Domestic Medicine:

OR, A

TREATISE

ON THE

PREVENTION AND CURE

0 F

DISEASES

BY

REGIMEN AND SIMPLE MEDICINES.

WITH

An APPENDIX, containing a DISPENSATORY for the Ufe of Private Practitioners.

By WILLIAM BUCHAN, M.D. Fellow of the Royal College of Phylicians, Edinburgh.

THE FIFTEENTH EDITION;

To which is added, OBSERVATIONS concerning the DIET OF THE COMMON PEOPLE, recommending a Method of living lets expensive, and more conducive to Health, than the prefent.

LONDON:

Printed for A. STRAHAN, and T. CADELL jun. and W. DAVIES, (Succeffors to Mr. CADELL,) in the Strand; And J. BALFOUR, and W. CREECH, Edinburgh.

MDCCXCVII.

Omnes homines artem medicam notife oportet. — Sapientiæ cognitionem medicinæ fororem ac contubernalem effe puto. HIPPOCRATES.

ATTFFOCKATES.

- Primoque medendi fcientia, fapientiæ pars habebatur.—Rationalem quidem puto medicinam effe debere. CELSUS.
- Quemadmodum fanitas omnium rerum pretium excedit, omnifque felicitas fundamentum eft, ita fcientia vitæ ac fanitatis tuendæ omnium nobiliffima, omnibulque hominibus commendatiffima effe debet. HOFFMAN.

Sir JOSEPH BANKS, Bart.

PRESIDENT OF THE ROYAL SOCIETY.

SIR,

THE DOMESTIC MEDICINE having been honoured, on its first appearance, with the patronage of your learned and worthy Predecessfor, the late Sir JOHN PRINGLE, I beg leave, in a more improved state, to dedicate it to you, as a small, but fincere testimony of that veneration and esteem with which I have long beheld the Man who, born to ease and affluence, had resolution to encounter the dangers of unknown seas and distant climes,

a 2

DEDICATION.

climes, in purfuit of ufeful Science; and whofe conftant object has been to render that Science fubfervient to the happines and civilization of Society.

I have the honour to be, with great refpect,

SIR,

Your most obedient fervant,

W. BUCHAN.

London, Nov. 10, 1783.

ADVERTISEMENT.

TWenty-fix years have now elapfed fince the firft Edition of this Book made its appearance. During this period, the Author having been in conftant practice, has taken occafion to improve feveral articles, which were with lefs accuracy inferted in the more early imprefions. For this he has been cenfured by fome, but the more candid and diferning muft approve his conduct. It would be unpardonable in an Author to fuffer an error in a book, on which health and life may depend, to ftand uncorrected; nor would it be much lefs fo to perceive an omiffion, and leave it unfupplied. His improvements, however, are not the refult of mercenary views. The fame principle which prompted the Author to write the Book, will ever induce him to improve it to the utmost of his power.

The improvements of the later editions are chiefly inferted in the form of notes. Thefe are intended either to illustrate the text, or. to put people on their guard in dangerous fituations, and prevent fatal mittakes in the practice of medicine, which it is to be regretted are but too common.

To this Edition is added a chapter concerning the diet of the common people, recommending a method of living lefs expensive and more conducive to health, than the prefent.

Some attention has likewife been paid to the language. Where that was either inaccurate or obfcure, as far as was practicable, it has been corrected. Indeed, the Author has all along endeavoured to obferve fuch fimplicity and perfpicuity in his ftyle as might enable the reader clearly to underftand it : a

circum-

a 3

circumftance of the utmost importance in a performance of this nature.

Although the DOMESTIC MEDICINE was never intended to fupercede the ufe of a phyfician, but to fupply his place in fituations where medical affiftance could not eafily be obtained; yet the Author is forry to obferve, that the jealoufies and fears of the faculty have prompted many of them to treat this Work in a manner altogether unbecoming the profeffors of a liberal fcience: notwithftanding their injurious treatment, he is determined to perfift in his plan, being fully convinced of its utility; nor fhall intereft or prejudice ever deter him from exerting his beft endeavours to render the Medical Art more extenfively beneficial to MANKIND.

But this illiberal treatment of the Faculty is not the only thing of which the Author has caufe to complain. By fome of them his Book has been ferved up mangled and mutilated, and its title, type, fize, &c. fo closely imitated, that purchafers are mified, and frequently boy these fpurious productions instead of the real one. That a needy Author, incapable himself of producing an original work, should prey upon another, and that a mercenary Bookseller should vend such productions, knowing them to be stolen, are things not to be wondered at: but that all this can be done with impunity, shews that the laws of this country respecting literary property, are still in a very imperfect state, and stand much in need of amendment.

New Store-Street, Bedford-Square, London, Jan. 20, 1797.

vi

PREFACE.

WHEN I first fignified my intention of pub-lishing the following sheets, I was told by my friends it would draw on me the refentment of the whole Faculty. As I never could entertain fuch an unfavourable idea, I was refolved to make the experiment, which indeed came out pretty much as might have been expected. Many whole learning and liberality of fentiments do honour to medicine. received the book in a manner which at once fhewed their indulgence and the falfity of the opinion that every phylician wilbes to conceal bis art; while the more felfish and narrow-minded, generally the most numerous in every profession, have not failed to perfecute both the book and its author.

The reception, however, which this work has met with from the Public, merits my molt grateful acknowledgments. As the beft way of exprefling thefe, I have endeavoured to render it more generally uleful, by enlarging the prophylaxis, or that part which treats of preventing difeafes; and by adding many articles which had been entirely omitted in the former impressions. It is needless to enumerate these additions; I shall only fay, that I hope they will be found real improvements.

The observations relative to Nursing and the Management of Children, were chiefly fuggefted by an extensive practice among infants, in a large branch of the Foundling Hospital, where I had an opportunity not only of treating the difeates incident to childhood, but likewife of trying different plans of nurfing, and observing their effects. Whenever I had it in my power to place the children under the care of proper nurfes, to inftruct these nurfes in their duty,

a 4

duty, and to be fatisfied that they performed it. very few of them died; but when, from diftance of place, and other unavoidable circumftances, the children were left to the fole care of mercenary nurfes. without any perfon to inftruct or fuperintend them, fcarce any of them lived.

This was fo apparent, as with me to amount to a proof of the following melancholy fact: That almost one half of the human species perish in infancy, by improper management or neglect. This reflection has made me often with to be the happy inftrument of alleviating the miferies of those fuffering innocents, or of refcuing them from an untimely grave. No one, who has not had an opportunity of obferving them, can imagine what abfurd and ridiculous practices still prevail in the nursing and management of infants, and what numbers of lives are by that means loft to fociety. As these practices are chiefly owing to ignorance, it is to be hoped, that when nurfes are better informed, their conduct will be more proper.

The application of medicine to the various occupations of life has been in general the refult of observation. An extensive practice for several years, in one of the largest manufacturing towns in England, afforded me fufficient opportunities of obferving the injuries which those useful people fustain from their particular employments, and likewife of trying various methods of obviating fuch injuries. The fuccels which attended these trials was fufficient to encourage this attempt, which I hope will be of use to those who are under the necessity of earning their bread by fuch employments as are unfavourable to health.

I do not mean to intimidate men, far lefs to infinuate that even those arts, the practice of which is attended with fome degree of danger, fhould not be carried on; but to guard the lefs cautious and unwary against those dangers which they have it in their

9

their power to avoid, and which they often, through mere ignorance, incur. As every occupation in life difpofes those who follow it to fome particular difeafes more than to others, it is certainly of importance to know these, in order that people may be upon their guard against them. It is always better to be warned of the approach of an enemy, than to be furprized by him, especially where there is a possibility of avoiding the danger.

The obfervations concerning Diet, Air, Exercife, &cc. are of a more general nature, and have not efcaped the attention of phyficians in any age. They are fubjects of too great importance, however, to be paffed over in an attempt of this kind, and can never be fufficiently recommended. The man who pays a proper attention to thefe, will feldom need the phyfician; and he who does not, will feldom enjoy health, let him employ as many phyficians as he pleafes.

Though we have endeavoured to point out the caufes of difeafes, and to put people upon their guard againft them, yet it muft be acknowledged that they are often of fuch a nature as to admit of being removed only by the diligence and activity of the public magiftrate. We are forry, indeed, to obferve, that the power of the magiftrate is feldom exerted in this country for the prefervation of health. The importance of a proper medical police is either not underflood, or little regarded. Many things highly injurious to the public health are daily practified with impunity, while others, abfolutely neceffary for its prefervation, are entirely neglected.

Some of the public means of preferving health are mentioned in the general prophylaxis, as the infpection of provisions, widening the itreets of great towns, keeping them clean, fupplying the inhabitants with wholelome water, &c.; but they are paffed over in a very curfory manner. A proper attention to thefe these would have fwelled this volume to too large a fize; I have therefore referved them for the subject of a future publication.

In the treatment of difeafes, I have been pecu-liarly attentive to regimen. The generality of people lay too much strefs upon Medicine, and truft too little to their own endeavours. It is always in the power of the patient, or of those about him, to do as much towards his recovery as can be effected by the phyfician. By not attending to this, the defigns of Medicine are often fruftrated ; and the patient, by purfuing a wrong plan of regimen, not only defeats the Doctor's endeavours, but renders them dangerous. I have often known patients killed by an error in regimen, when they were using very proper medicines. It will be faid, the phyfician always orders the regimen, when he prefcribes a medicine. I w fh it were fo, both for the honour of the Faculty and the fafety of their patients; but phyficians, as well as other people, are too little attentive to this matter.

Though many reckon it doubtful whether phyfic is more beneficial or hurtful to mankind, yet all allow the neceffity and importance of a proper regimen in dileafes. Indeed the very appetites of the fick prove its propriety. No man in his fenfes ever imagined that a perfon in a fever, for example, could eat, drink, or conduct himfelf in the fame manner as one in perfect health. This part of medicine, therefore, is evidently founded in Nature, and is every way confiftent with reafon and common fenfe. Had men been more attentive to it, and lefs folicitous in hunting after fecret remedies, Medicine had never become an object of ridicule.

This feems to have been the first idea of Medicine. The ancient physicians acted chiefly in the capacity of nurses. They went very little beyond aliment in their preferiptions; and even this

they

they generally administered themfelves, attending the fick for that purpose through the whole course of the difease; which gave them an opportunity not only of marking the changes of difeases with great accuracy, but likewise of observing the effects of their different applications, and adapting them to the fymptoms.

The learned Dr. Arbuthnot afferts, that by a proper attention to thole things which are almost within the reach of every body, more good and lefs mifchief will be done in acute difeases, than by medicines improperly and usseafonably administered, and that great cures may be effected in chronical distempers, by a proper regimen of the diet only. So entirely do the Doctor's fentiments and mine agree, that I would advise every perfon, ignorant of physic, to confine his practice folely to diet, and the other parts of regimen; by which means he may often do much good, and can feldom do any hurt.

This feems alfo to have been the opinion of the ingenious Dr. Huxham, who obferves, that we often feek from Art, what all-bountiful Nature most readily, and as effectually, offers us, had we diligence and fagacity enough to obferve and make use of them; that the *dietetic* part of medicine is not fo much fludied as it ought to be; and that, though lefs pompous, yet it is the most natural method of curing difeases.

To render this book more generally ufeful, however, as well as more acceptable to the intelligent 4 part of mankind, I have in moft difeafes, befides regimen, recommended fome of the moft fimple and approved forms of medicine, and added tuch cautions and directions as feemed neceffary for their fate administration. It would no doubt have been more acceptable to many, had the book abounded with pompous preferiptions, and promifed great cures in confequence of their ufe; but this was not my plan : I think I think the administration of medicines always doubtful, and often dangerous, and would much rather teach men how to avoid the neceffity of using them, than how they fhould be used.

Several medicines, and thofe of confiderable efficacy, may be adminiftered with great freedom and fafety. Phyficians generally trifle a long time with medicines before they learn their proper ufe. Many peafants at prefent know better how to ufe fome of the noft important articles in the *materia medica*, than phyficians did a century ago; and doubtlefs the fame obfervation will hold with regard to others fome time hence. Wherever I was convinced that medicine might be ufed with fafety, or where the cure depended chiefly upon it, I have taken care to recommend it; but where it was either highly dangerous, or not very neceffary, it is omitted.

I have not troubled the reader with an ufelefs parade of quotations from different authors, but have in general adopted their observations where my own were either defective, or totally wanting, Those to whom I am most obliged are, Ramazini, Arbuthnot, and Tiffot; the laft of which, in his Avis au Peuple, comes the nearest to my views of any author which I have feen. Had the Doctor's plan been as complete as the execution is mafterly, we should have had no occasion for any new treattile of this kind foon; but by confining himfelf to the acute difeafes, he has in my opinion omitted the most useful part of the subject. People in acute difeafes may fometimes be their own phyficians; but in chronic cases, the cure must ever depend chiefly upon the patient's own endeavours. The Doctor has also passed over the Prophylaxis, or preventive part of medicine, very flightly, though it is certainly of the greateft importance in fuch a work. He had no doubt his reasons for fo doing, and I am fo far from finding fault with him, that I think

think his performance does great honour both to his head and to his heart.

Several other foreign phyficians of eminence have written on nearly the fame plan with Tiflot, as the Baron Van Swieten, phyfician to their Imperial Majefties; M. Rofen, first phyfician of the kingdom of Sweden, &cc.; but these gentlemen's productions have never come to my hand. I cannot help withing, however, that some of our diffinguished countrymen would follow their example. There ftill remains much to be done on this fubject, and it does not appear to me how any man could better employ his time or talents, than in eradicating hurtful prejudices, and diffusing useful knowledge among the people.

I know fome of the faculty difapprove of every attempt of this nature, imagining that it muft totally deftroy their influence. But this notion appears to me to be as abfurd as it is illiberal. People in diftrefs will always apply for relief to men of fuperior abilities, when they have it in their power.; and they will do this with far greater confidence and readinefs when they believe that Medicine is a rational fcience, than when they take it to be only a matter of mere conjecture.

Though I have endeavoured to render this Treatife plain and ufeful, yet I found it impoffible to avoid fome terms of art; but thofe are in general either explained, or are fuch as moft people underftand. In fhort, I have endeavoured to conform my flyle to the capacities of mankind in general; and, if my readers do not flatter either themfelves or me, with fome degree of fuccefs. On a medical fubject, this is not fo eafy a matter as fome may imagine. To make a flew of learning is eafier than to write plain fenfe, efpecially in a feience which has been kept at fuch a diffance from common obfervation. It would however be no difficult matter to prove, that every thing valuable in the practical practical part of Medicine is within the reach of common abilities.

It would be ungenerous not to express my warmeft acknowledgments to those Gentlemen who have endeavoured to extend the usefulnefs of this Performance, by translating it into the language of their respective countries. Most of them have not only given elegant tranflations of the Book, but have alfo enriched it with many useful observations; by which it is rendered more complete, and better adapted to the climace and the conftitutions of their countrymen. To the learned Dr. Duplanil of Paris, phyfician to the Count d'Artois, I lie under particular obligations; as this Gentleman has not only confiderably enlarged my treatife, but, by his very ingenious and uleful notes, has rendered it fo popular on the Continent, as to occasion its being translated into all the languages of modern Europe.

I have only to add, that the book has not more exceeded my expectations in its fuccefs, than in the effects it has produced. Some of the most pernicious practices, with regard to the treatment of the fick, have already given place to a more rational conduct; and many of the most hurtful prejudices, which feemed to be quite infurmountable, have in a great measure yielded to better information. Of this a ftronger instance cannot be given than the inoculation of the fmall-pox. Few mothers, fome years ago, would fubmit to have their children inoculated even by the hand of a Phyfician; yet nothing is more certain, than that of late many of them have performed this operation with their own hands ; and as their fuccefs has been equal to that of the most dignified inoculators, there is little reason to doubt that the practice will become general. Whenever this shall be the cafe, more lives will be faved by inoculation alone, than are at prefent by all the endeavours of the Faculty.

INTRODUCTION.

5

\$12.

HE improvements in Medicine, fince the revival of learning, have by no means kept pace with those of the other arts. The reason is obvious. Medicine has been studied by few, except those who intended to live by it as a busines. Such, either from a miftaken zeal for the honour of Medicine, or to raife their own importance, have endeavoured to difguife and conceal the art. Medical authors have generally written in a foreign language; and those who were unequal to this task, have even valued themfelves upon couching, at leaft, their prefcriptions, in terms and characters unintelligible to the reft of mankind.

The contentions of the clergy, which happened foon after the reftoration of learning, engaged the attention of mankind, and paved the way for that freedom of thought and inquiry, which has fince prevailed in most parts of Europe with regard to religious matters. Every man took a fide in those bloody difputes; and every gentleman, that he might diffinguish himfelf on one fide or other, was instructed in Divinity. This taught people to think and reason for themselves in matters of religion, and at laft totally deftroyed that complete and abfolute dominion which the clergy had obtained over the minds of men.

The fludy of Law has likewife, in most civilized nations, been justly deemed a necessary part of the education of a gentleman. Every gentleman ought certainly to know at leaft the laws of his own country: and, if he were also acquainted with those of others. 5

others, it might be more than barely an ornament to him.

The different branches of Philosophy have also of late been very universally fludied by all who pretended to a liberal education. The advantages of this are manifelt. It frees the mind from prejudice and superstition; fits it for the investigation of truth; induces habits of reasoning and judging properly; opens an inexhaustible fource of entertainment; paves the way to the improvement of arts and agriculture; and qualifies men for acting with propriety in the most important stations of life.

Natural Hiftory has likewife become an object of general attention; and it well deferves to be fo. It leads to difcoveries of the greateft importance. Indeed agriculture, the most uteful of all arts, is only a branch of Natural Hiftory, and can never arrive at a high degree of improvement where the fludy of that fcience is neglected.

Medicine however has not, as far as I know, in any country, been reckoned a neceffary part of the education of a gentleman. But furely no fufficient reafon can be affigned for this omiffion. No fcience lays open a more extensive field of useful knowledge, or affords more ample entertainment to an inquifitive mind. Anatomy, Botany, Chymiftry, and the Materia Medica, are all branches of Natural Hiftory, and are fraught with fuch amufement and utility, that the man who entirely neglects them has but a forry claim either to talte or learning. If a gentleman has a turn for obfervation, fays an excellent and fenfible writer *, furely the natural hiftory of his own species is a more interesting subject, and prefents a more ample field for the exertion of genius, than the natural hiftory of fpiders and cocklefhells.

* Obfervations on the Duties and Offices of a Phyfician.

We

XVI

We do not mean that every man fhould become a phyfician. This would be an attempt as ridiculous as it is impoffible. All we plead for is, that men of fenfe and learning fhould be for far acquainted with the general principles of Medicine, as to be in a condition to derive from it fome of those advantages with which it is fraught; and at the fame time to guard themfelves againft the deftructive influences of Ignorance, Superfluion, and Quackery.

As matters fland at prefent, it is eafier to cheat a man out of his life than of a fhilling, and almost impoffible either to detect or punish the offender. Notwithstanding this, people still shut their eyes. and take every thing upon truft that is administered by any Pretender to Medicine, without daring to alk him a reason for any part of his conduct. Implicit faith, every where elle the object of ridicule, is still facred here. Many of the faculty are no doubt worthy of all the confidence that can be reposed in them; but as this can never be the character of every individual in any profession, it would certainly be for the fafety, as well as the honout, of mankind, to have fome check upon the conduct of those to whom they entrust fo valuable a treasure as health.

The veil of myftery, which ftill hangs over medicine, renders it not only a conjectural, but even a fufpicious art. This has been long ago removed from the other fciences, which induces many to believe that Medicine is a mere trick, and that it will not bear a fair and candid examination. Medicine, however, needs only to be better known, in order to fecure the general efteem of mankind. Its precepts are fuch as every wife man would choofe to obferve, and it forbids nothing but what is incompatible with true happinefs.

b

Difguifing

Difguifing Medicine not only retards its improvement as a science, but exposes the profession to ridicule, and is injurious to the true interests of fociety. An art founded on observation can never arrive at any high degree of improvement, while it is confined to a few who make a trade of it; The united observations of all the ingenious and fenfible part of mankind, would do more in a few years towards the improvement of Medicine than those of the Faculty alone in a great many. Any man can tell when a medicine gives him eafe as well as a phyfician; and if he only knows the name and dofe of the medicine, and the name of the difeafe, it is sufficient to perpetuate the fact. Yet the man who adds one fingle fact to the flock of medical obfervations, does more real fervice to the art, than he who writes a volume in fupport of fome favourable hypothefis.

Very few of the valuable difcoveries in Medicine have been made by phyficians. They have in general either been the effect of chance or of neceffity, and have been ufually oppofed by the Faculty, till every one elfe was convinced of their importance. An implicit faith in the opinions of teachers, an attachment to fyftems and eftablished forms, and the dread of reflections, will always operate upon thofe who follow Medicine as a trade. Few improvements are to be expected from a man who might ruin his character and family by even the fmalleft deviation from an eftablished rule.

If men of letters, fays the author of the performance quoted above, were to claim their right of inquiry into a matter that fo nearly concerns them, the good effects of Medicine would foon appear. Such men would have no feparate intereft from that of the art. They would detect and expose affuming Ignorance under the mask of Gravity

5

and

xviii

and Importance, and would be the judges and patrons of modelt merit. Not having their underftandings perverted in their youth by falle theories, unawed by authority, and unbiaffed by interest. they would canvals with freedom the most univerfally received principles in Medicine, and expose the uncertainty of many of those doctrines, of which a physician dates not fo much as feem to doubt.

No argument, continues he, can be brought against laying open Medicine, which does not apply with equal, if not greater force, to religion; yet experience has shewn, that fince the laity have afferted their right of inquiry into thefe fubjects, Theology, confidered as a fcience, has been improved, the interests of real religion have been promoted, and the clergy have become a more learned, a more uleful, and a more respectable body of men, than they ever were in the days of their greateft power and fplendour.

Had other medical writers been as honeft as this gentleman, the art had been upon a very different footing at this day. Most of them extol the merit of those men who brought Philosophy out of the schools, and subjected it to the rules of common fense. But they never confider that Medecine, at prefent, is in nearly the fame fituation as Philosophy was at that time, and that it might be as much improved by being treated in the fame manner. Indeed, no science can either be rendered rational or useful, without being fubmitted to the common fenfe and reason of mankind. These alone stamp a value upon fcience; and what will not bear the teft of these ought to be rejected.

I know it will be faid, that diffusing medical knowledge among the people might induce them to tamper with Medicine, and to truft to their own skill instead of calling a physician. The reverse of this

XX

this however is true. Perfons who have most knowledge in these matters, are commonly most ready both to ask and follow advice, when it is neceffary. The ignorant are always most apt to tamper with Medicine, and have the least confidence in physicians. Infrances of this are daily to be met with among the ignorant pratents, who, while they abfolutely refuse to take a medicine which has been preferibed by a physician, will fwallow with greediness any thing that is recommended to them by their credulous neighbours. Where men will act even without knowledge, it is certainly more rational to afford them all the light we can, than to leave them entirely in the dark.

It may also be alleged, that laying Medicine more open to mankind would leffen their faith in it. This would indeed be the cafe with regard to fome; but it would have a quite contrary effect upon others. I know many people who have the utmost dread and horror of every thing prefcribed by a phyfician, but who will nevertheleis very readily take a medicine which they know, and whole qualities they are in fome measure acquainted with. Hence it is evident, that the dread arifes from the doctor, not from the drug. Nothing ever can or will infpire mankind with an abfolute confidence in phyficians, but an open, frank, and undifguifed behaviour. While the least shadow of mystery remains in the conduct of the Faculty, doubts, jealoufies, and fufpicions, will arife in the minds of men.

No doubt cafes will fometimes occur, where a prudent phyfician may find it expedient to difguife a medicine. The whims and humours of men muft be regarded by thofe who mean to do them fervice; but this can never affect the general argument in favour of candour and opennels. A man might as well allege, because there are knaves and and fools in the world, that he ought to take every one he meets for fuch, and to treat him accordingly. A fentible phyfician will always know where difguile is neceffary; but it ought never to appear on the face of his general conduct.

The appearance of mystery in the conduct of phyficians not only renders their art fuspicious, but lays the foundations of Quackery, which is the disgrace of Medicine. No two characters can be more different than that of the honeft phyfician and the quack; yet they have generally been very much confounded. The line between them is not fufficiently apparent; at least is too fine for the general eye. Few perfons are able to diffinguish fufficiently between the conduct of that man who administers a fecret medicine, and him who writes a prefcription in mystical characters and an unknown tongue. Thus the conduct of the honeft phyfician, which needs no difguife, gives a fanction to that of the villain, whole fole confequence depends upon fecrecy.

No laws will ever be able to prevent quackery, while people believe that the quack is as honeft a man, and as well qualified, as the phyfician. A very fmall degree of medical knowledge, however, would be fufficient to break this fpell; and nothing elle can effectually undeceive them. It is the ignorance and credulity of the multitude, with regard to medicine, which renders them fuch an eafy prey to every one who has the hardinefs to attack them on this quarter. Nor can the evil be remedied by any other means but by making them wifer.

The most effectual way to destroy quackery in any art or science, is to diffuse the knowledge of it among mankind. Did physicians write their preferiptions in the common language of the country, and explain their intentions to the patient, as far as he could understand them, it would enable him to

know

b 3

know when the medicine had the defired effects would infpire him with abfolute confidence in the phyfician; and would make him dread and deteft every man who pretended to cram a fecret medicine down his throat.

Men in the different flates of fociety, have very different views of the fame object. Some time ago it was the practice of this country for every perfon to fay his prayers in Latin, whether he knew any thing of that language or not. This conduct, though facred in the eyes of our anceftors, appears ridiculous enough to us; and doubtlefs fome parts of ours will feem as ftrange to pofterity. Among thefe we may reckon the prefent mode of medical prefcription, which, we venture to affirm, will fome time hence appear to have been completely ridiculous, and a very high burlefque upon the common fenfe of mankind.

But this practice is not only ridiculous, it is likewife dangerous. However capable phyficians may be of writing Latin, I am certain apothecaries are not always in a condition to read it, and that dangerous miftakes, in confequence of this, often happen. But fuppole the apothecary ever fo able to read the phyfician's prefcription, he is generally otherwife em-ployed, and the bulinefs of making up prefcriptions is left entirely to the apprentice. By this means the greatest man in the kingdom, even when he employs a first-rate physician, in reality trusts his life in the hands of an idle boy, who has not only the chance of being very ignorant, but likewife giddy and carelefs. Miftakes will fometimes happen in fpite of the greateft care; but, where human lives are concerned, all roffible methods ought certainly to be taken to prevent them. For this reason, the prescriptions of phyficians, inftead of being couched in myftical characters and a dead language, ought, in my humble opinion, to be conceived in the most plain and obvious terms imaginable.

Diffuling

xxii

Diffusing medical knowledge among the people would not only tend to improve the art and to banifh quackery, but likewite to render Medicine more univerfally uleful, by extending its benefits to fociety. However long Medicine may have been known as a fcience, we will venture to fay, that many of its moft important purpofes to fociety have either been overlooked, or very little attended to. The cure of difeafes is doubtlefs a matter of great importance; but the prefervation of health is of ftill greater. This is the concern of every man, and furely what relates to it ought to be rendered as plain and obvious to all as polfible. It is not to be supposed, that men can be fufficiently upon their guard against difeases, who are totally ignorant of their caufes. Neither can the Legislature, in whose power it is to do much more for preferving the public health than can ever be done by the Faculty, exert that power with propriety, and to the greatest advantage, without fome degree of medical knowledge.

Men of every occupation and condition in life might avail themfelves of a degree of medical knowledge; as it would teach them to avoid the dangers peculiar to their respective flations; which is always eafier than to remove their effects. Medical knowledge, inftead of being a check upon the enjoyments of life, only teaches men how to make the most of them. It has indeed been faid, that to live medically, is to live miferably: but it might with equal propriety be faid that to live rationally is to live miferably. If phyficians obtrude their own ridiculous whims upon mankind, or lay down rules inconfistent with reason or common fense, no doubt they will be despised. But this is not the fault of medicine. It proposes no rules that I know, but fuch as are perfectly confiftent with the true enjoyment of life, and every way

b 4

xxiii

way conducive to the real happiness of mankind.

We are forry indeed to observe, that Medicine has hitherto hardly been confidered as a popular fcience, but as a branch of knowledge folely confined to a particular fet of men, while all the reft have been taught not only to neglect, but even to dread and defpife it. It will however appear, upon a more firict examination, that no fcience better deferves their attention, or is more capable of being rendered generally uleful.

People are told, that if they dip the least into medical knowledge, it will render them fanciful, and make them believe they have every difeafe of which they read. This I am fatisfied will feldom be the cafe with fenfible people; and fuppofe it were, they must foon be undeceived. A fhort time will thew them their error, and a little more reading will infallibly correct it. A fingle inftance will fhew the abfurdity of this notion. A fenfible lady, rather than read a medical performance, which would inftruct her in the management of her children; generally leaves them entirely to the care and conduct of the most ignorant, credulous, and superstitious part of the human fpecies.

No part of medecine is of more general importance than that which relates to the nurfing and management of children. Yet few parents pay a proper attention to it. They leave the fole care of their tender offspring, at the very time when care and attention are most necessary, to hirelings, who are either too negligent to do their duty or too ignorant to know it. We will venture to affirm, that more human lives are loft by the careleffnefs and inattention of parents and nurfes, than are faved by the Faculty; and that the joint and well-conducted endeavours, both of private perfons

9

INTRODUCTION.

fons and the public, for the prefervation of infant lives, would be of more advantage to fociety than the whole art of Medicine, upon its prefent footing.

The benefits of Medicine, as a trade, will ever be confined to thole who are able to pay for them; and of courfe, the far greater part of mankind will be every where deprived of them. Phyficians, like other people, must live by their employment, and the poor must either want advice altogether, or take up with that which is worfe than none. There are not however any where wanting well-dilpoled people, of better fenfe, who are willing to fupply the defect of medical advice to the poor, did not their fear of doing ill often fupprefs their inclination to do good. Such people are often deterred from the most noble and praise-worthy actions, by the foolifh alarms founded in their ears by a fet of men who, to raife their own importance, magnify the difficulties of doing good, find fault with what is truely commendable, and fleer at every attempt to relieve the fick which is not conducted by the precife rules of Medicine. These gentlemen must however excuse me for faying, that I have often known fuch well-difposed perfons do much good; and that their practice, which is generally the refult of good fenfe and observation, allisted by a little medical reading, is frequently more rational than that of the ignorant retainer to physic, who defpifes both reafon and obfervation, that he may go wrong by rule; and who, while he is dofing his patient with medicines often neglects other things of far greater importance.

Many things are neceffary for the fick befides medicine. Nor is the perfon who takes care to produre thefe, for them, of les importance than a physician. The poor oftener perifh in difeases for want of proper nursing than of medicine. They a ... are

or with name to the to

xxvi

are frequently in want of even the neceffaries of life, and ftill more fo of what is proper for a fickbed. No one can imagine, who has not been a witnefs of thefe fituations, how much good a welldifposed perfon may do, by only taking care to have fuch wants fupplied. There certainly cannot be a more neceffary, a more noble, or a more godlike action, than to administer to the wants of our fellow-creatures in diffrefs. While virtue or religion are known among mankind, this conduct will be approved; and while Heaven is just it muft be rewarded!

Perfons who do not choose to administer medicine to the fick, may neverthelefs direct their regimen. An eminent medical author has faid, That by diet alone all the intentions of Medicine may be answered *. No doubt a great many of them may; but there are other things belide diet, which ought by no means to be neglected. Many hurtful and deftructive prejudices, with regard to the treatment of the fick, ftill prevail among the people, which perfons of better fenfe and learning alone can eradicate. To guard the poor against the influence of thefe prejudices, and to inftil into their minds fome just ideas of the importance of proper food, fresh air, cleanliness, and other pieces of regimen neceffary in difeafes, would be a work of great merit, and productive of many happy confequences. A proper regimen, in most difeafes, is at leaft equal to medicine, and in many of them it is greatly fuperior.

To affift the well-meant endeavours of the humane and benevolent in relieving diffrefs; to eradicate dangerous and hurtful prejudices; to guard the ignorant and credulous againft the frauds and impofitions of quacks and impoftors; and to fhew

* Arbuthnot.

men

INTRODUCTION.

men what is in their own power, both with regard to the prevention and cure of difeafes, are certainly objects worthy of the phyfician's attention. Thefe were the leading views in composing and publishing the following fheets. They were fuggefted by an attention to the conduct of mankind, with regard to Medicine, in the course of a pretty long practice in different parts of this island, during which the author has often had occasion to with that his patients, or those about them, had been poffeffed of fome fuch plain directory for regulating their conduct. How far he has fucceeded in his endeavours to fupply this deficiency, must be left to others to determine : but if they be found to contribute in any measure towards alleviating the calamities of mankind, he will think his labour very well bestowed.

XXVII

MANY who peruse the DOMESTIC MEDICINE have expressed a with that the catalogue of medicines contained in that book should be more extensive, and likewise that the dose of each article should be ascertained, as they are often at a loss to know how to administer even those medicines, the names of which they meet with in almost every medical author. To obviate this objection, and furniss a greater foope to those who may with to employ more articles than are contained in the Dispensatory annexed to the above work, the following Lift of Simples and Compounds, taken from the most improved Dispensatories, is now inferted.

To prevent militakes, the English name of every medicine is not only ufed, but the different articles are arranged according to the order of the English alphabet, and the smalless and largess dose placed opposite to each article. The doses indeed refer to adults, but may be adapted to different ages by attending to the rules laid down in the Introduction to the Appendix, p. 687. Short cautions are occasionally inferted under such articles as require to be used with care.

Though a greater variety of medicines is contained in this than in any former edition of the Domeftic Medicine, yet the Author would advife those who peruse ir, as far as possible, to adhere to fimplicity in practice. Diseases are not cured by the multiplicity of medicines, but by their proper application. A few fimples, judiciously adminiflered, and accompanied with a proper regimen, will do more good, than a farrago of medicines employed at random.

A LIST

[xxx]

A LIST of the MEDICINES commonly ufed in Practice, with their proper Dofes.

А

PART I.

OF THE

GENERAL CAUSES OF DISEASES.

CHAP. I.

OF CHILDREN.

HE better to trace difeafes from their original caufes, we shall take a view of the common treatment of mankind in the state of infancy. In this period of our lives, the foundations of a good or bad conflictution are generally laid; it is therefore of importance, that parents be well acquainted with the various caufes which may injure the health of their offspring.

It appears from the annual registers of the dead, that almost one half of the children born in Great Britain die under twelve years of age. To many, indeed, this may appear a natural evil; but on due examination, it will be found to be one of our own creating. Were the death of infants a natural evil, other animals would be as liable to die young as man; but this we find is by no means the cafe.

It may feem ftrange that man, notwithflanding his fuperior reafon, fhould fall fo far fhort of other animals in the management of his young: But our furprife will foon ceafe, if we confider that brutes, guided by inftinct, never err in this refpect; while man, trufting folely to art, is feldom right. Were a catalogue of those infants who perifh annually by

В

art

art alone exhibited to public view, it would aftonifh moft people.

If parents are above taking care of their children, others muft be employed for that purpole: thefe will always endeavour to recommend themfelves by the appearance of extraordinary fkill and addrefs. By this means fuch a number of unneceffary and deftructive articles have been introduced into the diet, clothing, &c. of infants, that it is no wonder fo many of them perifh.

Nothing can be more prepofterous than a mother who thinks it below her to take care of her own child, or who is fo ignorant as not to know what is proper to be done for it. If we fearch Nature throughout, we cannot find a parallel to this. Every other animal is the nurfe of its own offspring, and they thrive accordingly. Were the brutes to bring up their young by proxy, they would fhare the fame fate with those of the human species.

We mean not, however, to impofe it as a tafk, upon every mother to fuckle her own child. This, whatever fpeculative writers may allege, is in fome cafes impracticable, and would inevitably prove deftructive both to the mother and child. Women of delicate conflictutions, fubject to hyfteric fits, or other nervous affections, make very bad nurfes*: and thefe complaints are now fo common, that it is rare to find a woman of fashion free from them; fuch women, therefore, fuppofing them willing, are often unable to fuckle their own children.

Almost every mother would be in a condition to give fuck, did mankind live agreeably to Nature; but whoever confiders how far many mothers deviate from her dictates, will not be furprifed to find fome of them unable to perform that neceffary office. Mothers who do not eat a fufficient quantity of folid food, nor enjoy the benefit of free air and exercise,

* I have known an hyfteric woman kill her child, by being feized with a fit in the night.

can neither have wholefome juices themfelves, nor afford proper nourifhment to an infant. Hence children who are fuckled by delicate women, either die young, or continue weak and fickly all their lives.

When we fay that mothers are not always in a condition to fuckle their own children, we would not be underftood as difcouraging that practice. Every mother who can, ought certainly to perform fo tender and agreeable an office *. But fuppole it to be out of her power, fhe may, neverthelefs, be of great fervice to her child. The bufinefs of nurfing is by no means confined to giving fuck. To a woman who abounds with milk, this is the eafieft part of it. Numberlefs other offices are neceffary for a child, which the mother ought at leaft to fee done.

A mother who abandons the fruit of her womb, as foon as it is born, to the fole care of an hireling, hardly deferves that name. A child, by being brought up under the mother's eye, not only fecures her affection, but may reap all the advantages of a parent's care, though it be fuckled by another. How can a mother be better employed than in fuperintending the nurfery? This is at once the most delightful and important office; yet the most trivial bufinefs or infipid amufements are often preferred to it ! A ftrong proof both of the bad tafte and wrong education of modern females.

* Many advantages would arife to fociety, as well as to individuals, from mothers fuckling their own children. It would prevent the temptation which poor women are laid under of abandoning their children to fuckle thofe of the rich for the fake of gain ; by which means fociety lofes many of its moft ufcful members, and mothers become in fome fenfe the murderers of their own offspring. I am fure I fpeak within the truth when I fay, that not one in twenty of thofe children live, who are thus abandoned by their mothers. For this reafon no mother fhould be allowed to fuckle another's child, till her own is either dead, or fit to be weaned. A regulation of this kind would fave many lives among the poorer fort, and could do no hurt to the rich, as moft women who make good nurfes are able to fuckle two children in fucceffion upon the fame milk.

It

3

B 2

It is indeed to be regretted, that more care is not bestowed in teaching the proper management of children to those whom Nature has defigned for mothers. This, inflead of being made the principal, is feldom confidered as any part of female education. Is it any wonder, when females fo educated come to be mothers, that they should be quite ignorant of the duties belonging to that character? However strange it may appear, it is certainly true, that many mothers, and those of fashion too, are as ignorant, when they have brought a child into the world, of what is to be done for it, as the infant itfelf. Indeed, the most ignorant of the fex are generally reckoned most knowing in the bulinels of nurfing. Hence, fenfible people become the dupes of ignorance and fuperflition; and the nurfing of children, inftead of being conducted by reafon, is the refult of whim and caprice *.

Were the time that is generally fpent by females in the acquifition of trifling accomplifhments, employed in learning how to bring up their children; how to drefs them fo as not to hurt, cramp, or confine their motions; how to feed them with wholefome and nourifhing food; how to exercife their tender bodies, fo as beft to promote their growth and ftrength : were thefe made the objects of female inftruction, mankind would derive the greateft advantages from it. But while the education of females implies little more than what relates to drefs and public fhew, we have nothing to expect from them but ignorance even in the molt important concerns.

* Tacitus, the celebrated Roman hiftorian, complains greatly of the degeneracy of the Roman ladies in his time, with regard to the care of their offspring. He fays that, in former times, the greatefl women in Rome of d to account it their chief glory to keep the houfe and attend their children; but that now the young infant was committed to the fole care of fome poor Grecian wench, or other menial fervant.—We are afaid, wherever luxury and effeminney prevail, there will be too much ground for this complaint. Did

4

Did mothers reflect on their own importance, and lay it to heart, they would embrace every opportunity of informing themselves of the duties which they owe to their infant offspring. It is their province, not only to form the body, but also to give the mind its most early bias. They have it very much in their power to make men healthy or valetudinary, ufeful in life, or the pefts of fociety.

But the mother is not the only perfon concerned in the management of children. The father has an equal intereft in their welfare, and ought to affift in every thing that respects either the improvement of the body or mind.

It is pity that the men fhould be fo inattentive to this matter. Their negligence is one reafon why females know fo little of it. Women will ever be defirous to excel in fuch accomplifhments as recommend them to the other fex. But men generally keep at fuch a diftance from even the fmalleft acquaintance with the affairs of the nurfery, that many would reckon it an affront, were they supposed to know any thing of them. Not fo, however, with the kennel or the ftables :' a gentleman of the first rank is not ashamed to give directions concerning the management of his dogs or norfes, yet would blufh were he furprifed in performing the fame office for that being who derived its existence from himself, who is the heir of his fortunes, and the future hope of his country.

Nor have phyficians themfelves been fufficiently attentive to the management of children : this has been generally confidered as the fole province of old women, while men of the first character in physic have refused to visit infants even when sick. Such conduct in the faculty has not only caufed this branch of medicine to be neglected, but has also encouraged the other fex to affume an abfolute title to prefcribe for children in the most dangerous difeases. The B 3 con-

confequence is, that a phyfician is feldom called till the good women have exhaufted all their fkill; when his attendance can only ferve to divide the blame, and appeale the difconfolate parents.

Nurfes fhould do all in their power to prevent difeafes; but when a child is taken ill, fome perfon of fkill ought immediately to be confulted. The difeafes of children are generally acute, and the leaft delay is dangerous.

Were phyficians more attentive to the difeafes of infants, they would not only be better qualified to treat them properly when fick, but likewife to give uleful directions for their management when well. The difeafes of children are by no means fo difficult to be underflood as many imagine. It is true, children cannot tell their complaints ; but the caufes of them may be pretty certainly difcovered by obferving the fymptoms, and putting proper queftions to the nurfes. Befides, the difeafes of infants being lefs complicated, are eafier cured than thofe of adults*.

It is really aftonifhing, that fo little attention fhould in general be paid to the prefervation of infants. What labour and expence are daily beftowed to prop an old tottering carcafe for a few years, while thoufands of thofe who might be ufeful in life, perifh without being regarded ! Mankind are too apt to value things according to their prefent, not their future, ufefulnefs. Though this is of all others the moft erroneous method of effimation; yet upon no other principle is it poffible to account for the general indifference with refpect to the death of infants.

* The common opinion, that the difeafes of infants are hard to difeover and difficult to cure, has deterred many phyficians from paying that attention to them which they deferve. I can, however, from experience declare, that this opinion is without foundation; and that the difeafes of infants are neither fo difficult to diffeover, nor fo ill to cure, as those of adults.

Qf

OF CHILDREN.

Of Difeased Parents.

One great fource of the difeafes of children is, the UNHEALTHINESS OF PARENTS. It would be as reafonable to expect a rich crop from a barren foil, as that ftrong and healthy children fhould be born of parents whofe conftitutions have been worn out with intemperance or difeafe.

An ingenious writer * obferves, that on the conflitution of mothers depends originally that of their offspring. No one who believes this, will be furprifed, on a view of the female world, to find difeafes and death fo frequent among children. A delicate female, brought up within doors, an utter firanger to exercife and open air, who lives on tea and other flops, may bring a child into the world, but it will hardly be fit to live. The first blaft of difeafe will nip the tender plant in the bud: or, fhould it flruggle through a few years exiftence, its feeble frame, flaken with convultions from every trivial caufe, will be unable to perform the common functions of life, and prove a burden to fociety.

If to the delicacy of mothers, we add the irregular lives of fathers, we shall fee further cause to believe that children are often hurt by the conflictation of their parents. A fickly frame may be originally induced by hardships or intemperance, but chiefly by the latter. It is impossible that a course of vice should not so the best conflictation : and, did the evil terminate here, it would be a just punishment for the folly of the fufferer; but when once a diffuse is contracted and riveted in the habit, it is entailed on polterity. What a dreadful inheritance is the gout, the foury, or the king's evil to transmit to our offspring! how happy had it been for the heir of many a great effate, had he been born a beggar, rather than to in-

* Rouffeau,

B 4

herit

herit his father's fortunes at the expence of inheriting his difeafes !

A perfon labouring under any incurable malady ought not to marry. He thereby not only flortens his own life, but transmits milery to others: but when both parties are deeply tainted with the forophula, the fourvy, or the like, the effects must be fill worfe. If fuch have any iffue, they must be milerable indeed. Want of attention to these things, in forming connections for life, has toored out more families than plague, famine, or the fword; and as long as these connections are formed from mercenary views, the evil will be continued *.

In our matrimonial contracts, it is amazing fo little regard is had to the health and form of the object. Our fportfmen know that the generous courfer cannot be bred out of the foundered jade, nor the fagacious fpaniel out of the fnarling cur. This is fettled upon immutable laws. The man who marries a woman of a fickly confitution, and defeended of unhealthy parents, whatever his views may be, cannot be faid to act a prudent part. A difeafed woman may prove fertile; fnould this be the cafe, the family muft become an infirmary: what profpect of happinefs the father of fuch a family has, we fhall leave any one to judge +.

Such children as have the misfortune to be born of difeated parents, will require to be nurfed with greater care than others. This is the only way to

* The Lacedemonians condemned their king Archidamus for having married a weak, puny woman; becaufe, faid they, inflead of propagating a race of herces, you will fill the throne with a progeny of changelings.

+ The Jews, by their laws, were, in certain cafes, forbid to have any manner of commerce with the difeafed; and indeed to this all wife legiflators ought to have a fpecial regard. In fone countries, difeafed perfons have actually been forbid to marry. This is an evil of a complicated kind, a natural deformity, and political mifchief; and therefore requires a public confideration.

make

make amends for the defects of confliction; and it will often go a great length. A healthy nurfe, wholefome air, and fufficient exercife, will do wonders. But when thefe are neglected, little is to be expected from any other quarter. The defects of confliction cannot be fupplied by medicine.

Those who inherit any family difease ought to be very circumspect in their manner of living. They should confider well the nature of such difease, and guard against it by a proper regimen. It is certain, that family difeases have often, by proper care, been kept off tor one generation; and there is reason to believe, that, by perfisting in the fame course, fuch difeases might at length be wholly eradicated. This is a subject very little regarded, though of the greatest importance. Family constitutions are as capable of improvement as family effates; and the libertine, who impairs the one, does greater injury to his posterity, than the prodigal who fquanders away the other.

Of the clothing of Children.

The clothing of an infant is fo fimple a matter, that it is furprifing how any perion fhould err in it; yet many children lole their lives, and others are deformed, by inattention to this article.

Nature knows no use of clothes to an infant, but to keep it warm. All that is neceffary for this purpole, is to wrap it in a foft loose covering. Were a mother left to the dictates of Nature alone, fhe would certainly pursue this course. But the business of dreffing an infant has long been out of the hands of mothers, and has at last become a fecret which none but adepts pretend to understand.

From the most early ages it has been thought neceffary, that a woman in labour should have some person to attend her. This in time became a business:

nefs; and, as in all others, those who were employed in it ftrove to outdo one another in the different branches of their profession. The dreffing of a child came of course to be confidered as the midwife's province, who no doubt imagined, that the more dexterity fhe could fhew in this article, the more her skill would be admired. Her attempts were feconded by the vanity of parents, who, too often defirous of making a flew of the infant as foon as it was born, were ambitious to have as much finery heaped upon it as poffible. Thus it came to be thought as necelfary for a midwife to excel in bracing and dreffing an infant, as for a furgeon to be expert in applying bandages to a broken limb; and the poor child, as foon as it came into the world, had as many rollers. and wrappers applied to its body, as if every bone had been fractured in the birth ; while these were often fo tight, as not only to gall and wound its tender frame, but even to obstruct the motion of the heart, lungs, and other organs neceffary for life.

In most parts of Britain, the practice of rolling children with fo many bandages is now, in fome meafure, laid alide; but it would still be a difficult task to perfuade the generality of mankind, that the fhape of an infant does not entirely depend on the care of the midwife. So far, however, are all her endeavours to mend the fhape from being fuccefsful, that they conftantly operate the contrary way, and mankind become deformed in proportion to the means ufed to prevent it. How little deformity of body is to be found among uncivilized nations? So little indeed, that it is vulgarly believed they put all their deformed children to death. The truth is, they hardly know fuch a thing as a deformed child. Neither should we, if we followed their example. Savage nations never think of manacling their children. They allow them the full use of every organ, carry them abroad in the open air, wash their bodies daily daily in cold water, &c. By this management, their children become fo ftrong and hardy, that by the time our puny infants get out of the nurfe's arms, theirs are able to fhift for themfelves *.

Among brute animals, no art is neceffary to procure a fine fhape. Though many of them are extremely delicate when they come into the world, yet we never find them grow crooked for want of fwaddling bands. Is Nature lefs generous to the human kind? No: but we take the bufinefs out of Nature's hands.

Not only the analogy of other animals, but the very feelings of infants tell us, they ought to be kept eafy and free from all preffure. They cannot indeed tell their complaints; but they can fhew figns of pain; and this they never fail to do, by crying when hurt by their clothes. No fooner are they freed from their bracings, than they feem pleafed and happy: yet, ftrange infatuation 1 the moment they hold their peace, they are again committed to their chains.

If we confider the body of an infant as a bundle of foft pipes, replenished with fluids in continual motion, the danger of preffure will appear in the ftrongeft light. Nature, in order to make way for the growth of children, has formed their bodies foft and flexible; and left they should receive any injury from preffure in the womb, has furrounded the *fatus* every where with fluids. This shews the care which Nature takes to prevent all unequal preffure on the bodies of infants, and to defend them against every thing that might in the least cramp or confine their motions.

* A friend of mine, who was feveral years on the coaft of Africa, tells me, that the natives neither put any clothes upon their children, nor apply to their bodies bandages of any kind, but lay them on a pallet, and fuffer them to tumble about at pleafure; yet they are all ftrait, and feldom have any difeafe.

Even

Even the bones of an infant are fo foft and cartilaginous, that they readily yield to the flighteft preffure, and eafily affume a bad fhape, which can never after be remedied. Hence it is, that fo many people appear with high fhoulders, crooked fpines, and flat breafts, who were as well proportioned at their births as others, but had the misfortune to be fqueezed out of fhape by the application of flays and bandages.

Preffure, by obfructing the circulation, likewife prevents the equal diffribution of nourifhment to the different parts of the body, by which means the growth becomes unequal. One part grows too large, while another remains too fmall; and thus in time the whole frame becomes difproportioned and mifhapen. To this we muft add, that when a child is cramped in its clothes, it naturally fhrinks from the part that is hurt; and, by putting its body into unnatural poffures, it becomes deformed by habit.

Deformity of body may indeed proceed from weaknefs or difeafe; but in general, it is the effect of improper clothing. Nine-tenths, at leaft, of the deformity among mankind, muft be imputed to this caufe. A deformed body is not only difagreeable to the eye, but by a bad figure both the animal and vital functions muft be impeded, and of courfe health impaired. Hence few people remarkably mifhapen are ftrong or healthy.

The new motions which commence at the birth, as the circulation of the whole mais of blood through the lungs, refpiration, the periftaltic motion, Ge. afford another ftrong argument for keeping the body of an infant free from all preffure. These organs, not having been accustomed to move, are easily stopped; but when this happens, death must ensue. Hardly any method could be devided more effectually to stop these motions, than bracing the body too tight with rollers rollers * and bandages. Were these to be applied in the fame manner to the body of an adult for an equal length of time, they would hardly fail to hurt the digestion and make him fick. How much more hurtful they muss prove to the tender bodies of infants, we shall leave any one to judge.

Whoever confiders thefe things will not be furprifed, that fo many children die of convultions foon after the birth. Thefe fits are generally attributed to fome inward caufe; but in fact they oftener proceed from our own imprudent conduct. I have known a child feized with convultion-fits foon after the midwife had done fwaddling it, who, upon taking off the rollers and bandages, was immediately relieved, and never had the difeafe afterwards. Numerous examples of this might be given, were they neceffary.

It would be fafer to faften the clothes of an infant with ftrings than pins, as these often gall and irritate their tender skins, and occasion diforders. Pins have been found sticking above half an inch into the body of a child, after it had died of convulsion-fits, which in all probability proceeded from that cause.

Children are not only hurt by the tightnefs of their clothes, but allo by the quantity. Every child has fome degree of fever after the birth; and if it be loaded with too many clothes, the fever muft be increafed. But this is not all; the child is generally laid in bed with the mother, who is often likewife feverift; to which we may add the heat of the bedchamber, the wines, and other heating things, too frequently given to children immediately after the birth. When all thefe are combined, which does not feldom happen, they muft increafe the fever to fuch a degree as will endanger the life of the infant.

* This is by no means inveighing against a thing that does not happen. In many parts of Britain at this day, a roller, eight or ten feet in length, is applied tightly round the child's body as foon as it is born.

The

The danger of keeping infants too hot will further appear, if we confider that, after they have been for fome time in the fituation mentioned above, they are often fent into the country to be nurfed in a cold houfe. Is it any wonder, if a child, from fuch a transition, catches a mortal cold, or contracts fome other fatal difeafe? When an infant is kept too hot, its lungs, not being fufficiently expanded, are apt to remain weak and flaccid for life; hence proceed coughs, confumptions, and other difeafes of the breaft.

It would answer little purpose to specify the particular species of dress proper for an infant. These will always vary in different countries, according to custom and the humour of parents. The great rule to be observed is, *That a child have no more clothes than are necessary to keep it warm, and that they be quite easy* for its body.

Stays are the very bane of infants. A volume would not fuffice to point out all the bad effects of this ridiculous piece of drefs both on children and adults. The madnefs in favour of ftays feems, however, to be fomewhat abated; and it is to be hoped the world will, in time, become wife enough to know. that the human fhape does not folely depend upon whale-bone and bend leather *.

I fhall only add with refpect to the clothes of children, that they ought to be kept thoroughly clean. Children perfpire more than adults; and if their clothes be not frequently changed, they become very

* Stays made of bend-leather are worn by all the women of lower flation in many parts of England.

I am forry to understand, that there are shill mothers mad enough to lace their daughters very tight in order to improve their shape. As reafoning would be totally lost upon fuch people, I shall beg leave just to ask them, Why there are ten deformed women for one man? and likewise to recommend to their perusal a short moral precept, which forbids us to deform the human lody.

hurtful.

3

hurtful. Dirty clothes not only gall and fret the tender fkins of infants, but likewife occafion ill finells; and, what is worfe, tend to produce vermin and cutaneous difeafes.

Cleanlinefs is not only agreeable to the eye, but tends greatly to preferve the health of children. It promotes the perfpiration, and, by that means, frees the body from fuperfluous humours, which, if retained, could not fail to occafion difeafes. No mother or nurfe can have any excufe for allowing a child to be dirty. Poverty may oblige her to give it coarfe clothes; but if fhe does not keep them clean, it muft be her own fault.

Of the Food of Children.

Nature not only points out the food proper for an infant, but actually prepares it. This, however, is not fufficient to prevent fome who think themfelves wifer than Nature, from attempting to bring up their children without her provifion. Nothing can fhew the difpolition which mankind have to depart from Nature more than their endeavouring to bring up children without the breaft. The mother's milk, or that of a healthy nurfe, is unqueftionably the beft food for an infant. Neither art nor nature can afford a proper fubfitute for it. Children may feem to thrive for a few months without the breaft; but when teething, the fmall-pox, and other difeafes incident to childhood, come on, they generally perifh.

A child, foon after the birth, fhews an inclination to fuck; and there is no reafon why it fhould not be gratified. It is true, the mother's milk does not always come immediately after the birth; but this is the way to bring it: befides, the first milk that the child can fqueeze out of the breast answers the purpose of cleansing, better than all the drugs in the apothecary's shop, and at the fame time prevents 16

vents inflammations of the breaft, fevers, and other difeases incident to mothers.

It is ftrange how people came to think that the fift thing given to a child fhould be drugs. This is beginning with medicine by times, and no wonder if they generally end with it. It fometimes happens, indeed, that a child does not discharge the meconium to foon as could be withed; this has induced phyficians, in tuch cates, to give fon ething of an opening nature to cleanfe the first passages. Midwifes have improved upon this hint, and never fail to give tyrups, oils, &c. whether they be neceffary or not. Cramming an infant with fuch indigeftible ftuff as foon as it is born, can hardly fail to make it fick, and is more likely to occafion difeafes than to prevent them. Children are feldom long after the birth without having paffage both by ftool and urine; though these evacuations may be wanting for fome time without any danger. But if children must have fomething before they be allowed the breaft, let it be a little thin water pap, to which may be added an equal quantity of new milk; or rather water alone, with the addition of a little raw fugar. If this be given without any wines or fpiceries, it will neither heat the blood, load the ftomach, nor occafion gripes.

Upon the first fight of an infant, almost every perfon is ftruck with the idea of its being weak, feeble, and wanting fupport. This naturally fuggefts the need of cordials. Accordingly wines are univerfally mixed with the fift food of children. Nothing can be more fallacious than this way of reafoning, or more huriful to infants than the conduct founded upon it. Children require very little food for fome time after the birth, and what they receive should be thin, weak, light, and of a cooling quality. A very fmall quantity of wine is fufficient to heat and inflame the blood of an infant; but every perfon

perfon converfant in these matters mult know, that most of the diseases of infants proceed from the heat of their humours.

If the mother or nurfe has enough of milk, the child will need little or no other food before the third or fourth month. It will then be proper to give it, onte or twice a day, a little of fome food that is eafy of digeftion, as water-pap, milk-pottage, weak broth with bread in it, and fuch like. This will eafe the mother, will accuftom the child by degrees to take food, and will render the weaning both lefs difficult and lefs dangerous. All great and fudden transitions are to be avoided in nurfing. For this purpofe, the food of children ought not only to be fimple, but to refemble, as nearly as poffible, the properties of milk. Indeed milk itfelf fhould make a principal part of their food, not only before they are weaned, but for fome time after.

Next to milk, we would recommend good light bread. Bread may be given to a child as foon as it fhews an inclination to chew; and it may at all times be allowed as much plain bread as it will eat. The very chewing of bread will promote the cutting of the teeth, and the difcharge of faliva, while, by mixing with the nurfe's milk in the ftomach, it will afford an excellent nourishment. Children discover an early inclination to chew whatever is put into their hands. Parents obferve the inclination, but generally miltake the object. Inftead of giving the child fomething which may at once exercise its gums and afford it nourifhment, they commonly put into its hands a piece of hard metal, or impenetrable coral. A cruft of bread is the beft gum-flick. It not only answers the purpose better than any thing else, but has the additional properties of nourifhing the child and carrying the faliva down to the ftomach, which is too valuable a liquor to be loft.

C

Bread,

Bread, befides being ufed dry, may be many ways prepared into food for children. One of the beft methods is to boil it in water, afterwards pouring the water off, and mixing with the bread a proper quantity of new milk unboiled. Milk is both more wholefome and nourifhing this way than boiled, and is lefs apt to occafion coftivenefs. For a child farther advanced, bread may be mixed in veal or chicken broth, made into puddings, or the like. Bread is a proper food for children at all times, provided it be plain, made of wholefome grain, and well fermented; but when enriched with fruits, fugars, or fuch things, it becomes very unwholefome.

It is foon enough to allow children animal food when they have got teeth to eat it. They fhould never tafte it till after they are weaned, and even then they ought to ufe it fparingly. Indeed, when children live wholly on vegetable food, it is apt to four on their ftomachs; but, on the other hand, too much fielh heats the body and occafions fevers and other inflammatory difeafes. This plainly points out a due mixture of animal and vegetable food as moft proper for children.

Few things prove more hurtful to infants than the common method of fweetening their food. It entices them to take more than they ought to do, which makes them grow fat and bloated. It is pretty certain, if the food of children were quite plain, that they would never take more than enough. Their exceffes are entirely owing to nurfes. If a child be gorged with food at all hours, and enticed to take it, by making it fweet and agreeable to the palate, is it any wonder that fuch a child fhould in time be induced to crave more food than it ought to have?

Children may be hurt by too little as well as too much food. After a child is weaned, it ought to be fed four or five times a-day; but fhould never be accuftomed to eat in the night; neither fhould it have

t00

too much at a time. Children thrive beft with fmall quantities of food frequently given. This neither overloads the ftomach nor hurts the digeftion, and is certainly most agreeable to nature.

Writers on nurfing have inveighed with fuch vehemence againft giving children too much food, that many parents, by endeavouring to fhun that error, have run into the oppofite extreme, and ruined the conflitutions of their children. But the error of pinching children in their food is more hurtful than the other extreme. Nature has many ways of relieving herfelf when overcharged; but a child, who is pinched with hunger, will never become a ftrong or healthy man. That errors are frequently committed on both fides, we are ready to acknowledge; but where one child is hurt by the quantity of its food, ten fuffer from the quality. This is the principal evil, and claims our ftricteft attention.

Many people imagine, that the food which they themfelves love cannot be bad for their children: but this notion is very abfurd. In the more advanced periods of life we often acquire an inclination for food₂ which when children we could not endure. Befides, there are many things that by habit may agree very well with the flomach of a grown perfon, which would be hurtful to a child: as high-feafoned, falted, and fmoke-dried provifions, &c. It would alfo be improper to feed children with fat meat, ftrong broths, rich foups, or the like.

All ftrong liquors are hurtful to children. Some parents teach their children to guzzle ale, and other fermented liquors, at every meal. Such a practice cannot fail to do mifchief. Thefe children feldom efcape the violence of the finall-pox, meafles, hooping cough, or fome inflammatory diforder. Milk, water, butter-milk, or whey, are the most proper for children to drink. If they have any thing ftronger, it may be fine fmall beer, or a little wine mixed with water. C 2 The ftomachs of children can digeft well enough without the affiftance of warm ftimulants: befides, being naturally hot, they are eafily hurt by every thing of a heating quality.

Few things are more hurtful to children than unripe fruits. They weaken the powers of digeftion, and four and relax the ftomach, by which means it becomes a proper neft for infects. Children indeed fhew a great inclination for fruit, and I am apt to believe, that if good ripe fruit were allowed them in proper quantity, it would have no bad effects. We never find a natural inclination wrong, if properly regulated. Fruits are generally of a cooling nature, and correct the heat and acrimony of the humours. This is what most children require; only care fhould be taken left they exceed. Indeed the beft way to prevent children from going to excess in the ufe of fruit, or eating that which is bad, is to allow them a proper quantity of what is good *.

Roots which contain a crude vifcid juice fhould be fparingly given to children. They fill the body with grofs humours, and tend to produce eruptive difeafes. This caution is peculiarly neceffary for the poor; glad to obtain at a fmall price what will fill the bellies of their children, they ftuff them two or three times a day with crude vegetables. Children had better eat a fmaller quantity of food which yields a wholefome nourifhment, than be crammed with what their digeftive powers are unable properly to affimilate.

* Children are always fickly in the fruit feafon, which may be thus accounted for: Two-thirds of the fruit which comes to market in this country is really unripe; and children not being in a condition to judge for themfelves, eat whatever they can lay their hands upon, which often proves little better than a poifon to their tender bowels. Servants, and others who have the care of children, fhould be firictly forbid to give them any fruit without the knowledge of their parents.

Butter

20

Butter ought likewife to be fparingly given to children. It both relaxes the ftomach, and produces grofs humours. Indeed, most things that are fat or oily, have this effect. Butter when falted, becomes still more hurtful. Inftead of butter, fo liberally given to children in most parts of Britain, we would recommend honey. Children who eat honey are feldom troubled with worms : they are also less subject to cutaneous difeases, as itch, scabbed head, &c.

Many people err in thinking that the diet of children ought to be altogether moift. When children live entirely upon flops, it relaxes their folids, renders them weak, and disposes them to the rickets, the scrophula, and other glandular diforders. Relaxation is one of the most general causes of the difeafes of children. Every thing therefore which tends to unbrace their folids, ought to be carefully avoided.

We would not be underflood by these observations as confining children to any particular kind of food. Their diet may be frequently varied, provided always that fufficient regard be had to fimplicity.

Of the Exercise of Children.

Of all the caufes which confpire to render the life of man fhort and miferable, none has greater influence than the want of proper EXERCISE : healthy parents, wholefome food, and proper clothing, will avail little, where exercife is neglected. Sufficient exercife will make up for feveral defects in nurfing; but nothing can fupply the want of it. It is abfolutely neceffary to the health, the growth, and the ftrength of children.

The defire of exercise is coeval with life itself. Were this principle attended to, many difeafes might be prevented. But, while indolence and fedentary employments prevent two-thirds of mankind from either taking fufficient exercise themselves, or giving it to their children, what have we to expect but difeafes eafes and deformity among their offspring? The rickets, fo deftructive to children, never appeared in Britain till manufactures began to flourith, and people, attracted by the love of gain, left the country to follow fedentary employments in great towns. It is amongft these people that this difease chiefly prevails, and not only deforms but kills many of their offspring.

The conduct of other young animals fhews the propriety of giving exercise to children. Every other animal makes use of its organs of motion as soon as it can, and many of them, even when under no neceffity of moving in quest of food, cannot be reftrained without force. This is evidently the case with the case of the lamb, and most other young animals. If these creatures were not permitted to frisk about and take exercise, they would foon die or become difeased. The fame inclination appears very early in the human species; but as they are not able to take exercise themselves, it is the business of their parents and nurses to affift them.

Children may be exercifed various ways. The beft method, while they are light, is to carry them about it the nurfe's arms *. This gives the nurfe an opportunity of talking to the child, and of pointing out every thing that may pleafe and delight its fancy. Befides, it is much fafer than fwinging an infant in a machine, or leaving it to the care of fuch as are not fit to take care of themfelves. Nothing can be more abfurd than to fet one child to keep another; this conduct has proved fatal to many infants, and has rendered others miferable for life.

When children begin to walk, the fafeft and beft method of leading them about, is by the hands. The

* The nurfe ought to be careful to keep the child in a proper pofition; as deformity is often the confequence of inattention to this circumflance. Its fituation ought also to be frequently changed. I have known a child's legs bent all on one fide, by the purfe carrying it conftantly on one arm.

common way, of fwinging them in leading ftrings, fixed to their backs, has feveral bad confequences. It makes them throw their bodies forward, and prefs with their whole weight upon the ftomach and breaft; by this means the breathing is obstructed, the breast flattened, and the bowels compressed; which must hurt the digeftion, and occasion confumptions of the lungs, and other difeafes.

It is a common notion, that if children are fet upon their feet too foon, their legs will become crooked. There is reafon to believe, that the very reverse of this is true. Every member acquires ftrength in proportion as it is exercifed. The limbs of children are weak indeed, but their bodies are proportionally light; and had they skill to direct themselves, they would foon be able to fupport their own weight. Whoever heard of any other animal that became crooked by using its legs too foon? Indeed, if a child is not permitted to make any use of its legs till a confiderable. time after the birth, and be then fet upon them with its whole weight at once, there may be fome danger; but this proceeds entirely from the child's not having been accultomed to ule its legs from the beginning.

Mothers of the poorer fort think they are great gainers by making their children lie or fit while they themfelves work. In this they are greatly miftaken. By neglecting to give their children exercife, they are obliged to keep them a long time before they can do any thing for themfelves, and to fpend more on medicine than would have paid for proper care.

To take care of their children, is the most useful bufinefs in which even the poor can be employed: but alas ! it is not always in their power. Poverty often obliges them to neglect their offspring in order to procure the necessaries of life. When this is the cafe, it becomes the interest as well as the duty of the public to affift them. Ten thousand times

C 4 24

times more benefit would acrue to the State, by enabling the poor to bring up their own children, than from all the hofpitals * that ever can be erected for that purpofe.

Whoever confiders the ftructure of the human body will foon be convinced of the neceffity of exercife for the health of children. The body is compoled of an infinite number of tubes, whole fluids cannot be pushed on without the action and preffure of the muscles. But, if the fluids remain inactive, obstructions must happen, and the humours will of course be vitiated, which cannot fail to occasion difeafes. Nature has furnished both the veffels which carry the blood and lymph with numerous valves, in order that the action of every mufcle might push forward their contents; but without action, this admirable contrivance can have no effect. This part of the animal economy proves to a demonstration the necessity of exercise for the prefervation of health.

Arguments to fhew the importance of exercife might be drawn from every part of the animal ecconomy; without exercise, the circulation of the blood cannot be properly carried on, nor the different fecretions duly performed; without exercise, the fluids cannot be properly prepared, nor the folids rendered ftrong or firm. The action of the heart, the motion of the lungs, and all the vital functions are greatly affilted by exercise. But to point out the

* If it were made the intercft of the poor to keep their children alive, we should lofe very few of them. A final premium given annually to each poor family, for every child they have alive at the year's end, would fave more infant lives than if the whole revenue of the crown were expended on hofpitals for this purpole. This would make the poor effeem fertility a blefling; whereas many of them think it the greateft curfe that can befal them; and in place of withing their children to live, fo far does poverty get the better of natural affection, that they are often very happy when they die.

manner

manner in which these effects are produced, would lead us further into the æconomy of the human body, than most of those for whom this treatise is intended would be able to follow. We shall therefore only add, that, where exercise is neglected, none of the animal functions can be duly performed; and when that is the case, the whole constitution must go to wreck.

A good conftitution ought certainly to be our first object in the management of children. It lays a foundation for their being useful and happy in life: and whoever neglects it, not only fails in his duty to his offspring, but to fociety.

One very common error of parents, by which they hurt the conflitutions of their children, is the fending them too young to fehool. This is often done folely to prevent trouble. When the child is at fehool, he needs no keeper. Thus the fehoolmafter is made the nurfe; and the poor child is fixed to a feat feven or eight hours a day, which time ought to be fpent in exercise and diversions. Sitting fo long cannot fail to produce the worft effects upon the body; nor is the mind lefs injured. Early application weakens the faculties, and often fixes in the mind an aversion to books, which continues for life *.

But, fuppose this were the way to make children fcholars, it certainly ought not to be done at the expence of their conflictations. Our ancestors, who feldom went to school very young, were not less learned than we. But we imagine the boy's education will be

* It is undoubtedly the duty of parents to inftruct their children, at leaft till they are of an age proper to take fome care of themfelves. This would tend much to confirm the ties of parental tendernefs and filial affection, of the want of which there are at prefent fo many deplorable inftances. Though few fathers have time to inftruct their children, yet moft mothers have; and furly they cannot be better employed.

quite

quite marred, unless he be carried to school in his nurse's arms. No wonder if such hot-bed plants feldom become either scholars or men!

Not only the confinement of children in public fchools, but their number, often proves hurtful. Children are much injured by being kept in crowds within doors; their breathing not only renders the place unwholefome, but if any one of them happens to be difeafed, the reft catch the infection. A fingle child has been often known to communicate the bloody flux, the hooping-cough, the itch, or other difeafes, to almost every individual in a numerous fchool.

But, if fashion must prevail, and infants are to be fent to fchool, we would recommend it to teachers, as they value the interests of fociety, not to confine them too long at a time, but allow them to run about and play at fuch active diversions as may promote their growth, and strengthen their constitutions. Were boys, instead of being whipped for stealing an hour to run, ride, fwim; or the like, encouraged to employ a proper part of their time in these manly and useful exercises, it would have many excellent effects.

It would be of great fervice to boys, if, at a proper age, they were taught the military exercife. This would increase their ftrength, infpire them with courage, and when their country called for their affistance, would enable them to act in her defence, without being obliged to undergo a tedious and troublefome course of inftructions, at a time when they are less fit to learn new motions, geftures, &cc.*

* I am happy to find that the mafters of academics now begin to put in practice this advice. Each of them ought to keep a drill ferjeant for teaching the boys the military exercite. This, befides contributing to their health and vigour of body, would have many other happy effects. An effeminate education will infallibly fpoil the beft natural conftitution; and if boys are brought up in a more delicate manner than even girls ought to be, they will never be men.

Nor is the common education of girls lefs hurtful to the conftitution than that of boys. Mifs is fet down to her frame before she can put on her clothes; and is taught to believe, that to excel at the needle is the only thing that can entitle her to general efteem. It is unneceffary here to infift upon the dangerous confequences of obliging girls to fit too much. They are pretty well known, and are too often felt at a certain time of life. But fuppoling this critical period to be got over, greater dangers still await them when they come to be mothers. Women who have been early accustomed to a fedentary life, generally run great hazard in childbed; while those who have been used to romp about, and take fufficient exercife, are feldom in any danger.

One hardly meets with a girl who can at the fame time boaft of early performances by the needle, and a good conflitution. Clofe and early confinement generally occafions indigeftions, head-achs, pale complexions, pain of the ftomach, lofs of appetite, coughs, confumptions of the lungs, and deformity of body. -The laft of thefe indeed is not to be wondered at, confidering the awkward poftures in which girls fit at many kinds of needle-work, and the delicate flexible ftate of their bodies in the early periods of life.

Would mothers, inftead of having their daughters inftructed in many trifling accomplithments, employ them in plain work and houfewifery, and allow them fufficient exercise in the open air, they would both make them more healthy mothers, and more uleful members of fociety. I am no enemy to genteel accomplifhments, but would have them only confidered fidered as fecondary, and always difregarded when they impair health.

Many people imagine it a great advantage for children to be early taught to earn their bread. This opinion is certainly right, provided they were fo employed as not to hurt their health or growth; but, when these fuffer, society, instead of being benefited, is a real lofer by their labour. There are few employments, except fedentary ones, by which children can earn a livelihood; and if they be fet to these too foon, it ruins their constitutions. Thus, by gaining a few years from childhood, we generally lofe twice as many in the latter period of life, and even render the perfon lefs ufeful while he does live.

In order to be fatisfied of the truth of this obfervation, we need only look into the great manufacturing towns, where we shall find a puny degenerate race of people, weak and fickly all their lives, feldom exceeding the middle period of life; or if they do, being unfit for bufinefs, they become a burden to fociety. Thus arts and manufactures, though they may increase the riches of a country, are by no means favourable to the health of its inhabitants. Good policy would therefore require, that fuch people as labour during life, fhould not be fet too early to work. Every perfon converfant in the breed of horfes, or other working animals, knows, that if they be fet to hard labour too foon, they never will turn out to advantage. This is equally true with refpect to the human fpecies.

There are nevertheless various ways of employing young people without hurting their health. The eafier parts of gardening, hufbandry, or any bufinefs carried on without doors, are most proper. These are employments which most young people are fond of,

Q

of, and fome parts of them may always be adapted to their age, talte, and ftrength *.

Such parents, however, as are under the neceffity of employing their children within doors, ought to allow them fufficient time for active diversions without. This would both encourage them to do more work, and prevent their conftitutions from being hurt.

Some imagine, that exercife within doors is fufficient; but they are greatly miftaken. One hour fpent in running, or any other exercife without doors, is worth ten within. When children cannot go abroad, they may indeed be exercifed at home. The beft method of doing this, is to make them run about in a long room, or dance. This laft kind of exercife, if not carried to excefs, is of excellent fervice to young people. It cheers the fpirits, promotes perfpiration, ftrengthens the limbs, &cc. I know an eminent phyfician who ufed to fay, that he made his children dance, inftead of giving them phyfic. It were well if more people followed his example.

The COLD BATH may be confidered as an aid to exercife. By it the body is braced and ftrengthened, the circulation and fecretions promoted, and, were it conducted with prudence, many difeafes, as the rickets, fcrophula, &c. might thereby be prevented. The ancients, who took every method to render children hardy and robuft, were no ftrangers to the ufe of the cold bath; and, if we may credie report, the practice of immerfing children daily in cold water must have been very common among our anceftors.

* I have been told that in China, where the police is the best in the world, all the children are employed in the easier part of gardening and hubbandry; as weeding, gathering stones off the land, and fuch like.

The greatest objection to the use of the cold bath arifes from the fuperstitious prejudices of nurses. These are often to ftrong, that it is impossible to bring them to make a proper use of it. I have known fome of them who would not dry a child's fkin after bathing it, left it fhould deftroy the effect of the water. Others will even put cloths dipt in the water upon the child, and either put it to bed, or fuffer it to go about in that condition. Some believe, that the whole virtue of the water depends upon its being dedicated to a particular faint; while others place their confidence in a certain number of dips, as three, feven, nine, or the like; and the world could not perfuade them, if thefe do not fucceed, to try it a little longer. Thus, by the whims of nurfes, children lofe the benefit of the cold bath, and the hopes of the phyfician from that medicine are often fruftrated.

We ought not, however, entirely to fet afide the cold bath, becaufe fome nurfes make a wrong ufe of it. Every child, when in health, fhould at leaft have its extremities daily wafned in cold water. This is a partial ufe of the cold bath, and is better than none. In winter this may fuffice; but, in the warm feafon, if a child be relaxed, or feem to have a tendency to the rickets or fcrophula, its whole body ought to be frequently immerfed in cold water. Care however muft be taken not to do this when the body is hot, or the ftomach full. The child fhould be dipped only once at a time, fhould be taken out immediately, and have its fkin well rubbed with a dry cloth.

The bad Effects of unwholesome Air upon Children.

Few things prove more deftructive to children than confined or unwholefome air. This is onereafon why fo few of thofe infants, who are put into hofpitals, or parifh workhoufes, live. Thefe places

30

places are generally crowded with old, fickly, and infirm people; by which means the air is rendered fo extremely pernicious, that it becomes a poilon to infants.

Want of wholefome air is likewife destructive to many of the children born in great towns. There the poorer fort of inhabitants live in low, dirty, confined houfes, to which the fresh air has hardly any accefs. Though grown people, who are hardy and robuft, may live in fuch fituations, yet they generally prove fatal to their offspring, few of whom arrive at maturity, and those who do are weak and deformed. As fuch people are not in a condition to carry their children abroad into the open air, we must lay our account with losing the greater part of them. But the rich have not this excufe. It is their bufinefs to fee that their children be daily carried abroad, and that they be kept in the open air for a sufficient time. This will always fucceed better if the mother goes along with them. Servants are often negligent in these matters, and allow a child to fit or lie on the damp ground, inftead of leading or carrying it about. The mother furely needs air as well as her children; and how can she be better employed than in attending them?

A very bad cuftom prevails, of making children fleep in fmall apartments, or crowding two or three beds into one chamber. Inftead of this, the nurfery ought always to be the largeft and beft aired room in the houfe. When children are confined in fmall apartments, the air not only becomes unwholefome, but the heat relaxes their folids, renders them delicate, and dipoles them to colds and many other diforders. Nor is the cuftom of wrapping them up too clofe in cradles lefs pernicious. One would think that nurfes were afraid left children fhould fuffer by breathing free air, as many of them actually tually cover the child's face while afleep, and others wrap a covering over the whole cradle, by which means the child is forced to breathe the fame air over and over all the time it fleeps. Cradles indeed are on many accounts hurtful to children, and it would be better if the use of them were totally laid afide *.

A child is generally laid to fleep with all its clothes on; and if a number of others are heaped above them, it muft be overheated; by which means it cannot fail to catch cold on being taken out of the cradle, and exposed to the open air with only its usual clothing, which is too frequently the case.

Children who are kept within doors all day, and fleep all night in warm clofe apartments, may, with great propriety, be compared to plants, nurfed in a hot-houfe, inftead of the open air. Though fuch plants may by this means be kept alive for fome time, they will never arrive at that degree of ftrength, vigour, and magnitude, which they would have acquired in the open air, nor would they be able to bear it afterwards, fhould they be exposed to it.

Children brought up in the country, who have been accuftomed to open air, fhould not be too early fent to great towns, where it is confined and unwholefome. This is frequently done with a view to forward their education, but proves very hurtful

* It is amazing how children efcape fuffocation, confidering the manner in which they are often rolled up in flannels, &c. I lately attended an infant, whom I found muffled up over head and cars in many folds of flannel, though it was in the middle of June. I begged for a little free air to the poor babe; but though this indulgence was granted during my flay, I found it always on my return in the fame fituation. Death, as might be expected, foon freed the infant from all its miferies: but it was not in my power to free the minds of its parents from thofe prejudices which proved fatal to their child.

I was very lately called to fee an infant which was faid to be expiring in convultion fits. I defined the mother to firip the child, and wrap it in a loofe covering. It had no more convultion fits.

to

to their health. All fchools and feminaries of learning ought, if poffible, to be fo fituated as to have frefh, dry, wholefome air, and fhould never be too much crowded.

Without entering into a detail of the particular advantages of wholefome air to children, or of the bad confequences which proceed from the want of it, I fhall only oblerve, that of feveral thousands of children which have been under my care, I do not remember one inftance of a fingle child who continued healthy in a close confined fituation; but have often known the most obstinate difeases cured by removing them from such a fituation to an open free air.

Of Nurfes.

It is not here intended to lay down rules for the choice of nurfes. This would be waiting time. Common fenfe will direct every one to chufe a woman who is healthy, and has plenty of milk *. If the be at the fame time cleanly, careful, and good-natured, the can hardly fail to make a proper nurfe. After all, however, the only certain proof of a good nurfe, is a healthy child upon her breaft. But, as the mifconduct of nurfes often proves fatal to children, it will be of importance to point out a few of their moft baneful errors, in order to roufe the attention of parents, and to make them look more ftrictly into the conduct of thole to whom they commit the care of their infant offspring.

Though it admits of fome exceptions, yet we may lay it down as a general rule, that every woman who nurfes for hire should be carefully looked after, otherwife she will not do her duty. For this reason parents ought always to have their children nurfed under their

* I have often known people fo impofed upon, as to give an infant to a nurfe to be fuckled who had not one drop of milk in her breaft.

own

own eye, if poffible; and where this cannot be done, they fhould be extremely circumfpect in the choice of those perfons to whom they intrust them. It is folly to imagine that any woman, who abandons her own child to fuckle another for the fake of gain, fhould feel all the affections of a parent towards her nurfling: yet fo neceffary are the affections in a nurfe, that, but for them, the human race would foon be extinct.

One of the moft common faults of those who nurse for hire, is doing children with stupefactives, or fuch things as lull them assessed. An indolent nurse, who does not give a child sufficient exercise in the open air to make it step, and does not chuse to be disturbed by it in the night, will feldom fail to procure for it a dole of laudanum, diacodium, faffron, or what answers the same purpole, a dole of spirits, or other strong liquors. These, though they be certain poison to infants, are every day administered by many who bear the character of very good nurses*.

A nurfe who has not milk enough is apt to imagine that this defect may be fupplied by giving the child wines, cordial waters, or other ftrong liquors. This is an egregious miftake. The only thing that has any chance to fupply the place of the nurfe's milk, muft be fomewhat nearly of the fame quality, as cow's milk, afs's milk, or beef tea, with a little bread. It never can be done by the help of ftrong liquors. Thefe, inftead of nourifhing an infant, never fail to produce the contrary effect.

^c Children are often hurt by nurfes fuffering them to cry long and vehemently. This ftrains their tender bodies, and frequently occasions ruptures, inflammations of the throat, lungs, &c. A child

* If a mother on vifiting her child at nurfe find it always afleep, I would advife her to remove it immediately; otherwife it will foon fleep its laft.

never

never continues to cry long without fome caufe, which might always be difcovered by proper attention; and the nurfe who can hear an infant cry till it has almost fpent itfelf, without endeavouring to pleafe it, mult be cruel indeed, and is unworthy to be intrusted with the care of an human creature.

Nurfes who deal much in medicine are always to be fufpected. They truft to it, and neglect their duty. I never knew a good nurfe who had her Godfrey's cordial, Daffy's elixirs, Dalby's carminative, &c. at hand. Such generally imagine, that a dofe of medicine will make up for all defects in food, air, exercife, and cleanlinefs. By errors of this kind, I will venture to fay, that one half the children who die annually in London lofe their lives.

Allowing children to continue long wet, is another very pernicious cuftom of indolent nurfes. This is not only difagreeable, but it galls and frets the infant, and, by relaxing the folids, occafions fcrophulas, rickets, and other difeafes. A dirty nurfe is always to be fufpected.

Nature often attempts to free the bodies of children from bad humours, by throwing them upon the fkin: by this means fevers and other difeafes are prevented. Nurfes are apt to miftake fuch critical eruptions for an itch, or fome other infectious diforder. Accordingly they take every method to drive them in. In this way many children lofe their lives; and no wonder, as Nature is opposed in the very method fhe takes to relieve them. It ought to be a rule, which every nurfe fhould obferve, never to ftop any eruption without proper advice, or being well affured that it is not of a critical nature. At any rate, it is never to be done without previous evacuations.

Loofe ftools is another method by which Nature often prevents or carries off the difeafes of infants.

 D_2

If

If these proceed too far, no doubt they ought to be checked; but this is never to be done without the greatest caution. Nurfes, upon the first appearance of loofe flools, frequently fly to the use of aftringents. or fuch things as bind the body. Hence inflammatory fevers, and other fatal difeafes, are occafioned. A dofe of rhubarb, a gentle vomit, or fome other evacuation, fhould always precede the use of aftringent medicines.

One of the greateft faults of nurfes is, concealing the difeafes of children from their parents. This they are extremely ready to do, especially when the difeate is the effect of their own negligence. Many inftances might be given of perfons who have been rendered lame for life by a fall from their nurfe's arms, which fhe, through fear, concealed till the misfortune was paft cure. Every parent who intrufts a nurfe with the care of a child, ought to give her the ftricteft charge not to conceal the most trifling diforder or misfortune that may befal it.

We can fee no reafon why a nurfe, who conceals any misfortune which happens to a child under her care, till it lofes its life or limbs, should not be punished. A few examples of this would fave the lives of many infants; but as there is little reafon to expect that it ever will be the cafe, we would earneftly recommend it to all parents to look carefully after their children, and not to truft fo valuable a treasure entirely in the hands of an hireling.

No perfon ought to imagine these things unworthy of his attention. On the proper management of children depend not only their health and usefulness in life, but likewise the fafety and profperity of the flate to which they belong. Effeminacy ever will prove the ruin of any ftate where it prevails; and, when its foundations are laid in infancy, it can never afterwards be whoily eradicated. Parents

2

Parents who love their offspring, and wifh well to their country, ought therefore, in the management of their children, to avoid every thing that may have a tendency to make them weak or effeminate, and to take every method in their power to render their conflictutions ftrong and hardy.

By arts like thefe Laconia nurs'd of old her hardy fons; And Rome's unconquer'd legions urg'd their way, Unhurt, thro' every toil in every clime *.

CHAP. II.

OF THE LABORIOUS, THE SEDENTARY, AND THE STUDIOUS.

HAT men are exposed to particular diseafes from the occupations which they follow, is a fact well known; but to remedy this evil is a matter of fome difficulty. Most people are under the neceffity of following those employments to which they have been bred, whether they be favourable to health or not. For this reason, instead of inveighing, in a general way, as fome authors have done, against those occupations which are hurtful to health, we shall endeavour to point out the circumstances in each of them from which the danger chiefly arises, and to propose the most rational methods of preventing it.

Chymifts, founders, forgers, glafs-makers, and feveral other artifts, are hurt by the unwholefome air which they are obliged to breathe. This air is

* Armftrong,

not only loaded with the noxious exhalations arifing from metals and minerals, but is fo charged with phlogifton as to be rendered unfit for expanding the lungs fufficiently, and answering the other important purposes of respiration. Hence proceed afthmas, coughs, and confumptions of the lungs, fo incident to perfons who follow these employments.

To prevent fuch confequences, as far as poffible, the places where thefe occupations are carried on, ought to be conftructed in fuch a manner as to difcharge the fmoke and other exhalations, and admit a free current of frefh air. Such artifts ought never to continue long at work; and when they give over, they fhould fuffer themfelves to cool gradually, and put on their clothes before they go into the open air. They ought never to drink large quantities of cold, weak, or watery liquors, while their bodies are hot, nor to indulge in raw fruits, fallads, or any thing that is cold on the ftomach *.

Miners, and all who work under ground, are likewife hurt by unwholefome air. The air, by its ftagnation in deep mines, not only lofes its proper fpring and other qualities neceffary for refpiration, but is often loaded with fuch noxious exhalations as to become a most deadly poifon.

The two kinds of air which prove most deftructive to miners, are what they call the *fire damp*, and the *eboke damp*. In both cases the air becomes a poison by its being loaded with phlogiston. The danger from the former may be obviated by making it explode before it accumulates in too great quantities; and the latter may be generally carried off by promoting a free circulation of air in the mine.

* When perfons heated with labour have drank cold liquor, they ought to continue at work for fome time after,

Miners are not only hurt by unwholefome air, but likewife by the particles of metal which adhere to their fkin, clothes, &c. Thefe are abforbed, or taken up into the body, and occafion palfies, vertigoes, and other nervous affections, which often prove fatal. Fallopius obferves, that thofe who work in mines of mercury feldom live above three or four years. Lead, and feveral other metals, are likewife very pernicious to the health.

Miners ought never to go to work fafting, nor to continue too long at work. Their food ought to be nourifhing, and their liquor generous : nothing more certainly hurts them than living too low. They fhould by all means avoid coftivenefs. This may either be done by chewing a little rhubarb, or taking a fufficient quantity of fallad oil. Oil not only opens the body, but fheathes and defends the inteffines from the ill effects of the metals. All who work in mines or metals ought to wafh carefully, and to change their clothes as foon as they give over working. Nothing would tend more to preferve the health of fuch people than a flrict, and almost religious regard to cleanlinefs.

Plumbers, painters, gilders, fmelters, makers of white lead, and many others who work in metals, are liable to the fame difeafes as miners; and ought to obferve the fame directions for avoiding them.

Tallow-chandlers, boilers of oil, and all who work in putrid animal fubitances, are likewife liable to fuffer from the unwholefome fmells or effluvia of thefe bodies. They ought to pay the fame regard to cleanlinefs as miners; and when they are affected with naufea, ficknefs, or indigeftion, we would advife them to take a vomit or a gentle purge. Such fubftances ought always to be manufactured as foon as poffible. When long kept, they not only become unwholefome to thofe who manufacture them, but likewife to people who live in the neighbourhood.

It

It would greatly exceed the limits of this part of our fubject, to fpecify the difeafes peculiar to perfons of every occupation; we fhall therefore confider mankind under the general claffes of *Laborious*, *Sedentary*, and *Studious*.

THE LABORIOUS.

Though those who follow laborious employments are in general the most healthy of mankind, yet the pature of their occupations, and the places where they are carried on, expose them more particularly to fome difeases. Husbandmen, for example, are exposed to all the vicifitudes of the weather, which, in this country, are often very great and fudden, and occafion colds, coughs, quinfies, rheumatisms, fevers, and other acute diforders. They are likewise forced to work hard, and often to carry burdens above their ftrength, which, by overstraining the veffels, occasion afthmas, ruptures, pleurifies, &cc.

Those who labour without doors are often afflicted with intermitting fevers or agues, occasioned by the frequent vicifitudes of heat and cold, poor living, bad water, fitting or lying on the damp ground, evening dews, night air, &c. to which they are frequently exposed.

Such as bear heavy burdens, as porters, labourers, &c. are obliged to draw in the air with much greater force, and allo to keep their lungs diffended with more violence than neceffary for common refpiration: by this means the tender veffels of the lungs are overftretched, and often burft, infomuch that a fpitting of blood or fever enfues. Hippocrates mentions an inftance to this purpole, of a man, who, upon a wager, carried an als; but was foon after feized with a fever, a vomiting of blood, and a rupture.

Carrying heavy burdens is generally the effect of mere lazinefs, which prompts people to do at once what fhould be done at twice. Sometimes it proceeds from from vanity or emulation. Hence it is, that the ftrongeft men are most commonly hurt by heavy burdens, hard labour, or feats of activity. It is rare to find one who boalts of his ftrength without a rupture, a fpitting of blood, or fome other difeafe, which he reaps as the fruit of his folly. One would imagine the daily inflances we have of the fatal effects of carrying great weights, running, wreftling, and the like, would be fufficient to prevent fuch practices.

There are indeed fome employments which necefarily require a great exertion of ftrength; as porters, blackfmiths, carpenters, &c. None ought to follow thefe but men of ftrong body; and they fhould never exert their ftrength to the utmoft, nor work too long. When the mufcles are violently ftrained, frequent reft is neceflary, in order that they may recover their tone; without this, the ftrength and conflicution will foon be worn out, and a premature old age be induced.

The erifipelas, or St. Anthony's fire, is a difeafe very incident to the laborious. It is occafioned by whatever gives a fudden check to the perfpiration, as drinking cold water when the body is warm, wet feer, keeping on wet clothes, fitting or lying on the damp ground, &zc. It is impoffible for thole who labour without doors always to guard againft thefe inconveniences; but it is known from experience, that their ill confequences might often be prevented by proper care.

The iliac paffion, the colic, and other complaints of the bowels, are often occafioned by the fame caufes as the erifipelas, but they may likewife proceed from flatulent and Indigeftible food. Labourers generally eat unfermented bread, made of peas, beans, rye, and other windy ingredients. They alfo devour great quantities of unripe fruits, baked, ftewed, or raw, with various kinds of roots and herbs, upon which they

they often drink four milk, ftale fmall beer, or the like. Such a mixture cannot fail to fill the bowels with wind, and occafion difeafes of those parts.

Inflammations, whitloes, and other difeafes of the extremities, are likewife common among thofe who labour without doors. Thefe difeafes are often attributed to venom, or fome kind of poifon: but they generally proceed either from fudden heat after cold, or the contrary. When labourers, milk-maids, &cc. come from the field, cold or wet, they run to the fire, and often plunge their hands in warm water, by which means the blood and other humours in thofe parts are fuddenly expanded, and, the veffels not yielding fo quickly, a ftrangulation happens, and an inflammation or a mortification enfues.

When fuch perfons come home cold, they ought to keep at a diffance from the fire for fome time, to wafh their hands in cold water, and to rub them well with a dry cloth. It fometimes happens, that people are fo benumbed with cold, as to be quite deprived of the ufe of their limbs. In this cafe, the only remedy is to rub the parts affected with fnow, or, where it cannot be had, with cold water. If they be held near the fire, or plunged into warm water, a mortification will generally enfue.

Labourers in the hot feafon are apt to lie down and fleep in the fun. This practice is fo dangerous, that they often awake in a burning fever. Thefe ardent fevers, which prove fo fatal about the end of fummer and beginning of autumn, are frequently occafioned by this means. When labourers leave off work, which they ought always to do during the heat of the day, they fhould go home, or at leaft get under fome cover where they may repole themfelves in fafety.

Many people follow their employments in the fields from morning till night, without eating any

thing.

4

thing. This cannot fail to hurt their health. However homely their fare be, they ought to have it at regular times; and the harder they work, the more frequently they fhould eat. If the humours be not frequently replenifhed with freſh nouriſhment, they foon become putrid, and produce fevers of the very worſt kind.

Many peafants are extremely carelefs with refpect to what they eat or drink, and often, through mere indolence, ufe unwholefome food, when they might, for the fame expence, have that which is wholefome. In fome parts of Britain, the peafants are too carelefs even to take the trouble of dreffing their own victuals. Such people would live upon one meal a-day in indolence, rather than labour, though it were to procure them the greateft affluence.

Fevers of a very bad kind are often occafioned among labourers by *poor living*. When the body is not fufficiently nourifhed, the humours become vitiated, and the folds weak; from whence the molt fatal confequences enfue. *Poor living* is likewife productive of many of those cutaneous difeases fo frequent among the lower class of people. It is remarkable that cattle, when pinched in their food, are generally affected with difeases of the fkin, which feldom fail to difapear when they are put upon a good pafture. This fhews how much a good flate of the humours depends upon a fufficient quantity of proper nourifhment.

Poverty not only occasions, but aggravates, many of the difeafes of the laborious. Few of them have much forefight; and, if they had, it is feldom in their power to fave any thing. They are glad to make a fhift to live from day to day; and when any difeafe overtakes them, they are miferable indeed. Here the godlike virtue of charity ought always to exert itfelf. To relieve the industrious poor in diffres, is furely the most exalted act of religion and humanity. They alone,

alone, who are witneffes of those scenes of calamity, can form a notion of what numbers perish in difeases, for want of proper affistance, and even for want of the necessaries of life.

Labourers are often hurt by a foolifh emulation, which prompts them to vie with one another, till they overheat themfelves to fuch a degree as to occafion a fever, or even to drop down dead. Such as wantonly throw away their lives in this manner, deferve to be looked upon in no better light than felfmurderers.

The office of a *foldier*, in time of war, may be ranked among the laborious employments. Soldiers fuffer many hardfhips from the inclemency of feafons, long marches, bad provifions, hunger, watching, unwholefome climates, bad water, &cc. Thefe occafion fevers, fluxes, rheumatifus, and other fatal difeafes, which generally do greater execution than the fword, efpecially when campaigns are continued too late in the feafon. A few weeks of cold rainy weather will often prove more fatal than an engagement.

Those who have the command of armies should take care that their foldiers be well clothed and well fed. They ought alfo to finish their campaigns in due seafon, and to provide their men with dry and well-aired winter quarters. These rules, taking care, at the same time, to keep the fick at a proper distance from those in health, would tend greatly to preferve the lives of the foldiery *.

Sailors

* It is indeed to be regretted, that foldiers fuffer not lefs from indolence and intemperance in time of peace, than from hardfhips in time of war. If men are idle they will be vicious. It would therefore be of great importance, could a feheme be formed for rendering the military, in times of peace, both more healthy and more ufeful. Thele defirable objects might, in our opinion, be obtained, by employing them for fome hours every day, and advancing their pay accordingly. By this means, idlenels, the mother of vice, might be prevented, the price of labour lowered, public works, as harbours, canels, tumpike roads, &c. might be made

and the STUDIOUS.

Sailors may also be numbered among the laborious. They undergo great hardfhips from change of climate, the violence of the weather, hard labour, bad provisions, &c. Sailors are of to great importance both to the trade and fafety of this kingdom, that too much pains can never be beftowed in pointing out the means of preferving their lives.

One great fource of the difeafes of fea-faring people is excefs. When they get on fhore, after having been long at fea, without regard to the climate, or their own conflictions, they plunge headlong into all manner of riot, and often perfift till a fever puts an end to their lives. Thus intemperance, and not the climate, is often the caufe why fo many of our brave failors die on foreign coafts. Such people ought not to live too low; but they will find moderation the beft defence againft fevers and many other maladies.

Sailors, when on duty, cannot avoid fometimes getting wet. When this happens, they fhould change their clothes as foon as they are relieved, and take every method to reftore the perfpiration. They fhould not, in this cafe, make too free with fpirits or other ftrong liquors, but fhould rather drink them diluted with warm water, and go immediately to bed, where a found fleep and a gentle fweat would fet all to rights.

But the health of failors fuffers most from unwholefome food. The constant use of falted pro-

made without hurting manufactures; and foldiers might be enabled to marry and bring up children. A feheme of this kind might eafily be conducted, fo as not to deprefs the martial fpirit, provided the men were only to work four or five hours every day, and always to work without doors: no foldiers fhould be fuffered to work too long, or to follow any fedentary employment. Sedentary employments render men weak and effeminate, quite unfit for the hardfhips of war: whereas working for a few hours every day without doors, would inure them to the weather, brace their perves, and increafe their firength and courage.

visions

vifions vitiates their humours, and occafions the fcurvy, and other obfinate maladies. It is no eafy matter to prevent this difeafe in long voyages; yet we cannot help thinking, that much might be done towards effecting fo defirable an end, were due pains beftowed for that purpole. For example, various roots, greens, and fruits, might be kept a long time at fea, as onions, potatoes, cabbages, lemons, oranges, tamarinds, apples, &c. When fruits cannot be kept, the juices of them, either freth or fermented, may. With thefe all the drink, and even the food of the fhip's company, ought to be acidulated in long voyages.

Stale bread and beer likewife contribute to vitiate the humours. Flour will keep for a long time on board, of which frefh bread might frequently be made. Malt too might be kept, and infuted with boiling water at any time. This liquor, when drank even in form of wort, is very wholefome, and is found to be an antidote againft the fcurvy. Small wines and cyder might likewife be plentifully laid in; and fhould they turn four, they would ftill be ufeful as vinegar. Vinegar is a great antidote againft difeafes, and fhould be ufed by all travellers, efpecially at fea. It may either be mixed with the water they drink, or taken in their food.

Such animals as can be kept alive, ought likewife to be carried on board, as hens, ducks, pigs, &c. Frefh broths made of portable foup, and puddings made of peas or other vegetables, ought to be ufed plentifully. Many other things will readily occur to people converfant in these matters, which would tend to preferve the health of that brave and ufeful fet of men^{*}.

* Our countryman, the celebrated Captain Cook, has fhewn how far, by proper care and attention, the difeafes formerly fo fatal to feamen may be prevented. In a voyage of three years and eighteen days, during which he was exposed to every climate, from

We

We have reafon to believe, if due attention were paid to the diet, air, cloathing, and above all things to the cleanlinefs of fea-faring people, they would be the most healthy fet of men in the world; but when these are neglected the very reverse will happen.

The best medical antidote that we can recommend to failors or foldiers on foreign coafts, especially where dampness prevails, is the Peruvian bark. This will often prevent fevers, and other fatal difeafes. About a drachm of it may be chewed every day; or if this fhould prove difagreeable, an ounce of bark, with half an ounce of orange peel, and two drachms of fnake root coarfely powdered, may be infufed for two or three days in an English quart of brandy, and half a wine glass of it taken twice or thrice a-day, when the ftomach is empty. This has been found to be an excellent antidote against fluxes, putrid, intermitting, and other fevers, in unhealthy climates. It is not material in what form this medicine is taken. It may either be infused in water, wine, or fpirits, as recommended above, or made into an electuary with fyrup of lemons, oranges, or the like.

THE SEDENTARY.

Though nothing can be more contrary to the nature of man than a fedentary life, yet this clafs comprehends by far the greater part of the fpecies. Almost the whole female world, and in manufacturing countries, the major part of the males, may be reckoned fedentary *.

Agricul-

from the 52° north to the 71° of fouth latitude, of one hundred and eighteen men, composing the fhip's company, he loft only one, who died of a *phthifs pulmonalis*. The principal means he used were, to preferve a ftrict attention to cleanlinefs, to procure abundance of vegetables and frefh provisions, efpecially good water, and to allow his people fufficient time for reft.

* The appellation of fedentary has generally been given only to the fludious; we can fee no reafon, however, for reftricting it te

Agriculture, the first and most healthful of all employments, is now followed by few who are able to carry on any other busines. But those who imagine that the culture of the earth is not fufficient to employ all its inhabitants, are greatly mistaken. An ancient Roman, we are told, could maintain his family from the produce of one acre of ground. So might a modern Briton, if he would be contented to live like a Roman. This fnews what an immense increase of inhabitants Britain might admit of, and all of them live by the culture of the ground.

Agriculture is the great fource of domeftic riches. Where it is neglected, whatever wealth may be imported from abroad, poverty and mifery will abound at home. Such is, and ever will be, the fluctuating ftate of trade and manufactures, that thoufands of people may be in full employment to-day and in beggary to-morrow. This can never happen to those who cultivate the ground. They can eat the fruit of their labour, and can always by induftry obtain, at leaft, the neceffaries of life.

Though fedentary employments are neceffary, yet there feems to be no reafon why any perfon fhould be confined for life to thefe alone. Were fuch employments intermixed with the more active and laborious, they would never do hurt. It is conftant confinement that ruins the health. A man may not be hurt by fitting five or fix hours a-day; but if he is obliged to fit ten or twelve, he will foon become difeafed.

But it is not want of exercise alone which hurts fedentary people; they likewise fuffer from the confined air which they breathe. It is very common

to them alone. Many artificers may, with as much propriety, be denominated fedentary as the fludious, with this particular difadvantage, that they are often obliged to fit in very awkward poftures, which the fludious need not do, unlefs they pleafe.

to

to fee ten or a dozen taylors *, or flay makers, for example, crowded into one fmall apartment, where there is hardly room for one perfon to breathe freely. In this fituation they generally continue for many hours at a time, often with the addition of feveral candles, which tend likewife to wafte the air, and render it lefs fit for refpiration. Air that is breathed repeatedly becomes unfit for expanding the lungs. This is one caufe of the phthifical coughs, and other complaints of the breaft, fo incident to fedentary artificers.

Even the perfpiration from a great number of perfons pent up together, renders the air unwholefome. The danger from this quarter will be greatly encreased, if any one of them happens to have bad lungs, or to be otherwise difeased. Those who fit near him, being forced to breathe the fame air, can hardly fail to be infected. It would be a rare thing, however, to find a dozen of fedentary people all in good health. The danger of crowding them together must therefore be evident to every one.

Many of those who follow fedentary employments are constantly in a bending posture, as thoemakers, taylors, cutlers, &c. Such a fituation is extremely hurtful. A bending posture obstructs all the vital motions, and of course must deftroy the health. Accordingly we find fuch artificers generally complaining of indigestions, flatulences, head-achs, pains of the breast, &c.

* A perfon of obfervation in that line of life told me, that molt taylors die of confumptions; which he attributed chiefly to the unfavorable poffures in which they fit, and the unwholefomenefs of those places where their bufinefs is carried on. If more attention was not paid to profit than to the prefervation of human lives, this evil might be eafily remedied; but while mafters only mind their own intereft, nothing will be done for the fafety of their fervants.

E

The

The aliment in fedentary people, inftead of being pufhed forwards by an creft pofture, and the action of the mufcles, is in a manner confined in the bowels. Hence indigeftions, coftivenefs, wind, and other hypochondriacal affections, the conftant companions of the fedentary. Indeed none of the excretions can be duly performed where exercife is wanting; and when the matter which ought to be difcharged in this way is retained too long in the body, it muft have bad effects, as it is again taken up into the mafs of humours.

A bending pofture is likewife hurtful to the lungs. When this organ is comprefied, the air cannot have free accefs into all its parts, fo as to expand them properly. Hence tubercles, adhefions, &c. are formed, which often end in confumptions. Befides, the proper action of the lungs being abfolutely neceffary for making good blood, when that organ fails, the humours foon become univerfally depraved, and the whole conftitution goes to wreck.

Sedentary artificers are not only hurt by preffure on the bowels, but alfo on the inferior extremities, which obftructs the circulation in thefe parts, and renders them weak and feeble. Thus taylors, fhoemakers, &c. frequently loole the ule of their legs altogether : befides, the blood and humours are, by ftagnation, vitiated, and the perfpiration is obftructed; from whence proceed the fcab, ulcerous fores, foul blotches, and other cutaneous difeafes to common among fedentary artificers.

A bad figure of body is a very common confequence of clofe application to fedentary employments. The fpine, for example, by being continually bent, puts on a crooked thape, and generally remains fo ever after. But a bad figure of body has already been been observed to be hurtful to health, as the vital functions are thereby impeded.

A fedentary life feldom fails to occafion an univerfal relaxation of the folids. This is the great fource from whence moft of the difeafes of fedentary people flow. The fcrophula, confumption, hyfterics, and nervous difeafes, now fo common, were very little known in this country before fedentary artificers became fo numerous: and they are very little known ftill among fuch of our people as follow active employments without doors, though in great towns at leaft two thirds of the inhabitants are afflicted with them.

It is very difficult to remedy thole evils, becaule many who have been accultomed to a fedentary life, like ricketty children, lofe all inclination for exercife; we fhall, however, throw out a few hints with refpect to the moft likely means for preferving the health of this uleful fet of people, which fome of them, we hope, will be wife enough to take.

It has been already obferved, that fedentary artificers are often hurt by their bending pofture. They ought therefore to ftand or fit as erect as the nature of their employments will permit. They fhould likewife change their pofture frequently, and fhould never fit too long at a time, but leave off work, and walk, ride, run, or do any thing that will promote the vital functions.

Sedentary artificers are generally allowed too little time for exercife; yet fhort as it is, they feldom employ it properly. A journeyman taylor or weaver, for example, inftead of walking abroad for exercife and frefh air, at his hours of leifure, chufes often to fpend them in a public-houfe, or in playing at fome fedentary game, by which he generally lofes both his time and his money.

The

The awkward poftures in which many fedentary artificers work, feem rather to be the effect of cuftom than neceffity. For example, a table might furely be contrived for ten or a dozen taylors to fit round with liberty for their legs either to hang down, or reft upon a foot-board, as they fhould chufe. A place might likewife be cut out for each perfon, in fuch a manner that he might fit as conveniently for working as in the prefent mode of fitting crofslegged.

All fedentary artificers ought to pay the most religious regard to cleanlinefs. Both their fituation and occupations render this highly neceffary. Nothing would contribute more to preferve their health, than a firic attention to it: and fuch of them as neglect it, not only run the hazard of lofang health, but of becoming a nuifance to their neighbours.

Sedentary people ought to avoid food that is windy or hard of digeftion, and fhould pay the ftricteft regard to fobriety. A perfon who works hard without doors will foon throw off a debauch; but one who fits has by no means an equal chance. Hence it often happens, that fedentary people are feized with fevers after hard drinking. When fuch perfons feel their fpirits low, inftead of running to the tavern for relief, they fhould ride or walk in the fields. This would remove the complaint more effectually than ftrong liquor, and would never hurt the conflictution.

Inftead of multiplying rules for preferving the health of the fedentary, we fhall recommend to them the following general plan, viz. That every perfon who follows a fedentary employment fhould cultivate a piece of ground with his own hands. This he might dig, plant, fow, and weed at leifure hours, to as to make it both an exercise and amufement. ment, while it produced many of the neceffaries of life. After working an hour in a garden, a man will return with more keennefs to his employment within doors, than if he had been all the while idle.

Labouring the ground is every way conducive to health. It not only gives exercise to every part of the body, but the very fmell of the earth and fresh herbs revives and cheers the spirits, whilf the perpetual prospect of something coming to maturity, delights and entertains the mind. We are so formed as to be always pleafed with somewhat in prospect, however distant or however trivial. Hence the happiness that most men feel in planting, fowing, building, &c. These seems to have been the chief employments of the more early ages : and, when kings and conquerors cultivated the ground, there is reason to believe that they knew as well wherein true happiness consisted as we do.

It may feem romantic to recommend gardening to manufacturers in great towns; but observation proves that the plan is very practicable. In the town of Sheffield, in Yorkshire, where the great iron manufacture is carried on, there is hardly a journeymen cutler who does not possels a piece of ground, which he cultivates as a garden. This practice has many falutary effects. It not only induces these people to take exercife without doors, but alfo to eat many greens, roots, &c. of their own growth, which they would never think of purchafing, There can be no reafon why manufacturers in any other town in Great Britain should not follow the fame plan. It is indeed to be regretted, that in fuch a place as London a plan of this kind is not practicable : yet even there, fedentary artificers may find opportunities of taking air and exercise, if they chuse to embrace them.

Mechanics

Mechanics are too much inclined to crowd into great towns. The fituation may have fome advantages; but it has likewife many difadvantages. All mechanics who live in the country have it in their power to cultivate a piece of ground; which indeed moft of them do. This not only gives them exercife, but enables them to live more comfortably. So far at leaft as my obfervation extends, mechanics who live in the country are far more happy than thofe in great towns. They enjoy better health, live in greater affluence, and feldom fail to rear a healthy and numerous offspring.

In a word, exercife without doors, in one fhape or another, is abfolutely neceffary to health. Thofe who neglect it, though they may for a while drag out life, can hardly be faid to enjoy it. Weak and effeminate, they languish for a few years, and soon drop into an untimely grave.

THE STUDIOUS.

Intenfe thinking is fo deftructive to health, that few inftances can be produced of fludious perfons who are ftrong and healthy. Hard fludy always implies a fedentary life; and when intenfe thinking is joined to the want of exercife, the confequences muft be bad. We have frequently known even a few months of clofe application to fludy ruin an excellent conflitution, by inducing a train of nervous complaints which could never be removed. Man is evidently not formed for continual thought more than for perpetual action, and would be as foon worn out by the one as by the other.

So great is the power of the mind over the body, that, by its influence, the whole vital motions may be accelerated or retarded, to almost any degree. Thus cheerfulness and mirth quicken the circulation, and promote all the fectetions; whereas fad-

nefs

nefs and profound thought never fail to retard them. Hence it would appear, that even a degree of thoughtleffness is necessary to health. Indeed the perpetual thinker feldom enjoys either health or fpirits; while the perfon, who can hardly be faid to think at all, generally enjoys both.

Perpetual thinkers, as they are called, feldom think long. In a few, years they generally become quite flupid, and exhibit a melancholy proof how readily the greatest bleffings may be abused. Thinking, like every thing elfe, when carried to extreme, becomes a vice; nor can any thing afford a greater proof of wildom, than for a man frequently and feafonably to unbend his mind. This may generally be done by mixing in cheerful company, active diverfions, or the like.

Inftead of attempting to inveftigate the nature of that connection which subfifts between the mind and body, or to inquire into the manner in which they mutually affect each other, we shall only mention those difeases to which the learned are more peculiarly liable, and endeavour to point out the means of avoiding them.

Studious perfons are very fubject to the gout. This painful difeafe in a great measure proceeds from indigeftion, and an obstructed perspiration. It is impoffible that the man who fits from morning till night should either digest his food, or have any of the secretions in due quantity. But when that matter which fhould be thrown off by the ikin, is retained in the body, and the humours are not duly prepared, difeales must enfue.

The fludious are likewife very liable to the flone and gravel. Exercife greatly promotes both the fecretion and difcharge of urine; confequently a fedentary life must have the contrary effect. Any one may be fatisfied of this by observing, that he paffes much more urine by day than in the night, and

E 4 .

and alfo when he walks or rides, than when he fits.

The circulation in the liver being flow, obfructions in that organ can hardly fail to be the confequence of inactivity. Hence fedentary people are frequently afflicted with fchirrous livers. But the proper fecretion and difcharge of the bile is fo neceffary a part of the animal economy, that where thefe are not duly performed, the health muft foon be impaired. Jaundice, indigeftion, lofs of appetite, and a wafting of the whole body, feldom fail to be the confequences of a vitiated flate of the liver or obfructions of the bile.

Few difeafes prove more fatal to the fludious than confumptions of the lungs. It has already been obferved, that this organ cannot he duly expanded in those who do not take proper exercise; and where that is the case, obstructions and adhesions will enfue. Not only want of exercise, but the posture in which fludious perfons generally fit, is very hurtful to the lungs. Those who read or write much are ready to contract a habit of bending forwards, and often prefs with their breast upon a table or bench. This posture cannot fail to hurt the lungs.

The functions of the heart may likewife by this means be injured. I remember to have feen a man opened, whofe pericardium adhered to the breaftbone in fuch a manner as to obfiruct the motion of the heart, and occasion his death. The only probable cause that could be affigned for this fingular fymptom was, that the man, whose business was writing, used constantly to fit in a bending posture, with his breast pressing upon the edge of a plain table.

No perfon can enjoy health who does not properly digeft his food. But intenfe thinking and inactivity never fail to weaken the powers of digeftion, geftion. Hence the humours become crude and vitiated, the folids weak and relaxed, and the whole conflitution goes to ruin.

Long and intenfe thinking often occafions grievous head-achs, which bring on vertigoes, apoplexies, palfies, and other fatal diforders. The beft way to prevent thefe is, never to fludy too long at one time, and to keep the body regular, either by proper food, or taking frequently a little of fome opening medicine.

Those who read or write much are often afflicted with fore eyes. Studying by candle-light is peculiarly hurtful to the fight. This ought to be practifed as feldom as poffible. When it is unavoidable, the eyes fhould be fhaded, and the head fhould not be held too low. When the eyes are weak or painful, they fhould be bathed every night and morning in cold water, to which a little brandy may be added.

It has already been obferved, that the excretions are very defective in the fludious. The dropfy is often occafioned by the retention of those humours which ought to be carried off in this way. Any perfon may obferve, that fitting makes his legs fwell, and that this goes off by exercise, which clearly points out the method of prevention.

Fevers, efpecially of the nervous kind, are often the effect of ftudy. Nothing affects the nerves fo much as intenfe thought. It in a manner unhinges the whole human frame, and not only hurts the vital motions, but diforders the mind itfelf. Hence a delirium, melancholy, and even madnefs, are often the effect of clofe application to ftudy. In fine, there is no difeafe which can proceed either from a bad ftate of the humours, a defect of the ufual fecretions, or a debility of the nervous fyftem, which may not be induced by intenfe thinking.

But the moft afflicting of all the difeafes which attack the ftudious is the hypochondriac. This difeafe feldom fails to be the companion of deep thought. It may rather be called a complication of maladies than a fingle one. To what a wretched condition are the belt of men often reduced by it! Their ftrength and appetite fail; a perpetual gloom hangs over their minds; they live in the conftant dread of death, and are continually in fearch of relief from medicine, where, alas! it is not to be found. Thofe who labour under this diforder, though they are often made the fubject of ridicule, juftly claim our higheft fympathy and compaffion.

Hardly any thing can be more prepofterous than for a perfon to make ftudy his fole bufinefs. A mere ftudent is feldom an useful member of fociety. He often neglects the most important duties of life, in order to pursue studies of a very trifling nature. Indeed it rarely happens, that any uleful invention is the effect of mere fludy. The farther men dive into profound refearches, they generally deviate the more from common fense, and too often lose fight of it altogether. Profound speculations, instead of making men wifer or better, generally render them abfolute fceptics, and overwhelm them with doubt and uncertainty. All that is neceffary for man to know, in order to be happy, is eafily obtained; and the reft, like the forbidden fruit, ferves only to encreafe his mifery.

Studious perfons, in order to relieve their minds, muft not only difcontinue to read and write, but engage in fome employment or diversion that will fo far occupy the thought as to make them forget the bufinefs of the clofet. A folicary ride or walk are fo far from relaxing the mind, that they rather encourage thought. Nothing can divert the mind when

2

it

it gets into a train of ferious thinking, but attention to tubjects of a more trivial nature. These prove a kind of play to the mind, and consequently relieve it.

Learned men often contract a contempt for what they call trifling company. They are afhamed to be feen with any but philofophers. This however is no proof of their being philofophers themfelves. No man deferves that name who is afhamed to unbend his mind, by affociating with the cheerful and gay. Even the fociety of children will relieve the mind, and expel the gloom which application to ftudy is too apt to occafion.

As fludious people are neceffarily much within doors, they should make choice of a large and wellaired place for fludy. This would not only prevent the bad effects which attend confined air, but would cheer the fpirits, and have a most happy influence both on the body and mind. It is faid of Euripides the tragedian, that he used to retire to a dark cave to compose his tragedies, and of Demosthenes the Grecian orator, that he chose a place. for fludy where nothing could be either heard or feen. With all deference to fuch venerable names, we cannot help condemning their talte. A man may furely think to as good purpole in an elegant apartment as in a cave; and may have as happy conceptions where the all-cheering rays of the fun render the air wholefome, as in places where they never enter.

Those who read or write much should be very attentive to their posture. They ought to fit and stand by turns, always keeping as nearly in an erect posture as possible. Those who distate, may do it walking. It has an excellent effect frequently to read or speak aloud. This not only exercises the lungs, but almost the whole body. Hence studious people are greatly benefited by delivering discourses in

in public. Public speakers, indeed, sometimes hurt themfelves by overacting their part; but this is their own fault. The martyr to mere vociferation merits not our fympathy.

The morning has, by all medical writers, been reckoned the best time for study. It is fo. But it is also the most proper featon for exercise, while the ftomach is empty, and the fpirits refreshed with fleep. Studious people fhould therefore fometimes fpend the morning in walking, riding, or fome manly diversions without doors. This would make them return to ftudy with greater alacrity, and would be of more fervice than twice the time after their fpirits are worn out with fatigue. It is not fufficient to take diversion only when we can think no longer. Every fludious perfon should make it a part of his bulinels, and fhould let nothing interrupt his hours of recreation more than those of ftudy.

Mufic has a very happy effect in relieving the mind when fatigued with fudy. It would be well if every fludious perfon were to far acquainted with that fcience as to amule himfelf after fevere thought, by playing fuch airs as have a tendency to raife the fpirits, and infpire cheerfulnefs and good humour.

It is a reproach to learning, that any of her votaries, to relieve the mind after fludy, fhould betake themfelves to the ute of ftrong liquors. This indeed is a remedy; but it is a defperate one, and always proves deftructive. Would fuch perfons, when their spirits are low, get on horfeback, and ride ten or a dozen miles, they would find it a more effectual remedy than any cordial medicine in the apothecary's shop, or all the strong liquors in the world.

The following is my plan, and I cannot recommend a better to others. When my mind is fatigued

9

tigued with ftudy, or other ferious bufinefs, I mount my horfe, and ride ten or twelve miles into the country, where I fpend a day, and fometimes two, with a cheerful friend; after which I never fail to return to town with new vigour, and to purfue my ftudies or bufinefs with fresh alacrity.

It is much to be regretted, that learned men, while in health, pay fo little regard to thefe things! There is not any thing more common than to fee a miferable object over-run with nervous difeafes, bathing, walking, riding, and, in a word, doing every thing for health after it is gone; yet, if any one had recommended thefe things to him by way of prevention, the advice would, in all probability, have been treated with contempt, or, at leaft, with neglect. Such is the weaknefs and folly of mankind, and fuch the want of forefight, even in those who ought to be wiler than others!

With regard to the diet of the fludious, we fee no reafon why they flould abftain from any kind of food that is wholefome, provided they ufe it in moderation. They ought, however, to be fparing in the ufe of every thing that is windy, rancid, or hard of digeftion. Their fuppers flould always be light, or taken foon in the evening. Their drink may be water, fine malt liquor, not too ftrong, good cyder, wine and water, or, if troubled with acidities, water mixed with a little brandy, rum, or any other genuine fpirit.

We shall only observe, with regard to those kinds of exercise which are most proper for the studious, that they should not be too violent, nor ever carried to the degree of excessive fatigue. They ought likewise to be frequently varied fo as to give action to all the different parts of the body; and should, as often as possible, be taken in the open air. In general, riding on horseback, walking, working in in a garden, or playing at fome active diversions, are the beft.

We would likewife recommend the ufe of the cold bath to the fludious. It will, in fome meafure, fupply the place of exercise, and fhould not be neglected by perfons of a relaxed habit, especially in the warm feason.

No perfon ought either to take violent exercife or to fludy immediately after a full meal.

CHAP. III.

OF ALIMENT.

UNWHOLESOME food, and irregularities of diet, occafion many difeafes. There is no doubt but the whole conflitution of body may be changed by diet alone. The fluids may be thereby attenuated or condenfed, rendered mild or acrimonious, coagulated or diluted, to almost any degree. Nor are its effects upon the folids lefs confiderable. They may be braced or relaxed, have their fensibility, motions, &c. greatly encreafed or diministed, by different kinds of aliment. A very fmall attention to thefe things will be fufficient to fhew, how much the prefervation of health depends upon a proper regimen of the diet.

Nor is an attention to diet neceffary for the preferyation of health only: it is likewife of importance in the cure of difeafes. Every intention in the cure of many difeafes, may be anfwered by diet alone. Its effects, indeed, are not always fo quick as thole of medicine, but they are generally more lafting: befides, it is neither fo difagreeable to the patient, nor fo dangerous as medicine, and is always more eafily obtained.

Our

Our intention here is not to enquire minutely into the nature and properties of the various kinds of aliment in use among mankind; nor to shew their effects upon the different conflicutions of the human body; but to mark fome of the most pernicious errors which people are apt to fall into, with respect both to the quantity and quality of their food, and to point out their influence upon health.

It is not indeed an eafy matter to afcertain the exact quantity of food proper for every age, fex, and conftitution : but a fcrupulous nicety here is by no means neceffary. The beft rule is to avoid all extremes. Mankind were never intended to weigh and meafure their food. Nature teaches every creature when it has enough; and the calls of thirft and hunger are fufficient to inform them when more is neceffary.

Though *moderation* is the chief rule with regard to the quantity, yet the quality of food merits a farther confideration. There are many ways by which provisions may be rendered unwholefome. Bad feafons may either prevent the ripening of grain, or damage it afterwards. Thefe, indeed, are acts of Providence, and we mult fubmit to them; but furely no punishment can be too fevere for thofe who fuffer provisions to fpoil by hoarding them, on purpole to raile the price, or who promote their own intereft by adulterating the neceffaries of life *.

Animal, as well as vegetable food, may be rendered unwholefome, by being kept too long. All animal fubftances have a conftant tendency to putrefaction; and, when that has proceeded too far, they

* The poor, indeed, are generally the first who fuffer by unfound provisions; but the lives of the labouring poor are of great importance to the flate: besides, difeases occasioned by unwholesome food often prove infectious, by which means they reach people in every flation. It is therefore the interest of all to take care that no fpoilt provisions of any kind be exposed to fale.

not

not only become offenfive to the fenfes, but hurtful to health. Difeafed animals, and fuch as die of themfelves, ought never to be eaten. It is a common practice, however, in fome grazing countries, for fervants and poor people to eat fuch animals as die of any difeafe, or are killed by accident. Poverty, indeed, may oblige people to do this; but they had better eat a fmaller quantity of what is found and wholefome: it would both afford a better nourifhment, and be attended with lefs danger.

The injunctions given to the Jews, not to eat any creature which died of itfelf, feem to have a ftrict regard to health; and ought to be obferved by Chriftians as well as Jews. Animals never die themfelves without fome previous difeafe; but how a difeafed animal fhould be wholefome food, is inconceivable: even thofe which die by accident muft be hurtful, as their blood is mixed with the flefth, and foon turns putrid.

Animals which feed grofsly, as tame ducks, hogs, &cc. are neither fo eafily digefted, nor afford fuch wholefome nourifhment as others. No animal can be wholefome which does not take fufficient exercife. Moft of our ftalled cattle are crammed with grofs food, but not allowed exercife nor free air; by which means they indeed grow fat, but their juices not being properly prepared or affimilated, remain crude, and occafion indigeftions, grofs humours, and opprefiion of the fpirits, in those who feed upon them.

Animals are often rendered unwholefome by being over-heated. Exceffive heat caufes a fever, exalts the animal falts, and mixes the blood fo intimately with the flefh, that it cannot be feparated. For this reafon, butchers fhould be feverely punifhed who over drive their cattle. No perfon would chufe to eat the flefh of an animal which had died in a high fever; yet that is the cafe with all over-drove cattle; and

64

and the fever is often raifed even to the degree of madnefs.

But this is not the only way by which butchers render meat unwholefome. The abominable cuftom of filling the cellular membrane of animals with air, in order to make them appear far, is every day practifed. This not only fpoils the meat, and renaders it unfit for keeping, but is fuch a dirty trick; that the very idea of it is fufficient to difguft a perfon of any delicacy at every thing which comes from the fhambles. Who can bear the thought of eating meat which has been blown up with air from the lungs of a dirty fellow, perhaps labouring under the very worft of difeafes.

Butchers have likewife a method of filling the cellular membranes of animals with blood. This makes the meat feem fatter, and likewife weigh more, but is notwithstanding a very pernicious cuftom, as it both renders the meat unwholfome and unfit for keeping. I feldom fee a piece of meat from the shambles, where the blood is not diffused through the cellular texture. I shall not fay that this is always the effect of defign; but I am certain it is not the cafe with animals that are killed for domeftic ufe, and properly blooded. Veal feems to be moft frequently spoilt in this way. Perhaps that may in fome meafure be owing to the practice of carrying calves from a great diftance to market, by which means their tender flesh is bruifed, and many of their veffels burft.

No people in the world eat fuch quantities of animal food as the Englifh, which is one reafon why they are fo generally tainted with the fcurvy and its numerous train of confequences, indigeftion, low fpirits, hypochondriacifm, &c. Animal food was furely defigned for man, and with a proper mixture of vegetables, it will be found the moft wholefome; F

but to gorge, beef, mutton, pork, fish, and fowl, twice or thrice a day, is certainly too much. All who value health ought to be contented with making one meal of flesh in the twenty-four hours, and this ought to confift of one kind only.

The most obstinate scurvy has often been cured by a vegetable diet; nay, milk alone will frequently do more in that difeafe than any medicine. Hence it is evident, that if vegetables and milk were more uled in diet, we should have less fcurvy, and likewife fewer putrid and inflammatory fevers. Fresh vegetables, indeed, come to be daily more ufed in diet; this laudable practice we hope will continue to gain ground.

Our aliment ought neither to be too moift nor too dry. Moift aliment relaxes the folids, and renders the body feeble. Thus we fee females, who live much on tea and other watery diet, generally become weak and unable to digeft folid food : hence proceed hysterics, and all their dreadful confequences. On the other hand, food that is too dry, renders the folids in a manner rigid, and the humours viscid, which disposes the body to inflammatory fevers, scurvies, and the like.

Much has been faid on the ill effects of tea in diet. They are, no doubt, numerous; but they proceed rather from the imprudent use of it, than from any bad qualities in the tea itfelf. Tea is now the univerfal breakfast in this part of the world; but the morning is furely the most improper time of the day for drinking it. Most delicate perfons, who, by the bye, are the greatest tea drinkers, cannot eat any thing in the morning. If fuch perfons, after fasting ten or twelve hours, drink four or five cups of green tea without eating almost any bread, it must hurt them. Good tea, taken in a moderate quantity, not too ftrong, nor too hot, nor drank upon an empty ftomach.

ftomach, will feldom do harm; but if it be bad, which is often the cafe, or fubfituted in the room of folid food, it must have many ill effects.

The arts of cookery render many things unwholefome, which are not fo in their own nature. By jumbling together a number of different ingredients, in order to make a poignant fauce, or rich foup, the composition proves almost a poison. All high feasoning, pickles, &c. are only incentives to luxury, and never fail to hurt the ftomach. It were well for mankind, if cookery, as an art, were entirely prohibited. Plain roafting or boiling is all that the ftomach requires. These alone are fufficient for people in health, and the fick have ftill less need of a cook.

The liquid part of our aliment likewife claims our attention. Water is not only the bafis of most liquors, but also composes a great part of our folid food. Good water must therefore be of the greatest importance in diet. The beft water is that which is most pure, and free from any mixture of foreign bodies. Water takes up parts of most bodies with which it comes into contact; by this means it is often impregnated with metals or minerals of a hurtful or poifonous nature. Hence the inhabitants of fome billy countries have peculiar difeates, which in all probability proceed from the water. Thus the people who live near the Alps in Switzerland, and the inhabitants of the Peak of Derby in England, have large tumours or wens on their necks. This difeafe is generally imputed to the fnow water; but there is more reason to believe it is owing to the minerals in the mountains through which the waters pafs.

When water is impregnated with foreign bodies, it generally appears by its weight, colour, tafte, fmell, heat, or fome other fenfible quality. Our bufiness therefore is to chuse fuch water, for com- F_2 mon mon ufe, as is lighteft, and without any particular colour, tafte, or fmell. In moft places of Britain the inhabitants have it in their power to make choice of their water; and few things would contribute more to health than a due attention to this article. But mere indolence often induces people to make ule of the water that is neareft to them, without confidering its qualities.

Before water is brought into great towns, the ftricteft attention ought to be paid to its qualities, as many difeafes may be occasioned or aggravated by bad water; and when once it has been procured at a great expence, people are unwilling to give it up.

The common methods of rendering water clear by filtration, or foft, by expofing it to the fun and air, &c. are fo generally known that it is unneceffary to fpend time in explaining them. We fhall only, in general, advife all to avoid waters which ftagnate long in fmall lakes, ponds, or the like, as fuch waters often become putrid, by the corruption of animal and vegetable bodies with which they abound. Even cattle frequently fuffer by drinking, in dry feafons, water which has flood long in fmall refervoirs, without being fupplied by fprings, or frefhened with fhowers. All wells ought to be kept clean, and to have a free communication with the air.

As fermented liquors, notwithftanding they have been exclaimed againft by many writers, ftill continue to be the common drink of almoft every perfon who can afford them, we fhall rather endeavour to affift people in the choice of thefe liquors, than pretend to condemn what cuftom has fo firmly eftablished. It is not the moderate use of found fermented liquors which hurts mankind: it is excefs, and using fuch as are ill prepared or vitiated.

Fermented liquors, which are too ftrong, hurt digeftion; and the body is fo far from being ftrengthened by them, that it is weakened and relaxed. Many

Many imagine that hard labour could not be fupported without drinking ftrong liquors : this is a very erroneous notion. Men who never tafte ftrong liquors are not only able to endure more fatigue but alfo live much longer, than those who use them daily. But, suppose strong liquors did enable a man to do more work, they must neverthelefs wafte the powers of life, and occasion premature old age. They keep up a conftant fever, which exhaufts the fpirits, inflames the blood, and difpofes the body to numberless difeases.

But fermented liquors may be too weak as well as too ftrong : when that is the cafe, they must either be drank new, or they become four and dead: when fuch liquors are drank new, the fermentation not being over, they generate air in the bowels, and occafion flatulencies, and, when kept till flale, they turn four on the ftomach, and hurt digeftion. For this reason all malt-liquors, cyder, &c. ought to be of fuch ftrength as to keep till they be ripe, and then they should be used. When such liquors are kept too long, though they fhould not become four, yet they generally contract a hardness which renders them unwholefome.

All families, who can, ought to prepare their own liquors. Since preparing and vending of liquors became one of the most general branches of bufinefs, every method has been tried to adulterate them. The great object both to the makers and venders of liquor is, to render it intoxicating, and give it the appearance of age. But it is well known that this may be done by other ingredients than those which ought to be used for making it frong. It would be imprudent even to name those things which are daily made use of to render liquors heady. Suffice it to fay, that the practice is very common, and that all the ingredients used for this purpole are of a narcotic or flupefactive F 2 quality.

quality. But as all opiates are poifonous, it is eafy to fee what must be the confequence of their general ufe. Though they do not kill fuddenly, yet they hurt the nerves, relax and weaken the ftomach, and fpoil the digeftion.

Were fermented liquors faithfully prepared, kept to a proper age, and used in moderation, they would prove real bleffings to mankind. But, while they are ill prepared, various ways adulterated, and taken to excess, they must have many pernicious effects.

We would recommend it to families, not only to prepare their own liquors, but likewife their bread. Bread is fo neceffary a part of diet, that too much care cannot be beftowed in order to have it found and wholefome. For this purpofe, it is not only neceffary that it be made of good grain, but likewife properly prepared, and kept free from all unwholefome ingredients. This, however, we have reafon to believe is not always the cafe with bread prepared by thofe who make a trade of vending it. Their object is rather to pleafe the eye, than to confult the health. The beft bread is that which is neither too coarfe nor too fine; well fermented, and made of wheat flour, or rather of wheat and rye mixed together.

