry was not merely the architect of the finest modern Gothic building in the world, or that in another manner he introduced an entirely different character into the architecture of streets, villas, and club-houses, wherein, by himself and others, art in architecture has been eminently shown; he was the artist in whatever he laboured on, the man of ready pencil and of active brain, and the architect chief of workmen, and revivifier or producer of numerous attendant arts. It is not the Gothic detail so accurately harmonizing with the cloisters, and other parts of the old building at Westminster, and with the neighbouring Henry VII's Chapel, that most reflects the power of his mind; it is that grandeur of the Victoria Tower, which is beyond the Mediaeval works of almost every country and place; it is the perspective of his corridors and courts, the fretted vaulting of his halls, the fine effect of his entrances and staircases, and the combination of sculpture as of the other arts with architecture, that mark the Palace at Westminster far out of the category of revivalism, as far above the appreciation of some who, from the old or new bases of criticism, have cavilled at the exuberance, or at some other characteristic of its detail. Enough that whatever it be else, the Palace has what our architecture almost wholly lacked till Barry appeared; and that as a work of building and of art, commenced under the greatest disadvantages of knowledge, and of skilled labour and art-manufacture, pursued under the greatest injustice that has ever been the lot of architect employed for a nation or a government, and completed in little more than twenty years under one direction, it remains the most remarkable work of this, or of any time. Without disparagement of his many able pupils, it is the work, too, of the one hand. Barry indeed had the faculty common with great men, for perceiving and using the abilities of others. Many who worked with him he warily attached to himself; and those not inclined for work he, under pressure of business perhaps, could not tolerate. But over all that had to be built, or chiselled or cast, his pencil had gone: so that if the metropolitan cathedral be the fitting monument of Wren, as the inscription there points or did point out, the Palace at Westminster must be considered a work in which the memory of an equal name is inscribed in the effect from every point of sight;—

“ \* \* \* quocunque vides, quocunque movetis,”  
and lives in every form, and along every line. But the Westminster Palace, and the decorative arts which are contributing at this time when we write, generally to architecture, are not the only work of Charles Barry. So long as there exists any vestige of the school of taste which he introduced in the Travellers' Club, and elaborated with more than Italian elegance in the Reform, and in his best work of that class, Bridge-water House,—so long as there remains the elegant façade in Whitehall,—so long as architectural design is displayed predominantly in fenestration and *cornici*, rather than in application sometimes slavish of the orders,—so long will there be monument, and debt due, to Charles Barry. In Manchester, where an influence from his art was born even earlier than in London, it is difficult to say what may not be attributable primarily to his works there.

To trace the life of such a man, precise dates are required; and of these on the instant, we are able ourselves to supply only a moderate number of those that we possess. The facts we can mention, however, will be valued; and the general view we are able to take of the artist's life and character, may possibly not be unworthy of perusal.

Charles Barry was born on the 23rd May, 1795, in Westminster,—in Bridge-street, as he lived by his family. His father was a stationer in a comfortable position—having a running contract with the Stationary Office, which enabled him to leave his family moderately well provided for. The son's education was commenced at private schools,—in Lambeth, and one we believe in Bedford. He was articled to Messrs. Middleton & Bailey, surveyors to the parish of Lambeth, and was the favourite pupil of the former, who left him a handsome legacy. They could scarcely be called architects. He had no other professional education except that due to his exertions: but his surveying acquirements were not unimportant to his architectural attainments and his course in after-life. Always from his earliest years he showed taste for drawing and design.

In 1817 he determined to travel, and to that end to devote (very foolishly his friends thought) the whole of the small property he had inherited from his father. He remained some time in France, principally in Paris and Rouen, and then proceeded to Italy. In Rome he met with Mr. Eastlake (now Sir Charles), Kinnaird, the editor of “Stuart's Athens,” and Johnson, afterwards a professor of Oriental languages at Haileybury. With them he visited Athens and other parts of Greece. While there, his drawings attracting attention, he was engaged by Mr. Ballie, a gentleman of fortune, as his travelling artist, and with him visited Constantinople, Asia Minor (where he was interested about the Bosphorus marbles, now in the British Museum), Syria, Palestine, Mount Sinai (where he became acquainted with the late William Bonkes), and the Decapolis, where he made accurate plans of Jerash (Geraza), then little known. He with his party attempted a journey to Palmyra, but was disappointed by a quarrel with the Arabs. He visited Egypt, up to the second cataracts, his party consisting of Mr. Ballie, Mr. Wise (now our envoy at Athens), Mr. Godfrey, and himself. One of his sketches made at that time will be remembered in Mr. Gwilt's edition of “Chambers's Civil Architecture,”—the matter of which, relating to the tombs of Beni-hassan, is of some importance to the comprehension of the relation between Egyptian and Grecian architecture; and probably at the time of its appearance put that subject in a new light. Results of these journeys, however, are but slightly known to the profession or to the world. There exist, we believe, numerous sketches of places and remains of the utmost interest, besides journals closely packed with Barry's characteristic handwriting; and, shortly before his death, we heard of his being deeply engaged in the preparation of an article on the Holy Land, for the Dictionary of the Architectural Publication Society.

Barry returned to Rome, his engagement with Mr. Ballie having terminated, and he became famous for his sketches, which for facility, accuracy, and expression, were then unrivalled. It was at this time he became acquainted with Mr. Wolfe; and their friendship has ceased only with the life of Barry. He was devoted, when Mr. Wolfe first knew him, to his profession of architecture, but cared for little but Greek, concerning which he was enthusiastic. Wolfe, a pupil of Joseph Gwilt, had gone out from home a *Palladian*; they both felt the beauties of Gothic; but believing it would not be useable, paid little attention to it. They carefully studied *Italian*—measuring in detail the best examples at Rome, and at Florence—where he measured the Trinita-bridge,—Venice, and the rest of the north of Italy. There Barry became an enthusiastic admirer of Palladio, Sansovino, and Sannicichello; and some of the incidents of that period, such as lighting up with torches the so-called house of Palladio at Vicenza, to see the effect of the foliated

capitals, show the enthusiasm and energy with which he pursued his object. It was the same when in Rome—nothing was passed by; everything that could be drawn was looked at. His study was unintermittent; his perseverance indomitable. The world often forgets in the case of men called "fortunate,"—of men in the possession of powers—the struggles by which Fortune was made servant, the labour with which the powers were attained. In July 1820 he left Italy, and returned straight to England, with little money remaining, and after an absence of three years and four months. His first works in architecture were St. Matthew's Church, Manchester, and another at Stand, in the neighbourhood. Of nearly the same date was the erection of St. Peter's Church, Brighton,—wanting a feature of the original design, the spire, which has not since been supplied. One or all of these works he had obtained by competition, not long after his return. Soon afterwards, the late Daniel Wilson gave him three churches to erect in his parish of Islington—Ball's-pond, Cloudesty square, and Holloway. Sir Charles Barry had not much studied the detail of Gothic when he built his first churches; but soon afterwards he made a tour in England for the express purpose, and from that moment he became as great a lover of Gothic as of Italian architecture.

Though none of his early Gothic works were much admired by himself in later years, they were, several of them, differently regarded by the public at the time of their erection; so that they did service in their day, and conducted to the widened field of perception of our art. The churches at Manchester and Stand, the former with a needle-like spire, and the latter with square tower, and each having lofty lancet-formed openings at the base of the tower, are faulty in detail and defective in proportion; but they, nevertheless, have merits not undeserving of notice even by the more recent Gothicists. He does not appear to have done much further in the same department of practice, till about the year 1836, which is the date we should fix for the commencement of his Unitarian Chapel at Manchester, a work which, of Early English character, with high-pitched roof, and deeply-recessed arch enclosing the window and doorway of the western end, was as much as the previous works, remarkable in the district, showed the great advance he had made in the management of detail for its effect, and in the knowledge of Gothic; and which still remains a work of merit. We have little knowledge of his works in London, of a general class dating immediately after the Brighton Church: but about that time he was engaged in the building of a house for Mr., afterwards Sir Thomas Potter, at Bute-hill, near Manchester. Drawings of the internal finishings of this house show that the ornament was of Greek character; and it is marked by the refinement of design and excellence of delineation, belonging to everything that he did. His Manchester connection shortly procured him the work of erection of the Royal Institution of that town. This was in progress in the year 1828. Beyond its conspicuous position in one of the principal streets, and its comparative dimensions, and the frontage to three sides, the building was one of great importance, historically speaking, and in results already adverted to. By contrast with the pseudo-Greek which was general in public buildings, and which in Manchester had even degenerated from the time of Harrison; it presented what was at once Greek derivatively, or Greco-Roman, in details or in impress, and yet was work new or original,—work of art and mind. The portico as a feature of architecture was used, but not spoiled; that feature, and the remainder of the building, became grouped together, instead of as in Greek of that day, where a portico was tacked on to a many-windowed facade; whilst the staircase-hall of the Manchester building, grand in proportions within, and culminating to a central feature of the exterior, was the forerunner of later efforts of the kind by the same architect, and by others. It was after this time that he adopted the style of architecture which he first exhibited in 1831, in the building of the Travellers' Club, a work to a certain extent modelled upon the Pandolfini Palace, and unfortunately of cement, yet valuable for the art which there is in it, in each of its fronts, and in its internal planning and decorative character, as it was important in its results. The Athenæum, Manchester, in the same style, and marked by still greater beauty in its mouldings, and of stone, must have been designed about the year 1836, and not completed till about 1839. In the Reform Club is to be traced, as in the Travellers', the in-

fluence of a model of the Romano-Florentine school—in this case the Farnese Palace; but the result is a work finer than the model. In designing this building the drawings were, like all those from Barry's hand, subjected to most careful revision; and an entire second set was made on account of an enlargement which he decided upon of the windows. Both the buildings in Pall-mall are remarkable for the feature of the balustrade of the area-enclosure, a feature which, with the analogous base and foreground given by the terrace-garden in a villa, he both perceived the importance of and understood how to manage. The Reform Club is especially remarkable for its hall adapted from the quadrangle of the Italian palace.

Up to the date of the competition for the Houses of Parliament in 1835, and throughout the period of progress of a work which would have sufficed for the whole time of an ordinary man, he was largely occupied in works of which we have yet named only a selection. Amongst the number was Lord Tankerville's villa at Walton-on-Thames, a work of the Italian style, with a square tower modelled after the campanile, which may be said to have chiefly conducted to the prevalence of the erection in later works of architects. His Birmingham school should be named as the precursor in character of style, of the Houses of Parliament.

It was in progress in 1833, and at the time of its erection was regarded as an adaptation from the collegiate and civil with the ecclesiastical Pointed architecture of the Tudor period. A writer of that date considered it as likely, when completed, to afford a "distinguished proof that novel and beautiful combinations" might be made of approved models, "without either servile copying, or tame imitation." It has the character anticipated; and such is the character of all Barry's Gothic. In 1834 and 1835 we find him at work on the new front of the College of Surgeons. The ground adjoining the original site being taken in, a new front was required. One of the columns of the portico was shifted, and two were added to place the new portico in the centre. The work was done chiefly in artificial stone. As the portico has not a pediment, and the details have the merit of everything that came from Barry's pencil, there is a satisfactory effect produced very different to that of most of the pedimented porticoes then recently built, and notwithstanding any error that there may be in the use of such a feature in advance of windows. The cornice of the building has some elegance. Amongst his works within recent recollection, besides the Reform Club and Bridgegate House, which we have named, and the front of the Imperial Insurance Office in Pall Mall, which we have not, was that of the arrangement of Trafalgar-square, with the basins and fountain—the least successful of his productions; though many of the details are palpably the work of no less skillful hand. But, as we have said, he was never idle. Work went on without affixing dates, the extensive works in which he was engaged for the Duke of Sutherland, the chief of which extended over a period of eight or ten years, and should, in point of fact, be regarded as new building. They included the works at Trentham Hall, Staffordshire; at Cliefden House, near Maidenhead—perhaps entirely new work; and at Stafford House, St. James's, so far as regards remodelling the interior; also, he made designs for alterations to Dunrobin Castle for the same nobleman; but we do not recollect whether these were proceeded with. For the Earl of Carnarvon, at Highclere, he carried into effect works which entirely changed the character of the building from that of pseudo-Greek to an Italianized form of Jacobean architecture. To Harwood House, near Leeds, a well-known building, he added wings, and he also re-arranged or added a terrace-garden which is one of the examples of his skill, already referred to, in an important element of effect. The same skill was displayed in his terraces and pavilions at Shrubland-park, the seat of Sir W. Hamilton. Other alterations and additions, most of them considerable in extent, were made by him to the seat of the Earl of Maclesfield; to Duncombe-park, for Lord Eversham; to a house for Sir John Guest; to Gwathorpe Hall, for Sir James Shuttlesworth; to Dalwich College and to Kingston Hall, Dorsetshire. To the College he was surveyor many years, till succeeded by his eldest son Charles, now in partnership with Mr. Banks, who had been with Sir Charles previously, many years. His works further include alterations and new gates at Bowood, the residence of Lord Lansdowne; the spire of Petworth Church, and churches at Saffron-hill, London, and Hurstpierpoint, Sussex, which (and perhaps there may be others) we have omitted to take into account in the previous view

of his ecclesiastical architectural labours. There are, however, yet several new works to be added. They comprise the wing of University College, Oxford, including the library, a building in the style of the Birmingham School; the Sussex County Hospital; a new wing and other work to St. Thomas's Hospital; and a late work, the Downhills Schools. It is impossible, however, just now to complete the list. The importance, architecturally, of his alterations, or most of them, where he used the old materials, is perhaps best shown by the example of the Government Offices in Whitehall. His designs, exclusive of some which were sent in competitions, but not carried out, are scarcely less deserving of notice than those of his executed works; since, besides his reports, these were made for works of the greatest public importance. The designs, giving those for the public works last, include some for alterations to Worcester College, Oxford; and for Lord Willoughby, to Drummond Castle; for a restoration of Drumlaugh Castle, for the Duke of Buccleugh; and for works at Buchanan House, for the Duke of Montrose; for a new residence for the Duke of Northumberland on the site of Northumberland House, and for one for the Duke of Newcastle, at Clumber; there were those for the new Westminster Bridge, which may be regarded as being partially carried out in the works now in progress; for the re-arrangement and enlargement of the British Museum, and of the National Gallery, Trafalgar-square; for new Law Courts proposed in Lincoln's-inn, wherein Grecian Doric architecture was used; for the improvement and enlargement of the Horse Guards; the completion of the Palace, at Westminster, at New Palace-yard, and on the site of the present Law Courts; and for the Royal Academy, on the site of Burlington House. His principal reports,—exclusive of those, which were numerous, on the construction and decoration of the Palace,—related to Westminster-bridge, to the Thames embankment, for which he tendered a design as a member of the commission which sat thereon, and to the British Museum. His design exhibited at the Royal Academy, for the Government Offices, wherein he proposed (as did his youngest son, in the competition, in a different design), to treat the offices as one building, of which the present structure in Whitehall should form part, was noticed by us when it appeared; and our readers are also aware that he prepared designs for the street-improvement of Westminster and parts adjacent, and of the great value of the suggestions which were therein made. It is to be hoped that some of these designs, in the hands of those who survive him, and who have participated in his labours, may yet be turned to public advantage. Of his latest works, Westminster Palace is hardly to be called complete; though all for which designs had been approved or may be said to be so, save the final coronal or apex to the roof of the Victoria Tower, intended to bear aloft the standard he did not live to raise. The Halifax Town-hall is but little advanced. The loss to our art from the severance of his connection with that building is, in the present state of architecture, not the least important part of the general loss which has been sustained. We were permitted to engrave his design; but what he would have made of the building, only those who knew his mode of working can form idea of. We are inclined to think that the termination of the tower would have become different; at least, we judge so from observations of his respecting it. We doubt not, the building, called Italian in style, would have been a rival to the art-work of the Netherlands; and it could scarcely but have helped to solve questions which are rife, and to remove the impediment to progress which there is by the pursuit of style in place of art. Of what he really did at an important juncture we cannot further speak at the length which the case deserves. Under the disadvantages of a time when architectural education was supposed to consist only in the observance of ancient models, and practice in the imitation of them; when such old works in any number, were drafted into use, and there was no more regard for general consistency and public appreciation of art (unless only in painting and sculpture) than there was of a breathing architecture by architects themselves, when æsthetics and criticism, and the prolific literature of every kind bearing upon architecture, had to be created, Charles Barry may have gone to the limit of dis-cussiveness in the common pursuit of many different styles. The wonder is that he could become equally familiar and could equally infuse art into all; and perhaps by him alone was such infusion thoroughly accomplished. There were, however, evidences in the later period of his

career, that he would have been able to give to the aesthetics of architecture, and the adjustment of any question of art and style, more than he could have derived therefrom. He deliberately proposed, on the question of the Foreign Office, whilst reversing the opinion of one side, and that expected by the other from himself, to erect a building of classical style opposite to the Gothic of the Westminster Palace, and said he would not care to object to a Gothic building on the score of the difference, were its position opposite St. Paul's Cathedral. Were this the continuation of old opinions and practices, there might have been little to hope for; but, combined with well-known disapproval of much of later practice, his condemnation of extravagance in colour, and the manner of his more recent designs, or notably the Halifax Town Hall, it appears to be rather a form of assertion of the supremacy of the art-element over style; whilst had he his course to go over again, it would have been marked by less of the discursiveness, and would have gained in art and appreciation by that concentration of effort, with comprehensiveness of study, for which all now contend.

But, we must on another occasion pursue the subject of the influence on our art, of the life and works of the artist-architect—Charles Barry. We have supposed our readers informed,—if only from the articles in our journal, on architecture at the commencement of this century,—of many of the circumstances under which his career began, and acquainted with the progress of the works of the Palace at Westminster.

The building, commenced in 1837 as far as the coffer-dam was concerned (the competition having been in 1835), was brought so nearly to completion in 1852, that on February 2nd, the new House of Commons and all the grand halls and corridors were opened, and the Queen alighted for the first time under the great Tower; and on the 11th of the same month, the architect received the honour of knighthood at Windsor Castle.

The Houses of Parliament themselves may be considered finished; but work on the Palace remains to be done. Sir Charles's wish as to his successor is shown by the circumstance that he has specially bequeathed the whole of the papers, drawings, and books relating to the New Palace, to his younger son, Mr. Edward M. Barry, he having been especially connected with him in carrying out the work.

Sir Charles Barry was a member of the following societies and institutes:—The Royal Academy of Arts, the Royal Society, the Institute of British Architects, and the Society of Arts; and of the foreign academies of Rome (the San Luca), of Stockholm, Antwerp, Belgium, Prussia, Russia, and Denmark, and of the American Institute of Architects. He received the Royal Gold Medal of the Institute of British Architects; and the Grand Medal of Honour of the French Exhibition, which exhibition he visited in a public capacity; and he received a diamond snuff-box, with cipher in brilliants, from the Emperor Nicholas of Russia; further, he was a member of the Commission of the Exhibition of 1851.

It was first arranged that the remains of Sir Charles Barry should have been buried privately in the cemetery at Norwood on this Friday; but it was felt by some members of the profession that a more eminent resting-place and a more public demonstration were deserved and desirable. Mr. Cockerell and Professor Donaldson, therefore, with the concurrence of the family, went to the Dean of Westminster, and in the name of the Institute requested that the body of Sir Charles might be buried in the Abbey. This request was granted most readily, as we understand; and the funeral will take place on Tuesday next, at one o'clock. The Dean of St. Paul's, likewise, expressed a willingness to permit the interment of the remains in the cathedral, side by side with those of Wren; but a wish often expressed by Barry, the probability that he was born in the parish, and the neighbourhood of his greatest work, fixed Westminster Abbey as the proper place. We have but few words to add.

The circumstances of his death were very terrible. He died in a quarter of an hour after he was taken ill. The cause was disease of the heart, acted upon by congestion of the lungs. He expired in Lady Barry's arms, between eleven and twelve p.m., and before the doctor, who had been sent for, could arrive. We could say much of the love he bore his family,—the love they, united and happy, felt for him, and the sorrow into which his loss has plunged them; but this would take us beyond our province. Let it comfort them to know that this grief is shared far and wide, and most by those who know him best.

#### THE SEASON FOR EXERTIONS.

GLOOMY WINTER has lasted long, and yet seems unwilling to depart. April's tears were frequent, and May's smiles, at present, are but cold and few; yet it is a time of hope for all. In the metropolis and in the suburbs, a large army of artisans will be kept busily at work. Some important buildings are in progress, or about to be commenced, both in town and country. London is growing, and houses of different classes are rapidly rising. Business seems steady, and, if the blessings of peace be continued, there seems every prospect of a successful summer for those connected with the building trade.

In spite of the sharp weather, the unusual snow and hail-storms of last month, both the court end and the city are beginning to assume their seasonable appearance. In Covent-garden and other great markets are seen the early flowers: in dismal alleys and courts the easter-mongers seem hurried in the multitude of spring plants: the cry of "Cowslips and primroses" resounds in quiet parts of the city: ivy, "creeping Jenny," and other climbing plants are temptingly exhibited; and it is extraordinary in what large quantities these are sold, and in what strange and unlikely places attempts are made to grow them. The sight of these plants leads the thoughts of many to country places, where, in the spring time,—

"All nature laughs, the groves are fresh and fair,  
The sun's mild lustre warms the vital air."

In the suburbs the trees and gardens begin to present a pleasant appearance. In the orchards the blossoms of the fruit-trees afford both beauty and promise. At no time of the year are the clouds of such a pure pearly hue: they roll in varied forms, and throw bright and dazzling edges to the sun. Rare and tender colours of the mosses on tree trunks and branches form delicate harmony with the bursting buds, and the imprisoned song-birds of the town give cheerful voice. We see, in the advent of Spring, as Longfellow says, the great annual miracle of the blossoming of Aaron's rod repeated on myriads and myriads of branches! To some the returning sunshine and warmth bring hopes of health; to others, thoughts of pleasure and amusement; to all, encouragement to renewed exertions.

The changes which have recently been made in our foreign relations will call for renewed exertions on the part of both manufacturers and workmen. It is asserted that for a time the ribbon weavers of Coventry will be thrown out of employment; that the importation of French clocks and watches will destroy the trade of Clerkenwell and other parts; and that it will seriously, to a further extent, damage the already depressed business of the Spitalfields silk weavers. There are other branches of trade and commerce the effects on which are viewed by many with feelings of alarm. Other trades, on the contrary, will be forced into activity.

It is a distressing feature of changes which produce much general good that important interests severely suffer for a time, and that many are left to struggle with poverty and the sad effects of the want of employment. It was so when steam power was brought to bear on hand labour, and when the locomotive superseded other methods of land conveyance. This temporary evil passed away, and such immense benefits have resulted that none in former years could have calculated their extent. In these and other changes the greatest amount of evil happened to those who obstinately refused to move with the stream, who opposed or laughed at the improvements. Many instances might be mentioned in illustration of this, but few are more instructive than that of the clock and watch makers of Clerkenwell. At one time the chief part of the manufacture of church turret and other clocks, not only for the use of the United Kingdom but for many foreign countries, was in their hands. Unfortunately, when science was rapidly advancing in France, when French workmen were receiving mathematical and artistic education, and applying new methods, the English workmen were continuing on the old plan, and not caring for advanced intelligence in the pursuit of their craft. In Paris persons of ability applied their earnest attention to the general principles of clock-making, and workmen strove by the subdivision of labour to acquire excellence in particular branches. The consequence of this has been that the manufacture of clocks is now almost entirely confined to Paris. If proper energy and intelligence had been used, the men of Clerkenwell might still have been the makers of the more important description of clocks for the whole world. If proper means are not used, the watch-making trade will also depart. On this point

Mr. Bennett remarks that in Switzerland, whence a vast number of watches are sent to so many nations, apart from the better system adopted there, and the extensive employment of female hands, their admirable system of general education is at the root of the matter. The Swiss belief for years past has been that, to obtain a perfect work, it was absolutely necessary to educate the workman. They could not expect workmen to adapt themselves readily to the altered requirements of the public taste here and abroad without a high degree of cultivated intelligence. Ignorance was opposed to all change, because it was unable to see how to effect it without injury to the workmen who had been brought up by the mere rule of thumb.

In Switzerland the education of the people is to a considerable extent a national affair: half of the expense is drawn from the Federal funds, half the rest from local taxation, leaving only the fourth to be paid by the parent, a payment of about thirty francs a year. In the case of a widow's poverty, even this fourth is remitted; and in certain districts, in the case of a poor parent to whom the child's labour would be remunerative, the local authorities actually pay to the parent a sum in lieu of what the child would have earned.

Nor is this education limited to the bare rudiments of common English schools; but the knowledge and practice of mathematics, of a foreign language, and the elements of natural philosophy, embracing mechanical science, are ably and effectually taught, as well to girls as boys: vocal music is also taught, and every school is made a school of design, where a taste for art is systematically taught to every child. Who can wonder that the watches produced by a people thus trained should be found more elegant and cheap than those produced in such very different circumstances at home.

In natural ability, perseverance, and skill of hand, the English workman may compete successfully with those of any other country; but notwithstanding, it is difficult for them to compete fairly against competitors with such advantages as those above mentioned.

As regards the Coventry ribbon-weavers, it will be the improved skill in design, the cultivated taste, and the educated eye for colour, with which the French may, if proper measures are not taken, permanently injure this branch of our manufactures. This shows how necessary it is, by every possible means, to improve and extend our schools of art, as well as those intended for general and national education. Vigorous exertions are required, not only to advance and develop our established branches of industry, but also to establish and encourage new ones, which may be the means of employing labour, and adding to the wealth and prosperity of the country. Admitting that great efforts will be for some time to come required to compete successfully with certain advantages elsewhere, it should be remembered that the changes in the tariff during the last few years have vastly increased both trade and commerce; that both the necessities and luxuries of life, clothing, &c., have been lessened; and that, if one branch of industry for a time suffer, others are greatly improved. The reduction of the export duty on English coils will give employment to, and improve the condition of, thousands of miners, will add to the general wealth, and make the peace of England more necessary to France. It is, however, as we have already remarked, absolutely necessary that Government, manufacturers, workmen, and the community at large, should all use their best endeavours to improve both the general and art education of the people.

#### GOTHIC ARCHITECTURE AND DOMESTIC BUILDINGS.

LECTURES IN CONNECTION WITH THE ARCHITECTURAL EXHIBITION.

MR. G. E. STREEP delivered a lecture last Tuesday evening, in the Gallery, Conduit-street, "On the Application of Gothic Architecture to Civil and Domestic Buildings."

In the absence of Mr. Beresford Hop, the chair was taken by Mr. Robert Kerr.

The Chairman, in introducing the lecturer, said he could not begin the business of a meeting like the present, without alluding to the decease of one who had just been removed from amongst them—Sir Charles Barry. It was only a fortnight since Sir Charles had received the applause of a like audience to that now assembled, which was called down in recognition of his merits as a designer. Every one acquainted with the subject acknowledged Sir Charles to be the most successful of the Eclectic School that modern

Europe has produced. He was almost tempted to say that his loss was irreparable, did he not reflect that the genius of art was raising up others to close the ranks, if not to fill the place vacated by those who were passing away from amongst them.

Mr. Street said he felt that the subject was one which had occupied the attention of the public lately, principally through the discussions in which members of the profession had engaged. The statement was constantly heard from the opponents to the revival of Gothic architecture, that it could never be suitably introduced except in ecclesiastical edifices; that it was unsuited to this progressive age; that it could not be adopted with any degree of comfort; that it was costly, and ascetic. Some persons charged its admirers with a love of savageness for its own sake, and ignored therein Westminster and Florence; others associated it with the grotesque; forgetting that in so doing there was both good and bad grotesque in the world. The different views on the subject had divided architects into separate and often hostile camps, which of itself tends to affect public opinion against Gothic. Yet, if an opinion was to be formed from the Press, Lord Palmerston's declaration on the subject found few in its favour. The *Quarterly Review* was the only periodical which had supported that statesman's opinion, whilst on the opposite side were to be found the leading public journals. But if they looked inside the profession, there were two classes quite opposed to the revival of Gothic architecture: one of these was one of which he desired to speak with especial respect, especially as the president of the Royal Institute had indissolubly associated his name with it: it was that class which followed out Classic architecture. This class, though much opposed to their own (the Gothic), and though he deprecated the main feature of their school, that of working in a foreign style, he admitted had many excellencies which could be safely adopted by themselves. The other class who decried against the revival of Gothic architecture consisted principally of younger men, who had started with the notion that the architect should work equally well in all styles, and should be prepared to undertake any class of designing, if he hoped to make his profession remunerative. It was natural that the Gothic should excite the enmity of this class: the former argued for the use of one style, and demanded some mark of the artist in every building he designed; nor was it by chance that the Gothic thus claimed a single style, for it knew well that since the creation no school has been successful that has worked in more than one. This class had in some instances carried its antipathy to the Gothic to an extreme: they had demanded, in the case of Mr. Scott, that he should be deprived of all control over the new Foreign Office. The favourite argument with this class was, that Gothic did not pay, and therefore was not suited to the age. They looked up to Sir Christopher Wren as their model, forgetting that we owe his Gothic works to the instinct of his employers, who, intently alive to the requirements of the age in which they lived, would not allow him to follow the bias which his studies had imparted to him.

This class, however, had showed its readiness to throw in their lot with those who offered greatest freedom, and would gradually decrease in number and in influence. An objection frequently urged against the Gothic was its incapability of revival unless by departure from its original principles. Our opponents here forget that the Classic has its Renaissance, and whilst the Gothic in seeking its natural and healthy development is not bound down to an old style, refuses to introduce sham productions into architecture. The effect of the Eclectic school upon the country has been unfortunate. To judge of it we had only to look upon the painters, sculptors, masons, workers of textile fabrics, goldsmiths, jewellers, carpenters, whom the last two centuries of Renaissance had originated. Impoverishment of genius has been the result. To take the instance of sculpture: the school of architecture had always depeuded upon sculpture: it fell to the lot of Renaissance to separate them: this produced inferior works. The greatest sculptors threw away their time on busts: the second-class men looked to truncated obelisks and monuments in St. Paul's as the sole resources upon which to employ their intellects. But the Gothic revival was fast establishing the connection between sculpture and architecture. In the same way the carpenter had been debased in the lowest mechanical drudge, but under the influence of Gothic revival would learn once again that there were higher aims to which his calling would raise him. He would now proceed to show that Gothic architecture was equally applicable to civil and

domestic as to ecclesiastical buildings. To allow that Gothic was only suited to sacred edifices would be an objection fatal to the entire art; for he believed that no architecture could be healthy whose ecclesiastical buildings were not put up in a style suited to ordinary buildings. No art could be successfully pursued which had not seized hold of the hearts of the people, and the limitation of Gothic to one class of buildings would in itself prove that it was not indigenous. But a uniform development of the Gothic style was alone suited to the requirements of this age: to prove this, he need only maintain that it must be by the development of one style that success could be obtained. He should merely point out the effects of the Renaissance school, which had as yet given no proof that it could adapt itself to the wants of the day, and he would show that the nature of Gothic was eminently what the age required. Indeed, he might go further, and appeal to history, to religion, to romance, in his favour; that the Gothic style was alone indigenous—was the only one which had been begun, developed, and perfected by Christianity; he might call in aid the feelings and instincts of his audience, but he preferred at present to meet his opponents on a higher ground. He claimed a preference for Gothic architecture in domestic buildings, because it was a style especially practical, real, truthful, and free. If we looked to the domestic buildings of Greece or Rome, we found them suited to the purposes for which they were put up; and if we went back to the earlier or to the foreign Gothic, we saw that the design for a chapel was not identical with that for an infirmary: the principal rooms in the private dwelling-house were not packed four square, with windows exactly the same shape and size. Whether the building was a castle or a church, the rooms intended for study or for amusement, each had its characteristic externally, with which the interior arrangements naturally corresponded. To go into a modern house, you find no room which possesses a single speciality, nothing to attract love for the home; but instead thereof the working out of an iron law which had impressed itself on architecture, and left man little better than a machine. The lovers of the Gothic built no enormous porticos, such as in the British Museum or the National Gallery, under which an awning must be improvised to protect the visitor from the weather. The Elizabethan and Jacobean dwellings which are still to be met with in various parts of the country are the result of this clinging after the ancient Gothic, which was consecrated by its national and religious character, which was connected with that heraldry that still found favour in the Anglo-Saxon breast, and which was recommended by its utilitarian character. An assertion was frequently made that the developments of Gothic art must destroy the Gothic character of the work. A dream inspired the minds of those who fancied this, that the student in Gothic would import foreign copies, which would be unsuited to our own country. He quite agreed that Venetian palaces put up amid the trees and parks of England would not correspond to the landscape; but he felt that as the Italians were little behind the French in love of Gothic, they could aid us in erecting buildings "light, airy, and cheerful," according to Lord Palmerston's description, with windows ample in width, from which the use of plate-glass would not be debarred. The plan of an Italian window was not unknown in our own country. Indeed, in Classic buildings the window is an inconvenience. In Gothic it is the principal feature. The same advantage would present itself in favour of doors; they could be hung with the greatest liberty on the plainest hinge of iron to the most finished of polished brass. The inside finishings of the house could correspond; the ceilings open or covered, with one exception, that plastering could not be permitted as a sham imitation of stone. In the internal fittings our ancestors used oak, because it was readiest to their hands; but we must seize whatever material came in our way, and adapt it to our purpose, a privilege which the freedom of Gothic permitted. In the matter of furniture, the Gothic feared no comparison with the Renaissance. The wretched productions of modern times were the result of this system, in which workmen do not aim to arrive at a high standard. But before that a Gothic house could be suitably furnished, some attempt must be made to improve modern upholstery, and, following in the steps of Pugin, we must establish a Gothic manufactory. One of the main results of the Exhibition of 1851 had been to convince those most conversant with our textile fabrics that, if we hope for improvement, we must submit to take lessons from the

East, whose works in this class were of the same kind as those of the barbarous Gothic. One good effect resulting from this had been the working of Medieval embroidery, which, though at present confined to our churches, would soon, in the hands of ladies enthusiastic on the subject, be introduced into private dwellings, and supersede the mechanical works in wool and muslin, which for too long a time had engrossed the female fingers. The application of iron to Gothic architecture had been successful: to show this, he need only point to the museum at Oxford, for the design of which we are indebted to Gothic artists, and the erection to Gothic workmen. A similar instance of the application of iron to Renaissance could not be pointed out, to which it must ever prove foreign, through its eagerness to conceal the material used in construction. The cost of Gothic was alleged against its use, and if a comparison were made between a speculative Classic house intended to last ninety-nine years, and a substantial Gothic built for perpetuity, no doubt the estimate would be in favour of the former; but a permanent dwelling in either style would demand the same outlay of money. He might now be allowed to point to the reasons why Gothic buildings had proved unsuccessful, and he found them in the facts that architects had adopted the new Gothic only in their erections, had sought external effect to please the eye, and had overlooked the comfort of the interior; had become Gothic to so exaggerated a degree as even to alarm Gothic men; and that those who had worked out the Gothic had been trained in Classic and Renaissance, and had found themselves unequal to rise above early prejudices. In conclusion he felt that there were men now devoted to the pursuit of Gothic architecture whose works would be the best proofs of his remarks in favour of the application of this national style to the buildings of our country.

The Chairman, in proposing a vote of thanks to the lecturer, said the audience had had the advantage of hearing one of the ablest supporters of the Gothic school.

The vote was accorded amid general applause.

#### DOINGS IN PARIS.

THE transforming of the plantations, on the right side of the grand avenue of the Champs Elysees, into flower-gardens and shrubberies, continues actively. Considerable quantities of earth have already been shifted for the flower-beds and grass-plots of this side, which is to imitate the present disposition of the left side of the road. Thus, straight alleys will be carried round each plot, and large open spaces (*correfours*), where many alleys meet, will be established near the cafés and other places of amusement. The walks are to be of ample size for the demands of circulation, and double seats, with a back, are to be provided for promenaders. Water conduits are being laid down, with all necessary appendages, for irrigating the grounds.

An order of the Prefect of Police has nominated commissioners of public health for the twenty arrondissements of Paris, Sceaux, St. Denis, St. Cloud, Sèvres, and Meulan. Sanitary commissions in Paris are not of new creation: as early as 15th December, 1851, a decree formed them, and the members worked with the greatest zeal till 31st December, 1859, in the twelve arrondissements. Owing to the increase of the territory, Paris can boast of twenty committees.

The works of the subterranean canalization of Paris proceed actively. It is proposed that the Seine shall be relieved from all the drainage water now brought into it by the actual sewers, and that they shall be turned into the grand collecting sewer of Asnières. At present a deep excavation is being made on the Boulevard de la Madeleine, beginning at the Rue St. Honoré, for a sewer destined to unite with that of Asnières, the drain which passes under the Neuve St. Augustin, and which receives the water from this thoroughfare and all the quarter.

The Pont au Change, now in course of reconstruction, upon which the works were for some months past interrupted by the overflows of the Seine, was re-taken into active hands on the 18th ult. A powerful dredging machine has been moored between the two river piers already commenced, in order to deepen the bed at that spot, while it temporarily closes up the navigable channel from the passage of boats likely to interrupt the work. A great number of men have been set to work at the left abutment, and the least advanced of the piers, that near the Quai des Fleurs, has already its caisson up to the level of the river. Meanwhile the walling of the Quay de l'Horloge,

at the north of the Palais de Justice, advances rapidly. At present the parapet is in a forward state: it is of Jura limestone, capable of receiving a high polish, equal to that of marble,—the same stone which was successfully employed on the St. Michel and Solferino bridges in Paris. This quay has been considerably widened out between the Boulevard de Sebastopol, in the "Cité" and the Rue de Harlay. At the new Place du Louvre the works for raising it to the level of the adjoining streets are terminated. A carriage-way, paved with asphalt, has been laid down all round the plantation of trees in front of the Church of St. Germain-l'Auxerrois and the mairie of the first arrondissement; also, the avenue in front of the tower which separates these two buildings is similarly paved. This open space, formerly plunged in total darkness during the night, is now brilliantly lighted by gas candelabra spread over the two plantations. Benches have also been placed for the convenience of pedestrians: they are of the same model as those in the Champs Elysées and the Boulevards, with two seats, and a back in the middle.

#### THE ARCHITECTURAL ASSOCIATION.

The special business meeting of this session was held on Friday evening (the 11th), at the house in Conduit-street. Mr. Penfold, President, in the chair.

The minutes of the last meeting having been read and confirmed,—

Mr. Arthur Cates proposed the following resolution:—"That this meeting expresses its satisfaction at observing that a series of propositions has been issued by the Council of the Royal Institute of British Architects for an examination of their members as the initiation of a scheme which they hope to see further developed and extended to all members of the profession." Mr. Cates, in introducing the resolution, congratulated the members that a standard was about to be established by which a criterion could be formed as to the merits of young men entering upon the profession of architecture. The Association had always shown an anxiety in this matter, and had discussed it frequently, but they had met with discouragement in their attempts. He thought that the Council of the Institute had acted wisely in confining the measure, in the first instance, to their own members. They were not, in his opinion, of sufficient strength to carry out a public examination; and if they attempted it and failed, they could never afterwards recover their position.

When the experience which they would derive from the present movement would form the foundation of a more extensive and, he hoped, successful scheme.

Mr. S. C. Cates seconded the resolution. Mr. Billing objected to the principle. It was, he said, absurd to demand a qualification for an artist. As well might an examination be appointed to test proficiency in painting or in sculpture as in architecture. The test would be only limited, and not extended to all branches of the profession. So it would prove a failure.

The Chairman was glad to say that the Royal Institute had adopted the views of the Association on this important subject.

The resolution was put from the chair and carried.

Mr. Arthur Cates then proposed that the secretaries of this Association be directed to communicate to the secretaries of the Institute the foregoing resolution.

Mr. T. M. Rickman, in seconding the proposition, drew the attention of the subscribers to the nature of examination, which was, in his opinion, more valuable than any tests introduced by the Universities.

Mr. Bunker moved, as an amendment to the foregoing, "That the meeting proceed to the next question."

The amendment was seconded by Mr. Billing, and carried.

Mr. Bunker next proposed, and Mr. Cates seconded, the following resolution:—"That the members of this Architectural Association have not afforded and do not afford that practical support in its working which is needed for carrying out its objects, and that it is, therefore, desirable that the committee should further consider and report whether there is any course short of closing its operations which they can recommend for the adoption of the Association."

The resolution was put from the chair and unanimously carried.

The proceedings then terminated.

#### CAMP HOSPITALS A HUNDRED YEARS AGO.

THE century whose date-marks record famous deeds by England's two most famous captains,—the culminating glories of the first, the brilliant promise of the second,—was one in which the temple of Janus was but seldom closed, and then but for brief intervals of repose. In both hemispheres and on every continent, British soldiers marched and fought. British fleets sailed on every sea. When we inquire, however, from which of the many fields that were traversed there have come down to us records bearing on the personal conditions and the hygienic circumstances under which these operations were carried on, it will appear that they are very limited. As to the fleets, we are very much indebted to Lind, Blaine, and other physicians who accompanied them, men of great judgment and ability, to whose scientific foresight, and not to a slothful and corrupt Admiralty, it was owing that ships were enabled to remain at sea long enough for the fulfilment of their objects. These physicians have taught us much on the subject of personal hygiene, not without a glance at questions of hospital construction, the good effects of which we can see, even now, in the well-built naval hospitals which have always so favourably contrasted with those provided for the army. The field of medical observation, as far as the army was concerned, seems to be limited to the various campaigns in the Low Countries and Germany, and to the experience of the large standing camps which, on the threat of French invasion, were established at various points for the purpose of covering the metropolis. Having already endeavoured to briefly utilize and deduce one or two lessons, useful at the present time, from Dr. Brocklesby's experience of camp life and disease in England, and from Sir John Pringle's experience in the Low Countries and the Culloden campaign,\* we shall now make Dr. Donald Monro's "Observations on the Means of Preserving the Health of Soldiers, and of Conducting Military Hospitals," the text for a few further remarks. If called on to supply a student with one book on the army sanitary history of these times, we would put this book of Monro's into his hands rather than Pringle's much better known work. And for this reason, that the former is more the more systematic of the two; and also that the close personal observations which it is his chief purpose to record, were made after the publication of the latter, and under the influence of a teaching which is always gratefully acknowledged.

If a head-roll of names eminent in science and letters can ever make a family distinguished, Dr. Monro was one of a stock than which few have been more illustrious. It was founded by John Monro, a surgeon in William the Third's army, and who established the famous medical school at Edinburgh, and its last notable representative died, a professor in that school, only a few months ago. Our author was the son of the first Alexander Monro, and brother of the second and most distinguished anatomist of that name. Shortly after the battle of Minden, he joined the British Contingent of the Allied Army in Germany, commanded by the Marquis of Granby, which was taking part in the Seven Years' War under Prince Ferdinand of Brunswick. With it he remained for three years, at the end of which time he returned to his duties at St. George's Hospital. In 1778, and again in the following year, he was physician to the great camp at Coxheath, near Maidstone, which, with one at Warley-common, was established in the expectation of a French attack, and at which Sheridan has laid the scene of one of his best military farces.

With regard to these old-fashioned books,—with regard to books of any period which treat of these subjects,—it is important to bear in mind that we must not look in them for any new principles,—for any theories hitherto unknown. That effete and decaying animal matter must be removed from the means of affecting the living body; that the effective agents of that removal are the three primal purifiers,—air, fire, water; that Nature abhors waste; that the effete matters should be applied to the reproduction of vegetable life; that death and life, and life springing directly from death, should proceed in a regular cycle; and that when we break her laws, even in the smallest particular, Nature is swift and certain to punish us,—these are the elementary principles on which health has been given to us. At that point—after that has been set forth—the work of the theorist is done. The work remains for the chemist and the engineer; for the chemist, to

demonstrate the connection between cause and effect; for the engineer, to give practical effect to the theories and demonstrations. There is very much for both to do. The engineer has hitherto done little more than either to pump the effete matters into tidal rivers, to be pumped back again into human habitations, there to cause frightful mortality, as was the case at Exeter in 1832, at Hull in 1843, at Newcastle in 1853, and at other places; or, on the other hand, to hurry in the sea, as is being now done, the rich treasures which should go to fertilize and beautify our fields. The great value of such books as we have been quoting lies in their multiplication of instances which exhibit the perversion of the natural laws and the certain manner in which these laws avenge themselves. For instance, the battle of Warbourg was fought on the 31st July, 1760, and the victors encamped on the site of it; many of the dead were scarce covered with earth; the camp was speedily covered with dead animals, and, in the absence of a camp police, it became covered also with the *dejecta* of a numerous army. Instantly, in the first week of August, peticular fever appeared, and raged without intermission, but with always increasing urgency, until December, when the troops went into cantonments at Paderborn. At that place there was no diminution of its intensity until the hospitals were thinned by convalescents being sent away in January. When, in February, the Guards marched for Hesse, and the number of troops was thus greatly reduced, the fever almost entirely ceased. Even then, two battalions were exceptionally crowded, and the disease assumed new virulence among them, ceasing when the men were scattered in billets. Again, at Osnaburg, in 1761, an outbreak of the same disease was traced to a neighbouring "foul ward," and when it was thinned, and the sick removed to a large, airy hospital, the disease ceased at once.

The first remark that will occur to any one who reads certain parts of this book, and who is, at the same time, familiar with discussions on kindred subjects that have been rife during the last few years, is likely to be this: that Dr. Monro seems to have anticipated these discussions, that had the methods and provisions which he lays down with care and minuteness been followed in any respect, these discussions could never have originated. The rules which he has systematized for the conduct of field hospitals, which have respect to details both large and minute, exhibit a faculty of circumspection and observation, and a regard for the possible influence of collateral circumstances, together with the power of ascending from the particular to the general,—the very gifts which go to make the efficient and successful administrator. The distinctive characters of the hospitals required by an army in the field,—the regimental hospital in front, the ambulatory hospital immediately in rear, the great general hospitals at the bases of operations,—the necessity of congregating the sick at some times, the importance of segregating them at others,—the influence of soil, temperature, character of surface, climatic peculiarities,—these subjects, together with that of the necessary order of subordination of hospital attendants, the supply of portable provisions, the rules for camp and hospital police, the supply of shirts—a most important particular, which seems to have been the first cause of shipwreck at Scutari,—all these matters, with others which it would be too tedious to mention, are discussed, and their relative importance is pointed out. In the same strain, his description of the great camp at Coxheath, of all the sanitary influences which were present there, and of the results, is a model of excellence which is well worthy of imitation.