To fpecify the different kinds of aliment, to explain their nature and properties, and to point out their effects in different conflictutions, would far exceed the limits of our defign. Inftead of a detail of this kind, which would not be generally underflood, and of courfe little attended to, we fhall only mention the following eafy rules with refpect to the choice of aliment.

Perfons whole folids are weak and relaxed, ought to avoid all vifeid food, or fuch things as are hard of digeftion. Their diet, however, ought to be nourifhing; and they fhould take fufficient exercise in the open air.

Such

Such as abound with blood fhould be fparing in the use of every thing that is highly nourishing, as fat meat, rich wines, ftrong ale, and fuch like. Their food fhould confift chiefly of bread and other vegetable substances; and their drink ought to be water, whey, or fmall beer.

Fat people should not eat freely of oily nourishing They ought frequently to use raddish, garlic, diet. fpices, or fuch things as are heating and promote perfpiration and urine. Their drink should be water, coffee, tea, or the like; and they ought to take much exercife and little fleep.

Those who are too lean must follow an opposite courfe.

Such as are troubled with acidities, or whole food is apt to four on the ftomach, should live much on animal food; and those who are afflicted with hot alkaline eructations, ought to use a diet confisting chiefly of acid vegetables.

People who are affected with the gout, low fpirits, hypochondriac or hyfteric diforders, ought to avoid all flatulent food, every thing that is vifcid, or hard of digeftion, all falted or fmoke-dried provisions, and whatever is auftere, acid, or apt to turn four on the ftomach. Their food fhould be light, spare, cool, and of an opening nature.

The diet ought not only to be fuited to the age and conftitution, but also to the manner of life: a fedentary or fludious perfon fhould live more sparingly than one who labours hard without doors. Many kinds of food will nourifh a peafant very well which would be almost indigestible to a citizen; and the latter will live upon a diet on which the former would ftarve.

Diet ought not to be too uniform. The conftant use of one kind of food might have some bad effects. Nature teaches us this, by the great variety of aliment which she has provided for man, and F4 likewife

42

likewife by giving him an appetite for different kinds of food.

Those who labour under any particular difease; ought to avoid such aliments as have a tendency to increafe it: for example, a gouty perfon fhould not indulge in rich wines, ftrong foups, or gravies, and should avoid all acids. One who is troubled with the gravel ought to fhun all auftere and aftringent aliments; and those who are fcorbutic should be sparing in the use of falted provisions. &c.

In the first period of life, our food ought to be light, but nourifhing, and frequently taken. Food that is folid, with a fufficient degree of tenacity, is most proper for the state of manhood. The diet fuited to the last period of life, when nature is upon the decline, approaches nearly to that of the first. It should be lighter and more fucculent than that of vigorous age, and likewife more frequently taken.

It is not only neceffary for health that our diet be wholefome, but alfo that it be taken at regular periods. Some imagine long fasting will atone for excess; but this, inftead of mending the matter, generally makes it worfe. When the ftomach and inteftines are over diftended with food, they lofe their proper tone, and, by long fafting, they become weak, and inflated with wind. Thus, either gluttony or fafting deftroys the powers of digeftion.

The frequent repetition of aliment is not only neceffary for repairing the continual wafte of our bodies, but likewife to keep the fluids found and fweet. Our humours, even in the most healthy state, have a constant tendency to putrefaction, which can only be prevented by frequent supplies of fresh nourishment : when that is wanting too long, the putrefaction often proceeds fo far as to occafion very dangerous fevers. From hence we may

may learn the neceffity of regular meals. No perfon can enjoy a good ftate of health, whofe veffels are either frequently overcharged, or the humours long deprived of fresh supplies of chyle.

Long fafting is extremely hurtful to young people; it not only vitiates their humours, but prevents their growth. Nor is it lefs injurious to the aged. Moft perfons, in the decline of life, are afflicted with wind: this complaint is not only increafed, but even rendered dangerous, and often fatal, by long fafting. Old people, when their ftomachs are empty, are frequently feized with giddinefs, head-achs, and faintnefs. Thefe complaints may generally be removed by a piece of bread and a glats of wine, or taking any other folid food; which plainly points out the method of preventing them.

It is more than probable, that many of the fudden deaths, which happen in the advanced periods of life, are occafioned by fafting too long, as it exhaufts the fpirits, and fills the bowels with wind; we would therefore advife people in the decline of life, never to allow their ftomachs to be too long empty. Many people take nothing but a few cups of tea and a little bread, from nine o'clock at night till two or three next afternoon. Such may be faid to faft almost three-fourths of their time. This can hardly fail to ruin the appetite, vitiate the humours, and fill the bowels with, wind; all which might be prevented by a folid breakfaft.

It is a very common practice to eat a light breakfaft and a heavy fupper. This cuftom ought to be reverfed. When people fup late, their iupper fhould be very light; but the breakfaft ought always to be folid. If any one eats a light fupper, goes foon to bed, and rifes betimes in the morning, he he will be fure to find an appetite for his breakfaft, and he may freely indulge it.

The ftrong and healthy do not indeed fuffer fo much from failing as the weak and delicate; but they run great hazard from its oppofite, viz. repletion. Many difeales, efpecially fevers, are the effect of a plethora, or too great fulnels of the veffels. Strong people, in high health, have generally a great quantity of blood and other humours. When these are fuddenly increased, by an overcharge of rich and nourishing diet, the veffels become too much diftended, and obstructions and inflammations enfue. Hence fo many people are feized with inflammatory and eruptive fevers, apoplexies, &c. after a feast or debauch.

All great and fudden changes in diet are dangerous. What the ftomach has been long accuftomed to digeft, though lefs wholefome, will agree better with it than food of a more falutary nature to which it has not been ufed. When therefore a change becomes neceffary, it ought always to be made gradually; a fudden transition from a poor and low, to a rich and luxurious diet, or the contrary, might fo difturb the functions of the body as to endanger health, or even to occafion death itfelf.

When we recommend regularity in diet, we would not be underflood as condemning every fmall deviation from it. It is next to impoffible for people at all times to avoid fome degree of excefs, and living too much by rule might make even the fmalleft deviation dangerous. It may therefore be prudent to vary a little, fometimes taking more, fometimes lefs, than the ufual quantity of meat and drink, provided always that a due regard be had to moderation.

[75]

CHAP. IV.

OF AIR.

UNWHOLESOME air is a very common caufe of diteales. Few are aware of the danger aifing from it. People generally pay fome attention to what they eat or drink, but feldom regard what goes into the lungs, though the latter proves often more fuddenly fatal than the former.

Air, as well as water, takes up parts of moft bodies with which it comes in contact, and is often fo replenished with those of a noxious quality, as to occassion immediate death. But such violent effects feldom happen, as people are generally on their guard against them. The less perceptible influences of bad air prove more generally hurtful to mankind; we shall therefore endeavour to point out fome of these, and to shew whence the danger chiefly arises.

Air may become noxious many ways. Whatever greatly alters its degree of heat, cold, moifture, &c. renders it unwholefome: for example, that which is too hot diffipates the warry parts of the blood, exalts the bile, and renders the whole humours aduft and thick. Hence proceed bilious and inflammatory fevers, cholera morbus, &c. Very cold air obfructs the perfpiration, confiringes the folids, and condenfes the fluids. It occafions rheumatifins, coughs, and catarrhs, with other difeafes of the throat and breaft. Air that is too moift defiroys the elafticity or fpring of the folids, induces phlegmatic or lax confiitutions, and difpofes the body to agues, or intermitting fevers, dropfies, &c.

Wherever great numbers of people are crowded into one place, if the air has not a free circulation, it it foon becomes unwholefome. Hence it is that delicate perfons are fo apt to turn fick or faint in crowded churches, affemblies, or any place where the air is injured by breathing, fires, candles, or the like.

In great cities fo many things tend to contaminate the air, that it is no wonder it proves fo fatal to the inhabitants. The air in cities is not only breathed repeatedly over, but is likewife loaded with fulphur, fmoke, and other exhalations, befides the vapours continually arifing from Pinnumerable putrid fubflances, as dunghills, flaughter-houfes, &cc. All poffible care fhould be taken to keep the ftreets of large towns open and wide, that the air may have a free current through them. They ought likewife to be kept very clean. Nothing tends more to pollute and contaminate the air of a city than dirty ftreets.

It is very common in this country to have churchyards in the middle of populous cities. Whether this be the effect of ancient fuperfition, or owing to the increase of fuch towns, is a matter of noconfequence. Whatever gave rife to the custom, it is a bad one. It is habit alone which reconciles us to thefe things; by means of which the most ridiculous, nay pernicious customs, often become facred. Certain it is, that thousands of puttid carcasses, fo near the furface of the earth, in a place where the air is confined, cannot fail to taint it, and that fuch air, when breathed into the lungs, must occasses and the furface of the earth of the furface of the second that fuch air, when breathed into the lungs, must oc-

Burying within churches is a practice fill more deteftable. The air in churches is feldom good,

* In most eaftern countries it was cultomary to bury the dead at fome diffance from any town. As this practice obtained among the Jews, the Greeks, and alfo the Romans, it is ftrange that the worthern parts of Europe flould not have followed their example in a cultom fo truly laudable.

and

and the effluvia from putrid carcaffes muft render it ftill worfe. Churches are commonly old buildings with arched roofs. They are feldom open above once a week, are never ventilated by fires nor open windows, and rarely kept clean. This occafions that damp, mufty, unwholefome fmell which one feels upon entering a church, and renders it a very unfafe place for the weak and valetudinary. Thefe inconveniences might, in a great meafure, be obviated, by prohibiting all perfons from burying within churches, by keeping them clean, and permitting a ftream of frefh air to pafs frequently through them, by opening oppofite doors and windows *.

Wherever air ftagnates long, it becomes unwholefome. Hence the unhappy perfons confined in jails not only contract malignant fevers themfelves, but often communicate them to others. Nor are many of the holes, for we cannot call them houfes, polfeffed by the poor in great towns, much better than jails. Thefe low dirty habitations are the very lurking places of bad air and contagious difeafes. Such as live in them feldom enjoy good health; and their children commonly die young. In the choice of a houfe, thofe who have it in their power ought always to pay the greateft attention to open free air.

The various methods which luxury has invented to make houfes clofe and warm, contribute not a little to render them unwholefome. No houfe can be wholefome unlets the air has a free paffage through it. For which reafon houfes ought daily to be ventilated, by opening opposite windows, and admitting a current of fresh air into every room. Beds, instead of being made up as foon as people rife out of them, ought to be turned down, and exposed to the fresh air from the open windows

* One cannot pass through a large church or cathedral, even in fummer, without feeling quite chilly.

through

OF AIR.

through the day. This would expel any noxious vapour, and could not fail to promote the health of the inhabitants.

In hospitals, jails, ships, &c. where that cannot be conveniently done, ventilators should be used. The method of expelling foul, and introducing fresh air, by means of ventilators, is a most falutary invention, and is indeed the most useful of all our modern medical improvements. It is capable of universal application, and is fraught with numerous advantages, both to those in health and fickness. In all places, where numbers of people are crowded together, ventilation becomes absolutely neceffary.

Air which ftagnates in mines, wells, cellars, &c. is extremely noxious. That kind of air is to be avoided as the moft deadly poifon. It often kills almoft as quickly as lightning. For this reafon, people fhould be very cautious in opening cellars that have been long flut, or going down into deep wells or pits, effectally if they have been kept clofe covered *.

Many people who have fplendid houfes, chufe to fleep in fmall apartments. This conduct is very imprudent. A bed chamber ought always to be well aired; as it is generally occupied in the night only, when all doors and windows are fhut. If a fire be kept in it, the danger from a fmall room becomes ftill greater. Numbers have been ftifled when afleep by a fire in a fmall apartment, which is always hurtful.

Those who are obliged, on account of bufines, to spend the day in close towns, ought, if possible, to sleep in the country. Breathing free air in the

* We have daily accounts of perfons who lofe their lives by going down into deep wells and other places where the air flagnates; all thefe accidents might be prevented by only letting down a lighted candle before them, and flopping when they perceive it go out; yet this precaution, fimple as it is, is feldom ufed.

night

night will, in fome meafure, make up for the want of it through the day. This practice would have a greater effect in preferving the health of citizens than is commonly imagined.

Delicate perfons ought, as much as poffible, to avoid the air of great towns. It is peculiarly hurtful to the afthmatic and confumptive. Such perfons should avoid cities as they would the plague. The hypochondriac are likewife much hurt by it. I have often feen perfons fo much afflicted with this malady while in town, that it feemed imposfible for them to live, who, upon being removed to the country, were immediately relieved. The fame observation holds with regard to nervous and hyfteric women. Many people, indeed, have it not in their power to change their fituation in queft of better air. All we can fay to fuch perfons is, that they should go as often abroad into the open air as they can, that they should admit fresh air frequently into their houses, and take care to keep them very clean.

It was neceffary in former times, for fafety, to furround cities, colleges, and even fingle houfes, with high walls. Thefe, by obftructing the free current of air, never fail to render fuch places damp and unwholefome. As fuch walls are now, in molt parts of this country, become ufelefs, they ought to be pulled down, and every method taken to admit a free paffage to the air. Proper attention to AIR and CLEANLINESS would tend more to preferve the health of mankind, than all the prefcriptions of the faculty.

Surrounding houfes too clofely with planting or thick woods, likewife tends to render the air unwholefome. Wood not only obftructs the free current of the air, but fends forth great quantities of moift exhalations, which render it conftantly damp. Wood is very agreeable at a proper diftance from a houfe, houfe, but should never be planted too near it, especially in a flat country. Many of the gentlemen's feats in England are rendered very unwholesome from the great quantity of wood which furrounds them.

Houfes fituated in low marfhy countries, or near large lakes of flagnating water, are likewife unwholefome. Waters which flagnate not only render the air damp, but load it with putrid exhalations, which produce the most dangerous and fatal difeases. Those who are obliged to inhabit marfhy countries, ought to make choice of the dryest fituations they can find, to live generously, and to pay the strictest regard to cleanline is.

If fresh air be necessary for those in health, it is shill more so for the fick, who often lose their lives for want of it. The notion that fick people must be kept very hot, is so common, that one can hardly enter the chamber where a patient lies, without being ready to faint, by reason of the hot suffocating finell. How this must affect the fick, any one may judge. No medicine is so beneficial to the fick as fresh air. It is the most reviving of all cordials, if it be administered with prudence. We are not, however, to throw open doors and windows at random upon the fick. Fresh air is to be let into the chamber gradually, and, if possible, by opening the windows of fome other apartment.

The air of a fick perfon's chamber may be greatly frefhened, and the patient much revived, by fprinkling the floor, bed, &c. frequently with vinegar, juice of lemon, or any other flrong vegetable acid.

In places where numbers of fick are crowded into the fame houfe, or, which is often the cafe, into the fame apartment, the frequent admiffion of frefh air becomes abfolutely neceffary. Infirmaries, hofpitals, &cc. are often rendered fo noxious, for want of proper ventilation, that the fick run more hazard from them than from the difeafe. This is particularly

OF EXERCISE.

larly the cafe when putrid fevers, dyfenteries, and other infectious difeafes prevail.

Phyficians, furgeons, and others who attend hofpitals, ought, for their own fafety, to take care that they be properly ventilated. Such perfons as are obliged to fpend most of their time amongst the fick, run great hazard of being themfelves infected when the air is bad. All hofpitals, and places of reception for the fick, ought to have an open fituation, at fome diftance from any great town, and fuch patients as labour under any infectious difease ought never to be fuffered to come near the reft *.

CHAP. V.

OF EXERCISE.

ANY people look upon the necefiity man is under of earning his bread by labour, as a curfe. Be this as it may, it is evident from the ftructure of the body, that exercise is not less neceffary than food for the prefervation of health : those whom poverty obliges to labour for daily bread, are not only the most healthy, but generally the most happy part of mankind. Industry feldom fails to place them above want, and activity ferves them instead of physic. This is peculiarly the cafe with those who live by the culture of the ground. The great increase of inhabitants in infant cologies, and the longevity of fuch as follow agriculture every where, evidently prove it to be the most neathful as well as the most useful employment.

* A year feldom paffes that we do not hear of fome hofpital physician or furgeon having lot his life by an hofpital fever caught from his patients. For this they have themfelves alone to blame. Their patients are either in an improper fituation, or they are too sarelefs with regard to their own conduct.

The

SE

The love of activity fhews itfelf very early in man. So ftrong is this principle, that a healthy youth cannot be reftrained from exercife, even by the fear of punifhment. Our love of motion is furely a ftrong proof of its utility. Nature implants no difpolition in vain. It feems to be a catholic law throughout the whole animal creation, that no creature, without exercife, fhould enjoy health, or be able to find fubliftence. Every creature, except man, takes as much of it as its neceffary. He alone, and fuch animals as are underhis direction, deviate from this original law, and they fuffer accordingly.

Inactivity never fails to induce an univerfal relaxation of the folids, which difpofes the body to innumerable difeafes. When the folids are relaxed, neither the digeftion, nor any of the fecretions can be duly performed. In this cafe, the worft confequences muft enfue. How can perfons who loll all day in eafy chairs, and fleep all night on beds of down, fail to be relaxed? Nor do fuch greatly mend the matter, who never ftir abroad but in a coach, fedan, or fuch like. Thefe elegant pieces of luxury are become fo common, that the inhabitants of great towns feem to be in fome danger of lofing the ufe of their limbs altogether. It is now below any one to walk, who can afford to be carried. How ridiculous would it feem, to a perfon unacquainted with modern luxury, to behold the young and healthy fwinging along on the fhoulders of their fellow-creatures! or to fee a fat carcafe, over-run with difeafes occasioned by inactivity, dragged through the ffreets by half a dozen horfes *!

* It is not neceffity, but fashion, which makes the use of carriages to common. There are many people who have not exercise enough to keep their humours wholefome, who yet dare not venture to make a vifit to their next neighbours, but in a coach or fedan, left they should be looked down upon. Strange, that men should be fuch fools as to be laughed out of the use of their limbs, or to throw away their health, in order to gratify a piece of vanity, or to comply with a ridiculous fashion !

Glandular

Glandular obftructions, now fo common, generally proceed from inactivity. Thefe are the moft obftinate of maladies. So long as the liver, kidnies, and other glands, duly perform their functions, health is feldom impaired; but when they fail, nothing can reftore it. Exercise is almost the only cure we know for glandular obftructions; indeed, it does not always fucceed as a remedy; but there is reason to believe that it would feldom fail to prevent thefe complaints, were it used in due time. One thing is certain, that, amongst those who take fufficient exercise, glandular difeases are very little known; whereas the indolent and inactive are feldom free from them.

Weak nerves are the conftant companions of inactivity. Nothing but exercise and open air can brace and ftrengthen the nerves, or prevent the endless train of difease which proceed from a relaxed state of these organs. We feldom hear the active or laborious complain of nervous difeases; these are referved for the fons of ease and affluence. Many have been completely cured of these diforders by being reduced, from a state of opulence, to labour for their daily bread. This plainly points out the sources from whence nervous difeases show, and the means by which they may be prevented.

It is abfolutely impoffible to enjoy health, where the perfpiration is not duly carried on; but that can never be the cafe where exercife is neglected. When the matter which ought to be thrown off by perfpiration is retained in the body, it vitiates the humours, and occafions the gout, fevers, rheumatifm, &c. Exercife alone would prevent many of those difeases which cannot be cured, and would remove others where medicine proves ineffectual.

A late author*, in his excellent treatife on health, fays that the weak and valetudinary ought to make

> * Cheyne. G 2

exercife

exercife a part of their religion. We would recome mend this, not only to the weak and valetudinary, but to all whole bufinefs does not oblige them to take fufficient exercife, as fedentary artificers*, fhopkeepers, ftudious perfons, &c. Such ought to use exercise as regularly as they take food. This might generally be done without any interruption to bufinefs or real loss of time.

No piece of indolence hurts the health more than the modern cuftom of lying a-bed too long in a morning. This is the general practice in great towns. The inhabitants of cities feldom rife before eight or nine o'clock; but the morning is undoubtedly the best time for exercise, while the stomach is empty, and the body refreihed with fleep. Befides, the morning air braces and ftrengthens the nerves, and, in some measure, answers the purpose of a cold bath. Let any one who has been accustomed to lie a-bed till eight or nine o'clock, rife by fix or feven, fpend a couple of hours in walking, riding, or any active diversion without doors, and he will find his fpirits cheerful and ferene through the day, his appetite keen, and his body braced and ftrengthened. Cuftom foon renders early rifing agreeable,

* Sedentary occupations ought chiefly to be followed by women. They bear confinement much better than men, and are fitter for every kind of bufinefs which does not require much frength. It is ridiculous enough to fee a lufty fellow making pins, needles, or watch wheels, while many of the laborious, parts of hufbandry are carried on by the other fex. The fact is, we want men for laborious employments, while one half of the other fex are rendered ufclefs for want of occupations fuited to their ftrength, &c. Were girls bred to mechanical employments, we fhould not fee fuch numbers of them profitute themfelves for bread, nor find fuch a want of men for the important purpofes of navigation, agriculture, &c. An eminent filk manufacturer told me, that he found women answer better for that bufinefs than men, and that he had lately taken a great many girls apprentices as filk weavers. I hope his example will be followed by many others.

84

 \mathcal{D}

and nothing contributes more to the prefervation of health.

The inactive are continually complaining of pains of the ftomach, flatulences, indigeftions, &c. Thefe complaints, which pave the way to many others, are not to be removed by medicines. They can only be cured by a vigorous courfe of exercise, to which indeed they feldom fail to yield.

Exercife, if poffible, ought always to be taken in the open air. When that cannot be done, various methods may be contrived for exercifing the body within doors; as the dumb bell, dancing, fencing, &cc. It is not neceffary to adhere frictly to any particular kind of exercife. The beft way is to take them by turns, and to ufe that longeft which is moft fuitable to the fitrength and confliction. Those kinds of exercife which give action to moft of the bodily organs, are always to be preferred, as walking, running, riding, digging, rubbing furniture, and fuch like.

It is much to be regretted, that active and manly diverfions are now to little practifed. Diverfions make people take more exercise than they otherwife would do, and are of the greatest fervice to fuch as are not under the neceffity of labouring for their bread. As active diversions lose ground, those of a fedentary kind feem to prevail. Sedentary diversions are of no other use but to confume time. Instead of relieving the mind, they often require more thought than either fluidy or bufines. Every thing that induces people to fit fill, unless it be fome neceffary employment, ought to be avoided.

The diversions which afford the best exercise are, hunting, shooting, playing at cricket, handball, golff*, &c. These exercise the limbs, promote

* Golff is a diverfion very common in North Britain. It is well calculated for exercifing the body, and may always be taken G_3 in mote perfpiration, and the other fecretions. They likewite ftrengthen the lungs, and give firmnefs and agility to the whole body.

Such as can, ought to fpend two or three hours aday on horfeback; thofe who cannot ride, fhould employ the fame time in walking. Exercise fhould never be continued too long. Over-fatigue prevents the benefit of exercise, and inftead of ftrengthening the body tends to weaken it.

Every man should lay himself under some fort of necessity to take exercise. Indolence, like other vices when indulged, gains ground, and at length becomes agreeable. Hence many who were fond of exercise in the early part of life, become quite averse from it afterwards. This is the case of most hypochondriac and gouty people, which renders their discases in a great measure incurable.

In fome countries laws have been made, obliging every man, of whatever rank, to learn fome mechanical employment. Whether fuch laws were defigned for the prefervation of health, or the encouragement of manufacture, is a queftion of no importance. Certain it is, that if gentlemen were frequently to amufe and exercife themfelves in this way, it might have many good effects. They would at leaft derive as much honour from a few mafterly fpecimens of their own workmanfhip, as from the character of having ruined moft of their companions by gaming or drinking. Befides, men of leifure, by applying themfelves to the mechanical arts, might improve them, to the great benefit of fociety.

Indolence not only occafions difeafes, and renders men ufelefs to fociety, but promotes all manner of vice. To fay a man is idle, is little better than to call him vicious. The mind, if not engaged in

in fuch moderation, as neither to over heat nor fatigue. It has greatly the preference over cricket, tennis, or any of those games which cannot be played without violence.

lome

fome uleful purfuit, is conftantly in queft of ideal pleafures, or imprefied with the apprehenfion of fome imaginary evil. From thefe fources proceed most of the mileries of mankind. Certainly man was never intended to be idle. Inactivity frustrates the very defign of his creation; whereas an active life is the beft guardian of virtue, and the greatest prefervative of health.

CHAP. VI.

OF SLEEP AND CLOTHING.

S LEEP, as well as dief, ought to be duly regulated. Too little fleep weakens the nerves, exhaufts the fpirits, and occafions difeafes; and too much renders the mind dull, the body grofs, and difpofes to apoplexies, lethargies, and other complaints of a fimilar nature. A medium ought therefore to be obferved; but this is not eafy to fix. Children require more fleep than grown perfons, the laborious than the idle, and fuch as eat and drink freely, than thofe who live abflemioufly. Befides, the real quantity of fleep cannot be meafured by time; as one perfon will be more refreshed by five or fix hours fleep, than another by eight or ten.

Children may always be allowed to take as much fleep as they pleafe; but, for adults, fix or feven hours is certainly fufficient, and no one ought to exceed eight. Those who lie a-bed more than eight hours may flumber, but they can hardly be faid to fleep; fuch generally tofs and dream away the forepart of the night, fink to reft towards morning, and dofe till noon. The beft way to make fleep found and refreshing is to rife betimes. The cultom of lying a-bed for nine or ten hours, not only makes the G_4 fleep fleep lefs refreshing, but relaxes the folids, and greatly weakens the conftitution.

Nature points out night as the proper feafon for fleep. Nothing more certainly deftroys the conflitution than night-watching. It is great pity that a practice fo deftructive to health flould be fo much in fashion. How quickly the want of reft in due feafon will blaft the most blooming complexion, or ruin the best conflictution, is evident from the ghaftly countenances of those who, as the phrase is, turn day into night, and night into day.

To make fleep refreshing, the following things are requisite: First, to take sufficient exercise in the open air; to avoid strong tea or coffee; next, to eat a light supper; and lastly, to lie down with a mind as cheerful and server as possible.

It is certain that too much exercife will prevent fleep, as well as too little. We feldom however hear the active and laborious complain of reftlefs nights. It is the indolent and flothful who generally have thefe complaints. Is it any wonder that a bed of down fhould not be refrefhing to a perfon who fits all day in an eafy chair? A great part of the pleafure of life confifts in alternate reft and motion; but they who neglect the latter can never relifh the former. The labourer enjoys more true luxury in plain food and found fleep, than is to be found in fumptuous tables and downy pillows, where exercife is wanting.

That light fuppers caufe found fleep, is true even to a proverb. Many perfons, if they exceed the leaft at that meal, are fure to have uneafy nights; and, if they fall affeep, the load and oppreffion on their flomach and fiprirs occafion frightful dreams, broken and diffurbed repofe, the nightmare, &c. Were the fame perfons to go to bed with a light fupper, or fit up till that meal was pretty

pretty well digefted, they would enjoy found fleep, and rife refreshed and cheerful. There are indeed fome people who cannot sleep unless they have eat fome folid food at night, but this does not imply the necessfity of a heavy supper; besides, these are generally perfons who have accustomed themselves to this method, and who do not take a sufficient quantity of folid food and exercise.

Nothing more certainly diffurbs our repole than anxiety. When the mind is not at eafe, one feldom enjoys found fleep. This greateft of human bleffings flies the wretched, and vifits the happy, the cheerful, and the gay. This is a fufficient reafon why every man fhould endeavour to be as eafy in his mind as poffible when he goes to reft. Many, by indulging grief and anxious thought, have banifhed found fleep fo long, that they could never afterwards enjoy it.

Sleep, when taken in the fore-part of the night, is generally reckoned moft refreshing. Whether, this be the effect of habit or not, is hard to fay; but as most people are accultomed to go early to bed when young, it may be prefumed that fleep, at this feason, will prove most refreshing to them ever after. Whether the fore part of the night be best for fleep or not, furely the fore-part of the day is fittest both for businets and amufement. I hardly ever knew an early rifer who did not enjoy a good flate of health *.

Of Clothing.

The clothing ought to be fuited to the climate. Cuftom has no doubt a very great influence in this

* Men of every occupation, and in every fituation of life, have lived to a good old age; nay fome have enjoyed this bleffing whofe plan of living was by no means regular: but it confifts with obfervation, that all very old men have been early rifers. This is the only circumfrance attending longevity to which I never knew an exception.

article ;

article; but no cuftom can ever change the nature of things fo far, as to render the fame clothing fit for an inhabitant of Nova Zembla and the ifland of Jamaica. It is not indeed neceffary to obferve an exact proportion between the quantity of clothes we wear, and the degree of latitude which we inhabit; but, at the fame time, proper attention ought to be paid to it, as well as to the opennels of the country, the frequency and violence of ftorms, &c.

In youth, while the blood is hot and the perfpiration free, it is lefs neceffary to cover the body with a great quantity of clothes; but in the decline of life, when the fkin becomes rigid and the humours more cool, the clothing fhould be increafed. Many difeafes in the latter period of life proceed from a defect of perfpiration: thefe may, in fome meafure, be prevented by a fuitable addition to the clothing, or by wearing fuch as are better calculated for promoting the difcharge from the fkin, as clothes made of cotton, flannel, &c.

The clothing ought likewife to be fuited to the feafon of the year. Clothing may be warm enough for fummer, which is by no means fufficient for winter. The greateft caution, however, is neceffary in making thefe changes. We ought neither to put off our winter clothes too foon, nor to wear our fummer ones too long. In this country, the winter often fets in very early with great rigour, and we have frequently cold weather even after the commencement of the fummer months. It would likewife be prudent not to make the change all at once, but to do it gradually; and indeed the changes of apparel in this climate ought to be very inconfiderable, efpecially among thofe who have paffed the meridian of life *.

Clothes

* That colds kill more than plagues, is an old obfervation; and, with regard to this country, it holds firstly true. Every perfon the different however, will perceive, that most of the colds which

OF SLEEP AND CLOTHING.

Clothes often become hurtful by their being made fubfervient to the purpoles of pride of vanity. Mankind in all ages feem to have confidered clothes in this view; accordingly their fafhion and figure have been continually varying, with very little regard either to health, the climate; or conveniency: a farthingale, for example, may be very neceffary in hot fouthern climates, but furely nothing can be more ridiculous in the cold regions of the north.

Even the human fhape is often attempted to be mended by drefs, and thofe who know no better believe that mankind would be monftrous without its affiftance. All attempts of this nature are highly pernicious. The most deftructive of them in this country is that of squeezing the fromach and bowels into as narrow a compais as possible, to procure, what is fallely called, a fine shape *. By this practice the action of the stomach and bowels, the motion of the heart and lungs, and almost all the vital functions, are obstructed. Hence proceed indigeftions, syncopes, or fainting fits, coughs, confumptions of the lungs, and other complaints so common among females.

The feet likewife often fuffer by prefiure. How a fmall foot came to be reckoned genteel, I will not pretend to fay; but certain it is, that this notion has made many perfons lame. Almost ninetenths of mankind are troubled with corns: a dif-

which prove to deftructive to the inhabitants of Britain, are owing to their imprudence in changing clothes. A few warm days in March or April induce them to throw off their winter garments, without confidering that our most penetrating colds generally happen in the fpring.

* This madnefs feems to have pervaded the minds of mothers in every age and country. Terence, in his Comedy of the Eunuch, ridicules the Roman matrons for attempting to mend the Mape of their daughters.

91 '

eafe -

OF SLEEP AND CLOTHING.

eafe that is feldom or never occafioned but by ftrait fhoes. Corns are not only very troublefome, but by rendering people unable to walk, they may likewife be confidered as the remote caufe of other difeafes *.

The fize and figure of the fhoe ought certainly to be adapted to the foot. In children the feet are as well shaped as the hands, and the motion of the toes as free and eafy as that of the fingers; yet few perfons in the advanced period of life are able to make any use of their toes. They are generally, by narrow shoes, squeezed all of a heap, and often laid over one another in fuch a manner as to be rendered altogether incapable of motion. Nor is the high heel lefs hurtful than the narrow toe. A lady may feem taller for walking on her tiptoes, but fhe will never walk well in this manner. It ftrains her joints, difforts her limbs, makes her floop, and utterly deftroys all her eafe and gracefulnefs of motion : it is entirely owing to fhoes with high heels and narrow toes, that not one female in ten can be faid to walk well.

In fixing on the clothes, due care fhould be taken to avoid all tight bandages. Garters, buckles, &c. when drawn too tight, not only prevent the free motion and use of the parts about which they are bound, but likewise obstruct the circulation of the blood, which prevents the equal nourishment and growth of thele parts, and occasions various difeases. Tight bandages about the neck, as flocks, cravats, necklaces, &c. are extremely dangerous. They obstruct the blood in its courte from the brain, by which means headachs, vertigoes, apo-

* We often fee perfons, who are rendered quite lame by the nails of their toes having grown into the flefh, and frequently hear of mortifications proceeding from this caule. All thefe, and many other inconveniencies attending the feet, muft be imputed folely to the use of flort and first flores.

plexies.

OF SLEEP AND CLOTHING.

plexies, and other fatal difeafes are often occafioned.

The perfection of drefs is to be eafy and clean. Nothing can be more ridiculous, than for any one to make himfelf a flave to fine clothes. Such a one, and many fuch there are, would rather remain as fixt as a flatue from morning till night, than difcompofe a fingle hair or alter the pofition of a pin. Were we to recommend any particular pattern for drefs, it would be that which is worn by the people called Quakers. They are always neat, clean, and often elegant, without any thing fuperfluous. What others lay out upon tawdry laces, ruffles, and ribands, they beftow upon fuperior cleanlinefs. Finery is only the affectation of drefs, and very often covers a great deal of dirt.

We shall only add, with regard to clothing, that it ought not only to be fuited to the climate, the feafon of the year, and the period of life; but likewife to the temperature and conflictution. Robust perfons are able to endure either cold or heat better than the delicate; confequently may be lefs attentive to their clothing. But the precife quantity of clothes neceffary for any perfon cannot be determined by reafoning. It is entirely a matter of experience, and every man is the best judge for himfelf what quantity of clothes is neceffary to keep him warm *.

* The celebrated Boerhaave ufed to fay, that no body fuffered by cold fave fools and beggars; the latter not being able to procure clothes, and the former not having fenfe to wear them. Be this as it may, I can with the firicfeft truth deckre, that in many cafes where the powers of medicine had been tried in vain, I have cured the patient by recommending thick fhoes, a flannel waiftcoat and drawers, a pair of under flockings, or a flannel petticeat, to be worn during the cold feafon at leaft. Where warmer clothing is wanted, I would recommend the fleecy hofiery to be worn next the fkin.

CHAP.

[94]

CHAP. VII.

OF INTEMPERANCE.

MODERN author * obferves, that temperance and exercife are the two beft phyficians in the world. He might have added, that if thefe were duly regarded, there would be little occation for any other. Temperance may juftly be called the parent of health; yet numbers of mankind act as if they thought difeafes and death too flow in their progrefs, and by intemperance and debauch feem as it were to folicit their approach.

The danger of intemperance appears from the very conftruction of the human body. Health depends on that flate of the folids and fluids which fits them for the due performance of the vital functions; and while thefe go regularly on, we are found and well; but whatever diffurbs them neceffarily impairs health. Intemperance never fails to diforder the whole animal occonomy; it hurts the digeftion, relaxes the nerves, renders the different fecretions irregolar, vitiates the humours, and occafions numberlefs difeafes.

The analogy between the nourifhment of plants and animals affords a firiking proof of the danger of intemperance. Moifture and manure greatly promote vegetation; yet an over-quantity of either will entirely deftroy it. The beft things become hurtful, nay deftructive, when carried to excefs. Hence we learn, that the higheft degree of human wifdom confifts in regulating our appetites and paffions fo as to avoid all extremes. It is that chiefly which en-

* Rouffeau.

titles us to the character of rational beings. The flave of appetite will ever be the difgrace of human nature.

The Author of Nature hath endued us with various paffions, for the propagation of the fpecies, the prefervation of the individual, &c. Intemperance is the abufe of thefe paffions; and moderation confifts in the proper regulation of them. Men, not contented with fatisfying the fimple calls of Nature, create artificial wants, and are perpetually in fearch after fomething that may gratified. Nature is content with little; but luxury knows no bounds. Hence the epicure, the drunkard, and the debauchee, feldom flop in their career, till their money or their conflitution fails: then indeed they generally fee their error when too late.

It is impoffible to lay down fixed rules with regard to diet, on account of the different conftitutions of mankind. The most ignorant perfon, however, certainly knows what is meant by excess; and it is in the power of every man, if he chufes, to avoid it.

The great rule of diet is to fludy fimplicity. Nature delights in the moft plain and fimple food, and every animal, except man, follows her dictates. Man alone riots at large, and ranfacks the whole creation in queft of luxuries, to his own deftruction. An elegant writer * of the laft age fpeaks thus of intemperance in diet: " For my part, when I behold a " fafhionable table fet out in all its magnificence, " I fancy that I fee gouts and dropfies, fevers and " lethargies, with other innumerable diffempers, " lying in ambufcade among the diffes."

Nor is intemperance in other things lefs deftructive than in diet. How quickly does the immoderate purfuit of carnal pleafures, or the abufe of in-

* Addifon.

toxicating

toxicating liquors, ruin the beft conftitution ! Indeed thefe vices generally go hand in hand. Hence it is that we fo often behold the votaries of Bacchus and Venus, even before they have arrived at the prime of life, worn out with difeafes, and hafting with fwift pace to an untimely grave. Did men reflect on the painful difeafes and premature deaths, which are daily occafioned by intemperance, it would be fufficient to make them flrink back with horror from the indulgence even of their darling pleafures.

Intemperance does not hurt its votaries alone; the innocent too often feel the direful effects of it. How many wretched orphans are to be feen embracing dunghills, whole parents, regardlefs of the future, fpent in riot and debauch what might have ferved to bring up their offspring in a decent manner? How often do we behold the miferable mother, with her helplefs infants, pining in want, while the cruel father is indulging his infatiate appetites?

Families are not only reduced to mifery, but even extirpated, by intemperance. Nothing tends for much to prevent propagation, and to thorten the lives of children, as the intemperance of parents. The poor man who labours all day, and at night lies down contented with his humble fare, can boaft a numerous offspring, while his pampered lord, funk in eafe and luxury, often languithes without an heir to his ample fortunes. Even flates and empires feel the influence of intemperance, and rife or fall as it prevails.

Inftead of mentioning the different kinds of intemperance, and pointing out their influence upon health, we shall only, by way of example, make a few observations on one particular species of that vice, viz. the abuse of intoxicating liquors.

Every act of intoxication puts nature to the expence of a fever, in order to difcharge the poilonous draught. When this is repeated almost every day, it

is

97

is eafy to forefee the confequences. That conftitu-tion muft be ftrong indeed, which is able long to hold out under a daily fever! but fevers occasioned by drinking do not always go off in a day; they frequently end in an inflammation of the breaft, liver, or brain, and produce fatal effects.

Though the drunkard fhould not fall by an acute difeafe, he feldom escapes those of a chronic kind. Intoxicating liquors, when used to excefs, weaken the bowels and spoil the digeftion; they destroy the power of the nerves, and occafion paralytic and convullive diforders; they likewife heat and inflame the blood, deftroy its balfamic quality, render it unfit for circulation, and the nourifhment of the body. Hence obstructions, atrophies, dropfies, and confumptions of the lungs. These are the common ways in which drunkards make their exit. Difeafes of this kind, when brought on by hard drinking, feldom admit of a cure.

Many people injure their health by drinking, who feldom get drunk. The continual habit of foaking, as it is called, though its effects be not fo violent, is not lefs pernicious. When the veffels are kept conftantly full and upon the ftretch, the different digeftions can neither be duly performed, nor the hu-mours properly prepared. Hence molt people of this character are afflicted with the gout, the gravel, ulcerous fores in the legs, &c. If these diforders do not appear, they are feized with low fpirits, hypochondriacal affections, and other symptoms of indigeftion.

Confumptions are now fo common, that it is thought one-tenth of the inhabitants of great towns die of that difeate. Hard drinking is no doubt one of the caufes to which we must impute the increase of confumptions. The great quantities of viscid malt liquor drank by the common people of Eng-H land, land, cannot fail to render the blood fizy and unfit for circulation; from whence proceed obftructions, and inflammations of the lungs. There are few great ale-drinkers who are not phthifical: nor is that to be wondered at, confidering the glutinous and almost indigeftible nature of strong ale.

Those who drink ardent fpirits or ftrong wines run ftill greater hazard; these liquors heat and inflame the blood, and tear the tender vessels of the lungs to pieces; yet so great is the confumption of them in this country, that one would almost be induced to think that the inhabitants lived upon them*.

The habit of drinking proceeds frequently from misfortunes in life. The miferable fly to it for relief. It affords them indeed a temporary eafe. But, alas! this folace is fhort lived; and when it is over, the fpirits fink as much below their usual tone as they had before been raifed above it. Hence a repetition of the dofe becomes neceffary, and every fresh dole makes way for another, till the unhappy wretch becomes a flave to the bottle, and at length falls a facrifice to what at first perhaps was taken only as a medicine. No man is fo dejected as the drunkard when his debauch is gone off. Hence it is, that those who have the greatest flow of spirits while the glafs circulates freely, are of all others the moft melancholy when fober, and often put an end to their own miserable existence in a fit of spleen or ill humour.

* We may form fome notion of the immenfe quantity of ardent fpirits confumed in Great Britain from this circumflance, that in the city of Edinburgh and its environs, befides the great quantity of foreign fpirits duly entered, and the ftill greater quantity which is fuppofed to be fmuggled, it is computed that above two thoufand private ftills are conftantly employed in preparing a poifonous liquor called *Molaffer*. The common people have got fo univerfally into the habit of drinking this bafe fpirit, that when a porter or labourer is feen reeling along the fireets, they fay, *be has got molaffed*.

Drunkennefs

OF INTEMPERANCE.

Drunkennefs not only proves deftructive to health, but likewife to the faculties of the mind. It is ftrange that creatures who value themfelves on account of a fuperior degree of reafon to that of brutes, fhould take pleafure in finking fo far below them: Were fuch as voluntarily deprive themfelves of the ufe of reafon, to continue ever after in that condition, it would feem but a juft punifhment. Though this be not the confequence of one act of intoxication, it feldom fails to fucceed a courfe of it. By a habit of drinking, the greateft genius is often reduced to a mere idiot *.

Intoxication is peculiarly hurtful to young perfons. It heats their blood, impairs their ftrength, and obftructs their growth; befides, the frequent use of ftrong liquors in the early part of life deftroys any benefit that might arise from them afterwards. Those who make a practice of drinking generous liquors when young, cannot expect to reap any benefit from them as a cordial in the decline of life.

Drunkennels is not only in itfelf a most abominable vice, but is an inducement to many others. There is hardly any crime fo horrid that the drunkard will not perpetrate for the love of liquor. We have known mothers fell their children's clothes, the

* It is amazing that our improvements in arts, learning, and politenefs, have not put the barbarous cuftom of drinking to excefs out of fathion. It is indeed lefs commo in South Britain than it was formerly; but it full prevails very much in the North, where this relic of barbarity is miftaken for-hofpitality. There no man is fuppofed to entertain his guefts well, who does not make them drunk. Forcing people to drink is certainly the greateft piece of rudenefs that any man can be guilty of. Manlinefs, complaifance, or meer good-nature, may induce a man to take his glafs, if urged to it, at a time when he might as well take poifon. The cuftom of drinking to excefs has long been out of fafhion in France; and, as it begins to lofe ground among the politer part of the Englift, we hope it will foon be banifhed from every part of this ifland.

food

OF CLEANLINESS.

100

food that they fhould have eat, and afterwards even the infants themfelves, in order to purchase the accurfed draught.

CHAP. VIII.

OF CLEANLINESS.

THE want of cleanlines is a fault which admits of no excufe. Where water can be had for nothing, it is furely in the power of every perfon to be clean. The continual difcharge from our bodies by perfpiration, renders frequent change of apparel neceffary. Changing apparel greatly promotes the fecretion from the fkin, fo neceffary for health. When that matter which ought to be carried off by perfpiration, is either retained in the body, or reforbed from dirty clothes, it must occasion difeases.

Difeafes of the fkin are chiefly owing to want of cleanlinefs*. They may indeed be caught by infection, or brought on by poor living, unwholefome food, &cc. but they will feldom continue long where cleanlinefs prevails. To the fame caufe muft we impute the various kinds of vermin which infeft the human body, houfes, &cc. Thefe may always be banifhed by cleanlinefs alone, and wherever they abound, we have reafon to believe it is neglected.

One common caufe of putrid and malignant fevers is the want of cleanlinefs. Thefe fevers commonly begin among the inhabitants of clofe dirty houfes,

* Mr. Pot, in his furgical obfervations, mentions a difeafe which he calls the chimney-fweeper's cancer, as it is almost peculiar to that unhappy fet of people. This he attributes to neglect of cleanlines, and with great juffice. I am convinced, that if that part of the body which is the feat of this cruel difeafe was kept elean by frequent walking, it would never happen. The elimbing boys, as they are called, are certainly the most miferable wretches on the face of the earth; yet, for cleaning chimnies, no fuch perfons are neceffary.

who

who breathe unwholefome air, take little exercife, and wear dirty clothes. There the infection is generally hatched, which often spreads far and wide, to the destruction of many. Hence cleanliness may be confidered as an object of public attention. It is not sufficient that I be clean myself, while the want of it in my neighbour affects my health as well as his. If dirty people cannot be removed as a common nuifance, they ought at least to be avoided as infectious. All who regard their health fhould keep at a distance even from their habitations.

In places where great numbers of people are collected, cleanliness becomes of the utmost importance. It is well known that infectious difeafes are communicated by tainted air. Every thing, therefore, which tends to pollute the air, or fpread the infection, ought with the utmost care to be guarded against. For this reason, in great towns, no filth, of any kind, fhould be permitted to lie upon the ftreets. Nothing is more apt to convey infection than the excrements of the difeafed.

In many great towns the ftreets are little better than dunghills, being frequently covered with afhes, dung, and naftinefs of every kind. Even flaughterhoutes, or killing fhambles, are often to be feen in the very centre of great towns. The putrid blood, excrements, &c. with which these places are generally covered, cannot fail to taint the air, and render it unwholefome. How eafily might this be prevented by active magistrates, who have it always in their power to make proper laws relative to things of this nature, and to enforce the observance of them !

We are forry to fay, that the importance of general cleanlinefs does not feem to be fufficiently underflood by the magistrates of most great towns in Britain; though health, pleafure, and delicacy, all confpire to recommend an attention to it. Nothing Cap can be more agreeable to the fenfes, more to the honour of the inhabitants, or more conducive to their health, than a clean town; nor can any thing imprets a ftranger with a more difrefpectful idea of any people than its opposite. Whatever pretensions people may make to learning, politeness, or civilization, we will venture to affirm, that while they neglect cleanliness, they are in a ftate of barbarity*.

The peafants in most countries feem to hold cleanlinefs in a fort of contempt. Were it not for the open fituation of their houses, they would often feel the bad effects of this difpolition. One feldom fees a farm house without a dunghill before the door, and frequently the cattle and their masters lodge under the fame roof. Peafants are likewife extremely carelefs with refect to change of apparel, keeping their houses, &c. clean. This is merely the effect of indolence and a dirty disposition. Habit may indeed render it lefs disgreeable to them, but no habit can ever make it falutary to wear dirty clothes or breathe unwholefome air.

As many articles of diet come through the hands of peafants, every method fhould be taken to encourage and promote habits of cleanlinefs among them. This, for example, might be done by giving a fmall premium to the perfon who brings the cleaneft and beft article of any kind to market, as butter, cheefe, &c. and by punifhing feverely thofe who bring it

* In ancient Rome the greateft men did not think cleanlinefs an object unworthy of their attention. Pliny fays, the *Chace*, or common fewers for the conveyance of filth and nathnefs from the city, were the greateft of all the public works; and beftows higher encomiums upon Tarquinius, Agrippa, and others who made and improved them, than on thofe who achieved the greateft conquefts.

⁵ How truly great does the emperor Trajan appear, when giving directions to Pliny his proconful, concerning the making of a common fewer for the health and convenience of a conquered city?

102

dirty. The fame method fhould be taken with butchers, bakers, brewers, and all who are employed in preparing the neceffaries of life.

In camps the ftricteft regard fhould be paid to cleanlinefs. By negligence in this matter, infectious difeafes are often fpread amongft a whole army; and frequently more die of thefe than by the fword. The Jews, during their encampments in the wildernefs, received particular inftructions with refpect to cleanlinefs*. The rules enjoined them ought to be obferved by all in the like fituation. Indeed the whole fyftem of laws delivered to that people has a manifeft tendency to promote cleanlinefs. Whoever confiders the nature of their climate, the difeafes to which they were liable, and their dirty difposition, will fee the propriety of fuch laws.

It is remarkable that, in most eastern countries, cleanliness makes a great part of their religion. The Mahometan, as well as the Jewish religion enjoins various bathings, washings, and purifications. No doubt these might be designed to represent inward purity; but they were at the fame time calculated for the prefervation of health. However whimfical thefe washings may appear to some, few things would tend more to prevent difeafes than a proper attention to many of them. Were every perfon, for example, after vifiting the fick, handling a dead body, or touching any thing that might convey infection, to wash before he went into company, or fat down to meat, he would run less hazard either of catching the infection himfelf, or of communicating it to others.

Frequent washing not only removes the filth and fordes which adhere to the fkin, but likewife pro-

* Thou fhalt have a place alfo without the camp, whither thou fhalt go forth abroad; and thou fhalt have a paddle upon thy weapon: and it fhall be when thou fhalt eafe thyfelf abroad, thou fhalt dig therewith, and fhalt turn back, and cover that which cometh from thes, &c. Deuter. chap. xxii. ver. 12, 13. motes the perfpiration, braces the body, and enlivens the fpirits. How refreshed, how cheerful, and agreeable does one feel on being shaved, washed, and thifted; especially when these offices have been neglected longer than usual!

The eaftern cuftom of washing the feet, though lefs neceffary in this country, is neverthelefs a very agreeable piece of cleanlinefs, and contributes greatly to the prefervation of health. The fweat and dirt with which these parts are frequently covered, cannot fail to obfruct the perfuration. This piece of cleanlinefs would often prevent colds and fevers. Were people careful to bathe their feet and legs in lukewarm water at night, after being exposed to cold or wet through the day, they would leldom experience the ill effects which often proceed from thefe caufes.

A proper attention to cleanlinefs is no where more neceffary than on fhipboard. If epidemical diftempers break out there, no one can be fafe. The beft way to prevent them, is to take care that the whole company be cleanly in their clothes, bedding, &c. When infectious difeates do break out, cleanlinefs is the most likely means to prevent their fpreading : it is likewife neceffary to prevent their returning afterwards, or being conveyed to other places. For this purpofe, the clothes, bedding, &c. of the fick ought to be carefully washed, and fumigated with brimftone. Infection will lodge a long time in dirty clothes, and afterwards break out in the most terrible manner.

In places where great numbers of fick people are collected together, cleanlinefs ought to be moft religioufly obferved. The very fmell in fuch places is often fufficient to make one fick. It is eafy to imagine what effect that is likely to have upon the difeated. In an hofpital or imfirmary, where cleanlinefs is neglected, a perfon in perfect health has a greater greater chance to become fick, than a fick perfon has to get well.

Few things are more unaccountable than that neglect, or rather dread of cleanlinefs, which appears among those who have the care of the fick; they think it almost criminal to fuffer any thing that is clean to come near a perfon in a fever, for example, and would rather allow him to wallow in all manner of filth, than change the least bit of his linen. If cleanliness be neceffary for perfons in health, it is certainly more fo for the fick. Many difeafes may be cured by cleanliness alone; most of them might be mitigated by it; and, where it is neglected, the flightett diforders are often changed into the moft malignant. The fame miftaken care which prompted people to prevent the leaft admission of fresh air to the fick, feems to have induced them to keep them dirty. Both these destructive prejudices will, we hope, be foon entirely eradicated.

Cleanline's is certainly agreeable to our nature. We cannot help approving it in others, even though we fhould not practife it ourfelves. It fooner attracts our regard than even finery itfelf, and often gains effeem where that fails. It is an ornament to the higheft as well as the loweft ftation, and cannot be difpenfed with in either. Few virtues are of more importance to fociety than general cleanline's. It ought to be carefully cultivated every where, but in populous cities it fhould be almoft revered *.

* As it is impofible to be thoroughly clean without a fufficient quantity of water, we would earneftly recommend it to the magifrates of great towns to be particularly attentive to this article. Moft great towns in Britain are fo fituated as to be eafily fupplied with water; and thofe perfons who will not make a proper use of it, after it is brought to their hand, certainly deferve to be feverely punifhed. The fitreets of great towns, where water can be had, ought to be walhed every day. This is the only effectual method for keeping them thoroughly clean; and, upon trial, we are perfuaded it will be found the cheapelt.

Some of the most dreadful difeafes incident to human nature might, in my opinion, be entirely eradicated by cleanlinefs.

105

[106]

CHAP. IX.

OF INFECTION.

ANY difeafes are infectious. Every performought therefore, as far as he can, to avoid all communication with the difeafed. The common practice of vifiting the fick, though often well meant, has many ill confequences. Far be it from me to difcourage any act of charity or benevolence, efpecially towards those in diffres; but I cannot help blaming fuch as endanger their own or their neighbours lives, by a miftaken friendship or an impertinent curiofity.

The houfes of the fick, efpecially in the country, are generally crowded from morning till night with idle vifitors. It is cuftomary, in fuch places, for fervants and young people to wait upon the fick by turns, and even to fit up with them all night. It would be a miracle indeed fhould fuch always efcape. Experience teaches us the danger of this conduct. People often catch fevers in this way, and communicate them to others, till at length they become epidemic.

It would be thought highly improper for one who had not had the fmall-pox, to wait upon a patient in that difeafe; yet many other fevers are almost as infectious as the fmall-pox, and not lefs fatal. Some imagine that fevers prove more fatal in villages than in great towns, for want of proper medical affiftance. This may fometimes be the cafe; but I am inclined to think it oftener proceeds from the caufe above mentioned.

Were a plan to be laid down for communicating infection, it could not be done more effectually than by the common method of vifiting the fick. Such Such vifitors not only endanger themfelves and their connections, but likewife hurt the fick. By crowding the houfe they render the air unwholefome, and by their private whilpers and difmal countenances difturb the imagination of the patient, and deprefs his fpirits. Perfons who are ill, efpecially in fevers, ought to be kept as quiet as poffible. The fight of ftrange faces, and every thing that difturbs the mind, hurts them.

The common practice in country places of inviting great numbers of people to funerals, and crowding them into the fame apartment where the corpfe hes, is another way of fpreading infection. The infection does not always die with the patient. Every thing that comes into contact with his body while alive, receives the contagion, and fome of them, as clothes, blankets, &c. will retain it for a long time. Perfons who die of infectious diforders ought not to lie long unburied; and people fhould keep as much as poffible at a diffance from them.

It would tend greatly to prevent the foreading of infectious difeafes, if those in health were kept at a proper diffance from the fick. The Jewifh Legiflator, among many other wife inflitutions for preferving health, has been peculiarly attentive to the means of preventing infection, or defilement as it is called, either from a difeafed perfon or a dead body. In many cafes the difeafed were to be feparated from those in health; and it was deemed a crime even to approach their habitations. If a perfon only touched a difeafed or dead body, he was appointed to wafth himfelf in water, and to keep for fome time at a diftance from fociety.

Infectious difeafes are often communicated by clothes. It is extremely dangerous to wear apparel which has been worn by the deceafed, unlefs it has been well washed and fumigated, as infection may

4

107

lodge

lodge a long time in it, and afterwards produce very tragical effects. This fhews the danger of buying at random the clothes which have been worn by other people.

Infectious diforders are frequently imported. Commerce, together with the riches of foreign climes, bring us alfo their difeafes. Thefe do often more than counterbalance all the advantages of that trade by means of which they are introduced. It is to be regretted, that fo little care is commonly beftowed, either to prevent the introduction or fpreading of infectious maladies. Some attention indeed is generally paid to the plague; but other difeafes pafs unregarded *.

Infection is often fpread through cities, by jails, hofpitals, &c. Thefe are frequently fituated in the very middle of populous towns; and when infectious difeafes break out in them, it is impossible for the inhabitants to efcape. Did magistrates pay any regard to the health of the people, this evil might be eafily remedied.

Many are the caufes which tend to diffufe infection through populous cities. The whole atmofphere of a large town is one contaminated mafs, abounding with various kinds of infection, and

* Were the tenth part of the care taken to prevent the importation of difeafes, that there is to prevent fmuggling, it would be attended with many happy confequences. This might eafly be done by appointing a phyfician at every confiderable fea-port, to infpect the fhip's company, paffengers, &c. before they came afhore, and, if any fever or other infectious diforder prevailed, to order the fhip to perform a fhort quarantine, and to fend the fick to fome hofpital or proper place to be cured. He might likewife order all the clothes, bedding, &c. which had been ufed by the fick during the voyage, to be either deftroyed, or thoroughly cleanfed by fumigation, &c. before any of them were fent afhore. A fcheme of this kind, if properly conducted, would prevent many fevers, and other infections diffafes, from being brought by failors into fea-port towns, and by this means diffued all over the country.

108

must be pernicious to health. The best advice that we can give to fuch as are obliged to live in large cities, is to chuse an open situation; to avoid narrow, dirty, crowded streets; to keep their own house and offices clean; and to be as much abroad in the open air as their time will permit.

It would tend greatly to prevent the fpreading of infectious difeafes, were proper nurfes every where employed to take care of the fick. This might often fave a family, or even a whole town, from being infected by one perfon. We do not mean that people thould abandon their friends or relations in diffrefs, but only to put them on their guard against being too much in company with thofe who are afflicted with difeafes of an infectious nature.

Such as wait upon the fick in infectious difeafes run very great hazard. They fhould ftuff their nofes with tobacco, or fome other ftrong fmelling herb, as rue, tanfy, or the like. They ought likewife to keep the patient very clean, to fprinkle the room where he lies with vinegar, or other ftrong acids, frequently to admit a ftream of frefh air into it, and to avoid the fmell of his breath as much as they can. They ought never to go into company without having changed their clothes and wafhed their hands; otherwife, if the difeafe be infectious, they will in all probability carry the contagion along with them *.

However

* There is reafon to believe that infection is often conveyed from one place to another by the careleffnefs of the faculty themfelves. Many phyficians affect a familiar way of fitting upon the patient's bedfide, and holding his arm for a confiderable time. If the patient has the fmall-pox, or any other infectious diffect, there is no doubt but the doctor's hands, clothes, &cc. will carry away fome of the infection, and, if he goes directly to vifit another patient without wafning his hands, changing his clothes, or being exposed to the open air, which is not feldom the cafe, is However triffing it may appear to inconfiderate perfons, we will venture to affirm, that a due attention to those things which tend to diffuse infection would be of great importance in preventing difeases. As most difeases are in fome degree infectious, no one thould continue long with the fick, except the neceffary attendants. I mean not, however, by this caution, to deter those whose duty or office leads them to wait upon the fick, from fuch a laudable and neceffary employment.

Many things are in the power of the magistrate which would tend to prevent the fpreading of infection, as the promoting of public cleanlinefs, re-moving jails, hofpitals, burying grounds, and other places where infection may be generated, at a pro-per diftance from great towns *; widening the ftreets; pulling down useless walls, and taking all methods to promote a free circulation of air through every part of the town, &c. Public hospitals, or proper places, of reception for the fick, provided they were kept clean, well ventilated, and placed in an open fituation, would likewife tend to prevent the spreading of infection. Such places of reception would prevent the poor, when fick, from being visited by their idle or officious neighbours. They would likewife render it unneceffary for fick fervants to be kept in their mafter's houfes. Mafters had better pay for having their fervants taken care of in an hospital, than run the hazard of having an infectious difeafe diffufed among a numerous fa-

is it any wonder that he fhould carry the difeafe along with him? Phyficians not only endanger others, but also themfelves, by this practice. And indeed they fometimes fuffer for their want of care.

* The antients would not fuffer even the temples of their gods, where the fick reforted, to be built within the walls of a city.

mily.

mily. Sick fervants and poor people, when placed in holpitals, are not only lefs apt to diffuse infection among their neighbours, but have likewise the advantage of being well attended.

wantage of being well attended. We are not, however, to learn that hofpitals, in-ftead of preventing infection, may become the means of diffuling it. When they are placed in the middle of great towns; when numbers of patients are crowded together in fmall apartments; when there is a conftant communication kept up between the citizens and the patients; and when cleanlinefs and ventilation are neglected, they become nefts for hatching difeafes, and every one who goes into them not only runs a rifk of receiving infection himfelf, but likewife of communicating it to others. This however is not the fault of the hofpitals, but of those who have the management of them. It were to be wifhed, that they were both more nu-merous, and upon a more refpectable footing, as that would induce people to go into them with lefs reluctance. This is the more to be defired, because most of the putrid fevers and other infectious diforders break out among the poor, and are by them communicated to the better fort. Were proper attention paid to the first appearances of such diforders, and the patients early conveyed to an hospital, we should feldom see a putrid fever, which is almost as infectious as the plague, become epidemic.

CHAP. X.

OF THE PASSIONS.

THE paffions have great influence both in the caufe and cure of difeafes. How the mind affects the body, will in all probability ever remain a fecret.

a fecret. It is fufficient for us to know, that there is eftablished a reciprocal influence between the mental and corporeal parts, and that whatever injures the one diforders the other.

Of Anger.

The paffion of *anger* ruffles the mind, difforts the countenance, hurries on the circulation of the blood, and diforders the whole vital and animal functions. It often occafions fevers, and other acute difeafes; and fometimes even fudden death. This paffion is peculiarly hurtful to the delicate, and those of weak nerves. I have known fuch perfons frequently lose their lives by a violent fit of anger, and would advife them to guard against the excels of this paffion with the utmotic care.

It is not indeed always in our power to prevent being angry; but we may furely avoid harbouring refentment in our breaft. Refentment preys upon the mind, and occafions the most obstinate chronical diforders, which gradually waste the constitution. Nothing shews true greatness of mind more than to forgive injuries; it promotes the peace of fociety, and greatly conduces to our own ease, health, and felicity.

Such as value health fhould avoid violent gufts of anger, as they would the most deadly poifon. Neither ought they to indulge refertment, but to endeavour at all times to keep their minds calm and ferene. Nothing tends fo much to the health of the body as a conftant tranquillity of mind.

Of Fear.

The influence of *fear*, both in occafioning and aggravating difeafes, is very great. No man ought to be blamed for a decent concern about life; but too great a defire to preferve it is often the

the caule of losing it. Fear and anxiety, by depreffing the fpirits, not only dispose us to difease, but often render those diseases fatal which an undaunted mind would overcome.

Sudden fear has generally violent effects. Epileptic fits, and other convulsive diforders, are often occasioned by it. Hence the danger of that practice, so common among young people, of frightening one another. Many have loss their lives, and others have been rendered miferable, by frolics of this kind. It is dangerous to tamper with the human passions. The mind may easily be thrown into such diforder as never again to act with regularity.

But the gradual effects of fear prove moft hurtful. The conftant dread of fome future evil, by dwelling upon the mind, often occafions the very evil itfelf. Hence it comes to pafs, that fo many die of thofe very difeafes of which they long had a dread, or which had been imprefied on their minds by fome accident, or foolifh prediction. This, for example, is often the cafe with women in child-bed. Many of thofe who die in that fituation are imprefied with the notion of their death a long time before it happens; and there is reafon to believe that this imprefion is often the caufe of it.

The methods taken to impress the minds of women with the apprehensions of the great *pain* and *peril* of child-birth, are very hurtful. Few women die in labour, though many loose their lives after it; which may be thus accounted for. A woman after delivery, finding herself weak and exhausted, immediately apprehends she is in danger; but this fear feldom fails to obstruct the necessfary evacuations, upon which her recovery depends. Thus the fex often fall a facrifice to their own imaginations.

113

nations, when there would be no danger, did they apprehend none.

It feldom happens that two or three women in a great town die in child-bed, but their death is followed by many others. Every woman of their acquaintance who is with child dreads the fame fate, and the difeafe becomes epidemical by the mere force of imagination. This fhould induce pregnant women to defpife fear, and by all means to avoid thofe tatling goffips who are continually buzzing in their ears the misfortunes of others. Every thing that may in the leaft alarm a pregnant or child-bed woman, ought with the greateft care to be guarded againft.

Many women have loft their lives in child bed by the old fuperfitious cuftom, ftill kept up in moft parts of Britain, of tolling the parifh bell for every perfon who dies. People who think themfelves indanger are very inquifitive; and if they come to know that the bell tolls for one who died in the fame fituation with themfelves, what muft be the confequence? At any rate they are apt to fuppofe that this is the cafe, and it will often be found a very difficult matter to perfuade them of the contrary.

But this cuftom is not pernicious to child-bed women only. It is hurtful in many other cafes. When low fevers, in which it is difficult to fupport the patient's fpirits, prevail, what muft be the effect of a funeral peal founding five or fix times a day in his ears? No doubt his imagination will fuggeft that others died of the fame difeafe under which he labours. This apprehenfion will have a greater tendency to deprefs his fpirits, than all the cordials of which medicine can boaft will have to raife them.

If this useless piece of ceremony cannot be abolished, we ought to keep the fick as much from

hearing

114

hearing it as poffible, and from every other thing that may tend to alarm them. So far however is this from being generally attended to, that many make it their bufinefs to vifit the fick, on purpose to whifper difmal flories in their ears. Such may pass for lympathizing friends, but they ought rather to be confidered as enemies. All who with well to the fick ought to keep fuch performs at the greatest distance from them.

A cuftom has long prevailed among phyficians of prognofficating, as they call it, the patient's fate, or foretelling the iffue of the difeafe. Vanity no doubt introduced this practice, and ftill supports it, in fpite of common fenfe and the fafety of mankind. I have known a phyfician barbarous enough to boaft, that he pronounced more fentences than all his Majefty's judges. Would to God that fuch fentences were not often equally fatal! It may indeed be alledged, that the doctor does not declare his opinion before the patient. So much the worfe. A fenfible patient had better hear what the doctor fays, than learn it from the difconfolate looks, the watery eyes, and the broken whilpers of those about him. It feldom happens, when the doctor gives an unfavourable opinion, that it can be concealed from the patient. The very embarrasiment which the friends and attendants fhew in difguifing what he has faid, is generally fufficient to discover the truth.

Kind Heaven has, for the wifeft ends, concealed from mortals their fate; and we do not fee what right any man has to announce the death of another especially if such a declaration has a chance to kill him. Mankind are indeed very fond of prying into future events, and feldom fail to folicit the physician for his opinion. A doubtful anfwer, however, or one that may tend rather to encourage the hopes of the fick, is furely the most

I 2

proper.

proper. This conduct could neither hurt the patient nor the phyfician. Nothing tends more to de-ftroy the credit of phyfic than those bold prog-nofticators, who by the bye, are generally the most ignorant of the faculty. The mistakes which daily happen in this way are fo many flanding proofs of human vanity, and the weakness of fcience.

We readily admit, that there are cafes where the phylician ought to give intimation of the patient's danger to fome of his near connections; though even this ought always to be done with the greatest caution: but it never can be neceffary in any cafe that the whole town and country fhould know, immediately after the doctor has made his firft vifit, that he has no hopes of his patient's recovery. Perfons whole impertinent curiofity leads them to queftion the phylician, with regard to the fate of his pa-tient, certainly deferve no other than an evalue anfwer.

The vanity of foretelling the fate of the fick is not peculiar to the faculty. Others follow their example, and those who think themselves wifer than their neighbours often do much hurt in this way. Humanity furely calls upon every one to comfort the fick, and not to add to their affliction by alarming their fears. A friend, or even a phyfician, may often do more good by a mild and fym-pathizing behaviour than by medicine, and fhould never neglect to administer that greatest of all cordials. HOPE.

Of Grief.

Grief is the most destructive of all the passions; Its effects are permanent; and when it finks deep into the mind, it generally proves fatal. Anger and fear, being of a more violent nature, feldom last long; but grief often changes into a fixed melancholy, lancholy, which preys upon the fpirits, and waltes the conftitution. This paffion ought not to be indulged. It may generally be conquered at the beginning; but when it has gained ftrength, all attemps to remove it are vain.

No perfon can prevent misfortunes in life; but it fhews true greatnefs of mind to bear them with ferenity. Many perfons make a merit of indulging grief, and when misfortunes happen, they obflinately refufe all confolation, till the mind, overwhelmed with melancholy, finks under the load. Such conduct is not only deftructive to health, but inconfiftent with reafon, religion, and common fenfe.

Change of ideas is as neceffary for health as change of pofture. When the mind dwells long upon one fubject, efpecially of a difagreeable nature, it hurts the whole functions of the body. Hence grief indulged ipoils the digeftion and deftroys the appetite; by which means the fpirits are deprefied, the nerves relaxed, the bowels inflated with wind, and the humours, for want of frefh fupplies of chyle, vitiated. Thus many an excellent conflictution has been ruined by a family misfortune, or any thing that occasions exceffive grief.

It is utterly impoffible that any perfon of a dejected mind fhould enjoy health. Life may indeed be dragged out for a few years; but whoever would live to a good old age, muft be good humoured and cheerful. This indeed is not altogether in our own power; yet our temper of mind, as well as our actions, depend greatly upon ourfelves. We can either affociate with cheerful or malancholy companions, mingle in the amufements and offices of life, or fit ftill and brood over our calamities as we choofe. Thefe, and many fuch things, are certainly in our power, and from thefe the mind generally takes its caft.

I 3

The

The variety of fcenes which prefent themfelves to the fenfes, were certainly defigned to prevent our attention from being too long fixed upon any one object. Nature abounds with variety, and the mind, unlefs fixed down by habit, delights in con-templating new objects. This at once points out the method of relieving the mind in diffrefs. Turn the attention frequently to new objects. Examine them for fome time. When the mind begins to recoil, fhift the fcene. By this means a conftant fucceffion of new ideas may be kept up, till the difagreeable ones entirely difappear. Thus travelling, the itudy of any art or fcience, reading, or writing on fuch fubjects as deeply engage the attention, will fooner expel grief than the most sprightly amusements.

It has already been observed, that the body cannot be healthy unlefs it be exercised; neither can the mind. Indolence nourifhes grief. When the mind has nothing elie to think of but calamities, no wonder that it dwells there. Few people who purfue bufinefs with attention are hurt by grief. Inftead therefore of abstracting ourfelves from the world or bufinefs when misfortunes happen, we ought to engage in it with more than usual attention, to difcharge with double diligence the functions of our flation, and to mix with friends of a cheerful and focial temper.

Innocent amusements are by no means to be neglected. Thefe, by leading the mind infenfibly to the contemplation of agreeable objects, help to difpel the gloom which misfortunes caft over it. They make time feem lefs tedious, and have many other happy effects.

Some perfons, when overwhelmed with grief, betake themfelves to drinking. This is making the cure worfe than the difeafe. It feldom fails to end

2

118

end in the ruin of fortune, character, and conflitution.

Of Love.

Love is perhaps the ftrongeft of all the paffions; at leaft, when it becomes violent, it is lefs fubject to the controul either of the underftanding or will, than any of the reft. Fear, anger, and feveral other paffions, are neceffary for the prefervation of the individual, but love is neceffary for the continuation of the fpecies itfelf: it was therefore proper that this paffion fhould be deeply rooted in the human breaft.

Though love be a ftrong paffion, it is feldom fo rapid in its progrefs as feveral of the others. Few perfons fall detperately in love all at once. We would therefore advife every one, before he tampers with this paffion, to confider well the probability of his being able to obtain the object of his wifhes. When that is not likely, he fhould avoid every occafion of increating it. He ought immediately to flee the company of the beloved object; to apply his mind attentively to bufinefs or fludy; to take every kind of amufement; and above all to endeavour, if poffible, to find another object which may engage his affections, and which it may be in his power to obtain.

There is no paffion with which people are for ready to tamper as love, although none is more dangerous. Some men make love for amufement, others from mere vanity, or on purpofe to flew their confequence with the fair. This is perhaps the greateft piece of cruchty which any one can be guilty of. What we eagerly with for we eafily credit. Hence the too credulous fair are often betrayed into a fituation which is truly deplorable, before they are able to difcover that the pretended I 4.

IIG

T20 OF THE PASSIONS:

lover was only in jeft. But there is no jefting with this paffion. When love is got to a certain height, it admits of no other cure but the poffeffion of its object, which in this cafe ought always, if poffible, to be obtained *.

Of Religious Melancholy.

Many perfons of a religious turn of mind behave as if they thought it a crime to be cheerful. They imagine the whole of religion confifts in certain mortifications, or denying themfelves the fmalleft indulgence, even of the most innocent amufements. A perpetual gloom hangs over their countenances, while the deepest melancholy preys upon their minds. At length the fairest prospects vanish, every thing puts on a difinal appearance, and those very objects which ought to give delight, afford nothing but difgust. Life itself becomes a burden, and the unhappy wretch, perfuaded that no evil can equal what he feels, often puts an end to his miserable existence.

It is great pity that ever religion fhould be fo far perverted, as to become the caufe of those very evils which it was defigned to cure. Nothing can be better calculated than *True Religion*, to raife and fupport the mind of its votaries under every affliction that can befal them. It teaches men that even the fufferings of this life are preparatory to

* The conduct of parents with regard to the difpofal of their children in marriage is often very blameable. An advantageous match is the conflant aim of parents; while their children often fuffer a real martyrdom betwixt their inclinations and duty. The first thing which parents ought to confult in difpofing their children in marriage, is certainly their inclinations. Were due regard always paid to thefe, there would be fewer unhappy couples, and parents would not have fo often caufe to repent the feverity of their conduct, after a ruined confliction, a loft character, or a diffracted mind, has fhewn them their miftake.

the

the happine's of the next; and that all who perfift in a courfe of virtue shall at length arrive at complete felicity.

Perfons whofe bufinefs it is to recommend religion to others, fhould beware of dwelling too much on gloomy fubjects. That peace and tranquillity mind, which true religion is calculated to infpire, is a more powerful argument in its favour than all the terrors that can be uttered. Terror may indeed deter men from outward acts of wickednefs, but can never infpire them with that love of God, and real goodnefs of heart, in which alone true religion confifts.

To conclude; the beft way to counteract the violence of any paffion, is to keep the mind clofely engaged in fome useful purfuit.

CHAP. XI.

OF THE COMMON EVACUATIONS.

THE principal evacuations from the human body are those by *ftool*, urine, and infensible perspiration. None of these can be long obstructed without impairing the health. When that which ought to be thrown out of the body is too long retained, it not only occasions a plethora, or too great fulnels of the veffels, but acquires qualities which are hurtful to the health, as acrimony, putrescence, &c.

Of the Evacuation by Stool.

Few things conduce more to health than keeping the body regular. When the *fæces* lie too long in the bowels, they vitiate the humours; and when they are too foon difcharged, the body is not fufficiently nourifhed. A medium is therefore to be defired,

defired, which can only be obtained by regularity in diet, fleep, and exercife. Whenever the body is not regular, there is reason to fuspect a fault in one or other of these.

Perions who eat and drink at irregular hours, and who eat various kinds of food, and drink of feveral different liquors at every meal, have no reafon to expect either that their digeftion will be good, or their difcharges regular. Irregularity in eating and drinking difturbs every part of the animal œconomy, and never fails to occafion difeates. Either too much or too little food will have this effect. The former indeed generally occafions loofenefs, and the latter coftivenefs; but both have a tendency to hurt the health.

It would be difficult to afcertain the exact number of ftools which may be confiftent with health, as thefe differ in the different periods of life, in different conflitutions, and even in the fame conflitution under a different regimen of diet, exercife, &cc. It is however generally allowed, that one ftool a-day is fufficient for an adult, and that lefs is hurtful. But this, like moft general rules, admits of many exceptions. I have known perfons in perfect health who did not go to ftool above once a-week * Such a degree of coftivenefs however is not fafe; though the perfon who labours under it may for fome time enjoy tolerable health, yet at length it may occafion difeafes.

One method of procuring a ftool every day is to rife betimes, and go abroad in the open air. Not only the pofture in bed is unfavourable to regular ftools, but alfo the warmth. This, by promoting the perfpiration, leffens all the other difcharges,

The method recommended for this purpole by Mr. Locke is likewife very proper, viz. to folicit

* Some perfons have told me that they did not go to flool above once a month.

natures

nature, by going regularly to flool every morning whether one has a call or not. Habits of this kind may be acquired, which will in time become natural.

Perfons who have a frequent recourfe to medicines for preventing coffivenels feldom fail to ruin their conftitution. Purging medicines frequently repeated weaken the bowels, hurt the digeftion, and every dofe makes way for another, till at length they become as neceffary as daily bread. Thole who are troubled with coffivenels ought rather, if poffible, to remove it by diet than drugs. They fhould likewife go thinly cloathed, and avoid every thing of an aftringent or of an beating nature. The diet and other regimen neceffary in this cafe will be found under the article *Coffivenels*, where this flate of the bowels is treated as a difeafe.

Such perfons as are troubled with an habitual loofenefs ought likewife to fuit their diet to the nature of their complaint. They fhould ufe food which braces and ftrengthens the bowels, and which is rather of an aftringent quality, as wheat-bread made of the fineft flour, cheefe, eggs, rice boiled in milk, &c. Their drink fhould be red port, claret, brandy and water in which toafted bread has been boiled, and fuch like.

As an habitual loofenefs is often owing to an obftructed perfpiration, perfons affected with it ought to keep their feet warm, to wear flannel next their fkin, and take every other method to promote the perfpiration. Further directions with regard to the treatment of this complaint will be found under the article *Loofenefs*.

Of Urine.

So many things tend to change both the quantity and appearances of the urine, that it is very difficult to lay down any determined rules for judging of either.

either *. Dr. Cheyne fays, the urine ought to be equal to three-fourths of the liquid part of our aliment. But fuppofe any one were to take the trouble of meafuring both, he would find that every thing which altered the degree of perfpiration, would alter this proportion, and likewife that different kinds of aliment would afford very different quantities of urine. Though for thefe, and other reafons, no rule can be given for judging of the precife quantity of urine which ought to be difcharged, yet a perfon of common fenfe will feldom be at a lofs to know when it is in either extreme.

As a free difcharge of urine not only prevents but actually cures many difeafes, it ought by all means to be promoted; and every thing that may obfruct it fhould be carefully avoided. Both the fecretion and difcharge of urine are leffened by a fedentary life, fleeping on beds that are too foft and warm, food of a dry and heating quality, liquors which are aftringent and heating, as red port, claret, and fuch like. Those who have reason to fuspect that their urine is in too small quantity, or who have any

* It has long been an obfervation among phyficians, that the appearances of the urine are very uncertain, and very little to be depended on. No one will be furprized at this who confiders how many ways it may be affected, and confequently have its appearance altered. The paffions, the flate of the atmosphere, the quantity and quality of the food, the exercise, the clothing, the flate of the other evacuations, and numberless other causes, are fufficient to induce a change either in the quantity or appearance of the urine. Any one who attends to this, will be aftonished at the impudence of those daring quacks, who pretend to find out difeafes, and prefcribe to patients from the bare infpection of their urine. These impostors, however, are very common all over Britain, and by the amazing credulity of the populace, many of them amafa confiderable fortunes. Of all the medical prejudices which prevail in this country, that in favour of urine doctors is the ftrongeft. The common people have ftill an unlimited faith in their skill, although it has been demonstrated that no one of them is able to diftinguish the urine of a horse, or any other animal, from that of a man.

fymptoms

fymptoms of the gravel, ought not only to avoid thefe things, but whatever elfe they find has a tendency to leffen the quantity of their urine.

When the urine is too long retained, it is not only reforbed, or taken up again into the mafs of fluids, but by ftagnating in the bladder it becomes thicker, the more watry parts flying off firft, and the more grofs and earthy remaining behind. By the conftant tendency which thefe have to concrete, the formation of ftones and gravel in the bladder is promoted. Hence it comes to pafs that indolent and fedentary people are much more liable to thefe difeafes, than perfons of a more active life.

Many perfons have loft their lives, and others have brought on very tedious, and even incurable diforders by retaining their urine too long, from a falfe delicacy. When the bladder has been overdiftended, it often lofes its power of action altogether, or becomes paralytic, by which means it is rendered unable either to retain the urine, or expel it properly. The calls of nature ought never to be poftponed. Delicacy is doubtlefs a virtue, but that can never be reckoned true delicacy, which induces any one to tifk his health or hazard his life.

But the urine may be in two great as well as too fmall a quantity. This may be occafioned by drinking large quantities of weak watry liquors, by the excellive use of alkaline falts, or any thing that flimulates the kidnies, dilutes the blood, &c. This diforder very foon weakens the body, and induces a confumption. It is difficult to cure, but may be mitigated by ftrengthening diet and aftringent medicines, fuch as are recommended under the article Diabetes, or exceffive difcharge of urine.

Of the Perspiration.

Infentible perfpiration is generally reckoned the greateft of all the difcharges from the human body.

It is of fo great importance to health; that few difeafes attack us while it goes properly on; but when it is obftructed, the whole frame is foon difordered. This difcharge however, being lefs perceptible than any of the reft, is confequently lefs attended to. Hence it is, that acute fevers, rheumatifms, agues, &cc. often proceed from obftructed perfpiration before we are aware of its having taken place.

On examining patients, we find moft of them impute their difeafes either to violent colds which they had caught, or to flight ones which had been neglected. For this reation inflead of a critical inquiry into the nature of the perfpiration, its difference in different feafons, climates, conflictutions, &c. we fhall endeavour to point out the caufes which atoft commonly obfruct it, and to fhew how far they may be either avoided, or have their influence counteracted by timely care. The want of a due attention to thefe, colts Britain annually fome thoufands of uleful lives.

Changes in the Atmosphere.

One of the most common causes of obstructed perfpiration, or catching cold, in this country, is the changeableness of the weather, or flate of the atmofphere. There is no place where fuch changes happen more frequently than in Great Britain. With us the degrees of heat and cold are not only very different in the different feasons of the year, but often change almost from one extreme to another in a few days, and fometimes even in the course of one day. That fuch changes must affect the flate of the perspiration is obvious to every one *.

* I never knew a more remarkable inflance of the uncertainty of the weather in this country, than happened when I was writing thefe notes. This morning, Aug 14, 1783, the thermometer in the fhade was down at fifty-three degrees, and a very few

The beft method of fortifying the body against the changes of the weather, is to be abroad every day. Those who keep most within doors are most liable to catch cold. Such perfons generally render themselves so delicate as to feel even the flightest changes in the atmosphere, and by their pains, coughs, and oppressions of the breast, &c. they become a kind of living barometers.

Wet Clothes.

Wet clothes not only by their coldness obstruct the perspiration, but their moisture, by being abforbed, or taken up into the body, greatly increases the danger. The most robust constitution is not proof against the danger arising from wet clothes; they daily occasion fevers, rheumatisms, and other fatal diforders, even in the young and healthy.

It is impossible for people who go frequently abroad to avoid fometimes being wet. But the danger might generally be leffened, if not wholly prevented, by changing their clothes foon; when this cannot be done, they should keep in motion till they be dry. So far are many from taking this precaution, that they often fit or lie down in the fields with their clothes wet, and frequently fleep even whole nights in this condition. The frequent inflances which we have of the fatal effects of this condust, ought certainly to deter all from being guilty of it.

Wet Feet.

Even wet feet often occasion fatal difeafes. The cholic, inflammations of the breast and of the bowels, the iliac passion, *cholera morbus*, &c. are often occa-

few days ago it flood above eighty. No one who reflects on fuch great and fudden changes in the atmosphere, will be furprifed to find colds, coughs, rheums, with other affections of the break and bowels, fo common in this country.

fioned

fioned by wet feet. Habit will, no doubt, render this lefs dangerous; but it ought, as far as poffible, to be avoided. The delicate, and those who are not accustomed to have their clothes or feet wet. should be peculiarly careful in this refpect.

Night Air.

The perspiration is often obstructed by night air; even in fummer, this ought to be avoided. The dews which fall plentifully after the hotteft day, make the night more dangerous than when the weather is cool. Hence, in warm countries, the evening dews are more hurtful than where the climate is more temperate.

It is very agreeable after a warm day to be abroad in a cool evening; but this is a pleafure to be avoided by all who value their health. The effects of evening dews are gradual indeed, and almost imperceptible; but they are not the lefs to be dreaded : we would therefore advise travellers, labourers, and all who are much heated by day, carefully to avoid them. When the perspiration has been great, these become dangerous in proportion. By not attending to this, in flat marfhy countries, where the exhalations and dews are copious, labourers are often feized with intermitting fevers, quinfeys, and other dangerous difeafes.

Damp Beds.

Beds become damp, either from their not being used, standing in damp houses, or in rooms without fire, or from the linen not being dry when laid on the bed. Nothing is more to be dreaded by travellers than damp beds, which are very common in all places where fuel is fcarce. When a traveller, cold and wet, arrives at an inn, he may by means of a good fire, warm diluting liquor, and a dry bed, have the perspiration restored; but if he be put into a cold room, and laid in a damp bed, it will be more

more obstructed, and the worst confequences will enfue. Travellers should avoid inns which are noted for damp beds, as they would a houfe infected with the plague, as no man, however robuft, is proof against the danger arifing from them.

But inns are not the only places where damp beds are to be met with. Beds kept in private families for the reception of ftrangers are often equally dangerous. All kinds of linen and bedding, when not frequently ufed, become damp. How then is it poffible that beds, which are not flept in above two or three times a year, fhould be fafe? Nothing is more common than to hear people complain of having caught cold by changing their bed. The reafon is obvious: were they careful never to fleep in a bed but what was frequently used, they would feldom find any ill confequences from a change.

Nothing is more to be dreaded by a delicate perfon when on a visit than being laid in a bed which is kept on purpole for strangers. That ill-judged piece of complaifance becomes a real injury. All the bad confequences from this quarter might eafily be prevented in private families, by caufing their fervants to fleep in the spare beds, and refign them to strangers when they come. In inns, where the beds are ufed almost every night, nothing elfe is necessary than to keep the rooms well feafoned by frequent fires, and the linen dry.

That baneful cuftom faid to be practifed in many inns, of damping fheets, and preffing them in order to fave washing, and afterwards laying them on the beds, ought, when difcovered, to be punished with the utmost feverity. It is really a species of murder, and will often prove as fatal as poilon or guns fhot. Indeed no linen, especially if it has been washed in winter, ought to be used till it has been exposed for some time to the fire; nor is this operation lefs neceffary for linen washed in fummer, K provided

provided it has lain by for any length of time. This caution is the more needful, as gentlemen are often exceedingly attentive to what they eat or drink at an inn, yet pay no regard to a circumstance of much more importance *.

Damp Houses.

Damp houses frequently produce the like ill confequences; for this reason those who build should be careful to chuse a dry situation. A house which stands on a damp marshy foil or deep clay, will never be thoroughly dry. All houses, unless where the ground is exceeding dry, should have the first floor a little raised. Servants and others, who are obliged to live in cellars and funk stories, feldom continue long in health : masters ought furely to pay fome regard to the health of their fervants, as well as to their own.

Nothing is more common than for people, merely to avoid fome trifling inconveniency, to hazard their lives, by inhabiting a houfe almost as foon as the masons, plaisterers, &c. have done with it: fuch houses are not only dangerous from their dampness, but likewise from the smell of lime, paint, &c. The afthmas, confumptions, and other diseases of the lungs, fo incident to people who work in these articles, are fufficient proofs of their being unwholefome.

Rooms are often rendered damp by an unfeafonable piece of cleanlines; I mean the pernicious cuftom of washing them immediately before company is put into them. 'Most people catch cold, if

* If a perfon fufpects that his bed is damp, the fimple precaution of taking off the fheets and lying in the blankets, with all, or most of his clothes on, will prevent all the danger. I have practified this for many years, and never have been hurt by damp beds, though no conflictution, without care, is proof against their baneful influence.

they fit but a very fhort time in a room that has been lately washed; the delicate ought carefully to avoid fuch a fituation, and even the robust are not always proof against its influence *.

Sudden Transitions from Heat to Cold.

The perfpiration is commonly obstructed by SUD-DEN TRANSITIONS from heat to cold. Colds are feldom caught, unlefs when people have been too much heated. Heat rarifies the blood, quickens the circulation, and increases the perfpiration; but when these are fuddenly checked, the confequences must be bad. It is indeed impossible for labourers not to be too hot upon fome occasions; but it is generally in their power to let themfelves cool gradually, to put on their clothes when they leave off work, to make choice of a dry place to reft themfelves in, and to avoid fleeping in the open fields. These easy rules, if observed, would often prevent fevers and other fatal diforders.

It is very common for people, when hot, to drink, freely of cold water, or fmall liquors. This conduct is extremely dangerous. Thirft indeed is hard to bear, and the inclination to gratify that appetite frequently gets the better of reafon, and makes us do what our judgment difapproves. Every peafant, however, knows, if his horfe be permitted to drink his bellyful of cold water after violent exercife, and be immediately put into the ftable, or fuffered to remain at reft, that it will kill him. This they take the utmoft care to prevent. It were well if they were equally attentive to their own fafety.

* People imagine if a good fire is made in a room after it has been walhed, that there is no danger from fitting in it; but they mult give me leave to fay that this increafes the danger. The evaporation excited by the fire generates cold, and renders the damp more active.

Thirft

Thirst may be quenched many ways without fwallowing large quantities of cold liquor. The fields afford variety of acid fruits and plants, the very chewing of which would abate thirft. Water kept in the mouth for fome time, and fpit out again, if frequently repeated, will have the fame effect. If a bit of bread be eaten along with a few mouthfuls of water, it will both quench thirst more effectually, and make the danger lefs. When a perfon is extremely hot, a mouthful of brandy, or other spirits, if it can be obtained, ought to be preferred to any thing elfe. But if any one has been to foolifh, when hot, as to drink freely of cold liquor, he ought to continue his exercife at leaft till what he drank be thoroughly warmed upon his ftomach.

It would be tedious to enumerate all the bad effects which flow from drinking cold liquors when the body is hot. Sometimes this has occafioned immediate death. Hoarseness, quinfeys, and fevers of various kinds, are its common confequences. Neither is it 'fafe when warm to eat freely of raw fruits, falads, or the like. Thefe indeed have not fo fudden an effect on the body as cold liquors, but they are notwithstanding dangerous, and ought 'to be avoided.

Sitting in a warm room, and drinking hot liquors till the pores are quite open, and immediately going into the cold air, is extremely dangerous. Colds, coughs, and inflammations of the breaft, are the ufual effects of this conduct; yet nothing is more common than for people, after they have drank warm liquors for feveral hours, to walk or ride a number of miles in the coldeft night, or to ramble about in the ftreets *.

People

* The tap-rooms in London and other great towns, where fuch numbers of people fpend their evenings, are highly pernicious. The breath of a number of people crowded into a low apartment,

9

People are very apt, when a room is hot, to throw open a window, and to fit near it. This is a moft dangerous practice. Any perfon had better fit without doors than in fuch a fituation, as the current of air is directed against one particular part of the body. Inflammatory fevers and confumptions have often been occasioned by fitting or flanding thinly clothed near an open window. Nor is fleeping with open windows lefs to be dreaded. That ought never to be done, even in the hottest feason, unlefs the window is at a distance. I have known mechanics frequently contract fatal difeases, by working ftript at an open window, and would advise all of them to beware of fuch a practice.

Few things expose people more to catch cold than keeping their own houses too warm; such perfons may be faid to live in a fort of hot-houses; they can hardly fitr abroad to visit a neighbour but at the hazard of their lives. Were there no other reason for keeping houses' moderately cool, that alone is fufficient: but no house that is too hot can be wholefome; heat destroys the spring and elasticity of the air, and renders it less fit for expanding the lungs, and the other purposes of respiration. Hence it is that confumptions and other difeases of the lungs prove so fatal to people who work in forges, glasshouses, and the like.

Some are even fo fool hardy, as to plunge themfelves when hot in cold water. Not only fevers, but madnefs itfelf, has frequently been the effect of this conduct. Indeed it looks too like the action of a madman to deferve a ferious confideration.

The refult of all these observations is, that every one ought to avoid, with the utmost attention, all

apartment, with the addition of fires, candles, the fmoke of tobacco, and the fumes of hot liquor, &c. much not only render it hurtful to continue in fuch places, but dangerous to go out of them into a cold and chilly atmosphere.

füdden

fudden transitions from heat to cold, and to keep the body in as uniform a temperature as poffible; or where that cannot be done, to take care to let it cool gradually.

People may imagine that too ftrict an attention to these things would tend to render them delicate. So far however is this from being my design, that the very first rule proposed for preventing colds, is to harden the body, by enuring it daily to the open air.

I shall put an end to what relates to this part of my fubject, by giving an abstract of the justly celebrated advice of Celfus, with refpect to the prefervation of health. "A man," fays he, "who is bleffed with " good health, fhould confine himfelf to no particu-" lar rules, either with refpect to regimen or medi-" cine. He ought frequently to diverfify his man-" ner of living; to be fometimes in town, fometimes " in the country; to hunt, fail, indulge himfelf in reft, but more frequently to use exercise. 66 He " ought to refuse no kind of food that is commonly " ufed, but fometimes to eat more and fometimes " lefs; fometimes to make one at an entertainment, 66 and fometimes to forbear it; to make rather two meals a-day than one, and always to eat heartily, 66 " provided he can digeft it. He ought neither too " eagerly to purfue, nor too fcrupuloufly to avoid in-" tercourfe with the fair fex : pleafures of this kind, rarely indulged, render the body alert and active; 66 " but when too frequently repeated, weak and lan-" guid. He should be careful in time of health not " to deftroy, by exceffes of any kind, that vigour of " conftitution which should support him under ss ficknefs."

[135]

PART II.

OF DISEASES.

CHAP. XII.

OF THE KNOWLEDGE AND CURE OF DISEASES.

THE cure of difeafes does not depend fo much upon fcientific principles as many imagine. It is chiefly the refult of experience and observation. By attending the fick, and carefully observing the various occurrences in difeases, a great degree of accuracy may be acquired, both in diffinguishing their fymptoms, and in the application of medicines. Hence fenfible nurses, and other perfons who wait upon the fick, often foresee the patients fate sooner than those who have been bred to phyfic. We do not however mean to infinuate that a medical education is of no use: It is doubtless of the greatest importance; but it never can fupply the place of observation and experience.

Every difease may be confidered as an affemblage of fymptoms, and must be diftinguished by those which are most obvious and permanent. Inftead therefore of giving a claffical arrangement of difeafes, according to the fyftematic method, it will be more fuitable, in a performance of this nature, to give a full and accurate defeription of each particular difeafe as it occurs; and, where any of the fymptoms of one difeafe have a near refemblance to those of another, to take notice of that circumstance, and at the fame time to point K 4 out

out the peculiar or characteristic fymptoms by which it may be diffinguished. By a due attention to these, the investigation of diseases will be found to be a less difficult matter than most people would at first be ready to imagine.

A proper attention to the patient's age, fex, temper of mind, conflitution, and manner of life, will likewife greatly affift, both in the inveftigation and treatment of difeafes.

In childhood the fibres are lax and foft, the nerves extremely irritable, and the fluids thin; whereas in old age the fibres are rigid, the nerves become almost infensible, and many of the vessels imperviable. These and other peculiarities render the diseases of the young and aged very different, and of course they must require a different method of treatment.

Females are liable to many difeafes which do not afflict the other fex: befides, the nervous fyftem being more irritable in them than in men, their difeafes require to be treated with greater caution. They are lefs able to bear large evacuations; and all ftimulating medicines ought to be administered to them with a fparing hand.

Particular conflictutions not only difpofe perfons to peculiar difeafes, but likewife render it neceffary to treat thefe difeafes in a peculiar manner. A delicate perfon, for example, with weak nerves, who lives moftly within doors, muft not be treated, under any difeafe, precifely in the fame manner as one who is hardy and robuft, and who is much exposed to the open air.

The temper of mind ought to be carefully attended to in difeafes. Fear, anxiety, and a fretful temper, both occasion and aggravate difeafes. In vain do we apply medicines to the body to remove maladies which proceed from the mind. When it is affected, the best medicine is to foothe

136

the

the paffions, to divert the mind from anxious thought, and to keep the patient as eafy and cheerful as polfible.

Attention ought likewife to be paid to the climate, or place where the patient lives, the air he breathes, his diet, &c. Such as live in low marfhy fituations are fubject to many difeafes which are unknown to the inhabitants of high countries. Those who breathe the impure air of cities, have many maladies to which the more happy ruftics are entire frangers. Perfons who feed grofsly, and indulge in ftrong liquors, are liable to difeafes which do not affect the temperate and abstemious, &c.

It has already been obferved, that the different occupations and fituations in life difpole men to peculiar differents. It is therefore neceffary to inquire into the patient's occupation, manner of life, &cc. This will not only affift us in finding out the different but will likewife direct us in the treatment of it. It would be very imprudent to treat the laborious and the fedentary precifely in the fame manner, even fuppofing them to labour under the fame different.

It will likewife be proper to inquire, whether the difeafe be conftitutional or accidental; whether it has been of long or fhort duration; whether it proceeds from any great and fudden alteration in the diet, manner of life, &c. The ftate of the patient's body, and of the other evacuations, ought alfo to be inquired into; and likewife whether he can with eafe perform all the vital and animal functions, as breathing, digeftion, &c.

Laftly, it will be proper to inquire what difeafes the patient has formerly been liable to, and what medicines were most beneficial to him; if he has a strong aversion to any particular drug, &c.

As

As many of the indications of cure may be anfwered by diet alone, it is always the first thing to be attended to in the treatment of difeases. Those who know no better, imagine that every thing which goes by the name of a medicine possible forme wonderful power or fecret charm, and think, if the patient solutions enough of drugs, that he must do well. This mistake has many ill consequences; it makes people trust to drugs, and neglect their own endeavours; befides, it discourages all attempts to relieve the fick where medicines cannot be obtained.

Medicines are no doubt ufeful in their places; and, when administered with prudence, they may do much good; but when they are put in place of every thing elfe, or administered at random, which is not feldom the cafe, they must do mifchief. We would therefore wish to call the attention of mankind from the pursuit of fecret medicines, to fuch things as they are acquainted with. The proper regulation of thefe may often do much good, and there is little danger of their ever doing hurt.

Every difeafe weakens the digeftive powers. The diet ought therefore, in all difeafes, to be light and of eafy digeftion. It would be as prudent for a perfon with a broken leg to attempt to walk, as for one in a fever to eat the fame kind of food, and in the fame quantity, as when he was in perfect health. Even abstinence alone will often cure a fever, efpecially when it has been occasioned by excess in eating or drinking.

In all fevers attended with inflammation, as pleurifies, peripneumonies, &c. thin gruels, wheys, watery infufions of mucilaginous plants, roots, &c. are not only proper for the patient's food, but they are likewile the beft medicines which can be adminiftered.

In

In fevers of a flow, nervous, or putrid kind, where there are no fymptoms of imflammation, and where the patient must be fupported with cordials, that intention can always be more effectually answered by nourifhing diet and generous wines, than by any medicines yet known.

Nor is a proper attention to diet of lefs importance in chronic than in acute difeafes. Perfons afflicted with low fpirits, wind, weak nerves, and other hypochondriacal affections, generally find more benefit from the use of folid food and generous liquors, than from all the cordial and carminative medicines which can be administered to them.

The fcurvy, that most obstinate malady, will fooner yield to a proper vegetable diet, than to all the boasted antifcorbutic remedies of the shops.

In confumptions, when the humours are vitiated, and the ftomach fo much weakened as to be unable to digeft the folid fibres of animals, or even to affimilate the juices of vegetables, a diet confifting chiefly of *milk* will not only fupport the patient, but will often cure the difeafe after every other medicing has failed.

Nor is an attention to other things of lefs importance than to diet. The ftrange infatuation which has long induced people to fhut up the fick from all communication with the external air has done great mifchief. Not only in fevers, but in many other difeafes, the patient will receive more benefit from having the frefh air prudently admitted into his chamber, than from all the medicines which can be given him.

Exercife may likewife in many cafes be confidered as a medicine. Sailing, or riding on horfeback, for example, will be of more fervice in the cure of confumptions, glandular obftructions, &c. than any medicine yet known. In difeates which proceed proceed from a relaxed ftate of the folids, the cold bath, and other parts of the gymnaftic regimen, will be found equally beneficial.

Few things are of greater importance in the cure of difeafes than cleanlinefs. When a patient is fuffered to lie in dirty clothes, whatever perfpires from his body is again reforbed, or taken up into it, which ferves to nourifh the difeafe and increafe the danger. Many difeafes may be cured by cleanlinefs alone, moft of them may be mitigated by it, and in all of them it is highly neceffary both for the patient and thofe who attend him.

Many other obfervations, were it neceffary, might be adduced to prove the importance of a proper regimen in difeafes. Regimen will often cure difeafes without medicine, but medicine will feldom fucceed where a proper regimen is neglected. For this reafon, in the treatment of difeafes, we have always given the first place to regimen. Those who are ignorant of medicine may confine themfelves to it only. For others who have more knowledge, we have recommended fome of the most fimple but approved forms of medicine in every difeafe. These however are never to be administered but by people of better understanding; nor even by them without the greatest precaution.

CHAP. XIII.

OF FEVERS IN GENERAL.

A S more than one half of mankind is faid to perifh by fevers, it is of importance to be acquainted with their caufes. The most general caufes of fevers are, infection, errors in diet, unwholefome

wholefome air, violent emotions of the mind, excels or fuppreffion of ufual evacuations, external or internal injuries, and extreme degrees of heat or cold. As most of these have already been treated of at confiderable length, and their effects shewn, we shall not now refume the confideration of them, but shall only recommend it to all, as they would wish to avoid fevers and other fatal diseases, to pay the most punctual attention to these articles.

Fevers are not only the most frequent of all difeafes, but they are likewife the most complex. In the most fimple species of sever there is always a combination of several different symptoms. The diftinguishing symptoms of sever are, increased beas, frequency of pulse, loss of appetite, general debility, pain in the bead, and a difficulty in performing fonce of the vital or animal functions. The other symptoms usually attendant on severs are, nausea, thirs, want of step, or the severing of the field, want of sever or the severe disturbed and not refreshing.

When the fever comes on gradually, the patient generally complains first of languor or listless, forenels of the shear, or the bones, as the country people express it, heaviness of the head, loss of appetite, fickness, with clamminess of the mouth; after fome time come on excessive heat, violent thirst, restless, &c.

When the fever attacks fuddenly, it always begins with an uneafy fenfation of exceffive cold, accompanied with debility and lofs of appetite; frequently the cold is attended with flivering, oppref4 fion about the heart, and fickness at ftomach, or vomiting.

Fevers are divided into continual, remitting, intermitting, and fuch as are attended with cutaneous eruption or topical inflammation, as the fmallpox, erifipelas, &c. By a continual fever is meant that

that which never leaves the patient during the whole courfe of the difeafe, or which fhews no remarkable increafe or abatement in the fymptoms. This kind of fever is likewife divided into acute, flow, and malignant. The fever is called *acute* when its progrefs is quick, and the fymptoms violent, but when thefe are more gentle, it is generally denominated *flow*. When livid or petechial fpots fhew a putrid flate of the humours, the fever is called *malignant*, *putrid*, or *petechial*.

A remitting fever differs from a continual only in a degree. It has frequent increases and decreases, or exacerbations and remissions, but never wholly leaves the patient during the course of the diffease. Intermitting fevers or agues are those which, during the time that the patient may be said to be ill, have evident intervals or remissions of the symptoms.

As a fever is only an effort of Nature to free herfelf from an offending caufe, it is the bufinefs of those who have the care of the fick to observe with diligence which way Nature points, and to endeavour to affis her operations. Our bodies are fo framed, as to have a constant tendency to expel or throw off whatever is injurious to health. This is generally done by urine, fweat, stool, expectoration, vomit, or fome other evacuation.

There is reafon to believe, if the efforts of Nature, at the beginning of a fever, were duly attended to and promoted, it would feldom continue long; but when her attempts are either neglected or counteracted, it is no wonder if the difeafe proves fatal. There are daily inftances of perfons who, after catching cold, have all the fymptoms of a beginning fever; but by keeping warm, drinking diluting liquors, bathing their feet in warm water, &c. the fymptoms in a few hours difappear, and the danger is prevented. When When fevers of a putrid kind threaten, the best method of obviating their effects is by repeated vomits.

Our defign is not to enter into a critical enquiry into the nature and immediate caufes of fevers, but to mark their most obvious fymptoms, and to point out the proper treatment of the patient with respect to his diet, drink, air, &c. in the different stages of the difeafe. In these articles the inclinations of the patient will in a great measure direct our conduct.

Almost every perfon in a fever complains of great thirft, and calls out for drink, efpecially of a cooling nature. This at once points out the use of *water*, and other cooling liquors. What is fo likely to abate the heat, attenuate the humours, remove spafms and obstructions, promote perspiration, increase the quantity of urine, and in short produce every falutary effect in an ardent or inflammatory fever, as drinking plentifully of water, thin gruel, or any other weak liquor, of which water is the basis? The neceffity of diluting liquors is pointed out by the dry tongue, the parched skin, and the burning heat, as well as by the unquenchable thirst of the patient.

Many cooling liquors, which are extremely grateful to patients in a fever, may be prepared from fruits, as decoctions of tamarinds, apple tea, orange whey, and the like. Mucilaginous liquors might also be prepared from marsh-mallow roots, linsed, limetree buds, and other mild vegetables. These liquors, especially when acidulated, are highly agreeable to the patient, and should never be denied him.

At the beginning of a fever the patient generally complains of great laffitude or wearinefs, and has no inclination to move. This evidently flews the propriety of keeping him eafy, and if poffible in

144 OF FEVERS IN GENERAL:

in bed. Lying in bed relaxes the fpafms, abates the violence of the circulation, and gives Nature an opportunity of exerting all her force to overcome the difeafe. The bed alone would often remove a fever at the beginning; but when the patient ftruggles with the difeafe, inflead of driving it off, he only fixes it the deeper; and renders it more dangerous. This obfervation is too often verified in travellers, who happen when on a journey to be feized with a fever. Their anxiety to get home induces them to travel with the fever upon them, which conduct feldom fails to render it fatal.

In fevers the mind as well as the body fhould be kept eafy. Company is feldom agreeable to the fick. Indeed every thing that diffurbs the imagination, increafes the difeafe; for which reafon every perfon in a fever ought to be kept perfectly quiet, and neither allowed to fee nor hear any thing that may in the leaft affect or difcompose his mind.

Though the patient in a fever has the greateft inclination for drink, yet he feldom has any appetite for folid food: hence the impropriety of urging him to take victuals is evident. Much folid food in a fever is every way hurtful. It opprefies nature, and, inftead of nourifhing the patient, ferves only to feed the difeafe. What food the patient takes fhould be in fmall quantity, light, and of eafy digeftion. It ought to be chiefly of the vegetable kind, as panada, roafted apples, gruels, and fuch like.

Poor people, when any of their family are taken ill, run directly to their rich neighbour for cordials, and pour wine, fpirits, &cc. into the patient, who perhaps never had been accuftomed to tafte fuch liquors when in health. If there be any degree of fever, this conduct muft increafe it, and if there be none, this is the ready way to raile one. Stuffing Stuffing the patient with fweetmeats and other delicacies is likewife very pernicious. These are always harder to digest than common food, and cannot fail to hurt.

Nothing is more defired by a patient in a fever than frefh air. It not only removes his anxiety, but cools the blood, revives the fpirits, and proves every way beneficial. Many patients are in a manner flifled to death in fevers for want of frefh air; yet fuch is the unaccountable infatuation of moft people, that the moment they think a perfon in a fever, they imagine he fhould be kept in a clofe chamber, into which not one particle of frefh air muft be admitted. Inftead of this, there ought to be a conftant fiream of frefh air into a fick perfon's chamber, fo as to keep it moderately cool. Indeed its degree of warmth ought never to be greater than is agreeable to one in perfect health.

Nothing fpoils the air of a fick perfon's chamber, or hurts the patient more, than a number of people breathing in it. When the blood is inflamed, or the humours in a putrid ftate, air that has been breathed repeatedly will greatly increase the difeafe. Such air not only loses its fpring, and becomes unfit for the purpose of respiration, but acquires a noxious quality, which renders it in a manner poisonous to the fick.

In fevers, when the patient's fpirits are low and depreffed, he is not only to be fupported with cordials, but every method fhould be taken to cheer and comfort his mind. Many, from a miltaken zeal, when they think a perfon in danger, inftead of folacing his mind with the hopes and confolations of religion, fright him with the views of hell and damnation. It would be unfuitable here to dwell upon the impropriety and dangerous confoquences of this conduct; it often hurts the body, L and

En

146 OF FEVERS IN GENERAL.

and there is reafon to believe feldom benefits the foul.

Among common people, the very name of a fever generally fuggefts the neceffity of bleeding. This notion feems to have taken its rife from molt fevers in this country having been formerly of an inflammatory nature; but true inflammatory fevers are now feldom to be met with. Sedentary occupations, and a different manner of living, have fo changed the state of difeases in Britain, that there is now hardly one fever in ten where the lancet is neceffary. In most low, nervous, and putrid fevers, which are now to common, bleeding is really hurtful, as it weakens the patient, finks his fpirits, &c. We would recommend this general rule, never to bleed at the beginning of a fever, unleis there be evident figns of inflammation. Bleeding is an excellent me-dicine when neceffary, but fhould never be wantonly performed.

It is likewife a common notion, that fweating is always neceffary in the beginning of a fever. When the fever proceeds from an obstructed perspiration, this notion is not ill-founded. If the patient only lies in bed, bathes his feet and legs in warm water, and drinks freely of warm water-gruel, or any other weak diluting liquor, he will feldom fail to perfpire freely. The warmth of the bed, and the diluting drink, will relax the universal spasm, which generally affects the fkin at the beginning of a fever; it will open the pores, and promote the perfpiration, by means of which the fever may often be carried off. But inftead of this, the common practice is to heap clothes upon the patient, and to give him things of a hot nature, as spirits, spiceries &c. which fire his blood, increase the spasms, and render the difease more dangerous.

In all fevers a proper attention should be paid to the patient's longings. These are the calls of Na-

ture;

ture, and often point out what may be of real ufe. Patients are not indeed to be indulged in every thing that the fickly appetite may crave; but it is generally right to let them have a little of what they eagerly defire, though it may not feem altogether proper. What the patient longs for, his ftomach will generally digeft; and fuch things have fometimes a very happy effect.

When a patient is recovering from a fever, great care is neceffary to prevent a relapfe. Many perfons, by too foon imagining themfelves well, have loft their lives, or contracted other difeafes of an obfinate nature. As the body after a fever is weak and delicate, it is neceffary to guard againft catching cold. Moderate exercife in the open air will be of ufe, but great fatigue is by all means to be avoided; agreeable company will alfo have a good effect. The duet muft be light but nourifhing. It fhould be taken frequently, but in fmall quantities, It is dangerous, at fuch a time, to eat as much as the ftomach may crave.

CHAP. XIV.

OF INTERMITTING FEVERS, OR AGUES.

INTERMITTING fevers afford the beft opportunity both of obferving the nature of a fever, and also the effects of medicine. No perfon can be at a lofs to diffinguish an intermitting fever from any other, and the proper medicine for it is now almost universally known.

The

The feveral kinds of intermitting fevers take their names from the period in which the fit returns, as quotidian, tertian, quartan, &c.

CAUSES .---- Agues are occafioned by effluvia from putrid stagnating water. This is evident from their abounding in rainy feafons, and being most frequent in countries where the foil is marshy, as in Holland, the Fens of Cambridgeshire, the Hundreds of Effex, &c. This difeate may alfo be occafioned by eating too much ftone fruit, by a poor watery diet, damp houses, evening dews, lying upon the damp ground, watching, fatigue, deprefiing paffions, and the like. When the inhabitants of a high country remove to a low one, they are generally feized with intermitting fevers, and to fuch the difease is most apt to prove fatal. In a word, whatever relaxes the folids, diminifhes the perfpiration, or obstructs the circulation in the capillary or fmall veffels, disposes the body to agues.

SYMPTOMS .--- An intermitting fever generally begins with a pain of the head and loins, wearinefs of the limbs, coldnefs of the extremities, ftretching, yawning, with fometimes great ficknefs and vomiting; to which fucceed fhivering and violent shaking. Afterwards the skin becomes moift, and a profule fweat breaks out, which generally terminates the fit or paroxyim. Sometimes indeed the difeafe comes on fuddeply, when the perfon thinks himfelf in perfect health, but it is more commonly preceded by liftleffnets, lots of appetite, and the fymptoms mentioned above.

REGIMEN .----- While the fit continues, the patient ought to drink freely of water-gruel, orangewhey, weak camomile tea; or, if his fpirits be low, fmall wine-whey, fharpened with the juice of lemon. All his drink fhould be warm, as that will

will affift in bringing on the fweat, and confequently shorten the paroxy im *.

Between the paroxyfms the patient muft be fupported with food that is nourifhing, but light and eafy of digeftion, as veal or chicken broths, fago, gruel with a little wine, light puddings, and fuch like. His drink may be finall negus, acidulated with the juice of lemons or oranges, and fometimes a little weak punch. He may likewife drink infufions of bitter herbs, as camomile, wormwood, or water-trefoil, and may now and then take a glafs of finall wine, in which gentian root, centaury, or fome other bitter, has been intufed.

As the chief intentions of cure in an ague are to brace the folids, and promote perfpiration, the patient ought to take as much exercife between the fits as he can bear. If he be able to go abroad, riding on horfeback, or in a carriage, will be of great fervice. But if he cannot bear that kind of exercife, he ought to take fuch as his ftrength will permit. Nothing tends more to prolong an intermitting fever, than indulging a lazy indolent difpofition.

Intermitting fevers, under a proper regimen, will often go off without medicine; and when the difeafe is mild, in an open dry country, there is feldom any danger from allowing it to take its courfe; but when the patient's ftrength feems to decline, or the paroxyfms are fo violent that his life is in danger, medicine ought immediately to be adminiftered. This however fhould never be done till the difeafe be properly formed, that is to fay,

* Dr. Lind fays, that twenty or twenty-five drops of laudanum put into a cup of the patient's drink, and given about half an hour after the commencement of the hot fit, promotes the fiveat, flortens the fit, relieves the head, and tends greatly to remove the difeafe.

till the patient has had feveral fits of fhaking and fweating.

MEDICINE. The first thing to be done in the cure of an intermitting fever, is to cleanfe the ftomach and bowels. This not only renders the application of other medicines more fafe, but likewife more efficacious. In this difeafe, the ftomach is generally loaded with cold vifcid phlegm, and frequently great quantities of bile are discharged by vomit; which plainly points out the neceffity of fuch evacuations. Vomits are therefore to be administered before the patient takes any other medicine. A dofe of ipecacuanha will generally answer this purpose very well. A scruple or half a dram of the powder will be fufficient for an adult, and for a younger perfon the dole must be lefs in proportion. After the vomit begins to operate, the patient ought to drink plentifully of weak camomile-tea. The vomit should be taken two or three hours before the return of the fit, and may be repeated at the diftance of two or three days. Vomits not only cleanse the stomach, but increase the perfpiration, and all the other fecretions, which render them of fuch importance, that they often cure intermitting fevers without the affiftance of any other medicine.

Purging medicines are likewife ufeful and often neceffary in intermitting fevers. A fmart purge has been known to cure an obflinate ague, after the Peruvian bark and other medicines had been ufed in vain. Vomits however are more fuitable in this difeafe, and render purging lefs neceffary; but if the patient be afraid to take a vomit, he ought in this cafe to cleanfe the bowels by a dofe or two of Glauber's falt, jalap, or rhubarb.

Bleeding may fometimes be proper at the beginning of an intermitting fever, when exceflive heat, a de-

a delirium, &c. give reason to suffect an inflamma-tion; but as the blood is seldom in an inflammatory state in intermitting fevers, this operation is rarely neceffary. When frequently repeated, it tends to prolong the difeafe.

After proper evacuations the patient may fafely use the Peruvian bark, which may be taken in any way that is most agreeable to him. No prepa-ration of the bark feems to answer better than the most simple form in which it can be given, viz. in powder.

Two ounces of the best Peruvian bark, finely powdered, may be divided into twenty-four dofes. These may either be made into boluss as they are uled, with a little fyrup of lemon, or mixed in a glafs of red wine, a cup of camomile-tea, water-gruel, or any other drink that is more agreeable to the patient *.

In an ague which returns every day, one of the above dofes may be taken every two hours during the interval of the fits. By this method the patient will be able to take five or fix dofes between each paroxyfm. In a tertian or third day ague it will be fufficient to take a dofe every third hour during the interval, and in a quartan every fourth. If the patient cannot take fo large a dole of the bark, he may divide each of the powders into two parts, and take one every hour, &c. For a young perfon a fmaller quantity of this medicine will be fufficient, and the dose must be adapted to the age, constitution and violence of the fymptoms +.

The

* It has lately been obferved, that the red bark is more powerful than that which has for fome time been in common ufe. Its fu-perior efficacy feems to arife from its being of a more perfect growth than the quill bark, and confequently more fully impregnated with the medical properties of the plant.

+ In intermitting fevers of an obfinate nature, I have found it peceffary to throw in the bark much fafter. Indeed the benefits

L 4

The above quantity of bark will frequently cure an ague; the patient, however, ought not to leave off taking the medicine as foon as the paroxyfms are flopped, but fhould continue to ufe it till there is reafon to believe the difeafe is entirely overcome. Moft of the failures in the cure of this difeafe are owing to patients not continuing to ufe the medicine long enough. They are generally directed to take it till the fits are flopped, then to leave it off, and begin again at fome diffance of time; by which means the difeafe gathers ftrength, and often returns with as much violence as before. A relapfe may always be prevented by the patient's continuing to take fmall dofes of the medicine for fome time after the fymptoms difappear. This is both the moft fafe and effectual method of cure.

An ounce of gentian root, colamus aromaticus, and orange-peel, of each half an ounce, with three or four handfuls of camomile-flowers, and an handful of coriander-feed, all bruifed together in a mortar, may be ufed in form of infufion or tea. About half an handful of thefe ingredients may be put into a tea-pot, and an Englifh pint of boiling water poured on them. A cup of this infufion drank three or four times a day will greatly promote the cure. Such patients as cannot drink the watery infufion, may put two handfuls of the fame ingredients into a bottle of white wine, and take a glafs of it twice or thrice a day. If patients drink freely of the above, or any other proper infufion of bitters, a fmaller

nefits arifing from this medicine depend chiefly upon a large quantity of it being adminifiered in a fhort time. Several ounces of bark given in a few days will do more than as many pounds taken in the courfe of fome weeks. When this medicine is intended either to ftop a mortification, or cure an obflinate ague, it ought to be thrown in as faft as the flomach can poflibly bear it. Inattention to this circumflance has hurt the reputation of one of the beft medicines of which we are in pofleflion.

quantity

quantity of bark than is generally used will be fufficient to cure an ague *.

Those who cannot fwallow the bark in fubftance, may take it in decoction or infusion. An ounce of bark in powder may be infused in a bottle of white wine for four or five days, frequently fhaking the bottle, afterwards let the powder fublide, and pour off the clear liquor. A wine glass may be drank three or four times a day, or oftener, as there is occasion. If a decoction be more agreeable, an ounce of the bark, and two drams of fnake-root bruiled, with an equal quantity of falt of wormwood, may be boiled in a quart of water, to an English pint. To the ftrained liquor may be added an equal quantity of red wine, and a glass of it taken frequently.

In obftinate agues, the bark will be found much more efficacious when affifted by brandy, or other warm cordials, than taken alone. This I have had frequently occafion to obferve in a country where intermittent fevers were endemical. The bark feldom fucceeded unlefs affifted by fnake-root, ginger, canella alba, or fome other warm aromatic. When the fits are very frequent and violent, in which cafe the fever often approaches towards an inflammatory nature, it will be fafer to keep out the aromatics, and to add falt of tartar in their ftead. But in an obftinate tertian or quartan, in the end of autumn or beginning

* There is reafon to believe, that fundry of our own plants or barks, which are very bitter and aftingent, would fucceed in the cure of intermittent fevers, efpecially when affifted by aromatics. But as the Peruvian bark has been long approved in the cure of this difeafe, and is now to be obtained at a very reafonable rate, it is of lefs importance to fearch after new medicines. We cannot however omit taking notice, that the Peruvian bark is very often adulterated, and that it requires confiderable fkill to diftinguifh between the genuine and the falfe. This ought to make people very soutious of whom they purchafe it.

of winter, warm and cordial medicines are abfolutely neceffary *.

As autumnal and winter agues generally prove much more obftinate than those which attack the patient in fpring or fummer, it will be neceffary to continue the use of medicines longer in the former than in the latter. A perfon who is feized with an intermitting fever in the beginning of winter, ought frequently, if the feason proves rainy, to take a little medicine, although the difease may feem to be cured, to prevent a relapte, till the return of the warm feason. He ought likewise to take care not to be much abroad in wet weather, especially in cold easterly winds.

When agues are not properly cured, they often degenerate into obftinate chronical difeafes, as the dropfy, jaundice, &c. For this reafon all poffible care fhould be taken to have them radically cured, before the conflicution has been too much weakened.

Though nothing is more rational than the method of treating intermitting fevers, yet, by fome ftrange infatuation, more charms and whimfical remedies are daily ufed for removing this than any other difeate. There is hardly an old woman who is not in poffeffion of a noftrum for ftopping an ague; and it is amazing with what readinefs their pretenfions are believed. Thofe in diffrefs eagerly grafp at any thing that promifes fudden relief; but the fhorteft way is not always the beft in the treatment of diffeafes. The only method to obtain a fafe and lafting cure, is gradually to affift Nature in removing the caule of the difforder.

* In obfinate agues, when the patient is old, the habit phlegmatic, the feafon rainy, the fituation damp, or the like, it will be neceflary to mix with two ounces of the bark, half an ounce of Virginian fnake-root, and a quarter of an ounce of ginger, or fome other warm aromatic; but when the fymptoms are of an inflammatory nature, half an ounce of falt of wormwood or falt of tartar may be added to the above quantity of bark.

Some

Some indeed try bold, or rather fool-hardy experiments to cure agues, as drinking great quantities of ftrong liquors, jumping into a river, taking arfenic, &c. Thefe may fomctimes have the defired effect, but muft always be attended with danger *. When there is any degree of inflammation, or the leaft tendency to it, fuch experiments may prove fatal. The only patient whom I remember to have loft in an intermitting fever, evidently killed himfelf by drinking ftrong liquor, which fome perfon had perfuaded him would prove an infallible remedy.

Many dirty things are extolled for the cure of intermitting fevers, as fpiders, cobwebs, fnuffings of candles, &c. Though thefe may fometimes fucceed, yet their very naftinels is fufficient to fet them afide, efpecially when cleanly medicines will anfwer the purpole better. The only medicine that can be depended upon for thoroughly curing an intermittent fever, is the Peruvian bark. It may always be ufed with fafety: and I can honefly declare, that in all my practice I never knew it fail, when combined with the medicines mentioned above, and duly perfifted in.

Where agues are endemical, even children are often afflicted with that difeafe. Such patients are very difficult to cure, as they can feldom be prevailed upon to take the bark, or any other difagreeable medicine. One method of rendering this medicine more palatable, is to make it into a mixture with diftilled waters and fyrup, and afterwards to give it an agreeable fharpnefs with the elixir or fpirit of vitriol. This both improves the medicine, and takes off the naufeous tafte. In cafes where the bark cannot be adminiftered, the *faline mixture* may be given with advantage to children †.

* Arfenic has of late been recommended as an infallible remedy in the ague; but I would advife that it fhould be ufed only under the eye of a phyfician.

+ See Appendix, Saline Mixture.

Wine-

Wine-whey is a very proper drink for a child in an ague; to half an English pint of which may be put a tea fpoonful of the spirit of hartshorn. Exercise is likewife of considerable service; and when the disease proves obstinate, the child ought, if possible, to be removed to a warm dry air. The food ought to be nourishing, and sometimes a little generous wine should be allowed.

To children, and fuch as cannot fwallow the bark, or when the ftomach will not bear it, it may be given by clyfter. Half an ounce of the extract of bark, diffolved in four ounces of warm water, with the addition of half an ounce of fweet oil, and fix or eight drops of laudanum, is the form recommended by Dr. Lind for an adult, and this to be repeated every fourth hour, or oftener, as the occafion shall require. For children the quantity of extract and laudanum muft be proportionably leffened. Children have been cured of agues by making them wear a wailtcoat with powdered bark quilted between the folds of it; by bathing them frequently in a ftrong decoction of the bark, and by rubbing the fpine with ftrong fpirits, or with a mixture of equal parts of laudanum and the faponaceous liniment.

We have been the more full upon this difeafe, becaufe it is very common, and becaufe few patients in an ague apply to phyficians unlefs in extremities. There are, however, many cafes in which the difeafe is very irregular, being complicated with other difeafes, or attended with fymptoms which are both very dangerous and very difficult to underftand. All thefe we have purpofely paffed over, as they would only bewilder the generality of readers. When the difeafe is very irregular, or the fymptoms dangerous, the patient ought immediately to apply to a phyfician, and ftricftly to follow his advice.

To prevent agues, people must endeavour to avoid their causes. These have been already pointed out

ia

in the beginning of this fection: we fhall therefore only add one preventive medicine, which may be of ufe to fuch as are obliged to live in low marfhy countries, or who are liable to frequent attacks of this difeafe.

Take an ounce of the beft Peruvian bark; Virginian fnake-root, and orange peel, of each half an ounce; bruife them all together, and infufe for five or fix days in a bottle of brandy, Holland gin, or any good fpirit; afterwards pour off the clear liquor, and take a wine glass of it twice or thrice a day. This indeed is recommending a dram; but the better ingredients in a great measure take off the ill effects of the fpirit. Those who do not chufe it in brandy, may infuse it in wine; and fuch as can bring themfelves to chew the bark, will find that method fucceed very well. Gentian root, or calamus aromaticus, may also be chewed by turns for the purpole. All bitters feem to be antidotes to agues, especially those that are warm and aftringent.

CHAP. XV.

OF AN ACUTE CONTINUAL FEVER.

HIS fever is denominated acute, ardent, or inflammatory. It most commonly attacks the young, or perfons about the prime and vigour of life, especially fuch as live high, abound with blood, and whole fibres are strong and elastic. It feizes people at all feasons of the year; but is most frequent in the spring and beginning of summer.

CAUSES.—An ardent fever may be occafioned by any thing that overheats the body, or produces plethora, as violent exercife, fleeping in the fun, drinking ftrong liquors, eating fpiceries, a full diet, with little exercife, &c. It may likewife be occafioned by whatever obftructs the perfpiration, as lying on the damp

damp ground, drinking cold liquor when the body is hot, night watching, or the like.

SYMPTOMS. — A rigour or chillinefs generally ufhers in this fever, which is foon fucceeded by great heat, a frequent and full pulfe, pain of the head, dry fkin, rednets of the eyes, a florid countenance, pains in the back, loins, &c. To thefe fucceed difficulty of breathing, ficknefs, with an inclination to vomit. The patient complains of great thirft, has no appetite for folid food, is reftlefs, and his tongue generally appears black and rough.

A delirium, exceffive reftleffnefs, great oppreffion of the breaft, with laborious refpiration, flarting of the tendons, hiccup, cold clammy fweats, and an involuntary difcharge of urine, are very dangerous, fymptoms.

As this difeafe is always attended with danger, the beft medical affiftance ought to be procured as foon as poffible. A phyfician may be of ufe at the beginning, but his fkill is often of no avail afterwards. Nothing can be more unaccountable than the conduct of those who have it in their power, at the beginning of a fever, to procure the beft medical affiftance, yet put it off till things come to an extremity. When the difeafe, by delay or wrong treatment, has become incurable, and has exhausted the ftrength of the patient, it is vain to hope for relief from medicine. Phyficians may indeed affift Nature; but their attempts must ever prove fruitles, when the is no longer able to co-operate with their endeavours.

REGIMEN.—From the fymptoms of this difeafe, it is evident, that the blood and other humours require to be attenuated; that the perfpiration, urine, faliva, and all the other fecretions, are in too fmall quantity; that the veffels are rigid, and the heat of the whole body too great: all these clearly point out the necessfity of a regimen calculated to dilute the 2 blood,

blood, correct the acrimony of the humours, allay the exceffive heat, remove the fpafmodic ftricture of the veffels, and promote the fecretions.

Thefe important purpoles may be greatly promoted by drinking plentifully of diluting liquors, as watergruel, or oatmeal-tea, clear-whey, barley-water, balmtea, apple-tea, &c. Thefe may be fharpened with juice of orange, jelly of currants, rafpberries, and fuch like: orange-whey is likewife an excellent cooling drink. It is made by boiling among milk and water a bitter orange fliced, till the curd feparates. If no orange can be had, a lemon, a little cream of tartar, or a few fpoonfuls of vinegar, will have the fame effect. Two or three fpoonfuls of white wine may occafionally be added to the liquor when boiling.

If the patient be coftive, an ounce of tamarinds, with two ounces of ftoned raifins of the fun, and a couple of figs, may be boiled in three English pints of water to a quart. This makes a very pleasant drink, and may be used at difcretion. The common pectoral decoction is likewise a very proper drink in this difease. A tea-cup full of it may be taken every two hours, or oftener, if the patient's heat and thirst be very great *.

The above liquids muft all be drank a little warm. They may be used in fmaller quantities at the beginning of a fever, but more freely afterwards, in order to affift in carrying off the discafe by promoting the different excretions. We have mentioned a variety of drinks, that the patient may have it in his power to chuse those which are most agreeable; and that, when tired of one, he may have recourse to another.

The patient's diet must be very spare and light. All forts of flesh-meats, and even chicken-broths, are to be avoided. He may be allowed groat-gruel,

* See Appendix, Pettoral Decotion.

panado,

panado, or light bread boiled in water; to which may be added a few grains of common falt, and a little fugar, which will render it more palatable. He may eat roafted apples with a little fugar, toafted bread with jelly of currants, boiled prunes, &c.

It will greatly relieve the patient, especially in an hot feason, to have fresh air frequently let into his chamber. This, however, must always be done in such a manner as not to endanger his catching cold.

It is too common in fevers to load the patient with bed clothes, under the pretence of making him fweat, or defending him from the cold. This cuftom has many ill effects. It encreafes the heat of the body, fatigues the patient, and retards, inflead of promoting, the perfpiration.

Sitting upright in bed, if the patient is able to bear it, will often have a good effect. It relieves the head, by retarding the motion of the blood to the brain. But this pofture ought never to be continued too long: and if the patient is inclined to fweat, it will be more fafe to let him lie, only railing his head a little with pillows.

Sprinkling the chamber with vinegar, juice of lemon, or vinegar and role water, with a little nitre diffolved in it, will greatly refresh the patient. This ought to be done frequently, especially if the weather is hot.

The patient's mouth should be often washed with a mixture of water and honey, to which a little vinegar may be added, or with a decocition of figs in barley water. His feet and hands ought likewite frequently to be bathed in lukewarm water; especially if the head is affected.

The patient fhould be kept as quiet and eafy as poffible. Company, noife, and every thing that difturbs the mind, is hurtful. Even too much light, or any thing that affects the fenfes, ought

to

to be avoided. His attendants should be as few as poffible, and they ought not to be too often changed. His inclinations ought rather to be foothed than contradicted ; even the promife of what he craves will often fatisfy him as much as its reality.

MEDICINE .---- In this and all other fevers, attended with a hard, full, quick pulfe, bleeding is of the greatest importance. This operation ought always to be performed as foon as the fymptoms of an inflammatory fever appear. The quantity of blood to be taken away, however, must be in proportion to the ftrength of the patient and the violence of the difeafe. If after the first bleeding the fever should increafe, and the pulfe become more frequent and hard, there will be a neceffity for repeating it a fecond, and perhaps a third, or even a fourth time, which may be done at the diftance of twelve, eighteen, or twenty four hours from each other, as the fymptoms require. If the pulse continues foft, and the patient is tolerably easy after the first bleeding, it ought not to be repeated.

If the heat and fever be very great, forty or fifty drops of the dulcified or fweet fpirit of nitre may be made into a draught, with an ounce of role-water, two ounces of common water, and half an ounce of fimple fyrup, or a bit of loaf-fugar. This draught may be given to the patient every three or four hours while the fever is violent; afterwards once in five or fix hours will be fufficient.

If the patient be afflicted with reaching, or an inclination to vomit, it will be right to affift Nature's attempts, by giving him weak camomile-tea, or lukewarm water to drink.

If the body is bound, a clyfter of milk and water, with a little falt, and a spoonful of sweet oil or fresh butter in it, ought daily to be administered. Should this not have the defired effect, a tea-spoonful of M magnefia

magnefia alba, or cream of tartar, may be frequently put into his drink. He may likewife eat tamarinds, boiled prunes, roafted apples, and the like.

If about the tenth, eleventh, or twelfth day, the pulfe become more foft, the tongue moifter, and the urine begins to let fall a reddifh fediment, there is reafon to expect a favourable iffue to the difeafe. But if, inftead of these fymptoms, the patient's fpirits grow languid, his pulfe finks, and his breathing becomes difficult; with a flupor, trembling of the nerves, flarting of the tendons, &c. there is reason to fear that the consequences will be fatal. In this cafe bliftering plafters must be applied to the head, ancles, infide of the legs or thighs, as there may be occasion; poultices of wheat-bread, mustard, and vinegar, may likewife be applied to the foles of the feet, and the patient must be supported with cordials, as ftrong wine-whey, negus, fago-gruel, with wine in it, and fuch like.

A proper regimen is not only neceffary during the fever, but likewife after the patient begins to recover. By neglecting this, many relapfe, or fall into other difeafes, and continue valetudinary for life. Though the body is weak after a fever, yet the diet for fome time ought to be rather light than of too nourifhing a nature. Too much food, drink, exercife, company, &cc. are carefully to be avoided. The mind ought likewife to be kept eafy, and the patient fhould not attempt to purfue ftudy, or any bufinefs that requires intenfe thinking.

If the digeftion is bad, or the patient is feized at times with feverifh heats, an infufion of Peruvian bark in cold water will be of ufe. It will ftrengthen the ftomach, and help to fubdue the remains of the fever.