Dr. Monro was a thorough-going contagionist. *Infectionist* would be the more correct word, but we employ the term that is in general use. His is a question about which we can hardly be said to think more precisely than they did a hundred years ago, although our loose, unprecise thoughts have taken a somewhat different direction. It is curious how persistently the most rigid contagionist notions prevail even now when quarantine, their logical effect, is almost, comparatively speaking, abolished. No one has done more for the diffusion of sound sanitary knowledge among the general public than Mr. Kingsley, but Mr. Kingsley, in his novel of "Alton Lock," has made the old theory of propagation by *foetida*, or substances such as woollens, cotton, feathers, which are supposed to acquire and retain contagious effluvia, serve the useful purpose of killing off some half-dozen of his characters. A clergyman's straight-cut coat, such a very simple instrument of death, first kills several wretched creatures who had put it together in a sweater's

\* The Builder, February 4th, and March 17th.

den, then the shopman who delivered it, then the servant who brushed it, and, last of all, the clergyman who wore it.

Again, in the autumn of 1854, the soldiers' packs were thrown overboard from every transport in the Black Sea in which cholera had shown itself. The unfortunate men were therefore quite unprovided, themselves, when they went as patients to an unprovided hospital. Thus, a practical adhesion to this doctrine of propagation by *fomites*, on the part of some ship captains, was one great cause of the first misery at Scutari. Here, on the other hand, is a case in which the contrary doctrine seems to have prevailed. During a late cholera epidemic, an army surgeon was tried by court-martial at Dublin, on the heavy charge of cowardice, because he had taken certain precautions against the supposed contagion of that disease, which were trifling indeed when compared with the rules laid down by our author. Frequent ablutions, a waxed linen coat, rolls of lint stuffed into the nostrils, and a vessel of heated vinegar held between patient and physician, are what Dr. Monro enjoins. The unlucky surgeon at Dublin had simply worn a pair of gloves, but he was found guilty. Evidently his judges did not believe in contagion, and so differed from Mr. Kingsley, and the transport captains.

When we attempt to state exactly what we really do know of the different stages of the propagation of the class of diseases which were once called contagions, but which it is now the fashion to call zymotic, it will be well to begin with a general confession of ignorance, and also to have a similar confession ready for almost every stage of the inquiry. The first remark to make is that the very term *zymotic* is inaccurate, because it expresses a theory which may be true, but which we only fancy to be true, it being as yet unsupported by a sufficient accumulation of precise and demonstrable data. The theory is that which is succinctly expressed in Hauleit's well-known lines,—

"It will but skin and flim the ulcerous place,  
While rank corruption, mingling all within,  
Infects anscen."

Ask any surgeon, and he will tell you that these lines express most accurately what he fancies to be the mode of action in certain specific diseases, which are first propagated by contagion or actual contact, and then diffused through the system by infection, or what we call, from a supposed analogy to the chemico-vital process of fermentation, *zymosis*. This notion of a humoured fermentation has been present ever since the time of Hippocrates; but it was Lichig, whose fanciful analogies have impressed the present generation so much, who first gave it the form and prominence which it now displays. If we agree with the registrar-general, to admit a terminology which expresses it, it is important to remember, what the registrar-general fully admits, that the theory is not yet admissible as founded on fact. The question then remains, What is the cause of these diseases? It can be safely asserted to be established beyond the reach of controversy, that zymotic and zymotic diseases stand in the relation of cause and effect. Here is the modern "Board of Health doctrine" put in a form which, if the spelling were a little altered, might almost read as an extract from Dr. Southwood Smith or Mr. Chadwick:—"The terrestrial causes thereof are, by common consent of most writers, as follows:—venomous and stinking vapours arising from fens, standing ponds or pools, ditches, lakes, dung-hills, sluices, channels, vaults, or the like; as also unclean slaughter-houses of beasts, dead carcases of men, as in time of warre, and of stinking fish, fowl, or anything that hath contained life and is putrid; as also, more particularly in great cities, as in London, the unclean keeping of houses, lanes, alleys, and streets; from those recited, and the like, infectious vapours, by warmth of the sun exhaled, are apt and able to infect the living bodies of men, and thereby to produce the plague, which, once produced, is too apt, by infection, to spread and become popular, as experience too much sheweth." This seems modern enough, but it is quoted from a book called "The Surgeon's Mate, written by Mr. John Woodall, Surgeon of his Majesty's Hospital of St. Bartholomew," and is the result of his observations of the great plague of London. Even when this doctrine is taken as admitted, much remains unsettled, however great a step may have been gained. It is quite absurd to say that, cause and effect being found, there remains no more room for inquiry, because, for one thing, the cause does not always produce the result; and, for another, because we have to decide—and that is a most important point—the law, in accordance with which the par-

ticular result assumes such various forms. And here an almost total ignorance must be confessed. All that it is possible to attempt is to indicate in what directions it seems probable that a fuller light may eventually be obtained. All analogy and all reasoning force us to assume that although we cannot now see or handle that which passes from the putrescing mass to the living body, still that, with greater means and more extended observation, we shall ultimately be able to do so, that the *contagium* is something real, physical, and concrete. *Es nihil aliud fit* is a maxim of the oldest philosophy, but it seems to be discarded by some persons who dogmatize on this subject. In all reasoning about material things, we must have seen or at least we must suppose the existence of material causes throughout the whole course of the inquiry. A notion that these diseases are propagated by minute insects is almost as old as the fermentation idea, and was revived, some years ago, by Sir Henry Holland; but there is so little support for it, and so much that seems opposed to it, that it may be dismissed. It appears to be probable, then, that our inquiries, to be in the right road, must run in one of three directions. For the first, we must try to see if a remote specific influence, following laws of its own, traversing a course of its own, calls into action the infecting cause in the same way that the rudimentary germs contained in the pistil of a flower are vivified by the pollen shed on them. In the second place, we have to try to discover certain specific causes for each specific disease, differing one from the other, just as the phenomena of the morbid result differ; or, if the conveyed cause is always identical, we must discover, in the third place, the law of election by virtue of which the variation of the resulting phenomena is determined. The first notion is a very old one, which has much support at the hands of some who have a right to speak with authority in these matters. In the second way, we would be able to know the physical and chemical difference which may exist between the poison which causes, say small-pox, and that which causes, say yellow fever. According to the third, the poison being uniformly and in all instances the same, we would discover why it should at one time choose to attack, say the throat and cause diphtheria, at another the intestines and cause dysentery. Whatever the exact nature of the infecting cause may be, and in what way soever it may operate, one thing is quite certain, that as yet we know of only one way of neutralizing it. That one way is by dilution in the atmosphere, and, as a matter of real, accurate knowledge, there is no other "disinfectant." Even Dr. Monro quotes with approbation his friend Lind's apophthegm,—that the chief value of the so-called disinfectants lies in their compelling attendants to open doors and windows.

A hundred years ago there were constant apprehensions of a French attack, and the mobile divisions and brigades were, from time to time, located at different points, all having reference to the defence of London,—at Sandheath, near Ripley, at Titchfield, near Gosport, at Winchester, at Chatham lines, at Hythe, at Warley Common, and at Coxheath, of which latter we have been speaking. As has been mentioned, it was at Coxheath that Sheridan laid the scene of his little musical comedy, with Bonminster in the principal part, a piece from which, if it were put again on the stage now, an audience would possibly be able to draw some jokes and allusions not inappropriate to the present time, when we, too, are thinking of invasion, and are busy, also, with camps and the movement of troops. And now, having added the complimentary allusion to a Trefoil of last century Wortbies, one is tempted, if it did not seem probable that the result would be by no means satisfactory, to institute a comparison between the men of 1760 and the men of 1860. It is the fashion to speak lightly of these old gentlemen of the last century, and modern sanitarians are careful to ignore their labours, as if afraid of indicating the sources of their own inspiration; but they were real and earnest workers, ripe scholars, and useful public servants. When they took up a matter for inquiry, they tried to reach the central truth and real outcome of it. There was no evasion in their line of research. They tried to show forth tangible results, not to put names or figures in the place of results. Never for a moment did they condescend to wear "the foolish face of conformity." To one authority, and to one only did they bend,—to the traditions and the venerable influence of a literature that is 2,000 years old. Contrast this with what may have been observed at a later period,—a total abdication of professional functions and an inglorious vitality exhibited merely by a louder and louder call for "returns." This is just what must

be the result when an exaggerated value is attached to statistics, and when they are placed in any but a subordinate position. It cannot be too well remembered that a statistic is, by the necessity of his mental organization, a fatalist and that the attitude of a true sanitarian, on the other hand, is, by the necessity of his position aggressive and offensive; and if you offer the choice of these two antagonistic attitudes to several hundred men, indifferently chosen, what think you, will he the result? Is it not very certain that the great majority will repudiate the which gives trouble, will "steep their brows in slumber's holy balm," and indolently sink back into a fool's paradise of figures? And that is precisely the direction towards which present tendencies seem very certain to lead us. An old proverb teaches that when the night is darkest, day is at hand; and when we have reached the very deepest profundity of soulless routine and statistical pedantry, there may be reason to look for some streaks of light above the horizon. Mean time, let us earnestly hope for it, and do our little best to promote it, and, looking to the thick coming troubles that seem not far distant, let us all join in the sentiment of the lines which conclude Sheridan's "Camp" at Coxheath:—

"May true glory still wave her bright banners around  
Sill with fame, power, and freedom, Old England's  
crown'd."

CWM.

## THE SERPENTINE.

In the Blue Book is recorded the result of a inquiry, which is remarkable for the ability, patience, and acumen of the investigators, and for the high standing and talent of the witnesses. 3,728 questions were asked, answered, and registered.

That which stands out most prominent is the discrepancy in the views, and conflict in opinion of the delegated writers, upon the decision of whose reports the balance was so equal, that in the division, the chairman's casting vote settled the question! As to the testimony of the eminent engineers, there was no extreme dissonance, all agreed that the plan of daily and perpetual refiltration was not what they would advise, and whenever reference was made to the works recently executed, that system was tolerated only on account of the expense already incurred,—the circulating system owing its protection to 15,000 of the circulating medium already jeopardized.

It may be permitted to an old correspondent of the *Builder*, who has for many years treated upon the Public Parks, broad waters, &c., and who has attended the committee, to note down some fact issuing out of the inquiry.

The general tenor of the evidence went to prove—that the supply of water ought to be, at least a million gallons daily; that the bed of the Serpentine ought to be cleaned, and in particular to be deepened above bridge, the sides sloping down from 2 feet at the edge to 5 feet in the centre of that section, hnt to a greater depth in the wide reach below, so as to secure a larger body and greater purity of water. No one had contemplated pouring fresh water into the dirty basin, and Mr. Hawkesley himself admitted that on the first inception of the project between him and Mr. Fitzroy, the *limitation of expense* left him no better alternative than the supplementary process of filtration which he has adopted, but which otherwise he would not have chosen.

On the 16th March, the sixth day of sitting, it became so obvious that the filtering scheme would prove abortive, that the committee resolved to stop the works in progress, without prejudice to Messrs. Bird's contract for works in hand; these works commenced in the depth of winter, and which, up to the appointment of the committee, had progressed with extraordinary despatch, were all a once forced forward with almost magic velocity, so that the mile of culvert had been completed, the dam formed, the filter-beds, pipes, and foundations laid in, and all but the ornamental figures, balustrades, and urns brought on the ground—in this case, the liability, if not the total expense was incurred.

It was not in default of engineering intelligence, from several sources that the insufficient and now condemned project was adopted. No; it was because the Chief Commissioner must limit the cost to the grant of 17,000*l.*; and because he would do something, he decided, first, to clear the flower-holders, and then to clear the stagnant waters by filtration!

So early as 20th July, 1859, Messrs. Easton & Amos were applied to by the Chief Commissioner to state—first, the time it would take to complete their plan for supplying the Serpentine with

000,000 or 2,000,000 gallons of fresh water per diem; secondly, the cost; thirdly, would they guarantee that supply? and fourthly, whether they contemplated to level and cleanse the bed?

This letter was directly answered by that firm, and the letters and replies were duly produced and read in evidence before the committee—the purport being, first, from five to six months to complete the supply; secondly, the estimate of January 1st was for pumping 1,200 gallons per minute through the 15-inch pipe now laid from St. James's Park to the Serpentine: that of the 5th August was to supply 1,600 gallons per minute through a 6-inch pipe, delivered to the upper end of the Serpentine, the whole distance, including also the supply to Kensington Palace Gardens, to St. James's Park, and Bakingham Palace Gardens; thirdly, the guarantee required was given.

From the evidence of eleven civil engineers, supplied with that of five practical professors of chemistry, it is manifest that the rivalry created by the Chief-Commissioner's literary correspondence had been in nowise abated by publicity. Opposition was courted, and estimates were therefore dragged into collision and conflict. Mr. Hawkesley proposed as follows:—

For filtering .....	£17,000
Additional for procuring water from a deep well on the site .....	3,000
For clearing the Serpentine, on Mr. Simpson's plan .....	30,000
Making a grand total of .....	£50,000
Messrs. Eason & Amos offered to concrete the whole of the Serpentine for .....	£28,000
and to supply 1,000,000 gallons a day from Duck Island for .....	9,000
At a total cost of .....	£37,000

There remains an after-consideration of some importance, viz., that the annual cost of Messrs. Eason's plan, inclusive of supplies to St. James's Park, Buckingham and Kensington Palace Gardens, and fire-mains to the public offices, would be 50*l.* per annum; whereas the proposition of Mr. Hawkesley, for the Serpentine alone, amounts to 200*l.* a year!—so much for figures. Now, in reference to the quantity of water to be furnished daily, it is by no means so clear that so large a supply can be obtained from the Paddington basin as from the lower strata of gravel already risen in St. James's Park.

As to the change effected in the gardens, by filling up of about 260 feet of the fig-end of the park, the site of the filtering-beds,—it is a happy accident: at that point the water was narrow, but 10 feet or 60 feet wide: the banks shelved down, and were overshadowed by large timber trees: the ground was doubtfully covered mud was pestilent; and a narrow haug heavily throughout the dell. Besides, in this popular angle of entrance the space was rather too circumscribed. The dedication of this small scope to Flora would be a most satisfactory information. The balustrades, fountains, urns, and other pictured addenda are sufficiently artistic or their dark position in our cold climate; nevertheless, there are five months of genial weather, when fountains, the treasured ornaments of other cities, might be tolerated in London, and be considered a luxury by frequenters of Kensington, as well as of others of our public gardens. There is this personage to whom the public is already indebted for large contributions to science, art, and moral advancement, and to him we believe such is owing for improvements in these designs originally contemplated.

Again, an allusion may be made to the proposed change of the public bathing privilege, from the side reach opposite the receiving-house to the narrower waters in Kensington-gardens. There are some doubts as to the greater seclusion of the latter, for it is more particularly the lounge of families, nurses, and children; moreover, the surface of water is less, whilst improved balneæ would more than double the number of bathers. The hours of privilege being from six to eight o'clock p.m., and eight to nine o'clock p.m., very few questioners would be found so early or so late in the latter row; and unless females—which we do not think at all probable—were to promenade the bank opposite to the receiving-house, with a view to the study of anatomical drawing, no offence could arise from continuing the liberty on the present terms. But there is an argument stronger still against the change,—and that is the distance. Artisans, children, and young business men find it scarce safe far enough: do not, therefore, impose another half mile, twice told, upon the toiling million. At present the upper lake is in a fearful state.

On Sunday last crowds were inspecting the works; but all is confusion—the water fetid—heaps of clay and gravel confounding all, and extending along the south margin nearly the whole length. Nothing can be done with the bottom during the warm months, but unless fresh water be poured in, the malaria will be pestiferous: is this to be done? and who is to do it?

As to the proposed Italian garden, there is no room for it, unless planted on the filtering-beds, three of which are complete and the fourth nearly so, numbers of men being now engaged in forcing the work forward.

QUONDAM.

EXCAVATING IN WATER.

A NEW machine has been invented by Dr. Payerne, for the excavations under water at the Port of Fécamp, which he calls the "hydrostat." It consists of a wrought-iron case, divided into three parts by two horizontal divisions. The lower story, or, if we may so call it, the working chamber, rests on the bottom of the sea, and presents an area of 5*m.* square by 2*m.* high. The double sides, enclosed at bottom, contain the necessary ballast for the sinking and stability of the structure. Thirty-five men can work at ease in the working chamber.

IRELAND.

THE sum of 20,000*l.* has been generously placed at the disposal of the Dean and Chapter of St. Patrick's Cathedral, Dublin, by Benjamin Lee Guinness, esq., of Dublin, for the purpose of restoring that ancient building. St. Patrick's Cathedral is, it may be said the only monument of Gothic art in Ireland, in a state at all approaching to good. Although in a sadly neglected state, it still has many very beautiful remains of the Early English period, and it is to be expected that other heauties will be brought to light in the approaching restorations. It is to be wished that Mr. Guinness's munificent example would be followed by the Dublin public, on behalf of Christ Church Cathedral, which contains some curious remains of transition work, between Norman and Early English. This very ancient building is in a most disgraceful condition. The choir underwent some alterations many years ago, and is now one of the grossest outrages on the proprieties of Gothic architecture in the three kingdoms.

The fine club-house for the Kildare-street Club, Kildare-street and Nassau-street, Dublin, Messrs. Deane, Son, & Woodward, architects, progresses favourably. It is in the Venetio-Gothic style. The exterior is of brick, with a sparing use of cut stone in arch strings, and in connection with which an effect is sought to be gained by the introduction of black limestone. The strings, capitals of columns, &c., are richly and elaborately carved.

THE HORTICULTURAL SOCIETY'S PROPOSED GARDEN.

SOME time since we published, with authority, a view of the gardens proposed to be formed by the Horticultural Society at Brompton, and the Society circulated our view as showing their actual intention. Afterwards, however, circumstances led to a revision of the design; Mr. Nesfield was called into council, and the plan we now publish has been determined on. The works are being proceeded with very rapidly. The figures 2S mark the site which has been appropriated to the proposed memorial of the Great Exhibition, on a terrace surmounting water. The following is Mr. Nesfield's own statement as to the plan:—

The architecture (the conservatory and corridors) is upon three levels, and the gardens likewise are so, exclusive of the several terraces. Although the respective sites of tall single trees and groups are indicated to render the composition of the design complete, they cannot as yet be particularized till much consideration is given to a selection of plants already prepared for removal from the society's garden at Chiswick.

Many seats and small tazze will be introduced about the gardens which the small scale of the plan renders it difficult to show: these are omitted, and sites for principal sculpture only are given.

The architecture is represented by dark shading. Trees of varied size show as circles. Grass slopes of terraces and groups of shrubs are shaded.

- A. Entrance from Exhibition-road.
- B. Centre walk to ante-garden, leading to principal garden.

- 1. Basin for Nymphæa.
- 2. Ferns and rock plants.
- 3. Tall trees, round and spiral.
- 4. Belt of evergreen shrubs.
- 5. Compartment for American plants, with grass alleys.
- 6. Belt of evergreens, to enclose the American Compartment.
- 9. Phœnautery, 50 feet by 30 feet.
- 10. Mass of Shrubs.
- 11. Aviary for song birds.
- 12. Maze, formed by yew or hornbeam hedges, about 1/2 acre.
- C. Entrance from Prince Albert-road.
- D. Centre walk to principal garden, on a higher level than ante-garden.

- 13. Basins.
- 14. Diagonal grass promenade (access by grass ramps).
- 15. Large compartment for flowers and box embroidery.
- 16. Mass of very low shrubs.
- 17. Group of low trees.
- 18. Shrubs of medium height.
- 19. Avenue of spiral evergreen shrubs.
- 20. Standard Portugal laurels on the Verges, which latter are 15 inches above the surfaces of compartments and promenades.

- E. Branch walk to conservatory terraces.
- 21. Circular compartment for flower beds and box embroidery.
- 22. Standard roses.
- 23. Dwarf evergreen shrubs.
- 24. Large basin, with cascade 18 feet wide and 11 feet high.
- 25. Compartment for flower beds (without embroidery) accompanied by

- 26. Groups of flowering shrubs, &c.
- 27. Standard rhododendron.
- F. Flower on first terrace.
- G. Second terrace.
- 28. Memorial sculpture for Great Exhibition of 1851.
- 29. Large trees.
- 30. Band houses (east and west) on circular paved platforms.

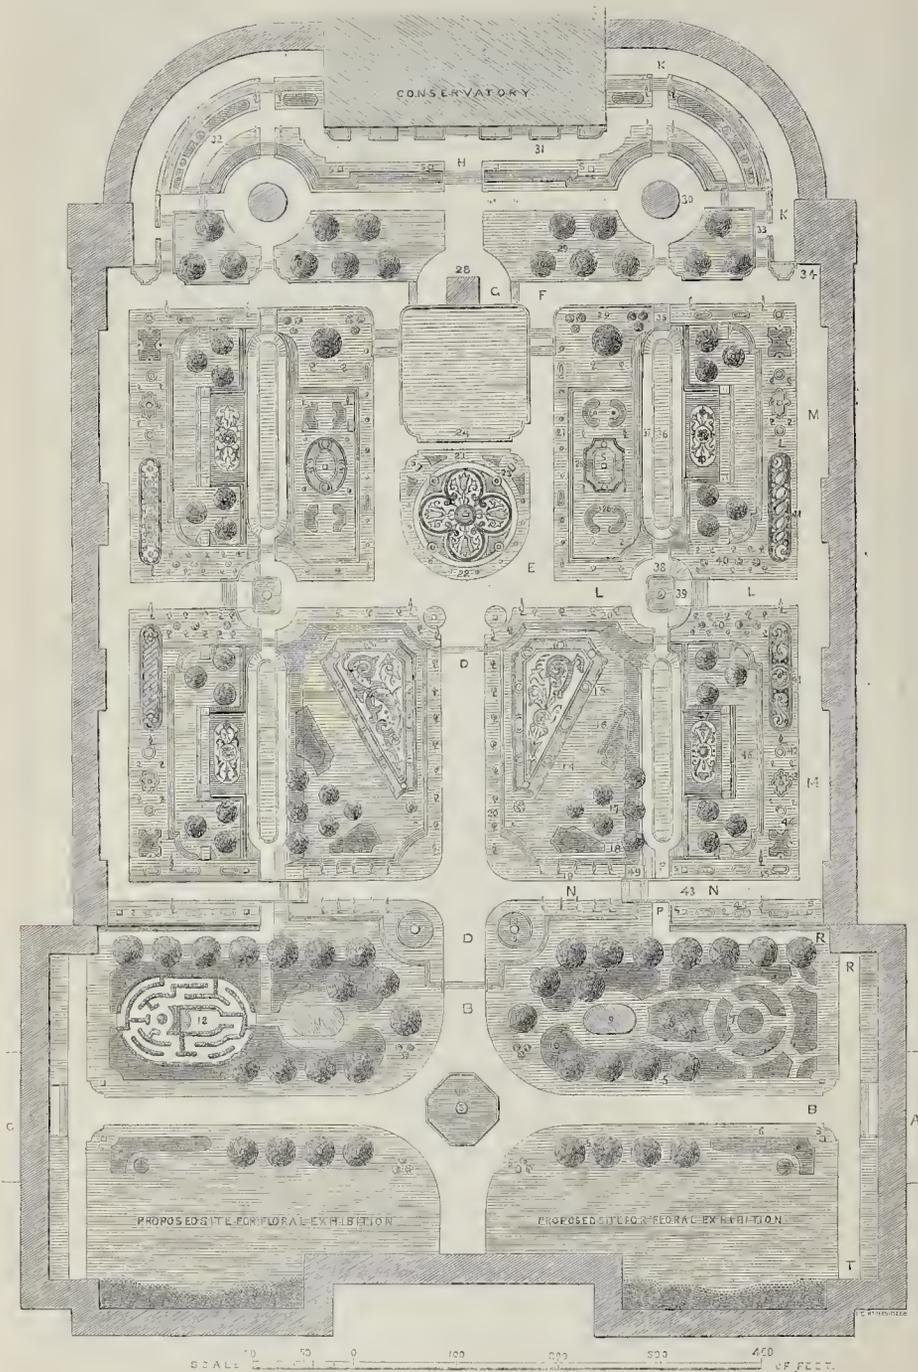

- 31. Third terrace.
- 32. Kerbed bed for flowers between steps to conservatory arcade.
- 33. Belt of shrubs.
- 34. Upper terrace, on a level with upper corridor.
- 35. Steps down to band house and lower terrace.
- 36. Kerbed bed for tall flowers.
- 37. Steps to the lowest level of the garden.
- 38. Canal for running water supplied by cascades.
- 39. Walks round canals (seats under retaining walls of east and west terraces).
- 40. Basin, with jets.
- 41. Steps to lower terraces, opposite centres of middle corridor.

- L. Centre cross-walk from east to west corridors.
- 42. Avenue of standard roses, and belts for dwarfs.
- M. Middle corridor walk.
- 43. Fricée compartments for medium-sized flowers.
- 44. Kerbed beds for tall flowers.
- 45. Moulded kerbed beds, with large tazze for tall flowers.
- 46. Group of low flowering shrubs.
- 47. Spiral plants and simple kerbed beds for tall flowers, such as dahlias and lily-beds.

- 48. Panels of east and west corridor terraces, with lime trees on their flanks.
- 49. Glacis sloping towards canals, each embellished with embroidery only (the object of the glacis is that the running water of the canals, together with all other features across the garden, may be visible from the corridor or first terraces).
- N. South cross-walk of principal garden.
- 49. Bridge and steps.
- 50. Ramp, to descend to the level of canals.
- P. Walk under the bridge, leading through the lower corridor of ante-garden (K).
- R. T. Walk from north to south lower corridor.
- S. Signifies sites for principal sculpture, whether for figures or large tazze.

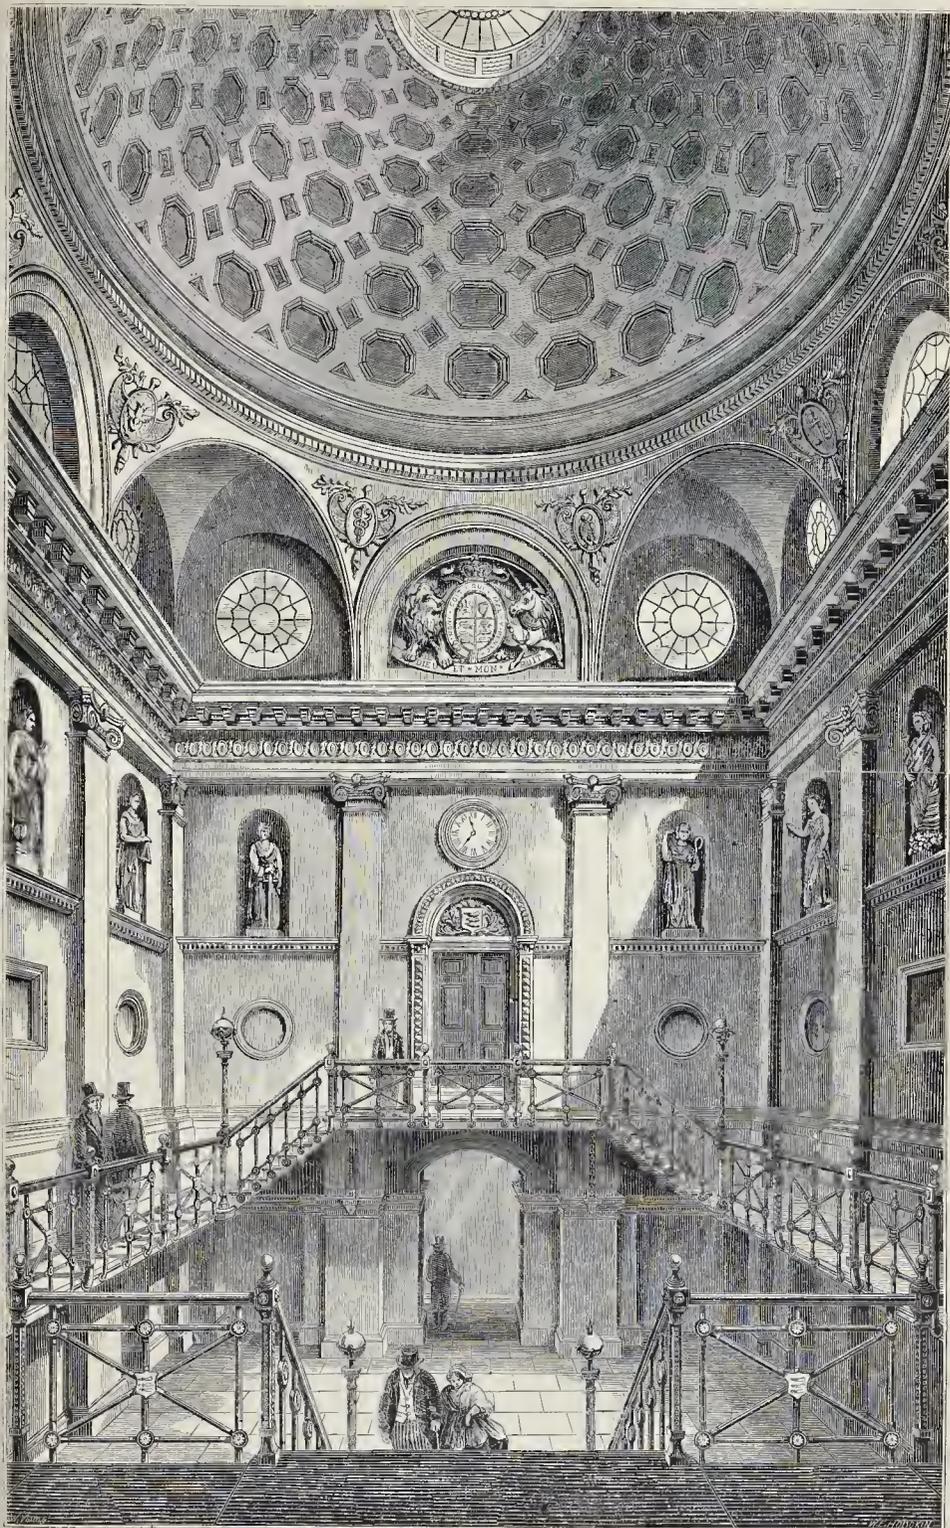

The upper terrace, K (above the band house), would be favourable for statues of eminent musical composers.

ST. MICHAEL'S CHURCH, CORNHILL. — This structure, which has been closed for nearly three years for repair and decoration, was re-opened on Sunday last, for divine service. No expense has been spared upon the work of restoration, and skill of high kind has been employed.

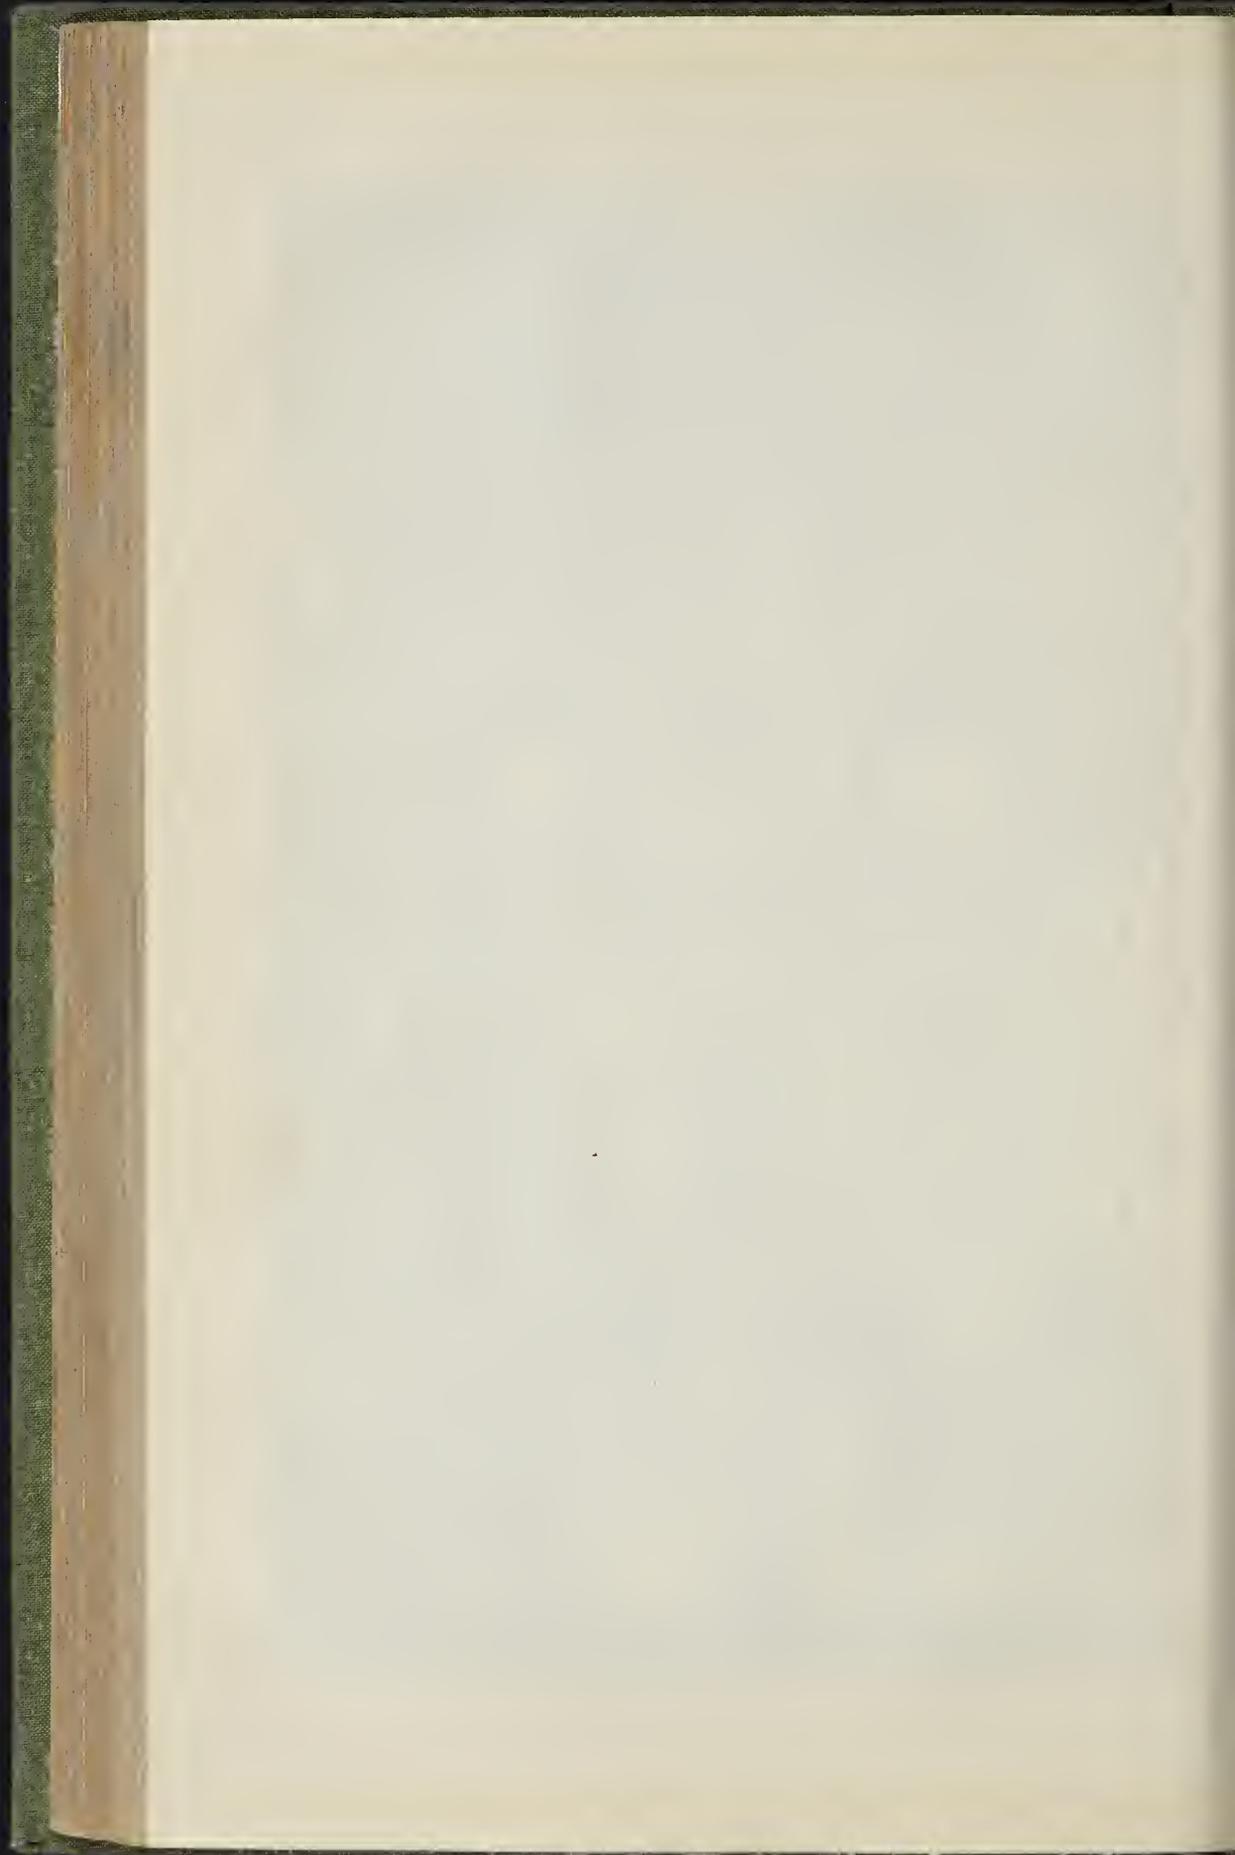

HORTICULTURAL SOCIETY: PLAN OF PROPOSED GEOMETRIC GARDENS AT BROMPTON.

*Designed by Mr. Nesfield.*

CENTRAL HALL, CLERKENWELL SESSIONS-HOUSE, —AS ALTERED.—Mr. F. H. POWNALL, ARCHITECT.

### THE MIDDLESEX SESSIONS HOUSE, CLERKENWELL GREEN.

CONSIDERABLE alterations and additions are being made at the Sessions House, Clerkenwell, under the direction of Mr. F. H. Pownall, architect. These have been occasioned chiefly by the necessity of providing a large room for the purposes of a second court, the magistrates' private committee-room having been hitherto used for such business during the sessions. This was effected by fitting up the old dining-room as a criminal court, access for the public being obtained by a new gallery and staircase direct from the central hall. A new dining-room for the justices has been built on the second-floor, with a new kitchen, scullery, serving, and retiring rooms. Very extensive alterations have also been made in the offices of the clerk of the peace, the county treasurer, and the clerk of committees. A new and enlarged back staircase has been built, by which these last-named offices can be approached without entering the main portion of the building.

A new system of warming, on Messrs. Haden's principle, has been introduced, as well for the courts as for the prisoners' cells in the basement.

The accompanying engraving represents the central hall as it now appears.

The exterior of the building has been recessed on three sides with Portland stone and cement, where before there existed only brickwork of a very unsightly character. The old stone front towards Clerkenwell-green has been cleaned down and repaired only.

The original contract for the internal works was obtained during the past year in a limited competition by Messrs. Piper & Son, of Bishopsgate-street, who have since also executed the external improvements.

The Sessions-House originally stood in St. John's-street, Clerkenwell, opposite the Windmill Inn, and was named after Sir Baptist Hickeys, of Kensington, one of the justices, who, "out of his worthy disposition," built it in 1612, and gave it to the justices of the county for ever. In the present structure, which was finished in 1782 (Mr. Rogers, architect), will be found a carved chimney-piece, of Jacobean character, with an inscription recording Hickeys's gift, and which was removed from the old Sessions-House. An engraving of this is given in our second volume, p. 562. The distances on the Great North-road were formerly measured from the site of the old Sessions-House; and many will remember stones—indeed, some may still be seen—inscribed, so many "miles from the spot where Hickeys's Hall formerly stood!"

### BISHOP AUCKLAND TOWN-HALL COM- PETITION.

WE engraved what was sent to us as the selected design in this competition, believing that it was to be carried out; and were surprised, therefore, to see an advertisement for tenders to erect the town-hall, with the name of another architect attached. The author of the design we engraved says:—

"On March 15th I received a note inclosing a cheque for the amount of the premium, and also stating, in answer to a question of mine consequent upon a report that another architect had been selected to make a modified design, that such was not the fact, and at the same time saying I did not name the 'price' for which 'I would perform the work.' To this I replied: 'of course I named no price, for it was understood an architect's charge was five per cent., and also stating I was glad to find the report of another architect being employed was not true. I considered the matter so far satisfactory, but heard nothing further, though the view was published in the *Builder*, until April 11th, when I received a note from the secretary stating that 'the directors met last evening and decided to employ a Newcastle architect to carry out our intended designs.' Against this I course protested, and demanded my designs returned; or, if they determined to retain them, I sent a nominal charge for them, stating I was desirous to have the matter tried, though I was desirous to leave the matter to arbitration, as the principle involved was one of great importance to my profession. In reply to this the secretary returned the prize designs rather than have the matter tried; but, sir, I and teachers of them have been kept, and the honesty of this course of procedure I will leave your readers to judge of. I asked who was the architect employed, but I was not informed and I saw an advertisement for tenders in your paper last week, that is, four days before my drawings were traced and returned."

One of the authorities to whom we applied for information very coolly advises us to exercise a little more caution in future before we engrave designs sent us by successful competitors, and adds, "the design we intend to carry out is an entirely new one by Mr. John Johnstone, of Newcastle." How much longer members of the profession will subject themselves to such behaviour on the part of competition committees remains to be seen.

### COMPETITIONS.

*Derby.*—The Derby Corn-Exchange Company received numerous designs. Amongst the competitors were Messrs. H. I. Stevens, Ifine (Nottingham), Bellamy & Hardy (Lincoln), Young & Bidlake (Derby and Wolverhampton), Giles & Brookhouse (Derby), Benjamin Wilson (Derby), Ordish (Leicestershire), Murray (Coventry), &c. The designs were hung up in the Grand Jury Room, at the Town Hall, and, after several meetings had been held, were thrown open to the public. The committee reduced the number of competitors from twelve down to four, the selected four being Mr. Benjamin Wilson, Messrs. Giles & Brookhouse, Mr. Ordish, and Messrs. Bellamy & Hardy. At a meeting on Friday, the 27th ult., the design of Mr. Benjamin Wilson was selected to be carried out. Messrs. Giles & Brookhouse were awarded the second premium. The design is to be erected in brick with some dressings, and is of the Italian style of architecture. The large hall is 110 feet long, 55 feet wide in the clear, and covered with an ornamented framed timber roof of laminated ribs springing from ornamental iron columns standing in front of the gallery, with circular ribs springing from them again to the wall and acting as abutments; circular ribs also spring from column to column longitudinally, supporting an open fretwork cornice, and the spandrels of the ribs are filled in ornamentally.

*St. James's Vestry Hall, London.*—The first premium has been awarded to Mr. Pearce, of Clapham; second, to Mr. H. W. Budd, of North-street, Westminster.

### THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

SIR CHARLES BARRY.

A SPECIAL meeting of the members of the Institute, fully attended, was held on Wednesday evening last, at the House in Conduit-street, to consider what steps should be taken consequent on the lamented decease of Sir Charles Barry.

Mr. Cockerell, the president, took the chair, and announced, in feeling terms, the loss which had been sustained. He further communicated the assent of the Dean and Chapter of Westminster to the request made on the part of the Institute, that the remains of Sir Charles Barry should be interred in Westminster Abbey.

On the motion of Mr. Tite, M.P., seconded by Mr. G. Vulliamy, it was resolved, that,—

"The Royal Institute of British Architects, sensible of the honour which the burial of Sir Charles Barry in Westminster Abbey will do to the memory of their late distinguished professional colleague, tender their most grateful thanks to the Very Rev. the Dean of Westminster for the permission he has been pleased to accord."

Mr. Sydney Smirke, R.A., moved; Professor Donaldson seconded, and it was carried unanimously, that—

"The Royal Institute of British Architects, impressed with the loss the profession and his country have sustained through the decease of Sir Charles Barry, whose genius has conferred great lustre upon this age, hereby record their profound sympathy with the affliction which has fallen (more immediately) upon the widow and family of their lamented friend."

Arrangements having been made for the attendance of members of the Institute at the funeral, thanks were voted to the chairman, and the meeting separated.

At the next ordinary general meeting of the session, to be held on the 21st inst., Mr. M. Digby Wyatt will read some notes on the career of the late Sir Charles Barry.

### EXHIBITION IN AID OF "THE HOME FOR DAY WORKERS."

In a previous volume we brought under the notice of the public the "Home for Day Workers," in Great Ormond-street, Queen-square, established by Lady Hobart and the Countess de Grey and Ripon.\* We may repeat that it is intended for the benefit of young women (whose friends reside in the country) employed in milliners' and dress-makers' establishments or shops during the day, to give them a comfortable home at a cheap rate, with cheerful society and protection, as well as to assist them in obtaining work, by inviting employers to apply at the Home for workers. Bed, use of kitchen, a comfortable sitting-room, books, with fire and lights, from six to eleven o'clock every evening, are supplied for from 2s. to 2s. 6d. per week. Funds being urgently required for the purposes of the institution, an exhibition of paintings and drawings by amateur artists has been opened at 120, Pall-mall, and well deserves a

\* See also "Town Swamps and Social Bridges," p. 42.

visit, apart from the excellence of the purpose. The Queen has been to see it, and made some purchases; for example, No. 5, "Old Gateway at Rotterdam," by Col. Northey. Amongst the contributions will be found some charming works by Mrs. Higford Burr, Miss Blake, Lady Augusta Cadogan, Mrs. Bridgeman Simpson, Miss Severn, Miss Amy Hogg, the Rev. S. C. Malan, Earl Somers, Sir Countess Lindsay, Lord Northampton, and many other distinguished and accomplished amateurs.