When the patient's firength is pretty well recovered, he ought to take fome gentle laxative. An

7

ounce

OF THE PLEURISY. 163

ounce of tamarinds and a dram of fena may be boiled for a few minutes in an English pint of water, and an ounce of manna diffolved in the decoction; afterwards it may be strained, and a teacupful drank every hour till it operates. This dose may be repeated twice or thrice, five or fix days intervening.

Those who follow laborious employments ought not to return too foon to their labour after a fever, but fhould keep eafy till their ftrength and spirits are fufficiently recruited.

CHAP XVI.

OF THE PLEURISY.

HE true pleurify is an inflammation of that membrane called the *pleura*, which lines the infide of the breaft. It is diffinguifhed into the moift and dry. In the former, the patient fpits freely; in the latter, little or none at all. There is likewife a fpecies of this difeafe, which is called the *fpurious* or *baftard pleurify*, in which the pain is more external, and chiefly affects the mufcles between the efpecially fuch as work without doors, and are of a fanguine conflictution. It is moft frequent in the fpring feafon.

CAUSES.— The pleurify may be occafioned by whatever obftructs the perfpiration; as cold northerly winds; drinking cold liquors when the body is hot; fleeping without doors on the damp ground; wet clothes; plunging the body into cold water, or M_2 expofing exposing it to the cold air, when covered with fweat, &c. It may likewife be occafioned by drinking ftrong liquors; by the ftoppage of ulual evacuations; as old ulcers, iffues, fweating of the feet or hands, &c. the fudden ftriking in of any eruption, as the itch, the meafles, or the fmall-pox. Those who have been accuftomed to bleed at a certain featon of the year are apt, if they neglect it, to be feized with a pleurify. Keeping the body too warm by means of fire, clothes, &c. renders it more liable to this difeafe. A pleurify may likewife be occafioned by violent exercife, as running, wreftling, leaping, or by fupporting great weight, blows on the breaft, &c. A bad conformation of the body renders perfons more liable to this difeafe, as a narrow cheft, a ftraitness of the arteries of the pleura, &c.

SYMPTOMS.—This, like moft other fevers, generally begins with chilline's and thivering, which are followed by heat, thirt¹, and reftlefine's. To thefe fucceeds a violent pricking pain in one of the fides among the ribs. Sometimes the pain extends towards the back-bone, fometimes towards the forepart of the breaft, and at other times towards the fhoulder blackes. The pain is generally moft violent when the patient draws his breath.

The pulle in this difeafe is commonly quick and hard, the urine high coloured; and it blood be let, it is covered with a tough cruft, or buffy coat. The patient's fpittle is at first thin, but afterwards it becomes groffer, and is often streaked with blood.

REGIMEN.— Nature generally endeavours to carry off this difeate by a critical difcharge of blood from fome part of the body, by expectoration, fweat, loofe ftools, thick urine, or the like. We ought therefore to fecond her intentions by leffening the force of the circulation, relaxing the veffels,

veffels, diluting the humours, and promoting expec-

For thefe purpofes the diet, as in the former difeafe, ought to be cool, flender, and diluting. The patient muft avoid all food that is vifcid, hard of digeftion, or that affords much nourifhment; as flefh, butter, cheefe, eggs, milk, and alfo every thing that is of a heating nature. His drink may be whey, or an infufion of pectoral and balfamic vegetables *

Barley-water, with a little honey or jelly of currants mixed with it, is likewife a very proper drink in this difeafe. It is made by boiling an ounce of pearl-barley in three Englift pints of water to two, which muft afterwards be ftrained. The decoction of figs, raifins, barley, recommended in the preceding difeafe, is here likewife very proper. Thefe and other diluting liquors are not to be drank in large quantities at a time; but the patient ought to keep continually fipping them, fo as to render his mouth and throat always moift. All his food and drink thould be taken a little warm.

The patient fhould be kept quiet, cool, and every way eafy, as directed under the foregoing difeafe. His feet and hands ought daily to be bathed in lukewarm water, and he may fometimes fit up in bed for a fhort fpace, in order to relieve his head.

MEDICINE.——Almoft every perfon knows, when a fever is attended with a violent pain of the fide, and a quick hard pulfe, that bleeding is neceffary. When thefe fymptoms come on, the fooner this operation is performed the better; and the quantity at first must be pretty large, provided the patient is able to bear it. A large quantity of

> * See Appendix, Pettoral infusion. M 3

blood

blood let at once, in the beginning of a pleurify, has a much better effect than repeated fmall bleedings. A man may loofe twelve or fourteen ounces of blood as foon as it is certainly known that he is feized with a pleurify. For a younger perfon, or one of a delicate conflitution, the quantity must be lefs,

If, after the first bleeding, the flitch, with the other violent fymptoms, should flill continue, it will be neceffary, at the diftance of twelve or eighteen hours, to let eight or nine ounces more. If the fymptoms do not then abate, and the blood shews a flrong buffy coat, a third or even a fourth bleeding may be requisite. If the pain of the fide abates, the pulle becomes foster, or the patient begins to fpit freely, bleeding ought not to be repeated. This operation is feldom neceffary after the third or fourth day of the fever, and ought not then to be performed, unlefs in the most urgent circumstances.

The blood may be many ways attenuated without bleeding. There are likewife many things that may be done to eafe the pain of the fide without this operation, as fomenting, bliftering, &c. Fomentations may be made by boiling a handful of the flowers of elder, camomile, and common mallows, or any other foft vegetables in a proper quantity of water. The herbs may be either put into a flannel bag, and applied warm to the fide, or flannels may be dipped in the decoction, afterwards wrung out, and applied to the part affected, with as much warmth as the patient can eafily bear. As the clothes grow cool, they must be changed, and great care taken that the patient do not catch cold. A bladder may be filled with warm milk and water, and applied to the fide, if the above method of fomenting be found inconvenient. Fomentations not only eafe the pain, but relax the veffels,

veffels, and prevent the ftagnation of the blood and other humours. The fide may likewife be frequently rubbed with a little of the volatile liniment *.

Topical bleeding has often a very good effect in this difeafe. It may either be performed by applying a number of leeches to the part affected, or by cupping, which is both a more certain and expeditious method than the other.

Leaves of various plants might likewife be applied to the patient's fide with advantage. I have often feen great benefit from young cabbage-leaves applied warm to the fide in a pleurify. These not only relax: the parts, but likewise draw off a little moisture, and may prevent the neceffity of bliftering-plafters; which however, when other things fail, must be applied.

If the flitch continues after repeated bleedings, fomentations, &c. a bliftering-plafter must be applied over the part affected, and fuffered to remain for two days. This not only procures a difcharge from the fide, but takes off the fpafm, and by that means affifts in removing the caufe of the difeafe. To prevent a ftranguary when the blifteringplaster is on, the patient may drink freely of the Arabic emultion +.

If the patient is coftive, a clyster of thin water-gruel, or of barley-water, in which a handful of mallows, or any other emollient vegetable has been boiled, may be daily administered. This will not only empty the bowels, but have the effect of a warm fomentation applied to the inferior vifcera, which will help to make a derivation from the breaft.

The expectoration may be promoted by fharp, oily, and mucilaginous medicines. For this purpofe an

> * See Appendix, Volatile liniment. + See Appendix, Arabic emulfion. M4

ounce

ounce of the oxymel, or the vinegar of fquills, may be added to fix ounces of the pectoral decoction, and two table-spoonfuls of it taken every two hours.

Should the fquill difagree with the ftomach, the oily emulfion may be administered *; or, in place of it, two ounces of the oil of fweet almonds, or oil of olives, and two ounces of the fyrup of violets may be mixed with as much fugar-candy powdered, as will make an electuary of the, confiftence of honey. The patient may take a tea-fpoontul of this frequently, when the cough is troublefome. Should oily medicines prove naufeous, which is fometimes, the cafe, two table-spoonfuls of the folution of gum ammoniac in barley-water may be given three or four times a-day +.

If the patient does not perfpire, but has a burning heat upon his fkin, and paffes very little water, fome fmall dofes of purified nitre and camphire will be of ufe. Two drams of the former may be rubbed with five or fix grains of the latter in a mortar, and the whole divided into fix dofes, one of which may be taken every five or fix hours, in a little of the patient's ordinary drink.

We fhall only mention one medicine more which fome reckon almost a specific in the pleurify, viz. the decoction of the feneka rattle fnake root t. After bleeding and other evacuations have been premifed, the patient may take two, three, or four table-fpoonfuls of this decoction, according as his ftomach will bear it, three or four times a-day. If it should occafion vomiting, two or three ounces of fimple cinnamon water may be mixed with the quantity of decoction here directed, or it may be taken in fmaller dofes. As this medicine promotes perspira-

* See Appendix, Oily emulfion.

+ See Appendix, Solution of gum ammoniac.

1 See Appendix, Decoction of feneka root.

tion

tion and urine, and likewife keeps the body eafy, it may be of fome fervice in a pleurify, or any other inflammation of the breaft.

No one will imagine that these medicines are all to be used at the same time. We have mentioned different things, on purpose that people may have it in their power to chuse; and likewise, that when one cannot be obtained, they may make use of another. Different medicines are no doubt neceffary in the different periods of a diforder; and where one fails of fucces, or difagrees with the patient, it will be proper to try another.

What is called the crifis or height of the fever, is fometimes attended with very alarming fymptoms, as difficulty of breathing, an irregular pulfe, convulfive motions, &c. Thefe are apt to frighten the attendants, and induce them to do improper things, as bleeding the patient, giving him ftrong ftimulating medicines, or the like. But they are only the ftruggles of Nature to overcome the difeafe, in which fhe ought to be afilited by plenty of diluting drink, which is then peculiarly neceffary. If the patient's ftrength however be much exhaulted by the difeafe, it will be neceffary at this time to fupport him with frequent fmall draughts of wine-whey, negus, or the like.

When the pain and fever are gone, it will be proper, after the patient has recovered fufficient ftrength, to give him fome gentle purges, as those directed towards the end of an acute continual fever. He ought likewise to use a light diet, of easy digestion, and his drink should be butter-milk, whey, and other things of a cleansing nature.

Of the BASTARD PLEURISY.

That fpecies of pleurify which is called the *baflard* or *fpurious*, generally goes off by keeping warm for a few a few days, drinking plenty of diluting liquors, and obferving a cooling regimen.

It is known by a dry cough, a quick pulfe, and a difficulty of lying on the affected fide, which laft does not always happen in the true pleurify. Sometimes indeed this difeafe proves obfinate, and requires bleeding, with cupping, and fearifications of the part affected. Thefe, together with the use of nitrous and other cooling medicines, feldom fail to effect a cure.

Of the PARAPHRENITIS.

The *paraphrenitis*, or inflammation of the diaphragm, is fo nearly connected with the pleurify, and refembles it fo much in the manner of treatment, that it is fearce neceffary to confider it as a feparate difeafe.

It is attended with a very acute fever, and an extreme pain in the part affected, which is generally augmented by coughing, fneezing, drawing in the breath, taking food, going to ftool, making water, &c. Hence the patient breathes quick, and draws in his bowels to prevent the motion of the diaphragm; is refilefs, anxious, has a dry cough, a hiccup, and often a delirium. A convultive laugh, or rather a kind of involuntary grin, is no uncommon fymptom of this difeafe.

Every method must be taken to prevent a suppuration, as it is impossible to fave the patient's life when this happens. The regimen and medicine are in all respects the fame as in the pleurify. We shall only add, that in this difease, emollient clysters are peculiarly useful, as they relax the bowels, and by that means make a derivation from the part affected.

CHAP.

[171]

CHAP. XVII.

OF A PERIPNEUMONY, OR INFLAMMA-TION OF THE LUNGS.

A S this difeafe affects an organ which is abfolutely neceffary to life, it muft always be attended with danger. Perfons who abound with thick blood, whofe fibres are tenfe and rigid, who feed upon grofs aliment, and drink ftrong vifcid liquors, are moft liable to a peripneumony. It is generally fatal to thofe who have a flat breaft, or narrow cheft, and to fuch as are afflicted with an afthma, efpecially in the decline of life. Sometimes the inflammation reaches to one lobe of the lungs only, at other times the whole of the organ is affected; in which cafe the difeafe can hardly fail to prove fatal.

When the difeafe proceeds from a vifcid pituitous matter obstructing the veffels of the lungs, it is called a *fpurious* or *bastard peripneumony*. When it arifes from a thin acrid defluction on the lungs, it is denominated a *catarrhal peripneumony*, &c.

CAUSES.——An inflammation of the lungs, is fometimes a primary difeafe, and fometimes it is the confequence of other difeafes, as a quinfey, a pleurify, &c. It proceeds from the fame caufes as the pleurify, wiz. an obftructed perfpiration from cold, wet clothes &c. or from an increafed circulation of the blood by violent exercife, the ufe of fpiceries, ardent fpirits, and fuch like. The pleurify and peripneumony are often complicated, in which cafe the difeafe is called a *pleuro-peripneumony*.

SYMPTOMS.—Most of the symptoms of a pleurify likewife attend an inflammation of the lungs; only in the latter the pulse is more fost, and the pain lefs

172 OF A PERIPNEUMONY.

lefs acute; but the difficulty of breathing, an oppreffion of the breaft, are generally greater.

REGIMEN.------As the regimen and medicine are in all respects the fame in the true peripneumony as in the pleurify, we shall not here repeat them, but refer the reader to the treatment of that difeafe. It may not however be improper to add, that the aliment ought to be more flender and thin in this than in any other inflammatory difeafe. The learned Dr. Arbuthnot afferts, that even common whey is fufficient to support the patient and that decoctions of barley, and infufions of fennel roots in warm water with milk, are the most proper both for drink and nourishment. He likewife recommends the steam of warm water taken in by the breath, which ferves as a kind of internal fomentation, and helps to attenuate the impacted humours. If the patient has loofe ftools, but is not weakened by them, they are not to be ftopped, but rather promoted by the use of emollient clyfters.

It has already been observed, that the *fpurious* or *baftard* peripneumony is occasioned by a vifcid pituitous matter obstructing the veffels of the lungs. It commonly attacks the old, infirm, and phlegmatic, in winter and wet feasons.

The patient at the beginning is cold and hot by turns, has a fmall quick pulle, feels a fenfe of weight upon his breaft, breathes with difficulty, and fometimes complains of a pain and giddinefs of his head. His urine is ufually pale, and his colour very little changed.

The diet in this as well as in the true peripneumony, muft be very flender, as weak broths, fharpened with the juice of orange or lemon, and fuch like. His drink may be thin water-gruel fweetened with honey, or a decoction of the roots of fennel, liquorice, and quick grafs. An ounce of each of thefe may be boiled in three English pints of

OF A PERIPNEUMONY. 173

of water to a quart, and fharpened with a little currant-jelly, or the like.

Bleeding and purging are generally proper at the beginning of this difeafe; but if the patient's fpittle is pretty thick, or well concocted, neither of them are neceffary. It will be fufficient to affift the expectoration by fome of the fharp medicines recommended for that purpofe in the pleurify, as the folution of gum-ammoniac with oxymel of fquills, &c. Bliftering plafters have generally a good effect, and ought to be applied pretty early.

If the patient does not fpit, he muft be bled according as his ftrength will permit, and have a gentle purge administered. Afterwards his body may be kept open by clyfters, and the expectoration promoted, by taking every four hours two table spoonfuls of the folution mentioned above.

When an inflammation of the breaft does not yield to bleeding, bliftering and other evacuations, it commonly ends in a fuppuration, which is more or lefs dangerous, according to the part where it is fituated. When this happens in the pleura, it fometimes breaks outwardly, and the matter is difcharged by the wound.

When the fuppuration happens within the fubftance or body of the lungs, the matter may be difcharged by expectoration, but if the matter floats in the cavity of the breaft, between the pleura and the lungs, it can only be difcharged by an incifion made betwixt the ribs.

If the patient's ftrength does not return after the inflammation is to all appearance removed; if his pulfe continues quick though foft, his breathing difficult and oppreffed; if he has cold fhiverings at times, his checks flufhed, his lips dry; and if he complains of thirft, and want of appetite, there is reafon to fear a fuppuration, and that a phthifis or confumption

174 OF CONSUMPTIONS.

confumption of the lungs will enfue. We fhall therefore next proceed to confider the proper treatment of that difeafe.

CHAP. XVIII.

OF CONSUMPTIONS.

A CONSUMPTION is a wafting or decay of the whole body from an ulcer, tubercles, or concretions of the lungs, an empyema, a nervous atrophy, or cachexy.

Dr. Arbuthnot obferves, that in his time confumptions, made up above one tenth-part of the bills of mortality in and about London. There is reafon to believe they have rather increafed fince; and we know from experience, that they are not lefs fatal in fome other towns of England than in London.

Young perfons, between the age of fifteen and thirty, of a flender make, long neck, high floulders, and flat breafts, are most liable to this dileafe.

Confumptions prevail more in England than in any other part of the world, owing perhaps to the great use of animal food and malt liquors, the general application to fedentary employments, and the great quantity of pit-coal which is there burnt; to which we may add the perpetual changes in the atmosphere, or variableness of the weather.

CAUSES.——It has already been observed, that an inflammation of the breaft often ends in an imposthume: confequently whatever disposes people to this difease, must likewise be confidered as a cause of confumption.

Other

OF CONSUMPTIONS.

Other difeafes, by vitiating the habit, may likewife occafion confumptions; as the fcurvy, the fcrophula, or king's evil, the venereal difeafe, the afthma, fmall-pox, meafles, &c.

As this difeafe is feldom cured, we fhall endeavour the more particularly to point out its caufes, in order that people may be enabled to avoid it. Thefe are:

Confined or unwholefome air. When this fluid is impregnated with the fumes of metals or minerals, it proves extremely hurtful to the lungs, and often corrodes the tender veffels of that neceffary organ.

Violent paffions, exertions, or affections of the mind; as grief, difappointment, anxiety, or clofe application to the fludy of abstrufe arts or sciences.

Great evacuations; as fweating, diarrhœas, diabetes, exceffive venery, the fluor albus, an overdifcharge of the menftrual flux, giving fuck too long, &c.

The fudden ftoppage of cuftomary evacuations; as the bleeding piles, fweating of the feet, bleeding at the nofe, the menfes, iffues, ulcers, or eruptions of any kind.

Injuries done to the lungs, calculi, &c. I lately faw the fymptoms of a phthifis occafioned by a fmall bone flicking in the *broncha*. It was afterwards vomited along with a confiderable quantity of purulent matter, and the patient, by a proper regimen, and the use of the peruvian bark recovered.

——Frequent and exceffive debaucheries. Late watching, and drinking firong liquors, which generally go together, can hardly fail to deftroy the lungs. Hence the *bon companion* generally falls a facrifice to this difeafe.

175

Infection. Confumptions are likewife caught by fleeping with the difeated; for which reafen this should be carefully avoided. It cannot be of great benefit to the fick, and muft hurt those in health.

——Occupations in life. Those artificers who fit much, and are conftantly leaning forward, or preffing upon the ftomach and breaft, as cutlers, taylors, fhoe-makers, feamftreffes, &cc. often die of confumptions. They likewife prove fatal to fingers, and all who have occasion to make frequent and violent exertions of the lungs.

——Cold. More confumptive patients date the beginning of their diforders from wet feet, damp beds, night air, wet clothes, or catching cold after the body had been heated, than from all other caufes.

Sharp, faline, and aromatic aliments, which heat and inflame the blood, are likewife frequently the caufe of confumptions.

We fhall only add, that this difeafe is often owing to an hereditary taint, or a fcrophulous habit; in which cafe it is generally incurable.

SYMTOMS.——This difeafe generally begins with a dry cough, which often continues for fome months. If a difpolition to vomit after eating be excited by it, there is fill greater reafon to fear an approaching confumption. The patient complains of a more than ufual degree of heat, a pain and oppreflion of the breaft, efpecially after motion; his ipittle is of a faltifh tafte, and fometimes mixed with blood. He is apt to be fad; his appetite is bad, and his thirft great. There is generally a quick, foft, fmall pulfe; though fometimes the pulfe is pretty full, and rather hard. Thefe are the common fymptoms of a beginning confumption.

Afterwards the patient begins to fpit a greenifh, white, or bloody matter. His body is extenuated by the hectic fever, and colliquative fweats, which mutually fucceed one another, viz. the one towards night,

176

night, and the other in the morning. A loofenefs, and an exceffive difcharge of urine, are often troubles fome fymptoms at this time, and greatly weaken the patient. There is a burning heat in the palms of the hands, and the face generally flushes after eating, the fingers become remarkably fmall, the nails are bent inwards, and the hairs fall off.

At laft the fwelling of the feet and legs, the total lofs of ftrength, the finking of the eyes, the difficulty of fwallowing, and the coldnefs of the extremities, fhew the immediate approach of death, which however the patient feldom believes to be fo near. Such is the ufual progrefs of this fatal difeafe, which, if not early checked, commonly fets all medicine at defiance.

REGIMEN.—On the first appearance of a confumption, if the patient lives in a large town, or any place where the air is confined, he ought immediately to quit it, and to make choice of a fituation in the country, where the air is pure and free. Here he must not remain inactive, but take every day as much exercise as he can bear.

The beft method of taking exercife is to ride on horfeback, as this gives the body a great deal of motion without much fatigue. Such as cannot bear this kind of exercife, muft make ufe of a carriage. A long journey, as it amufes the mind by a continual change of objects, is greatly preferable to riding the fame ground over and over. Care however muft be taken to avoid catching cold from wet clothes, damp beds, or the like. The patient ought always to finifh his ride in the morning, or at leaft before dinner; otherwife it will oftener do harm than good.

It is pity those who attend the fick feldom recommend riding in this difease, till the patient is either unable to bear it, or the malady has become incurable. Patients are likewise apt to trifle with every thing that is in their own power. They cannot see how

one

178 OF CONSUMPTIONS.

one of the common actions of life fhould prove a remedy in an obflinate difeafe, and therefore they reject it, while they greedily hunt after relief from medicine, merely becaufe they do not underftand it.

Thole who have firength and courage to undertake a pretty long voyage, may expect great advantage from it. This, to my knowledge, has frequently-cured a confumption after the patient was, to all appearance, far advanced in that difeafe, and where medicine had proved ineffectual. Hence it is reafonable to conclude, that if a voyage were undertaken in due time, it would feldom fail to perform a cure *.

Such as try this method of cure ought to carry as much freth provifions along with them as will ferve for the whole time they are at fea. As milk is not eafily obtained in this fituation, they ought to live upon fruits, and the broth of chickens, or other young animals which can be kept alive on board. It is fearce neceffary to add, that fuch voyages fhould be undertaken, if poffible, in the mildeft feafon, and that they ought to be towards a warmer climate 4.

Those who have not courage for a long voyage may travel into a more fouthern climate, as the fouth of France, Spain, or Portugal; and if they find the air of these countries agree with them, they should continue there at least till their health be confirmed.

* Two things chiefly operate to prevent the benefits which would arife from failing. The one is, that phyficians feldom order it till the difeafe is too far advanced; and the other is, that they feldom order a voyage of a fufficient length. A patient may receive no benefit by crofling the channel, who, fhould he crofs the Atlantic, might be completely cured. Indeed we have reafon to believe, that a voyage of this kind, if taken in due time, would feldom fail to cure a confumption.

+ Though I do not remember to have feen one inflance of a genuine confumption of the lungs cured by medicine, yet I have known a Weft-India voyage work wonders in that dreadful diforder.

Next

OF CONSUMPTIONS.

Next to proper air and exercife, we would recommend a due attention to diet. The patient fhould eat nothing that is either heating or hard of digeftion, and his drink muft be of a foft and cooling nature. All the diet ought to be calculated to leffen the acrimony of the humours, and to nourifh and fupport the patient. For this purpofe he muft keep chiefly to the ufe of vegetables and milk. Milk alone is of more value in this difeale than the whole materia medica.

Affes milk is commonly reckoned preferable to any other; but it cannot always be obtained; befides, it is generally taken in a very finall quantity; whereas, to produce any effects, it ought to make a confiderable part of the patient's diet. It is hardly to be expected, that a gill or two of affes milk, drank in the fpace of twenty-four hours, fhould be able to produce any confiderable change in the humours of an adult; and when people do not perceive its effects foon; they lofe hope, and fo leave it off. Hence it happens that this medicine, however valuable, very feldom performs a cure. The reafon is obvious; it is commonly ufed too lare, is taken in too fmall quantities, and is not duly perfifted in.

I have known very extraordinary effects from affes milk in obftinate coughs, which threatened a confumption of the lungs; and do verily believe, if used at this period, that it would feldom fail; but if it be delayed till an ulcer is formed, which is generally the cafe, how can it be expected to fucceed?

Affes milk ought to be drank, if poffible, in its natural warmth, and by a grown perfon, in the quantity of half an English pint at a time. Instead of taking this quantity night and morning only, the patient ought to take it four times, or at least thrice a-day, and to eat a little light bread along with it, fo as to make it a kind of meal.

If

179

If the milk fhould happen to purge, it may be mixed with old conferve of rofes. When that cannot be obtained, the powder of crabs claws may be used in its ftead. Affes milk is usually ordered to be drank warm in bed; but as it generally throws the patient in a fweat when taken in this way, it would perhaps be better to give it after he rifes.

Some extraordinary cures in confumptive cafes have been performed by women's milk. Could this be obtained in fufficient quantity, we would recommend it in preference to any other. It is better if the patient can fuck it from the breaft, than to drink it afterwards. I knew a man who was reduced to fuch a degree of weaknefs in a confumption, as not to be able to turn himfelf in bed. His wife was at that time giving fuck, and the child happening to die, he fucked her breafts, not with a view to reap any advantage from the milk, but to make her eafy. Finding himfelf however greatly benefited by it, he continued to fuck her till he became perfectly well, and is at prefent a ftrong and healthy man.

Some prefer butter-milk to any other, and it is indeed a very valuable medicine, if the ftomach be able to bear it. It does not agree with every perfon at firft; and is therefore often laid afide without a fufficient trial. It fhould at firft be taken fparingly, and the quantity gradually increased, until it comes to be almost the fole food. I never knew it fucceed unlefs where the patient almost lived upon it.

Cows milk is moft readily obtained of any, and though it be not fo eafily digefted as that of affes or mares, it may be rendered lighter by adding to it an equal quantity of barley-water, or allowing it to ftand for fome hours, and afterwards taking off the cream. If it fhould, notwithftanding, prove heavy on the ftomach, a fmall quantity of brandy or rum, with a little

180

little fugar, may be added, which will render it both more light and nourifhing.

It is not to be wondered, that milk fhould for fome time difagree with a ftomach that has not been accuftomed to digeft any thing but flefh and ftrong liquors, which is the cafe with many of thofe who fall into confumptions. We do not however advife thofe who have been accuftomed to animal food and ftrong liquors to leave them off all at once. This might be dangerous. It will be neceffary for fuch to eat a little once a day of the flefh of fome young animal, or rather to ufe the broth made of chickens, veal, lamb, or fuch like. They ought likewife to drink a little wine made into negus, or diluted with twice or thrice its quantity of water, and to make it gradually weaker till they can leave it off altogether.

Thefe muft be ufed only as preparatives to a diet confifting chiefly of milk and vegetables, which the fooner the patient can be brought to bear, the better. Rice and milk, or barley and milk, boiled with a little fugar, is very proper food. Ripe fruits roafted, baked, or boiled, are likewife proper, as goofe or currant berry tarts, apples roafted, or boiled in milk, &cc. The jellies, conferves, and preferves, &c. of ripe fubacid fruits, ought to be eaten plentifully, as the jelly of currants, conferve of rofes, preferved plums, cherries, &c.

Wholefome air, proper exercife, and a diet confifting chiefly of these and other vegetables, with milk, is the only courfe that can be depended on in a beginning confumption. If the patient has ftrength and fufficient resolution to perfift in this courfe, he will feldom be disappointed of a cure.

In a populous town in England *, where confumptions are very common, I have frequently feen con-

> * Sheffield. N 3

fumptive

fumptive patients, who had been fent to the country with orders to ride and live upon milk and vegetables, return in a few months quite plump, and free from any complaint. This indeed was not always the cafe, efpecially when the difeafe was hereditary, or far advanced; but it was the only method in which fuccefs was to be expected: where it failed, I never knew medicine fucceed.

If the patient's firength and fpirits flag, he muft be fupported by firong broths, jellies, and fuch like. Some recommend fhell-fifth in this diforder, and with fome reafon, as they are nourifhing and reftorative *. All the food and drink ought however to be taken in fmall quantities, left an overcharge of fresh chyle should opprefs the lungs, and too much accelerate the circulation of the blood.

The patient's mind ought to be kept as eafy and cheerful as poffible. Confumptions are often occafioned, and always aggravated, by a melancholy caft of mind; for which reafon mufic, cheerful company, and every thing that infpires mirth, are highly beneficial. The patient ought feldom to be left alone, as brooding over his calamities is fure to render him worfe.

MEDICINE — Though the cure of this difeafe depends chiefly upon regimen and the patient's own endeavours, yet we fhall mention a few things which may be of fervice in relieving fome of the more violent fymptoms.

In the first stage of a confumption, the cough may fometimes be appealed by bleeding; and the expectoration may be promoted by the following medicines. Take fresh squills, gum-ammoniac, and powdered

* I have often known perfons of a confumptive habit, where the fymptoms were not violent, reap great benefit from the ufe of ovflers. They generally ate them raw, and drank the juice along with them.

carda-

cardamum feeds, of each a quarter of an ounce; beat them together in a mortar, and if the maß proves too hard for pills, a little of any kind of fyrup may be added to it. This may be formed into pills of a moderate fize, and four or five of them taken twice or thrice a-day, according as the patient's ftomach will bear them.

The *lac ammoniacum*, or milk of gum ammoniac, as it is called, is likewife a proper medicine in this ftage of the difeafe. It may be used as directed in the pleurity.

A mixture made of equal parts of lemon juice, fine honey, and fyrup of poppies, may likewife be ufed. Four ounces of each of thefe may be fimmered togeth r in a fauce-pan, over a gentle fire, and a tablefpoonful of it taken at any time when the cough is troublefome.

It is common in this flage of the difeafe to load the patient's flomach with oily and balfamic medicines. Thefe, inflead of removing the caufe of the difeafe, tend rather to increafe it by heating the blood, while they pall the appetite, relax the folids, and prove every way hurtful to the patient. Whatever is ufed for removing the cough, befides riding and other proper regimen, ought to be medicines of a fharp and cleanfing nature; as oxymel, fyrup of lemon, &c.

Acids feem to have peculiarly good effects in this difeafe; they both tend to quench the patient's thirft and to cool the blood. The vegetable acids, as apples, oranges, lemons, &c. appear to be the moft proper. I have known patients fuck the juice of feveral lemons every day with manifeft advantage, and would for this reafon recommend acid vegetables to be taken in as great quantity as the flomach will bear them.

For the patient's drink, we would recommend infufions of the bitter plants, as ground-ivy, the $N \neq 0$ lefter leffer centaury, camomile flowers, or water-trefoil. Thefe infufions may be drank at pleafure. They ftrengthen the ftomach, promote digeftion, and at the fame time anfwer all the purpofes of dilution, and quench thirft much better than things that are lufcious or fweet. But if the patient fpits blood, he ought to ufe, for his ordinary drink, infufions or decoctions of the vulnerary roots, plants, &c.*

There are many other mucilaginous plants and feeds, of a healing and agglutinating nature, from which decoctions or infufions may be prepared with the fame intention; as the orches, the quincefeed, coltsfoot, linfeed, farfaparilla, &cc. It is not neceffary to mention the different ways in which thefe may be prepared. Simple infufion or boiling is all that is neceffary, and the dofe may be at differetion.

The conferve of roles is here peculiarly proper. It may either be put into the decoction above prefcribed, or eaten by itfelf. No benefit is to be expected from trifling doles of this medicine. I never knew it of any fervice, unlefs where three or four ounces at leaft were ufed daily for a confiderable time. In this way I have feen it produce very happy effects, and would recommend it wherever there is a difcharge of blood from the lungs.

When the fpitting up of groß matter, opprefion of the breaft, and the hectic fymptoms, fhew that an impofthume is formed in the lungs, we would recommend the Peruvian bark, that being the only drug which has any chance to counteract the general tendency which the humours then have to putrefaction.

An ounce of the bark in powder may be divided into eighteen or twenty dofes, of which one may be

* See Appendix, Vulnerary decoction.

taken

taken every three hours through the day, in a little fyrup, or a cup of horehound tea.

If the bark fhould happen to purge, it may be made into an electuary, with the conferve of roles, thus: Take old conferve of roles a quarter of a pound, Peruvian bark in powder an ounce, fyrup of orange or lemon, as much as will make it of the confiftence of honey. This quantity will ferve the patient four or five days, and may be repeated as there is occafion.

Such as cannot take the bark in fubftance, may infufe it in cold water. This feems to be the beft menftruum for extracting the virtues of that drug. Half an ounce of bark in powder may be infufed for twenty-four hours in half an English pint of water. Afterwards let it be paffed through a fine ftrainer, and an ordinary tea-cupful of it taken three or four times a-day.

We would not recommend the bark while there are any fymptoms of an inflammation of the breaft; but when it is certainly known that matter is collected there, it is one of the beft medicines which can be ufed. Few patients indeed have refolution enough to give the bark a fair trial at this period of the difeafe, otherwife we have reafon to believe that fome benefit might be reaped from it.

When it is evident that there is an impofthume in the breaft, and the matter can neither be fpit up nor carried off by abforption, the patient muft endeavour to make it break inwardly, by drawing in the fteams of warm water, or vinegar with his breath, coughing, laughing, or bawling aloud, &c. When it happens to burft within the lungs, the matter may be difcharged by the mouth. Sometimes indeed the burfting of the vomica occations immediate death by fuffocating the patient. When the quantity of matter is great, and the patient's

5

186 OF CONSUMPTIONS.

tient's ftrength exhaufted, this is commonly the cafe. At any rate the patient is ready to fall into a fwoon, and fhould have volatile falts or fpirits held to his nofe.

If the matter difcharged be thick, and the cough and breathing become eafier, there may be fome hopes of a cure. The diet at this time ought to be light, but reftorative, as chicken-broths, fago-gruel, rice-milk, &c. the drink, butter-milk or whey, fweetened with honey. This is likewife a proper time for ufing the Peruvian bark, which may be taken as directed above.

If the vomica or impofthume fhould difcharge itfelf into the cavity of the breaft, between the pleura and the lungs, there is no way of getting the matter out but by an incifion, as has already been obferved. As this operation muft always be performed by a furgeon, it is not neceffary here to deferibe it. We fhall only add, that it is not fo dreadful as people are apt to imagine, and that it is the only chance the patient in this cafe has for his life.

A NERVOUS CONSUMPTION is a wafting or decay of the whole body, without any confiderable degree of fever, cough, or difficulty of breathing. It is attended with indigestion, weakness, and want of appetite, &c.

^{*}Thole who are of a fretful temper, who indulge in fpirituous liquors, or who breathe an unwholefome air, are most liable to this difease.

We would chiefly recommend, for the cure of a nervous confumption, a light and nourifhing diet, plenty of exercife in a free open air, and the ufe of fuch bitters as brace and ftrengthen the ftomach; as the Peruvian bark, gentian root, camomile, horehound, &c. Thefe may be infufed in water or wine, and a glafs of it drank frequently. It will greatly affift the digeftion, and promote the cure of this difeafe, to take twice a-day twenty or thirty drops of the elixir of vitriol in a glafs of wine or water. The chalybeate wine is likewife an excellent medicine in this cafe. It ftrengthens the folids, and powerfully affifts Nature in the preparation of good blood*.

Agreeable amufements, cheerful company, and riding about, are however preferable to all medicines in this difeafe. For which reafon, when the patient can afford it, we would recommend a long journey of pleafure, as the most likely means to reftore his health.

What is called a *fymptomatic confumption*, cannot be cured without first removing the difease by which it is occasioned. Thus, when a confumption proceeds from the fcrophula, or king's evil, from the fcurvy, the afthma, the venereal difease, &cc. a due attention must be paid to the malady from whence it arises, and the regimen and medicine directed accordingly.

When exceffive evacuations of any kind occasion a confumption, they must not only be reftrained, but the patient's ftrength must be reftored by gentle exercise, nourifhing diet, and generous cordials. Young and delicate mothers often fall into confumptions, by giving fuck too long. As foon as they perceive their ftrength and appetite begin to fail, they ought immediately to wean the child, or provide another nurse, otherwise they cannot expect a cure.

Before we quit this fubject, we would earneftly recommend it to all, as they wifh to avoid confumptions, to take as much exercife, without doors, as they can, to avoid unwholefome air, and to ftudy fobriety. Confumptions owe their prefent increase

* See Appendix, Chalybeate wine.

not

188 OF THE NERVOUS FEVER.

not a little to the fathion of fitting up late, eating hot fuppers, and fpending every evening over a bowl of hot punch or other firong liquors. Thefe liquors, when too freely ufed, not only hurt the digeftion, and fpoil the appetite, but heat and inflame the blood, and fet the whole conftitution on fire.

CHAP. XIX.

OF THE SLOW OR NERVOUS FEVER.

NERVOUS fevers have increafed greatly of late years in this ifland, owing doublefs to our different manner of living, and the increafe of fedentary employments; as they commonly attack perfons of a weak relaxed habit, who neglect exercife, eat little folid food, ftudy hard, or indulge in fpirituous liquors.

CAUSES.——Nervous fevers may be occafioned by whatever deprefiles the fpirits, or impoverifhes the blood; as grief, fear, anxiety, want of fleep, intenfe thought, living on poor watery diet, unripe fruits, cucumbers, melons, mufhrooms, &cc. They may likewife be occafioned by damp, confined, or unwholefome air. Hence they are very common in rainy feafons, and prove moft fatal to thofe who live in dirty low houfes, crowded ftreets, hofpitals, jails, or fuch-like places.

Perfons whofe conftitutions have been broken by exceffive venery, frequent falivations, too free an ufe of purgative medicines, or any other exceffive evacuations, are most liable to this difeafe.

Keeping on wet clothes, lying on the damp ground, exceflive fatigue, and whatever obstructs the the perfpiration, or caufes a fpafmodic ftricture of the folids, may likewife occafion nervous fevers. We fhall only add, frequent and great irregularities in diet. Too great abflinence, as well as excefs, is hurtful. Nothing tends fo much to preferve the body in a found ftate as a regular diet; nor can any thing contribute more to occafion fevers of the worft kind than its oppofite.

SYMPTOMS.—Low fpirits, want of appetite, weaknefs, wearinefs after motion, watchfulnefs, deep fighing, and dejection of mind, are generally the forerunners of this difeafe. Thefe are fucceeded by a quick low pulle, a dry tongue without any confiderable thirft, chillnefs and flufhing in turns, &c.

After fome time the patient complains of a giddinefs and pain of the head, has a naufea, with reachings and vomiting; the pulfe is quick, and fometimes intermitting; the urine pale, refembling dead fmall-beer, and the breathing is difficult, with oppreffion of the breaft, and flight alienations of mind.

If towards the ninth, tenth, or twelfth day, the tongue becomes more moift, with a plentiful fpitting, a gentle purging, or a moifture upon the fkin; or if a fuppuration happens in one or both ears, or large pultules break out about the lips and nofe, there is reafon to hope for a favourable crifis.

But if there is an exceflive loofenels or wafting fweats, with frequent fainting fits; if the tongue, when put out, trembles exceflively, and the extremities feel cold, with a fluttering or flow creeping pulle; if there is a flatting of the tendons, an almost totallofs of fight and hearing, and an involuntary difcharge by flool and urine, there is great reason to fear that death is approaching.

REGI-

190 OF THE NERVOUS FEVER,

REGIMEN.—It is very neceffary in this difeafe to keep the patient cool and quiet. The leaft motion would fatigue him, and will be apt to occafion wearinefs, and even faintings. His mind ought not only to be kept eafy, but foothed and comforted with the hopes of a fpeedy recovery. Nothing is more hurtful in low fevers of this kind than pretenting to the patient's imagination gloomy or frightful ideas. Thefe of themfelves often occafion nervous fevers, and it is not to be doubted but they will likewife aggravate them.

The patient must not be kept too low. His ftrength and fpirits ought to be fupported by nourishing diet and generous cordials. For this purpole his gruel, panado, or whatever food he takes, must be mixed with wine according as the fymptoms may require. Pretty ftrong wine-whey, or fmall negus fharpened with the juice of orange or lemon, will be proper for his ordinary drink. Mustard-whey is likewife a very proper drink in this fever, and may be rendered an excellent cordial medicine by the addition of a proper quantity of white-wine*.

Wine in this difeafe, if it could be obtained genuine, is almost the only medicine that would be neceffary. Good wine posseful the virtues of the cordial medicines, while it is free from many of their bad qualities. I fay good wine; for however common this atticle of luxury is now become, it is rarely to be obtained genuine, especially by the poor, who are obliged to purchase it in small quantities.

I have often feen patients in low nervous fevers where the pulfe could hardly be telt, with a conftant delirium, coldness of the extremities, and al-

* See Appendix, Mulard why.

moft

most every other mortal fymptom, recover by using in whey, gruel, and negus, a bottle or two of ftrong wine every day. Good old found claret is the best, and may be made into negus, or given by itself, as circumstances require.

In a word, the great aim in this difeafe is to fupport the patient's ftrength, by giving him frequently fmall quantities of the above, or other drinks of a warm and cordial nature. He is not however to be overheated either with liquor or clothes; and his food ought to be light, and given in fmall quantities.

MEDICINE. Where a naufea, load, ard ficknefs at ftomach, prevail at the beginning of the fever, it will be neceffary to give the patient a gentle vomit. Fifteen or twenty grains of ipecacuanha in fine powder, or a few fpoonsfuls of the vomiting julep*, will generally anfwer this purpofe very well. This may be repeated any time before the third or fourth day, if the above fymptoms continue. Vomits not only clean the ftomach, but, by the general fhock which they give, promote the perfpiration, and have many other excellent effects in flowfevers, where there are no figns of inflammation, and nature wants roufing.

Such as dare not venture upon a vomit may clean the bowels by a fmall dofe of Turkey rhubarb, or an infufion of fenna and manna.

In all fevers, the great point is to regulate the fymproms, fo as to prevent them from going to either extreme. Thus, in fevers of the inflammatory kind, where the force of the circulation is too great, or the blood denfe, and the fibres too rigid, bleeding and other evacuations are neceffary. But in nervous fevers, where nature flags, where the blood is vapid and poor, and the folids relaxed,

> * See Appendix, Vomiting Julep. 6

the

the lancet must be spared, and wine, with other cordials, plentifully administered.

It is the more neceffary to caution people againft bleeding in this difeafe, as there is generally at the beginning an universal ftricture upon the veffels, and fometimes an opprefilion and difficulty of breathing, which fuggeft the idea of a plethora, or too great a quantity of blood. I have known even fome of the faculty deceived by their own feelings in this refpect, fo far as to infift upon being bled, when it was evident from the confequences that the operation was improper.

Though bleeding is generally improper in this difeafe, yet bliftering is highly neceffary. Bliftering-plafters may be applied at all times of the fever with great advantage. If the patient is delirious he ought to be bliftered on the neck or head, and it will be the fafeft courfe, when the infentibility continues, as foon as the difcharge occafioned by one bliftering-plafter abates to apply another to fome other part of the body, and by that means keep up a continual fucceffion of them till he be out of danger.

I have been more fenfible of the advantage of bliftering in this than in any other difeafe. Bliftering-plafters not only ftimulate the folids to action, but likewife occafion a continual difcharge, which may in fome measure fupply the want of critical evacuations, which feldom happen in this kind of fever. They are most proper, however, either towards the beginning, or after fome degree of flupor has come on, in which laft cafe it will always be proper to blifter the head.

If the patient is coffive through the courfe of the difeafe it will be neceffary to procure a ftool, by giving him every other day a clyfter of milk and water, with a little fugar, to which may be added a fpoonful a spoonful of common falt, if the above does not operate.

Should a violent loofenefs come on, it may be checked by fmall quantities of Venice treacle, or giving the patient for his ordinary drink the white decoction *.

A miliary eruption fometimes breaks out about the ninth or tenth day. As eruptions are often critical, great care fhould be taken not to retard Nature's operation in this particular. The eruption ought neither to be checked by bleeding nor other evacuations, nor pufhed out by a hot regimen; but the patient fhould be fupported by gentle cordials, as wine-whey, fmall negus, fago-gruel with a little wine in it, and fuch like. He ought not to be kept too warm; yet a kindly breathing fweat fhould by no means be checked.

Though bliftering and the ufe of cordial liquors are the chief things to be depended on in this kind of fever; yet for those who may chufe to use them, we shall mention one or two of the forms of medicine which are commonly pescribed in it +.

In defperate cafes, where the hiccup and ftarting of the tendons have already come on, we have fometimes feen extraordinary effects from large dofes of mufk frequently repeated. Mufk is doubtlefs an antifpafmodic, and may be given to the quantity of a fcruple three or four times a day, or oftener if neceffary.

* See Appendix, White Decostion.

[†] When the patient is low, ten grains of Virginian fnake-root, and the fame quantity of contrayerva-root, with five grains of Ruffian caftor, all in fine powder, may be made into a bolus with a little of the cordial confection of fyrup of faffron. One of thefe may be taken every four or five hours.

The following powder may be used with the fame intention: Take wild Valerian-root in powder one foruple, faffron and caltor each four grains. Mix these by rubbing them together in a mortar, and give one in a cup of wine-whey, three or four times a-day.

Q

Some-

194 OF THE NERVOUS FEVER.

Sometimes it may be proper to add to the mufk a fewgrains of camphire, and falt of hartfhorn, as thefe tend to promote perfpiration and the difcharge of urine. Thus fifteen grains of mufk, with three grains of camphire, and fix grains of falt of hartfhorn, may be made into a bolus with a little fyrup, and given as above.

If the fever fhould happen to intermit, which it frequently does towards the decline, or if the patient's ftrength fhould be wafted with colliquative fweats, &c. it will be neceffary to give him the Peruvian bark. Half a drachm, or a whole drachm, if the ftomach will bear it, of the bark in fine powder, may be given four or five times a-day in a glafs of red port or claret. Should the bark in fubftance not fit eafy on the ftomach, an ounce of it in powder may be infufed in a bottle of Lifbon or Rhenifh wine for two or three days, afterwards it may be ftrained, and a glafs of it taken frequently *.

Some give the bark in this and other fevers, where there are no fymptoms of inflammation, without any regard to the remiffion or intermiffion of the fever. How far future observations may tend to establish this practice, we will not pretend to fay; but we have reason to believe that the bark is a very universal febrifuge, and that it may be administered with advantage in most fevers where bleeding is not neceffary, or where there are no fymptoms of topical inflammation.

* The bark may likewife be very properly administered, along with other cordials, in the following manner: Take an ounce of Peruvian bark, orange-peel half an ounce, Virginian fnake-root two drachms, fafron one drachm. Let all of them be powdered, and infasfed in an English pint of the beft brandy for three or four days. Afterwards the liquor may be firained, and two tea-fpoonfuls of it given three or four times a-day in a glafs of fmall wine or megus.

[195]

CHAP. XX.

OF THE MALIGNANT, PUTRID OR SPOTTED FEVER.

THIS may be called the *pefilential fever* of Europe, as in many of its fymptoms it bears a great refemblance to that dreadful difeafe the plague. Perfons of a lax habit, a melancholy difpolition, and those whose vigour has been wafted by long falting, watching, hard labour, exceflive venery, frequent fall-vations, &c. are most liable to it.

CAUSES.—This fever is occafioned by foul air, from a number of people being confined in a narrow place, not properly ventilated: from putrid animal and vegetable effluvia, &c. Hence it prevails incamps, jails, holpitals and infirmaries, effectially where fuch places are too much crowded, and cleanlinefs is neglected.

A close conftitution of the air, with long rainy or foggy weather, likewife occasions putrid fevers. They often fucceed great inundations in low and marshy countries, especially when these are preceded or followed by a hot and fultry feason.

Living too much upon animal food, without a proper mixture of vegetables, or eating fifh or flefh that has been kept too long, are likewife apt to occafion this kind of fever. Hence failors on long voyages, and the inhabitants of befieged cities, are very often visited with putrid fevers.

Corn that has been greatly damaged by rainy feafons, or long keeping, and water which has become putrid by ftagnation, &c. may likewife occasion this fever.

Dead

Dead carcafes tainting the air, efpecially in hot feafons, are very apt to occafion putrid difeafes. Hence this kind of fever often prevails in countries which are the fcenes of war and bloodfhed. This fhews the propriety of removing burying-grounds, flaughter-houfes, &c. at a proper diftance from great towns.

Want of cleanlinefs is a very general caufe of putrid fevers. Hence they prevail amongft the poor inhabitants of large towns, who breathe a confined unwholefome air, and neglect cleanlinefs. Such mechanics as carry on dirty employments, and are conflantly confined within doors, are likewife very liable to this difeafe.

We fhall only add, that putrid, malignant, or fpotted 'fevers, are highly infectious, and are therefore often communicated by contagion. For which reafon all perfons ought to keep at a diftance from those affected with fuch difeafes, unlefs their attendance is abfolutely neceffary.

SYMPTOMS.—The malignant fever is generally preceded by a remarkable weaknefs or lofs of ftrength, without any apparent caufe. This is fometimes fo great, that the patient can fcarce walk, or even fit upright, without being in danger of fainting away. His mind too is greatly dejected; he fighs, and is full of dreadful apprehenfions.

There is a naufea, and fometimes a vomiting of bile; a violent pain of the head, with a ftrong pulfation or throbbing of the temporal arteries; the eyes often appear red and inflamed, with a pain at the bottom of the orbit; there is a noife in the ears, the breathing is labourious, and often interrupted with a figh; the patient complains of a pain about the region of the flomach, and in his back and loins; his tongue is at first white, but afterwards it

2

appears

appears black and chaped; and his teeth are covered with a black cruft. He fometimes paffes worms both upwards and downwards, is affected with tremors or fhaking, and often becomes delitions

If blood is let, it appears diffolved, or with a very fmall degree of cohefion, and foon becomes putrid; the ftools fmell extremely foetid, and are fometimes of a greenifh, black, or reddifh caft. Spots of a pale purple, dun, or black colour, often appear upon the fkin, and fometimes there are violent hæmorrhages or difcharges of blood from the mouth, eyes, nofe, &c.

Putrid fevers may be diftinguished from the inflammatory, by the fmallness of the pulse, the great dejection of mind, the diffolved flate of the blood, the petechiæ, or purple fpots, and the putrid fmell of the excrements. They may likewife be diftinguished from the low or nervous fever, by the heat and thirst being greater, the urine of a higher colour, and the loss of ftrength, dejection of mind, and all the other fymptoms more violent.

It fometimes happens, however, that the inflammatory, nervous, and putrid fymptoms are fo blended together, as to render it very difficult to determine to which class the fever belongs. In this cafe the greatest caution and skill are requisite. Attention must be paid to those symptoms which are most prevalent, and both the regimen and medicines adapted to them.

Inflammatory and nervous fevers may be converted into malignant and putrid, by too hot a regimen or improper medicines.

The duration of putrid fevers is extremely uncertain; fometimes they terminate between the feventh and fourteenth day, and at other times they are prolonged for five or fix weeks. Their duration depends greatly

greatly upon the conflictution of the patient, and the manner of treating the difeafe.

The moft favourable fymptoms are, a gentle loofenefs after the fourth or fifth day, with a warm mild fweat. Thefe, when continued for a confiderable time, often carry off the fever, and fhould never be imprudently ftopped. Small miliary puftules appearing between the petechiæ or purple fpots are likewife favourable, as alfo hot fcabby eruptions about the mouth and nofe. It is a good fign when the pulfe rifes upon the ufe of wine, or other cordials, and the nervous fymptoms abate; deafnefs coming on towards the decline of the fever, is likewife often a favourable fymptom *, as are abfceffes in the groin or parotid glands.

Among the unfavourable fymptoms may be reckoned an exceffive loofenefs, with a hard fwelled belly; large black or livid blotches breaking out upon the fkin; apthæ in the mouth; cold clammy fweats; blindnefs; change of the voice; a wild ftaring of the eyes; difficulty of fwallowing; inability to put out the tongue; and a conftant inclination to uncover the breaft. When the fweat and faliva are tinged with blood, and the urine is black, or depofits a black footy fediment, the patient is in great danger. Starting of the tendons, and feetid, ichorous, involuntary ftools, attended with coldnefs of the extremities, are generally the forerunners of death.

REGIMEN.—In the treatment of this difeafe we ought to endeavour as far as poffible to counteract the putrid tendency of the humours; to fupport the patient's firength and fpirits; and to aftift Nature in expelling the caufe of this difeafe,

* Deafnefs is not always a favourable fymptom in this difeafe. Perhaps it is only fo when occasioned by abfceffes formed within the ears.

by gently promoting perfpiration and the other evacuations.

It has been obferved, that putrid fevers are often occafioned by unwholefome air, and of courfe they muft be aggravated by it. Care fhould therefore be taken to prevent the air from flagnating in the patient's chamber, to keep it cool, and renew it frequently, by opening the doors or windows of fome adjacent apartment. The breath and perfpiration of perfons in perfect health foon render the air of a fmall apartment noxious; but this will fooner, happen from the perfpiration and breath of a perfon whole whole mals of humours are in a purrid flate.

Befides the frequent admission of fresh air, we would recommend the use of vinegar, verjuice, juice of lemon, Seville orange, or any kind of vegetable acid that can be most readily obtained. These ought frequently to be sprinkled upon the floor, the bed, and every part of the room. They may alfo be evaporated with a hot iron, or by boiling, &c. The fresh skins of lemons or oranges ought likewife to be laid in different parts of the room, and they should be frequently held to the patient's nofe. The ule of acids in this manner would not only prove very refreshing to the patient, but would likewife tend to prevent the infection from fpreading among those who attend him. Strong fcented herbs, as rue, tanfy, rofemary, wormwood, &c. may likewife be laid in different parts of the house, and smelled to by those who go near the patient.

The patient must not only be kept cool, but likewife quiet and eafy. The least noise will affect his head, and the smallest fatigue will be apt to make him faint.

Few things are of greater importance in this diferfe than acids, which ought to be mixed with all O_4 the

the patient's food as well as drink. Orange, lemon, or vinegar-whey, are all very proper, and may be drank by turns, according to the patient's inclination. They may be rendered cordial by the addition of wine in fuch quantity as the patient's ftrength feems to require. When he is very low, he may drink negus, with only one half water, and fharpened with the juice of orange or lemon. In fome cafes a glafs of wine may now and then be allowed. The moft proper wine is Rhenifh; but if the body be open, red port or claret is to be preferred.

When the body is bound, a tea-fpoonful of the cream of tartar may be put into a cup of the patient's drink, as there is occafion; or he may drink a decoction of tamarinds, which will both quench his thirft, and promote a difcharge by ftool.

If camomile-tea will fit upon his ftomach, it is a very proper drink in this difeafe. It may be fharpened by adding to every cup of the tea ten or fifteen drops of the elixir of vitriol.

The food must be light, as panado or groat-gruel, to which a little wine may be added, if the patient be weak and low; and they ought all to be sharpened with the juice of orange, the jelly of currants, or the bke. The patient ought likewise to eat freely of ripe fruits, as roafted apples, currant or goosberry tarts, preferved cherries, or plums, &c.

Taking a little food or drink frequently, not only fupports the fpirits, but counteracts the putrid tendency of the humours; for which reafon the patient ought frequently to be fipping fmall quantities of fome of the acid liquors mentioned above, or any that may be more agreeable to his palate, or more readily obtained.

If he is delirious, his feet and hands ought to be frequently fomented with a ftrong infufion of camomile flowers. This, or an infufion of the bark, to fuch

fuch as can afford it, cannot fail to have a good effect. Fomentations of this kind not only relieve the head, by relaxing the vefiels in the extremities, but as their contents are abforbed, and taken into the fyftem, they may affift in preventing the putrefcency of the humours.

MEDICINE.——If a vomit be given at the beginning of this fever, it will hardly fail to have a good effect; but if the fever has gone on for fome days, and the fymptoms are violent, vomits are not quite fo fafe. The body however is always to be kept gently open by clyfters, or mild laxative medicines.

Bleeding is feldom neceffary in putrid fevers. If there be figns of an inflammation, it may fometimes be permitted at the first onset; but the repetition of it generally proves hurtful.

generally proves hurtful. Bliftering plafters are never to be used unlefs in the greatest extremities. If the petechiæ or spots should fuddenly disappear, the patient's pulse fink remarkably, and a delirium, with other bad symptoms, come on, bliftering may be permitted. In this case the bliftering plassers are to be applied to the head, and inside of the legs or thighs. But as they are fometimes apt to occass a gangrene, we would rather recommend warm cataplass or poultices of mussar to be applied to the feet, having recourse to blifters only in the utmost extremities.

It is common in the beginning of this fever to give the emetic tartar in finall dofes, repeated every fecond or third hour, till it fhall either vomit, purge, or throw the patient into a fweat. This practice is very proper, provided it be not pulhed fo far as to weaken the patient.

A very ridiculous notion has long prevailed of expelling the poilonous matter of malignant difcales by triffling doles of cordial or alexipharmic medi-

medicines. In confequence of this notion, the contrayerva-root, the cordial confection, the mithridate, &c. have been extolled as infallible remedies. There is realon however to believe, that thefe feldom do much good. Where cordials are neceffary, we know none that is fuperior to good wine; and therefore again recommend it both as the fafeft and beft. Wine, with acids and antifeptics, are the only things to be relied on in the cure of malignant fevers.

In the most dangerous species of this diseafe, when it is attended with purple, livid, or black spots, the Peruvian bark must be administered. I have seen it, when joined with acids, prove successful, even in cases where the petechiæ had the most threatening aspect. But to answer this purpose it must not only be given in large doses, but duly perfisted in.

The beft method of administering the bark is certainly in fubflance. An ounce of it in powder may be mixed with half an English pint of water, and the fame quantity of red wine, and sharpened with the elixir or the spirit of vitriol, which will both make it fit easier on the stomach, and render it more beneficial. Two or three ounces of the syrup of lemon may be added, and two table-spoonfuls of the mixture taken every two hours, or oftener, if the stomach is able to bear it.

Those who cannot take the bark in fubftance may infuse it in wine, as recommended in the preceding disease.

If there be a violent loofenefs, the bark muft be boiled in red wine with a little cinnamon, and fharpened with the elixir of vitriol, as above. Nothing can be more beneficial in this kind of loofenefs than plenty of acids, and fuch things as promote a gentle perfpiration.

If the patient be troubled with vomiting, a dram of the falt of wormwood, diffolved in an ounce and half of freth lemon juice, and made into a draught with an ounce of fimple cinnamon water, and a bit of fugar, may be given and repeated as often as it is necefiary.

If fwellings of the glands appear, their fuppuration is to be promoted by the application of poultices, ripening cataplasms, &c. And as foon as there is any appearance of matter in them, they ought to be laid open and the poultices continued.

I have known large ulcerous fores break out in various parts of the body, in the decline of this fever, of a livid gangrenous appearance, and a moft putrid cadaverous fmell. Thefe gradually healed, and the patient recovered, by the plentiful use of Peruvian bark and wine, sharpened with the spirits of vitriol.

For preventing putrid fevers we would recommend a ftrict regard to cleanline(s; a dry fituation; fufficent exercile in the open air; wholelome food, and a moderate ufe of generous liquors. Infection ought above all things to be avoided. No conflitution is proof againt it. I have known perfons feized with a putrid fever, by only making a fingle vifit to a patient in it; others have caught it by lodging for one night in a town where it prevailed; and fome by attending the funerals of fuch as died of it*.

* The late Sir John Pringle expressed a concern left these cautions should prevent people from attending their friends or relations when afflicted with putrid fevers. I told him I meant only to difcourage unneceflary attendance, and mentioned a number of inflances where putrid fevers had proved fatal to perfons, who were rather hurtful than beneficial to the fick. This fagacious phylician agreed with me, in thinking that a good doctor and a careful nurfe were the only neceflary attendants ; and that all others not only endagered themfelves, but generally, by their folicitude and ill-directed care, hurt the fick.

When

When a putrid fever feizes any perfon in a family, the greateft attention is neceffary to prevent the difeafe from fpreading. The fick ought to be placed in a large apartment, as remote from the reft of the family as poffible; he ought likewife to be kept extremely clean, and fhould have frefh air frequently let into his chamber; whatever comes from him fhould be immediately removed, his linen fhould be frequently changed, and thole in health ought to avoid all unneceffary communication with him.

Any one who is apprehenfive of having caught the infection, ought immediately to take a vomit, and to work it off by drinking plentifully of camomile tea. This may be repeated in a day or two, if the apprehenfions ftill continue, or any unfavourable fymptoms appear.

The perfon ought likewife to take an infufion of the bark and camomile flowers for his ordinary drink; and before he goes to bed, he may drink an Englifh pint of pretty ftrong negus, or a few glaffes of generous wine. I have been frequently obliged to follow this courfe when malignant fevers prevailed, and have likewife recommended it to others with conftant fuccefs.

People generally fly to bleeding and purging as antidotes against infection; but these are so far from fecuring them, that they often, by debilitating the body, increase the danger.

Those who wait upon the fick in putrid fevers, ought always to have a piece of spunge or a handkerchief dipt in vinegar, or juice of lemon, to smell to while near the patient. They ought likewise to wash their hands, and, if possible, to change their clothes, before they go into company.

[205]

CHAP. XXI.

OF THE MILIARY FEVER.

THIS fever takes its name from the fmall puftules or bladders which appear on the fkin, refembling, in fhape and fize, the feeds of millet. The puftules are either red or white, and fometimes both are mixed together.

The whole body is fometimes covered with puftules; but they are generally more numerous where the fweat is most abundant, as on the breast, the back &c. A gentle fweat, or moisture on the skin, greatly promotes the eruption; but when the skin is dry, the eruption is both more painful and dangerous.

Sometimes this is a primary difeafe; but it is much oftener only a fymptom of fome other malady, as the fmall-pox, meafles, ardent, putrid, or nervous fever, &c. In all these cases it is generally the effect of too hot a regimen or medicines.

The miliary fever chiefly attacks the idle and the phlegmatic, or perfons of a relaxed habit. The young and the aged are more liable to it than thofe in the vigour and prime of life. It is likewife more incident to women than men, efpecially the delicate and the indolent, who, neglecting exercife, keep continually within doors, and live upon weak watery diet. Such females are extremely liable to be feized with this difeafe in childbed, and often loofe their lives by it.

CAUSES.——The miliary fever is fometimes occafioned by violent paffions or affections of the mind; as exceffive grief, anxiety, thoughtfulnefs, &cc. It may likewife be occafioned by exceffive watching, great evacuations, a weak watery diet, rainy

206 OF THE MILIARY FEVER.

rainy feafons, eating too freely of cold, crude, unripe fruits, as plums, cherries, cucumbers, melons, &c. Impure waters, or provifions which have been fpoiled by rainy feafons, long keeping, &c. may likewife caufe miliary fevers. They may alfo be occafioned by the ftoppage of any cuftomary evacuation, as iffues, fetons, uccers, the bleeding piles in men, or the menftrual flux in women, &c.

This difeafe in childbed-women is fometimes the effect of great coftivenels during pregnancy; it may likewife be occafioned by their exceffive ufe of green trafh, and other unwholefome things, in which pregnant women are too apt to indulge. But its moft general caufe is indolence. Such women as lead a fedentary life, efpecially during pregnancy, and at the fame time live großly, can hardly efcape this difeafe in childbed. Hence it proves extremely fatal to women of fafhion, and likewife to thofe women in manufacturing towns, who, in order to affift their hufbands, fit clofe within doors for almoft the whole of their time. But among women who are active and laborious, who live in the country, and take fufficient exercife without doors, this difeafe is very little known.

SYMPTOMS.—When this is a primary difeafe, it makes its attack, like most other eruptive fevers, with a flight fhivering, which is fucceeded by heat, loss of ftrength, faintifhness, fighing, a low quick pulfe, difficulty of breathing, with great anxiety and opprefion of the breath. The patient is reftlefs, and fometimes delirious; the tongue appears white, and the hands fhake, with often a burning heat in the palms; and in childbed-women the milk generally goes away, and the other discharges ftop.

The patient feels an itching or pricking pain under the fkin, after which innumerable fmall puffules of a red or white colour begin to appear. Upon this this the fymptoms generally abate, the pulfe becomes more full and loft, the fkin grows moifter, and the fweat, as the difeafe advances, begins to have a peculiar foetid fmell; the great load on the breaft, and oppression of the spirits, generally go off, and the cultomary evacuations gradually return. About the fixth or leventh day from the eruption, the pultules begin to dry and fall off, which occasions a very difagreeable itching in the fkin.

It is impossible to afcertain the exact time when the pultules will either appear or go off. They generally come out on the third or fourth day, when the eruption is critical; but, when fymptomatical, they may appear at any time of the difeafe.

Sometimes the puftules appear and vanish by turns. When that is the cafe, there is always danger; but when they go in all of a fudden, and do not appear again, the danger is very great.

In child bed-women the puftules are commonly at first filled with clear water, afterwards they grow yellowish. Sometimes they are intersperfed with pustules of a red colour. When these only appear the difease goes by the name of a rafh.

REGIMEN .---- In all eruptive fevers of what-ever kind, the chief point is to prevent the fudden difappearing of the puftules, and to promote their maturation. For this purpose the patient must be kept in fuch a temperature, as neither to push out the eruption too fast, nor to cause it to retreat prematurely. The diet and drink ought therefore to be in a moderate degree nourifhing and cordial; but neither ftrong nor heating. The patient's chamber ought neither to be kept too hot nor cold; and he fhould not be too much covered with clothes. Above all, the mind is to be kept eafy and cheerful. Nothing to certainly makes an eruption go in as fear, or the apprehension of danger.

The

The food muft be weak chicken broth with bread, panado, fago, or groat-gruel, &c. to a gill of which may be added a fpoonful or two of wine, as the patient's ftrength requires, with a few grains of falt and a little fugar. Good apples roafted or boiled, with other ripe fruits of an opening cooling nature, may be eaten.

The drink may be fuited to the flate of the patient's flrength and fpirits. If these be pretty high, the drink ought to be weak; as water-gruel, balm-tea, or the decoction mentioned below *.

When the patient's fpirits are low, and the eruption does not rife fufficiently, his drink muft be a little more generous; as wine whey, or fmall negus, fharpened with the juice of orange or lemon, and made ftronger or weaker as circumftances may require.

Sometimes the miliary fever approaches towards a putrid nature, in which cafe the patient's ftrength must be supported with generous cordials, joined with acids; and, if the degree of putrescence be great, the Peruvian bark must be administered. If the head be much affected, the body must be kept open by emollient clysters \pm .

MEDI-

* Take two ounces of the flavings of hartfhorn, and the fame quantity of farfaparilla, boil them in two Englifh quarts of water. To the firained decoction add a little white fugar, and let the patient take it for his ordinary drink.

[‡] In the commercium literarium for the year 1735, we have the hiftory of an epidemical miliary fever, which raged at Strafburgh in the months of November, December, and January; from which we learn the neceflity of a temperate regimen in this malady, and likewife that phyficians are not always the first who difcover the proper treatment of difeafes. "This fever made terrible havock even among men of robust conflictutions, and all medicine proved in vain. They were feized in an inflant with thivering, yauning, ftretching, and pains in the back, fucceeded by a most intenfe heat; at the fame time there was a great loss of ftrength and appetite. On the feventh or ninth day the miliary eruptions

OF THE MILIARY FEVER.

MEDICINE.—If the food and drink be properly regulated, there will be little occafion for medicine in this difeafe. Should the eruption however not rife, or the fpirits flag, it will not only be neceffary to fupport the patient with cordials, but likewife to apply bliftering plafters. The moft proper cordial, in this cafe, is good wine, which may either be taken in the patient's food or drink; and if there be figns of putrefcence, the bark and acids may be mixed with wine, as directed in the putrid fever.

Some recommend bliftering through the whole course of this difease; and where Nature flags, and the eruption comes and goes, it may be neceffary to keep up a flimulus, by a continual succeffion of small bliftering plafters; but we would not recommend above one at a time. If however the pulse should fink remarkably, the pussues fall in, and the head be affected, it will be neceffary to apply several bliftering plafters to the most fensible parts, as the infide of the legs and thighs, &cc.

Bleeding is feldom neceffary in this difeafe, and fometimes it does much hurt, as it weakens the patient, and depreffes his fpirits. It is therefore never to be attempted unlefs by the advice of a phyfician. We mention this, becaufe it has been cuftomary to treat this difeate in childbed-women by plentiful bleeding, and other evacuations, as if it were highly inflammatory. But this practice is generally very

eruptions appeared, or fpots like flea-bites, with great anxiety, a delirium, reftlefsnefs, and toffing in bed. Bleeding was fatal. While matters were in this unhappy fituation, a/midwife, of her own accord, gave to a patient, in the height of the difeafe, a elyfter of rain water and butter without falt, and for his ordinary drink a quart of fpring water, half a pint of generous wine, the juice of a lemon, and fix ounces of the whiteff fugar, gently boiled till a feum arofe, and this with great fuccefs; for the belly was foon loofened, the grievous fymptoms vanified, and the patient was reftored to his fenfes, and fnatched from the jaws of death." This practice was imitated by others with the like happy effects.

P

unsafe.

210 OF THE REMITTING FEVER.

unfafe. Patients in this fituation bear evacuations very ill. And indeed the difeafe feems often to be more of a putrid than of an inflammatory nature.

Though this fever is often occafioned in child-bedwomen by too hot a regimen, yet it would be dangerous to leave that off all of a fudden, and have recourfe to a very cool regimen, and large evacuations. We have reaion to believe, that fupporting the patient's fpirits, and promoting the natural evacuations, is here much fafer than to have recourfe to artificial ones, as thefe, by finking the fpirits, feldom fail to increafe the danger.

If the difease proves tedious, or the recovery flow, we would recommend the Peruvian bark, which may either be taken in fubitance, or infused in wine or water, as the patient inclines.

The miliary fever, like other eruptive difeafes, requires gentle purging, which fhould not be neglected, as foon as the fever is gone off, and the patient's ftrength will permit.

To prevent this difeafe, a pure dry air, fufficient exercife, and wholefome food, are neceffary. Pregnant women fhould guard againft coffivenefs, and take daily as much exercife as they can bear, avoiding all green trafhy fruits, and other unwholefomethings; and when in child-bed, they ought ftrictly to obferve a cool regimen.

CHAP. XXII.

OF THE REMITTING FEVER.

HIS fever takes its name from a remiffion of the fymptoms, which happens fometimes fooner, and fometimes later, but generally before the eighth day. The remiffion is commonly preceded by a gentle

OF THE REMITTING FEVER, 211

gentle fweat, after which the patient feems greatly relieved, but in a few hours the fever returns. Thefe remiffions return at very irregular periods, and are fometimes of, longer, fometimes of fhorter duration: the nearer however that the fever approaches to a regular intermittent, the danger is the lefs.

CAUSES.—Remitting fevers prevail in low marfhy countries abounding with wood and ftagnating water; but they prove moft fatal in places where great heat and moifture are combined, as in fome parts of Africa, the province of Bengal in the Eaft Indies, &c. where remitting fevers are generally of a putrid kind, and prove very fatal. They are moft frequent in clofe calm weather, efpecially after rainy feafons, great inundations, or the like. No age, fex, or conflictution is exempted from the attack of this fever; but it chiefly feizes perfons of a relaxed habit, who live in low dirty habitations, breathe an impure ftagnating air, take little exercife, and ufe unwholefome diet.

SYMPTOMS.——The firft fymptoms of this fever are generally yauning, ftretching, pain, and giddinefs in the head, with alternate fits of heat and cold. Sometimes the patient is affected with a delirium at the very firft attack. There is a pain, and fometimes a fwelling, about the region of the ftomach, the tongue is white, the eyes and fkin frequently appear yellow, and the patient is often afflicted with bilious vomitings. The pulfe is fometimes a little hard, but feldom full, and the blood, when let, rarely fnews any figns of inflammation. Some patients are exceedingly coftive, and-others are afflicted with a very troublefome loofenefs.

It is impossible to defcribe all the fymptoms of this difeafe, as they vary according to the fituation, the feafon of the year, and the conflictution of the patient. They may likewife be greatly changed by the method of treatment, and by many other cir- P_2 cumfances

212 OF THE REMITTING FEVER.

cumftances too tedious to mention. Sometimes the bilious fymptoms predominate, fometimes the nervous, and at other times the putrid. Ner is it at all uncommon to find a fucceffion of each of thefe, or even a complication of them at the fame time, in the fame perfon.

RÉGIMEN.— The regimen must be adapted to the prevailing fymptoms. When there are any figns of inflammation, the diet must be flender, and the drink weak and diluting. But when nervous or putrid fymptoms prevail, it will be neceffary to fupport the patient with food and liquors of a more generous nature, fuch as are recommended in the immediately preceding fevers. We must however be very cautious in the use of things of a heating quality, as this fever is frequently changed into a *continual* by an hot regimen, and improper medicines.

Whatever the fymptoms are, the patient ought to be kept cool, quiet, and clean. His apartment, if poffible, fhould be large and frequently ventilated by letting in frefh air at the doors and windows. It ought likewife to be fprinkled with vinegar, juice of lemon, or the like. His linen, bed-clothes, &c. fhould be frequently changed, and all his excrements immediately removed. Though thefe things have been recommended before, we think it neceffary to repeat them here, as they are of more importance to the fick than practitioners are apt to imagine *.

MEDI-

* The ingenious Dr. Lind, of Windfor, in his inaugural differtation concerning the putrid remitting fever of Bengal, has the following obfervation: " Indutia, Iodices, ac tragula, feepius funt mutanda, ac aëri exponenda; foces fordefque quam primum removendæ oportet etiam ut loca quibus ægri decumbent fint falubria et aceto confperfa; denique ut ægris cura quanta maxima profpiciatur. Compertum ego habeo, medicum hæc fedulo obfervantem, quique ca exequi poteft, multo magis ægris profuturum, quam medicum peritiorem hifle commodie, deliturum.⁴⁷

"The

OF THE REMITTING FEVER.

MEDICINE.——In order to cure this fever, we must endeavour to bring it to a regular intermission. This intention may be promoted by bleeding, if there be any figns of inflammation; but when that is not the cafe, bleeding ought by no means to be attempted, as it will weaken the patient and prolong the difeafe. A vomit however will feldom be improper, and is generally of great fervice. Twenty or thirty grains of ipecacuanha will answer this purpofe very well; but, where it can be obtained, we would rather recommend a grain or two of tartar emetic, with five or fix grains of ipecacuanha, to be made into a draught, and given for a vomit. This may be repeated once or twice at proper intervals, if the fickness or naufea continues.

The body ought to be kept open either by clyfters or gentle laxatives, as weak infufions of fenna and manna, fmall dofes of the lenitive electuary, cream of tartar, tamarinds, flewed prunes, or the like; but all ftrong or draftic purgatives are to be carefully avoided.

By this course the fever in a few days may generally be brought to a pretty regular or diffinct intermisfion, in which cafe the Peruvian bark may be adminiftered, and it will feldom fail to perfect the cure. It is needless here to repeat the methods of giving the bark, as we have already had occasion frequently to mention them.

The most likely way to avoid this fever is to use a wholefome and nourifhing diet, to pay the most forupulous attention to cleanlines, to keep the body

"The patient's fhirt, bed-clothes, and bedding, ought frequently to be changed, and expoled to the air, and all his excrements immediately removed; the bed-chamber fhould be well ventilated, and frequently fprinkled with vinegar; in fhort every attention fhould be paid to the patient. I can affirm, that a phylician who puts thefe in practice will much oftener fucceed than one who is even more fkilful, but has not opportunity of using thefe means,"

warm,

warm, to take fufficient exercife, and in hot countries to avoid damp fituations, night air, evening dews, and the like. In countries where it is endemical, the beft preventive medicine which we can recommend is the Peruvian bark, which may either be chewed, or infufed in brandy or wine, &c. Some recommend fmoaking tobacco as very beneficial in marfhy countries, both for the prevention of this and intermitting fevers.

CHAP. XXIII.

OF THE SMALL-POX.

HIS difeafe, which originally came from Arabia, is now become fo general, that very few efcape it at one time of life or another. It is a most contagious malady; and has for many years proved the fcourge of Europe.

The fmall-pox generally appear towards the fpring. They are very frequent in fummer, lefs fo in autumn,, and leaft of all in winter. Children are most liable to this difease; and those whose food is unwholefome, who want proper exercise, and abound with gross humours, run the greatest hazard from it.

The difeafe is diftinguished into the diffinct and confluent kind; the latter of which is always attended with danger. There are likewise other diftinctions of the imall-pox; as the crystalline, the blody, &c.

CAUSES.——The fmall-pox is commonly caught by infection. Since the difeafe was first brought into Europe, the infection has never been wholly extinguished, nor have any proper methods, as far

as I know, been taken for that purpole; fo that now it has become in a manner conflictutional. Children who have over-heated themfelves by running, wreftling, &c. or adults after a debauch, are most apt to be feized with the fmall-pox.

SYMPTOMS.——This difeafe is fo generally known, that a minute defcription of it is unneceffary. Children commonly look a little dull, feem liftlefs and drowfy for a few days before the more violent fymptoms of the fmall-pox appear. They are likewife more inclined to drink than ufufal, have little appetite for folid food, complain of wearinefs, and, upon taking exercife, are apt to fweat. Thefe are fucceeded by flight fits of cold and heat in turns, which, as the time of the eruption approaches, become more violent, and are accompanied with pains of the head and loins, vomiting, &cc. The pulfe is quick, with a great heat of the fkin, and reftlefinefs. When the patient drops afleep, he wakes in a kind of horror, with a fudden flart, which is a very common fymptom of the approaching eruption; as are alfo convulfion-fits in very young children.

About the third or fourth day from the time of fickening, the fmall-pox generally begin to appear; fometimes indeed they appear fooner, but that is no favourable fymptom. At first they very nearly refemble flea-bites, and are foonest discovered on the face, arms, and breast.

The moft favourable fymptoms are a flow eruption, and an abatement of the fever as foon as the pufules appear. In a mild diftinct kind of fmallpox the pufules feldom appear before the fourth day from the time of fickening, and they generally keep coming out gradually for feveral days after. Pufules which are diftinct, with a florid red bafis, and which fill with thick purulent matter, firft of a P 4 whitift. whitifh, and afterwards of a yellowifh colour, are the beft.

A livid brown colour of the pultules is an unfavourable fymptom; as also when they are fmall and flat, with black fpecks in the middle. Puttules which contain a thin watery ichor are very bad. A great number of pox on the face is always attended with danger. It is likewife a very bad, fign when they run into one another.

It is a most unfavourable fymptom when petechiæ, or purple, brown, or black fpots are interfperfed among the puftules. These are figns of a putrid diffolution of the blood;" and fhew the danger to be very great. Bloody fto is or urine, with a fwelled belly, are bad fymptoms; as is also a continual strangury. Pale urine and a violent throbbing of the arteries of the neck are figns of an ap-proaching delirium, or of convultion-fits. When the face does not fwell, or falls before the pox come to maturity, it is very unfavourable. If the face begins to fall about the eleventh or twelfth day, and at the fame time the hands and feet begin to fwell, the patient generally does well; but when these do not fucceed to each other, there is reafon to apprehend danger. When the tongue is covered with a brown cruft, it is an unfavourable symptom. Cold fhivering fits coming on at the height of the difcafe are likewife unfavourable. Grinding of the teeth, when it proceeds from an affection of the . nervous fystem, is a bad fign; but sometimes it is occafioned by worms, or a difordered ftomach.

REGIMEN.——When the first symptoms of the fmall-pox appear, people are ready to be alarmed, and often fly to the use of medicine, to the great danger of the patient's life. I have known children, to appeale the anxiety of their parents, bled, blistered,

bliftered, and purged, during the fever which preceded the eruption of the fmall-pox, to fuch a degree, that Nature was not only diffurbed in her operation, but rendered unable to fupport the pultules after they were out; fo that the patient, exhausted by mere evacuations, funk under the diffeafe.

When convultions appear, they give a dreadful alarm. Immediately fome noftrum is applied, as if this were a primary difeafe; whereas it is only a fymptom, and far from being an unfavourable one, of the approaching eruption. As the fits generally go off before the actual appearance of the fmallpox, it is attributed to the medicine, which by this means acquires a reputation without any merit *.

All that is, generally fpeaking, neceffary during the eruptive fever, is to keep the patient cool and eafy, allowing him to drink freely of fome weak diluting liquors; as balm-tea, barley-water, clear whey, gruels, &c. He fhould not be confined to bed, but fhould fit up as much as he is able, and fhould have his feet and legs frequently bathed in lukewarm water. His food ought to be very light; and he fhould be as little difturbed with company as poffible.

Much mifchief is done at this period by confining the patient too foon to his bed, and plying him with warm cordials or fudorific medicines. Every thing that heats and inflames the blood increases the fever, and pushes out the pushules prematurely. This

* Convultion-fits are no doubt very alarming, but their effects are often falutary. They feem to be one of the means made use of by Nature for breaking the force of a fever. I have always obferved the fever abated, and fometimes quite removed, after one or more convultion-fits. This readily accounts for convultions being a favourable fymptom in the fever which precedes the eruption of the fmall-pox, as every thing that mitigates this fever leftens the eruption.

has

has numberles ill effects. It not only increases the number of puscules, but likewise tends to make them run into one another; and when they have been pusched out with too great violence, they generally fall in before they come to maturity.

The good women, as foon as they fee the finallpox begin to appear, commonly ply their tender charge with cordials, faffron, and marigold-teas, wine, punch, and even brandy itfelf. All thefe are given with a view, as they term it, to throw out the eruption from the heart. This, like moft other popular miftakes, is the abufe of a very juft obfervation, that when there is a moifure on the *fkin*, the pox rife better, and the patient is eofier, than when it continues dry and parched. But that is no reafon for forcing the patient into a fweat. Sweating never relieves unlefs where it comes fpontaneoufly, or is the effect of drinking weak diluting liquors.

Children are often fo peevifh, that they will not lie a-bed without a nurfe conftantly by them. Indulging them in this, we have reafon to believe, has many bad effects both upon the nurfe and child. Even the natural heat of the nurfe cannot fail to augment the fever of the child; but if fhe too proves feverifh, which is often the cafe, the danger muft be increafed*.

Laying feveral children who have the fmall-pox in the fame bed has many ill confequences. They ought if poffible never to be in the fame chamber, as the perfpiration, the heat, the fmell, &c. all tend to augment the fever, and to heighten the

* I have known a nurfe, who had the fmall-pox before, fo infected by lying conflantly a-bed with a child in a bad kind of fmall-pox, that fhe had not only a great number of puffules which broke out all over her body, but afterwards a malignant fever which terminated in a number of impofthumes or boils, and from which fhe narrowly elcaped with her life. We mention this to put others upon their guard against the danger of this virulent infection.

disease.

difeafe. It is common among the poor to fee two or three children lying in the fame bed, with fuch a load of puffules that even their fkins flick together. One can hardly view a fcene of this kind without being fickened by the fight. But how muft the effluvia affect the poor patients, many of whom perifh by this ulage *.

A very dirty cultom prevails among the lower class of people, of allowing children in the fmallpox to keep on the fame linen during the whole period of that loathfome difeafe. This is done left they fhould catch cold; but it has many ill confequences. The linen becomes hard by the moifture which it abforbs, and frets the tender fkin. It likewife occafions a bad fmell, which is very pernicious both to the patient and thofe about him; befides, the filth and fordes which adhere to the linen being reforbed, or taken up again into the body, greatly augment the difeafe.

A patient fhould not be fuffered to be dirty in an internal difeafe, far lefs in the fmall-pox. Cutaneous diforders are often occafioned by naftinefs alone, and are always increafed by it. Were the patient's linen to be changed every day, it would greatly refrefh him. Care indeed is to be taken that the linen be thoroughly dry. It ought likewife to be put on when the patient is moft cool.

* This obfervation is likewife applicable to hofpitals, workhoufes, &cc. where numbers of children happen to have the fmallpox at the fame time. I have feen above forty children cooped up in one apartment all the while they had this difeafe, without any of them being admitted to breathe the frefh air. No one can be at a lofs to fee the impropriety of fuch conduct. It ought to be a rule not only in hofpitals for the fmall-pox, but likewife for other difeafes, that no patient fhould be within fight or hearing of another. This is a matter to which too little regard is paid. In molt hofpitals and infirmaries, the fick, the dying, and the dead, are often to be feen in the fame apartment.

219

So

So ftrong is the vulgar prejudice in this country. notwithstanding all that has been faid against the hot regimen in the fmall-pox, that numbers ftill fall a facrifice to that error. I have feen poor women travelling in the depth of winter, and carrying their children along with them in the fmallpox, and have frequently observed others begging by the way-fide with infants in their arms covered with the puftules; yet I could never learn that one of these children died by this fort of treatment. This is certainly a fufficient proof of the fafety, at leaft, of exposing patients in the small-pox to the open air. There can be no reason however for expoling them to public view. It is now very com-mon in the environs of great towns to meet patients in the finall-pox on the public walks. This practice, however well it may fuit the purpofes of boafting inoculators, is dangerous to the citizens, and contrary to the laws of humanity and found policy.

The food in this difease ought to be very light, and of a cooling nature, as panado, or bread boiled with equal quantities of milk and water, good apples roafted or boiled with milk, and sweetened with a little sugar or such like.

The drink may be equal parts of milk and water, clear fweet whey, barley-water, or thin gruel, &c. After the pox are full, butter-milk, being of an opening and cleanfing nature, is a very proper drink.

It has already been obferved, that little more is necefiary during the primary fever than to keep the patient cool and quiet, allowing him to drink diluting

luting liquors, and bathing his feet frequently in warm water. Though this be generally the fafeft courfe that can be taken with infants, yet adults, of a ftrong conflitution and plethoric habit, fometimes require bleeding. When a full pulfe, a dry fkin, and other fymptoms of inflammation render this operation neceflary, it ought to be performed; but, unlefs thefe fymptoms are urgent, it is fafer to let it alone; if the body is bound, emollient clyfters may be thrown in.

If there is a great naufea or inclination to vomit, weak camomile tea or lukewarm water may be drank, in order to cleanle the flomach. At the beginning of a fever, Nature generally attemps a difcharge, either upwards or downwards, which, if promoted by gentle means, would tend greatly to abate the violence of the difeafe.

Though every method is to be taken during the primary fever, by a cool regimen, &c. to prevent too great an eruption; yet after the puftules have made their appearance, our bufinefs is to promote the fuppuration, by diluting drink, light food, and, if Nature feems to flag, by generous cordials. When a low creeping pulle, faintifinefs, and great lofs of ftrength, render cordials neceffary, we would recommend good wine, which may be made into negus, with an equal quantity of water, and fharpened with the juice of orange, the jelly of currants, or the like. Wine-whey, fharpened as above, is likewife a proper drink in this cafe; great care however muft be taken not to overheat the patient by any of thefe things. This, inftead of promoting, would retard the eruption.

The rifing of the fmall-pox is often prevented by the violence of the fever; in this cafe the cool regimen is ftrictly to be observed. The patient's chamber must not only be kept cool, but he ought likewife likewife frequently to be taken out of bed, and to be lightly covered with clothes while in it.

Exceffive reftleffnels often prevents the rifing and filling of the fmall pox. When this happens, gentle opiates are neceffary. These however ought always to be administered with a sparing hand. To an infant, a tea-spoonful of the syrup of poppies may be given every five or fix hours till it has the defired effect. An adult will require a table-spoonful in order to answer the fame purpose.

If the patient be troubled with a ftrangury, or fupprefion of urine, which often happens in the fmall-pox, he fhould be frequently taken out of bed, and, if he be able, fhould walk across the room with his feet bare. When he cannot do this, he may be frequently fet on his knees in bed, and fhould endeavour to pass his urine as often as he can. When these do not fucceed, a tea-spoonful of the fweet spirits of nitre may be occasionally mixed with his drink. Nothing more certainly relieves the patient, or is more beneficial in the fmall-pox, than a plentiful discharge of urine.

If the mouth be foul, and the tongue dry and chapped, it ought frequently to be washed, and the throat gargled with water and honey, sharpened with a little vinegar or currant jelly.

During the rifing of the fmall-pox, it frequently happens that the patient is eight or ten days without a ftool. This not only tends to heat and inflame the blood, but the fæces, by lodging fo long in the body, become acrid, and even putrid; from whence bad confequences muft enfue. It will therefore be proper, when the body is bound, to throw an emollient clyfter every fecond or third day through the whole courfe of the difeafe. This will greatly cool and relieve the patient.

When petechiæ, or purple, black, or livid fpots appear among the fmall-pox, the Peruvian bark, muft

must immediately be administered in as large dofes as the patient's flomach can bear. For a child, two drachms of the bark in powder may be mixed in three ounces of common water, one ounce of fimple cinnamon water, and two ounces of the fyrup of orange or lemon. This may be flarpened with the fpirits of vitriol, and a table-spoonful of it given every hour. If it be given to an adult in the same form, he may take at least three or four spoonfuls every hour. This medicine ought not to be triffed with, but must be administered as frequently as the flomach can bear it; in which case it will often produce very happy effects. I have frequently feen the petechiae disappear, and the small-pox, which had a very threatening aspect, rife and fill with laudable matter, by the use of the bark and acids.

The patient's drink ought likewife in this cafe to be generous, as wine or ftrong negus acidulated with fpirits of vitriol, vinegar, the juice of lemon, jelly of currants, or fuch like. His food muft confift of apples, roafted or boiled, preferved cherries, plums, and other fruits of an acid nature.

The bark and acids are not only neceffary when the petechiæ or putrid fymptoms appear, but likewife in the lymphatic or cryftalline fmall-pox, where the matter is thin, and not duly prepared. The Peruvian bark feems to poffefs a fingular power of affifting Nature in preparing laudable pus, or what is called good matter; confequently it must be beneficial both in this and other difeafes, where the crifis depends on a fuppuration. I have often obferved where the fmall-pox were flat, and the matter contained in them quite clear and tranfparent, and where at first they had the appearance of running into one another, that the Peruvian bark, acidulated as above, changed the colour and confistence

fiftence of the matter, and produce the most happý effects.

When the eruption fublides fuddenly, or, as the good women term it, when the fmall-pox *firike in*, before they have arrived at maturity, the danger is very great. In this cafe bliftering plafters mult be immediately applied to the wrifts and ancles, and the patient's fpirits fupported with cordials.

Sometimes bleeding has a furprizing effect in raifing the pultules after they have fubfided; but it requires fkill to know when this is proper, or to what length the patient can bear it. Sharp cataplafms however may be applied to the feet and hands, as they tend to promote the fwelling of these parts, and by that means to draw the humours towards the extremities.

The most dangerous period of this difease is what we call the secondary fever. This generally comes on when the small-pox begin to blacken, or turn on the face; and most of those who die of the small-pox are carried off by this sever,

Nature generally attempts, at the turn of the fmall-pox, to relieve the patient by loofe ftools. Her endeavours this way are by no means to be counteracted, but promoted, and the patient at the fame time fupported by food and drink of a nourifhing and cordial nature.

If at the approach of the fecondary fever, the pulfe be very quick, hard, and ftrong, the heat intenfe, and the breathing laborious, with other iymptoms of an inflammation of the breaft, the patient muft immediately be bled. The quantity of blood to be let muft be regulated by the patient's ftrength, age, and the urgency of the fymptom.

But in the fecondary fever, if the patient be faintifh, the pultules become fuddenly pale, and if there be great coldness of the extremities, bliftering-

ing plafters must be applied, and the patient must be fupported with generous cordials. Wine and even fpirits have fometimes been given in fuch cafes with amazing fuccefs.

As the fecondary fever is in great measure, if not wholly, owing to the abforption of the matter, it would feem highly confonant to reason, that the puftules as soon as they come to maturity, should be opened. This is every day practifed in other phlegmons which tend to suppuration; and there feems to be no cause why it should be lefs proper here. On the contrary, we have reason to believe that by this means the secondary fever might always be leffened, and often wholly prevented.

The puftules fhould be opened when they begin to turn of a yellow colour. Very little art is neceffary for this operation. They may either be opened with a lancet or a needle, and the matter abforbed by a little dry lint. As the puftules are generally first ripe on the face, it will be proper to begin with opening these, and the others in course as they become ripe. The puftules generally fill again, a fecond or even a third time; for which cause the operation, must be repeated, or rather continued as long as there is any confiderable appearance of matter in the puftules.

We have reafon to believe that this operation rational as it is, has been neglected from a piece of miftaken tendernefs in parents. They believe that it must give great pain to the poor child; and therefore would rather fee it die than have it thus tortured. This notion however is entirely without foundation. I have frequently opened the puffules when the patient did not fee me, without his being in the least fensible of it; but fuppofe it were attended with a little pain, that is nothing in comparison to the advantages which arile from it.

225

Opening

Opening the pultules not only prevents the reforption of the matter into the blood, but likewife takes off the tenfion of the fkin, and by that means greatly relieves the patient. It likewife tends to prevent the pitting, which is a matter of no fmall importance. Acrid matter by lodging long in the pultules, cannot fail to corrode the tender fkin ; by which many a handfome face becomes fo deformed as hardly to bear a tefemblance to the human figure*.

It is generally neceffary, after the fmall-pox are gone off, to purge the patient. If however the body has been open through the whole course of the disease, or if butter milk and other things of an opening nature have been drank freely after the height of the small-pox, purging becomes lefs necessary; but it ought never wholly to be neglected.

For very young children, an infusion of fenna and prunes, with a little rheubarb, may be fweetened with coarse fugar, and given in small quantities till it operates. Those who are farther advanced must take medicines of a sharper nature. For example, a child of five or fix years of age may take eight or ten grains of fine rhubarb in powder over night, and the same quantity of jalap in powder next morning. This may be wrought off with fresh broth or water-gruel, and may be repeated three or four times, five or fix days intervening between each dofe. For children further advanced,

* Though this operation can never do harm, yet it is only neceffary when the patient has a great load of fmall-pox, or when the matter which they contain is of fo thin and actid a nature, that there is reation to apprehend had confequences from its being too quickly reforbed, or taken up again into the mafs of circulating humours.

and

and adults, the dole must be increased in proportion to the age and conflicution *.

When imposthumes happen after the small-pox, which is not feldom the cafe, they must be brought to suppuration as foon as possible, by means of ripening poultices; and when they have been opened, or have broke of their own accord, the patient must be purged. The Peruvian bark and a milk diet will likewife be useful in this cafe.

When a cough, a difficulty of breathing, or other fymptoms of a confumption, fucceed to the fmallpox, the patient must be fent to a place where the air is good, and put upon a course of affes milk, with fuch exercife as he can bear. For further directions in this cafe, fee the article Confumptions.

OF INOCULATION.

Though no difeafe, after it is formed baffles the powers of medicine more effectually than the fmallpox, yet more may be done before-hand to render this difeafe favourable than any one we know, as almost all the danger from it may be prevented by inoculation. This falutary invention has been known in Europe above half a century; but, like most other useful discoveries, it has till of late made but flow progrefs. It must however be acknowledged, to the honour of this country, that inoculation has met with a more favourable reception here, than among any of our neighbours. It is still however far from being general, which we have reason to fear will be the cafe, as long as the practice continues in the hands of the faculty.

* I have of late been accuftomed, after the fmall-pox, to give one, two, three, four, or five grains, of calomel, according to the age of the patient, over night, and to work it off next morning with a fuitable dofe of jalap. Or the jalap and calomel may be mixed together, and given in the morning. No

No difcovery can be of general utility, while the practice of it is kept in the hands of a few. Had the inoculation of the fmall-pox been introduced as a fashion, and not as a medical discovery, or had it been practifed by the fame kind of operators here, as it is in those countries from whence we learned it, it had long ago been universal. The fears, the jealoufies, the prejudices, and the oppofite interefts of the faculty, are, and ever will be, the most effectual obstacles to the progress of any falutary discovery. Hence it is that the practife of inoculation never became in any measure general, even in England, till taken up by men not bred to phyfic. These have not only rendered the practice more extensive, but likewife more fafe, and by acting under lefs reftraint than the regular practitioners, have taught them that the patient's greatest danger arose, not from the want of care, but from the excels of it.

They know very little of the matter, who impute the fuccefs of modern inoculators to any fuperior fkill, either in preparing the patient or communicating the difeafe. Some of them indeed, from a fordid defire of engroffing the whole practice to themfelves, pretend to have extraordinary fecrets or noftrums for preparing perfons for inoculation, which never fail of fuccefs. But this is only a pretence calculated to blind the ignorant and inattentive. Common fenfe and prudence alone are fufficient both in the choice of the tubject and management of the operation. Whoever is poffelfed of thefe may perform this office for his children whenever he finds it convenient, provided they be in a good flate of health.

This fentiment is not the refult of theory, but of obfervation. Though few phyficans have had more opportunities of trying inoculation in all its different forms, fo little appears to me to depend on those, generally reckoned important circumftances, of preparing the body, communicating the intection by this this or the other method, &c. that for feveral years paft I have perfuaded the parents or nurfes to perform the whole themfelves, and have found that method followed with equal fuccefs, while it is free from many inconveniences that attend the other*.

The fmall-pox may me communicated in a great variety of ways with nearly the fame degree of fafety and fuccefs. In Turkey, from whence we learned the practice, the women communicate the difeafe to children, by opening a bit of the fkin with a needle, and putting into the wound a little matter taken from a ripe puffule. On the coaft of Barbary they pafs a thread wet with the matter through the fkin between the thumb and fore-finger; and in fome of the flates of Barbary, inoculation is performed by rubbing in the variolous matter between the thumb and fore-finger, or on other parts of the body. The practice of communicating the fmall-pox, by rubbing the variolous matter upon the fkin, has been long known in many parts of Afia and Europe as well as in Barbary, and has generally gone by the name of *buying the fmall-pox*.

* A critical fituation, too often to be met with, first put me upon trying this method. A gentleman who had loft all his children except one fon by the natural fmall-pox, was determined to have him inoculated. He told me his intention, and defired I would pertuade the mother and grandmother, &c. of its pro-priety. But that was impossible. They were not to be perfuaded, and either could not get the better of their fears, or were determined against conviction. It was always a point with me not to perform the operation without the confent of the parties concerned. I therefore advised the father, after giving his fon a dofe or two of rhubarb, to go to a patient who had the imall-pox of a good kind, to open two or three of the puftules, taking up the matter with a little cotton, and as foon as he came home to take his fon apart, and give his arm a flight fcratch with a pin, afterwards to rub the place well with the cotton, and take no farther notice of it. All this he punctually performed : and at the ufual period the small-pox made their appearance, which were of an exceeding good kind, and fo mild as not to confine the boy an hour to his bed. None of the other relations knew but the difeafe had come in the natural way, till the boy was well.

The

230

The prefent method of inoculating in Britain is to make two or three flanting incifions in the arm, to fuperficial as not to pierce quite through the fkin, with a lancet wet with frefh matter taken from a ripe puffule; afterwards the wounds are clofed up, and left without any dreffing. Some make ule of a lancet covered with the dry matter; but this is lefs certain, and ought never to be ufed unlefs where frefh matter cannot be obtained : when this is the cafe, the matter ought to be moiftened by holding the lancet for fome time in the fteam of warm water*.

Indeed if fresh matter be applied long enough to the fkin, there is no occafion for any wound at all. Let a bit of thread, about half an inch long, wet with the matter, be immediately applied to the arm, midway between the fhoulder and the elbow, and covered with a piece of the common flicking plaster, and kept on for eight or ten days. This will feldom fail to communicate the difeafe. We mention this method, because many people are afraid of a wound; and doubtlefs the more eafily the operation can be performed, it has the greater chance to become general. Some people imagine, that the difcharge from a wound leffens the eruption; but there is no great ftrefs to be laid upon this notion; besides, deep wounds often ulcerate, and become troublesome.

We do not find that inoculation is at all confidered as a medical operation in those countries from whence we learned it. In Turkey it is performed by the women, and in the East Indies by the Brachmins or priefts. In this country the cuftom is ftill in its infancy; we make no doubt, however, but it will

* Mr. TRONCHIN communicates this difeafe by a little bit of thread dipt in the matter, which he covers with a fmall blifteringplafter. This method may no doubt be ufed with advantage in those cafes where the patient is very much alarmed at the fight of any cutting influment.

foon

from become fo familiar, that parents will think no more of inoculating their children, than at prefent they do of giving them a purge.

No fet of men have it fo much in their power to render the practice of inoculation general as the clergy, the greatest opposition to it still arising from fome fcruples of confcience, which they alone can remove. I would recommend it to them not only to endeavour to remove the religious objections which weak minds may have to this falutary pracrice, but to enjoin it as a duty, and to point out the danger of neglecting to make use of a mean which Providence has put in our power, for faving the lives of our offspring. Surely fuch parents as wilfully neglect the means of faving their children's lives, are as guilty as those who put them to death. I with this matter were duly weighed. No one is more ready to make allowance for human weakness and religious prejudices; yet I cannot help recommending it, in the warmest manner, to parents, to confider how great an injury they do their children, by neglecting to give them this difeafe in the early period of life.

The numerous advantages ariling from the inoculation of the imall-pox have been pretty fully pointed out by the learned Dr. M^cKenzie, in his Hiltory of Health*. To thole mentioned by the Doctor

* "Many and great," fays this humane author, " are the dangers attending the natural infection, from all which the inoculation is quite featre. The natural infection may invade weak or diftempered bodies, by no means difpored for its kindly reception. It may attack them at a feafon of the year either violently hot or intenfely cold. It may be communicated from a fort of fmall-pox impregnated with the utmost virulence. It may hay hold upon people unexpectedly, when a dangerous fort is imprudently imported into a maritime place. It may furprife us foon after exceffes committed in luxury, intemperance, or lewdnefs. It may likewife feize on the innocent after indifpenfably watchings, hard Q 4

Doctor we fhall only add, that fuch as have not had the finall-pox in the early period of life are not only rendered unhappy, but likewife in a great measure unfit for fultaining many of the most ufeful and important offices. Few people would chufe even to hire a fervant who had not had the finallpox, far lefs to purchafe a flave, who had the chance of dying of this difeafe. How could a phyfician or a furgeon, who had never had the finall-pox himfelf, attend others under that malady? How deplorable is the fituation of females, who arrive at mature age without having had the fmall-pox! A woman with child feldom furvives this difeafe: and if an infant happen to be feized with the fmall-pox upon the

labour or neceffary journies. And is it a trivial advantage, that all thefe unhappy circumftances can be prevented by inoculation ? By inoculation numbers are faved from deformity as well as from death. In the natural fmall-pox, how often are the fineft features, and the most beautiful complexions, miferably disfigured? Whereas inoculation rarely leaves any ugly marks or fcars, even where the number of pullules on the face has been very confiderable, and the fymptoms by no means favourable. And many other grievous complaints that are frequently fubfequent to the natural fort, feldom follow the artificial. Does not inoculation alfo prevent those inexpressible terrors that perpetually harafs perfons who never had this difeafe, infomuch that when the fmall-pox is epidemical, entire villages are depopulated, markets ruined, and the face of diffrefs fpread over the whole country ? From this terror it arifes, that juffice is frequently postponed, or difcouraged, at feffions or affizes where the fmall-pox rages. Witneffes and juries dare not appear; and by reafon of the neceffary abfence of fome gentlemen, our honourable and ufeful judges are not attended with that reverence and fplendour due to their office and merit. Does not inoculation, in like manner, prevent our brave failors from being feized with this diffemper on fhipboard, where they mult quickly spread the infection among such of the crew who never had it before, and where they have fcarce any chance to eleape, being half fliffed with the clofenefs of their cabins, and but very indifferently nurfed ? Laftly, with regard to the foldiery, the mileries attending thefe poor creatures, when attacked by the fmall-pox on a march, are inconceivable, without attendance, without lodgings, without any accommodation ; fo that one of three commonly perifhes."

mother's

mother's breaft, who has not had the difeafe herfelf, the scene must be distressing! If she continue to suckle the child, it is at the peril of her own life; and if fhe wean it, in all probability it will perifh. How often is the affectionate mother forced to leave her houfe, and abandon her children, at the very time when her care is most necessary? Yet, should parental affection get the better of her fears, the confequences would often prove fatal. I have known the tender mother and her fucking infant laid in the fame grave, both untimely victims to this dreadful malady. But thefe are fcenes too fhocking even to mention. Let parents who run away with their children to avoid the fmall-pox, or who refule to inoculate them in infancy, confider to what deplorable fituations they may be reduced by this miltaken tendernefs 1

As the fmall-pox is now become an epidemical difeafe in most parts of the known world, no other choice remains but to render the malady as mild as poffible. This is the only manner of extirpation now left in our power; and though it may feem paradoxical, the artificial method of communicating the difeafe, could it be rendered universal, would amount to nearly the fame thing as rooting it out. It is a matter of small confequence, whether a difeafe be entirely extirpated, or rendered fo mild as neither to deftroy life nor hurt the conftitution; but that this may be done by inoculation, does not now admit of a doubt. The numbers who die under inoculation hardly deferve to be named. In the natural way, one in four or five generally dies; but by inoculation not one of a thoufand. Nay, fome can boalt of having inoculated ten thousand without the loss of a fingle patient.

I have often wifhed to fee fome plan eftablished for rendering this falutary practice oniversal; but am afraid I shall never be fo happy. The difficulties indeed

deed are many; yet the thing is by no means impract, ticable. The aim is great: no lefs than faving the lives of one-fourth part of mankind. What ought not to be attempted in order to accomplifh fo defirable an end?

The first step towards rendering the practice univerfal, must be to remove the religious prejudices against it. This, as already observed, can only be done by the clergy. They must not only recommend it as a duty to others, but likewise practife it on their own children. Example will ever have more influence than precept.

The next thing requisite is to put it in the power of all. For this purpole we would recommend it to the Faculty to inoculate the children of the poor gratis. It is hard that fo useful a part of mankind thould, by their poverty, be excluded from fuch a benefit.

Should this fail, it is furely in the power of any State to render the practice general, at leaft as far as their dominion extends. We do not mean that it ought to be enforced by a law. The beft way to promote it would be to employ a fufficient number of operators at the public expence to inoculate the children of the poor. This would only be neceffary till the practice became general; afterwards cuttom, the ftrongeft of all laws, would oblige every individual to inoculate his children to prevent reflections.

It may be objected to this fcheme, that the poor would refufe to employ the inoculators: this difficulty is eafily removed. A fmall premium to enable mothers to attend their children while under the difface, would be a fufficient inducement; befides, the fuccefs attending the operation would foon banifh all objections to it. Even confiderations of profit would induce the poor to embrace this plan. They often bring up their children to the age of ten or twelve and

and when they come to be useful, they are fnatched away by this malady, to the great loss of their parents, and detriment of the public.

The British legislature has of late years shewn great attention to the prefervation of infant-lives, by fupporting the foundling-hofpital, &c. But we will venture to fay, if one-tenth part of the lums laid out in fupporting that inftitution, had been beftowed towards promoting the practice of inoculation of the fmallpox among the poor, that not only more uleful lives had been faved, but the practice ere now, rendered quite univerfal in this island. It is not to be imagined what effect example and a little money will have upon the poor ; yet, it left to themselves, they would go on for ever in the old way, without thinking of any improvement. We only mean this as a hint to the humane and public-fpirited. Should fuch a fcheme be approved, a proper plan might eafily be laid down for the execution of it.

But as public plans are very difficult to bring about, and often, by the felfifh views and mifconduct of those entrusted with the execution of them, fail of answering the noble purposes for which they were defigned; we shall therefore point out fome other method by which the benefits of inoculation may be extended to the poor.

There is no doubt but inoculators will daily become more numerous. We would therefore have every parifh in Britain to allow one of them a fmall annual falary for inoculating all the children of the parifh at a proper age. This might be done at a very triffing expence, and it would enable every one to enjoy the benefit of this falutary invention.

Two things chiefly operate to prevent the progrefs of inoculation. The one is a wifh to put the evil day as far off as poffible. This is a principle in our nature.

2:35

ture; and as inoculation feems rather to be anticipating a future evil, it is no wonder mankind are fo averfe to it. But this objection is fufficiently answered by the fuccefs. Who in his fenfes would not prefer a leffer evil to-day to a greater to-morrow, provided they were equally certain?

The other obftacle is the fear of reflections. This has a very great weight with the bulk of mankind. Should the child die, they think the world would blame them. This they cannot bear. Here lies the difficulty; and, till that be removed, inoculation will make but fmall progrefs. Nothing however, can remove it but cuftom. Make the practice fashionable, and all objections will foon vanish. It is fashion alone that has led the multitude fince the beginning of the world, and will lead them to the end. We must therefore call upon the more enlightened part of mankind to fet a pattern to the reft. Their example, though it may for fome time meet with opposition, will at length prevail.

I am aware of an objection to this practice from the expence with which it may be attended: this is eafily obviated. We do not mean that every parifh ought to employ a Sutton or a Dimfdale as incoculators. Thefe have by their fuccefs already recommended themfelves to crowned heads, and are beyond the vulgar reach, but have not others an equal chance to fucceed? They certainly have, Let them make the fame trial, and the difficulties will foon vanifh. There is not a parifh, and hardly a village in Britain, defitute of fone perfon who can bleed. But this is a far more difficult operation, and requires both more fkill and dexterity than inoculation.

The perfons to whom we would chiefly recommend the performance of this operation are the clergy. Most of them know fomething of medicine,

cine. Almost all of them bleed, and can order a purge, which are all the qualifications necessary for the practice of inoculation. The priefts among the lefs enlightened Indians perform this office, and why should a Christian teacher think himself above it? Surely the bodies of men, as well as their fouls, merit a part of the paftor's care; at least the greatest Teacher who ever appeared among men, feems to have thought fo.

Should all other methods fail, we would recommend it to parents to perform the operation themfelves. Let them take any method of com-municating the difeafe they pleafe; provided the fubjects be healthy, and of a proper age they will feldom fail to fucceed to their with. I have known many inftances even of mothers performing the operation, and never fo much as heard of one bad confequence. A planter in one of the Weft India iflands is faid to have inoculated, with his own hand, in one year, three hundred of his flaves, who, notwithstanding the warmth of the climate, and other unfavourable circumstances, all did well. Common mechanics have often, to my knowledge, performed the operation with as good fuccefs' as phyficians. We do not however mean to discourage those who have it in their power, from employing people of fkill to inoculate their children, and attend them while under the difeafe; but only to fhew, that where fuch cannot be had, the operation ought not upon that account to be neglected.

Inftead of multiplying arguments to recommend this practice, I thall juft beg leave to mention the method which I took with my own fon, then an only child. After giving him two gentle purges, I ordered the nurfe to take a bit of thread which had been previoufly wet with frefh matter from a pock, and to lay it upon his arm, covering it with a piece of flickingplafter.

plafter. This remained on fix or feven days, till it was rubbed off by accident. At the ufual time the fmall-pox made their appearance, and were exceedingly favourable. Surely this, which is all that is generally neceffary, may be done without any fkill in medicine.

We have been the more full on this fubject becaule the benefits of inoculation cannot be extended to fociety by any other means than making the practice general. While it is confined to a few, it must prove hurtful to the whole. By means of it the contagion is foread, and is communicated to many who might otherwile never have had the difeafe. Accordingly it is found that nearly the fame number die of the famil-pox now as before inoculation was introduced; and this important difcovery, by which alone more lives might be faved than by all the endeavours of the Faculty, is in a great meafure loft by its benefits not being extended to the whole community *.

The ipring and autumn have been ufually reckoned the moft proper feafons for inoculation, on account of the weather being then moft temperate; but it ought to be-confidered that thefe are generally the moft unhealthy feafons of the whole year. Undoubtedly the beft preparation for the difeafe is a previous good ftate of health. I have always obferved that children in particular are more fickly towards the end of fpring and autumn than at any other time of the year. On this account, as well as for the advantage of cool air, I would propofe winter as the moft proper feafon for inoculation; though, on every other confideration, the ipring would feem to be preferable.

* By a well-laid plan for extending inoculation, more lives might be faved at a fmall expense, than are at prefent preferved by all the hofpitals in England, which cost the public fuch an amazing fum.

The moft proper age for inoculation is between three and five. Many approve of inoculating on the breaft, and where no circumftances forbid this practice, I have no objection to it. Children, however, are more liable to convultions at this time than afterwards; befides, the anxiety of the mother or nurfe, thould the child be in danger, would not fail to heighten it by ipoiling the milk.

Children who have conflictutional difeafes, muft neverthelefs be inoculated. It will often mend the habit of body; but ought to be performed at a time when they are most healthy. Accidental difeafes should always be removed before inoculation.

It is generally thought neceffary to regulate the diet for fome time before the difeafe be communicated. In children, however, great alteration in diet is feldom neceffary, their food being commonly of the moft fimple and wholefome kind, as milk, water pap, weak broths, bread, light pudding, mild roots, and white meats.

But children who have been accultomed to a richer diet, who are of a groß habit, or abound with bad humours, ought to be put upon a spare diet before they are inoculated. Their food should be of a light cooling nature, and their drink whey, butter-milk, and such like.

We would recommend no other medicinal preparation but two or three mild purges, which ought to be fuited to the age and ftrength of the patient. The fuccefs of inoculators does not depend on the preparation of their patients, but on their management of them while under the difeafe. Their conftant care is to keep them cool, and their bodies gently open, by which means the fever is kept low, and the eruption greatly leffened. The danger is feldom great when the putfules are few; and their number is generally in proportion to the fever which which precedes and attends the eruption. Hence the chief fecret of inoculation confifts in regulating the eruptive fever, which generally may be kept fufficiently low by the methods mentioned above.

The regimen during the difeafe is in all refpects the fame as under the natural fmall-pox. The patient muft be kept cool, his diet fhould be light, and his drink weak and diluting, &cc. Should any bad fymptoms appear, which is feldom the cafe, they muft be treated in the fame way as directed in the natural fmall-pox. Purging is not lefs neceffary after the fmall-pox by inoculation than in the natural way, and ought by no means to be neglected.

CHAP. XXIV.

OF THE MEASLES.

THE meafles appeared in Europe about the fame time with the fmall-pox, and have a great affinity to that difeafe. They both came from the fame quarter of the world, are both infectious, and feldom attack the fame perfon more than once. The meafles are most common in the fpring feafon, and generally difappear in fummer. The difeafe itself, when properly managed, teldom proves fatal; but its confequences are often very troublefome.

CAUSE. — This difeafe, like the fmall pox, proceeds from infection, and is more or lefs dangerous according to the conflitution of the patient, the feafon of the year, the climate, &c.

SYMPTOMS.—The meafles, like other fevers, are preceded by alternate fits of heat and cold, with ficknefs, and lofs of appetite. The tongue

tongue is white, but generally moift. There is a fhort cough, a heaviness of the head and eyes, drowfinefs, and a running at the nofe. Sometimes indeed the cough does not come before the eruption has appeared. There is an inflammation and heat in the eyes, accompanied with a defluxion of tharp rheum, and great acutenels of fensation, fo that they cannot bear the light without pain. The eye-lids frequently fwell fo as to occasion blindness. The patient generally complains of his throat; and a vomiting or loofenefs often precedes the eruption. The stools in children are commonly greenish; they complain of an itching of the skin, and are remarkably peevifh. Bleeding at the nofe is common, both before and in the progrefs of the difeafe.

About the fourth day, fmall fpots, refembling flea-bites, appear, first upon the face, then upon the breaft, and afterwards on the extremities : thefe may be diffinguished from the small-pox by their fcarcely rifing above the fkin. The fever, cough, and difficulty of breathing, instead of being removed by the eruption, as in the fmail-pox, are rather increased; but the vomiting generally ceases.

About the fixth or feventh day from the time of fickening, the measles begin to turn pale on the face, and afterwards upon the body; fo that by the ninth day they entirely difappear. The fever, however, and difficulty of breathing, often continue, especially if the patient has been kept upon too hot a regimen. Petechiæ, or purple spots, may likewife be occasioned by this error.

A violent loofeness fometimes fucceeds the measles; in which cafe the patient's life is in imminent danger.

Such as die of the measles generally expire about the ninth day from the invalion, and are commonly carried

R

carried off by a peripneumony, or inflammation of the lungs.

The most favourable fymptoms are a moderate loofenefs, a moift fkin, and a plentiful difcharge of urine.

When the eruption fuddenly falls in, and the patient is feized with a delirium, he is in the greateft danger. If the meafles turn too foon of a pale colour, it is an unfavourable fymptom, as are alfo great weaknefs, vomiting, reftlefinefs, and difficulty of fwallowing. Purple or black fpots appearing among the meafles are very unfavourable. When a continual cough, with hoarfenefs, fucceeds the difeafe, there is reafon to fufpect an approaching confumption of the lungs.

Our bulinels in this difeafe is to affift Nature, by proper cordials, in throwing out the eruption, if her efforts be too languid, but when they are too violent they must be restrained by evacuations, and cool diluting liquors, &c. We ought likewife to endeavour to appeale the most urgent symptoms, as the cough, restless, and difficulty of breathing.

REGIMEN.——The cool regimen is neceffary here as well as in the fmall-pox. The food too muft be light, and the drink diluting. Acids however do not anfwer fo well in the meafles as in the fmall-pox, as they tend to exafperate the cough. Small-beer likewife, though a good drink in the fmall-pox, is here improper. The moft fuitable liquors are decoctions of liquorice with marfh-mallow roots and farfaparilla, infufions of linfeed or of the flowers of elder, balm-tea, clarified whey, barleywater, and fuch like. Thefe, if the patient be coftive, may be fweetened with honey; or if that fhould difagree with the flomach, a little manna may occafionally be added to them.

2

MEDI-

MEDICINE.——The meafles being an inflammatory difeafe, without any critical difcharge of matter, as in the imall-pox, bleeding is commonly neceffary, efpecially when the fever runs high, with difficulty of breathing, and great opprefilion of the breaft. But if the difeafe be of a mild kind, bleeding may be omitted *.

Bathing the feet and legs frequently in lukewarm water both tends to abate the violence of the fever, and to promote the eruption.

The patient is often greatly relieved by vomiting. When there is a tendency this way, it ought to be promoted by drinking lukewarm water, or weak camonile-tea.

When the cough is very troublefome, with drynefs of the throat, and difficulty of breathing, the patient may hold his head over the fteam of warm water, and draw the fteam into his lungs.

He may likewife lick a little fperma-ceti and fugarcandy pounded together; or take now and then a fpoonful of the oil of fweet almonds, with fugar-candy diffolved in it. Thefe will foften the throat, and relieve the tickling cough.

If at the turn of the difeafe the fever affumes new vigour, and there appears great danger of fuffocation, the patient muft be bled according to his ftrength, and bliftering-plafters applied, with a view to prevent the load from being thrown on the lungs, where, if an inflammation should fix itself, the patient's life will be in imminent danger.

In cafe the meafles hould fuddenly difappear, it will be neceffary to purfue the fame method which we have recommended when the fmall-pox recede. The patient must be fupported with wine and cordials. Bliftering-plasters must be applied to the

* I do not know any difeafe wherein bleeding is more neceffary than in the meafles, especially when the fever runs high: in this cafe I have always found it relieve the patient.

R 2

legs

legs and arms, and the body rubbed all over with warm flannels. Warm poultices may likewife be applied to the feet and palms of the hands.

When purple or black fpots appear, the patient's drink fhould be fharpened with fpirits of vitriol; and if the putrid fymptoms increafe, the Peruvian bark muft be adminiftered in the fame manner as directed in the fmall-pox.

Opiates are fometimes neceffary, but fhould never be given except in cafes of extreme reftlefinefs, a violent loofenefs, or when the cough is very troublefome. For children, the fyrup of poppies is fufficient. A tea-fpoonful or two may be occafionally given, according to the patient's age, or the violence of the fymptoms.

After the meafles are gone off, the patient ought to be purged. This may be conducted in the fame manner as directed in the fmall-pox.

If a violent loofenefs fucceeds the meafles, it may be checked by taking for fome days a gentle dole of rhubarb in the morning, and an opiate over night; but if these do not remove it, bleeding will feldom fail to have that effect.

Patients recovering after the meafles fhould be careful what they eat or drink. Their food for fome time ought to be light, and in fmall quantities, and their drink diluting, and rather of an opening nature, as butter-milk, whey, and fuch like. They ought alfo to beware of exposing themfelves too foon to the cold air, left a fuffocating catarrh, an afthma, or a confumption of the lungs, fhould enfue.

Should'a cough, with difficulty of breathing, and other fymptoms of a confumption, remain after the meafles, fmall quantities of blood may be frequently, let at proper intervals, as the patient's thrength and conflitution will permit. He ought likewife to drink affes milk, to remove to a free air, if in

244

OF THE SCARLET FEVER. 245

in a large town, and to ride daily on horfeback. He muft keep clofe to a diet confifting of milk and vegetables; and laftly, if these do not succeed, let him remove to a warmer climate*.

OF THE SCARLET FEVER.

The fcarlet fever is fo called from the colour of the patient's fkin, which appears as if it were tinged with red wine. It happens at any feafon of the year, but is most common towards the end of fummer; at which time it often feizes whole families; children and young perfons are most fubject to it.

It begins like other fevers, with coldnefs and fhivering, without any violent ficknefs. Afterwards the fkin is covered with red fpots, which are broader, more florid, and lefs uniform than the meafles. They continue two or three days, and then difappear; after which the cuticle, or fcarf-fkin, falls off.

* Attempts have been made to communicate the meafles, as well as the fmall-pox, by inoculation, and we make no doubt but in time the practice may fucceed. Dr. Home of Edinburgh fays, he communicated the difeafe by the blood. Others have tried this method, and have not found it fucceed. Some think the difeafe would be more certainly communicated by rubbing the fkin of a patient who has the measles with cotton, and afterwards applying the cotton to a wound as in the fmall-pox ; while others recommend a bit of flannel which had been applied to the patient's fkin, all the time of the difease, to be afterwards laid upon the arm or leg of the perfon to whom the infection is to be communicated. There is no doubt but this difeafe, as well as the fmall-pox, may be communicated various ways; the most probable, however, is either from cotton rubbed upon the fkin, as mentioned above, or by introducing a little of the fharp humour which diftils from the eyes of the patient into the blood. It is agreed on all hands, that fuch patients as have been inoculated had the difeafe very mildly ; we therefore with the practice were more general, as the meafles have of late become very fatal.

There

There is feldom any occasion for medicine in this difease. The patient ought however to keep within doors, to abstain from fleth, strong liquors, and cordials, and to drink freely of cool duluting liquors. If the fever runs high, the body must be kept gently open by emollient clysters, or small doses of nitre and rhubarb. A scruple of the former, with five grains of the latter, may be taken thrice a-day, or oftener, if necessary.

Children and young perfons are fometimes feized at the beginning of this difeafe with a kind of ftupor and epileptic fits. In this cafe the feet and legs fhould be bathed in warm water, a large blifteringplafter applied to the neck, and a dofe of the fyrup of poppies given every night till the patient recovers*.

The fearlet fever however is not always of fo mild a nature. It is fometimes attended with putrid or malignant fymptoms, in which cafe it is always dangerous. In the malignant fearlet fever the patient is not only affected with coldnefs and fhivering, but with languor, ficknefs, and great opprefilon; to thefe fuceed exceffive heat, naufea, and vomiting, with a forenefs of the throat; the pulfe is extremely quick, but fmall and deprefied; the breathing frequent and laborious; the fkin hot, but not quite dry; the tongue moilf, and covered with a whitifh mucus; the tonfils inflamed and ulcerated. When the eruption appears, it brings no relief; on the contrary, the fymptoms generally grow worfe, and frefh ones come on, as purging, delirium, &c.

When this difeafe is miltaken for a fimple inflammation, and treated with repeated bleedings, purging and cooling medicines, it generally proves fatal. The only medicines that can be depended on in this cafe are cordials and antifeptics, as the

* Sydenham.

Peruvian

OF THE BILIOUS FEVER.

Peruvian bark, wine, fnake-root, and the like. The treatment muft be in general fimilar to that of the puttid fever, or of the malignant ulcerous fore throat *.

OF THE BILIOUS FEVER.

When a continual, remitting, or intermitting fever is accompanied with a frequent or copious evacuation of bile, either by vomit or flool, the fever is denominated bilious. In Britain the bilious fever generally makes its appearance about the end of fummer, and ceafes towards the approach of winter. It is most frequent and fatal in warm countries, efpecially where the foil is marfhy, and when great rains are fucceeded by fultry heats. Perfons who work without doors, lie in camps, or who are exposed to the night air, are most liable to this kind of fever.

If there are fymptoms of inflammation at the beginning of this fever, it will be neceffary to bleed, and to put the patient upon the cool diluting regimen recommended in the inflammatory fever. The faline draught may likewife be frequently adminiftered, and the patient's body kept open by clyfters or mild purgatives. But if the fever fhould remit or intermit, bleeding will feldom be neceffary. In this cafe a vomit may be adminiftered, and, if the body be bound, a gentle purge; after which the Peruvian bark will generally complete the cure.

* In the year 1774, during winter, a very bad fpecies of this fever prevailed in Edinburgh. It raged chiefly among young people. The eruption was generally accompanied with a quinfey, and the inflammatory fymptoms were fo blended with others of a putrid nature, as to render the treatment of the difeafe very difficult. Many of the patients, towards the decline of the fever, were afflicted with large fwellings of the fubmaxillary glands, and not a few had a fuppuration in one or both cars.

Ia

In cafe of a violent loofenefs, the patient most be fupported with chicken broth, jellies of hartfhorn, and the like; and he may use the *white dea costion* for his ordinary drink *. If a bloody flux fhould accompany this fever, it must be treated in the manner recommended under the article *Dyfentery*.

When there is a burning heat, and the patient does not fweat, that evacuation may be promoted by giving him, three or four times a-day, a table-fpoonful of Mindererus's fpirit + mixed in a cup of his ordinary drink.

If the bilious fever be attended with the nervous, malignan, or putrid fymptoms, which is fometimes the cafe, the patient must be treated in the fame manner as directed under these diseases.

After this fever, proper care is neceffary to prevent a relapfe. For this purpofe the patient, efpecially towards the end of autumn, ought to continue the ufe of the Peruvian bark for fome time after he is well. He fhould likewife abftain from all trafhy fruits, new liquors, and every kind of flatulent aliment.

CHAP XXV,

OF THE ERYSIPELAS, OR ST. ANTHONY'S FIRE.

HIS difeafe, which in fome parts of Britain is called *the rofe*, attacks perfons at any period of life, but is most common between the age of thirty

> * See Appendix, White Decoction. + See Appendix, Spirit of Mindererus.

> > and

OR ST. ANTHONY'S FIRE.

and forty. Perfons of a fanguine or plethoric habit are moft liable to it. It often attacks young people, and pregnant women; and fuch as have once been afflicted with it are very liable to have it again. Sometimes it is a primary difeafe, and at other times only a fymptom of fome other malady. Every part of the body is liable to be attacked by an eryfipelas, but it moft frequently feizes the legs or face, efpecially the latter. It is moft common in autumn, or when hot weather is fucceeded by cold and wet.

CAUSES.——The eryfipelas may be occafioned by violent paffions or affections of the mind; as fear, anger, &c. When the body has been heated to a great degree, and is immediately expoled to the cold air, fo that the perfpiration is fuddenly checked, an eryfipelas will often enfue*. It may allo be occafioned by drinking to excefs, by continuing too long in a warm bath, or by any thing' that overheats the blood. If any of the natural evacuations be obftructed, or in too fmall quantity, it may caufe an eryfipelas. The fame effect will follow from the ftoppage of artificial evacuations; as iffues, fetons, or the like.

SYMPTOMS.—The eryfipelas attacks with fhivering, thirft, loss of ftrength, pain in the head and back, heat, reftleffnefs, and a quick pulse; to which may be added vomiting, and fometimes a delirium. On the fecond, third, or fourth day, the part fwells, becomes red, and fmall pultules appear; at which time the fever generally abates.

* The country people in many parts of Britain call this difeafe a blagh, and imagine it proceeds from foul air, or ill wind, as they term it. The truth is, they often lie down to, reft them, when warm and fatigued, upon the damp ground, where they fall afleep, and lie fo long as to catch cold, which occafions the eryfipelas. This difeafe may indeed proceed from other caufes, but we may venture to fay, that nine times out of ten it is occafion by cold caught after the body has been greatly heated or fatigued.

When

When the eryfipelas feizes the foot, the parts contiguous fwell, the fkin fhines; and, if the pain be violent, it will alcend to the leg, and will not bear to be touched.

When it attacks the face, it fwells, appears red, and the fkin is covered with fmall putfules filled with clear water. One or both eyes are generally clofed with a fwelling; and there is a difficulty of breathing. If the mouth and noftrils be very dry, and the patient drowfy, there is reafon to fulpect an inflammation of the brain.

If the eryfipelas affects the breaft, it fwells and becomes exceedingly hard, with great pain, and is apt to tuppurate. There is a violent pain in the arm-pit on the fide affected, where an abfcefs is often formed.

If in a day or two the fwelling fubfides, the heat and pain abate, the colour of the part turns yellow, and the cuticle breaks and falls off in fcales, the danger is over.

When the erylipelas is large, deep, and affects a very fenfible part of the body, the danger is great. If the red colour changes into a livid or black, it will end in a mortification. Sometimes the inflammation cannot be difcuffed, but comes to a fuppuration; in which cafe fiftulas, a gangrene, or mortification, often enfue.

Such as die of this difeafe are commonly carried off by the fever, which is attended with difficulty of breathing, and fometimes with a delirium and great drowfinefs. They generally die about the feventh or eighth day.

REGIMEN.——In the eryfipelas the patient muft neither be kept too hot nor too cold, as either of these extremes will tend to make it retreat, which is always to be guarded against. When the disease is mild, it will be fufficient to keep the patient within doors

250

doors, without confining him to his bed, and to promote the perfpiration by diluting liquors, &c.

The diet ought to be flender, and of a moderately cooling and moiftening quality, as groat-gruel, panado, chicken or barley broth, with cooling herbs and fruits, &c. avoiding flefh, fifh, ftrong drink, fpices, pickles, and all other things that may heat and inflame the blood; the drink may be barleywater, an infufion of elder-flowers, common whey, and fuch like.

But if the pulle be low, and the fpirits funk, the patient mult be fupported with negus, and other things of a cordial nature. His food may be fagogruel, with a little wine, and nourifhing broths, taken in fmall quantities, and often repeated. Great care, however, mult be taken not to overheat him.

MEDICINE. In this difeafe much mischief is often done by medicine, especially by external applications. People, when they fee an inflammation, immediately think that fomething ought to be applied to it. This indeed is neceffary in large phlegmons; but in an eryfipelas the fafer courfe is to apply nothing. Almost all ointments, falves, and plasters, being of a greafy nature, tend rather to obftruct and repel, than promote any discharge from the part. At the beginning of this difease it is neither fafe to promote a fuppuration, nor to repel the matter too quickly. The eryfipelas in many respects resembles the gout, and is to be treated with the greatest caution. Fine wool, or very foft flannel, are the fafest applications to the part. These not only defend it from the external air, but likewife promote the perfpiration, which has a great tendency to carry off the difeafe. In Scotland the common people generally apply a mealy cloth to the parts affected, which is far from being improper.

It is common to bleed in the eryfipelas; but this likewife requires caution. If however the fever be high, 252

high, the pulle hard and firong, and the patient vigorous, it will be proper to bleed; but the quantity muft be regulated by these circumfances, and the operation repeated as the fymptoms may require. If the patient has been accustomed to firong liquors, and the difease attacks his head, bleeding is absolutely neceffary.

Bathing the feet and legs frequently in lukewarm water, when the difeafe attacks the face or brain, has an excellent effect. It tends to make a derivation from the head, and feldom fails to relieve the patient. When bathing proves ineffectual, poultices, or fharp finapifms, may be applied to the foles of the feet, for the fame purpofe.

In cafes where bleeding is requifite, it is likewife neceffary to keep the body open. This may be effected by emollient clyfters, or fmall dofes of nitre and rhubarb. Some indeed recommend very large dofes of nitre in the eryfipelas; but nitre feldom fits eafy on the fiomach when taken in large dofes. It is however one of the beft medicines when the fever and inflammation run high. Half a drachm of it, with four or five grains of rhubarb, may be taken in the patient's ordinary drink, four times a day.

When the eryfipelas leaves the extremities, and feizes the head fo as to occafion a delirium or ftupor, it is abfolutely neceffary to open the body. If clyfters and mild purgatives fail to have this effect, ftronger ones muft be given. Bliftering plafters muft likewife be applied to the neck, or behind the ears, and fharp cataplafms laid to the foles of the feet.

When the inflammation cannot be difcuffed, and the part has a tendency to ulcerate, it will then be proper to promote fuppuration, which may be done by the application of ripening poultices, with faffron, warm fomentations, and fuch like.

When the black, livid, or blue colour of the part fhews a tendency to mortification, the Peruvian bark

4

OR ST. ANTHONY'S FIRE.

bark must be administered. It may be taken along with acids, as recommended in the fmall-pox, or in any other form more agreeable to the patient. It must not however, be trifled with, as the patient's life is at ftake. A drachm may be given every two hours, if the fymptoms be threatening, and cloths dipped in warm camphorated fpirits of wine, or the tincture of myrrh and aloes, may be applied to the part, and frequently renewed. It may likewife be proper in this cafe to apply poultices of the bark, or to foment the part affected with a ftrong decoction of it.

In what is commonly called the *fcorbutic eryfipelas*, which continues for a confiderable time, it will only be neceffary to give gentle laxatives, and fuch things as purify the blood and promote the perfpiration. Thus, after the inflammation has been checked by opening medicines, the decoction of woods * may be drank, after which a courfe of bitters will be proper.

Such as are liable to frequent attacks of the eryfipelas ought carefully to guard againft all violent paffions; to abftain from ftrong liquors, and all fat, vifcid, and highly-nourifhing food. They fhould likewife take fufficient exercife, carefully avoiding the extremes of heat or cold. Their food fhould confift chiefly of milk, and fuch fruits, herbs, and roots, as are of a cooling quality; and their drink ought to be fmall-beer, whey, butter-milk, and fuch like. They fhould never fuffer themfelves to be long coftive. If that cannot be prevented by fuitable dier, it will be proper to take frequently a gentle dofe of rhubarb, cream of tartar, the lenitive electuary, or fome other mild purgative.