### PROVINCIAL NEWS.

*Ulverston.*—A new temperance hall and hotel are now in the course of erection in Ulverston; and a second donation of 600*l.* towards the cost has just been made by a lady resident of Ulverston named Miss H. Goad.

*Swansea.*—For years, says the *Cambrian*, the town has been steadily progressing in the character of its public buildings, whilst at this moment it seems as though its inhabitants were striving every nerve to swell its dimensions to their utmost limit: capital, energy, and tact, all seem concentrated in the one great feature of the town, "building." Swansea is daily stretching forth its arms in every direction. In the Burrows fields alone, 400 houses have sprung into existence within the last eighteen months; and not only so, but the foundations of 200 more are prepared. The large majority of these houses belong to working men. In the neighbourhood of Fygone, houses of a superior class are to be seen springing up in every direction, whilst pretty ornamental villas bespeak the more aristocratic and wealthy owners. Six terraces, containing 210 houses, are to be erected here forthwith. Northward, in the neighbourhood of the Havod, another large and important district has just sprung into existence. Streets upon streets have been laid out, and scores of houses erected, almost every one of which, as in other parts of the borough, is inhabited before it is properly finished.

### KEENE'S CEMENT AND INTERNAL DECORATION.

In a recent number of the *Builder*, p. 261, there are some remarks on "a marble cement," which no doubt have reference to the material we manufacture under the name of "Keene's Cement."

Objection is therein taken to the use of the term "marble," as inaccurately describing the properties of this plaster, which, it is said, "does not in the least deserve the name given to it."

It ought, however, to be explained that the term "marble-like" was originally applied to the cement as indicative of the hardness and texture of marble rather than of the colour of that material in its white and in this country most commonly employed form.

It is quite true that "ordinary workmen," that is to say, the plasterers who stucco our houses, cannot produce, with their every-day means and appliances, and with the labour ordinarily allotted to lime stuccoes, the marble-like effect of which these cements in other hands are susceptible.

To do this, is a department by itself, and belongs rather to the scagliolist than the plasterer. It is, in fact, artist's work. In such hands they are capable of immense development; and, when judiciously bleuded with colours, these cements can be made the means of very beautiful and yet not very costly ornamentation.

It must be said, however, though without intending reproach to an enlightened profession, that there is an almost morbid antipathy with many architects to the use of any cements, whether for external or internal decoration. This feeling has no doubt been mainly produced by their excessive abuse; but, carried to the extent that at present prevails, it simply operates to prevent the employment of materials which in careful hands and under proper guidance in the combination of forms and colours might be made as instrumental for the decoration of wall surfaces as are the productions of the ceramic art for the adornment of floors.

It may be that climate has something to do with the non-application in this country of these polished surfaces for walls. The condensation of moisture upon them in the cold season, and the consequent absence of that feeling of the "comfortable" which is paramount with every Englishman, often to the exclusion of all effect, seem to deter from their employment. This prejudice, however, is not confined to cements, but is extended to marbles, which, except on rare occasions, are

not, as they might well and economically be, employed for internal adornment. In Paris and other Continental cities it is common to see the halls and staircases of public buildings, the interiors of churches, and even the *magazines* of trade, enriched with Lyons and other native marbles, which, by the warmth of their colours and the varied beauty of their pencillings, replace real satisfactorily the stone-coloured walls and deal surfaces which are the prevailing characteristics of English decoration.

Where, however, a different course has been pursued, and where the so-called (and rather badly-abused) marble cements have been employed, with a due regard to their nature and capabilities, the result has not disappointed the expectations formed of them.

A portion of the interior of Dorchester House is being so decorated, at the present time, in a manner as satisfactory as its cost is moderate.

At the church in Margaret-street, where all "slans" were rigidly excluded, Keene's cement was found the most fitting material in which to execute, in conjunction with marble, a not unimportant part of the decoration.

At the large and handsome range of offices in course of erection in Mining-lane, the proprietor has not hesitated, even in that locality, to line the whole of his corridors and staircases with polished Keene's cement, in imitation of coloured marbles, with a very sparing admixture of white; and, though the first cost cannot be inconsiderable, he has judged, and no doubt rightly, that decoration so effected is done once and for all; and that, in producing an effect quite unusual, he has not departed from the principles of a strict economy.

We believe, then, we can justify the application given to this particular cement, but we do not on that account disguise the fact that many of the cements of every-day use, and, amongst them, perhaps, some that we ourselves make, are called by names which either convey no idea at all, or else a very inadequate one of their properties; and, moreover, that characteristics and qualities are claimed for them, which not having been always justified by results, do render it suitable that manufacturers should, from time to time, "revise the wording of their directions and of their claims." JOHN BAZLEY WHITE & DROTHERS.

#### FEMALE SCHOOL OF ART.

UNDER the patronage of Her Most Gracious Majesty the Queen, a *conversations* will be held at the South Kensington Museum for the purpose of raising a fund for erecting the building for the Female School of Art, on Thursday, 21st June, 1860. By permission of the Queen, the Kohinoor diamond, which has been recut since the Exhibition of 1851, will be exhibited, together with a collection of ancient and modern jewellery, which the council of the Fine Arts Club has kindly consented to provide for this occasion. The Marquess of Salisbury will liberally contribute the services of the band of the Herefordshire Militia for the night. The admission will be by tickets only, which may be obtained by any member of the committee of the Female School of Art. Gentlemen's tickets will be 5s. each, and ladies' 2s. 6d. each. We understand that the Clothworkers' Company and the Drapers' Company have each sent a donation of 20l. to the school.

#### ARTISTS' BENEVOLENT FUND.

The anniversary dinner of this Institution was held at the Freemasons' Tavern on Saturday evening last. The Right Hon. Lord Staley, M.P., presided, supported by Sir C. Eastlake, P.R.A., Messrs. George Doll, H. G. Bohn, C. J. Dimond (hon. sec.), J. S. S. Hopwood, Christopher Moore, Henry Warren (president), New Water Colour Society, David Roberts, R.A., William Boxall, A.R.A., E. W. Phillips, &c. The chairman made a strong appeal in favour of the fund. Speaking of its financial position, he said its income amounted for the past year to 1,120l., of which 630l. were derived from property invested. The sum granted in relief was 880l., or nearly 80 per cent. of the whole revenue. They had also an annuity fund, which was self-supporting, the benefits of the Benevolent Fund being confined to those who contributed to the former. That limitation of the scope of the society was more apparent than real; and whatever hardship it might occasion was obviated by the labours of another institution, not a rival but a coadjutor in the same field. The progress of the Artists' Benevolent Fund, since its first establishment half a century ago, had been steady and uninterrupted.

It had accumulated 20,000l. of invested property, showing an average saving of 400l. per annum. The guests were not very numerous, scarcely seventy, but a subscription of more than 600l. was announced. The Institution is considerably indebted to its present honorary secretary, Mr. C. J. Dimond.

#### BUILDERS' FOREMEN'S PROVIDENT INSTITUTION.

THE annual festival of the members and friends of the Builders' Foremen and Clerks of Works' Provident Institution was held on Wednesday last at the Bay-tree tavern, St. Swithin's-lane. The chair was occupied by Mr. Joseph Taylor, and the vice-chair by Mr. R. Webster. About 120 gentlemen sat down to dinner. The cloth having been removed,

The Chairman proposed "The Health of the Queen," which was drunk with loud applause.

The toasts of "The Prince Consort and Prince of Wales" and "The Army and Navy" having been disposed of,

The Chairman, in proposing the toast of the evening, "The Provident Institution of Builders' Foremen and Clerks of Works," observed that he regretted the Institution had not a better advocate, but he assured them that no one could sympathize more deeply than he did in the welfare of the Institution, or had its interest more at heart. He had been in the ranks himself, and, although it was a long time ago, he could look back with pleasure to the time and could sympathize with those who were doing their utmost in their several spheres to promote the interest of their employers, and to improve their own position in society. It had been truly stated in the report that, notwithstanding the number of magnificent buildings which were rising daily in all parts of the metropolis, it too often happened that the very men who were the means of carrying them out were, in the decline of life, unable to obtain those comforts which tended so much to make life endurable. The Builders' Provident Institution had been founded to meet these exigencies, and he could point to two recent cases in which the widows of men who were in the ranks, and who had been suddenly cut off, had been saved from want by its instrumentality. He hoped the Institution would continue to prosper, and the progress which it had made was so satisfactory, that he had no doubt upon the point. When they commenced they had but twenty members, and now they had upwards of 200, with 2,000l. of capital invested. He was sure it was needless for him to dilate upon the benefits of provident institutions. Some persons in early life objected to insure their lives, for they said that they were in good health, and that they would not want it. It was, no doubt, very well to have a sovereign in one's pocket, but it was a very bad thing to be without it, and there was no one who could say that however prosperous he might be now, a rainy day might not come. He hoped that those who heard him might never have to appeal to the Institution, but it was their duty to subscribe to it, and he only regretted that it was not better supported by the great and wealthy builders of the metropolis. He knew that their governor, Mr. Lee, took the utmost interest in it, but it was within his own knowledge that many builders who had been for several years in the trade had never heard of it. It was therefore the duty of those who managed the affairs of the institution to bring it under their notice, and, by inducing them to subscribe, show them the way to remember it for the future. He hoped that all who were present that evening would endeavor, by inducing others to join the institution, to give a practical proof of their desire to increase its prosperity and extend its usefulness. He proposed in connection with the toast the name of Mr. Webster.

Mr. John Lucas, the secretary, read the annual report, which, after referring to the individual cases in which assistance had been afforded to the widows and families of deceased members, stated that there had been received, in the year ended the 30th of April last, from honorary members, 101l. 17s.; from ordinary members, 148l. 11s. 2d.; and from dividends, 69l. 10s. The cash invested on the 5th of April was 1,833l. 17s. 6d.; the balance in the hands of the treasurer and secretary amounted to 120l. 15s.; and the cash in the bank to 361l. 15s. 7d.; making the total assets 2,316l. 8s. 1d. The disbursements during the year included payments to pensioners, 93l. 11s.; funeral expenses, 6l.; and gratuities, 5l. Weekly stipends were also paid to several persons who had become chargeable on the funds.

The library report, which was also read by Mr. Lucas, thanked Mr. Burnell for his exertions in

its behalf, and stated that the principal cause which had contributed to the improvement of the library had been by the removal of the Institution from the Bay-tree tavern to the inn at Lyon's-inn, where much more convenience was afforded for placing the bookshelves within the reach of members on all meeting-nights; the result of which had been greatly to increase the number of readers, and also the demand for new books,—a demand which the committee had complied with by purchasing some of the most valuable books recently published.

Mr. Webster returned thanks in suitable language for the manner in which the chairman had connected his name with the toast. He had long taken a lively interest in the welfare of the institution, and he assured the architects, engineers, and master builders of the kingdom that there was no benevolent institution in the country which had greater claims upon their consideration. He was glad to say that the attendance of the members at the library was gradually increasing since their removal to Lyon's-inn, and that the members continue to take the greatest interest in the works provided for their instruction and amusement.

Mr. Samuel Trickett next proposed the health of the "Governor and Trustees of the Institution."

The Chairman said he was the only trustee present, but that he would take care to convey to their Governor (Mr. Henry Lee), the kind manner in which the toast had been responded to.

Mr. Joseph Kay proposed the health of "The Chairman," which was acknowledged in fitting terms by that gentleman.

The Chairman proposed the health of the visitors and friends, coupling with the toast the name of Mr. Matthews.

Mr. Matthews responded to the compliment, and expressed his hope that the society would each year continue to find many friends—not merely friends in name, but friends who would not hesitate to show, by an appeal to their purses, that their friendship was of a practical and benevolent character.

After some other toasts, including "Absent Friends," and the "Stewards and Officers of the Institution," the company separated at a late hour.

#### STAINED GLASS OF GLASGOW CATHEDRAL.

Sir,—In your able journal, vol. 18, No. 597, page 210, you have inserted a paragraph in reference to the stained glass of Glasgow Cathedral, alluding also to the rejection of a window by Mr. Ballantyne of Edinburgh. Not having seen the works already erected in that cathedral, I can have no critical objection in writing this, nor, from being in practice myself, would it become me to do so even if I were not an amateur. In answer, however, to the question here of the same class as the glass at Peter House, Cambridge; Mr. Hope's Church, in Kent; and elsewhere: indeed, I have a letter from a gentleman in Glasgow, who is a minister there, containing a sketch of one of the windows already inserted in the cathedral, which confirms it; and I must say that it is not calculated to make an impression of very high notions of its appropriateness or despatch.

The same authority states that 3l. per foot super. is paid for the figure and canopy work of Early English windows, and for Geometric windows, however, are not confined to the Munich school alone, as my informant says: there are two from Brussels, and one from Dresden. Such being the case, it must have been wrongly put to the Board of Works, to have elicited such a reply as you quote; and how the "original agreement to have only Munich windows" can be reconciled to the facts to the contrary, I cannot understand.

I freely admit that art cannot be held to be of any particular nationality; and, if Continental art is clearly superior to native, in my opinion it should be preferred, both for the sake of example and progression, but on no account otherwise; and unless this can be clearly shown, and the superiority made manifest, it is a just and discouraging to native talent. It is the more especially so when the artist is employed on national funds, which are derived from artists themselves, in common with the rest of the community: nor is it less so, when the works are under national cognizance, as they thus become national honours, which native artists have a natural right to share in. Reciprocity is a most desirable feeling, provided the sentiment be mutual, but how stands the present case? Were English art profoundly pre-eminent over Continental, and yet during its forty years' progress, much inferior and trashy work has been brought from time to time from the Continent. John Bull has a great notion of the excellence and cheapness of things from abroad; often fancying he has met with great bargains, when, in fact, he has too frequently found a mare's nest, and is really paying dearly for things he could have obtained better at home. It may occur to some that, our Scotch neighbours have the reputation of being cheap in parting with the siller, the cheapness of foreign art may have had some influence in this matter; but, as I have shown, much larger prices are paid for foreign art than British artists usually demand.

Individually, this matter is of no importance to me; and it is only from a sense of justice that I address you, feeling as I do, without any prejudice towards foreigners, that no works that I have seen, in Belgium, Germany, or France, give them any claim, even to equality, with the average works in this country by native artists. Couleuvre and the other artists are almost all of them invariably at war about; nor can this be wondered at: they have not the successive varieties of architecture that we have here, hence their inegritty of design; but when called on to do a design for the condescend to borrow from us, as I shall presently show.

Mr. Currie and his son called upon me expressly to state that in passing through Munich they had visited the royal manufactory of stained glass; and seeing that they appeared to treat everything as pictures, without reference to style, they were curious to learn how they would deal with the Norman period: they therefore asked for a design for a Norman triplet. After much searching of portfolios, a lithographic coloured print of a Norman triplet was produced, as the very best thing they could recommend, stating that it was faithful from the original, and that they could not do better than adopt it. The question of where could it be seen? proved a very puzzling question; so Mr. Currie said: "I will tell you: the windows are in the Church of Bromley St. Leonard's, and Bow Lane; and were executed by Mr. Warrington, for me, as memorials to my father, who was many years incumbent of that parish, which you will discover by the inscription."

It is also said that the photograph from Glasgow was sent to me chiefly to show that the border of that window was a literary copy of mine in the Bromley St. Leonard's window. I do not by any means complain of this, as the contrary is a constituent one of the illustrative plates of my "History of Stained Glass," it is public property; but when great people bring great artists (?) from abroad, to place them in ludicrous positions of inferiority or exclusion of ours, we do not expect to be plagiarized by them.

WILLIAM WARRINGTON.

#### ROYAL ACADEMY.

Sir.—In your excellent paper on the Royal Academy, of the 17th inst., I read the following passage in the speech of Sir Charles Eastlake, when proposing the health of her Majesty's Ministers, in reference to the position of the Academy:—

"The exertions of the artists have been great, and it is only to be regretted that all the meritorious works included in this year's display could not be placed in the situation they deserved. Indeed, some of us have been repeatedly compelled to do so for no other reason than that *fit places could not be found for them!*"

Is not this a most melancholy fact to proclaim in a society like ours, where science and art are so much developed, and which ranks herself at the head of progress?

Could not the Royal Academy adopt the system found of giving great satisfaction on the Continent, when space is insufficient for pictures *once accepted*, viz.—that of dividing them into two "categories," one half or more, if possible, to be hung during one month or six weeks, and the other half by those remaining. This operation would be of small trouble to the Academy, and would give great satisfaction. During the three days only, last year at Paris, it was closed for three days only, to change the position of nearly all the pictures admitted, so as to give a fair chance to each artist.

Certainly our wealthy Academy might afford the loss of *three days*.

At the exhibition of Brussels, which takes place every three years, the Government puts at the disposal of the commission of artists, their magnificent building, the "Musée" (National Gallery).

The artists' pictures being boarded in by 1-inch planks, covered with green baize, the pictures admitted being hung upon them. Occasionally also, as in 1851 and 1857, a special temporary pavilion was erected, and thus few artists, whose works had real merit, were disappointed.

G. B.

#### THE PATHS IN HYDE-PARK.

You remark, on the walks in Hyde-park, that the turf banks are protected, and the gravelled ways defined, and you add that in the Regent's-park these walks are kept. The reason of the difference appears to me to be this: in one case the walk is composed of a fine level material pleasant to walk upon; in the other the gravel is coarse and pebbly, most unpleasant to the feet. I cross these parks frequently, and at times a layer of broken shells is put on, and the turf then escapes injury; but, as if the public were required to do penance, this agreeable material is superseded by a coarse, ruddy, loose gravel, which drives pedestrians aside, and you may see the made path deserted, and extempore tracks struck out at each side. If this were noticed and attended to, all parties would be better served, the public would have a proper path, and the managers would not see their work spoilt.

C. H. H.

#### ARCHITECTS' ACTIONS.

COPIED BY B. BUNCOMBE.

Is this cause, tried in the Exchequer Court, Mr. Montague Chambers being plaintiff, and Messrs. Currie and his son defendants, and Mr. Griffiths for the defendant. It was an action to recover the sum of 70l. 8s. for work done as an architect and surveyor.

The defendant was formerly an attorney at Taunton, but took to the employment of farming, and employed the plaintiff to put a new roof on to the farmhouse, as well as to make other alterations. When the plans and specifications were complete, and the work commenced, the plaintiff discovered that, owing to the state of the walls, all attempts to repair were hopeless, and suggested to the defendant that he had better build a new house. Fresh plans, elevations, and drawings were accordingly made, and the house completed, the plaintiff charging, for both sets of plans, &c., 2 per cent. on the outlay. The defendant paid him altogether 48l. 11s. 4d.,

and the question in dispute was whether the plaintiff was entitled to recover 21l. 16s. 8d. more.

Some architects were called, who swore that the plans, &c., were sufficient for all practical purposes, although not so elaborately finished as they themselves would have turned them out, nor perhaps quite so perfect in detail; but still they were sufficient for the guidance of the carpenters and bricklayers employed upon the work.

For the defence it was urged that, after making the plans and drawings, having previously closely inspected the house, the plaintiff said that he must make the alterations required, and that he must prepare fresh plans for a new house; but, instead of preparing original plans, they were, with the slightest alterations, mere copies of the original ones; that the plaintiff had made journeys when they were quite unnecessary, charging three guineas for each of them; that the working plans were so defective that the workpeople were unable to work by them, and made complaints to that effect; that the staircase was ill-fitted to the house; two of the ceilings cracked across, and the floors were uneven; and that the sum the plaintiff had already received was a sufficient remuneration for his services.

His lordship left the whole matter to the jury, who found for the plaintiff for the balance he sought to recover.

#### CHURCH-BUILDING NEWS.

**Colchester.**—An addition has been made to the Roman Catholic church in Prior-street, to meet, in some measure, the demand for increased accommodation, caused by the establishment of the camp in this town. The walls of the sacristy have been carried up as high as the parapet of the church, so as to form a transept opening into the church by a semicircular arch in the same style as the main building (Anglo-Norman). The exterior is of white brick, relieved by a string course of red brick and a cross in the same material. The architect is Mr. Walter Scargill, the contractor Mr. John Hun; both of Colchester.

**Oxford.**—The preparations for the erection of the new church of St. Philip and St. James, in the parish of St. Giles, have been so far advanced as to admit of laying the foundation stone, which has been done by the bishop of Oxford. The proposed edifice is in the Medieval style of architecture, and will be capable of containing about 600 sittings. The design is by Mr. Street, and the edifice, which will be built by Mr. Joseph Castle, is to be constructed of Bath stone from the Coombe-down quarries. The entire cost of erection will be between 7,000, and 8,000.

**Sandy ( Beds ).**—St. Swithin's Church, Sandy, previous to its restoration by the architect, Mr. W. G. Habershon, of London, was one of the most dilapidated in the county. It has now been thoroughly renovated and enlarged. To its chancel, built in the Decorated period, 45 feet in length, has been added aisles, with two moulded arches on each side dividing the same from the chancel, and which spring from clustered columns with carved capitals. A new chancel arch has also been added. Carved oak stalls have been placed in the chancel. The chancel is paved with Minton's encaustic tiles; and in the nave and elsewhere being simply black and red, in diagonal pattern. The ancient sedilia and piscina have been scraped and left entire. The organ, which formerly stood in an unsightly gallery at the west end, blocking up the tower, but now removed, has been placed in the new north chancel aisle. The pulpit is executed in Caen stone; the prayer-desk is of oak, with Decorated tracery. The seating in the nave is of pitch pine, merely varnished, and similar in design to the old seating. The additional accommodation gained by the recent alterations is 268 sittings—the total being 642. New stained deal roofs have been added throughout, with the exception of the chancel, which has been boarded and panelled internally. Old windows have been restored with their tracery, where possible, and new windows inserted elsewhere, with tracery. The east window being a four-light, it is hoped before long stained glass will be inserted. A wooden south porch has also been added. The tower, which was in a very decayed state, and which during the repairs required careful watching on the part of the clerk of the works (Mr. Jackson), forms an interesting feature. The total cost of the works will amount to upwards of 3,000l. Mr. Wing, of Bedford, was the contractor. The sub-contractors were Messrs. Small & Freshwater, of Bedford, and Mr. Haines, of Girtford.

**Staugham (Sussex).**—The church here is to be completely repaired. The building has long been in a bad state of repair. The roof will be removed, and extensive alterations made both in the interior and exterior. The portion of the church known as "De Covert Chapel," in which is a carved sandstone monument of that family, is to be thrown into the body of the church. The present pews will be taken away, and open seats substituted. Mr. Joseph Clarke is the architect, and the works will be carried out by Mr. Parker Ayers, the builder of the lunatic asylum at Hayward's Heath, Offham church, the Cuckfield Union church, &c.

**Birkenhead.**—St. Paul's Presbyterian Church, Jackson-street, Birkenhead, has been opened. The style is Middle-pointed Gothic, and the edifice consists of nave and aisles of four bays, with engaged tower and spire at the north-west angle. The tower is divided into three stages, and terminated with plain spire, surrounded with four plain pinnacles, and four lucerne lights, the whole height amounting to 120 feet. Stoutest stone has been used for the front and returns of the building, and the rest of it is built of red brick, with such stone dressings as were indispensable. Provision is made for constructing a gallery on the two sides and the end over the vestibule. High two-light windows, with lancet heads, light each side of the church, and in the recess behind the pulpit is a large marigold window, to be filled in with stained glass. The cost of the building, when finished, will be about 2,500l. The ground-floor will seat 500 persons, and the galleries, when erected, some 280 more. Mr. John Pooley is the sole contractor for the work, and Messrs. Hay are the architects.

**Manchester.**—The foundation stone has been laid here of a new Greek church. The site is at Higher Broughton. The building will be of the Corinthian order externally. The front will have a portico of four columns in the centre, and two pilasters on each side; the sides will have a series of pilasters, with windows in the compartments between them. The doors and windows will have ornamental dressings. Internally, the building will be divided into nave and aisles. The aisles will have flat parallel ceilings, and the nave a circular ceiling intersected by circular windows, to form a clerestory which will not be visible externally. The clerestory walls will be supported on columns which, with the pilasters attached to the aisle walls and all the inside cornices, will be of the Ionic order. A screen, the panels of which will be filled with paintings, will extend across the whole width of the church to divide it from the sanctuary or chancel. The sittings for ladies will be 28 inches wide, and those for gentlemen will be 24 inches wide, instead of 20 inches. The ladies' seats will have doors, and the remainder will be open. Each sitting will be divided from the adjoining by an ornamental elbow. The following will be the inside dimensions of the church: length, 94 feet; width, 46 feet 9 inches; length of apse, 12 feet 6 inches; width, 20 feet 9 inches; height of aisles, 21 feet; height of nave, 32 feet. The church will be divided in length by pilasters on each side and columns in the nave into eight compartments or bays, each, both in the aisles and clerestory, will contain a window. All the front of the building and the principal portion of the sides will be faced with Hollington stone, and the remainder of the sides with white bricks and cement. The design was selected in a private competition, and is furnished by Messrs. Clegg and Knowles, of Manchester, architects, under whose direction the works are to be carried out. The cost will be about 5,500l. The following contractors undertake the several works: J. Griffiths, excavating and brickwork; Ellis and Hinchliffe, masonry; Bowden and Co., joiners' work; V. Kitchen, ironfounders' work; R. Heywood, plumbing and glazing; G. and J. Kirkley, slating; W. Ward and Co., plastering and painting.

**Bradford.**—The foundation stone of St. Stephen's Church, Bowling Old-lane, Bradford, was laid on Saturday, July 2nd, 1859, and the consecration of it has just taken place. It is the second of the ten new churches to be built within five years. The site was given by Mr. E. B. W. Balme. The style of architecture is Decorated. It consists of nave with aisles, and chancel of the form of a hexagonal apse. The tower forms the north-west corner of the north aisle. The following are the general dimensions:—Nave, 75 feet by 50 feet 4 inches; aisles, 75 feet by 13 feet; chancel, 25 feet by 21 feet; vestry, 13 feet by 14 feet; tower, 9 feet by 2 feet. The west end is lighted with a five-light window of considerable dimensions, without any geometric or interlacing tracery, the lights following the rake of the window arch, and foliated in their heads. The aisles have windows of three lights, foliated, and are in pairs, separated by buttresses. The windows at the ends of the aisles are of two lights, foliated, as is the case with the vestry window, which is at the east end of the south aisle. The windows of the chancel are longer than those in the nave, and placed higher in the wall. They are four in number. The tower is of three stories, and gabled on its four sides, and has its slated roof rising from the points of the gables. The slating is vari-coloured. The nave and chancel roofs form one continuous line of equal height. The interior of the church is divided by aisles into four bays on the north side and six

bays on the south side. The piers are circular, the soffits of the arches moulded. The nave receives a large addition of light from the introduction of dormer lights into its roof. These dormers are four in number on either side of the nave roof. They are of two lights, similar to those in the east and west ends of the nave. The roof of the apse naturally assumes a somewhat different form, and runs down the wall, resting upon stone brackets. The various contractors for the work were the following:—Masons, Messrs. Birkby & Holdsworth; joiner, Mr. Jas. Neill; plasterers, Messrs. Brayshaw & Muff; plumber, Mr. J. Scholefield; slater, Mr. John Hill. The architects were Messrs. Mallinson & Henley, of Bradford. There are (including 134 sittings for children) 611 sittings, of which 461 are free. The entire cost is something like 2,500l.

### Books Received.

*Report of a Committee of the Working Classes of Edinburgh, on the present overcrowded and uncomfortable State of their Dwelling-houses: with an Introduction and Notes.* By ALEXANDER MACPHERSON, Secretary to the Committee. London: Hamilton, Adams, & Co. 1860.

THE Edinburgh working men are taking into their own hands the question how to improve their homes,—a question which presses at least as heavily upon the working-class denizens of Edinburgh as upon those of London. As regards a remedy, however, the difficulty will probably not be so great in Edinburgh, where suburban ground may be readily got at what a Londoner would conceive to be an easy and convenient distance from the central parts of the town.

Dissatisfaction with their want of healthful and convenient homes having induced the Edinburgh workmen to hold a public meeting (on 15th July, 1858) on the subject, that meeting appointed a committee to investigate and report on the whole question. This committee solicited Mr. Macpherson's aid as secretary; and the report under notice is the result. The view finally adopted, after much deliberation, was simply to recommend their constituents to offer themselves as tenants for a certain description and locality of property, which they conceived, or had discovered, was most suited to their wants and convenience, trusting that some Joint Stock Association will result to supply the expressed demand. Model dwellings for the working-classes do exist to a very limited extent in Edinburgh; but the reporters are by no means satisfied with them even as a model, and it is stated by Mr. Macpherson in his Introduction, while alluding to the financial failure of the model buildings in St. Pancras and Gray's-inn-lane, that the Edinburgh schemes are too much like these in financial respects. Besides, the charitable element does not seem to be approved of in Edinburgh any more than in London, and the "ominous resemblance to a charity workhouse" in the interior of one at least of the Edinburgh model houses, called the "Ashley-buildings," has had a repellent influence, just as the like resemblance had at St. Pancras, we remember, on the workmen of London.

The description of property conceived to be most eligible is given in detail in a sub-committee's report on the plans. It is based on the flat system, which appears to be deliberately chosen by the Edinburgh workmen, generally, as well as by their committee, in preference to the London or so-called self-contained system. On the subject of the plans, the sub-committee's report says:—

"The property should consist of tenements about 55 feet by 38 feet, and may either be of three or four stories in height, according to circumstances. Each flat should consist of two houses, containing room and kitchen and two bed recesses, with a pantry, a water-closet, and sink with soil pipe; the height of the ceilings not less than 9 feet; the size of the kitchen, exclusive of the bed recess, 10 feet by 11 feet 6 inches, and of the room 12 feet by 9 feet. The water-closets should be placed in the passage behind the outer door, with a borrowed light into the staircase. The staircase should be thoroughly ventilated, both by openings made from the front wall through the joisting to the stair passages, and by the roof; it should also be well lighted, by means of glazing, between the rafters, the whole part of the roof which covers the staircase. The passage and stair should be 31 feet wide. The whole property should be finished in a neat but plain and substantial manner. The walls of rubble, 22 or 24 inches thick; the partitions of brick from top to bottom. There should be no lead on in every house, and brackets fixed both in the room and kitchen. It would be a saving to the property were the fire grates, also fixed. Lastly, in accordance with several suggestions which the committee have received, we recommend that Arno's valve should be built into every kitchen chimney."

The cost of the sixteen houses thus provided, is

estimated at 1,350l., or about 81l. 8s. each, and the rent to be received for each is put down at 7l. 10s.; giving a return of 7 per cent. after allowing for ground-rent, repairs, and taxes.

The sleeping accommodation provided is manifestly insufficient.

*A Course of Six Lectures on the various Forces of Matter, and their Relations to each other.* By MICHAEL FARADAY, D.C.L., F.R.S. Edited by WILLIAM CROOKES, F.C.S. With numerous illustrations. London and Glasgow: R. Griffin & Co. 1860.

THE discourses and speculations of Dr. Faraday have been for many years a delight to young and old, and, although the present course was designed specially for the young, it will not the less be read with pleasure and profit by all who take any interest in science and philosophy. The chief purpose of these lectures was to point attention to, and to prove, by experimental illustration, the close connections which exist between the various forces of nature, or rather the protuberant aspects which force in the abstract seems to assume. Thus heat enables us to eliminate, or it assumes the forms of light, electricity, magnetism, and chemical action; chemical action those of light, electricity, and heat; all the forces of nature thus tending to form a mutually dependent series of systems. Into the theoretical causes of this correlation we do not mean here to enter, but we may refer to an article in the *Builder* of November 11th, 1854, by J. E. Dove, titled "Electricity and its alleged Connection with Disease: What is Electricity?" in which some light of rather a peculiar description appears to be shed upon the subject of forces in general and their special connection with the molecular and other forms of matter in the organic economy of nature. We prefer, in the present instance, to offer our readers a passage from Dr. Faraday's last lecture of the series before us,—namely, on "Lighthouse Illumination: the Electric Light," as an example of the style of the little book under notice:—

"By means of a magnet, and of motion, we can get the same kind of electricity as I have here from the battery; and, under the authority of the Trinity House, Professor Holmes has been occupied in introducing the magneto-electric light in the lighthouse at the South Foreland; for the voltaic battery has been tried in every conceivable circumstance, and I take the liberty of saying it has hitherto proved a decided failure. Here, however, is an instrument wrought only by mechanical motion. The moment we give motion to this coil from in front of the magnet, we get a spark. It is true in this apparatus it is very small, but it is sufficient for you to judge of its character. It is the magneto-electric light; and an instrument has been constructed as there shown, which reports a number of magnets placed radially upon a wheel—three wheels of magnets and two sets of helices. When the machine, which is worked by a two-horse power engine, is properly set in motion, and the different currents are all brought together, and thrown by Professor Holmes up into the lantern, we have a light equal to the one we have been using this evening. For the last six months the South Foreland has been shining by means of this electric light—beyond all comparison better than its former light. It has done in France, and has been seen there and taken notice of by the authorities, who work with beautiful exactness with us in all these matters. Never for once during six months has it failed in doing its duty—never once, more than was expected by the inventor. It has shown forth with its own peculiar character, and this even with the old apparatus,—for as yet no attempt has been made to construct special reflectors or refractors for it, because it is not yet established. I will not tell you that the problem of employing the magneto-electric spark for lighthouse illumination is quite solved yet, although I desire it should be established most earnestly (for) repairs this magnetic spark as one of my own offspring. The thing is not yet delicately accomplished, and what the considerations of expense and other matters may be, I cannot tell. I am only here to tell you, as a philosopher, how far the results have been carried, but I do hope that the authorities will find it a proper thing to carry out in full. If it cannot be introduced at all the lighthouses, if it can only be used at one, why really it will be an honour to the nation which can originate such an improvement as this,—one which must of necessity be followed by other nations."

*Barclay's Designs for Marking Silver-plate.* London: 22, Gerard-street, Soho.

WE have here a series of designs of a new kind, together with a few prefatory remarks, the whole written, designed, engraved, and published, by Mr. George Barclay, the well-known heraldic art designer and engraver. In pursuance of this new idea of Mr. Barclay's, it is contemplated to omit totally the system of producing effect by shading, composed of innumerable fine and close lines, and to substitute, instead, expression in outline by a bold and vigorous drawing:—

"Immediately preceding our rapid acquisition of wealth, which led to the still increasing use of silver-plate," remarks the author, "the style which had intruded in the history of art exercised a material and most unhappy influence over, and a still perpetuated upon, most silver articles. Some really glorious productions of the present day, and the facilities to an extended variety of form which electro-silvering contributes, promise an emancipation of the manufacture from the narrowing influence and hitherto slavish adherence to French ornament."

And the fifty-one designs for spoon and other handles now given are intended to show how endless is the variety and how graceful are the outlines which may be traced in this way, even on so homely and restricted a heraldic "field."

### Miscellanea.

**BENIHAM'S BARRACK AND HOSPITAL COOKING STOVE.**—Reference having been made to this apparatus in the House of Commons and the daily papers, our readers may like to have some particulars of it:—The apparatus consists of an oven, built of brick or stone, and heated by a fire, the flame from which passes into the oven and out at a flue. There is also a flue round the outside of the oven, in which a number of boilers or saucapans are fixed for cooking meat, soup, vegetables, &c. The same furnace heats the oven and the boilers. Above this furnace there is a hot-water boiler, which also supplies steam for steaming potatoes, puddings, &c. &c., which are placed on trays or in perforated boxes in the steam-chest. By this arrangement all the processes of roasting, baking, holding, and steaming, may be carried on simultaneously, and it is said with a very remarkable economy of fuel; or bread may be baked in large quantities if required. It is intended especially for the use of the army, and has already been adopted by the War Department for the barracks at Woolwich, Edinburgh, and Gibraltar. It appears, however, to be suited for workhouses, and other large establishments. The evidence in its favour in the shape of official reports is certainly very strong.

**THE SANITARY WORKS OF WALLASEY.**—Sir: In the very able report on "Sanitary Progress," at p. 275, I perceive my name is mentioned as having devised and executed the sanitary works of this district. I beg to say that I cannot lay claim to so much honour, as the drainage scheme executed under my supervision here was a premeditated design of Mr. Charles Macpherson's, the then surveyor to the Wallasey Board, and the present borough engineer of Edinburgh. I therefore deem it due to that gentleman to beg your insertion of this letter.—JAMES T. LEA.

**THE EXITS AT ST. MARTIN'S HALL.**—Sir: A recent letter to you on the subject of the exits from Exeter Hall, in case of fire, or commotion, reminds me of the same sad deficiency at St. Martin's Hall. On an oratorical night this is most disagreeably felt, and should there happen a panic some evening, I fear serious accidents and loss of life would occur. Perhaps you may be able to bring this subject before the proper parties, and thus prevent so direful a calamity.—J. E.

**OUR REVIEW OF THE ACADEMY EXHIBITION.**—In connection with our review, last week, of the architectural drawings exhibited at the Royal Academy, we are asked to mention that the architect for (No. 634) East Tyrley Parsonage, Hants (erected at the expense of Sir F. H. Goldsmid, Bart), was Mr. Charles Smith, of Reading.

**SOME FREE EXHIBITIONS.**—The Bridgewater Gallery of Pictures and Sculpture at Bridgewater House, Cleveland-square, St. James's-street, by the kindness of the Earl of Ellesmere, is open to the public by free tickets which admit parties of four persons. These cards may be had gratis of Mr. Smith, 137, New Bond-street.—Sir John Soane's Museum, Lincoln's-Inn-Fields, may be viewed every Tuesday, Thursday, and Friday, by tickets previously obtained by written application to the curator at the Museum.—The paintings at Dulwich may be seen without the trouble of obtaining tickets as formerly.—The Exhibition of New Inventions at the Society of Arts is open every day, and on Wednesday evenings from seven till ten.—The Elizabethan Mansion, Knowledge-park, closely adjoining the town of Seven Oaks, is shown to visitors for a small consideration each person every day. The house contains a collection of art treasures and curiosities.

**ST. LEONARD'S, BRIDGENDORTH.**—Sir: As one of the committee for the restoration of the parish church of St. Leonard's, Bridgendorth, permit me to correct your report of the proceedings at our last meeting. The question was simply whether or no a London architect should be employed in preference to Mr. Griffiths, the local architect. Mr. Scott was not proposed at all; and of the three London architects who were—W. Slater, C. Ainslie, and B. Ferrey—the first-named gentleman was elected, and has since completed his survey of the church, the restoration of which will be commenced at once.

WILLIAM PETERON, Curate.

**THE DRINKING-FOUNTAIN MOVEMENT.**—A drinking-fountain is in course of erection in the Zoological Gardens, Regent's-park, from a design representing a water-lily surrounded by foliage, executed in white marble, by Mr. John Bell, sculptor. Preparations are also being made to place in the gardens now forming the centre of Battersea-park two fountains, sculptured from a classical design by an eminent artist.—The drinking-fountain which is erected at the Royal Exchange, is in the form of a young girl, emblematical of Temperance, pouring the refreshing beverage from the water-bottle into a cup placed for the use of drinkers. This work is the gift of Mr. Samuel Gurney.—A fountain has been opened in the centre of Wandsworth. The design, which is the work of a gentleman in the parish, consists of a column, surmounted by a globe-shaped lamp, the gift of a lady, with suitable cups, and a trough for cattle.—A drinking-fountain has been erected at Great Horton.—A fountain has been inserted in the wall of St. Andrew's Church-yard, Newcastle-upon-Tyne, adjoining the Gallowgate Baths and Washhouses.—A fountain in marble has just been erected in the western portion of the Stirling Cemetery Grounds. The design was executed by Messrs. Barclay & Reid, of Stirling.

**STRIKES.**—At Malvern, the larger number of the building-trades' workmen, about 100, have struck for a ten-hours' day's work and short Saturdays.—The joiners and carpenters at Bury have struck for an advance of wages from 1*l.* 6*s.* to 1*l.* 8*s.* a week.—A ten-hours' movement is being agitated at Middlesbrough among the bricklayers, joiners, and others, and a strike is threatened.—At Leeds, some bricklayers' labourers struck for an advance of 1*s.* a day; but the advance has been agreed to.—At Glasgow, the Council of Trades' Delegates have passed a resolution to the effect that from the conflicting statements made by the different parties in the painters' strike, they are not in a position to give any other advice than that the matter can be easily settled by mutual arbitrators; and, until the masters agree to arbitrate they will consider the operatives in the right, and entitled to the support of all the associated trades of Glasgow.

**MOVEMENTS.**—For the Andrews' Memorial at Southampton three designs were submitted by Mr. Brannon, one by Mr. Pedley, one by Mr. Guillaume, jun. (representing a statue upon a pedestal), and one by Mr. C. Turner, and also a wax model by Mr. Fryer. Mr. Brannon's designs each exhibited a statue standing upon ornamented Gothic and Romanesque compositions, with iron railings, &c. Mr. Pedley's design consisted of a statue standing upon a square pedestal, upon the sides of which are figures illustrating the leading incidents of Mr. Andrews' life. Mr. Turner's represented a statue standing on a plain pedestal. The committee selected two designs, that of Mr. Pedley, and one of Mr. Brannon's, and referred them to a sub-committee to report upon, and to bring up specifications and estimates.

**THE PROPOSED PUBLIC OFFICES FOR LIVERPOOL.**—A report by the special committee on the plans for new public offices in Dale-street was read at the last meeting of the town council. The report recommended,—1st. That the area of land to be occupied by the offices should not exceed the quantity which would have been available for that purpose had the proposed arrangements for the erection of a new post-office been carried out. This quantity would have been about 4,750 square yards, upon which, in the opinion of your committee, a building may be erected affording all the required accommodation for municipal purposes, including a council-chamber. 2nd. That the cost of the building, exclusive of land, should not exceed 60,000*l.*, a sum which your committee believe would be fully adequate for the erection of a suitable character. Should the council approve of these views, your committee will direct plans and estimates to be prepared in accordance therewith for the consideration of the council." A motion was put that the proceedings be confirmed, but an amendment, postponing the consideration of the report till the next monthly meeting of the council, after a good deal of discussion, was carried by a majority of 25 to 19.

**EXHIBITION BUILDING FOR MONTREAL.**—The Montreal council has resolved that power be asked from the Legislature to contribute an amount, not to exceed 5,000*l.*, towards securing to Montreal a permanent site and building for exhibitions of the industrial products, and for a museum and gallery of the fine and industrial arts, and for that purpose to issue bonds redeemable in six years, and bearing interest at 6 per cent. It is proposed to have the building completed before the visit of the Prince of Wales.

**THE FOREIGN-OFFICE.**—In answer to a question put by Sir John Shelley, Mr. Cowper, the Chief Commissioner of Works, stated last week, in the Commons, that some temporary accommodation must be found for the Foreign-office, while the present building was being pulled down, and the new offices erected. A plan had been under consideration by which the house of the clerk of the parliament would be used for that purpose. Before spending any money on the new building, a plan would be submitted to the House for its consideration as promised.

**THE EXTERNAL STONERWORK OF THE HOUSES OF PARLIAMENT.**—Sir F. Kelly asked the Chief Commissioner of Works whether he had received the report of Sir Roderick Murchison and Professor Faraday on the processes for preserving the external stonework of the Houses of Parliament, and whether he had any objection to lay the same before the House, together with copies of the instructions or minutes of reference to those gentlemen? Mr. Cowper said he had received the reports alluded to; but inasmuch as they were given more for his own private guidance than for any public use, he did not feel justified in producing them. But at the same time he was ready to take upon himself the responsibility of any course which he might take in consequence of these documents.

**STAINED GLASS AT ST. GILES'S, CAMBERWELL.**—The committee report to the subscribers and parishioners generally the progress made with the chancel windows, four of which have already been fixed by the artists, Messrs. Lavers & Barraud. The committee hope that the parishioners will enable them by their contributions to complete the whole of the six windows at once, under designs by the same artists. The following are the windows already fixed. Eastern window, north side;—"St. Peter entering the House of Cornelius;" "St. Peter healing the Cripple at the Beautiful Gate of the Temple;" "St. Andrew following our Lord;" "St. Andrew's Martyrdom." Eastern window, south side;—"St. James the Great called at the Sea of Galilee;" "St. James the Great's Martyrdom;" "St. John leaning on the Lord's Breast at Supper;" "St. John at the Foot of the Cross." Centre window, north side;—"St. Philip bringing Nathaniel to our Lord;" "St. Philip's Secret Prayer, 'Lord, show us the Father.'" "St. Bartholomew's Secret Prayer under the Fig-tree;" "St. Bartholomew coming to our Lord." Centre window, south side;—"St. Thomas expressing his Unbelief;" "St. Thomas confessing his Faith;" "St. Matthew called from the Receipt of Custom;" "St. Matthew's Feast in his House."

**BIRMINGHAM ARCHITECTURAL SOCIETY.**—The annual general meeting of this society was held last week, when the report of the council was read, and the officers elected for the ensuing year. Mr. J. G. Bland was elected president, Mr. W. Harris vice-president, and Professor Chamberlain honorary secretary. Mr. Empson exhibited two views of the Exchange at Monte Video. Mr. J. H. Chamberlain exhibited drawings for the alterations at Umberslade Hall, and specimens of wood carving by Mr. Barfield. Mr. J. G. Bland exhibited the prize plan for the Stroud Church competition.

**CAMBRIDGE ARCHITECTURAL CONGRESS.**—During Whitson week, it is proposed to hold in Cambridge a congress of various architectural societies, under the presidency of A. J. B. Beresford Hope, Esq. Professor Willis will attend, and give a lecture on "The Architectural History of the University," on Monday, the 25th inst. On Tuesday, an expedition will be formed to Ely; and on Wednesday, Mr. Hope will give a lecture on "The English Cathedral of the Nineteenth Century." On Thursday, an expedition will be made to Bury St. Edmund's.