* See Appendix, Decotion of Woods.

CHAP.

[254]

CHAP. XXVI.

OF THE PHRENITIS, OR INFLAMMATION OF THE BRAIN.

THIS is fometimes a primary difeafe, but oftener only a fymptom of fome other malady; as the inflammatory, eruptive, or fpotted fever, &c. It is very common, however, as a primary difeafe in warm climates, and is most incident to perfons about the prime or vigour of life. The passionate, the ftudious, and those whose nervous system is irritable in a high degree, are most liable to it.

CAUSES.——This difeafe is often occafioned by night watching, efpecially when joined with hard fludy: it may likewife proceed from hard drinking, anger, grief, or anxiety. It is often occafioned by the ftoppage of ufual evacuations; as the bleeding piles in men, the cuftomary difcharges of women, &c. Such as imprudently expofe themfelves to the heat of the fun, efpecially by fleeping without doors, in a hot feafon, with their heads uncovered, are often fuddenly feized with an inflammation of the brain, fo as to awake quite delirious. When repellents are imprudently ufed in an eryfipelas, an inflammation of the brain is fometimes the confequence. It may likewife be occafioned by external injuries, as blows or bruifes upon the head, &c.

SYMPTOMS.——The fymptoms which ufually precede a true inflammation of the brain are pain of the head, rednefs of the eyes, a violent flufhing of the face, diffurbed fleep, or a total want of it, great drynefs of the fkin, coftivenefs, a retention of urine, a fmall dropping of blood from the nofe, finging of the ears, and extreme fenfibility of the nervous fyftem.

OF THE PHRENITIS, &c.

255

When the inflammation is formed, the fymptoms in general are fimilar to those of the inflammatory fever. The pulse indeed is often weak, irregular, and trembling; but fometimes it is hard and contracted. When the brain itself is inflamed, the pulfe is always foft and low; but when the inflammation only affects the integuments of the brain, viz. the dura and pia mater, it is hard. A remarkable quickness of hearing is a common symptom of this difeafe; but that feldom continues long. Another ufual fymptom is a great throbbing or pulfation in the arteries of the neck and temples. Though the tongue is often black and dry, yet the patient feldom complains of thirst, and even refuses drink. The mind chiefly runs upon fuch objects as have before made a deep impression on it; and sometimes, from a fullen filence, the patient becomes all of a fudden quite outrageous.

A conftant trembling and ftarting of the tendons is an unfavourable fymptom, as are allo a fuppreffion of urine; a total want of fleep; a conftant fpitting; a grinding of the teeth; which laft may be confidered as a kind of convulfion. When a phrenitis fucceeds an inflammation of the lungs, of the inteftines, or of the throat, &c. it is owing to a tranflation of the difeafe from thefe parts to the brain, and generally proves fatal. This flews the neceffity of proper evacuations, and the danger of repellents in all inflammatory dileafes.

The favourable fymptoms are, a free perfpiration, a copious difcharge of blood from the nofe, the bleeding piles, a plentiful difcharge of urine, which lets fall a copious fediment. Sometimes the difeafe is carried off by a loofenefs, and in women by an exceffive flow of the menfes.

As this difeafe often proves fatal in a few days, it requires the molt fpeedy applications. When it is prolonged, or improperly treated, it fometimes ends

256 OF THE PHRENITIS, OR

ends in madnefs, or a kind of flupidity which continues for life.

In the cure, two things are chiefly to be attended to, viz. to leffen the quantity of blood in the brain, and to retard the circulation towards the head.

REGIMEN.— The patient ought to be kept very quict. Company, noife, and every thing that affects the fenfes, or difturbs the imagination, increafes the difeafe. Even too much light is hurtful; for which reafon the patient's chamber ought to be a little darkened, and he fhould neither be kept too hot nor cold. It is not however neceffary to exclude the company of an agreeable friend; as this has a tendency to footh and quiet the mindi Neither ought the patient to be kept too much in the dark, left it fhould occafion a gloomy melancholy, which is too often the confequence of this difeafe.

The patient must, as far as possible, be soothed and humoured in every thing. Contradiction will ruffle his mind, and increase his malady. Even when he calls for things which are not to be obtained, or which might prove hurtful, he is not to be politively denied them, but rather put off with the promife of having them as foon as they can be obtained, or by fome other excufe. A little of any thing that the mind is fet upon, though not quite proper, will hurt the patient less than a pofitive refulal. In a word, whatever he was fond of, or used to be delighted with, when in health, may here be tried; as pleafing ftories, foft mulic, or whatever has a tendency to footh the paffions and compose the mind. Boerhaave proposes feveral mechanical experiments for this purpole; as the foft noife of water diftilling by drops into a bason, . and the patient trying to reckon them, &c. Any uniform found, if low and continued, has a tendency

INFLAMMATION OF THE BRAIN. 257

ency to procure fleep, and confequently may be of fervice.

The aliment ought to be light, confifting chiefly of farinaccous fubftances; as panado, and watergruel fharpened with jelly of currants, or juice of lemons, ripe fruits roafted or boiled, jellies, preferves, &cc. The drink fmall, diluting, and cooling; as whey, barley-water, or decoctions of barley and tamarinds, which latter not only render the liquor more palatable, but likewife more beneficial, as they are of an opening nature.

MEDICINE.—In an inflammation of the brain, nothing more, certainly relieves the patient than a free difcharge of blood from the nofe. When this comes of its own accord, it is by no means to be ftopped, but rather promoted, by applying cloths dipped in warm water to the part. When bleeding at the nofe does not happen fpontaneoufly, it may be provoked, by putting a ftraw, or any other fharp body up the noftril.

Bleeding in the temporal arteries greatly relieves the head: but as this operation cannot always be performed, we would recommend in its ftead bleeding in the jugular veins. When the patient's pulfe and fpirits are fo low, that he cannot bear bleeding with the lancet, leeches may be applied to the temples. Thefe not only draw off the blood more gradually, but by being applied nearer to the part affected, generally give more immediate relief.

A difcharge of blood from the hæmorrhoidal veins is likewife of great fervice, and ought by all means to be promoted. If the patient has been fubject to the bleeding piles, and that difcharge has been ftopped, every method muft be tried to reftore it; as the application of leeches to the parts, fitting over the fteams of warm water, fharp clyflers, or fuppofitories made of honey, aloes, and rock-falt.

If

If the inflammation of the brain be occafioned by the floppage of evacuations either natural or artificial, as the menfles, iffues, fetons, or fuch like, all means muft be used to reftore them as foon as possible, or to substitute others in their stead.

The patient's body muft be kept open by ftimulating clyfters or fmart purges; and fmall quantities of nitre ought frequently to be mixed with his drink. Two or three drachms, or more, if the cafe be dangerous, may be used in the space of twenty-four hours.

The head fhould be fhaved and frequently rubbed with vinegar and rofe-water. Cloths dipped in this mixture may likewife be applied to the temples. The feet ought frequently to be bathed in luke-warm water, and fort poultices of bread and milk may be kept conftantly applied to them.

If the difeafe proves obfinate, and does not yield to these medicines, it will be neceffary to apply a bliftering-plafter to the whole head.

CHAP. XXVII.

OF THE OPHTHALMIA, OR INFLAM-MATION OF THE EYES.

HIS difeafe may be occafioned by external injuries; as blows, burns, bruifes, and the like. It may likewife proceed from duft, quicklime, or other fubftances, getting into the eyes. It is often caufed by the ftoppage of cultomary evacuations; as the healing of old fores, drying up of iffues, the fupprefiling of gentle morning fweats, or of the fweating of the feet, &c. Long expolure to the night air, elpecially in cold northerly winds, a

258

INFLAMMATION OF THE EYES. 259

or whatever fuddenly checks the perfpiration, effecially after the body has been much heated, is very apt to caufe an inflammation of the eyes. Viewing fnow or other white bodies for a long time, or looking ftedfattly at the fun, a clear fire, or any bright object, will hkewife occafion this malady. A fudden tranfiation from darknefs to very bright light will often have the fame effect.

Nothing more certainly occasions an inflammation of the eyes than night-watching, especially reading or writing by candle-light. Drinking fpirituous liquors, and excess of venery, are likewife very hurtful to the eyes. The acrid fumes of me-tals, and of feveral kinds of fuel, are also pernicious. Sometimes an inflammation of the eyes proceeds from a venereal taint, and often from a icrophulous or gouty habit. It may likewife be occafioned by hairs in the eye-lids turning inwards, and hurting the eyes. Sometimes the difeafe is epidemic, especially after wet feasons; and I have frequently known it prove infectious, particularly to those who lived in the fame house with the patient. It may be occasioned by moift air, or living in low damp houses, especially in perfons who are not accustomed to such situations. In children it often proceeds from imprudently drying up of fcabbed heads, a running behind the ears, or any other difcharge of that kind. Inflammations of the eyes often fucceed the fmall-pox or meafles, efpecially in children of a ferophulcus habit.

SYMPTOMS.—An inflammation of the eyes is attended with acute pain, heat, rednefs, and fwelling. The patient is not able to bear the light, and fometimes he feels a pricking pain, as if his eyes were pierced with a thorn. Sometimes he imagines his eyes are full of motes, or thinks he fees flies dancing before him. The eyes are filled with a fealding rheum, which rufhes forth in great

\$ 2

quantities,

260 OF THE OPHTHALMIA, OR

quantities, whenever the patient attempts to look up. The pulfe is generally quick and hard, with fome degree of fever. When the difeafe is violent, the neighbouring parts fwell, and there is a throbbing or pulfation in the temporal arteries, &c.

A flight inflammation of the eyes, efpecially from an external caufe, is eafily cured; but when the difeafe is violent, and continues long, it often leaves fpecks upon the eyes, or dimnefs of fight, and fometimes total blindnefs.

If the patient be feized with a loofenefs, it has a good effect; and when the inflammation paffes from one eye to another, as it were by infection, it is no unfavourable fymptom. But when the difeafe is accompanied with a violent pain of the head, and continues long, the patient is in danger of lofing his fight.

REGIMEN.——The diet, unlefs in fcrophulouscafes, can hardly be too fpare, efpecially at the beginning. The patient mult abftain from every thing of a heating nature. His food fhould confift chiefly of mild vegetables, weak broths, and gruels. His drink may be barley-water, balm-tea, common whey, and fuch like.

The patient's chamber must be darkened, or his eyes fhaded by a cover, fo as to exclude the light, but not to prefs upon the eyes. He fhould not look at a candle, the fire, or any luminous object; and ought to avoid all fmoke, as the fumes of tobacco, or any thing that may caufe coughing, fneezing, or vomiting. He fhould be kept quiet, avoiding all violent efforts, either of body or mind, and encouraging fleep as much as poffible.

MEDICINE.——This is one of those difeases wherein great hurt is often done by external applications. Almost every person pretends to be posfessed of a remedy for the cure of sore eyes. These remedies generally consist of eye-waters and ointments.

INFLAMMATION OF THE EYES. 261

ments, with other external applications, which do milchief twenty times for once they do good. People ought therefore to be very cautious how they use fuch things, as even the preffure upon the eyes often increates the malady.

Bleeding, in a violent inflammation of the eyes, is always neceffary. This fhould be performed as near the part affected as poffible. An adult may lofe ten or twelve ounces of blood from the jugular vein, and the operation may be repeated according to the urgency of the fymptoms. If it fhould not be convenient to bleed in the neck, the fame quantity may be let from the arm, or any other part of the body.

Leeches are often applied to the temples, or under the eyes, with good effect. The wounds muft be fuffered to bleed for fome hours, and if the bleeding ftop foon, it may be promoted by the application of cloths dipt in warm water. In obflinate cafes, it will be neceffary to repeat this operation feveral times.

Opening and diluting medicines are by no means to be neglected. The patient may take a fmall dofe of Glauber's falts, and cream of tartar, every fecond or third day, or a decoction of tamarinds with fenna. If these be not agreeable, gentle doses of rhubarb and nitre, a little of the lenitive electuary, or any other mild purgative, will answer the fame end. The patient at the fame time must drink freely of watergruel, tea, whey, or any other weak diluting liquor. He ought likewife to take, at bed-time, a large draught of very weak wine-whey, in order to promote perspiration. His feet and legs must frequently be bathed in lukewarm water, and his head thaved twice or thrice a week, and afterwards washed in cold water. This has often a remarkably good effect,

If the inflammation does not yield to these evacuations, bliftering-plasters must be applied to the temples, behind the ears, or upon the neck, and kept open for some time by the mild blifteringointment. I have feldom known these, if long enough kept open, fail to remove the most obflinate inflammation of the eyes; but for this purpose it is often neceffary to continue the discharge for several weeks.

When the difeafe has been of long ftanding, I have feen very extraordinary effects from a feton in the neck, or between the fhoulders, effectively the latter. It fhould be put upwards and downwards, or in the direction of the fpine, and in the middle between the fhoulder blades. It may be dreffed twice a day with yellow bafilicon. I have known patients, who had been blind for a confiderable time, recover fight by means of a feton placed as above. When the feton is put acrofs the neck, it foon wears out, and is both more painful and troublefome then between the fhoulders; befides, it leaves a difigreeable mark, and does not difcharge fo freely.

When the heat and pain of the eyes are very great, a positive of bread and milk, fortened with fweet oil or fresh butter, may be applied to them, at leaft all night; and they may be bathed with lukewarm milk and water in the morning.

If the patient cannot fleep, which is fometimes the cafe, he may take twenty or thirty drops of laudanum, or two fpoonfuls of the fyrup of poppies, over night, more or lefs according to his age, or the violence of the fymptoms.

After the inflammation is gone off, if the eyes ftill remain weak and tender, they may be bathed every night and morning with cold water and a little brandy, fix parts of the former to one of the latter.

INFLAMMATION OF THE EYES. 263

latter. A method fhould be contrived by which the eye can be quite immerfed in the brandy and water, where it fhould be kept for fome time. I have generally found this, or cold water and vinegar, as good a ftrengthener of the eyes as any of the moft celebrated collyriums.

When an inflammation of the eyes proceeds from a fcrophulous habit, it generally proves very obftinate. In this cafe the patient's diet must not be too low, and he may be allowed to drink fmall negus, or now and then a glass of wine. The most proper medicine is the Peruvian bark, which may either be given in fubstance, or prepared in the following manner:

Take an ounce of the bark in powder, with two drachms of Winter's bark, and boil them in an Englifh quart of water to a pint; when it has boiled nearly long enough; add half an ounce of liquorice-root fliced. Let the liquor be ftrained. Two, three, or four table-fpoonfuls, according to the age of the patient, may be taken three or four times a-day. It is impoffible to fay how long this medicine fhould be continued, as the cure is fooner performed in fome than in others: but in general it requires a confiderable time to produce any lafting effects.

Dr. Cheyne fays, ' that Æthiop's mineral never fails in obilinate inflammations of the eyes, even fcrophulous ones, if given in a fufficient dofe, and duly perfifted in.' There is no doubt but this and other preparations of mercury may be of fingular fervice in ophthalmias of long continuance, but they ought always to be adminiftered with the greateft caution, or by perfons of fkill in phyfic.

It will be proper frequently to look into the eyes, to fee if any hairs be turned inwards, or preffing S 4 upon upon them^{*}. These ought to be removed by plucking them out with a pair of small pincers.

264

Those who are liable to frequent returns of this difease, ought constantly to have an iffue in one or both arms. Bleeding or purging in the spring and autumn will be very beneficial to such persons. They ought likewise to live with the greatest regularity, avoiding strong liquor, and every thing of a heating quality. Above all, let them avoid the night-air and late studies +.

CHAP. XXVIII.

OF THE QUINSEY, OR INFLAMMA-TION OF THE THROAT.

T H I S difeafe is very common in Britain, and is frequently attended with great danger. It prevails in the winter and fpring, and is most fatal to young people of a fanguine temperament.

CAUSES.——In general it proceeds from the fame caufes as other inflammatory diforders, viz. an obfructed perfpiration, or whatever heats or inflames the blood. An inflammation of the throat is often occafioned by omitting fome part of the covering ufually worn about the neck, by drinking cold liquor when the body is warm, by riding or walking againft a cold northerly wind, or any thing that

* Any foreign body lodged in the eye may be expeditioufly removed by paffing a fmall hair pencil between the eye-lid and the ball of the eye. In fome places, the peafants do this very effectually, by using their tongue in the fame manner.

+ As most people are fond of using eye-waters and ointments in this and other difeases of the eyes, we have inferted some of the most approved forms of these medicines in the Appendix. See Appendix, *Eye-water* and *Eye-falve*.

greatly

INFLAMMATION of the THROAT. 265

greatly cools the throat, and parts adjacent. It may likewife proceed from the neglect of bleeding, purging, or any cultomary evacuation.

Singing, fpeaking loud and long, or whatever ftrains the throat, may likewife caufe an inflammation of that organ. I have often known the quinfey prove fatal to jovial companions, who, after fitting long in a warm room, drinking hot liquors, and finging with vehemence, were fo imprudent as to go abroad in the cold night-air. Sitting with wet feet, or keeping on wet clothes, are very apt to occafion this malady. It is likewife frequently occafioned by continuing long in a moift place, fitting near an open window, fleeping in a damp bed, fitting in a room that has been newly plaftered, &c. I know people who never fail to have a fore throat if they fit even but a fhort time in a room that has been lately wafhed.

Acrid or irritating food may likewife inflame the throat, and occafion a quinfey. It may alfo proceed from bones, pins, or other fharp fubstances flicking in the throat, or from the caustic fumes of metals or minerals, as arfenic, antimony, &c. taken in by the breath. This difease is fometimes epidemic and infectious.

SYMPTOMS.—The inflammation of the throat is evident from infpection, the parts appearing red and fwelled; befides, the patient complains of pain in fwallowing. His pulfe is quick and hard, with other fymptoms of a fever. If blood be let, it is generally covered with a tough coat of a whitifh colour, and the patient fpits' a tough phlegm. As the fwelling and inflammation increafe, the breathing and fwallowing become more difficult; the pain affects the ears; the eyes generally appear red; and the face fwells. The patient is often obliged to keep himfelf in an erect pofture, being in danger of fuffocation; there is a conftant naufea, or inclination to vomit. vomit, and the drink, inflead of paffing into the fomach, is often returned by the noie. The patient is fometimes flaved at laft, merely from an inability to fwallow any kind of food.

When the breathing is laborious with ftraitnefs of the breaft, and anxiety, the danger is great. Though the pain in fwallowing be very great, yet while the patient breathes eafy, there is not fo much danger. An external fwelling is no unfavourable fymptom; but if it fuddenly falls, and the difeafe affects the breaft, the danger is very great. When a quinfey is the confequence of fome other difeafe, which has already weakened the patient, his fituation is dangerous. A frothing at the mouth, with a fwelled tongue, a pale, ghaftly countenance, and coldnefs of the extremities, are fatal fymptoms.

REGIMEN.——The regimen in this difeafe is in all refpects the fame as in the pleurify, or peripneumony. The food must be light, and in fmall quantity, and the drink plentiful, weak, and diluting, mixed with acids.

It is highly neceffary that the patient be kept eafy and quiet. Violent affections of the mind, or great efforts of the body, may prove fatal. He should not even attempt to speak but in a low voice. Such a degree of warmth as to promote a constant, gentle sweat, is proper. When the patient is in bed, his head ought to be railed a little higher than usual.

It is peculiarly neceffary that the neck be kept warm, for which purpole leveral folds of foft flannel may be wrapt round it. That alone will often remove a flight complaint of the throat, efpecially if applied in due time. We cannot here omit obferving the propriety of a cuftom which prevails among the peafants of Scotland. When they feel any uneafinefs of the throat, they wrap a flocking about it all night. So effectual is this remedy, that in many

INFLAMMATION of the THROAT. 267

many places it paffes for a charm, and the flocking is applied with particular ceremonies: the cuftom, however, is undoubtedly a good one, and fhould never be neglected. When the throat has been thus wrapped up all night, it muft not be exposed to the cold air through the day, but a handkerchief or a piece of flannel kept about it till the inflammation be removed.

The jelly of black currants is a medicine very much in effecem for complaints of the throat; and indeed it is of fome ufe. It fhould be almost contantly kept in the mouth, and fwallowed down leifurely. It may likewife be mixed in the patient's drink, or taken any other way. When it cannot be obtained, the jelly of red currants, or of mulberries, may be ufed in its flead.

Gargles for the throat are very beneficial. They may be made of fage-tea, with a little vinegar and honey, or by adding to half an Englith pint of the pectoral decoction two or three fpoonfuls of honey, and the fame quantity of currant jelly. This may be ufed three or four times a-day; and if the patient be troubled with tough vifcid phlegm, the gargle may be rendered more tharp and cleanfing, by adding to it a tea-fpoonful of the fpirit of *fal ammoniac*. Some recommend gargles made of a decoction of the leaves or bark of the black currant-buft, but where the jelly can be had, thefe are unneceffary.

There is no difeafe wherein the benefit of bathing the feet and legs in lukewarm water is more apparent: that practice ought therefore never to be neglected. If people were careful to keep warm, to wrap up their throats with flannel, to bathe their feet and legs in warm water, and to use a fpare diet, with diluting liquors, at the beginning of this difeafe, it would feldom proceed to a great height, or be attended with any danger; but when theie precautions cautions are neglected, and the difeafe becomes violent, more powerful medicines are neceffary.

MEDICINE.——An inflammation of the throat being a most acute and dangerous diftemper, which fometimes takes off the patient very fuddenly, it will be proper, as foon as the fymptoms appear, to bleed in the arm, or rather in the jugular vein, and to repeat the operation if circumstances require.

The body fhould likewife be kept gently open. This may either be done by giving the patient for his ordinary drink a decoction of figs and tamarinds, or fmall dofes of rhubarb and nitre, as recommended in the eryfipelas. These may be increased according to the age of the patient, and repeated till they have the defired effect.

I have often known very good effects from a bit of *fal prunel*, or purified nitre, held in the mouth, and fwallowed down as it melted. This promotes the difcharge of *faliva*, by which means it answers the end of a gargle, while at the fame time it abates the fever, by promoting the difcharge of urine, &c.

The throat ought likewife to be rubbed twice or thrice a-day with a little of the volatile liniment. This feldom fails to produce fome good effects: At the fame time the neck ought to be carefully covered with wool or flannel, to prevent the cold from penetrating the fkin, as this application renders it very tender. Many other external applications are recommended in this difeate, as a fwallow's neft, poultices made of the fungus called Jew's ears, album Græcum, &c. But as we do not look upon any of thefe to be preferable to a common poultice of bread and milk, we fhall take no farther notice of them.

Some recommend the gum-guaicum as a fpecific in this difeafe. Half a drachm of the gum in powder may

INFLAMMATION of the THROAT. 269

may be made into an electuary with the rob of elderberries, or the jelly of currants for a dole, and repeated occasionally *.

Bliftering upon the neck or behind the ears in violent inflammations of the throat is very beneficial; and in bad cafes it will be neceffary to lay a bliftering-plafter quite across the throat, fo as to reach from ear to ear. After the plafters are taken off, the parts ought to be kept running by the application of iffue ointment, till the inflammation is gone; otherwife, upon their drying up, the patient will be in danger of a relapse.

When the patient has been treated as above, a fuppuration feldom happens. This however is fometimes the cafe, in fpite of all endeavours to prevent it. When the inflammation and fwelling continue, and it is evident that a fuppuration will enfue, it ought to be promoted by drawing the fteam of warm water into the throat through a tunnel, or the like. Soft poultices ought likewife to be applied outwardly, and the patient may keep a roafted fig conftantly in his mouth.

It fometimes happens, before the tumour breaks, that the fwelling is fo great, as entirely to prevent any thing from getting down into the flomach. In this cafe the patient muft inevitably perifh, unlefs he can be fupported in fome other way. This can only be done by nourifhing clyfters of broth, or gruel with milk, &c. Patients have often been fupported by thefe for feveral days, till the tumour has broke; and afterwards they have recovered.

Not only the fwallowing, but the breathing, is often prevented by the tumour. In this cafe nothing can fave the patient's life, but opening the treachea or wind-pipe. As that has been often done with fuccefs, no perfon, in fuch defperate circum

* Dr. Home.

stances,

270

ftances, ought to hefitate a moment about the operation; but as it can only be performed by a furgeon, it is not neceffary here to give any directions about it.

When a difficulty of fwallowing is not attended with an acute pain or inflammation, it is generally owing to an obstruction of the glands about the throat, and only requires that the part be kept warm, and the throat frequently gargled with fomething that may gently ftimulate the glands, as a decoction of figs with vinegar and honey; to which may be added a little multard, or a fmall quantity of fpirits. But this gargle is never to be used where there are figns of an inflammation. This fpecies of angina has various names among the common people, as the pap of the throat, the falling down of the almonds of the ears, &c. Accordingly, to remove it, they lift the patient up by the hair of the head, and thruft their fingers under his jaws, &c. all which practices are at beft useles, and often hurtful.

Those who are subject to inflammations of the throat, in order to avoid that difeafe, ought to live temperate. Such as do not choose to observe this rule, must have frequent recourse to purging and other evacuations, to discharge the superfluous humours. They ought likewife to beware of catching cold, and fhould abitain from aliment and medicines of an aftringent or flimulating nature.

Violent exercife, by increasing the motion and force of the blood, is apt to occasion an inflammation of the throat, especially if cold liquor be drank immediately after it, or the body fuffered fuddenly to cool. Those who would avoid this difease ought therefore, after speaking aloud, fing-ing, running, drinking warm liquor, or doing any thing that may firain the throat, or increase the circulation of the blood towards it, to take care to cool

Of the MALIGNANT QUINSEY, &c. 271

cool gradually, and to wrap fome additional covering about their necks.

I have often known perfons who had been fubject to fore throats, entirely freed from that complaint by only wearing a ribband, or a bit of flannel, conftantly about their necks, or by wearing thicker fhoes, a flannel waiftcoat, or the like. Thefe may feem triffing, but they have great effect. There is danger indeed in leaving them off after perfons have been accuftomed to them; but furely the inconveniency of using fuch things for life, is not to be compared with the danger which may attend the neglect of them.

Sometimes, after an inflammation, the glands of the throat continue fwelled, and become hard and callous. This complaint is not eafily removed, and is often rendered dangerous by the too frequent application of ftrong ftimulating and ftyptic medicines. The beft method is to keep it warm; and to gargle it twice a-day with a decoction of figs fharpened a little with the elixir or fpirit of vitriol.

OF THE MALIGNANT QUINSEY, or PUTRID, ULCEROUS SORE THROAT.

This kind of quinfey is but little known in the northern parts of Britain, though, for fome time paft, it has been fatal in the more fouthern counties. Children are more liable to it than adults, females than males, and the delicate than those who are hardy and robuft. It prevails chiefly in autumn, and is most frequent after a long course of damp or fultry weather.

CAUSES.—This is evidently a contagious diftemper, and is generally communicated by infection. Whole families, and even entire villages, often

272 Of the MALIGNANT QUINSEY, or

often receive the infection from one perfon. This ought to put people upon their guard againft going near fuch patients as labour under the diforder; as by that means they endanger not only their own lives, but likewife thofe of their friends and connexions. Whatever tends to produce putrid or malignant fevers, may likewife occafion the putrid ulcerous fore throat, as unwholefome air, damaged provifions, neglect of cleanlinefs, &c.

SYMPTOMS.----It begins with alternate fits of thivering and heat. The pulse is quick, but low and unequal, and generally continues fo through the whole course of the disease. The patient complains greatly of weakness and oppression of the breast; his spirits are low, and he is apt to faint away when fet upright; he is troubled with a naufea, and often with a vomiting or purging. The two latter are most common in children. The eves appear red and watery, and the face fwells. The urine is at first pale and crude; but, as the difeafe advances, it turns more of a yellowish colour. The tongue is white, and generally moift, which diftinguilhes this from an inflammatory difeafe. Upon looking into the throat it appears fwelled, and of a florid red colour. Pale or afh-coloured fpots, however, are here and there interspersed, and sometimes one broad patch or fpot, of an irregular figure, and pale white colour, furrounded with florid red. only appears. These whitish spots or floughs cover fo many ulcers.

An efflorescence, or eruption upon the neck, arms, breast, and fingers, about the second or third day, is a common symptom of this disease. When it appears, the purging and vomiting generally cease.

There is often a flight degree of delirium, and the face frequently appears bloated, and the infide of the noftrils red and inflamed. The patient complains

PUTRID ULCEROUS SORE THROAT. 273

plains of a difagreeable purtid fmell, and his breath is very offenfive.

The putrid, ulcerous fore throat may be diffinguifhed from the inflammatory, by the vomiting and oofenefs with which it is generally ufhered in; the foul ulcers in the throat covered with a white or livid coat; and by the exceflive weaknefs of the patient; with other fymptoms of a putrid fever.

Unfavourable fymptoms are, an obftinate purging, extreme weaknefs, dimnefs of the fight, a livid or black colour of the fpots, and frequent fhiverings, with a weak, fluttering pulfe. If the eruption upon the fkin fuddenly difappears, or becomes of a livid colour, with a difcharge of blood from the nofe or mouth, the danger is very great.

If a gentle fweat break out about the third or fourth day, and continue with a flow, firm, and equal pulfe; if the floughs caft off in a kindly manner, and appear clean and florid at the bottom; and if the breathing is foft and free, with a lively colour of the eyes, there is reason to hope for a falutary crifis.

REGIMEN.——The patient must be kept quiet, and for the most part in bed, as he will be apt to faint when taken out of it. His food must be nourishing and reftorative; as fago-gruel with red wine, jellies, ftrong broths, &c. His drink ought to be generous, and of an antifeptic quality; as red wine negus, white-wine whey, and fuch like.

MEDICINE.——The medicine in this kind of quinfey is entirely different from that which is proper in the inflammatory. All evacuations, as bleeding, purging, &c. which weaken the patient, muft be avoided. Cooling medicines, as nitre and cream of tartar, are likewife hurtful. Strengthening cordials alone can be ufed with fafety; and these ought never to be neglected.

274 Of the MALIGNANT QUINSEY, or

If at the beginning there is a great naulea, or inclination to vomit, the patient must drink an infusion of green tea, camomile flowers, or carduus benediclus, in order to cleanse the ftomach. If these are not fufficient, he may take a few grains of the powder of ipecacuanha, or any other gentle vomit.

If the difeafe is mild, the throat may be gargled with an infusion of fage and rofe leaves, to a gill of which may be added a spoonful or two of honey; and as much vinegar as will make it agreeably acid a but when the fymptoms are urgent, the floughs large and thick, and the breath very offenfive, the following gargle may be used:

To fix or feven ounces of the pectoral decoction, when boiling, add half an ounce of contrayervaroot; let it boil for some time, and afterwards frain the liquor; to which add two ounces of whitewine vinegar, an ounce of fine honey, and an ounce of the tincture of myrrh. This ought not only to be used as a gargle, but a little of it should frequently be injected with a fyringe to clean the throat, before the patient takes any meat or drink, This method is peculiarly neceffary for children, who cannot use a gargle,

It will be of great benefit if the patient frequently receives into his mouth, through an inverted funnel, the fleams of warm vinegar, myrrh, and honey.

But when the putrid fymptoms run high, and the difeafe is attended with danger, the only medicine that can be depended upon is the Peruvian bark. It may be taken in fubstance, if the patient's ftomach will bear it. If not, an ounce of bark grossly powdered, with two drachms of Virginian inake-root, may be boiled in an English pint and a half of water to half a pint; to which a tea-fpoonful

PUTRID ULCEROUS SORE THROAT. 275

ful of the elixir of vitriol may be added, and an ordinary tea-cupful of it taken every three or four hours. Bliftering-plafters are very beneficial in this difeafe, efpecially when the patient's pulfe and fpirits are low. They may be applied to the throat, behind the ears, or upon the back part of the neck.

Should the vomiting prove troublefome, it will be proper to give the patient two table fpoonfuls of the faline julep every hour. Tea made of mint and a little cinnamon will be very proper for his ordinary drink, efpecially if an equal quantity of red-wine be mixed with it.

In cafe of a violent loofenels, the fize of a nutmeg of *diafcordium*, or the japonic confection, may be taken two or three times a-day, or oftener if neceffary.

If a difcharge of blood from the nofe happens, the fteams of warm vinegar may be received up the noftrils frequently; and the drink muft be fharpened with fpirits of vitricl, or tincture of rofes.

In cafe of a ftrangury, the belly must be fomented with warm water, and emollient clysters given three or four times a-day.

After the violence of the difeafe is over, the body fhould fill be kept open with mild purgatives; as manna, fenna, rhubarb, or the like.

If great weaknefs and dejection of fpirits, of night-iweats, with other fymptoms of a confumption, fhould enfue, we would advife the patient to continue the ufe of the Peruvian bark, with the elixir of vitriol, and to take frequently a glafs of generous wine. Thefe, together with a milk diet, and riding on horfeback, are the most likely means for recovering his ftrength.

[276]

CHAP. XXIX.

OF COLDS AND COUGHS.

T has already been observed, that colds are the Thas already been observed, the com-effect of an obstructed perfpiration; the common caufes of which we have likewife endeavoured to point out, and shall not here repeat them. Neither shall we spend time in enumerating all the various fymptoms of colds, as they are pretty generally known. It may not however be amifs to observe, that almost every cold is a kind of fever, which only differs in degree from fome of those that have already been treated of.

No age, fex, or conftitution, is exempted from this difeafe; neither is it in the power of any medicine or regimen to prevent it. The inhabitants of every elimate are liable to catch cold, nor can even the greateft circumfpection defend them at all times from its attacks. Indeed, if the human body could be kept conftantly in an uniform degree of warmth, fuch a thing as catching cold would be impoffible: but as that cannot be effected by any means, the perspiration must be liable to many changes. Such changes, however, when fmall, do not affect the health; but, when great, they must prove hurtful.

When oppression of the breast, a stuffing of the nole, unufual wearinefs, pain of the head, &c. give ground to believe that the perfpiration is obstructed, or, in other words, that the perfon has caught cold, he ought immediately to leffen his diet, at leaft the ufual quantity of his folid food, and to abstain from all strong liquors. Instead of flesh, fish, eggs, milk.

OF COLDS AND COUGHS. 277

milk, and other nourishing diet, he may eat light bread-pudding, veal or chicken broth, panado, gruels, and fuch like. His drink may be watergruel fweetened with a little honey; an infufion of balm, or linfeed fharpened with the juice of orange or lemon; a decoction of barley and liquorice, with tamarinds, or any other cool, diluting, acid liquor.

Above all, his fupper fhould be light; as fmall poffet, or water-gruel fweetened with honey, and a little toafted bread in it. If honey should difagree with the ftomach, the gruel may be fweetened with treacle or coarfe fugar, and fharpened with the jelly of currants. Those who have been accustomed to generous liquors may take wine-whey inftead of gruel, which may be fweetened as above.

The patient ought to lie longer than ufual a-bed, and to encourage a gentle fweat, which is eafily brought on towards morning, by drinking tea, or any kind of warm diluting liquor. I have often known this practice carry off a cold in one day, which, in all probability, had it been neglected, would have coft the patient his life, or have con-fined him for fome months. Would people facrifice a little time to eafe and warmth, and practife a moderate degree of abstinence when the first fymptoms of a cold appear, we have reafon to believe that most of the bad effects which flow from an obstructed perspiration might be prevented. But, after the difease has gathered ftrength by delay, all attempts to remove it often prove vain. A pleurify, a peripneumony, or a fatal confumption of the lungs, are the common effects of colds which have either been totally neglected or treated improperly.

Many attempt to cure a cold, by getting drunk : but this, to fay no worfe of it, is a very hazardous experiment, No doubt it may fometimes fucceed, by

T 3

278 OF COLDS AND COUGHS.

by fuddenly reftoring the perspiration; but when there is any degree of inflammation, which is frequently the cafe, ftrong liquors, instead of removing the malady, will increase it. By this means a common cold may be converted into an inflammatory fever.

When those who labour for their daily bread have the misfortune to catch cold, they cannot afford to loofe a day or two, in order to keep themfelves warm, and take a little medicine; by which means the diforder is often fo aggravated as to confine them for a long time, or even to render them ever after unable to fustain hard labour. But even fuch of the labouring poor as can afford to take care of themselves, are often too hardy to do it; they affect to defpife colds, and as long as they can crawl about, fcorn to be confined by what they call a common cold. Hence it is, that colds deftroy fuch numbers of mankind. Like an enemy defpifed, they gather strength from delay, till at length they become invincible. We often fee this verified in travellers, who, rather than lofe a day in the profecution of their bufinefs, throw away their lives by purfuing their journey, even in the feverest weather, with this disease upon them.

It is certain, however, that colds may be too much indulged. When a perfon, for every flight cold, fhuts himfelf up in a warm room, and drinks great quantities of warm liquor, it may occafion fuch a general relaxation of the folids as will not be eafily removed. It will therefore be proper, when the difeafe will permit, and the weather is mild, to join to the regimen mentioned above gentle exercife; as walking, riding on horfeback, or in a carriage, &cc. An obflinate cold, which no medicine can remove, will yield to gentle exercife and a proper regimen of the diet,

OF COLDS AND COUGHS. 279

Bathing the feet and legs in warm water has a great tendency to reftore the perfpiration. But care muft be taken that the water be not too warm, otherwife it will do hurt. It fhould never be much warmer than the blood, and the patient fhould go immediately to bed after ufing it. Bathing the feet in warm water, lying in bed, and drinking warm water-gruel, or other weak liquors, will fooner take off a fpafin, and reftore the perfpiration, than all the hot fudorific medicines in the world. This is all that is neceffary for removing a common cold; and if this courfe be taken at the beginning, it will feldom fail.

But when the fymptoms do not yield to abflinence, warmth, and diluting liquors, there is reafon to fear the approach of fome other difeafe, as an inflammation of the breaft, an ardent fever, or the like. If the pulfe therefore be hard and frequent, the fkin hot and dry, and the patient complains of his head or breaft, it will be neceffary to bleed, and to give the cooling powders recommended in the fcarlet fever, every three or four hours, till they give a ftool.

It will likewife be proper to put a blifteringplafter on the back, to give two table-fpoonfuls of the faline mixture every two hours, and in fhort to treat the patient in all refpects as for a flight fever. I have often feen this courfe, when obferved at the beginning, remove the complaint in two or three days, when the patient had all the fymptoms of an approaching ardent fever, or an inflammation of the breaft.

The chief fecret of preventing colds lies in avoiding, as far as possible, all extremes either of heat or cold, and in taking care, when the body is heated, to let it cool gradually. These and other circumstances relating to this important fubject, T 4

are fo fully treated of under the article Obstructed Perspiration, that it is needless here to refume the confideration of them.

OF A COMMON COUGH.

A COUGH is generally the effect of a cold, which has either been improperly treated, or entirely neglected. When it proves obftinate, there is always reafon to fear the confequences, as this fhews a weak ftate of the lungs, and is often the forerunner of a confumption.

If the cough be violent, and the patient young and ftrong, with a hard quick pulfe, bleeding will be proper; but in weak and relaxed habits, bleeding rather prolongs the difeafe. When the patient fpits freely, bleeding is unneceffary, and fometimes hurtful, as it tends to leffen that difcharge.

When the cough is not attended with any degree of fever, and the fpittle is vifcid and tough, fharp pectoral medicines are to be adminiftered; as gumammoniac, fquills, &c. Two table-fpoonfuls of the folution of gum-ammoniac may be taken three or four times a-day, more or lefs, according to the age and confitution of the patient. Squills may be given various ways: two ounces of the vinegar, the oxymel, or the fyrup, may be mixed with the fame quantity of fimple cinnamon-water, to which may be added an ounce of common water and an ounce of balfamic fyrup. Two table-fpoonfuls of this mixture may be taken three or four times a-day.

A fyrup made of equal parts of lemon-juice, honey, and fugar-candy, is likewile very proper in this kind of cough. A table-spoonful of it may be taken at pleafure.

But when the defluxion is fharp and thin, thefe medicines rather do hurt. In this cafe gentle opiates,

oils,

oils, and mucilages, are more proper. A cup of an infufion of wild poppey leaves, and marfh-mallow roots, or the flowers of colts-foot, may be taken frequently; or a tea-fpoonful of the paregoric elixir may be put into the patient's drink twice a-day. Fuller's Spanifh infufion is also a very proper medicine in this cafe, and may be taken in the quantity of a tea-cupful three or four times a-day *.

When a cough is occalioned by acrid humours tickling the throat and *fauces*, the patient fhould keep fome foft pectoral lozenges almost constantly in his mouth, as the Pontefract liquorice cakes, barley-fugar, the common balfamic lozenges, Spanish juice, &c. Thefe blunt the acrimony of the humours, and by taking off their ftimulating quality, help to appeale the cough +.

In oblitinate coughs, proceeding from a flux of humours upon the lungs, it will often be neceffary, befides expectorating medicines, to have recourfe to iffues, fetons, or fome other drain. In this cafe I have often obferved the moft happy effects from a Burgundy-pitch plafter applied between the fhoulders. I have ordered this fimple remedy in the moft obfinate coughs, in a great number of cafes, and in many different conflictutions, without ever knowing it fail to give relief, unlefs where there were evident figns of an ulcer in the lungs.

About the bulk of a nutmeg of Burgundy-pitch may be fpread thin upon a piece of foft leather, about

* See Appendix, Spanifs Infusion.

+ In a former edition of this book I recommended, for an obfinate tickling cough, an oily emulion, made with the paregoric elixir of the Edinburgh Difpenfatory, inftead of the common alkaline fpirit. I have fince been told by feveral practitioners, that they found it to be an excellent medicine in this diforder, and every way deferving of the character which I had given it. Where this elixir is not kept, its place may be fupplied by adding to the common oily emultion, an adequate proportion of the *Thebaic tindure*, or liquid laudanum.

the fize of the hand, and laid between the fhoulderblades. It may be taken off and wiped every three or four days, and ought to be renewed once a fortnight or three weeks. This is indeed a cheap and fimple medicine, and confequently apt to be defpifed; but we will venture to affirm, that the whole materiae inedica does not afford an application more efficacious in almoft every kind of cough. It has not indeed always an immediate.effect; but, if kept on for fome time, it will fucceed where moft other medieines fail.

The only inconveniency attending this platter is the itching which it occasions; but furely this may be dispensed with, confidering the advantage which the patient may expect to reap from the application; besides, when the itching becomes very uneasy the platter may be taken off, and the part rubbed with a dry cloth, or washed with a little warm milk and water. Some caution indeed is necessfary in discontinuing the use of such a plaster; this however may be fafely done by making it states by degrees, and at length quitting it altogether in a warm leason*.

But coughs proceed from many other caufes befides defluxions upon the lungs. In these cases the cure is not to be attempted by pectoral medicines. Thus, in a cough proceeding from a foulness and debility of the stomach, fyrups, oils, mucilages, and all kinds of balfamic medicines do hurt. The *flomach cough* may be known from one that is owing to a fault in the lungs by this, that in the latter the patient coughs whenever he infpires, or draws

* Some complain that the pitch plafter adheres too faft, while others find difficulty in keeping it on. This proceeds from the difficient kinds of pitch made ufe of, and likewife from the manner of making it. I generally find it answer beft when mixed with a little bees-wax, and fpread as cool as possible. The clear, hards transparent pitch answers the purpose beft.

in his breath fully; but in the former that does not happen.

The cure of this cough depends chiefly upon cleanfing and ftrengthening the ftomach; for which purpole gentle vomits and bitter purgatives are most proper. Thus, after a vomit or two, the facred tincture, as it is called, may be taken for a confiderable time in the dole of one or two table-spoonfuls twice a-day, or as often as it is found neceffary, to keep the body gently open. People may make this tincture themselves, by infusing an ounce of *biera picra** in an English pint of white wine, letting it ftand a few days, and then ftraining it.

In coughs which proceed from a debility of the ftomach, the Peruvian bark is likewife of confiderable fervice. It may either be chewed, taken in powder, or made into a tincture along with other ftomachic bitters.

A nervous cougb can only be removed by change of air and proper exercife; to which may be added the use of gentle opiates. Instead of the faponaceous pill, the paregoric elixir, &c. which are only opium difguided, ten, fifteen, twenty, or twenty-five drops of liquid laudanum, more or lefs, as circumstances require, may be taken at bed-time, or when the cough is most troublefome. Immerfing the feet and hands in warm water will often appeale the violence of a nervous cough.

When a cough is only the fymptom of fome other malady, it is in vain to attempt to remove it without first curing the difeafe from which it proceeds. Thus, when a cough is occasioned by *teetbing*, keeping the body open, fcarifying the gums, or whatever facilitates the cutting of the teeth, likewife appeafes the cough. In like manner, when *worms* occasion a cough, fuch medicines as remove these vermin will generally

* See Appendix, Hiera Picra.

cure

284 OF THE HOOPING-COUGH,

cure the cough; as bitter purgatives, oily clyfters, and fuch like.

Women, during the laft months of pregnancy, are often greatly afflicted with a cough, which is generally relieved by bleeding, and keeping the body gently open. They ought to avoid all flatulent food, and to wear a loofe eafy drefs.

A cough is not only a fymptom, but is often likewife the forerunner of difeafes. Thus, the gout is frequently ufhered in by a very troublefome cough, which affects the patient for fome days before the coming on of the fit. This cough is generally removed by a paroxy fm of the gout, which fhould therefore be promoted, by keeping the extremities warm, drinking warm liquors, and bathing the feet and legs frequently in lukewarm water.

OF THE HOOPING-COUGH, OR CHIN-COUGH.

THIS cough feldom affects adults, but proves often fatal to children. Such children as live upon thin watery diet, who breathe unwholefome air, and have too little exercife, are most liable to this difeafe, and generally fuffer most from it.

The chin-cough is fo well known, even to nurfes, that a defcription of it is unneceffary. Whatever hurts the digeftion, obftructs the perfpiration, or relaxes the folids, difpofes to this difeafe; confequently its cure must depend upon cleansing and strengthening the stomach, bracing the folids, and at the same time promoting perfpiration and the different secretions.

The diet must be light, and of eafy digestion, for children, good bread made into pap or pudding, chicken broth, with other light spoon meats, are proper; but those who are farther advanced may be allowed sago-gruel, and if the fever be not high, a little little boiled chicken, or other white meats. The drink may be hyffop, or penny-royal tea, fweetened with honey or fugar-candy, fmall wine-whey; or if the patient be weak, he may fometimes be allowed a little negus.

One of the moft effectual remedies in the chincough is change of air. This often removes the malady, even when the change feems to be from a purer to a lefs wholefome air. This may in fome meafure depend on the patient's being removed from the place where the infection prevails. Moft of the difeafes of children are infectious; nor is it at all uncommon to find the chin-cough prevailing in one town or village, when another, at a very fmall diftance, is quite free from it. But whatever be the caufe, we are fure of the fact. No time ought therefore to be loft in removing the patient at fome diftance from the place where he caught the difeafe, and, if poffible, into a more pure and warm air *.

When the difeafe proves violent, and the patient is in danger of being fuffocated by the cough, he ought to be bled, efpecially if there be a fever with a hard full pulfe. But as the chief intention of bleeding is to prevent an inflammation of the lungs, and to render it more fafe to give vomits, it will feldom be neceffary to repeat the operation; yet if there are fymptoms of an inflammation of the lungs, a fecond or even a third bleeding may be requifite.

It is generally reckoned a favourable fymptom when a fit of coughing makes the patient vomit. This cleanles the fromach, and greatly relieves the

* Some think the air ought not to be changed till the difeafe is on the decline; but there feems to be no fufficient reafon for this opinion, as patients have been known to reap benefit from a change of air at all periods of the difeafe. It is not fufficient to take the patient out daily in a carriage. This feldom anfwers any good purpofe; but often does hurt, by giving him cold,

cough.

286 OF THE HOOPING-COUGH,

cough. It will therefore be proper to promote this difcharge, either by fmall dofes of ipecacuanha, or the vomiting julep recommended in the Appendix *.

It is very difficult to make children drink after a vomit. I have often feen them happily deceived, by infufing a fcruple or half a drachm of the powder of ipecacuanha in a tea-pot, with half an English pint of boiling water. If this be disguifed with a few drops of milk and a little fugar, they will imagine it tea, and drink it very greedily. A fmall tea-cupful of this may be given every quarter of an hour, or rather every ten minutes, till it operates. When the child begins to puke, there will be no occasion for drinking any more, as the water already on the stomach will be fufficient.

Vomits not only cleanfe the ftomach, which in this difeafe is generally loaded with vifcid phlegm, but they likewife promote the perfpiration and other fecretions, and ought therefore to be repeated according to the obfinacy of the difeafe. They fhould not however be ftrong; gentle vomits frequently repeated are both lefs dangerous, and more beneficial than ftrong ones.

The body ought to be kept gently open. The beft medicines for this purpofe are rhubarb and its preparations, as the fyrup, tincture, &c. Of thefe a teafpoonful or two may be given to an infant twice or thrice a-day, as there is occafion. To fuch as are farther advanced, the dofe muft be proportionally increafed, and repeated till it has the defired effect. Thofe who cannot be brought to take the bitter tincture, may have an infufion of fenna and prunes, fweetened with manna, coarfe fugar, or honey; or a few grains of rhubarb mixed with a tea-fpoonful or two of fyrup, or currant jelly, fo as to difguife the

* See Appendix, Vomiting Julep.

taftei

raffe. Most children are fond of fyrups and jellies, and feldom refuse even a difagreeable medicine when mixed with them.

Many people believe that oily, pectoral, and balfamic medicines poffers wonderful virtues for the cure of the chin-cough, and accordingly exhibit them plentifully to patients of every age and conftitution, without confidering that every thing of this nature muft load the ftomach, hurt the digeftion, and of courfe aggravate the diforder *.

The millepedes, or wood-lice, are greatly recommended for the cure of a chin-cough. Those who choose to make use of these infects, may infuse two ounces of them bruised in an English pint of fmall white-wine for one night. Afterwards the liquor may be strained through a cloth, and a tablespoonful of it given to the patient three or four times a-day.

Opiates are fometimes neceffary to allay the violence of the cough. For this purpole a little of the fyrup of poppies, or five, fix, or feven drops of laudanum, according to the age of the patient, may be taken in a cup of hyffop or penny-royal tea, and repeated occafionally +.

The garlic ointment is a well-known remedy in North-Britain for the chin-cough. It is made by beating in a mortar garlic with an equal quantity of hogs lard. With this the foles of the feet may

* Dr. DUPLANIL fays, he has feen many good effects from the kermes mineral in this complaint, the cough being frequently alleviated even by the first dofe. The dofe for a child of one year old, is a quarter of a grain diffolved in a cup of any liquid, repeated two or three times a-day. For a child of two years, the dofe is half a grain; and the quantity must be thus increased in proportion to the age of the patient.

† Some recommend the extract of hemlock as an extraordinary remedy in the hooping-cough; but fo far as I have been able to obferve, it is no way fuperior to opium, which, when properly adminiltered, will often relieve fome of the most troublefome fymptoms of this diforder,

288 OF THE HOOPING-COUGH, &c.

be rubbed twice or thrice a-day; but the beft method is to fpread it upon a rag, and apply it in the form of plafter. It fhould be renewed every night and morning at leaft, as the garlic foon lofes its virtue. This is an exceeding good medicine both in the chin-cough, and in moft other coughs of an obflinate nature. It ought not however to be ufed when the patient is very hot or feverifh, left it fhould increafe thefe fymptoms.

The feet fhould be bathed once every two or three days in lukewarm water; and a Burgundypitch plafter kept conftantly between the fhoulders. But when the difeafe proves very violent, it will be neceffary, inftead of it, to apply a bliftering-plafter, and to keep the part open for fome time with iffueointment.

When the difease is prolonged, and the patient is free from a fever, the Peruvian bark, and other bitters, are the most proper medicines. The bark may either be taken in fubstance, or in a decoction or infusion, as is most agreeable. For a child, ten, fifteen, or twenty grains, according to the age of the patient, may be given three or four times aday. For an adult, half a drachm or two fcruples. will be proper. Some give the extract of the bark with cantharides; but to manage this requires a confiderable attention. It is more fafe to give a few grains of caftor along with the bark. A child of fix or feven years of age may take feven or eight grains of caftor, with fifteen grains of powdered bark, for a dose. This may be made into a mixture with two or three ounces of any fimple diffilled water, and a little fyrup, and taken three or four times a-day.

* As this difeafe is evidently spafmodic, I am inclined to think that tonic medicines will in time be found the most proper for its cure.

[289]

CHAP, XXX.

INFLAMMATION OF THE STOMACH, AND OTHER VISCERA.

A L L inflammations of the bowels are dangerous, and require the most speedy affiftance, as they frequently end in a suppuration, and sometimes in a mortification, which is certain death.

CAUSES. An inflammation of the flomach may proceed from any of the caufes which produce an inflammatory fever; as cold liquor drank while the body is warm, obftructed perfpiration, or the fudden ftriking in of any eruption. It may likewife proceed from the acrimony of the bile, or from acrid and firmulating fubftances taken into the ftomach; as ftrong vomits or purges, corrofive poifons, and fuch like. When the gout has been repelled from the extremities, either by cold or improper applications, it often occafions an inflammation of the ftomach. Hard or indigeftible fubftances taken into the ftomach, as bones, the ftones of fruits, &c. may likewife have that effect.

SYMPTOMS.—It is attended with a fixed pain and burning heat in the ftomach; great reftleffnefs and anxiety; a fmall, quick, and hard pulfe; vomiting, or, at leaft, a naufea and ficknefs; exceffive thirft; coldnefs of the extremities; difficulty of breathing; cold clammy fweats; and fometimes convulfions and fainting fits. The ftomach is fwelled, and often feels hard to the touch. One of the most certain figns of this difeafe is the fenfe of pain, which the patient feels upon taking U any

290 INFLAMMATION of the STOMACH, &c.

any kind of food or drink, especially if it be either too hot or too cold.

When the patient vomits every thing he eats or drinks, is extremely reftlefs, has a hiccup, with an intermitting pulfe, and frequent fainting fits, the danger is very great.

REGIMEN.——All acrimonious, heating, and irritating food and drink are carefully to be avoided. The weaknefs of the patient may deceive the byflanders, and induce them to give him wines, fpirits, or other cordials; but thefe never fail to increafe the difeafe, and often occafion fudden death. The inclination to vomit may likewife impofe on the attendants, and make them think a vomit neceffary; but that too is almoft certain death.

The food must be light, thin, cool, and eafy of digeftion. It must be given in fmall quantities, and should neither be quite cold nor too hot. Thin gruel made of barley or oatmeal, light toasted bread diffolved in boiling water, or very weak chicken broth, are the most proper. The drink should be clear whey, barley-water, water in which toasted bread has been boiled, or decostions of emollient vegetables, as liquorice and marsh-mallow roots, farfaparilla, or the like.

MEDICINE.—Bleeding in this difeafe is abfolutely neceffary, and is almost the only thing that can be depended on. When the difeafe proves obstinate, it will often be proper to repeat this operation feveral times, nor must the low state of the pulle deter us from doing fo. The pulle indeed generally rifes upon bleeding, and as long as that is the cafe, the operation is f.fe.

Frequent fomentations with lukewarm water, or a decoction of emollient vegetables, are likewife beneficial. Flannel cloths dipped in these must be applied to the region of the stomach, and removed as they grow cool. They must neither be applied too warm,

warm, nor be fuffered to continue till they become quite cold, as either of thefe extremes would aggravate the difeafe.

The feet and legs ought likewife to be frequently bathed in lukewarm water, and warm bricks or poultices may be applied to the foles of the feet. The warm bath, if it can be conveniently ufed, will be of great fervice.

In this, and all other inflammations of the bowels, an epifpaftic, or bliftering plafter, applied over the part affected, is one of the beft remedies I know. I have often ufed it, and do not recollect one inflance wherein it did not give relief to the patient.

The only internal medicines which we fhall venture to recommend in this difeafe, are mild clyfters. Thefe may be made of warm water, or thin watergruel; and if the patient is coffive, a little fweet oil, honey, or manna, may be added. Clyfters anfwer the purpole of an internal fomentation, while they keep the body open, and at the fame time nourifh the patient, who is often in this difeafe unable to retain any food upon his ftomach. For thefe reafons they muft not be neglected, as the patient's life may depend on them.

INFLAMMATION OF THE INTESTINES.

THIS is one of the moft painful and dangerous difeafes that mankind is liable to. It generally proceeds from the fame *caufes* as the inflammation of the ftomach; to which may be added coffivenefs, worms, eating unripe fruits, or great quantities of nuts, drinking hard windy malt liquors, as ftale bottled beer or ale, four wine, cyder, &c. It may likewife be occafioned by a rupture, by fcirrhous tumours of the inteffines, or by their oppofite fides growing together.

The inflammation of the inteffines is denominated *Iliac peffion*, *Enteritis*, &c. according to the name of the parts affected. The treatment however is nearly the fame whatever part of the inteftinal canal be the feat of the difeate; we fhall therefore omit thefe distinctions, left they fhould perplex the reader.

The fymptoms here are nearly the fame as in the foregoing difeafe; only the pain, if poffible, is more acute, and is fituated lower. The vomiting is likewife more violent, and fometimes even the excrements, together with the clyfters, are difcharged by the mouth. The patient is continually belching up wind, and has often an obftruction of his urine.

While the pain fhifts and the vomiting only returns at certain intervals, and while the clyfters pafs downwards, there is ground for hope; but when the clyfters and *faces* are vomited, and the patient is exceeding weak, with a low fluttering pulfe, a pale countenance, and a diagreeable or flinking breath, there is great realon to fear that the confequences will prove fatal. Clammy fweats, black fœtid flools, with a fmall intermitting pulfe, and a total ceflation of pain, are figns of a mortification already begun, and of approaching death.

REGIMEN.— The regimen in this difeafe is in general the fame as in an inflammation of the fromach. The patient muft be kept quiet, avoiding cold, and all violent patients of the mind. His food ought to be very light, and given in fmall quantities; his drink weak and diluting; as clear whey, barleywater, and fuch like.

MEDICINE.——Bleeding in this, as well as in the inflammation of the ftomach, is of the greateft importance. It fhould be performed as foon as the fymptoms appear, and muft be repeated according

to

to the firength of the patient, and the violence of the difeafe.

A bliftering-plafter is here likewile to be applied immediately over the part where the moft violent pain is. This not only relieves the pain of the bowels, but even clyfters and purgative medicines, which before had no effect, will operate when the blifter begins to rife.

Fomentations and laxative clyfters are by no means to be omitted. The patient's fret and legs fhould frequently be bathed in warm water; and cloths dipped in it applied to his belly. Bladders filled with warm water may likewife be applied to the region of the navel, and warm bricks, or bottles filled with warm water, to the foles of the feet. The clyfters may be made of barley-water or thin gruel with falt, and foftened with fweet oil or frefh butter. These may be administered every, two or three hours, or oftener, if the patient continues coftive.

If the difeafe does not yield to clyfters and fomentations, recourfe muft be had to pretty ftrong purgatives, but as thefe, by irritating the bowels, often increase their contraction, and by that means frustrate their own intention, it will be necessary to join them with opiates, which, by allaying the pain, and relaxing the spafmodic contractions of the guts, greatly affift the operation of purgatives in this cafe.

What answers the purpole of opening the body very well, is a folution of the bitter purging falts. Two ounces of these may be diffolved in an English pint of warm water, or thin gruel, and a tea cupful of it taken every half hour till it operates. At the fame time fifteen, twenty, or twenty-five drops of laudanum may be given in a glass of peppermint or fimple cinnamon-water, to appeale the irritation, and prevent the vomiting, &cc.

U 3

Acids

Acids have often a very happy effect in ftaying the vomiting, and appealing the other violent fymptoms of this dileale. It will therefore be of ule to fharpen the patient's drink with cream of tartar, juice of lemon; or, when thele cannot be obtained, with vinegar.

But it often happens that no liquid whatever will ftay on the ftomach. In this cafe the patient muft take purging pills. I have generally found the following answer very well: Take jalap in powder, and vitriolated tartar, of each half a drachm, opium one grain, Caftile foap as much as will make the mafs fit for pills. Thefe muft be taken at one dofe, and if they do not operate in a few hours, the dofe may be repeated.

If a ftool cannot be procured by any of the above means, it will be neceffary to immerfe the patient in warm water up to the breaft. I have often feen this fucceed when other means had been tried in vain. The patient muft continue in the water as long as he can eafily bear it without fainting, and if one immerfion has not the defired effect, it may be repeated as foon as the patient's ftrength and fpirits are recruited. It is more fafe for him to go frequently into the bath, than to continue too long at a time, and it is often neceffary to repeat it feveral times before it has the defired effect.

It has fometimes happened, after all other means of procuring a flool had been tried to no purpole, that this was brought about by immerfing the patient's lower extremities in cold water, or making him walk upon a wet pavement, and dafhing his legs and thighs with the cold water. This method, when others fail, at leaft merits a trial. It is indeed attended with fome danger; but a doubtful remedy is better, than none.

In defperate cafes it is common to give quickfilver. This may be given to the quantity of feveral ounces. ounces, or even a pound, but fhould not exceed that *. When there is reafon to fulpect a mortification of the guts, this medicine ought not to be tried. In that cafe it cannot cure the patient, and will only haften his death. But when the obfruction is occafioned by any caufe that can be removed by force, quickfilver is not only a proper medicine, but the beft that can be adminifered, as it is the fitteft body we know for making its way through the inteltinal canal.

If the difeafe proceeds from a rupture, the patient must be laid with his head very low, and the intestines returned by gentle preffure with the hand. If this, with fomentations and clysters, should not fucceed, recourfe must be had to a furgical operation, which may give the patient relief.

Such as would avoid this excruciating and dangerous difeafe, muft take care never to be too long without a flool. Some who have died of it have had feveral pounds of hard dry *faces* taken out of their guts. They fhould likewile beware of eating too freely of four or unripe fruits, or drinking ftale windy liquors, &c. I have known it brought on by living too much on baked fruits, which are feldom good. It likewife proceeds frequently from cold caught by wet clothes, &c. but effecially from wet feet.

OF THE COLIC.

And Real of

THE colic has a great refemblance to the two preceding difeafes, both in its fymptoms and method of cure. It is generally attended with coftivenefs

* When quickfilver is given in too large quantities, it defeats, its own intention, as it drags down the bottom of the flomach, which prevents it getting over the Pylorus. In this cafe the patient flould be hung up by the heels, in order that the quickfilver may be difcharged by his mouth.

and

295

and acute pain of the bowels; and requires diluting diet, evacuations, fomentations, &c.

Colics are variously denominated according to their causes, as the *flatulent*, the *bilions*, the *bysteric*, the *nervous*, &c. As each of these requires a particular method of treatment, we shall point out their most general symptoms, and the means to be used for their relief.

The *flatulent*, or wind-colic, is generally occafioned by an indifferent use of unripe fruits, meats of hard digeftion, windy vegetables, fermenting liquors, and fuch like. It may likewise proceed from an obftructed perspiration, or catching cold. Delicate people, whose digeftive powers are weak, are most liable to this kind of colic.

The flatulent colic may either affect the flomach or inteftines. It is attended with a painful flretching of the affected part. The patient feels a rumbling in his guts, and is generally relieved by a difcharge of wind, either upwards or downwards. The pain is feldom confined to any particular part, as the vapour wanders from one division of the bowels to another till it finds a vent.

When the difeafe proceeds from windy liquor, green fruit, four herbs, or the like, the beft medicine on the first appearance of the fymptoms is a dram of brandy, gin, or any good spirits. The patient should likewife fit with his feet upon a warm hearth-stone, or apply warm bricks to them; and warm cloths may be applied to his stomach and bowels.

This is the only colic wherein ardent fpirits, fpiceries, or any thing of a hot nature, may be ventured upon. Nor indeed are they to be ufed here unlets at the very beginning, before any fymptoms of inflammation appear. We have reafon to believe, that a colic occafioned by wind or flatulent food might always be cured by fpirits and warm liquors,

298

liquors, if they were taken immediately upon perceiving the first uneafinefs; but when the pain has continued for a confiderable time, and there is reason to fear an inflammation of the bowels is already begun, all hot things are to be avoided as poison, and the patient is to be treated in the fame manner as for the inflammation of the intestines.

Several kinds of food, as honey, eggs, &c. occafion colics in fome particular conftitutions. I have generally found the beft method of cure for thefe was to drink plentifully of fmall diluting liquors, as watergruel, fmall poffet, water with toafted bread loaked in it, &c.

Colics which proceed from excels and indigeftion generally cure themfelves by occasioning vomiting or purging. These discharges are by no means to be stopped, but promoted by drinking plentifully of warm water, or weak posset. When their violence is over, the patient may take a dose of rhubarb, or any other gentle purge, to carry off the dregs of his debauch.

Colics which are occafioned by wet feet, or catching cold, may generally be removed at the beginning, by bathing the feet and legs in warm water, and drinking fuch warm diluting liquors as will promote the perfpiration, as weak wine-whey, or water-gruel, with a fmall quantity of fpirits in it.

- Those flatulent colics, which prevail fo much among country people, might generally be prevented were they careful to change their clothes when they get wet. They ought likewife to take a dram, or to drink fome warm liquor after eating any kind of green trafh. We do not mean to recommend the practice of dram-drinking, but in this cafe ardent fpirits prove a real medicine, and indeed the best that can be administered. A glass of good peppermint-water will have nearly the fame fame effect as a glass of brandy, and in some cases is rather to be preferred.

The *bilious* colic is attended with very acute pains about the region of the navel. The patient complains of great thirft, and is generally coffive. He vomits a hot, bitter, yellow-coloured bile, which being difcharged, feems to afford fome relief, but is quickly followed by the fame violent pain as before. As the diffemper advances, the propenfity to vomit fometimes increafes fo as to become almost continual, and the proper motion of the inteflines is fo far perverted, that there are all the fymptoms of an impending iliac paffion.

If the patient be young and ftrong, and the pulfe full and frequent, it will be proper to bleed, after which clyfters may be administered. Clear whey or gruel, fharpened with the juice of lemon, or cream of tartar, must be drank freely. Small chicken-broth, with a little manna diffolved in it, or a flight decoction of tamarinds, are likewife very proper, or any other thin, acid, opening liquor.

Befides bleeding and plentiful dilution, it will be neceffary to foment the belly with cloths dipped in warm water, and if this fhould not fucceed, the patient muft be immerfed up to the breaft in warm water.

In the bilious colic the vomiting is often very difficult to reftrain. When this happens, the patient may drink a decoction of toafted bread, or an infufion of garden-mint in boiling water. Should thefe not have the defired effect, the faline draught, with a few drops of laudanum in it, may be given, and repeated according to the urgency of the lymptoms. A fmall quantity of Venice treacle may be fpread in form of a cataplafm, and applied to the pit of the ftomach. Clyfters, with a proper quantity of Venice treacle or liquid laudanum in them, may likewife be frequently administered. The

298

The *byfteric* colic bears a great refemblance to the bilious. It is attended with acute pains about the region of the ftomach, vomiting, &c. What the patient vomits in this cafe is commonly of a greenifh colour. There is a great finking of the fpirits, with dejection of mind and difficulty of breathing, which are the characteriftic fymptoms of this diforder. Sometimes it is accompanied with the jaundice, but this generally goes off of its own accord in a few days.

In this colic all evacuations, as bleeding, purging, vomiting, &c. do hurt. Every thing that weakens the patient, or finks the fpirits, is to be avoided. If however the vomiting fhould prove violent, lukewarm water, or fmall poffer, may be drank to cleanle the ftomach. Afterwards the patient may take fifteen, twenty, or twenty-five drops of liquid laudanum in a glafs of cinnamon-water. This may be repeated every ten or twelve hours till the fymptoms abate.

The patient may likewife take four or five of the fætid pills every fix hours, and drink a cup of penny-royal tea after them. If alafoetida fhould prove difagreeable, which is fometimes the cafe, a tea-fpoonful of the tincture of caftor in a cup of pennyroyal tea, or thirty or forty drops of the balfam of Peru dropped upon a bit of loaf-fugar, may be taken in its ftead. The anti-hyfteric plafter may alfo be ufed, which has often a good effect *.

The nervous colic prevails among miners, fmelters of lead, plumbers, the manufacturers of white lead, &cc. It is very common in the cycler counties of England, and is fuppofed to be occafioned by the leaden veffels ufed in preparing that liquor. It is likewife a frequent difeafe in the Weft Indies, where it is termed the dry belly-ache.

* See Appendix, Anti-hyfieric Plaster.

No

No difeafe of the bowels is attended with more excruciating pain than this. Nor is it foon at an end. I have known it continue eight or ten days with very little intermiffion, the body all the while continuing bound in fpite of medicine, yet at length yield, and the patient recover *. It generally however leaves the patient weak, and often ends in a palfy.

The general treatment of this difeafe is fo nearly the fame with that of the iliac paffion, or inflammation of the guts, that we fhall not infift upon it. The body is to be opened by mild purgatives given in fmall dofes, and frequently repeated, and their operation muft be affifted by foft oily clyfters, fomentations, &c. The caftor oil is reckoned peculiarly proper in this difeafe. It may both be mixed with the clyfters and given by the mouth \dagger .

The Barbadoes tar is faid to be an efficacious medicine in this complaint. It may be taken to the quantity of two drachms three times a day, or oftener if the ftomach will bear it. This tar, mixed with an equal quantity of ftrong rum, is likewife proper for rubbing the fpine, in cafe any tingling, or other fymptoms of a palfy, are felt. When the tar cannot be obtained, the back may be rubbed with ftrong fpirits, or a little oil of nutmegs, or of rofemary.

If the patient remains weak and languid after this difeafe, he must take exercise on horfeback, and use an infusion of the Peruvian bark in wine. When the difease ends in a palfy, the Bath waters are found to be extremely proper.

* As the fmoke of tobacco thrown into the bowels will often procure a flool when all other means have failed, an apparatus for this purpofe ought to be kept by every furgeon. It may be purchafed at a fmall expence, and will be of fervice in feveral other cafes, as the recovery of drowned perfons, &c.

+ The dofe is from one table-fpoonful to two or three, if neceffary to open the body.

INFLAMMATION of the KIDNEYS. 301

To avoid this kind of colic, people mult fhun all four fruits, acids, and auftere liquors, &c. Thofe who work in lead ought never to go to their bufinefs fafting, and their food fhould be oily or fat. They may take a glafs of falad oil, with a little brandy or rum, every morning, but fhould never take fpirits alone. Liquid aliment is beft for them; as fat broths, &c. but low living is bad. They fhould frequently go a little out of the tainted air; and fhould never fuffer themfelves to be coftive. In the Weft Indies, and on the coaft of Guinea, it has been found of great ufe, for preventing this colic, to wear a piece of flannel round the waift, and to drink an infufion of ginger by way of tea.

Sundry other kinds of this dileafe might be mentioned, but too many diffinctions would tend only to perplex the reader. Those already mentioned are the most material, and should indeed be attended to, as their treatment is very different. But even perfons who are not in a condition to diftinguish very accurately in these matters, may neverthelefs be of great fervice to patients in colics of every kind, by only obferving the following general rules, viz. To bathe the feet and legs in warm water; to apply bladders filled with warm water, or cloths wrung out of it, to the ftomach and bowels; to make the patient drink freely of diluting mucilaginous liquors; and to give him an emollient clyfter every two or three hours. Should these not fucceed, the patient ought to be immersed in warm water.

INFLAMMATION OF THE KIDNEYS.

CAUSES.——This difeafe may proceed from any of those causes which produce an inflammatory fever.

302 INFLAMMATION of the KIDNEYS.

fever. It may likewife be occafioned by wounds or bruifes of the kidneys; fmall ftones or gravel lodging within them; by ftrong diuretic medicines; as fpirits of turpentine, tincture of cantharides, &c. Violent motion, as hard riding or walking, elpecially in hot weather, or whatever drives the blood too forcibly into the kidneys, may occafion this malady. It may likewife proceed from lying too for, too much on the back, involuntary contractions, or fpafms, in the urinary veffels, &c.

SYMPTOMS — There is a fharp pain about the region of the kidneys, with fome degree of fever, and a flupor or dull pain in the thigh of the affected fide. The urine is at firft clear, and afterwards of a reddift colour; but in the worft kind of the difface it generally continues pale, is paffed with difficulty, and commonly in fmall quantities at a time. The patient feels great uneafinefs when he endeavours to walk or fit upright. He lies with moft eafe on the affected fide, and has generally a naufea or vomiting, refembling that which happens in the colic.

This difeafe however may be diffinguished from the colic by the pain being feated farther back, and by the difficulty of paffing urine with which it is conftantly attended.

REGIMEN.—Every thing of a heating or ftimulating nature is to be avoided. The food muft be thin and light; as panado, fmall broths, with mild vegetables, and the like. Emollicnt and thin liquors muft be plentifully drank; as clear whey, or balm-tea fweetened with honey, decoctions of marfh-mallow roots, with barley and liquorice, &c. The patient, notwithftanding the vomiting, muft conftantly keep fipping fmall quantities of thefe or other diluting liquors. Nothing fo fafely and certainly abates the inflammation, and expels the obftructing caufe, as copious dilution. The patient

INFLAMMATION of the KIDNEYS. 303

patient must be kept easy, quiet, and free from cold, as long as any symptoms of inflammation remain.

MEDICINE. ——Bleeding is generally neceffary, efpecially at the beginning. Ten or twelve ounces may be let from the arm or foot with a lancet, and if the pain and inflammation continue, the operation may be repeated in twenty four hours, efpecially if the patient be of a full habit. Leeches may likewife be applied to the hæmorrhoidal veins, as a difcharge from these will greatly relieve the patient.

Cloths dipped in warm water, or bladders filled with it, muft be applied as near as possible to the part affected, and renewed as they grow cool. If the bladders be filled with a decoction of mallows and camomile flowers, to which a little faffron is added, and mixed with about a third part of new milk, it will be ftill more beneficial.

Emollient clyfters ought frequently to be adminiftered; and if these do not open the body, a little falt and honey or manna may be added to them.

The fame courfe is to be followed where gravel or ftone is lodged in the kidney, but when the gravel or ftone is feparated from the kidney, and lodges in the Ureter *, it will be proper, befides the fomentations, to rub the fmall of the back with fweet oil, and to give gentle diuretics; as juniper-water fweetened with the fyrup of marfh-mallows: a teafpoonful of the fweet fpirits of nitre, with a few drops of laudanum, may now and then be put in a cup of the patient's drink. He ought likewife to take exercife on horfeback, or in a carriage, if he be able to bear it.

* The Ureters are two long and fmall canals, one on each fide, which carry the urine from the bafon of the kidneys to the bladder. They are fometimes obfructed by fmall pieces of gravel falling down from the kidneys, and lodging in them.

When

304 INFLAMMATION of the BLADDER.

When the difeafe is protracted beyond the feventh or eighth day, and the patient complains of a flupor and heavine's of the part, has frequent returns of chillne's, fhivering, &c. there is reason to suppet that matter is forming in the kidney, and that an abscess will ensue.

When matter in the urine flews that an ulcer is already formed in the kidney, the patient must be careful to abstain from all acrid, four, and falted provifions; and to live chiefly upon mild mucilaginous herbs and fruits, together with the broth of young animals, made with barley, and common pot herbs, His drink may be whey, and butter-milk Stc. that is not four. The latter is by fome reckoned a specific remedy in ulcers of the kidneys. To anfwer this character, however, it must be drank for a confiderable time. Chalybeate waters have likewife been found beneficial in this difeafe. This medicine is eafily obtained, as it is found in every part of Great Britain, It must likewise be used for a confiderable time, in order to produce any falutary effects.

Those who are liable to frequent returns of inflammation, or obstructions of the kidneys, must abstrain from wines, especially such as abound with tartar; and their food ought to be light and of easy digestion. They should use moderate exercise, and should not lie too hot, nor too much on their back.

INFLAMMATION OF THE BLADDER.

THE inflammation of the bladder proceeds, in a great measure, from the same causes as that of the kidneys. It is known by an acute pain towards the bottom of the belly, and difficulty of passing urine, with some degree of sever, a constant inclination to go to shool, and a perpetual defire to make water.

7

This

INFLAMMATION of the LIVER.

This difeafe must be treated on the fame principles as the one immediately preceding. The diet must be light and thin, and the drink of a cooling nature. Bleeding is very proper at the beginning, and in robust conflictuions it will often be neceffary to repeat it. The lower part of the belly should be fomented with warm water, or a decoction of mild vegetables; and emollient clysters ought frequently to be administered, &c.

The patient fhould abftain from every thing that is of a hot, acrid, and ftimulating quality, and fhould live entirely upon fmall broths, gruels, or mild vegetables.

A stoppage of urine may proceed from other caufes befides an inflammation of the bladder; as a fwelling of the hæmorrhoidal veins; hard fæces lodged in the rettum; a ftone in the bladder; excre-Icences in the urinary paffages, a pally of the bladder, hysteric affections, &c. Each of these requires a particular treatment, which does not fall under our prefent confideration. We shall only observe, that in all of them mild and gentle applications are the fafeft, as ftrong diuretic medicines, or things of an irritating nature, generally increase the danger. I have known fome perfons kill themfelves by introducing probes into the urinary paffages, to remove, as they, thought, fomewhat that obstructed the difcharge of urine, and others bring on a violent inflammation of the bladder, by using ftrong diuretics, as oil of turpentine, &c. for that purpofe.

INFLAMMATION OF THE LIVER.

THE liver is lefs fubject to inflammation than most of the other vifcera, as in it the circulation is flower; but when an inflammation does happen, it is with difficulty removed, and often ends in a suppuration or schirrus.

CAUSES.

305

CAUSES.——Befides the common caufes of inflammation, we may here reckon the following, viz exceffive fatnefs, a fchirrus of the liver itfelf, violent fhocks from ftrong vomits when the liver was before unfound, an adult or atrabiliarian flate of the blood, any thing that fuddenly cools the liver after it has been greatly heated, ftones obfiructing the courfe of the bile, drinking ftrong wines and fpirituous liquors, ufing hot fpicy aliment, obfinate hypochondriacal affections, &c.

SYMPTOMS.——This difeafe is known by a painful tenfion of the right fide under the falle ribs, attended with fome degree of fever, a fenfe of weight, or fulnefs of the part, difficulty of breathing, loathing of food, great thirft, with a pale or yellowish colour of the fkin and eyes.

The fymptoms here are various, according to the degree of inflammation, and likewife according to the particular part of the liver where the inflammation happens. Sometimes the pain is to inconfiderable, that an inflammation is not fo much as fufpected; but when it happens in the upper or convex part of the liver, the pain is more acute, the pulfe quicker, and the patient is often troubled with a dry cough, a hiccup, and a pain extending to the fhoulder, with difficulty of lying on the left fide, &cc.

This difeafe may be diftinguished from the pleurify by the pain being lefs violent, feated under the falle ribs, the pulse not fo hard, and by the difficulty of lying on the left fide. It may be diffinguished from the hysteric and hypochondriac diforders by the degree of fever with which it is always attended.

This difeafe, if properly treated, is feldom mortal. A conftant hiccuping, violent fever, and exceffive thirft, are bad fymptoms. If it ends in a fuppuration, and the matter cannot be difcharged outwardly, the danger is great. When the feirthus

of

INFLAMMATION of the LIVER. 307

of the liver enfues, the patient, if he observes a proper regimen, may nevertheles live a number of years tolerably easy; but if he indulge in animal food and strong liquors, or take medicines of an acrid or irritating nature, the schirrhus will be converted into a cancer, which must infallibly prove fatal.

REGIMEN.——The fame regimen is to be obferved in this as in other inflammatory diforders. All hot things are to be carefully avoided, and cool diluting liquors, as whey, barley-water, &c. drank freely. The food muft be light and thin, and the body, as well as the mind, kept eafy and quiet.

MEDICINE. Bleeding is proper at the beginning of this difeafe, and it will often be neceffary, even though the pulfe fhould not feel hard, to repeat it. All violent purgatives are to be avoided; the body however muft be kept gently open. A decoction of tamarinds, with a little honey or manna, will answer this purpole very well. The fide affected muft be fomented in the manner directed in the foregoing difeafes. Mild laxative clyfters fhould be frequently adminifered; and if the pain fhould notwithftanding continue violent, a bliftering plafter may be applied over the part affected; or rather a plafter made of gum ammoniac and vinegar of fquills.

Medicines which promote the fecretion of urine have a very good effect here: For this purpole half a drachm of purified nitre, or a tea-spoonful of the fweet spirits of nitre, may be taken in a cup of the patient's drink three or four times a-day.

When there is an inclination to fweat, it ought to be promoted, but not by warm fudorifics. The only thing to be used for that purpose is plenty of diluting liquors drank about the warmth of the human blood. Indeed the patient in this cafe, as well as in all other topical inflammations, ought to drink nothing that is colder than the blood.

308 INFLAMMATION of the LIVER.

If the ftools fhould be loofe, and even ftreaked with blood, no means must be used to ftop them, unless they be fo frequent as to weaken the patient. Loofe ftools often prove critical, and carry off the difeafe.

If an abfcefs or impofthume is formed in the liver, all methods fhould be tried to make it break and difcharge itfelf outwardly, as fomentations, the application of poultices, ripening cataplafms, &c. Sometimes indeed the matter of an abfcefs comes away in the urine, and fometimes it is difcharged by ftool, but thefe are efforts of Nature which no means can promote. When the abfcefs burfts into the cavity of the *abdomen* at large, death muft enfue; nor will the event be more favourable when the abfcefs is opened by an incifion, unlefs in cafes where the liver adheres to the *periton.eum*, fo as to form a bag for the matter, and prevent it from falling into the cavity of the *abdomen*; in which cafe opening the abfcefs by a fufficiently large incifion will probably fave the patient's life *.

If the diforder, in fpite of all endeavours to the contrary, fhould end in a fchirrhus, the patient muft be careful to regulate his diet, &c. in fuch a manner as not to aggravate the difeafe. He muft not indulge in flefh, fith, ftrong liquors, or any highly feafoned or falted provifions; but fhould, for the moft part, live on mild vegetables, as fruits and roots, taking gentle exercife, and drinking whey, barley-water, or buttermilk. If he takes any thing ftronger, it fhould be fine mild ale, which is lefs heating than wines or fpirits.

We shall take no notice of inflammations of the other vifcera. They muft in general be treated upon the fame principles as those already mentioned.

^{*} I know a gentleman who has had feveral abfceffes of the liver opened, and is now a ftrong and healthy man, though above eighty years of age.

Of the CHOLERA MORBUS, &c. 309

The chief rule with respect to all of them is, to let blood, to avoid every thing that is strong, or of a heating nature, to apply warm fomentations to the part affected, and to cause the patient to drink a sufficient quantity of warm diluting liquors.

CHAP. XXXI.

OF THE CHOLERA MORBUS, AND OTHER EXCESSIVE DISCHARGES FROM THE STOMACH AND BOWELS.

THE cholera morbus is a violent purging and vomiting, attended with gripes, ficknefs, and a conftant defire to go to ftool. It comes on fuddenly, and is most common in autumn. There is hardly any difease that kills more quickly than this, when proper means are not used in due time for removing it.

CAUSES.——It is occafioned by a redundancy and putrid acrimony of the bile; cold; food that eafily turns rancid or four on the ftomach; as butter, bacon, fweat-meats, cucumbers, melons, cherries, and other cold fruits^{*}. It is fometimes the effect of ftrong acrid purges or vomits, or of poifonous fubftances taken into the ftomach. It may likewife proceed from violent paffions or affections of the mind; as fear, anger, &c.

SYMPTOMS.——It is generally preceded by a cardialgia, or heart-burn, four belchings, and flatulencies, with pain of the ftomach and inteftines. To thele fucceed exceffive vomiting, and purging

* I have been twice brought to the gates of death by this difeafe, and both times it was occasioned by eating rancid bacon.

 X_3

of

310 Of the CHOLERA MOBUS, &c.

of green, yellow, or blackifh coloured bile, with a diffention of the ftomach, and violent griping pains. There is likewife a great thirft, with a very quick unequal pulfe, and often a fixed acute pain about the region of the navel. As the diffafe advances, the pulfe often finks fo low as to become quite imperceptible, the extremities grow cold, or cramped, and are often covered with a clammy fweat, the urine is obfructed, and there is a palpitation of the heart. Violent hiccuping, fainting, and convulfions, are the figns of approaching death.

MÉDICINÉ.———At the beginning of this difeafe, the efforts of Nature to expel the offending caufe fhould be affifted, by promoting the purging and vomiting. For this purpofe the patient mult drink freely of diluting liquors; as whey, buttermilk, warm water, thin water-gruel, fmall poffet, or, what is perhaps preferable to any of them, very weak chicken broth. This fhould not only be drank plentifully to promote the vomiting, but a clyfter of it given every hour in order to promote the purging.

After these evacuations have been continued for fome time, a decoction of toafted oat-bread may be drank to ftop the vomiting. The bread fhould be toafted till it is of a brown colour, and afterwards boiled in spring water. If oat-bread cannot be had, wheat-bread, or oat-meal well toafted, may be used in its ftead. If this does not put a ftop to the vomiting, two table-spoonfuls of the faline julep, with ten drops of laudanum, may be taken every hour till it ceales.

The vomiting and purging however ought never to be flopped too foon. As long as thefe difcharges do not weaken the patient, they are falutary, and may be allowed to go on, or rather ought to be promoted. But when the patient is weakened by the evacuations, which may be known

1

Of the CHOLERA MORBUS, &c. 311

from the finking of his pulfe, &c. recourfe muft immediately be had to opiates, as recommended above; to which may be added ftrong wines, with fpirituous cinnamon waters, and other generous cordials. Warm negus, or ftrong wine-whey, will likewife be neceffary to fupport the patient's fpirits, and promote the perfpiration. His legs fhould be bathed in warm water, and afterwards rubbed with flannel cloths, or wrapped in warm blankets, and warm bricks applied to the foles of his feet. Flannels wrung out of warm fpirituous fomentations fhould likewife be applied to the region of the ftomach.

When the violence of the difeafe is over, to prevent a relapfe, it will be neceffary for fome time to continue the ufe of imall dofes of laudanum. Ten or twelve drops may be taken in a glafs of wine, at leaft twice a-day, for eight or ten days. The patient's food ought to be nourifhing, but taken in fmall quantities, and he fhould ufe moderate exercife. As the ftomach and inteflines are generally much weakened, an infufion of the bark, or other bitters, in fmall wine, fharpened with the elixir of vitriol, may be drank for fome time.

Though phyficians are feldom called in due time in this difeafe, they ought not to defpair of relieving the patient even in the most defperate circumftances. Of this I lately faw a very firiking proof in an old man and his fon, who had been both feized with it about the middle of the night. I did not fee them till next morning, when they had much more the appearance of dead than of living men. No pulfe could be felt; the extremities were cold and rigid, the countenance was ghaftly, and the ftrength almost quite exhausted. Yet from this deplorable condition they were both recovered by the wfe of opiates and cordial medicines,

OF A DIARRHCEA, or LOOSENESS,

A LOOSENESS, in many cafes, is not to be confidered as a difeafe, but rather as a falutary evacuation. It ought therefore never to be flopped, unlefs when it continues too long, or evidently weakens the patient. As this however fometimes happens, we fhall point out the most common caufes of a loofenefs, with the proper method of treatment.

When a loofenefs is occafioned by catching cold, or an obftructed perfpiration, the patient ought to keep warm, to drink freely of weak diluting liquors, to bath his feet and legs frequently in lukewarm water, to wear flannel next his ikin, and to take every other method to reftore the perfpiration.

In a loofenefs which proceeds from excefs or repletion, a vomit is the proper medicine. Vomits not only cleanfe the flomach, but promote all the fecretions, which renders them of great importance in carrying off a debauch. Half a drachm of ipecacuanha in powder will anfwer this purpole very well. A day or two after the vomit, the fame quantity of rhubarb may be taken, and repeated two or three times, if the loofenefs continues. The patient ought to live upon light vegetable food of eafy digeftion, and to drink whey, thin gruel, or barleywater.

A loofenefs, occafioned by the obfruction of any cuftomary evacuation, generally requires bleeding. If that does not fucceed, other evacuations may be fubfituted in the room of those which are obfructed. At the fame time, every method is to be taken to reflore the usual discharges, as not only

the

[312

Of a DIARRHOEA, or LOOSENESS. 313

the cure of the difeafe, but the patient's life, may depend on this.

A periodical loofenefs ought never to be ftopped. It is always an effort of Nature to carry off fome offending matter, which, if retained in the body, might have fatal effects. Children are very liable to this kind of loofenefs, efpecially while teething. It is however fo far from being hurtful to them, that fuch children generally get their teeth with leaft trouble. If thefe loofe ftools fhould at any time prove four or griping, a tea-fpoonful of magnefia alba, with four or five grains of rhubarb, may be given to the child in a little panado, or any other food. 'This, if repeated three or four times, will generally correct the acidity, and carry off the griping ftools.

A diarrhœa, or loofeneſs, which proceeds from violent pafilons or affections of the mind, muſt be treated with the greateft caution. Vomits in this cafe are highly improper. Nor are purges ſaſe, unleſs they be very mild, and given in imall quantities. Opiates, and other antitpaſmodic medicines, are moſt proper. Ten or twelve drops of liquid laudanum may be taken in a cup of valerian or penny-royal tea every eight or ten hours, till the ſymptoms abate. Eaſe, chearſulneſs, and tranquillity of mind are here of the greateſt importance.

When a loofenefs proceeds from acrid or poifonous fubfances taken into the fromach, the patient muft drink large quantities of diluting liquors, with oil or fat broths, to promote vomiting and purging. Afterwards, if there be reafon to fulpect that the bowels are inflamed, bleeding will be neceffary. Small dofes of laudanum may likewife be taken to remove their irritation.

When the gout, repelled from the extremities, occafions a loofenefs, it ought to be promoted by gentle

314 Of a DIARRHOEA, or LOOSENESS.

gentle dofes of rhubarb, or other mild purgatives. The gouty matter is likewife to be folicited towards the extremities by warm fomentations, cataplafms, &c. The perfpiration ought at the fame time to be promoted by warm diluting liquors; as wine-whey with fpirits of hartfhorn, or a few drops of liquid laudanum, in it.

When a loofenefs proceeds from worms, which may be known from the fliminets of the ftools, mixed with pieces of decayed worms, &cc. medicines muft be given to kill and carry off these vermin, as the powder of tin with purges of rhubarb and calomel. Afterwards lime-water, either alone, or with a fmall quantity of rhubarb infuted, will be proper to ftrengthen the bowels, and prevent the new generation of worms.

A loofenefs is often occafioned by drinking bad water. When this is the cafe, the difeafe generally proves epidemical. When there is reafon to believe that this or any other difeafe proceeds from the ufe of unwholefome water, it ought immediately to be changed, or, if that cannot be done, it may be corrected by mixing with it quick lime, chalk, or the like.

In people whofe ftomachs are weak, violent exercife immediately after eating will occafion a loofenefs. Though the cure of this is obvious, yet it will be proper, befides avoiding violent exercife, to use fuch medicines as tend to brace and ftrengthen the ftomach, as infufions of the bark, with other bitter and aftringent ingredients, in white wine. Such perfons ought likewife to take frequently a glafs or two of old red port, or good claret.

From whatever caufe a loofenefs proceeds, when it is found neceffary to check it, the diet ought to confift of rice boiled with milk, and flavoured with cinnamon; rice-jelly, fago with red port; and the lighter forts of flefh-meat roafted. The drink may may be thin water-gruel, rice wtter, or weak broth made from lean veal, or with a fheep's head, as being more gelatinous than mutton, beef, or chickenbroth.

Perfons who, from a peculiar weaknefs, or too great an irritability of the bowels, are liable to frequent returns of this difeafe, fhould live temperately, avoiding crude fummer fruits, all- unwholelome foods, and meats of hard digeftion. They ought likewife to beware of cold, moifture, or whatever may obftruct the perfpiration, and fhould wear flannel next the fkin. All violent paffions, as fear, anger, &cc. are likewife carefully to be guarded againft.

OF VOMITING.

VOMITING may proceed from various caufes; as excerts in eating and drinking; foulnefs of the ftomach; the acrimony of the aliments; a translation of the morbific matter of ulcers, of the gout, the eryfipelas, or other difeafes, to the ftomach. It may likewife proceed from a loofenefs having been too fuddenly ftopped; from the ftoppage of any cuftomary evacuation, as the bleeding piles, the menfes, &cc. from a weaknefs of the ftomach, the colic, the iliac paffion, a rupture, a fit of the gravel, worms; or from any kind of poifon taken into the ftomach. It is an ufual fymptom of injuries done to the brain; as contufions, comprefiions, &cc. It is likewife a fymptom of wounds or inflammations of the diaphragm, inteflines, fpleen, liver, kidneys, &cc.

Vomiting may be occasioned by unufual motions, as failing, being drawn backwards in a carriage, &c. It may likewife be excited by violent passions, or by the idea of nauseous or difagreeable objects, especially of such things as have formerly

315

merly produced vomiting. Sometimes it proceeds from a regurgitation of the bile into the ftomach; in this cafe, what the patient vomits is generally of a yellow or greenifh colour, and has a bittertafte. Perfons who are fubject to nervous affections are often fuddenly feized with violent fits of vomiting. Laftly, vomiting is a common fymptom of pregnancy. In this cafe it generally comes on about two weeks after the ftoppage of the memfes, and continues during the first three or four months.

When vomiting proceeds from a foul ftomach or indigeftion, it is not to be confidered as a difeafe, but as the cure of a difeafe. It ought therefore to be promoted by drinking lukewarm water, or thin gruel. If this does not put a ftop to the vomiting, a dofe of ipecacuanha may be taken, and worked off with weak camomile-tea.

When the retroceffion of the gout, or the obfruction of cultomary evacuations, occafion vomiting, all means mult be ufed to reftore thefe difcharges; or, if that cannot be effected, their place muft be iupplied by others, as bleeding, purging, bathing the extremities in warm water, opening iffues, ferons, perpetual blifters, &c.

When vomiting is the effect of pregnancy, it may generally be mitigated by bleeding, and keeping the body gently open. The bleeding however ought to be in fmall quantities at a time, and the purgatives fhould be of the mildeft kind, as figs, flewed prunes, manna, or fenna. Pregnant women are moft apt to vomit in the morning immediately after getting out of bed, which is owing partly to the change of pofture, but more to the emptinefs of the flomach. It may generally be prevented by taking a difh of coffee, tea, or fome light breakfaft in bed. Pregnant women who are afflicted with vomiting ought to be kept eafy both in 8 body body and mind. They should neither allow their stomachs to be quite empty, nor should they eat much at once. Cold water is a very proper drink in this case; if the stomach be weak, a little brandy may be added to it. If the spirits are low, and the person apt to faint, a spoonful of cinnamonwater, with a little marmalade of quinces or oranges, may be taken.

If vomiting proceeds from weakness of the fromach, bitters will be of fervice. Peruvian bark infused in wine or brandy, with as much rhubarb as will keep the body gently open, is an excellent medicine in this case. The elixir of vitriol is also a good medicine. It may be taken in the dose of fifteen or twenty drops, twice or thrice a-day, in a glass of wine or water. Habitual vomitings are fometimes alleviated by making oysters a principal part of diet.

A vomiting, which proceeds from acidities in the ftomach, is relieved by alkaline purges. The beft medicine of this kind is the magnelia alba, a teafpoonful of which may be taken in a difh of tea or a little milk, three or four times a day, or oftener if neceffary, to keep the body open.

When vomiting proceeds from violent paffions, or affections of the mind, all evacuants muft be carefully avoided, efpecially vomits. Thefe are exceedingly dangerous. The patient in this cafe ought to be kept perfectly eafy and quiet, to have the mind foothed, and to take fome gentle cordial, as negus, or a little brandy and water, to which a few drops of laudanum may occafionally be added.

When vomiting proceeds from fpafmodic affections of the ftomach, mufk, caftor, and other antifpafmodic medicines, are of ufe. Warm and aromatic plafters have likewife a good effect. The ftomach-plafter of the London or Edinburgh difpenfatory may be applied applied to the pit of the flomach, or a plafter of *theriaca*, which will answer rather better. Aromatic medicines may likewife be taken inwardly, as cinnamon or mint-tea, wine with spiceries boiled in it, &c. The region of the flomach may be rubbed with ather, or, if that cannot be had, with flrong brandy, or other spirits. The belly should be fomented with warm water, or the patient immersed up to the breaft in a warm bath.

I have always found the faline draughts, taken in the act of effervescence, of singular use in stopping a vomiting, from whatever cause it proceeded. These may be prepared by diffolving a drachm of the falt of tartar in an ounce and a half of fresh lemon-juice, and adding to it an ounce of peppermint-water, the fame quantity of simple cinnamon-water, and a little white fugar. This draught mult be fwallowed before the effervescence is quite over, and may be repeated every two hours, or oftener, if the vomiting be violent. A violent vomiting has sometimes been stopped by cupping on the region of the stomach after all other means had failed.

As the least motion will often bring on the vomiting again, even after it has been ftopped, the patient must avoid all manner of action. The diet must be fo regulated as to fit eafy upon the ftomach, and nothing should be taken that is hard of digestion. We do not however mean that the patient should live entirely upon slops. Solid food, in this cafe, often sits easier on the stomach than liquids.

[319]

CHAP. XXXII.

OF THE DIABETES, AND OTHER DISORDERS OF THE KIDNEYS AND BLADDER.

THE diabetes is a frequent and exceffive difcharge of urine. It is feldom to be met with among young people; but often attacks perfons in the decline of life, efpecially those who follow the more violent employments, or have been hard drinkers in their youth.

CAUSES .- A diabetes is often the confequence of acute difeafes, as fevers, fluxes, &c. where the patient has fuffered by exceffive evacuations; it may also be occafioned by great fatigue, as riding long journies upon a hard-trotting horfe, carrying heavy burdens, running, &c. It may be brought on by hard drinking, or the use of strong stimulating diuretic medicines, as tincture of cantharides, spirits of turpentine, and fuch like. It is often the effect of drinking too great quantities of mineral waters. Many imagine that these will do them no fervice unless they be drank in great quantities, by which miftake it often happens that they occasion worfe difeases than those they were intended to cure. In a word, this difeafe may either proceed from too great a laxity of the organs which fecrete the urine, from fomething that ftimulates the kidneys too much, or from a thin diffolved state of the blood, which makes too great a quantity of it run off by the urinary paflages.

SYMPTOMS.—In a diabetes, the urine generally exceeds in quantity all the liquid food which the patient patient takes. It is thin and pale, of a fweetift taffe, and an agreeable finell. The patient has a continual thirft, with fome degree of fever; his mouth is dry, and he fpits frequently a frothy fpittle. The ftrength fails, the appetite decays, and the flefth waftes away till the patient is reduced to fkin and bone. There is a heat of the bowels, and frequently the loins, tefticles, and feet are fwelled.

This difeafe may generally be cured at the beginning; but after it has continued long, the cure becomes very difficult. In drunkards, and very old people, a perfect cure is not to be expected.

REGIMEN. — Every thing that ftimulates the urinary paffages, or tends to relax the habit, muft be avoided. For this reafon the patient fhould live chiefly on folid food. His thirft may be quenched with acids; as forrel, juice of lemon, or vinegar. The mucilaginous vegetables, as rice, fago, and falop, with milk, are the most proper food. Of animal fubftances, fhell-fifth are to be preferred; as oyfters, crabs, &c.

The drink may be Briftol-water. When that cannot be obtained, lime-water, in which a due proportion of oak-bark has been macerated, may be ufed. The white decoction *, with ifinglass diffolved in it, is likewife a very proper drink.

The patient ought daily to take exercife, but it fhould be fo gentle as not to fatigue him. He fhould lie upon a hard bed or matrafs. Nothing hurts the kidneys more than lying too foft. A warm dry air, the use of the flefth-bruth, and every thing that promotes perfpiration, is of fervice. For this reafon the patient ought to wear flannel next his fkin. A large ftrengthening plafter may be applied to the back, or, what will anlwer better, a great part of the body may be wrapped in plafter.

* See Appendix, White Decostion.

MEDI-

320

MEDICINE.—Gentle purges, if the patient be not too much weakened by the difeafe, have a good effect. They may conflict of rhubarb, with cardamum feeds, or any other fpiceries, infused in wine, and may be taken in fuch quantities as to keep the body gently open.

The patient muft next have recourse to aftringents and corroborants. Half a drachm of powder made of equal parts of allum and the infpiffated juice, commonly called *Terra Japonica*, may be taken four times a-day, or oftener, if the ftomach will bear it. The allum muft first be melted in a crucible; afterwards they may both be pounded together. Along with every dose of this powder the patient may take a tea-cupful of the tincture of rofes *.

If the patient's ftomach cannot bear the allum in fubftance, whey may be made of it, and taken in the dole of a tea-cupful three or four times a-day. The allum-whey is prepared by boiling two English quarts of milk over a flow fire, with three drachms of allum, till the curd feparates.

Opiates are of fervice in this difeafe, even though the patient refts well. They take off ipafm and irritation, and at the fame time leffen the force of the circulation. Ten or twelve drops of liquid laudanum may be taken in a cup of the patient's drink three or four times a-day.

The beft corroborants which we know, are the Peruvian bark and wine. A drachm of bark may be taken in a glafs of red port or claret three times a-day. The medicine will be both more efficacious and lefs difagreeable, if fifteen or twenty drops of the acid elixir of vitriol be added to each dofe. Such as cannot take the bark in fubfiance may use the decoction, mixed with an equal quantity of red wine, and fharpened as above.

* See Appendix, Tinclure of Rofes.

There

322 OF A SUPPRESSION OF URINE.

There is a difease incident to labouring people in the decline of life, called an INCONTINENCY of Urine. But this is very different from a diabetes, as the water paffes off involuntarily by drops, and does not exceed the usual quantity. This difeafe is rather troublefome than dangerous. It is owing to a relaxation of the fphincter of the bladder, and is often the effect of a pally. Some. times it proceeds from hurts, or injuries occasioned by blows, bruifes, preternatural labours, &c. Sometimes it is the effect of a fever. It may likewife be occasioned by a long use of strong diuretics, or of flimulating medicines injected into the bladder.

This difeafe may be mitigated by the ufe of aftringent and corroborating medicines, fuch as have been mentioned above; but we do not remember ever to have feen it cuted.

In an incontinency of urine, from whatever caufe, a piece of fponge ought to be worn, or a bladder applied in fuch a manner as to prevent the urine from galling and excortating the parts *.

OF A SUPPRESSION OF URINE.

It has already been observed, that a suppression of urine may proceed from various causes; as an inflammation of the kidneys, or bladder; small stones or gravel lodging in the urinary passages, hard *fæces* lying in the *restum*, pregnancy, a spass or contraction of the neck of the bladder, clotted blood in the bladder itself, a swelling of the hæmorrhoidal veins, &c.

Some of these cafes require the catheter, both to remove the obstructing matter, and to draw off the urine; but as this inftrument can only be managed with fafety by perfons skilled in furgery, we shall

* A bottle made of the India rubber, and properly applied, anfwers this purpole beft.

2

fay

OF A SUPPRESSION OF URINE. 323

fay nothing further of its ufe. A bougee may be ufed by any cautious hand, and will often fucceed better than the catheter.

We would chiefly recommend, in all obltructions of urine, fomentations, and evacuants. Bleeding, as far as the patient's ftrength will permit, is neceffary, efpecially where there are fymptoms of topical inflammation. Bleeding in this cafe not only abates the fever, by leffening the force of the circulation, but, by relaxing the folids, it takes off the fpafm or ftricture upon the veffels which occafioned the obftruction.

After bleeding, fomentations muft be ufed. Thefe may either confift of warm water alone, or of decoctions of mild vegetables; as mallows, camomile-flowers, &cc. Clothes dipped in thefe may either be applied to the part affected, or a large bladder filled with the decoction may be kept continually upon it. Some put the herbs themfelves into a flannel bag, and apply them to the part, which is far from being a bad method. Thefe continue longer warm than cloths dipped in the decoction, and at the fame time keep the part equally moift.

In all obstructions of urine, the body ought to be kept open. This is not however to be attempted by strong purgatives, but by emollient clyfters, or gentle infusions of senna and manna. Clyfters in this case not only open the body, but answer the purpose of an internal somentation, and greatly affist in removing the spass of the bladder and parts adjacent.

The food must be light, and taken in small quantities. The drink may be weak broth, or decoctions and infusions of mucilaginous vegetables, as marshmallow roots, lime-tree buds, &c. A tea-spoonful of the sweet spirits of nitre, or a drachm of Castile soap, may be frequently put into the patient's drink;

Y 2

÷

and,

324 OF THE GRAVEL AND STONE.

and, if there be no inflammation, he may drink fauall gin punch.

Perfons fubject to a fupprefilon of urine ought to live very temperate. Their diet fhould be light, and their liquor diluting. They fhould avoid all acids and auftere wines, fhould take fufficient exercife, lie hard, and avoid fludy and fedentary occupations.

OF THE GRAVEL AND STONE.

WHEN fmall ftones are lodged in the kidneys, or difcharged along with the urine, the patient is faid to be afflicted with the gravel. If one of these ftones happens to make a lodgment in the bladder for fome time, it accumulates fresh matter, and at length becomes too large to pass off with the urine. In this cafe the patient is faid to have the ftone.

CAUSES.—The ftone and gravel may be occafioned by high living; the use of ftrong aftringent wines; a sedentary life; lying too hot, soft, or too much on the back; the constant use of water impregnated with earthy or stony particles; aliments of an aftringent or windy nature, &cc. It may likewise proceed from an hereditary disposition. Perfons in the decline of life, and those who have been much afflicted with the gout or theumatism, are most liable to it.

SYMPTOMS.—Small ftones or gravel in the kidneys occasion pain in the loins, ficknefs, vomiting, and fometimes bloody urine. When the ftone defcends into the *areter*, and is too large to pafs along with eafe, all the above fymptoms are increafed; the pain extends towards the bladder; the thigh and leg of the affected fide are benumbed; the telticles are drawn upwards, and the urine is obftructed.

ĩ

A ftone

OF THE GRAVEL AND STONE, 325

A ftone in the bladder is known from a pain at the time, as well as before and after making water; from the urine coming away by drops, or ftopping fuddenly when it was running in a full ftream; by a violent pain in the neck of the bladder upon motion, efpecially on horfeback, or in a carriage on a rough road; from a white, thick, copious, flinking, mucous fediment in the urine; from an itching in the top of the penis; from bloody urine; from an inclination to go to ftool during the difcharge of urine; from the patient's paffing his urine more eafily when lying than in an erect pofture; from a kind of a convultive motion occafioned by the sharp pain in discharging the last drops of the urine; and laftly, from founding or fearching with the catheter.

REGIMEN .- Perfons afflicted with the gravel or ftone should avoid aliments of a windy or heating nature, as falt meats, four fruits, &c. Their diet ought chiefly to confilt of fuch things as tend to promote the fecretion of urine, and to keep the body open. Artichokes, asparagus, spinnage, lettuce, parfley, fuccory, purflane, turnips, potatoes, carrots, and radifhes, may be fafely eaten. Onions, leeks, and cellery are, in this cafe, reckoned medicinal. The most proper drinks are whey, butter milk, milk and water, barley-water; decoctions or infusions of the roots of marth-mallows, parfley, liquorice, or of other mild mucilaginous vegetables, as linfeed, lime-tree buds or leaves, &c. If the patient has been accustomed to generous liquors, he may drink gin and water not too ftrong.

Gentle exercife is proper; but violent motion is apt to occasion bloody urine. We would therefore advife that it should be taken in moderation, Perfons afflicted with the gravel often pals a great number of stones after riding on horseback, or in a Y 3 carriage;

326 OF THE GRAVEL AND STONE.

carriage; but those who have a ftone in the bladder are feldom able to bear these kinds of exercise. Where there is a hereditary tendency to this disease, a fedentary life ought never to be indulged. Were people careful, upon the first fymptoms of gravel, to observe a proper regimen of diet, and to take fufficient exercise, it might often be carried off, or at least prevented from increasing; but if the same course which occasioned the disease is persisted in, it must be aggravated.

MEDICINE.—In what is called a fit of the gravel, which is commonly occafioned by a flone flicking in the *ureter* or fome part of the urinary paffages, the patient muft be bled, warm fomentations fhould likewife be applied to the part affected, emollient clyfters adminiftered, and diluting mucilaginous liquors drank, &c. The treatment of this cafe has been fully pointed out under the articles, *inflammation of the kidneys and bladder*, to which we refer.

Dr. Whyte advifes patients who are fubject to frequent fits of gravel in the kidneys, but have no ftone in the bladder, to drink every morning, two or three hours before breakfaft, an English pint of oyfter or cockle-shell lime-water. The Doctor very justly obierves, that though this quantity might be too small to have any fensible effect in diffolving a stone in the bladder, yet it may very probably prevent its growth.

When a ftone is formed in the bladder, the Doceor recommends Alicant foap, and oyfter or cockle-fhell lime-water *, to be taken in the following manner: The patient muft fwallow every day, in any form that is leaft difagreeable, an ounce of the internal part of Alicant foap, and drink three or four English pints of oyfter or cockle-fhell lime-

* See Appendix, Lime-water.

OF THE GRAVEL AND STONE, 327

water, the foap is to be divided into three dofes; the largeft to be taken fafting in the morning early; the fecond at noon; and the third at feven in the evening; drinking above each dofe a large draught of the lime-water; the remainder of which he may take any time betwixt dinner and fupper, inftead of other liquors.

The patient fhould begin with a fmaller quantity, of the lime-water and loap than that mentioned above; at first an English pint of the former, and three drachms of the latter may be taken daily. This quantity, however, he may increase by degrees, and ought to perfevere in the ufe of thefe medicines, especially if he finds any abatement of his complaints, for feveral months; nay, if the stone be very large, for years. It may likewife be proper for the patient, if he be feverely pained, not only to begin with the foap and lime-water in fmall quantities, but to take the fecond or third limewater instead of the first. However, after he has been for fome time accustomed to these medicines, he may not only take the first water, but, if he finds he can eafily bear it, heighten its diffolving power still more by pouring it a fecond time on fresh calcined fhells.

The cauftic alkali, or foap-lees, is the medicine chiefy in vogue at prefent for the flone. It is of a very acrid nature, and ought therefore to be given in fome gelatinous or mucilaginous liquor; as veal-broth, new milk, linfeed-tea, a folution of gumarabic, or a decoction of marfhmallow roots. The patient muft begin with fmall dofes of the lees, as thirty or forty drops, and increase by degrees, as far as the flomach can bear it •.

* The cauftic alkali may be prepared by mixing two parts of quick lime with one of pot-aftes, and fuffering them to fland till the lixivium be formed, which muft be carefully filtrated before it be ufcd. If the folution does not happen readily, a fmall quantity of water may be added to the mixture.

Though

328 INVOLUNTARY DISCHARGES

Though the foap-lees and lime-water are the most powerful medicines which have hitherto been discovered for the ftone; yet there are fome things of a more fimple nature, which in certain cafes are found to be beneficial, and therefore deferve a trial. An infusion of the feeds of daucus sylvestris, or wild carrot, fweetened with honey, has been found to give confiderable eafe in cafes where the ftomach could not bear any thing of an acrid nature. A decoction of raw coffee-berries taken morning and evening, to the quantity of eight or ten ounces, with ten drops of fweet spirit of nitre, has likewife been found very efficacious in bringing away large quantities of earthy matter in flakes. Honey is likewife found to be of confiderable fervice, and may be taken in gruel, or in any other form that is more agreeable.

The only other medicine which we fhall mention is the *uva urft*. It has been greatly extolled of late both for the gravel and ftone. It feems however to be in all respects inferior to the foap and lime-water; but it is lefs difagreeable, and has frequently, to my knowledge, relieved gravelly complaints. It is generally taken in powder from half a drachm to a whole drachm, two or three times a-day. It may however be taken to the quantity of feven or eight drachms a-day, with great fafety and good effect.

CHAP. XXXIII,

OF INVOLUNTARY DISCHARGES OF BLOOD.

SPONTANEOUS or involuntary difcharges of blood, often happen from various parts of the body. These however are fo far from being always ways dangerous, that they often prove falutary. When fuch difcharges are critical, which is frequently the cafe in fevers, they ought not to be ftopped. Nor indeed is it proper at any time to ftop them, unlefs they be fo great as to endanger the patient's life. Moft people, afraid of the fmalleft difcharge of blood from any part of the body, fly immediately to the ufe of ftyptic and aftringent medicines, by which means an inflammation of the brain, or fome other fatal difeafe, is occafioned, which, had the difcharge been allowed to go on, might have been prevented.

Periodical difcharges of blood, from whatever part of the body they proceed, muft not be ftopped. They are always the efforts of Nature to relieve herfelf; and fatal difeafes have often been the confequence of obfructing them. It may indeed be fometimes neceffary to check the violence of fuch difcharges; but even this requires the greateft caution. Inftances might be given where the ftopping of a fmall periodical flux of blood, from one of the fingers, has proved fatal to the health.

In the early period of life, bleeding at the nofe is very common. Those who are farther advanced in years are more liable to hæmoptoe, or discharge of blood from the lungs. After the middle period of life, hæmorrhoidal fluxes are most common; and in the decline of life, discharges of blood from the urinary passages.

Involuntary fluxes of blood may proceed from very different, and often from quite opposite causes. Sometimes they are owing to a particular conftruction of the body, as a fanguine temperament, a laxity of the veffels, a plethoric habit, &c. At other times they proceed from a determination of the blood towards one particular part, as the head, the hæmorrhoidal veins, &cc. They may likewife proceed from an inflammatory disposition of the bloods

330 INVOLUNTARY DISCHARGES, Ge.

blood, in which cafe there is generally fome degree of fever: this likewife happens when the flux is occaffoned by an obstructed perfpiration, or a ftricture upon the skin, the bowels, or any particular part of the system.

But a diffolved flate of the blood will likewife occasion hæmorrhages. Thus, in putrid fevers, the dyfentery, the fcurvy, the malignant small-pox, &cc. there are often very great difcharges of blood from different parts of the body. They may likewife be brought on by too liberal an use of medicines which tend to diffolve the blood, as cantharides, the volatile alkaline falts, &cc. Food of an acrid or irritating quality may likewife occasion hæmorrhages, as also ftrong purges and vomits, or any thing that greatly ftimulates the bowels.

Violent paffions or agitations of the mind will likewife have this effect. Thefe often caufe bleeding at the nofe, and I have known them fometimes occafion an hæmorrhage in the brain. Violent efforts of the body, by overftraining or hurting the veffels, may have the fame effect, efpecially when the body is long kept in an unnatural pofture, as hanging the head very low, &c.

The cure of an hæmorrhage must be adapted to its cause. When it proceeds from too much blood, or a tendency to inflammation, bleeding, with gentle purges and other evacuations, will be neceffary. It will likewise be proper for the patient in this case to live chiefly upon a vegetable diet, to avoid all strong liquors, and food that is of an acrid, hot, or stimulating quality. The body should be kept cool, and the mind casy.

When an hæmorrhage is owing to a putrid or diffolved ftate of the blood, the patient ought to live chiefly upon acid fruits with milk, and vegetables of a nourifhing nature, as fago, falop, &c. His drink may be wine diluted with water, and fhyrpened

OF BLEEDING AT THE NOSE. 331

fharpened with the juice of lemom, vinegar, or fpirits, of vitriol. The beft medicine in this cafe is the Peruvian bark, which may be taken according to the urgency of the fymptoms.

When a flux of blood is the effect of acrid food, or of ftrong ftimulating medicines, the cure is to be effected by loft and mucilaginous diet. The patient may likewife take frequently about the bulk of a nutmeg of Locatelli's balfam, or the fame quantity of fperma-ceti.

When an obstructed perspiration, or a stricture upon any part of the system, is the cause of an hæmorrhage, it may be removed by drinking warm diluting liquors, lying a-bed, bathing the extremities in warm water, &c.

OF BLEEDING AT THE NOSE.

BLEEDING at the nofe is commonly preceded by fome degree of quickness of the pulle, flushing in the face, pulsation of the temporal arteries, heaviness in the head, dimness of the fight, heat and itching of the nostrils, &c.

To perfons who abound with blood, this difcharge is very falutary. It often cures a vertigo, the headach, a phrenzy, and even an epilepfy. In fevers, where there is a great determination of blood towards the head, it is of the utmoft fervice. It is likewife beneficial in inflammations of the liver and fpleen, and often in the gout and rheumatifm. In all difeafes where bleeding is neceffary, a fpontaneous difcharge of blood from the nofe is of much more fervice than the fame quantity let with a lancet.

In a difcharge of blood from the nofe, the great point is to determine whether it ought to be ftopped or not. It is a common practice to ftop the bleeding, without confidering whether it be a difeafe, or the

332 OF BLEEDING AT THE NOSE.

the cure of a difeafe. This conduct proceeds from fear; but it has often bad, and fometimes fatal confequences.

When a difcharge of blood from the nofe happens in an inflammatory difeafe, there is always reafon to believe that it may prove falutary; and therefore it fhould be fuffered to go on, at leaft as long as the patient is not weakened by it.

When it happens to perfons in perfect health, who are full of blood, it ought not to be fuddenly ftopped, efpecially if the fymptoms of plethora, mentioned above, have preceded it. In this cafe it cannot be ftopped without rifking the patient's life.

In fine, whenever bleeding at the nofe relieves any bad fymptom, and does not proceed fo far as to endanger the patient's life, it ought not to be ftopped. But when it returns frequently, or continues till the pulfe becomes low, the extremities begin to grow cold, the lips pale, or the patient complains of being fick or faint, it must immediately be ftopped.

For this purpole the patient fhould be fet nearly upright, with his head reclining a little, and his legs immerfed in water about the warmth of new milk. His hands ought likewife to be put in lukewarm water, and his garters may be tied a little tighter than ufual. Ligatures may be applied to the arms, about the place where they are ufually made for bleeding, and with nearly the fame degree of tightnefs. These muft be gradually flackened as the blood begins to ftop, and removed entirely as foon as it gives over.

Sometimes dry lint put up the noftrils will ftop the bleeding. When this does not fucceed, doffils of lint dipped in ftrong fpirits of wine may be put up the noftrils, or if that cannot be had, they may be dipped in brandy. Blue vitriol diffolved

in

OF BLEEDING AT THE NOSE. 333

in water may likewife be ufed for this purpofe, or a tent dipped in the white of an egg well beat up, may be rolled in a powder made of equal parts of white fugar, burnt allum, and white vitriol, and put up the noftril from whence the blood iffues.

Internal medicines can hardly be of use here, as they have feldom time to operate. It may not however be amifs to give the patient half an ounce of Glauber's falt, and the fame quantity of manna, diffolved in four or five ounces of barley-water. This may be taken at a draught, and repeated, if it does not operate, in a few hours. Ten or twelve grains of nitre may be taken in a glass of cold water and vinegar every hour, or oftener, if the thomach will bear it. If a ftronger medicine be neceffary, a tea-cupful of the tincture of roles, with twenty or thirty drops of the weak foirit of vitriol, may be taken every hour. When these things cannot be had, the patient may drink water, with a little common falt in it, or equal parts of water and vinegar *.

If the genitals be immerfed for fome time in cold water, it will generally ftop a bleeding at the nofe. I have not known this fail.

Sometimes, when the bleeding is ftopped outwardly, it continues inwardly. This is very troublefome, and requires particular attention, as the patient is apt to be fuffocated with the blood, especially if he falls afleep, which he is very ready to do after losing a great quantity of blood.

When the patient is in danger of fuffocation from the blood getting into his throat, the paffages may be ftopped by drawing threads up the noftrils, and bringing them out at the mouth, then faftening pieces of fponge, or fmall rolls of linen cloth to their extremities; afterwards drawing them back, and tying them on the outfide with a fufficient degree of tightnefs.

* From ten to twenty drops of the oil of turpentine in a little water given frequently, feldom fails to flop a bleeding at the nofe, or from any other part.

After

334 BLEEDING AND BLIND PILES.

After the bleeding is flopped the patient ought to be kept as eafy and quiet as possible. He should not pick his nofe, nor take away the tents or clotted blood, till they fall off of their own accord, and should not lie with his head low.

Thole who are affected with frequent bleeding at the nole, ought to bathe their feet often in warm water, and to keep them warm and dry. They ought to wear nothing tight about their necks, to keep their body as much in an erect pofture as poffible, and never to view any object obliquely. If they have too much blood, a vegetable diet, with now and then a cooling purge, is the fafeft way to leften it.

But when the difeafe proceeds from a thin diffolved flate of the blood, the diet fhould be rich and nourifhing; as ftrong broths and jellies, fago-gruel with wine and fugar, &c. Infufions of the Peruvian bark in wine ought likewife to be taken and perfifted in for a confiderable time.

OF THE BLEEDING AND BLIND. PILES.

At DISCHARGE of blood from the hæmorrhoidal veffels is called the *bleeding piles*. When the veffels only fwell, and difcharge no blood, but are exceeding painful, the difeafe is called the *blind piles*.

Perfons of a loofe fpongy fibre, of a bulky fize, who live high, and lead a fedentary, inactive life, are most fubject to this difease. It is often owing to a hereditary disposition. Where this is the case, it attacks perfons more early in life than when it is accidental. Men are more liable to it than women, especially those of a fanguine, plethoric, or a scorbutic habit, or of a melancholy disposition.

The piles may be occafioned by an excels of blood, by ftrong aloctic purges, high-feafoned food, drinking

BLEEDING AND BLIND PILES. 335

drinking great quantities of fweet wines, the neglect of bleeding, or other cuftomary evacuations, much riding, great coftivenels, or any thing that occafions hard or difficult ftools. Anger, grief, or other violent paffions, will likewife occafion the piles. I have often known them brought on by fitting on the damp ground. A pair of thin breeches will excite the diforder in a perfon who is fubject to it, and fometimes even in those who never had it before. Pregnant women are often afflicted with the piles.

A flux of blood from the *anus* is not always to be treated as a difeafe. It is even more falutary than bleeding at the nofe, and often prevents or carries off difeafes. It is peculiarly beneficial in the gout, rheumatifm, afthma, and hypochondriacal complaints, and often proves critical in colics, and inflammatory fevers.

In the management of the patient, regard muff be had to his habit of body, his age, ftrength, and manner of living. A difcharge which might be exceffive and prove hurtful to one, may be very moderate, and even falutary to another. That only is to be efferemed dangerous, which continues too long, and is in fuch quantity as to wafte the patient's ftrength, hurt the digeftion, nutrition, and other functions neceffary to life.

When this is the cafe, the difcharge muft be checked by a proper regimen, and aftringent medicines. The DIET muft be cool but nourifhing, confifting chiefly of bread, milk, cooling vegetables and broths. The drink may be chalybeate water, orangewhey, decoctions or infufions of the aftringent and mucilaginous plants, as the tormentil root, biftorr, the marfhmallow-roots, &cc.

Old conferve of red rofes is a very good medicine in this cafe. It may be mixed with new milk, and taken in the quantity of an ounce three or four

336 BLEEDING AND BLIND PILES.

four times a-day. This medicine is in no great repute, owing to its being feldom taken in fuch quantity as to produce any effects; but when taken as here directed, and duly perfifted in, I have known it perform very extraordinary cures in violent hæmorrhages, efpecially when affifted by the tincture of roles; a tea-cupful of which may be taken about an hour after every dofe of the conferve.

The Peruvian bark is likewife proper in this cafe, both as a ftrengthener and aftringent. Half a drachm of it may be taken in a glafs of red wine, fharpened with a few drops of the elixir of vitriol, three or four times a-day.

The bleeding piles are fometimes periodical, and return regularly once a month, or once in three weeks. In this cafe they are always to be confidered as a falutary difcharge and by no means to be ftopped. Some have entirely ruined their health by ftopping a periodical difcharge of blood from the hæmorrhoidal veins.

In the *blind piles* bleeding is generally of ufe. The diet muft be light and thin, and the drink cool and diluting. It is likewife neceffary that the body be kept gently open. This may be done by fmall dofes of the flowers of brimflone and cream of tartar. Thefe may be mixed in equal quantities, and a tea-fpconful taken two or three times a-day, or oftener if neceffary. Or an ounce of the flowers of brimflone and half an ounce of purified nitre may be mixed with three or four ounces of the lenitive electuary, and a tea-fpoonful of it taken three or four times a-day.

Emollient clyfters are here likewife beneficial; but there is fometimes fuch an aftriction of the anus, that they cannot be thrown up. In this cafe I have known a vomit have a very good effect.

When

When the piles are exceeding painful and fwelled, but discharge nothing, the patient must fit over the steams of warm water. He may likewise apply a linen cloth dipped in warm fpirits of wine to the part, or poultices made of bread and milk, or of leeks fried with butter. If thefe do not produce a difcharge, and the piles appear large, leeches must be applied as near them as possible, or if they will fix upon the piles themfelves, fo much the better. When leeches will not fix, the piles may be opened with a lancet. The operation is very eafy, and is attended with no danger.

Various ointments, and other external applications, are recommended in the piles; but I do not remember to have feen any effects from thefe worth mentioning. Their principal ufe is to keep the part moift, which may be done as well by a foft poultice, or an emollient cataplasm. When the pain however is very great, a liniment made of two ounces of emollient ointment, and half an ounce of liquid laudanum, beat up with the yolk of an egg, may be applied.

SPITTING OF BLOOD.

WE mean here to treat of that discharge of blood from the lungs only which is called an bemoptoe, or spitting of blood. Persons of a flender make, and a lax fibre, who have long necks and ftrait breafts, are most liable to this difease. It is most common in the spring, and generally attacks people before they arrive at the prime or middle period of life. It is a common obfervation, that those who have been subject to bleeding at the nofe when young, are afterwards most liable to an hæmoptoe.

CAUSES .- An hæmoptoe may proceed from excels of blood, from a peculiar weaknels of the lungs, Z of

338 SPITTING OF BLOOD.

or a bad conformation of the breaft. It is often occafioned by exceflive drinking, running, wreftling, finging, or fpeaking aloud. Such as have weak lungs, ought to avoid all violent exertions of that organ, as they value life. They fhould likewife guard against violent paffions, exceflive drinking, and every thing that occasions a rapid circulation of the blood.

This difeafe may likewife proceed from wounds of the lungs. Thefe may either be received from without, or they may be occasioned by hard bodies getting into the wind-pipe, and fo falling down upon the lungs, and hurting that tender organ. The obstruction of any customary evacuation may occafion a fpitting of blood; as neglect of bleeding or purging at the ufual feafons, the ftoppage of the bleeding piles in men, or the menfes in women, &c. It may likewife proceed from a polypus, fcirrhous concretions, or any thing that obstructs the circulation of the blood in the lungs. It is often the effect of a long and violent cough; in which cafe it is generally the forerunner of a confumption. violent degree of cold fuddenly applied to the external parts of the body will occasion an hæmoptoe. It may likewife be occafioned by breathing air which is too much rarified to be able properly to expand the lungs. This is often the cafe with those who work in hot places, as furnaces, glafs-houfes, or the like. It is likewife faid to happen to fuch as afcend to the top of very high mountains, as the Peak of Teneriff, &c.

Spitting of blood is not always to be confidered as a primary difeafe. It is often only a fymptom, and in fome difeafes not an unfavourable one. This is the cafe in pleurifies, peripneumonies, and fundry other fevers. In a dropfy, fcurvy, or confumption, it is a bad fymptom, and thews that the lungs are ulcerated.

SYMP-

SPITTING OF BLOOD.

SYMPTOMS .- Spitting of blood is generally preceded by a fenfe of weight, and oppreffion of the breaft, a dry tickling cough, hoarfenefs, and a difficulty of breathing. Sometimes it is ufhered in with fhivering coldness of the extremities, coftivenels, great lassitude, flatulence, pain of the back and loins, &c. As these shew a general stricture upon the veffels, and a tendency of the blood to inflammation, they are commonly the forerunners of a very copious difcharge. The above fymptoms do not attend a discharge of blood from the gums or fauces, by which means thefe may always be diftinguished from an hæmoptoe. Sometimes the blood that is fpit up is thin, and of a florid red colour; and at other times it is thick, and of a dark or blackish colour; nothing however can be inferred from this circumstance, but that the blood has lain a longer or shorter time in the breast before it was discharged.

Spitting of blood, in a ftrong healthy perfon, of a found conftitution, is not very dangerous; but when it attacks the tender and delicate, or perfons of a weak lax fibre, it is with difficulty removed. When it proceeds from a feirrhus or polypus of the lungs, it is bad. The danger is greater when the difcharge proceeds from the rupture of a large veffel than of a fmall one. When the extravafated blood is not fpit up, but lodges in the breaft, it corrupts, and greatly increafes the danger. When the blood proceeds from an ulcer in the lungs, it is generally fatal.

REGIMEN. — The patient ought to be kept cool and eafy. Every thing that heats the body or quickens the circulation, increases the danger. The mind ought likewife to be foothed, and every occasion of exciting the passions avoided. The diet should be fost, cooling, and flender; as rice Z 2 boiled

340 SPITTING OF BLOOD.

boiled with milk, fmall broths, barley-gruels, panado, &c. The diet, in this cafe, can fcarce be too low. Even water gruel is fufficient to fupport the patient for fome days. All ftrong liquors muft be avoided. The patient may drink milk and water, barley-water, whey, butter-milk, and fuch like. Every thing however fhould be drank cold, and in fmall quantities at a time. He fhould obferve the ftricteft filence, or at leaft fpeak with a very low voice.

MEDICINE.—This, like the other involuntary difcharges of blood, ought not to be fuddenly ftopped by aftringent medicines. More mifchief is often done by these than if it were suffered to go on. It may however proceed so far as to weaken the patient, and even endanger his life; in which case proper means must be used for reftraining it.

The body fhould be kept gently open by laxative diet; as roafted apples, flewed prunes, and fuch like. If these should not have the defired effect, a tea-spoonful of the lenitive electuary may be taken twice or thrice a-day, as is found necessary. If the bleeding proves violent, ligatures may be applied to the extremities, as directed for a bleeding at the nose.

If the patient be hot or feverifh, bleeding and fmall dofes of nitre will be of ufe; a fcruple or half a drachm of nitre may be taken in a cup of his ordinary drink twice or thrice a day. His drink may likewife be fharpened with acids, as juice of lemon, or a few drops of the fpirit of vitriol; or he may take frequently a cup of the tincture of rofes.

Bathing the feet and legs in lukewarm water has likewife a very good effect in this difeafe. Opiates too are fometimes beneficial; but thefe must be administered with caution. Ten or twelve drops

of

of laudanum may be given in a cup of barley-water twice a-day, and continued for fome time, provided they be found beneficial.

The conferve of roles is likewife a very good medicine in this cafe, provided it be taken in fufficient quantity, and long enough perfifted in. Ic may be taken to the quantity of three or four ounces a-day; and, if the patient be troubled with a cough, it should be made into an electuary with balfamic fyrup, and a little of the fyrup of poppies.

If ftronger aftringents be neceffary, fifteen or twenty drops of the elixir of vitriol may be given in a glass of water three or four times a-day.

Those who are subject to frequent returns of this difease should avoid all excess. Their diet should be light and cool, confifting chiefly of milk and vegetables. Above all, let them beware of vigorous efforts of the body, and violent agitations of the mind.

VOMITING OF BLOOD.

THIS is not fo common as the other difcharges of blood which have already been mentioned; but it is very dangerous, and requires particular attention.

Vomiting of blood is generally preceded by pain of the stomach, fickness, and nausea; and is accompanied with great anxiety, and frequent fainting fits.

This difeafe is fometimes periodical; in which cafe it is lefs dangerous. It often proceeds from an obstruction of the menses in women; and sometimes from the ftopping of the hæmorrhoidal flux in men. It may be occasioned by any thing that greatly ftimulates or wounds the ftomach, as ftrong vomits or purges, acrid poifons, fharp or hard Z 3 fub-

fubftances taken into the flomach, &c. It is often the effect of obstructions in the liver, the fpleen, or fome of the other viscera. It may likewise proceed from external violence, as blows or bruises, or from any of the causes which produce inflammation. In hysteric women, vomiting of blood is a very common, but by no means a dangerous symptom.

A great part of the danger in this difeafe arifes from the extravalated blood lodging in the bowels, and becoming putrid, by which means a dyfentery or putrid fever may be occasioned. The best way of preventing this, is to keep the body gently open, by frequently exhibiting emollient clyfters. Purges must not be given till the discharge is ftopt, otherwife they will irritate the ftomach, and increase the diforder. All the food and drink must be of a mild cooling nature, and taken in small quantities. Even drinking cold water has fometimes proved a remedy, but it will fucceed better when fharpened with the weak fpirits of vitriol, When there are figns of an inflammation, bleeding may be neceffary; but the patient's weakness will seldom permit it. Opiates may be of use; but they must be given in very small doles, as four or five drops of liquid laudanum twice or thrice a-day.

After the difcharge is over, as the patient is generally troubled with gripes, occafioned by the acrimony of the blood lodged in the inteffines, gentle purges will be neceffary.

OF BLOODY URINE,

THIS is a difcharge of blood from the veffels of the kidneys or bladder, occafiored by their being either enlarged, broken, or eroded. It is more or lefs

342

lefs dangerous according to the different circumftances which attend it.

When pure blood is voided fuddenly without interruption and without pain, it proceeds from the kidneys; but if the blood be in fmall quantity, of a dark colour, and emitted with heat and pain about the bottom of the belly, it proceeds from the bladder. When bloody urine is occafioned by a rough ftone defeending from the kidneys to the bladder, which wounds the *areters*, it is attended with a fharp pain in the back, and difficulty of making water. If the coats of the bladder are hurt by a ftone, and the bloody urine follows, it is attended with the moft acute pain, and a previous ftoppage of urine.

Bloody urine may likewife be occafioned by falls, blows, the lifting or carrying of heavy burdens, hard riding, or any violent motion. It may alfo proceed from ulcers of the bladder, from a ftone lodged in the kidneys, or from violent purges, or fharp diuretic medicines, efpecially cantharides.

Bloody urine is always attended with fome degree of danger: but it is peculiarly fo when mixed with purolent matter, as this fhews an ulcer fomewhere in the urinary paffages. Sometimes this difcharge proceeds from excels of blood, in which cafe it is rather to be confidered as a falutary evacuation than a difeafe. If the difcharge however be very great, it may wafte the patient's ftrength, and occafion an ill habit of body, a dropfy, or a confumption.

The treatment of this diforder must be varied according to the different causes from which it proceeds,

When it is owing to a ftone in the bladder, the cure depends upon an operation, a defcription of which would be foreign to our purpofe. If it be attended with a plethora, and fymptoms of inflammation, bleeding will be neceffary. The body must likewise be kept open by emollient clyfters, or cooling purgative medicines; as cream of tartar, rhubarb, manna, or fmall doses of lenitive electuary.

When bloody urine proceeds from a diffolved ftate of the blood, it is commonly the fymptom of fome malignant difeafe; as the fmall-pox, a putrid fever, or the like. In this cafe the patient's life depends on the liberal use of the Peruvian bark and acids, as has already been shewn.

When there is reafon to fufpect an ulcer in the kidneys or bladder, the patient's diet muft be cool, and his drink of a foft, healing, balfamic quality, as decoctions of marfh-mallow roots with liquorice, folutions of gum-arabic, &c. Three ounces of marfhmallow roots, and half an ounce of liquorice, may be boiled in two Englift quarts of water to one; two ounces of gum-arabic, and half an ounce of purified nitre, may be diffolved in the ftrained liquor, and a tea-cupfol of it taken four or five times a-day.

The early use of altringents in this difease has often bad confequences. When the flux is stopped too foon, the grumous blood, by being confined in the vesselets, may produce inflammations, ablects, and ulcers. If however the case be urgent, or the patient feems to fuffer from the loss of blood, gentle aftringents may be necessfary. In this case the patient may take three or four ounces of lime-water, with half an ounce of the tincture of Peruvian bark, three times a-day.

OF THE DYSENTERY, OR BLOODY FLUX.

THIS difeafe prevails in the fpring and autumn. It is most common in marshy countries, where, after hot and dry summers, it is apt to become epidemic. Perfons are most liable to it who are much exposed to the night-air, or who live in places where the air is confined and unwholefome. Hence it often proves fatal in camps, on shipboard, in jails, hospitals, and such like places.

CAUSES.—The dyfentery may be occafioned by any thing that obitructs the perfpiration, or renders the humours putrid; as damp beds, wet clothes, unwholefome diet, bad air, &c. But it is molt frequently communicated by infection. This ought to make people extremely cautious in going near fuch perfons as labour under the difeafe. Even the fmell of the patient's excrements has been known to communicate the infection.

SYMPTOMS .---- It is known by a flux of the belly, attended by violent pain of the bowels, a conftant inclination to go to ftool, and generally more or lefs blood in the stools. It begins, like other fevers, with chillness, loss of ftrength, a quick pulfe, great thirst, and an inclination to vomit. The ftools are at first greafy and frothy, afterwards they are streaked with blood, and at last have frequently the appearance of pure blood, mixed with fmall filaments refembling bits of fkin. Worms are sometimes passed both upwards and downwards through the whole course of the disease. When the patient goes to ftool, he feels a bearing down, as if the whole bowels were falling out, and fometimes a part of the inteffine is actually protruded, which proves exceeding troublefome, efpecially in children.

OF THE DYSENTERY,

316

children. Flatulency is likewife a troublefome fymptom, efpecially towards the end of the difeafe.

This difeafe may be diftinguished from a diarrhoea or loofenes, by the acute pain of the bowels, and the blood which generally appears in the stools. It may be diftinguished from the *cholera morbus* by its not being attended with such violent and frequent fits of vomiting, &c.

When the dyfentery attacks the old, the delicate, or fuch as have been wafted by the gout, the fcurvy, or other lingering difeafes, it generally proves fatal. Vomiting and hiccuping are bad figns, as they fhew an inflammation of the ftomach. When the ftools are green, black, or have an exceeding difagreeable cadaverous fmell, the danger is very great, as it fhews the difeafe to be of the putrid kind. It is an unfavourable fymptom when clyfters are immediately returned; but ftill more fo, when the paffage is fo obfinately flut, that they cannot be injected. A feeble pulfe, coldnefs of the extremities, with difficulty of fwallowing, and convulfions, are figns of approaching death.

REGIMEN.—Nothing is of more importance in this difeafe than cleanlinefs. It contributes greatly to the recovery of the patient, and no lefs to the tafety of tuch as attend him. In all contagious difeafes the danger is increafed, and the infection fpread, by the neglect of cleanlinefs; but in no one more than this. Every thing about the patient fhould be frequently changed. The excrement fhould never be fuffered to continue in his chamber, but removed immediately and buried under ground. A conflant ftream of frefh air fhould be admitted into the chamber; and it ought frequently to be fprinkled with vinegar, juice of lemon, or fome other ftrong acid.

The

The patient muft not be difcouraged, but his fpirits kept up in hopes of a cure. Nothing tends more to render any putrid difeafe mortal, than the fears and apprehenfions of the fick. All difeafes of this nature have a tendency to fink and deprefs the fpirits, and when that is increased by fears and alarms from those whom the patient believes to be perfons of fkill, it cannot fail to have the worft effects.

A flannel waiftcoat worn next the fkin has often a very good effect in the dyfentery. This promotes the perfpiration without over-heating the body. Great caution however is neceffary in leaving it off. I have often known a dyfentery brought on by imprudently throwing off a flannel waiftcoat before the feafon was fufficiently warm. For whatever purpofe this piece of drefs is worn, it flould never be left off but in a warm feafon.

In this difeafe the greateft attention must be paid to the patient's diet. Flesh, fish, and every thing that has a tendency to turn putrid or rancid on the ftomach must be abstained from. Apples boiled in milk, water-pap, and plain light pudding, with broth made of the gelatinous parts of animals, may conflictute the principal part of the patient's food. Gelatinous broth not only answers the purpose of food, but likewife of medicine. I have often known dysenteries, which were not of a putrid nature, cured by it, after pompous medicines had proved ineffectual *.

Another

The manner of making this broth is, to take a fheep's head and feet with the fkin upon them, and to burn the wool off with a hot iron; afterwards to boil them till the broth is quite a jelly. A little cinnamon or mace may be added, to give the broth an agreeable flavour, and the patient may take a little of it warm with toafted bread three or four times a-day. A clyfter of it may likewife be given twice a-day. Such as cannot ufe the broth made in this way, may have the head and feet fkinned; but we have 348 OF THE DYSENTERY,

Another kind of food very proper in the dyfentery, which may be ufed by fuch as cannot take the broth mentioned above, is made by boiling a few handfuls of fine flour, tied in a cloth, for fix or feven hours, till it becomes as hard as flarch. Two or three table-fpoonfuls of this may be grated down, and boiled in fuch a quantity of new milk and water as to be of the thicknefs of pap. This may be fweetened to the patient's tafte, and taken for his ordinary food *.

In a *putrid dyfentery* the patient may be allowed to eat freely of most kinds of good ripe fruit; as apples, grapes, gooseberries, currant-berries, ftrawberries, &c. These may either be eaten raw or boiled, with or without milk, as the patient chooses. The prejudice against fruit in this difease is fo great, that many believe it to be the common cause of dysenteries. This however is an egregious mistake. Both reason and experience show, that good fruit is one of the best medicines, both for the preven-

have reafon to believe that this injures the medicine. It is not our buffneds here to reafon upon the nature and qualities of medicine, otherwife this might be fhewn to poffeds virtues every way fuited to the cure of a dyfentery which does not proceed from a putrid flate of the humours. One thing we know, which is preferable to all reafoning, that whole families have often been cured by it, lifter they had ufed many other medicines in vain. It will, however, be proper that the patient take a vomit, and a dofe or two of rhubarb, before he begins to ufe the broth. It will likewife be neeffary to continue the ufe of it for a confiderable time, and to make it the principal food.

* The learned and humane Dr. Rutherford, late profeffor of medicine in the univerfuy of Edinburgh, ufed to mention this food in his public leftures with great encomiums. He directed it to be made by tying a pound or two of the fineff flour, as tight as poffible, in a linen rag, afterwards to dip it frequently in water, and to dridge the outfide with flour, till a cake or cruft was formed around it, which prevents the water from foaking into it while boiling. It is then to be boiled till it becomes a hard dry maß, as directed above. This, when mixed with milk and water, will not only answer the purpofe of food, but may likewife be given in clyfters.

tion

tion and cure of the dyfentery. Good fruit is in every respect calculated to counteract that tendency to putrefaction, from whence the most dangerous kind of dysentery proceeds. The patient in such a case ought therefore to be allowed to eat as much fruit as he pleases, provided it be ripe *.

The moft proper drink in this diforder is whey. The dyfentery has often been cured by the ufe of clear whey alone. It may be taken both for drink and in form of clyfter. When whey cannot be had, barley-water fharpened with cream of tartar may be drank, or a decoction of barley and tamarinds; two ounces of the former and one of the latter may be boiled in two Englifh quarts of water to one. Warm water, water-gruel, or water wherein hot iron has been frequently quenched, are all very proper, and may be drank in turns. Camomile-tea, if the ftomach will bear it, is an exceeding proper drink. It both ftrengthens the ftomach, and by its antifeptic quality tends to prevent a mortification of the bowels.

MEDICINE.——At the beginning of this difeafe it is always neceffary to cleanfe the first paffages. For this purpose a vomit of ipecacuanha must be given, and wrought off with weak camo-

* I lately faw a young man who had been feized with a dyfentery in North America. Many things had been tried there for his relief, but to no purpole. At length, tired out with difappointments from medicine, and reduced to fkin and bone, he came over to Britain, rather with a view to die among his relations, than with any hopes of a cure. After taking fundry medicines here with no better fuccefs than abroad, I advifed him to leave off the ufe of drugs, and to traff entirely to a diet of milk and fruits, with gentle exercife. Strawberries was the only fruit he could procure at that feafon. Thefe he ate with milk twice and fometimes thrice a-day. The confequence was, that in a fhort time his fkools were reduced from upwards of twenty in a-day, to three or four, and fometimes not io many. He ufed the other fruits as they camp in, and was in a few weeks fo well as to leave that part of the country where I was with a view to return to America.

16

mile-

350 OF THE DYSENTERY,

mile-tea. Strong vonits are feldom neceffary here. A fcruple, or at moft half a drachm of ipecacuanha, is generally fufficient for an adult, and fometimes a very few grains will fuffice. The day after the vonit, half a drachm, or two fcruples of rhubarb, muft be taken; or what will anfwer the purpofe rather better, an ounce or an ounce and a half of Epfom falts. This dofe may be repeated every other day for two or three times. Afterwards fmall dofes of ipecacuanha may be taken for fome time. Two or three grains of the powder may be mixed in a tablefpoonful of the fyrup of poppies, and taken three times a day.

These evacuations, and the regimen prescribed above, will often be fufficient to effect a cure. Should it however happen otherwise, the following astringent medicines may be used :

A clyfter of ftarch or fat mutton-broth, with thirty or forty drops of liquid laudanum in it, may be administered twice a day. At the fame time an ounce of gum-arabic, and half an ounce of gumtragacanth, may be diffolved in an English pint of barley-water, over a flow fire, and a table-spoonful of it taken every hour.

If these have not the defired effect, the patient may take, four times a-day, about the bulk of a nutmeg of the *Japonic confection*, drinking after it a tea-cupful of the decoccion of logwood *.

Perfons who have been cured of this difeafe are very hable to relapfe; to prevent which, great circumfpection with respect to diet is neceffary. The patient must abstain from all fermented liquors, except now and then a glass of good wine; but he must drink no kind of malt liquor. He should likewife abstain from animal food, as fish and flesh, and live principally on milk and vegetables.

* See Appendix, Decostion of Logwood.

Gentle

201

Gentle exercife and wholefome air are likewife of importance. The patient fhould go to the country as foon as his ftrength will permit, and fhould take exercife daily on horfeback, or in a carriage. He may likewife ufe bitters infufed in wine or brandy, and may drink twice a-day a gill of lime-water mixed with an equal quantity of new milk.

When dyfenteries prevail, we would recommend a ftrict attention to cleanlinels, a fpare use of animal food, and the free use of found ripe fruits, and other vegetables. The night air is to be carefully avoided, and all communication with the fick. Bad fmells are likewise to be fhunned, cfpecially those which arise from putrid animal fubstances. The neceffaries where the fick go are carefully to be avoided.

When the first fymptoms of the dyfentery appear, the patient ought immediately to take a vomit, to go to bed, and drink plentifully of weak warm liquor, to promote a fweat. This, with a dofe or two of rhubarb at the beginning, would often carry off the difeafe. In countries where dyfenteries prevail, we would advife fuch as are liable to them, to take either a vomit or a purge every fpring or autumn, as a preventive.

There are fundry other fluxes of the belly, as te LIENTERY and CCELIAC PASSION, which, though lefs dangerous than the dyfentery, yet merit confideration. Thefe difeafes generally, proceed from a relaxed flate of the ftomach and inteflines, which is fometimes fo great, that the food paffes' through them with hardly any fenfible alteration; and the patient dies merely from the want of nourifhment.

When the lientery or coeliac paffion fucceeds to a dyfentery, the cafe is bad. They are always dangerous in old age, effectially when the continution has been broken by excepts or acute dileates. If the ftools ftools be very frequent, and quite crude, the thirft great, with little urine, the mouth ulcerated, and the face marked with fpots of different colours, the danger is very great.

The treatment of the patient is in general the fame as in the dyfentery. In all obfinate fluxes of the belly, the cure muft be attempted, by first cleanfing the stomach and bowels with gentle vomits and purges; afterwards such a diet as has a tendency to heal and strengthen the bowels, with opiates and astringent medicines, will generally complete the cure.

The fame obfervation holds with refpect to a TENESMUS, or frequent defire of going to ftool. This difeafe refembles the dyfentery fo much, both in its fymptoms and method of cure, that we think it needlefs to infift upon it.

CHAP. XXXIV.

OF THE HEAD-ACH.

A CHES and pains proceed from very different causes, and may affect any part of the body; but we shall point out those only which occur most frequently and are attended with the greatest danger.

When the head-ach is flight, and affects a particular part of the head only, it is called *cephalalgia*; when the whole head is affected, *cephalaea*; and when on one fide only, *hemicrania*. A fixed pain in the forehead, which may be covered with the end of the thumb, is called the *clavis by/tericus*.

There are also other diffinctions. Sometimes the pain is internal, fometimes external; fometimes it is

is an original difeafe, and at other times only fymptomatic. When the head-ach proceeds from a hot bilious habit, the pain is very acute and throbbing, with a confiderable heat of the part affected. When from a cold phlegmatic habit, the patient complains of a dull heavy pain, and has a fense of coldness in the part. This kind of head-ach is fometimes attended with a degree of flupidity or folly.

Whatever obstructs the free circulation of the blood through the veffels of the head, may occafion a head-ach. In perfons of a full habit, who abound with blood, the head-ach often proceeds from the suppression of customary evacuations; as bleed ing at the nofe, fweating of the feet, &c. It may likewife proceed from any caule that determines a oreat flux of blood towards the head; as coldness of the extremities, or hanging down the head for a long time. Whatever prevents the return of the blood from the head will likewife occafion a headach; as looking long obliquely at any object, wearing any thing tight about the neck, a new hat, or the like.

When a head-ach proceeds from the ftoppage of a running at the nofe, there is a heavy, obtuie, preffing pain in the fore-part of the head, in which there feems to be fuch a weight, that the patient can fcarce hold it up. When it is occasioned by the cauftic matter of the venereal difeafe, it generally affects the skull, and often produces a caries of the bones.

Sometimes the head-ach proceeds from the repulfion or retroceffion of the gout, the eryfipelas, the fmall-pox, meafles, itch, or other eruptive What is called a bemicrania generally prodifeafes. ceeds from crudities or indigeftion. Inanition, or emptinefs, will often alfo occafion head-achs. I have often feen inftances of this in nurfes who gave fuck too

too long, or who did not take a fufficient quantity of folid food.

There is likewife a most violent, fixed, constant, and almost intolerable head-ach, which occasions great debility both of body and mind, prevents fleep, deftroys the appetite, caules a vertigo, dimnels of light, a noile in the ears, convultions, epileptic fits, and fometimes vomiting, coffiveness, coldness of the extremities, &c.

The head-ach is often fymptomatic in continual and intermitting fevers, especially quartans. It is likewife a very common fymptom in hyfteric and hypochondriac complaints.

When a head-ach attends an accute fever, with pale urine, it is an unfavourable fymtom. In exceffive head-achs, coldness of the extremities is a bad fign.

When the difeafe continues long, and is very violent, it often terminates in blindnefs, an apoplexy, deafneis, a vertigo, the palfy, or the epilepfy.

In this difeafe the cool regimen in general is to be observed. The diet ought to confist of fuch emollient fubstances as will correct the acrimony of the humours, and keep the body open; as apples boiled in milk, fpinage, turnips, and fuch like. The drink ought to be diluting; as barley-water, infufions of mild mucilaginous vegetables, decoctions of the fudorific woods, &c. The feet and legs ought to be kept warm, and frequently bathed in lukewarm water; the head fhould be fhaved, and bathed with water and vinegar. The patient ought as much as poffible to keep in an crect posture, and not to lie with his head too low.

When the head ach is owing to excefs of blood, or an hot bilious conflitution, bleeding is neceffary. The patient may be bled in the jugular vein, and

2 -

OF THE HEAD-ACH.

and the operation repeated if there be occasion, Cupping alfo, or the application of leeches to the temples, and behind the ears, will be of fervice. Atterwards a bliftering-plafter may be applied to the neck behind the ears, or to any part of the head that is most affected. In fome cases it will be proper to blifter the whole head. In perfons of a grofs habit, iffues or perpetual blifters will be of fervice. The body ought likewife to be kept open by gentle laxatives.

But when the head-ach proceeds from a copious vitiated *ferum* ftagnating in the membranes, either within or without the fkull, with a dull, heavy, continual pain, which will neither yield to bleeding nor gentle laxatives, then more powerful purgatives are neceffary, as pills made of aloes, refin of jalap, or the like. It will also be neceffary in this cafe to blifter the whole head, and to keep the back part of the neck open for a confiderable time by a perpetual blifter.

When the head-ach is occafioned by the ftoppage of a running at the nole, the patient fhould frequently fmeil to a bottle of volatile falts; he may hkewife take fouff, or any thing that will irritate the nole, fo as to promote a difcharge from it; as the herb maftich, ground ivy, &cc.

A bemicrania, efpecially a periodical one, is generally owing to a foulnefs of the ftomach, for which gentle vomits muft be adminifiered, as allo purges of rhubarb. After the bowels have been fufficient ly cleared, chalybeate waters, and fuch bitters as ftrengthen the ftomach, will be neceffary. A periodia cal head ach has been cured by wearing a piece of flained over the forehead during the night.

When the head-ach arifes from a vitiated ftate of the humours, as in the feurvy and venereal diffeale, the patient, after proper evacuations, muft drink freely of the decostion of woods, or the

Aa 2

353

decog

decoction of farfaparilla, with raifins and liquorice *. Thefe, if duly perfifted in, will produce very happy effects. When a collection of matter is felt under the fkin, it muft be difcharged by an incifion, otherwife it will render the bone carious.

When the head ach is fo intolerable as to endanger the patient's life, or is attended with continual watching and dilirium, recourfe muft be had to opiates. Thefe, after proper evacuations by clyfters or mild purgatives, may be applied both externally and internally. The affected part may be rubbed with Bate's anodyne balfam, or a cloth dipped in it may be applied to the part. The patient may, at the fame time, take twenty drops of laudanum, in a cup of valerian or penny-royal tea, twice or thrice a-day. This is only to be done in cafe of extreme pain. Proper evacuations ought always to accompany and follow the use of opiates †.

When the patient cannot bear the loss of blood, his feet ought frequently to be bathed in lukewarm water, and well rubbed with a coarse cloth. Cataplasms with mustard or horse-radish ought likewise to be applied to them. This course is peculiarly necessary when the pain proceeds from a gouty humour affecting the head.

When the head-ach is occafioned by great heat, hard labour, or violent exercise of any kind, it may be allayed by cooling medicines; as the faline draughts with nitre, and the like.

* See Appendix, Decoclion of Sarfaparilla.

⁺ When the pain is very violent, and does not yield to fmall dofes of laudanum, the quantity may be increafed. I have known a patient in extreme pain take three hundred drops in twenty-four hours; but fuch dofes ought only to be adminifiered by a perfon of fkill.

A little

OF THE TOOTH-ACH.

A little æther, dropt into the palm of the hand, and applied to the forehead, will fometimes remove a violent head-ach.

OF THE TOOTH-ACH.

THIS difeafe is fo well known, that it needs no defoription. It has great affinity with the rheumatifm, and often fucceeds pains of the fhoulders and other parts of the body.

It may proceed from obstructed perspiration, or any of the othe caufes of inflammation. I have often known the tooth-ach occasioned by neglecting fome part of the ufual coverings of the head, by fitting with the head bare near an open window, or expoling it to a draught of cold air. Food or drink taken either too hot or too cold is very burtful to the teeth. Great quantities of fugar, or other fweet meats, are likewife hurtful. Nothing is more diftructive to the teeth than cracking nuts, or chewing any kind of hard fubstances. Picking the teeth with pins, needles, or any thing that may hurt the enamel with which they are covered, does great mifchief, as the tooth is fure to be spoiled whenever the air gets into it. Breeding women are very fubject to the tooth-ach, especially during the first three or four months of pregnancy. The tooth-ach often proceeds from fcorbutic humours affecting the gums. In this cafe the teeth are fometimes wafted, and fall out without any confiderable degree of pain. The more immediate caufe of the tooth-ach is a rotten or carious tooth.

In order to relieve the tooth-ach, we must first endeavour to leffen the flux of humours to the part affected. This may be done by mild purgatives, fcarifying the gums, or applying leeches to them, and bathing the feet frequently with warm water. The perfpiration ought likewife to be promoted, by drink-

Aa 3

357

ing

OF THE TOOTH-ACH.

ing freely of weak wine-whey, or other diluting liquors, with fmall dofes of nitre. Vomits too have often an exceeding good effect in the tooth-ach. It is feldom fafe to administer opiates, or any kind of hearing medicines, or even to draw a tooth, till proper evacuations have been premifed; and these alone will often effect the cure.

If this fails, and the pain and inflammation ftill increafe, a fuppuration may be expected, to promote which a toafted fig fhould be held between the gumand the cheek; bags filled with boiled camomileflowers, flowers of elder, or the like, may be applied near the part affected, with as great a degree of warmth as the patient can bear, and renewed as they grow cool: the patient may likewife receive the fleams of warm water into his mouth, through an inverted funnel, or by holding his head over the mouth of a porringer filled with warm water.

Such things as promote the difcharge of faliva, or caufe the patient to fpit, are generally of fervice. For this purpofe, bitter, hot, or pungent vegetables may be chewed; as gentian, calamus aromaticus, or pellitory of Spain. Allen recommends the root of *yellow water flower-de-lace* in this cafe. This root may either be rubbed upon the tooth, or a little of it chewed. Brookes fays he hardly ever knew it fail to eafe the tooth-ach. It cught however to be ufed with caution.

Many other herbs, roots, and feeds, are recommended for curing the tooth-ach; as the leaves or roots of millefoil or yarrow chewed, tobacco fmoked or chewed, ftaves-acre, or the feeds of multard chewed, &c. Thefe bitter, hot, and pungent things, by occasioning a greater flow of *faliva*, frequently give eafe in the tooth-ach.

Opiates often relieve the tooth-ach. For this purpose a little cotton wet with laudanum may be held between the teeth; or a piece of flickingplaster,

OF THE TOOTH-ACH.

plaster, about the bigness of a shilling, with a bit of opium in the middle of it, of a fize not to prevent the slicking of the other, may be laid on the temporal artery, where the pulsation is most fensible. De la Moste affirms, that there are few cases wherein this will not give relief. If there be a hollow tooth, a small pill made of equal parts of camphire and opium, put into the hollow, is often beneficial. When this cannot be had, the hollow tooth may be filled with gum massich, wax, lead, or any fubstance that will stick in it, and keep out the external air.

Few applications give more relief in the tooth-ach than bliftering-plafters. These may be applied between the thoulders; but they have the best effect when put behind the ears, and made so large as to cover a great part of the lower jaw.

After all, when a tooth is carious, it is often impoffible to remove the pain without extracting it; and, as a fpoiled tooth never becomes found again, it is prudent to draw it foon, left it fhould affect the reft. Tooth-drawing, like bleeding, is very much practified by mechanics, as well as perfons of the medical profeffion. The operation however is not without danger, and ought always to be performed with care. A perfon unacquainted with the ftructure of the parts will be in danger of hurting the jawbone, or of drawing a found tooth inftead of a rotten one*.

When the tooth-ach returns periodically, and the pain chiefly affects the gums, it may be cured by the bark.

Some pretend to have found great benefit in the tooth-ach, from the application of an artificial magnet

* This may always be prevented by the operator flriking upon the teeth with any piece of metal, as this never fails to excite the pain in the carious tooth.

to the affected tooth. We fhall not attempt to account for its mode of operation; but, if it be found to answer, though only in particular cafes, it certainly deferves a trial, as it is attended with no expence, and cannot do any harm. Electricity has likewife been recommended, and particular inftruments have been invented for fending a shock through the affected tooth.

Perfons who have returns of the tooth-ach at certain feafons, as fpring and autumn, might often prevent it by taking a purge at thefe times.

Keeping the teeth clean has no doubt a tendency to prevent the tooth-ach. The beft method of doing this is to wash them daily with falt and water, a decoction of the bark, or with cold water alone. All brushing and scraping of the teeth is dangerous, and, unless it be performed with great care, does mitchief.

OF THE EAR-ACH.

THIS diforder chiefly affects the membrane which lines the inner cavity of the ear called the *meatus auditorius*. It is often fo violent as to occafion great reftleffnefs, anxiety, and even delirium. Sometimes epileptic fits, and other convulfive diforders, have been brought on by extreme pain in the ear.

The ear-ach may proceed from any of the caufes which produce inflammation. It often proceeds from a fudden fupprefilion of perfpiration, or from the head being exposed to cold when covered with fweat. It may also be occasioned by worms, or other infects getting into the ear, or being bred there; or from any hard body flicking in the ear. Sometimes it proceeds from the translation of morbific matter to the ear. This often happens in the decline of malignant fevers, and occasions deafnels.

OF THE EAR-ACH.

nefs, which is generally reckoned a favourable fymptom.

When the ear-ach proceeds from infects, or any hard body flicking in the ear, every method muft be taken to remove them as foon as poffible. The membranes may be relaxed by dropping into the ear oil of fweet almonds, or olive oil. Afterwards the patient fhould be made to fneeze, by taking fnuff, or fome ftrong fternutatory. If this fhould not force out the body, it muft be extracted by art. I have feen infects, which had got into the ear, come out of their own accord upon pouring in oil.

When the pain of the ear proceeds from inflammation, it must be treated like other topical inflammations, by a cooling regimen, and opening medicines. Bleeding at the beginning, either in the arm or jugular vein, or cupping in the neck, will be proper. The ear may likewife be fomented with fteams of warm water; or flannel bags filled with boiled mallows and camomile-flowers may be applied to it warm; or bladders filled with warm milk and water. An exceeding good method of fomenting the ear is to apply it clofe to the mouth of a jug filled with warm water, or a flrong decoction of camomile flowers.

The patient's feet fhould be frequently bathed in lukewarm water, and he ought to take fmall doles of nitre and rhubarb, viz. a foruple of the former, and ten grains of the latter, three times a-day. His drink may be whey, or decoction of barley and liquorice with figs or raifins. The parts behind the ear ought frequently to be rubbed with camphorated oil, or a little of the volatile liniment.

When the inflammation cannot be difcuffed, a poultice of bread and milk, or roafted onions, may be applied to the ear, and frequently renewed, till the

362 PAIN OF THE STOMACH, St.

the abfcefs breaks, or can be opened. Afterwards the humours may be diverted from the part by gentle laxatives, blifters, or iffues; but the difcharge must not be fuddenly dried up by any external application.

PAIN OF THE STOMACH, &c.

This may proceed from various caules, as indigeftion; wind; the acrimony of the bile; fharp, acrid, or poifonous fubftances taken into the ftomach, &c. It may likewife be occafioned by worms; the ftoppage of cuftomary evacuations; a tranflation of gouty matter to the ftomach, the bowels, &c.

Women in the decline of life are very liable to pains of the ftomach and bowels, especially such as are afflicted with hysteric complaints. It is likewise very common to hypochondriac men of a fedentary and luxurious life. In such persons it often proves so extremely obstinate as to baffle all the powers of medicine.

When the pain of the fromach is most violent after eating, there is reason to suspect that it proceeds from some fault either in the digestion or the food. In this case the patient ought to change his diet, till he finds what kind of food agrees best with his stomach, and should continue chiefly to use it. If a change of diet does not remove the complaint, the patient may take a gentle vomit, and afterwards a dole or two of rhubarb. He ought likewise to take an infusion of camonile flowers, or some other flomachic bitter, either in wine or water. I have often known exercise remove this complaint, especially failing, or a long journey on horfeback, or in a tarriage.

When

PAIN OF THE STOMACH, Gc. 363

When a pain of the ftomach proceeds from flarulency, the patient is conftantly belching up wind, and feels an uneafy diffention of the ftomach after meals. This is a moft deplorable difeafe, and is feldom thoroughly cured. In general, the patient ought to avoid all windy diet, and every thing that fours on the ftomach, as greens, roots, &c. This rule however admits of fome exceptions. There are many inflances of perfons very much troubled with wind, who have received great benefit from eating parched peafe, though that grain is generally tuppofed to be of a windy nature *.

This complaint may likewife be greatly relieved by labour, efpecially digging, reaping, mowing, or any kind of active employment by which the bowels are alternately compressed and dilated. The most obtinate case of this kind I ever met with was in a perfon of a fedentary occupation, whom I advifed, after he had tried every kind of medicine in vain, to turn gardener', which he did, and has ever fince enjoyed good health.

When a pain of the ftomach is occafioned by the fwallowing of actid or poifonous fubftances, they must be difcharged by vomit; this may be excited by butter, oils, or other foft things, which fheath and detend the ftomach from the actimony of its contents.

When pain of the ftomach proceeds from a tranflation of gouty matter, warm cordials are neceffary, as generous wines, French brandy, &c. Some have drank a whole bottle of brandy or rum, in this cafe, in a few hours, without being in the leaft intoxic.tted, or even feeling the ftomach warmed by it. It is impossible to afcertain the quantity

* Thefe are prepared by feeping or foaking peafe in water, and afterwards drying them in a pot or kiln till they be quite hard. They may be used at pleasure.

necel.

364 PAIN OF THE STOMACH, &c.

neceffary upon these occasions. This must be left to the feelings and diferention of the patient. The fafer way however is, not to go too far. When there is an inclination to vomit, it may be promoted by drinking an infusion of camomile-flowers, or carduus benediëtus.

If a pain of the ftomach proceed from the ftoppage of cuftomary evacuations, bleeding will be neceffary, efpecially in fanguine and very full habits. It will likewife be of ufe to keep the body gently open by mild purgatives; as rhubarb or fenna. When this difeate affects women in the decline of life, after the ftoppage of the *menfes*, making an iffue in the leg or arm will be of peculiar fervice.

When the difeafe is occafioned by worms, they must be deftroyed, or expelled by fuch means as are recommended in the following fection.

When the ftomach is greatly relaxed and the digeftion bad, which often occafion flatulencies, the elixir of vitriol will be of fingular fervice. Fifteen or twenty drops of it may be taken in a glass of wine or water twice or thrice a-day.

Perfons afflicted with flatulency are generally unhappy unlefs they be taking fome purgative medicines; thefe, though they may give immediate eafe, tend to weaken and relax the flomach and bowels, and confequently increase the diforder. Their beft method is to mix purgatives and flomachics together. Equal parts of Peruvian bark and rhubarb may be infufed in brandy or wine, and taken in fuch quantity as to keep the body gently open.

CHAP. XXXV.

OF WORMS.

THESE are chiefly of three kinds, viz. the tania, or tape-worm; the teres, or round and long worm; and the afcarides, or round and fhort worm. There are many other kinds of worms found in the human body; but as they proceed, in a great meafure, from fimilar caufes, have nearly the fame fymptoms, and require almost the fame method of treatment as these already mentioned, we shall not spend time in enumerating them.

The tape-worm is white, very long, and full of joints. It is generally bred either in the ftomach or imall inteffines. The round and long worm is likewife bred in the fmall guts, and fometimes in the ftomach. The round and fhort worms commonly lodge in the reflum, or what is called the end gut, and occasion a difagreeable itching about the feat.

The long round worms occafion fqueamifhnefs, vomiting, a difagreeable breath, gripes, loofenefs, fwelling of the belly, fwoonings, loathing of food, and at other times a voracious appetite, a dry cough, convultions, epileptic fits, and fometimes a privation of fpeech. Thefe worms have been known to perforate the inteflines, and get into the cavity of the belly. The effects of the tape-vorm are nearly the fame with those of the long and round, but rather more violent.

Andry fays, the following fymptoms particularly attend the *folium*, which is a fpecies of the tape-worm, *viz.* fwoonings, privation of fpeech, and a voracious appetite. The round worms called *afcarides*, befides an itching of the *anus*, caufe fwoonings, and tenefmus, or an inclination to go to ftool.

CAUSES.

CAUSES.——Worms may proceed from various caufes; but they are feldom found except in weak and relaxed ftomachs, where the digeftion is bad. Sedentary perfons are more liable to them than the active and laborious. Those who eat great quantities of unripe fruit, or who live much on raw herbs and roots, are generally fubject to worms, There feems to be an hereditary disposition in fome perfons to this difeafe. I have often feen all the children of a family fubject to worms of a particular kind. They feem likewife frequently to be owing to the nurfe. Children of the fame family, nurfed by one woman, have often worms, when those nurfed by another have none.

SYMPTOMS .- The common fymptoms of worms are, paleness of the countenance, and at other times, an universal flushing of the face; itching of the nofe; this however is doubtful, as children pick their nofes in all difeafes; ftarting, and grinding of the teeth in fleep; fwelling of the upper lip; the appetite fometimes bad, at other times quite voracious; loofenefs; a four or ftinking breath; a hard fwelled belly; great thirst; the urine frothy, and fometimes of a whitish colour a priping, or colic pains; an involuntary difcharge of faliva, efpecially when afleep; frequent pains of the fide, with a dry cough, and unequal pulfe; palpitations of the heart; fwoonings; drowfinefs; cold fweats; palfy; epileptic fits, with many other unaccountable nervous fymptoms, which were formerly attributed to witchcraft, or the influence of evil fpirits. Small bodies in the excrements refembling melon or cucumber feeds are fymptoms of the tape-worm.

I lately faw fome very furprifing eff. Its of worms in a girl about five years of age, who used to lie for * whole hours as if dead, She at laft expired, and, upon opening her body, a number of the teres, or long long round worms, were found in her guts, which were confiderably inflamed; and what anatomifts call an *intus fufceptia*, or involving of one part of the gut within another, had taken place in no lefs than four different parts of the inteftinal canal^{*}.

MEDICINE. — Though numberless medicines are extolled for expelling and killing worms +, yet no difease more frequently baffles the physician's skill. In general, the most proper medicines for their exputfion are strong purgatives; and to prevent their breeding, stomachic bitters, with now and then a glass of good wine.

The beft purge for an adult is jalap and calomel, Five and twenty or thirty grains of the former with fix or feven of the latter, mixed in fyrup, may be taken early in the morning, for a dofe. It will be proper that the patient keep the house all day, and drink nothing cold. The dofe may be repeated once or twice a week, for a fortnight or three weeks. On the intermediate days the patient may take a drachm of the powder of tin, twice or thrice a-day, mixed with fyrup, honey, or treacle.

Those who do not choose to take calomel may make use of the bitter purgatives, as aloes, hiera picra, tincture of fenna, and rhubarb, &cc.

Oily medicines are fometimes found beneficial for expelling worms. An ounce of falad oil and

* That worms exift in the human body there can be no doubt, and that they mult fometimes be confidered as a difeafe, is equally certain : but this is not the cafe fo often as people imagine. The idea that worms occafon many difeafes, gives an opportunity to the profeffed worm-doctors of impofing on the credulity of mankind, and doing much mifchief. They find worms in every cafe, and liberally throw in their antidotes, which generally confift of frong draftic purges. I have known thefe given in delicate confitutions to the defiruction of the patient, where there was not the leaft fymptom of worms.

A medical writer of the prefent age has enumerated upwards of fifty British plants, all celebrated for killing and expelling worms.

a table.

a table-fpoonful of common falt may be taken in a glafs of red port wine thrice a-day, or oftener, if the ftomach will bear it. But the more common form of ufing oil is in clyfters. Oily clyfters, fweetened with fugar or honey, are very efficacious in bringing away the fhort round worms called *afcarides*, and likewife the *teres*.

The Harrowgate water is an excellent medicine for expelling worms, efpecially the *afcarides*. As this water is impregnated with fulphur, we may hence infer, that fulphur alone muft be a good medicine in this cafe, which is found to be a fact. Many practitioners give flour of fulphur in very large dofes, and with great fuccels. It fhould be made into an electuary with honey or treacle, and taken in fuch quantity as to purge the patient.

Where Harrowgate water cannot be obtained fea-water may be used, which is far from being a contemptible medicine in this case. If fea-water cannot be had, common falt diffolved in water may be drank. I have often seen this used by country nurses with very good effect. Some flower of sulphur may be taken over night, and the salt-water in the morning.

But worms, though expelled, will foon breed again, if the ftomach remains weak and relaxed; to prevent which, we would recommend the Peruvain bark. Half a drachm of bark in powder may be taken in a glafs of red port wine three or four times a-day, after the above medicines have been ufed. Lime-water is likewife good for this purpole, or a table-fpoonful of the chalybeate wine taken twice or thrice a-day. Infufions or decoctions of bit ter herbs may likewife be drank; as the infufion of tanfy, water trefoil, camomile-flowers, tops of wormwood, the leffer centaury, &c.

For a child of four or five years old, fix grains of rhubarb, five of jalap, and two of calomel, may

be

be mixed in a fpoonful of fyrup or honey, and given in the morning. The child fhould keep the houfe all day, and take nothing cold. This dofe may be repeated twice a-week for three or four weeks. On the intermediate days the child may take a fcruple of powdered tin a d ten grains of æthiops mineral in a fpoonful of treacle twice a-day. This dofe muft be increafed or diminished according to the age of the patient.

Biffet fays, the great baftard black hellebore, or bear's foot, is a moft powerful vermifuge for the long round worms. He orders the decoction of about a drachm of the green leaves, or about fifteen grains of the dried leaves in powder for a dole to a child between four and feven years of age. This dole is to be repeated two or three times. He adds, that the green leaves made into a fyrup with coaffe fugar, is almost the only medicine he has ufed for round worms for three years paft. Before prefling out the juice, he moiftens the bruifed leaves with vinegar, which corrects the medicine. The dole is a tea-fpoonful at bed-time, and one or two next morning.

I have frequently known thole big bellies, which in children are commonly reckoned a fign of worms, quite removed by giving them white foap in their pottage or other food. Tanly, garlic, and rue, are all good againft worms, and may be ufed various ways. We might here mention many other plants, both for external and internal ufe, as the cabbage-bark, &c. but think the powder of tin with æthiops mineral, and the purges of rhubarb and calomel, are more to be depended on.

Ball's purging vermifuge powder is a very powerful medicine. It is made of equal parts of rhubarb, fcammony, and calomel, with as much double refined fugar as is equal to the weight of all the other ingredients. These must be well mixed to-Bb gether,

OF THE JAUNDICE.

370

gether, and reduced to a fine powder. The dofe for a child is from ten grains to twenty, once or twice a-week. An adult may take a drachm for a dofe *.

Parents who would preferve their children from worms ought to allow them plenty of exercife in the open air; to take care that their food be wholefome and fufficiently folid; and, as far as poffible, to prevent their eating raw herbs, roots, or green trafhy fruits. It will not be amifs to allow a child who is fubject to worms, a glafs of red wine after meals; as every thing that braces and ftrengthens the ftomach is good both for preventing and expelling thefe vermin \dagger .

CHAP. XXXVI.

OF THE JAUNDICE.

THIS difeafe is first observable in the white of the eye, which appears yellow. Afterwards the whole skin puts on a yellow appearance. The urine too is of a faffion hue, and dies a white cloth

* A powder for the tape-worm refembling this, was long kept a fecret on the Continent; it was lately purchafed by the French king, and will be found under the article *Powder*, in the Appendix.

⁴ We think it neceffary here to warn people of their danger who buy cakes, powders, and other worm medicines, at random from quacks, and give them to their children without proper care. The principal ingredients in moît of thefe medicines is mercury, which is never to be trifled with. I lately faw a flocking inflance of the danger of this conduct. A girl who had taken a dofe of worm powder, bought of a travelling quack, went out, and perhaps was fo imprudent as to drink cold water during its operation. She immediately fwelled, and died on the following day, with all the fymptoms of having been poifoned. of the fame colour. There is likewife a fpecies of this difeafe called the Black Jaundice.

CAUSES.—The immediate caufe of the jaundice is an obftruction of the bile. The remote or occafional caufes are, the bites of poifonous animals, as the viper, mad dog, &c. the bilious or hyfteric colic; violent paffions, as grief, anger, &c. Strong purges or vomits will likewife occafion the jaundice. Sometimes it proceeds from obftinate agues, or from that difeafe being prematurely ftopped by aftringent medicines. In infants it is often occafioned by the meconium not being fufficiently purged off. Pregnant women are very fubject to it. It is likewife a fymptom in feveral kinds of fever. Catching cold, or the ftoppage of cuftomary evacuations, as the menfes, the bleeding piles, iffues, &c. will occafion the jaundice.

SYMPTOMS.—The patient at first complains of exceffive wearinefs, and has great aversion to every kind of motion. His skin is dry, and he generally feels a kind of itching or pricking pain over the whole body. The stools are of a whitish or clay colour, and the urine, as was observed above, is yellow. The breathing is difficult, and the patient complains of an unufual load or oppression on his breast. There is a heat in the nostrils, a bitter taste in the mouth, loathing of food, fickness of the stomach, vomiting, flaulency, and other symptoms of indigestion.

If the patient be young, and the difeafe complicated with no other malady, it is feldom dangerous; but in old people, where it continues long, returns frequently, or is complicated with the droply or hypochondriac fymptoms, it generally proves fatal. The black jaundice is more dangerous than the yellow.

REGIMEN.—The diet fhould be cool, light, and diluting, confifting chiefly of ripe fruits and B b 2 mild

OF THE JAUNDICE.

mild vegetables; as apples boiled or roafted, ftewed prunes, preferved plums, boiled fpinage, &c. Veal or chicken-broth, with light bread, are likewife very proper. Many have been cured by living almost wholly for fome days on raw eggs. The drink should be butter-milk, whey sweetened with honey, or decocctions of cool opening vegetables; or marsh-mallow roots, with liquorice, &c.

The patient flould take as much exercife as he can bear, either on horfeback, or in a carriage; walking, running, and even jumping, are likewife proper, provided he can bear them without pain, and there be no fymptoms of inflammation. Patients have been often cured of this difeafe by a long journey, after medicines had proved ineffectual.

Amufements are likewife of great ufe in the jaundice. The difeafe is often occafioned by a fedentary life, joined to a dull melancholy difpofition. Whatever therefore tends to promote the circulation, and to cheer the fpirits, muft have a good effect; as dancing, laughing, finging, &c.

MEDICINE .- If the patient be young, of a full fanguine habit, and complains of pain in the right fide about the region of the liver, bleeding will be necessary. After this a vomit must be administered, and if the discase proves obstinate, it may be repeated once or twice. No medicines are more beneficial in the jaundice than vomits, especially where it is not attended with inflamma-Half a drachm of ipecacuanha in powder tion. will be a fufficient dofe for an adult. It may be wrought off with weak camomile-tea or lukewarm water. The body must likewife be kept open by taking a sufficient quantity of Castile foap, or the pills for the jaundice recommended in the Appendix.

Fomenting the parts about the region of the ftomach and liver, and rubbing them with a warm

hand

hand or flefh-brufh, are likewife beneficial; but it is ftill more fo for the patient to fit in a bath of warm water up to the breaft. He ought to do this frequently, and fhould continue in it as long as his itrength will permit.

Many dirty things are recommended for the cure of the jaundice; as lice, millepedes, &c. But thefe do more harm than good, as people truft to them, and neglect more valuable medicines; befides, they are feldom taken in fufficient quantity to produce any effects. People always expect that fuch *things* fhould act as charms, and confequently feldom perfift in the ufe of them. Vomits, purges, fomentations, and exercife, will feldom fail to cure the jaundice when it is a fimple difeafe; and when complicated with the dropfy, a fcirrhous liver, or other chronic complaints, it is hardly to be cured by any means.

Numberles British herbs are extolled for the cure of this difease. The author of the *Medicina Britannica* mentions near a hundred, all famous for curing the jaundice. The fact is the difease often goes off of its own accord; in which case the last medicine is always faid to have performed the cure. I have fometimes however feen confiderable benefit, in a very obflinate jaundice, from a decoction of hempfeed. Four ounces of the feed may be boiled in two English quarts of ale, and fweetened with coarfe fugar. The dose is half an English pint every morning. It may be continued for eight or nine days.

I have likewife known Harrowgate fulphur water cure a jaundice of very long ftanding. It should be used for fome weeks, and the patient must both drink and bathe.

The foluble tartar is a very proper medicine in the jaundice. A drachm of it may be taken every night and morning in a cup of tea or water-gruel.

Bb3

IF

OF THE DROPSY.

374

If it does not open the body, the dofe may be increafed.

Perfons fubject to the jaundice ought to take as much exercife as poffible, and to avoid all heating and aftringent aliments.

C H A P. XXXVII.

OF THE DROPSY.

THE dropfy is a preternatural fwelling of the whole body, or fome part of it, occalioned by a collection of watery humour. It is diffinguished by different names, according to the part affected, as the anafarca, or a collection of water under the skin; the afcites, or a collection of water in the belly; the kydreps pessoris, or dropfy of the breast; the kydrosepkalus, or dropfy of the brain, &c.

CAUSES.—The dropfy is often owing to an hereditary difpolition. It may likewife proceed from drinking ardent fpirits, or other flrong liquors. It is true, almoft to a proverb, that great drinkers die of a dropfy. The want of exercife is alfo a very common caufe of the dropfy. Hence it is juftly reckoned among the difeafes of the fedentary. It often proceeds from exceffive evacuations, as frequent and copious bleedings, flrong purges often repeated, frequent falivations, &c. The fudden floppage of cuftomary or neceffary evacuations, as the *menfes*, the hæmorrhoids, fluxes of the belly, &c. may likewife caufe a dropfy.

I have known the dropfy occafioned by drinking large quantities of cold, weak, watery liquor, when the body was heated by violent exercife. A low. low, damp, or marshy situation is likewise a frequent cause of it. Hence it is a common disease in moift, flat, fenny countries. It may also be brought on by a long use of poor watery diet, or of viscous aliment that is hard of digestion. It is often the effect of other diseases, as the jaundice, a feirrhus of the liver, a violent ague of long continuance, a diarrhœa, a dysentery, an empyema, or a confumption of the lungs. In short, whatever obstructs the perspiration, or prevents the blood from being duly prepared, may occasion a dropfy.

SYMPTOMS.—The anafarca generally begins with a twelling of the feet and ancles towards night, whi h for fome time difappears in the morning. In the evening the parts, if preffed with the finger, will pit. The fwelling gradually afcends, and occupies the trunk of the body, the arms, and the head. Afterwards the breathing becomes difficult, the urine is in fmall quantity, and the thirft great; the body is bound, and the perfpiration is greatly obfructed. To thefe tucceed torpor, heavinefs, a flow wafting fever, and a troublefome cough. This laft is generally a fatal fymptom, as it flews that the lungs are affected.

In an *afcites*, befides the above fymptoms, there is a fwelling of the belly, and often a fluctuation, which may be perceived by firiking the belly on one fide, and laying the palm of the hand on the oppofite. This may be diftinguished from a tympany by the weight of the fwelling, as well as by the fluctuation. When the anafarca and afcites are combined, the cafe is very dangerous. Even a fimple afcites feldom admits of a radical cure. Almost all that can be done is, to let off the water by tapping, which feldom affords more than a temporary relief.

When

When the difeafe comes fuddenly on, and the patient is young and ftrong, there is reafon however to hope for a cure, efpecially if medicine be given early. But if the patient be old, has led an irregular or a fedentary life, or if there be reafon to fufpect that the liver, lungs, or any of the vifcera are unfound, there is great reafon to fear that the confequences will prove fatal.

REGIMEN .- The patient must abstain, as much as poffible, from all drink, efpecially weak and watery liquors, and must quench his thirst with mustardwhey, or acids, as juice of lemons, oranges, forrel, or fuch like. His aliment ought to be dry, of a ftimulating and diuretic quality, as toafted bread, the flesh of birds, or other wild animals roasted; pungent and aromatic vegetables, as garlic, mustard, onions, creffes, horfe-radifh, rocambole, fhalot, &c. He may alfo eat fea-bifcuit dipped in wine or a little brandy. This is not only nourifhing, but tends to quench thirft. Some have been actually cured of a dropfy by a total abstinence from all liquids, and living entirely upon fuch things as are mentioned above. If the patient must have drink, the Spawater, or Rhenish wine, with diuretic medicines infused in it, are the beft.

Exercise is of the greatest importance in a dropfy. If the patient be able to walk, dig, or the like, he ought to continue these exercises as long as he can. If he is not able to walk or labour, he must ride on horseback, or in a carriage, and the more violent the motion for much the better, provided he can bear it. His bed ought to be hard, and the air of his apartments warm and dry. If he' lives in a damp country, he ought to be removed into a dry one, and, if possible, into a warmer climate. In a word, every method should be taken to promote the perspiration, and to brace the folids. For 4 this purpole it will likewife be proper to rub the patient's body, two or three times a-day, with a hard cloth, or the flefh-brufh; and he ought conftantly to wear flannel next his fkin.

MEDICINE.——If the patient be young, his conftitution good, and the difeafe has come on fuddenly, it may generally be removed by ftrong vomits, brifk purges, and fuch medicines as promote a difcharge by fweat and urine. For an adult, half a drachm of ipecacuanha in powder, and half an ounce of oxymel of fquills, will be a proper vomit. This may be repeated as often as is found neceffary, three or four days intervening between the dofes. The patient muft not drink much after taking the vomit, otherwife he deftroys its effect. A cup or two of camomile-tea will be fufficient to work it off.

Between each vomit, on one of the intermediate days, the patient may take the following purge: Jalap in powder half a drachm, cream of tartar two darchms, calomel fix grains. Thefe may be made into a bolus with a little fyrup of pale rofes, and taken early in the morning. The lefs the patient drinks after it the better. If he be much griped, he may now and then take a cup of chickenbroth.

The patient may likewife take every night at bed-time the following bolus: To four or five grains of camphor add one grain of opium, and as much fyrup of orange-peel as is fufficient to make them into a bolus. This will generally promote a gentle fweat, which fhould be encouraged by drinking now and then a fmall cup of wine-whey, with a tea-fpoonful of the foirits of hartfhorn in it. A tea-upful of the following diuretic infufion may likewife be taken every four or five hours through the day:

Take

Take juniper berries, muftard feed, and horferadifh, of each half an ounce, afhes of broom half a pound; infufe them in a quart of Rhenifh wine or ftrong ale for a few days, and afterwards ftrain off the liquor. Such as cannot take this infufion, may ufe the decoction of feneka-root, which is both diuretic and fudorific. I have known an obfinate *anafarca* cured by an infufion of the afhes of broom in wine.

The above courfe will often cure an incidental dropfy, if the conftitution be good; but when the difeafe proceeds from a bad habit, or an unfound ftate of the vifcera, ftrong purges and vomits are not to be ventured upon. In this cafe, the fafer courfe is to palliate the fymptoms by the ufe of fuch medicines as promote the fecretions, and to fupport the patient's ftrength by warm and nourifhing cordials.

The fecretion of urine may be greatly promoted by nitre. Brookes fays, he knew a young woman who was cured of a dropfy by taking a drachm of nitre every morning in a draught of ale, after fhe had been given over as incurable. The powder of fquills is likewife a good diuretic. Six or eight grains of it, with a foruple of nitre, may be given twice a-day in a glafs of ftrong cinnamon-water. Ball fays, a large fpoonful of unbruifed muftardfeed taken every night and morning, and drinking half an Englifh pint of the decoction of the tops of green broom after it, has performed a cure after other powerful medicines had proved ineffectual.

I have fometimes feen good effects from cream of tartar in this difeafe. It promotes the difcharges by ftool and urine, and will at leaft palliate, it it does not perform a cure. The patient may begin by taking an ounce every fecond or third day, and may

may increase the quantity to two or even to three ounces, if the ftomach will bear it. This quantity is not however to be taken at once, but divided into three or four dofes.

To promote perfpiration, the patient may use the decoction of feneka-root, as directed above; or he may take two table-fpoonfuls of Mindererus's spirit in a cup of wine-whey three or four times a-day. To promote a discharge of urine, the following infusion of the London hospitals will likewise beneficial:

Take of zedoary-root two drachms; dried fquills, rhubarb, and juniper-berries bruifed, of each a drachm; cinnamon in powder, three drachms; falt of wornwood, a drachm and a half; infufe in an Englifh pint and a half of old hock-wine, and when fit for ufe, filter the liquor. A wine-glafs of it may be taken three or four times a-day.

In the anafarca it is ufual to fcarify the feet and legs. By this means the water is often difcharged; but the operator must be cautious not to make the incifions too deep; they ought barely to pierce through the skin, and especial care must be taken, by spirituous fomentations and proper digestives, to prevent a gangrene.

In an *afcites*, when the difeafe does not evidently and fpeedily give way to purgative and diurctic medicines, the water ought to be let off by tapping. This is a very fimple and fafe operation, and would often fucceed, if it were performed in due time; but if it be delayed till the humours are vitiated, or the bowels fpoiled, by long foaking in water, it can hardly be expected that any permanent relief will be procured *.

After

* The very name of an operation is dreadful to most people, and they with to try every thing before they have recourfe to it. This is the reafon why tapping fo feldom fucceeds to our with. I had

After the evacuation of the water, the patient is to be put on a course of strengthening medicines; as the Peruvian bark; the elixit of vitriol; warm aromatics, with a due proportion of rhubarb, infufed in wine, and fuch like. His diet ought to be dry and nourishing, fuch as is recommended in the beginning of the Chapter; and he should take as much exercise as he can bear without fatigue. He should wear flannel, or rather steep holiery, next his skin, and make daily use of the flesh-brush.

CHAP. XXXVIII.

OF THE GOUT.

HERE is no difeafe which fhews the imperfection of medicine, or fets the advantages of temperance and exercife in a ftronger light, than the gout. Excels and idlenefs are the true fources from whence it originally forung, and all who would avoid it must be assive and temperate.

Though idleness and intemperance are the principal causes of the gout, yet many other things may contribute to bring on the diforder in those who are not, and to induce a paroxysm in those who are subject to it; as intense fludy; too free an use of acidulated liquors; night-watching; grief or uneasiness of mind; an obstruction or defect of any of the customary discharges, as the *menses*, fweating of the feet, perspiration, &cc.

had a patient who was regularly tapped once a month for feveral years, and who ufed to eat her dinner as well after the operation as if nothing had happened. She died at laft rather worn out by age than by the difeafe.

SYMP-

SYMPTOMS.---- A fit of the gout is generally preceded by indigeftion, drowfinefs, belching of wind, a flight head-ach, ficknefs, and fometimes vomiting. The patient complains of wearinefs and dejection of fpirits, and has often a pain in the limbs, with a fenfation as if wind or cold water were paffing down the thigh. The appetite is often remarkably keen a day or two before the fit, and there is a flight pain in paffing urine, and frequently an involuntary fhedding of tears. Sometimes thefe fymptoms are much more violent, efpecially upon the near approach of the fit; and it has been observed, that as is the fever which ushers in the gout, fo will the fit be; if the fever be fhort and tharp, the fit will be fo likewife; if it be feeble, long, and lingering, the fit will be fuch alfo. But this observation can only hold with respect to very. regular fits of the gout.

The regular gout generally makes its attack in the fpring or beginning of winter, in the following manner: About two or three in the morning, the patient is feized with a pain in his great toe, fometimes in the heel, and at other times in the ancle or calf of the leg. This pain is accompanied with a fenfation as if cold water were poured upon the part, which is fucceeded by a fhivering, with fome degree of fever. Afterwards the pain increases, and fixing among the small bones of the foot, the patient feels all the different kinds of torture, as if the part were ftretched, burnt, fqueezed, gnawed, or torn in pieces. The part at length becomes fo exquisitely fensible, that the patient cannot bear to have it touched, or even fuffer any perfon to walk across the room.

The patient is generally in exquisite torture for twenty-four hours, from the time of the coming on of the fit: he then becomes easier, the part begins

to

to fwell, appears red, and is covered with a little moifture. Towards morning he drops afleep, and generally falls into a gentle breathing fweat. This terminates the firft paroxyfin, a number of which conftitutes a fit of the gout; which is longer or fhorter according to the patient's age, ftrength, the feafon of the year, and the difpolition of the body to this difeafe.

The patient is always worfe towards night, and eafier in the morning. The paroxyfms however generally grow milder every day, till at length the difeafe is carried off by perfpiration, urine, and the other evacuations. In fome patients this happens in a few days; in others, it requires weeks, and in fome, months, to finish the fit. Those whom age and frequent fits of the gout have greatly debilitated, feldom get free from it before the approach of fummer, and iometimes not till it be pretty far advanced.

REGIMEN.——As there are no medicines yet known that will cure the gout, we fhall confine our obfervations chiefly to regimen, both in and out of the fit.

In the fit, if the patient be young and ftrong, his diet ought to be thin and cooling, and his drink of a diluting nature; but where the conftitution is weak, and the patient has been accuftomed to live high, this is not a proper time to retrench. In this cafe he muft keep nearly to his ufual diet, and fhould take frequently a cup of ftrong negus, or a glafs of generous wine. Wine whey is a very proper drink in this cafe, as it promotes the perfpiration without greatly heating the patient. It will anfwer this purpole better if a tea-fpoonful of *fal volatile oleofum*, or fpirits of harthorn, be put into a cup of it twice a-day. It will likewife be proper to give at bed-time a tea-fpoonful of the volatile

volatile tincture of guaiacum in a large draught of warm wine-whey. This will greatly promote perspiration through the night.

As the most fafe and efficacious method of difcharging the gouty matter is by perfpiration, this ought to be kept up by all means, efpecially in the affected part. For this purpole the leg and foot fhould be wrapt in foft flannel, fur, or wool. The laft is most readily obtained, and feems to answer the purpose better than any thing elfe. The people of Lancashire look upon wool as a kind of specific in the gout. They wrap a great quantity of it about the leg and foot affected, and cover it with a fkin of foft dreffed leather. This they fuffer to continue for eight or ten days, and fometimes for a fortnight or three weeks, or longer, if the pain does not ceafe. I never knew any external application answer fo well in the gout. I have often feen it applied when the fwelling and inflammation were very great, with violent pain, and have found all these fymptoms relieved by it in a few days. The wool which they use is generally greafed, and carded or combed. They choose the softest which can be had, and feldom or never remove it till the fit be entirely gone off.

The patient ought likewife to be kept quiet and eafy during the fit. Every thing that affects the mind difturbs the paroxyfm, and tends to throw the gout upon the nobler parts. All external applications that repel the matter are to be avoided as death. They do not cure the difeafe but remove it from a fafer to a more dangerous part of the body, where it often proves fatal. A fit of the gout is to be confidered as Nature's method of removing fomething that might prove deftructive to the body, and all that we can do with fafety, is to promote her intentions, and to affift her in expelling the enemy in her own way, Evacuations by bleeding,

ing, ftool, &c. are likewife to be ufed with caution, they do not remove the caufe of the difeafe, and fometimes by weakening the patient prolong the fit: but where the conflitution is able to bear it, it will be of ufe to keep the body gently open by diet, or very mild laxative medicines.

Many things will indeed forten a fit of the gout. and fome will drive it off altogether: but nothing has yet been found which will do this with fafety to the patient. In pain we eagerly grafp at any thing that promifes immediate eafe, and even hazard life itself for a temporary relief. This is the true reafon why fo many infallible remedies have been proposed for the gout, and why fuch numbers have loft their lives by the use of them. It would be as prudent to ftop the small-pox from rising, and to drive them into the blood, as to attempt to repel the gouty matter after it has been thrown upon the extremities. The latter is as much an effort of Nature to free herfelf from an offending caufe as the former, and ought equally to be promoted.

When the pain however is very great, and the patient is reftlefs, thirty or forty drops of laudanum, more or lefs, according to the violence of the fymptoms, may be taken at bed-time. This will eafe the pain, procure reft, promote perfpiration, and forward the crifis of the difeafe.

After the fit is over, the patient ought to take a gentle dofe or two of the bitter tincture of rhubarb, or fome other warm ftomachic purge. He fhould alfo drink a weak infufion of ftomachic bitters in fmall wine or ale, as the Peruvian bark, with cinnamon, Virginian fnake-root, and orange-peel. The diet at this time fhould be light, but nourifhing, and gentle exercife ought to be taken on horfeback, or in a carriage.

Out of the fir, it is in the patient's power to do many things towards preventing a return of the diforder, or rendering the fit, if it fhould return, lefs fevere. This however is not to be attempted by medicine. I have frequently known the gout kept off for feveral years by the Peruvian bark and other aftringent medicines; but in all the cafes where I had occafion to fee this tried, the perfons died fuddenly, and, to all appearance for want of a regular fit of the gout. One would be apt, from hence, to conclude, that a fit of the gout, to fome conflictuions, in the decline of life, is rather falutary than hurtful.

Though it may be dangerous to ftop a fit of the gout by medicine, yet it the confliction can be fo changed by diet and exercife, as to leffen or totally prevent its return, there certainly can be no danger in following fuch a courfe. It is well known that the whole habit may be fo altered by a proper regimen, as quite to eradicate this difeafe; and those only who have fufficient refolution to perfift in fuch a courfe have reafon to expect a cure.

The courfe which we would recommend for preventing the gout, is as follows: In the first place, univerfal temperance. In the next place fufficient exercise*, By this we do not mean fauntering about in an indolent manner, but labour, sweat, and toil. These only can render the humours wholesome, and keep them fo. Going early to bed, and rising be-times, are also of great importance. It is likewise proper to avoid night fludies, and intense thinking. The supper should be light and taken early. All strong liquors, especially generous wines and four punch, are to be avoided.

* Some make a fecret of curing the gout by *mulcular exercite*. This feeret, however, is as old as Celfus, who ftrongly recommends that mode of cure; and whoever will fubmit to it in the fulleft extent, may expect to reap folid and permanent advantages.

Cc

We would likewife recommend fome dofes of magnefia alba and rhubarb to be taken every foring and autumn; and afterwards a course of ftomachie bitters, as tanfey or water-trefoil tea, an infusion of gentian and camomile flowers, or a decoction of burdock-root, &c. Any of thefe, or an infufion of any wholefome bitter that is more agreeable to the patient, may be drank for two or three weeks in March and October twice a-day. An iffue or perpetual blifter has a great tendency to prevent the gout. If thefe were more generally used in the decline of life, they would not only often prevent the gout, but also other chronic maladies. Such as can afford to go to Bath, will find great benefit from bathing and drinking the water. It both promotes digeftion, and invigorates the habit.

Though there is little room for medicine during a regular fit of the gout, yet when it leaves the extremities, and falls on fome of the internal parts, proper applications to recal and fix it become abfolutely neceffary. When the gout affects the head, the pain of the joints ceafes, and the fwelling difappears, while either fevere head-ach, drowfinefs, trembling, giddinefs, convulfions, or delirium come on. When it feizes the lungs, great opprefion, with cough and difficulty of breathing, enfue. If it attacks the flomach, extreme ficknefs, vomiting, anxiety, pain in the epigraftic region, and total lofs of ftrength, will fucceed.

When the gout attacks the head or lungs, every method muft be taken to fix it in the feet. They muft be frequently bathed in warm water, and acrid cataplafms applied to the foles. Bliftering-plafters ought likewife to be applied to the ancles or calves of the legs. Bleeding in the feet or ancles is alfo neceffary, and warm flomachic purges. The patient tient ought to keep in bed for the most part, if there be any figns of inflammation, and should be very careful not to catch-cold.

If it attack the ftomach with a fenfe of cold, the most warm cordials are necessary; as ftrong wine boiled up with cinnamon or other spices; cinnamonwater; peppermint-water; and even brandy or rum*. The patient should keep his bed, and endeavour to promote a fweat by drinking warm liquors; and if he should be troubled with a nausea, or inclination to vomit, he may drink camonile-tea, or any thing that will make him vomit freely.

When the gout attacks the kidneys, and imitates gravel-pains, the patient ought to drink freely of a decoction of marsh-mallows, and to have the parts fomented with warm water. An emollient clyster ought likewife to be given, and afterwards an opiate. If the pain be very violent, twenty or thirty drops of laudanum may be taken in a cup of the decoction.

Perions who have had the gout fhould be very attentive to any complaints that may happen to them about the time when they have reason to expect a return of the fit. The gout imitates many other diforders, and by being miltaken for them, and treated improperly, is often diverted from its regular course, to the great danger of the patient's life.

Those who never had the gout, but who, from their conftitution or manner of living, have reason to expect it, ought likewise to be very circumspect with regard to its first approach. If the difease, by wrong conduct or improper medicines, be diverted from its proper course, the miferable pa-

* Æther is found to be an efficacious remedy in this cafe.

tient

OF THE RHEUMATISM.

tient has a chance to be ever after tormented with bead-achs, coughs, pains of the ftomach and inteffines; and to fall at laft a victim to its attack upon fome of the more noble parts.

OF THE RHEUMATISM.

THIS difeate has often a refemblance to the gout. It generally attacks the joints with exquisite pain, and is fometimes attended with inflammation and fwelling. It is most common in the fpring, and towards the end of autumn. It is usually diftinguished into acute and chronic; or the rheumatism with and without a fever.

CAUSES .--- The caufes of a rheumatifm are frequently the fame as those of an inflammatory fever, viz. an obstructed perspiration, the immoderate use of strong liquors, and the like. Sudden changes of the weather, and all quick transitions from heat to cold, are very apt to occasion the rheumatifm. The most extraordinary cafe of a rheumatifm that I ever faw, where almost every joint of the body was difforted, was a man who used to work one part of the day by the fire, and the other part of it in the water. Very obftinate rheumatifms have likewife been brought on by perfons not accuftomed to it, allowing their feet to continue long wet. The fame effects are often produced by wet clothes, damp beds, fitting or lying on the damp ground, travelling in the night, &c.

The rheumatifm may likewife be occafioned by exceffive evacuations or the ftoppage of cultomary difcharges. It is often the effect of chronic difeafes, which vitiate the humours; as the fcurvy, the *lues venerea*, obflinate autumnal agues, &c.

The rheumatifm prevails in cold, damp, marfhy countries. It is most common among the poorer

fort of pealants, who are ill clothed, live in low damp houles, and eat coarfe unwholefome food, which contains but little nourifhment, and is not eafily digetted.

SYMPTOMS.—The acute rheumatifm commonly begins with wearinefs, fhivering, a quick pulfe, reftlefinefs, thirft, and other. fymptoms of fever. Afterwards the patient complains of flying pains, which are increased by the leatt motion. Theie at length fix in the joints, which are often affected with fwelling and inflammation. If blood be let in this difeafe, it has generally the fame appearance as in the pleurify.

In this kind of rheumatism the treatment of the patient is nearly the fame as in an acute or inflammatory fever. If he be young and ftrong, bleeding is neceffary, which may be repeated according to the exigencies of the cafe. The body ought likewife to be kept open by emollient clyfters, or cool opening liquors; as decoctions of tamarinds, cream of tartar, whey, fenna-tea, and the like. The diet fhould be light, and in fmall quantity, confifting chiefly of roafled apples, groat-gruel, or weak chicken broth. After the feverifh fymptoms have abated, if the pain still continues, the patient must keep his bed, and take fuch things as promote per-Spiration; as wine-whey, with spiritus Mindereri, &c. He may likewife take, for a few nights, at bedtime, in a cup of wine-whey, a drachm of the cream of tartar, and half a drachm of gum guaiacum in powder.

Warm bathing, after proper evacuations, has often an exceeding good effect. The patient may either be put into a bath of warm water, or have cloths wrung out of it applied to the parts affected. Great care must be taken that he do not catch cold after bathing.

OF THE RHEUMATISM.

The chronic rheumatism is feldom attended with any confiderable degree of fever, and is generally confined to fome particular part of the body, as the shoulders, the back, or the loins. There is feldom any inflammation or fwelling in this cafe. Perfons in the decline of life are most subject to the chronic rheumatism. In such patients it often proves extremely obstinate and sometimes incurable.

In this kind of rheumatifm the regimen fhould be nearly the fame as in the acute. Cool and diluting diet, confifting chiefly of vegetable fubstances, as ftewed prunes, coddled apples, currants or goofeberries boiled in milk, is most proper. Arbuthnot fays, " If there be a specific in aliment for the rheumatifm, it is certainly whey ;" and adds, " That he knew a perfon subject to this difease, who could never be cured by any other method but a diet of whey and bread." He likewife fays, " That cream of tartar in water-gruel, taken for feveral days, will eafe rheumatic pains confiderably." This I have often experienced, but found it always more efficacious when joined with gum guaiacum, as already directed. In this cafe the patient may take the dofe formerly mentioned twice a day, and likewife a tea-fooonful of the volatile tincture of gum guaiacum, at b.d-time, in wine whey.

This course may be continued for a week, or longer, if the case proves obflinate, and the patient's ftrength will permit. It ought then to be omitted for a few days, and repeated again. At the fame time leeches or a bhstering-plaster may be applied to the part affected. What I have generally found answer better than either of these, in obflinate fixed rheumatic pains, is the warm-plafler *. I have likewise known a plaster of Bur-

* See Appendix, Warm Plafter.

gundy

gundy pitch worn for fome time on the part affected give great relief in rheumatic pains. My ingenious friend, Dr. Alexander of Edinburgh, fays, he has frequently cured very obflinate rheumatic pains by rubbing the parts affected with tincture of cantharides. When the common tincture did not fucceed, he ufed it of a double or treble ftrength. Cupping upon the part affected is likewife often very beneficial, and fo is the application of leeches.

Though this difeafe may not feem to yield to medicines for fome time, yet they ought ftill to be perfifted in. Perfons who are fubject to frequent returns of the rheumatifm, will often find their account in ufing medicines, whether they be immediately affected with the difeafe or not. The chronic rheumatifm is fimilar to the gout in this respect, that the most proper time for ufing medicines to extirpate it, is when the patient is most free from the diforder.

To thole who can afford the expence, I would recommend the warm baths of Buxton or Matlock in Derbyfhire. Thefe have often, to my knowledge, cured very obflinate rheumatifms, and are always fafe either in or out of the fit. When the rheumatifm is complicated with fcorbutic complaints, which is not feldom the cafe, the Harrowgate waters, and thole of Moffat, are proper. They fhould both be drank and ufed as a warm bath.

There are feveral of our own domeftic plants which may be used with advantage in the rheumatifm. One of the beft is the white *mustard*. A table fpoonful of the feed of this plant may be taken twice or thrice a day, in a glais of water or fmall wine. The water-trefoil is likewise of great use in this complaint. It may be infused in wine or ale, or drank in form of tea. The ground-ivy, C c 4 camomile, and feveral other bitters, are alfo benefieial, and may be ufed in the fame manner. No benefit however is to be expected from thefe, unlefs they be taken for a confiderable time. Excellent medicines are often defpifed in this difeafe, becaufe they do not perform an immediate cure; whereas nothing would be more certain than their effect were they duly perfifted in. Want of perfeverance in the ufe of medicines is one reafon why chronic difeafes are fo feldom cured.

Cold bathing, efpecially in falt water, often cures the rheumatifm. We would allo recommend exercife and wearing flannel next the fkin. Iffues are likewife very proper, efpecially in chronic cafes. If the pain affects the fhoulders, an iffue may be made in the arm; but if it affects the loins, it fhould be put into the leg or thigh.

Perfons afflicted with the feurvy are very fubject to rheumatic complaints. The beft medicines in this cafe are bitters and mild purgatives. Thefe may either be taken feparately or together, as the patient inclines. An ounce of Peruvian bark, and half an ounce of rhubarb in powder, may be infufed in a bottle of wine; and one, two, or three wine glaffes of it taken daily, as fhall be found neceffary for keeping the body gently open. In cafes where the bark titelf proves fufficiently purgative, the rhubarb may be emitted.

Such as are fubject to frequent attacks of the rheumatifm ought to make choice of a dry, warm fituation, to avoid the night-air, wet-clothes, and wet feet, as much as poffible. Their clothing fhould be warm, and they fhould wear flannel next their fkin, and make frequent use of the flefh brufh.

[393]

CHAP. XXXIX.

OF THE SCURVY.

HIS difeafe prevails chiefly in cold northern countries, efpecially in low damp fituations, near large marshes, or great quantities of stagnating water. Sedentary people, of a dull melancholy difposition are most subject to ir. It proves often fatal to failors on long voyages, particularly in ships that are not properly ventilated, have many people on board, or where cleanlines is neglected.

It is not neceffary to mention the different fpecies into which this difeafe has been divided, as they differ from one another chiefly in degree. What is called the *land feuroy*, however, is leldom attended with those highly putrid fymptoms which appear in patients who have been long at fea, and which, we prefume, are rather owing to confined air, want of exercise, and the unwholetome food eaten by failors on long voyages, than to any specific difference in the diffeafe.

CAUSES.——The fcurvy is occafioned by cold moift air; by the long use of falted or fmoke-dried provifions, or any kind of food that is hard of digestion, and affords little nourishment. It may also proceed from the suppression of customary evacuations; as the *menses*, the hæmorrhoidal flux, &c. It is fometimes owing to a hereditary taint, in which case a very small cause will excite the latent diforder. Grief, fear, and other depressing passions, have a great tendency both to excite and aggravate this difease. The same observation holds with regard to negle to f cleanlines; bad clothing; the want of proper exercise; confined air; unwholefome fome food; or any difeafe which greatly weakens the body, or vitiates the humours.

SYMPTOMS,----This difeafe may be known by unufual wearinefs, heavinefs, and difficulty of breathing, especially after motion; rottennels of the gums, which are apt to bleed on the flighteft touch; a flinking breath; frequent bleeding at the nofe; crackling of the joints; difficulty of walking; fometimes a fwelling and fometimes a falling away of the legs, on which there are livid, yellow, or violet coloured spots; the face is generally of .a pale or leaden colour. As the difease advances, other fymptoms come on; as rottennels of the teeth, hæmorrhages, or discharges of blood from different parts of the body, foul obstinate ulcers, pains in various parts, efpecially about the breaft, dry scaly eruptions all over the body, &c. At last a walting or hectic fever comes on, and the miferable patient is often carried off by a dyfentery, a diarrhœa, a dropfy, the palfy, fainting fits, or a mortification of fome of the bowels.

CURE .---- We know no way of curing this difeafe but by purfuing a plan directly oppofite to that which brings it on. It proceeds from a vitiated flate of the humours, occafioned by errors in diet, air, or exercife; and this cannot be removed but by a proper attention to thefe important articles.

If the patient has been obliged to breathe a cold, damp, or confined air, he should be removed, as foon as poffible, to a dry, open, and moderately warm one. If there is reafon to believe that the difeafe proceeds from a fedentary life or depreffing paffions, as grief, fear, &c. the patient must take daily as much exercife in the open air as he can bear, and his mind should be diverted by cheerful company and other amufements. Nothing has a greater

greater tendency either to prevent or remove this difeafe, than conftant cheerfulnefs and good humour. But this, alas! is feldom the lot of perfors afflicted with the fcurvy; they are generally furly, peevifh, and morofe.

When the fcurvy has been brought on by a long use of falted provisions, the proper medicine is a diet confifting chiefly of frefh vegetables; as oranges, apples, lemons, limes, tamarinds, water-creffes, fcurvy-grafs, brook-lime, &cc. The use of thefe, with milk, pot-herbs, new bread, and frefh beer or cyder, will feldom fail to remove a fcurvy of this kind, if taken before it be too far advanced; but to have this effect, they must be perfisted in for a confiderable time. When frefh vegetables cannot be obtained, pickled or preferved ones may be used; and where thefe are wanting, recours must be had to the chymical acids. All the patient's food and drink fhould in this cafe be fharpened with cream of tartar, elixir of vitriol, vinegar, or the fpirit of fea-falt.

Thefe things however will more certainly prevent than cure the fcurvy; for which reason feafaring people, efpecially on long voyages, ought to lay in plenty of them. Cabbages, onions, goofeberries, and many other vegetables, may be kept a long time by pickling, preferving, &c. and when thefe fail, the chymical acids, recommended above, which will keep for any length of time, may be used. We have reason to believe, if ships were well ventilated, had got ftore of fruits, greens, cyder, &c. laid in, and if proper regard were paid to cleanlinefs and warmth, that failors would be the most healthy people in the world, and would feldom fuffer either from the fcurvy or putrid fevers, which are fo fatal to that useful fet of men; but it is too much the temper of fuch people to defpife all precaution; they will not think of any calamity till

OF THE SCURVY:

till it overtakes them, when it is too late to ward off the blow.

It must indeed be owned, that many of them have it not in their power to make the provision we are speaking of; but in this cafe it is the duty of their employers to make it for them; and no man ought to engage in a long voyage without having these articles secured.

I have often feen very extraordinary effects in the land-feurvy from a milk diet. This preparation of Nature is a mixture of animal and vegetable properties, which of all others is the moft fit for reftoring a decayed conflicution, and removing that particular acrimony of the humours, which feems to conflict the very effence of the feury, and many other difeafes. But people defpife this wholefome and nourifhing food, becaufe it is cheap, and devour with greedinefs, flefh and fermented liquors, while milk is only deemed fit for their hogs.

The most proper drink in the fcurvy is whey or butter-milk. When these cannot be had, found cyder, perry, or spruce-beer, may be used. Wort has likewife been found to be a proper drink in the fourvy, and may be used at fea, as malt will keep during the longest voyage. A decoction of the tops of the spruce fir is likewife proper. It may be drank in the quantity of an English pint twice a-day. Tar-water may be used for the lame purpole, or decoctions of any of the mild mucilaginous vegetables; as farfaparilla, marsh-mallow roots, &c. Infusions of the bitter plants, as ground-ivy, the leffer centaury, marsh-trefoil, &c. are likewife beneficial. I have feen the pealants in fome parts of Britain express the juice of the last-mentioned plant, and drink it with good effect in those foul scorbutic eruptions with which they are often troubled in the fpring feafon.

Harrow-

Harrowgate-water is certainly an excellent medieine in the land-fcurvy. I have often feen patients who had been reduced to the most deplorable condition by this difeafe, greatly relieved by drinking the fulphur-water, and bathing in it. The chalvbeate-water may also be used with advantage, especially with a view to brace the ftomach after drinking the fulphur-water, which, though it fharpens the appetite, never fails to weaken the powers of digeftion.

A flight degree of fcurvy may be carried off by frequently fucking a little of the juice of a bitter orange or a lemon. When the difease affects the gums only, this practice, if continued for fome time, will generally carry it off. We would however recommend the bitter orange as greatly preferable to lemon ; it feems to be as good a medicine, and is not near fo hurtful to the ftomach. Perhaps our own forrel may be little inferior to either of them.

All kinds of falad are good in the fcurvy, and ought to be eaten very plentifully, as fpinage, lettuce, parfley, celery, endive, radifh, dandelion, &c. It is amazing to fee how foon fresh vegetables in the fpring cure the brute animals of any fcab or foul-nefs which is upon their fkins. It is reafonable to suppose that their effects would be as great upon the human species, were they used in proper quantity for a fufficient length of time.

I have fometimes feen good effects in fcorbutig complaints of very long flanding, from the use of a decoction of the roots of water-dock. It is ufually made by boiling a pound of the fresh root in fix English pints of water, till about one-third of it be confumed. The dole is from half a pint to a whole pint of the decoction every day, But in all the cafes where I have feen it prove beneficial, it was made much ftronger, and drank in larger quanti-Lies.

OF THE SCROPHULA,

ties. The fafeft way, however, is for the patient to begin with fmall doles, and increase them both in ftrength and quantity as he finds his ftomach will bear it. It must be used for a confiderable time. I have known some take it for many months, and have been told of others who had used it for feveral years, before they were fensible of any benefit, but who nevertheles were cured by it at length.

The leprofy, which was fo common in this country long ago, feems to have been near a-kin to the fcurvy. Perhaps its appearing fo feldom now, may be owing to the inhabitants of Britain eating more vegetable food than formerly, living more upon tea and other diluting diet, ufing lefs falted meat, being more cleanly, better lodged and clothed, &cc.—For the cure of this difeafe we would recommend the fame courfe of diet and medicine as in the fcurvy.

OF THE SCROPHULA, OR KING'S EVIL.

This difeafe chiefly affects the glands, efpecially those of the neck. Children and young perfons of a fedentary life are very subject to it. It is one of those difeases which may be removed by proper regimen, but feldom yields to medicine. The inhabitants of cold, damp, marshy countries are most liable to the scrophula.

CAUSES.—This difeafe may proceed from a hereditary taint, from a fcrophulous nurfe, &c. Children who have the misfortune to be born of fickly parents, whole conflitutions have been greatly injured by the pox, or other chronic difeafes, are apt to be affected by the fcrophula. It may likewife proceed from fuch difeafes as weaken the habit or vitiate the humours, as the fmall-pox, meafles, &c. External injuries, as blows, bruifes, and the like, fometimes produce fcrophulous ulcers :

cers; but we have reafon to believe, when this happens, that there has been a predifpolition in the habit to this difeafe. In fhort, whatever tends to vitiate the humours or relax the folids, paves the way to the fcrophula; as the want of proper exercife, too much heat or cold, confined air, unwholefome food, bad water, the long ufe of poor, weak, watery aliments, the neglect of cleanlinefs, &cc. Nothing tends more to induce this difeafe in children than allowing them to continue long wet *.

SYMPTOMS.—At first fmall knots appear under the chin or behind the ears, which gradually increase in number and fize, till they form one large hard tumour. This often continues for a long time without breaking, and when it does break, it only difcharges a thin *fanies*, or watery humour. Other parts of the body are likewife liable to its attack, as the arm-pits, groins, feet, hands, eyes, breasts, &c. Nor are the internal parts exempt from it. It often affects the lungs, liver, or fpleen; and I have frequently feen the glands of the mysentery greatly enlarged by it.

Those obstinate ulcers which break out upon the feet and hands with fwelling, and little or no rednefs, are of the ferophulous kind. They feldom difcharge good matter, and are exceedingly difficult to cure. The *white fwellings* of the joints feem likewhice to be of this kind. They are with difficulty brought to a fuppuration, and when opened they only difcharge a thin ichor. There is not a more general fymptom of the ferophula than a fwelling of the upper lip and nofe.

* The fcrophula, as well as the rickets, is found to prevail in large manufacturing towns, where people live grofs and lead fedentary lives.

REGI-

REGIMEN .---- As this difeafe proceeds, in a great measure, from relaxation, the diet ought to be generous and nourifhing, but at the fame time light and of eafy digeftion; as well fermented bread made of found grain, the flefh and broth of young animals, with now and then a glass of generous wine, or good ale. The air ought to be open, dry, and not too cold. and the patient should take as much exercise as he can bear. This is of the utmost importance. Children who have fufficient exercife are feldom troubled with the fcrophula.

MEDICINE .---- The vulgar are remarkably credulous with regard to the cure of the fcrophula; many of them believing in the virtue of the royal touch, that of the feventh fon, &c. The truth is. we know but little either of the nature or cure of this difeafe, and where reafon or medicines fail. superstition always comes in their place. Hence it is, that in difeafes which are the most difficult to understand, we generally hear of the greatest number of miraculous cures being performed. Here, however, the deception is eafily accounted for. The fcrophula, at a certain period of life, often cures of itself; and, if the patient happens to be touched about this time, the cure is imputed to the touch. and not to Nature, who is really the phyfician. In the fame way the infignificant noftrums of quacks and old women often gain applause when they deferve none.

There is nothing more pernicious than the cuftom of plying children in the fcrophula with ftrong purgative medicines. People imagine it proceeds from humours which must be purged off, without confidering that these purgatives increase the debility and aggravate the difeafe. It has indeed been found, that keeping the body gently open for fome time, especially with fea-water, has a good effect; But

2

but this fhould only be given in grofs habits, and in fuch quantity as to procure one, or at most two ftools every day.

Bathing in the falt-water has likewife a very good effect, effectively in the warm feafon. I have often known a courfe of bathing in falt-water, and drinking it in fuch quantities as to keep the body gently open, cure a fcrophula, after many other medicines had been tried in vain. When falt-water cannot be obtained, the patient may be bathed in frefh water, and his body kept open by fmall quantities of falt and water, or fome other mild purgative.

Next to cold bathing, and drinking the falt-water, we would recommend the Peruvian bark. The cold bath may be used in summer, and the bark in winter. To an adult half a drachm of the bark in powder may be given in a glass of red wine four or five times a-day. Children, and such as cannot take it in substance, may use the decoction made in the following manner.

Boil an ounce of Peruvian bark and a drachm of Winter's bark, both grofsly powdered, in an Englifh quart of water to a pint: towards the end half an ounce of fliced liquorice-root, and a handful of raifins may be added, which will both render the decoction lefs difagreeable, and make it take up more of the bark. The liquor muft be ftrained, and two, three, or four table-fpoonfuls, according to the age of the patient, given three times a-day.

The Moffat and Harrowgate waters, efpecially the latter, are likewife very proper medicines in the fcrophula. They ought not however to be drank in large quantities, but fhould be taken fo as to keep the body gently open, and mult be used for a confiderable time.

Dd

The

402 OF THE SCROPHULA, &c.

The hemlock may fometimes be used with advantage in the fcrophula. Some lay it down as a general rule, that the fea-water is most proper before there are any fuppuration or fymptoms of *tabes*; the Peruvian bark, when there are running fores, and a degree of hectic fever; and the hemlock in old inveterate cases, approaching to the fcirrhous or cancerous state. Either the extract or the fresh juice of this plant may be used. The dose may be small at first, and increased gradually as far as the stomach is able to bear it.

External applications are of little ufe. Before the tumour breaks, nothing ought to be applied to it, unlefs a piece of flannel, or fomething to keep it warm. After it breaks, the fore may be dreffed with fome digefive ointment. What I have always found to anfwer beft, was the yellow bafilicon mixed with about a fixth or eighth part of its weight of red precipitate of mercury. The fore may be dreffed with this twice a-day; and if it be very fungous, and does not digeft well, a larger proportion of the precipitate may be added.

Medicines which mitigate this difeafe, though they do not cure it, are not to be defpifed. If the patient can be kept alive by any means till he arrives at the age of puberty, he has a great chance to get well, but if he does not recover at this time, in -all probability he never will.

There is no malady which parents are are fo apt to communicate to their offspring as the fcrophula, for which reafon people ought to beware of marrying into families affected with this difeafe.

For the means of preventing the fcrophula we must refer the reader to the observations on nurfing at the beginning of the book.

[403]

OF THE ITCH.

THOUGH this difeafe is commonly communicated by infection, yet it feldom prevails where due regard is paid to cleanlinefs, fresh air, and wholesome diet. It generally appears in form of fmall watery puftules, first about the wrifts, or between the fingers ; afterwards it affects the arms, legs, thighs, &c. These pustules are attended with an intolerable itching, especially when the patient is warm in bed, or fits by the fire. Sometimes indeed the fkin is covered with large blotches or fcabs, and at other times with a white fcurf, or fcaly eruption. This last is called the dry itch, and is the most difficult to cure.

The itch is feldom a dangerous disease, unless when it is rendered fo by neglect, or improper treatment. If it be fuffered to continue too long, it may vitiate the whole mais of humours; and, if it be fuddenly drove in, without proper evacuations, it may occafion fevers, inflammations of the vifcera, or other internal diforders.

The best medicine yet known for the itch is fulphur, which ought to be used both externally and internally. The parts most affected may be rubbed with an ointment made of the flower of fulphur, two ounces; crude fal ammoniac finely powdered two drachms; hog's lard, or butter, four ounces. If a fcruple or half a drachm of the effence of lemon be added, it will entirely take away the difagreeable fmell. About the bulk of a nutmeg of this may be rubbed upon the extremities at bed-time twice or thrice a-week. It is feldom neceffary to rub the whole body; but when it is, it ought not to be done all at once, but by turns, as Dd 2 it

OF THE ITCH.

404

it is dangerous to ftop too many pores at the fame time.

Before the patient begins to use the ointment, he ought, if he be of a full habit, to bleed or take a purge or two. It will likewife be proper, during the use of it, to take every night and morning as much of the flower of brimftone and cream of tartar, in a little treacle or new milk, as will keep the body gently open. He fhould beware of catching cold, fhould wear more clothes than ufual, and, take every thing warm. The fame clothes, the linen excepted, ought to be worn all the time of using the ointment; and such clothes as have been worn while the patient was under the difeafe, are not to be used again, unlefs they have been fumigated with brimftone, and thoroughly cleanfed, otherwife they will communicate the infection anew *.

I never knew brimftone, when ufed as directed above, fail to cure the itch; and I have reafon to believe, that if duly perfifted in, it never will fail; but if it be only ufed once or twice, and cleanlinefs neglected, it is no wonder if the diforder returns. The quantity of ointment mentioned above will generally be fufficient for the cure of one perfon; but, if any fymptoms of the difeafe fhould appear again, the medicine muft be repeated. It is both more fafe and efficacious when perfifted in for a confiderable time, than when a large quantity is applied at once. As most people diflike the fmell

* Sir John Pringle obferves, that though this difeafe may feem triffing, there is no one in the army that is more troublefome to cure, as the infection often lurks in clothes, &c. and breaks out a fecond, or even a third time. The fame inconveniency occurs in private families, unlefs particular regard is paid to the changing or cleaning of their clothes, which laft is by no means an eafy operation. of fulphur, they may use in its place the powder of white helebore root made up into an ointment, in the same manner, which will feldom fail to cure the itch.

People ought to be extremely cautious left they take other eruptions for the itch; as the ftoppage of thefe may be attended with fatal confequences. Many of the eruptive diforders to which children are liable, have a near refemblance to this difeafe; and I have often known infants killed by being rubbed with greafy ointments that make thefe eruptions ftrike fuddenly in, which nature had thrown out to preferve the patient's life, or prevent fome other malady.

Much mifchief is likewife done by the ufe of mercury in this difeafe. Some perfons are fo foolhardy as to walh the parts affected with a ftrong folution of the corrofive fublimate. Others ufe the mercurial ointment, without taking the leaft care either to avoid cold, keep the body open, or obferve a proper regimen. The confequences of fuch conduct may be eafily gueffed. I have known even the mercurial girdles produce bad effects, and would advife every perfon, as he values his health, to beware how he ufes them. Mercury ought never to be ufed as a medicine without the greateft care. Ignorant people look upon thefe girdles as a kind of charm, without confidering that the mercury enters the body.

It is not to be told what milchief is done by using mercurial ointment for curing the itch and killing vermin; yet it is unneceffary for either: the former may be always more certainly cured by fulphur, and the latter will never be found where due regard is paid to cleanlinefs.

Those who would avoid this detestable difease ought to beware of infected perfons, to us Dd 2 wholefome

OF THE ASTHMA.

wholefome food, and to fludy universal cleanlinefs *.

CHAP. XL.

OF THE ASTHMA.

THE affirms is a difeafe of the lungs, which feldom admits of a cure. Perfons in the decline of life are most liable to it. It is diftinguished into the most and dry, or humoural and nervous. The former is attended with expectoration or fpitting; but in the latter the patient feldom spits, unless fometimes a little tough phlegm by the mere force of coughing.

CAUSES.————The afthma is fometimes hereditary. It may likewife proceed from a bad formation of the breaft; the fumes of metals or minerals taken into the lungs; violent exercife, efpecially running; the obftruction of cuftomary evacuations, as the menfes, hœmorrhoids, &c. the fudden retroceffion of the gout, or ftriking in of eruptions, as the fmall-pox, meafles, &c. violent paffions of the mind, as fudden fear or furprife. In a word, the difeafe may proceed from any caufe that either impedes the circulation of the blood through the

* The itch is now by cleanline's banifhed from every genteel family in Britain It flill however prevails among the poorer forts of peafants in Scotland, and among the manufacturers in England. Thefe are not only fufficient to keep the feeds of the difeafe alive, but to fpread the infection among others. It were to be withed that forme effectual method could be devifed for extirpating it altogether. Several country clergymen have told me, that by getting fuch as were infected cured, and firongly recommending an attention to cleanline's, they have banifhed the itch entirely out of their parifies. Why might not others do the fame?

406

lungs,

OF THE ASTHMA.

lungs, or prevents their being duly expanded by the air.

SYMPTOMS.—An affirm is known by a quick laborious breathing, which is generally performed with a kind of wheezing noife. Sometimes the difficulty of breathing is fo great, that the patient is obliged to keep in an erect pofture, otherwife he is in danger of being fuffocated. A fit or paroxyfm of the affirm generally happens after a perfon has been exposed to cold eafterly winds, or has been abroad in thick foggy weather, or has got wet, or continued long in a damp place under ground, or has taken fome food which the ftomach. could not digeft, as paftries, toafted cheefe, or the like.

The paroxyfm is commonly ufhered in with liftleffnefs, want of fleep, hoarfenefs, a cough, belching of wind, a fenfe of heavinefs about the breaft, and difficulty of breathing. To thefe fucceed heat, fever, pain of the head, ficknefs and naufea, great oppreffion of the breaft, palpitation of the heart, a weak and fometimes intermitting pulfe, an involuntary flow of tears, bilious vomitings, &cc. All the fymptoms grow worfe towards night; the patient is eafier when up than in bed, and is very defirous of cool air.

REGIMEN.—The food ought to be light and of eafy digeftion. Boiled meats are to be preferred to roafted, and the flefh of young animals to that of old. All windy food, and whatever is apt to fwell in the flomach, is to be avoided. Light puddings, white broths, and ripe fruits baked, boiled, or roafted, are proper. Strong liquors of all kinds, efpecially malt-liquor, are hurtful. The patient fhould eat a very light fupper, or rather none at all, and fhould never fuffer himfelf to be long coftive. His clothing fhould be warm, efpecially in the winter-feafon. As all diforders of the breatt D d 4

are much relieved by keeping the feet warm, and promoting the perfpiration, a flannel fhirt or waiftcoat, and thick floes, will be of fingular fervice.

But nothing is of fo great importance in the afthma as pure and moderately warm air. Afthmatic people can feldom bear either the close heavy air of a large town, or the fharp keen atmosphere of a bleak hilly country; a medium therefore between thefe is to be chosen. The air near a large town is often better than at a distance, provided the patient be removed fo far as not to be affected by the fmoke. Some afthmatic patients indeed breath eafier in town than in the country; but this is feldom the cafe. efpecially in towns where much coal is burnt. Afthmatic perfons who are obliged to be in town all day, ought at least to sleep out of it. Even this will often prove of great fervice. Those who can afford it ought to travel into a warmer climate. Many afthmatic perfons who cannot live in Britain, enjoy very good health in the fouth of France, Portugal, Spain, or Italy.

Exercife is likewife of very great importance in the afthma, as it promotes the digeftion, and preparation of the blood. The blood of afthmatic perfons is feldom duly prepared, owing to the proper action of the lungs being impeded. For this reafon fuch people ought daily to take as much exercife, either on foot, horfeback, or in a carriage, as they can bear.

MEDICINE.——Almost all that can be done by medicine in this difease, is to relieve the patient when feized with a violent fit. This indeed requires the greatest expedition, as the difease often proves studdenly fatal. In the paroxysm or fit, the body is generally bound; a purging clyster, with a folution of asafactida, ought therefore to be administered, and if there be occasion, it may be repeated two or three times. The patient's feet and legs

legs ought to be immerfed in warm water, and afterwards rubbed with a warm hand, or dry cloth. Bleeding, unlefs extreme weaknefs or old age fhould forbid it, is highly proper. If there be a violent spafm about the breaft or stomach, warm fomentations, or bladders filled with warm milk and water. may be applied to the part affected, and warm cataplasms to the foles of the feet. The patient must drink freely of diluting liquors, and may take a teaspoonful of the tincture of caftor and of faffron mixed together, in a cup of valerian-tea, twice or thrice a-day. Sometimes a vomit has a very good effect, and inatches the patient, as it were, from the jaws of death. This however will be more fafe after other evacuations have been premiled. A very ftrong infusion of roasted coffee is faid to give ease in an afthmatic paroxyfm.

In the moilt althma, fuch things as promote expectoration or fpitting ought to be used; as the fyrup of fquills, gum-ammoniac, and such like. A common spoonful of the fyrup, or oxymel of squills, mixed with an equal quantity of cinnamon-water, may be taken three or four times through the day, and four or five pills made of equal parts of as fast cetida and gum-ammoniac at bed-time *.

For the convultive or nervous afthma, antifpafmodics and bracers are the most proper medicines. The patient may take a tea-spoonful of the paregoric elixir twice a-day. The Peruvian bark is sometimes found to be of use in this case. It may be taken in substance, or infused in wine. In short,

* After copious evacuations, large dofes of æther have been found very efficacious in removing a fit of the afthma. I have likewife known the following mixture produce very happy effects: To four or five ounces of the folution or milk of gum-ammoniac add two ounces of fimple cinnamon-water, the fame quantity of balfamic fyrup, and half an ounce of paregoric elixir. Of this two table-fpoonfuls may be taken every three hours.

every

every thing that braces the nerves, or takes off fpafm, may be of use in a nervous afthma. It is often relieved by the use of affes milk; I have likewife known cows milk drank warm in the morning have a very good effect in this cafe.

In every fpecies of afthma, fetons and iffues have a good effect; they may either be fet in the back or fide, and should never be allowed to dry up. We shall here, once for all, observe, that not only in the afthma, but in most chronic difeases, issues are extremely proper. They are both a fafe and efficacious remedy; and though they do not always cure the difeafe, yet they will often prolong the patient's life.

CHAP. XLI.

OF THE APOPLEXY.

THE apoplexy is a fudden loss of fense and motion, during which the patient is to all appearance dead; the heart and lungs however still continue to move. Though this difease proves often fatal, yet it may fometimes be removed by proper care. It chiefly attacks fedentary perfons of a grofs habit, who use a rich and plentiful diet, and indulge in ftrong liquors. People in the decline of life are most fubject to the apoplexy. It prevails most in winter, efpecially in rainy featons, and very low ftates of the barometer.

CAUSES .- The immediate caufe of an apoplexy is a compression of the brain, occasioned by an excess of blood, or a collection of watery humours. The former is called a fanguine, and the latter

latter a ferous apoplexy. It may be occasioned by any thing that increases the circulation towards the brain, or prevents the return of the blood from the head; as intenfe fludy; violent paffions *; viewing objects for a long time obliquely; wearing any thing too tight about the neck; a rich and luxurious diet; suppression of urine; suffering the body to cool fuddenly after having been greatly heated; continuing long in a warm or cold bath; the exceffive use of spiceries, or high feasoned food; excels of venery; the fudden firking in of any eruption; fuffering iffues, fetons, &c. fuddenly to dry up, or the stoppage of any customary evacuation; a mercurial falivation pushed too far, or fuddenly checked by cold; wounds or bruifes on the head : long exposure to exceffive cold; poifonous exhalations. &c.

SYMPTOMS, and method of cure.——The ufual forerunners of an apoplexy are giddinefs, pain and fwimming of the head; lofs of memory; drowfinefs; noife in the ears; the night-mare; a fpontaneous flux of tears, and laborious refpiration. When perfons of an apoplectic make obferve thefe fymptoms, they have reafon to fear the approach of a fit, and fhould endeavour to prevent it by bleeding, a flender diet, and opening medicines.

In the fanguine apoplexy, if the patient does not die fuddenly, the countenance appears florid, the face is fwelled or puffed up, and the blood veffels, efpecially about the neck and temples, are turgid; the pulle beats firong; the eyes are prominent and

* I knew a woman who in a violent fit of anger was feized with a fanguine apoplexy. She at first complained of extreme pain, as if daggers had been thrugt through her bead, as fine exprefield it. Afterwards the became comatofe, her pulfe funk very low, and was exceeding flow. By bleeding, bliftening, and other evacuations, the was kept alive for about a fortnight. When her head was opened, a large quantity of extravalated blood was found in the left ventricle of the brain.

fixed,

fixed, and the breathing is difficult, and performed with a fnorting noife. The excrements and urine are often voided fpontaneoufly, and the patient is fometimes feized with vomiting.

In this species of apoplexy every method must be taken to leffen the force of the circulation towards the head. The patient should be kept perfectly eafy and cool. His head should be raifed pretty high, and his feet fuffered to hang down. His clothes ought to be loofened, especially about the neck, and fresh air admitted into his chamber. His garters should be tied pretty tight, by which means the motion of the blood from the lower extremities will be retarded. As foon as the patient is placed in a proper pofture, he fhould be bled freely in the neck or arm, and, if there be occasion, the operation may be repeated in two or three hours. A laxative clyfter, with plenty of fweet oil, or frefh butter, and a fpoonful or two of common falt in it, may be administered every two hours; and bliftering-plasters applied between the shoulders, and to the calves of the legs.

As foon as the lymptoms are a little abated, and the patient is able to fwallow, he ought to drink freely of fome diluting opening liquor, as a decoction of tamarinds and liquorice, cream-tartar-whey, or common whey with cream of tartar diffolved in it. Or he may take any cooling purge, as Glauber's falt, manna diffolved in an infufion of fenna, or the like. All fpirits and other ftrong liquors are to be avoided. Even volatile falts held to the nofe do mifchief. Vomits, for the fame reafon, ought not to be given, or any thing that may increafe the motion of the blood towards the head.

In the ferous apoplexy, the fymptoms are nearly the fame, only the pulfe is not fo ftrong, the countenance is lefs florid, and the breathing lefs difficult. Bleeding is not fo neceffary here as in the former cafe.

cafe. It may however generally be performed once with fafety and advantage, but fhould not be repeated. The patient fhould be placed in the fame pofture as directed above, and fhould have bliftering-plafters applied, and receive opening clyfters in the fame manner. Purges are here likewife neceffary, and the patient may drink firong balm-tea. If he be inclined to fweat, it ought to be promoted by drinking fmall wine-whey, or an infufion of carduus benedictus. A plentiful fweat kept up for a confiderable time has often carried of a ferous apoplexy.

When apoplectic fymptoms proceed from opium, or other narcotic fubftances taken into the ftomach, vomits are neceffary. The patient is generally relieved as foon as he has difcharged the poifon in this way.

Perfons of an apoplectic make, or those who have been attacked by it, ought to use a very spare and flender diet, avoiding all ftrong liquors, fpiceries, and high-feafoned food. They ought likewife to guard against all violent passions, and to avoid the extremes of heat and cold. The head should be shaved, and daily washed with cold water. The feet ought to be kept warm, and never fuffered to continue long wet. The body must be kept open either by food or medicine, and a little blood may be let every fpring and fall. Exercise should by no means be neglected; but it ought to be taken in moderation. Nothing has a more happy effect in preventing an apoplexy than perpetual iffues or fetons; great care however must be taken not to fuffer them to dry up, without opening others in their ftead. Apoplectic perfons ought never to go to reft with a full ftomach, or to lie with their heads low, or wear any thing too tight about their necks.

[414]

CHAP. XLII.

OF COSTIVENESS, AND OTHER AFFECTIONS OF THE STOMACH AND BOWELS.

W E do not here mean to treat of those affrictions of the bowels which are the fymptoms of diteafes, as of the colic, the iliac paffion, &c. but only to take notice of that infrequency of ftools which fometimes happens, and which in tome particular conflictutions may occasion difeafes.

Coftivenels may proceed from drinking rough red wines, or other aftringent liquors; too much exercife, efpecially on horfeback. It may likewife proceed from a long ufe of cold infipid food, which does not fufficiently ftimulate the inteflines. Sometimes it is owing to the bile not defcending to the inteflines, as in the jaundice; and at other times it proceeds from difeafes of the inteflines themfelves, as a palfy, fpafms, torpor, tumours, a cold dry flate of the inteflines, &c.

Exceflive coffivenels is apt to occalion pains of the head, vomiting, colics, and other complaints of the bowels. It is peculiarly hurtful to hypochondriac and hyfteric perfons, as it generates wind and other grievous fymptoms. Some people however can bear coffivenels to a great degree. I know perfons who enjoy pretty good health, yet do not go to ftool above once a-week, and others not above once a-fortnight. Indeed I have heard of fome who do not go above once a month.

Perfons who are generally coffive fhould live upon a moiftening and laxative diet, as roafted or boiled apples, pears, flewed prunes, raifins, gruels with currants, currants, butter, honey, fugar, and fuch like. Broths with fpinage, leeks, and other foft pot-herbs, are likewife proper. Rye-bread, or that which is made of a mixture of wheat and rye together, ought to be eaten. No perfon troubled with coflivenefs, fhould eat white bread alone, efpecially that which is made of fine flour. The beft bread for keeping the body foluble is what in fome parts of England they call *meflin*. It is made of a mixture of wheat and rye, and is very agreeable to those who are accuftomed to it.

Coftivenels is increased by keeping the body too warm, and by every thing that promotes the perspiration; as wearing flannel, lying too long in bed, &c. Intense thought and a fedentary life, are likewise hurtful. All the fecretions and excretions are promoted by moderate exercise without doors, and by a gay, cheerful, sprightly temper of mind.

The drink fhould be of an opening quality. All ardent fpirits, auftere and aftringent wines, as port, claret, &c. ought to be avoided. Malt-liquor that is fine, and of a moderate ftrength, is very proper. Butter-milk, whey, and other watery liquors, are likewife proper, and may be drank in turns, as the patient's inclination directs.

Those who are troubled with coffiveness, ought, if possible, to remedy it by diet, as the constant use of medicines for that purpose is attended with many inconveniencies, and often with bad confequences*. I never knew any one get into a habit

of

* The learned Dr. Arbuthnot advifes thofe who are troubled with coflivencis to use animal oils, as frefh butter, cream, marrow, fat broths, efpecially those made of the internal parts of animals, as the liver, heart, midriff, &c. He likewise recommends the expressed oils of mild vegetables, as olives, almonds, pastaches, and the fruits themselves; all oily and mild fruits, as figs;

of taking medicine or keeping the body open, who could leave it off. In time the cuftom becomes neceffary, and generally ends in a total relaxation of the bowels, indigeftion, lofs of appetite, wafting of the ftrength, and death.

When the body cannot be kept open without medicine, we would recommend gentle dofes of rhubarb to be taken twice or thrice a-week. This is not near fo injurious to the flomach as aloes, jalap, or the other draftic purgatives fo much in ufe. Infufions of fenna and manna may likewife be taken, or half an ounce of foluble tartar diffolved in water-gruel. About the fize of a nutmeg of lenitive electuary taken twice or thrice a-day generally anfwers the purpofe very well.

WANT OF APPETITE.

THIS may proceed from a foul ftomach; indigeftion; the want of free air and exercife; grief; fear; anxiety; or any of the depreffing paflions; exceffive heat; the use of ftrong broths, fat meats, or any thing that palls the appetite, or is hard of digeftion; the immoderate use of ftrong liquors, tea, tobacco, opium, &cc.

figs; decochions of mealy vegetables; thefe lubricate the inteftines; fome faponaceous fubflances which flimulate gently, as honey, hydromel, or boiled honey and water, unrefined fugar, &c.

The Doctor obferves, that fuch lenitive fubftances are proper for perfors of dry atrabilarian conflictutions, who are fubject to aftriction of the belly, and the piles, and will operate when fironger medicinal fubftances are fometimes ineffectual; but that fach lenitive diet hurts those whose bowels are weak and lax. He likewise observes, that all watery fubftances are lenitive, and that even common water, whey, four milk, and butter-milk, have that effect :--That new milk, efpecially affes milk, finulates ftill more when it fours on the stomach; and that whey turned four will purge firongly.

416

The

The patient ought, if poffible, to make choice of an open dry air; to take exercife daily on horfeback or in a carriage; to rife betimes; and to avoid all intenfe thoughr. He fhould use a diet of eafy digeftion; and fhould avoid exceflive heat and great fatigue.

If want of appetite proceeds from errors in diet, or any other part of the patient's regimen, it ought to be changed. If naufea and reachings fhew that the ftomach is loaded with crudities, a vomit will be of fervice. After this a gentle purge or two of rhubarb, or any of the bitter purging falts, may be taken. The patient ought next to ufe fome of the ftomachic bitters infufed in wine. Though gentle evacuations be neceffary, yet ftrong purges and vomits are to be avoided, as they weaken the ftomach, and hurt digeftion.

Elixir of vitriol is an excellent medicine in moft cafes of indigeftion, weaknels of the ftomach, or want of appetite. From twenty to thirty drops of it may be taken twice or thrice a-day in a glafs of wine or water. It may likewife be mixed with the tincture of the bark, one drachm of the former to an ounce of the latter, and two tea fpoonfuls of it taken in wine and water, as above.

The chalybeate waters, if drank in moderation, are generally of confiderable fervice in this cafe. The falt-water has likewife good effects; but it muft not be ufed too freely. The waters of Harrowgate, Scarborough, Moffat, and moft other fpas in Britain, may be ufed with advantage. We would advife all who are afflicted with indigeftion and want of appetite, to tepair to these places of public rendezvous. The very change of air, and the cheerful company, will be of fervice; not to mention the exercise, diffipation, amufements, &c.

417

Ee

OF THE HEART-BURN

WHAT is commonly called the *heart-burn*, is not a difeafe of that organ, but an uneafy fenfation of heat, or acrimony about the pit of the flomach, which is fometimes attended with anxiety, naufea, and vomiting.

It may proceed from debility of the ftomach, indigeftion, bile, the abounding of an acid in the ftomach, &c. Perfons who are liable to this complaint ought to avoid ftale liquors, acids, windy or greafy aliments, and fhould never ufe violent exercife foon after a plentiful meal. I know many perfons who never fail to have the heart-burn if they ride foon after dinner, provided they have drank ale, wine, or any fermented liquor; but are never troubled with it when they have drank rum or brandy and water without any fugar or acid.

When the heart-burn proceeds from debility of the flomach, or indigeftion, the patient ought to take a dole or two of rhubarb; afterwards he may use infusions of the Peruvian bark; or any other of the flomachic bitters, in wine or brandy. Exercise in the open air will likewise be of use, and every thing that promotes digeftion.

When bilious humours occasion the heart-burn, a tea-spoonful of the fweet spirit of nitre in a glass of water, or a cup of tea, will generally give ease. If it proceeds from the use of greafy aliments, a dram of brandy or rum may be taken.

If acidity or fournefs of the ftomach occafions the heart-burn, abforbents are the proper medicines. In this cafe an ounce of powdered chalk, half an ounce of fine fugar, and a quarter of an ounce of gum-arabic, may be mixed in an Englifh quart of water, and a tea-cupful of it taken as often

OF THE HEART-BURN.

often as is neceffary. Such as do not chufe chalk may take a tea-fpoonful of prepared oyfter-fhells, or of the powder called crabs-eyes, in a glafs of cinnamon or peppermint-water. But the fafeft and beft abforbent, is magnefia alba. This not only acts as an abforbent, but likewife as a purgative; whereas chalk, and other abforbents of that kind, are apt to lie in the inteffines, aud occafion obftructions. This powder is not difagreeable, and may be taken in a cup of tea, or a glafs of mint-water. A large tea-fpoonful is the ufual dofe; but it may be taken in a much greater quantity when there is occafion. Thefe things are now generally made up into lozenges for the conveniency of being carried in the pocket, and taken at pleafure.

If wind be the caufe of this complaint, the moft proper medicines are those called carminatives; as anifeeds, juniper-berries, ginger, canella alba, cardamom feeds, &c. These may either be chewed, or infused in wine, brandy, or other fpirits. One of the fasteft medicines of this kind is the tincture made by infusing an ounce of rhubarb, and a quarter of an an ounce of the leffer cardamom feeds, in an English pint of brandy. After this has digested for two or three days, it ought to be ftrained, and four ounces of white fugar-candy added to it. It must fland to digest a fecond time till the fugar be diffolved. A table-fipoonful of it may be taken occasionally for a dose.

I have frequently known the heart-burn cured, particularly in pregnant women, by chewing green tea. Two table-fpoonfuls of what is called the milk of gum-ammoniac, taken once or twice a-day, will fometimes cure the heart-burn.

Ee 2

[420]

CHAP. XLIII.

OF NERVOUS DISEASES.

F all difeases incident to mankind, those of the nervous kind are the most complicated and difficult to cure. A volume would not be fufficient to point out their various appearances. They imitate almost every difease; and are feldom alike in two different perfons, or even in the fame perfon at different times. Proteus-like, they are continually changing fhape; and upon every fresh attack, the patient thinks he feels fymptoms which he never experienced before. Nor do they only affect the body ; the mind likewife fuffers, and is often thereby rendered extremely weak and peevifh. The low fpirits, timoroufnefs, melancholy, and ficklenefs of temper, which generally attend nervous diforders, induce many to believe that they are entirely difeafes of the mind; but this change of temper is rather a confequence, than the caufe of nervous difeafes.

CAUSES.—Every thing that tends to relax or weaken the body, difpofes it to nervous difeafes, as indolence, exceffive venery, drinking too muchtea, or other weak watery liquors warm, frequent bleeding, purging, vomiting, &c. Whatever hurts the digeftion, or prevents the proper affimilation of the food, has likewife this effect; as long fafting, excefs in eating or drinking, the ufe of windy, crude, or unwholefome aliments, an unfavourable pofture of the body, &c.

Nervous diforders often proceed from intenle application to fludy. Indeed few fludious perfons are entirely free from them. Nor is this at all to be wondered at; intense thinking not only preys upon the spirits, but prevents the person from taking proper exercise, by which means the digestion is impaired, the nourishment prevented, the solids relaxed, and the whole mass of humours vitiated. Grief and disappointment likewise produce the same effects. I have known more nervous patients, who dated the commencement of their disorders from the loss of a husband, a favourite child, or from some disappointment in life, than from any other cause. In a word, whatever weakens the body, or depresses the spirits, may occassion nervous disorders, as unwholesome air, want of steep, great fatigue, disagreeable apprehensions, anxiety, vexation, &c.

SYMPTOMS.—We fhall only mention fome of the moft general fymptoms of thefe diforders, as it would be both an ufelefs and an endlefs tafk to enumerate the whole. They generally begin with windy inflations or diffentions of the ftomach and inteffines; the appetite and digeffion are ufually bad; yet fometimes there is an uncommon craving for food, and a quick digeftion. The food often turns four on the ftomach; and the patient is troubled with vomiting of clear water, tough phlegm, or a blackifh-coloured liquor refembling the grounds of coffee. Excruciating pains are often felt about the navel, attended with a rumbling or murmuring noife in the bowels. The body is fometimes loofe, but more commonly bound, which occafions a retention of wind and great uncafinefs.

The urine is fometimes in fmall quantity, at other times very copious and quite clear. There is a great ftraitnefs of the breaft, with difficulty of breathing; violent palpitations of the heart; fudden flufhings of heat in various parts of the body; at other times a fenfe of cold, as if water were $E \in 3$ poured

422 OF NERVOUS DISEASES.

poured on them, flying pains in the arms and limbs, pains in the back and belly, refembling thofe occafioned by gravel; the pulle very variable, fometimes uncommonly flow, and at other times very quick; yawning, the hiccup, frequent fighing, and a fenfe of fuffocation, as if from a ball or lump in the throat; alternate fits of crying and convultive laughing; the fleep is unfound, and feldom refrething, and the patient is often troubled with the night-mare.

As the difeafe increafes, the patient is molefted with head-achs, cramps, and fixed pains in various parts of the body; the eyes are clouded, and often affected with pain and drynefs; there is a noife in the ears, and often a dulnefs of hearing; in fhort, the whole animal functions are impaired. The mind is diffurbed on the moft trivial occafions, and is hurried into the moft perverfe commotions, inquietudes, terror, fadnefs, anger, diffidence, &cc. The patient is apt to entertain wild imaginations and extravagant fancies; the memory becomes weak, and the judgment fails.

Nothing is more characteriftic of this difeafe than a conftant dread of death. This renders those unhappy perfons who labour under it peevifh, fickle, impatient, and apt to run from one phyfician to another; which is one reason why they feldom reap any benefit from medicine, as they have not fufficient resolution to perfift in any one course till it has time to produce its proper effects. They are likewife apt to imagine that they labour under difeases from which they are quite free; and are very angry if any one attempts to fet them right, or laugh them out of their ridiculous notions.

REGIMEN.——Perfons afflicted with nervous difeates ought never to fast long. Their food fhould be folid and nourifhing, but of easy digestion. Fat meats and heavy fauces are hurtful. All

All excels should be carefully avoided. They ought never to eat more at a time than they can eafily digeft ; but if they feel themfelves weak and faint between meals, they ought to eat a bit of bread, and drink a glafs of wine. Heavy suppers are to be avoided. Though wine in excess enfeebles the body, and impairs the faculties of the mind, yet taken in moderation, it strengthens, the stomach, and promotes digestion. Wine and water is a very proper drink at meals; but if wine fours on the ftomach, or the patient is much troubled with wind, brandy and water will answer better. Every thing that is windy or hard of digeftion must be avoided. All weak and warm liquors are hurtful, as tea, coffee, punch, &c. People may find a temporary relief in the use of these, but they always increase the malady, as they weaken the ftomach and hurt digeftion. Above all things, drams are to be avoided. Whatever immediate eafe the patient may feel from the use of ardent fpirits, they are fure to aggravate the malady, and prove certain poifons at last. These cautions are the more neceffary, as most nervous people are peculiarly fond of tea and ardent fpirits; to the use of which many, of them fall victims.

Exercife in nervous diforders is fuperior to all medicines. Riding on horfeback is generally effeemed the beft, as it gives motion to the whole body, without fatiguing it. I have known fome patients, however, with whom walking agreed better, and others who were most benefited by riding in a carriage. Every one ought to ufe that which he finds most beneficial. Long fea voyages have an excellent effect; and to those who have fufficient refolution, we would by all means recommend this course. Even change of place, and the fight of new objects, by diverting the mind, have a great tendency to remove these complaints. For this E e 4 reason

424 OF NERVOUS DISEASES.

reason a long journey, or a voyage, is of much more advantage than riding short journeys near home.

A cool and dry air is proper, as it braces and invigorates the whole body. Few things tend more to relax and enervate than hot air, especially that which is rendered to by great fires, or ftoves in fmall apartments. But when the ftomach or bowels are weak, the body ought to be well guarded againft cold, efpecially in winter, by wearing a thin flannel waistcoat next the fkin. This will keep up an equal perfpiration, and defend the alimentay canal from many impreffions to which it would otherwife be fubject, upon every fudden change from warm to cold weather.' Rubbing the body frequently with a flefh brufh, or a coarfe linen cloth, is likewife beneficial, as it promotes the eirculation, perspiration, &c. Persons who have weak nerves ought to rife early, and take exercife before breakfast, as lying too long a bed cannot fail to relax the folids. They ought likewife to be diverted, and to be kept as eafy and cheerful as poffible. There is not any thing which hurts the nervous fystem, or weakens the digestive powers, more than fear, grief, or anxiety.

MEDICINES.— Though nervous difeafes are feldom radically cured, yet their fymptoms may fometimes be alleviated, and the patient's life rendered at leaft more comfortable by proper medicines.

When the patient is coflive, he ought to take a little rhubarb, or fome other mild purgative, and fhould never fuffer his body to be long bound. All ftrong and violent purgatives, are however to be avoided, as aloes, jalap, &c. I have generally feen an infufion of fenna and rhubarb in brandy anfwer very well. This may be made of any ftrength, and taken in fuch quantity as the patient, finds

OF NERVOUS DISEASES.

finds neceffary. When digeftion is bad or the fomach relaxed and weak, the following infufion of Peruvian bark and other bitters may be used with advantage :

Take of Peruvian bark an ounce, gentian-root, orange-peel, and coriander-fred, of each half an ounce; let these ingredients be all bruised in a mortar, and infused in a bottle of brandy or rum, for the space of five or fix days. A table-spoonful of the strained liquor may be taken in half a glass of water, an hour before breakfast, dinner, and supper.

Few things tend more to ftrengthen the nervous fyftem than cold bathing. This practice, if duly perfifted in, will produce very extraordinary effects; but when the liver or other vifcera are obftructed, or otherwife unfound, the cold bath is improper. It is therefore to be ufed with very great caution. The most proper feasons for it are fummer and autumn. It will be fufficient, efpecially for perfons of a fpare habit, to go into the cold bath three or four times a-week. If the patient be weakened by it, or feels chilly for a long time after coming out, it is improper,

In patients afflicted with wind, I have always observed the greateft benefit from the elixir of vitriol. It may be taken in the quantity of fifteen, twenty, or thirty drops, twice or thrice a day, in a glass of water. This both expels wind, ftrengthens the ftomach, and promotes digeftion.

Opiates are generally extolled in thefe maladies; but as they only palliate the fymptoms and generally afterwards increase the difease, we would advise people to be extremely sparing in the use of them, left habit render them at last absolutely neceffary.

It would be an eafy matter to enumerate many medicines which have been extolled for relieving nervous

nervous diforders; but whoever wiftes for a thorough cure, muft expect it from regimen alone; we fhall therefore omit mentioning more medicines, and again recommend the ftricteft attention to DIET, AIR, EXERCISE, and AMUSEMENTS.

OF MELANCHOLY.

MELANCHOLY is that flate of alienation or weaknels of mind which renders people incapable of enjoying the pleafures, or performing the duties of life. It is a degree of infanity, and often terminates in abfolute madnels.

CAUSES .---- It may proceed from an hereditary difpofition; intenfe thinking, especially where the mind is long occupied about one object; violent paffions or affections of the mind, as love, fear, joy, grief, pride, and fuch like. It may alfo be occafioned by exceffive venery; narcotic or ftupefactive poifons; a fedentary life; folitude; the suppreffion of cultomary evacuations; acute fevers; or other difeafes. Violent anger will change melancholy into madnels; and exceffive cold, efpecially of the lower extremities, will force the blood into the brain, and produce all the fymptoms of madnefs. It may likewife proceed from the ufe of aliment that is hard of digeftion, or which cannot be eafily affimilated; from a callous flate of the integuments of the brain, or a drynefs of the brain itfelf. To all which we may add gloomy or miftaken notions of religion.

SYMPTOMS.—When perfons begin to be melancholy, they are timorous; watchful; fond of folitude; fretful; fickle; captious and inquifitive; folicitous about trifles; fometimes niggardly, and at other times prodigal. The body is generally bound; the urine thin, and in finall quantity; the ftomach

ftomach and bowels inflated with wind; the complexion pale; the pulfe flow and weak. The functions of the mind are alfo greatly perverted, in fomuch that the patient often imagines himfelf dead, or changed into fome other animal. Some have imagined their bodies were made of glafs, or other brittle fubftances, and were afraid to move, left they fhould be broken to pieces. The unhappy patient, in this cafe, unlefs carefully watched, is apt to put an end to his own miferable life.

When the difease is owing to an obstruction of customary evacuations, or any bodily diforder, it is easier cured than when it proceeds from affections of the mind, or an hereditary taint. A discharge of blood from the nose, looseness, scabby eruptions, the bleeding piles, or the menses, sometimes carry off this difease.

REGIMEN.——The diet fhould confift chiefly of vegetables of a cooling and opening quality. Animal food, efpecially falted or fmoke-dried fifh or flefh, ought to be avoided. All kinds of fhell-fifh are bad. Aliments prepared with onions, garlic, or any thing that generates thick blood, are likewife improper. All kinds of fruits that are wholefome may be eaten with advantage. Boerhaave gives an inftance of a patient who, by a long ufe of whey, water, and garden-fruit, recovered, after having evacuated a great quantity of black-coloured matter.

Strong liquors of every kind ought to be avoided as poilon. The most proper drink is water, whey, or very fmall beer. Tea and coffee are improper. If honey agrees with the patient, it may be eaten freely, or his drink may be fweetened with it. Infusions of balm-leaves, penny-royal, the roots of wild valerian, or the flowers of the lime-tree, may be drank freely, either by themfelves, or fweetened with honey, as the patient fhall chufe,

The

The patient ought to take as much exercise in the open air as he can bear. This helps to diffolve the viscid humours, it removes obstructions, promotes the perspiration, and all the other fecretions. Every kind of madnefs is attended with a diminished perpiration; all means ought therefore to be used to promote that neceffary and falutary discharge. Nothing can have a more direct tendency to increase the difease than confining the patient to a close apartment. Were he forced to ride or walk a certain number of miles every day, it would tend greatly to alleviate his diforder; but it would have ftill a better effect, if he were obliged to labour a piece of ground. By digging, hoeing, planting, fowing, &c. both the body and mind would be exercised. A long journey, or a voyage, especially towards a warmer climate, with agreeable companions, have often very happy effects. A plan of this kind, with a ftrict attention to diet, is a much more rational method of cure, than confining the patient within doors and plying him with medicines.

MEDICINE. In the cure of this difeafe particular attention must be paid to the mind. When the patient is in a low ftate, his mind ought to be foothed and diverted with variety of amufements, as entertaining ftories, pastimes, music, &c. This feems to have been the method of curing melancholy among the Jews, as we learn from the ftory of King Saul; and indeed it is a very rational one. Nothing can remove difeafes of the mind to effectually as applications to the mind itself, the most efficacious of which is mulic. The patient's company ought likewife to confift of fuch perfons as are agreeable to him. People in this flate are apt to conceive unaccountable averfions against particular perfons; and the very fight of fuch perfons is fufficient to diftract their minds, and throw them into the utmost peturbation.

When

When the patient is high, evacuations are neceffary. In this cafe he muft be bled, and have his body kept open by purging medicines, as manna, rhubarb, cream of tartar, or the foluble tartar. I have feen the laft have very happy effects. It may be taken in the dofe of half an ounce, diffolved in water-gruel, every day, for feveral weeks, or even for months, if neceffary. More or lefs may be given according as it operates. Vomits have likewife a good effect; but they muft be pretty flrong, otherwife they will not operate.

Whatever increases the evacuation of urine or promotes perspiration, has a tendency to remove this difease. Both these fecretions may be promoted by the use of nitre and vinegar. Half a drachm of purified nitre may be given three or four times a-day in any manner that is most agreeable to the patient; and an ounce and a half of distilled vinegar may be daily mixed with his drink. Dr. Locker seems to think vinegar the best medicine that can be given in this disease.

Camphire and muſk have likewiſe been uſed in this caſe with advantage. Ten or twelve grains of camphire may be rubbed in a mortar with half a drachm of nitre, and taken twice a day, or oftener, if the ſtomach will bear it. If it will not ſit upon the ſtomach in this form, it may be made into pills with gum aſaſcetida and Ruſſian caſtor, and taken in the quantity above directed. If muſk is to be adminiſtered, a ſcruple or twenty-ſive grains of it may be made into a bolus with a little honey or common ſyrup, and taken twice or thrice a-day. We do not mean that all theſe medicines ſhould be adminiſtered at once; but whichever of them is given, muſt be duly perſitted in, and where one fails another may be tried. As it is very difficult to induce patients in this difeafe to take medicines, we shall mention a few outward applications which fometimes do good; the principal of these are issues, fetons, and warm bathing. Iffues may be made in any part of the body, but they generally have the best effect near the spine. The discharge from these may be greatly promoted by dreffing them with the mild blistering ointment, and keeping what are commonly called the orrice pease in them. The most proper place for a feton is between the shoulder-blades, and it ought to be placed upwards and downwards, or in the direction of the spine.

OF THE PALSY.

THE palfy is a lofs or diminution of fenfe or motion, or of both, in one or more parts of the body. Of all the affections called nervous, this is the moft fuddenly fatal. It is more or lefs dangerous, according to the importance of the part affected. A palfy of the heart, lungs, or any part neceffary to life, is mortal. When it affects the ftomach, the inteflines, or the bladder, it is highly dangerous. If the face be affected, the cafe is bad, as it fhews that the difeafe proceeds from the brain. When the part affected feels cold, is infenfible, or waftes away, or when the judgment and memory begin to fail, there is fmall hope of a cure.

CAUSES.——The immediate caufe of palfy is any thing that prevents the regular exertion of the nervous power upon any particular mutcle or part of the body. The occalional and predifpoing caufes are various, as drunkennefs, wounds of the brain, or fpinal marrow; preffure upon the brain, or nerves; very cold or damp air; the fuppreffion of 6 cultomary

OF THE PALSY.

cuftomary evacuations; fudden fear; want of exercife; or whatever greatly relaxes the fyftem, as drinking much tea*, or coffee. The palfy may likewife proceed from wounds of the nerves themfelves, from the poifonous fumes of metals or minerals, as mercury, lead, arfenic.

In young perfons of a full habit, the palfy muft be treated in the fame manner as the fanguine apoplexy. The patient must be bled, bliftered, and have his body opened by fharp clyfters or purgative medicines. But in old age, or when the difeafe proceeds from relaxation or debility, which is gened rally the cafe, a quite contrary courfe must be purfued. The diet must be warm and ivigorating, feafoned with fpicy and aromatic vegetables, as mustard, horse-radish, &c. The drink may be generous wine, muftard-whey, or brandy and water. Friction with the flefh-brufh, or a warm hand, is extremely proper, especially on the parts affected. Bliftering-plafters may likewife be applied to the affected parts with advantage. When this cannot be done, they may be rubbed with the volatile liniment, or the nerve ointment of the Edinburgh difpenfatory. One of the best external applications is electricity. The flocks, or rather vibrations, should be received on the part affected; and they ought daily to be repeated for feveral weeks.

Vomits are very beneficial in this kind of palfy, and ought frequently to be administered. Cephalic

* Many people imagine, that tea has no tendency to hurt the nerves, and that drinking the fame quantity of warm water would be equally pernicious. This however feems to be a miftake. Many perfons drink three or four cups of warm milk and water daily, without feeling any bad confequences; yet the fame quantity of tea will make their hands fhake for twenty four hours. That tea affects the nerves, is likewife evident from its preventing fleep, occafioning giddinefs, dimnefs of the fight, ficknefs, &cc.

43I

fnuff,

fnuff, or any thing that makes the patient fneeze, is likewife of ufe. Some pretend to have found great benefit from rubbing the parts affected with nettles ; but this does not feem to be any way preferable to bliftering. If the tongue is affected, the patient may gargle his mouth frequently with brandy and mustard; or he may hold a bit of fugar in his mouth wet with the palfy-drops or compound spirits of lavender. The wild valerian-root is a very proper medicine in this cafe. It may either be taken in an infusion with fage-leaves, or half a drachm of it in powder may be given in a glass of wine three or four times a day. If the patient cannot use the valerian, he may take of fal volatile oleofum, compound fpirits of lavender, and tincture of caftor, each half an ounce; mix these together, and take forty or fifty drops in a glass of wine three or four times a-day. A table-spoonful of mustard-seed taken frequently is a very good medicine. The patient ought likewife to chew cinnamon bark, ginger, or other warm spiceries.

Exercife is of the utmost importance in the palfy; but the patient must beware of cold, damp, and moist air. He ought to wear flannel next his skin; and, if possible, should remove into a warmer climate.

OF THE EPILEPSY, or FALLING SICKNESS.

THE epilepfy is a fudden deprivation of all the fenfes, wherein the patient falls fuddenly down, and is affected with violent convultive motions. Children, efpecially those who are delicately brought up, are most fubject to it. It more frequently attacks men than women, and is very difficult to cure. When the epilepfy attacks children, there is reason to hope it may go off about the time of puberty.

When

When it attacks any perfon after twenty years of age the cure is difficult; but when after forty, a cure is hardly to be expected. If the fit continues only for a fhort fpace, and returns feldom, there is reafon to hope; but if it continues long; and returns frequently, the profpect is bad. It is a very unfavourable fymptom when the patient is feized with the fits in his fleep.

CAUSES.—The epilepfy is fometimes hereditary. It may likewife proceed from blows, bruifes, or wounds on the head; a collection of water, blood, or ferous humours in the brain; a polypus; tumours or concretions within the fkull; exceffive drinking; intenfe ftudy; excefs of venery; worms; teething; fupprefilion of cuftomary evacuations; too great emptinefs or repletion; violent paffions or affections of the mind, as fear, joy, &c.; hyfteric affections; contagion received into the body, as the infection of the fmall-pox, meafles, &c.

SYMPTOMS.—An epileptic fit is generally preceded by unufual wearinefs; pain of the head; dulnefs; giddinefs; noife in the ears; dimnefs of fight; palpitation of the heart; diffurbed fleep; difficult breathing; the bowels are inflated with wind; the urine is in great quantity, but thin; the complexion is pale; the extremities are cold; and the patient often feels, as it were, a ftream of cold air afcending towards his head.

In the fit, the patient generally makes an unufual noife; his thumbs are drawn in towards the palms of the hands; his eyes are difforted; he ftarts, and foams at the mouth; his extremities are bent or twifted various ways; he often difcharges his feed, urine, and fæces involuntarily; and is quite deftitute of all fenfe and reafon. After the fit is over, his fenfes gradually return, and he complains of a kind of ftupor, wearinefs, and pain of his head; F f OF THE EPILEPSY,

but has no remembrance of what happened to him during the fit.

The fits are fometimes excited by violent affections of the mind, a debauch of liquor, exceffive hear, cold, or the like.

This difeafe, from the difficulty of invettigating its caufes, and its ftrange fymptoms, was formerly attributed to the wrath of the gods, or the agency of evil fpirits. In modern times it has often, by the vulgar, been imputed to witchcraft or fafcination. It depends however as much upon natural caufes as any other malady; and its cure may often be effected by perfifting in the use of proper means.

REGIMEN. — Epileptic patients ought, if poffible, to breathe a pure and free air. Their diet fhould be light but nourifhing. They ought to drink nothing ftrong, to avoid fwine's flefh, waterfowl, and likewife all windy and oily vegetables, as cabbage, nuts, &c. They ought to keep themfelves cheerful, carefully guarding againft all violent paffions, as anger, fear, exceffive joy, and the like.