**VOTING AT THE INSTITUTE.**—Sir: Some changes being proposed to be inaugurated at the Institute, I think the mode of election urgently requires revision. The greatest difficulty is found in getting people to vote; so that it may happen that one adverse vote, counting four, may override the assent of the entire meeting. Such a surprise could in some measure be obviated by taking the numbers again. For my own part, I would rather have open voting, than that the Institute should be made the instrument of private malice.—MEMO.

**PUBLIC CARRIAGE-WAY ACROSS HYDE-PARK.**—A petition from many of the residents north and south of Hyde-park has been presented to Parliament, praying for some more direct communication than they yet have had between these districts. Lord Ebury supported the prayer of the petition, and also Lord Llanover and Lord Powis.

**WATERWORKS.**—The total cost of the Pentrich Waterworks extension is estimated at 1,758*l.*—At Kirkaldy, a scheme is being agitated for obtaining an abundant supply of water to the town and district from Lochgelly Loch. Mr. John Sang, C.E., calculates that the loch will afford storage-room for 25,000,000 of cubic feet, and afford a supply of 625 gallons per minute. The pipe-track will be five miles in length. The cost of the whole undertaking he estimates at from 13,000*l.* to 14,000*l.* The burgh trustees have remitted the matter to a committee.

**THE POLYTECHNIC INSTITUTION.**—A public meeting was held on Monday last, in the Lecture-hall of this Institution, Regent-street, under the re-organized management of the Institution, to lay before the shareholders and the public the steps that had been taken towards its re-opening, as well as to commend it to the public for that amount of support necessary to the accomplishment of such intention. The Earl of Shaftesbury occupied the chair. The formation of the present company virtually commenced in August last, and at a subsequent meeting it was resolved that a company be formed, with a capital of 20,000*l.*, in 2,000 shares of 10*l.* each. At a general meeting of shareholders the directors were authorized to purchase the building for a sum not exceeding 4,000*l.*, and accordingly agreed to pay to the official managers appointed by the Court of Chancery to wind up the affairs of the late Institution the sum of 4,000*l.* for the leases, furniture, and apparatus. It is estimated that a further sum of 4,000*l.* will be required for repairs, thus making a total expenditure of 8,000*l.* Up to the time of meeting 900 shares had been subscribed. The committee, however, have only called up 7*l.* per share, rendering a sum of 6,300*l.* available from shareholders. They have received 600*l.* in donations, and have power to raise a guaranteed loan for 650*l.*, making a total sum of 7,550*l.*, which leaves a deficiency of 450*l.* on the price of purchase and estimated repairs. It is greatly to be desired that the few additional shareholders required should be forthcoming. So valuable a piece of instructive amusement should not be lost.

**THE SEWAGE QUESTION.**—A Wellington correspondent, Mr. B. Shaw, builder, sends us a plan and sections of an apparatus (for which he is taking out a patent) for filtering the sewage of London (or other towns), and which, he says, if carried out, will produce a vast amount of valuable manure, and effect the purification of the river Thames. After describing the diagrams, which relate mainly to subsiding apparatus, he says,—“By the above arrangement, the whole body of mud and water would be reduced to a stagnant pool, allowing the solid particles to subside or settle in the pans, while the filtered water would pass off in a thin sheet, freed from its impurities. The whole apparatus will be so arranged as not to be an obstruction during heavy rain or thunderstorms. The method which I propose for working the apparatus is by mechanical means entirely, viz., an engine traversing the whole space occupied, at an elevation sufficient to empty the pans into railway waggons, to be conveyed to the most eligible place, where I leave it to agricultural chemists.” In explaining a diagram representing a stench-trap, he says,—“It is for places where the drain is on a level with the floor in which the trap is fixed, such as cellars (or in a channel passing through a number of partition walls), in which case each occupier would be obliged to collect his own portion of rubbish, and could not force it on his neighbour.” One trap “was a handle to lift it out by, when full of mud, to be cleaned, filled with cleau water, and put in its place again.”

**INSTITUTION OF CIVIL ENGINEERS.**—The annual conversation given by the president of the Institution of Civil Engineers, will this year take place on Tuesday, the 5th of June, instead of the 29th inst., as at one time intended. Mr. G. P. Bidder occupies the office of president.

**HARDENING SAWS AND STEEL PLATES.**—Mr. Seth Ward, Pimlico, proposes to place two metallic discs, or plates, furnished with ribs, or other projections, sharpened to a feather edge, on two iron pins, so that when the faces of the ribs or projections are brought together by means of a screw and nut they will retain in its proper position, and straighten, any saw or other plate of steel which has been heated and placed between them, and prevent the same from warping or bending when the whole apparatus is immersed in the hardening liquid, which, however, is not prevented from having free access to every part of the saw or steel.

**THE MERTHYR WATERWORKS.**—A report upon the state of progress of these works has just been sent to the Local Board of Health. By this scheme it is intended to take the waters of Taff Vachen, at Pont Stiecell, and 1,050 feet above sea-level, by a main pipe, down the valley, nearly six miles; the diameter of the main pipe being 14 inches. At Poubry the pipe terminates in a succession of filter beds, and a pure water-tank for the immediate supply of the district. In respect to the most important contract, the report says:—"The land for the large reservoir has been enclosed, and the new road is nearly ready. The puddle trench is in progress; but is prepared for fifty navigators, and about ninety-six are now at work. . . . It was, in the first place, necessary that the foundations of the embankment should be very completely examined, and the ground probed, by the sinking of trial shafts through the clay, silt, and gravel, down to the solid rock. Some difficulty was experienced in finding a competent contractor to sink these shafts; and, as it was necessary to provide against water, it was found economical to purchase a small pumping-engine, which has been transferred to the contractor. The results of the trials were very favourable, so that we are assured that the embankment or dam will be firm and substantial." The report speaks of November for the completion of the whole of the works.

**SINGULAR DESTRUCTION OF A RAILWAY BRIDGE.** The bridge of the Newcastle and Carlisle Railway across the Tyne at Scotswood has been destroyed by fire. The Board of Trade had sent Colonel Yolland down to inspect it. A number of engines were run backward and forward on the bridge, sometimes keeping one standing on it for nearly an hour at a time. It is supposed that the hot ashes from the engine fires had got in between the crevices of the wood planking, where it had smouldered for some time and then ignited. A meeting of the Newcastle Town-council was convened for the day of the fire, for the special purpose of adopting measures to oppose the amalgamation of the Newcastle and Carlisle with the North-Eastern Railway unless this identical structure was removed, as it was a great hindrance to navigation and river improvement. But while they were assembled a telegraphic message arrived that the Bill was thrown out in committee, and they had not been long dispersed when intelligence arrived in the town that the bridge itself was in a blaze.

**SCULPTURE.**—There may now be seen in the studio of Mr. Goodwillie, sculptor, South-street, says the *Elgin Courier*, a group of very strange-looking figures, representing monks, knights, templars, and Augustine canons, all cut out of our Morayshire sandstone. The figures are to be placed over the windows of Callen House, one of the residences of Lord Seafield, who in this, as in many other respects, is an encourager of the fine arts.

**COPPER DEPOSIT IN LOWER CANADA.**—The richest and most extraordinary copper mine in the world, it is said, is now opening at Acton. The great Burra Burra of Australia is said to sink into insignificance, and the richest mines of Europe to be pigmies, beside this mineral giant. Here presents itself a great bed of ore, says the *Montreal Commercial Advertiser*, so vast, so pure, and so wonderful, that it is almost as much past belief as it is beyond all previous experience. Where the deposit has been opened up there is exhibited a mass of ore from 30 to 40 per cent. pure, 60 feet long, by 30 feet wide, and of an unknown depth. A single blast put into the mass threw out 7 tons of ore, worth 1,050 dollars. The expenditure of 300l. has already sent to market at Boston 90 tons of ore, which realized 150 dollars per ton, or 3,125l.

**"THE CHAP THAT ROW'D THE PLATES."**—Standing the other day at that part of the Polytechnic where Messrs. Lockwood's large model of the iron troopship is placed, we felt ourselves pulled gently by the arm, and, on looking round, perceived a little sandy-whiskered man in an attitude of inquiry:—"Aw say, mister," said he, with an unmistakable *bur*, "will you read us this card?" We read the card, which described the proportions, hulls' name, &c., of the vessel aforesaid. "Is there owt about the chap that row'd the plates?" inquired he anxiously. "No," responded we, rather smilingly. "Why, aw's the chap that row'd the plates, and they hanout put my name of the card, if aw ony could write mesel aw'd put it doon." Exit the Northumbrian in disgust. Well, thought we, here at least is something which needs correcting. We commend it to the notice of the Polytechnic committee.—*Stockton Gazette.*

**HOW WE DISFIGURE.**—Sir: Since I have become a reader of your interesting and philanthropic journal, and an observer of the beautiful illustrations you give every week, I have taken notice of the buildings of London and elsewhere, both ancient and modern, public and private, and have even passed an opinion to myself as to the effect, convenience, or propriety of decoration of any building which came under my observation. I was surprised to see, the other day, disfiguring what to me appeared to be a noble staircase at St. Martin's Hall; large advertisements advising the people to reform their tailors' bills, and informing the public that footmen's liveries could be purchased for 3l. 3s. Now, sir, it seems to me very inconsistent of the proprietors of this hall, after going to a great expense to decorate the staircase with coloured medallion portraits of the greatest musical composers the world has produced, to hang a parcel of signboards in close proximity to these portraits, thus marring the art of the architect and the painter. Such proceedings must confirm foreigners in the opinion that we are a nation of shopkeepers.—**A WORKING MAN.**

**PUTTING ON THE SCREW.**—The *Chicago Press and Tribune* describes the raising, by means of screws, of a solid front of first-class business blocks, 320 feet in length. The block comprises thirteen first-class stores, and a large double-marble structure—the Marine Bank buildings—all presenting an unbroken front, and filled with occupants! The block had been raised 4 feet 8 inches in five days, and the masons were busy putting in permanent supports. The entire weight raised was about 35,000 tons, and so carefully had this been done that not a pane of glass was broken, and the interior of the block had remained undisturbed, 6,000 sewers and about 600 men had been employed in the process. The paper adds that the work as it then stood was worth a walk of miles to see, and had been the marvel and wonder of the inhabitants since it had commenced. This is the way to raise architecture out of the dirt.

**HOW TO STRENGTHEN THE ENGLISHMAN.**—The Rev. Baptist Noel has lately published a letter to the noblemen and gentlemen who encouraged the late prize fight. After urging the evils likely to result from the encouragement of the prize-ring, the writer continues:—"You say that you wish to make the people manly, when they work all day in ill-ventilated workshops until they are exhausted, and then poison themselves with drink? If you wish them to be manly, improve the ventilation of their workshops and cottages, raise their wages by encouraging emigration, teach them self respect by a good education; then, with good food, temperance, and a sense of duty, you may make them the bravest and manliest nation in the world."

**TENDERS**

For erecting new warehouses, at No. 22, London-wall. Mr. E. Woodthorpe, architect:—

Myers	£4,339 0 0
Lucas, Brothers	4,319 0 0
Jeffery	4,299 0 0
Piper & Son	4,219 0 0
Ashby & Son	4,111 0 0
Brown	4,035 0 0
Turner & Sons	3,989 0 0
Wilson	3,981 0 0
Brown & Robinson	3,933 0 0

For erecting new warehouses, at Nos. 23, 24, and 25, London-wall. Mr. E. Woodthorpe, architect:—

Myers	£4,439 0 0
Lucas, Brothers	4,222 0 0
Jeffery	4,229 0 0
Piper & Son	4,130 0 0
Ashby & Son	3,960 0 0
Brass	3,893 0 0
Turner & Sons	3,819 0 0
Brown & Robinson	3,775 0 0
Wilson	3,769 0 0

For Mr. Norman's new house and premises, in the Drapery, Northampton. Mr. E. F. Law, architect, Northampton:—

Young, Lincoln	£3,868 0 0
James Watkin, Northampton	3,798 0 0
Dunley, Ilsworth	3,729 12 4
Costford, Northampton	3,720 0 0
Clifton, Leicester	3,735 0 0
Pooley, Liverpool	3,430 0 0
John Watkin, Northampton	3,399 0 0
(accepted)	3,390 0 0

For malthouses, at Lincoln, for Mr. R. G. Hunt. Mr. Charles Bully, architect, Newark. Quantities supplied by Mr. Charles Poind:—

Ashton, Retford	£2,379 0 0
Pretwell & Henderson, Newark	2,350 0 0
Ward, Lincoln (accepted)	2,298 0 0

For erecting two houses, in the English-lod, Islington. Mr. F. G. Widdows, architect:—

Wood	£1,650 0 0
Smith	1,000 0 0
When	997 0 0

For the drainage of the ground, and also for the erection of chapel, lodge, tool-house, and boundary-wall, for the Battersea Burial Board:—

	Drainage.			Barrel Drain.			Total.		
	£.	s.	d.	£.	s.	d.	£.	s.	d.

For Painting, Plastering, and Decorating:— Messrs. Ward & Co. (accepted). £235 0 0

For pair of houses, to be erected for Mr. Richard Howard, in the Calverley-road, Taurbridge Wells. Mr. Henry H. Crouk, architect. Quantities supplied:—

Barrett	£1,675 0 0
Walker	1,689 0 0
Pink	1,830 0 0
Noakes	1,789 13 0

For erecting a dwelling house, at Upper Norwood. Mr. B. A. C. Herring, architect:—

**One House.**

Turner & Son	£1,445 0 0
Marsland & Son	1,350 0 0
Brown & Robinson	1,335 0 0
Coleman	1,349 0 0

**Two Houses built at same time.**

Turner & Sons	2,819 0 0
Marsland & Son	2,710 0 0
Coleman	2,698 0 0
Brown & Robinson	2,670 0 0

For St. Job's Catholic Schools, Birmingham. Mr. E. Welby Pugin, architect:—

Hardwick & Sims	£1,608 10 0
Brayson & Gwyther	1,575 0 0
Gascoyne	1,575 0 0
Wilson	1,539 0 0
Briggs	1,461 10 0

For additions and repairs to two villas, at Leigham Court Avenue, Streatham. Mr. R. Drew, Architect. Quantities not supplied:—

Warburton	£1,280 0 0
G. Todd, Junr.	1,210 0 0
Downs	1,160 0 0

For constructing two pairs of small villas, at Tottenham, for Mr. Thomas Keadley. Mr. T. H. Bawley, architect:—

Rivett, Stratford	£1,163 0 0
Umphery, Tottenham	1,135 0 0
Bank, Tottenham	1,062 0 0
Gosden, Tottenham	1,039 0 0
Chapman, Tottenham	1,045 10 0
Cushing, Tottenham	938 0 0

For the new congregational chapel, schools, enclosure-walls, &c., Little Hampton, Sussex. Mr. James G. Stapleton, junr, architect:—

Blaker	£1,110 0 0
Snewin	1,075 0 0
Ellis	1,048 0 0
Bushby	947 0 0
Canon (too late)	850 0 0

For house, at Tooling. Mr. James G. Stapleton, junr, architect:—

Fulton	£1,039 0 0
Ridgway	890 0 0
Ridkin	879 0 0
M'Lennan & Bird	876 0 0
Sweeting	864 0 0
Newman & Mann	770 0 0
Canon	770 0 0
Scott	760 0 0
Brazier	750 0 0
Harding	732 0 0
Gates	670 0 0

For repairing two houses, Nos. 115 and 117, Pentonville-road, including taking down and rebuilding part of back front of one house. Mr. J. B. Watson, architect:—

Morley	£110 0 0
Barnes	83 14 0
Blanch	85 0 0
Wright	68 0 0
Helm	42 10 0

# The Builder.

VOL. XVIII.—No. 903.

Funeral of Sir Charles Barry.

ON Tuesday last the remains of Sir Charles Barry were removed from his late residence, on Clapham-common, and buried on the north side of the nave of Westminster Abbey, nearly opposite to the fifth column from the west, and in close neighbourhood with the resting-place of Robert Stephenson. Mourning-coaches, scarfs, and hat-bands were provided at the Institute of Architects, the Institution of Civil Engineers, the Royal Academy, and elsewhere, for the members of council of the various bodies who had accepted the invitation to attend; and these, together with the private carriages of friends, assembled at the foot of Vauxhall-bridge, and ultimately there fell into procession with the hearse. In Westminster the houses were mostly closed. On the Victoria Tower, the crowning work of the architect, the Union Jack was hoisted half-mast high; and at each angle of the tower was suspended a black flag. Opposite the tower—and this was the most striking and touching feature of the event—stood 500 of the workmen who have been engaged on the building, volunteers from places far and near, and who, as the hearse passed them, reverently took off their hats. They who saw the movement will not soon forget it. The tears come into our eyes involuntarily as we recall it in writing. They were as fine a body of men as were ever seen, mostly in mourning, and represented with credit the working men of England. Of course they afterwards went into the nave.

At a few minutes past one o'clock the cortege arrived at the Abbey, and a procession was formed at the cloister door, through which the body was to be brought. It consisted of the High Bailiff of Westminster, who led the way; the bedesmen of the Abbey, the Rev. S. F. Jones, M.A., incumbent of St. Matthew's, Spring-gardens, and Minor Canon of Westminster; the Rev. C. M. Arnold, M.A., Minor Canon; the Rev. J. C. Haden, the Precentor; the Rev. J. Lupton, M.A., rector of Quenchith, and Minor Canon of Westminster; the Venerable Archdeacon Pentkirk; the Rev. Lord John Thynne, sub-dean; the Rev. Canon Jennings; and the Very Rev. the Dean. Then followed the coffin. Sir Charles Eastlake, P.R.A.; Mr. G. P. Bidder, P.I.C.E.; Mr. A. J. Beresford Hope (Architectural Museum); Mr. C. R. Cockerell, R.A., President of the Royal Institute of British Architects; Right Hon. W. Cowper, M.P., her Majesty's Chief Commissioner of Works; Lieut.-Gen. the Hon. Sir Edward Cust, the Very Rev. the Dean of St. Paul's, and Mr. Tite, M.P., F.R.S., were the pall-bearers. The family of the deceased, consisting of Mr. Charles Barry, Mr. Edward M. Barry, and three other of his sons less known to our readers, were the chief mourners.

Of the House of Commons there were the Right Hon. Lord John Manners, Mr. J. Green, Mr. R. S. Gard, Sir Joseph Paxton, Sir Morton Peto, Sir Alexander Hood, Mr. W. F. Hume. The following societies were also represented:—Of the council and members of the Royal Academy, there were Messrs. Thomas Creswick, A. Elmore, J. H. Foley, D. Maclise, H. W. Pickersgill, David Roberts, Sydney Smirke, Richard Partridge, P. F. Poole, G. G. Scott, J. T. Willmore, S. A. Hart, J. R. Herbert, G. Jones, P. Macdowell, F. R. Pickersgill, R.

Redgrave, R. Westmacott, T. S. Cooper, E. W. Cook, H. O'Neil, J. P. Knight, Sir Edwin Landseer, Charles Landseer, W. C. Marshall, J. Philip, C. Stanfield, W. E. Frost, F. Goodall, and R. J. Lane. Of the council and members of the Royal Society:—Rev. J. Barlow, Sir Roderick I. Marchison, Mr. Gassiot, Mr. C. R. Weld, and Rev. W. Walton. Of the Council of the Institution of Civil Engineers:—Sir John Kennie, F.R.S.; Messrs. H. Gregory, T. Hawksley, James Sturpison, T. H. Wyatt, J. Cubitt, Joseph Locke, Charles Manby, F.R.S.; J. Hawkshaw, F.R.S.; J. E. Ellington, J. Murray, J. Forrest, J. R. Maclean, T. E. Harrison, and T. W. Hemans. Of the Council of the Architectural Museum:—Messrs. Joseph Clarke, R. Brandon, E. Christian, Rev. T. Scott, G. Scharf, R. D. Chautrill, W. Slater, J. Gibson, M. J. Lomax, and G. E. Street. Some members of the Architectural Association, whose names have not reached us. Of the members, Council, and Vice-presidents of the Royal Institute of British Architects:—Sir W. R. Farquharson, Bart.; Messrs. T. L. Donaldson, Digby Wyatt, and George Godwin, F.R.S., Vice-Presidents; J. H. Stevens, J. Norton, C. Fowler, J. B. Bunning, H. E. Kendall, T. M. Lewis, James Bell, G. Morgan, G. Vulliamy, S. Angell, H. Ashton, D. Burton, F.R.S.; D. Mocatta, F. C. Penrose, F. J. Francis, R. L. Roumieu, B. Ferrey, J. J. Scoles, T. Bellamy, Owen Jones, A. Salvin, and J. Pennothorne.

The Duchess of Sutherland and Lord Carlisle had seats in the choir, together with Archdeacon Hale, the Dean of Chichester, Mr. A. Anstun and Mr. H. Hunt (from the Board of Works), Mr. Franks from the Society of Antiquaries, and the representatives already mentioned. Mr. Thomas Grissell (by whom the Houses were for the most part erected), his brother, Col. Grissell, Mr. John Thomas, Mr. Quarm (who has acted as clerk of the works), Mr. C. H. Smith, and others connected with the deceased in his great work, were also there.

The following members of the Institute, named as we recall them, no one being before or after the other, undertook, under the direction of Professor Donaldson, to conduct the various bodies to their seats:—Messrs. John Papworth, Robert Kerr, Wyatt Papworth, F. P. Cockerell, C. F. Hayward, Good, J. S. Donaldson, W. M. Teulon, Matthew Wyatt, A. J. Baker, W. J. Green, S. Salter, Bright Smith, Octavius Hansard, James Edmeston, J. J. Cole, H. A. Darbishire, H. H. Burnell, A. Cates, Chas. Fowler, jun., T. E. Kneightley, W. Lightly, &c., so that everything went smoothly.

In addition to those already named, there was a numerous attendance of members of the Institute, the Association, the Architectural Museum, and others, including Messrs. Edward Hall, E. H. Roberts, E. Salomons, G. M. Hills, J. M. Lockyer, G. Mair, Whichcord, James Noble, G. Myers, J. Billing, T. Bury, Hakewill, Kendall, jun., Tarring, Woodthorpe, W. G. Rogers, Garling, C. Mayhew, Leicester, T. Bury, G. Truefit, Oliver, E. Nash, Wigginton, E. B. Lamh, Cobbett, Knowles, Freeman, Jennings, W. Burges, R. R. Rowe, Clutton, Pocock, P'Anson, Tress, Boulnois, Allason, T. Roger Smith, Penfold, Harger, Currey, E. Falkener, Hon. Arthur Gordon, the Rev. K. Burgess, John Jay, Jeakes, Bond, Hardman, G. Plucknett, Jabez James, &c.

As the procession passed through the nave to the choir the minor canons and choristers sang "I am the Resurrection and the Life," adding greatly to the solemnity of the scene. As soon as the coffin had been deposited under the choir screen, the anthem, "When the ear heard," was sung, and the appointed lesson from the 15th chapter of the 1st Epistle to the Corinthians was read by Lord John Thynne. The procession was then re-formed, and moved back to the grave in the nave. Here the coffin was uncovered. It was of oak, with a raised cross, further defined by nail-heads, above the plate, and an orb below it. The plate was inscribed "Charles Barry, Knight, R.A., F.R.I.B.A., F.R.S. Died 12 May, 1860, aged 64 years."

If he had lived until Wednesday last, he would have been 65.

When the coffin had been lowered into the comparatively shallow grave prepared for it (it did not seem more than 6 feet in depth), "Man that is born of a woman" was sung, and the Dean (French) proceeded with the burial service, which he read with impressive earnestness, the anthem—"I heard a voice from Heaven," being sung in its appointed place. At the close of this portion of the service, the choir sang—"His body is hurried in peace, but his soul liveth evermore."

It was an impressive scene. The crowd, large as it was, gathered beneath the vault of the grey old Abbey (itself beautiful, exceedingly), was an assemblage of friends, not of vacant spectators: all, with very few exceptions, were in mourning, and the general feeling was one of sorrowful regard. Sir Charles Barry has gone to his rest, universally regretted and esteemed, and from this time forward will find few detractors. "Death hath this also," says Bacon, "that it openeth the gate of Fame, and extinguisheth envy."

The arrangements were made by a committee of the Institute, Mr. J. G. Crace materially assisting. The moving spirit, however, was the estimable Professor of Architecture at the London University. All honour and love to Thomas Leverton Donaldson, the head and hand in every generous and kindly movement connected with the profession!

The following acknowledgment has been addressed by Lady Barry to the workmen who, as we have already mentioned, took part in the funeral ceremony:—

"The widow and family of the late Sir Charles Barry return their hearty thanks to those workmen who, having laboured under his direction during his lifetime, have this day attended him to the grave. They recognize in that attendance, not only a kind and cordial sympathy with their own sorrow, but also a proof of the respect with which his memory is regarded, and of the pride and interest felt in having aided to accomplish what his genius had conceived.

Amidst all the consoling memories of this day, there is none on which they will dwell with greater pleasure; and their thanks are given, not so much for themselves as for him, who, as he felt a cordial interest in all his fellow-labourers, so would have been deeply touched by such a proof of their respect and sympathy with him.

Clapham Common, 22nd May, 1860."

## A SKETCH: MAY 22, 1860.

(Founded on the suggestion that the very day first used for his funeral was one on which the great architect of our age might have hoped to crown, with the Royal Standard, the superb Tower of Westminster, just finished; the dearest wish of his later years having been the desire to live to see it complete.)

ON the proud summit of Victoria's Tower,

At last—at last—

See Victory's flag spring grandly to the peak!

Hurrah!

The gilded crest is on,—

Crown of the princely task;

Let fly Old England's ensign, and hurrah!

Hush! Boaster, hush!

Mark that dim speck up on the giddy height,—

He gazes down

Upon his DREAM;

Bear with him if in awe;

For he was young when that fair dream was new,

And he has dreamt until his hair is grey,—

Grey with the dreaming of illustrious age.

Hush! hush! it is not he.

Oh, yes, it was his fondest hope,—

His hand alone must let the flag fly free

On the crown'd summit of his mighty Tower.

See how it trembles on the pole,—

Sweeps gently through the lazy morning air,

And flutters as in play.

The wind is waiting for the signal stroke,

When all the bells shall ring out merrily;

Then England's flag of victory

Shall gleam across the sky!

Oh, hush! there are no merry bells to-day;

There is no flag of victory

To gleam in the blue sky.

It trembles on the pole,—

It flutters as in play,—

And the breeze waits:—until a mighty heart  
Gives God glad thanks for victory!  
The fairy dream  
Of half a life of intellectual toil  
(Alas!—he muses—but, as yesterday,  
This was a vision of the hope—  
A castle in the air)  
Clings round his brain,—his eye may well be dim,—  
Kind summer wind,  
Blow softly through his thin grey hair,—  
Light up his smile,—  
And fan the gleam of his clear eye.  
Why do the bells delay?  
Why keep the flag of England's pride  
Thus fluttering at the pole?

Hush, hush! the flag of England's pride  
Hangs—half-mast high!  
The long-awaited day has come,—  
The long-awaited crown is set  
Upon Victoria's Tower,—  
The Fairy DREAM is dream no more,—  
The princely task is done.  
But the summer wind on that royal height—  
Oh! it lifts not his thin grey hair;  
It fans no gleam in his gleamless eye,—  
Lights up no smile, and waits no prayer,—  
And the flag of a thousand shouts of joy  
Droops drearily in woe.

DEATH, with the silent footfall of a king,  
Came with the midnight hell,—  
Thy work is done;  
Thy fame complete:  
What favour more hast thou to win?  
What more applause to meet?

What! not—*one—hour—of warning?*  
Nay, why an hour's delay?  
When work is done,  
And battle won,—  
When dream is dream no more,—  
Why stay to dally with inglorious ease?  
“One day,” he whispered, “one short day,—  
One day from midnight now to noon,—  
That from the crown of great Victoria's tower,  
I may but lose the flag!”

The old King took him by the hand and smiled.—  
“It shall be better, and yet better done:  
The flag shall fly!  
The flag shall fly in victory!  
I, Victor of all victors 'neath the sun,  
For thee, and for thy victory,  
Myself will loose the flag!  
Victor, in Victory's hour—  
Thus I release thee from thy work well done;  
Thus I admit thee to the hero-land;  
Thus—*at thy post*—I claim thee for thy fame,—  
Death's honour to the greatest!”

But, oh! the flag hangs trembling on the pole;  
It flutters sadly in the summer's heat,  
Droops wearily upon the golden crest  
That crowns that Fairy Dream!

#### ON THE ARCHITECTURAL CAREER OF THE LATE SIR CHARLES BARRY.\*

No one can be more sensible than I am of the extreme difficulty attendant on the satisfactory discharge of the duty which has been imposed upon me this evening by our sincerely respected president; a difficulty enhanced in no slight degree by three circumstances—the shortness of the time in which the following remarks have had to be prepared; the ability and manly feeling with which the *Builder* has already put you in possession of many facts, some of which must be recapitulated in any memoir of our distinguished and lamented friend; and last, not least, my own inadequacy to so great and so touching an occasion. Who, gentlemen, could dare, but in a spirit of almost paralysing reverence, to pronounce a funeral oration upon the architect of St. Paul's? And who amongst us will feel inclined to deny that the architect of the New Palace at Westminster is worthy of an equal tribute of respect and regard at the hands of these who, having known and admired him living, have now only to mourn and venerate him dead? Praying your indulgence, therefore, for any involuntary shortcomings, I shall proceed to address myself, after a few preliminary observations, to the story, and, as far as I may be able, to the moral, of the architectural career of the late Sir Charles Barry.

Of such men it is occasionally said, that they cannot be rightly appreciated in their own generation, and that it is not until intervening time

may have, as it were, permitted “the mind's eye” to recede sufficiently to be enabled to embrace generalities, and blend them according to proper pictorial conditions, that the relations of such men to the circumstances by which they may have been surrounded can be justly estimated. Of the philosopher, legislator, politician, and of the hero who dominates in the feverish turmoil of class against class, or nation against nation, this observation may frequently hold good, but of the great artist, comparatively rarely. His creations are of an essentially monumental character, and it has scarcely ever occurred that the author of works commonly known at the date of their execution, and ultimately accepted by the universal verdict of posterity, has failed to be recognised by his own generation, and certainly by contemporaries in his own profession, at his approximate value. There is in fact no more distinctive and vital characteristic of true art than its universality. Really creative power is neither for this time nor for that class, but for all time and for all classes,—for the present as for the future, and for the future as for the present. The poet, the painter, the sculptor, the musician, the architect, appeal in their highest efforts to sympathies, aggregate as well as individual. From this inherent condition of universality in all great works of art emanate three especial bonds of union and affection:—Firstly, between genius and the world at large; secondly, between genius and all who, however devoid of it, may be endeavouring to achieve success in the same department of art; and, thirdly, between genius and kindred spirits of all ages, who, in pursuits of the most widely differing natures, have reared their heads aloft above the average of mortality, and won admission to that noble brotherhood whose very names have become landmarks in the history of civilization. In the death of every great artist these bonds receive a sudden shock, which, however it may jar and strain, can never break them. There can be no higher tribute to the ascendancy of genius than this impotence of death itself to finally sever bonds of union between mind and mind which it can only slatter, and it is the very measure of this impotence which affords the best scale for ascertaining the nature, force, and amount of the loftiest order of human creative power.

Let us for a moment apply it to the case of the friend we have lost, and try his memory by the three bonds described as at once the essential tests, concomitants, and rewards, of genius, contradistinguished from mere talent, industry, and experience.

In the first place, then, can the world at large cease to esteem the designer of the Houses of Parliament, the Reform and Travellers' Clubs, Bridge-water House, Clifden, or Trentham? Surely to this the only answer can be,—Yes, when they have forgotten Sir Christopher Wren and Inigo Jones, Bramante, Claude Perrault, and Palladio; and not till then. In the second place, can we, as architects, or can they who may succeed us when we shall rest from our labours, as our friend now rests from his, cease to regard with interest and admiration the models for study bequeathed to our art in monuments such as those, on the production and perfection of which his most strenuous efforts were concentrated? Surely never so long as architecture remains a fine art, based on any recognized laws of symmetry, eurythmia, fitness, and proportion, can we fail to appreciate works in which (whether under a more or less classical or medieval garb) the true importance and, indeed, indispensability of a rigid but at the same time free subordination to those laws, are more fully vindicated than (according to my belief) in the works of any other architect who has lived for at least two centuries?

Can, in the third place, Sir Charles Barry be refused admission to that fraternity figured in the immortal school of Athens by the immortal Raffaello? Most assuredly not. There, as in the sanctuary of the illustrious dead in which his remains will be deposited to-morrow, a place may be clearly retained for him; and whenever Wren, and Jones, Vignola, Peruzzi, Palladio, Sansovino, San Michele, and others whose title is undisputed, join that group in which Bramante and Archimedes are all conspicuous, Barry and Visconti, Schinkel, and Von Klenze (when he shall be taken from us), may find their places as no unworthy representatives of the architectural genius of the nineteenth century.

Tried by such tests, by the minutest study of his works, their number, excellence, importance, novelty, fitness, and promise of stability for ages, and by the influence exerted through his example upon the current practice of his art, Sir Charles Barry may be no hyperbolic straining be classed with Wren and Jones, with Wykeham and with

Waynflete. Let us now trace, far too briefly, the steps of conscientious labour by which this glorious and enduring pre-eminence was attained.

Charles Barry was born on the 23rd of May, 1795, of parents in a comfortable position in life, and resident in Bridge-street, Westminster. From mere boyhood he displayed and indulged a marked talent for drawing; and I have been told that it was his habit to sketch all over the walls of the bedroom in which he slept. When no more space was left he would paste lining-paper over the surface he had covered with scribbles of his fancies, and start afresh upon a new series. The first part of his education Barry received at Mr. Wright's academy, now Mr. Beaufoy's,—Carron House, South Lambeth, where he was at school as early as 1804; the latter part he gained at Christ's Hospital. At the age of sixteen he was articled to Messrs. Middleton & Bailey, respectable surveyors to the parish of Lambeth, with whom he appears to have remained about five years. One of these gentlemen at least must have been able to give his pupil artistic instruction, for I observe the name of Mr. Bailey, of Lambeth, appended to several designs in the exhibition of an ambitious character, such as “For a National Museum and Cemetery,” &c., during the term for which his apprentice had been bound to him.

Barry must have been a tolerable draughtsman at the time of his entry into his master's office, for so early as 1812, before he was seventeen years old, he was admitted as an exhibitor at the Royal Academy; and, singularly enough, his first exhibited drawing was “A View of the Interior of Westminster Hall,” the very building which, as it were, served as the key-note to his greatest work in art's years. It appears in the catalogue of 1812 as the production of “C. Barry, at Messrs. Middleton & Bailey's, Lambeth.” It was on his way from his father's house to the office in which he worked that the young student met every day another young lad *en route* from Kennington, where he resided, to the chambers of Mr. Joseph Gwill, to whom he was articled. That young lad was the Mr. Wolfe whose friendship and intimate sympathy proved in after-life a permanent source of pleasure and comfort in all the most trying epochs of Sir Charles's career. The two youths soon made acquaintance, and mutually aided one another in the studies, on their proficiency in which they supposed that their future advancement would depend. Mr. Wolfe, it is well known, was induced to abandon the pursuit of his profession for more immediately lucrative occupation; but the divergence of their paths in life never chilled the mutual regard of these two enthusiastic young students. In 1813, “C. Barry” made his *début* at the Royal Academy with an original design, “for a church.” In the following year his contribution is of a still more ambitious nature, being for no less a monument than “A Museum and Library, with an Observatory.” In 1815 he re-appears, still giving his address “At Messrs. Bailey & Middleton's, Lambeth,” with a more practical effort in the shape of “A Design for a Group of Buildings for a Nobleman's Park; comprising a Picture gallery, Library, Music-room, Conservatory, and Billiard-room.” In the following year, to the best of my belief, several events happened, which suffice to account for his absence from the Exhibition of 1816. His articles expired, he fell in love with the lady whom he subsequently married, and his father died. All of these circumstances, coupled with the fact of his coming into the immediate possession of a few hundred pounds, caused him to resolve upon, and to carry out, against all the advice of his family, a bold step, on the indispensability of which to the attainment of that excellence upon the acquisition of which he had firmly set his heart, he had fully made up his mind.

In April, 1817, he accordingly quitted England, in the company of a Mr. Conduitt, with whom he travelled for some time; his friend Wolfe subsequently joined him, and for some months they worked hard in Northern Italy, drawing and measuring, at Florence and elsewhere, with the utmost zeal and perseverance. At Rome he met Eastlake, and other artist friends, whom he always highly esteemed. With Mr. Eastlake, Mr. Kinnaird (the editor of “Stuart's Athens”), and Mr. Johnson—subsequently Professor Johnson, of Haileybury College—he visited Greece in 1818, and made many beautiful drawings. One of these, “A View of the West Front of the Parthenon, taken on the spot,” he sent to Somerset House in 1821. Another, “A View of the Temple of Theseus, at Athens, drawn and tinted on the spot in the year 1818,” appeared in the exhibition

\* Read by Mr. M. Digby Wyatt, as elsewhere mentioned.

of 1823. He returned to Rome with his portfolios full, but with his pockets so empty, that despite his earnest desire to go further a-field, he was on the very point of starting homewards, when he happily made the acquaintance of a gentleman of fortune, a Mr. Baillie, who was so pleased with his sketches, that he made him an offer of an engagement as travelling artist. With that gentleman, in 1818 and 1819, young Barry went up the Nile several times, and visited the Holy Land, making beautiful sketches of the principal localities, from some of which engravings were subsequently executed for Finden's landscape illustrations of the Bible. "A View of a Street in Grand Cairo, from a sketch taken on the spot in the year 1818," exhibited in 1824, was one of the fruits of these happy wanderings. At Sinai he met Mr. William Bankes (son of the well-known Mr. Bankes, of Corfe Castle), in whom he found an accomplished acquaintance and a liberal patron. A memorial of this association may be traced in the exhibition catalogue of 1822, when Barry contributed a drawing of "the Scene of a Roman Theatre at D'Jerab (great part of which actually exists), restored principally from documents collected on the spot, by William Henry Bankes, Esq." He remained with Mr. Baillie for about a year and a half, and returned to England in July 1820. During the whole of his wanderings he kept an admirable journal, which, it is to be hoped, may be some day given to the world. In that same year, 1820, he established himself in business at 39, Ely-place, and I believe married Miss Rowell, to whom he had engaged himself before leaving England. In the catalogue of the exhibition of 1821—to which he forwarded a picture of "Ruins of the Great Temple of Egyptian Thebes, the view taken on the spot in the year 1819,"—his address is given at the recently occupied abode. I am unable to trace his first architectural employment, and can identify nothing earlier than the Manchester Church, which he appears to have been employed to design in 1822. A drawing of it, described as "now building," was in the exhibition of 1823, together "with the west elevation of a design for a Church to be built at Oldham." About the same period he built another church in the same district at Stand. In 1823 he competed for, in public competition, and obtained employment as architect to the new church, St. Peter's, at Brighton. Two views of it as "now building" were sent to Somerset House in 1821. In many respects this church was superior to any contemporary ecclesiastical work, and its popularity greatly enhanced that of its designer. It certainly led to his first aristocratic connection, for it induced Lord Egremont to employ him to sketch a steeple to the parish church at Petworth, a sketch of which was exhibited in 1827; and to make several designs for alterations, &c. to his seat at Petworth. A drawing of a spire it was proposed to add to the Brighton Church was exhibited in 1826, together with a front view of the "Royal Institution for the Fine Arts now building at Manchester." About this time, Barry appears to have been a good deal employed at Brighton, in laying out the Queen's Park, building a house for a Mr. Attree; and another (Clarence Mansions, since much altered, but not by him) of a good Italian character, looking over the sea, has been pointed out to me on the spot as one of his early works. Many of my hearers will doubtless remember a brilliant lithograph, by our fellow, Mr. T. Allom, showing Barry's original intentions with respect to the Queen's Park, Brighton. He also built the Sussex County Hospital. The Manchester Royal Institution, and a house which he erected about the same time for Mr. afterwards Sir Thomas Potter, at Buile Hill, near that city, were in that Anglo-Grecian style which Sir Robert Smirke had mainly popularised; but from which, despite fashion, Barry took the earliest possible opportunity of emancipating himself. His success (for such it assuredly was at the date of its execution) with the Brighton church led to his engagement to design a group of churches proposed to be executed by the Church Commissioners, under a strong stimulus from the late Daniel Wilson, in the parish of Islington. The three carried out by Barry were respectively, St. John's, Holloway, perpendicular, with a tower, to hold 1,782 persons, at a cost of 11,809*l.*; St. Paul's, a very similar building, to hold 1,793 persons, at a cost of 10,947*l.*; and Trinity Church, Cloudestey-square, a larger but corresponding structure, to hold 2,009 persons, at a cost of 11,535*l.* Of this last a curious little aqua-tint engraving, an early work of the afterwards well-known architectural draughtsman, is extant, published by G. Hawkins, near the Grove, Hackney, on the 1st May, 1826," at which

date the church would appear to have been recently completed. At a subsequent date, Barry built another church in the Islington district, the funds for which were provided by the Commissioners of Queen Anne's Bounty, that of St. Peter's, River-lane, Islington. This building, which cost only 3,407*l.* 2*s.* 7*d.*, in the days of the cheapest and worst churches, was consecrated on the 14th of July, 1835. In order to complete here the summary of Barry's ecclesiastical works, I may engaged during his career upon three other churches,—the parish church of Stoke Newington, which he almost entirely rebuilt and refitted; one at Hurstpierpoint, in Sussex; and another, St. Andrew's, on Saffron-hill, Holborn, with a turret and vaults, to contain 1,783 persons, at a cost of 9,004*l.* All of these, with the exception of Hurstpierpoint, which is Middle-pointed, were, I believe, in the Perpendicular style, and were rather above than below the average work of the best men of the day who were beginning to make Gothic a somewhat special and exclusive study. His Unitarian chapel at Manchester, the design for which he exhibited in 1840, at which date it was, I believe, completed, was his only attempt in the first Pointed style, and attracted considerable notice at the date of its execution.

Soon after his establishment in business, Barry obtained the appointment of architect to Dulwich College, and was soon employed to erect a new wing to that building; he also became in some way connected, I believe about the same time, with the construction of a new wing to St. Thomas's Hospital.

In 1827, Barry's increasing business and connection justified his removal westwards, and he accordingly found him leaving 39, Ely, for 27, Foley-place. Among the most important of the studies made in that year was a design, which was approved of by Lord Gwydir, for the rebuilding of Drmmmond Castle, Perthshire, two views of which were exhibited in 1828. In 1829 he designed but did not carry out, various additions to the Pitt Press at Cambridge; and struck at last upon the golden vein which ultimately made him a prosperous man. In the designs for the Travellers' Club, which were submitted in limited competition, Barry first revealed his resources in planning, and that refined perception of just proportion, both in detail and general distribution, in which he has scarcely ever been rivalled. The garden front is, so far as my knowledge extends, an absolutely original conception; and as such may, I consider, take its place in the history of art. The Pall Mall front has been frequently characterized by superficial observers as a copy, or reproduction, with slight modifications, from Raffaello's Pandolfini Palace at Florence. One moment's comparison of the two elevations will suffice to entirely dispel the idea. The Pandolfini Palace has only, in common with the Travellers' Club-house, the accidents of being two-storied, having rusticated angles, and a doorway at the extreme right-hand side of the ground-floor. In every other respect, the dissimilarities are most striking; the proportions of the windows are about one-third narrower in the Travellers' than they are in the Pandolfini; in the former, they are Ionic on the first floor, and Doric on the ground; while in the latter, they are Corinthian on the first-floor, and have simply returned architraves and no order on the ground-floor. The four windows of the first-floor of the Florentine facade are surmounted with alternately angular and segmental pediments, and united by panels in the interspaces and horizontal members, while the five of the Pall-mall building are precisely uniform, and the running through of any of the members forming or decorating the fenestration above the sill level. One of the leading features of the Pandolfini is its deep plain frieze, adorned only with a very simple classic-looking inscription; while in the entablature of the Travellers' Club the frieze is reduced to so small a proportion and is so highly carved, as in fact to do duty rather as an enriched member of the cornice than as a distinctive frieze at all. As a corroboration of the remarks I have ventured to make in respect to the universality of genius, and the immediate effect upon the public of any salient manifestation of it in the shape of a work of art, it may be noted, that from the date of its completion, in the year 1832, to the present time, no architectural Zeilus has ever raised his puny voice to the disparagement of this real gem. The contract was taken early in 1830, by Messrs. Lees, at 19,000*l.*; and the total cost was 23,160*l.* On the completion of this beautiful structure, its architect was elected a life member of the club: a compli-

ment, considering the very exclusive nature of its constitution, of no slight social and professional importance to a rising artist.

Pall-mall also possesses two ordinary house facades of great cleverness, executed by Barry; and the Imperial Insurance Offices, opposite to his great club-houses, and of about the same date as the Travellers'. While the last-named was in progress, he was subjected to three disappointments, one of which annoyed him a good deal. He became an unsuccessful competitor for the Westminster Hospital, carried out by Inwood; for the Law Institution, carried out by Vulliamy; and for the Birmingham Town-hall, entrusted, as is well known, to Messrs. Hansom & Welsh, under very peculiar circumstances. In response to the advertisement issued at the close of 1830, calling for designs for the last-named building, Barry forwarded a noble scheme for a Doric temple of grandeur, and at the same time of so much simplicity, that his friends confidently averred that it might be well carried out for the 18,000*l.*, which formed the limit fixed for the committee. Barry's plan was so long placed in the ascendant, that he confidently reckoned on being employed to execute it. From first, however, it somehow sank down to third, and a design was at last adopted, which, after utterly ruining the contractors, cost the Corporation nearly double the amount to which they at first limited the outlay. Barry exhibited his design, which was much admired, in 1832. From that year his occupation appears to have been so incessant as to preclude his contributing to the Royal Academy, and it is not until 1840, that he re-appears in the architectural world. Nothing daunted by his bad luck with the town-hall, Barry sent in designs (for the preparation of which two months only had been allowed) on the 1st November, 1832, for the Free Grammar School, commonly known as King Edward's, at Birmingham, which he won easily. This popular building, with its seven regular bays, and bay windows breaking through two stories at each end, was most carefully carried out in every detail, and in a good collegiate style in that most beautiful building stone, Darley Dale, and gave great satisfaction. It was completed in 1837, at a cost of 39,263*l.* The study bestowed by Barry upon the working out of this building, and consequently upon the Tudor style generally, he found of the greatest possible service to him when subsequently called upon for the Houses of Parliament competition. It was about the period of the completion of the Birmingham schools that Barry became acquainted with Welby Pugin, whose talents he always greatly admired. Pugin was selected and employed to work out the drawings from Barry's sketches for some of the ornamental details, and for the furniture of that building, and thus the foundation of their mutual regard and respect for one another's powers was laid.