Exercife is likewife of great ufe; but the patient muft be careful to avoid all extremes either of heat or cold, all dangerous fituations, as flanding upon precipices, riding, deep waters, and fuch like.

MEDICINE. — The intentions of cure muft vary according to the caufe of the difeafe. If the patient be of a fanguine temperament, and there be reafon to fear an obfruction in the brain, bleeding and other evacuations will be neceffary. When the difeafe is occafioned by the ftoppage of cuftomary evacuations, thefe, if poffible, muft be reftored; if this cannot be done, others may be fubficuted in their place. Iffues or fetons in this cafe have often a very good effect. When there is reafon to believe that

that the difeafe proceeds from worms, proper medicines muft be ufed to kill, or carry off thefe vermin. When the difeafe proceeds from teething, the body fhould be kept open by emollient clyfters, the feet frequently bathed in warm water, and, if the fits prove obflinate, a bliftering-plafter may be put between the fhoulders. The fame method is to be followed, when epileptic fits precede the eruption of the fmall-pox, or meafles, &c.

When the difeafe is hereditary, or proceeds from a wrong formation of the brain, a cure is not to be expected. When it is owing to a debility, or too great an irritability of the nervous fyftem, fuch medicines as tend to brace and ftrengthen the nerves may be ufed, as the Peruvian bark, and fteel; or the *anti-epileptic* electuaries, recommended by Fuller and Mead *.

The flowers of zinc, have of late been highly extolled for the cure of the epilepfy. Though this medicine will not be found to anfwer the expectations which have been raifed concerning it, yet in obfinate epileptic cafes it deferves a trial. The dofe is from one to three or four grains, which may be taken either in pills or a bolus, as the patient inclines. The beft method is to begin with a fingle grain four or five times a day, and gradually to increafe the dofe as far as the patient can bear it. I have known this medicine, when duly perfifted in, prove beneficial.

Mufk has fometimes been found to fucceed in the epilepfy. Ten or twelve grains of it, with the fame quantity of factitious cinnabar, may be made up into a bolus, and taken every night and morning.

Sometimes the epilepfy has been cured by electricity.

* See Appendix, Electuary for the Epilepfy.

Ff 2

Convultion-

Convultion-fits proceed from the fame caufes. and must be treated in the fame manner as the epilepfy.

There is one particular fpecies of convultion-fits which commonly goes by the name of St. Vitus's dance, wherein the patient is agitated with ftrange motions and gefficulations, which by the common people are generally believed to be the effects of witchcraft. This difeafe may be cured by repeated bleedings and purges; and afterwards using the medicines prefcibed above for the epilepfy, viz. the Peruvian bark and fnake root, &c. Chalybeate waters are found to be beneficial in this cafe. The cold bath is likewife of fingular fervice, and ought never to be neglected when the patient can bear it.

OF THE HICCUP.

The hiccup is a fpafmodic or convultive affection of the ftomach and midriff, arising from any caufe that irritates their nervous fibres.

It may proceed from excefs in eating or drinking; from a hurt of the ftomach; poifons; inflammations or tchirrous tumours of the ftomach, inteffines, bladder, midriff, or the reft of the viscera. In gangrenes, acute and malignant fevers, a hiccup is often the forerunner of death.

When the hiccup proceeds from the use of aliment that is flatulent, or hard of digeftion, a draught of generous wine, or a dram of any fpirituous liquor, will generally remove it. If poilon be the caufe, plenty of milk and oil must be drank, as has been formerly recommended. When it proceeds from an inflammation of the ftomach, &c. it is very dangerous. In this cafe the cooling regimen ought to be firicily observed. The patient must be bled, and take frequently a few drops of the fweet

OF THE HICCUP.

fweet spirits of nitre in a cup of wine-whey. His ftomach fhould likewife be fomented with cloths dipped in warm water, or have bladders filled with warm milk and water applied to it.

When the hiccup proceeds from a gangrene or mortification, the Peruvian bark, with other antifeptics, are the only medicines which have a chance to fucceed. When it is a primary difease, and proceeds from a foul flomach, loaded either with a pituitous or a bilious humour, a gentle vomit and purge, if the patient be able to bear them, will be of fervice. If it arifes from flatulencies, the carminative medicines directed for the heart-burn muft be ufed.

When the hiccup proves very obstinate, recourse must be had to the most powerful aromatic and antilpalmodic medicines. The principal of these is musk; fifteen or twenty grains of which may be made into a bolus, and repeated occasionally. Opiates are likewife of fervice; but they must be used with caution. A bit of fugar dipped in compound spirits of lavender, or the volatile aromatic tincture. may be taken frequently. External applications are fometimes also beneficial; as the ftomach plaster, or a cataplaim of the Venice treacle of the Edinburgh or London difpenfatory, applied to the region of the ftomach.

I lately attended a patient who had almost a confant hiccup for above nine weeks. It was frequently flopped by the use of musk, opium, wine, and other cordial and antispasmodic medicines, but always returned. Nothing however gave the patient to much eafe as brifk fmall-beer. By drinking freely of this, the hiccup was often kept off for feveral days, which was more than could be done by the moft powerful medicines. The patient was at length feized with a vomiting of blood, which foon put an end to his life. Upon opening Ff 3 the

438 CRAMP OF THE STOMACH.

the body, a large fchirrous tumour was found near the pylorus or right orifice of the ftomach.

The hiccup may be removed by taking vinegar; or by a few drops of the oil of vitriol taken in water.

CRAMP OF THE STOMACH.

This difeafe often feizes people fuddenly, is very dangerous, and requires immediate affiftance. It is most incident to perfons in the decline of life, especially the nervous, gouty, hysteric, and hypochondriac.

If the patient has any inclination to vomit, he ought to take fome draughts of warm water, or weak canomile-tea, to cleanfe his ftomach. After this, if he has been coflive, a laxative clyfter may be given. He ought then to take laudanum. The beft way of adminittering it is in a clyfter. Sixty or feventy drops of liquid laudanum may be given in a clyfter of warm water. This is much more certain than laudanum given by the mouth, which is often vomited, and in fome cafes increafes the pain and fpafms in the ftomach.

If the pain and cramps return with great violence, after the effects of the anodyne clyfter are over, another, with an equal or a larger quantity of opium, may be given; and every four or five hours a bolus, with ten or twelve grains of mufk, and half a drachm of the Venice treacle.

In the mean time, the ftomach ought to be fomented with cloths dipped in warm water, or bladders filled with warm milk and water fhould be conftantly applied to it. I have often feen thefe produce the moft happy effects. The anodyne balfam may alfo be rubbed on the part affected; and an anti-hyfteric plafter worn upon it for fome time after the cramps are removed, to prevent their return.

OF THE NIGHT-MARE.

In very violent and lafting pains of the ftomach, fome blood ought to be let, unlefs the weaknefs of the patient forbids it. When the pain or cramps proceed from a suppression of the menses, bleeding is of use. If they be owing to the gout, recourse must be had to fpirits, or fome of the warm cordial waters. Bliftering plafters ought likewise in this cafe to be applied to the ancles. I have often feen violent cramps and pains of the ftomach removed by covering it with a large plaster of Venice treacle.

OF THE NIGHT-MARE.

In this difeafe the patient, in time of fleep, imagines he feels an uncommon oppreffion or weight about his breaft or ftomach, which he can by no means fhake off. He groans, and fometimes cries out, though oftener he attempts to fpeak in vain. Sometimes he imagines himfelf engaged with an enemy, and in danger of being killed, attempts to run away, but finds he cannot. Sometimes he fancies himfelf in a houfe that is on fire, or that he is in danger of being drowned in a river. He often thinks he is falling over a precipice, and the dread of being dashed to pieces fuddenly awakes him.

This diforder has been fuppofed to proceed from too much blood; from a stagnation of blood in the brain, lungs, &c. But it is rather a nervous affection, and arifes chiefly from indigeftion. Hence we find that perfons of weak nerves, who lead a fedentary life, and live full, are most commonly afflicted with the night-mare. Nothing tends more to produce it than heavy fuppers, efpecially when eaten late, or the patient goes to bed foon after. Wind is likewife a very frequent caufe of this difeafe; for which reafon those who are afflicted with it ought to avoid all flatulent food. Deep thought, anxiety,

439

Ff 4

anxiety, or any thing that oppreffes the mind, ought also to be avoided.

As perfons afflicted with the night-mare generally moan, or make fome noife in the fit, they should be waked, or spoken to by such as hear them, as the uneafinefs generally goes off as foon as the patient is awake. Dr. Whytt fays, he generally found a dram of brandy, taken at bed-time, prevent this difeafe. That however is a bad cuftom, and in time lofes its effects. We would rather have the patient depend upon the use of food of easy digettion. cheerfulneis, exercife through the day, and a light fupper taken early, than to accustom himself to drams. A glafs of peppermint-water will often promote digestion as much as a glass of brandy, and is much fater. After a perfon of weak digeftion, however, has eaten flatulent food, a dram may be neceffary; in this cafe we would recommend it as the most proper medicine.

Perfons who are young, and full of blood, if troubled with the night-mare, ought to take a purge frequently, and use a spare diet.

OF SWOONINGS.

People of weak nerves or delicate conftitutions are liable to fwoonings or fainting fits. Thefe indeed are feldom dangerous when duly attended to; but when wholly neglected, or improperly treated, they often prove hurtful, and fometimes fatal.

The general caules of fwoonings are, fudden tranfition from cold to heat, breathing air that is deprived of its proper fpring or elafticity; great fatigue; exceffive weaknefs, lofs of blood; long fafting; fear, grief, and other violent paffions or affections of the mind.

It is well known, that perfons who have been long exposed to cold, often faint or fall into a fwoon.

fwoon, upon coming into the houfe, efpecially if they drink hot liquor, or fit near a large fire. This might eafily be prevented by people taking care not to go into a warm room immediately after they have been exposed to the cold air, to approach the fire gradually, and not to eat or drink any thing hot, till the body has been gradually brought into a warm temperature.

When any one, in confequence of neglecting thefe precautions, falls into a fwoon, he ought immediately to be removed to a cooler apartment, to have ligatures applied above his knees and elbows, and to have his hands and face fprinkled with vinegar or cold water. He fhould likewife be made to fmell to vinegar, and fhould have a fpoonful or two of water, if he can fwallow, with about a third part of vinegar mixed with it, poured into his mouth. If thefe fhould not remove the complaint, it will be neceffary to bleed the patient, and afterwards to give him a clyfter.

As air that is breathed frequently lofes its elafticity or fpring, it is no wonder if perfons who refpire in it often fall into a fwoon or fainting fit. They are in this cafe deprived of the very principle of life. Hence it is that fainting fits are fo frequent in all crowded affemblies, efpecially in hot feafons. Such fits however mult be confidered as a kind of temporary death; and, to the weak and delicate, they fometimes prove fatal. They ought therefore with the utmoft care to be guarded againft. The method of doing this is obvious. Let affembly-rooms, and all other places of public refort, be large and well ventilated; and let the weak and delicate avoid fuch places, particularly in warm feafons.

A perfon who faints in fuch a fituation, ought immediately to be carried into the open air; his temples fhould be rubbed with ftrong vinegar or brandy, brandy, and volatile fpirits or falts held to his nofe. He should be laid upon his back with his head low, and have a little wine, or fome other cordial, as foon as he is able to swallow it, poured into his mouth. If the perfon has been subject to hysteric fits, caftor or afafœtida should be applied to the nose, or burnt feathers, horn, or leather, &c.

When fainting fits proceed from mere weaknefs or exhauftion, which is often the cafe after great fatigue, long falting, lofs of blood, or the like, the patient must be supported with generous cordials, as jellies, wines, fpirituous liquors, and fuch like. Thefe however must be given at first in very small quantities, and increased gradually as the patient is able to bear them. He ought to be allowed to lie quite still and eafy upon his back, with his head low, and fhould have fresh air admitted into his chamber. His food should confift of nourifhing broths, fago-gruel with wine, new milk, and other things of a light and cordial nature. These things are to be given out of the fit. All that can be done in the fit is, to let him fmell to a bottle of Hungary-water, eau de luce, or spirits of hartfhorn, and to rub his temples with warm brandy, or to lay a compress dipped in it to the pit of the ftomach.

In fainting fits that proceed from fear, grief, or other violent paffions or affections of the mind, the patient muft be very cautioufly managed. He fhould be fuffered to remain at reft, and only made to fimell to fome vinegar. After he is come to himfelf he may drink freely of warm lemonade, or balm-tea, with fome orange or lemon-peel in it. It will likewite be proper, if the fainting fits have been long and fevere, to clean the bowels by throwing in an emollient clyfter.

It is common in fainting fits, from whatever caufe they proceed, to bleed the patient. This practice

442

OF FLATULENCIES, OR WIND. 443

practice may be very proper in ftrong perfons of a full habit; but in thole who are weak and delicate, or fubject to nervous diforders, it is dangerous. The proper method with fuch people is, to expose them to the free air, and to use cordial and ftimulating medicines, as volatile falts, Hungary-water, fpirits of lavender, tincture of caftor, and the like.

OF FLATULENCIES, OR WIND.

All nervous patients, without exception, are afficted with wind or flatulencies in the ftomach and bowels, which arife chiefly from the want of tone or vigour in these organs. Crude flatulent aliment, as green peas, beans, coleworts, cabbages, and fuch like, may increase this complaint; but ftrong and healthy people are feldom troubled with wind, unlefs they either overload their ftomachs, or drink liquors that are in a fermenting flate, and confequently full of elaftic air. While therefore the matter of flatulence proceeds from our aliments, the caufe which makes air feparate from them in fuch quantity as to occafion complaints, is almost always a fault of the bowels themfelves, which are too weak either to prevent the production of elaftic air, or to expel it after it is produced.

To relieve this complaint, fuch medicines ought to be used as have a tendency to expel wind, and by ftrengthening the alimentary canal, to prevent its being produced there *.

The lift of medicines for expelling wind is very numerous, they often however difappoint the ex-

* Many nervous people find great benefit from tating a dry bifcuit, efpecially when the flomach is empty. I look upon this as one of the beft carminative medicines; and would recommend it in all complaints of the flomach, arifing from flatulence, indigeftion, &c.

pectations

444 OF FLATULENCIES, OR WIND.

pectations of both the phyfician and his patient. The moft celebrated among the clafs of carminatives are juniper berries; the roots of ginger and zedoary; the feeds of anife, carraway, and coriander; gum afafœtida and opium; the warm waters, tinctures, and fpirits, as the aromatic water, the tincture of woodfoot, the volatile aromatic fpirit, æther, &c.

Dr. Whytt fays, he found no medicines more efficacious in expelling wind than æther and laudanum. He generally gave the laudanum in a mixture with peppermint-water and tincture of caftor, or fweet fpirits of nitre. Sometimes, in place of this, he gave opium in pills with afafœtida. He obferves that the good effects of opiates are equally confpicuous, whether the flatulence be contained in the flomach or inteflines; whereas thofe warm medicines, commonly called *carminatives*, do not often give immediate relief, except when the wind is in the flomach.

With regard to æther, the Doctor fays, he has often feen very good effects from it in flatulent complaints, where other medicines failed. The dofe is a tea fpoonful mixed with two table-fpoonfuls of water*. In gouty cafes he obferves, that æther, a glafs of French brandy, or of the aromatic water, or ginger, either taken in fubftance or infufed in boiling water, are among the beft medicines for expelling wind.

When the cafe of flatulent patients is fuch as makes it improper to give them warm medicines inwardly, the Doctor recommends. external applications, which are fometimes of advantage. Equal parts of the anti-hyfteric and flomach plafter may

* Though the patient may begin with this quantity, it will be neceflary to increase the dole gradually as the flomach can bear it. Æther is now given in confiderably greater dofes than it was in Dr. Whytt's time.

be

OF FLATULENCIES, OR WIND. 445

be fpread upon a piece of foft leather, of fuch fize as to cover the greater part of the belly. This fhould be kept on for a confiderable time, provided the patient be able to bear it; if it fhould give great uneafinefs, it may be taken off, and the following liniment ufed in its flead:

Take of Bates's anodyne balfam an ounce; of the expressed oil of mace half an ounce; oil of mint two drachms. Let these ingredients be mixed together, and about a table-spoonful well rubbed on the parts at bed-time.

For firengthening the ftomach and bowels, and confequently for leffening the production of flatulence, the Doctor recommends the Peruvian bark, bitters, chalybeates, and exercife. In flatulent cafes, he thinks fome nutmeg or ginger fhould be added to the tincture of the bark and bitters, and that the aromatic powder fhould be joined with the filings of iron.

When windy complaints are attended with coflivenefs, which is often the cafe, few things will be found to anfwer better than four or five of the following pills taken every night at bed-time:

Take of afafœtida two drachms; fuccotrine aloes, falt of iron, and powdered ginger, of each one drachm; as much of the *elixir proprietatis* as will be fufficient to form them into pills.

On the other hand, when the body is too open, twelve or fitteen grains of rhubarb, with half a drachm or two feruples of the Japonic confection, given every other evening, will have very good effects.

In those flatulent complaints which come on about the time the *menfes* cease, repeated small bleedings often give more relief than any other remedy.

With regard to diet, the Doctor obferves, that tea, and likewife all flatulent aliments, are to be avoided; avoided; and that for drink, water with a little brandy or rum is not only preferable to malt liquor, but in most cases also to wine.

As Dr. Whytt has paid great attention to this fubject, and as his fentiments upon it in a great meafure agree with mine, I have taken the liberty to adopt them; and fhall only add to his obfervations, that exercife is in my opinion fuperior to all medicine, both for preventing the production and likewife for expelling of flatulencies. Thefe effects, however, are not to be expected from fauntering about, or lolling in a carriage; but from labour, or fuch active amulements as give exercife to every part of the body.

OF LOW SPIRITS.

All who have weak nerves are fubject to low fpirits in a greater or lefs degree. Generous diet, the cold bath, exercife, and amufements, are the moft likely means to remove this complaint. It is greatly increafed by folitude and indulging gloomy ideas, but may often be relieved by cheerful company and fprightly amufements.

When low fpirits are owing to a weak relaxed flate of the flomach and bowels, an infufion of the Peruvian bark with cinnamon or nutmeg will be proper. Steel joined with aromatics may likewife in this cafe be ufed with advantage; but riding, and a proper diet, are most to be depended on.

When they arife from a foulnels of the ftomach and inteffines, or obftruction in the hypochondriac vifcera, aloetic purges will be proper. I have fometimes known the Harrowgate fulphur-water of fervice in this cafe.

When low fpirits proceed from a fupprefion of the menfitual or of the hæmorrhoidal flux, thefe evacuations may either be reftored, or fome others fubflitured

OF HYSTERIC AFFECTIONS.

fubfituted in their place, as iffues, fetons, or the like. Dr. Whytt obferves, that nothing has fuch fudden good effects in this cafe as bleeding.

When low fpirits have been brought on by longcontinued grief, anxiety, or other diffrefs of mind, agreeable company, variety of amufements, and change of place, especially travelling into foreign countries, will afford the most certain relief.

Perfons afflicted with low fpirits fhould avoid all kinds of excefs, efpecially of venery and ftrong liquors. The moderate use of wine and other ftrong liquors is by no means hurtful; but when taken to excefs they weaken the ftomach, vitiate the humours, and deprefs the fpirits. This caution is the more neceffary, as the unfortunate and melancholy often fly to throng liquors for relief, by which means they never fail to precipitate their own deftruction.

OF HYSTERIC AFFECTIONS.

These likewise belong to the numerous tribe of nervous difeases, which may be justly reckoned the reproach of medicine. Women of a delicate habit, whose store and intestines are relaxed, and whose nervous system is extremely sensible, are most subject to hysteric complaints. In such performs a hysteric fit, as it is called, may be brought on by an irritation of the nerves of the store or intestines, by wind, acrid humour, or the like. A fudden suppression of the mem/es often gives rise to hysteric fits. They may likewise be excited by violent passions or affections of the mind, as fear, grief, anger, or great disappointments.

Sometimes the hyfteric fit refembles a fwoon or fainting fit, during which the patient lies as in a fleep, only the breathing, is fo low as fcarce to be perceived. At other times the patient is affected with catchings and ftrong convultions. The fymptoms

448 OF HYSTERIC AFFECTIONS.

toms which precede hyfteric fits are likewife various in different perfons. Sometimes the fits come on with coldness of the extremities, yawning and ftretching, lownefs of fpirits, oppreffion and anxiety. At other times the approach of the fit is foretold by a feeling, as if there were a ball at the lower part of the belly, which gradually rifes towards the ftomach, where it occasions inflation, ficknels, and fometimes vomiting; afterwards it rifes into the gullet, and occafions a degree of fuffocation, to which quick breathing, palpitation of the heart. giddinefs of the head, dimnefs of the fight, lofs of hearing, with convulfive motions of the extremities and other parts of the body, fucceed. The hyfteric paroxyim is often introduced by an immoderate fit of laughter, and fometimes it goes off by crying. Indeed there is not much difference between the laughing and crying of an highly hyfteric lady.

Our aim in the treatment of this difeafe must be to fhorten the fit or paroxyfm when prefent, and to prevent its return. The longer the fits continue, and the more frequently they return, the difeafe becomes the more obflinate. Their ftrength is increafed by habit, and they induce fo great a relaxation of the fystem, that it is with difficulty removed.

It is cuftomary, during the hyfieric fit or paroxyfm, to bleed the patient. In ftrong perfons of a plethoric habit, and where the pulfe is full, this may be proper; but in weak and delicate conflitutions, or where the difeafe has been of long ftanding, or arifes from inanition, it is not fafe. The beft courfe in fuch cafes is to roufe the patient by ftrong fmells, as burnt feathers, afafœtida, or fpirits of hartfhorn, held to the nofe. Hot bricks may alfo be applied to the foles of the feet, and the legs, arms, and belly may be ftrongly rubbed with

a warm cloth. But the beft application is to put the feet and legs into warm water. This is peculiarly proper when the fits precede the flow of the menfes. In cafe of coffivenels, a laxative clyfter with afafcetida will be proper; and as foon as the patient can fwallow, two table-fpoonfuls of a folution of afafcetida, or cf fome cordial julep, may be given*.

The radical cure of this diforder will be beft attempted at a time when the patient is most free from the fits. It will be greatly promoted by a proper attention to diet. A milk and vegetable diet, when duly perfifted in, will often perform a cure. If however the patient has been accustomed to a more generous diet, it will not be fafe to leave it off all at once, but by degrees. The most proper drink is water with a finall quantity of fpirits. A cool dry air is the beft. Cold bathing and every thing that braces the nerves, and invigorates the fystem, is beneficial; but lying too long in bed, or whatever relaxes the body, is hurtful. It is of the greatest importance to have the mind kept constantly easy and cheerful, and, if possible, to have it always engaged in fome agreeable and interefting pursuit.

The proper medicines are those which fitrengthen the alimentary canal and the whole nervous fystem, as the preparations of iron, the Peruvian bark, and other bitters. Twenty drops of the elixir of vi-

* When hyfferic fits are occafioned by fympathy, they may be cured by exciting an opposite pation. This is faid to have been the cafe of a whole febool of young ladies in Holland, who were all cured by being told, that the first who was feized fhould be burnt to death. But this method of cure to my knowledge, will not always fucceed. I would therefore advife, that young ladies who are fubject to hyfleric fits fhould not be fent to boarding febools, as the difeafe may be caught by imitation. I have known madnefs itfelf brought on by fympathy.

triol,

triol, in a cup of the infufion of the bark, may be taken twice or thrice a-day. The bark and iron may likewife be taken in fubftance, provided the ftomach can bear them; but they are generally given in too fmall dofes to have any effect. The chalybeate waters generally prove benchical in this diforder.

If the flomach is loaded with phlegm, comits will be of ufe; but they flould not be too flrong, nor frequently repeated, as they tend to relax and weaken the flomach. If there be a tendency to coffivenels, it must be removed either by diet, or by taking an opening pill as often as it fhall be found neceffary.

To leffen the irritability of the fyftem, antifpafmodic medicines will be of ufe. The beft antifpafmodic medicines are mufk, opium, and caftor. When opium difagrees with the ftomach, it may either be applied externally, or given in clyfters. It is often fuccefsful in removing those periodical head-achs to which hyfteric and hypochondriac patients are fubject. Caftor has in tome cafes been found to procure ficep where opium failed; for which reafon Dr. Whytt advifes, that they fhould be joined together. He likewife recommends the antihyfteric plafter to be applied to the *abdomen**.

Hysteric women are often afflicted with cramps in various parts of the body, which are most apt to feize them in bed, or when aster. The most efficacious medicines in this case are opium, bliftering-plasters, and warm bathing or fomentations. When the cramp or spass very violent, opium is

* Though antifpafmodics and anodynes are univerfally recommended in this difeafe, yet all the extraordinary cures that I ever knew in hyfteric cafes, were performed by means of tonic and corroborating medicines.

the remedy most to be depended on. In milder cafes, immerfing the feet and legs in warm water, or applying a bliftering-plaster to the part affected, will often be fufficient to remove the complaint. In patients whose nerves are uncommonly delicate and fensible, it will be better to omit the blifteringplaster, and to attempt the cure by opiates, musc, camphire, and the warm bath.

Cramps are often prevented or cured by compreffion. Thus cramps in the legs are prevented, and fometimes removed, by tight bandages; and when convultions arife from a flatulent differtion of the inteffines, or from spafms beginning in them, they may be often leffened or cured by making a pretty ftrong compression upon the abdomen by means of a broad belt. A roll of brimftone held in the hand is frequently used as a remedy for cramps. Though this feems to owe its effect chiefly to imagination, vet. as it fometimes fucceeds, it merits a trial *. When fpalms or convullive motions arife from fharp humours in the ftomach and inteftines, no lafting relief can be procured till these are either corrected or expelled. The Peruvian bark has fometimes cured periodic convulsions after other medicines had failed.

OF HYPOCHONDRIAC AFFECTIONS.

THIS difeafe generally attacks the indolent, the luxurious, the unfortunate, and the fludious. It becomes daily more common in this country, owing, no doubt, to the increase of luxury and fedentary employments. It has fo near a refemblance to the immediately preceding, that many authors confider

* Some perfons afflicted with cramps pretend to reap great benefit from fmall bundles of rofemary tied all night about their feet, ancles, and knees.

them as the fame difeafe, and treat them accordingly. They require, however, a very different regimen; and the fymptoms of the latter, though lefs violent, are more permanent than those of the former.

Men of a melancholy temperament, whofe minds are capable of great attention, and whofe paffions are not eafily moved, are, in the advanced periods of life, moft liable to this difeafe. It is ufually brought on by long and ferious attention to abflrufe fubjects, grief, the fupprefilon of cuftomary evacuations, excefs of venery, the repulfion of cutaneous eruptions, long continued evacuations, obflructions in fome of the vifcera, as the liver, fpleen, &cc.

Hypochondriac perfons ought never to fast long, and their food should be folid and nourishing. All accfeent and windy vegetables are to be avoided. Flesh meats agree best with them, and their drink should be old claret or good madeira. Should these difagree with the stomach, water with a little brandy or rum in it may be drank.

Cheerfulnefs and ferenity of mind are by all means to be cultivated. Exercise of every kind is useful. The cold bath is likewise beneficial; and, where it does not agree with the patient, frictions with the flefh-brush or a coarse cloth may be tried. If the patient has it in his power, he ought to travel either by sea or land. A voyage or a long journey, especially towards a warmer climate, will be of more fervice than any medicine.

The general intentions of cure, in this difeafe, are to itrengthen the alimentary canal, and to promote the fecretions. These intentions will be best answered by the different preparations of iron and the Peruvian bark, which, after proper evacuations, may be taken in the same manner as directed in the preceding difease-

If

If the patient be coffive, it will be neceffary to make use of fome gentle opening medicine, as pills composed of equal parts of aloes, rhubarb, and afafoetida, with as much of the elixir proprietatis as is neceffary to form the ingredients into pills. Two, three, or four of these may be taken as often as it shall be found needful to keep the body gently open. Such as cannot bear the afafoetida may substitute Spanish foap in its place. Though a cheerful glass may have good effects

Though a cheerful glafs may have good effects in this difeafe, yet all manner of excefs is hurtful. Intenfe fludy, and every thing that depreffes the fpirits, are likewife pernicious.

Though the general fymptoms and treatment of nervous diforders were pointed out in the beginning of this chapter; yet, for the benefit of the unhappy perfons afflicted with those obstinate and complicated maladies, I have treated feveral of their capital fymptoms under diftinct or feparate heads. These however are not to be confidered as different diseafes, but as various modifications of the fame difeafe. They all arife from the fame general caufes, and require nearly the fame method of treatment. There are many other fymptoms that merit particular attention, which the nature of my plan will not permit me to treat of at full length. I shall therefore omit them altogether, and conclude this chapter with a few general remarks on the most obvious means of preventing or avoiding nervous diforders.

In all perfons afflicted with nervous diforders, there is a great delicacy and fenfibility of the whole fyftem, and an uncommon degree of weaknefs of the organs of digeftion. Thefe may be either natural or acquired. When owing to a defect in the conflitution, they are hardly to be removed; but may be mitigated by proper care. When induced by difeafes, as long or repeated fe-G g 3 vers,

vers, profuse hæmorrhages, or the like, they prove also very obstinate, and will yield only to a course of regimen calculated to restore and invigorate the habit.

But nervous affections arife more frequently from caufes, which it is in a great meafure in our own power to avoid, than from difeafes, or an original fault in the conftitution, &c. Exceflive grief, intenfe ftudy, improper diet, and neglect of exercife, are the great fources of this extensive class of difeafes.

It has been already obferved, that grief indulged deftroys the appetite and digeftion, depreffes the fpirits, and induces an univerfal relaxation and debility of the whole fyitem. Inflances of this are daily to be feen. The lois of a near relation, or any other misfortune in life, is often fufficient to occafion the moft complicated feries of nervous fymptoms. Such misfortunes indeed are not to be avoided, but furely their effects, by a vigorous and proper exertion of the mind, might be rendered lefs hurtful. For directions in this matter we muft refer the reader to the article GRIEF, in the chapter on the pafilons.

The effects of intenfe fludy are pretry fimilar to thole occalioned by grief. It preys upon the animal fpirits, and deftroys the appetite and digeftion. To prevent thefe effects, fludious perfons ought, according to the Poet, to toy with their books*. They fhould never fludy too long at a time; nor attend long to one particular fubject, efpecialy if it be of a ferious nature. They ought likewife to be attentive to their poflure, and fhould take care frequently to unbend their minds by mufic, diverfions, or going into agreeable company.

* Armftrong on Health.

With regard to diet, I fhall only obferve, that nervous difeafes may be induced either by excefs or inanition. Both of thele extremes burt the digeftion and vitiate the humours. When Nature is oppreffed with frefh loads of food, before fhe has had time to digeft and affimilate the former meal, her powers are weakened, and the veffels are filled with crude humours. On the other hand, when the food is not fufficiently nourifhing, or is taken too feldom, the bowels are inflated with wind, and the humours, for want of regular frefh fupplies of wholefome chyle, are vitiated. Thefe extremes are therefore with equal care to be avoided. They both tend to induce a relaxation and debility of the nervous fystem, with all its dreadful train of confequences.

But the most general cause of nervous diforders is *indolence*. The active and laborious are feldom troubled with them. They are referved for the children of ease and affluence, who generally feel their keenest force. All we shall fay to fuch perfons is, that the means of prevention and cure are both in their own power. If the constitution of human nature be such, that man must either labour or fuffer difeases, furely no individual has any right to expect an exemption from the general rule.

Those however who are willing to take exercise, but whose occupations confine them to the house, and perhaps to an unfavourable pofture, really deferve our pity. We have in a former part of the book endeavoured to lay down rules for their conduct; and shall only add, that where these cannot be complied with, their place may, in fome meafure, be supplied by the use of bracing and strengthening medicines, as the Peruvian bark, with other bitters; the preparations of steel; the elixir of vitriol, and fuch like.

Gg4

[456]

CHAP. XLIV.

DISORDERS OF THE SENSES.

W E do not mean to treat of the nature of our fenfations, or to give a minute defcription of the various organs by which they are performed; but to point out fome of the difeafes to which thefe organs are most liable, and to shew how they may be prevented or remedied.

OF THE EYE.

No organ of the body is fubject to more difeafes than the eye; nor is there any one of which the difeafes are more difficult to cure. Though more ignorant perfons pretend to cure thefe than any other class of difeases; yet a very superficial acquaintance with the ftructure of the eye, and the nature of vision, will be fufficient to convince any one of the danger of trufting to them. These difeafes often exceed the skill of the most learned phyfician; hence we may eafily infer the danger of trufting them to ignorant quacks, who, without all peradventure, put out more eyes than they cure. But, though the difeafes of the eye can feldom be cured, they might often, by due care, be prevented; and, even where the fight is totally loft, many things might be done, which are generally neglected, to render the unhappy perfon both more uleful to himfelf and to fociety*.

The

* Ices a pity those who have the misfortune to be born blind, or who lose their fight when young, fhould be fuffered to remain in ignorance or to beg. This is both cruelty and want of economy. The eyes are hurt by viewing bright or luminous objects; keeping the head too long in a hanging pofture; violent head-achs; exceffive venery; the long uie of bitters; the effluvia from acrid or volatile fubftances; various difeafes; as the fmallpox, meafles, &cc. but, above all, from nightwatching, and candle-light ftudies. Long fafting is likewife hurtful to the eyes, and frequent heats and colds are no lefs pernicious. The eyes are often hurt by the ftoppage of cuftomary evacuations; as morning fweats; fweating of the feet; the menfes in women; and the bleeding piles in men, All kinds of excefs are likewife hurtful to the fight, particularly the immoderate ufe of ardent fpirits and other ftrong liguors.

In all difeates of the eyes, efpecially those attended with inflammation, the cool regimen ought to be observed. The patient must abstain from all fpirituous liquors. The fmoke of tobacco, fmoky rooms, the vapours of onions and garlic, and all vivid lights and glaring colours, are carefully to be avoided. The drink may be water, whey, or fmall beer; and the aliment must be light and of eafy digettion.

For preventing diforders of the eyes, iffues and fetons are of prime ufe. Every perfon, whole eyes are tender, cught to have one or more of these in fome part of the body. It will likewife be of ufe to keep the body gently open, and either to bleed

nomy. There are many employments of which blind perfons are very capable, as knitting, carding, turning a wheel, teaching languages, &c. Nor are inflances wanting of perfons who have arrived at the higheft pitch of learning, without having the leaft idea of light. Witnefs the late famous Nicholas Sanderfon of Cambridge, and my worthy friend Dr. Thomas Blacklock of Edinburgh. The former was one of the first mathematicians of his age, and the latter, befides being a good poet and philofopher, is mafter of all the learned languages, and a very confiderable adept in the liberal arts.

or

or purge every fpring and fall. All excefs and night fludies are to be avoided. Such as do not choofe a feton or an iffue, will reap benefit from wearing a fmall Burgundy-pitch plafter between their fhoulders.

A gutta serena or amaurofis, is an abolition of the fight without any apparent caufe or fault in the eyes. When it is owing to a decay or wafting of the optic nerve, it does not admit of a cure; but when it proceeds from a compression of the nerves by redundant humours, thefe may in fome meafure be drained off, and the patient relieved. For this purpofe, the body must be kept open with the laxative mercurial pills. If the patient be young and of a fanguine habit he may be bled. Cupping, with fcarifications on the back part of the head, will likewife be of ufe. A running at the nofe may be promoted by volatile falts, ftimulating powders, &c. But the most likely means for relieving the patient are iffues or blifters kept open for a long time on the back part of the head, behind the ears, or on the neck. I have known thefe reftore fight, even after it had been for a confideraable time loft.

Should thefe fail, recourfe must be had to a mercurial falivation; or what will perhaps answer the purpose better, twelve grains of the corrosive sublimate of mercury may be dissolved in an English pint and a half of brandy, and a table-spoonful of it taken twice a day, drinking half a pint of the decoction of farfaparilla after it.

A catarati is an obstruction of the pupil, by the interposition of fome opaque substance which either diminishes or totally extinguishes the fight. It is generally an opacity of the crystalline humour. In a recent or beginning cataract, the fame medicines are to be used as in the gutta serena; and they will fometimes succeed. But when this does not happen, pen, and the cataract becomes firm, it must be couched, or rather extracted. I have refolved a recent cataract by giving the patient frequent purges with calomel, keeping a poultice of fresh hemlock constantly upon the eye, and a perpetual blister on the neck *.

The myopia, or *flort-fightednefs*, and the prefbyopia, or *feeing only at too great a diffance*, are difforders which depend on the original fructure or figure of the eye, therefore admit of no cure. The inconveniencies arifing from them may however be, in fome measure, remedied by the help of proper glaffes. The former requires the aid of a concave, and the latter of a convex glafs.

A frabifmus, or fquinting, depends upon an irregular contraction of the mufcles of the eye from a fpafm, paly, epilepfy, or an ill habit. Children often contract this diforder by having their eyes unequally exposed to the light. They may likewife acquire it by imitation from a fquinting nurfe or play fellow, &c. As this diforder can hardly be cured, parents ought to be careful to prevent it. Almost the only thing which can be done for it is to contrive a mask for the child to wear, which will only permit him to fee in a ftraight direction.

Spots or fpecks on the eyes are generally the effect of inflammation, and often appear after the fmall pox, the meafles, or violent ophthalmias. They are very difficult to cure, and often occafion total blindnefs. If the fpecks are foft and thin, they may fometimes be taken off by gentle cauftics and difficulters; as vitriol, the juice of celandine, &cc. When thefe do not fucceed, a furgical operation may be tried: the fuccefs of this however is always very doubtful.

The blood-fhot eye may be occasioned by a stroke, a fall, retching, vomiting, violent coughing, &c.

* In both these cases electricity merits a trial.

I have

I have frequently known it happen to children in the hooping-cough. It appears at first like a bit of fcarlet, and is afterwards of a livid or blackist colour. This diforder generally goes off without medicine. Should it prove obstinate, the patient may be bled, and have his eyes fomented with a decostion of compliny roots and elder flowers. A fost poultice may be applied to the eyes; and the body should be kept open by gentle purgatives.

The watery or weeping eye, is generally occafioned by a relaxation or weaknefs of the glandular parts of that organ. Thefe may be braced and itrengthened by bathing the eye with brandy and water, Hungary-water, rofe water, with white vitriol diffolved in it, &c. Medicines which make a revulfion are likewife proper; as mild purgatives, perpetual blifters on the neck, bathing the feet frequently in lukewarm water, &c.

When this difeafe proceeds from an obfruction of the lachrymal duct, or natural paffage of the tears, it is called a *fifula lacbrymalis*, and can only be cured by a furgical operation *.

OF THE EAR.

THE functions of the ear may be injured by wounds, ulcers, or any thing that hurts its fabric. The hearing may likewife be hurt by exceffive noife; violent colds in the head; tevers; hard wax, or other fubftances flicking in the cavity of the ear; too great a degree of moifture or drynefs of the ear; Deatnefs is very often the effect of old age, and is incident to most people in the decline of life. Sometimes it is owing to an original faulte in the fructure or formation of the ear itfelf. When this is the cafe, it admits of no cure; and the unhappy

* A weeping or watery eye is often the mark of a fchrophulous habit.

perfon

perfon not only continues deaf, but generally likewife dumb, for life *.

When deafnefs is the effect of wounds or ulcers of the ears, or of old age, it is not eafily removed. When it proceeds from cold of the head, the patient muft be careful to keep his head warm, effectially in the night; he fhould likewife take fome gentle purges, and keep his feet warm, and bathe them frequently in lukewarm water at bed-time. When deafnefs is the effect of a fever, it generally goes off after the patient recovers. If it proceeds from dry wax flicking in the ears, it may be foftened by dropping oil into them; afterwards they muft be fyringed with warm milk and water.

* Though those who have the misfortune to be born deaf are generally fuffered to continue dumb, and confequently are in a " great meafure loft to fociety, yet nothing is more certain than that fuch perfons may be taught not only to read and write, but alfo to fpeak, and to underftand what others fay to them. Teaching the dumb to fpeak will appear paradoxical to those who do not con-fider that the formation of founds is merely mechanical, and may be taught without the affiftance of the ear. This is not only capable of demonstration, but is actually reduced to practice by the ingenious Mr. Thomas Braidwood of Edinburgh. This gentleman has, by the mere force of genius and application, brought the teaching of dumb perions to fuch a degree of perfection, that his fcholars are generally more forward in their education than those of the fame age who enjoy all their faculties. They not only read and write with the utmost readiness, but likewife fpcak. and are eapable of holding converfation with any perfon in the light. What a pity any of the human species should remain in a state of idiotism, who are capable of being rendered as useful and intelligent as others ! We mention this not only from humanity to those who have the misfortune to be born deaf, but also in julice to Mr. Braidwood, whofe fuccefs has far exceeded all former attempts this way; and indeed it exceeds imagination itfelf fo far, that no perfon who has not feen and examined his pupils, can believe what they are capable of .- As this gentleman, however willing, is only able to teach a few, and as the far greater part of those who are born deaf cannot afford to attend him, it would be an act of great humanity, as well as of public utility, to erect an academy for their benefit.

If

If deafnels proceeds from drynels of the ears; which may be known by looking into them, half an ounce of the oil of fweet almonds, and the fame quantity of liquid apodeldoch, or tincture of afafœtida, may be mixed together, and a few drops of it put into the ear every night at bed-time, thopping them afterwards with a little wool or cotton. Some, inftead of oil, put a fmall flice of the fat of bacon into each ear, which is faid to anfwer the purpofe very well. When the ears abound with moilture, it may be drained off by an iffue or feton, which fhould be made as near the affected parts as poffible.

Some, for the cure of deafnefs, recommend the gall of an eel mixed with fpirit of wine, to be dropped into the ear; others, equal parts of Hungary-water and fpirit of lavender. Etmuller extols amber and mufk; and Brookes tays, he has often known hardnefs of hearing cured by putting a grain or two of mufk into the ear with cottonwool. But these and other applications muft be varied according to the cause of the diforder *.

Though tuch applications may fometimes be of fervice, yet they much oftener fail, and frequently they do hurt. Neither the eyes nor ears ought to be tampered with; they are tender organs, and require a very delicate touch. For this reafon, what we would chiefly recommend in deafnefs, is, to keep the head warm. From whatever caufe the diforder proceeds, this is always proper; and I have known more benefit from it alone, in the moft obflinate

* A gentleman, on whole veracity I can depend, told me, that after using many things to no purpole for an obflinate deafnels, he was at laft adviled to put a few drops of his own urine warm into his ears every night and morning, from which he received great benefit. It is probable that a folution of *fal ammoniac*, in water, would produce the fame effect.

cafes

462

OF THE TASTE AND SMELL. 46_3 cafes of deafness, than from all the medicines I ever used *.

OF THE TASTE AND SMELL.

THOUGH these fenses are not of to great importance to man in a flate of fociety, as the fight and hearing; yet as the loss of them is attended with fome inconveniency, they deferve our notice. They are feldom to be reflored when loft; which ought to make us very attentive to their prefervation, by carefully avoiding whatever may in the least prove injurious to them. As there is a very great affinity between the organs of 'tafting and finelling, whatever hurts the one generally affects the other.

Luxury is highly injurious to thefe organs. When the nofe and palate are frequently filmulated by fragrant and poignant diffies, they foon lofe the power of diffinguilhing taftes and odours with any degree of nicety. Man, in a flate of nature, may perhaps have these faculties as acute as any other animal.

The fenfe of finelling may be diminified or deftroyed by difeafes; as, the molfture, drynefs, inflammation or fuppuration of that membrane which lines the infide of the nofe, commonly called the olfactory membrane; the comprellion of the nerves which fupply this membrane, or fome fault in the brain itfett at their origin. A defect, or too great a degree of folidity, of the finall fpungy bones of the upper jaw, the caverns of the forehead, &cc. may likewife impair the fenfe of finelling. It may alfo be injured by a collection of fœtid matter in thole caverns, which keeps conftantly exhaling from them. Few things are more hurtful to the fenfe of finelling than taking great quantities of fnuff,

* An obftinate deafnefs has been cured by electricity. When

464 OF THE TASTE AND SMELL.

When the nofe abounds with moifture, after gentle evacuations, fuch things as tend to take off irritation, and coagulate the thin fharp ferum, may be applied; as the oil of annife mixed with fine flour; camphire diffolved in oil of almonds, &c. The vapours of amber, frankincenfe, gum mastic, and benjamin, may likewife be received into the nofe and mouth.

For moiftening the mucus when it is too dry, fome recommend fnuff made of the leaves of marjoram, mixed with the oil of amber, marjoram and annifeed; or a sternutatory of calcined white vitriol; twelve grains of which may be mixed with two ounces of marjoram-water, and filtrated. The fteam or vapour of vinegar upon hot iron received up the noftrils is likewife of ufe for foftening the mucus, opening obstructions, &c.

If there is an ulcer in the note, it ought to be dieffed with fome emollient ointment, to which, if the pain be very great, a little laudanum may be added. If it be a venereal ulcer, it is not to be cured without mercury. In that cafe, the folution of the corrofive fublimate in brandy may be taken, as directed in the gutta ferena. The ulcer ought likewife to be washed with it; and the fumes of cinnabar may be received up the noftrils.

If there be reafon to fufpect that the nerves which fupply the organs of fmelling are inert, or want ftimulating, volatile falts, ftrong fnuffs, and other things which occafion fneezing, may be applied to the nofe. The forehead may likewife be anointed with balfam of Peru, to which may be added a little of the oil of amber.

The tafte may be diminished by crufts, filth, mucus, apthæ, pellicles, warts, &c. covering the tongue: it may be depraved by a fault of the faliva, which, being discharged into the mouth, gives the fame

fame fenfations as if the food which the perfon takes had really a bad tafte; or it may be entirely deftroyed by injuries done to the nerves of the tongue and palate. Few things prove more hurtful either to the fenfe of tafting or fmelling than obfinate colds, especially those which affect the head.

When the tafte is diminished by filth, mucus, &c. the tongue ought to be fcraped, and frequently washed with a mixture of water, vinegar, and honey, or fome other detergent. When the faliva is vitiated, which feldom happens unlefs in fevers or other difeafes, the curing of the diforder is the cure of this fymptom. To relieve it however in the mean time, the following things may be of ule: If there be a bitter tafte, it may be taken away by vomits, purges, and other things which evacuate bile. What is called a nidorous tafte, arifing from putrid humours, is corrected by the juice of citrons, oranges, and other acids: A falt tafte is cured by plentiful dilution with watery liquors. An acid tafte is deftroyed by abforbents, and alkaline falts, as powder of oyfter shells, falt of wormwood, &c.

When the fenfibility of the nerves which fupply the organs of tafte is diminifhed, the chewing of horfe-radifh, or other flimulating fubftances, will help to recover it.

OF THE TOUCH.

THE fense of touching may be hurt by any thing that obstructs the nervous influence, or prevents its being regularly conveyed to the organs of touching; as preffure, extreme cold, &c. It may likewife be hurt by too great a degree of fensibility, when the nerve is not fufficiently covered by the H h cuticle

cuticle or fcarf-fkin, or where there is too great a tenfion of it, or it is too delicate. Whatever diforders the functions of the brain and nerves, hurts the fenfe of touching. Hence it appears to proceed from the fame general caufes as palfy and apoplexy, and requires nearly the fame method of treatment.

In a *flupor*, or defect of touching, which arifes from an obfruction of the cutaneous nerves, the patient must first be purged; afterwards fuch medicines as excite the action of the nerves, or flimulate the fystem, may be used. For this purpose, the fpirit of hartshorn, *fal volatile oleofum*, horferadish, &c. may be taken inwardly; the difordered parts, at the fame time, may be frequently rubbed with fresh nettles, or fpirit of *fal ammoniac*. Blistering-platters and finapism applied to the parts will likewise be of use, as also warm bathing, especially in the natural hot baths.

CHAP. XLV.

OF A SCIRRHUS AND CANCER.

A SCIRRHUS is a hard indolent tumour ufually feated in fome of the glands; as the breafts, the arm-pits, &c. If the tumour becomes large, unequal, of a livid, blackifh, or leaden colour, and is attended with violent pain, it gets the name of an occult cancer. When the fkin is broken and a fanies or ichorous matter of an abominable feetid fmell is difcharged from the fore, it is called an open or ulcerated cancer. Perfons after the age of forty five, particularly women, and those who lead

an

an indolent fedentary life, are most subject to this difease.

CAUSES .---- This difeafe is often owing to fuppreffed evacuations; hence it proves fo frequently, fatal to women of a groß habit, particularly old maids and widows, about the time when the mentrual flux ceafes. It may likewife be oc-cafioned by exceffive fear, grief, anger, religious melancholy, or any of the depressing passions. Hence the unfortunate, the choleric, and those perfons who devote themselves to a religious life in convents or monasteries, are often afflicted with it. It may also be occasioned by the long-continued use of food that is too hard of digeftion, or of an acrid nature; by barrennefs; celibacy; indolence; cold; blows; friction; preffure; or the like. Women often fuffer from the last of these by means of their ftays, which fqueeze and compress their breaft fo as to occafion great mischief. Sometimes the difease is owing to an hereditary disposition.

SYMPTOMS, This diforder feems often very trifling at the beginning. A hard tumour about the fize of a hazle nut, or perhaps fmaller, is generally the first symptom. This will often continue for a long time without feeming to increase or giving the patient great uneasines; but if the constitution be hurt, or the tumour irritated by preffure or improper treatment of any kind, it begins to extend itfelf towards the neighbouring parts by pushing out a kind of roots or limbs. It then gets the name of cancer, from a fancied refemblance between these limbs and the claws of a crab. The colour of the fkin begins to change, which is first red, afterwards purple, then bluish, livid, and at last black. The patient complains of heat, with a burning, gnawing, fhooting pain. The tumour is very hard, rough, and unequal, with Hh2 a pro-

a protuberance, or rifing, in the middle; its fize increafes daily, and the neighbouring veins become thick, knotty, and of a blackifh colour.

The fkin at length gives way, and a thin fharp ichor begins to flow, which corrodes the neighbouring parts till it forms a large unfightly ulcer. More occult cancers arife, and communicate with the neighbouring glands. The pain and ftench become intolerable; the appetite fails; the ftrength is exhaufted by a continual hectic fever; at laft, a violent hæmorrhage, or difcharge of blood, from fome part of the body, with faintings, or convulfion fits, generally put an end to the miferable patient's life.

REGIMEN.—— The diet ought to be light, but nourifhing. All ftrong liquors, and high feafoned or falted provisions, are to be avoided. The patient may take as much exercife as he can eafily bear; and fhould use every method to divert thought, and amuse his fancy. All kinds of external injury are carefully to be guarded against, particularly of the affected part, which ought to be defended from all preffure, and even from the external air, by covering it with fur or fort flannel.

MEDICINE.——This is one of those difeases for which no certain remedy is yet known. Its progrefs however may fometimes be retarded, and fome of its most difagreeable fymptoms mitigated, by proper applications. One misfortune attending the difease is, that the unhappy patient often conceals it too long. Were proper means used in due time, a cancer might often be cured; but after the diforder has arrived at a certain height, it generally fets all medicine at defiance.

When a feirrhous tumour is first discovered, the patient ought to observe a proper regimen, and to take twice or thrice a week a dose of the common purging mercurial pill. Some blood may also be

9

let.

let, and the part affected may be gently rubbed, twice a-day with a little of the mercurial ointment, and kept warm with fur or flannel. The food muft be light, and an English pint of the decoction of woods or farfaparilla may be drank daily. I have fometimes difcuffed hard tumours, which had the appearance of beginning cancers, by a course of this kind.

Should the tumour however not yield to this treatment, but, on the contrary, become larger and harder, it will be proper to extirpate it, either by the knife or cauftic. Indeed, whenever this can be done with fafety, the fooner it is done the better. It can anfwer no purpofe to extirpate a cancer after the conftitution is ruined, or the whole mafs of humours corrupted by it. This however is the common way, which makes the operation fo feldom fucceed. Few people will fubmit to the extirpation till death ftares them in the face; whereas, if it were done early, the patient's life would not be endangered by the operation, and it would generally prove a radical cure.

When the cancer is fo fituated that it cannot be cut off, or if the patient will not fubmit to the operation, fuch medicines as will mitigate or relieve the moft urgent fymptoms may be ufed. Dr. Home fays, that half a grain of the corrofive fublimate of mercury, diffolved in a proper quantity of brandy, and taken night and morning, will often be of fervice in cancers of the face and nofe. He likewife recommends an infufion of the *folanum*, or night-fhade, in cancers of the breafts.

But the medicine most in repute at prefent for this difease is hemlock. Dr. Stork, physician at Vienna, has of late recommended the extract of this plant as very efficacious in cancers of every kind. The Doctor fays, he has given some hundred weights of it without ever hurting any body, and H h 2 often

often with manifest advantage. He advifes the patient however to begin with very fmall doles, as two or three grains, and to increase the dole gradually till fome good effect be perceived, and there to reft without further increase. From two or three grains at first, the Doctor fays he has increased the dole to two, three, or four drachms a-day, and finds that fuch doles may be continued for several weeks without any bad confequences.

The regimen which the Doctor recommends during the use of the medicine, is to avoid farinaceous fubftances not fermented, and too acrid aromatics. He fays, good wine will not be hurtful to those who are accustomed to it, nor a moderate use of acids; and adds, that the patient should live in a pure free air, and keep his mind as quiet and cheerful as possible.

[†] The Doctor does not pretend to fix the time in which a cancer may be refolved by the ufe of hemlock, but fays he has given it for above two years in large dofes without any apparent benefit; neverthelefs the patient has been cured by perfifting in the ufe of it for half a year longer. This is at leaft encouragement to give it a fair trial. Though we are far from thinking the hemlock merits those extravagant encomiums which the Doctor has befrowed upon it, yet, in a difeafe which has fo long baffled the boafted powers of medicine, we think it ought always to be tried.

The powder of hemlock is by fome preferred to the extract. They are both made of the fresh leaves, and may be used nearly in the fame manner. Dr. Nicholfon of Berwick fays, he gradually increased the dose of the powder from a few grains to half a drachm, and gave near four drachms of it in the day with remarkably good effects. The hemlock may also be used externally either as a poultice or fomentation. The fore may likewise be kept clean by

by injecting daily a ftrong decoction of the tops and leaves into it.

Few things contribute more to the healing of foul fordid ulcers of any kind than keeping them tho-This ought never to be neglected. roughly clean. The best application for this purpose feems to be the carrot poultice. The root of the common carrot may be grated, and moiftened with as much water as will bring it to the confiftence of a poultice or cataplasm. This must be applied to the fore, and renewed twice a-day. It generally cleans the fore, eafes the pain, and takes away the difagreeable fmell, which are objects of no fmall importance in fuch a dreadful diforder *.

Wort, or an infusion of malt, has heen recommended not only as a proper drink, but as a powerful medicine in this difeale. It must be frequently made fresh, and the patient may take it at pleasure. Two, three, or even four English pints of it may be drank every day for a confiderable time. No benefit can be expected from any medicine in this disease, unless it be persisted in for a long time. It is of too obstinate a nature to be foon removed ; and, when it admits of a cure at all, it must be brought about by inducing an almost total change of the habit. which must always be a work of time. Setons or iffues in the neighbourhood of the cancer have fometimes good effects +.

When

* London Medical Effays.

+ In a cancer which had fet all medicines, and even furgery. at defiance, I lately faw remarkable effects from an obfinate perfeverance in a courfe of antifeptics. I ordered the deep ulcers to be washed to the bottom by means of a fyringe, twice or thrice a day, either with an infusion of the bark, or a decoction of carrot, and that the patient fhould take four or five times a-day, a glass of good wine, with half a drachm of the beft powdered bark in it. The fores, after being wafhed, were likewife fprinkled-with the fame powder. When the patient began this courfe, her death was daily expected. She continued îŧ

Hha

When all other medicines fail, recourse must be had to opium, as a kind of folace. This will not indeed cure the difease, but it will ease the patient's agony, and render life more tolerable while it continues.

To avoid this dreadful diforder, people ought to use wholefome food; to take fufficient exercise in the open air; to be as easy and cheerful as possible; and carefully to guard against all blows, bruises, and every kind of preffure upon the breasts, or other glandular parts*.

CHAP. XLVI.

OF POISONS.

VERY perfon ought, in fome measure, to be acquainted with the nature and cure of poisons. They are generally taken unawares, and their effects are often fo fudden and violent, as not to admit of delay, or allow time to procure the affistance of phyficians. Happily indeed no great degree of medical knowledge is here neceffary; the remedies for most poisons being generally at hand, or easily obtained, and nothing but common prudence needful in the application of them.

it for above two years, with manifeft advantage; but being told by an eminent furgeon, that the bark would not cure a cancer, and that the fores ought not to be wafhed, fhe difcontinued the practice, and died in a few weeks. This courfe was not expected to eure the cancer, but to prolong the patient's life, which it evidently did almoss to a miracle.

* As hemlock is the principal medicine recommended in this difeafe, we would have given fome directions for the gathering and preparing of that plant; but as its different preparations are now kept in the fhops, we think it much fafer for people to get them there, with proper directions for uling them. The vulgar notion that every poilon is cured by fome counter-poilon, as a fpecific, has done much hurt. People believe they can do nothing for the patient, unlefs they know the particular antidote to that kind of poilon which he has taken. Whereas the cure of all poilons taken into the flomach, without exception, depends chiefly on difcharging them as foon as poffible.

There is no cafe wherein the indications of cure are more obvious. Poifon is feldom long in the ftomach before it occafions ficknefs, with an inclination to vomit. This flews plainly what ought to be done. Indeed common fenfe dictates to every one, that, if any thing has been taken into the ftomach which endangers life, it ought immediately to be difcharged. Were this duly regarded, the danger arifing from poifons might generally be avoided. The method of prevention is obvious, and the means are in the hands of every one.

We fhall not take up the reader's time with a detail of the ridiculous notions which have prevailed among ignorant people in different ages with regard to poifons; neither fhall we mention the boafted antidotes, which have been recommended either for preventing or obviating their effects; but fhall content ourfelves with pointing out the poifons moft common in this country, and the means of avoiding their dangerous confequences.

Poilons either belong to the mineral, the vegetable, or the animal kingdom.

Mineral poifons are commonly of an acrid or corrofive quality; as arfenic, cobalt, the eorrofive fublimate of mercury, &c.

Thole of the vegetable kind are generally of a narcotic or flupefactive quality; as poppy, hemlock, henbane, berries of the deadly night-fhade, &c.

Poifonous

Poifonous animals communicate their infection either by the bite or fting. This poifon is very different from the former, and only produces its effects when received into the body by a wound.

MINERAL POISONS.——Arfenic is the moft common of this clafs; and, as the whole of them are pretty fimilar both in their effects and method of cure, what is faid with refpect to it will be applicable to every other fpecies of corrofive poifon.

When a perfon has taken arfenic, he foon perceives a burning heat, and a violent pricking pain in his ftomach and bowels, with an intolerable thirft, and an inclination to vomit. The tongue and throat feel rough and dry; and, if proper means be not foon administered, the patient is feized with great anxiety, hiccuping, faintings, and coldnefs of the extremities. To these fucceed black vomits, fœtid ftools, with a mortification of the ftomach and inteffines, which are the immediate forerunners of death.

On the first appearance of these fymptoms the patient should drink large quantities of new milk and fallad oil till he vomits; or he may drink warm water mixed with oil. Fat broths are likewise proper, provided they can be got ready in time. Where no oil is to be had, fresh butter may be melted and mixed with the milk or water. These things are to be drank as long as the inclination to vomit continues. Some have drank eight or ten English quarts before the vomiting ceased; and it is never safe to leave-off drinking while one particle of the poison remains. in the ftomach.

These oily or fat fubstances not only provoke vomiting, but likewise blunt the acrimony of the poison, and prevent its wounding the bowels; but if they should not make the person vomit, half a drachm

474

drachm or two fcruples of the powder of ipecacuanha muft be given, or a few fpoonfuls of the oxymel or vinegar of fquills may be mixed with the water which he drinks. Vomiting may likewife be excited by tickling the infide of the throat with a feather. Should these methods however fail, half a drachm of white vitriol, or five or fix grains of emetic tartar, muft be administered.

If tormenting pains are felt in the lower belly, and there is reafon to fear that the poifon has got down to the inteffines, clyfters of milk and oil muft be very frequently thrown up; and the patient muft drink emollient decoctions of barley, oatmeal, marfh-mallows, and fuch like. He muft likewife take an infufion of fenna and manna, a folution of Glauber's falts, or fome other purgative.

After the poifon has been evacuated, the patient ought, for fome time, to live upon fuch things as are of a healing and cooling quality; to abitain from flefh and all ftrong liquors, and to live upon milk, broth, gruel, light puddings, and other fpoon-meats of eafy digetion. His drink fhould be barley-water, linfeed-tea, or infufions of any of the mild mucilaginous vegetables.

VEGETABLE POISONS, befides heat and pain of the ftomach, commonly occafion fome degree of giddinefs, and often a kind of ftupidity or folly. Perfons who have taken these poifons must be treated in the fame manner as for the mineral or corrofive.

Though the vegetable poifons, when allowed to remain in the ftomach, often prove fatal; yet the danger is generally over as foon as they are difcharged. Not being of fuch a cauftic or corrofive nature, they are lefs apt to wound or inflame the bowels than mineral fubftances: no time, however, ought to be loft in having them difcharged.

5

Opium, being frequently taken by miftake, mcrits particular attention. It is used as a medicine both in a folid and liquid form, which latter commonly goes by the name of laudanum. It is indeed a valuable medicine when taken in proper quantity; but as an over-dose proves a ftrong poifon, we shall point out its common effects, together with the method of cure.

An over-dofe of opium generally occasions great drowfinefs, with flupor and other apoplectic fymptoms. Sometimes the perfon has fo great an inclination to fleep, that it is almost impossible to keep him awake. Every method must however be tried for this purpofe. He fhould be toffed, shaked, and moved about. Sharp bliftering-plasters should be applied to his legs or arms, and stimulating medicines, as falts of hartshorn, &cc. held under his nofe. It will also be proper to let blood. At the fame time every method must be taken to make him discharge the poison. This may be done in the manner directed above, viz. by the use of strong vomits, drinking plenty of warm water with oil, &cc.

Mead, befides vomits, in this cafe, recommends acid medicines with lixivial falts. He fays, that he has often given falt of wormwood mixed with juice of lemon in repeated dofes with great fuccefs.

If the body fhould remain weak and languid after the poifon has been difcharged, nourifhing diet and cordials will be proper; but when there is reafon to fear that the flomach or bowels are inflamed, the greateft circumspection is necessary both with regard to food and medicine.

[477]

OF THE BITES OF POISONOUS ANIMALS.

 W_E fhall begin with the bite of a mad dog, as it is both the most common and dangerous animal-poifon in this country.

The creatures naturally liable to contract this difeafe are, as far as we yet know, all of the dog kind, *viz.* foxes, dogs, and wolves. Hence it is called the *rabies canina*, or dog-madnefs. Of the laft we have none in this ifland; and it fo feldom happens that any perfon is bit by the firft, that they fcarce deferve to be taken notice of. If fuch a thing fhould happen, the method of treatment is precifely the fame as for the bite of a mad dog.

The fymptoms of madnels in a dog are as follow: At first he looks dull, shews an aversion to food and company: he does not bark as ufual, but feems to murmur, is peevifh, and apt to bite ftrangers : his ears and tail droop more than usual, and he appears drowfy : afterwards he begins to loll out his tongue, and froth at the mouth, his eye feeming heavy and watery: he now, if not confined, takes off, runs panting along with a kind of dejected air, and endeavours to bite every one he meets. Other dogs are faid to fly from him. Some think this a certain fign of madnels, supposing that they know him by the fmell; but it is not to be depended on. If he efcapes being killed, he feldom runs above two or three days, till he dies exhausted with heat, hunger, and fatigue.

This difeafe is most frequent after long, dry, hot feafons; and fuch dogs as live upon putrid flinking carrion, without having enough of fresh-water, are most liable to it.

When

When any perfon has been bit by a dog, the ftricts eft inquiry ought to be made whether the animal was really mad. Many difagreeable confequences arife from neglecting to afcertain this point. Some people have lived in continual anxiety for many years, becaufe they had been bit by a dog which they believed to be mad; but, as he had been killed on the fpot, it was impoffible to afcertain the fact. This should induce us, inftead of killing a dog the moment he has bit any perfon, to do all in our power to keep him alive, at leaft till we can be certain whether he be mad or not.

Many circumftances may contribute to make people imagine a dog mad. He loofes his mafter, runs about in queft of him, is fet upon by other dogs, and perhaps by men. The creature, thus frightened, beat, and abufed, looks wild, and lolls out his tongue as he runs along. Immediately a croud is after him; while he, finding himfelf clofely purfued, and taking every one he meets for an enemy, naturally attempts to bite him in felf-defence. He foon gets knocked on the head, and it paffes currently that he was mad, as it is then impoffible to prove the contrary.

This being the true hiftory of, by far, the greater part of those dogs which pass for mad, is it any wonder that numberless whimsical medicines have been extolled for preventing the effects of their bite? This readily accounts for the great variety of infallible remedies for the bite of a mad dog, which are to be met with in almost every family. Though not one in a thousand has any claim to merit, yet they are all supported by numberless vouchers. No wonder that imaginary difeases should be cured by imaginary remedies. In this way, credulous people first impose upon themselves, and then deceive others. The same medicine which was supposed

posed to prevent the effects of the bite, when the dog was not mad, is recommended to a perfon who has had the misfortune to be bit by a dog that was really mad. He takes it, trusts to it, and is undone.

To these mistakes we must impute the frequent ill fuccels of the medicines used for preventing the effects of the bite of a mad dog. It is not owing fo much to a defect in medicine, as to wrong applications. I am perfuaded, if proper medicines were administered immediately after the bite is received, and continued for a fufficient length of time, we should not lose one in a thousand of those who have the misfortune to be bit by a mad dog.

This poifon is generally communicated by a wound, which neverthelefs heals as foon as a common wound: but afterwards it begins to feel painful, and as the pain fpreads towards the neighbouring parts, the perfon becomes heavy and liftlefs. His fleep is unquiet with frightful dreams; he fighs, looks dull, and loves folitude. Thefe are the forerunners, or rather the first fymptoms, of that dreadful difeafe occasioned by the bite of a mad dog. But as we do not propose to treat fully of the difeafe itfelf, but to point out the method of preventing it, we shall not take up time in shewing its progress from the first invasion to its commonly fatal end.

The common notion, that this poifon may lie in the body for many yeaas, and afterwards prove fatal, is both hurtful and ridiculous. It muft render fuch perfons as have had the misfortune to be bit very unhappy, and can have no good effects. If the perfon takes proper medicines for forty days after the time of his being bit, and feels no fymptoms of the difeafe, there is reafon to believe him out of danger.

The medicines recommended for preventing the effects of the bite of a mad dog, are chiefly fuch as promote the different fecretions, and antifpafmodics.

Dr. Mead recommends a preventive medicine, which he fays he never knew fail, though in the fpace of thirty years he had ufed it a thoufand times.

The Doctor's prefcription is as follows :

"Take afh-coloured ground liver-wort, cleaned, dried, and powdered, half an ounce; of black pepper powdered, a quarter of an ounce. Mix thefe well together, and divide the powder into four dofes; one of which must be taken every morning fasting, for four mornings succeffively, in half an English pint of cows milk warm.

"After these four doles are taken, the patient must go into the cold bath, or a cold spring or river, every morning fasting, for a month; he must be dipped all over, but not stay in (with his head above water) longer than half a minute, if the water be very cold. After this he must go in three times a-week for a fortnight longer.

"The perfon must be bled before he begins to use the medicine *."

We shall next mention the famous East India specific, as it is called. This medicine is composed of cinnabar and musk. It is effected a great antispass function of the second second second second lible remedy for preventing the effects of the bite of a mad dog.

* Though we give this prefeription on the credit of Dr. Mead, yet we would not advife any perfon, who has reafon to believe that he has been bit by a dog which was really mad, to truff to it alone. Mead was an able phyfician, but he feems to have been no great philofopher, and was fometimes the dupe of his own credulity.

" Take

" Take native and factitious cinnabar, of each twenty-four grains, muſk ſixteen grains. Let theſe be made into a fine powder, and taken in a glaſs of arrack or brandy."

This fingle dofe is faid to fecure the perfon for thirty days, at the end of which it must be repeated; but if he has any fymptoms of the difease, it must be repeated in three hours.

The following is likewife reckoned a good antifpafmodic medicine:

" Take of Virginian fnake-root in powder half a drachm, gum afafætida twelve grains, gum camphire feven grains; make thefe into a bolus with a little fyrup of faffron."

Camphire may also be given in the following manner:

"Take purified nitre half an ounce, Virginian fnake-root in powder two drachms, camphire one drachm, rub them together in a mortar, and divide the whole into ten dofes."

Mercury is likewife recommended as of great efficacy, both in the prevention and cure of this kind of madnefs. When ufed as a preventive, it will be fufficient to rub daily a drachm of the ointment into the parts about the wound.

Vinegar is likewife of confiderable fervice, and fhould be taken freely, either in the patient's food or drink.

These are the principal medicines recommended for preventing the effects of the bite of a mad dog. We would not however advise people to trust to any one of them; but from a proper combination of their different powers, there is the greatest reason to hope for fuccels.

The great error in the ufe of these medicines lies in not taking them for a fufficient length of time. They are used more like charms, than medicines intended to produce any change in the

l i

body.

body. To this, and not to the infufficiency of the medicines, we must impute their frequent want of fuccefs.

Dr. Mead fays, that the virtue of his medicine confifts in promoting urine. But how a poifon thould be expelled by urine, with only three or four dofes of any medicine, however powerful, it is not eafy to conceive. More time is certainly neceffary, even though the medicine were more powerful than that which the doctor preferibes.

The Eaft-India fpecific is ftill more exceptionable on this account.

As thefe and moft other medicines, taken fingly, have frequently been found to fail, we shall recommend the following course:

If a perfon is bit in a flefhy part, where there is no hazard of hurting any large blood-veffel, the parts adjacent to the wound may be cut away. But if this be not done foon after the bite has been received, it will be better to omit it.

The wound may be dreffed with falt and water, or a pickle made of vinegar and falt, and aftetwards dreffed twice a-day with yellow bafilicon mixed with red precipitate of mercury.

The patient fhould begin to use either Dr. Mead's medicine, or fome of the others mentioned above. If he takes Mead's medicine, he may use it as the Doctor directs for four days successively. Let him then omit it for two or three days, and again repeat the fame number of doles as before.

During this courfe, he must rub into the parts about the wound, daily, one drachm of the mercurial ointment. This may be done for ten or twelve days at leaft.

When this courfe is over, he may take a purge or two, and wait a few days till the effect of the mercury be gone off. He must then begin to use the cold bath, into which he may go every morn-6 ing

ing for five or fix weeks. If he fhould feel cold and chilly for a long time after coming out of the cold bath, it will be better to use a tepid one, or to have the water a little warmed.

In the mean time, we would advife him not to leave off all internal medicines, but to take either one of the bolufes of fnake-root, afafœtida, and camphire, or one of the powders of nitre, camphire, and fnake-root, twice a-day. Thefe may be ufed during the whole time he is bathing.

During the use of the mercurial ointment, the patient must keep within doors, and take nothing cold.

A proper regimen must be observed throughout the whole course. The patient should abstain from flesh, and all falted and high feasoned provisions. He must avoid strong liquors, and live mostly upon a light and rather spare diet. His mind should be kept as easy and cheerful as possible, and all excessive heat and violent passions avoided with the utmost care.

I have never feen this courfe of medicine, with proper regimen, fail to prevent the hydrophobia, and cannot help again obferving, that the want of fuccefs muft generally be owing either to the application of improper medicines, or not using proper ones for a fufficient length of time.

Mankind are extremely fond of every thing that promifes a fudden or miraculous cure. By trufting to thefe they often lofe their lives, when a regular courfe of medicine would have rendered them abfolutely fafe. This holds remarkably in the prefent cafe. Numbers of people, for example, believe if they or their cattle were once dipped in the fea, it is fufficient; as if the falt water were a charm againft the effects of the bite. This, and fuch like whims, have proved fatal to many.

It is a common notion, if a perfon be bit by a dog which is not mad, that, if he fhould go mad afterwards, the perfon would be affected with the diforder at the fame time; but this notion is too ridiculous to deferve a ferious confideration. It is a good rule, however, to avoid dogs as much as poffible, as the difeafe is often upon them for fome time before its violent fymptoms appear. The hydrophobia has been occafioned by the bite of a dog which fhewed no other fymptoms of the difeafe but liftleffnefs and a fullen difpofition.

Though we do not mean to treat fully of the cure of the hydrophobia, yet we are far from reckoning it incurable. The notion that this difeafe could not be cured, has been productive of the moft horrid confequences. It was ufual either to abandon the unhappy perfons, as foon as they were feized with the difeafe, to their fate, to bleed them to death, or to fuffocate them between mattraffes or feather-beds, &c. This conduct certainly deferved the fevereft punifhment! We hope, for the honour of human nature, it will never again be heard of.

I have never had an opportunity of treating this difeafe, and therefore can fay nothing of it from my own experience; but the learned Dr. Tiffot fays, it may be cured in the following manner:

1. The patient must be bled to a confiderable quantity; and this may be repeated twice, or thrice, or even a fourth time, if circumstances require it.

2. The patient fhould be put, if possible, into a warm bath; and this should be used twice a-day.

3. He should every day receive two, or even three emollient clysters.

4. The wound, and the parts adjoining to it, fhould be rubbed with the mercurial ointment twice a-day.

5. The

5. The whole limb which contains the wound fhould be rubbed with oil, and be wrapped up in an oily flannel.

6. Every three hours a dole of Cob's powder fhould be taken in a cup of the infufion of limetree and elder flowers. This powder is made by rubbing together in a mortar, to a very fine powder, of native and factitious cinnabar, each twenty-four grains; of mufk, fixteen grains *.

7. The following bolus is to be given every night, and to be repeated in the morning if the patient is not eafy, washing it down with the infusion mentioned above: Take one drachm of Virginian Inakeroot in powder; of camphire and asafeetida, ten grains each; of opium, one grain; and with a sufficient quantity of conferve, or rob of elder; make a bolus.

8. If there be a great naufea at the ftomach, with a bitternels in the mouth, thirty-five or forty grains of ipecacuanha, in powder, may be taken for a vomit.

9. The patient's food, if he takes any, must be light; as panado, foups made of farinaceous or mealy vegetables, &c.

10. If the patient fhould long continue weak, and fubject to terrors, he may take half a drachm of the Peruvian bark thrice a-day.

The next poifonous animal which we fhall mention is the VIPER. The greafe of this animal rubbed into the wound is faid to cure the bite. Though that is all the viper-catchers generally do

* The Ormfkirk medicine, as it is called, feems to me to confift chiefly of cinnabar. Though it is faid to be infallible, as a preventive; yet I would not advife any one to truft to it alone. Indeed it is ordered to be taken in a manner which gives it more the appearance of a charm than of a medicine. Surely if a medicine is to produce any change in the body, it mult be taken for fome confiderable time, and in fufficient quantity.

Ii3

when

when bit, we fhould not think it fufficient for the bite of an enraged viper. It would furely be more fafe to have the wound well fucked*, and afterwards rubbed with warm falad-oil. A poultice of bread and milk, foftened with falad-oil, fhould likewife be applied to the wound; and the patient ought to drink freely of vinegar-whey, or watergruel with vinegar in it, to make him fweat. Vinegar is one of the beft medicines which can be ufed in any kind of poifon, and ought to be taken very liberally. If the patient be fick, he may take a vomit. This courfe will be fufficient to cure the bite of any of the poifonous animals of this country.

With regard to poifonous infects, as the bee, the wafp, the hornet, &c. their ftings are feldom attended with danger, unlefs when a perfon happens to be flung by a great number of them at the fame time; in which cafe fomething fhould be done to abate the inflammation and fwelling. Some, for this purpofe, apply honey, others lay pounded parfley to the part. A mixture of vinegar and Venice treacle is likewife recommended; but I have always found rubbing the part with warm falad-oil fucceed very well. Indeed, when the ftings are fo numerous as to endanger the patient's life, which is fometimes the cafe, he muft not only have oily poultices applied to the part, but fhould like-

* The practice of fucking out poifons is very ancient; and indeed nothing can be more rational. Where the bite cannot be cut out, this is the moft likely way for extracting the poifon. There can be no danger in performing this office, as the poifon does no harm unlefs it be taken into the body by a wound. The perfon who fucks the wound ought however to walh his mouth frequently with falad oil, which will fecure him from even the leaft inconveniency. The Pfylli in Africa, and the *Marfi* in Italy, were famed for curing the bites of poifonous animals by fucking the wound; and we are told, that the Indians in North America practife the fame at this day.

wife

wife be bled, and take fome cooling medicines, as nitre, or cream of tartar, and fhould drink plenufully of diluting liquors.

It is the happinels of this island to have very few poilonous animals, and those which we have are by no means of the most virulent kind. Nine-tenths of the effects attributed to poilon or venom in this country, are really other diseases, and proceed from quite different causes.

We cannot however make the fame obfervation with regard to poifonous vegetables. Thefe abound every where, and prove often fatal to the ignorant and unwary. This indeed is chiefly owing to careleffnefs. Children ought early to be cautioned againft eating any kind of fruit, roots, or berries, which they do not know; and all poifonous plants to which they can have accefs, ought, as far as pofible, to be deftroyed. This would not be fo difficult a tafk as fome people imagine.

Poifonous plants have no doubt their ufe, and they ought to be propagated in proper places; but, as they prove often defiructive to cattle; they fhould be rooted out of all pafture-grounds. They ought likewife, for the fafety of the human fpecies, to be deftroyed in the neighbourhood of all towns and villages; which, by the bye, are the places where they moft commonly abound. I have feen the poifonous hemlock, henbane, wolfsbane, and deadly night-fhade, all growing within the *environs* of a fmall town, where, though feveral perfons, within the memory of thofe living in it, had loft their lives by one or other of thefe plants, yet no method, that I could hear of, had ever been taken to root them out; though this might be done at a very trifling expence.

Seldom a year paffes but we have accounts of feveral perfons poifoned by eating hemlock-roots I i 4 inftead

inftead of parfnips, or fome kinds of fungus which they had gathered for mufhrooms. Thefe examples ought to put people upon their guard with refpect to the former, and to put the latter entirely out of ufe. Mufhrooms may be a delicate difh, but they are a dangerous one, as they are generally gathered by perfons who do not know one kind of fungus from another, and take every thing for a mufhroom which has that appearance.

We might here mention many other plants and animals of a poifonous nature which are found in foreign countries; but, as our observations are chiefly intended for this island, we shall pass these over. It may not however be amifs to observe. for the benefit of fuch of our countrymen as go to America, that an effectual remedy is now faid to be found for the bite of the rattle-Inake .- The prefcription is as follows: Take of the roots of plantain and horehound, in fummer, roots and branches together, a fufficient quantity; bruife them in a mortar, and squeeze out the juice, of which give, as foon as poffible, one large spoonful; if the patient be fwelled, you must force it down his throat. This generally will cure; but, if he finds no relief in an hour after, you may give another spoonful, which never fails .- If the roots are dried, they must be moiftened with a little water. To the wound may be applied a leaf of good tobacco moiftened with rum.

We give this upon the faith of Dr. Brookes, who fays it was the invention of a negro; for the difcovery of which he had his freedom purchaled, and a hundred pounds *per annum* fettled upon him during life, by the General Affembly of Carolina.

It is poffible there may be in nature fpecific remedies for every kind of poilon; but as we have very little

OF THE VENEREAL DISEASE. 489

little faith in any of those which have yet been pretended to be discovered, we shall beg leave again to recommend the most strict attention to the following rules, viz. That when any poisonous subftance has been taken into the stomach, it ought, as foon as possible, to be discharged by vomits, clyfters, and purges; and, when poison has been received into the body by a wound, that it be expelled by medicines which promote the different fecretions, especially those of sweat, urine, and intensible perfpiration; to which may be joined antispass or fuch medicines as take off tension and irritation; the chief of which are opium, musc, camphire, and afacetida.

CHAP. XLVII.

014

OF THE VENEREAL DISEASE.

IN the first edition of this book the venereal difease was omitted. The reasons however which at that time induced me to leave it out, have upon more mature confideration vanished. Bad confequences, no doubt, may arise from ignorant perfons tampering with medicine in this diforder; but the danger from that quarter seems to be more than balanced by the great and folid advantages, which must arise to the patient from an early knowledge of his case, and an attention to a plan of regimen, which, if it does not cure the difease, will be fure to render it more mild, and less hurtful to the conflictution.

It is peculiarly unfortunate for the unhappy perfons who contract this difeafe, that it lies under a fort of difgrace. This renders difguife neechary, and

490 OF THE VENEREAL DISEASE.

and makes the patient either conceal his diforder altogether, or apply to those who promise a fudden and fecret cure; but who in fact only remove the fymptoms for a time, while they fix the discafe deeper in the habit. By this means a flight infection, which might have been easily removed, is often conwerted into an obstinate, and sometimes incurable malady.

Another unfavourable circumftance attending this difeafe is, that it affumes a variety of different fhapes, and may with more propriety be called an affemblage of difeafes, than a fingle one. No two difeafes can require a more different method of treatment than this does in its different ftages. Hence the folly and danger of trufting to any particular noftrum for the cure of it. Such noftrums are however generally administered in the fame manner to all who apply for them, without the leaft regard to the ftate of the difeafe, the confliction of the patient, the degree of infection, and a thoufand other circumftances of the utmoft importance.

Though the venereal difeafe is generally the fruit of unlawful embraces, yet it may be communicated to the innocent as well as the guilty. Infants, nurfes, midwives, and married women whofe hufbands lead diffolute lives, are often affected with it, and frequently lofe their lives by not being aware of their danger in due time. The unhappy condition of fuch perfons will certainly plead cur excufe, if any excufe be neceffary, for endeavouring to point out the fymptoms and cure of this too common difeafe.

To enumerate all its different fymptoms, however, and to trace the difeafe minutely through its various stages, would require a much larger space than falls to this part of my subject; I shall therefore confine my observations chiefly to circumstances

OF THE VIRULENT GONORRHOEA. 491

ftances of importance, omitting fuch as are either trifling; or which occur but feldom. I fhall likewife pafs over the hiftory of the difeafe, with the different methods of treatment which it has undergone fince it was first introduced into Europe, and many other circumstances of a fimilar nature; all of which, though they might tend to amufe the reader, yet could afford him little or no ufeful knowledge.

OF THE VIRULENT GONORRHEA.

The virulent Gonorrhœa is an involuntary difcharge of infectious matter from the parts of generation in either fex. It generally makes its appearance within eight or ten days after the infection has been received; fometimes indeed it appears in two or three days, and at other times not before the end of four or five weeks. Previous, to the difcharge the patient feels an itching, with a fmall degree of pain in the genitals. Afterwards a thin glary matter begins to diftil from the urinary paffage, which stains the linen, and occasions a small degree of titillation, particularly in the time of making water; this gradually increasing, arifes at length to a degree of heat and pain, which are chiefly perceived about the extremity of the urinary paffage, where a flight degree of rednefs and inflammation likewife begin to appear.

As the diforder advances, the pain, heat of wrine, and running, increafe, while fresh symptoms daily enfue. In men, the erections become painful and involuntary, and are more frequent and lasting than when natural. This symptom is most troubles when the patient is warm in bed. The pain which was at first only perceived towards the extremity, now begins to reach all up

492 OF THE VIRULENT GONORRHOEA.

up the urinary paffage, and is most intense just after the patient has done making water. The running gradually recedes from the colour of seed, grows yellow, and at length puts on the appearance of mucus.

When the diforder has arrived at its height, all the fymptoms are more intenfe; the heat of urine is fo great, that the patient dreads the making water: and though he feels a conftant inclination this way, yet it is rendered with the greateft difficulty, and often only by drops: the involuntary erections now become extremely painful and frequent; there is alfo a pain, heat, and fenfe of fulnefs about the feat, and the running is plentiful and fharp, of a brown, greenifh, and fometimes of a bloody colour.

By a proper treatment the violence of the fymptoms gradually abates; the heat of urine goes off; the involuntary and painful erections, and the heat and pain about the feat, become eafier; the running alfo gradually decreases, grows whiter and thicker, till at laft it entirely disappears.

By attending to thele fymptoms the gonorrhœa may be generally diftinguished from any other difease. There are however some sew disorders for which it may be mistaken, as an ulcer in the kidnies or bladder, the *fluor albus* or whites in women, &ce. But in the former of these, the matter comes away only with the urine, or when the sphincter of the bladder is open; whereas in a gonorrhœa, the discharge is constant. The latter is more difficult to diftinguish, and must be known chiefly from its effects, as pain, communicating the infection, &ce.

REGIMEN.——When a perfon has reafon to fufpect that he has caught the venereal infection, he ought most firstly to observe a cooling regimen, to avoid every thing of a heating nature, as wines, spirituous

OF THE VIRULENT GONORRHOEA. 493

fpirituous liquors, rich fauces, fpices, falted, highfeafoned and fmoke-dried provifions, &c. as alto all aromatic and flimulating vegetables, as opions, garlic, fhallot, nutneg, muftard, cinnamon, mace, ginger, and fuch-like. His food ought chiefly to confift of mild vegetables, milk, broths, light puddings, panado, gruels, &c. His drink may be barley-water, milk and water, decoctions of marfh-mallows and liquorice, linfeed tea, or clear whey. Of thefe he ought to drink plentifully. Violent exercife of all kinds, efpecially riding on horfeback, and veneral pleafures, are to be avoided. The patient muft beware of cold, and when the inflammation is violent, he ought to keep his bed.

MEDICINE.——A virulent gonorrhœa cannot always be cured speedily and effectually at the same time. The patient ought therefore not to expect, nor the physician to promise it. It will often continue for two or three weeks, and sometimes for five or fix, even where the treatment has been very proper.

Sometimes indeed a flight infection may be carried off in a few days, by bathing the parts in warm milk and water, and injecting frequently up the urethra a little fweet oil or linfeed-tea about the warmth of new milk. Should thefe not fucceed in carrying off the infection, they will at least have a tendency to leffen its virulence.

To effect a cure, however, aftringent injections will generally be found neceffary. Thefe may be various ways prepared, but I think thofe made with the white vitriol are both moft fafe and efficacious. They can be made flronger or weaker as circumftances may require; but it is beft to begin with the more gentle, and increase their power if neceffary. I generally order a drachm of white vitriol to be diffolved in eight or nine ounces of 5 common

494 OF THE VIRULENT GONORRHOA.

common or role water, and an ordinary fyringe full of it to be thrown up three or four times a-day. If this quantity does not perform a cure, it may be repeated, and the dole increased *.

Whether injections be uled or not, cooling purges are always proper in the gonorrhœa. They ought not however to be of the ftrong or draftic kind. Whatever raifes a violent commotion in the body increafes the danger, and tends to drive the difeafe deeper into the habit. Procuring two or three ftools every fecond or third day for the first formight, and the fame number every fourth or fifth day for the fecond, will generally be fufficient to remove the inflammatory fymptoms, to diminish the running, and to change its colour and confistence. It gradually becomes more white and ropy as the virulence abates \ddagger .

When

* Although it is now very common to cure the gonorrheea by aftringent injections, there are ftill many practitioners who do not approve this mode of practice. I can, however, from much experience, aftert, that it is both the mole eafy, elegant, and efficacious method of cure; and that any bad confequences ariling from it muft be owing to the ignorance or miconduct of the practitioner himfelf, and not to the remedy. Many, for example, ule ftrong preparations of lead, all of which are dangerous when applied to the internal furfaces of the body; others ufe efcharotics, which inflame and injure the parts. I have known a gonorrhœa actually cured by an injection made of green-tea, and would always recommend gentle methods where they will fucceed.

+ If the patient can fwallow a folution of falts and manna, he may take fix drachms, or, if his conflitution requires it, an ounce of the former, with half an ounce of the latter. Thefe may be diffolyed in an Englifh pint of boiling water, whey, or thin water-gruel, and taken early in the morning.

If an infution of fenna and tamarinds be more agreeable, two drachms of the former, and an ounce of the latter, may be infufed all night in an English pint of boiling water. The infution may be strained next morning, and half an ounce of Glauber's falts diffolved in it. A tea-cupful of this infusion may be taken every half hour till it operates.

Should

OF THE VIRULENT GONORRHCEA. 495

When the inflammatory fymptoms run high, bleeding is always neceffary at the beginning. This operation, as in other topical inflammations, muft be repeated according to the ftrength and conftitution of the patient, and the vehemence and urgency of the fymptoms.

Medicines which promote the fecretion of urine, are likewife proper in this ftage of the diforder. For this purpole, an ounce of nitre and two ounces of gum-arabic, pounded together, may be divided, into twenty-four dofes, one of which may be taken frequently in a cup of the patient's drink. If thefe fhould make him pafs his urine fo often as to become troublefome to him, he may either take them lefs frequently, or leave out the nitre altogether, and take equal parts of gum-arabic and cream of tartar. Thefe may be pounded together, and a tea-fpoonful taken in a cup of the patient's drink four or five times a-day. I have generally found this anfwer extremely well both as a diuretic, and for keeping the body gently open.

When the pain and inflammation are feated high, towards the neck of the bladder, it will be proper frequently to throw up an emollient clyfter, which, befides the benefit of procuring ftools, will ferve as a fomentation to the inflamed parts.

Should the patient prefer an electuary, the following will be found to anfwer very well. Take of the lenitive electuary four ounces, cream of tartar two ounces, jalap in powder two drachms, rhubarb one drachm, and as much of the fyrup of pale rofes as will ferve to make up the whole into a foft electuary: Two or three tea-fpoonfuls of this may be taken over-night, and about the fame quantity next morning, every day that the patient chufes to take a purge. The dofes of the above medicines may be increafed or dimi-

The dofes of the above medicines may be increated or diminifhed according as the patient finds it neceffary. We have ordered the falts to be diffolved in a large quantity of water, becaule it renders their operation more mild.

Soft

496 OF THE VIRULENT GONORRHOEA.

Soft poultices, when they can conveniently be applied to the parts, are of great fervice. They may be made of the flour of linfeed, or of wheatbread and milk, foftened with frefb outter or fweet oil. When poultices cannot be conveniently ufed, cloths wrung out of warm water, or bladders filled with warm milk and water, may be applied. I have often known the most excruciating pains, during the inflammatory flate of the gonorrhœa, relieved by one or other of thefe applications.

Few things tend more to keep off inflammation in the fpermatic veffels, than a proper truls for the fcrotum. It ought to be fo contrived as to fupport the tefficles, and fhould be worn from the first appearance of the difease till it has ceased fome weeks.

The above treatment will fometimes remove the gonorrhœa fo quickly, that the perfon will be in doubt whether he really laboured under that difeafe. This, however, is too favourable a turn to be often expected. It more frequently happens, that we are able only to procure an abatement or remiffion of the inflammatory fymptoms, fo far as to make it fafe to have recourfe to the great antidote mercury.

Many people, on the first appearance of a gonorrheea, fly to the use of mercury. This is a bad plan. Mercury is often not at all neceffary in a gonorrheea; and when taken too early, it does mifchief. It may be neceffary to complete the cure, but can never be proper at the commencement of it.

When bleeding, purging, fomentations, and the other things recommended as above, have eafed the pain, foftened the pulse, relieved the heat of urine, and rendered the involuntary erections lefs frequent, the patient may begin to use mercury in any form that is leaft difagreeable to him.

OF THE VIRULENT GONORRHCEA. 497

If he takes the common mercurial pill, two at night and one in the morning will be a fufficient dofe at firft. Should they affect the mouth too much, the dofe muft be leffened; if not at all, it may be gradually increafed to five or fix pills in the day. If calomel be thought preferable, two or three grains of it, formed into a bolus with a little of the conferve of hips, may be taken at bed-time, and the dofe gradually increafed to eight or ten grains. One of the moft common preparations of mercury now in ufe is the corrofive fublimate. This may be taken in the manner afterwards recommended under the confirmed lues or pox. I have always found it one of the moft fafe and efficacious medicines when properly ufed.

The above medicines may either be taken every day or every other day, as the patient is able to bear them. They ought never to be taken in fuch quantity as to raife a falivation, unlefs in a very flight degree. The difeafe may be more fafely, and as certainly, cured without a falivation as with it. When the mercury runs off by the mouth, it is not fo fuccefsful in carrying off the difeafe, as when it continues longer in the body, and is difcharged gradually.

Should the patient be purged or griped in the night by the mercury, he muft take an infufion of fenna, or fome other purgative, and drink free'y of water-gruel, to prevent bloody flools, which are very apt to happen fhould the patient catch cold, or if the mercury has not been duly prepared. When the bowels are weak and the mercury is apt to gripe or purge, thefe difagreeable confequences may be prevented by taking, with the above pills or bolus, half a drachm or two feruples of diafcordium, or of the Japonic confection.

To prevent the difagreeable circumftance of the mercury's affecting the mouth too much, or bring-K k

498 OF THE VIRULENT GONORRHOEA.

ing on a falivation, it may be combined with purgatives. With this view the laxative mercurial pill has been contrived, the ufual dofe of which is half a drachm, or three pills, night and morning, to be repeated every other day; but the fafer way is for the patient to begin with two, or even with one pill, gradually increasing the dofe.

To fuch perfons as can neither fwallow a bolus nor a pill, mercury may be given in a liquid form, as it can be fufpended even in a watery vehicle, by means of gum-arabic; which not only ferves this purpofe, but likewife prevents the mercury from affecting the mouth, and renders it in many refpects a better medicine*.

It happens very fortunately for thole who cannot be brought to take mercury inwardly, and likewife for perfons whole bowels are too tender to bear it, that an external application of it will anfwer equally well, and in fome refpects better. It muft be acknowledged, that mercury, taken inwardly for any length of time, greatly weakens and diforders the bowels; for which reafon, when a plentiful ufe of it becomes neceffary, we would prefer rubbing to the mercurial pills. The common mercurial or blue ointment will anfwer very well. Of that which is made by rubbing together equal quantities of hog's-lard and quickfilver, about a drachm may be ufed at a time. The beft time for rubbing it on is at night, and the moft proper place

* Take quickfilver one drachm, gum-arabic reduced to a mucilage two drachms; let the quickfilver be rubbed with the mucilage, in a marble mortar, until the globules of mercury entirely difappear; a dterwards add gradually, fiill continuing the trituration, half an ounce of balfamic fyrup, and eight ounces of fimple cinnamon-water. Two table-fpoonfuls of this folution may be taken night and morning. Some reckon this the beft form in which quickfilver can be exhibited for the cure of a gonorrhexa.

the

OF THE VIRULENT GONORRHOA. 499

the inner fide of the thighs. The patient fhould ftand before the fire when he rubs, and fhould wear flannel drawers next his fkin at the time he is using the ointment. If ointment of a weaker or ftronger kind be used, the quantity must be increased or diminished in proportion.

If, during the use of the ointment, the inflammation of the genital parts, together with the heat and feverishness, should return, or if the mouth should grow fore, the gums tender, and the breath become offensive, a dose or two of Glauber's falts, or fome other cooling purge, may be taken, and the rubbing intermitted for a few days. As foon, however, as the figns of spitting are gone off, if the virulency be not quite corrected, the ointment mult be repeated, but in smaller quantities, and at longer intervals than before. Whatever way mercury is administered, its use must be persisted in as long as any virulency is fuspected to remain.

During this, which may be called the fecond ftage of the diforder, though fo ftrict a regimen is not neceffary as in the firft or inflammatory ftate, yet intemperance of every kind muft be avoided. The food muft be light, plain, and of eafy digeftion; and the greateft indulgence that may be allowed with refpect to drink is, a little wine diluted with a fufficient quantity of water. Spirituous liquors are to be avoided in every fhape. I have often known the inflammatory fymptoms renewed and heightened, the running increated, and the cure rendered extremely difficult and tedious, by one fit of exceflive drinking.

When the above treatment has removed the heat of urine, and forenefs of the genital parts; when the quantity of running is confiderably leffened, without any pain or fwelling in the groin or tefficie fupervening; when the patient is free from involuntary erections; and lattly, when the run-K k 2 ning

OF GLEETS.

500

ning becomes pale, whitifh, thick, void of ill fmell, and tenaceous or ropy; when all or moft of thefe fymptoms appear, the gonorrhœa is arrived at its laft ftage, and we may gradually proceed to treat it as a gleet with aftringent and agglutinating medicines.

OF GLEETS.

A gonorrhea frequently repeated, or improperly treated, often ends in a gleet, which may either proceed from a relaxation, or from fome remains of the difeafe. It is however of the greateft importance in the cure of the gleet, to know from which of thefe caufes it proceeds. When the difcharge proves very obfinate, and receives little or no check from aftringent remedies, there is ground to fufpect that it is owing to the latter; but if the drain is inconftant, and is chiefly obfervable when the patient is ftimulated by lafcivious ideas, or upon ftraining to go to ftool, we may reafonably conclude that it is chiefly owing to the former.

In the cure of a gleet proceeding from relaxation, the principal defign is to brace, and reftore a proper degree of tenfion to the debilitated and relaxed veffels. For this purpofe, befides the medicines recommended in the gonorrhœa, the patient may have recourfe to ftronger and more powerful aftringents, as the Peruvian bark *, alum, vi-

* The Peruvian bark may be combined with other aftringents, and prepared in the following manner:

Take of Peruvian bark bruiled fix drachms, of frefh galls bruifed two drachms; boil them in a pound and a half of water to a pound : to the firained liquor add three ounces of the fimple tincture of the bark. A finall tea-cupful of this may be taken three times a-day, adding to each cup fifteen or twenty drops of the acid elixir of vitriol.

triol,

triol, galls, tormentil, biftort, balduftines, tincture of gum kino, &c. The injections may be rendered more aftringent by the addition of a few grains of alum, or increasing the quantity of vitriol as far as the parts are able to bear it.

The laft remedy which we shall mention in this cafe is the cold bath, than which there is not perhaps a more powerful bracer in the whole compass of medicine. It ought never to be omitted in this species of gleet, unless there be fomething in the conflitution of the patient which renders the ule of it unfafe. The chief objections to the use of the cold bath are a full habit, and an unfound state of the vifcera. The danger from the former may always be leffened, if not removed, by purging and bleeding; but the latter is an infurmountable obstacle, as the preffure of the water, and the fudden contraction of the external veffels, by throwing the blood with too much force upon the internal parts, are apt to occasion ruptures of the veffels, or a flux of humours upon the difeafed organs. But where no objection of this kind prevails, the patient ought to plunge over head in water every morning fafting, for three or four weeks together. He fhould not however flav long in the water, and should take care to have his skin dried as soon as he comes out.

The regimen proper in this cafe is the fame as was mentioned in the laft ftage of the gonorrhœa: the diet muft be drying and aftringent, and the drink Spa, Pyrmont, or Briftol waters, with which a little claret or red wine may fometimes be mixed. Any perfon may now afford to drink thefe waters, as they can be every where prepared at almost no expence, by a mixture of common chalk and oil of vitriol.

When the gleet does, not in the fmalleft degree yield to thefe medicines, there is reafon to fufpect K k 3 that that it proceeds from ulcers. In this cafe recourfe must be had to mercury, and fuch medicines as tend to correct any predominant acrimony with which the juices may be affected, as the decoction of China, farfaparilla, fafiafras, or the like.

Mr. Fordyce fays, he has feen many obfinate gleets, of two, three, or four years ftanding, effectually cured by a mercurial inunction, when almoft every other medicine has been tried in vain. Dr. Chapman feems to be of the fame opinion; but fays, he has always found the mercury fucceed beft in this cafe when joined with terebinthinate and other agglutinating medicines. For which reafon the Doctor recommends pills made of calomel and Venice turpentine *; and defires that their use may be accompanied with a decoction of guaiacum or farfaparilla.

The laft kind of remedy which we fhall mention for the cure of ulcers in the urinary paffage, are the fuppurating candles or bougies: as thefe are prepared various ways, and are generally to be bought ready made, it is needlefs to fpend time in enumerating the different ingredients of which they are compofed, or teaching the manner of preparing them. Before a bougie be introduced into the urethra, however, it fhould be fmeared all over with fweet oil, to prevent it from flimulating too fuddenly; it may be fuffered to continue in from one to feven or eight hours, according as the patient can bear it. Obfinate ulcers are not only often healed, but tumours and excrefeences in the

* Take Venice turpentine, boiled to a fufficient degree of hardnefs, half an ounce, calomel half a drachm. Let thefe be mixed and formed into fixty pills, of which five or fix may be taken night and morning. If, during the ufe of thefe pills, the mouth fhould grow fore, or the breath become offenfive, they muft be difficuntinued till thefe fymptoms diffappear.

urinary

OF THE SWELLED TESTICLE 503

urinary paffages taken away, and an obftruction of urine removed by means of bougies. Obftinate gleets may be removed by the ufe of bougies.

OF THE SWELLED TESTICLE.

THE fwelled tefficie may either proceed from infection lately contracted, or from the venereal poilon lurking in the body; the latter indeed is not very common, but the former frequently happens both in the firft and fecond ftages of a gonorrhœa; particularly when the running is unfeatonably checked, by cold, hard drinking, ftrong draftic purges, violent exercife, the too early use of aftringent medicines, or the like.

In the inflammatory ftage bleeding is neceffary, which muft be repeated according to the urgency of the fymptoms *. The food muft be light, and the drink diluting. High-fcafoned food, flefth, wines, and every thing of a heating nature, are to be avoided. Fomentations are of fingular fervice. Poultices of bread and milk, foftened with frefh butter or oil, are likewife very proper, and ought conftantly to be applied when the patient is in bed; when he is up, the tefficies fhould be kept warm, and fupported by a bag or trufs, which may eafily be contrived in fuch a manner as to prevent the weight of the tefficie from having any effect.

If it fhould be found impracticable to clear the tefficie by the cooling regimen now pointed out, and extended according to circumftances, it will be neceffary to lead the patient through fuch a complete antivenereal courfe as fhall enfure him againft any future uneafinefs. For this purpofe, befides rubbing the mercurial ointment on the thighs

* I have been accuftomed for fome time paft to apply leeches to inflamed tefficies, which practice has always been followed with the most happy effects. as directed in the gonorrhœa, the patient muft be confined to bed, if neceffary, for five or fix weeks, fufpending the tefficle, all the while, with a bag or trufs, and plying him inwardly with ftrong decoctions of farfaparilla.

When thefe means do not fucceed, and there is reafon to fufpect a fcrophulous or cancerous habit, either of which may fupport a fcirrhous induration, after the venereal poifon is corrected, the parts fhould be fomented daily with a decoction of hemlock, the bruiled leaves of which may likewife be added to the poultice, and the extract at the fame time taken inwardly*. This practice is ftrongly recommended by Dr. Storck in fcirrhous and cancerous cafes; and Mr. Fordyce affures us, that by this method he has cured difeafed tefficles of two or three years ftanding, even when ulcerated, and when the fcirrhous had begun to be affected with pricking and lancing pains.

OF BUBOES.

Venereal bubbes are hard tumours feated in the groin, occafioned by the venereal poifon lodged in this part. They are of two kinds; viz. fuch as proceed from a recent infection, and fuch as accompany a confirmed lues.

The cure of recent buboes, that is, fuch as appear foon after impure coition, may be first attempted by *difperfion*, and, if that should not fucceed, by *fuppuration*. To promote the differsion of a bubo, the fame regimen must be observed as was directed in the first stage of a gonorrhœa. The patient must likewise be bled, and take fome cool-

* The extract of hemlock may be made into pills, and taken in the manner directed under the article Cancer.-

ing

ing purges, as the decoction of tamarinds and fenna, Glauber's falts, and the like. If by this courfe, the fwelling and other inflammatory fymptoms abate, we may lafely proceed to the use of mercury, which must be continued till the venereal virus is quite fubdued*.

But if the bubo fhould, from the beginning, be attended with great heat, pain, and pulfation, it will be proper to promote its fuppuration. For this purpole the patient may be allowed to ufe his. ordinary diet, and to take now and then a glafs of wine. Emollient cataplafins, confifting of bread and milk foftened with oil or frefh butter, may be applied to the part; and, in cold conflitutions, where the tumour advances flowly, white lily-roots boiled, or fliced onions raw, and a fufficient quantity of yellow bafilicon, may be added to the poultice.

When the tumour is ripe, which may be known by its conical figure, the foftness of the skin, and a fluctuation of matter plainly to be felt under the singer, it may be opened either by a caustic or a lancet, and afterwards dreffed with digestive ointment.

It fometimes however happens, that buboes can neither be difperfed nor brought to a fuppuration, but remain hard indolent tumours. In this cafe the indurated glands muft be confumed by cauftic; if they fhould become fcirrhous, they muft be diffolved by the application of hemlock, both externally and internally, as directed in the fcirrhous tefficie.

* For the difpersion of a bubo, a number of leeches applied to the part affected will be found equally efficacious as in the inflamed tefficie.

[506]

OF CHANCRES.

CHANCRES are fuperficial, callous, eating ulcers; which may happen either with or without a gonorrhœa. They are commonly feated about the glans, and make their appearance in the following manner: Firft a little red pimple arifes, which foon becomes pointed at top, and is filled with a whitifh matter inclining to yellow. This pimple is hot, and itches generally before it breaks: afterwards it degenerates into an obfinate ulcer, the bottom of which is ufually covered with a vifcid mucus, and whofe edges gradually become hard and callous. Sometimes the firft appearance refembles a fimple excertation of the cuticle; which, however, if the caufe be venereal, foon becomes a true chancre.

A chancre is fometimes a primary affection, but it is much oftener fymptomatic, and is the mark of a confirmed lues. Primary chancres difcover themfelves foon after impure coition, and are generally feated in parts covered with a thin cuticle, as the lips, the nipples of women, the glans penis of men, &c.*

When a chancre appears foon after impure coition, its treatment is nearly fimilar to that of the virulent gonorrhœa. The patient muft obferve the cooling regimen, loofe a little blood, and take fome gentle doles of falts and manna. The parts af-

* When venereal ulcers are feated in the lips, the infection may be communicated by kifling. I have feen very obflinate venereal ulcers in the lips, which I had all the reafon in the world to believe were communicated in this manner.

Nurfes ought to beware of fuckling infected children, or having their breafts drawn by perfons tainted with the venereal difeafe. This caution is peculiarly neceffary for nurfes who refide in the neighbourhood of great towns.

fected

fected ought frequently to be bathed, or rather foaked, in warm milk and water, and, if the inflammation be great, an emollient poultice or cataplafm may be applied to them. This courfe will, in most cafes, be fufficient to abate the inflammation, and prepare the patient for the use of mercury.

Symptomatic chancres are commonly accompanied with ulcers in the throat, nocturnal pains, feurvy eruptions about the roots of the hair, and other fymptoms of a confirmed lues. Though they may be feated in any of the parts mentioned above, they commonly appear upon the private parts, or the infide of the thigh. They are alfo lefs painful, but frequently much larger and harder than primary chances. As their cure muft depend upon that of the pox, of which they are only a fymptom, we fhall take no further notice of them, till we come to treat. of a confirmed lues*.

Thus we have related most of the fymptoms which accompany or fucceed a violent gonorrhea, and have also given a flort view of their proper treatment; there are, however, feveral others which fometimes attend this difeafe, as a *ftrangury* or obstruction of urine, a *phymofis*, *paraphymofis*, &c.

A ftrangury may be occafioned either by a fpafmodic conftriction, or an inflammation of the urethra and parts about the neck of the bladder. In the former cafe, the patient begins to void his urine with tolerable eafe; but, as foon as it touches the galled or inflamed urethra, a fudden conftriction takes place, and the urine is voided by fpurts, and fometimes by drops only. When the ftrangury is

* I have found it answer extremely well to fprinkle chancres twice a-day with calomel. This will often perform a cure without any other application whatever. If the chancres are upon the *glans*, they may be walled with milk and water, a little warm, and afterwards the calomel may be applied as above.

owing

owing to an inflammation about the neck of the bladder, there is a conftant heat and uneafinefs of the part, a perpetual defire to make water, while the patient can only render a few drops, and a troublefome *tenefmus*, or conftant inclination to go to theol.

When the ftrangury is owing to fpaim, fuch medicines as tend to dilute and blunt the falts of the urine will be proper. For this purpole, befides the common diluting liquors, foft and cooling emultions, fweetened with the fyrup of poppies, may be used. Should these not have the defired effect, bleeding, and emollient fomentations, will be neceffary.

When the complaint is evidently owing to an inflammation about the neck of the bladder, bleeding muft be more liberally performed, and repeated according to the urgency of the fymptoms. After bleeding, if the ftrangury ftill continues, foft clyfters, with a proper quantity of laudanum in them, may be adminiftered, and emollient fomentations applied to the region of the bladder. At the fame time, the patient may take every four hours a tea-cupful of barley-water, to an English pint of which fix ounces of the fyrup of marsh-mallows, four ounces of the oil of sweet almonds, and half an ounce of nitre, may be added. If these remedies should not relieve the complaint, and a total suppression of urine should come on, bleeding must be repeated, and the patient fet in a warm bath up to the middle. It will be proper in this cafe to discontinue the diuretics, and to draw off the water with a catheter; but as the patient is feldom able to bear its being introduced, we would rather recommend the use of mild bougies. These often lubricate the paffage, and greatly facilitate the difcharge of urine. Whenever they begin to ftimulate or give any uneafinefs, they may be withdrawn.

8

The

The *phymofis* is fuch a conftriction of the prepuce over the glans, as hinders it from being drawn backwards; the *paraphymofis*, on the contrary, is fuch a conftriction of the prepuce behind the glans, as hinders it from being brought forward.

The treatment of these fymptoms is fo nearly the fame with that of the virulent gonorrhœa, that we have no occasion to enlarge upon it. In general, bleeding, purging, poultices, and emollient formentations are fufficient. Should these, however, fail of removing the ftricture, and the parts be threatened with a mortification, twenty or thirty grains of ipecacuanha, and one grain of emetic tartar, may be given for a vomit, and may be worked off with warm water or thin gruel.

It fometimes happens, that, in fpite of all endeavours to the contrary, the inflammation goes on, and fymptoms of a beginning mortification appear. When this is the cafe, the prepuce muft be fcarified with a lancet, and, if neceflary, divided, in order to prevent a ftrangulation, and fet the imprifoned glans at liberty. We fhall not defcribe the manner of performing this operation, as it ought always to be done by a furgeon. When a mortification has actually taken place, it will be neceffary, befides performing the above operations, to foment the parts frequently with cloths wrung out of a ftrong decoction of camomile flowers and bark, and to give the patient a drachm of the bark in powder every two or three hours.

With regard to the *priapifm*, *chordee*, and other diffortions of the *penis*, their treatment is no way different from that of the gonorrhœa. When they prove very troublefome, the patient may take a few drops of laudanum at night, effectially after the operation of a purgative through the day.

OF A CONFIRMED LUES.

We have hitherto treated of those affections in which the venereal poifon is fupposed to be confined chiefly to the particular part by which it was received, and shall next take a view of the lues in its confirmed state; that is, when the poifon is actually received into the blood, and, circulating with it through every part of the body, mixes with the feveral fecretions, and renders the whole habit tainted.

The fymptoms of a confirmed lues are, buboes in the groin, pains of the head and joints, which are peculiarly troublefome in the night, or when the patient is warm in bed; fcabs and fcurfs in various parts of the body, especially on the head, of a vellowifh colour, refembling a honey-comb; corroding ulcers in various parts of the body, which generally begin about the throat, from whence they creep gradually, by the palate, towards the cartilage of the nofe, which they deftroy; excrefcences or exoftofes arife in the middle of the bones, and their fpongy ends become brittle and break upon the leaft accident; at other times they are foft, and bend like wax; the conglobate glands become hard and callous, and form in the neck, armpits, groin, and mefentery, hard moveable tumours, like the king's evil; tumours of different kinds are likewile formed in the lymphatic veffels, tendons, ligaments, and nerves, as the gummata, ganglia, nodes, topbs, &c.; the eyes are affected with itching, pain, rednefs, and fometimes with total blindnefs, and the ears with a finging noife, pain, and deafnefs, whilft their internal substance is exulcerated and rendered carious; at length all the animal, vital, and

and natural functions are depraved; the face becomes pale and livid; the body emaciated and unfit for motion, and the miferable patient falls into an atrophy or wasting confumption.

Women have fymptoms peculiar to the fex; as cancers of the breaft; a fupprefilion or overflowing of the menfes; the whites; hyfteric affections; an inflammation, ablcefs, fchirrhus, gangrene, cancer, or ulcer of the womb; they are generally either barren or fubject to abortion; or, if they bring children into the world, they have an univerfal eryfipelas, are half rotten, and covered with ulcers.

Such is the catalogue of fymptoms attending this dreadful difeafe in its confirmed flate. Indeed, they are feldom all to be met with in the fame perfon, or at the fame time; fo many of them, however, are generally prefent as are fufficient to alarm the patient; and if he has reafon to fufpect the infection is lurking in his body, he ought immediately to fet about the expulsion of it, otherwife the most tragical confequences will enfue.

The only certain remedy hitherto known in Europe, for the cure of this difeafe, is mercury, which may be ufed in a great variety of forms, with nearly the fame fuccefs*. Some time ago it was reckoned impofible to cure a confirmed lues without a falivation. This method is now however pretty generally laid afide, and mercury is found to be as efficacious, or rather more fo, in expelling the venereal poifon, when adminifered in fuch a manner as not to run off by the falivary glands.

Though many are of opinion, that the mercurial ointment is as efficacious as any other preparation of that mineral; yet experience has taught me to think otherwife. I have often feen the moft obftinate venereal cafes, where great quantities of mercurial ointment had been ufed in vain, yield to

* The preparations which I now chiefly use, in the confirmed hues, are calomel and calcined mercury.

OF A CONFIRMED LUES.

the faline preparations of mercury. Nor am I fingular in this opinion. Mr. Clare, an eminent furgeon of this city, affores me, that for fome time paft he has employed, in venereal cafes, a faline preparation of mercury with moft happy fuccefs. This preparation, rubbed with a fufficient quantity of any mild powder, he applies, in fmall portions, to the tongue, where, with a gentle degree of friction, it is immediately abforbed, and produces its full effect upon the fyftem, without doing the leaft injury to the ftomach or bowels; a matter of the greateft importance in the application of this moft active and powerful remedy.

It is impossible to afcertain either the exact quantity of medicines that must be taken, or the time they ought to be continued, in order to perform a cure. These will ever vary according to the conflitution of the patient, the feason of the year, the degree of infection, the time it has lodged in the body, &c. But though it is difficult, as Astrue obferves, to determine à priori, what quantity of 'mercury will, in the whole, be neceffary to cure this diftemper completely; yet it may be judged of à posseriori, from the abatement and ceasing of the fymptoms. The fame author adds, that commonly not less than two ounces of the ftrong mercurial ointment is fufficient, and not more than three or four ounces heceffary.

The only chemical preparation of mercury which we shall take notice of, is the corrolive sublimate. This was some time ago brought into use for the venereal discase, in Germany, by the illuftrious Baron Van Switten; and was soon after introduced into Britain by the learned Sir John Pringle, at that time physician to the army. The method of giving it is as follows: One grain of corrolive sublimate is diffolved in two ounces of French brandy or malt spirits; and of this folution, and

512

OF A CONFIRMED LUES.

an ordinary table-spoonful, or the quantity of half an ounce, is to be taken twice a day, and to be continued as long as any symptoms of the disorder remain. To those whose stomach cannot bear the solution, the sublimate may be given in form of pill *.

Several roots, woods, and barks, have been recommended for curing the venereal diffeafe, but none of them have been found, upon experience, to answer the high encomiums which had been beftowed upon them. Though no one of thefe is to be depended upon alone, yet, when joined with mercury, fome of them are found to be very beneficial in promoting a cure. One of the beft we know yet is farfaparilla, which may be prepared and taken according to the directions in the Appendix \uparrow .

The mezercon-root is likewife found to be a powerful affiltant to the fublimate, or any other mercurial. It may either be ufed along with the farfaparilla, as directed in the Appendix, or by itfelf. Thole who choofe to ufe the mezercon by itfelf, may boil an ounce of the fresh bark, taken from the root, in twelve English pints of water to eight, adding towards the end an ounce of liquorice. The dole of this is the fame as of the decoction of farfaparilla.

We have been told that the natives of America oure the venereal difeafe, in every ftage, by a de-

* The fublimate may be given in diffilled water, or any other liquid that the patient choofes. I commonly order ten grains to be diffolved in an ounce of the fpirit of wine, for the conveniency of carriage, and let the patient take twenty or thirty drops of it aight and morning in half a glafs of brandy or other fpirits. Mr. Debraw, an ingeaious chymith of this place, informs me, that he prepares a falt of mercury much more mild and gentle in its operation than the fublimate, though equally efficacious.

+ See Appendix, Decosion of Sarfaparilla.

coction

coclion of the root of a plant called the Lobelia. It is used either fresh or dried; but we have no certain accounts with regard to the proportion. Sometimes they mix other roots with it, as those of the ranunculus, the ceanothus, &c.; but whether these are defigned to difguife or affift it, is doubtful. The patient takes a large draught of the decoction early in the morning, and continues to use it for his ordinary drink through the day *.

Many other roots and woods might be mentioned which have been extolled for curing the venereal difeafe, as the china-root, the roots of foap-wort, burdock, &c. as allo the wood of guaiacum and fafiafras; but as none of thefe have been found to poffers virtues fuperior to those already mentioned, we fhall, for the fake of brevity, pass them over, and fhall conclude our observations on this difeafe, with a few general remarks concerning the proper management of the patient, and the nature of the infection.

* Though we are flill very much in the dark with regard to the method of curing this difeafe among the natives of America, yet it is generally affirmed, that they do cure it with fpeed, fafety, and fuccefs, and that without the leaft knowledge of mercury. Hence it becomes an object of confiderable importance to difcover their method of cure. This might furely be done by making trials of the various plants which are found in thofe parts, and particularly of fuch as the natives are known to make ufe of. All people in a rude flate take their medicines chicfly from the vegetable kingdom, and are often poffeffed of valuable fecrets with regard to the virtues of plants, of which more enlightened nations are ignorant. Indeed we make no doubt but fome plants of our own growth, were proper pains taken to difcover them, would be found as efficacious in curing the veneral difeafe as thofe of America. It mult however be remembered, that what will cure the venereal difeafe in one country, will not always be found to have equal fuccefs in another.

514

GENERAL OBSERVATIONS.

THE condition of the patient ought always to be confidered previous to his entering upon a courfe of mercury in any form. It would be equally rafh and . dangerous to administer mercury to a perfon labouring under any violent acute difeafe, as a putrid fever, pleurify, peripneumony, or the like. It would likewife be dangerous in fome chronic cafes; as a flow hectic fever, or the last stage of a confumption. Sometimes, however, these difeases proceed from a confirmed lues; in which cafe it will be neceffary to give mercury. In chronic difeafes of a lefs dangerous nature, as the afthma, the gravel, and fuch like, mercury, if neceffary, may be fafely administered. If the patient's firength has been greatly exhaufted by ficknefs, labour, abstinence, or any other caufe, the use of mercury must be postponed, till by time, reft, and a nourifhing diet, it can be fufficiently reftored.

Mercury ought not to be adminifered to women during the menftrual flux, or when the period is near at hand. Neither fhould it be given in the laft ftage of pregnancy. If, however, the woman be not near the time of her delivery, and circumftances render it neceffary, mercury may be given, but in fmaller dofes, and at greater intervals than ufual; with thefe precautions, both the mother and child may be cured at the fame time; if not, the diforder will at leaft be kept from growing worfe, till the woman be brought to bed, and fufficiently recovered, when a more effectual method may be purfued, which, if he fuckles her child, will in all probability be fufficient for the cure of both.

L.1 2

Mercury

OF A CONFIRMED LUES. 516

Mercury ought always to be administered to infants with the greatest caution. Their tender condition unfits them for supporting a falivation, and makes it neceffary to administer even the mildest preparations of mercury to them with a fparing hand. A fimilar conduct is recommended in the treatment of old perfons, who have the misfortune to labour under a confirmed lues. No doubt the infirmities of age must render people lefs able to undergo the fatigues of a falivation; but this, as was formerly observed, is never neceffary; befides, we have generally found that mercury had much lefs effect upon very old perfons than on those who were vounger.

Hysterie and hypochondriac perfons, and fuch as are subject to an habitual diarrhœa or dyfentery, or to frequent and violent attacks of the epilepfy, or who are afflicted with the fcrophula, or the fcurvy, ought to be cautious in the use of mercury. Where any one of these diforders prevails, it ought either, if peffible, to be cured, or at least palliated, before the patient enters upon a courfe of mercury. When this cannot be done, the mercury must be administered in smaller doses, and at longer intervals than ufual.

The most proper seafons for entering upon a coarle of mercury, are the fpring and autumn, when the air is of a moderate warmth. If the circumstances of the cafe, however, will not admit of delay, we must not defer the cure on account of the feason, but must administer the mercury; taking care at the fame time to keep the patient's chamber warmer or cooler, according as the feafon of the year requires.

The next thing to be confidered is the preparation neceffary to be observed before we proceed to administer a course of mercury. Some lay great ftrefs Trefs upon this circumftance, obferving, that by previoufly relaxing the veffels, and correcting any diforder which may happen to prevail in the blood, not only the mercury will be difpofed to act more kindly, but many other inconveniencies will be prevented.

We have already recommended bleeding and gentle purges, previous to the administration of mercury, and shall only now add, that these are always to be repeated according to the age, ftrength, constitution, and other circumstances of the patient. Afterwards, if it can be conveniently done, the patient ought to bathe once or twice a day, for a few days, in lukewarm water. His diet in the mean time must be light, moist, and cooling. Wine, and all heating liquors, also violent bodily exercise, and all great exertions of the mind, are carefully to be avoided.

A proper regimen is likewife to be obferved by fuch as are under a course of mercury. Inattention to this not only endangers the patient's life, but often also disappoints him of a cure. A much smaller quantity of mercury will be sufficient for the cure of a person who lives low, keeps warm, and avoids all manner of excess, than of one who cannot endure to put the smallest restraint upon his appetites: indeed it but rarely happens that such are thoroughly cured.

There is hardly any thing of more importance; either for preventing or removing venereal infecttion, than cleanlinels. By an early attention to this, the infection might often be prevented from entering the body; and, where it has already taken place, its effects may be greatly initigated. The moment any perfon has reafon to fulfpect that he has received the infection, he ought to walh the parts with water and fpirits, fweet oil, or milk and water; a fmall quantity of the laft may likewife be L 1 3

518 OF A CONFIRMED LUES.

injected up the urethra, if it can be conveniently done. Whether this difeafe at first took its rife from dirtiness is hard to fay; but wherever that prevails, the infection is found in its greatest degree of virulence, which gives ground to believe that a strict attention to cleanliness would go far towards extirpating it altogether *.

When the venereal difeafe has been neglected, or improperly treated, it often becomes a diforder of the habit. In this cafe the cure muft be attempted by reftoratives, as a milk diet, the decoction of farfaparilla, and fuch like, to which mercury may be occafionally added. It is a common practice in North Britain to fend fuch patients to drink goatwhey. This is a very proper plan, provided the

* I have not only often feen a recent infection carried off in a few days by means of cleanlinefs, viz. bathing, fomentations, injections, &c. but have likewise found it of the greatest advantage in the more advanced flages of the difeafe. Of this I had lately a very remarkable inftance, in a man whole penis was almost wholly confumed by venereal ulcers; the matter had been allowed to continue on the fores, without any care having been taken to clean them, till, notwithstanding the use of mercury and other medicines, it had produced the effects above mentioned. I ordered warm milk and water to be injected three or four times a-day into all the finuous ulcers, in order to wash out the matter; after which they were fluffed with dry lint to abforb the fresh matter as it was generated. The patient at the fame time took every day half a grain of the corrofive fublimate of mercury, diffolved in an ounce of brandy, and drank an English quart of the decoction of farfaparilla. By this treatment, in about fix weeks, he was perfectly cured; and, what was very remarkable, a part of the penis was actually regenerated.

Doctor Gilchrift has given an account of a fpecies of the *lues* venerea which prevails in the weft of Scotland, to which the natives give the name of Sibbins or Sivvins. The Doctor obferves, that the fpreading of this difeafe is chiefly owing to the neglect of cleanlines, and feems to think, that by due attention to that sirtue, it might be extirpated. The treatment of this difeafe is fimilar to that of a confirmed lues or pox. The yaws, a difeafe which is now very common both in America and the Weft India iJands, may also be cured in the fame manner.

infection

infection has been totally eradicated before-hand; but when that is not the cafe, and the patient trufts to the whey for finifhing his cure, he will often be difappointed. I have frequently known the difeafe return with all its virulence after a courfe of goat-whey, even when that courfe had been thought quite fufficient for completing the cure.

One of the most unfortunate circumstances attending patients in this difeafe, is the neceffity they are often laid under of hurrying the cure. This induces them to take medicine too faft, and to leave it off too foon. A few grains more of medicine, or a few days longer confinement, would often be fufficient to perfect the cure; whereas, by neglect of thefe, a fmall degree of virulence is ftill left in the humours, which gradually vitiates, and at length contaminates the whole mass. To avoid this, we would advife, that the patient fhould never leave off taking medicine immediately upon the difappearing of the fymptoms, but continue it for fome time after, gradually leffening the quantity, till there is fufficient ground to believe that the difeate is entirely eradicated.

It is not only difficult, but abfolutely impoffible, to afcertain the exact degree of virulence that may attend the difeafe; for which reafon it will always be a much fafer rule to continue the use of medicine too long, than to leave it off too foon. This feems to be the leading maxim of a modern practitioner of fome note for the venereal difeafe, who always orders his patient to perform a quarentine of at least forty days, during which time he takes forty bottles of, I fuppole, a ftrong decoction of farfaparilla, or fome other anti-venereal fimple. Whoever takes this method, and adds a fufficient quantity of corrofive fublimate, or fome other active preparation of mercury to the decoction, will feldom fail to cure a confirmed lues.

Ιŗ

It is peculiarly unfortunate for the cure of this difease, that not one in ten of those who contract it, are either able or willing to fubmit to a proper plan of regimen. The patient is willing to take medicine; but he must follow his business, and, to prevent fuspicions, must eat and drink like the reft of the family. This is the true fource of ninetenths of all the mifchief arifing from the venereal difease. I never knew the cure attended with any great difficulty or danger where the patient strictly followed the physician's advice: but a volume would not be fufficient to point out the dreadful confequences which proceed from an oppofite conduct. Scirrhous tefficles, ulcerous fore throats. madnefs, confumptions, carious bones, and a rotten progeny, are a few of the bleffings derived from this fource.

There is a species of false reasoning, with regard to this difeafe, which proves fatal to many. A perfon of a found conftitution contracts a flight degree of the diforder. He gets well without taking any great care, or using much medicine, and hence concludes that this will always be the cafe. The next time the difeafe occurs, though ten times more virulent, he purfues the fame courfe, and his conftitution is ruined. Indeed, the different degrees of virulence in the fmall-pex are not greater than this difeafe, though, as the learn d Sydenham oblerves, in fome cafes the most skilful phyficians cannot cure, and in others the moft ignotant old woman cannot kill the patient in that diforder. Though a good conftitution is always in favour of the patient, yet too great ftrefs may be laid upon it. It does not appear from observation, that the most robust constitution is able to overcome the virulence of the venereal contagion, after it has got into the habit. In this cafe a proper courfe

520

DISEASES OF WOMEN. 521

courfe of medicine is always indifpenfably nececeffary.

Although it is impoffible, on account of the different degrees of virulence, &cc. to lay down fixed and certain rules for the cure of this difeafe, yet the following general plan will always be found fate, and often fuccelsful, viz. to bleed and alminiter gentle purges with diuretics during the inflammatory flate, and as foon as the fymptoms of inflammation are abated, to adminifer mercury, in any form that may be moft agreeable to the patient. The fame medicine, affifted by the decoction of farfaparilla, and a proper regimen, will not only fecure the conflicution againft the further progress of a confirmed pox, but will generally perform a complete cure.

CHAP. XLVIII.

DISEASES OF WOMEN.

W OMEN, in all civilized nations, have the management of domefic affairs, and it is very proper they flould, as Nature has made them lefs fit for the more active and laborious employments. This indulgence, however, is generally carried too far; and females, inflead of being benefited by it, are greatly injured, from the want of exercife and free air. To be fatisfied of this, one need only compare the frefh and ruddy looks of a milk-maid, with the pale complexion of those females whose whole time is spent within doors. Though Nature has made an evident diffinction between the male and female with regard to bodily ftrength and vigour, yet fhe certainly never meant, either that the

the one fhould be always without, or the other always within doors.

The confinement of females, befides hurting their figure and complexion, relaxes their folids, weakens their minds, and diforders all the functions of the body. Hence proceed obftructions, indigetion, flatulence, abortions, and the whole train of nervous diforders. Thefe not only unfit women for being mothers and nurfes, but often render them whimfical and ridiculous. A found mind depends fo much upon a healthy body, that where the latter is wanting the former is rarely to be found.

I have always obferved, that women who were chiefly employed without doors, in the different branches of hufbandry, gardening, and the like, were almoft as hardy as their hufbands, and that their children were likewife ftrong and healthy. But as the bad effects of confinement and inactivity upon both fexes have been already fhewn, we fhall proceed to point out those circumftances in the ftructure and defign of females, which fubject them to peculiar difeases; the chief of which are, their monthly evacuations, pregnancy, and child-bearing. These indeed cannot properly be called difeases, but, from the delicacy of the fex, and their being often improperly managed in fuch fituations, they become the fource of numerous calamities.

OF THE MENSTRUAL DISCHARGE.

Females generally begin to menftruate about the age of fifteen, and leave it off about fifty, which renders thefe two periods the moft critical of their lives. About the first appearance of this difcharge, the conftitution undergoes a very confiderable change, generally indeed for the better, though fometimes for

for the worfe. The greateft care is now neceffary, as the future health and happinels of the female depends in a great measure upon her conduct at this period *.

If a girl about this time of life be confined to the houfe, kept conftantly fitting, and neither allowed to romp about, nor employed in any active bulinefs, which gives exercife to the whole body, fhe becomes weak, relaxed, and puny; her blood not being duly prepared, fhe looks pale and wan; her health, fpirits, and vigour decline, and fhe finks into a valetudinarian for life. Such is the fate of numbers of those unhappy females, who, either from too much indulgence, or their own narrow circumftances, are, at this critical period, denied the benefit of exercife and free air.

A lazy, indolent difpolition proves likewife very hurtful to girls at this period. One feldom meets with complaints from obftructions amongft the more active and induffrious part of the fex; whereas the indolent and lazy are feldom free from them. Thefe are in a manner eaten up by the *cblorofis*, or greenficknefs, and other difeafes of this nature. We would therefore recommend it to all who wifh to efcape thefe calamities, to avoid indolence and inactivity, as their greateft enemies, and to be as much abroad in the open air as poffible.

* It is the duty of mothers, and thole who are intrufted with the education of girls, to influct them early in the conduct and management of themfelves at this critical period of their lives. Falle modefty, inattention, and ignorance of what is benchicial or hurtful at this time, are the fources of many difeafes and misfortunes in life, which a few fenible leffons from an experienced mafron might have prevented. Nor is care lefs neceffary in the fubfequent returns of this difcharge. Taking improper food, violent affections of the mind, or catching cold at this period, is often fufficient to ruin the health, or to render the female ever after incapable of procreation.

Another

Another thing which proves very hurtful to girls about this period of life, is unwholefome food. Fond of all manner of trafh, they often indulge in it, till their whole humours are quite vitiated. Hence enfue indigeftions, want of appetite, and a numerous train of evils. If the fluids be not duly prepared, it is utterly impoffible that the fecretions fhould go properly on. Accordingly we find, that fuch girls as lead an indolent life, and eat great quantities of trafh, are not only fubject to obftructions of the menfes, but hkewife to glandular obftructions; as the fcrophula, or king's evil, &c.

A dull difpolition is also very hurtful to girls at this period. It is a rare thing to fee a fprightly girl who does not enjoy good health, while the grave, moping, melancholy creature, proves the very prey of vapours and hyfterics. Youth is the feason for mitth and cheerfulnels. Let it therefore be indulged. It is an absolute duty. To lay in a flock of health in time of youth, is as neceffary a piece of prudence, as to make provision againft the decays of old age. While, therefore, wife Nature prompts the happy youth to join in sprightly amufements, let not the fevere dictates of hoary age forbid the uteful impulfe, nor damp with ferious gloom, the feason defined to mirth and innocent feftivity.

Another thing very hurtful to females about this period of life is ftrait clothes. They are fond of a fine fhape, and foolifhly imagine that this can be acquired by lacing themfelves tight. Hence by fqueezing the ftomach and bowels, they hurt the digeftion, and occafion many incurable maladies. This error is not indeed fo common as it has been; but, as fafhions change, it may come about again : we therefore think it not improper to mention it. I know many females who, to this day, feel the direful

ful effects of that wretched cultom which prevailed fome years ago, of fqueezing every girl into as fmall a fize in the middle as poffible. Human invention could not poffibly have devifed a practice more deftructive to health.

After a female has arrived at that period of life when the *menfes* ufually begin to flow, and they do not appear, but, on the contrary, her health and fpirits begin to decline, we would advife, inflead of fhutting the poor girl up in the houfe, and dofing her with fteel, afafœtida, and other naufeous drugs, to place her in a fituation where the can enjoy the benefit of free air and agreeable company. There let her eat wholefome food, take fufficient exercife, and amufe herfelf in the moft agreeable manner; and we have little reafon to fear, but Nature, thus affifted, will do her proper work. Indeed the feldom fails, unlefs where the fault is on our fide.

This difcharge in the beginning is feldom fo inftantaneous as to furprize females unawares. It is generally preceded by fymptoms which foretel its approach; as a fenfe of heat, weight, and dull pain in the loins; diffention and hardnefs of the breafts; head-ach; lofs of appetite; laffitude; palenefs of the countenance; and fometimes a flight degree of fever. When thefe fymptoms appear about the age at which the menftrual flux ufually begins, every thing fhould be carefully avoided which may obfituet that neceffary and falutary evacuation; and all means ufed to promote it; as fitting frequently over the fteams of warm water, drinking warm diluting liquors, &c.