1834 was a eventful year for our profession, and especially for that member of it whose career I am now endeavouring to trace, since on the 16th of October in it took place that memorable fire which rendered the reconstruction of our national assembly a positive necessity. That event occurred at a time when Barry was closely occupied upon several works of importance, in addition to those already mentioned, such as various constructions at Bowdoin, for Lord Lansdowne; the Campanile Lodge and Golden Gates, being in progress so late as 1838; the portico and enlargement of the College of Surgeons, which was sufficiently advanced to show the general character of its design in February, 1835, and was finished in 1837; Lord Tankerville's beautiful Italian villa at Walton-on-Thames; and various alterations at Woburn for the Duke of Bedford. He had also been called in by the Marquis and Marchioness of Stafford, who had been first impressed with his talent for picturesque gardening, by the terraces and other features which they had remarked at a *filie* given in the Queen's Park, Brighton. The architect was introduced to these leaders of taste at the time by Mr. Attree, for whom he had laid out the grounds in which the *filie* was given, and was subsequently employed at first in trifles such as vases if weeps, and ornamental details; but, ultimately in vast works at Trentham, Stafford House, and Clifden so late as 1853; as well as in great designs for Dunrobin Castle.

In 1833, the extensive designs for the conversion of Trentham, an ugly house in a flat and uncongenial soil, into what that princely seat now is, were made. No one could be a better judge than the late Mr. Loudon of the local difficulties presenting themselves to the architect and landscape gardener, and I prefer, therefore, quoting

him to making any comments of my own. He thus (writing in May, 1833) records his impression of the daring and talent evinced by the artist architect:—

"Trentham Hall, the residence of the Duke of Sutherland, is about to undergo extensive improvements. When we first heard of this, and that Mr. Barry was employed, we could not help doubting whether even Mr. Barry could make anything of this great, dull, flat place, with its immense mansion, as tame and spiritless as the ground on which it stands. We have seen the plans, however, for the additions to and alterations of the house, and we must confess that we were delighted and astonished with them beyond measure. Let no one henceforth ever despair of a dead flat. We shall not attempt to describe the additions made to the house at present; but we may observe that the modifications of the ground, and the large lake of water and its islands, which are proposed by Mr. Barry, prove him to have as just a taste in landscape-gardening as he has a refined and correct one in architecture. The architectural flower-garden, which will contain several acres, will be the largest and the best of the kind in England. On one of the islands a villa with terraces, in the manner of the Isola Bella, will be erected, as a feature to be seen from the house over the architectural garden; and a column now erecting on a distant hill will form another feature. The fountains of the garden, which will throw their waters as high as those at Chatsworth, Versailles, or Nymphenburg, will be supplied by a steam-engine, or by a water-wheel on a distant stream; and no garden beauty will have a more striking effect in Staffordshire than this feature."

Barry's employment in realizing the greater part of this vast programme extended over about ten years. By way of current business in 1835, he had also in hand the Manchester Athenæum, a well-worked-out but simple Italian building, costing about 15,000*l.* We now approach the great event in Barry's life—the competition for the New Houses of Parliament.

On October the 16th, 1834, as I have already stated, the conflagration took place, and shortly afterwards Sir Robert Smirke was employed by the Department of Works to make plans, &c. for the re-building. Sir Robert Peel, always a kind patron to Sir Robert Smirke, appointed a committee to examine his designs. The committee publicly acknowledged themselves unable to form a sufficiently accurate judgement upon the merits of any plan, but recommended open competition and the appointment of a Royal Commission, which was accordingly applied for.

To this course, so far as the appointment of a commission of five is concerned, they were no doubt mainly instigated by Sir Edward Cust's celebrated letter to Sir Robert Peel, dated January 31st, 1835. Sir Edward was, however,averse to the principle of competition in the matter, he would have intrusted the selection of the architect to the commission he suggested. The style of the proposed building was determined by Parliament should be either Gothic or Elizabethan.

On the 17th of July, 1835, the country obtained from the King the issue of a royal commission, to fix the site, and obtain designs for new Houses of Parliament. The terms of the royal commission provided for a selection of not less than three, nor more than five designs, all of which were to be reported to Parliament, and one of the three or five to be definitively recommended for adoption. The acting commissioners were the late Mr. Haubray Tracy, afterwards Lord Sudeley, Sir Edward Cust, Thos. Liddell, esq., and George Vivian, esq., Lord Duncannon being at the time First Commissioner of her Majesty's Woods and Works. Ninety-seven designs, comprising upwards of 1,000 drawings, were contributed in competition for three or five premiums, of 500*l.* each, and after a private view for the members of both Houses, &c., and the confirmation by a Parliamentary committee of the report of the royal commissioners, were publicly exhibited from the 28th of April. The royal commissioners state in that document, approved by his Majesty, and presented to both Houses of Parliament, on the 20th of February, 1836, that "although a difference of opinion may exist between us with respect to the ground-plans separately considered, we are all unanimous in our opinion that the one delivered to us, marked 61, with the emblem of a porcellus, bears throughout such evident marks of genius and superiority of talent, as fully to entitle it to the preference we have given it in our classification; and we have no hesitation in giving it as our opinion, that the elevations are of an order so superior, and display so much taste and know-

ledge of Gothic architecture, as to leave no doubt whatever in our minds of the author's ability to carry into effect your Majesty's commands, should you be pleased to honour him with your commands." The design thus recommended proved to be the one drawn, to a great extent, by the very hands of the late Sir Charles. It is not generally known, but it is, nevertheless, the case, that Barry entertained a predilection in favour of an Italian style for the Houses of Parliament, and went so far, in despite of the formal prescription, as to prepare sketches and studies, some of which are still in existence. The second premium was awarded to Mr. Buckler, the third to Mr. Hamilton, and a fourth to Mr. Railton. It was not from these rivals, however, that the most strenuous efforts subsequently made to wrest away the precious prize from the victor emanated. The battle of the styles appears to have been opened by the late Mr. W. R. Hamilton's first letter to the Earl of Elgin (July, 1836), recommending Greek, and its disciples, Sir Robert Smirke and Mr. Wilkins. Mr. Hamilton's letter was followed by a second in the same year, in February, 1837, and an article on Barry's designs in the "London and Westminster Review." These were replied to ably by Colonel J. R. Jackson, who supported Gothic on the plea mainly of nationality. Mr. Hamilton's views were endorsed by Mr. Wilkins, (under the pseudonym "Phil-Archimedes"), Mr. Grellier, and Mr. A. W. Hake-well; and Colonel Jackson's were anticipated by Welby Pugin and Benjamin Ferrey, who, with T. L. Donaldson, stood up honourably in favour of the execution in its integrity of the selected design, with none of the petty jealousies displayed by Savage, Hopper, Cottingham, Wilkins, and others. Acrimonious pamphlets, in the shape of "observations, apologies, strictures," &c. were freely handed about. Accusations of favouritism were made against Sir Edward Cust on the plea of his having been concerned in assisting in the production, a year or two previous to the competition, of a curious little etching by Barry, now very rare, showing the defects of the lowness of Wilkins's designs for the National Gallery and the effects of a loftier structure. That somewhat satirical performance had offended Wilkins, who had previously come off victorious in a competition for the works at King's College, for which Barry had sent in; and its execution may account for the sharp stings of Wilkins's very pointed pen.

It is curious, in looking over these old controversial wranglings between Goth and Greek, to note how little we have changed. The battle, unfortunately, still wages amongst us at the present moment, and we are obliged to confess that the spitefulness of yesterday, and of many a yesterday, is but a version, with scarcely a variation, of the spitefulness of to-day.

All these hot agitations and hearth-ruminations, coupled with the proverbially feeble administration of the Department of Works, and the slow and desultory action of Parliamentary committees, retarded, more even than the physical difficulties to be overcome, the commencement of the works. Contemporary protests against all this *friction* were by no means wanting, and the following, from the pen of Mr. Bartholomew, is among the most animated, and evinces a just appreciation of the powers of the architect, and the difficulties which lay in his path:—"The nation may take this pleasing assurance," he observes, "that, confided to Mr. Barry, a senate-house worthy of the empire will be produced, with every detail correct, not only in the principal parts of the pile, but also in the most retired parts of it. This excellent architect is rarely found straying from his subject; he studied it like a Freeman of the olden times: the nation should, therefore, second liberally his generous efforts; it would afterwards be very proud of them: it should allow him to build indeed substantially with granite, with Portland stone, and with oak; it should deny him no proper ornaments; they cost comparatively little, and if denied now, regret will be felt hereafter."

In the interval which elapsed between the acceptance of his plan and the laying of the first stone, which took place on the 27th of April, 1810, Barry was, as we shall now see, by no means idle. In addition to the preparation of the vast quantity of designs and working drawings necessary for entering into contracts for the Houses of Parliament, and for carrying on the works he had in hand before the competition, he proceeded, in 1837, to enter actively into the limited competition for the Reform Club, to which Messrs. Boscawell, Blore, Smirke, Burton, Cockerell, and he himself, had been invited. On Wednesday, the 13th of December, in that year, the committee proceeded almost unanimously to fix upon his design, which

was ultimately carried out at a cost of about 80,000*l.* This noble building is so completely patent to every Londoner, and its merits are so universally acknowledged, that I shall offer remarks upon three points only in connection with it. First, then, let me remind you of the entire originality of converting the usual cortile of the Italian palace into an internal and most beautiful hall; secondly, let me call your attention to the perfection of the domestic arrangements, which teaches us that the most minute attention to comfort, and the satisfactory working of utilitarian necessities, are compatible with the exercise of the most delicate sense of refinement, and the hardness of hold and towering genius; thirdly, I would beg to vindicate the memory of Sir Charles Barry from a charge of plagiarism, to the full as absurd as that which has been grounded upon the fancied resemblance of the Pall-mall front of the Travellers' to the Strada Pandolfini front of Raffaello's Florentine Palace. It has been alleged that the Reform Club in some degree finds its prototype in the Palazzo Farnese. Setting aside the utter non-conformity of any two features in their respective plans, let us for an instant compare their elevations: the one contains thirteen bays in width, the other nine. Both are three-story buildings, with large crowning cornices, and there the resemblance ends. Every detail is absolutely different, and let me add that I do not think that Sir Charles Barry ever did or ever could copy: his whole system of working was opposed to anything of the kind. Should you ever have the opportunity of tracing out the progress of his thoughts, as I have frequently, and as no doubt all his pupils have, through any series of his studies for any particular building, you will find that the work is always, as it were, growing evenly under his hand from the slightest generalization in the first small scale sketch to the large scale detail; then back again into another general elevation, to see how far that particular detail will work well in combination, then altered according to the result of that test, and roughed out again to a large scale, to make sure of the effect of the parts when near the eye; and so on frequently until his fastidious judgment would get almost bewildered under the multiplying and conflicting impressions produced by the various studies. The man who works in that way perseveringly may at least make sure of two things,—that his work will be good; and that it will be his own and nobody else's.\*

#### SUGGESTIONS ON ARCHITECTURAL COMPOSITION.†

ALL honour to the memory of Sir Charles Barry! To-day we have paid a last tribute of respect to his remains. The gathering was one of universal feeling, showing that the world had lost a great man; and all those present who understood and appreciated his genius must have blended a feeling of pride with their sorrow—pride, that his merit had received these last honours so justly due to him—and sorrow, that so bright a career was so early and suddenly terminated. The proud pageantry has passed, but his name needs no association with the great and august in the venerable Abbey—no engraving on the cold marble of empty eulogy: it will be ever associated with our art and engraved on our memories. All honour to the memory of Sir Charles Barry.

In presenting to you this evening some suggestions on architectural composition, I am actuated by no wish to press my opinions before those of established authority; nor have I any desire to dogmatize upon our art; but as one sincerely zealous in the promotion and elevation of architecture to its proper position among the other fine arts, I trust you will accept my crude notions in the spirit, rather than the letter, in which I am desirous of rendering them.

To within a few years, architecture, although acknowledged as a member of the sisterhood, has scarcely held the position of a fine art by the mode of treatment she has received. Too much has been given to rules, and too little to principles, by which compositions have been regulated; and although the former should govern the latter, it is too painfully evident that rules have mostly swayed the art.

In the study of architecture every known work extant should be carefully examined, its objects

\* To be continued.

† Read by Mr. E. B. Lamb, at the Architectural Exhibition on Tuesday evening, in Mr. Edgar Hall in the chair. The addresses of the holders of season-tickets not being known, the committee were unable to alter the arrangement for the lecture of Tuesday, as circumstances of the day would have dictated.

and intentions investigated, its position scanned, the cause of its excellence inquired into,—why its locality was determined upon,—and why the composition assumed a character and expression, which drew our attention to it. Yet should we be careful in this investigation not to misapply our knowledge of the past, but to use it in comparing and ascertaining if we have advanced in the same ratio as was evidently the case in preceding periods;—if we have composed our works upon the principles which governed the compositions of our forefathers,—if we have introduced any new features which the alterations of the requirements of society have demanded,—if we have produced any new works that will live in the estimation of posterity.

Composition in all fine art may be defined as the combination and arrangement of several parts to form a harmonious whole; but frequently the architect is cramped in his composition by circumstances and things over which he has no control. Not so the painter, who may take his flight in any direction: the wide expanse of nature is ever open to him to select and arrange to the utmost extent of his imagination: he knows no bounds but the limit of his canvas. Although the compositions of the architect are frequently fettered by the limit of his means, the difficulties of the arrangement of plan, and the materials for his use, he has still to bear in mind that, like the painter, the same principles of harmony should pervade his whole work. Then, indeed, he may give latitude to his imagination either in simple or ornate detail, according to the exigencies of the subject, which would result in a good work irrespective of style.

Composition in architecture may comprise the appropriate adaptation of known or ancient forms to particular purposes, or the reproduction of the characteristic features of a past style of architecture; but, where those features are reproduced without regard to the changes of customs in modern times, many incongruities will necessarily arise. Then it becomes necessary to resort to inconvenient and expensive expedients to carry out the reproduction, such expedients showing clear testimony that the composition has been misapplied, and ill adapted to its purpose. Architecture is a progressive art, and there is no instance on record in former ages of a retrogression in art, or a reproduction of the works of former times. Even now we should think little of the genius of a painter or sculptor who could only produce copies of the eminent distinction of a poet. Yet, in the present time, architecture is rarely commended unless it bears indelible marks of some ancient authority from which it is taken; nay, the efforts at original thought, and where a disposition is evinced to shake off the trammels of precedent, meet with doubt, distrust, and ridicule, however well the works may show the evidences of the deep study of principles, and however suited they may be to the wants and requirements of the present time, or the circumstances by which they have been governed. It may be said, "Why is this?" Why is architecture to be levelled from its elevated position among the fine arts, and reduced to the degraded position of mere precedent? What does this arise from? One thing, probably, it may be. At present we have hardly ventured out of the leading-strings of the mechanical diets of former training: few have dared to traverse the paths of original thought: few have dared to shake off the fetters and enter the broad field of invention. Constantly we hear works spoken of as "founded upon some ancient temple or church, and the nearer the approach to the original type the more laudatory the criticism; the comparison gives a handle to remarks, although the reproduction may be replete with incongruous expedients, which render all pleasurable applications of the ancient art a botch and a bungle.

The works of former ages were frequently beautiful, because they were consistent. The artists of those times blended the forms of beauty and harmony in art with the conveniences which had resulted from long and successive improvements in the requirements of society. The occupants of the houses of the middle ages required protection, warmth, and security: they cared little for extensive views from the windows: in fact, views were denied them, from the necessity of enclosing their houses with high walls: glass, too, was of inferior quality, and only procurable in small panes, and at great cost. We cannot, however, close our eyes to the stubborn fact, that as men began to fear their neighbours less, they threw down by degrees the barriers which shut them from the beauties of the landscape: then,

too, a desire sprung up for a more convenient and agreeable arrangement of the window: the natural, although not the most tasteful, method ensued for this object: the mullions were knocked out of the windows, and the sash was introduced. This practice was quickly carried out to a very great extent, not only in this country, but on the continent, and which was no doubt strengthened by the general introduction of Italian Architecture: this added to the ruthless destruction: in some instances the mullions became more attenuated before their entire demise, but at last so reduced that they fell away altogether; and the vulgar sash usurped their place. And so, following on the same broad principle, in the ordinary course of events, almost all towns underwent great alterations: the houses were rebuilt or considerably modified, but no mullions were used in the windows, and the high-pointed arches were reduced to flat-headed openings. Casements, which were then, and still are, but clumsy contrivances, soon gave way to the much more convenient sash. It may thus be fairly said, that the attack upon the art at the time of the introduction of the sash was a fatal blow, for it took from Gothic architecture one of its most vital elements.

In more recent times, the desire to revive the architecture of the middle ages has brought with it the difficulties and inconveniences which caused the fearful havoc I have just spoken of among the mansions of the olden times. The mullion is still a difficulty, and the sash is its antagonist. This, coupled with the now almost universal use of plate-glass in large sheets, must result in its disuse once more—perhaps not in the same unceremonious way in which our ancestors solved the difficulty, but in some way that may allow us to use Gothic architecture in a modified and progressive state, without entirely divesting it of its most leading and characteristic feature.

Almost every practical architect has felt that his hands were tied when compelled to use Gothic architecture in its antiquarian and not its artistic form. How many of us have introduced a double mullioned window—that is, a stone one outside, to satisfy authority, and a wood one inside, fitted with sashes for the convenience and comfort of the inmates. This mode, when money is plentiful, may be well enough, and who but the owner should complain of the cost? not so, however, when the greatest effect is to be obtained for the smallest means. Such lavish expenditure could not, then, be tolerated. Then comes our trouble, the mullion and the iron casement, for at present there has been no substitute to take its place, at about the same amount of cost. But suppose we get over this difficulty, we have other objectors, who love the works of the old masters, and wish to emulate them; but they object to mullions. This is no exaggeration: it is what I have experienced, and I have no doubt others have been in the same position. Some years ago I erected a Gothic building in the country, but, before its entire completion, circumstances occurred which rendered it necessary that the property should be sold. It changed hands; and, when my Gothic building required to be completed, every obstacle was removed to render that completion as reasonable in cost and convenient in its appliances as possible: the mullions were knocked out, and the convenient sash fixed in their place. As may be supposed, my astonishment was great, when, a few years afterwards I passed by my Gothic building, which had then assumed something of the appearance of those of the mansions so industriously mutilated a century ago.

In the present day the same cry is raised against mullions, in many instances, perhaps, with little reason, and the difficulty has, in some measure, been met by the application of an earlier or foreign style of Mediæval art. There can be no doubt that the style of the thirteenth century would admit of an easier mode of arrangement of windows, because shafts, and not mullions, were then used, which would allow of the sash being behind the shaft, and unconnected with it, and wide openings would be admissible in that style without shafts; yet it would be a double window, and that would hardly be in the spirit of the old style, or consistent with reasonable practice, and could surely not be mistaken for a resuscitation of the art in its fullest integrity. Would it not appear very little better than the mere Act of Parliament gaps? Would it not rather harmonize with the modified and now generally accepted Italian style rather than the Gothic? Would it not be an Italian skeleton in Gothic habiliments? It could hardly be considered a healthy state of art, but would be, after all, a mere sham, and that sort of transparent sham that would leave no doubt upon our physical or mental

vision. I should be bold indeed were I to say that all styles have been "used up," or that I had little respect for the art of past ages. This, however, is not the case. I venerate the relics of those times: I have the deepest feeling of respect for the men whose minds have produced such marvellous works; but my respect and veneration give me a desire to emulate them—to dive into the thoughts that spangled the world with such gems: I would study their art, that I might think in their art: I would sit at the board with them: I would not be their outside lackey.

I cannot help thinking that a time is not far distant—may, I almost see it springing up already—when architecture will be studied with more attention to artistic principles and less to precedent. Then will be generated a style of art in which the thoughts of the old minds may be fairly united with young ideas.

The greatest stumbling-block to the reproduction of Gothic architecture is the mullion. It is the monster ever before us. How, then, shall we overpower him? Not, I fear, by a mere imitation of any known style of art. It must be by a progressive development of art out of the wants which knowledge and refinement are constantly creating. Then let us fearlessly grapple with the subject: let us unite, in our transitional state, the past with the present, only compounding out of the good material ideas which might have arisen if similar circumstances required them in the olden time; but let those ideas be free, unshackled, unprejudiced, and only restricted to the laws of harmony, of form, colour, material, and construction. I would borrow ideas from all ages, but I would not take a whole building: I would endeavour to use those ideas so as to produce the same amount of artistic effect as I found in its prototype, whether the style be Gothic or Classic. Few would inquire where the knowledge was obtained if the effect produced were likely to be satisfactory and permanent.

That all art declined about the sixteenth and seventeenth centuries is generally admitted, and that it is now in a state of transition. Within the last twenty years, much has been done to bring into use more artistic principles in composition, than had taken place in the years immediately preceding; and I think there can be little doubt that, in any new amalgamation of style that may arise, the principles will be founded upon Gothic architecture, as the most plastic art, and the most suitable for the application of the native materials; but, although the style may be Gothic in principle, I can scarcely think it will be Gothic as now applied, but one that will date its revival from probably the point where it may be said architecture as well as the other arts stopped. About the seventeenth century, or the Renaissance of France, the style of that period may be considered a transition from the Gothic style, out of which the perfect style is yet to be developed. It is pliable, admits of great variety of form and pictorial effect, frequently elegant in detail—although sometimes coarse—suited to the material of any district of this country; truthful in construction, and capable of receiving an amount of coloured decoration that would satisfy the most vivid imagination. It is a style fitted with its sire, and one that might be moulded into beauty, breadth, and dignity, as well as pictorial effect.

It is not my intention to advocate the style of architecture of the sixteenth century, but merely to show that that was the point where art may be said to have declined, and where progression should recommence. I would not advocate any style in particular, as all style must depend upon the natural or rational application of the materials of a country, which necessarily constitute a national architecture. In all countries this fact is evidently and fully developed, and any reproduction of a style of art not indigenous would render the application of the native material difficult, dangerous, and inconsistent: comforts and conveniences would be outraged: artistic effects would be false and unconnected; and the whole of the natural laws of the beautiful and the picturesque, viz., harmony, and unity of science and material, would be destroyed.

We cannot dwell too much upon these truths: at the present time, the unsettled state of the question of "style" has been the cause of the introduction of designs, in architecture, of such a variety of nations and periods, that we not only regret the want of pictorial effect in our streets, but we are absolutely offended at the violent contrasts exhibited.

The artist leads the public by his knowledge, taste, and skill: it is incumbent upon him, therefore, to produce such works as will impress them with a certain conviction that what he does is not

only useful in every respect, but is also in good taste; and, if a universal tone of feeling could pervade the professors of art, there would be universal harmony in our edifices—the various compositions would blend in one pleasing group, yet each individual might be stamped with genius and originality incidental to the requirements of the subject. That this feeling was the case in former times, the researches of the antiquary, and the illustrations they have presented to the world, amply testify.

The different modes of treating *one style* by our forefathers form inexhaustible subjects for study, both for the architect and the painter; but, in our time, the diversity of feeling and opinion on this matter, I fear, only tends to the fact that there is too much desire to produce variety by the introduction of new styles, and too little knowledge of the proper and artistic mode of using them.

It would be inconsistent in an artist if he confined his attention to one model or to one subject, instead of gathering his ideas from the various forms and incidents constantly presented to him: his work would not only become mannered, but monotonous and wearisome in the extreme. He would be like a bibliologist who could see no beauties in books that were not printed in black letter. Equally inconsistent would be the architect whose mind was only stored with the architecture of one country or one period: it would be unfair for him to adjudicate on other works, or attempt to set up a standard of aesthetics: he could have no enlarged views of artistic beauty, and he closes his mind to an extensive field of operation, the study of which would enhance the value of his labours.

The battle of the styles, as the present controversy has not inaptly been called, can scarcely be termed a battle to obtain a victory favourable to art: it is rather a conflict of prejudices between antiquarianism and militarism; it is a fight between things as they are, and which common consent and convenience have made them—and things as they were, which require so much cutting and contriving to render fit for our purpose. It is not so much the contest between the two great divisions of style, as the rational development of a new style, or a consistent and characteristic decoration of the vernacular style, which the everyday requirements of the present time have rendered useful, and are still rendering more useful, although not in all instances beautiful.

In all controversy upon the vexed question of style, I know of no artistic champion who has entered the lists on either side. I know of no statement why one style is preferable to the other as a work of fine art. It is true that the term "most beautiful" has been largely applied to each, but upon what grounds, has not to my knowledge been stated: such terms are too frequently misapplied, and become dogmatical, and are too apt to mislead the great bulk of the public, who are unacquainted with architecture as a fine art, and scarcely think for themselves, but are content to let those who appear to know more think for them.

Let us, however, endeavour to treat style as it ought to be treated. When in reference to the preservation and restoration of works of past ages, which have been acknowledged by all to be worthy of preservation, let us fully enter into all the details, so that they may be still preserved for future ages, to show how our forefathers *did* think at a particular time, and for a specific purpose; and to show also when that purpose was answered, and other circumstances required new thought—how they abandoned the old habits for new,—not suddenly, or by total obliteration, but by an engraving of new ideas upon the old stock, and thus yielding new shoots. It was not abrupt and discordant: it insinuated itself, as it were, into a fraternization, and became part of the old family: more vigorous, perhaps, more refined—it was an advance upon the past. Why, then, should not the art at the present time insinuate itself into the good forms of all past periods, and become part of that great family, but vigorous and healthy in its development, instead of the rickety apparition and crippled representative of the venerable Paternosters? Why should he not clear away the mere shadows of antiquarianism, and try to direct our thoughts to the same principles which then governed art? Each particular age bore its characteristic distinction: it was one art—one great thought; although, as we know by our researches, we may call it a dream of one feeling, but of infinite complexity—tangled, yet distinct.

The laws of the beautiful are equally applicable to all art at all times, but styles in art were

created by various circumstances at different periods, the result of the advanced condition of society, and its union with mechanical science and manufactured products, and although art in its progress will necessarily be tinted with preceding styles, yet it may contain much original conception. It would be as inconsistent to condemn one style as another, when perhaps the modification of either or both might form a suitable basis for a transition style to meet all our wants. A mere repetition of past art can only be called antiquarian architecture; but a blending of all the ideas we can obtain in our harmonious composition, so as to suit the exigencies of the present time, would do much more towards a legitimate revival of fine art than all the quackery of authority, which shows so little inventive power or artistic skill.

Out of the natural or rational application of the materials of a district or country, an individual style of architecture might again arise: the evidence of past times attest this truth; but any reproduction of a style of art not indigenous would render the use of the native material difficult, dangerous, inconsistent, and costly: art and science would give way to expeditious comforts and conveniences would be shackled, artistic effects false and unconnected, and the whole natural laws of the beautiful and picturesque would be annihilated.

The habit of observing and admiring antiquities—the associations they engender—their pictorial effects—their harmonious grouping and blending of colour, too often fill the mind with crude and false notions of what such works would be if reproduced for our modern institutions and domestic edifices: such reproduction would frequently want the charm and picturesque effect the old types have acquired, by mouldering decay, roughness, and discolouration.

There is a generation attached to ancient art which frequently gives it a value beyond its artistic merit. As historical records, all works of the past have intense interest, and well repay the antiquary's pursuit: they possess, too, for him, a feeling unknown to ordinary observers; for he can fathom, in the overturned fragments and mutilated sculpture, the thoughts of a generation long since perished, perhaps only recorded in those remains. But, if he does see beauty in a grinning gargoyle, or a royal statue with an arrangement of bones and muscles nature never authorized, and if we cannot agree with those opinions, at least we must admire his zeal in a cause which prepares the way for other reflections; for architects should examine, pursue, sketch, and store, yet dispute the agglomeration—forget the historical interest, and only use those ideas where excellence and beauty abound, and which would bear the strictest test of architectural criticism. The ancient art should be collected as tools of thought, by which may be wrought the noblest works. "Instead of copying the touches of old masters," says Sir Joshua, "copy their conceptions." Yes: enter into the spirit of their imaginations, and not into the letter of their remains: think with them. "The real trouble of all professions," says Barnett, "is the trouble of thinking."

There are two great and main systems of architecture: one which has a decided tendency to horizontal lines, and the other that partakes of a greater inclination to vertical lines; yet at particular intervals they merge into each other. The one great division is generally known as Classic art, or the trahested system; the other Gothic, or Pointed.

The Early Classic type may be fairly considered as a system of strong contrasts. It consisted of a series of blocks, at various intervals, set upon each other or forming massive walling; and in regular positions spacious voids were arranged for windows and doors.

Classic architecture, as it is now understood, comprises an extensive period of art of an early character, as well as a more modern application of the style; and although in this range the character is greatly varied, the principal features and leading forms are the same. The column and entablature are used through all the periods, and the general deviations are in the forms of openings, in the use of the dome, and the building a series of stories, one above another, each containing a single order.

Yet in various degrees of beauty, through the whole development of the Classic art, the compositions were generally harmonious; and those who can see beauty in all fine works will look with enthusiastic pleasure upon the early Classic architecture, nor will they allow one deduction from the merited commendations that system has received. Yet Classic art is difficult of application in this country without considerable modifica-

tion; and when such modification has been made by men of genius, we lose the ancient type, except as a progression in art, and obtain much originality of feeling, uniting with convenience of arrangement and general unity in the composition. The works of Wren, Hawksmoor, Vanbrugh, Inigo Jones, and others, show to what extent the Classic art could be modified in such hands. Yet still they were trammelled, and followed to a great extent the laws laid down by the Italian architects. They rarely ventured to deviate from the five orders, and scarcely attempted to overcome the difficulties of construction when carrying out the entablature in its full authority. We still see the combination of stones with vertical joints stretching from column to column: in some cases the joints of the stones radiate from a common centre, but still the soffits of the architrave is horizontal, the effect of which is to give the appearance of a deflection, if not an actual one in the architrave. The materials of this country will rarely admit of large stones being applied, as in the original type of the Classic art; hence arose some modifications, but these did not go far enough.

It must be admitted that the introduction of Grecian architecture in more recent times rather retarded than advanced the legitimate use of materials; showing that however much the temples of Greece deserve our study, they are unfitted for English houses. The Greek temple style, however, had a short reign: it was sought by us with avidity: its details were used in every conceivable position and utensil: it remained with us long enough to show its utter unfitness for our purposes in its perfect state: it left us as suddenly as it came, and is now almost entirely disused: still this style contains the elements of beauty in design, and harmony of form which no unprejudiced artist can deny. And it would be well if we were to study its adjuncts, its decorative perfection, and its basso-relievo: these mark their perfect union with the architecture, more by a similarity of breadth and simplicity in their composition, which is in harmony with it, than an immediate connection by an absolute union with its parts. The sculpture also possesses the great merit of simplicity of drapery, and correctness of development of the human form. It would be well if this union of the sculpture and architecture in a building were more carefully studied by our artists, so that that vexed question, "Is Gothic architecture in union with the highest class of painting and sculpture?" might be at once settled. The sculptor and architect of the Greek temples seemed to work with one mind; not so, however, the architect and sculptor of the present time, for the sculpture is either so antiquarian that it would be difficult to define the outline of the human form from the multitudinous folds of its ample drapery; or it is designed on such high-art principles that its position would be quite as unsuitable in one place as another. Let it not be thought that I intend to disparage the works of the sculptors of our time. I ask only for a unity of thought between them and the architects, and for them to descend from their high school of art to our humble sphere, so that their labours should merge into the ever-growing and progressive changes of architecture. May I, without offence, say that sculpture is a decoration of architecture and should be in harmony with, but subordinate to it; and that architecture is not a mere frame for the exhibition of sculpture. In the spirit of unity, the two arts should go hand in hand.

The later division, but before the Grecian mania, of classic art, or rather the skeleton of the art, was a style again used up to a very recent period, and, by its almost universal application, is evidently suitable to our wants. It had before been the cause of the fading away of the Gothic art, and little remained unaltered, except in Ecclesiastical architecture; for it was less necessary and more difficult to alter these buildings to the same extent as those of a domestic character.

It is easy to talk of the ugliness of our "hole-in-the-wall" street architecture, but for a large town built under similar circumstances, as most of our towns are, could Gothic architecture be admitted? No doubt we could build our gabled or embattled elevations—our oriel windows, our buttressed walls; but I fear this, too, would soon become a pattern for lachal property; and, if not too expensive, we might see infinite rows of Gothic houses in place of our present dingy structures; but we have limited space and means as well as the fear of the Building Act before our eyes.

The custom of knocking out the mullions of the Medieval windows caused the vernacular art to assume more of Classic character than Gothic;

and as the great majority of town houses partake of the former type, any attempt at change would, I fear, only result in establishing the unsuitableness for its purpose.

Inquiries of this nature are necessary to show to what extent any known style would be applicable to modern uses: hitherto, however, all reproduction of any style of architecture in its unaltered state, has been utterly futile when found to unite with our customs and appliances. Sir Joshua again expresses my own feeling where he says, "That which is most worthy of esteem in its allotted sphere becomes an object, not of respect, but of derision, when it is forced into another to which it is not suited."<sup>78</sup>

#### THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The ordinary meeting of members was held last Monday evening at the house in Conduit-street, Hanover-square.

The attendance of members was large, attracted by the desire of seizing an additional opportunity to pay a tribute of respect to the memory of one who had so recently been removed from the profession, and the features of whose life were, as had been previously announced, to be brought before the Institute by Mr. Digby Wyatt.

Mr. C. R. Cockerell, R.A., president, took the chair.

Mr. T. H. Lewis (hon. sec.) announced, amongst other donations, a work of the president's, containing drawings of the temples of Jupiter Panhellenion at Egina, and of Apollo Epicurius at Bassa, near Phigaleia, in Arcadia, the gift of the author.

Professor Donaldson, in proposing a vote of thanks to the donors, who were thereby improving the already valuable collection of the Institute, referred to this work, which he said was the result of the labours of thirty years. The President had been one of the noble band who first brought to light the hitherto undiscovered architectural treasures of Greece, and throughout his life had been intent in carrying out the principles which were contained in the letterpress now presented. There was an imperfection in the work which he would take the liberty of pointing out, but which the President could remedy—the absence of the author's autograph.

Mr. Penrose, in seconding the vote of thanks, felt himself privileged to testify his admiration for the President's labours. He (Mr. Penrose) was an humble follower in the same field, and revered the Parthenon, and those who had investigated its mysteries.

The President said,—"I am extremely flattered by the kind reception which you have generously accorded to my donation. The work ought to have appeared many years ago, but you, who follow our fastidious art, must know the difficulties which exist in bringing out such illustrations. I thought before I went hence that I should leave some memento of the scenes of many pleasant days of labour, which would interest you, and which some of my younger brethren might investigate more fully. I have now the pleasure of calling upon Mr. Digby Wyatt to read the notes which he has collected on the life and labours of Sir Charles Barry."

Mr. Wyatt then read the paper, the commencement of which, *in extenso*, we have given elsewhere.

The deep feeling under the influence of which Mr. Wyatt concluded his remarks pervaded the meeting for some time. The silence was broken by

Mr. Beresford Hope, who, in proposing a vote of thanks to Mr. Wyatt for his interesting lecture, said that the meeting owed him a debt of gratitude for that labour of love which he had discharged with so much dignity, such deep solemnity, and that playful fancy which best suited the sacred occasion. Those who knew Sir Charles Barry personally—and he believed that many of those present had enjoyed the privilege—as well as those who knew him only through his works, would cordially follow Mr. Wyatt throughout the notes which he had read. They would, with him (Mr. Hope) see in them the foundation for a large memoir of one who ought not to be allowed to go down to posterity known only by the inference which his works would afford. The history of the competitive struggle in which Sir Charles's claim to rebuild the Houses of Parliament was finally settled contained the Battle of the Styles—a battle which at the present time was raging no less warmly than then, for some (said Mr. Hope) are Greeks, and some are Gaths. It was well, in the dispensations of Providence, to be called upon at times to forget these differences, and to feel that

\* To be continued.

in one common feeling we could gather round the bier where departed worth was laid. He was sure that this united feeling would be uppermost in every one's mind to-morrow; and that in meeting together to follow to the tomb one who belonged to his country, not one thought would arise to jar upon the solemnity of the sad occasion.

The President, putting the vote to the meeting, said, it is impossible for those who have traced the course of our deceased friend not to admire the care with which Mr. Wyatt has followed out the progress of his life. It was to be regretted that there had not been time to enlarge upon those qualities of mind which endeared Sir Charles to all who knew him. His well-known integrity, in carrying out the great contracts with which the nation entrusted him, his consideration for all about him, united with an authority which betokened the great mind that all felt it their duty to obey, were points in his character familiar to those intimate with them. I have had the privilege of knowing Sir Charles for a long time. I remember when he returned from his travels, and have seen him entering upon or carrying out the most of his works since. I do hope that the paper of this evening will be the commencement of a memoir which will furnish the reading public with an historical account of our departed friend.

A gentleman in the body of the meeting here announced that a Life of Sir Charles would be drawn up by his sons,—the Rev. Alfred Barry, of Leeds, and Mr. Edward Barry; and by Mr. Wolfe, whose early association with Sir Charles would enable him to supply many interesting particulars hitherto unknown.

Mr. Talbot Bury said that, as reference had been made to the familiar friendship which had sprung up between Sir Charles and Pugin, he, as the friend of the latter worthy, might allude to the intimacy which had existed between the two. He believed that it had commenced at the time when Barry was occupied with the erection of King Edward's School, Birmingham. Pugin was engaged in the details, and ever expressed his pride that he could lend any aid to Barry, whose mastermind he was not slow in observing. It was a conversation between these two (Barry and Pugin) which led to the design for the Houses of Parliament being changed in style from Elizabethan to Gothic. In a conversation which he (Mr. Bury) had once with Pugin he recollected the feelings which his friend exhibited on seeing Barry's design for the new Houses: he said at once that he must yield to higher merit, for that Barry's plans were complete. The friendship which had existed between them continued until Pugin's death: at his funeral Sir Charles attended as a chief mourner, and none was more sincere in his grief. That great man laid his greatness by, and put on the humility of sorrow at the loss of his friend, and he was sure that at to-morrow's mournful rite a like humbling sadness would pervade those who had attended to see the last of one whom they had admired whilst amongst them.

Mr. Digby Wyatt, in calling the attention of the meeting to the series of designs which had been made by Sir Charles for the new Foreign Offices, and which, though they were exhibited in Westminster Hall at the time, might have escaped the particular attention of some present, owing to their being surrounded by numbers of similar sketches, expressed his conviction that these would be cared for and preserved, and that in time to come they would be regarded with the same feelings as the present age looked upon the plan of Sir Christopher Wren for the rebuilding of the City.

Mr. Edwin Nash remarked that Sir Charles had not been engaged in the addition to St. Thomas's Hospital, as had been stated in the lecture, and in the *Builder* of last week.\*

Mr. Edward Hall observed that an impression certainly existed that Sir Charles Barry had in some way been connected with St. Thomas's Hospital at the time of its erection.†

\* Mr. Nash writes to us thus:—"In the excellent memoir of the late Sir Charles Barry given in the *Builder*, you enumerate amongst his works 'a new wing and other works to St. Thomas's Hospital.' If this be intended for the hospital in Southwark, it is an error. The wing was part of a general plan for a new hospital designed by Mr. Samuel Robinson and his partner, Mr. James Field, the then surveyors to the charity; and the plan and constructive details of the design were designed and carried out by them, but their elevation having, at the wish of the hospital governors, been submitted to Sir Robert Smirke, he made drawings modifying the exterior only, and it was built according to Sir Robert Smirke's external design."

† After a second inquiry, we have no doubt that Barry was at least consulted respecting the design for part of St. Thomas's Hospital. The drawings were at his office, and our informant well recollects work being done at them. After the explanation of Mr. Nash, however, it would be erroneous to include the wing of the hospital, or any portion of it, amongst Barry's works.—Ed.

Mr. Scott was called upon by the President, but declined, under the saddening influences of the present time, to make any remarks upon one whom he felt himself unequal to speak of in proportion to his high deserts.

After some further observations,

The Hon. Secretary announced that the paper "On the Origin and Development of the Use of Crypts in Christian Churches, from the Earliest Period," which Mr. Arthur Aschitel, Fellow, was to have read this evening, but which was postponed in consequence of the desire that some notice should be taken at so fitting a time of the life and labours of Sir Charles Barry, would be brought before the Institute at the next meeting, on June 4.

The following gentlemen were, on ballot, elected Fellows of the Institute:—Mr. William Burges, of Buckingham-street, Strand; and Mr. Edward Roberts, of Holles-street, Cavendish-square. Mr. Hartley Burgess, of Walbrook, City; Mr. Frederick R. Kempson, of Gordon-square; and Mr. Martin Underwood, of Denhigh, North Wales, were elected Associates.

#### THE ARCHITECTURAL DRAWINGS AT THE ROYAL ACADEMY.\*

The notice of the drawings at the exhibition in Trafalgar-square, in our last number but one, left undescribed several important designs for works of ecclesiastical architecture and subjects of a different class. Mr. Aschitel's "Design for the Restoration of St. Margaret's, Westminster" (650), is for a building, professedly in the spirit of the style of the church as it was rebuilt a short period before the erection of Henry VII.'s Chapel, and as it remained till "about 1700 years ago," when "the present Batty Langley casing" was substituted for the previous work. That there are sufficient data for "restoration" is doubtful; and assuming that argument is drawn from the interior in favour of giving a particular character to the new exterior, we hardly think Mr. Aschitel has produced a design that should be adopted, at least in the details. Not only could equal or greater effect have been obtained with less work—which some would call defect of the style; but the whole details in the design have something of the character that is condemned in work of the period of 120 years ago. The open canopies of the windows, with the parapet of the aisles; the clerestory parapet, and the open-work spire, could certainly be improved; whilst the spire, as in too many other works, is set on the tower rather than grouped and connected with it.—Messrs. Hadfield and Goldie contribute (656) an "Interior View of the Chancel of the new Roman Catholic Church, Lanark," a building for which "Studies" by Mr. Goldie, in the Exhibition in Conduit-street, have been already noticed by us. The drawing at the Academy is not altogether favourable to appreciation of the work; and some parts of the design cannot be approved of. The sculpture of the reredos is too archaic, judged from any other point of view than such as the sculpture of the Saviour on the Cross with what might be called an excess of ornament; and the scroll ornament to the wagon-headed vault is slightly too much in resemblance of door-hinges, as those of buildings of the same geometric "Decorated" class. These, however, are only deductions from general merit of the work. There is a good geometric-traceried circular window under pointed arch mouldings, over the reredos. The "South-cast Prospect of St. Peter's Church, Pfishboro, Dublin" (697), however, we must regard as a poor representation of a building which, at least, wants greater union than is apparent in the eastern end here shown. We cannot but think there is some need to draw the attention of many of our architects of churches, to a similar defect in grouping of the several parts of plan where a design includes aisles and other adjuncts to the chancel.†

\* See page 299, ante.

† We may take this opportunity of saying to correspondents who have addressed us on the subject of our remarks on Messrs. Hadfield & Goldie's drawings in the Architectural Exhibition, that we have neither used the words nor expressed the opinions stated as ours. In one case we gave a favourable opinion of certain features of the design, and a different opinion of others; and far from speaking of the whole design as a *masterly and finished production*, we expressed no opinion except to the extent now stated. In the case of the design for the Cork church, which we called "preliterate," quoting from the catalogue, we pursued a similar course as to the exterior; and we limited greater or more general approval of the interior, of course to the interior only. Our opinions may be freely canvassed, but, whilst we have lost no opportunity of indicating the necessity for taking into consideration all features and attributes of a design before

The view of "St. Augustine's Church, Dublin" (657), exhibited by Mr. E. W. Pugin, represents a design by Messrs. Pugin and Ashlin. The building is, we suppose, the lately erected; but by one of those omissions which we have frequently mentioned, the catalogue does not inform us on the point. The whole western end of the church for the space of one bay of the aisles, rises to the height of the clerestory, so as to form a transept on the western extremity of the plan; whilst the tower rises still higher, and is oblong on plan—being carried upon one bay of the nave. The roofs of the transepts are bipped at the ends, and the tower is crowned by a high-pitched roof, on a similar plan. There are three doorways, and windows over them, the centre being made prominent by a lofty arch, the window under it circular. The whole west end, as shown, has considerable novelty and merit.—Mr. W. Smith's "New Church at Norwich" (665), now being erected from his designs, has a polygonal apse, and at the east of the nave a low tower, which is effectively treated,—the square form, with pinnacles, being gathered into an octagon, and terminated by a pyramidal caping.

"A design for the completion of the interior of St. Paul's" (670), is exhibited by Mr. F. C. Penrose. It will attract the attention which the subject, and indeed the design, deserves. The drawing, however, being rather sketchily made, and being a section, and therefore particularly inadequate to the representation of a future effect of such a lofty interior seen from the floor level, is under many disadvantages, exhibited any where but in the building itself. The intention of the design is to carry out the proposal of Wren, as mentioned in the "Parentalia." Wren's intention, as there stated, was "instead of painting in the manner now performed, to have beautified the inside of the enpola with the more durable ornament of mosaic work, as is nobly executed in the cupola of St. Peter's, at Rome;" but the quotation continues, "as this art was a great novelty in England, and not generally apprehended, it did not receive the encouragement it deserved." We have here no information on the question of appropriate character, or that irrespective of vehicle, which is the most important question. It is plain, however, that if Wren had had advantages which are part of our progression, he would have refrained from any implied approval of the work of Sir James Thornhill, which is based upon a principle that, however fortified by the name of Michelangelo and the example of the ceiling of the Sistine Chapel, is wrong in principle so far as it seeks to destroy the effect of the structural form and surface, rather than to bring the pictorial into harmony with the structural, and misconceives the office or limitation of each art, by making the pictorial representative of framework, or making that which professes to be structural merely an imitation. The general question, however, and the special one of the decoration of the dome of St. Paul's, have received so much attention from us that we need say little more than that Mr. Penrose's design starts from the correct basis of principle, and is in the main worthy the object. Whether the design meets the requirements of taste, so as to entirely harmonize with the work of Wren, we can hardly say at present. The dome generally is correctly treated; but there are some differences of scale in the figure subjects, and some results produced by the pictorial part of the decoration upon the scale of the building, which should be further considered. It may be supposed that besides what is due to Mr. Penrose, we see here some results of the counsel of others, as that of the architect lately lost to us; under any circumstances therefore, we prefer to direct attention to the drawing rather than to criticize the design at length. We may say, however, that if the drawing be correct in showing gliding used on portions or edges of the leaves, instead of for the whole leaf or background, such use of gold is one of the mistakes that we hoped had been corrected. We rather think also, there is in minor parts, some indication of pictorial imitation of framework, notwithstanding the general absence of that. The dome is divided into panels by thin lines of blue, with red. At the base of the dome, somewhat in the position of an attic to the tambour, there is a circle of half length figures, on blue backgrounds, under arched framework. Panels with subjects on blue or gold backgrounds, red or green

deciding on its entire merits, and equally have felt the claim to appreciation of merits which may exist along with defects, we suggest that our friends in future should read what we have written ere they deem it necessary to quote to us what may prove to be, as in this instance, entire fabrication or the result of misconception.

backgrounds to the sculpture, and pictorial compositions on the domical soffits at angles of the rotunda, are the other elements of the design—which however altogether, should be examined rather than taken from any description that can be given in words.

No. 692 shows an exterior view, and No. 696 an interior, of the church of St. Paul ("Decorated" Gothic), now being erected at Maidstone, Messrs. Peck & Stephens, architects; and No. 693 is an "Interior View of a new Church in Tottenham-park, for the Marquis of Aylesbury," in a similar style, by Mr. T. H. Wyatt. Talent is displayed by Mr. F. T. Gompertz in his design (651) "for a Cathedral of the Thirteenth Century." Spires are shown at the transepts, as well as in the usual positions in the plan. Mr. W. G. Habershon's restorations and new roofs of Sandy Church, Beds, shown by an interior view and a plan (686), appear to have been conceived with judgment. Messrs. Walton and Robson should be commended for an endeavour to work in a path of their own. This is manifested in their "Shops recently erected at Folkstone" (653) for Mr. W. Garstang, as also in their works represented in the Conduit-street Exhibition; but their window-dressings and cornices have much of that heaviness which is found in many designs that attempt decorative brick-work.—"The National Schools, on the Boundary of the Park, Dynevor Castle, Carmarthenshire" (655), erected for the town of Llandilo by Lord Dynevor, are picturesque Gothic, of blue-coloured stone, with white stone dressings, and red and white voussoirs or arch-stones, and have a two-storied half-timbered porch, and a conical capped bell-turret.—Of the "Buildings for the 2nd Regiment of the Cheshire Militia, erected at Macclesfield" by Mr. F. H. Pownall, we can ascertain little from the drawing (658) in its elevated position, except that they are Gothic, and are of stone, and that there are circular turrets to a building which probably contains the officers' quarters.—The "New Business Premises," near Smithfield (Cart's Charity Estate), "leased to the London Printing and Publishing Company, in course of completion," by Mr. G. S. Clarke, we are better acquainted with, having had the opportunity of glancing at the building itself. It is a building of seven principal stories, with high-pitched and cornice-stepped-gabled roof, three of the stories of windows being grouped under one tier of arches. The materials are red and black bricks and stone. Though the design is not devoid of merit, it is certainly as much characterized by that mere whimsicality in form and excess in colour which are so prominent in the architecture of the day.—A similar disadvantage of position prevents our doing justice to the next drawing (660), one of the most interesting in the room just now, from subject, "The Grosvenor Hotel, now in course of erection at the Victoria Station, Piccadilly," by Mr. J. T. Knowles. Indeed, the absurdity of the Academy provision for architecture is this year very noticeable. Oil paintings in the principal gallery are no longer hung close to the ceiling; but architectural drawings, which require the closest inspection, are placed without any reference to the requirement. The arrangement even at the Conduit-street galleries goes to the very limits of deviation from "the line," if not beyond them. We can just make out that the hotel will be a five-storied building of Italian character; that the ends are treated as pavilions, having high curved roofs; that a continuous balcony to the first-floor windows, and balconies to the windows above, and bold *cornicioni*, are amongst the features; and that there is considerable variation and good grouping in all these. The result, however, will not be so satisfactory as might possibly be anticipated from the drawing, should the work happen to be executed in cement. That material is, as we have often said, unfavourable to effect, not only where it is imitative of stonework, but from the absence of that variation which there is in the tint of stone, even as stone is in towns, or seen under the most disadvantageous circumstances. The inherent drawbacks to the use of the material for superficial work are only increased on painting it. Artificial stone has not so much these particular defects. The contrast between stone and cement of the best kind, after exposure to smoky atmosphere, may be tested just now by their appearance in the portico of the Opera House, Covent-garden, where the columns and architecture are of the stone, and the cement has become much more and evenly dirty. We predicted that result in the Opera House, and have at other times questioned the judgment of the surveyor to London estates, whose course really is doing harm rather than good by the manner in which they enjoin that alterations shall be carried into effect, or by

the use of cement. The architect of the new Opera House, Mr. E. M. Barry, acted under this sort of compulsion. He has a view of the new Floral Hall, with the House, in the present exhibition (690). A different view of the Finchley Hall School to that in the Conduit-street exhibition, is exhibited by the architect, Mr. E. Roberts (661); and a drawing of the "Henham and Wangford National Schools, Suffolk" (662), by Mr. E. L. Blackburne. The design in the latter, so far as we can see it, is Gothic, of a prevailing character, in which hands of colour, red-tiled roof coverings, and a *louvre* or *stèche*, play important parts. Mr. E. W. Mantell's "Schools" (663) erecting, one at Lydiard Tregoy, Wiltshire, and the other at Purton, in the same county, are good plain designs. In one of them, the upper part of the gable of each dormer, is retrenched, and hipped roof covering is substituted in a common manner, but one that here aids the result desired.

We have still to mention some of the drawings; and, indeed, some of the best.

#### STOCKTON CHURCH, SALOP.

This edifice, with the exception of a great part of the tower, has been restored, under the direction of Mr. T. C. Whitmore, of Apley-park, adjacent. In addition to a massive tower at the west end, it consists of nave, north and south transepts, and chancel, with vestry on the north side. As parts only of the ancient church existed, the rest being of a Debased character, scope was presented for extensive improvements. The whole of the chancel has been refaced with stone, inside as well as outside, and the antiquities brought to light appropriately enriched with ornament. This portion is originally of the early part of the twelfth century, but had insertions, some of the Decorated period, and some Debased; in its treatment, except where Norman work was called for, the Decorated style has been chiefly adopted. The ceiling, being a handsome one, of the latter end of the fifteenth century, has been retained. In contriving for it, it was found necessary to project the wall-plates within the inner sides of the walls, and to support them partly by brackets, which with their pendants assume a very ornamental appearance, whilst heaviness is avoided in the wall-plates by carving the interstices into cornices, leaving blocks at intervals, which serve as super-capitals to the sculptured stone capitals on which they rest. Each pendant on the north side is terminated with a Knight Temple in a devotional attitude, and on the south with an angel. The east window is a triplet of lancets with tracery, and in its stained glass presents the birth, life, and crucifixion of Christ; the minor compartments having suitable accompanying devices: the sills are deep, and fronted with alabaster carved as a reledo. The chancel side-windows have paintings of the four Evangelists. The nave and transepts have been restored in the Perpendicular style. The principal entrance is through the tower, where a Jacobean porch and a short inferior window above it have been exchanged for a doorway and window in a style transitional between Decorated and Perpendicular, in accordance with the age of the lower part of the tower. The large west window and those of the nave have cathedral glass; the transept windows stained glass. The encaustic tiles of the flooring increase in richness at the usual gradations eastward. The woodwork of the nave has been improved and retained. The vestry, which was an ugly lean-to, now has the resemblance of a small chapel in the Tudor style.

#### COMPETITIONS.

**Raddiffe, near Manchester.**—The designs of Mr. W. Walker have been accepted in competition for the new church of St. Thomas, at Raddiffe, near Manchester.

**Worcester Training College.**—The committee of the Worcester Diocesan Training College, at Suttley, near Birmingham, are about making considerable additions to the instruction department of the college. Competition plans were invited from architects of the diocese, and ultimately those of Mr. G. T. Robinson, of Leamington, were accepted.

**Hertford Cottage-building Company.**—A number of designs have been sent in for the cottages about to be erected for this company. From these has been selected, as the most appropriate, one by Mr. F. Dyball, of London.

**Exeter Branch Bank.**—The author of the design marked "Use," to which the "second" premium was awarded, is Mr. Walter Damant, architect, late of Plymouth.

## INDIAN RAILWAYS.

## INSTITUTION OF CIVIL ENGINEERS.

At a meeting on the 8th, the paper read was "On Indian Railways; with a Description of the Great Indian Peninsula Railway," by Mr. Jas. J. Berkeley.

It was remarked, that the reason why the commerce of India had continued so incommensurate with the resources of the country might be chiefly assigned to the want of proper communications. Indian railways would not, as in England, be the substitution of a perfect system of conveyance for other convenient means; but in many districts they would be the first introduction of any communication whatever adapted for the requirements of the country.

Since the year 1849, when the Government took the first decided step towards the establishment of a system of railways in India, the formation of 4,521 miles had been sanctioned; 636 miles had been opened for traffic; 765 miles were expected to be opened in the current year, and 864 miles in 1861. The estimated capital was nearly 52,500,000*l.*; of which sum the expenditure upwards of 34,000,000*l.* had been sanctioned, and more than 27,000,000*l.* had been subscribed. The arrangements under which Indian railways were being carried out consisted of a Government guarantee as the means of raising the requisite capital; the agency of incorporated companies to design, execute, and manage them; and Government supervision to define the projects and control the proceedings and expenditure. The terms of the contract between the Government and the companies were then briefly stated; and it was remarked that, as far as they had been brought into operation, they might be pronounced to have been successful, although attended with some disadvantages, which were pointed out, the principal one being delay, owing to the necessity for reference to many widely-scattered tribunals.

Certain standard dimensions had been adopted for all the lines and the rolling stock, including a uniform gauge of 5 feet 6 inches, and a minimum clear width between the tracks of 6 feet.

The principal lines of the Great Indian Peninsula Railway, which it was the more immediate object of the paper to describe, were proposed to extend from the port and city of Bombay to join the East-Indian line at Jubbulpore on the north-east, with a long branch to Nagpore, and to meet the Madras line at or about the river Krishna on the south-east.

The first section undertaken was from Bombay to Callian, a distance of 33 miles, with a branch to Mahim  $\frac{1}{2}$  mile. It was called the experimental line; was commenced in February, 1851; and the portion from Bombay to Tannah, being a length of 20 miles, was opened for public traffic on the 16th April, 1852.

From Callian diverged the south-eastern extension to Poonah and Sholapore, and by the proposed extension to the river Krishna and the Madras Railway to Madras; and the north-eastern extension to Nasick and Jubbulpore, to join the East-Indian Railway from Calcutta, by which also a communication would be effected to the north-west provinces of India.

The first section of the south-eastern extension from Callian to Camponlee, a distance of 37 $\frac{3}{4}$  miles, contained no work of a special character, but was remarkable for the extraordinary floods and rapid torrents to which it was exposed on both sides. It had been made for a double line, but only one road had been laid. The average cost, exclusive of rolling stock, was only 4,500*l.* per mile.

The Bhoze Ghaut incline, which was expected to be finished about three years hence, was 15 miles 68 chains in length, with a total rise of 1,831 feet. The steepest gradients were 1 in 37 and 1 in 40; short lengths of level and of 1 in 380 being introduced, to facilitate the working of the engine in the ascent. It comprised twenty-five tunnels, eight viaducts, a large quantity of retaining walls, upwards of one million and a quarter cubic yards of cutting, chiefly rock, and nearly two million cubic yards of embankments. The estimated cost of this incline was 750,000*l.*

The next section of the south-eastern extension, from Lanowlee, the summit of the Bhoze Ghaut incline, to Poonah and Sholapore, was 205 $\frac{1}{2}$  miles in length, of which 185 miles were already completed, with a ruling gradient of 1 in 132.

The general style of design for these trunk lines was derived from the model of the late Robert Stephenson's English railways. The character of the works was plain, substantial, and durable; such as would provide for the regular and expeditious conveyance of a heavy and increasing traffic in goods, and the accommodation of numerous passengers, at a moderate working cost, and at a

reasonable expenditure in maintenance. Native labour by which these works had been executed was cheap, but very inferior to that of England. Nearly 100,000 men had been employed upon the Great Indian Peninsula Railway lines at one time, and as many as 20,000 on the Bhoze Ghaut incline alone. The wages of the several classes per day were now:—Native maistries, or foremen of masonry, brickwork, or carpentry, 2s. 6d.; masons, 1s. 9d.; bricklayers, 1s. 3d.; carpenters, 1s. 6d.; smitbs, 2s.; miners (a very large class), 9d.; excavators, 7d.; and labourers, 6d. The following table was given of the relative cost of each kind of labour in England and in the Bombay Presidency; it being understood to refer to simple labour only, and not to the cost of finished work:—

Class of Labour.	Proportion of Work done by each.		Relative cost of Labour in each Country.	
	England	Bombay	England	Bombay
Masons .....	24	1	1 $\frac{1}{2}$	1
Bricklayers .....	4	1	1	1
Carpenters .....	3	1	1 $\frac{1}{2}$	1
Miners .....	3	1	2	1
Excavators .....	3	1	1 $\frac{1}{2}$	1
Labourers .....	34	1	1 $\frac{1}{2}$	1

The whole of the Great Indian Peninsula Railway had been executed by contract, and this, it was believed, had led to remarkable economy in the construction of the various lines. The average cost of the opened portions had been about 8,000*l.* per mile. The introduction of the contract system into India, on a large scale, was an important effect of railway enterprise, and it was thought that its advantage could not be long confined to railway construction.

On May 15th the paper was discussed.

In commencing the discussion, it was remarked, that the East-Indian Railway, extending from Calcutta to Delhi, with three branches, and a line from Allahabad to Jubbulpore, was 1,338 miles in length, of which 295 miles were now open for traffic. There was only one tunnel, which was 300 yards in length; but there were viaducts of considerable magnitude, particularly those over the rivers Soane and Jumna, in which cases carriage roads were constructed under the railway, as well as over the Adjai, Moree, Keel, and Tonsa. Coal had been found on this line, which was used as fuel for the locomotive engines, and in which there was already a large traffic along the line. The estimated cost of this railway was 14,480*l.* per mile; but the finished portions had been executed for 12,900*l.* per mile. It had been calculated, that the cost of the works would be increased by the mutiny, to the extent of three millions sterling.

In reference to the Great Indian Peninsula Railway it was stated, that the estimated cost was about 10,000*l.* a mile, but the opened portions had only cost 8,713*l.* a mile.

The Madras Railway, extending from Madras, on the eastern side of the Peninsula, to Beypore, on the western coast, with a line to meet the Great Indian Peninsula at the river Krishna, was 845 miles in length, of which 96 miles had been opened. The peculiar features of this line were, the crossings of some of the principal rivers, and its construction without the intervention of contractors. It would be interesting to know the reasons that had induced this departure from the system pursued in England, where the judicious subdivision of labour introduced by the contract system had been found to result in economy and efficiency. The execution of the works on the Bombay and Baroda, and also on the Great Southern of India, was likewise undertaken by the engineers. The advantages of the introduction of contractors of capital and of experience into the Bombay presidency had been clearly stated in the paper.

The Scinde Railway extended from Kurrachee to Kotree on the Indus, for a length of 114 miles; and the Panjnah Railway from Moulton to Lahore and Umritsir, a distance of 250 miles. A line was also under survey from Lahore to Delhi. The difficulties to be surmounted in the navigation of the Indus, and the class of steamers and other vessels proposed to be employed were well worthy of consideration.

The other lines were—the Bombay, Baroda, and Central India, extending from Bombay through Surat, Broach, and Baroda to Ahmedabad, for a distance of 309 $\frac{1}{2}$  miles, on which the bridges were composed entirely of iron; the Eastern Bengal, from Calcutta to Koosbree on the Ganges, 108 miles in length; the Great Southern of India, of which 80 miles, from Negapatam to Trichinopoly, were under considera-

tion, and which it was proposed to extend to the Madras Railway, near Erode, on the north, and to the coast, at Tuticorin, on the south; and the Calcutta and South-Eastern, between Calcutta and the river Mutla, a length of 28 $\frac{1}{2}$  miles.

The construction of railways in India had awakened a spirit of enterprise; had caused the country to be examined for its more valuable products, of which iron and coal had been found; had induced designs for docks, and for the improvement of navigation and of irrigation; had given employment, on an average, to 100,000 labourers; had led to an expenditure of fourteen millions of money, within a few years, chiefly among the native population; and had involved the delivery into the country of 700,000 tons of material, irrespective of contractors' plant, &c., costing about ten millions and a half of money.

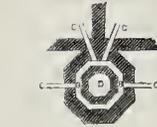

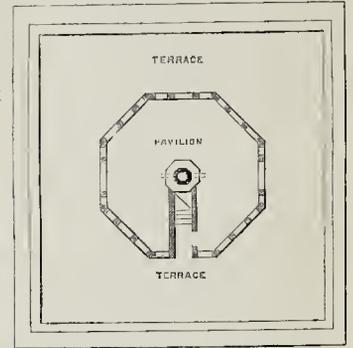

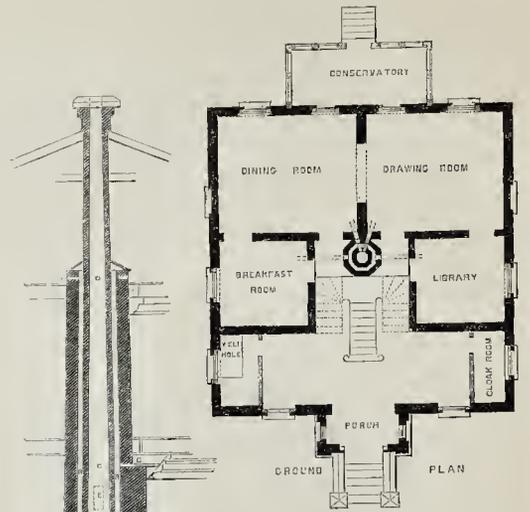

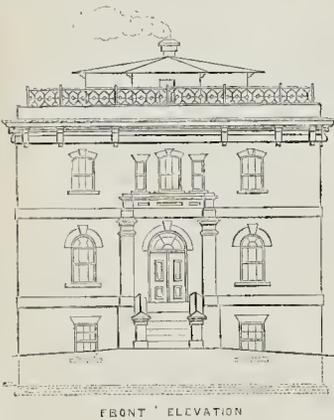

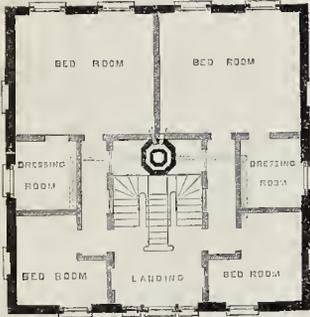

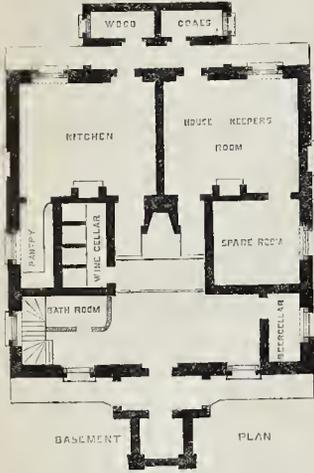

The number of men employed on the opened portions of the Indian railways, in 1859, was 590 English and 7,855 natives, giving an average of sixteen men per mile. At this rate the lines now being constructed would give permanent employment to 77,000 persons. The fares in the Bombay presidency in 1859 were, 1st class, 2*d.*; 2nd class, 1*d.*; and 3rd class, 3*d.* per mile. The speed of the trains, including stoppages, was from sixteen to twenty miles an hour. The total number of passengers carried was 1,161,501, and the number conveyed over one mile, per mile of railway open, was 192,974; the average distance travelled by each passenger being 32*4* miles. The total number of passengers, on all the lines, in 1859, was 2,822,382, of which nearly ninety-three per cent. were third class. The average receipts in the Bombay presidency, for the year ending June, 1859, had been for passengers 453*l.*, and for goods 46*l.* per mile. It was evident that the goods' traffic had not yet been fully developed, as the lines were not continuous, nor had they reached the principal producing districts. The cost of working, to June, 1859, which had been since increased, was only 4*1* per cent. of the gross receipts, notwithstanding that the cost of fuel was three guineas per ton. The dividend on the expended capital was about 5*14* per cent. The East Indian had realized even a larger dividend.

## FAIR OAK HOUSE, ISLE OF WIGHT.

THE peculiarities of this house consist in the mode adopted to warm all the rooms by means of one central shaft. The mode of application is as follows:—A large open stove is fixed at the bottom of the shaft in the basement story, the smoke of which passes up through the inner flue, and escapes in the ordinary way at the top. The *outer* or *air flue* is separated from the *inner* or *smoke flue*, by a thin ring of brickwork in cement; into this the cool air of the house flows through the slotted holes in the exterior surface, and is warmed by coming into contact with the heated surface of the smoke flue, and is admitted into the several rooms through perforated cornices, the supply to the apartments being regulated by a simple valve opening by means of a rack and pulley. By this means enough warm air is generated for the use of the whole house by only keeping one moderate fire and by warming the *air previously* to its entrance into the rooms, and the architect firmly believes that a fire in the hall of any house would be found the most economical arrangement, as well as the most conducive to health, inasmuch as it would tend to reduce the draughts that continually occur through the cold air rushing in to the rooms that are warmed in the ordinary way by the open fireplaces.

The architect would have preferred the warmed air entering the rooms through *perforated skirting*, rather than through *perforated cornices*, but obstacles presented themselves which rendered it necessary to adopt the latter plan. The original idea to warm this building in the manner described was first entertained by Dr. Urquhart, B.N. (the proprietor of Fair Oak House), and was carried out by Mr. F. Warburton Stent, and although there were many things that he, as architect, would have preferred modifying, we are informed that the arrangements have been a decided success.

There is nothing to comment on further than that, for the purposes of cooking, two fireplaces are constructed in the basement, the flues from which enter the smoke flue of the central shaft. There is an asphalted terrace on the top of the house, from which a fine view may be had of the surrounding beautiful scenery. As there may appear an absence of some sanitary and necessary arrangements in the plans, it is only requisite to state that the deficiency is rectified by means of apparatus which it is not requisite to describe.

ARRANGEMENTS FOR WARMING: FAIR OAK HOUSE, ISLE OF WIGHT.

MR. F. W. STENT, ARCHITECT.

EYESHAM HALL, NEAR HARFORD-BRIDGE, HANTS.—MR. S. S. TRELON, ARCHT.

## ELVETHAM HALL, HANTS.

ELVETHAM HALL, which is about 1½ mile from Hartford-bridge, Hants, has been distinguished in history by the honour of receiving a visit from Queen Elizabeth to Edward Seymour, Earl of Hartford, eldest surviving son of the unfortunate Protector, Duke of Somerset, by his second wife, Anne, daughter of Sir Edward Stanhope, knight. The history of Hampshire gives a most elaborate account of the extraordinary entertainment, with sham fight on the lake, which was given on this occasion. The property now belongs to Lord Calthorpe. The ancient house was pulled down many years ago, and a very plain house built out of the old materials. This is now being recast and added to very considerably. Indeed, the whole of the principal apartments, with the hall, staircase, and corridors, are all new, and the whole is being erected in brick, with a very small admixture of stone. There is a great deal of elaborate iron-work by Skidmore. Mr. S. S. Teulon is the architect.

## THE ARCHITECTURAL MUSEUM.

On Friday, May 18, a special meeting of the committee of the Architectural Museum was held at the residence of the President, Mr. Beresford Hope, for the purpose of expressing their sense of the severe loss which art has sustained in the demise of Sir Charles Barry, and also to record their own personal loss in him, as one of their trustees and a cordial supporter of the museum. A resolution was passed expressive of the sincere sympathy and condolence with the family of the late Sir Charles Barry, which was requested to convey, and arrangements were made for the attendance of the Council of the Architectural Museum at the funeral in Westminster Abbey.

## THOROUGHFARES.

Of the many plans projected by the *Builder* from year to year, there is but one which is now in progress—that which leads from Cranbourne-street to Grove-garden. This is a casement gained by the demolition of a few ruinous houses; and the increased value of the ground-rents will tend to lessen the cost of the clearance.

There is but one other of our suggestions which is in part accomplished—the opening out of the Spring-garden strait to St. James's; and here the New Commissioners of Improvements have made only a slight enlargement to afford a peep into the Mall; suffering the small 19 feet house facing Spring-garden to stint the passage, and to affront and darken the new hall of their consulate!

When they once get into action, we may expect great things from the importance of the building on which so much has been already expended,—that another illustrious opening may be driven direct from the Mall to the Strand, thus revealing to Charing-cross, the *core of London*, an illimitable prospect of open park.

Hitherto, the Corporation was the only public body that caused any improvement in these respects; but now an institution of the collegiate, if not monastic, order, has begun with spirit a *reformation* which is likely to stimulate to the imitation of such a move. *Christ's Hospital* has actually pulled down an extensive stack of houses, Bull's-head-court, in Newgate-street; and having systematically, for some years, withdrawn the old street line some 8 feet, adding it to the causeway, they are now about to enlarge the width of King Edward-street, and to make it a respectable approach to their college, their chapel, and their grounds. This alteration, if extended as it ought to be, to Little Britain, would give free access to Smithfield and the *Charter House*, and would confer immense value upon both estates.

Considering the vast rise in property, and the stint of room in the General Post-office, no site could be more apposite for that establishment; and it is certain that there is no other spot in the City which might be attained with less violence to private interests. A little sympathy of feeling, and combined action between the council of the two great educational foundations, might now lead to what we have often advised—the profitable disposal of both of these City colleges, and their removal to suitable positions in the home counties.

On that subject we have before dilated upon the point; but for the great body of the public there is not one in twenty who would not vote for their removal to the country; the more particularly as the value of the urban sites would not only pro-

duce funds to purchase parks, and raise *universities*, but also to yield splendid endowments for their perpetuation.

Much as openings for free intercourse have been needed, it has been left to private speculation to effect any great reform in this particular; and now, as if by a system of combined energies, it appears, the old modes of exit and entrance are to be wholly changed. Railway stations at Victoria-hall, at Hungerford, at Blackfriars, at Victoria-street, and Tokenhouse-yard, are to be the media of distribution for all arrivals and departures.

What effect this may have in alleviating the pressure upon great leading thoroughfares remains to be seen; but if, as in all other cases of facilitated intercommunication, we shall have increased crowds in motion, and accumulated merchandise *in transitu*, there will be, nevertheless, occasion for widened, straightened, and improved main streets.

According to the present map of London, there is a great want of direct linear routes: from the north we may enumerate six,—Edgware-road, Regent-street, Tottenham-court-road, Gray's Inn-lane, Goswell-road, Shoreditch, on the south, three,—Old Kent, Cauerwell, and Kennington roads; on the east, two,—Whitechapel and Commercial roads; and on the west, three,—Brompton, Kensington, and Bayswater. These are the main arteries leading through a compacted mass, extending nine miles from east to west, and seven miles from north to south; and it will be seen at a glance that all these are devious, winding, and irregular in width, and that they are the result of accident, which has from time to time added suburb after suburb to the now heterogeneous mass of the metropolis.

In making for any point distant but a couple of miles from the centre, how many turns must be made—pretty much as in sailing against a head-wind: you must tack now to the right, then to the left, in steering for the desired haven; and often, in long distances, when driving, the most prudent plan is, after the new mode of circuit-sailing, to strike off from the main routes, and make a detour of a mile or two, in order to escape the stops and dead locks, as a mariner would seek the outer ring of a cyclone.

At present the omnibus carries nearly all men of business from the City, or centre, to their suburban retreats: very few, comparatively, drive their own vehicles; and as soon as the access by central railways shall be consummated, the probability is, that both city and town will be still more deserted as residential, and that the multitudes will seek homes further placed, but arrived at with much greater certitude and celerity.

With such a change of habits as these transformational will occasion, there must be, in the first instance, a considerable alleviation of pressure on the main thoroughfares; but improved systems of locomotion will, as in all parallel cases, create a greater circulation of people, and enlarged plans of trade and commerce: the growing population, and with it the growing wealth of the nation, will require enlarged ducts of intercommunication; and even the cross streets, now so little regarded, will claim some attention, not only to their width, but their *alignment*.

A great portion of the City proper consists of lanes, crooked, and barely admitting the passage of one team; and the expensive character of the houses forbids any change in their width. On this account alone the wider and more direct lines of intercommunication ought to be enlarged, and made straight where possible. Finch-lane, St. Switbin's-lane, Bucklersbury, and numerous others, are fair examples: these must be reconnoitred before any carriage can attempt the passage—the steersman must look out that there are no breakers-a-head.

It is in the principal routes, where there are straits and narrows, that any immediate improvement is practicable—such as Fleet-street or Holborn, or at the corner of Chancery-lane. In the busy hours, rows of four, and even five or six carriages keep up a continuous stream, to and fro, in the wide portions; but at the straits of the Bars there is only room for two: this of necessity stops the traffic, pretty much in the same way as the gate of issue from a theatre will become choked by a rush for escape: two single files pressing on with regularity would pass double the number, without a crowd or a rush; but as in a conduit of water, say of a 20-inch bore, if at only one point it be reduced to 10 inches, then the supply will also be lowered to one-fourth the quantity, so it is as to the current of traffic through Temple Bar.

The Thames embankment question will now have consideration. The select committee appointed consists of Sir Joseph Paxton, Lord John

Manners, Mr. Cowper, Sir John Pakington, Mr. Alderman Cubitt, Sir John Shelley, Mr. Stirling, Mr. Tite, Lord Robert Montagu, Mr. Waiter, Sir Morton Peto, Mr. Phillips, Mr. Roupell, Mr. Yorke, and Mr. Beamish.

We shall look anxiously for the evidence that will be given.

With the exception of coal, which is brought from ships in the Pool and elsewhere, here to the wharfs, the quantity of goods landed along the line in question is not considerable, and it may be, that the plan of loading the coal into lighters, unloading them at these wharfs, and then putting the coals into waggons of tremendous weight and strength, which, when loaded, are dragged with great difficulty up steep inclines, is an unwise one.

During the last twenty or thirty years, the progress of steam-power has made material changes in the management of several trades: not long ago "the jolly young watermen" formed well-known features along this portion of the river: their occupation is now nearly gone; the steamers have taken up their trade, and daily carry thousands of persons at a cheap rate, with great safety and expedition.

When the coal-wharfs were established at Hungerford and elsewhere, we had no great docks in which ships could be unloaded, and "sea coal" taken by railway to depôts in the northern parts of London; but soon by a system of railways ramifying throughout the metropolis we shall have both sea and land-coal warehoused in convenient situations, where, by means of machinery, the waggons could be lifted and their contents emptied, and by an easy process the coals could be weighed and placed in the vans for delivery: see, for instance, how this is managed at the Great Northern Railway Station, in the Caledonian-road, and some other stations along the North-London line of railway.

Once upon a time the chief part of the coals shipped in the Tyne was brought from stations belonging to the several collieries in keels;\* the time lost in loading them was great; and it required hours for those lumbering vessels to navigate the river and get laid alongside the ships; then by hand labour the coals were slowly passed into the ship, the valuable material being broken and wasted by the process. In order to prevent this, several of the coal owners projected staiths, on which were tramways, to such a distance into the river that ships could come alongside: the coal-wagon, loaded as it was at the pit mouth, could be lowered by a simple machinery to the hatches of the hold; then, by the easiest means, the bottom of the wagon could be opened, and the coal dropped into the hold. Great was the opposition offered to this plan: the keelmen proceeded to strikes and rioting; all, however, failed to prevent such an evident advantage. These staiths, like the coal-barges and their mooring-places in the Thames, did damage to the Tyne.

They have, notwithstanding, led the way to great improvement, for now two docks of immense size have been constructed, to which enormous quantities of coal are brought by railways, and the ships are loaded in the manner mentioned, without at all interfering with the current of the river. By this means a ship of 1,000 tons burden can be loaded in a day: if this be a steam collier, it could clear the port of Tyne, and be moored in the Victoria Docks, unloaded by steam apparatus, and in a time which twenty years ago would have seemed fabulous, be in the London market convenient for sale. These facilities, notwithstanding the great additional supply required, have caused the cheapening of coal; and we have mentioned these circumstances as showing changes which have been made which render the coal-wharfs along the City margin of the Thames less necessary than formerly, and that there might be wisdom on the part of those engaged in this business in meeting the circumstances of the times; for it is evident that it will be impossible for the wharfs thus situated to compete with the more modern arrangements. Be this as it may, however, it would be easy to accommodate the wharf owners in making the embankment.

We earnestly hope that no time will be lost in bringing this important matter to a decision. The coal dues will shortly cease: it might be worth while for a time to continue their imposition, and strictly apply the proceeds towards the payment of the cost of the embankment. In consideration of the fact that the well-being of the

\* These vessels were shallow, and so wide in form that they were almost semicircular: large sweeps or oars were used, also a great square-sail. Antiquaries say that the keels were of the same model as the ships of the Danes, which so often ravaged this coast.

Thames is an affair of national importance, it would be but an act of justice to grant a certain amount from the Imperial treasury: many districts of the metropolis could ill bear more taxation, but if the coal dues be appropriated, and a further sum be guaranteed by the Government, by the extending of the payment over a longer period, a great improvement might be carried out without any oppressive taxation: moreover, land would be redeemed from the river which would be very valuable. In a sanitary and aesthetic point of view, the desirability of forming a noble quay is obvious.

#### GAS LEAKAGE AND ITS EFFECTS.\*

An able report, recently made by Mr. Spencer, the analytical chemist, and the acknowledged discoverer of electro-type, has a peculiar bearing upon the question of the purification of the Thames, and its summer stench, and is likely, we should think, to excite attention and discussion on this ground, much more than on the subject which the report was directly intended to elucidate.

Special attention has frequently been drawn in the *Builder* to the black mud of the Thames. Now this mud, Mr. Spencer maintains, after investigations for several years past, is not only the legitimate offspring of the stinking black earth of the London street-subsoil, but also the special source of the summer stench of the river in the metropolitan bounds. That stench, Mr. Spencer says, he has experimentally extracted from the black mud by means of artificial summer heat, and analyzed into that abominable compound sulphuretted carbon, essentially, though combined with other less obnoxious ingredients. It lies hidden, as it were, in the mud, at all temperatures below a certain pretty strong summer heat, but at that heat it escapes from the black oxide of iron to which it is attached; and it is thus and then, Mr. Spencer conceives, that it contaminates the atmosphere along the course of the river.

The origin of this stinking black mud, as we have hinted, Mr. Spencer traces, not to the sewage of London, but to the abundant percolations of the black earth of the street subsoil into the sewers, and this black earth he traces back without difficulty to its well-known source in gas leakage. But he does not attribute this abomination merely to impurities in the gas so leaking, but to the gas itself, however pure or impure; and of this gas the quantity which leaks from London gas-pipes is something enormous,—no less than 9 per cent., or between six and seven million cubic feet per annum. No such leakage occurs in other populous towns, such as Liverpool or Manchester, where the joints of the pipes are bored and turned, and so fitted to each other like glass bottles to their ground stoppers, whereas the London gas-pipes are jointed with tow and lead, so that, after a little endurance of changes of temperature in summer and winter, and consequent expansion and contraction, the lead parts from the more expansive iron in summer, and is compressed by the more contractile iron in winter, in such a way as to destroy the joint entirely as a tight fit especially for gas.

The gas so allowed to leak in enormous and perpetual quantities has been found by Mr. Spencer to react upon the gypsum or sulphate of lime in the London subsoil, and thus to liberate the sulphur from its harmless combination with the lime, and promote its union with the carbon of the gas, forming a vile sulphuretted carbon, which corrodes not only the gas-pipes but the water-mains also, and converts them almost entirely into a sort of plumbago in ten years, although in pure London subsoil they will last for a century. The corroded matter crumbles, and is converted into black, foul earth, and, according to Mr. Spencer's investigations, percolates, with moisture, into the sewers, chiefly from above, and not only subsides into the heavy black "slime" of the Thames banks, but is actually choking up the sewers themselves. And, indeed, the accumulation of even half a century of a heavy, unfloating, thick, tenacious, slimy deposit, from so fertile and never-ceasing an origin, may well choke up both sewers and river, if this be the way in which the work proceeds.

As for mere sulphuretted hydrogen, Mr. Spencer, like others, has failed to obtain any really serious, or noxious, or even simply obnoxious, quantity from the Thames water, or even from the London

sewage; and he is quite convinced that the summer stench does not arise from mere sulphuretted hydrogen, but mainly from sulphuretted carbon: other chemists differ.

The importance of Mr. Spencer's conclusions, if correct, is obvious, and so is their novelty. If he be right in these conclusions, a new way opens up for the sweetening of the river. The immediate removal of the black mud would be but the initiative: gas companies would require to be compelled, by legislative enactment, to rejoin their pipes, or otherwise abate their nuisance; and not only Mr. Spencer, but gas engineers whom he has consulted, can see no difficulty, such as may be alleged to be peculiar to London streets, in the matter: the thing has already been done in other populous and busy towns: why should it not be done in London? The saving of gas would repay the cost. Only think of 6,000,000 cubic feet of gas added, every year, with sulphate of lime *ad libitum*, to the accumulative nuisance of the ill-smelling black earth of the street subsoil beneath our feet, even though its connection with the egestate black mud of the Thames banks could be disproved.

However feasible the result of Mr. Spencer's interesting and important investigations may appear, there is one apparent objection to the idea that it is the black mud alone whence the summer stench issues which we must here reiterate. If it were so, why is it that the stench subsides as the black mud becomes exposed to the sun at low water, and increases as this mud becomes covered by the rising tide? We do not mean to say that an ingenious and skilful chemist like Mr. Spencer may not be able easily to explain away such an objection; but, at all events, it requires explanation ere his final result can be fully admitted, even although he has extracted the stench (or at least the abominable sulphuretted carbon) from this very mud by an artificial summer's heat, and has even simulated the whole process, *ab initio*, in his laboratory.

#### BUILDING OPERATIVES AND THEIR EMPLOYEES.

It will have been seen with deep regret that the Unionists are striving to throw out of work their fellow-workmen engaged under the "Declaration," and as the masters are bound by every feeling of justice and honour to support the latter, a serious collision, we fear, must be anticipated. An "Architect" writes thus:—

"The subjoined notice has been served on a respectable builder (Mr. Anley, of Whitecross-street), who is carrying on some extensive works under me at Messrs. Cope-take, Moore, and Co.'s, Whitecross-street. It happened the notice was served while I was at Mr. Anley's office, and I witnessed the whole transaction. Mr. Anley quietly remonstrated with the deputation who delivered the notice, and asked four specific questions, viz. whether the men had any fault to find with himself, his foremen, his clerks, or the rate of wages? To each of these plain questions a distinct negative reply was given. After a lengthened remonstrance, Mr. Anley stated that he would give the men half an hour to reconsider their course. They left the office, and returned shortly after, stating that they had determined to strike unless the obnoxious men (two in number) were discharged.

"This is a plain statement of facts, and hardly needs any comment. I thought I was living in a free city: it appears that I am not, if such acts are to be tolerated. I am glad to add that Messrs. Cope-take & Co. will not press Mr. Anley to fulfil his contract, although the delay is very inconvenient to them at this moment.—I am, Sir, yours, &c., W. BARNES, Architect."

The following is a copy of the notice referred to:—

"At a meeting of joiners in the employ of Mr. Anley, Tuesday evening, May 15th, 1860, it was resolved that Mr. Anley be given to understand that the men who are working under the declaration in his shop be discharged, and unless we have a definite answer by dinner-time tomorrow to that effect, we cease work immediately."

(Signed by thirty joiners.)

At the Westminster Police Court, last week, two society men were brought up for intimidating a fellow-workman, and warrants were ultimately issued against them on the charge of conspiring to induce his employer to dismiss him. Other society men have been brought up for threatening a man working under the "Declaration" at Mr. George Smith's, Pimlico.

There is nothing to prevent men from uniting and agreeing with one another to work only on certain conditions, such as they may think, either wisely or not, calculated to advance their interests; but they have no right whatever to seek to coerce others into the same views, and to interfere with the rights of their fellow-workmen: society at large would feel itself bound to protect the latter, and to prevent the growth of any system of terrorism, as tending to the destruction of the whole body politic.

A partial strike of Mr. Myers's men, at work at

Mr. Rothschild's, in Piccadilly, took place a few days ago, but the men ultimately came back.

Organizations of the most extensive kind are being formed, and what will be the result it is impossible to say. We have before us "The Rules of the Amalgamated Society of Carpenters and Joiners," but have not yet had time to give them consideration. The address issued by the delegates who have been seeking to effect this amalgamation says:—

"The first and most important consideration that influenced their deliberations was the *command of the surplus labour of our trade*. To the present time that surplus labour has been wielded against us by the employer, to our great injury; because, when trade is depressed, the artisan, having no dependence on which to rely for the necessities of life for himself, his wife, and little ones, no alternative is left but to take work on the employer's terms (as a temporary relief), to his certain and final injury, and the injury of his fellow-men. The above council of delegates believe that the most effective and speedy means of wresting from the grasp of the employer this *command of surplus labour*, is to provide substantial aid for our unemployed fellow-men, which provision is set forth in the 15th rule."

This rule commences:—

"Should any free member be thrown out of employment more than one week, under circumstances satisfactory to the branch to which he belongs, and not dismissed in accordance with Rule 13, from the commencement of the second week he shall be entitled to the sum of 10s. per week for twelve weeks, and a further sum of 6s. for twelve weeks, making a total of 12s. in one year. If a free or non-free member be withdrawn from his employment by a branch or executive council, his claim to the above donation shall date from the time of his withdrawal. Or any member withdrawn from his employment (to maintain the existing privileges of the trade), shall be entitled to half the wages he is then receiving."

No explanation is given of the grounds on which members are to be "withdrawn from their employment."

#### THE STOPPAGE OF THE ROADWAYS.

GREAT complaints, which are certainly not without reason, have for some time past been made, of the carelessness which has been shown by the contractors who are engaged in carrying out the works of the City underground railway. In the York-road, one side of the foot-path has for a considerable time been completely stopped up, and the other in parts also covered over; so that the generally considerable traffic of the thoroughfare has been turned into other directions, greatly to the loss and inconvenience of the tradespeople.

By a very little care this might have been prevented, either by banking up the soil or by carrying away at a proper time a sufficient quantity of the soil which has been excavated. Similar want of regard of the public comfort is shown at other parts of this work. The great mounds of earth are allowed to remain much in danger than is necessary, and are managed in such a slovenly manner that needless distractions are made. The other day a little boy slipped from one of these clay hills and fell under the wheels of an omnibus, which killed him almost immediately. At the inquest the jury expressed in strong terms their disapproval of the little care which had been shown for the general convenience.

Unless a change be made in these arrangements, and measures taken which would involve little, if any, additional cost, and would show a heter spirit of accommodation, it is to be feared that a very unpleasant feeling will be raised during the progress of this important work.

#### BUILDERS' BENEVOLENT INSTITUTION.

YESTERDAY (Thursday) a numerous meeting of subscribers to the above charitable institution was held at the London Tavern, Bishopsgate-street, for the purpose of celebrating their fifteenth election of pensioners. Mr. Joseph Bird, in the absence of Mr. George Smith (president), occupied the chair.

The Report set forth that the subscriptions and donations for the past twelve months amount to 1,035*l.* 0*s.* 6*d.*; and that the trustees have purchased 583*l.* 7*s.* 2*d.* Stock Three-per-Cent. Consols; 457*l.* 1*s.* 1*d.* for the Relief Fund; and 125*l.* 8*s.* 3*d.* for the Building Fund. The total sum invested is 7,111*l.* 7*s.* 9*d.*, with a balance at the bankers' of 218*l.* 1*s.* 6*d.*

The Chairman, after an expression of regret at the absence of their president, said they had met for the purpose of carrying out their fifteenth election since the foundation of their institution. He had much pleasure in stating that the funds of the institution were progressing, for gentlemen of note who witnessed their procedure had now come forth to aid them in their cause. They had some difficulty at starting, but having attained a good position and safe foundation, their more

\* Report to the New River Company on the Corrosion of Iron Mains, and the effects of Gas Leakage on the Metropolitan Street Earth. By Thomas Spencer, F.C.S. &c. Printed by J. Heddewick & Son, printers to her Majesty. 1860.

opulent hretbren now came forward. They bad at present met to elect three pensioners—two males and one female—out of sixteen candidates. They bad now 7,000*l.* in the Funds, and be considered that very good indeed; and they were paying for pensions between 800*l.* and 900*l.* annually. He was in hope that they would have been enabled to elect six instead of three, but probably there would be another election in November next. As an inducement to the unsuccessful candidates, he urged them to be vigilant, and during the next five or six months to get as many votes as possible.