After the menfes have once begun to flow, the greateft care fhould be taken to avoid every thing that may tend to obstruct them. Females ought to be exceeding cautious of what they eat or drink at the time they are out of order. Every thing

thing that is cold, or apt to four on the ftomach, ought to be avoided; as fruit, butter-milk, and fuch like. Fifh, and all kinds of food that are hard of digeftion, are allo to be avoided. As it is impofible to mention every thing that may difagree with individuals at this time, we would recommend it to every female to be very attentive to what difagrees with herfelf, and carefully to avoid it.

Cold is extremely hurtful at this particular period. More of the fex date their difeafes from colds, caught while they are out of order, than from all other caufes. This ought furely to put them upon their guard, and to make them very circumspect in their conduct at such times. A degree of cold that will not in the least hurt them at another time, will at this period be sufficient entirely to ruin their health and constitution.

The greatest attention ought likewife to be paid to the mind, which should be kept as easy and cheerful as possible. Every part of the animal economy is influenced by the passions, but none more fo than this. Anger, fear, grief, and other affections of the mind, often occasion obstructions of the menstrual flux, which prove absolutely incurable.

* From whatever caufe this flux is obftructed, except in the flate of pregnancy, proper means fhould be ufed to reftore it. For this purpofe we would recommend fufficient exercife, in a dry, open, and rather cool air; wholefome diet, and, if the body be weak and languid, generous liquors; alfo cheerful company and all manner of amufements. If these fail, recourfe muft be had to medicine.

When obftructions proceed from a weak relaxed ftate of the folids, fuch medicines as tend to promote digeftion, to brace the folids, and affift the body in preparing good blood, ought to be ufed. The principal

principal of these are iron and the Peruvian bark, with other bitter and aftringent medicines. Filings of iron may be infused in wine or ale, two or three ounces to an English quart, and after it has flood for two or three weeks it may be filtered, and about half a wine-glass of it taken twice a-day: or prepared fteel may be taken in the dole of half a drachm, mixed with a little honey or treacle, three or four times a day. The bark and other bitters may either be taken in fubftance or infusion, as is most agreeable to the patient.

When obftructions proceed from a vifcid ftate of the blood; or for women of a grois or full habit, evacuations, and fuch medicines as attenuate the humours, are neceffary. The patient in this cafe ought to be bled, to bathe her feet frequently in warm water, to take now and then a cooling purge, and to live upon a fpare thin diet. Her drink fhould be whey, water, or fmall beer, and fhe ought to take fufficient exercife. A tea-fpoonful of the tincture of black hellebore may alfo be taken twice a-day in a cup of warm water.

When obfiructions proceed from affections of the mind, as grief, fear, anger, &cc. every method fhould be taken to amufe and divert the patient. And that the may the more readily forget the caufe of her affliction, fhe ought, if poffible, to be removed from the place where it happened. A change of place, by prefenting the mind with a variety of new objects, has often a very happy influence in relieving it from the deepeft diffrefs. A foothing, kind, and affable behaviour to females in this fituation is allo of the laft importance.

An obstruction of the *menses* is often the effect of other maladies. When this is the cafe, instead of giving medicines to force that discharge, which might be dangerous, we ought by all means to endeavour to refeore the patient's health and ftrength.

9

When

When that is effected, the other will return of courfe.

But the menfitual flux may be too great as well as too fmall. When this happens, the patient becomes weak, the colour pale, the appetite and digeftion are bad, to which ceden.atous fwellings of the feet, dropfies, and confumptions often enfue. This frequently happens to women about the age of forty-five or fifty, and is very difficult to cure. It may proceed from a fedentary life; a full diet, confifting chiefly of falted, high-feafoned, or actid food; the ufe of fpirituous liquors; exceflive fatigue; relaxation; a diffolved ftate of the blood; violent paffions of the mind, &cc.

The treatment of this difease must be varied according to its cause. When it is occasioned by any error in the patient's regimen, an opposite course to that which induced the diforder must be pursued, and such medicines taken as have a tendency to reftrain the flux, and counteract the morbid affections of the system from whence it proceeds.

To reftrain the flux, the patient fhould be kept quiet and eafy both in body and mind. If it be very violent, fhe ought to lie in bed with her head low; to live upon a cool and flender diet, as veal or chicken broths with bread; and to drink decoctions of nettleroots, or the greater comfrey. If these be not fufficient to ftop the flux, ftronger aftringents may be used, as Japan earth, allum, elixir of vitriol, the Peruvian bark, &c.*

* Two drachms of allum and one of Japan earth may be pounded together, and divided into eight or nine doles, one of which may be taken three times a-day.

Perfons whole flomachs cannot bear the allum, may take two table-fpoonfuls of the tincture of rofes three or four times a-day, to each dofe of which ten drops of laudanum may be added.

If these should fail, half a drachm of the Peruvian bark, in powder, with ten drops of the elixir of vitriol, may be taken, in a glass of red wine, four times a day.

The uterine flux may offend in quality as well as in quantity. What is ufually called the fluer albus, or whites, is a very common difeafe, and proves extremely hurtful to delicate women. This difcharge, however, is not always white, but fometimes pale, yellow, green, or of a blackifh colour; fometimes it is fharp and corrofive, fometimes foul and fœtid, &cc. It is attended with a pale complexion, pain in the back, lofs of appetite, fwelling of the feet, and other figns of debility. It generally proceeds from a relaxed flate of the body, arifing from indolence, the exceflive ufe of tea, coffee, or other weak and watery diet.

To remove this difeafe, the patient must take as much exercife as the can bear without fatigue. Her food should be folid and nourishing, but of easy digeftion; and her drink rather generous, as red port or claret mixed with Pyrmont, Briftol, or lime-water. Tea and coffee are to be avoided. I have often known ftrong broths have an exceeding good effect, and fometimes a milk diet alone will perform a cure. The patient ought not to lie too long a-bed. When medicine is neceffary, we know none preferable to the Peruvian bark, which in this cafe ought always to be taken in substance. In warm weather, the cold bath will be of confiderable fervice.

That period of life at which the *menfes* ceafe to flow, is likewife very critical to the fex. The floppage of any cuftomary evacuation, however fmall, is fufficient to diforder the whole frame, and often to deftroy life itfelf. Hence it comes to pafs, that fo many women either fall into chronic diforders, or die about this time. Such of them, however, as furvive it, without contracting any chronic difeafe, often become more healthy and hardy than M m they were before, and enjoy ftrength and vigour to a very great age.

If the menfes ceafe all of a fudden, in women of a full habit, they ought to abate fomewhat of their ufual quantity of food, efpecially of the more nourifhing kind, as flefh, eggs, &c. They ought likewife to take fufficient exercife, and to keep the body open. This may be done by taking, once or twice a-week, a little rhubarb, or an infufion of hiera picra in wine or brandy.

It often happens that women of a groß habit, at this period of life, have ulcerous fores break out about their ancles, or in other parts of the body. Such ulcers ought to be confidered as critical, and fhould either be fuffered to continue open, or have artificial drains fublituted in their flead. Women who will have fuch fores dried up, are often foon after. carried off by acute difeafes, or fall into those of a chronic nature.

OF PREGNANCY.

THOUGH pregnancy is not a difeafe, yet that flate is often attended with a variety of complaints which merit attention, and which fometimes require the affiftance of medicine. Some women indeed are more healthy during their pregnancy than at any other time; but this is by no means the general cafe: moft of them *breed in forrow*, and are frequently indifpofed during the whole time of pregnancy. Few fatal difeafes, however, happen during that period; and hardly any, except abortion, that can be called dangerous.

Pregnant women are often afflicted with the heartburn. The method of treating this complaint has been already pointed out. They are likewife, in the more more early periods of pregnancy, often hataffed with ficknefs and vomiting, efpecially in the morning. The method of relieving thefe complaints has also been fnewn. Both the head-ach and tooth-ach are very troublefome fymptoms of pregnancy. The former may generally be removed by keeping the body gently open, by the ufe of prunes, figs, roafted apples, and fuch like. When the pain is very violent, bleeding may be neceffary. For the treatment of the latter, we muft refer to that article. Several other complaints incident to pregnant women might be mentioned, as a cough and difficulty of breathing, fuppreffion and incontinency of urine, &c.; but as all of thefe have been taken notice of before, it is needlefs to repeat them.

Every pregnant woman is more or lefs in danger of abortion. This fhould be guarded againft with the greateft care, as it not only weakens the conftitution, but renders the woman liable to the fame misfortune afterwards*. Abortion may happen at any period of pregnancy, but it is moft common in the fecond or third month. Sometimes, however, it happens in the fourth or fifth. If it happens within the firft month, it is ufually called a falle conception; if, after the feventh month, the child may often be kept alive by proper care.

The common caules of abortion are, the death of the child; weaknefs or relaxation of the mother; great evacuations; violent exercife; raifing great

* Every mother who procures an abortion does it at the hazard of her life; yet there are not a few who run this rifk merely to prevent the trouble of bearing and bringing up children. It is furely as molt unnatural crime, and cannot, even in the moft abandoned, be viewed without horror; but in the decent matron, it is ftill more unpardonable.—Thofe wretches who daily advertife their affiftance to women in this bufinefs, deferve, in my opinion, the moft fevere of all human punifuments.

weights;

weights; reaching too high; jumping, or ftepping from an eminence; vomiting; coughing; convultion fits; blows on the belly; falls; fevers; difagreeable fmells; excefs of blood; indolence; high living, or the contrary; violent paffions or affections of the mind, as fear, grief, &c.

The figns of approaching abortion are, pain in the loins, or about the bottom of the belly; a dull heavy pain in the infide of the thighs; a flight degree of coldnefs, or flivering; ficknefs, palpitation of the heart; the breafts become flat and foft; the belly falls; and there is a difcharge of blood or watery humours from the womb.

To prevent abortion, we would advife women of a weak or relaxed habit to use folid food, avoiding great quantities of tea, and other weak and watery liquors; to rife early and go soon to bed; to shun damp houses; to take frequent exercise in the open air, but to avoid fatigue; and never to go abroad in damp foggy weather, if they can shun it.

Women of a full habit ought to use a spare diet, avoiding strong liquors, and every thing that may tend to heat the body, or increase the quantity of blood. Their diet should be of an opening nature, confisting principally of vegetable substances. Every woman with child ought to be kept cheerful and easy in her mind. Her appetites, even though depraved, ought to be indulged as far as prudence will permit.

When any figns of abortion appear, the woman ought to be laid in bed on a mattrefs, with her head low. She fhould be kept quiet, and her mind foothed and comforted. She ought not to be kept too hot, nor to take any thing of a heating nature. Her food fhould confift of broths, rice, and milk, jellies, gruels made of oatmeal, and the like, all of which ought to be taken cold. If fhe be able to bear it, fhe fhould lofe at leaft half a pound of blood from the arm. Her drink ought to be barley water fharpened with juice of lemon; or fhe may take half a drachm of powdered nitre, in a cup of water-gruel, every five or fix hours. If the woman be feized with a violent loofenefs, fhe ought to drink the decoction of calcined hartfhorn prepared. If fhe be affected with vomiting, let her take frequently two table-fpoonfuls of the faline mixture. In general, opiates are of fervice; but they fhould always be given with caution.

Sanguine robust women, who are liable to mifcarry at a certain time of pregnancy, ought always to be bled a few days before that period arrives. By this means, and observing the regimen above prescribed, they might often escape that misfortune.

Though we recommend due care for preventing abortion, we would not be underftood as reftraining pregnant women from their ufual exercifes. This would generally operate the quite contrary way. Want of exercife not only relaxes the body, but induces a plethora, or too great a fulnefs of the veffels, which are the two principal caufes of abortion. There are, however, fome women of fo delicate a texture, that it is neceffary for them to avoid almoft every kind of exercife during the whole period of pregnancy.

OF CHILD-BIRTH.

MANY difeafes proceed from the want of due care in child-bed; and the more hardy part of the fex are most apt to despite the neceffary precautions in this state. This is peculiarly the case with young wives. They think, when the labour pains are M m 3 ended, 534

ended, the danger is over; but in truth it may only then be faid to be begun. Nature, if left to herfelf, will feldom fail to expel the *fatus*; but proper care and management are certainly neceffary for the recovery of the mother. No doubt mifchief may be done by too much as well as by too little care. Hence females who have the greateft number of attendants in child-bed generally recover worft. But this is not peculiar to the flate of child-bed. Exceffive care always defeats its own intention, and is generally more dangerous than none at all *.

During actual labour, nothing of a heating nature ought to be given. The woman may now and then take a little panado, and her drink ought to be toaft and water, or thin groar-gruel. Spints, wines, cordial-waters, and other things which are given with a view to ftrengthen the mother, and promote the birth, for the moft part tend only to increafe the fever, inflame the womb, and retard the labour. Befides, they endanger the woman afterwards, as they often occafion violent and

* Though the management of women in child-bed has been practified as an employment fince the earlieft accounts of time; yet it is fill in most countries on a very bad footing. Few women think of following this employment till they are reduced to the neceffity of doing it for bread. Hence not one in a hundred of them have any education, or proper knowledge of their bufinefs. It is true, that Nature, if left to herfelf, will generally expel the *fatus*; but it is equally true, that most women in child-bed require to be managed with fkill and attention, and that they are often hurt by the fuperfittious prejudices of ignorant and officious midwives. The mifchief done in this way is much greater than is generally imagined; most of which might be prevented by allowing no women to practife midwifery but fuch as are properly qualified. Were due attention paid to this, it would not only be the means of faving many lives, but would prevent the neceffity of employing men in this indelicate and difagreeable branch of medicine which is, on many accounts, more proper for the other fex.

mortal

mortal hæmorrhages, or difpole her to eruptive and other fevers.

When the labour proves tedious and difficult, to prevent inflammations, it will be proper to bleed. An emollient clyfter ought likewife frequently to be adminiftered, and the patient fhould fit over the fteams of warm water. The paffage ought to be gently rubbed with a little foft *pomatum* or frefh butter, and cloths wrung out of warm water applied over the belly. If nature feems to fink, and the woman is greatly exhaufted with fatigue, a draught of generous wine, or fome other cordial, may be given, but not otherwife. Thefe directions are fufficient in natural labours; and in all preternatural cafes, a fkilful furgeon, or man-midwife, ought to be called as foon as poffible.

After delivery, the woman ought to be kept as quiet and eafy as poffible *. Her food fhould be light and thin, as gruel, panado, &cc. and her drink weak and diluting. To this rule, however, there are many exceptions. I have known feveral women, whofe fpirits could not be fupported in child-bed without folid food and generous liquors; to fuch, a glafs of wine and a bit of chicken muft be allowed.

Sometimes an exceffive hæmorrhage or flooding happens after delivery. In this cafe the patient fhould be laid with her head low, kept cool, and be in all refpects treated as for an exceffive flux of the menfes. If the flooding proves violent, linen cloths, which have been wrung out of a mixture of

* We cannot help taking notice of that ridiculous cultom which fill prevails in fome parts of the country, of collecting a number of women together upon fuch occalions. Thefe, inflead of being ufeful, ferve only to crowd the houfe, and obftruct the neceflary attendants. Befides, they hurt the patient with their noife; and often, by their untimely and impertinent advice, do much mifchief.

equal

equal parts of vinegar and water, or red wine, fhould be applied to the belly, the loins, and the thighs: thefe must be changed as they grow dry; and may be difcontinued as foon as the flooding abates*.

If there be violent pains after delivery, the patient ought to drink plentifully of warm diluting liquors, as groat gruel, or tea with a little faffron in it; and to take fmall broths, with carraway-feeds, or a bit of orange-peel in them; an ounce of the oil of fweet almonds may likewife be frequently taken in a cup of any of the above liquors; and if the patient be reftlefs, a fpoonful of the fyrup of poppies may now and then be mixed with a cup of her drink. If the be hot or feverifh, one of the following powders may be taken in a cup of her ufual drink, every five or fix hours \ddagger .

An inflammation of the womb is a dangerous and not unfrequent difeate after delivery. It is known by pains in the lower part of the belly, which are greatly increafed upon touching; by the tenfion or tightnefs of the parts; great weaknefs; change of countenance; a conflant fever, with a weak and hard pulfe; a flight *d-livium*, or raving; fometimes inceffant vomiting; a hiccup; a difcharge of reddifh, flinking, fharp water from the womb; an inclination to go frequently to flcol; a heat, and fometimes total fupprefilon of urine.

* In a violent flooding after delivery, I have feen very good effects from the following mixture: Take of penny-royal water, fimple cinnamon-water, and fyrup of poppies, each two ounces, elixir of vitriol a drachm. Mix, and take two table-fpoonfuls every two hours, or oftener, if neceffary.

⁺ Take of crabs claws prepared half an ounce, purified nitre two drachms, faffron powdered half a drachm; rub them together in a mortar, and divide the whole into eight or nine dofes.

When the patient is low fpirited, or troubled with hyflerical complaints, fhe ought to take frequently twelve or fifteen drops of the tincture of alafeetida in a cup of penny-royal tea.

536

0

This

This must be treated like other inflammatory diforders, by bleeding and plentiful dilution. The drink may be thin gruel or barley-water; in a cup of which half a drachm of nitre may be diffolved, and taken three or four times a-day. Clyfters of warm milk and water must be frequently administered; and the belly lhould be fomented by cloths wrung out of warm water, or by applying bladders filled with warm milk and water to ir.

A fupprefion of the *lechia*, or ufual difcharges after delivery, and the milk-fever, muft be treated nearly in the fame manner as an inflammation of the womb. In all thefe cafes, the fafeft courfe is plentiful dilution, gentle evacuations, and fomentations of the parts affected. In the milk-fever, the breafts may be embrocated with a little warm linfeed-oil, or the leaves of red cabbage may be applied to them. The child fhould be often put to the breaft, or it fhould be drawn by fome other perfon.

Nothing would tend more to prevent the milkfever than putting the child early to the breaft. The cuftom of not allowing children to fuck for the first two or three days, is contrary to Nature and common fenfe, and is very hurtful both to the mother and child.

Every mother who has milk in her breafts, ought either to fuckle her own child, or to have her breafts frequently drawn, at leaft for the first month. This would prevent many of the difeases which prove fatal to women in child-bed.

When an inflammation happens in the breaft, attended with rednefs, hardnefs, and other fymptoms of fuppuration, the fafeft application is a poultice of bread and milk, foftened with oil or frefh butter. This may be renewed twice a day, till the tumour be either difcuffed or brought to fuppuration. The ufe of repellents, in this cafe, is very dangerous; dangerous; they often occafion fevers, and fometimes cancers; whereas a fuppuration is feldom attended with any danger, and has often the most falutary effects.

When the nipples are fretted or chapt, they may be anointed with a mixture of oil and beeswax, or a little powdered gum-arabic may be fprinkled on them. I have feen Hungary water applied to the nipples have a very good effect. Should the complaint prove obfinate, a cooling purge may be given, which generally removes it.

The miliary fever is a difeafe incident to women in child-bed; but as it has been treated of already, we shall take no farther notice of it. The celebrated Hoffman observes. That this fever of childbed women might generally be prevented, if they, during their pregnancy, were regular in their diet, used moderate exercise, took now and then a gentle laxative of manna, rhubarb, or cream of tartar; not forgetting to bleed in the first months, and avoid all fharp air. When the labour is coming on, it is not to be haftened with forcing medicines, which inflame the blood and humours, or put them into unnatural commotions. Care should be taken, after the birth, that the natural excretions proceed regularly; and if the pulfe be quick, a little nitrous powder, or fome other cooling medicines, fhould be administered.

The most fatal diforder confequent upon delivery is the *puerperal*, or child-bed fever. It generally makes its attack upon the fecond or third day after delivery. Sometimes indeed it comes on fooner, and at other times, though rarely, it does not appear before the fifth or fixth day.

It begins like most other fevers, with a cold or fhivering fit, which is fucceeded by reftlefsnefs, pain of the head, great ficknefs at the ftomach, and bilious

lious vomiting. The pulse is generally quick, the tongue dry, and there is a remarkable depression of fpirits and loss of ftrength. A great pain is usually felt in the back, hips, and region of the womb; a fudden change in the quantity or quality of the locbia. alfo takes place; and the patient is frequently troubled with a tene/mus, or conftant inclination to go to ftool. The urine, which is very high coloured, is discharged in fmall quantity, and generally with pain. The belly fometimes fwells to a confiderable bulk, and becomes fusceptible of pain from the flightest touch. When the fever has continued for a few days, the fymptoms of inflammation usually fublide, and the dilease acquires a more putrid form. At this period, if not sooner, a bilious or putrid looseness, of an obstinate and dangerous nature, comes on, and accompanies the difease through all its future progrefs.

There is not any difeafe that requires to be treated with more fkill and attention than this; confequently the beft affiftance ought always to be obtained as foon as polible. In women of plethoric conflictations, bleeding will generally be proper at the beginning; it ought however to be ufed with caution, and not to be repeated unlefs where the figns of inflammation rife high; in which cafe it will allo be neceffary to apply a bliftering-plafter to the region of the womb.

During the rigour, or cold fit, proper means fhould be ufed to abate its violence and fhorten its duration. For this purpofe the patient may drink freely of warm diluting liquors, and, if low, may take now and then a cup of wine whey, warm applications to the extremities, as heated bricks, bottles or bladders filled with warm water, and fuch like, may alfo be ufed with advantage.

Emollient clyfters of milk and water, or of chicken water, ought to be frequently administered through

. =

through the course of the difeafe. These prove benchicial by promoting a discharge from the intestines, and also by acting as a kindly fomentation to the womb and parts adjacent. Great care however is requisite in giving them, on account of the tenderness of the parts in the *pelvis* at this time.

To evacuate the offending bile from the flomach, a vomit is generally given. But as this is apt to increase the irritability of the flomach, already too great, it will be faster to omit it, and to give in its itead a gentle laxative, which will both tend to cool the body, and to procure a free discharge of the bile *.

The medicine which I have always found to fucceed beft in this difeate is the faline draught. This, if frequently repeated, will often put a ftop to the vomiting, and at the fame time leffen the violence of the fever. If it runs off by ftool, or if the patient be reftlefs; a few drops of laudanum, or fome fyrup of poppies, may occafionally be added.

If the ftools hould prove to frequent as to weaken and exhault the patient, a ftarch clyfler, with thirty or forty drops of laudanum in it, may be administered as occation thall require; and the drink may be ricewater, in every English pint of which half an ounce of gum-arabic has been diffolved. Should thefe fail, recourse must be had to Columbo-root, or fome other aftringent medicines.

Though in general the food ought to be light, and the drink diluting, yet when the difeafe has been long protracted, and the patient is greatly

* Midwives ought to be very cautious in administering vomits or purges to women in child-bed. I have known a woman who was recovering extremely well, thrown into the most imminent danger, by a firong purge which was given her by an officious midwile.

fpent by evacuations, it will be neceffary to fupport her with nourifhing diet and generous cordials.

It was observed, that this fever, after continuing for fome time, often acquires a putrid form. In this cafe the Peruvian bark muft be given, either by itfelf, or joined with cordials, as circumfrances may require. As the bark in fubfrance will be apt to purge, it may be given in decoction or infusion mixed with the tincture of roles, or other gentle aftringents; or, a feruple of the extract of bark with half an ounce of fpirituous cinnamonwater, two ounces of common water, and ten drops of laudanum, may be made into a draught, and given every fecond, third, or fourth hour, as fhall be found neceffary.

When the ftomach will not bear any kind of nourifhment, the patient may be fupported for fome time by clyfters of beef tea, or chickenwater.

To avoid this fever, every woman in child-bed ought to be kept perfectly eafy; her food fhould be light and fimple, and her bed-chamber cool, and properly ventilated. There is not any thing more hurtful to a woman in this fituation than being kept too warm. She ought not to have her body bound too tight, nor to rife too foon from bed, after delivery; catching cold is alfo to be avoided; and a proper attention fhould be paid to cleanlinets.

To prevent the milk-fever, the breafts ought to be frequently drawn; and if they are filled previous to the onfet of a fever, they fhould, upon its first appearance, be drawn, to prevent the milk from becoming acrid, and its being abforbed in this flate. Coffivenels is likewife to be avoided. This will be beft effected by the ufe of mild clysters and a laxative diet.

We

We shall conclude our observations on child-hed women by recommending it to them, above all things to beware of cold. Poor women, whole circumftances oblige them to quit their bed too foon. often contract diseafes from cold, of which they never recover. It is a pity the poor are not better taken care of in this fituation.

But the better fort of women run the greateft hazard from too much heat. They are generally kept in a fort of bagnio for the first eight or ten days, and then dreffed out to fee company. The danger of this conduct must be obvious to every one.

The fuperflitious cuftom of obliging women to keep the houfe till they go to church, is likewife a very common caufe of catching cold. All churches are damp, and most of them cold; confequently they are the very worfe places to which a woman can go to make her first visit, after having been confined in a warm room for a month.

OF BARRENNESS.

BARRENNESS may be very properly reckoned among the difeafes of females, as few married women who have not children enjoy a good flate of health. It may proceed from various caufes, as high living, grief, relaxation, &c. but it is chiefly owing to an obltruction or irregularity of the menftrual flux.

It is very certain that high living vitiates the humours, and prevents fecundity. We feldom find a barren woman among the labouring poor, while nothing is more common among the rich and affluent. The inhabitants of every country are prolific in proportion to their poverty; and it would be an eafy matter to adduce many inftances of women, men, who, by being reduced to live entirely upon a milk and vegetable diet, have conceived and brought forth children, though they never had any before. Would the rich ufe the fame fort of food and exercife as the better fort of peafants, they would feldom have caufe to envy their poor vaffals and dependants the bleffing of a numerous and healthy offspring, while they pine in forrow for the want of even a fingle heir to their extensive domains.

Affluence begets indolence, which not only vitiates the humours, but induces a general relaxation of the folids; a flate highly unfavourable to procreation. To remove this, we would recommend the following courfe: Firft, fufficient exercife in the open air; fecondly, a diet confifting chiefly of milk and vegetables*; thirdly, the ufe of aftringent medicines, as fleel, allum, dragon's blood, elixir of vitriol, the Spaw or Tunbridge waters, Peruvian bark, &c.; and laftly, above all, the cold bath.

Barrennels is often the confequence of grief, fudden fear, anxiety, or any of the paffions which tend to obftruct the menftrual flux. When barrennels is fulpected to proceed from affections of the mind, the perfon ought to be kept as eafy and cheerful as poffible; all difagreeable objects are to be avoided, and every method taken to amufe and entertain the fancy.

* Dr. Cheyne avers, that want of children is oftener the fault of the male than of the female, and flrongly recommends a milk and vegetable diet to the former as well as the latter; adding that his friend Dr. Taylor, whom he calls the Milk-doctor of Croydon, had brought fundry opulent families in his neighbourhood, who had continued fome years after marriage without progeny, to have feveral fine children, by keeping both parents, for a confiderable time, to a milk and vegetable diet.

[544]

C H A P. XLIX.

DISEASES OF CHILDREN.

ISERABLE indeed is the lot of man in the ftate of infancy! He comes into the world more helplefs than any other animal, and ftands much longer in need of the protection and care of his parents, but, alas! this care is not always beftowed upon him; and when it is, he often fuffers as much from improper management as he would have done from neglect. Hence the officious care of parents, nurles, and midwives, becomes one of the molt fruitful fources of the diforders of infants *.

It must be obvious to every attentive perfor, that the first difeafes of infants arife chiefly from their bowels. Nor is this in the least to be wondered at, as they are in a manner poiloned with indigestible drugs and improper diet as soon as they come into the world. Every thing that the stomach cannot digest may be confidered as a poilon; and unless it can be thrown up, or voided by stool, it must occasion fickness, gripes, stopasmodic

* Of the officious and ill-judged care of midwives, we fhall adduce only one inflance, viz. the common practice of torturing infants by fqueezing their breafts, to draw off the milk, as they call it. Though a imall quantity of moiffure is generally found in the breafts of infants, yet, as they are certainly not intended to give fuck, this ought never to be drawn off. I have feen this cruel operation bring on hardnefs, inflammation, and fuppuration of the breafts; but never knew any ill confequences from its being omitted. When the breafts are hard, the only application that we would recommend is a foft poultice, or a little of the diachylon plafter, fpread thin upon a bit of foft leather, about the fize of half a crown, and applied over each nipple. Thefe may be fuffered to continue till the hardnefs difappears.

affections

affections of the bowels, or what the good women call inward fits, and at last convulsions and death.

As these symptoms evidently arise from fomewhat that irritates the inteffines, doubtlefs the proper method of cure must be to expel it as foon as poffible. The most fafe and effectual method of doing this is by gentle vomits. Five or fix grains of the powder of ipecacuanha may be mixed in two table fpoonfuls of water, and fweetened with a little fugar. A tea-spoonful of this may be given to the infant every quarter of an hour till it operates; or, what will more certainly answer the purpole, a grain of emetic tartar, may be diffolved in three ounces of water, fweetened with a little fyrup, and given as above. Those who are willing to use the emetic tartar, may give fix or feven drops of the antimonial wine, in a tea-spoonful of water or thin gruel. Small dofes of the ipecacuanha wine will be found more gentle than any of the above, and ought to be preferred.

Thefe medicines will not only cleanfe the fromach, but will generally likewife open the body. Should this however not happen, and if the child be coftive, fome gentle purge will be neceffary: for this purpofe, fome manna and pulp of caffia may be diffolved in boiling water, and given in fmall quantities till it operates; or, what will anfwer rather better, a few grains of *magnefia a ba* may be mixed in any kind of food that is given to the child; and continued till it has the defired effect. If thefe medicines be properly adminiftered, and the child's belly and limbs frequently rubbed with a warm hand before the fire, they will feldom fail to relieve thofe affections' of the fromach and bowels from which infants fuffer fo much.

These general directions include most of what can be done for relieving the internal diforders of N n infants, infants. They will likewife go a confiderable way in alleviating those which appear externally, as the rash, gum, or fellon, &cc. These, as was formerly observed, are principally owing to too hot a regimen, and consequently will be most effectually relieved by gentle evacuations. Indeed, evacuations of one kind or other constitute a principal part of the medicine of infants, and will feldom, if administered with prudence, in any of their difeases, fail to give relief.

OF THE MECONIUM.

The ftomach and bowels of a new-born infant are filled with a blackifh-coloured matter of the confiftence of fyrup, commonly called the *meconium*. This is generally paffed foon after the birth, by the mere effort of Nature; in which cafe it is not neceffary to give the infant any kind of medicine. But if it fhould be retained, or not fufficiently carried off, a little manna or *magnefia alba* may be given, as mentioned above; or, if the fe fhould not be at hand, a common fpoonful of whey, fweetened with a little honey, or raw fugar, will aniwer the purpofe.

The most proper medicine for expelling the meconium is the mother's milk, which is always at first of a purgative quality. Were children allowed to fuck as foon as they shew an inclination for the breast, they would feldom have occasion for medicines to discharge the meconium; but even where this is not allowed, they ought never to have daubs of fyrup, oils, and other indigestible stuff, crammed down their throats.

[547]

THE APHTHÆ OR THRUSH.

THE aphthæ are little whitift ulcers affecting the whole infide of the mouth, tongue, throat, and ftomach of infants. Sometimes they reach through the whole inteftinal canal; in which cafe they are very dangerous, and often put an end to the infant's life.

If the aphthæ are of a pale colour, pellucid, few in number, foft, superficial, and fall easily off, they are not dangerous; but if opake, yellow, brown, black, thick, or running together, they ought to be dreaded.

It is generally thought that the aphthæ owe their origin to acid humours; we have reafon however to believe, they are more frequently owing to too hot a regimen both of the mother and child. It is a rare thing to find a child who is not dofed with wine, punch, cinnamon-waters, or fome other hot and inflaming liquors, almost as foon as it is born. It is well known that thefe will occasion inflammatory diforders even in adults; is it any wonder then that they should heat and inflame the tender bodies of infants, and fet as it were the whole constitution on a blaze!

The most proper medicines for the aphthæ are vomits, fuch as have been already recommended, and gentle laxatives. Five grains of rhubarb and half a drachm of magnefia alba may be rubbed together, and divided into fix doles, one of which may be given to the infant every four or five hours till they operate. These powders may either be given in the child's food, or a little of the fyrup of pale roles, and may be repeated as often as is found neceffary to keep the body open. It is com-N n 2 mon mon in this cafe to administer calomel; but as that medicine fometimes occasions gripes, it ought always to be given to infants with caution.

Many things have been recommended for gargling the mouth and throat in this difeafe; but it is not eafy to apply thefe in very young children; we would therefore recommend it to the nurfe to rub the child's mouth frequently with a little borax and honey; or with the following mixture: Take fine honey an ounce, borax a drachm, burnt alum half a drachm, rofe-water two drachms; mix them together. A very proper application in this cafe, is a folution of ten or twelve grains of white vitriol in eight ounces of barley-water. Thefe may be applied with the finger, or by means of a bit of foft rag tied to the end of a probe.

OF ACIDITIES.

The food of children being for the moft part of an acefcent nature, it readily turns four upon the ftomach, efpetially if the body be any way difordered. Hence moft difeafes of children are accompanied with evident figns of acidity, as green thools, gripes, &c. Thefe appearances have induced many to believe, that all the difeafes of children were owing to an acid abounding in the ftomach and bowels; but whoever confiders the matter attentively, will find that thefe fymptoms of acidity are oftner the effect than the caufe of their difeafes.

Nature evidently intended, that the food of children fhould be acefcent; and unlefs the body be difordered, or the digetion hurt, from fome other caufe, we will venture to fay, that the acefcent quality of their food is feldom injurious to them. Acidity,

Acidity, however, is often a fymptom of diforders in children, and, as it is fometimes a troublefome one, we fhall point out the method of relieving it.

When green ftools, gripes, purgings, four fmells, &c. fhew that the bowels abound with an acid, the child fhould have a little fmall broth, with light white bread in it; and fhould have fufficient exercife in order to promote the digeftion. It has been cuftomary in this cafe to give the pearl-julep, chalk, crabs eyes, and other teltaceous powders. Thefe, indeed, by their abforbent quality, may correct the acidity; but they are attended with this inconvenience, that they are apt to lodge in the bowels, and occafion coffivenefs, which may prove very hurtful to the infant. For this reafon they fhould never be given unlefs mixed with purgative medicines; as rhubarb, manna, or fuch like.

The beft medicine which we know, in all cafes of acidity, is that fine infipid powder called magmefia alba. It purges, and at the fame time corrects the acidity : by which means it not only removes the difeafe, but carries off its caufe. It may be given in any kind of food, or in a mixture, as recommended in the Appendix *.

When an infant is troubled with gripes, it ought not at first to be dofed with brandy, spiceries, and other hot things. But should have its body opened with an emollient clyster, or the medicine mentioned above; and at the fame time a little brandy may be rubbed on its belly with a warm hand before the fire. I have feldom feen this fail to ease the gripes of infants. If it should happen, however, not to fucceed, a little brandy or other spirits may be mixed with thrice the quantity of warm water, and a tea-spoonful of it given frequently till

> * See Appendix, Laxative abforbent Mixture. N n 2

the

550 GALLING AND EXCORIATION.

the infant be eafier. Sometimes a little peppermintwater will answer this purpose very well.

GALLING AND EXCORIATION.

These are very troublesome to children. They happen chiefly about the groin and wrinkles of the neck, under the arms, behind the ears, and in other parts that are moistened by the sweat or urine.

As these complaints are, in a great measure, owing to want of cleanliness, the most effectual means of preventing them are, to wash the parts frequently with cold water, to change the linen often, and, in a word, to keep the child in all refpects thoroughly clean. When this is not fufficient, the excoriated parts may be fprinkled with abforbent or drying powders; as burnt hartfhorn, tutty, chalk, crabs claws prepared, and the like. When the parts affected are very fore, and tend to a real ulceration, it will be proper to add a little fugar of lead to the powders; or to anoint the place with the camphorated ointment. If the parts be washed with spring-water, in which a little white vitriol has been diffolved, it will dry and heal them very powerfully. One of the beft applications for this purpofe is to diffolve fome fuller's earth in a fufficient quantity of hot water; and after it has flood till it is cold, to rub it gently upon the galled parts once or twice a day.

STOPPAGE OF THE NOSE.

The noftrils of infants are often plugged up with a groß mucus, which prevents their breathing freely,

STOPPAGE OF THE NOSE.

freely, and likewife renders it difficult for them to fuck or fwallow.

Some in this cafe order, after a fuitable purge, two or three grains of white vitriol diffolved in half an ounce of marjoram-water, and filtered, to be applied now and then to the noftrils with a linen rag. Wedellus fays, if two grains of white vitriol, and the fame quantity of *elaterium*, be diffolved in half an ounce of marjoram-water, and applied to the nofe, as above directed, that it brings away the *mucus* without fneezing.

In obftinate cafes the fe medicines may be tried; but I have never found any thing neceffary, befides rubbing the nofe at bed-time with a little fweet oil, or fresh butter. This refolves the filth, and renders the breathing more free *.

OF VOMITING.

From the delicate state of children, and the great fensibility of their organs, a vomiting or loofenes's may be induced by any thing that irritates the nerves of the stomach or intestines. Hence these diforders are much more common in childhood than in the more advanced periods of life. They are feldom however dangerous, and ought never to be confidered as difeases, unles when they are violent, or continue so long as to exhaust the strength of the patient.

Vomiting may be excited by an over-quantity of food; by food that is of fuch a nature as to irritate the nerves of the ftomach too much; or by the fenfibility of the nerves being fo much increased as to

* Some nurfes remove this complaint by fucking the child's nofe. This is by no means a cleanly operation; but when nurfes have the refolution to do it, I am far from difcouraging the practice.

render

render them unable to bear the ftimulus of even the mildeft element.

When vomiting is occafioned by too much food, it ought to be promoted, as the cure will depend upon cleanfing the ftomach. This may be done either by a few grains of ipecacuanha, or a weak folution of emetic tartar, as mentioned before. When it is owing to food of an acrid or irritating quality, the diet ought to be changed, and aliment of a milder nature ftubftituted in its ftead.

When vomiting proceeds from an increased degree of fensibility, or too great an irritability of the nerves of the flomach, such medicines as have a tendency to brace and firengthen that organ, and to abate its fensibility, must be used. The first of thefe intentions may be answered by a flight infusion of the Peruvian bark, with the addition of a little rhubarb and orange-peel: and the fecond by the falme draughts, to which a few drops of liquid laudanum may occasionally be added.

In obflinate vomitings the operation of internal medicines may be affifted by atomatic fomentations made with wine, applied warm to the pit of the flomach; or the use of the stomach-plaster, with the addition of a little *Theriaca*.

OF A LOOSENESS.

A loofenefs may generally be reckoned falutary when the ftools are four, flimy, green, or curdled. It is not the difcharge, but the production of fuch ftools, which ought to be remedied. Even where the purging is thin and watery, it ought not to be checked too fuddenly, as it often proves critical, efpecially when the child has caught cold, or an eruption on the fkin has difappeared. Sometimes an evacuation of this kind fucceeds a humid ftate of

of the atmosphere, in which cafe it may also prove of advantage, by carrying off a quantity of watery humours, which would otherwise tend to relax the habit.

As the principal intention of the cure of a loofenefs is to evacuate the offending matter, it is cuftomary to give the patient a gentle vomit of ipecacuanha, and afterwards to exhibit fmall and frequent dofes of rhubarb; interpofing abforbent medicines to mitigate the acrimony of the humours. The beft purge, however, in this cafe, is *magnefia alba*. It is at the fame time abforbent and laxative, and operates without exciting gripes.

The antimonial wine, which acts both as an emetic and purge, is alfo an excellent medicine in this cafe. By being diluted with water, it may be proportioned to the weakeft conftitution; and, not being difagreeable to the palate, it may be repeated as often as occafion requires. Even one dofe will frequently mitigate the difeafe, and pave the way for the ufe of abforbents. If, however, the patient's ftrength will permit, the medicine ought to be repeated every fix or eight hours, till the ftools begin to affume a more natural appearance; afterwards a longer fpace may be allowed to intervene between the dofes. When it is neceffary to repeat the medicine frequently, the dofe ought always to be a little increafed, as its efficacy is generally diminifhed by ufe.

Some, upon the first appearance of a loofenels, fly immediately to the use of abforbent medicines and aftringents. If these be administered before the offending humours are discharged, though the difease may appear to be mitigated for a little time, it soon afterwards breaks forth with greater violence, and often proves fatal. After proper evacuations, however, these medicines may be administered with confiderable advantage.

OF ERUPTIONS.

Should any gripings or reftlefsnefs remain after the fromach and bowels have been cleanfed, a tea-fpoonful of the fyrup of poppies may be given in a little fimple cinnamon-water three or four times a-day till thefe fymptoms have ceafed.

OF ERUPTIONS.

Children, while on the breaft, are feldom free from eruptions of one kind or other. Thefe, however, are not often dangerous, and ought never to be dried up but with the greateft caution. They tend to free the bodies of infants from hurtful humours, which, if retained, might produce fatal diforders.

The eruptions of children are chiefly owing to improper food and neglect of cleanlinefs. If a child be fluffed at all hours with food that its flomach is not able to digeft, fuch food, not being properly affinilated, inftead of nourifhing the body, fills it with groß humours. Thefe muft either break out in form of eruptions upon the fkin, or remain in the body, and occafion fevers and other internal diforders. That neglect of cleanlinefs is a very general caufe of eruptive diforders, muft be obvious to every one. The children of the poor, and of all who defpife cleanlinefs, are almost conftantly found to fwarm with vermin, and are generally covered with the fcab, itch, and other eruptions.

When eruptions are the effect of improper food, or want of cleanlinefs, a proper attention to thefe alone will generally be fufficient to remove them. If this fhould not be the cate, fome drying medicines will be neceffary. When they are applied, the body ought at the fame time to be kept open, and cold is carefully to be avoided. We know no medicine

medicine that is more fafe for drawing up cutaneous eruptions than fulphur, provided it be prudently ufed. A little of the flowers of fulphur may be mixed with fresh butter, oil, or hog's lard, and the parts affected frequently touched with it.

The most obstinate of all the eruptions incident to children are, the *tinea capitis*, or fcabbed head, and chilblains. The fcabbed head is often exceeding difficult to cure, and fometimes indeed the cure proves worfe than the difeafe. I have frequently known children feized with internal diforders, of which they died foon after their fcabbed heads had been healed by the application of drying medicines *. The cure ought always first to be attempted by keeping the head very clean, cutting off the hair, combing and brushing away the scabs, &c. If this is not sufficient, let the head be shaved once a week, washed daily with foap fuds, and gently anointed with a liniment made of train oil eight ounces, red precipitate, in fine powder, one drachm. And if there be proud flefh, it fhould be touched with a bit of blue vitriol, or sprinkled with a little burnt allum. While thefe things are

* I fome time ago faw a very firiking inflance of the danget of fubfituting drying medicines in the place of cleanline's and wholefome food, in the Foundling Hofpital at Ackworth, where the children were grievoully afflicted with fcabbed heads and other cutaneous diforders. Upon inquiry it was found, that very little attention was paid either to the propriety or foundnefs of their provifions, and that cleanline's was totally neglecked ; accordingly it was advifed that they fhould have more wholefome food, and be kept thoroughly clean. This advice, however, was not followed. It was too troublefome to the fervants, furperintendants, &c. The bufinefs was to be done by medicine; which was accordingly attempted, but had nearly proved fatal to the whole houfe. Fevers and other internal diforders immediately appeared, and at length a putrid dyfentery, which proved fo infectious, that it carried off a great many of the children, and fpread over a confiderable part of the neighbouring country.

doing,

doing, the patient muft be confined to a regular light diet, the body fhould be kept gently open; and cold, as far as poffible, ought to be avoided. To prevent any bad confequences from flopping this difcharge, it will be proper, efpecially in children of a grofs habit, to make an iffue in the neck or arm, which may be kept open till the patient becomes more flrong, and the conflictution be fomewhat mended.

Chilblains commonly attack children in cold weather. They are generally occafioned by the fect or hands being kept long wet or cold, and afterwards fuddenly heated. When children are cold, inflead of taking exercife to warm themfelves gradually, they run to the fire. This occafions a fudden rarefaction of the humours, and an infarction of the veffels; which, being often repeated, the veffels are at laft over diftended, and forced to give way.

To prevent it, violent cold and fudden heat muft be equally avoided. When the parts begin to look red and fwell, the patient ought to be purged, and to have the affected parts frequently rubbed with muftard and brandy, or fomething of a warming nature. They ought likewife to be covered with flannel, and kept warm and dry. Some apply warm afters between cloths to the fwelled parts, which frequently help to reduce them. When there is a fore, it muft be dreffed with Turner's cerate, the ointment of tutty, the plafter of cerus, or fome other drying ointment. These fores are indeed troublefome, but feldom dangerous. They generally heal as foon as the warm weather fets in.

[557]

OF THE CROUP.

Children are often feized very fuddenly with this difeafe, which, if not quickly relieved, proves' mortal. It is known by various names in different parts of Britain. On the eaft coaft of Scotland it is called the *croup*. On the weft they call it the *cbock* or *fluffing*. In fome parts of England, where I have obferved it, the good women call it *tbe rifing of the lights*. It feems to be a fpecies of *aftbma*, attended with very acute and violent catarrhal fymptoms.

This difeafe generally prevails in cold and wet feafons. It is most common upon the fea coast, and in low marshy countries. Children of a gross and lax habit are most liable to it. I have fometimes known it hereditary. It generally attacks children in the night, after having been much exposed to damp cold easterly winds through the day. Damp houses, wet feet, thin shoes, wet clothes, or any thing that obstructs the perspiration, may occafion the croup.

It is attended with a frequent pulle, quick and laborious breathing, which is performed with a peculiar kind of croaking noife, that may be heard at a confiderable diftance. The voice is fharp and fhrill, and the face is generally much flufhed, though tometimes it is of a livid colour.

When a child is feized with the above fymptoms, his feet fhould immediately be put into warm water. He ought likewife to be bled *, and to have a laxative clyfter administered as foon as poffible. He fhould be made to breathe over the

* In this difeafe bleeding is not always proper; but in very full habits it muft certainly be of ufe.

ficams

fteams of warm water and vinegar; or an emollient decoction, and emollient cataplafms or fomentations may be applied round his neck. If the fymptoms do not abate, a bliftering-plafter muft be applied round the neck, or between the fhoulders, and the child may take frequently a table-fpoonful of the following julep: Take penny-royal water three ounces, fyrup of althea and of poppies, each one ounce, mix them together.

Afafœtida is found to have a good effect in this cafe. It may be both given in form of clyfter, and taken by the mouth. Two drachms of afafœtida may be diffolved in one ounce of Mindererus's fpirit, and three ounces of penny-royal water. A table-fpoonful of this mixture may be given every hour, or oftener, if the patient's ftomach be able to bear it. If the child cannot be brought to take this medicine, two drachms of the afafœtida may be diffolved in a common clyfter, and adminiftered every fix or eight hours, till the violence of the diffale abates *.

To prevent a return of the diforder, all those things which occasion it must be carefully avoided;

* I was lately favoured with a letter from Dr. William Turnbull in London, a phyfician of great experience, and who, from his former fituation on the north-east coast of England, had many opportunities of obferving the fymptoms and progrefs of this dangerous difeafe. I am forry the letter came too late to be inferted at length; but as the Doctor's fentiments differ very little from my own, this misfortune is the lefs to be regretted. The Doctor indeed observes, that he never found bliftering of any fervice; but recommends cataplasms of garlic, camphor, and Venice treacle, to be applied both to the throat and foles of the feet. He likewife recommends boluffes of camphor, caftor, valerian root, falt of hartshorn, and musk, adapted to the age, ftrength, &c. of the patient ; after which he advifes two fpoonfuls of the following decoction :- Take of garlic and diftilled vinegar each an ounce, hyfop-water eight ounces; beat up the ingredients together, gradually mixing the water, and adding three ounces of honey. Let the whole be fimmered over a gentle fire, and afterwards strained for use.

as wet feet, cold, damp, eafterly winds, &c. Children who have had frequent returns of this difeafe, or whofe conflitutions feem to difpofe them to it, ought to have their diet properly regulated; all food that is vifcid or hard of digeftion, and all crude, raw, trafhy fruits, are to be avoided. They ought likewife to have a drain conftantly kept open in fome part of their body, by means of a feton or iffue. I have fometimes known a Burgundy-pitch plafter, worn continually between the fhoulders for feveral years, have a very happy effect in preventing the return of this dreadful diforder.

OF TEETHING,

Dr. Arbuthnot obferves, that above a tenth part of infants die in teething, by fymptoms proceeding from the irritation of the tender nervous parts of the jaws, occafioning inflammations, fevers, convultions, gangrenes, &c. Thefe fymptoms are in a great measure owing to the great delicacy and exquisite fentibility of the nervous fystem at this time of life, which is too often increased by an effeminate education. Hence it comes to pass, that children who are delicately brought up, always fuffer most in teething, and often fall by convultive diforders.

About the fixth or feventh month the teeth generally begin to make their appearance; first, the *incifores*, or fore-teeth; next, the *canini*, or dog-teeth; and, lastly, the *molares*, or grinders. About the feventh year, there comes a new fet; and about the twentieth, the two inner grinders, called *dentes* fa*pientia*, the teeth of wifdom.

Children about the time of cutting their teeth, flaver much, and have generally a loofenefs. When the teething is difficult, especially when the dogteeth teeth begin to make their way through the gums, the child has flartings in his fleep, tumours of the gums, watchings, gripes, green flools, the thrush, tever, difficult breathing, and convulsions.

Difficult teething requires nearly the fame treatment as an inflammatory difeafe. If the body be bound, it must be opened either by emollient clyfters or gentle purgatives; as manna, mägnefia alba, rhubarb, fenna, or the like. The food should be light, and in small quantity; the drink plentiful, but weak and diluting, as infusions of balm, or of the lime-tree flowers; to which about a third or fourth part of milk may be added.

If the fever be high, bleeding will be neceffary; but this in very young children ought always to be fparingly performed. It is an evacuation which they bear the worft of any. Purging, vomiting, or fweating agree much better with them, and are generally more beneficial. Harris, however, obferves, that, when an inflammation appears, the phyfician will labour in vain, if the *cure* be not begun with applying a leech under each ear. If the child be feized with convultion fits, a bliftering-plafter may be applied between the fhoulders, or one behind each ear.

Sydenham fays, that in fevers occafioned by teething, he never found any remedy fo effectual as two, three, or four drops of fipirits of hartfhorn in a fpoonful of fimple water, or other convenient vehicle, given every four hours. The number of dofes may be four, five, or fix. I have often pteferibed this medicine with fuccefs, but always found a larger dofe neceffary. It may be given from five drops to fifteen or twenty, according to the age of the child, and when coftivenefs does not forbid it, three or four drops of laudanum may be added to each dofe.

560

3

In

In Scotland, it is very common, when children are cutting their teeth, to put a fmall Burgundypitch plafter between their fhoulders. This generally eafes the tickling cough which attends teething, and is by no means an ufelefs application. When the teeth are cut with difficulty, it ought to be kept on during the whole time of teething. It may be enlarged as occafion requires, and ought to be renewed at leaft once a fortnight.

Several things have been recommended for rubbing the gums, as oils, mucilages, &c.; but from thefe much is not to be expected. If any thing of this kind is to be ufed, we would recommend a little fine honey, which may be rubbed on with the finger three or four times a-day. Children are generally at this time difpofed to chew whatever they get into their hands. For this reafon they ought never to be without fomewhat that will yield a little to the prefiure of their gums, as a cruft of bread, a wax candle, a bit of liquorice-root, or fuch like.

With regard to cutting the gums, we have feldom known it of any great benefit. In obfinate cafes, however, it ought to be tried. It may be performed by the finger-nail, the edge of a fixpenny piece that is worn thin, or any fharp body which can be with fafety introduced into the mouth ; but the lancet, in a fkilful hand, is certainly the moft proper.

In order to render the teething lefs difficult, parents ought to take care that their children's food be light and wholefome, and that their nerves be braced by fufficient exercife without doors, the ufe of the cold bath, &c. Were these things duly regarded, they would have a much better effect than *teething necklaces*, or other nonfenfical amulets worn for that purpose.

Qo

OF THE RICKETS

THIS difeafe generally attacks children between the age of nine months and two years. It appeared firft in England about the time when manufactures began to flourish, and ftill prevails most in towns where the inhabitants follow fedentary employments, by which means they neglect either to take proper exercise themfelves, or to give it to their children.

CAUSES. One caufe of the rickets is difeafed parents. Mothers of a weak relaxed habit, who neglect exercife, and live upon weak watery diet, can neither be expected to bring forth firong and healthy children, or to be able to nurfe them, after they are brought forth. Accordingly we find, that the children of fuch women generally die of the rickets, the fcrophula, confumptions, or fuch like difeafes. Children begotten by men in the decline of life, who are fubject to the gout, the gravel, or other chronic difeafes, or who have been often afflicted with the venereal difeafe in their youth, are likewife very liable to the rickets.

Any diforder that weakens the confliction, or relaxes the habit of children, as the fmall-pox, meafles, teething, the hooping-cough, &cc. difpofes them to this difeafe. It may likewife be occafioned by improper diet, as food that is either too weak and watery, or fo vifeid that the ftomach cannot digeft it.

Bad nurfing is the chief caufe of this difeafe. When the nurfe is either difeafed, or has not enough of milk to nourifh the child, it cannot thrive. But children fuffer oftener by want of care in nurfes than want of food. Allowing an infant to lie or fit too much. much, or not keeping it thoroughly clean in its clothes, has the most pernicious effects.

The want of free air is likewife very hurtful to children in this refpect. When a nurfe lives in a clofe fmall houfe, where the air is damp and confined, and is too indolent to carry her child abroad into the open air, it will hardly efcape this difeafe. A healthy child fhould always be in motion, unlefs when afleep; if it be fuffered to lie, or fit, inftead of being toffed and dandled about, it will not thrive.

SYMPTOMS .---- At the beginning of this difeafe the child's flefh grows fort and flabby; its ftrength is diminished; it loses its wonted cheerfulnefs, looks more grave and composed than is natural for its age, and does not choole to be moved. The head and belly become too large in proportion. to the other parts; the face appears full, and the complexion florid. Afterwards the bones begin to be affected, efpecially in the more foft and fpungy parts. Hence the wrifts and ancles become thicker than ufual; the fpine or back-bone puts on an unnatural shape; the breast is likewise often deformed; and the bones of the arms and legs grow crooked. All these symptoms vary according to the violence of the difeafe. The pulfe is generally quick, but feeble; the appetite and digeftion for the most part bad; the teeth come flowly and with difficulty, and they often rot and fall out afterwards. Rickety children generally have great acuteness of mind, and an understanding above their years. Whether this is owing to their being more in the company of adults than other children, or to the preternatural enlargement of the brain, is not material.

REGIMEN.—As this difeafe is always atrended with evident figns of weaknefs and relaxation, our chief aim in the cure must be to brace Oo 2 and and ftrengthen the folids, and to promote digeftion and the due preparation of the fluids. Thefe important ends will be beft anfwered by wholefome nourifhing diet, fuited to the age and ftrength of the patient, open dry air, and fufficient exercife. If the child has a bad nurfe, who either neglests her duty, or does not underftand it, fhe fhould be changed. If the feafon be cold, the child ought to be kept warm; and when the weather is hot, it ought to be kept cool; as fweating is apt to weaken it, and teo great a degree of cold has the fame effect. The limbs fhould be rubbed frequently with a warm hand, and the child kept as cheerful as poffible.

The diet ought to be dry and nourifhing, as good bread, roafted flefh, &cc. Bifcuit is generally teckoned the beft bread; and pigeons, pullets, veal, rabbits, or mutton roafted or minced, are the most proper flefh. If the child be too young for flefh meats, he may have rice, millet, or pearl-barley, boiled with raifins, to which may be added a little wine and fpice. His drink may be good claret, mixed with an equal quantity of water. These who cannot afford claret, may give the child now and then a wine-glafs of mild ale, or good porter.

MEDICINE.—Medicines are here of little avail, The difeafe may often be cured by the nurfe, but feldom by the phyfician. In children of a grofs habit, gentle vomits and repeated purges of thubarb may fometimes be of ufe, but they will feldom carry off the difeafe; that muft depend chiefly upon fuch things as brace and ftrengthen the fyftem: for which purpole, befides the regimen mentioned above, we would recommend the cold bath, efpecially in the warm feafon. It muft however be ufed with prudence, as fome ricketty children cannot bear it. The beft time for ufing the .

cold bath is in the morning, and the child fhould be well rubbed with a dry cloth immediately after he comes out of it. If the child fhould be weakened by the cold bath, it must be difcontinued.

Sometimes iffues have been found beneficial in this difeafe. They are peculiarly neceffary for children who abound with grofs humours. An infufion of the Peruvian bark in wine or ale would be of fervice, were it poffible to bring children to take it. We might here mention many other medicines which have been recommended for the rickets; but as there is far more danger in trufting to these than in neglecting them altogether, we chufe rather to pass them over, and to recommend a proper regimen as the thing chiefly to be depended on.

OF CONVULSIONS.

THOUGH more children are faid to die of convulfions than of any other difease, yet they are for the most part only a symptom of some other malady. Whatever greatly irritates or flimulates the nerves, may occasion convultions. Hence infants whole nerves are easily affected, are often thrown into convultions by any thing that irritates the alimentary canal: likewife by teething, ftraight clothes, the approach of the fmall-pox, meafles, or other eruptive difeafes.

When convultions proceed from an irritation of the ftomach or bowels, whatever clears them of their acrid contents, or renders thefe mild and inoffenfive, will generally perform a cure : wherefore, if the child be coffive, the best way will be to begin with a clyfter, and afterwards to give a gentle vomit, which may be repeated occasionally, and the body in the mean time kept open by gentle dofes

dofes of magnefia alba, or fmall quantities of rhubarb mixed with the powder of crabs claws.

Convultions which precede the eruption of the finall-pox or meafles generally go off upon thefe making their appearance. The principal danger in this cafe arifes from the fears and apprehenfions of thole who have the care of the patient. Convulfions are very alarming, and fomething muft be done to appeale the affrighted parents, nurfes, &c. Hence the unhappy infant often undergoes bleeding, bliftering, and feveral other operations, to the great danger of its life, when a little time, bathing the feet in warm water, and throwing in a mild clyfter, would have fet all to rights.

When convultion fits arife from the cutting of teeth, befides gentle evacuations, we would recommend bliftering, and the ufe of antifpafmodic medicines, as the tincture of foot, afafœtida, or caftor. A few drops of any of thefe may be mixed in a cup of white wine whey, and given occafionally.

When convultions proceed from any external caufe, as the preffure occafioned by firait clothes or bandages, &c. thefe ought immediately to be removed; though in this cafe taking away the caufe will not always remove the effect, yet it ought to be done. It is not likely that the patient will recover, as long as the caufe which first gave rife to the diforder continues to act.

When a child is feized with convultions without having any complaint in the bowels, or fymptoms of teething; or any rafh or other difcharge which has been fuddenly dried up; we have reafon to conclude that it is a primary difeafe, and proceeds immediately from the brain. Cafes of this kind, however, happen but feldom, which is very fortunate, as little can be done to relieve the unhappy patient. When a difeafe proceeds from an original

nal fault in the formation or ftructure of the brain itfelf, we cannot expect that it fhould yield to medicine. But as this is not always the caufe, even of convultions which proceed immediately from the brain, fome attempts fhould be made to remove them. The chief intention to be purfued for this purpofe, is to make fome derivation from the head, by bliftering, purging, and the like. Should thefe fail, iffues or fetons may be put in the neck, or between the fhoulders.

OF WATER IN THE HEAD.

THOUGH water in the head, or a dropfy of the brain, may affect adults as well as children, yet, as the latter are more peculiarly liable to it, we thought it would be most proper to place it among the difeases of infants.

CAUSES.——A dropfy of the brain may proceed from injuries done to the brain itfelf by falls, blows, or the like; it may likewife proceed from an original laxity or weaknefs of the brain: from feirrhous tumours or excreferences within the fkull; a thin watery ftate of the blood; a diminished fecretion of urine; a fudden check of the perspiration; and lastly, from tedious and lingering dileases, which waste and confume the patient.

SYMPTOMS.—This difeafe has at first the appearance of a flow fever; the patient complains of a pain in the crown of his head, or over his eyes; he fluns the light; is fick, and fometimes yonits; his pulfe is irregular and generally low: though he feems heavy and dull, yet he does not fleep: he is fometimes delirious, and frequently fees objects double; towards the end of this commonly fatal difeafe, the pulfe becomes more frequent, the pu-O 0 4 pils

567

568 OF WATER IN THE HEAD.

pils are generally dilated, the cheeks fluthed, the patient becomes comatole, and convultions enfue*.

MEDICINE.—No medicine has hitherto been found fufficient to carry off a dropfy of the brain. It is laudable, however, to make fome attempts, as time or chance may bring many things to light, of which at prefent we have no idea. The medicines generally ufed are, purges of rhubarb or jalap, with ealomel, and bliftering-plafters applied to the neck or back part of the head. To which we would beg leave to add diuretics, or medicines which promote the fecretion of urine, fuch as are recommended in the common dropfy. A difcharge from the nofe ought likewife to be promoted by caufing the patient to fnuff the powder of afarum, white hellebore, or the like,

Some practitioners have of late pretended to cure this difeafe by the ufe of mercury. I have not been fo happy as to fee any inftances of a cure being performed in a confirmed dropfy of the brain; but in fo defperate a malady every thing deferves a trial \uparrow .

* I very lately loft a patient in this difeafe, where a curious *metaflafis* feemed to take place. The water at first appeared to be in the abdomen, afterwards in the breast, and last of all it mounted up to the brain, where it foon proved fatal.

+ One reafon why this difeafe is feldom or never cured, may be, that it is feldom known till too far advanced to admit of remedy. Did parents watch the firft fymptoms, and call a phyfician in due time, I am inclined to think that fomething might be done. But thele fymptoms are not yet fufficiently known, and are often miltaken even by phyficians themfelves. Of this I lately faw a firking inflance in a patient, attended by an eminent practitioner of this eity, who had all along miltaken the difeafe for teething.

[569]

CHAP. L.

OF SURGERY.

O deferibe all the operations of furgery, and to point out the different difeafes in which these operations are neceffary, would extend this article far beyond the limits allotted to it: we must therefore confine our observations to fuch cases as most generally occur, and in which proper affistance is either not asked, or not always to be obtained.

Though an acquaintance with the ftructure of the human body is indifpenfably neceffary to qualify a man for being an expert furgeon; yet many things may be done to fave the lives of their fellowmen in emergencies by those who are no adepts in anatomy. It is amazing with what facility the peafants daily perform operations upon brute animals, which are not of a lefs difficult nature than many of those performed on the human species; yet they feldom fail of success.

Indeed every man is in fome meafure a furgeon whether he will or not. He feels an inclination to affift his fellow-men in diftrefs, and accidents happen every hour which give occafion to exercife this feeling. The feelings of the heart, however, when not directed by the judgment, are apt to miflead. Thus one, by a rafh attempt to fave his friend, may fometimes deftroy him; while another, for fear of doing amifs, ftands ftill and fees his bofomfriend expire without fo much as attempting to relieve him, even when the means are in his power. As every good man would wifh to fteer a courfe different from either of thefe, it will no doubt be agreeable

OF BLEEDING.

570

agreeable to him to know what ought to be done upon fuch emergencies.

OF BLEEDING.

No operation of furgery is fo frequently neceffary as bleeding; it ought therefore to be very generally underflood. But though practifed by midwives, gardeners, blackfmiths, &c. we have reafon to believe that very few know when it is proper. Even phylicians themfelves have been fo much the dupes of theory in this article, as to render it the fubject of ridicule. It is however an operation of great importance, and muft, when feafonably and properly performed, be of fingular fervice to thofe in diftrefs.

Bleeding is proper at the beginning of all in-flammatory fevers, as pleurifies, peripneumonics, &cc. It is likewife proper in all topical inflammations, as those of the intestines, womb, bladder, ftomach, kidnies, throat, eyes, &c. as also in the afthma, fciatic pains, coughs, head-achs, rheu-matifms, the apoplexy, epilepfy, and bloody flux, After falls, blows, bruifes, or any violent hurt received either externally or internally, bleeding is neceffary. It is likewife neceffary for perfons who have had the misfortune to be ftrangled, drowned, fuffocated with foul air, the fumes of metal, or the like. In a word, whenever the vital motions have been fuddenly ftopt from any caufe whatever, except in fwoonings occafioned by mere weaknefs or hyfteric affections, it is proper to open a vein. But in all diforders proceeding from a relaxation of the folids, and an impoverished flate of the blood, as dropfies, cacochymies, &cc. bleeding is improper.

Bleeding

Bleeding for topical inflammations ought always to be performed as near the part affected as poffible. When this can be done with a lancet, it is to be preferred to any other method; but where a vein cannot be found, recourfe must be had to leeches or cupping.

The quantity of blood to be let must always be regulated by the ftrength, age, conftitution, manner of life, and other circumstances relating to the patient. It would be ridiculous to suppose that a child could bear to lose as much blood as a grown person, or that a delicate lady should be bled to the same extent as a robust man.

From whatever part of the body blood is to be let, a bandage muft be applied between that part and the heart. As it is often neceffary, in order to raife the vein, to make the bandage pretty tight, it will be proper in fuch cafes, as foon as the blood begins to flow, to flacken it a little. The bandage ought to be applied at leaft an inch, or an inch and half from the place where the wound is intended to be made.

Perfons not fkilled in anatomy ought never to bleed in a vein that lies over an artery or a tendon, if they can avoid it. The former may eafily be known from its pulfation or beating, and the latter from its feeling hard or tight like a whipcord under the finger.

It was formerly a rule, even among those who had the character of being regular practitioners, to bleed their patients in certain difeases till they fainted. Surely a more ridiculous rule could not be proposed. One perfon will faint at the very fight of a lancet, while another will lose almoss the whole blood of his body before he faints. Swooning depends more upon the state of the mind than of the body: besides, it may often be occasioned or or prevented by the manner in which the operation is performed.

Children are generally bled with leeches. This, though fometimes neceffary, is a very troublefome and uncertain practice. It is impoffible to know what quantity of blood is taken away by leeches; befides, the bleeding is often very difficult to ftop, and the wounds are not eafily healed. Would thole who practife bleeding take a little more pains, and accuftom themfelves to bleed children, they would not find it fuch a difficult operation as they Imagine.

Certain hurtful prejudices, with regard to bleed. ing ftill prevail among the country people. They talk, for inftance, of head-veins, heart-veins, breait-veins, &c. and believe that bleeding in thefe will certainly cure all difeafes of the parts from whence they are fuppofed to come, without confidering that all the blood-veffels arife from the heart, and return to it again; for which reafon, unlefs in topical inflammations, it fignifies very little from what part of the body blood is taken. But this, though a foolifh prejudice, is not near fo hurtful as the vulgar notion that the first bleeding will perform wonders. This belief makes them often postpone the operation when necessary, in order to referve it for some more important occasion, and, when they think themfelves in extreme danger, they fly to it for relief, whether it be proper or not. Bleeding at certain flated periods or feafons has likewife had effects.

It is a common notion that bleeding in the feet draws the humours downwards, and confequently cures difeafes of the head and other fuperior parts; but we have already obferved that, in all topical affections, the blood ought to be drawn as near the part as poffible. When it is neceffary, however, to bleed in the foot or hand, as

OF INFLAMMATIONS and ABSCESSES. 573

as the veins are fmall, and the bleeding is apt to ftop too foon, the part ought to be immerfed in warm water, and kept there till a fufficient quantity of blood be let.

We shall not spend time in defcribing the manner of performing this operation : that will be better learned by example than precept. Twenty pages of defcription would not convey to just an idea of the operation as feeing it once performed by an expert hand. Neither is it neceffary to point out the different parts of the body from whence blood may be taken, as the arm, foot, forehead, temples, neck, &cc. Thefe will readily occur to every intelligent perfon, and the foregoing obfervations will be fufficient for determining which of them is most proper upon any particular occasion. In all cases where the intention is merely to leften the general mafs of blood, the arm is the most commodious part of the body in which the operation can be performed.

OF INFLAMMATIONS AND ABSCESSES,

FROM whatever caufe an inflammation proceeds, it must terminate either by dispersion, suppuration, or gangrene. Though it is impossible to fortel with certainty in which of these ways any particular inflammation will terminate, yet a probable conjecture may be formed with regard to the event, from a knowledge of the patient's age and conflitution. Inflammations happening in a flight degree upon colds, and without any previous indifposition, will most probably be dispersed; those which follow close upon a fever, or happen to perfons of a gross habit of body, will generally suppurate; and those which attack very old people, or perform

574 Of INFLAMMATIONS and ABSCESSES.

perfons of a dropfical habit, will have a ftrong tendency to gangrene.

If the inflammation be flight, and the conflitution found, the difperfion ought always to be attempted. This will be beft promoted by a flender diluting diet, plentiful bleeding, and repeated purges. The part itfelf muft be fomented, and, if the fkin be very tenfe, it may be embrocated with a mixture of three-fourths of fweet oil, and onefourth of vinegar, and afterwards covered with a piece of wax-plafter.

If, notwithstanding these applications, the fymptomatic fever increases, and the tumour becomes larger, with violent pain and pulsation, it will be proper to promote the fuppuration. The best application for this purpose is a fost poultice, which may be renewed twice a-day. If the fuppuration proceeds but flowly, a raw onion cut small or bruised may be spread upon the poultice. When the abscess is ripe or fit for opening, which may easily be known from the thinnels of the fkin in the most prominent part of it, fluctuation of matter which may be felt under the finger, and generally speaking, an abatement of the pain, it may be opened either with a lancet or by means of caustic.

The laft way in which an inflammation terminates, is in a gangrene or mortification, the approach of which may be known by the following dymptoms: the inflammation lofes its rednefs, and becomes dufkifh or livid; the tenfion of the fkin goes off, and it feels flabby; little bladders filled with ichor of different colours fpread all over it; the tumour fubfides, and from a dufkifh complexion becomes black; a quick low pulfe, with cold clammy fweats, are the immediate forerunners of death.

When

When these fymptoms first appear, the part ought to be dreffed with London treacle, or a cataplasm made of lixivium and bran. Should the fymptoms become worse, the part must be scarified, and afterwards dreffed with basilicum softened with oil of turpentine. All the dreffings must be applied warm. With regard to internal medicines, the patient must be supported with generous cordials, and the Peruvian bark exhibited in as large dofes as the stomach will bear it. If the mortified parts should separate, the wound will become a common ulcer, and must be treated accordingly.

This article includes the treatment of all those diseases, which, in different parts of the country, go by the names of *biles*, *imposthumes*, *wbitlees*, &c. They are all absceffes in confequence of a previous inflammation, which, if possible, ought to be discuffed; but when this cannot be done, the fuppuration should be promoted, and the matter discharged by an incision, if necessary; afterwards the fore may be dreffed with yellow basilicum, or fome other digestive ointment.

OF WOUNDS.

No part of medicine has been more miltaken than the treatment or cure of wounds. Mankind in general believe that certain herbs, ointments, and plafters are poffeffed of wonderful healing powers, and imagine that no wound can be cured without the application of them. It is kowever a fact, that no external application whatever contributes towards the cure of a wound, any other way than by keeping the parts foft, clean, and defending them from the external air, which may be as effectually done by dry lint, as by the moft pompous applications; while it is exempt from many of the bad confequences attending them.

The fame obfervation holds with respect to internal applications. These only promote the cure of wounds as far as they tend to prevent a fever, or to remove any cause that might obstruct or impede the operations of Nature. It is Nature alone that cures wounds. All that art can do is to remove obstacles, and to put the parts in such a condition as is the most favourable to Nature's efforts.

With this fimple view we shall confider the treatment of wounds, and endeavour to point out such steps as ought to be taken to facilitate their cure.

The first thing to be done when a perion has received a wound is to examine whether any foreign body be lodged in it, as wood, stone, iron, lead, gla(s, dirt, bits of cloth, or the like. These, if possible, ought to be extracted, and the wound cleaned before any dreffings be applied. When that cannot be effected with fastety, on account of the patient's weakness or loss of blood, they must be fuffered to remain in the wound, and asterwards extracted when he is more able to bear it.

When a wound penetrates into any of the cavities of the body, as the breaft, the bowels, &c. or where any confiderable blood veffel is cut, a fkilful furgeon ought immediately to be called, otherwife the patient may lofe his life. But fometimes the difcharge of blood is fo great, that if it be not ftopt, the patient may die, even before a furgeon, though at no great diffance, can arrive. In this cafe, fomething muft be done by thole who are prefent. If the wound be in any of the limbs, the bleeding may generally be ftopt by applying a tight ligature or bandage round the member a little above the wound. The beft method of doing this is

576

is to put a firong broad garter round the part, but fo flack as eafily to admit a finall piece of flick to be put under it, which muft be twifted, in the fame manner as a countryman does a cart-rope to fecure his loading, till the bleeding ftops. Whenever this is the cafe, he muft take care to twift it no longer, as ftraining it too much might occafion an inflammation of the parts, and endanger a gangrene.

In parts where this bandage cannot be applied, various other methods may be tried to ftop the bleeding, as the application of flyptics, aftringents, &c. Cloths dipped in a folution of blue vitriol in water, or the *flyptic water* of the difpenfatories, may be applied to the wound. When these cannot be obtained, ftrong firits of wine may be used. Some recommend the *agaric* * of the oak as preferable to any of the other flyptics; and indeed it deferves confiderable encomiums. It is eafily obtained, and ought to be kept in every family, in case of accidents. A piece of it must be laid upon the wound, and covered with a good

• Dr. Tiffot, in his Advice to the People, gives the following directions for gathering, preparing, and applying the agaric.— " Gather in autumn," fayshe, " while the fine weather lafts, the garic of the oak, which is a kind of funguis or excrefcence illuing from the wood of that tree. It confifts at first of four parts, which prefent themfelves fucceffively: 1. The outward rind or fkin, which may be thrown away. 2. The part immediately under this rind, which is the beft of all. This is to be beat well with a hammer, till it becomes foft and very pliable. This is the only preparation it requires, and a flice of it of a proper fize is to be applied directly over the burfting open blood veffels. It confiringes and brings them clofe together, flops the bleeding, and generally falls off at the end of two days. 3. The third part adhering to the fectond may ferve to flop the bleeding from the fmaller veffels; and the fourth and laft part may be reduced to powder as conducing to the fame purpofe."—Where the agaric cannot be had, fponge may be ufed in its flead. I then the fame applied in the fame manner, and has nearly the fame effects.

Рp

deal

deal of lint, above which a bandage may be applied fo tight as to keep it firmly on.

Though fpirits, tinctures, and hot balfams may be ufed, in order to ftop the bleeding when it is exceffive, they are improper at other times. They do not promote but retard the cure, and often change a fimple wound into an ulcer. People imagine, becaufe hot balfams congeal the blood, and feem, as it were, to folder up the wound, that they therefore heal it; but this is only a deception. They may indeed ftop the flowing blood, by fearing the mouths of the vefiels; but, by rendering the parts callous, they obftruct the cure.

In flight wounds, which do not penetrate much deeper than the fkin, the beft application is a bit of the common black flicking plafter. This keeps the fides of the wound together, and prevents the air from hurting it, which is all that is neceffary, When a wound penetrates deep, it is not fafe to keep its lips quite clofe: this keeps in the matter, and is apt to make the wound fefter. In this cafe the beft way is to fill the wound with foft lint, commonly called *caddis*. It however muft not be fluffed in too hard, otherwife it will do hurt. The lint may be covered with a cloth dipped in oil, or fpread with the common wax plafter *; and the whole muft be kept on by a proper bandage.

We shall not spend time in describing the different bandages that may be proper for wounds in different parts of the body; common sense will generally suggest the most commodious method of applying a bandage; besides, descriptions of this kind are not easily understood or remembered.

The first dreffing ought to continue on for at least two days; after which it may be removed, and fresh lint applied as before. If any part of

* See Appendix, Wax plaster.

the

the first dreffing flicks fo close as not to be removed with ease or fastery to the patient, it may be allowed to continue, and fresh lint dipped in sweet oil laid over it. This will soften it, so as to make it come off easily at next dreffing. Afterwards the wound may be dreffed twice a-day in the fame manner till it be quite healed. Those who are fond of falves or ointments, may, after the wound is become very superficial, drefs it with the yellow bashlicum *; and if fungous, or what is called proud fless, should rife in the wound, it may be checked, by mixing with the ointment a little burnt alum or red precipicate of mercury.

When a wound is greatly inflamed, the most proper application is a poultice of bread and milk, foftened with a little fweet oil or fresh butter. This must be applied instead of a plaster, and should be changed twice a day.

If the wound be large, and there is reafon to fear an inflammation, the patient fhould be kept on a very low diet. He muft abitain from flefh, ftrong liquors, and every thing that is of a heating nature. If he be of a full habit, and has loft but little blood from the wound, he muft be bled; and, if the fymptoms be urgent, the operation may be repeated. But when the patient has been greatly weakened by lofs of blood from the wound, it will be dangerous to bleed him, even though a fever fhould enfue. Nature fhould never be too far exhaufted. It is always more fafe to allow her to ftruggle with the difeafe in her own way, than to fink the patient's ftrength by exceffive evacuations.

Wounded perfons ought to be kept perfectly quiet and eafy. Every thing that ruffles the mind or moves the paffions, as love, anger, fear, exceffive

* See Appendix, Yellow bafilicum.

Pp2

joy,

579

joy, &c. are very hurtful. They ought above all things to abftain from venery. The body fhould be kept gently open, either by laxative clyfters, or by a cool vegetable diet, as roafted apples, flewed prunes, boiled fpinage, and fuch like.

OF BURNS.

In flight burns which do not break the fkin, it is cultomary to hold the part near the fire for a competent time, to rub it with falt, or to lay a comprefs upon it dipped in fpirits of wine or brandy. But when the burn has penetrated fo deep as to blifter or break the fkin, it must be dreffed with fome of the liniment for burns mentioned in the Appendix, or with the emollient and gently drying ointment, commonly called Turner's cerate *. This may be mixed with an equal quantity of fresh olive oil, and spread upon a fost rag, and applied to the part affected. When this ointment cannot be had, an egg may be beat up with about an equal quantity of the fweetest falad oil. This will ferve very well till a proper ointment can be prepared. When the borning is very deep, after the first two or three days, it should be dreffed with equal parts of yellow bafilicum and Turner's cerate mixed together.

When the burn is violent, or has occafioned a high degree of inflammation, and there is reafon to fear a gangrene or mortification, the fame means muft be ufed to prevent as are recommended in other violent inflammations. The patient, in this cafe, muft live low, and drink freely of weak diluting liquors. He muft likewife be bled, and have his body kept open. But if the burnt parts fhould become livid or black, with other fymp-

* See Appendix, Turner's cerate.

toms

toms of mortification, it will be neceffary to bathe them frequently with warm camphorated fpirits of wine, tincture of myrrh, or other antifeptics, mixed with a decoction of the bark. In this cafe the bark muft likewife be taken internally, and the patient's diet muft be more generous, with wine, &c.

As example teaches better than precept, I shall relate the treatment of the most dreadful cafe of this kind that has occurred in my practice. A middle-aged man, of a good conftitution, fell into a large veffel full of boiling water, and miferably fealded about one half of his body. As his clothes were on, the burning in fome parts was very deep before they could be got off. For the first two days the fealded parts had been frequently anointed with a mixture of lime-water and oil, which is a very proper application for recent burnings. the third day, when I first faw him, his fever was high, and his body coffive, for which he was bled. and had an emollient clyfter administered. Poultices of bread and milk, foftened with fresh butter, were likewife applied to the affected parts, to abate the heat and inflammation. His fever still continuing high, he was bled a fecond time, was kept strictly on the cooling regimen, took the faline mixture with fmall dofes of nitre, and had an emollient clyfter administered once a day. When the inflammation began to abate, the parts were dreffed with a digeftive composed of brown cerate and yellow bafilicum. Where any black fpots appeared, they were flightly fcarified, and touched with the tincture of myrrh; and, to prevent their fpreading, the Peruvian bark was administered. By this courfe, the man was fo well in three weeks as to be able to attend his business.

Pp3

OF BRUISES.

BRUISES are generally productive of worfe confequences than wounds. The danger from them does not appear immediately, by which means it often happens that they are neglected. It is needlefs to give any definition of a difeafe fo univerfally known; we fhall therefore proceed to point out the method of treating it.

In flight bruifes it will be fufficient to bathe the part with warm vinegar, to which a little brandy or rum may occafionally be added, and to keep cloths wet with this mixture conftantly applied to it. This is more proper than rubbing it with brandy, fpirits of wine, or other ardent fpirits, which are commonly ufed in fuch cafes.

In fome parts of the country the peafants apply to a recent bruife a cataplafm of fresh cow-dung. I have often feen this cataplasm applied to violent contustions occasioned by blows, falls, bruifes, and fuch like, and never knew it fail to have a good effect.

When a bruife is very violent, the patient ought immediately to be bled, and put upon a proper regimen. His food fhould be light and cool, and his drink weak, and of an opening nature; as whey fweetened with honey, decoctions of tamarinds, barley, cream-tartar-whey, and fuch like. The bruifed part muft be bathed with vinegar and water, as directed above; and a poultice made by boiling crumb of bread, elder-flowers, and camomile-flowers, in equal quantities of vinegar and water, applied to it. This poultice is peculiarly proper when a wound is joined to the bruife. It may be renewed two or three times a-day.

As

As the ftructure of the veffels is totally deftroyed by a violent bruife, there often enfues a great lofs of fubftance, which produces an ulcerous fore very difficult to cure. If the bone be affected, the fore will not heal before an exfoliation takes place; that is, before the difeafed part of the bone feparates, and comes out through the wound. This is often a very flow operation, and may even require feveral years to be completed. Hence it happens, that thefe fores are frequently miftaken for the king's evil, and treated as fuch, though in fact they proceed folely from the injury which the folid parts received from the blow.

Patients in this fituation are peftered with different advices. Every one who fees them propoles a new remedy, till the fore is fo much irritated with various and oppofite applications, that it is often at length rendered abfolutely incurable. The beft method of managing fuch fores is, to take care that the patient's conflictution does not fuffer by confinement, or improper medicine, and to apply nothing to them befides fimple ointment fpread upon foft lint, over which a poultice of bread and milk, with boiled camonile-flowers, or the like, may be put, to nourifh the part, and keep it foft and warm. Nature, thus affifted, will generally in time operate a cure, by throwing off the difeafed parts of the bone, after which the fore foon heals.

OF ULCERS.

ULCERS may be the confequence of wounds, bruifes, or impofthumes improperly treated; they may likewife proceed from an ill ftate of the humours, or what may be called a bad habit of body.

583

In

In the latter cafe, they ought not to be haftily dried up, otherwife it may prove fatal to the patient. Ulcers happen most commonly in the decline of life, and perfons who neglect exercife, and live grofsly, are most liable to them. They might often be prevented by retrenching fome part of the folid food, or by opening artificial drains, as iffues, fetons, or the like.

An ulcer may be diffinguished from a wound by its difcharging a thin watery humour, which is often to acrid as to inflame and corrode the fkin; by the hardness and perpendicular fituation of its fides or edges; by the time of its duration, &c.

It requires confiderable skill to be able to judge whether or not an ulcer ought to be dried up. In general, all ulcers which proceed from a bad habit of body, should be suffered to continue open. at leaft till the conftitution has been fo far changed by proper regimen, or the use of medicine, that they feem difpoled to heal of their own accord. Ulcers which are the effect of malignant fevers, or other acute difeafes, may generally be healed with fafety after the health has been reftored for fome time. The cure ought not however to be attempted too foon, nor at any time without the use of purging medicines and a proper regimen. When wounds or bruifes have, by wrong treatment, de-generated into ulcers, if the conftitution be good, they may generally be healed with fafety. When ulcers either accompany chronical difeafes, or come in their flead, they must be cautiously healed. If an ulcer conduces to the patient's health, from whatever caufe it proceeds, it ought not to be healed; but if, on the contrary, it waftes the ftrength, and confumes the patient by a flow fever, it should be healed as foon as poffible,

We

584

We would earneftly recommend a firict attention to thefe particulars, to all who have the misfortune to labour under this diforder, particularly perfons in the decline of life, as we have frequently known people throw away their lives by the want of it, while they were extolling and generoufly rewarding thofe whom they ought to have looked upon as their executioners.

The molt proper regimen for promoting the cure of ulcers, is to avoid all fpices, falted and high feafoned food, all ftrong liquors, and to leften the ufual quantity of flefh meat. The body ought to be kept gently open by a diet confifting chiefly of cooling laxative vegetables, and by drinking butter-milk, whey fweetened with honey, or the like. The patient ought to be kept cheerful, and fhould take as much exercise as he can cafily bear.

When the bottom and fides of an ulcer feem hard and callous, they may be fprinkled twice a-day with a little red precipitate of mercury, and afterwards dreffed with the yellow *bafilicum* ointment. Sometimes it will be neceffary to have the edges of the ulcer fcarified with the lancet.

Lime-water has frequently been known to have very happy effects in the cure of obstinate ulcers. It may be used in the fame manner as directed for the stone and gravel.

My late learned and ingenious friend Dr. Whytt, ftrongly recommends the ufe of the folution of corrofive tublimate of mercury in brandy, for the cura of obfinate ill-conditioned ulcers. I have frequently found this medicine, when given according to the Doctor's directions, prove very fucceffful. The dofe is a table-fpoonful night and morning; at the fame time wafhing the fore twice or thrice a-day with it. In'a letter which I had from the Doctor a little before his death, he informed me, "That he obferved wafhing the fore thrice a-day

a-day with the folution of a triple-ftrength was very beneficial *."

A fiftulous ulcer can feldom be cured without an operation. It must either be laid open so as to have its callous parts destroyed by fome corrofive applica. tion, or they must be entirely cut away by the knife : but as this operation requires the hand of an expert furgeon, there is no occasion to describe it. Ulsers about the anus are most apt to become fiftulous, and are very difficult to cure. Some indeed pretend to have found Ward's fiftula paste very successful in this complaint. It is not a dangerous medicine, and being eafily procured, it may deferve a trial; but as these ulcers generally proceed from an ill habit of body, they will feldom yield to any thing except a long course of regimen, affifted by medicines, which are calculated to correct that particular habit, and to induce an almost total change in the conftitution.

CHAP. LI.

OF DISLOCATIONS.

W HEN a bone is moved out of its place or articulation, fo as to impede its proper functions, it is faid to be *luxated* or *diflocated*. As this often happens to perfons in fituations where no medical affiltance can be obtained, by which means limbs, and even lives, are frequently loft, we fhall endeavour to point out the method of reducing

* In ulcers of the lower limbs great benefit is often received from tight rollers, or wearing a laced flocking, as this prevents, the flux of humours to the force, and difpofes them to heal.

the

the moft common luxations, and thole which require immediate affiftance. Any perfon of common fenfe and refolution, who is prefent when a diflocation happens, may often be of more fervice to the patient, than the moft expert furgeon can after the fwelling and inflammation have come on. When thefe are prefent, it is difficult to know the ftate of the joint, and dangerous to attempt a reduction; and by waiting till they are gone off, the mufcles become for relaxed, and the cavity filled up, that the bone can pever afterwards be retained in its place.

À recent diflocation may generally be reduced by extension alone, which must always be greater or lefs according to the firength of the muscles which move the joint, the age, robustnefs, and other circumstances of the patient. When the bone has been out of its place for any confiderable time, and a fwelling or inflammation has come on, it will be neceffary to bleed the patient, and, after fomenting the part, to apply fost poultices with vinegar to it for fome time before the reduction is attempted.

All that is neceffary after the reduction, is to apply cloths dipt in vinegar or camphorated fpirits of wine to the part, and to keep it perfectly eafy. Many bad confequences proceed from the neglect of this rule. A diflocation feldom happens without the tendons and ligaments of the joint being ftretched and fometimes torn. When thefe are kept eafy till they recover their ftrength and tone, all goes on very well; but if the injury be increafed by too frequent an exertion of the parts, no wonder if they be found weak, and difeafed ever after.

[588]

DISLOCATION OF THE JAW.

THE lower jaw may be luxated by yawning, blows, falls, chewing hard fubftances, or the like. It is eafily known from the patient's being unable to fhut his mouth, or to eat any thing, as the teeth of the under jaw do not correspond with those of the upper; befides, the chia either hangs down or is thrown toward one fide, and the patient is neither able to fpeak diffinctly, nor to fwallow without confiderable difficulty.

The ufual method of reducing a diflocated jaw, is to fet the patient upon a low ftool, fo as an affiftant may hold the head firm by preffing it againft his breaft. The operator is then to thruft his two thumbs, being firft wrapped up with linen cloths that they may not flip, as far back into the patient's mouth as he can, while his fingers are applied to the jaw externally. After he has got firm hold of the jaw, he is to prefs it ftrongly downwards and backwards, by which means the elapfed heads of the jaw may be eafily pufhed into their former cavities.

The peafants in fome parts of the country have a peculiar way of performing this operation. One of them puts a handkerchief under the patient's chin, then turning his back to that of the patient, pulls him up by the chin fo as to fufpend him from the ground. This method often fucceeds, but we think it a dangerous one, and therefore recommend the former.

DISLOCATION OF THE NECK.

THE neck may be diflocated by falls, violent blows, or the like. In this cafe, if the patient receives no affiltance, he foon dies, which makes people imagine the neck was broken; it is, however, for the moft part only partially diflocated, and may be reduced by almost any perfon who has refolution enough to attempt it. A complete diflocation of the neck is inftantaneous death.

When the neck is diflocated, the patient is immediately deprived of all fenfe and motion; his neck fwells, his countenance appears bloated; his chin lies upon his breaft, and his face is generally turned towards one fide.

To reduce this diflocation, the unhappy perfort fhould immediately be laid upon his back on the ground, and the operator muft place himfelf behind him fo as to be able to lay hold of his head with both hands, while he makes a refiftance by placing his knees againft the patient's fhoulders. In this pofture he muft pull the head with confiderable force, gently twifting it at the fame time, if the face be turned to one fide, till he perceives that the joint is replaced, which may be known from the noife which the bones generally make when going in, the patient's beginning to breathe, and the head continuing in its natural pofture.

This is one of those operations which it is more easy to perform than deferibe. I have known inftances of its being happily performed even by women, and often by men of no medical education. After the neck is reduced, the patient ought to be bled, and should be fuffered to reft for some days, till the parts recover their proper tone.

7

[590]

DISLOCATION OF THE RIBS.

As the articulation of the ribs with the backbone is very firong, they are not often diflocated. It does however fometimes happen, which is a fufficient reafon for our taking notice of it. When a rib is diflocated either upwards or downwards, in order to replace it, the patient fhould be laid upon his belly on a table, and the operator muft endeavour to pufh the head of the bone into its proper place. Should this method not fucceed, the arm of the difordered fide may be fufpended over a gate or ladder, and, while the ribs are thus ftretched afunder, the heads of fuch as are out of place may be thruft into their former fituation.

Those diflocations wherein the heads of the ribs are forced inwards, are both more dangerous and the most difficult to reduce, as neither the hand nor any infrument can be applied internally to direct the luxated heads of the ribs. Almost the only thing that can be done is, to lay the patient upon his belly over a cafk, or fome gibbous body, and to move the fore-part of the rib inward towards the back, fometimes fhaking it; by this means the heads of the luxated ribs may flip into their former place.

DISLOCATION OF THE SHOULDER.

THE humerus or upper bone of the arm may be diflocated in various directions: it happens however most frequently downwards, but very feldom directly upwards. From the nature of its articulation, as well as from its exposure to external iniuries.

DISLOCATION OF THE ELBOW. 591

juries, this bone is the moft fubject to diflocation of any in the body. A diflocation of the humerus may be known by a deprefition or cavity on the top of the fhoulder, and an inability to move the arm. When the diflocation is downward or forward, the arm is alongated, and a ball or lump is perceived under the arm-pit; but when it is backward their appears a protuberance behind the fhoulder, and the arm is thrown forwards toward the breaft.

The usual method of reducing diflocations of the fhoulder is to feat the patient upon a low ftool, and to caufe an affiftant to hold his body fo that it may not give way to the extension, while another lays hold of the arm a little above the elbow, and gradually extends it. The operator then puts a napkin under the patient's arm, and causes it to be tied behind his own neck : by this, while a fufficient extension is made, he lifts up the head of the bone, and with his hands directs it into its proper place. There are various machines invented for facilitating this operation, but the hand of an expert furgeon is always more fafe. In young and delicate patients, I have generally found it a very eafy matter to reduce the shoulder, by extending the arm with one hand, and thrufting in the head of the bone with the other. In making the extenfion, the arm ought always to be a little bent.

DISLOCATION OF THE ELBOW.

THE bones of the fore-arm may be diflocated in any direction. When this is the cafe, a protuberance may be observed on that fide of the arm towards which the bone is puthed, from which, and the patient's inability to bend his arm, a diflocation of this joint may eafily be known.

Two

592 DISLOCATION OF THE THIGH.

Two affiftants are generally neceffary for reducing a diflocation of the elbow; one of them muft lay hold of the arm above, and the other below the joint, and make a pretty ftrong extension, while the operator returns the bodes into their proper place. Afterwards the arm muft be bent, and fufpended for fome time with a fling about the neck.

Luxations of the wrift and fingers are to be reduced in the fame manner as those of the elbow, *viz.* by making an extension in different directions, and thrusting the head of the bone into its place.

DISLOCATION OF THE THIGH.

WHEN the thigh-bone is diflocated forward and downward, the knee and foot are turned out, and the leg is longer than the other; but when it is difplaced backward, it is ufually pufhed upward at the fame time, by which means the limb is fhortened, and the foot is turned inwards.

When the thigh-bone is difplaced forward and downward, the patient, in order to have it reduced, muft be laid upon his back, and made faft by bandages, or held by affiftants, while by others an extension is made by means of flings fixed about the bottom of the thigh a little above the knee. While the extension is made, the operator muft push the head of the bone outward, till it gets into the focket. If the diflocation be outward, the patient muft be laid upon his face, and, during the extension, the head of the bone muft be pushed inward.

Diflocations of the *knees*, *ancles*, and *toes*, are reduced much in the fame manner as those of the upper extremities, *viz*. by making an extension in opposite directions, while the operator replaces the hones.

OF BROKEN BONES, &c.

bones. In many cafes, however, the extension alone is fufficient, and the bone will flip into its place merely by pulling the limb with fufficient force. It is not hereby meant, that force alone is fufficient for the reduction of diflocations. Skill and addrefs will often fucceed better than force. I have known a diflocation of the thigh reduced by one man, after all the force that could be ufed by fix had proved ineffectual.

CHAP LIÍ.

OF BROKEN BONES, &c.

THERE is, in most country villages, fome perfon who pretends to the art of reducing fractures. Though in general fuch perfons are very ignorant, yet fome of them are very fuccelsful; which evidently proves, that a fmall degree of learning, with a fufficient fhare of common fenfe and a mechanical head, will enable a man to be uleful in this way. We would, however, advife people never to employ fuch operators, when an expert and fkilful furgeon can be had; but when that is impracticable, they muft be employed : we fhall therefore recommend the following hints to their confideration :

When a large bone is broken, the patient's diet ought in all respects to be the fame as in an inflammatory fever. He should likewife be kept quiet and cool, and his body open by emollient clysters; or, if these cannot be conveniently administered, by food that is of an opening quality; as shewed prunes, apples boiled in milk, boiled spinage, and the like. It ought however to be here remarked,

Qg

that

593

594

that perfons who have been accuftomed to live high, are not all of a fudden to be reduced to a very low diet. This might have fatal effects. There is often a neceffity for indulging even bad habits, in fome measure, where the nature of the discase might require a different treatment.

It will generally be neceffary to bleed the patient immediately after a fracture, efpecially if he be young, of a full habit, or has at the fame time received any bruife or contufion. This operation fhould not only be performed foon after the accident happens, but if the patient be very feverifh, it may be repeated next day. When feveral of the ribs are broken, bleeding is peculiarly neceffary.

If any of the large bones which fupport the body are broken, the patient muft keep his bed for feveral weeks. It is by no means neceffary, however, that he fhould lie all that time, as is cuftomary, upon his back. This fituation finks the fpirits, galls and frets the patient's fkin, and renders him very uneafy. After the fecond week he may be gently raifed up, and may fit feveral hours, fupported by a bed-chair, or the like, which will greatly relieve him. Great care, however, muft be taken in raifing him up, and laying him down, that he make no exertions himfelf, otherwife the action of the mufcles may pull the bone out of its place*.

* Various pieces of machinery have been contrived for counteracting the force of the mufcles, and retaining the fragments of broken bones; but as deforiptions of thefe without drawings would be of little ufe, I fhall refer the reader to a cheap and ufeful performance on the nature and cure of fradures, lately published by my ingenious friend Mr. Aitkin, furgeon, in Edinburgh; wherein that gentleman has not only given an account of the machines recommended in fractures by former authors, but has likewife added feveral improvements of his own, which are peculiarly ufeful in compound fractures, and in cafes where patients with broken bones are obliged to be transported from one place to another.

9

It

.595

It is of great importance to keep the patient dry and clean while in this fituation. By neglecting this, he is often fo galled and excoriated, that he is forced to keep fhifting places for eafe. I have known a fractured thigh-bone, after it had been kept ftraight for above a fortnight, displaced by this means, and continue bent for life, in spite of all that could be done.

It has been cuftomary when a bone was broken, to keep the limb for five or fix weeks continually upon the firetch. But this is a bad pofture. It is both uneafy to the patient, and unfavourable to the cure. The beft fituation is to keep the limb a little bent. This is the pofture into which every animal puts its limbs when it goes to reft, and in which feweft mufcles are upon the firetch. It is eafly effected, by either laying the patient upon his fide, or making the bed fo as to favour this pofition of the limb.

Bone-fetters ought carefully to examine whether the bone be not fhattered or broken into feveral pieces. In this cafe it will fometimes be neceffary to have the limb immediately taken off, otherwife a gangrene or mortification may enfue. The horror which attends the very idea of an amputation often occafions its being delayed in fuch cafes till too late. I have known this principle operate fo ftrongly, that a limb, where the bones were fhattered into more than twenty pieces, was not amputated before the third day after the accident, when the gangrene had proceeded fo far as to render the operation ufelefs.

When a fracture is accompanied with a wound, it must be dreffed in all respects as a common wound.

All that art can do towards the cure of a broken bone, is to lay it perfectly firaight, and to keep it quite eafy. All tight bandages do hurt. Q q 2 They

596 OF BROKEN BONES, &c.

They had much better be wanting altogether. A great many of the bad confequences which fucceed to fractured bones are owing to tight bandages. This is one of the ways in which the excefs of art, or rather the abufe of it, does more mifchief than would be occafioned by the want of it. Some of the moft fudden cures of broken bones which were ever known, happened where no bandages were applied at all. Some method however muft be taken to keep the member fleady; but this may be done many ways without bracing it with a tight bandage.

The beft method of retention is by two or more fplints made of leather or pafteboard. Thefe, if moiftened before they be applied, foon affume the fhape of the included member, and are fufficient, by the affiftance of a very flight bandage, for all the purpofes of retention. The bandage which we would recommend is that made with twelve or eighteen tails. It is much eafier applied and taken off than rollers, and anfwers all the purpofes of retention equally well. The fplints fhould always be as long as the limb, with holes cut for the ancles when the fracture is in the leg.

In fractures of the ribs, where a bandage cannot be properly ufed, an adhefive plafter may be applied over the part. The patient in this cafe ought to keep himfelf quite eafy, avoiding every thing that may occafion fneezing, laughing, coughing, or the like. He ought to keep his body in a ftraight pofture, and fhould take care that his ftomach be confantly diftended, by taking frequently fome light food, and drinking freely of weak watery liquors.

The most proper external application for a fracture is *oxycrate*, or a mixture of vinegar and water. The bandages should be wet with this at every dreffing.

[597]

OF STRAINS.

STRAINS are often attended with worfe confequences than broken bones. The reafon is obvious; they are generally neglected. When a bone is broken, the patient is obliged to keep the member eafy, becaufe he cannot make ufe of it; but when a joint is only ftrained, the perfon, finding he can ftill make a fhift to move it, is forry to lofe his time for fo trifling an ailment. In this way he deceives himfelf, and converts into an incurable malady what might have been removed by only keeping the part eafy for a few days.

Country people generally immerfe a ftrained limb in cold water. This is very proper, provided it be done immediately, and not kept in too long. But the cuftom of keeping the part immerfed in cold water for a long time is certainly dangerous. It relaxes inftead of bracing the part, and is more likely to produce a difeafe than remove one.

Wrapping a garter, or fome other bandage, pretty tight about the firained part, is likewife of ufe. It helps to reftore the proper tone of the veffels, and prevents the action of the parts from increasing the difeafe. It fhould not however be applied too tight. I have frequently known bleeding near the affected part have a very good effect: but what we would recommend above all is ea/e. It is more to be depended on than any medicine, and feldom fails to remove the complaint *.

* A great many external applications are recommended for frains, fome of which do good, and others hurt. The following are fuch as may be ufed with the greateff fafety, viz. poultices made of ftale beer or vinegar and oatmeal, camphorated fpirits of wine, Mindererus's fpirit, volatile liniment, volatile aromatic fpirit diluted with a double quantity of water, and the common fomentation, with the addition of brandy or fpirit of wine,

Qq3

[598]

OF RUPTURES.

CHILDREN and old people are most liable to this difeafe. In the former it is generally occasioned by exceffive crying, coughing, vomiting, or the like. In the latter, it is commonly the effect of blows or violent exertions of the strength, as leaping, carrying great weights, &c. In both a relaxed habit, indolence, and an oily or very moist diet, dispose the body to this difeafe.

A rupture fometimes proves fatal before it is difcovered. Whenever ficknefs, vomiting, and obftinate coftivenefs give reafon to fulpect an obftruction of the bowels, all those places where ruptures usually happen ought carefully to be examined. The protrufion of a very fmall part of the gut will occafion all these fymptoms; and, if not returned in due time, will prove fatal.

On the first appearance of a rupture in an infant, it ought to be laid upon its back, with its head very low. While in this posture, if the gut does not return of itself, it may easily be put up by gentle prefure. After it is returned, a piece of stickingplaster may be applied over the part, and a proper trufs or bandage must be constantly worn for a confiderable time. The method of making and applying these rupture-bandages for children is pretty well known. The child must, as far as possible, be kept from crying, and from all violent exertions, till the rupture is quite healed.

In adults, when the gut has been forced down with great violence, or happens from any caufe to be inflamed, there is often great difficulty in returning it, and fometimes the thing is quite impracticable practicable without an operation; a defeription of which is foreign to our purpole. As I have been fortunate enough, however, always to fucceed in my attempts to return the gut, without having recourse to any other means than what are in the power of every man, I shall briefly mention the method which I generally purfue.

After the patient has been bled, he must be laid upon his back, with his head very low, and his breech raifed high with pillows. In this fituation flannel-cloths wrung out of a decoction of mallows and camomile-flowers, or, if thele are not at hand, of warm water, must be applied for a confiderable time. A clyfter made of this decoction, with a large fooonful of butter and an ounce or two of falt, may be afterwards thrown up. If thefe should not prove successful, recourse must be had to preffure. If the tumour be very hard, confiderable force will be neceffary; but it is not force alone which fucceeds here. The operator, at the fame time that he makes a preffure with the palms of his hand, must with his fingers artfully conduct the gut in by the fame aperture through which it came out. The manner of doing this can be much eafier conceived than described. Should these endeavours prove ineffectual, clyfters of the fmoke of tobacco may be tried. These have been often known to fucceed where every other method failed.

There is reafon to believe that, by perfifting in, the ufe of thefe, and fuch other means as the circumftances of the cafe may fuggeft, most bernias might be reduced without an operation. Cutting for the bernia is a nice and difficult matter. I would therefore advife furgeons to try every method of returning the gut before they have recourfe to the knife. I have once and again fucceeded by perfevering in my endeavours, after eminent furgeons had Q q 4 declared declared the reduction of the gut impracticable without an operation *.

An adult, after the gut has been returned, muft wear a fteel bandage. It is needlefs to defcribe this, as it may always be had ready-made from the artifts. Such bandages are generally uneafy to the wearer for fome time, but by cuftom they become quite eafy. No perfon who has had a rupture after he arrived at man's eftate, fhould ever be without one of thefe bandages,

Perfons who have a rupture ought carefully to avoid a'l violent exercife, carrying great weights, leaping, running, and the like. They fhould likewife avoid windy aliment and ftrong liquors; and fhould carefully guard againft catching cold.

CHAP. LIII.

OF CASUALTIES.

T is certain that life, when to all appearance loft, may often, by due care, be reftored. Accidents frequently prove fatal, merely becaufe proper means are not used to counteract their effects.

* I would here beg leave to recommend it to every practitioner, when his patient complains of pain in the belly with obflinate coffivenefs, to examine the groins and every place where a rupture may happen, in order that it may be immediately reduced. By neglecting this, many perifh who were not fufpected to have had ruptures till after they were dead. I have known this happen where half a dozen of the faculty were in attendance. No perfon ought to be looked upon as killed by any accident, unless where the structure of the heart, brain, or fome organ necessary to life, is evidently deftroyed. The action of these organs may be fo far impaired as even to be for fome time imperceptible, when life is by no means gone. In this cafe, however, if the fluids be fuffered to grow cold, it will be impossible to put them again in motion, even though the folids should recover their power of acting. Thus, when the motion of the lungs has been ftopt by unwholeforme vapour, the action of the heart by a ftroke on the breaft, or the functions of the brain by a blow on the head, if the perfon be fuffered to grow cold, he will in all probability continue fo; but, if the body be kept warm, as foon as the injured part has recovered its power of acting, the fluids will again begin to move, and all the vital functions will be reftored.

It is a horrid cuftom immediately to confign over to death every perfon who has the misfortune. by a fall, a blow, or the like, to be deprived of the appearance of life. The unhappy perfon, inftead of being carried into a warm houfe, and laid by the fire, or put to a warm bed, is generally hurried away to church, or a barn, or fome other cold damp house, where, after a fruitless attempt has been made to bleed him, perhaps by one who knew nothing of the matter, he is given over for dead, and no further notice taken of him. This conduct feems to be the refult of ignorance, fupported by an ancient superstitious notion, which forbids the body of any perfon killed by accident to be laid in an house that is inhabited. What the ground of this superstition may be, we shall not pretend to inquire; but furely the conduct founded upon it is contrary to all the principles of reafon, humanity, and common fense.

When

602 SUBSTANCES STOPT BETWEEN

When a perfon feems to be fuddenly deprived of life, our first bufinels is to enquire into the caufe. We ought carefully to observe whether any fubfance be lodged in the windpipe or gullet ; and, if. that is the cafe, attempts must be made to remove it. When unwholefome air is the caufe, the patient ought immediately to be removed out of it. If the circulation be fuddenly ftopped, from any caufe whatever, except mere weaknefs, the patient fhould be bled. If the blood does not flow, he may be immerfed in warm water, or rubbed with warm cloths, &c. to promote the circulation. When the caufe cannot be fuddenly removed, our great aim must be to keep up the vital warmth, by rubbing the patient with hot cloths, or falt, and covering his body with warm fand, ashes, or the like.

I fhould now proceed to treat more fully of thole accidents, which, without immediate affiftance, would often prove fatal, and to point out the moft likely means for relieving the unhappy fufferers; but as I have been happily anticipated in this part of my fubject by the learned and humane Dr. Tiffor, I fhall content myfelf with collecting fuch of his obfervations as feem to be the moft important, and adding fuch of my own as have occurred in the courfe of practice,

OF SUBSTANCES STOPT BETWEEN THE MOUTH AND STOMACH.

THOUGH accidents of this kind are very common, and extremely dangerous, yet they are generally the effect of careleffnels. Children should be taught to chew their food well, and to put nothing into their mouths which it would be dangerous for them

THE MOUTH AND STOMACH. 603

them to fwallow. But children are not the only perfons guilty of this piece of imprudence. I know many adults who put pins, nails, and other fharp-pointed fubftances in their mouths upon every occalion, and fome who even fleep with the former there all night. This conduct is exceedingly injudicious, as a fit of coughing, or twenty other accidents, may force over the fubftance before the perfon is aware*.

When any fubftance is detained in the gullet, there are two ways of removing it, viz. either by extracting it, or pufhing it down. The fafeft and most certain way is to extract it; but this is not always the easieft; it may therefore be more eligible fometimes to thruft it down, especially when the obstructing body is of fuch a nature, that there is no danger from its reception into the stomach. The fubstances which may be pushed down without danger are, all common nourishing ones, as bread, flesh, fruits, and the like. All indigestible bodies, as cork, wood, bones, pieces of metal, and such like, ought if possible to be extracted, especially if these bodies be sharp pointed, as pins, needles, fishbones, bits of glass, &cc.

When fuch fubftances have not paffed in too deep, we fhould endeavour to extract them with our fingers, which method often fucceeds. When they are lower, we must make use of nippers, or a fmall pair of forceps, fuch as furgeons use. But this attempt to extract rarely fucceeds, if the fubftance be of a flexible nature, and has defcended far into the gullet.

If the fingers and nippers fail, or cannot be duly applied, crotchets, a kind of hooks, must be em-

* A woman in one of the hofpitals of this city lately difcharged a great number of pins, which the had fwallowed in the contre of her bufinefs, through an ulcer in her fide.

ployed,

604 SUBSTANCES STOPT BETWEEN

ployed. These may be made at once, by bending a piece of pretty ftrong iron wire at one end. It must be introduced in the flat way; and for the better conducting it, there should likewife be a curve or bending at the end it is held by, to ferve as a kind of handle to it; which has this further ufe, that it may be fecured by a ftring tied to it, a circumstance not to be omitted in any instrument employed on fuch occasions, to avoid fuch ill accidents as have fometimes enfued from these instruments flipping out of the operator's hand. After the crotchet has paffed below the fubstance that obftructs the paffage, it is drawn up again, and hooks up the body along with it. The crotchet is alfo very convenient, when a fubstance fomewhat flexible, as a pin or fifh-bone, flicks across the gullet, the hook, in fuch cafes, feizing them about their middle part, crooks and thus difengages them; or, if they are very brittle substances, ferves to break them.

When the obstructing bodies are fmall, and only flop up a part of the passage, and which may either eafily elude the hook, or ftraiten it by their refiftance, a kind of rings, made either of wire, wool, or filk, may be ufed. A piece of fine wire of a proper length may be bent into a circle, about the middle, of about an inch diameter, and the long unbent fides brought parallel, and near each other : thefe are to be held in the hand, and the circular part or ring introduced into the gullet, in order to be conducted about the obstructing body, and fo to extract it. More flexible rings may be made of wool, thread, filk, or fmall pack-thread, which may be waxed for their greater ftrength and confiftence. One of these is to be tied fast to a handle of iron wire, whale-bone, or any kind of flexible wood, and by this means introduced, in order to furround the obstructing substance, and to draw it out.

THE MOUTH AND STOMACH. 605

out. Several of these rings passed through one another may be used, the more certainly to lay hold by one, if another should mils it. These rings have one advantage, which is, that when the fub-ftance to be extracted is once laid hold of, it may then, by turning the handle, be retained fo ftrongly in the ring thus twifted, as to be moved every way, which must in many cafes be a confiderable advantage.

Another material employed on thefe unhappy occafions is the fponge. Its property of fwelling confiderably on being wet is the principal foundation of its usefulnels here. If any substance is ftopt in the gullet, but without filling up the whole paflage, a bit of fponge may be introduced into that part which is unftopt, and beyond the fubftance. The fponge foon dilates, and grows larger in this moift fituation; and indeed the enlargement of it may be forwarded by making the patient fwallow a few drops of water. Afterwards it is to be drawn back by the handle to which it is fastened; and as it is now too large to return through the fmall cavity by which it was conveyed in, it draws out the obftructing body along with it.

The comprefibility of fponge is another found-ation of its ufefulnefs in fuch cafes. A pretty large piece of fponge may be compreffed or fqueezed into a fmall fize, by winding a ftring of tape clofely about it, which may be eafily unwound, and withdrawn, after the fponge has been introduced. A bit of fponge may likewife be compresed by a piece of whale-bone split at one end; but this can hardly be introduced in fuch a manner as not to hurt the patient.

I have often known pins and other fharp bodies, which had fluck in the throat, brought up by caufing 6

606 SUBSTANCES STOPT BETWEEN

caufing the perfon to fwallow a bit of tough meat tied to a thread, and drawing it quickly up again. This is fafer than fwallowing fponge, and will often anfwer the purpofe equally well.

When all these methods prove unfuccessful, there remains one more, which is, to make the patient vomit: but this can fcarcely be of any fervice, unlefs when fuch obstructing bodies are fimply engaged in, and not hooked or fluck into the fides of the gullet, as in this cafe vomiting might fometimes occasion further mischief. If the patient can fwallow, vomiting may be excited by taking half a drachm or two fcruples of ipecacuanha in powder made into a draught. If he is not able to fwallow, an attempt may be made to excite vomiting, by tickling his throat with a feather; and, if that should not succeed, a clyster of tobacco may be administered. It is made by boiling an ounce of tobacco in a fufficient quantity of water; this has often been found to fucceed, when other attempts to excite vomiting had failed.

When the obftructing body is of fuch a nature that it may with fafety be pufhed downwards, this may be attempted by means of a wax-candle oiled, and a little heated, fo as to make it flexible; or a piece of whale-bone, wire, or flexible wood, with a fponge faftened to one end.

Should it be impossible to extract even those bodies which it is dangerous to admit into the ftomach, we must then prefer the least of two evils, and rather run the hazard of pushing them down than fuffer the patient to perish in a few minutes; and we ought to fcruple this resolution the less, as a great many instances have happened, where the fwallowing of fuch hurtful and indigestible fubftances has been followed by no diforder.

Whenever it is manifest that all endeavours either to extract or push down the substance must prove

THE MOUTH AND STOMACH.

prove ineffectual, they should be discontinued; because the inflammation occasioned by persisting in them might be as dangerous as the obstruction itself. Some have died in consequence of the inflammation, even after the body which caused the obstruction had been entirely removed.

607

While the means recommended above are making use of, the patient should often swallow, or, if he cannot, he should frequently receive by injection through a crooked tube or pipe that may reach down to the gullet, some emollient liquor, as warm milk and water, barley-water, or a decoction of mallows. Injections of this kind not only fosten and footh the irritated parts, but, when thrown in with force, are often more fuccefsful in loofening the obstruction than all attempts with inftruments.

When, after all our endeavours, we are obliged to leave the obfructing body in the part, the patient muft be treated as if he had an inflammatory diteafe. He should be bled, kept upon a low diet, and have his whole neck furrounded with emollient poultices. The like treatment muft also be used, if there be any reason to suspect an inflammation of the passages, though the obstructing body be removed.

A proper degree of agitation has fometimes loofened the inhering body more effectually than inftruments. Thus a blow on the back has often forced up a fubftance which fluck in the gullet; but this is fill more proper and efficacious when the fubftance gets into the wind-pipe. In this cafe vomiting and fneezing, are likewife to be excited. Pins, which fluck in the gullet, have been frequently difcharged by riding on horfeback, or in a carriage.

When any indigeftible fubftance has been forced down into the ftomach, the patient fhould use a very mild

608 OF DROWNED PERSONS.

mild and fmooth diet, confifting chiefly of fruits and farinaceous fubftances, as puddings, pottage, and foups. He fhould avoid all heating and irritating things, as wine, punch, pepper, and fuch like; and his drink fhould be milk and water, barley water, or whey.

When the gullet is fo ftrongly and fully clofed, that the patient can receive no food by the mouth, he must be nourished by clysters of foup, jelly, and the like.

When the patient is in danger of being immediately fuffocated, and all hope of freeing the paffage is vanished, so that death feems at hand, if refpiration be not reftored; the operation of bronchotomy, or opening of the wind-pipe, must be directly performed. As this operation is neither difficult to an expert furgeon, nor very painful to the patient, and is often the only method which can be taken to preferve life in these emergencies, we thought proper to mention it, though it should only be attempted by perfons skilled in furgery.

OF DROWNED PERSONS.

WHEN a perfon has remained above a quarter of an hour under water, there can be no confiderable hopes of his recovery. But as feveral circumftances may happen to have continued life, in fuch an unfortunate fituation, beyond the ordinary term, we fhould never too foon refign the unhappy object to his fate, but try every method for his relief, as there are many well attefted proofs of the recovery of perfons to life and health who had been taken out of the water apparently dead, and who remained a confiderable time without exhibiting any figns of life. The first thing to be done, after the body is taken out of the water, is to convey it as foon as possible to fome convenient place where the neceffary operations for its recovery may be performed. In doing this, care must be taken not to bruile or injure the body by carrying it in any unnatural posture with the head downwards, or the like. If an adult body, it ought to be laid on a bed, or on ftraw, with the head a little raifed, and carried on a cart or on men's shoulders, and kept in as natural and eafy a position as possible. A small body may be carried in the arms.

In attempting to recover perfons apparently drowned, the principal intention to be purfued is, to reftore the natural warmth, upon which all the vital functions depend; and to excite these functions by the application of ftimulants, not only to the skin, but likewise to the lungs, intestines, \mathcal{B}_c .

Though cold was by no means the caufe of the perfon's death, yet it will prove an effectual obitacle to his recovery. For this reafon, after ftripping him of his wet clothes, his body muft be ftrongly rubbed for a confiderable time with coarfe linen clothes, as warm as they can be made; and, as foon as a well-heated bed can be got ready, he may be laid in it, and the rubbing fhould be continued. Warm cloths ought likewife to be frequently applied to the ftomach and bowels, and hot bricks, or bottles of warm water, to the foles of his feet, and to the palms of his hands.

Strong volatile fpirits should be frequently applied to the nofe; and the spine of the back and pit of the stomach may be rubbed with warm brandy or spirit of wine. The temples ought also to be chafed with volatile spirits; and stimulating powders, as that of tobacco or majoram, may be blown up the nostrils.

To

To renew the breathing a ftrong perfon may blow his own breath into the patient's mouth with all the force he can, holding his noftrils at the tame time. When it can be perceived by the rifing of the cheft or belly that the lungs are filled with air, the perfon ought to defift from blowing, and fhould prefs the breaft and belly fo as to expel the air again; and this operation may be repeated for fome time, alternately inflating and deprefing the lungs fo as to imitate natural refpiration.

If the lungs cannot be inflated in this manner, it may be attempted by blowing through one of the noffuls, and at the fame time keeping the other clofe. Dr. Monro for this purpofe recommends a wooden pipe fitted at one end for filling the noffril, and at the other for being blown into by a perfon's mouth, or for receiving the pipe of a pair of bellows, to be employed for the fame purpofe, if neceffary.

When air cannot be forced into the cheft by the mouth or nofe, it may be neceffary to make an opening into the wind-pipe for this purpofe. It is needlefs, however, to fpend time in deferibing this operation, as it fhould not be attempted unlefs by perfons fkilled in furgery.

To ftimulate the inteflines, the fume of tobacco may be thrown up in form of a clyfter. There are various pieces of apparatus contrived for this purpole which may be uled when at hand; but where these cannot be obtained, the business may be done by a common tobacco-pipe. The bowl of the pipe must be filled with tobacco well kindled, and, after the small tube has been introduced into the fundament, the smay be forced up by blowing through a piece of paper full of holes wrapped round the mouth of the pipe, or by blowing through an empty pipe, the mouth of which is applied OF DROWNED PERSONS.

611

applied clofe to that of the other. This may alfo be done in the following manner: A common clyfter-pipe with a bag mounted upon it may be introduced into the fundament, and the mouth of the bag may be applied round the fmall end of a tobacco pipe, in the bowl of which tobacco is to be kindled, and the fmoke blown up as directed above. Should it be found impracticable to throw up the fmoke of tobacco, clyfters of warm water, with the addition of a little falt and fome wine or fpirits, may be frequently adminifered. This may be done by a common clyfter-bag, and pipe, but, as it ought to be thrown well up, a pretty large fyringe will aniwer the purpofe better.

While these things are doing, fome of the attendants ought to be preparing a warm bath, into which the perfon should be put, if the above endeavours prove ineffectual. Where there are no conveniencies for using the warm bath, the body may be covered with warm falt, fand, afhes, grains, or fuch like. Tiffot mentions an inftance of a girl who was reftored to life, after the had been taken out of the water, swelled, bloated, and to all appearance dead, by laying her naked body upon hot afhes, covering her with others equally hot, putting a bonnet round her head, and a flocking round her neck stuffed with the fame, and heaping coverings over all. After the had remained half an hour in this lituation, her pulse returned, she recovered speech, and cried out, I freeze, I freeze; a little cherry brandy was given her, and the remained buried as it were under the ashes for eight hours; afterwards fhe was taken out, without any other complaint except that of lassitude or weariness, which went off in a few days. The Doctor mentions likewife an inftance of a man who was reftored to life, after he had remained fix hours under water, by the heat of a dunghill.

Rr 2

Till

612 OF DROWNED PERSONS.

Till the patient fhews fome figns of life, and is able to fwallow, it would be ufelefs and even dangerous to pour liquors into his mouth. His lips, however, and tongue, may be frequently wet with a feather dipt in warm brandy or other ftrong fpirits; and, as foon as he has recovered the power of fwallowing, a little warm wine, or fome other cordial, ought every now and then to be adminiftered.

Some recommend a vomit after the patient is a little re-animated; but if he can be made to puke without the fickening draught, it will be more fale: this may generally be done by tickling the throat and fauces with an oiled feather, or fome other foft fubstance, which will not injure the parts. Tiffot in this cafe recommeds the oxymel of fquills, a table-fpoonful of which diluted with water, may be given every quarter of an hour, till the patient has taken five or fix dofes. Where that medicine is not at hand, a ftrong infusion of fage, camomile flowers, or carduus benedictus, fweetened with honey, or fome warm water, with the addition of a little falt, may, he fays, fupply its place. The Doctor does not intend that any of these things fhould be given in fuch quantity as to occafion vomiting. He thinks emetics in this fituation are not excedient.

We are by no means to discontinue our affiftance as foon as the patients discover fome tokens of life, fince they fometimes expire after thefe firft appearances of recovering. The warm and finulating applications are fluil to be continued, and fmall quantities of fome cordial l'quor ought frequently to be adminifered. Laftly, though the perfon should be manifeltly re-animated, there tometimes remain an opprefilion, a cough, and feverithnefs, which effectually conflitute a dileafe. In this cafe it will be neceffary to bleed the patient in the arm, and to caute him to drink plentifully.

of

OF NOXIOUS VAPOURS. 613

of barley-water, elder flower tea, or any other foft pectoral infufions.

Such perfons as have the misfortune to be deprived of the appearances of life, by a fall, a blow, fuffocation, or the like, must be treated nearly in the fame manner as those who have been for fome time under water. I once attended a patient who was fo ftunned by a fall from a horfe, that for above fix hours he fcarcely exhibited any figns of life; yet this man, by being bled, and proper methods taken to keep up the vital warmth, recovered, and in a few days was perfectly well. Dr. Alexander gives an inftance to the fame purpole, in the Edinburgh Phylical and Literary Effays, of a man who was to all appearance killed by a blow on the breaft, but recovered upon being immerfed for fome time in warm water. Thefe, and other inflances of a fimilar nature, which might be adduced, amount to a full proof of this fact, that many of those unhappy perfons who lose their lives by falls, blows and other accidents, might be faved by the ule of proper means duly perfifted in.

OF NOXIOUS VAPOURS.

AIR may be many ways rendered noxious, or even deftructive to animals. This may either happen from its vivifying principle being deftroyed, or from fubtle exhalations with which it is impregnated. Thus air that has paffed through burning fuel is neither capable of fupporting fire nor the life of animals. Hence the danger of fleeping in clofe chambers with coal fires. Some indeed fuppole the danger here proceeds from the fulphureous oil contained in the coal, which is fet at liberty and diffufed all over the chamber; while R r 3 others

614 OF NOXIOUS VAPOURS.

others imagine it is owing to the air of the room being charged with phlogifton. Be this as it may, it is a fituation carefully to be avoided. Indeed, it is dangerous to fleep in a fmall apartment with a fire of any kind. I lately faw four perfons who had been fuffocated by fleeping in an apartment where a fmall fire of coal had been left burning.

The vapour which exhales from wine, cyder, beer, or other liquors, in the ftate of fermentation, contains fomething poifonous, which kills in the fame manner as the vapour of coal. Hence there is always danger in going into cellars where a large quantity of thele liquors is in a ftate of fermentation, efpecially if they have been clofe fhut up for fome time. There have been many inftances of perfons ftruck dead on entering fuch places, and of others who have with difficulty efcaped.

When fubterraneous caves, that have been very long fhut, are opened, or when deep wells are cleaned, which have not been emptied for feveral years, the vapours arifing from them produce the fame effects as those mentioned above. For this reafon, no perfon ought to venture into a well, pit, cellar, or any place that is damp, and has been long fhut up, till the air has been fufficiently purified, by burning gunpowder in it. It is easy to know, as has been observed in a former part of this work, when the air of fuch places is unwholefome, by letting down a lighted candle, throwing in burning fuel, or the like. If these continue to burn, people may fafely venture in; but where they are fuddenly extinguifhed, no one ought to enter till the air has been first purified by fire.

The offenfive fmell of lamps and of candles, efpecially when their flames are extinguished, operate like other vapours, though with lefs violence, and

OF NOXIOUS VAPOURS. 615

and lefs fuddenly. There have however been inftances of people killed by the fumes of lamps which had been extinguished in a close chamber, and perfons of weak, delicate breafts generally find themfelves quickly opprefied in apartments illuminated with many candles.

Such as are fenfible of their danger in thefe fituations, and retreat feafonably from it, are generally relieved as foon as they get into the open air, or, if they have any remaining uneafinefs, a little water and vinegar, or lemonade, drank hor, affords them relief. But when they are fo far poifoned, as to have loft their feeling and underflanding, the following means muft be ufed for their recovery:

The patient fhould be exposed to a very pure, fresh, and open air; and volatile falts, or other ftimulating fubfrances, held to his nofe. He should next be bled in the arm, or if that does not fucceed, in the neck. His legs ought to be put into warm water, and well rubbed. As soon as he can swallow, fome lemonade, or water and vinegar, with the addition of a little nitre, may be given him.

Nor are fharp clyfters by any means to be neglected; thefe may be made, by adding to the common clyfter, fyrup of buckthorn and tincture of fenna, of each two ounces; or, in their flead, half an ounce of Venice turpentine diffolved in the yolk of an egg. Should thefe things not be at hand, two or three large fpoontiuls of common falt may be put into the clyfter. The fame means, if neceffary, which were recommended in the former part of this chapter, may be ufed to reftore the circulation, warmth, &cc.

Mr. Toffach, furgeon at Alloa, relates the cafe of a man fuffocated by the fteam of burning coal, whom he recovered by blowing his breath into the

Rr4

patient's

616 EFFECTS OF EXTREME COLD.

patient's mouth, bleeding him in the arm, and caufing him to be well rubbed and toffed about. And Dr. Frewen, of Suffex, mentions the cafe of a young man who was flupified by the fmoke of feacoal, but was recovered by being plunged into cold water, and afterwards laid in a warm bed.

The practice of plunging perfons fuffocated by noxious vapours, in cold water, would feem to be fupported by the common experiment of fuffocating dogs in the grotto del cani, and aftewards recovering them, by throwing them into the neighbouring lake.

EFFECTS OF EXTREME COLD.

WHEN cold is extremely fevere, and a perfon is exposed to it for a long time, it proves mortal, in confequence of its flopping the circulation in the extremities, and forcing too great a proportion of blood towards the brain; fo that the patient dies of a kind of apoplexy, preceded by great fleepinefs. The traveller, in this fituation, who finds himfelf begin to grow drowfy, fhould redouble his efforts to extricate himfelf from the imminent danger he is exposed to. This fleep, which he might confider as fome alleviation of his fufferings, would, if indulged, prove his laft.

Such violent effects of cold are happily not very common in this country; it frequently happens, however, that the hands or feet of travellers are fo benumbed or frozen, as to be in danger of a mortification, if proper means are not ufed to prevent it. The chief danger in this fituation arifes from the fudden application of heat. It is very common, when the hands or feet are pinched with cold, to hold them to the fire; yet reafon and obfervation fhew that this is a molt dangerous and imprudent practice,

Every

EFFECTS OF EXTREME COLD. 617

Every peafant knows, if frozen meat, fruits, or roots of any kind, be brought near the fire, or put into warm water, they will be deftroyed by rottennefs, or a kind of mortification, and that the only way to recover them, is to immerfe them for fome time in very cold water. The fame obfervation holds with regard to animals in this condition.

When the hands or feet are greatly benumbed with cold, they ought either to be immerfed in cold water, or rubbed with fnow, till they recover their natural warmth and fenfibility: after which, the perfon may be removed into an apartment a little warmer, and may drink fome cups of tea, or an infufion of elder-flowers fweetened with honey. Every perfon muft have obferved, when his hands were even but flightly affected with cold, that the beft way to warm them was by wafning them in cold water, and continuing to rub them well tor fome time.

When a perfon has been to long exposed to the cold, that all appearances of life are gone, it will be neceffary to rub him all over with fnow or cold water; or, what will answer better, if it can be obtained, to immerse him in a bath of the very coldeft water. There is the greatest encouragement to perfift in the use of these means, as we are affured that perfons who had remained in the fnow; or had been exposed to the freezing air during five or fix fucceffive days, and who had discovered no marks of life for feveral hours, have nevertheless been revived.

I have always thought, that the whitloes, kibes, chilblains, and other inflammations of the extremities, which are fo common among the pealants in the cold fealon, were chiefly occalioned by their fudden transitions from cold to heat. After they have been exposed to an extreme degree of cold, they

618 EFFECTS OF EXTREME HEAT.

they immediately apply their hands and feet to the fire, or, if they have occafion, plunge them into warm water, by which means, if a mortification does not happen, an inflammation feldom fails to enfue. Moft of the ill confequences from this quarter might be eafily avoided, by only observing the precautions mentioned above.

EFFECTS OF EXTREME HEAT.

THE effects of extreme heat, though not fo common in this country, are no lefs fatal, and much more fudden than those of cold. In hot countries people frequently drop down dead in the fireets, exhausted with heat and fatigue. In this cafe, if any warm cordial can be poured into the mouth it ought to be done. If this cannot be effected, they may be thrown up in form of a clyster. Volatile fpirits, and other things of a flimulating nature, may be applied to the fkin, which should be well rubbed with coarfe-cloaths, whipped with nettles, or other flimulating things. Some of the antient physicians are faid to have reftored to life perfons apparently dead, by beating them with rods.

CHAP. LIV.

OF FAINTING FITS, AND OTHER CASES WHICH REQUIRE IMMEDIATE ASSISTANCE.

S T R O N G and healthy perfons, who abound with blood, are often feized with fudden fainting fits, after violent exercife, drinking freely of warm warm or ftrong liquors, exposure to great heat, intense application to ftudy, or the like.

In fuch cafes the patient fhould be made to fmell to fome vinegar. His temples, forehead, and wrifts, ought at the fame time to be bathed with vinegar mixed with an equal quantity of warm water; and two or three fpoonfuls of vinegar, with four or five times as much water, may, if he can fwallow, be poured into his mouth.

If the fainting proves obfinate, or degenerates into a *fyncope*, that is an abolition of feeling and understanding, the patient must be bled. After the bleeding, a clyster will be proper, and then he should be kept easy and quiet, only giving him every half hour a cup or two of an infusion of any mild vegetable, with the addition of a little sugar and vinegar.

When fwoonings, which arife from this caufe, occur frequently in the fame perfon, he fhould, in order to efcape them, confine himfelf to a light diet, confifting chiefly of bread, fruits, and other vegetables. His drink ought to be water or fmall beer, and he fhould fleep but moderately, and take much exercise.

But fainting fits proceed much oftener from a defect than an excels of blood. Hence they are very ready to happen after great evacuations of any kind, obflinate watching, want of appetite, or fuch like. In these an almost directly opposite course to that mentioned above must be purfued.

The patient fhould be laid in bed, with his head low, and being covered, fhould have his legs, thighs, arms, and his whole body rubbed ftrongly with hot flannels. Hungary water, volatile falts, or ftrong fmelling herbs, as rue, mint, or rofemary, may be held to his nole. His mouth may be wet with a little rum or brandy; and, if he can fwallow, fome hot wine, mixed with fugar and cinnamon.

620 FAINTING FITS, Gc. WHICH REQUIRE

cinnamon, which is an excellent cordial, may be poured into his mouth. A comprefs of flannel dipt in hot wine or brandy muft be applied to the pit of his flomach, and warm bricks, or bottles filled with hot water, laid to his feet.

As foon as the patient is recovered a little, he fhould take fome ftrong foup or broth, or a little bread or bifcuit fooked in hot-friced wine. To prevent the return of the fits, he ought to take often, but in fmall quantities, fome light yet ftrengthening nourifhment, as panado imade with foup inftead of water, new laid eggs lightly poached, chocolate, light roaft meats, jellies, and fuch hke.

Those fainting fits, which are the effect of bleeding, or of the violent operation of purges, belong to this clais. Such as happen after artificial bleeding are feldom dangerous, generally terminating as loon as the patient is laid upon the bed; indeed perfons subject to this kind should always be bled lying, in order to prevent it. Should the fainting however continue longer than usual, volatile spirits may be held to the nose, and rubbed on the temples, &c.

When fainting is the effect of too ftrong or arrid purges or vomits, the patient mult be treated in all refpects as if he had taken poifon. He fhould be made to drink plentifully of milk, warm water, and oil, barley-water, or fuch like; emollient clyfters will likewife be proper, and the patient's ftrength fhould afterwards be recruited, by giving him generous cordials, and anodyne medicines.

Faintings are often occafioned by indigeftion. This may either proceed from the quantity or quality of the food. When the former of thefe is the caufe, the cure will be beft performed by vomiting, which may be promoted by caufing the patient to drink a weak infufion of camomile-flowers, *carduus*

IMMEDIATE ASSISTANCE.

carduus benedictus, or the like. When the diforder proceeds from the nature of the food, the patient, as in the cafe of weaknefs, muft be revived by ftrong fmells, &c. after which he fhould be made to fwallow a large quantity of light warm fluid, which may ferve to drown, as it were, the offending matter, to foften its acrimony, and either to effect a ditcharge of it by vomiting, or force it down into the inteffines.