At the close of the poll the names of the successful candidates were announced as follows:—James Oliver, of Devon; William Goodfellow, of Kensington; and Catherine Edmunds, of Bermondsey.

The Chairman remarked, that in declaring the names of the fortunate candidates, he could only say that he wished it was in their power to elect all; but that at present was impossible. They however had a great accession of subscribers, which he hoped would continue. He could not help thinking that there had been much dilatoriness on the part of many of the candidates, as there were 2,000 votes unrecorded, through the subscribers not having been called upon, among which there were some very heavy votes belonging to large firms. They were in hopes, however, that their funds would allow them to have another election in November of this year, when he trusted that the candidates would be active, so that every vote might tell.

After an expression of gratitude from the elected,—

The usual votes of thanks concluded the proceedings, the candidates retiring to a good dinner, provided for them by the institution.

#### HOW TO REDUCE THE PRICE OF BRICKS.

I HAVE several houses about to be erected in the neighbourhood of London, which cannot be commenced now on account of the enormous expense of bricks, both good and bad. I, therefore, am inserting a clause in my specifications that the works are not to be commenced till good stocks can be delivered at 35*s.* per thousand; and it strikes me that, if architects generally would adopt this rule, the agents and others who are speculating in bricks, after Stock Exchange fashion, would soon find themselves forced to let builders have them at a fair price. AN ARCHITECT.

#### GLASS IN PAVEMENTS.

In my walks through the City and other parts of London, I have noticed that several of the thick glass area lights are very much cracked, and in some instances dangerously so. I do not think that this has arisen from any overweight, but from the circumstance of the glass fitting too tightly in the iron frames. I am of opinion, that the cause of the mischief is the different degree of expansion and contraction of the two materials.

The introduction of an elastic medium between the edge of the glass and the frame would, I believe, obviate the evil, and prevent much expense and risk.

Similar fractures take place from too tightly fitting the plate-glass in shop-fronts, so that, upon the slightest settlement in the house or building occurring, the large and expensive plates are immediately shattered, as usual, from some "inevitable cause." FRED. BRAITHWAITE.

#### PROVINCIAL NEWS.

**Lincoln.**—The new post-office, in Guildhall-street, has been opened for business. It is 30 feet by 22 feet. The fittings are painted, and oak-grained. The upper part of the house is the master's residence. The elevation is Italian Gothic. Mr. H. Goddard was the architect, and Mr. H. Jackson the builder. The entire cost of the office, according to the *Lincoln Chronicle*, is about 1,100*l.*, which has been granted by the post-office authorities.

**Sutton Coldfield.**—Considerable additions to the Free Grammar School of Sutton Coldfield, are about to be made according to plans prepared by the trustees' architect, Mr. G. F. Robinson.

**Hartlepool.**—The new workhouse for this place will shortly be built, the plan submitted by Mr. Thompson, of Newcastle, having been accepted. At a late meeting of the board the architect was in attendance, and undertook to have the plans carried out for the sum named in the specifications—3,300*l.*

#### ARCHITECTS' ESTIMATES IN COMPETITION.

OFTEN we hear of the injustice of committees to whose selection designs are submitted in competition, and almost every week some one of your correspondents deplors the want of faith, or I was most going to say the dishonest proceedings, of committees. There is a rule in the courts of equity, that "they who seek equity should do equity." Now I think no one who has ever entered in competition for a moment doubt that a great majority of architects frame their design regardless of the amount placed at their disposal, while at the same time they estimate their work at the sum wished to be expended, all the while knowing that it is utterly impossible to carry out their design at the proposed cost.

I do not wish it to be understood that I think because wrong is committed on one side therefore unfair dealing may be permitted on the other, but that a great injury is done to the profession by this false mode of estimating, so much so that the fallacy of an architect's estimate is well nigh become a proverb.

Some committees, with a laudable wish to do what is right, and at the same time secure themselves against the probability of selecting a design which will cost double they wish to expend, have appointed a professional referee, or referees, for the moment about the profession itself in the person of the referee.

The essence of competition is that all should start from one point, and that that be the amount of money to be expended; therefore it becomes the duty of the referee to at once exclude *in toto* all designs that in his judgment would exceed by twenty per cent. the amount placed by the committee at the disposal of the competing architects. Were it known that such would be the proceedings of the referee, architects would see the necessity of framing their designs, both by arrangement and ornament, not to exceed the amount wished to be expended. Honesty would take the place of dishonesty, a healthy tone would be given to competition, and we should, as a profession, have a right to demand fairness and honesty in competition from the general public; but as long as we proceed in this false mode of estimating we cannot expect other treatment than that we now experience.

I have named a margin of twenty per cent. as ample to cover any difference of opinion as to the cost between the competitor and the referee.

#### THE CONDITION OF CARDIFF.

Sir,—In the *Builder* of the 21st April last you print a paper read before the Liverpool Architectural Society, by Mr. Robert Rawlinson, C. E., in which he makes statements respecting this town calculated to convey some practical information "contrary to the facts of the case."

—Extensive dock works are in progress near Cardiff; public sewers were commenced, but have not been completed. The sewers are large, and have comparatively flat invert: several manholes constantly employed within them to remove sediment and refuse, &c. &c.

With respect to the dock works in progress, presuming that the Penarth Dock at the mouth of the river Ely is allowed to have no other outlet to the sea than the pier, the better for the civil district, especially where freighters are the principal shareholders, though the town of Cardiff will hardly be benefited by the establishment of a rival port.

On the remark which follows, that public sewers were commenced but have not been completed, I beg to observe that public sewers have been constructed in every street of the town into which all house and surface drainage is connected, and by which all sewage matter is discharged into the sea at the extremity of the district, and at the furthest available point from the town. The length of sewer constructed by this Board is upwards of 45 miles, in addition to which a number of sewers, made by the late Marquis of Bute and his trustees, vest in the Board, making the total length under their control upwards of 17 miles. Sewers are already laid in streets forward, but not yet built on, in anticipation of future requirements, and there is not a court, alley, or lane in the town remaining undrained. More than 160,000 drainage pipes have been used by private individuals, chiefly from the manufactories of Messrs. Dulton, Messrs. Gibbs & Canbidge, and the North Devon Potteries.

Very much doubt whether any other compact town of 34,000 inhabitants has so large a provision of sewers. That the sewers are large is correct, the general size of street sewers being 3 feet by 2 feet. That they are not too large is evidenced by the fact that a heavy rainfall at high tide very nearly fills the out-fall sewers, and it is now under the consideration of the Board, on the repeated recommendation of Mr. Hawshaw (by whom the first and principal portion of the system was designed) whether they shall not increase the available area by constructing a small reservoir for reception of storm waters during spring tides.

That the sewers have comparatively flat inverts is especially incorrect, the inverts of five-sixths of the whole being constructed to a radius of 7 inches, which is, of course, equal to the surface given by the lower half of a 14 inch pipe, the fact being that the sewers are considerably steeper than is usually adopted in brick sewers.

That several men are constantly employed in the sewers to remove sediment and refuse is not, and never has been, the case. Since the works have been respectively handed over to the Board by the contractors, two men have been employed in alternate weeks to fix the doors by which the flushing water (and on every other day in summer) is directed down any particular line of streets, and at the same time to remove any large substances or deposit of gravel after heavy rains from street paving and macadamized roads: at no period has more than one man been employed at one time for these or any other purposes in the seventeen miles of sewer. That our sewers—have, as a rule, comparatively little fall is an unfortunate fact arising from natural causes. That the town is intersected by canals, docks, and dock-basins, which must in no way be interfered with, rendering drainage of any kind more than usually difficult, and that a considerable portion of the town lies under the level of spring tides, are circumstances which the Local Board can hardly be expected to control, and which "even the blindest brawler for local self-government," or for central official supervision, would acknowledge to be so. Every thing in connection with the sewers has been done under the sanction of the late General Board of Health (one of the best institutions of the country) and of the Home Secretary, acting through the Local Government-Act Office, the same name and the same name, and a new name, and I am

not aware that the General Board, or the Home Secretary, or their official advisers, have been supposed to go through their duties in a negligent or inefficient manner: as far as my slight intercourse with them enables me to judge, no professional man could exercise a more painstaking supervision, or conduct their inquiries in a more practical or courteous spirit.

Although I have not been in connection with the Cardiff Local Board of Health since its formation, I cannot but feel that the members of the Board have used the best means attainable in the most liberal spirit to place the town and district in a high sanitary condition.

Independent of sewerage, the amount expended in permanent street works and paving channelling and footpaths during one year and eleven months, ending 31st August last, was 10,500*l.* beyond the regular annual expenditure for maintenance and highway repairs. Of the result of such works and of general sanitary supervision I think the death-rate a very fair index, although other causes, especially a good supply of food, may materially effect it. In our Officer of Health's report you will find a comparison of two cycles of five years, as we may state it, "before taking sanitary measures," and "after taking sanitary measures," and the result stands thus:—Five years, ending 1854, average annual deaths per thousand, 34.37; five years, ending 1859, average annual deaths per thousand, 21.62. Surely in questions of sanitary progress some attention should be paid to these circumstances, and when practical information on any individual town is volunteered, some effort ought to be made to obtain it.

Surveyor to the Cardiff Local Board of Health.

#### CHURCH-BUILDING NEWS.

**Louth (Lincolnshire).**—The parish church of St. Mary, Ludborough, has been reopened for divine service. The fabric is very ancient, and has suffered considerably from the ravages of time. About two years ago, the nave was roofed by a storm, and it was then found that the building was in a very defective state, and steps were at once taken to get the whole thoroughly repaired. The north aisle of the north arcade of the nave was in a very dilapidated state, and the south clerestory wall and the chancel arch had also to be taken down. In rebuilding the clerestory wall, one of the old windows was discovered, and adopted as a model: they are simple roundhead, light, and widely splayed within. On the side of the western window of the north side of the chancel, on the removal of the old plastering, a scroll painting was discovered, which has been preserved. The whole of the roofs are new, and are of framed timber, stained and varnished, and covered with red tiles, those in the chancel being in striae of white and red. The walls are built of the white chalk stone of the district, in random courses, the dressing being of Ancaster stone. The greater part of the area of the nave and aisles has been seated with open wooden benches, the stalls of the chancel being of a more elaborate character. The floors throughout, except under the seats, are paved with tiles. The windows are glazed with yellow-tinted cathedral glass. The triforium in the gable of the chancel is filled with stained glass, having the sacred monogram in a medallion. The whole of the works have been completed under the superintendence, and from the designs, of Mr. James Fowler, architect, Louth; and Mr. Maxcy, of the same place, has carried out the architect's intentions.

**Ipswich.**—The foundation stone has been laid of the new Roman Catholic Church of St. Peter's, at Ipswich. The limited nature of the site has obliged the architect to adapt the plan to its irregular form. Adopting the material of the country, red brick is to be mainly employed, with a moderate use of stone, and the introduction of black bricks where they may serve to define and accentuate architectural features. A porch will give access to a spacious nave, flanked by aisles and terminated by an apsidal chancel, which will be marked interiorly by the different forms of its arches and piers, and externally by a spirelet of wood and metal. A baptistry at the western end, and a vestry, &c., at the east, form subsidiary portions of the plan. The style selected is a modification of that employed in this country at the close of the thirteenth century, the simple geometric character of the window tracery being its most marked and distinctive features. The church wall, in its greatest internal length and breadth, measure 87 feet by 57 feet, its estimated cost being nearly 4,000*l.* It is to seat 600 persons, and will be capable of holding 1,000. The architects are Messrs. Hadfield & Goldie, of Westminster, and Mr. Simpson, of London, is the builder. The funds for the erection of the building are given almost entirely by the incumbent of the mission, the Rev. C. J. Kemp.

**Hemel Hempstead.**—A vestry meeting has been held on the subject of the proposed alterations in the parish church. The vicar said that the building committee received two tenders for the work during last autumn, but in consequence of the strike among the builders, the architect recommended that the execution of the work should be

deferred. They had since received five fresh tenders, which he would read. For deal sittings—The London Building Company, 1,472*l.*; Cox & Son, 1,498*l.*; Elliott, 1,550*l.*; Sear, 1,717*l.* (Mr. Groom did not contract for the work in deal, or in partly deal). For deal sittings, with oak top rails and hook boards—Cox & Son, 1,512*l.*; London Building Company, 1,578*l.*; Sear, 1,717*l.*; Elliott, 1,730*l.*; Sear, 1,821*l.*; London Building Company, 2,117*l.*; Elliott, 2,130*l.*; Groom, 2,150*l.* If all the subscriptions were paid in they should have 1,700*l.* They had about 1,500*l.* in hand. The chairman read a letter he had received from Mr. Godwin, offering to give an additional 50*l.* if oak was used for the seats, or if they were of stained pine with oak top rails and hook boards. No resolution was passed accepting any of the contracts, but it was understood, says the *Herts Mercury*, that Messrs. Cox & Son's tender would be chosen.

**Birmingham.**—A memorial tower is about being added to the parish church of Hockley-on-the-Heath, near Birmingham, by Mr. Thomas Burman, to the memory of his parents, and from the designs of Mr. G. T. Robinson, Leamington.

**Bradford.**—The works at the borough cemetery at Scholemore, says the *Bradford Observer*, are hastening towards completion. The cemetery is situated just beyond Lidget-green, upon the borders of Clayton, and lying upon a slope overlooking the Thornton valley. The grounds already laid out consist of 20 acres. An estate of more than 30 acres was purchased in 1857, at a cost of 4,750*l.*, and more than 10 acres are reserved for future appropriation. The works have been executed under the direction of Mr. Gott, the borough surveyor. A residence for the registrar stands near the entrance, looking down Neopropolis-road. Two sides of the ground are enclosed by high stone walls. Near the centre is erected a chapel for the use of the Established Church, and one for the Nonconformists. The registrar's house and the chapels were erected from the designs of Mr. E. Milnes, architect.

**Newcastle-upon-Tyne.**—The John Knox Presbyterian church in this town, after having been closed for some time for the erection of galleries, has been re-opened for public worship. The improvements have cost 350*l.*, of which 200*l.* was subscribed by the congregation. The entire cost of the galleries is about 350*l.* They give about 200 additional sittings, and have had the effect of preventing vibration of sound. The design is by Mr. John Dobson, the architect of the church; and the execution by Mr. Wm. Dobson, builder, of this town.

**Hexham.**—The restoration, or rather re-building, of the east gable and window of Hexham Abbey-church has since the return of favourable weather, made rapid progress towards completion.

### Books Received.

*The Simplicity of the Creation; or, the Astronomical Movement of the Blessed Virgin. A New Theory of the Solar System, Thunderstorms, Waterspouts, Auroras Boreales, &c., and the Tides.* Dedicated to her. By WILLIAM ADOLPH. London: Catholic Publishing and Bookselling Company (Limited), Paternoster-row, 1859.

It is a pity the author of this treatise should have quite unnecessarily mixed up his original and suggestive electrical and astronomical speculations with any special form of religion; but, if determined so to do, why not have "dedicated" it a work on the worlds to the Creator of the worlds, more especially since it is Mr. Adolph's opinion that "He alone is the self-acting force Himself" by which the worlds He has created are for ever actuated; the Author of all having "created matter," but "created no forces?"

The material points of his new theory the author specifies to be "the existence and operation of positive electricity exterior to the solid part of the heavenly bodies, and of negative electricity confined within them." Many of our readers may recollect of Mr. Adolph's ingenious speculations on electricity, thunder, sound, the tides, &c., in the *Builder* of 1851 and 1852, and to which he now alludes, as the origin of this new and more extended theory.

### VARIORUM.

In a pamphlet, titled "Industrial Labour: Where and How to Get it" (Manchester: D. Kelly, 53, Market-street), Mr. Isaac Gregory, F.R.G.S., suggests the formation of industrial labour com-

mittees and inquiry offices in the various towns where industrial labour is likely to be either forthcoming or required; the object being to promote an organized system of migration, whereby the supply of labour may readily meet the sitting or fluctuating demand. "The idea is an important one, and merits attention. 'There are emigration offices,' says Mr. Gregory: 'why are there no migration offices? We have cheap trips and cheap pleasure trains: can we have no industrial labour trains once a week, at low rates? Many municipal corporations have a water committee, sewerage committee, paving committee: why no industrial labour committee,—and why no industrial labour office, where would-be employers and employed, buyers and sellers of labour, may register their wants, and have the weekly aggregate of their wants communicated to the industrial labour office or offices in any part of England?'"—An article in the *New Quarterly Review*, on "The Lace Trade and the Factory Act," in which the legislative application of the Factory Act to the lace trade is urged, as very much required, has been reprinted in a revised and enlarged form (Hardwicke, 192, Piccadilly). The object, a most desirable one, is to do away with the night-work of women and children in the lace factories, by the application to these of an Act of Parliament which is now uniformly esteemed in the manufacturing districts as "the best Act Parliament ever passed."

### Miscellaneous.

**PRESENTATION OF TESTIMONIALS TO ARCHITECTS.**—The gratuitous services of Messrs. Hirst & Underwood, as architects of the Fine Arts Academy at Bristol, have been recognized by a testimonial to each of these gentlemen. The testimonial to Mr. Hirst consists of an antique clock, in ornolu and blue Sèvres china. The clock is surmounted by figures of Diana and Minerva, and it bears the following inscription:—"Presented, with the accompanying vases, to J. H. Hirst, esq., M.I.B.A., architect, by the trustees, treasurer, and artists of the Bristol Academy of Fine Arts, in grateful acknowledgment of his gratuitous services in designing the tasteful exterior and various embellishments of that edifice.—May, 1860." The vases referred to are in chased ornolu and purple Sèvres china. The timepiece presented to Mr. Underwood is of black and verdantique marble, with a figure of Music in bronze. It is inscribed—"Presented, with the accompanying figures, to C. Underwood, esq., architect, by the trustees, treasurer, and artists of the Bristol Fine Arts Academy, in grateful acknowledgment of his gratuitous services in arranging, conjointly with J. H. Hirst, esq., the interior disposition of that edifice, and in ably superintending its erection.—May, 1860." The figures are rather large-sized statuettes, in bronze, of dancers with cymbals. The testimonials were got up in a short time, the subscriptions having been confined to the trustees and artists, and Mr. Hirst and Mr. Underwood were taken quite by surprise in the matter.

**BRITISH MUSEUM.**—The annual account of the British Museum has been presented to Parliament, with the usual statement of the mode in which the proposed estimate for the current year, 100,850*l.*, is to be expended. The salaries amount to 89,084*l.* and 25,228*l.* are appropriated to purchases, chiefly of books, antiquities, and minerals, with nearly as much for repairs, furniture, and fittings, the latter principally for the library and department of antiquities. Bookbinding costs 7,500*l.* a year. The additions to the library are greatly beyond the number of books directed by law to be supplied by the publishers. Above two-thirds of the books placed in the library last year were purchased. The number of readers was 122,424, which would give an average of 418 a day.

**THE ARCADES IN THE HORTICULTURAL GARDENS.**—Sir: You will regret to hear that the terraces in the new gardens of the Horticultural Society, of which you gave last week so capital a plan, have had a very bad commencement. It is said, and I believe with truth, that they are being constructed without the superintendence of the architect. The slender piers to the arcades of the grand entrance, both front and back, being constructed in mortar, showed such evident signs of failure, that, to prevent accident, they have been taken down and reconstructed in cement; the front of the building being carefully covered with tarpaulins during the operation.

AN ARCHITECT.

**THE WOOLWICH NEW DRINKING-FOUNTAIN.**—The fountain presented to the town of Woolwich by Dr. Conquest has been formally opened by Mr. S. Gurney. This fountain is the first erected in Woolwich. It was cast by the Coalbrook Dale Iron Company, from a design submitted by the Drinking-Fountain Association, and is composed principally of iron, being fixed in the wall of the station, the water flowing from a shell fixed in a niche, two metal cups being placed as drinking utensils. The fountain is surmounted by the inscription "Drink and be thankful." At the foot of the fountain is a basin fixed in a recess, into which the waste water flows from the fountain, and surrounding this are the words, "Love me, love my dog." The water is supplied from the spring and reservoir at Mount Pleasant, from which nearly the whole of Woolwich was a short time since supplied, but which has recently been disused. A perpetual supply is thus insured. The work of erection was done by Mr. Johnson, plumber. During the ceremonial of the opening Mr. Gurney remarked (according to Orr's *Kentish Journal*) that there were nearly thirty such drinking-fountains now opened in the metropolis, and he hoped that in a few years this number would be more than doubled.

**A HINT TO THE ENTERPRISING.**—We would direct the attention of capitalists to the peculiar opportunities which the howling wildernesses in the vicinage of St. Sepulchre present for successful enterprise. A small plot of land in Fleet-street has recently realized a fabulous sum, while whole acres within a stone's-throw are as unproductive and desolate as though they were integral parts of Salisbury Plain! What are the English people about? We are sure that a very little time will expire before a change will come over the spirit of their dream, and that which is now a disgrace to this proud city will become as profitable, as bustling, and as cheerful as the neighbourhood of the Great Western Railway. It is not for us to indicate the precise line it is expedient to follow in order to compass the ends all seek in the employment of capital. We would merely say that so soon as one or two railways shall be in operation, pouring thousands of people into the city from the suburbs, and from the far north and west—so soon as this result shall be accomplished, the whole face of the neighbourhood will become changed, and the property which has been for years the least in value of any in the city will at once be converted into a mine of wealth.—*City Press.*

**THE ECONOMIC MUSEUM.**—This useful and valuable museum, which was commenced by Mr. Twining, at the Society of Arts, in 1856, and subsequently exhibited in a state of progress at the South Kensington Museum and the Polytechnic Institution, is now located, for more complete development, in a building erected on the grounds of Perryn House, near the railway station, at Twickenham. On and after the 1st of July, 1860, orders for admission to the museum, on Wednesdays, between two and five p.m., may be obtained from the secretary of the Society of Arts. Additional facilities will be afforded as soon as the arrangements of the museum, in its new premises, shall be sufficiently advanced. Visitors will be received by the curator, Mr. W. Freeman, who will supply further particulars. All admission will be gratuitous. Communications should be addressed to T. Twining, esq., Perryn House, Twickenham, S.W.

**IRON TRAMWAYS IN THE CITY.**—Workmen are now employed in Fenchurch-street and Leadhall-street, laying down 500 feet of new iron pavement, Mr. J. B. Redman's patent, to form a tramway in 6-feet blocks, with grooves to prevent the slipping of horses. An iron roadway was commenced two years since in the same locality, but was soon afterwards taken up, the experiment having failed to answer the expectations of the projectors.

**THE ELLISON WATER COLOUR COLLECTION OF PAINTINGS.**—This interesting gift has now been deposited in the South Kensington Museum, and will be first exhibited to the public on Saturday next.

**THE CARVERS AT ALNWICK.**—The *Alnwick Journal* says,—"At Newcastle, in Elswick-lane, on the 7th instant, aged 34, died Mr. Thomas Albert Bohm, carver at Alnwick Castle. The regular staff of carvers at the castle is about twenty-six, and this is the fifth death that has occurred among them. There must be something detrimental to health, either in the occupation itself or in the sanitary arrangements of their workshops." This bears out an observation made in our journal not long ago, and should be inquired into.

**THE TOWN SEWAGE PROBLEM; PORTABLE SEWAGE MANURE.**—Mr. Manning, the patentee of a process for the treatment of the sewage of towns, and its conversion into a dry and portable manure, read a letter from Baron Liebig lately at a meeting of the Haddington Agricultural Club. After stating that the sample of sewage manure forwarded to him from the works at the South Back of the Canongate by Mr. Manning contained a large quantity of sulphate of lime, magnesia, potash, &c., with ammonia and a small percentage of phosphoric acid, Baron Liebig, according to the *Scottishman*, observes:—"In my opinion, which is, however, not yet confirmed by exact figures, the action of this manure, if used by itself, would be limited, the most active matters being contained in too small proportions relatively to its volume; but I believe, that a mixture of your manure with guano, or phosphate of lime (bone dust), would confer the most solid advantages upon agriculture. Your manure would add those useful elements which are neither contained in guano nor bones, and would increase their action and efficacy, so that, at the very moderate price at which you sell it, this mixture would prove also a source of great economy to the farmer. I was astonished to find in your manure so large a quantity of ammonia and potash, and I am convinced that your (patent) process is perfectly applicable to the treatment of the sewage of towns, and the manufacture of a sewage manure."

**NEW LIGHTHOUSE IN THE BAHAMAS.**—The tower is 157 feet 6 inches high, and formed of cast-iron plates, 8 feet by 7 feet, bolted together. The plates of the lowest tier weigh about 1½ ton each, but decrease gradually to the summit. The cast-iron shell of the tower stands on a ridging of oak piles, driven 20 feet through the sand and coral rock. At a height of 135 feet there is a projecting gallery, surmounted by a railing. A cast-iron pipe, 18 inches in diameter, is placed in the centre of the tower, extending from the foundation to the lantern. This serves as a central support to the floors, and carries the weight of the lens and lighting apparatus. A cast-iron spiral staircase ascends round the centre column to a height of 24 feet, and thence round the internal walls of the tower. The whole of the tower is lined with brick and concrete, decreasing from 8 feet in thickness at the ground to a single slab ring at the lantern floor. The dwellings of the keepers are of brick, with slated roof, and are arranged round the base of the tower in the form of a ten-sided polygon, while division-walls act as buttresses to the structure. Under the dwellings are ten cast-iron tanks, each capable of holding 1,000 gallons of water, and supplied by gutters connected with the roof. The work was designed by Mr. A. Gordon, C.E. and carried out by Mr. C. W. Scott, resident engineer. The working party landed on 1st April, 1858, and the light was exhibited exactly two years afterwards. No accident occurred during the erection.

**CONSERVATORY, KEW GARDENS.**—The tender of Messrs. Cubitt & Co., of Dinlicio, for the erection of the great conservatory in the pleasure grounds and arboretum adjoining the Botanic Gardens at Kew, has been accepted, and the work commenced. It will be a trifle short of 700 feet in length. It will occupy an extensive area on the right hand side of the grand lawn avenue, leading from the Palm House to the Pagoda.

TENDERS

For the Great Malvern Hotel; Mr. E. W. Elmslie, architect. First contract:—

Davis	£29,950 0 0
McCann & Everal	27,750 0 0
Essie	21,750 0 0
Wood	20,950 0 0
Farrell	20,800 0 0
Myers	20,760 0 0
Broadbent	18,990 0 0
Perkins (accepted)	17,800 0 0

For the erection of dwelling house, Earley-park, Berks, for Mr. Thomas Porter; Mr. A. Waterhouse, Manchester, architect. Quantities supplied:—

Carter	£6,600 0 0
Hooper	6,413 0 0
Patman & Fotheringham	6,408 0 0
Smith	6,115 0 0
Wheeler & Son	5,795 0 0

For restoration of St. Matthew's Church, Bethnal-green, recently destroyed by fire; Mr. T. E. Knightley, architect:—

Little	£5,908 0 0
Clark	5,875 0 0
Wood	5,835 0 0
Perry	5,741 0 0
Pritchard	5,589 0 0
Foster	5,579 0 0

For two houses in Hackney-downs; Mr. R. Roberts, architect:—

Jack-on & Shaw	£4,290 0 0
Callow	3,957 0 0
Brown & Robinson	3,949 0 0
Coleman & Co.	3,817 0 0
Corder	3,829 0 0
Galsworthy	3,745 0 0
Ashby & Sons	3,727 0 0
Perry	3,724 0 0

For works of restoration at Worcester Cathedral:—

Thompson	£4,346 0 0
Less if windows to lady chapel be not done	156 0 0
Total	£4,190 0 0
Messrs. Burnell & Son	4,316 10 0
Less if windows to lady chapel be not done	168 0 0
Total	£4,148 10 0

For two semi-detached villas, at Great Malvern, for Major Dandley; Mr. E. W. Elmslie, architect:—

Davis	£3,400 0 0
Perkins	3,195 0 0
Smart (accepted)	3,175 0 0

For seven new houses in Kettering, Northamptonshire; Mr. E. F. Law, architect:—

King	£3,323 13 8
Hawthorn	3,028 19 8
Pooley	2,828 0 0
Bayes & Brown	2,795 17 8
Cosford	2,739 0 0
Simpson & Glover	2,706 16 0
Henson	2,698 13 9
Bodington (accepted)	2,609 0 0

For a pair of semi-detached villas, to be built at Bishop's Deyn, Tonbridge Wells, for Mr. John Colbran; Mr. W. Bond, architect. Quantities supplied:—

Edwards	£3,142 13 0
Mercer & Campfield	3,012 10 0
Headment	2,988 0 0
Walker	2,921 16 7
Perigo & Vigor	2,810 0 0
Plink	2,792 0 0

For new schools, &c., for the parish of St. Giles, Northampton; Mr. E. F. Law, architect:—

Clifton	£2,843 0 0
Parker	2,750 0 0
Whitby	2,075 0 0
Headment	2,000 0 0
Ireson	2,443 0 0
Cosford (accepted)	2,300 0 0

For erecting three villas upon the Western Elms Estate at Reading; Messrs. Cooper & Goulding, Reading, architects. Quantities supplied:—

Woodroffe	£2,069 0 0
Orton & Child	2,096 0 0
Shepherd	1,998 0 0
Wells	1,953 0 0

For building a detached and a pair of semi-detached villas on the Western Elms Estate, Reading, for Mr. J. Wilson; Messrs. Cooper & Goulding, architects:—

Woodroffe	£2,069 0 0
Orton & Child	2,025 0 0
Shepherd	1,998 0 0
Wells	1,953 0 0

For High Wyck Church and Schools; Mr. G. E. Pritchett, architect:—

Burton	£3,792 0 0
Glassecock	3,000 0 0
Beil	2,925 0 0
Dickinson (accepted)	2,777 3 0

Add if Oak Seats are provided, instead of Deal.

Burton	£2,237 10 0
Glassecock	20 0 0
Beil	134 0 0
Dickinson (accepted)	93 0 0

For alterations to shop and premises, No. 115, Oxford-street; Mr. H. Field, architect. Quantities supplied:—

Edser	£1,057 0 0
Mansfield	1,050 0 0
Patman & Co.	1,015 0 0
Todd, jun.	961 0 0
Saunders	849 0 0

For vaults and other works, Barge-yard, Bucklersbury, for Mr. F. G. Debenham; Mr. William Nunn, architect:—

Glenn	£613 13 0
Sewell	655 0 0
Deansley	614 0 0
Brass	630 0 0
Turner	620 0 0
Day (accepted)	597 0 0

For alterations to Sidmouth House, Gray's Inn-road, and building new shop in forecourt, for Mr. Waller:—

Patridge & Crutch	£667 0 0
Hugo & Winter	598 0 0
Williams	591 0 0
Sands	562 0 0
Mitler (accepted)	523 0 0

For constructing about 620 feet of sewer, and forming Redcliffe-road, at West Brompton, Middlesex:—

Morris	£470 0 0
Bilton	459 0 0
Davis	448 0 0
Mutter	428 1 8
Walton	420 12 0
Ayers	325 7 6
Raymond	355 11 0
Guttridge	355 0 0

\* By post immediately after others had been opened.

For works to be done in alterations, &c., at St. A. bridge Church, London-wall; Messrs. Tillett & Chamberlain, architects:—

Knight	£920 0 0
Mason & Son	828 0 0
Brown & Robinson	698 0 0
Pritchard & Son	697 0 0
Wills	650 0 0

For works to be done in repairs, &c., to premises, Thornley-wharf, Regent's-park Basin, for Messrs. Finley, Seal, & Co.; Messrs. Tillett & Chamberlain, architects:—

Holland	£340 0 0
Cannon	270 0 0
Pritchard & Son	256 0 0
Wills	225 0 0

[Harp-lane.—Sir: With reference to the tender for works to be erected in Harp-lane, City, under Messrs. Young & Son, inserted in your journal of the 6th inst., I beg to inform you that my tender was the one finally accepted, Mr. Knight having declined.—H. HARR.]

TO CORRESPONDENTS.

Z.—Quotter (should have sent his name).—J. P. C. W. F.—Messrs. P.—G. F.—Mark Lane (each reply in our "Notices" appears to the initials before it only).—J. O. R.—W. H. (various notices of "killed" smoked bricks have been given at different times in our journal).—O. and C.—D. S.—W. B. R.—W. A. C.—A. C. G. S.—Old Subscriber (we cannot give address).—Scrie.—A. W. I. (will appear).

**NOTICE.**—All Communications respecting Advertisements, Subscriptions, &c., should be addressed to "The Publisher of the Builder," No. 1, York-street, Covent-garden. All other Communications should be addressed to the "Editor," and NOT to the "Publisher." Post-office Orders and Remittances should be made payable to Mr. Morris R. Coleman.

ADVERTISEMENTS.

Just published, price 6d. or 1s. in boards, **MEMORIALS OF WORKERS:** The Past to encourage the Present. BY GEORGE SIMMONS. Author of "Town Swains and Social Reform," &c. "This printed lecture would be read and thought over in the home of every peasant and artisan in Great Britain."—*Journal*, London: HAROLD RIFE, Printers, and at the office of "The Builder," 1, York-street.

**MR. WILLIAM ELLISON,** CONSULTING SURVEYOR, late of STAINBY-ROAD, Has taken Office at 13, FENCHURCH-BUILDINGS, FENCHURCH STREET, E.C. Where he continues to advise BUILDERS On BREACHES OF CONTRACT DISPUTED ACCOUNTS, &c.

**MR. T. Y. KIMPTON, ARCHITECT** AND SURVEYOR, 2, Adam's-court, Old Broad-street, London, E.C. Disputed accounts speedily adjusted. Architects' works measured and valued. Estates surveyed and mapped. Designs, working and full detail drawings, maps, plans, tracings, perspective, and professional aid generally. Lithography, artistic and commercial, with despatch.

**SYDNEY PARLIAMENT HOUSES.**—Architects wishing to treat for the execution of Perspective or General Drawings for this or other Commissions, &c., can have them PREPARED in a SUPERIOR MANNER from rough sketches.—Address, Mr. GEORGE SIMMONS, 20, Bushborough-street, Westminster, S.W.

**SURVEYOR WANTED.**—The Local Board of Health for the District of Waterloo-with-Seaford, near Liverpool, require a person fully qualified to undertake the duties of SURVEYOR and INSPECTOR OF MILLS. His whole time to be devoted to the business of the Board. Salary 1500 per annum.—Applications, with satisfactory references and testimonials to the Chairman of the said Local Board, and sent to the Office of Mr. GEORGE SIMMONS, Solicitor, No. 20, Bushborough-street, Liverpool, not later than FOUR o'clock, p.m. on THURSDAY, the 31st day of MAY inst. where, in the mean time, further information and particulars may be obtained.—By order of the said Local Board. J. H. MARION, Law Clerk. Public Offices, Waterloo, May 19, 1860.

**GLAZIER WANTED.**—Permanent employment for an efficient Young Man.—Apply to W. H. JACKSON, 319, Oxford-street, W.

**GOOD JOINERS WANTED.**—Apply to W. H. CULVERHOUSE, 135, Bunhill-row, E.C. TO HOUSE PAINTERS AND DECORATORS.

**GOOD HANDS** can have immediate EMPLOYMENT, at country wages, on application to J. HALES, MARLOWE, Hemel Hempstead, Herts.

**WANTED,** in a Builder's Office, a MAN who understands the business, with good reference.—Address, stating salary, &c. to Mr. GEORGE B. 94, Tottenham-street 8 mile, Birmingham.

**TO CLERKS OF WORKS.** WANTED, a good practical CLERK of WORKS, to undertake the superintendence of building a small church in Surrey.—Apply by letter to E. C. Mr. R. White's, General Advertising Office, 23, Fleet-street.

**WANTED,** an experienced CLERK of the WORKS, to superintend the erection of a Villa Residence of Italian design, about 22 miles from London.—Reply by letter only, at time usual, age, terms, references, &c. to Mr. J. T. LEFARD, Architect, 6, Cook-lane, London, E.C.

**TO BRASS FINISHERS.** WANTED, a WORKING FOREMAN—an ingenious man preferred.—Apply, by letter, to A. K. M. Kennedy's, Newspaper office, 9, Upper Berkeley-street, Portman-square, W.

**WANTED,** in a Builder's and Decorator's Office, a Young Man, between 17 and 25 years of age, as CLERK.—Address, stating salary required, references, &c. to A. H. Office of "The Builder."

A Large Assortment of Green Colours, Brushes, &c. For sale.

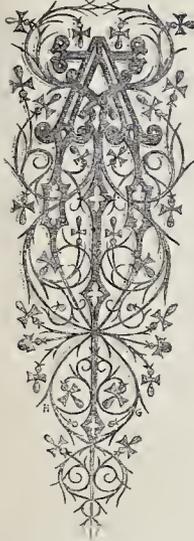

F. LANGTON'S OIL and VARNISH WAREHOUSE, 143 and 144, WHITECHURCH STREET, ST. LUKES.

Goods sent to all parts of London, and carriage free to any railway station.

# The Builder.

VOL. XVIII.—No. 904.

*Ecclesiastical Buildings in the Northern Counties.*

N excellent example, fraught with prospective good, has just now been set by the Venerable R. C. Coxe, Archdeacon of Lindisfarne. The archdeaconry having been lately divided into six rural deaneries, at the direction of the Bishop of Durham, now Archbishop of Canterbury, the archdeacon required the rural deans to furnish him with compendious reports of the state of the ecclesiastical buildings in the districts assigned to each. This has accordingly been done; and we have the result before us in the substance of an able charge delivered by the

Venerable Archdeacon, at the visitation held at Morpeth on the 22nd ult.

From this and our own knowledge we can say that the general condition of the churches is satisfactory. There are several cases of ruinous neglect and consequent insecurity; but by far the greater proportion of the churches are in good repair,—dry, warm, and ventilated. We must here premise that the churches of the latter class are, for the most part, those that have been built, or rebuilt, at the beginning of the present century, and are consequently without any of the ecclesiastical fitness more modern taste demands. A square room, penetrated with common sash windows, appears to have been the model from which too many of them have been built. They are nearly always destitute of chancels, and frequently deficient of towers; nevertheless, being in sound condition, a skilful hand could convert them, at but small expense, into more fitting temples of worship. On the other hand, the churches that are marked dangerous, by their bulging walls and cracked towers, are all ancient. The list would have been much larger, but for the restorations that have been effected in the instances we shall presently enumerate. A fourth class consists of new edifices. The glebe houses are generally in sound repair; although, as of course there would be anywhere over so large a district, there are a few cases calling for redress. Several of the buildings are fortified towers, strong and massive, suited, as they were intended, for a secure retreat for the vicar and his valuables on the approach of foes. In a list of Northumbrian fortresses, taken during the minority of Henry VIII., there were seven embattled towers mentioned as the residences of the clergymen of the respective districts. The church towers also present evidences of having been completely fortified. A good idea of the general insecurity of Border property in the good old times, and of the alteration in prices, may be gleaned from the fact that land which let for 5*l.* per annum in the latter part of the seventeenth century, now realizes 3,000*l.* annually.

We have already called attention to the profusion of abandoned buildings, better recognized under the name of ruins, in Northumber-

land, and to the vigorous manner in which some of the most important of them are being restored. Of these we take no account here, but proceed to place on record the existing condition of the churches now in use in the archdeaconry of Lindisfarne, in this year of grace 1860.

Beginning with the northernmost deanery, the ancient churches of Norham and Ford have been carefully restored. At Etall a mortuary chapel has recently been erected by Lady Frederick Fitzclarence. So far all is well; and we may believe that this district, so intertwined with the romance and remembrance of the fatal battle of Flodden, is in good hands.

Braxton Church is the first we shall mention of the ancient edifices that have been injudiciously tampered with. Unhappily, this little Norman church, on the borders of the battle-field, was taken down about thirty years ago, with the exception of the chancel-arch, and rebuilt. The west wall has since shrunk, and the south-west corner is in a dangerous condition.

Ancroft is another ancient church of which parts have been preserved. The tower and doorway are as the Normans left them: the rest of the edifice has suffered at the hands of the unformed. Cornhill and Carham are specimens of comparatively modern churches in the worst taste. Lowick was another of the same school; but here an attempt has been made, by the insertion of ecclesiastical windows, to improve matters slightly.

Coming coastwards, into the deanery of East Norham, we find a new church and parish, dedicated to St. Mary, at Berwick; and the mother church enlarged and re-arranged. At Kylee, the incumbent is exerting himself to procure the means of converting his unpromising church into a more beautiful form. Repairs are in progress at Holy Island church. At Scremerston all is comparatively modern.

Of the churches in the Bamborough deanery that of Bamborough stands foremost in point of architectural beauty. It has a crypt that has only recently been discovered, having been completely buried in the sand, large quantities of which are still swept into it by particular winds. The north transept is the only portion requiring remedial interference. Beadnel, Lucker, North Sunderland, Ilderton, and Wooler churches are all in good repair, but of condemnable taste. Belford, Chatton, Chillingham, and Doddington are ancient buildings restored by the present or last incumbents some years ago, not in unexceptionable taste, but so far deserving of praise, inasmuch as the builders have retained some of the ancient features instead of pulling all ruthlessly down. At Ellingham and Kirk Newton the churches are pronounced positively unsafe. There is a large crack in the north wall of the former: the tower is tottering, and the ceiling of the chancel broken and unsafe. At Kirk Newton the interesting old Norman church, built at the foot of Yeavinger Bell, one of the most lofty hills in the Cheviot range, and which has seen the roughest service in the dark ages, showing traces of fire and defence in its sapped foundations and mouldering arches, and enriched with curious sculpture so defaced as to be enigmatical to the most erudite of antiquaries, is to be restored forthwith. This rural deanery is fortunate in possessing the district in which the late Lord Crewe's charities are dispensed. At Bamborough Castle, part of the property devised by the bishop to suffering humanity, apartments are fitted up for shipwrecked sailors, in which bedding is provided for as many as thirty. A patrol is always on guard, and the utmost vigilance observed along the shore throughout the length of the manor. The extremely dangerous nature of this coast is now in great measure mitigated by the erection of the Varnie lighthouse, the scene of Grace Darling's heroic adventure: when accidents do occur, the promptest assistance is given, and coffins are provided, and funeral expenses paid for any unfortunates who may be cast ashore. The charity also embraces the gratuitous education of the children of the poor, besides an infirmary, and a market, at which meal and groceries are sold to the necessitous at a great reduction of price. The first person

bringing news of a vessel in distress to the castle is rewarded with a present proportioned to the distance he has come, and the darkness of the night. Thus this old rural residence of the Saxon kings of Northumbria is still a light unto the nations.

Chillingham also possesses features of unusual interest in its fine castle and park, and is even more remarkable for the breed of wild white cattle preserved there by Earl Tankerville.

The Alnwick rural deanery is in very good odour. The parish church of Alnwick is a Perpendicular building, repaired when the castle was renovated, in the Georgian Gothic of the last century. A new church was built by the late Duke of Northumberland, and dedicated to St. Paul, in the late Decorated style: it is now enriched by the Munich stained-glass window to his Grace's memory. At Lesbury and Rock, two ancient edifices have been restored recently; as has been the case at Embleton, with the exception of the chancel. At Rennington an old Norman church was taken down at the commencement of the century, and an abomination in the shape of a "neat structure" erected on its site. Howick Church has been recently and beautifully restored by Earl Grey. The ancient churches of Edlingham and Shilbottle call aloud for aid; else, say their shivering walls and shattered roofs, we perish. The chancel of Bolton Chapel, where Surrey and the English knights held a rendezvous on the eve before the battle of Flodden, and swore to conquer or die, is in a very dangerous state. At Alnmouth, a disused granary has been converted into a chapel by the Duke of Northumberland, for the temporary convenience of the inhabitants, whose Norman cruciform church was obliterated and washed away by the sea at the beginning of the present century.

Coming next to the rural deanery of Morpeth, and glancing at the care bestowed upon the old parish church and the handsome new one, we turn to Bolam Church, which is considered to be the oldest ecclesiastical edifice in the county. It is in sad want of a thorough and conscientious restoration. Bothal Church, recolent of departed chivalry, is also in want of immediate attention. The ancient church of Widdrington is in the same stage of decay; but is not without good hope of help. On the contrary, the churches of Hebron, Long Horsley, and Netherwitton, built in the most miserable taste, are all in sound repair.

The church of Alnham, in the deanery of Rothbury, like that of Ingram, is in a very dilapidated state. The situation of these crumbling is very retired, among the remotest of the border hills; and they appear to be as much out of mind, as they are out of the beaten track of travellers. The former is so exposed to the elements, that the incumbent is fain to hold service in his own house in mid-winter, in preference to having no congregation: for, rough country people as they are, and used to Cheviot weather, they are not willing to run the risks of catching colds and rheumatism in the damp, cold, windy church. In bright contrast to this deplorable state of things, are the buildings of Alwinton and Holystone, where both churches and schools are in good taste and condition. Whittingham Church, described by Rickman, and illustrated in Parker's edition for the sake of its fine old Saxon tower, has been taken down and re-built by the present incumbent; and thus this rare specimen is lost. The chancel roof and window already need repair. The new tower has been fitted with pigeons' nests, for the accommodation of those birds which reside there in great numbers. Rothbury Church has also been nearly rebuilt quite recently, but, although under the superintendence of a London architect, in a very inefficient manner: unless, indeed, proper means are taken to keep out the rain, the state of the building will soon be as bad as it was before it was restored. The plaster is falling from the open roof: the wet enters at nearly every window, as well as at the junction between chancel and nave, and at the tower. At Elsdon, the old church has been more carefully restored. At Otterbourne, where the gallant Hotspur avenged the loss of his pennon on "dowghtye Dowghlasse," one

"Lamassycde," some centuries gone, there is a new church just erected by individual munificence. At Edlingham, the state of the sacred structure calls for some expenditure.

The district we have glanced over so rapidly, although minutely, bound in by Cheviots, the Tweed, and the sea, on three sides.—the scene of constant petty warfare and several pitched battles,—is not devoid of association with men of letters. The celebrated Duns Scotius, "the most subtle doctor," professor and regent of the University of Paris in 1304, and afterwards professor of theology at Cologne, was born in a village adjoining Embleton. Bernard Gilpin, known as the Apostle of the North, who was only saved from being burnt as a heretic by Queen Mary by the accidental breaking of his leg on his road to London, and her cruel Majesty's death pending his recovery, was rector of Rothbury. Dr. Brown, the friend of Warburton and Pope, whose tragedies,—*"Barbarossa"* and *"Athelstan,"*—became stock pieces under the management of Garrick, was a native of Rothbury. Percival Stockdale, supposed to be the original of the eccentric Belfield in Miss Burney's novel of *"Cecilia,"* was born at Brunton, and was for many years vicar of Lesbury. In this quiet village, on the banks of the pleasant trout stream, the Ahe, he must have written the numerous works which procured him the friendship of Lord Lansdowne, Miss Porter, and other eminent persons. His acquaintances were not always his admirers, for it is related that Sheridan, when on a visit to Lord Grey, was observed to glance hastily over a volume of poems presented him by Stockdale, and to write something on a blank leaf. Instead of a complimentary tribute, however, the mortified author read the following lines:—

"It's tag, rag, and bobtail;  
The mad works of Stockdale."

The semi-civilized inhabitants of Elsdon were once convinced to the spiritual guidance of a Frenchman, the Rev. Louis Dutens, the author of several antiquarian works, and historiographer to his Majesty George III. The manner in which he overcame their fierce dislike to a foreign minister is too good not to be told, characteristic as it is of the men, the time, and the place. His parishioners, principally sheep-farmers and their herds, declared they could not understand one word he spoke, and were clamorous for his removal. The living being worth 2,000*l.* a year, deserved an effort to retain it. So the ingenious Frenchman pretended to be unconscious of all that was passing, mixed freely with the people, and in the most affable manner, and personally invited as many of the principal parishioners as his table would accommodate to dinner. When they arrived he expressed himself very much surprised to see them, as he thought they could not understand him. "Oh! oh! very good!" cried he; "when I preach you from my pulpit you not understand my speak, but when I invite you to my good dine you very well understand!" This good-humoured joke was followed by a capital dinner in the old rectory tower, and appears to have realized the desired effect.

The arts and sciences have had votaries in this remote locality. Conghan and Wilkin, the youthful mathematicians, whose problems were the puzzles of Sylvanus Urban, in the *Gentleman's Magazine*, were born here. Capability Brown, the landscape gardener, was also a native of this district. Those pioneer-masterpieces of art, the block engravings of Bewick, are preserved in his native county by a chemist in Alnwick. We mention these few instances, out of a great many, as a set-off against the general unsettled and unlearned character of the inhabitants. They are the more remarkable when we consider that it was the custom of their neighbours, respectable farmers, to meet at public houses and pin up a bank note to the wall and drink till it was expended; and in these drinking bouts to gamble for scores of sheep, or geese, or other farm stock; and, when the game went against them, and every thing was staked and lost, to go out upon the hills and moors and steal the first stock they came to, to pay their debts of honour. With the snow 20 feet deep for miles

around, we must not be too severe in our blame; but the snow is lying 30 feet deep in drifts on Cheviot at this present moment, and there is nothing of the sort going on. So much for the good new times, and the teachings of the printing press, and from the churches of Lindisfarne.

#### ON THE ARCHITECTURAL CAREER OF THE LATE SIR CHARLES BARRY.\*

AMONG the practical questions connected with the new Houses of Parliament, one of the most urgent was the selection of the stone; and as the mooted of that question led to the important survey by a commission in the year 1838, I may perhaps mention the immediate connection of Sir Charles with that movement. It appears from information with which I have been supplied by our kind friend Mr. C. H. Smith, the only surviving member of the commission, that, soon after the fire, Mr. Joubert, of Chen, sent specimens of Caen stone to about twenty different members of Parliament, and among others to Mr. Joseph Hume. Mr. Hume referred to Mr. Smith for a report, which was forwarded to the Department of Works, and by them to Mr. Barry, who at once wrote an admirable note to Mr. Hume, stating his views and his intention of making a tour throughout Great Britain to collect information. It was then arranged that scientific and practical men of eminence should go on the same errand with him, and the result was that, during fifty days in the autumn of 1838, the information was collected which has been embodied in the valuable report of the commissioners.

In 1840 Barry made fine designs, which were well carried out, for converting Highclere, a seat of Lord Camarvon's, into an irregular version of Italian. About the same time he completed additions to University College, Oxford, and I believe made comprehensive designs for buildings at Worcester College, in the same city. In the year following the laying of the first stone of the Houses, Barry began to reap the honours he had so fairly won—being elected Associate in that spring; Associate elect in 1842, and Royal Academician in Wilkie's place in 1844. His first recognition from abroad dates from Rome, Dec. 29th, 1842, conveying his affiliation to the Academy of St. Luke's; his second from St. Petersburg, Dec. 31, 1845. His election into the Russian Royal Academy, which was accompanied by the presentation of a diamond snuff-box from the Czar, was ultimately followed by his nomination to those of Belgium, 9th Jan. 1847; Prussia, 28th April, 1849; Sweden, 25th May, 1850; Denmark, Antwerp, and the American Institute. In 1855 he received the gold medal of honour for architecture, given at the Exposition Universelle of Paris, at which he acted as juror.

In 1841 Barry produced his noble design for Bridgewater House, for Lord Ellesmere, which was very different from that which he commenced as late as July 1817. Probably no building he ever executed was more elaborately studied, and the result is shown in much of the beautiful detail which decorates the princely structure.

The first stone of the superstructure of the Houses of Parliament, the angle of the plinth of the Speaker's house nearest the bridge, was laid (as has been already stated on the 27th of April, 1840) by the architect's wife, without any public ceremony, and in the presence of a few personal friends only. The first stone of the Victoria Tower was also laid in the same unpretentious way by Lady then Mrs. Barry, on her own birthday, the 22nd of December, 1843.

From 1840 to 1843, the works at Westminster, to which neighbourhood (32, Great George-street) Barry had removed in 1841, proceeded at a splendid pace; but shortly after that date difficulties arose against which even his strength, industry, energy, and unrivalled dexterity in managing recalcitrant employers, failed to make successful head. The only wonder is he was not killed by incessant worries and annoyances. To these cares his son Edward alluded in the following terms, in the paper he read here on the 1st February, 1858, on his father's great work:—

"In the session of 1844, a committee of the House of Lords, which was appointed to inquire into the progress made with the works, in consequence of a natural desire on the part of their lordships to enter their new house, and a still more natural inclination to blame an architect for anything inconvenient, commenced its labours, and reported that several alterations had been introduced into the design by the architect, without

any authority from the Government; an accusation he explicitly denied by stating that he had received authority, express or implied, for all he had had done. The alterations alluded to were a rearrangement of a portion of the plan between the Victoria Tower and the House of Lords.

Great objections were made by some members of the Lords committee to these modifications, and many inconveniences foretold, both to her Majesty and their lordships, but I am not aware that practice has justified these predictions, or reversed the opinion of the committee of the House of Commons, which sat soon afterwards, and resolved that 'no blame was to be attached to Mr. Barry for the cause he had taken, and that they had every reason to believe that all the alterations hitherto made had conduced to the convenience and general effect of the building.'

It was at this time that many complaints began to be made in Parliament about the so-called delay in completing the building, and the anxieties consequent on the various committees and other inquiries, in addition to the unavoidable responsibilities of the architect, caused him a serious illness, and thus made a reality of that delay which, up to this time, had been imaginary, as far as he was concerned.

Indeed, had it not been for the hearty and generous support of Lord Lincoln (now Duke of Newcastle), who was then First Commissioner of Woods, I do not think the works could have been carried to a completion by my father.

His lordship took special pains to make himself personally acquainted with the nature and bearing of the various complaints, and having satisfied himself that they were not based on justice, threw the whole of his official weight into the scale, and gave the architect no half-hearted or silted support in carrying out his views, until the close of his official connection with him."

All honour to the duke for this manly, kind, and persistent support of a great man, worried almost to death; and equal shame to those who hounded on the senseless fear from which this official shield in part protected him. I need scarcely remind this assembly of the feelings with which Barry was regarded by our late esteemed president, the Earl de Grey. On the occasion of the presentation to Barry of the Queen's gold medal in these rooms, on the evening of June 3, 1850, Lord de Grey touched on the peculiar trials to which the architect of the New Palace at Westminster, as it then began to be called, had been exposed, with his usual light but most skillful hand, in the following terms:—

" \* \* \* May you live to see the magnificent work now in your hands completed. St. Paul's was thirty-four years in its erection: you have not occupied half that time as yet, and have made a progress which, if it had depended on yourself, would have brought the Houses of Parliament nearly to completion, but the means of working have not been at your disposal. Sir Christopher Wren was entrusted with a large and striking work, destined for a single purpose. It was to be a great and glorious temple, dedicated to the worship of the Most High; but your work is to be devoted to I know not how many purposes. Sir Christopher Wren had to deal with men who knew what they wanted. Sir C. Wren, no doubt, received his instructions from men who knew the purpose to which the building was to be dedicated, and (to a certain extent) "what was required to carry it out; but I am sorry to say that that is not always the case with respect to the buildings entrusted to you. Sir C. Wren's masters" (however tyrannical and annoying) "were few: yours are legion. I am sorry to say that august assembly which has most to do with the erection of this magnificent structure has in it a vast number of men who ask questions, make suggestions, and offer criticisms, while at the same time they do not know what is wanted, or, indeed, what they want themselves. It is not wonderful, then, that the architect should be impeded, and that fault should be found without any good or substantial ground; and yet, with all these hindrances and drawbacks, you have made a progress in the stupendous work which you have undertaken which is perfectly surprising."

Of the true nature of the labours by which alone the difficulties of his task and position could be overcome, or even coped with, Sir Charles Barry has given the simplest, the most manly, and, I verily believe, the truest possible picture, in the following words, extracted from an official letter, and protest of his, which must for ever live as a judicious stigma upon those for whom the architect's noblest work was done.—"I may here add, as a ground for the increase rather than reduction of the customary remuneration in respect of public works, that, owing to the troubles, delays, and perplexities attendant

\* By Mr. M. Digby Wyatt. See p. 392, ante.

upon official communications and requirements, the architect's labours and anxieties are much greater than those which he has to incur in private practice; and if this be true of public buildings of an ordinary character, it may be easily conceived that those labours and anxieties have been incomparably greater in carrying into effect such a work as the new Palace at Westminster, in which not only the Government, but committees in Parliament, and even the public, have unceasingly assumed the right of criticism and control. As one proof among many others that might be adduced of the enormous amount of labour that has already devolved upon me in conducting this national work to its present state, it will not be irrelevant to mention that no less than between 8,000 and 9,000 original drawings and models have been prepared for it, a large portion of which have emanated from my own hand, and the whole of the remainder have been made under my own immediate direction and supervision.

I consider that I am entitled to a further remuneration for special services not connected with my professional duties in respect of the works of the building. These services consist of attendances upon the Fine Arts Commission, reports, and numerous drawings prepared in compliance with the orders of that commission, frequent communications with its secretary, and the artists appointed for the decoration of the interior of the new palace; attendances upon committees of Parliament in every session from the year 1841 to the present time, preparing data required by those committees; giving and correcting evidences, making up voluminous returns, in compliance with the orders of the House of Commons, one of which occupied myself and clerks for nearly four months; attendances to give evidence upon two Commissions of Inquiry with reference to Dr. Reid's system of warming and ventilating, preparing plans and other documents for the use of those commissioners; conferences and communications with the law officers of the Crown with reference to contracts, disputed claims, and threatened legal proceedings; numerous reports and estimates required from time to time by the Office of Woods, negotiations and arrangements consequent upon establishments of Government workshops at Thames-bank, and the superintendence of the collection of above 3,000 casts of the best specimens of Medieval art to be found in this as well as in foreign countries for the use of the wood-carvers; preparing plans, estimates, &c. for providing accommodation for the whole of the public records of the Kingdom, and other miscellaneous services."

Before such a crushing list of altogether unrequited exertions, how sadly the official sophisms of "my Lords" betray the thinness of the stately mantle through which peep out what closely resembles costly penury and meanness. Against their behaviour, and conclusions in respect to the remuneration of Sir Charles (a subject upon which I scarcely dare trust myself to speak), it must ever be a satisfaction to the members of this body to recollect that its council protested respectfully, but with firmness, and with a full appreciation of the special pleading of the representative for the time being of her Majesty's Treasury, in the following terms:—"Resolved," "That 5 per cent. upon outlay has been, and is, the only rate of charge recognized by the profession, as fairly remunerative in the average practice of architects. That it is to be deeply regretted that it should be proposed to depart from the above rate in the instance of the New Palace at Westminster; a building involving in its design and execution the exercise of the highest professional attainments. That the example which would be set by her Majesty's Government, should the course proposed be carried into execution (a legal appeal against their decision being practically impossible), is to be regarded as disastrous to the future prospects of architecture in this country, as calculated to lower the character of public monuments in England, and unworthy the Government of a great nation, whose obvious duty it is adequately to foster and protect the genius of its artists."

Under such complicated annoyances, Barry's health must inevitably have broken down altogether, if it had not been for the support, comfort, and affection he received in the bosom of his own family and the circle of his own friends. Happily for him in his domestic relations no man could be more auspiciously situated, and he has in moments of confidence expressed to me his sincere and almost solemn thankfulness for the manner in which all about him repaid the love he lavished unostentatiously upon them.

In the year 1840, his eldest son Charles entered

his father's office, therein to acquire that professional knowledge which such a school could so well give, and became the friend and associate of Mr. Banks, his present partner, then the chief confidential assistant of Sir Charles. Together they were actively concerned in all those varied works which for the next eight years were engrossing Sir Charles's attention, including the commencement of the New Palace at Westminster, and its prosecution, till the year 1848, in which, with the advice and sanction of Sir Charles, they entered into that professional connection founded on intimate friendship which still continues. Sir Charles's kind and valuable advice (at all times freely given to any young members of the profession) was especially afforded to Messrs. Banks & Barry, and greatly prized by them. From this time for the next two or three years, the partners occasionally assisted, and at times represented Sir Charles professionally, until their own practice increased so much as to require their whole attention; and the younger son, Edward Middleton (so named after Sir Charles's old master), who had been articled by his father to Messrs. Wyatt & Brandon, and who, on the dissolution of partnership between my brother and Mr. Brandon, about a year after Mr. Edward Barry had entered their office, served the remainder of his term with the former, had become able to assume that place of confidential assistant and representative which he held till the day of the decease of Sir Charles, who has bequeathed the drawings, papers, and books relative to the New Palace at Westminster, to the younger son, as having then for many years past been specially connected with his father in carrying out that great work.

Further of the Houses of Parliament it is scarcely necessary to speak: you know their merits: you, as architects, familiar with all that is greatest and most impressive in our art, know, as well as I know, that they will live to speak for themselves for centuries after the memory of such unmanly detractors as Mr. Dawson shall have passed away, and that as long as they endure they will tell but one tale.

No public building in Europe possesses a more ingenious and effective plan, a more perfect homogeneity of parts and style, a more graceful outline under every point of view, and greater technical excellencies and beauty. Let the most critical observer wander into every nook and corner of that enormous structure, and endeavour to detect a neglected point where the failing attention or ability of the architect have allowed a degeneration into meanness of finish, dissymmetry of axes or leading features, faulty proportion of line or detail, or anything like what is commonly called a bungle; and he finds one it will certainly be more than I, with very close attention, have ever been able to do. Supposing, however, that he may succeed, where I and many others have failed, let him, full of the notes he may have found in his brother's eye, take his stand either on Waterloo or Hungerford bridge, or on the river side near Lambeth Palace, and from one of those points, on a fine afternoon, watch till the sun goes down; and if he does not lose the impression of the "notes" in the enjoyment of one of the most exquisite pictures ever architect provided to feast a painter's eye, he "hath no music in his soul."

As practical architects, we are especially bound to recognize the extraordinary technical resources called into play in the structure and fitting up of the Houses of Parliament. At Barry's call, and under the vivifying influence of his daring and intelligence, a new race of workmen seemed to spring into existence. Trained by Pugin, and led on by John Thomas, workmen grew into artists; and who shall say for how much of the admirable masonry and carving which are now so rife throughout our land we are not indebted to the judicious establishment of the school, and prototype of our present Architectural Museum, at Thames Bank, by, and under the auspices of, Sir Charles Barry? Ever appreciative of the technical skill of others, he enlisted all the energies of those manufacturers and masters who first woke up in this country to the real capabilities of industrial art. For him, Hardman, Crace, and Minton exerted all their energies; giving him at once novelty, beauty, and excellence. Products and decorations which are now common enough were, when Barry and Pugin first employed them, rarities attainable only after repeated experiments, and with extreme difficulty. Mechanical arrangements for saving labour, the capacious mind of the former at once appreciated and applied, and, but for his great power in that respect, the Houses of Parliament could never have been completed, as they have approximately been, up to the present hour. It was given to him

at once to know how and when to use men as tools, and tools as men,—never confounding their legitimate functions, but deriving every possible aid from each and all. We cannot forget the ingenuity of all those contrivances for scaffolding and hoisting which were so ably described to us by Sir Charles's eldest son, on the 15th of June, 1857; neither can we overlook the debt we owe to one who, in all these matters, has so clearly shown us what may be done by intelligence and energy in overcoming every possible variety of mechanical and material obstruction an architect is likely to meet with in the course of the most diversified practice.

Nothing tended more to retard a general appreciation of the architectural merits of the Houses of Parliament than the necessarily slow and protracted realisation of its chief vertical features and skyline. The grand horizontal continuity of the river front, admirably calculated to contrast with and enhance the aspiring loftiness of the clock and Victoria Towers appeared comparatively unreasonable and monotonous until those features were brought to proximate completion. But a few years will, I sincerely believe, witness an entire revulsion of feeling with respect to the popular estimation of this building; and those who will then have grown accustomed to it in its entirety, and who may have learned to apprehend the skill with which its plan has been adapted to correspond effectively with the most complicated and, apparently, antagonistic exigencies, will wonder at the growls and grumbles which have continually proceeded from those who have persisted in pronouncing sentence on their own prognostics, rather than on the real schemes and designs of their truly accomplished architect, which they would not trouble themselves to apprehend.

In addition to the works I have already alluded to many more might be enumerated, several of which, in a less note-worthy career, would be regarded as of very great importance. Such, for instance, are the Privy Council Office and Trafalgar-square alterations; the terraces and additions at Shrublands (1849-54), for Sir William Middleton, done about 1849; Gawthorpe, a Gothic mansion, in Lancashire (1850-52), for Sir Kaye Shuttleworth; Kiddington, Conford Manor, Dorsetshire (1854-5), for Sir Josiah Guest; Schools, &c. at Dowlais (1855), for the same client; additions to the residence of Sir Isaac Lyon Goldsmid in the Regent's park; Harewood (1854-5), a large addition in a sort of Roman style, to his seat near Leeds, for Lord Harewood; Duncombe Park, for Lord Feversham; a Tudor house for Mr. Currie, near Leatherhead; Ensham Hall, for Lord Maclesfield; Cobham, for Sir John Cam Hobhouse; and King's-oak Lacey, for Mr. Banks. The last-named an early work, the rest, with scarcely an exception, since 1840. Among his designs, either not strictly, or not at all carried out, may be mentioned his projects for New Westminster-bridge, for Law Courts on the site of Lincoln's-inn-fields (made in 1838), and on a site abutting on the Strand by St. Clement's (made in 1852), for the reconstruction to a great extent of Northumberland House; of Drumlanrig Castle, for the Duke of Buccleugh; and of Buchanan House, for the Duke of Montrose; and for the completion of the Horse Guards, towards the Parade.

In 1849 Barry was appointed a Royal Commissioner for the Exhibition of Industry of 1851, and as a member of the Building Committee, on which he sat with Robert Stephenson, Brunel, the Duke of Buccleugh, Lord Ellesmere, Sir William Cubitt, our President, and Professor Donaldson, he took a most active part in the early settlement of all matters relating to the building. The section of the columns, with its ingenious provisions for attachment of girders, and superposition of other columns, the general proportions and arrangement of many of the leading parts, and the form of the transept roof, which I saw him sketch on the suggestion of Brunel, that rather than cut down or exclude the large trees it would be better to roof them in, were all his, and but for his having been beaten on the score of time and expense on the view he took of the desirability of covering the nave also with a semi-cylindrical roof, as has been done at the Sydenham Crystal Palace, he would no doubt have continued to render greater practical assistance than he did till the opening of the Exhibition.

As a Royal Commissioner he dissented from the South Kensington Museum and National Gallery schemes, and forwarded to his Royal Highness, the President, for submission to his colleagues, a comprehensive and most able scheme for an extension of the British Museum upon the site of some of the streets and squares now imme-

diately adjoining it. In how magnificent a manner he would have dealt with the National Gallery in its present commanding position, is well though slightly shown in several of his existing sketches, which, it is to be hoped, may be published in facsimile.

Mr. Barry became Sir Charles in 1852, having been knighted on the occasion of her Majesty's making, for the first time, in February of that year, her state entrance through the lower story of the Victoria Tower, and shortly afterwards he began to gradually withdraw from active practice. In 1855 he removed to Clapham. Among his last and finest designs were three series of great additions and alterations to Clumber, for the Duke of Newcastle, in 1857; plans and sketches for the construction of a building for the Royal Academy of Arts, on the site of Burlington House; drawings for the Halifax Town-hall; and that design, or rather collection of designs, for the improvement of the western portion of London, which he contributed as a sort of rider to the designs of his son Edward for the Government Offices. This last I venture to consider one of the most important designs he ever made. I look upon it as a legacy to his country of almost corresponding grandeur of treatment with that bequeathed to us by Sir Christopher Wren, and prepared after the Fire of London. Could but the scheme conceived by the architect who has shown us in the towers of Westminster and in the general composition of the Houses of Parliament what he could supply materially for the embellishment of the metropolis be realized, there can be no doubt that London would be the most beautiful and majestic looking city the world has ever seen.

In conversations I have at different times had on the subject of architecture with Sir Charles, he has always insisted on the indispensability of symmetrical arrangement, on sustained tranquillity of effect obtained through the reduplication of similar parts, on study and refinement in detail, and especially upon care in the grouping of masses and the treatment of the sky line in connection with landscape effects. It was his general practice, he has told me, to get out his roof plan as one of the earliest drawings in working out any design. The architects for whose works he generally professed the greatest respect were San Michele, Michelangelo, Vignola, Peruzzi, Soufflot, Perrault, Vanvitelli, Gibbs, Chambers, Jones, and Wren. For the latter his admiration was unbounded, and it was one of the latest acts in his life to give what assistance he could to the embellishment of Sir Christopher's great masterpiece.

In the summer of 1858, at the suggestion of Mr. Cockerell, Sir Charles Barry was invited to become a member of the committee for administering the St. Paul's Cathedral Fund, raised for the purpose of assisting the dean and chapter in providing, firstly, for the special evening services, and afterwards for the decoration of the cathedral. He entered heartily into the proceedings of this committee, and scarcely missed a single meeting. The surveyor to the fabric is anxious to bear witness with gratitude both to the value of his councils and the uniform kindness of his manner.

As it was sometimes necessary in the alterations that have been decided on, and already partially carried out, to take steps regarding which there could be no positive indications of Sir Christopher's mind (although, fortunately, in the main, there are such indications), it was of the greatest value to have an adviser who was so capable of deciding what Sir Christopher Wren would have been likely to have done under the new circumstances, and one who was independent of a superstitious veneration for the original arrangements when their change became desirable in consequence of the alteration of other parts. One of the last letters written by Sir Charles Barry was on the subject of the works in the Cathedral, to the Dean of St. Paul's, by whom his premature loss is deeply regretted, as it is by all others connected with the cathedral or the committee.

On all possible occasions Sir Charles Barry urged the necessity for a system of more complete and profound architectural study than has yet been organized amongst us. Quietly, though I have reason to know most strenuously, his views on this head were pressed upon the attention of his colleagues in the Royal Academy, and it was his earnest desire that the professorship of that body should be elevated into real practical efficiency.

In the formation of the Architectural Publication Society, Barry gave valuable and willing aid, but from compliance with the request of the com-

mittee for assistance towards the illustrations, he always excused himself, on the ground that his sketches were too slight to be placed before the public. When, however, the article "Baalbek," compiled for the "Dictionary of Architecture," issued by that society, was submitted to him, he acceded most readily to the wishes of the committee, and prepared the description (afterwards printed) of the ruins at that place, from his own memoranda and sketches. This assistance was the more remarkable and gratifying, as it is probable that, with the exception of a short, but often referred to, contribution to Gwilt's edition, in 1825, of Sir William Chambers's Treatise on Architecture, this account is the only literary production from his pen; in fact, he had quite sufficient employment for it in the many and able reports and descriptions he was daily called upon to make. His interest in the Architectural Publication Society he kept up to the last, having replied within a month before his decease to an inquiry made by the secretary as to the penitentiary of sound in a certain room in one of the buildings erected from his designs. It is also reported that he was engaged upon an account of the Architecture of the Holy Land for the same work, at the date of his untimely demise.

In his comparative leisure and retirement from active life at Clapham, his friends earnestly hoped that Sir Charles would find opportunities of regaining that strength and health which had been seriously impaired by a life of such intense and incessant exertion and anxiety. Their wishes, which seemed to be rapidly in process of realisation, it has pleased God to suddenly and awfully frustrate: how, after the exquisitely simple narrative given you by Professor Donaldson, it is unnecessary for me now to detail. It may suffice to record with thankfulness, that dreadfully unexpected as was the summons, it fell upon a Christian man, who had long looked upon death as a Christian man should, and whose piety was not less unobtrusive and genuine than were his faith, hope, and charity.

I might of course have urged many other points upon your attention in respect to the powers of Sir Charles Barry, as testified in each of the various works to which allusion has been made; but there are limits both to my powers and to your patience. The earnestness of the few remarks with which this memoir, in spite of its length, obviously too much abridged by stress of time, must necessarily be terminated, will be of little consequence, as no doubt many an abler pen than mine will be enlisted in drawing the most profitable instruction from so great an example, not only of what is excellent in art, but of what is most admirable in private life. Let us hope that whenever that extended memoir which may, I believe, be looked for from the great and united talents of his sons Alfred, Edward, and perhaps Charles, shall appear, it will prove to supply all lacunæ existing at the date of its publication, and that it will illustrate, copiously, both by pencil and pen, the life—artistic, personal, and historical—of Sir Charles Barry. It is satisfactory to think that he has not passed away without leaving materials for the picture of him which should obviously be placed in the National Portrait Gallery, or for the statue which should find its appropriate niche in one of the halls of the New Palace at Westminster. His portrait, by Harland, has been engraved; that by Hayter, in the possession of the family; one by Pickersgill exists. His bust has been modelled by Belmas; and last, not least, an excellent daguerotype of him, still in good condition, was taken by Claudet for his son Charles, immediately previous to his visit to Italy in 1847; and another, not less satisfactory, was executed of him by Killburn, in the present year. An engraving from this last may, I hope, accompany any extended memoir or biography.

I know not how any moral that the ablest rhetorician in the world could draw from Sir Charles Barry's professional career could be made to speak more strongly, or to admonish us more stringently, than the facts of his life, and the monuments he has left behind him, do for us unerringly, if we will but open our hearts to apprehend and study them aright. His incessant labours, first to learn and then to practise, again to learn and again to practise, and again, and again, and again to learn and practise, so long as his physical energies could support the activity of his intellect, should convey to us all a lesson of profound humility, and a stimulus to exertion of the most active kind.

If he, with all his natural genius and aptitude for art could achieve success, in the measure in which he did achieve it, only by never ending, ever re-beginning toil and study, how can we

emulate, even an approximation to his excellence in our art, without an exercise of both increased in the ratio of the disparity between our own natural powers and his? His life is only another practical illustration of that which lives of all the greatest artists who have ever lived,—of Titian, of Michelangelo, of Raffaele, of Leonardo da Vinci, of Albert Durer—already bear witness to,—that study and practice must in art ever go on hand-in-hand. Study without practice will but make the pedant; practice without study can but multiply busy worthlessness. He who would ever be in our art what Sir Charles Barry was, must don the same armour, and fight for every step in the upward struggle, with the same weapons, and with equal courage and pertinacity.

#### THE ARCHITECTURAL DRAWINGS AT THE ROYAL ACADEMY.\*

Of Hemsted House, in Kent, erecting for Mr. Guthorne Hardy, M.P., there are two good views by the architect, Mr. D. Braudon,—No. 671, the entrance front; and 683, the garden front. A Jacobean manner is here the basis; but a considerable amount of art is introduced, especially in the front last mentioned, where the terrace-garden is effectively arranged, and the loggia to the ground story, the balcony over balcony carried by columns, and other parts, are well managed. The materials are red brick and stone. The whole entrance front is marked by a feature of detail in one of the bay windows; namely, raking lines across the mullions—intended, we suppose, to indicate the position of the staircase. No one will accuse us of leaning towards the falsification of structure; we should favour the external exhibition of internal arrangements rather than the reverse; but there are other considerations to be also kept in view by the artist-architect; and these are not so held, in many of the prevalent attempts to mark the positions of staircases. Such attempts are a misreading of the lesson of Nature, who, it has been said, never lays bare the skeleton and whole system of structure upon which the beauty of a form is disposed. "Taverham Hall, in the county of Norfolk, erecting for the Rev. J. N. Micklethwaite" (677), by the same architect, is in the same character, Jacobean or Elizabethan; and perhaps the design should be regarded as more meritorious than the other, if not indeed highly effective.—We do not desire to see any revival of the distinctive French Gothic, especially with roofs of excessively high pitch, and exaggerated finials, as in Mr. Massey's "Design for a Baronial Residence" (674). The French models, as well as others, should be studied, and indeed made use of; but copyism is not justifiable in their case or any other.

Besides the drawing already mentioned, Mr. T. H. Wyatt exhibits a considerable number of works. The nature of his "Alterations and Additions in progress at Latham House, Lancashire," for Lord Skehversdale, is not explained by the view (681). The drawing, however, shows a good group—a central block, and outbuildings advanced,—an arrangement not to be adopted where it would shut out prospect; and a dwarf wall and gates inclose the area or quadrangle. The original details appear to have been of the seventeenth century Italian style. Though plain in character, even to the extent of what might be called commonplace, the Italian square-built mansions are often better in general mass and proportions than more enriched works of the present day. Mr. Wyatt's alterations and additions at Arley Hall, Cheshire, for Mr. R. E. Egerton Warburton, are of late Tudor or Elizabethan character, as shown in the view (704); and the mansion erecting at Carlett-park, in the same county, for Mr. John Torr, is of similar character, as in No. 710. The mansion erecting at Horsmonden, Kent, for Mr. Francis Austen (708), however, is Italian Gothic, and inferior to the other works of the same architect.—Every year goes to prove the reasonableness of the ground taken by us, when long ago we urged that there should be, if only for the sake of public appreciation of the art, but one current style; and this is being admitted by those who differ most on other points. The whole future now turns upon the education of the public;—so that there may be united expression of a demand for art, which is not imitation,—art-architectural, which exists the more, the more it is part and parcel with the provision of convenience. Let opinion of the art in the Elizabethan and Jacobean styles be what it may amongst educated architects, still will allow that the combination in those cases shows that some combination not devoid of art,

\* See pp. 290, 327, ante.

might be made, of the systems that are now in vogue, and without the defects which too much appear in designs, shown in the exhibitions, of a prominently Medieval or a foreign impress. This latter character is, in our opinion, quite enough to condemn the design (682), by Mr. E. George, "for a metropolitan hotel, with glass-covered court, the ground-floor appropriated to shops," further represented in the exhibition in Conduit-street. Were direct reproduction ever justifiable, surely the Italian-Gothic, valuable rightly used, is the very last style of which the details of the general character should be copied. Mr. T. Porter's design (700) for a building of the same class—"proposed International Hotel, Strand, London," is too distinctively Jacobean, and therefore falling short of our demand; but, at least, it is English as well as nearer to that customary street-architecture, the art-capabilities of which have been proved. It is also founded on a style which the late Sir Charles Barry, as we happen to know, thought could be further worked, and upon which, indeed, he based the design of one of his principal works mentioned in our notice of his life.

The amicable "battle of the styles" fought in Conduit-street is resumed by Mr. Tite in a drawing (698) at the Academy, "worked out by J. Green, and entitled "Contrasts and Comparisons, in Illustration of the Horizontal and Vertical Principles of Architectural Composition." Though useful, if properly looked at, and particularly so as showing what is to be done by the addition of art to bridge-building, as well as useful in reminding us of several excellent Continental classical works of the present century; we are obliged to demur both to the manner of representation and to the selection of the examples. The object of comparison requires at least that the whole of the examples should be exceedingly well drawn; whereas here the Gothic works are sadly mauled, and the dome of St. Paul's has its usual fate from draughtsmen, who, except one or two, seem never able to depict it, or to get at the fact that it is stuck from two centres—a peculiarity which makes its beauty and that of one or two other domes of the same family.

There is plenty of design, as usual in Mr. S. S. Teulon's works, in his "tower entrance (685), Elvetham Hall, now in progress of erection," for Lord Colthorpe; but the details, including the colour, are grotesque rather than architectonic. A general view of the building was given in our pages last week.—Mr. T. R. Smith has at the Academy a view of his "Stratton Audley Park, now in course of erection, near Bicester" (699), of which there are drawings at the other exhibition.—Mr. Owen Jones's large "View of Messrs. Osler's Gallery, 45, Oxford-street" (691), like his drawings in general, is prominent in the exhibition by its size and its very skilful execution. The character and the merits of the work in Oxford-street are well known to our readers; but it has been suggested as worthy of consideration, whether the effect from stained glass is favourable to correct opinions of the quantities desired in articles of white glass such as are here on sale at Messrs. Osler's.

We have left two of the most important works to the end of this notice. Mr. Sydney Spink, R.A., in the drawing No. 687, shows a portion of the "Arcades about to be erected at South Kensington, to inclose the gardens of the Horticultural Society" (the plan of which we gave recently), as well as "a Pavilion for Her Majesty's use." The arcades, of Italian character, are remarkable for a much more prominent use of coloured materials than has lately been shown in architecture of the same style. Though too obviously a reproduction, the whole promises a satisfactory result, and one that may be productive of an intimate relation between gardening and architecture which we have long desired to see, for the effect of each; but which has scarcely been thought of except in some country seats, and hardly at all where it is also required to some extent, or so far as space allows, in towns.—Mr. T. Page's "Design for the Bridge over the Golden Horn, Constantinople, arranged to admit of the Turkish men-of-war passing under the arch of the central towers" (689), not devoid of merit decoratively, must be a work deserving very long notice for its structural features. Besides having in his mind settled, as the drawing shows, any question remaining about the combination of the trussed girder and suspension principles for large spans, or that combination which he made in his Chelsea bridge, the author of the design has, we understand, fully considered the extraordinary difficulties which he would have to overcome in constructing the foundations of the central tower, or "towers," in the great depth, which is that of the water of the Golden Horn. The difficulty,

we believe it is thought, might be overcome by sinking a caisson; but the details of execution would deserve better description than we can here give.

Amongst the best drawings of old buildings in this room are two by Mr. T. Scandrett (679 and 680) of interiors at Ronen, and one entitled "Art in Devotion," of great excellence, representing the monks at work in the cloisters of the Certosa at Pavia (694), by Mr. F. P. Cockerell.

#### THE STORY OF A GREAT AND GOOD MAN.—WILLIAM OF WYKEHAM. THE ARCHITECTURAL EXHIBITION.\*

IN undertaking a lecture upon the character and acts of a person who has long since been dead, I will employ the apology of Bacon with reference to Henry VII. in a similar case,—“I took him to life as well as I could, sitting so far off, and having no better light.” I owe it also to this audience, to assure them that since I published a volume on the subject in 1852, I have been able to peruse the various sources of information of which I then availed myself, and have been also so fortunate as to make some additions, which, for the first time, I shall have the honour to submit to you. Still it is a subject of painful regret, that owing to the neglect of their opportunities of collecting facts by Wykeham's earlier biographers, we have lost "many things of worthy memory which now shall die in oblivion, and we return, unexperienced, to our graves."

In the same year, 1324, two of the most memorable men of a remarkable age, first saw the light—John Wycliffe the Reformer, and William of Wykeham, by far the greater and better man of the two. If there was ever a noteworthy instance of self-help in a religious spirit, it is that of this illustrious character. It has been asserted that he was connected with the family of Wickham, of Swallcliffe, in Oxfordshire. Whenever a man raises himself to rank, position, or wealth, there are always hundreds ready to claim kinship, and prefer a right to such distinction. It is quite certain that none of the name gave a helping hand to the young boy when he needed it. His father was known as John Longe; his mother's name was Sybilla, daughter of William and Alice Bowad; and quaint old Fuller, makes a very complimentary pun on his father's name. When he rose to eminence, he never adopted the arms of the Swallcliffe family, but took the device of a chevron, or carpenter's couple, in allusion to that science to which he owed his fortunes, or else as significant that he had been the architect of his own success. Those who are curious in the colours of heraldry read in the black perpetuity; and in the roses which he adopted, the ensigns of brotherly love.

The village of Wykeham, from which he took his name, lies four miles south of Waltham, on the west bank of the river Arle, in a very pretty and picturesque country. His mother was connected with the lords of Stratton, and she gave her child the Christian name of her father. Possibly to this alliance we may refer the patronage of Sir Nicholas Uvedale, lord of the manor of Wykeham, lieutenant of Southampton, and governor or constable of Winchester Castle. He was sent to the cathedral school, which stood near the King's Gate, just outside the walls of the Close, and occupied the site of a still earlier seminary, in which several sons of the Saxon kings, including Alfred himself, had received their education. He is said thence to have proceeded to Oxford, where he attended the mathematical lectures of Lewis Carleton, afterwards Bishop of Hereford; and the lectures in civil law of W. Dorch, during six years. French, geometry, logic, and arithmetic, he studied at Winchester. On the spot where his chantry now stands was an altar of St. Mary, where the morning mass was sung; and to it the boy constantly repaired for his devotions. Perhaps to these frequent visits we may attribute that love of architecture and inclination for the service of the Church which so eminently distinguished him in after-life. Of his Oxford career we learn only that he studied logic, mathematics, civil law, and arithmetic, and became the friend of W. Courtenay, afterwards primate, and John Buckingham, sometime Bishop of Lincoln. It is worthy of remark, that in all the patents previous to his reception of holy orders, he is styled clericus, which the great Oxford antiquary, A. Wood, informs us was the title of academical students. His early knowledge of arithmetic, mathematics, and geometry, tended

to his acquisition of the science of architecture. After six years spent at Oxford, Wykeham entered the service of his generous patron, to whom he recommended himself by his skill in overseeing repairs and alterations in Winchester Castle, and by his ability as a secretary in writing letters to the king and nobles. After three years Sir Richard Uvedale introduced him to Edyngden, the bishop of the diocese and Lord Treasurer of England, and he was received into his family, an expression referring to the household and young men of promise whom bishops at that period were in the habit of training for active employment in the church and state. The intimacy thus formed lasted through life. On December 10, 1353, Wykeham acted as his attorney in taking possession of certain lands, and in 1352 Henry Sturmy, of Elvetham, who had recently served the office of High Sheriff of the county, constituted him his attorney to deliver seisin of some estates to the bishop. We may, therefore, presume that his knowledge of law was by no means inconsiderable. The only letter of Wykeham extant is in French.

It is of more peculiar interest here to remember that the church of the native place of Edyngden contains the earliest appearance of the Perpendicular style, and must have been built during the residence of Wykeham in the bishop's house. Another noteworthy circumstance is, that Edyngden's chantry in the cathedral of Winchester is the first that was built as a distinct chapel between the piers of an arcade, and was the model of Wykeham's chantry, and of those of Bishop Gardiner and Cardinal Beaufort,—an arrangement peculiar to this cathedral,—and, we can hardly hesitate to infer, the design of Wykeham. The notice of Edyngden led to still more important results. In 1347 King Edward III., on his return from the siege of Calais, spent several days at Winchester. The constable and Edyngden presented their secretary to the king, who was then in need of engineers and architects, and Wykeham was "another Euclid in geometry." His excellent address, fine person, and great abilities installed him in the king's favour at the early age of three-and-twenty.

"His years but young, but his experience old;  
His head unmelow'd, but his judgment ripe."

The king plied him with pointed questions on subjects of finance, conditions and treaties of peace, declaration of war, and other political matters, and he answered with equal modesty and talent. The king found an easy method of supporting him; he made him a lay rector. An objection has been adduced against Wykeham for accepting the revenues of a parish without discharging its duties. Other men, equally honourable and conscientious, have held ecclesiastical preferment as laymen; for instance, Sir H. Wotten was Provost of Eton, and Camden had a stall at Salisbury; while at the present day the lay rector is still a name not unknown. Until we amend our own affairs in the nineteenth century, I think we need not be too curious in detecting faults in earlier periods of our history. Besides, at this particular time, it was well that an Englishman enjoyed even pluralities, so numerous were Italian and non-resident foreign clergy in the country; and the evil rose to such a height that, in 1374, King Edward III. required a return of their numbers. Indeed, in one instance, we find that Wykeham was a merely nominal rector, the pope having instituted proceedings against him for holding the living of Pulham. More than this, the confusion of the times, the scarcity and ignorance of the clergy necessitated the bestowal of pluralities on the few men capable of adorning high station and administering important offices. It is impossible to determine for what length of time, when exchanges were common and frequent, Wykeham held his benefices together, after he had taken holy orders. In 1365, Pope Urban directed a bull against pluralities; and in the return which was made, it was shown that he had voluntarily resigned those preferments with cure which necessitated residence: that he held only sinecures and stalls; while, as Archbishop of Lincoln, he no doubt was as vigilant and active as he afterwards proved when he became a bishop. However, there can be no question on the point, for in a bull of the pope, dated at the very close of that year, the Pontiff writes to Wykeham, assuring him that he had received from very many quarters of the highest credit, testimonies of praise for his great learning, his excellent life and character, his forethought in spiritual matters, and his prudence in things temporal. It is to us of interest here to know that he was Prebendary of Totenhall, in St. Paul's Cathedral, a canon of St. Stephen's Chapel, West-

\* Read by the Rev. Mackenzie Walcott, on Tuesday, May 29th.

minster, the crypt of which still remains, and has recently been restored; and also Dean of St. Martin's-le-Grand, which occupied the site of the General Post-office. In the chapel of Winchester House, Southwark, which adjoined the present priory church of St. Mary Overy, he was admitted priest and sub-deacon. In this church he married Gower, the poet, to Alice Goundolph. It was at St. Martin's that Wykeham first exhibited his bounty. We find his successor, W. de Mulsho, and the chapter, in 1367, declaring that, out of his own private means and at heavy charges, Sir W. de Wykeham, with works in wood and stone, restored their free chapel and the cloister in the midst thereof, in a new form of wonderful beauty (you will observe this expression, which certainly points to his invention of the Perpendicular style), built it and adorned it with ceilings of stone, and undertook to build the chapter-house from its foundations, which were dug to a great depth in the ground: he resolved to complete it in an admirable manner with stone ceiling and enrich it artistically, at an enormous expense—works which, without his hand and aid, beyond a doubt would never have been completed." The church was destroyed in 1547; but, on clearing the site in 1818, the crypt, part of Wykeham's building, was laid open to view. The value of this testimony is considerable. W. de Mulsho, canon of Windsor, was appointed surveyor of works at Windsor, 1358, and clerk of the works in 1361. On October, 1356, Wykeham became surveyor of works at Windsor, and chief warden and surveyor of the Castle July 10, 1359. In the latter year, according to a MS. chronicle of the period preserved at Christ Church College, Cambridge, Wykeham is said to have instigated the king to rebuild large portions of the castle, probably of the upper, now the middle ward. In 1356-7 the king, according to an old tradition, was urged by his royal prisoners, John and David, to extend the castle, and replied, "Yes, he would, with the help of their ransoms." W. de Mulsho, as Wykeham's successor and assistant, could correctly estimate his knowledge and science, and he offers this splendid testimony to his ability. In 1363 he was made canon of St. Stephen's Chapel, which was in course of building from 1330 to 1392: the same hand which designed the restoration of St. Martin's in 1360-63, was doubtless employed in the construction of the beautiful Chapel of Westminster at the very same period.

There is one office held by Wykeham, that of the provostship in Wells Cathedral, which shows that he was no mean proficient in music. He was president of the College of Minor Canons, and had equal powers with a sub-dean or sub-chancellor at York: he acted as the preacher's vicar, and in choir was superior to any canon. The office still exists at Milan.

Wykeham on his introduction to court proved eminently useful to the king. In the preamble to a licence of mortmain granted to his colleges, King Richard II. declares that he was induced to make the grant on consideration of his high merits, his strict honour, and the many advantageous services rendered, in various ways, by Wykeham, from early youth, to his royal grandfather, his father, and himself after his accession to the crown; in the laborious government of the realm and the administration of its affairs, by his advice, his opportune aid, his readiness, his loyalty, his steadfastness, his endurance of the toil and share in the expense." Surely this is a noble testimony to a young man set in the dangers and trials of a court, one the principal portion of whose active life was cast in the brilliant and eventful reign of Edward III., distinguished by French and Scottish conquest, by the improvement of home commerce and manufactures through the league with Jacques D'Arteveldt and the men of Ghent; by the encouragement of the native tongue of England, and the softening of its literature by those Provençal minstrels who accompanied the conqueror of Cressy and Poitiers from Guinne. He might have proved a soldier-bishop, like Courtenay; a courtier-priest, like Walsey; a mere creature of intrigue, like too many of those who have filled a similar position of trial; but that earnest piety which characterized the boy was the safeguard of the man.

The word architect, the chief workman, appears to have lapsed until modern times, since its use "were-master," the master of the work, or "law-meister," the master of the building, accurately conveys the same meaning, and is synonymous with the medieval title of the master of the fabric, an office established in every conventual house, and the ordinary phrase, surveyor of the works. There was another important post known as Clerk of the