Even difagreeable fmells will fometimes occafion fwoonings, efpecially in people of weak nerves. When this happens, the patient fhould be carried into the open air, have ftimulating things held to his nofe, and thofe fubftances which are difagreeable to him ought immediately to be removed. But we have already taken notice of fwoonings which arife from nervous diforders, and fhall therefore fay no more upon that head.

Fainting fits often happen in the progrefs of difeafes. In the beginning of putrid difeafes they generally denote an oppreffion at the ftomach, or a mals of corrupted humours, and they ceale after evacuations either by yomit or ftool. When they occur at the beginning of malignant fevers, they indicate great danger. In each of these cases, . vinegar used both externally and internally is the beft remedy during the paroxyfm, and plenty of lemon juice and water after it. Swoonings which happen in difeafes accompanied with great evacuations, must be treated like those which are owing to weakness, and the evacuations ought to be reftrained. When they happen towards the end of a violent fit of an intermitting fever, or at that of each exacerbation of a continual fever, the patient must be supported by small draughts of wine and water.

Delicate and hyfteric women are very liable to fwooning or fainting fits after delivery. These

might

621

622 OF FAINTING FITS, &c.

might be often prevented by generous cordials, and the admiffion of fresh air. When they are occafioned by exceffive flooding, it ought by all means to be reftrained. They are generally the effect of mere weaknels or exhauftion. Dr. Engleman relates the cafe of a woman " in childbed, who, " after being happily delivered, fuddenly fainted, " and lay upwards of a quarter of an hour appa-" rently dead. A phyfician was fent for ; her own " maid, in the mean while, being out of patience " at his delay, attempted to affift her herfelf, and " extending herfelf upon her miftrefs, applied her " mouth to her's, blew in as much breath as fhe " poffibly could, and in a very fhort time the ex-" hausted woman awaked as out of a profound " fleep; when proper things being given her, fhe " foon recovered.

"The maid being afked how fhe came to think of this expedient, faid fhe had feen it practifed at Altenburgh, by midwives, upon children with the happieft effect."

We mention this cafe chiefly that other midwives may be induced to follow fo laudable an example. Many children are born without any figns of life, and others expire foon after the birth, who might, without all doubt, by proper care, be reflored to life.

From whatever caufe fainting fits proceed, frefh air is always of the greateft importance to the patient. By not attending to this circumftance, people often kill their friends while they are endeavouring to fave them. Alarmed at the patient's fituation, they call in a crowd of people to his affiftance, or perhaps to witnefs his exit, whofe breathing exhaults the air, and increafes the danger. There is not the leaft doubt but this practice, which is very common among the lower fort of people, often proves fatal, efpecially to the delicate,

OF INTOXICATION.

licate, and fuch perfons as fall into fainting fits from mere exhaultion, or the violence of fome difeafe. No more perfons ought ever to be admitted into the room where a patient lies in a fwoon than are abiolutely neceffary for his affiftance, and the windows of the apartment fhould always be opened, at leaft as far as to admit a ftream of fresh air.

Perfons fubject to frequent fwoonings, or fainting fits, fhould neglect no means to remove the caufe of them, as their confequences are always injurious to the conflictution. Every fainting fit leaves the perfon in dejection and weaknefs; the fecretions are thereby fulpended, the humours difpoled to ftagnation, coagulations and obfructions are formed, and, if the motion of the blood be totally intercepted, or very confiderably checked, potypufes are tometimes formed in the heart or larger vefiels. The only kind of fwoonings not to be dreaded are those which fometimes mark the crifis in fevers; yet even thefe ought, as foon as possible, to be removed.

OF INTOXICATION.

THE effects of intoxication are often fatal. / No kind of poifon kills more certainly than an overdole of ardent fpirits. Sometimes, by deftroying the nervous energy, they put an end to life at once; but in general their effects are more flow, and in many refpects fimilar to thole of opium. Other kinds of intoxicating liquors may prove fatal when taken to excels, as well as ardent fpirits; but they may generally be difcharged by vomiting, which ought always to be excited when the flomach is overcharged with liquor.

More of those unhappy perfors, who die intoxicated, lose their lives from an inability to conduct them-

623

.624 OF INTOXICATION.

themselves, than from the destructive quality of the liquor. Unable to walk, they tumble down, and lie in fome awkward pofture, which obstructs the circulation or breathing, and often continue in this fituation till they die. No drunken perfon fhould be left by himfelf, till his clothes have been loofened, and his body laid in fuch a pofture as is most favourable for continuing the vital motions, difcharging the contents of the ftomach, &c. The best posture for discharging the contents of the ftomach is to lay the perfon upon his belly; when afleep he may be laid on his fide, with his head a little raifed, and particular care must be taken that his neck be no way bent, twifted, or have any thing too tight about it.

The exceffive degree of thrift occafioned by drinking ftrong liquors, often induces people to quench it by taking what is hurtful. I have known fatal confequences even from drinking freely of milk after a debauch of wine or four punch; thefe acid liquors, together with the heat of the ftomach, having coagulated the milk in fuch a manner that it could never be digefted. The fafeft drink after a debauch is water with a toaft, tea, infufions of balm, fage, barley-water, and fuch like. If the perfon wants to vomit, he may drink a weak infufion of camomile-flowers, or lukewarm water and oil; but in this condition vomiting may generally be excited by only tickling the throat with the finger or a feather.

Inftead of giving a detail of all the different fymptoms of intoxication which indicate danger, and proposing a general plan of treatment for perfons in this fituation, I shall briefly relate the hiftory of a cafe which lately fell under my own obfervation, wherein most of those fymptoms usually reckoned dangerous concurred, and where the treatment was fuccessful.

A young

A young man, about fifteen years of age, had, for a hire, drank ten glaffes of ftrong brandy. He foon after fell faft afleep, and continued in that fituation for feveral hours, till at length his uneafy manner of breathing, the coldnefs of the extremities, and other threatening fymptoms, alarmed his friends, and made them fend for me. I found him fill fleeping, his countenance ghaftly, and his fkin covered with a cold clammy fweat. Almost the only figns of life remaining were, a deep laborious breathing, and a convultive motion or agitation of his bowels.

I tried to roufe him, but in vain, by pinching, fhaking, applying volatile fpirits, and other ftimulating things to his nofe, &c. A few ounces of blood were likewife taken from his arm, and a mixture of vinegar and water was poured into his mouth; but, as he could not fwallow, very little of this got into the ftomach. None of these things having the leaft effect, and the danger feeming to increafe, I ordered his legs to be put into warm water, and a sharp clyster to be immediately administered. This gave him a ftool, and was the first thing that relieved him. It was afterwards repeated with the fame happy effect, and feemed to be the chief caufe of his recovery. He then began to thew fome figns of life, took drink when it was offered him, and came gradually to his fenfes. He conti-nued, however, for feveral days weak and feverifi, and complained much of a forenefs in his bowels, which gradually went off, by means of a flender diet, and cool mucilaginous liquors.

This young man would probably have been fuffered to die, without any affiltance being called, had not a neighbour, a few days before, who had been advifed to drink a bottle of fpirits to cure him of an ague, expired under very fimilar circumftances.

625

OF SUFFOCATION AND STRANGLING.

THESE may fometimes proceed from an infarction of the lungs, produced by vifcid clammy humours, or a fpafmodic affection of the nerves of that organ. Perfons who feed großly, and abound in rich blood, are very liable to fuffocating fits from the former of thefe caufes. Such ought, as foon as they are attacked, to be bled, to receive an emollient clyfter, and to take frequently a cup of diluting liquor with a little nitre in it. They fhould likewife receive the fteams of hot vinegar into their lungs by breathing.

Nervous and afthmatic perfons are most fubject to fpafmodic affections of the lungs. In this cafe the patient's legs should be immerfed in warm water, and the steams of vinegar applied as above. Warm diluting liquors should likewife be drank; to a cup of which a tea-spoonful of the parygoric elixir may occasionally be added. Burnt paper, feathers, or leather, may be held to the patient's nose, and fresh air should be freely admitted to him.

Infants are often fuffocated by the careleffnefs or inattention of their nurfes*. An infant when in bed fhould always be laid fo, that it cannot tumble down with its head under the bed-clothes; and when in a cradle, its face ought never to be covered. A fmall degree of attention to thefe two

* Thefe accidents are not always the effects of careleffnefs. I have known an infant over-laid by its mother being feized in the night with an hyfteric fit. This ought to ferve as a caution againft employing hyfteric women as nurfes; and fhould likewife teach fuch women never to lay an infant in the fame bed with themfelves, but in a fmall adjacent one.

fimple

SUFFOCATION AND STRANGLING. 627

fimple rules would fave the lives of many infants, and prevent others from being rendered weak and fickly all their days by the injuries done to their longs.

Inftead of laying down a plan for the recovery of infants who are fuffocated, or overlaid, as it is termed by their nurfes, I fhall give the hiftory of a cafe related by Monfieur Janin, of the Royal College of Surgery at Paris, as it was attended with fuccefs, and contains almost every thing that can be be done on fuch occafions.

A nurse having had the misfortune to over-lay a child, he was called in, and found the infant without any figns of life; no pulfation in the arteries, no refpiration, the face livid, the eyes open, dull, and tarnished, the nose full of snivel, the mouth gaping, in thort it was almost cold. Whilst fome linen clothes and a parcel of alhes were warming, he had the boy unswathed, and laid him in a warm bed, and on the right fide. He then was rubbed all over with fine linen, for fear of fretting his tender and delicate skin. As soon as the ashes had received their due degree of heat, Mr. Janin buried him in them, except the face, placed him on the fide oppofite to that on which he had been at first laid, and covered him with a blanket. He had a bottle of eau de luce in his pocket, which he prefented to his nofe from time to time; and between whiles fome puffs of tobacco were blown up his noftrils: to thefe fucceeded the blowing into his mouth, and fqueezing tight his nofe. Animal heat began thus to be excited gradually; the pulfations of the temporal artery were foon felt, the breathing became more frequent and free, and the eyes closed and opened alternately. At length the child fetched fome cries expressive of his want of the breast, which being applied to his mouth, he catched at it with avidity, and fucked as if nothing had hap-Sí2 pened

628 SUFFOCATION AND STRANGLING.

pened to him. Though the pullations of the arteries were by this time very well re-eftablifhed, and it was hot weather, yet Mr. Janin thought it advifable to leave his little patient three quarters of an hour longer under the afhes. He was afterwards taken out, cleaned and dreffed as ufual; to which a gentle fleep fucceeded, and he continued perfectly well.

Mr. Janin mentions likewise an example of a young man who had hanged himfelf through despair, to whom he administered help as effectually as in the preceding cafe.

Mr. Glover, furgeon in Doctors Commons, London, relates the case of a perfon who was rethored to life after twenty-nine minutes hanging, and continued in good health for many years after.

The principal means used to reftore this man to life were, opening the temporal artery and the external jugular; rubbing the back, mouth, and neck, with a quantity of volatile fpirits and oil; administering the tobacco clyster by means of lighted pipes, and ftrong frictions of the legs and arms. This course had been continued for about four hours, when an incifion was made into the windpipe, and air blown ftrongly through a canula into the lungs. About twenty minutes after this, the blood at the artery began to run down the face, and a flow pulfe was just preceptible at the wrift. The frictions were continued for fome time longer; his pulfe became more frequent, and his mouth and nofe being irritated with spirit of fal ammoniac, he opened his eyes. Warm cordials were then administered to him, and in two days he was fo well as to be able to walk eight miles.

These cafes are fufficient to shew what may be done for the recovery of those unhappy perfons who strangle themselves in a fit of despair.

[629]

OF PERSONS WHO EXPIRE IN CONVUL-SION FITS.

CONVULSION fits often conflitute the laft fcene of acute or chronic diforders. When this is the cafe, there can remain but fmall hopes of the patient's recovery after expiring in a fit. But when a perfon who appears to be in perfect health, is fuddealy feized with a convultion fit, and feems to expire, fome attempts ought always to be made to reftore him to life. Infants are most liable to convultions, and are often carried off very fuddenly by one or more fits about the time of teething. There are many well authenticated accounts of infants having been reftored to life, after they had to all appearance expired in convultions; but we fhall only relate the following inftance mentioned by Dr. Johnfon in his pamphlet on the prasticability of recovering perfons wiftbly dead.

In the parish of St. Clemens in Colchester, a child of fix months old, lying upon its mother's lap, having had the breaft, was feized with a ftrong convultion fit, which lafted fo long, and ended with fo total a privation of motion in the body, lungs, and pulle, that it was deemed abfolutely dead. It was accordingly ftripped, laid out, the paffing-bell ordered to be tolled, and a coffin to be made; but a neighbouring gentlewoman who used to admire the child, hearing of its fudden death, haftened to the house, and upon examining the child found it not cold, its joints limber, and fancied that a glass she held to its mouth and nose was a little damped with the breath; upon which fhe took the child in her lap, fat down before the fire, rubbed it, and kept it in gentle agitation. In a quarter of an hour fhe felt the heart begin to Sf 2 bear

630

beat faintly; the then put a little of the mother's milk into its mouth, continued to rub its palms and foles, found the child begin to move, and the milk was swallowed; and in another quarter of an hour the had the fatisfaction of reftoring to its difconfolate mother the babe quite recovered, eager to lay hold of the breaft, and able to fuck again. The child throve, had no more fits, is grown up, and at prefent alive.

Thefe means, which are certainly in the power of every person, were sufficient to restore to life an infant to all appearance dead, and who, in all probability, but for the use of these simple endeavours, would have remained fo. There are however many other things which might be done in cafe the above fhould not fucceed; as rubbing the body with ftrong fpirits, covering it with warm ashes or falt, blowing air into the lungs, throwing up warm ftimulating clyfters or the Imoak of tobacco, into the inteffines. and fuch like.

When children are dead born, or expire foon after the birth, the fame means ought to be used for their recovery, as if they had expired in circumstances fimilar to those mentioned above.

These directions may likewise be extended to adults, attention being always paid to the age and other circumstances of the patient.

The foregoing cafes and observations afford fufficient proof of the fuccess which may attend the endeavours of perfons totally ignorant of medicine, in affifting those who are fuddenly deprived of life by any accident or difease. Many facts of a fimilar nature might be adduced, were it neceffary; but thefe, it is hoped, will be fufficient to call up the attention of the public, and to excite the humane and benevolent to exert their utmost endeavours for the prefervation of their fellow-men.

The

IN CONVULSION FITS.

The fociety for the recovery of drowned perfons, inflituted at Amsterdam in the year 1767, had the Yatisfaction to find that no fewer than 150 perfons in the space of four years had been faved by the means pointed out by them, many of whom owed their prefervation to peafants and people of no medical knowledge. But the means used with fo much efficacy in recovering drowned perfons are, with equal fuccefs, applicable to a number of cafes where the powers of life feem in reality to be only fuspended, and to remain capable of renewing all their functions, on being put into motion again. It is flocking to reflect, that for want of this confideration many perfons have been committed to the grave in whom the principles of life might have been revived.

The cafes wherein fuch endeavours are most likely to be attended with fuccefs, are all those called fudden deaths from an invisible cause, as apoplexies, hysterics, faintings, and many other diforders wherein perfons in a moment fink down and expire. The various cafualties in which they may be tried are, fuffocations, from the fulphureous damps of mines, coal-pits, &cc. the unwholessome air of long unopened wells or caverns; the noxious vapours arising from fermenting liquors; the steams of burning charcoal; fulphureous mineral acids; arfenical effluvia, &cc.

The various accidents of drowning, ftrangling, and apparent deaths, by blows, falls, hunger, cold, &c. likewife furnifh opportunities of trying fuch endeavours. Those perhaps who to appearance are killed by lightning, or by any violent agitation of the paffions, as fear, joy, furprife, and fuch like, might alfo be frequently recovered by the use of proper means, as blowing ftrongly into their lungs, &c.

Sf4

The

631

The means to be used for the recovery of perfons fuddenly deprived of life are nearly the fame in all cafes; they are practicable by every one who happens to be prefent at the accident, and require no great expence, and lefs skill. The great aim is to reftore the warmth and vital motions. This may in general be attempted by means of heat, frictions, bleeding, blowing air into the lungs, administering clyfters and generous cordials. These must be varied according to circumftances. Common fenfe, and the fituation of the patient, will fuggest the proper manner of conducting them. Above all we would recommend perseverance. People ought never to despair on account of discouraging circumstances, or to leave off their endeavours as long as there is the leaft hope of fuccefs. Where much good and no hurt can be done, no one ought to grudge his labour.

It where greatly to be withed, that an infitution, fimilar to that of Amiterdam, was established, upon a more extensive plan, in Great Britain; and that a reward was allowed to every one who should be inftrumental in restoring to life a person seemingly dead*. Men will do much for fame, but still more for money. Should no profit, however, be annexed to those benevolent offices, the heart-

* The Author is happy to obferve, that, fince the first publieation of this work, feveral focieties have been inflituted in Britain with the fame benevolent intention as that of Amsterdam, and that their endeavours have proved no lefs fuccelsful. He is likewife happy to obferve, that premiums have been awarded to thofe who have been active in their endeavours to reflore to life perfons who had been drowned, or fuddenly deprived of life by any accident. How much is this fuperior to the fuperfititious inflitution, which allows any man a premium who brings a dead perfon out of the water, fo that he may receive Christian burial: but allows nothing to the perfon who brings him out alive, or who recovers him after he has been to all appearance dead.

632

felt

ON COLD BATHING, &c.

felt pleafure which a good man muft enjoy, on reflecting that he has been the happy inftrument of faving one of his fellow-creatures from an untimely grave, is itfelf a fufficient reward.

CHAP. LV.

CAUTIONS CONCERNING COLD BATHING, AND DRINKING THE MINERAL WATERS.

A S it is now failionable for perfons of all ranks to plunge into the fea, and drink the mineral waters, I was defirous of rendering this work full more extensively useful, by the addition of fome practical remarks on these active and useful medicines. Finding it impossible to bring these obfervations within fo narrow a compals as not to fwell the book, already too large, into an enormous fize, I refolved to confine myself to a few hints or cautions; which may be of fervice to perfons who bathe, or drink the mineral waters, without being able to put themselves under the care of a physician.

No part of the practice of medicine is of greater importance, or merits more the attention of the phylician, as many lives are loft, and numbers ruin their health, by cold bathing, and an imprudent use of the mineral waters. On fome future occasion I may probably refume this fubject, as I know not any work that contains a fufficient number of practical observations to regulate the patient's conduct in the use of these active and important medicines.

We

We have indeed many books on the mineral waters. and fome of them are written with much ingenuity; but they are chiefly employed in afcertaining the contents of the waters by chymical analysis. This no doubt has its use, but it is by no means of such importance as fome may imagine. A man may know the chymical analyfis of all the articles in the materia medica, without being able properly to apply any one of them in the cure of difeafes. One page of practical observations is worth a whole volume of chymical analyfis. But where are fuch obfervations to be met with? Few phylicians are in a fituation to make them, and fewer still are qualified for fuch a tafk. It can only be accomplished by practitioners who refide at the fountains, and who, poffeffing minds fuperior to local prejudices, are capable of diftinguishing difeases with accuracy, and of forming a found judgment respecting the genuine effects of medicines.

Without a proper diferimination with regard to the difeafe and the confliction of the patient, the most powerful medicine is more likely to do harm than good. Every one knows that the fame physician who, by cold bathing, cured Augustus, by an imprudent use of the fame medicine killed his heir. This induced the Roman fenate to make laws for regulating the baths, and preventing the numerous evils which arole from an imprudent and promiseus use of those elegant and fashionable pieces of luxury. But as no fuch laws exist in this country, every one does that which is right in bis own eyes, and of course many must do wrong.

People are apt to imagine that the fimple element of water can do no hurt, and that they may plunge into it at any time with impunity. In this, however, they are much miftaken. I have known apoplexies occasioned by going into the cold bath, favers

634

DRINKING MINERAL WATERS. 635

fevers excited by ftaying too long in it, and other maladies fo much aggravated by its continued ufe, that they could never be wholly eradicated. Nor are examples wanting, either in ancient or modern times, of the baneful confequences which have arifen allo from an injudicious application of the warm bath; but as warm baths are not fo common in this country, and are feldom ufed but under the direction of a phyfician, I fhall not enlarge on that part of the fubject.

Immersion in cold water is a custom which lays claim to the most remote antiquity: Indeed it must have been coëval with man himself. The neceffity of water for the purpose of cleanlines, and the pleasure ariting from its application to the body in hot countries, must very early have recommended it to the human species. Even the example of other animals was sufficient to give the hint to man. By instinct many of them are led to apply cold water in this manner; and some, when deprived of its use, have been known to languish, and even to die. But whether the practice of cold bathing arose from necessity, reasoning, or imitation, is an enquiry of no importance; our business is to point out the advantages which may be derived from it, and to guard people against an improper use of it.

The cold bath recommends itfelf in a variety of cafes, and is peculiarly beneficial to the inhabitants of populous cities, who indulge in idlenefs, and lead fedentary lives. In perfons of this defcription the action of the folids is always too weak, which induces a languid circulation, a crude indigefted mals of humours, and obfructions in the capillary veffels and glandular fyftem. Cold water, from its gravity as well as its tonic power, is well calculated either to obviate or remove thefe fymptoms. It accelerates the motion of the blood, promotes

636 ON COLD BATHING, AND

promotes the different fecretions, and gives permanent vigour to the folids. But all these important purposes will be more effentially answered by the application of *falt-water*. This ought not only to be preferred on account of its superior gravity, but likewise for its greater power of stimulating the skin, which promotes the perspiration, and prevents the patient from catching cold.

It is neceffary, however, to obferve, that cold bathing is more likely to prevent, than to remove obfiructions of the glandular or lymphatic fyftem. Indeed, when these have arrived at a certain pitch, they are not to be removed by any means. In this cafe the cold bath will only aggravate the fymptoms, and hurry the unhappy patient into an untimely grave. It is therefore of the utmost importance, previous to the patient's entering upon the use of the cold bath, to determine whether or not he labours under any obfinate obfiructions of the lungs or other *vifcera*; and where this is the cafe, cold bathing ought ftrictly to be prohibited *.

In what is called a plethoric ftate, or too great a fulnefs of the body, it is likewife dangerous to use the cold bath, without due preparation. In this cafe there is great danger of burifting a bloodveffel, or occasioning an inflammation of the brain, or fome of the *viscera*. This precaution is the

* The late celebrated Dr. Smollet has indeed faid, that if he were perfuaded he had an ulcer in the lungs he would jump into the cold bath; but here the Doctor evidently fhews more courage than differentian; and that he was more a man of wit than a phyfician, every one will allow. A nervous afthma, or an atrophy, may be miftaken for a pulmonary confumption; yet, in the two former, the cold bath proves often beneficial; though I never knew if fo in the latter. Indeed, all the phthifical patients I ever faw, who had tried the cold bath, were evidently hurt by it.

more

DRINKING MINERAL WATERS. 637

more neceffary to citizens, as most of them live full, and are of a grofs habit. Yet, what is very remarkable, these people refort in crowds every feafon to the scafide, and plunge in the water without the least confideration. No doubt they often escape with impunity; but does this give a fanction to the practice? Perfors of this description ought by no means to bathe, unless the body has been previously prepared by fuitable evacuations.

Another class of patients, who ftand peculiarly in need of the bracing qualities of cold water, is the nervous. This includes a great number of the male, and almost all the female inhabitants of great cities. Yet even those perfons ought to be cautious in using the cold bath. Nervous people have often weak bowels, and may, as well as others, be fubject to congestions and obstructions of the viscera; and in this cafe they will not be able to bear the effects of the cold water. For them, therefore, and indeed for all delicate people, the beft plan would be to accustom themfelves to it by the most pleafing and gentle degrees. They ought to begin with the temperate bath, and gradually use it cooler, till at length the coldest proves quite agreeable. Nature revolts against all great transitions: and those who do violence to her dictates, have often cause to repent of their temerity.

Wherever cold bathing is practifed, there ought likewife to be tepid baths for the purpole mentioned above. Indeed it is the practice of fome countries to throw cold water over the patient as foon as he comes out of the warm bath, but though this may not injure a Rufian peafant, we dare not recommend it to the inhabitants of this country. The ancient Greeks and Romans, we are told, when covered with fweat and duft, used to plunge into rivers, without receiving the fmalleft injury. Though Though they might often escape danger from this imprudent conduct, yet it was certainly contrary to found reason. I have known many robust men throw away their lives by such an attempt. We would not however advise patients to go into the cold water when the body is chilly; as much exercise, at least, ought to be taken, as may excite a gentle glow all over the body, but by no means fo as to overheat it.

To young people, and particularly to children, cold bathing is of the last importance. Their lax fibres render its tonic powers peculiarly proper. It promotes their growth, increases their ftrength *, and prevents a variety of difeafes incident to childhood. Were infants early accustomed to the cold bath, it would feldom difagree with them; and we should see fewer instances of the scrofula, rickets, and other difeafes, which prove fatal to many, and make others miferable for life. Sometimes, indeed, these diforders render infants incapable of bearing the shock of cold water; but this is owing to their not having been early and regularly accustomed to it. It is however neceffary here to caution young men against too frequent bathing; as I have known many fatal confequences refult from the daily practice of plunging into rivers, and continuing there too long.

The most proper time of the day for using the cold bath is no doubt the morning, or at least before dinner; and the best mode, that of quick immersion. As cold bathing has a constant tendency

* The celebrated phylician Galen fays, that immerfion in cold water is fit only for the young of lions and bears; and recommends warm bathing, as conducive to the growth and fitength of infants. How egregioufly do the greateft men err, whenever they lofe fight of facts, and fublitute reafoning in phyfic in place of obfervation and experience !

638

DRINKING MINERAL WATERS. 639

to propel the blood and other humours towards the head, it ought to be a rule always to wet that part as foon as poffible. By due attention to this circumftance, there is reafon to believe, that violent head-achs, and other complaints, which frequently proceed from cold bathing, might be often prevented.

The cold bath, when too long continued in, not only occasions an exceffive flux of humours towards the head, but chills the blood, cramps the muscles, relaxes the nerves, and wholly defeats the intention of bathing. Hence, by not adverting to this circumstance, expert fwimmers are often injured, and fometimes even lose their lives. All the beneficial purpoles of cold bathing are answered by one immersion at a time; and the patient ought to be rubbed dry the moment he comes out of the water, and should continue to take exercise for some time after.

When cold bathing occasions chilnefs, loss of appetite, liftlefsnefs, pain of the breaft or bowels, a profitration of strength, or violent head-achs, it ought to be discontinued.

Though these hints are by no means intended to point out all the cases where cold bathing may be hurtful, nor to illustrate its extensive utility as a medicine; yet it is hoped they may serve to guard people against some of those errors into which, from mere inattention, they are apt to fall, and thereby not only endanger their own lives, but bring an excellent medicine into diffepute.

Of drinking the Mineral Waters.

THE internal use of water, as a medicine, is no lefs an object of the physician's attention than the external. Pure elementary water is indeed the most inoffensive

643 ON COLD BATHING, AND

inoffenfive of all liquors, and conflitutes a principal part of the food of every animal. But this element is often impregnated with fubftances of a very active and penetrating nature; and of fuch an infidious quality, that, while they promote certain fecretions, and even alleviate fome difagreeable fymptoms, they weaken the powers of life, undermine the conflicution, and lay the foundation of worfe difeafes than those which they were employed to remove. Of this every practitioner must have feen inftances; and phyficians of eminence have more than once declared that they have known more difeafes occasioned than removed by the use of mineral waters. This doubtlefs has proceeded from the abuse of these powerful medicines, which evinces the neceffity of using them with caution.

By examining the contents of the mineral waters which are most used in this country, we shall be enabled to form an idea of the danger which may arise from an improper application of them either externally or internally; though it is to the latter of these that the present observations are chiefly confined.

The waters moft in use for medical purposes in Britain, are those impregnated with falts, fulphur, iron, and mephitic air, either separately, or varioully combined. Of these the most powerful is the faline fulphureous water of Harrowgate, of which I have had more occasion to observe the pernicious confequences, when improperly used, than of any other. To this, therefore, the following remarks will more immediately relate, though they will be found applicable to all th- purging waters in the kingdom which are strong enough to merit attention *.

* The greateft class of mineral waters in this country is the chalybeate. In many parts of Britain these are to be found in alanoft

The

DRINKING MINERAL WATERS. 641

The errors which fo often defeat the intention of drinking the purgative mineral waters, and which fo frequently prove injurious to the patient, proceed from the manner of using them, the quantity taken, the regimen purfued, or using them in cafes where they are not proper.

A very hurtful prejudice ftill prevails in this country, that all difacts muft be cured by medicines taken into the ftomach, and that the more violently these medicines operate, they are the more likely to have the defired effect. This opinion has proved fatal to thousands, and will, in all probability, deftroy many more before it can be wholly eradicated. Purging is often useful in acute diffects, and in chronical cafes may pave the way for the operation of other medicines; but it will feldom perform a cure; and by exhausting the ftrength of the patient, will often leave him in a worse condition than it found him. That this is frequently the cafe with regard to the more active mineral waters, every perfon conversant in these matters will readily allow.

Strong flimulants applied to the flomach and bowels for a length of time, mult tend to weaken and deftroy their energy; and what flimulants are more active than falt and fulphur, efpecially when thefe fubftances are intimately combined, and carried through the fyftem by the penetrating me-

almost every field; but those childs in use, for medical purposes, are the purging chalybeates, as the waters of Scarborough, Cheltenham, Thorp Arch, Nevil Holt, &c. Of those which de not purge, the waters of Tunbridge fland in the highest repute. The Saline purging waters; as those of Acton, Epfom, Kilburn, &c. are also in very general efteem; but the fountains mold frequented by the fick in this country, are those to which the minerals impart a certain degree of heat, as Bath, Briftol; Buxton, &c.

dium

642 ON COLD BATHING, AND

dium of water? Those bowels must be firong indeed, which can withstand the daily operation of fuch active principles for months together, and not be injured. This however is the plan pursued by most of those who drink the purging mineral waters, and whose circumstances will permit them to continue long enough at those fashionable places of refort.

Many people imagine that every thing depends on the quantity of water taken, and that the more they drink they will the fooner get well. This is an egregious error; for, while the unhappy patient thinks he is by this means eradicating his diforder, he is often in fact undermining the powers of life, and ruining his conftitution. Indeed nothing can do this fo effectually as weakening the powers of digeftion by the improper application of ftrong ftimulants. The very effence of health depends on the digeftive organs performing their due functions, and the most tedious maladies are all connected with indigeftion.

Drinking the water in too great quantity, not only injures the bowels and occafions indigeftion, but generally defeats the intention for which it is taken. The difeates for the cure of which mineral waters are chiefly celebrated, are moftly of the chronic kind; and it is well known that fuch difeafes can only be cured by the flow operation of alteratives, or fuch medicines as act by inducing a gradual change in the habit. This requires length of time, and never can be effected by medicines which run off by flool, and operate chiefly on the first paffages.

Those who wish for the cure of any obstinate malady from the mineral waters, ought to take them in fuch a manner as hardly to produce any effect whatever on the bowels. With this view a half-

DRINKING MINERAL WATERS. 648

half-pint glafs may be drank at bed-time *, and the fame quantity an hour before breakfaft, dinner, and fupper. The dofe, however, muft vary according to circumftances. Even the quantity mentioned above will purge fome perfons, while others will drink twice as much without being in the leaft moved by it. Its operation on the bowels is the only ftandard for uling the water as an alterative. No more ought to be taken than barely to move the body; nor is it always neceffary to carry it this length, provided the water goes off by the other emunctories, and does not occafion a chilnefs, of flatulency in the ftomach or bowels. When the water is intended to purge, the quantity meationed above may be all taken before breakfaft.

I would not only caution patients who drink the purging mineral waters over night to avoid heavy fuppers, but alfo from eating heavy meals at any time. The ftimulus of water, impregnated with falts, feems to create a falfe appetite. I have feen a delicate perfon, after drinking the Harrowgate waters of a morning, eat a breakfaft fufficient to have ferved two ploughmen, devour a plentiful dinner of flefh and fifh, and, to crown all, eat fuch a fupper as might have fatisfied a hungry porter. All this, indeed, the ftomach feemed to crave; but this craving had better remain not quite fatisfied, than that the ftomach fhould be loaded with what exceeds its powers. To ftarve patients was never my plan; but I am clearly of opinion, that, in the

* When I fpeak of drinking a glafs of the water over night. I mult beg leave to caution thole who follow this plan againft eating heavy fuppers. The late Dr. Daultry of York, who was the first that brought the Harrowgate waters into repute, ufed to advife his patients to drink a glafs before they went to bed ; the confequence of which was, that having eat a field fupper, and the water operating in the night, they were often tormented with gripes, and obliged to call for medical affiftance.

644 ON COLD BATHING, AND

use of all the purging mineral waters, a light and rather diluting diet is the most proper; and that no person, during such a course, ought to eat to the full extent of what his appetite craves.

To promote the operation of mineral waters, and to carry them through the fystem, exercise is indifpenfably neceffary. This may be taken in any manner that is most agreeable to the patient; but he ought never to carry it to excess. The best kinds of exercise are those connected with amuse-Every thing that tends to exhilarate the ment. fpirits, not only promotes the operation of the waters, but acts as a medicine. All who refort to the mineral waters ought therefore to leave every care behind, to mix with the company, and to make themfelves as cheerful and happy as poffible. From this conduct, affifted by the free and wholefome air of those fashionable places of refort, and alfo the regular and early hours which are ufually kept, the patient often receives more benefit than from using the waters.

But the greateft errors in drinking the purging mineral waters arife from their being ufed in cafes where they are abfolutely improper, and adverfe to the nature of the difeafe. When people hear of a wonderful cure having been performed by fome mineral water, they immediately conclude that it will cure every thing, and accordingly fwallow it down, when they might as well take poifon. Patients ought to be well informed, before they begin to drink the more active kinds of mineral waters, of the propriety of the courfe, and fhould never perfift in ufing them when they are found to aggravate the diforder.

In all cafes where purging is indicated, the faline mineral waters will be found to fulfil this intention better than any other medicine. Their operation, if taken

1 7 -

DRINKING MINERAL WATERS. 645

taken in proper quantity, is generally mild; and they are neither found to irritate 'the nerves, nor debilitate the patient fo much as the other purgatives.

As a purgative, these waters are chiefly recommended in diseases of the first passages, accompanied with, or proceeding from, inactivity of the fromach and bowels, acidity, indigestion, vitiated bile, worms, putrid fordes, the piles, and jaundice. In most cases of this kind they are the best medicines that can be administered. But when uted with this view, it is fufficient to take them twice, or at most three times a-week, fo as to move the body three or four times; and it will be proper to continue this course for fome weeks.

But the operation of the more active mineral waters is not confined to the bowels. They often promote the difcharge of urine, and not unfrequently increase the perfpiration. This fhews that they are capable of penetrating into every part of the body, and of ftimulating the whole fystem. Hence arises their efficacy in removing the most obfinate of all diforders, obfirustions of the glandular and lympbatic fystem. Under this class is comprehended the forofula or King's evil, indolent tumours, obfirustions of the liver, fpleen, kidnies, and mefenteric glands. When these great purpofes are to be effected, the waters must be used in the gradual manner mentioned above, and perfitted in for a length of time. It will be proper however pow and then to difcontinue their use for a few days.

The next great clafs of difeafes where mineral waters are found to be beneficial, are those of the skin, as the itch, scab, tetters, ringworms, scalv eruptions, leprofies, blotches, soul ulcers, &cc. Though these may seem superficial, yet they are often the most obstinate which the physician has to T t z encounter. encounter, and not unfrequently fet his fkill at defiance: but they will fometimes yield to the application of mineral waters for a fufficient length of time, and in most cafes of this kind thefe waters deferve a trial. The faline fulphureous waters, fuch as those of Moffat in Scotland, and Harrowgate in England, are the most likely to fucceed in difeases of the fkin; but for this purpose it will be neceffary not only to drink the waters, but likewife to use them externally.

To enumerate more particularly the qualities of the different mineral waters, to fpecify those difeases in which they are respectively indicated, and to point out their proper modes of application, would be an useful, and by no means a difagreeable employment; but as the limits preferibed to these remarks will not allow me to treat the subject at more length, I shall conclude by obferving, that whenever the mineral waters are found to exhaust the strength, depress the spirits, take away the appetite, excite fevers, diffend the bowels, or occasion a cough, they ought to be discontinued.

*** These Cautions having been printed and fold feparately for the accommodation of these who had purchased the former editions of this book, has induced fome perfons to confider them as a Treatife on fea-bathing and drinking the mineral waters; whereas the author's fole intention was to furnish a few general hints to perfons who frequent the fashionable places of refort, without putting themselves under the care of a physician. As he looks upon this fubjed however to be of the greatest importance to the fick, he pledges himself to treat it at more length es a fature occasion.

[647]

CHAP. LVI.

OBSERVATIONS CONCERNING THE DIET OF THE COMMON PEOPLE, RECOMMENDING A METHOD OF LIVING LESS EXPENSIVE, AND MORE CON-DUCIVE TO HEALTH, THAN THE PRESENT.

E XPERIENCE proves that not a few of the difeafes incident to the inhabitants of this country, are owing to their mode of living. The vegetable productions they confume, fall confiderably fhort of the proportion which they ought to bear to the animal part of their food. The conftant ufe of bread and animal fubfrances excites an unnatural thirfl, and leads to the immoderate ufe of beer and other frimulating liquors, which generate difeafe and reduce the lower orders of the people to a flate of indigence. To teach the poor man how to live cheaper and better, is the defign of the following pages,

Though the common people of this country live at a greater expence than any where elfe, it does not follow that they live better. They are ftrong indeed, but by no means healthy; and it is found that, from an attachment to a particular mode of living; they are more liable to difeafe and death in foreign climes, than the inhabitants of any other country.

It is certainly proper that the poor man fhould be inftructed in every thing that can make his little earnings go as far as poffible, or which can add to the comfort of himfelf and family. Nor can economy in living, be deemed a trivial virtue, in a country where the riches depend on the cheapnels of labour.

It is alleged that the English are for much attached to their own modes of living, that no argument will

Tt4

induce

648 DIET OF COMMON PEOPLE.

induce them to make the fimalleft change. Habits are indeed obftinate things, effectially those which relate to diet; but there are proofs that the English are not inflexible even in this matter. The mode of living, among the lower orders, has been greatly changed in my time, and I am forry to fay, not for the better.

The people of England have too much good fenfe not to liften to reason, provided due care were taken to inftruct them. But here the people may be truly faid, "to periff for want of knowledge." No means have been ufed to give them proper inftruction. Hurtful cuftoms have been fuffered to prevail, till they have flruck such deep roots that it will not be an easy matter to eradicate them. The difficulty, however, is not unfurmountable. A few experiments of reform would have the effect to render it as agreeable as it is falutary.

Adults have many old prejudices to overcome, but the cafe is different in regard to children. They may be taught to ule any kind of food, and what they ule when young they will love when old. If I can introduce a different method of feeding children, my purpofe will be answered. This alone will, in time, effect a total change in the general mode of living.

The late diffrefs of the poor has called forth many publications intended for their relief. Moft of them, however, were adapted only for the particular occafion, and not calculated to prevent the return of like evils. The following oblervations, it is hoped, will have a more permanent effect. They are intended to recommend a plan of living, which will render the people lefs dependant on bread and animal food for their fubliftence, and confequently not fo liable to fuffer from a fearcity or dearth of either of thefe articles in future.

Particular

DIET OF COMMON PEOPLE. 649

Particular attention has been paid to the fubfitutes for bread, as the fcarcity of this article proves peculiarly diftreffing to the poor. It will appear from the following pages, that bread is by no means fo much a neceffary of life as is generally imagined, and that its place may, in many inftances, be fupplied by a variety of other farinaceous fubfiances.

GENERAL OBSERVATIONS ON ALIMENT.

No creature eats fuch a variety of food as man. Intended for an inhabitant of every climate, he devours the productions of them all; and if they do not fuit his palate or agree with his ftomach, he calls in the aid of cookery, an art peculiar to himfelf; by which many things that, in a crude ftate, would prove hurtful, or even poilonous, are rendered wholefome and falutary.

The obvious division of food is into animal and vegetable. To fay that man was intended by nature for using either the one or the other alone, would be absurd. His ftructure and appetite prove that he was formed for both. Judgment, however, is requisite in adjusting the due proportions of each, fo as to avoid the inconveniencies arising from an extreme on either hand.

Though animal food is more nourifhing than vegetable, it is not fafe to live on that alone. Experience has fhewn that a diet confifting folely of animal food, excites thirft and naufea, occafions putrefcence in the ftomach and bowels, and finally brings on violent griping pains with cholera and dyfentery.

Animal food is lefs adapted to the fedentary than the laborious, and leaft of all to the ftudious, whole diet ought to confift chiefly of vegetables. Indulging in animal food renders men dull, and unfit for the purfuits

650 OBSERVATIONS ON ALIMENT.

purfuits of fcience, efpecially when it is accompanied with the free ufe of ftrong liquors.

The plethoric, or perfons of a full habit, fhould eat fparingly of animal food. It yields far more blood than vegetables taken in the fame quantity, and of courfe may induce inflammatory diforders. It acts as a flimulus to the whole fyftem, by which means the circulation of the blood is greatly accelerated.

I am inclined to think that confumptions, fo common in England, are in part owing to the great ufe of animal food. Though the *Pthifis Pulmonalis* is not, properly fpeaking, an inflammatory dileafe, yet it generally begins with fymptoms of inflammation, and is often accompanied with them through its whole progrefs.

But the difeafe most common to this country is the fcurvy. One finds a dash of it in almost every family, and in fome the taint is very deep. A difease to general must have a general cause, and there is none to obvious as the great quantity of animal food devoured by the natives. As a proof that fcurvy arises from this cause, we are in possession of no remedy for that difease equal to the free use of fresh vegetables.

By the uninterrupted use of animal food a putrid diathefis is induced in the fystem, which predisposes to a variety of diforders. I am fully convinced that many of those obstinate complaints for which we are at a loss to account, and find it still more difficult to cure, are the effects of a scorbutic taint lurking in the habit.

Improper diet affects the mind as well as the body. The choleric difpolition of the English is almost proverbial. Were I to affign a cause, it would be, their living so much on animal food. There is no doubt but this induces a ferocity of temper unknown to men whose food is chiefly taken from the vegetable kingdom.

Though

OBSERVATIONS ON ALIMENT. 651

Though these and fimilar consequences may arise from the excess of animal diet, we are far from difcouraging its use in moderation. In all cold countries it is certainly neceffary; but the major part of the aliment ought nevertheless to confist of vegetable fubstances. There is a continual tendency, in animal food, as well as in the human body itself, to putrefaction, which can only be counteracted by the free use of vegetables.

With regard to the proportion of vegetable food to that of animal, great nicety is by no means required. It must vary according to circumstances, as the heat of the weather, the warmth of the climate, and the like. The vegetable part, however, where nothing forbids, ought certainly to preponderate, and I think in the proportion at least of two to one.

The exceffive confumption of animal food is one great caufe of the fcarcity of grain. The food that a bullock affords bears but a fmall proportion to the quantity of vegetable matter he confumes.

I am no enemy to good fruit, as an article of diet; but the greater part of what is ufed in this country, by the lower orders of the people, is mere trafh. Fruit fhould be eaten in the early part of the day, when the ftomach is not loaded with food, and it never ought to be eaten raw till it is thoroughly ripe.

OF BREAD.

BREAD, or fomething refembling it, makes a part of the diet of all nations. Hence it is emphatically denominated *the flaff of life*. It may however be used too freely. The late Dr. Fothergill was of opinion, and I perfectly agree with him, that most people sat more bread than is conducive to their health. I do not mean to infinuate that bread is unwholefome, but that that the best things may prove hurtful when taken to excess. A furfeit of bread is more dangerous, than of any other food. Omnis repletio mala, repletio panis peffima. The French confume vast quantities of oread; but its bad effects are prevented by their copious use of fours and fruits, which have little or no share in the diet of the common people of England.

One important use of bread is to form a mass fit for filling up the alimentary canal, and carrying the nutritious juices along that paffage in fuch a flate, as to render them fit to be acted upon by the lacteal abforbents, which take up the nourifhment and convey it to the blood. In this light, bread may be confidered as a foil from whence the nourifhment is drawn. I do not fay that bread contains no nourifhment, but that its use, as an article of diet, does not folely depend on the quantity of nutriment it contains, but in fome measure on its fitness as a vehicle for conveying the nutritious particles through the inteffinal tubes. Hence it follows that the fineft bread is not always the best adapted for answering the purposes of nutrition.

The richeft food will not nourifh an animal, unlefs the alimentary canal is fufficiently diftended. A dog has been fed on the richeft broth, yet could not be kept alive; while another, which had only the meat boiled to a chip and water, throve very well. This fhews the folly of attempting to nourifh men on alimentary powders and other concentrated food.

The great art therefore of preparing food, is to blend the nutritive part of the aliment with a fufficient quantity of fome light farinaceous fubftance, in order to fill up the canal, without overcharging it with more nutritious particles than are neceffary for the fupport of the animal. This may be done either by bread, or other farinaceous fubftances, of which there is a great variety, as will appear from the fequel.

Bread is one of the molt expensive modes of using grain, and not adapted to the narrow circumstances of the

652

the lower orders of the people, as it is burthened with two heavy additional charges, in paffing through the hands of both the miller and the baker. Befides, the former often grinds down extraneous matter with the wheat, and the latter as frequently bakes it up with the addition of lime, chalk, allum, and other pernicious fubftances. Since the articles of diet have become branches of manufacture, the public neither know what they eat, nor what they drink.

People imagine, as the fineff flour contains the greateft quantity of nourifhment, that it muft theretore be the moit proper for making into bread; but this by no means follows. The fineft flour comes the neareft to flarch, which, though it may occafionally prove a good medicine, makes bad bread. Houfehold bread, which is made by grinding down the whole grain, and only feparating the coarfer bran, is without doubt the moft wholefome.

The beft household bread I ever remember to have ate, was in the county of York. It was what they call *meflin bread*, and confifted of wheat and rye ground together. I am not quite certain as to the proportion, but I think there might be two parts of the former to one of the latter. This bread, when well fermented, eats light, is of a pleafant tafte, and foluble to the bowels. After using it for fome years, I found that bread made entirely of flour was neither fo agreeable to the palate, nor fo conducive to health.

Bread is often fpoiled to pleafe the eye. The artificially whitened, drying, fluffing bread, though made of the heart of the wheat, is in reality the worft of any, yet this is the bread which most people prefer, and the poorer fort will eat no other.

All the different kinds of grain are occafionally made into bread, fome giving the preference to one and fome to another, according to early cuftom and prejudice. The people of South Britain generally prefer bread made of the fineft wheat flour, while those

of

of the nothern counties eat a mixture of flour and oatmeal, or ryemeal, and many give the preference to bread made of oatmeal alone. The common people of Scotland alfo eat a mixed bread, but more frequently bread of oatmeal only. In Germany the common bread is made of rye, and the American labourer thinks no bread fo ftrengthening as that which is made of Indian corn; nor do I much doubt but the Laplander thinks his bread made of the bones of fifthes is the beft of any.

Bread made of different kinds of grain is more wholefome than what is made of one only, as their qualities ferve to correct one another. For example, wheat flour, especially the finer kind, being of a ftarchy nature, is apt to occasion constipation. Bread made of ryemeal, on the other hand, proves often too flippery for the bowels. A due proportion of these makes the best bread.

For the more active and laborious I would recommend a mixture of rye with the ftronger grains, as peafe, beans, barley, oats, Indian corn, and the like. Thefe may be blended in many different ways: they make a hearty bread for a labouring man, and, to ufe his own language, they lie longer on his ftomach than bread made of wheat flour only. Barley bread paffes too quickly through the alimentary canal to afford time for conveying the proper nourifhment; but bread made of barley mixed with peafe is very nourifhing.

When potatoes, or boiled grain, are ufed, bread ceafes to be a neceffary article of diet. During the late fearcity of bread, I made it a rule not to eat above one half the quantity I ufed to do, and I found no inconveniency whatever from the change. Nay, fome told me, that for a confiderable time they had left off the ufe of bread altogether, without experiencing any change in the ftate of their health.

A great

A great part of the bread confumed in this country is by children. It is always ready, and when the child calls for food, a piece of bread is put into its hand, to fave the trouble of dreffing any other kind of victuals. Of many children this is the principal food, but it is far from being the moft proper. Children are often troubled with acidities of the ftomach and bowels; and it is well known that bread mixed with water, and kept in a degree of heat equalto that of the human ftomach, foon turns four.

During the late fcarcity, many of the labouring men, and even artificers, could not earn as much money as was fufficient to keep their families in the article of bread only. It is certain, however, that on a different plan, fuch families might have lived very comfortably. Many of the articles of diet are cheapar than bread, and equally wholefome. Above one half of the expence of living might be faved by a due felection of the articles of diet.

The English labourer lives chiefly on bread, which being accompanied with other dry, and often falt food, fires his blood, and excites an unquenchable thirst, fo that his perpetual cry is for drink.

But the greateft confumption of bread is occafioned by tea. It is faid that the fubjects of Great Britain confume a greater quantity of that herb, than the whole inhabitants of all the other nations of this quarter of the globe. The loweft woman in England muft have her tea, and the children generally fhare it with her. As tea contains no nourithment, either for young or old, there muft of courfe be bread and butter to eat along with it. The quartern loaf will not go far among a family of hungry children, and iff expence of one meal will be more than would be fufficient to fill their bellies with wholefome food three times a day.

There

There is reason to believe that one half the bread confumed in England is used to tea, without one hearty meal ever being made of it. The higher ranks use tea as a luxury, while the lower orders make a diet of it. I had lately occasion to see a firking inflance of this in a family that was represented to me as in diffress for want of bread. I sent them a little money, and was informed that they ran with it directly to the tea-shop.

To a heavy, fluggifh, phlegmatic man, a moderate use of tea may not prove pernicious, but where there is a debilitated ftomach and an irritability of fibre, it never fails to do much hurt. With many it has the effect to prevent fleep.

Tea will induce a total change of conflictution in the people of this country. Indeed it has gone a great way towards effecting that evil already. A debility, and confequent irritability of fibre, are become fo common, that not only women, but even men, are affected with them. That clafs of difeafes which, for want of a better name, we call nervous, has made almost a complete conqueft of the one fex, and is making hafty ftrides towards vanquishing the other.

Did women know the train of difeafes induced by debility, and how difagreeable these difeafes render them to the other fex, they would fhun tea as the most deadly poison. No man can love a woman eaten up with vapours, or washed down with diseafes arising from relaxation.

It is not tea taken as a beveridge after a full meal, or in a crowded affembly, that I to much condemn, though I think fomething as elegant and lefs pernicious might be fubfituted in its place. The mifchief occafioned by tea arifes chiefly from its being fubfittuted for folid food. This is fo much the cafe at prefent, that, had I time to fpare, I think it could not be better employed than in writing against this defructive drug.

0 F

OF BOILED GRAIN.

THOUGH farinaceous fubftances, of one kind or another, make a neceffary part of the food of man, yet there can be no reafon why fuch fubftances fhould always affume the name and form of bread. Many of them are more wholefome, and not lefs agreeable, in other forms. Bread is often ufed merely to fave the trouble of cookery; and, being portable, is the most convenient article of diet for carrying abroad.

It does not, however, admit of a doubt, that more grain is eaten boiled, though not in this country, than is made into bread; and that this mode of cookery is the moft wholefome. Simple boiling precludes all adulteration, and is an operation much lefs laborious and artificial than baking.

The moft general article of diet among mankind, is rice. This may be made into a variety of diffues; but fimple boiling is all that is required, to render it a proper fubfitute for bread. It may either be eaten alone, or with milk. In the eaft, it is ufed with mear, in the fame manner as we do bread. The people of this country believe that rice proves injurious to the eyes, but this feems to be without foundation, as it has no fuch effect on those who make it the principal part of their food.

Many other kinds of grain will, when boiled, make good fubfitutes for bread. Even thofe which make a hatfh and unpleafant fort of bread, are often rendered very palatable by boiling. This is the cafe with all the leguminous clafs of plants, as peafe, beans, &c. Even oats and barley are more agreeable, as well as more wholefome, when boiled, than made into bread,

All

All allow that peafe and beans boiled, when young, are a great luxury. But when old, they are equally wholefome, and, when properly cooked, by no means unpleafant. There are few who do not relifh peafe pudding, and even prefer it to bread. Beans are not fo fit for this purpofe; but they make an excellent ingredient in the poor man's broth, and whoever eats this broth will find little occafion for bread.

Peafe and beans contain an equal quantity of fugar with wheat, oats, or barley, and at the fame time a greater proportion of oil, confequently are more nourifhing. This fact is confirmed by daily experience.

On those farms where pease and beans are raised in great abundance, the labourers are much fed on that fort of grain; but when removed to farms where they are fed with other kinds of grain, they soon complain of a diminution of strength, and request a supply of pease meal as formerly.

Nature feems to have pointed out the propriety of the extensive use of pease and beans; it being a fact, that when crops of that kind are duly alternated with crops of wheat, barley, or oats, the fertility of the foil may be maintained, without reft or manure, for many years together; whereas, if the latter be raifed, on the fame foil for feveral years fucceffively, they render it barren, fo that, without reft or manure, its fertility cannot be preferved.

The people in England are but little accuftomed to the use of boiled grain, though in many countries it is eaten as a luxury. Boiled barley is a great favorite with the Dutch, and is eaten with milk, butter, or molaffes. It is the principal food of the Dutch failors, who, in general, are both healthy and robust.

Barley is one of the beft ingredients in foup. Count Rumford fays, it poffeffes the quality of lithing or thickening foups, in a fuperior degree to any other grain. We have reafon, however, to believe, that

658

grits, or coarle oatmeal, will answer that purpole still better.

Oatmeal is frequently made into bread; but it is a much more wholefome, as well as agreeable food, when made into hafty pudding, and eaten with milk. The peafants in many parts of Britain make two meals a day of it, while their children almost wholly fubfift on it; and it is well known that both old and young who are thus fed, are healthy and robust.

The opinion of oatmeal being heating, and occafioning fkin difeafes, is wholly without foundation. Bread made of oatmeal, when not leavened, will fometimes occafion the heart-burn; but this is no proof of its heating quality. Unleavened bread, of wheat, or any other grain, produces the fame effect on a debilitated ftomach. Oatmeal thoroughly boiled feldom gives the heart-burn.

Perfons who are fed on oatmeal bread, or hafty pudding, are not more fubject to difeafes of the fkin, than those who live on wheat meal. Cutaneous diforders proceed more from the want of cleanlines, than from any particular aliment. The French, fo far from thinking that oatmeal is heating, fpeak of it as possible of a cooling quality; and even the English give oatmeal, or grit gruel, to lying-in women, and fick people of every description, which shews that they are inconfistent with themselves, in alleging that the blood is fired by the use of oatmeal.

A lieutenant of the army, refiding at a country village within a few miles of Edinburgh, with a wife and ten children, having no other income than his half pay, fed the whole of his children with hafty pudding and butter milk only, from a conviction that it was the most wholefome and full diet, that fell within the reach of his narrow circumstances. They grew apace, and it was the universal remark of the neighbourhood, that they were as fprightly, healthy, $U \cdot u \hat{z}$ and

OF BOILED GRAIN.

660

and robuft, as other children, and at the fame time perfectly free from all fkin difeafes.

Children are feldom well, unlefs when their bodies are gently open. But this is more likely to be the cafe when fed on oatmeal and milk, than when their bellies are crammed with a ftarchy fubftance made of the finest flour; yet this in England is the common food of children. I have feen an infant ftuffed four or five times a-day with this kind of food. There needs no conjuror to tell the confequence.

A late Author, a man of learning but the dupe of prejudice, has, by a ridiculous definition, endeavoured to reprefent oats as proper food for horfes only. T wifh the horfes in England devoured a smaller quantity of that grain, and the people more. Few things would have a greater tendency to leffen the expence of living. The oats in North Britain are of a superior quality, and I hope the people will long have the fenfe to use them as an article of diet.

Indian corn is likewife faid to make the beft food when boiled. Count Rumford observes, that of all things it makes the best pudding, and that he has made a hearty meal of it, fauce included, for five farthings. What makes good puddings will make good dumplings, and thefe will, at any time, fupply the place of bread. The Count alfo remarks, that the negroes in America prefer Indian corn to rice; and that the Bavarian peafants prefer it to wheat; that it might be imported from North America at about four or five shillings per bushel; that, when made into flour, it would coft only one penny farthing per pound; and that it is highly nutritious, and the cheapeft food known. During the late fcarcity a large quantity of this grain was imported; but fuch is the averfion of the common people of this country to every fort of food to which they are not accuftomed, that they refused to purchase it, and the

A

the merchants were very great lofers by the importation. On the fame principle the Germans, till within these few years, could not be induced to eat potatoes, though now they are become extremely fond of them.

The American, the Italian, and the German, all cook Indian corn, in the fame way as the North Briton does his oatmeal, by making it into hafty pudding. It may be eaten in a variety of ways. Some eat it with a fauce, composed of butter and brown fugar, or butter and molasses. Others eat it with milk only. In either way it makes a good, cheap, and wholesome diet, by no means difagreeable to those who are accustomed to it.

The only other grain we shall mention as when best boiled, is buck wheat: It is of a very nucliaginous nature, and of course highly nutritious. In several parts of Europe, it constitutes a principal part of the food of the lower people. In former times it was eaten in Russia, not by the lower classes only, even the nobility made use of it. Boiled, and then buttered, it was such a favorite of the great Czar Peter, that he is faid feldom to have supped on any thing elfe.

OF BUTTER.

A 14 19 19 10 20 20

It has been faid, that the English have a thousand religions and but one fauce. It must be allowed that they use butter with almost every kind of food. Butter, though a good article of diet, may be used too freely, and in this country, I am convinced, that is the case. To weak stomachs it is hurtful, even in standard freely, it proves prejudicial to the strongest.

Butter, like other things of an oily nature, has a conftant tendency to turn rancid. This process, by the heat of the ftomach, is greatly accelerated, info-U u 3 much much that many people, foon after eating butter, complain of its rifing in their ftomachs, in a ftate highly difagreeable. Oils of every kind are with difficulty mixed with watery fluids. This is the reafon why butter floats on the ftomach, and rifes in fuch an unpleafant manner.

Perfons afflicted with bile fhould ufe butter very fparingly. Some fceptical authors doubt whether or not aliment of any kind has an effect on the bile. One thing, however, is certain, that many patients, afflicted with complaints which were fuppofed to be occafioned by bile, have been completely cured by a total abftinence from butter.

The most violent bilious complaints that I ever met with, were evidently occasioned by food that became rancid on the ftomach, as the cholera morbus and the like. Nor can fuch complaints be cured, till the rancid matter is totally evacuated by vomiting and purging.

But fuppoling butter did not poffefs the quality of becoming rancid on the ftomach, it may, neverthelefs, prove hurtful to digeftion. Oils of all kinds are of a relaxing quality, and tend to impede the action of digeftion. Hence the cuftom of giving rich broths and fat meats to perfons who have a voracious appetite.

The free use of butter, and other oily fubftances, not only tends to relax the ftomach, and impede its action, but to induce a debility of the folids, which paves the way to many maladies. In a country where two thirds of the inhabitants lead fedentary lives, a debility of fibre must predominate. Whatever encreases that debility ought to be avoided.

Children, without exception, are difpofed to difcafes arifing from relaxation. Butter, of courfe, ought to be given to them with a fparing hand. But is this the cafe? By no means. Bread and butter conftitute a great part of the food of children, and I am convinced

convinced that the grofs humours with which they are frequently troubled, are partly owing to this food. As children abound with moifture, bread alone is, generally fpeaking, better for them than bread and butter.

I have been aftonished to fee the quantities of butter eaten by groß women who lead fedentary lives. Their teabread is generally contrived fo as to fuck up butter like a spunge. What quantities of crumpets and muffins they will devour in a morning, foaked with this oil ! and afterwards complain of indigestion, when they have eaten what would overload the stomach of a ploughman. Dr. Fothergill is of opinion, that butter produces the nervous or fick headach, spoof of this, it is often cured by an emetic.

Oils, in certain quantities, excite naufea, and even vomiting. They mult of courfe prove unfriendly to digeftion. A Dutch failor, we are told, can digeft train oil. So may an Englifh failor; but it would be very improper food for a London lady.

To fome of the leaner farinaceous fubftances, as the potatoe and the like, butter makes a very proper addition, but eating it to flefh and fifh, of almost every defcription, is certainly wrong. The flefh eaten in this country is generally fat enough without the addition of butter, and the more oily kinds of fifh, as falmon or herrings, are lighter on the ftomach and eafier digested when eaten without it.

Butter is rather a groß food, and fitter for the athletic and laborious, than the fedentary and delicate. It is lefs hurtful when eaten fresh than falted. Salt butter certainly tends to induce skin difeases, and I am inclined to think, the free use of it at sea may have fome share in bringing on that dreadful malady, so definuctive to our brave failors, the sea feuroy.

Uu 4

There

There is a method of rendering falt butter lefs hurtful, but it feems not to be known in England. What I mean, is to mix it with an equal quantity of honey, and keep it for ufe. In this way it may be given to children with greater freedom. In North Britain this method of mixing butter with honey is well known, and from a common proverb, I take the cuftom to be very ancient.

Butter, in itfelf, is not near fo hurtful, as when combined with certain other things. For example: bread made with butter is almost indigestible, and pastries of every kind are little better; yet many people almost live upon pastry, and it is universally given to children. It is little better, however, than poifon, and never fails to diforder their stomachs. The fond mother cannot pass a pastry shop, without treating her darling boy with fome of the dainties, and then wonders how he got the cough, or cholic.

I have known a man, feemingly in perfect health, who, by eating a penny-worth of paftry, as he paffed along the ftreet, was feized with fuch an affimatic fit, that he was obliged to be carried home, and had nearly loft his life. This occurred whenever he inadvertently ate any thing baked with butter.

Every thing that proves very injurious to health ought, as far as poffible, to be prohibited, by laying a high duty upon it. A duty on paftry would be ferving the public in more refpects than one. It would fave many lives, and leffen fome tax on neceffaries.

Cheefe as a diet, is likewife injurious to health. It fhould never be eaten but as a defert. It occasions conftipation, fires the blood, and excites a constant craving for drink. It is very improper for the fedentary, and hardly to be digested even by the athletic.

If

OF BUTTER.

If men will live on dry bread, poor cheefe, falt butter, broiled bacon, and fuch like parching food, they will find their way to the ale houfe, the bane of the lower orders, and the fource of half the beggary in the nation.

OF FRUITS AND ROOTS.

FRUITS and roots form a large clafs of the fubfitutes for bread. The latter, being produced under ground, are lefs liable to fuffer from the inclemency of the feafons than grain. Men who wilh to inflame the minds of the multitude may inveigh againft the fubfitutes for bread; but reafon and found fenfe fay, the more fubfitutes for bread, the better. When one fails, recourfe can be had to another.

In warm climates the inhabitants have many fubfitutes for bread, and as their feafons are more uniform than ours, they can generally depend on the plant, or whatever it is, proving productive. The plantaintree, commonly called the Indian fig, which has from time immemorial been cultivated in South America, bears fruit of a fweetift tafte, which will diffolve in the mouth without chewing. It is eaten either raw, fried, or roafted. When intended to fupply the place of bread, it is gathered before it is ripe, and eaten either boiled or roafted. The banana is nearly of the fame nature, but its fruit is greatly fuperior both in tafte and flavour.

The inhabitants of the South Sea, or Ladrone islands, are supplied with bread from a tree, which has been lately imported into our West India islands, and will, it is shoped, be found to answer the fame purpose there. It has a flight degree of fweetness, but not much flavour. It refembles new bread, and requires to be roasted before it is eaten. Those who have tasted it fay, that it is in no respect superior to the potatoe.

In

In fome of the Weft India iflands the inhabitants fupply the place of grain by making bread from the root of a fhrub called the caffada, or caffava. Though, to my tafte, this bread is very infipid, yet the natives are fond of it, to fuch a degree, that I have known fome of them eat it, during their refidence in England, in preference to the fineft London bread.

But the most general fubilitutes for bread in the Weft Indies, are the yams. There are three different fpecies of this plant, the roots of which are promifcuoufly ufed for bread. They are faid to be very nutritious, of eafy digetion, and, when properly dreffed, are by fome preferred to the beft wheaten bread. The tafte is fomewhat like the potatoe, but more lufcious. The negroes generally eat them boiled, and beaten into a math. The white people have them ground into flour, and make bread and puddings of them. They can be preferved for feveral feafons, without lofing any of their primitive goodnefs.

Of all the fubfitutes for bread in Europe, the potatoe is the most extensively useful. This plant, is a native of Peru, and has been in Europe about two hundred years. Like most other important discoveries, it made but a flow progress, and is still far from being fo generally cultivated as it deferves to be. It is indeed known in most parts of Europe, but its culture is best understood in Ireland and the northern parts of England. At Harwich, however, the preference is given to the Dutch potatoes, brought over by the packets between that place and Helvoet Sluys. There is a light fandy foil in Holland very favorable to the culture of that ineftimable root.

As this plant thrives in every foil, and feldom fuffers from the inclemency of feafons, we muft blame ourfelves if we fuffer a famine to exift. Indeed no fuch thing ever can be, where due attention is paid to the culture of potatoes. A far greater quantity

OF FRUITS AND ROOTS.

quantity of farinaceous food can be raifed on an acre of ground planted with potatoes, than fown with any kind of grain. It is not uncommon to have a return of forty for one. They are not fo hearty a food as corn, but no man will ever perifh for hunger who can have potatoes.

Potatoes abound with an infipid juice, which induces fome to think that they are not very nutritious. Facts, however, are againft this opinion. Some of the ftouteft men we know, are brought up on milk and potatoes. Dr. Pearfon, who has beftowed fome pains in analizing this root, fays, that potatoes and water alone, with common falt, can nourifh men completely. They differ in colour and confiftence, but not materially with regard to their nutritive qualities.

Some think the firm kind are the most nutritious; but the Irish, who must be good judges, give the preference to the meally. The difference, however, depends much on the mode of cooking them.

More than half the fubftance of potatoes confifts of water, and experience flews, that that mode of cooking, which most diministics their moisture, is to be preferred. In London they are drenched in water and washed before they are brought to market, which accounts, in a great measure, for the bad quality of the London potatoes.

They are dreffed in a variety of ways, but fimple boiling or roafting feems to be all the cooking they require, to render them a proper fubilitute for bread. Some are fond of making bread of them. This, in my opinion, is marring both. Why manufacture any thing into bread, which requires only the aid of fire to make it fuch? Nobody thinks of making dough of the bread fruit; but the potatoe might with as great propriety be called the bread root, as it is made into bread by the fame procefs.

Stewed mutton and potatoes make not only a nourishing but a very palatable dish. The excels of fat of

OF FRUITS AND ROOTS.

of the mutton which, when otherwife cooked, fuftains great lofs, is thus preferved, by being abforbed by the potatoes. It is, however, to be observed, that, when potatoes are used in broth or flews, they ought previoully to be boiled, and the water thrown away, as it contains fomething deletereous. Simple boiling or roafting is fufficient to prepare potatoes to fupply the place of bread, but when they are intended to ferve as a meal, they require fomething of a foftening nature, as milk, butter, or both. What a treasure is a milch cow and a potatoe garden, to a poor man with a large family, who lives in the country ! Yet, with a little attention from landlonds and farmers, almost every man might be fo accommodated. What a fource of real wealth and population ! Men would multiply, and poverty, unlefs among the profligate, be unknown. Horfes are fometimes fed with potatoes, and become very fond of them. With the addition of a fmall quantity of hay, they are found to be fufficiently nourifhing.

I would beg leave to recommend both to landlords and farmers, a careful perufal of Earl Winchelfea's excellent letter to Sir John Sinclair, on the advantages of cottagers renting lands. This humane Nobleman takes up the matter in a truly patriotic light, and fhews, that farmers, inflead of leffening the number of poor, do every thing they can to multiply them; and I am forry to fay that, fo far as my observation goes, it agrees entirely with his lordship's.

Some think that the potatoe, unlefs it is made into bread, will not keep. An accident taught me the contrary. Many years ago a friend of mine fent me a potatoe, after it had been roafted in an oven, on account of its fingular figure. I laid it on a fhelf among fome other things of the like kind, and was furprized, on removing them many years after, to find the potatoe quite frefh, though as dry as a bone. On grating it down it was perfectly fweet; and as fit for making foup

OF FRUITS AND ROOTS.

foup as the day it was roafted. I apprehend that nothing made into bread would have kept fo long.

Pofterity will hardly believe that a fcarcity of bread could be felt in Britain, at a time when it was known that a fufficient quantity of farinaceous food could be railed in one county for the inhabitants of the whole Ifland. Let proper encouragement be given to the culture of potatoes, and fet famine at defiance.

Many other domettic roots, fprouts, &c. are very wholefome, and may occafionally fupply the place of bread. Of thefe Mr. Bryant of Norwich reckons above forty; but we fhall only take notice, by way of fpecimen, of the moft ufeful and productive. It is worthy of remark, that no nation can be very populous, which does not draw a great part of its food from under ground.

Of the elculent roots in this country, the parfnip is reckoned the moft nourifhing. It is likewife of eafy digeftion, and is agreeable to moft palates. Some indeed diflike it on account of its fweetnefs; but that is a proof of its nutritive quality, fugar being the moft nourifhing thing in nature. We are told that, in the north of Ireland, the poor people make beer from this root.

There is not any plant that affords a more flriking proof of the benefits of culture than the turnip. In its wild flate it is good for little or nothing; but, when properly cultivated, it not only affords wholefome nourithment for man, but furnifhes the principal winter food for cattle. There is a fpecies of this plant which grows in North Britain, called the yellow turnip, which is fweet, and of a fuperior quality to thofe produced in the fouth, particularly about London, which are bitter and firingy. The yellow turnip is the moft nourifhing, and also the moft hardy in fulfaining the winter. It is eaten with milk to cure the conlumption and fcurvy. Margraaf fays, he could

670

could extract no fugar from the turnip, which affords ground to conclude, that it is not fo nutritive as certain other roots. Not only the root of the turnip, but the tops, when young, make very pleafant greens. The fprouts, if gathered when very tender, make an excellent fallad.

The carrot, like the turnip, is good for little in its natural ftate, being fmall, tough, and ftringy. Manured, it grows large, fucculent, and of a pleafant flavour. It ought, however, to be eaten young, otherwife it lies on the ftomach, and is hard of digeftion. It is an ingredient in feveral foups, and being folid, may in fome measure fupply the place of bread.

Salfafy, fkirrets, and the feveral kinds of beets, are all pleafant and nourifhing. They are likewife of eafy digeftion, and may be dreffed in a variety of ways. Margraaf has by experiments difcovered, that both fkirrets and beets contain a confiderable quantity of fugar. Though the extracting a faccharine falt from thefe plants may be no object while we poffefs the Weft India iflands, yet it ferves to fhew that they poffefs a quantity of nutritious matter, fufficient to give them a rank among the articles calculated to fupply the place of bread.

The onion, we are told, was a great favorite in Egypt four thousand years ago, and Dr. Hasselquest fays, it is not to be wondered at, for whoever has tasted the onions of Egypt, must allow, that none can be better in any part of the globe. There, he fays, they are fweet, though in many countries they are fitrong and naufcous. There they are fost, whereas in northern countries they are hard; and their coats fo compact, that they are difficult to digest. This very quality may however recommend them in countries where food is fcarce. The Doctor observes, that the Turks eat them roassed with their meat as we do bread, and are fo fond of them that they wish to be indulged with this diffinin Paradife.

From

From the Doctor's account one would be induced to believe that the onion ufed in Egypt was of a different fpecies from ours; but I am rather inclined to think it may depend on the mode of culture, as well as on the warmth of the climate and the difference of foil, as we find in the fouthern parts of Europe they are milder than in the more northerly. In Spain they are very mild, and a root weighing two pounds will grow from a fingle feed.

Onions are dreffed in a variety of ways, but, in regard to wholefomenefs, there is no method better than fimple boiling. By this method of cooking, they are rendered mild, of eafy digeftion, and go off without leaving any difagreeable heat in the ftomach or bowels. Many fhun them on account of the ftrong difagreeable fmell they communicate to the breath. Mr. Bryant fays, this may be remedied, by eating a few raw parfley leaves immediately after, which will effectually overcome the fcent of the onions, and likewife caufe them to fit more eafy on the ftomach.

The leek is generally reckoned among pot-herbs; but as the root is the part chiefly ufed, the confideration of it comes under the prefent head of difcuffion. Indeed, it is as properly a root as the onion, which grows chiefly above ground. The leek, as well as the onion, is faid to be a conftant difh at the tables of the Egyptians, who chop them imall, and eat them with their meat.

The leek is used as a pot-herb in most parts of Britain, especially in Wales, where the natives are faid to be fond of it. In Scotland a full grown fowl and a small piece of falt beef, flewed with a large quantity of leeks, is a very favorite difh. In my opinion the leek is not fo generally used any where as it deferves to be. There is no ingredient goes into foup that is more wholefome, or that gives it a better flavour, than leeks. They are in many respects medicinal, and to my tafte,

2S

as an ingredient in foups, they are greatly fuperior to the onion, or any other pot-herb whatever.

It is a fact worthy of observation, that the boiling of vegetable substances thoroughly, extricates a confiderable quantity of air, and makes them less liable to produce statulency.

I could mention a great many more efculent plants which might occafionally fupply the place of bread, but the above fpecimen is fufficient to fhew how liberal nature is in fupplying man with food, provided he will take the trouble of cultivating and cooking it. Mr. Bryant, in his hiftory of efculent plants, enumerates above four hundred and fifty, each of which affords a wholefome nourifhment, and may occafionally be ufed in place of bread.

OF BROTHS AND SOUPS.

THESE may likewife be confidered as fubfitutes for bread. If properly made, they will ferve both for bread and drink. Though broth is a difh of the greateff antiquity, and may be confidered as extremely delicious, yet it is not a favorite in this country. Here the people are fond of what they call folids; yet thofe very folids they make into broth, by fwallowing as much drink after them as they can get. The only difference is, the foreigner makes his broth in a por, and the Englifhman makes his in the ftomach.

A very fenfible anonymous writer obferves, that in England a pound of meat makes fimply a pound of food; whereas, in any other country in Europe, that quantity of animal food, when flewed down with vegetables and Scotch barley, will produce an ample meal for half a dozen people. Hence he juftly infers that, among the variety of fchemes which may have been devifed by the humane for relieving the diffreffes of the poor, a better and more extensive charity cannot

not be devifed than that of inftructing them in a new mode of cookery.

The fame author adds that the refult of his experiments on this fubject had exceeded his most fanguine expectations, and that each day gave him fresh proofs of the excellency of his plan for teaching the poor and needy to find themfelves in a wholefome and palatable diet, at the cheapeft rate, in which little or no bread was required. "He concludes by afferting that there is fcarce a place in this kingdom where twenty perfons may not have a wholefome, hearty, and palatable meal for three fhillings.

This anonymous letter is followed by one from Colonel Poynter, two from Dr. Johnston, of the royal hospital at Haslar, addressed to Admiral Waldegrave, and one from the Admiral himfelf, written for infertion in a public paper. They contain a variety of receipts for making cheap, wholefome, and nourifhing diffes for the poor. These diffes confift chiefly of broths, foups, and ftews, or what they call pottage, and are calculated to make a hearty and plentiful meal without bread or drink.

I am inclined to pay the more attention to thefe letters, as they feem all to have been written by gentlemen of observation. The pamphlet is fold by Longman and Debrett, for a charitable purpole, at the fmall price of three-pence.

The writer who has paid most attention to the improvement of cookery for the benefit of the poor, is Count Rumford. In his economical and philofophical effays, he has given fuch a variety of forms for making wholefome, cheap, and nourifhing foups, ftews, and other diffes for common ufe, that little more feems neceffary to be faid on the fubject. I shall only observe that the mode of living on broths, foups, hafty-pudding, and fuch like, fo warmly and jufly recommended by the Count, has been practifed in the northern parts of this kingdom from time immemorial.

Xx

rial. There the food of the common people is haftypudding with milk for breakfast and supper, and broth, with vegetables and meat, for dinner. The poorer fort often make broth without meat; but they all use vegetables in great abundance, and fometimes they fupply the place of meat with butter. As the haftypudding and milk make a compleat meal, no bread is neceffary either at supper or breakfast; nor is much required at dinner, as the broth is made thick with barley, cabbage, and a variety of other vegetables or pot-herbs. Cabbage is a favorite ingredient in the Scotchman's broth. It is feldom made without this article, which is not eaten fo early as in England. It is there fuffered to grow to maturity, and when that is the cafe there is no plant more productive. This the Germans know well, and make it into four crout, one of the best antidotes against the fcurvy with which we are acquainted.

This kind of diet not only faves bread but drink. The labourer who lives on hafty-pudding and foups, feldom has occafion for drink; while he who is burnt up with dry bread and cheefe, or falt meat broiled, has a continual thirft, and fpends the greater part of his earnings in liquor. This, by acting as a powerful ftimulus, may make him do more work for fome time, but it generally cuts him off in the middle of his days. The Englifh labourer, who works hard and drinks hard, feldom lives long, and is an old man when he thould be in his prime.

The roafting of meat is a wafteful mode of cookery, which ought to be avoided by the poorer fort of people, as much of the fubftance, and the moft nutritive parts, are loft by fcorching, and fly off by evaporation.

I know it will be faid, that I recommend flops in place of folid food. They are fuch flops, however, as the greateft heroes of antiquity lived upon; and though I have vifited moft parts of the ifland, I know of no better men than those who live in the manner deforibed

OF BROTHS AND SOUPS.

defcribed above; nor are the people any where more healthy, or longer lived.

Broth is not only a difh of great antiquity, but one that can be made in a great variety of ways. It receives into its composition animal and vegetable fubstances of every kind that are used in diet, and it may be feasoned to as to fuit every palate. Indeed, people early accustomed to eat broths properly made, are generally fond of them for their whole lives.

It would be difficult to affign a reafon why the inhabitants of South Britain should diflike a difh fo much relifhed by other nations. Cuftom, no doubt, fettles all thefe things; but how cuftoms arife, is not fo clear a matter. If an alteration in diet is to be introduced with effect, it must begin with children. Whatever men are accustomed to eat when young, they generally prefer for the reft of their lives. Were the children in South Britain taught to eat hafty-pudding, with milk, for breakfast and fupper, and broth, with vegetables and meat boiled in it, for dinner, they would relifh these dishes as long as they lived, would find little occafion for bread, and ftill lefs for drink; and would thrive better than on their prefent food.

What parents love themfelves, they generally give to their children, without any regard to its being proper for them or not. I have feen a father who was fond of ftrong beer, make his fon, an infant, guzzle it at every meal, and the mother who delights in tea, does not fail to give it to her daughter whenever fhe takes it to herfelf. By this conduct, the fon becomes a tippler, and the daughter fips tea in place of folid food, until fhe is eaten up with vapours and other nervous diforders.

Count Rumford fays, brown foup is the common breakfaft of the Bavarian pealants, to which they occafionally add bread. This he avers is infinitely preferable in all respects to that pernicious wash, tea, X x 2 with

676 OF BROTHS AND SOUFS.

with which the lower claffes of the inhabitants of this ifland drench their ftomachs, and ruin their conflitutions. He adds, that a fimple infufion of this drug, drank boiling hot, as the poor generally drink it, is certainly a poilon, which, though it be fometimes flow in its operation, never fails to produce fatal effects, even in the ftrongeft conflitution, where the free ule of it is continued for a confiderable length of time.

The German on his *polenta*, the American on his *mulb*, and the North Briton on his *hafly-pudding*, can make a hearty breakfaft for a tenth part of what a tea-breakfaft would coft, while it is infinitely more wholefome. It has likewife the advantage that no bread is neceffary.

I have been often told, when recommending foups to the poor, that they had not time to make them, and that they could not afford fuel on account of its price, as it is dear in great towns. They can, however, find fuel twice a-day to boil a tea-kettle, and time to make the tea, which is a more tedious operation, by far, than making a mefs of hafty-pudding. For a great part of the year even the pooreft perfon muft have a little fire; and it would require no more to make a comfortable mefs of foup, which is always beft when made with a flow fire.

The mode of living that I would recommend to the lower orders of the people, with a view to fave expence and improve their health, is to fubfitute occafionally other farinaceous fubfiances in the place of bread, as potatoe, &cc. to give up in a great meafure the ufe of roafted, baked, and broiled meats, and to fupply their place with broths, foups, flews, and fuch like, made with a little meat and plenty of vegetables; to give to children, and to grown people who will eat it, for breakfaft, milk-porridge, or hafty-pudding with milk, fmall beer, or melafics. This will be found a

9

more

CONCLUSION.

more wholefome breakfaft than tea, while it is much cheaper and requires no bread.

CONCLUSION.

ALTHOUGH the place of bread may be occafionally supplied by farinaceous roots and other vegetables, yet we would by no means with to difcourage the culture of grain. The culture of grain is the culture of men. While the hufbandman is raifing food for his fellow-creatures, he is laying the foundation of health and longevity to himfelf and his offspring. Innumerable benefits are connected with the culture of grain. While the artificer is fitting in fome awkward pofture breathing confined and perhaps contaminated air, the cultivator of the foil rifes with the fun, eats his wholefome meal of milk and farinaceous food, hies him to the field, where he fpends the day in uleful labour, inhales the fresh breezes, and at eve returns home with a keen appetite, to enjoy his fimple repaft and found repofe.

It has been faid, as artificers can earn more money than thole who cultivate the ground, that arts ought to be encouraged, and grain, if neceffary, imported. No manufacture is equal to the manufacture of grain. It fopplies food for man and beaft, while the furplus, by being exported, enriches the nation. Nor is it fubject to the uncertainty of other manufactures. They often depend on falhion and caprice, but the neceffaries of life will always find their value fomewhere. Though I am convinced that fome regulations are wanting for the encouragement of agriculture, I do not confider it as my province to dictate to the wifdom of the legiflature. They know their duty, and I have reafon to believe that they are inclined to pay it all due attention.

Xx3

I will

I will venture however to affert, that if proper encouragement were given to agriculture, Britain would at all times not only have a fufficiency of grain for her own confumption, but a furplus for exportation. This would contribute more to her real wealth, the happinels of her people, and the ftability of her government, than either the encrease of her trade, the flourishing of her manufactures, or the extension of her territory.

It is matter of real regret and wonder that Britain, at a time when agriculture is cultivated as a fcience, fhould not be able to raife grain for the fupply of her own inhabitants, but become every year more dependent on foreign flates for even the neceflaries of life. Until an adequate remedy can be found for this growing evil, the free use of the various fubfitutes for bread cannot fail to alleviate the calamities of the poor, and to reduce the price of labour.

The great confumption of animal food, and the immenfe number of horfes kept in this country, are to be reckoned among the caules of the fcarcity of grain. Mr. Mackie computes the number of horfes in this country to be about two millions, and that every horfe, on an average, confumes the produce of three fertile acres; confequently the produce of fix millions of fertile acres is annually confumed by horfes. Thefe would produce a quantity of grain more than fufficient to maintain half the inhabitants of Great Britain. Two hundred and fixty thousand of these animals are kept for pleafure. I shall be told that they contribute to health. That I deny. Did our ladies of fashion and fine gentlemen make use of their limbs, instead of being dragged about in carriages, they would both benefit themfelves, and the public. I shall conclude these remarks with the advice of the humane and benevolent Thomfon:

678

ss Ye

CONCLUSION.

⁴⁴ Ye gen'rous Britons ! venerate the plough,
⁴⁶ And o'er your hills and long withdrawing vales
⁴⁶ Let Autumn fpread her treafures to the fun
⁴⁷ Luxuriant and unbounded. As the fea
⁴⁶ Far through his azure turbulent domain
⁴⁷ Your empire owns, and from a thoufand fhores
⁴⁶ Wafts all the pomp of life into your ports;
⁴⁷ So with fuperior boon may your rich foil
⁴⁶ Exub'rant Nature's better bleffings pour
⁴⁶ O'er ev'ry land, the naked nations clothe,
⁴⁶ And be the exhauftlefs gran'ry of a world,"

Xx4

APPENDIX:

CONTAINING

- A Lift of Simples and of fuch Medicinal Preparations as ought to be kept in Readiness for private Practice :
- The Method of preparing and compounding fuch Medicines as are recommended in the former Part of the Book, with the Addition of feveral others of a fimilar Nature :
- Remarks on the Dofes, Ufes, and Manner of applying the different Preparations.

Medicamentorum varietas ignorantia filia est. BACON.

INTRODUCTION.

IGNORANCE and fuperflition have attributed extraordinary medical virtues to almoft every production of nature. That fuch virtues were often imaginary, time and experiencce have fufficiently fhewn. Phyficians, however, from a veneration for antiquity, fill retain in their lifts of medicine many things which owe their reputation entirely to the fuperflition and credulity of our anceftors.

The inftruments of medicine will always be multiplied, in proportion to men's ignorance of the nature and caufe of difeafes: when thefe are fufficiently underftood, the method of cure will be fimple and obvious.

Ignorance of the real nature and permanent properties of thole fubftances employed in the cure of difeafes, is another reafon why they have been fo greatly multiplied. Phyficians thought they could effect by a number of ingredients, what could not be done by any one of them. Hence arofe thofe amazing farragos which have fo long difgraced the medical art, and which were effected powerful in proportion to the number of fimples that entered their composition.

The great variety of forms into which almost every article of medicine has been manufactured, affords another proof of the imperfection of the mdical art. A drug which is perhaps most efficacious in the fimplest form in which it can be administered, has been nevertheless ferved up in fo many different shapes, that one would be induced to think the whole art of physic lay in exhibiting medicine under as many different modes as possible.

Different forms of medicine, no doubt, have their ufe; but they ought never to be wantonly increafed. They are by no means to neceffary as is generally imagined. A few grains of powdered rhubarb, jalap, or ipecacuanha, will actually perform all that can be done by the different preparations of thefe roots, and may alfo be exhibited in as fafe and agreeable a manner. The fame obfervation holds with regard to the Peruvian bark, and many other fimples of which the preparations are very numerous.

5

Multi-

Multiplying the ingredients of a medicine, mot only renders it more expensive, but also lefs certain, both in its dofe and operation. Nor is this all. The compound, when kept, is apt to fpoil, or acquire qualities of a different nature. When a medicine is rendered more fafe, efficacious, or agreeable, by the addition of another, they ought no doult, to be joined; in all other cafes, they are better kept afunder. The combination of medicines embarraffes the phyfician, and retards the progrefs of medical knowledge. It is impoffible to afcertain the precife effect of any one medicine, as long as it is combined with others, either of a fimilar or diffimilar nature.

In the exhibition of medicine, regard fhould not only be had to fimplicity, but likewife to elegance. Patients feldom reap much benefit from things that are highly difagreeable to their fenfes. To tafle or fmell like a drug, is become a proverb; and to fay truth, there is too much ground for it. Indeed no art can take away the difagreeable tafle and flavour of fome drugs, without entirely defiroying their efficacy; it is poffible, however, to render many medicines lefs difguffful, and others even agreeable; an object highly deferving the attention of all who adminifer medicine.

The defign of the following pages is, to exhibit fuch a lift of drugs and medicines as may be neceffary for private practice. They are confiderably more numerous indeed than thole recommended in the former part of the Book, but are fill greatly within the number contained in the most reformed different forms; and where different medicines anfwer nearly the fame intention, there is commonly no more than one of them retained. Multiplying forms of medicine for the fame intention tends rather to bewilder than affift the young practitioner, and the experienced phyfician can never be at a lofs to vary his preferiptions as occaminations.

The chemical and other difficult preparations are for the most part omitted. All of them that are used by any private practitioner are not worth preparing. He will buy them much cheaper than he can make them. Great care however is neceffary to obtain them genuine. They are often adulterated, and ought never to be purchased unless from perfons of known veracity. Such of them as are in common use are

are inferted in the lift of drugs and medicines. Their proper dofes and manner of application, are mentioned in the practical part of the Book, wherever they are preferibed.

Such articles of medicine as are to be found in the houfe or garden of almost every pealant, as barley, eggs, onions, &c. are likewife, for the most part, omitted. It is needless to fwell a lift of medicines with fuch things as can be obtained whenever they are wanted, and which fpoil by being kept.

The preparations made and fold by diffillers and confectioners are alfo generally left out. These people, by operating upon a larger plan, generally make things better, while it is in their power to afford them much cheaper, than they can be prepared by any private hand.

The quantity ordered of every medicine is as fmall as could well be prepared, both to prevent unneceffary expence, and that the medicine might not fpoil by keeping. Almolt every medicine fuffers by being kept, and thould be ufed as foon after it has been prepared as poffible. Even fimple drugs are apt to fpoil, and thould therefore be laid in in fmall quantities; they either rot, are confumed by infects, or evaporate fo as to lofe their peculiar tafte or flavour, and often become quite infignificant.

In the preparation of medicines, I have generally followed the moft improved difpenfatories; but have taken the liberty to differ from them wherever my own obfervations, or thole of other practical writers, on whofe judgment I could depend, fuggefled an improvement.

In feveral compositions, the ingredient on which the efficacy of the medicine principally depends is increated, while the auxiliaries, which are generally ordered in fuch trifling quantities as to be of no importance, are left out, or only fuch of them retained as are neceffary to give the medicine a proper confiftence, or the like.

The colouring ingredients are likewife for the moft part omitted. They increafe the bulk and price of the medicine; without adding any thing to its value. It would be well if they were never ufed at all. Medicines are often adulterated for the fake of a colour. Acrid and even poifonous fubflances are, for this purpofe, fometimes introduced into thofe medicines which ought to be moft bland and emollient. Ointment of elder, for example, is often mixed with verdegrife grife to give it a fine green colour, which entirely fuffrates the intention of that mild ointment. Those who wish to obtain genuine medicines should pay no regard to their colour.

Some regard is likewife paid to expence. Such ingredients as greatly increafe the price of any composition, without adding confiderably to its virtue, are generally either omitted, or fomewhat lefs expensive fubfituted in their place. Medicines are by no means powerful in proportion to their price. The cheapeft are often the beft; befides, they are the least apt to be adulterated, and are always most readily obtained.

With regard to the method of compounding medicines, I have generally followed that which feemed to be the moft fimple and natural, mentioning the different fleps of the procefs in the fame order in which they ought to be taken, without paying an implicit regard to the method of other difpenfatories.

For many of the remarks concerning the preparation, &c. of medicines, I have been obliged to the author of the New Difpenfatory. The other obfervations are either fuch as have occurred to myfelf in practice, or have been fuggefted in the courfe of reading, by authors whole names I am not able diffinctly to recollect.

I have followed the alphabetical order, both with regard to the fimples and preparations. A more fcientific method would have been agreeable to fome perfons, but lefs ufeful to the generality of readers. The different claffes of medicine have no great dependance upon one another; and, where they have, it is hard to fay which fhould fland first or last; no doubt the fimple preparations ought to precede the more compound. But all the advantages arising from this method of arrangement do not appear equal to that fingle one, of being able, on the first opening of the book, to find out any article, which, by the alphabetical order, is rendered quite eafy.

The dofe of every medicine is mentioned whenever it appeared neceffary. When this is omitted it is to be underflood that the medicine may be ufed at difcretion. The dofe mentioned is always for an adult, unlefs when the contrary is expressed. It is not an easy matter to proportion the dofes of medicine exactly to the different ages, conflictutions, &c.

of

of patients; but, happily for mankind, mathematical exactnels here is by no means neceffary.

Several attempts have been made to afcertain the proportional dofes for the different ages and conflitutions of patients; but, after all that can be faid upon this fubject, a great deal muft be left to the judgment and fkill of the perfon who adminifiers the medicine. The following general proportions may be obferved; but they are by no means intended for exact rules. A patient between twenty and fourteen may take two thirds of the dofe ordered for an adult; from fourteen to nine, one-half; from nine to fix, onefixth; from fix to four, one-fourth; from four to two, onefixth; from two to one, a tenth; and below one, a twelfth.

Difpenfatories are ufually written in the Latin language. Even authors who write in Englifh, generally give their preferiptions in Latin; and fome of them flew fo great an attachment to that language, as firft to write their recipes in k, and afterwards translate them; while others, to compromife the matter, write the one half in Latin and the other in Englifh. What peculiar charm a medical prefeription, when written in Latin, may have, I shall not pretend to fay; but have ventured to make use of the plaines the English I could, and hope my preferiptions will fucceed no worke for it.

N. B. The Apothecary's weights, and the English wine^{*} measures, are used throughout the whole book, the different denominations of which will appear from the following Table:

A pound contains twelve ounces.

An ounce - - eight drachms. A drachm - - three fcruples. A fcruple - - twenty grains. A gallon contains eight pints.

A pint - - - fixteen ounces.

An ounce - - eight drachms.

A fpoonful is the measure of half an ounce.

MEDI-

[691]

MEDICINAL PREPARATIONS.

BALSAMS.

THE fubject of this fection is not the natural balfams, but certain compositions, which, from their being supposed to posses balfamic qualities, generally go by that name.

This class of medicines was formerly very numerous, and held in great effeem : modern practice, however, has juftly reduced it to a very narrow compais.

Anodyne Balfam.

Take of white Spanish foap, one ounce; opium, unprepared, two drachms; rectified spirit of wine, nine ounces. Digest them together in a gentle heat for three days; then strain off the liquor, and add to it three drachms of camphor.

This balfam, as its title expresses, is intended to ease pain. It is of fervice in violent flrains and rheumatic complaints, when not attended with inflammation. It must be rubbed with a warm hand on the the part affected; or a linen rag moiftened with it may be applied to the part; and renewed every third or fourth hour, till the pain abates. If the opium is left out, this will be the *faponacious balfam*.

Locatelli's Balfam.

Take of olive oil, one pint; Strafburg turpentine and yellow wax, of each half a pound; red faunders, fix drachms. Melt the wax with fome part of the oil over a gentle fire; then adding the remaining part of the oil and the turpentine; afterwards mix in the faunders, previoufly reduced to a powder, and keep them flirring together till the balfam is cold.

This balfam is recommended in erofions of the inteffines, the dyfentery, hæmorthages, internal bruifes, and in fome complaints of the breaft. Outwardly it is used for healing and cleanfing wounds and ulcers. The dofe, when taken internally, is from two feruples to two drachms.

The vulnerary Balfam.

Take of benzoin, powdered, three ounces; balfam of Peru, two ounces; hepatic aloes, in powder, half an ounce; rectified fpirit of wine, two pints. Digeft them in a genule heat for three days, and then firain the balfam.

This balfam, or rather tincture, is applied externally to heal recent wounds and bruifes. It is likewife employed in. Y y 2 ternally ternally to remove coughs, althmas, and other complaints of the breaft. It is faid to eafe the colic, cleanfe the kidnies, and to heal internal ulcers, &c.

The dole is from twenty to fixty drops.

This, though a medicine of fome value, does not deferve the extravagant encommons which have been beflowed on it. It has been celebrated under the different names of The Commander's Balfam, Perfian Balfam, Balfam of Berne, Wade's Balfam, Friar's Balfam, Jefuit's Drops, Tuxlington's Drops, &cc.

BOLUSES.

A S bolufes are intended for immediate ufe, volatile falts and other ingredients improper for being kept are admitted into their composition. They are generally composed of powders, with a proper quantity of fyrup, conferve, or mucilage. The lighter powders are commonly made up with fyrup, and the more ponderous, as mercury, &c. with conferve; but those of the lighter kind would be more conveniently made up with mucilage, as it increases their bulk lefs than the other additions, and likewise occasions the medicine to pass down more easily.

Aftringent Bolus.

Take of alum, in powder, fifteen grains; gum kino, five grains; fyrup a fufficient quantity to make a bolus.

In an exceflive flow of the *menfes*, and other violent difcharges of blood, proceeding from relaxation, this bolus may be given every four or five hours, till the difcharge abates.

Diaphoretic Bolus.

Take of gum guaiacum, in powder, ten grains; flowers of fulphur and cream of tartar, of each one fcruple; fimple fyrup, a fufficient quantity.

In rheumatic complaints, and diforders of the fkin, this bolus may be taken twice a day. It will also be of fervice in the inflammatory quinfey.

Mercurial Bolus.

Take of calomel, fix grains; conferve of roles, half a drachm. Make a bolus.

Where mercury is neceffary, this bolus may be taken twice or thrice a week. It may be taken over night; and if it does not operate, a few grains of jalap will be proper next day to carry it off. Bolus

CATAPLASMS AND SINAPISMS. 693

Bolus of Rhubarb and Mercury.

Take of the beft rhubarb, in powder, from a fcruple to half a drachm; of calomel, from four to fix grains; fimple fyrup, a fufficient quantity to make a bolus.

This is a proper purge in hypochondriac conflictutions; but its principal intention is to expel worms. Where a fironger purge is neceffary, jalap may be used instead of the rhubarb.

Pettoral Bolus.

Take of fperma ceti, a fcruple ; guin ammoniac, ten grains ; falt of hartfhorn, fix grains ; fimple fyrup, as much as will make them into a bolus.

This bolus is given in colds and coughs of long flanding, afthmas, and beginning confumptions of the lungs. It is generally proper to bleed the patient before he begins to ufe it.

Purging Bolus.

Take of jalap, in powder, a fcruple; cream of tartar, two fcruples. Let them be rubbed together, and formed into a bolus, with fimple fyrup.

Where a mild purge is wanted, this will answer the purpole very well. If a ftronger dole is neceffary, the jalap may be increased to half a drachm or upwards.

CATAPLASMS AND SINAPISMS.

CATAPLASMS polfels few or no virtues fuperior to a poultice, which may be fo made, as, in most cafes, to fupply their place. They are chiefly intended either to act as diffutients, or to promote fuppuration; and as they may be of fervice in fome cafes, we shall give a fpecimen of each kind.

Discutient Catap'asm.

Take of barley-meal, fix ounces; fresh hemlock leaves; bruifed, two ounces; vinegar, a fufficient quantity. Boil the meal and hemlock in the vinegar for a little, and then add two drachms of the fugar of lead.

Ripening Cataplasm.

Take of white lily root, four ounces; fat figs and raw onions, bruifed, of each one ounce; yellow bafilicum ointment, two ounces; gum galbanum, half an ounce; linfeed

Yy3

meal,

meal, as much as neceffary. Boil the roots along with the figs in a fufficient quantity of water; then bruife and add to them the other ingredients, fo as to form the whole into a foft cataplafm. The galbanum muft be previoufly diffolved. with the yolk of an egg.

Where it is neceffary to promote fuppuration, this cataplafm may be ufed by thofe who chufe to be at the trouble and expence of making it. For my part, I have never found any application more proper for this purpofe than a poultice of bread and milk, with a fufficient quantity of either boiled or raw onion in it, and foftened with oil or fresh butter.

Sinapisms.

Sinapifms are employed to recal the blood and fpirits to a weak part, as in the palfy and atrophy. They are alfo of fervice in deep-feated pains, as the feiatica, &c. When the gout feizes the head or the flomach, they are applied to the feet to bring the diforder to thefe parts. They are likewife applied to the patient's foles in the low flate of fevers. They fhould not be fuffered to lie on, however, till they have raifed blifters, but till the parts become red, and will continue fo when preffed with the finger.

The finapifm is only a poultice made with vinegar inflead of milk, and rendered warm and fimulating by the addition of muftard, horfe-radifh, or garlic.

The common finapifm is made by taking crumb of bread and muftard-feed in powder, of each equal quantities; flrong vinegar, as much as is fufficient, and mixing them fo as to make a poultice.

When finapifms of a more flimulating nature are wanted, a little bruifed garlic may be added to the above.

CLYSTERS.

THIS clafs of medicines is of more importance than is generally imagined. Clyflers ferve not only to evacuate the contents of the belly, but alfo to convey very active medicines into the fyftem. Opium, for example, may be adminifiered in this way when it will not fit upon the flomach, and alfo in larger dofes than at any time it can be taken by the mouth. The Peruvian bark may likewife be, with good effect, adminifiered in form of clyfler to perfons who cannot take it by the mouth.

A fimple.

A fimple clyfter can feldom do hurt, and there are many cafes where it may do much good. A clyfter even of warm water, by ferving as a fomentation to the parts, may be of confiderable fervice in inflammations of the bladder, and the lower inteflines, &c.

Some fubftances, as the fmoke of tobacco, may be thrown into the bowels in this way, which cannot by any other means whatever. This may be eafily effected by means of **a** pair of hand-bellows, with an apparatus fitted to them for that purpofe.

Nor is the use of clysters confined to medicines. Aliment may also be conveyed in this way. Perfons unable to fwallow, have been, for a confiderable time, supported by clysters.

Emollient Clyfter.

Take of linfeed tea and new milk, each fix ounces. Mix them.

If fifty or fixty drops of laudanum be added to this, it will fupply the place of the *Anodyne Clyfter*.

Laxative Clyfter.

Take of milk and water, each fix ounces; fweet oil or fresh butter, and brown sugar, of each two ounces. Mix them.

If an ounce of Glauber's falt, or two table fpoonfuls of common falt, be added to this, it will be the *Purging Clyfter*.

Carminative Clyfter.

Take of camomile flowers, an ounce; anife-feeds, half an ounce. Boil in a pint and a half of water to one pint.

In hyfteric and hypochondriac complaints this may be adminiftered inflead of the *Fætid Clyfter*, the fmell of which is fo difagreeable to moft patients.

Oily Clyfter.

To four ounces of the infufion of camomile flowers, add an equal quantity of Florence oil.

This clyfter is beneficial in bringing off the fmall worms lodged in the lower parts of the alimentary canal. When given to children the quantity muft be proportionably leftened.

Yy4

Starch

Starch Clyfter.

Take jelly of flarch, four ounces; linfeed oil, half an ounce. Liquify the jelly over a gentle fire, and then mix in the oil.

In the dyfentery or bloody flux, this clyfter may be adminiffered after every loofe flool, to heal the ulcerated inteffines and blunt the fharpnefs of corroding humours. Forty or fifty drops of laudanum may be occafionally added; in which cale, it will generally fupply the place of the *Aftringent Clyfter*.

Turpentine Clyster.

Take of common decoftion, ten ounces; Venice turpentine, diffolved with the yolk of an egg, half an ounce; Florence oil, one ounce. Mix them.

This diuretic clyfler is proper in obfructions of the urinary paffages, and in colicky complaints, proceeding from gravel.

Vinegar Clyfter.

This clyfter is made by mixing three ounces of vinegar with five of water-gruel.

It answers all the purpoles of a common clyster, with the peculiar advantage of being proper either in inflammatory or putrid diforders, especially in the latter.

 c_{T} We think it unneceffary to give more examples of this clafs of medicines, is ingredients adapted to any particular intention may be occasionally added to one or other of the above forms.

COLLYRIA, or EYE-WATERS.

E YE-WATERS have been multiplied without number, almost every perfon pretending to be posselfield of fome fecret preparation for the cure of fore eyes; I have examined many of them, and find that they are pretty much alike, the basis of most of them being either alum, vitriol, or lead. Their effects evidently are, to brace and reflore the tone of the parts: hence they are principally of fervice in flight inflammations; and in that relaxed flate of the parts which is induced by obflinate ones.

Camphor is commonly added to these compositions; but as it feldom incorporates properly with the water, it can be of little use. Boles and other earthy substances, as they do not diffolve in water, are likewise unfit for this purpose.

Collyrium

Collyrium of Alum.

Take of alum, half a drachm; agitate it well together with the white of one egg.

This is the Collyrium of Riverius. It is used in inflammation of the eyes, to allay heat, and reftrain the flux of humours. It must be fpread upon linen, and applied to the eyes; but should not be kept on above three or four hours at a time.

Vitriolic Collyrium.

Take of white vitriol, half a drachm; role-water, fix ounces. Diffolve the vitriol in the water, and filter the fiquor.

This, though fimple, is perhaps equal in virtue to most of the celebrated collyria. It is an ufeful application in weak, watery, and inflamed eyes. Though the flighter inflammations will generally yield to it, yet in those of a more obstinate nature the affistance of bleeding and bliftering will often be neceflary.

When a flrong aftringent is judged proper, a double or triple quantity of the virriol may be ufed. I have feen a folution of four times the flrength of the above ufed with manifeft advantage.

Collyrium of Lead.

Take fugar of lead, and crude fal ammoniac, of each four grains. Diffolve them in eight ounces of common water.

Forty or fifty drops of laudanum may be occafionally added to this collyrium.

Those who chuse may substitute instead of this the collyrium of lead recommended by Goulard; which is made by putting twenty-five drops of his *Extract of Lead* to eight ounces of water, and adding a tea-spoonful of brandy.

Indeed, common water and brandy, without any other addition, will in many cafes an wer very well as a collyrium. An ounce of the latter may be added to five or fix ounces of the former; and the eyes, if weak, bathed with it night and morning.

CONFECTIONS.

CONFECTIONS containing above fixty ingredients are fiill to be found in fome of the most reformed difpensatories. As most of their intentions, however, may be more certainly, and as effectually answered by a few glasses of wine

697

or

or grains of opium, we shall pass over this class of medicines very flightly.

Japonic Confection.

Take of Japan earth, three ounces; tormentil root, nutmeg, olibanum, of each two ounces; opium diffolved in a fufficient quantity of Lifbon wine, a drachm and a half; fimple fyrup and conferve of rofes, of each fourteen ounces. Mix and make them into an electuary.

This fupplies the place of the Diafcordium.

The dole of this electuary is from a fcruple to a drachm.

CONSERVES AND PRESERVES.

 \mathbf{E}^{VERY} Apothecary's flop was formerly fo full of thefe preparations, that it might have paffed for a confectioner's warehoufe. They poffel's very few medicinal properties, and may rather be claffed among fweetmeats than medicines. They are fometimes, however, of ufe, for reducing into bolutes or pills fome of the more ponderous powders, as the preparations of iron, mercury, and tin.

Conferves are compositions of fresh vegetables and fugar, beaten together into an uniform maß. In making these preparations, the leaves of vegetables must be freed from their flalks, the flowers from their cups, and the yellow part of orange-peel taken off with a rafp. They are then to be pounded in a marble mortar, with a wooden pessible, into a fmoth maßs; alter which, thrice their weight of fine sugar is commonly added by degrees, and the beating continued till they are uniformly mixed; but the conferve will be better if only twice its weight of sugar be added.

Those who prepare large quantities of conferve generally reduce the vegetables to a pulp by the means of a mill, and afterwards beat them up with the fugar.

Conferve of Red Rofes.

Take a pound of red role buds, cleared of their heels; beat them well in a mortar, and, adding by degrees two pounds of double-refined fugar, in powder, make a conterve.

After the fame manner are prepared the conferves of orange-peel, rofemary flowers, fea-wormwood, of the leaves of wood-forrel, Gc.

The conferve of roles is one of the moft agreeable and ufeful preparations belonging to this clafs. A drachm or

two

two of it, diffolved in warm milk, is ordered to be given as a gentle refiringent in weaknefs of the flomach, and likewife in phthifical coughs, and fpitting of blood. To have any confiderable effects, however, it must be taken in larger quantities.

Conferve of Sloes.

This may be made by boiling the floes gently in water, being careful to take them out before they burft; afterwards expreffing the juice, and beating it up with three times its weight of fine lugar.

In relaxations of the *uvula* and glands of the throat, this makes an excellent gargle, and may be used at diferentian.

Preferves are made by fteeping or boiling frefh vegetables firft in water, and afterwards in fyrup, or a folution of fugar. The fubject is either preferved moift in the fyrup, or taken out and dried, that the fugar may candy upon it. The laft is the most ufeful method.

Candied Orange Peel.

Soak Seville orange-peel in feveral waters, till it lofes its bitternefs; then boil it in a folution of double-refined fugar in water, till it becomes tender and transparent.

Candied lemon-peel is prepared in the fame manner.

It is needless to add more of these preparations, as they belong rather to the art of the confectioner than that of the apothecary.

DECOCTIONS.

WATER readily extracts the gummy and faline parts of vegetables; and though its action is chiefly confined to thele, yet the refinous and oily being intimately blended with the gummy and faline, are in great part taken up along with them. Hence watery decoctions and infufions of vegetables conflitute a large, and not unufeful, clafs of medicines. Although most vegetables yield their virtues to water, as well by infufion as decoftion, yet the latter is often neceffary, as it faves time, and does in a few minutes what the other would require hours, and fometimes days, to effect.

The medicines of this clafs are all intended for immediate ule.

Decostion of Althaa.

Take of the roots of marsh-mallows, moderately dried, three ounces; raisins of the fun, one ounce; water, three pints.

Boil

Boil the ingredients in the water till one third of it is confumed; afterwards firain the decolion and let it fland for fome time to fettle. If the roots be thoroughly dried, they must be boiled till one half the water be confumed.

In coughs, and fharp defluctions upon the lungs, this decoction may be used for ordinary drink.

The Common Decostion.

Take of camomile flowers, one ounce; elder flowers; and fweet fennel feeds, of each half an ounce; water, two quarts. Boil them for a little, and then firain the decofiion.

A medicine equally good may be prepared by infufing the ingredients for fome hours in boiling water.

This decoclion is chiefly intended as the bafis of clyfters, to which other ingredients may be occafionally added. It will likewife ferve as a common fomentation, fpirit of wine or other things being added in fuch quantity as the cafe may require.

Decostion of Logwood.

Boil three ounces of the fhavings, or chips of logwood, in four pints of water, till one half the liquor is walled. Two or three ounces of fimple cinnamon-water may be added to this decoction.

In fluxes of the belly, where the fironger aftringents are improper, a tea-cupful of this decofion may be taken with advantage three or four times a-day.

Decostion of the Bark.

Boil an ounce of the Peruvian bark, großly powdered, in a pint and a half of water to one pint; then firain the decoction. If a tea-fpoonful of the weak fpirit of vitriol be added to this medicine, it will render it both more agreeable and efficacious.

Compound Decostion of the Bark.

Take of Peruvian bark and Virginian fnake-root, großly powdered, each three drachms. Boil them in a pint of water to one half. To the firained liquor add an ounce and a half of aromatic water.

Sir John Pringle recommends this as a proper medicine towards the decline of malignant fevers, when the pulfe is low, the voice weak, and the head affected with a flupor but with little delirium.

The dole is four spoonfuls every fourth or fixth hour.

Decostion

Decostion of Sarsaparilla.

Take of frefh farfaparilla root, fliced and bruifed, two ounces; fhavings of guaiacum wood, one ounce. Boil over a flow fire, in three quarts of water, to one; adding towards the end, half an ounce of faffafras wood, and three drachms of liquorice. Strain the decociton.

This may either be employed as an affiftant to a courfe of mercurial alteratives, or taken after the mercury has been ufed for fome time. It firengthens the flomach, and reflores flefh and vigour to habits emaciated by the venereal difeafe. It may alfo be taken in the rheumatifm, and cutaneous diforders proceeding from foulnefs of the blood and juices. For all thefe intentions it is greatly preferable to the *DecoElion of Woods*.

This decoction may be taken, from a pint and a half to two quarts in the day.

The following decoftion is faid to be fimilar to that uled by *Kennedy*, in the cure of the venereal difeafe, and may fupply the place of Lifbon diet drink :

Take of farfaparilla, three ounces; liquorice and mezerion root, of each half an ounce; fhavings of guaiacum and falfafras wood, of each one ounce; crude antimony, powdered, an ounce and a half. Infufe thefe ingredients in eight pints of boiling water for twenty-four hours, then boil them till one half of the water is confumed; afterwards firain the decoftion.

This decoction may be used in the fame manner as the preceding.

Decostion of Seneka.

Take of feneka rattle-fnake root, one ounce; water, a pint and a half. Boil to one pint, and flrain.

This decoction is recommended in the pleurify, dropfy, rheumatifm, and fome obflinate diforders of the fkin. The dofe is two ounces, three or four times a-day, or oftner, if the flomach will bear it.

White Decoction.

Take of the pureft chalk, in powder, two ounces; gum arabic, half an ounce; water, three pints. Boil to one quart, and firain the decoction.

This is a proper drink in acute difeafes, attended with or inclining to, a loofenefs, and where acidities abound in the flomach flomach or bowels. It is peculiarly proper for children when afflicted with fourne's of the flomach, and for perfons who are fubject to the heartburn. It may be fweetened with fugar, as it is ufed, and two or three ounces of fimple cinnamon-water added to it.

An ounce of powdered chalk, mixed with two pints of water, will occafionally fupply the place of this decoction, and also of the chalk julep.

DRAUGHTS.

THIS is a proper form for exhibiting fuch medicines as are intended to operate immediately, and which do not need to be frequently repeated, as purges, vomits, and a few others, which are to be taken at one dofe. Where a medicine requires to be used for any length of time, it is better to make up a larger quantity of it at once, which faves both trouble and expence.

Anodyne Draught.

Take of liquid-laudanum, twenty-five drops; fimple cinnamon-water, an ounce; common fyrup, two drachms. Mix them.

In exceffive pain, where bleeding is not neceffary, and in great reftleffnefs, this composing draught may be taken and repeated occasionally.

Diuretic Draught.

Take of the diuretic falt, two fcruples; fyrup of poppies, two drachms; fimple cinnamon-water, and common water, of each an ounce.

This draught is of fervice in an obftruction or deficiency of urine.

Purging Draughts.

Take of manna, an ounce; foluble tartar, or Rochel falt, from three to four drachms. Diffolve in three ounces of boiling water; to which add Jamaica pepper-water, half an ounce.

As manna fometimes will not fit upon the flomach, an ounce or ten drachms of the bitter purging falts, diffolved in four ounces of water, may be taken inflead of the above.

Thole who cannot take falts, may use the following draught:

Take

ELECTUARIES.

Take of jalap in powder, a fcruple; common water, an ounce; aromatic tincture, fix drachms. Rub the jalap with twice its weight of fugar, and add to it the other ingredients.

Sweating Draughts.

Take fpirit of Mindererus, two ounces ; falt of hartfborn. five grains; fimple cinnamon-water, and fyrup of poppies. of each half an ounce. Make them into a draught.

In recent colds and rheumatic complaints, this draught is of fervice. To promote its effects, however, the patient ought to drink freely of warm water-gruel, or of fome other weak diluting liquor.

Vomiting Draughts.

Take of ipecacuanha, in powder, a fcruple; water, an ounce; fimple fyrup, a drachm. Mix them.

Perfons who require a fronger vomit may add to the above half a grain, or a grain, of emetic tartar.

Those who do not chuse the powder, may take ten drachms of the ipecacuanha wine; or half an ounce of' the wine, and an equal quantity of the fyrup of fquills.

ELECTUARIES.

E LECTUARIES are generally composed of the lighter powders, mixed with fyrup, honey, conferve, or mucilage, into fuch a confistence, that the powders may neither feparate by keeping, nor the mais prove too fliff for fwallowing. They receive chiefly the milder alterative medicines. and fuch as are not ungrateful to the palate.

Aftringent electuaries, and fuch as have pulps of fruit in them, fhould be prepared only in fmall quantities; as aftringent medicines lofe their virtues by being kept in this form. and the pulps of fruits are apt to ferment.

For the extraction of pulps it will be neceffary to boil unripe fruits, and ripe ones if they are dried, in a fmall quantity of water till they become foft. The pulp is then to be preffed out through a firong hair fieve, or thin cloth, and afterwards boiled to a due confistence, in an earthen veffel, over a gentle fire, taking care to prevent the matter from burning by continually flirring it. The pulps of fruit that are both ripe and fresh may be presed out without any previous boiling. 4

Lenitive

Lenitive Electuary.

Take of fenna, in fine powder, eight ounces; coriander feed, alfo in powder, four ounces; pulp of tamarinds and of French prunes, each a pound. Mix the pulps and powders together, and with a fufficient quantity of fimple fyrup, reduce the whole into an electuary.

A tea-fpoonful of this electuary, taken two or three times a-day, generally proves an agreeable laxative. It likewife ferves as a convenient vehicle for exhibiting more active medicines, as jalaps, fcammony, and fuch like.

This may fupply the place of the electuary of Caffia.

Electuary for the Dyfentery.

Take of the Japonic confection, two ounces; Locatelli's balfam, one ounce; rhubarb in powder, half an ounce; fyrup of marfhmallows, enough to make an electuary. -

It is often dangerous in dyfenteries to give opiates and aftringents, without interpoling purgatives. The purgative is here joined with these ingredients, which renders this a very fafe and useful medicine for the purpoles expressed in the title.

About the bulk of a nutmeg flould be taken twice or thrice a day, as the fymptoms and conflictution may require.

Electuary for the Epilepsy.

Take of Peruvian bark, in powder, an ounce; of powdered tin, and wild valerian root, each half an ounce; fimple fyrup, enough to make an electuary.

Dr. Mead directs a drachm of an electuary fimilar to this to be taken evening and morning, in the epilepfy, for the fpace of three months. It will be proper, however, to difcontinue the ufe of it for a few days every now and then. I have added the powdered tin, because the epilepfy often proceeds from worms.

Electuary for the Gonorrhæa.

Take of lenitive electuary, three ounces; jalap and rhubarb, in powder, of each two drachms; nitre, half an ounce; fimple fyrup, enough to make an electuary.

During the inflammation and tenfion of the urinary paffages, which accompany a virulent gonorrhœa, this cooling laxative may be ufed with advantage.

The dofe is a drachm, or about the bulk of a nutmeg, two or three times a day; more or lefs, as may be neceffary to keep the body gently open.

An electuary made of cream of tartar and fimple fyrup will occafionally fupply the place of this.

After the inflammation is gone off, the following electuary may be ufed:

Take of lenitive electuary, two ounces; balfam of capivi, one ounce; guin guaiacum and rhubarb, in powder, of each two drachms; fimple fyrup, enough to make an electuary. The dofe is the fame as of the preceding.

Electuary of the Bark.

Take of Peruvian bark, in powder, three ounces; cafcarilla, half an ounce; fyrup of ginger, enough to make an electuary.

In the cure of obflinate intermitting fevers, the bark is affifted by the cafcarilla. In hectic habits, however, it will be better to leave out the cafcarilla, and put three drachms of crude fal ammoniac in its flead.

Electuary for the Piles.

Take flowers of fulphur one ounce; cream of tartar, half an ounce; treacle, a fufficient quantity to form an electuary.

A tea-fpoonful of this may be taken three or four times a-day.

Electuary for the Palfy.

Take of powdered multard-feed, and conferve of rofes, each an ounce; fyrup of ginger, enough to make an electuary.

A tea-fpoonful of this may be taken three or four times a day.

Electuary for the Rheumatism.

Take of conferve of rofes, two ounces; cinnabar of antimony, levigated, an ounce and a half; gum guaiacum, in powder, an ounce; fyrup of ginger, a fufficient quantity to make an electuary.

In obflinate rheumatifms, which are not accompanied with a fever, a tea-fpoonful of this electuary may be taken twice a-day with confiderable advantage.

Z 7.

.....

EMUL-

APPENDIX.

EMULSIONS.

E MULSIONS, befide their ufe as medicines are also proper vehicles for certain fubftances, which could not otherwife be conveniently taken in a liquid form. Thus camphor, triturated with almonds, readily unites with water into an emulfion. Pure oils, balfams, refins, and other fimilar fubftances, are likewife rendered mifcible with water by the intervention of mucilages.

Common Emulfion.

Take of fweet almonds, an ounce; bitter almonds, a drachm; water, two pints.

Let the almonds be blanched, and beat up in a marble mortar; adding the water by little and little, fo as to make an emulfion; afterwards let it be ftrained.

Arabic Emulfion.

This is made in the fame manner as the above, adding to the almonds, while beating, two ounces and a half of the mucilage of gum arabic.

Where foft cooling liquors are neceffary, thefe emulfions may be used as ordinary drink.

Campborated Emulfion.

Take of camphor, half a drachm; fweet almonds, half a dozen; white fugar, half an ounce; mint water, eight ounces. Grind the camphor and almonds well together in a flone mortar, and add by degrees the mint water; then firain the liquor, and diffolve in it the fugar.

In fevers, and other diforders which require the use of camphor, a table-fpoonful of this emultion may be taken every two or three hours.

Emulsion of Gum Ammoniac.

Take of gum ammoniac, two drachms; water, eight ounces. Grind the gum with the water poured upon it by little and little, till it is diffolved.

This emultion is used for attenuating tough, vifcid phlegm, and promoting expectoration. In obflinate coughs, two ounces of the fyrup of poppies may be added to it. The dofe is two table-fpoonfuls three or four times a-day.

Oily

EXTRACTS.

Oily Emulfion.

Take of foft water, fix ounces; volatile aromatic fpirit, two drachms; Florence oil, an ounce; fhake them well together, and add, of fimple fyrup, half an ounce.

In recent colds and coughs, this emulfion is generally of fervice; but if the cough proves obfinate, it will fucceed better when made with the paregoric elixir of the Edinburgh Difpenfatory, inflead of the volasile aromatic fpirit. A tablefooonful of it may be taken every two or three hours.

EXTRACTS.

EXTRACTS are prepared by boiling the fubject in water, and evaporating the firained decoction to a due confiftence. By this process fome of the more active parts of plants are freed from the ufelefs, indiffoluble earthy matter, which makes the larger fhare of their bulk. Water, however, is not the only menftruum ufed in the preparation of extracts; fometimes it is joined with fpirits, and at other times rectified fpirit alone is employed for that purpofe.

Extracts are prepared from a variety of different drugs, as the bark, gentian, jalap, &c.; but, as they require a troublefome and tedious operation, it will be more convenient for a private practitioner to purchafe what he needs of them from a profeffed druggift, than to prepare them himfelf. Such of them as are generally ufed are inferted in our lift of fuch drugs and medicines as are to be kept for private practice.

FOMENTATIONS.

FOMENTATIONS are generally intended either to eafe pain, by taking off tenfion and fpafm; or to brace and reftore the tone and vigour of those parts to which they are applied. The first of these intentions may generally be answered by warm water, and the second by cold. Certain fubflances, however, are usually added to water with a view to heighten its effects, as anodynes, aromatics, aftringents, &c. We shall therefore fubjoin a few of the most useful medicated fomentations, that people may have it in their power to make use of them if they chuse.

Anodyne

APPENDIX.

Anodyne Fomentation.

Take of white poppy-heads, two ounces; elder flowers, half an ounce; water, three pints. Boil till one pint is evaporated, and flrain out the liquor.

This fomentation, as its title expresses, is used for relieving acute pain.

Aromatic Fomentation.

Take of Jamaica pepper, half an ounce; red wine, a pint. Boil them for a little, and then firain the liquor.

This is intended, not only as a topical application for external complaints, but alfo for relieving the internal parts. Pains of the bowels, which accompany dyfenteries and diarnhœas, flatulent colics, uneafinefs of the flomach, and retchings to vomit, are frequently abated by fomenting the abdomen and region of the flomach with the warm liquor.

Common Fomentation.

Take tops of wormwood and camomile flowers, dried, of each two ounces; water, two quarts. After a flight boiling, pour off the liquor.

Brandy or fpirit of wine may be added to this fomentation, in fuch quantity as the particular circumflances of the cafe fhall require; but thefe are not always neceffary.

Emollient Fomentation.

This is the fame as the common decoction.

Strengthening Fomentation.

Take of oak bark, one ounce; granate peel, half an ounce; alum, two drachms; fmith's forge water, three pints. Boil the water with the bark and peel to the confumption of one-third; then firain the remaining decofion, and diffolve it in alum.

This aftringent liquor is employed as an external fomentation to weak parts; it may also be used internally.

GARGLES.

HOWEVER trifling this class of medicines may appear, they are by no means without their ufe. They feldom indeed cure difeates, but they often alleviate very difagreeable lymptoms; as parchednels of the mouth, foulnels of the tongue and fauces, &c. they are peculiarly ufeful in fevers and and fore throats. In the latter, a gargle will fometimes remove the diforder; and in the former few things are more refreshing or agreeable to the patient, than to have his mouth frequently washed with fome foft detergent gargle.

One advantage of these medicines is, that they are eafily prepared. A little barley-water and honey may be had any where ; and if to these be added as much vinegar as will give them an agreeable sharpness, they will make a very useful gargle for fostening and cleansing the mouth.

Gargles have the best effect when injected with a fyringe.

Attenuating Gargle.

Take of water, fix ounces; honey, one ounce; nitre, a drachm and a half. Mix them.

This cooling gargle may be used either in the inflammatory quinfey, or in fevers, for cleaning the tongue and fauces.

Common Gargle.

Take of rofe-water, fix ounces; fyrup of clove Julyflowers, half an ounce; fpirit of vitriol, a fufficient quantity to give it an agreeable tharpnefs. Mix them.

This gargle, befides cleanfing the tongue and fauces, acts as a gentle repellent, and will fometimes remove a flight quinfey.

Detergent Gargle.

Take of the emollient gargle, a pint; tincture of myrrh, an ounce; honey, two ounces. Mix them.

When exulcerations require to be cleanfed, or the excretion of tough vifcid faliva promoted, this gargle will be of fervice.

Emollient. Gargle.

Take an ounce of marshmallow roots, and two or three figs: boil them in a quart of water till near one half of it be confumed; then strain out the liquor.

If an ounce of honey, and half an ounce of fpirit of falammoniac, be added to the above, it will then be an exceeding good *attenuating gargle*.

This gargle is beneficial in fevers, where the tongue and fauces are rough and parched, to foften these parts, and promote the difcharge of faliva.

The learned and accurate Sir John Pringle obferves, that in the inflammatory quinfey, or firangulation of the fauces, $Z \neq 3$ little little benefit arifes from the common gargles; that fuch as are of an acid nature do more harm than good, by contracting the emunctories of the faliva and mucus, and thickening thole humours; that a decoction of figs in milk and water has a contrary effect, efpecially if fome fal-ammoniac be added; by which the faliva is made thinner, and the glands brought to fecrete more freely; a circumflance always conducive to the cure.

INFUSIONS.

VEGETABLES yield nearly the fame properties to water by infufion as by decoction; and though they may require a longer time to give out their virtues in this way, yet it has feveral advantages over the other; fince boiling is found to diffipate the finer parts of many bitter and aromatic fabfiances, without more fully extracting their medicinal principles.

The author of the New Difpenfatory obferves, that even from those vegetables which are weak in virtue, rich infufions may be obtained, by returning the liquor upon fresh quantities of the subject, the water loading itself more and more with the active parts; and that these loaded infusions are applicable to valuable purposes in medicine, as they contain in a small compass the finer, more fubtile, and active principles of vegetables, in a form readily missible with the fluids of the human body.

Bitter Infusion.

Take tops of the leffer centaury and camomile flowers, of each half an ounce; yellow rind of lemon and orange peel, carefully freed from the inner white part, of each two drachms. Cut them in fmall pieces, and infufe them in a quart of boiling water.

For indigeftion, weaknefs of the flomach, or want of appetite, a tea-cupful of this infufion may be taken twice or thrice a day.

Infusion of the Bark.

To an ounce of the bark, in powder, add four or five table-fpoonfuls of brandy, and a pint of boiling water. Let them infule for two or three days.

This is one of the beft preparations of the bark for weak flomachs. In diforders where the corroborating virtues of that that medicine are required, a tea-cupful of it may be taken two or three times a-day.

Infusion of Carduus.

Infuse an ounce of the dried leaves of carduus benedictus, or bleffed thiftle, in a pint of common water, for fix hours, without heat; then filter the liquor through paper.

This light infufion may be given, with great benefit, in weaknefs of the flomach, where the common bitters do not agree. It may be flavoured at pleafure with cinnamon, or other aromatic materials.

Infusion of Linseed.

Take of linfeed, two fpoonfuls; liquorice root, fliced, half an ounce; boiling water, three pints. Let them ftand to infufe by the fire for fome hours, and then ftrain off the liquor.

If an ounce of the leaves of colt's-foot be added to thefe ingredients, it will then be the *pectoral infufion*. Both thefe are encollient mucilaginous liquors, and may be taken with advantage as ordinary drink in difficulty of making water; and in coughs and other complaints of the breaft.

Infusion of roses.

Take of red rofes, dried, half an ounce; boiling water, a quart; vitriolic acid, commonly called oil of vitriol, half a drachm; loaf fugar, an ounce.

Infuse the roles in the water for four hours, in an unglazed earthen veffel; afterwards pour in the acid, and having ftrained the liquor, add to it the fugar.

In an exceflive flow of the *men/es*, vomiting of blood, and other hæmorrhages, a tea-cupful of this gently aftringent infufion may be taken every three or four hours. It likewife makes an exceeding good gargle.

As the quantity of roles used here can have little or no effect, an equally valuable medicine may be prepared by mixing the acid and water without infusion.

Infusion of Tamarinds and Senna.

Take of tamarinds, one ounce; fenna, and cryftals of tartar, each two drachms. Let thefe ingredients be infufed four or five hours in a pint of boiling water; afterwards let the liquor be firained, and an ounce or two of the aromatic tincture added to it. Perfons who are eafily purged may leave out either the tamarinds or the cryftals of tartar.

ZZA

This

This is an agreeable cooling purge. A tea-cupful may be given every half hour till it operates.

This fupplies the place of the decostion of tamarinds and fenna.

Spanish Infusion.

Take of Spanish juice, cut into finall pieces, an ounce; falt of tartar, three drachms. Infuse in a quart of boiling water for a night. To the firained liquor add an ounce and an half of the lyrup of poppies.

In recent colds, coughs, and obfiructions of the breaft, a tea-cupful of this infufion may be taken with advantage three or four times a day.

Infusion for the Palfy.

Take of horfe-radifh root fhaved, muftard-feed bruifed, each four ounces; outer rind of orange-peel, one ounce. Infufe them in two quarts of boiling water, in a clofe veffel, for twenty-four hours.

In paralytic complaints, a tea-cupful of this warm flimulating medicine may be taken three or four times a-day. It excites the action of the folids, proves diuretic, and, if the patient be kept warm, promotes perfpiration.

If two or three ounces of the dried leaves of marfh-trefoil be used instead of the mustard, it will make the *antifcorbutic infusion*.

JULEPS.

THE bafis of Juleps is generally common water, or fome fimple diffilled water, with one-third or one-fourth its quantity of diffilled fpirituous water, and as much fugar or fyrup as is fufficient to render the mixture agreeable. This is tharpened with vegetable or mineral acids, or impregnated with other medicines fuitable to the intention.

Camphorated Julep.

Take of camphor, one drachm; rectified fpirit of wine, ten drops; double-refined fugar, half an ounce; boiling diffilled water, one pint. Rub the camphor first with the fpirit of wine, then with the fugar; lastly, add the water by degrees, and strain the liquor. In hyfterical and other complaints where camphor is proper, this julep may be taken in the dofe of a fpoonful or two as often as the ftomach will bear it.

Cordial Julep.

Take of fimple cinnamon-water, four ounces; Jamaica pepper-water, two ounces; volatile aromatic fpirit, and compound fpirit of lavender, of each two drachms; fyrap of orange-peel, an ounce. Mix them.

This is given in the dole of two fpoonfuls three or four times a-day, in diforders accompanied with great weaknefs and depreffion of fpirits.

Expectorating Julep.

Take of the emulfion of gum ammoniac, fix ounces; fyrup of fquills, two ounces. Mix them.

In coughs, afthmas, and obflructions of the breaft, two table-fpoonfuls of this julep may be taken every three or four hours.

Musk Julep.

Rub half a drachm of mußk well together with half an ounce of fugar, and add to it, gradually, of fimple cinuamon and pepper-mint water, each two ounces; of the volatile aromatic spirit, two drachms.

In the low flate of nervous fevers, hiccuping, convultions, and other fpafmodic affections, two table-fpoonfuls of this julep may be taken every two or three hours.

Saline Julep.

Diffolve two drachms of falt of tartar in three ounces of fresh lemon-juice, flrained; when the effervescence is over, add, of mint-water, and common water, each two ounces; of fimple fyrup, one ounce.

This removes fickness at the ftomach, relieves vomiting, promotes perspiration, and may be of some fervice in fevers, especially of the inflammatory kind.

Vomiting Julep.

Diffolve four grains of emetic tartar in eight ounces of water, and add to it half an ounce of the fyrnp of clove July flowers.

In the beginning of fevers, where there is no topical inflammation, this Julep may be given in the dofe of one table-4. fpoonful

APPENDIX.

fpoonful every quarter of an hour till it operates. Antimonial vomits ferve not only to evacuate the contents of the flomach, but likewife to promote the different excretions. Hence they are found in fevers to have nearly the fame effects as Dr. *James's Powder*.

MIXTURES.

A MIXTURE differs from a julep in this refpect, that it receives into its composition not only falts, extracts, and other substances diffoluble in water, but also earths, powders, and such substances as cannot be diffolved. A mixture is feldom either an elegant or agreeable medicine. It is nevertheless neceffary. Many perfons can take a mixture, who are not able to fwallow a bolus or an electuary : besides, there are medicines which act better in this than in any other form.

Astringent Mixture.

Take fimple cinnamon-water and common water, of each three ounces; fpirituous cinnamon-water, an ounce and a half; Japonic confection, half an ounce. Mix them.

In dyfenteries which are not of long flanding, after the neceffary evacuations, a fpoonful or two of this mixture may be taken every four hours, interpoing every fecond or third day a dole of rhubarb.

Diuretic Mixture.

Take of mint-water, five ounces; vinegar of fquills, fix drachms; fweet fpirit of nitre, half an ounce: fyrup of ginger, an ounce and a half. Mix them.

In obfructions of the urinary paffages, two fpoonfuls of this mixture may be taken twice or thrice a-day.

Laxative Abforbent Mixture.

Rub one drachm of magnefia alba in a mortar with ten or twelve grains of the best Turkey rhubarb, and add to them three ounces of common water; fimple cinnamon-water, and fyrup of fugar, of each one ounce.

As most difeates of infants are accompanied with acidities, this mixture may either be given with a view to correct thefe, or to open the body. A table-fpoonful may be taken for a dofe, and repeated three times a day. To a very young child half a fpoonful will be fufficient.

· When

714

MIXTURES.

When the mixture is intended to purge, the dofe may either be increased, or the quantity of rhubarb doubled.

This is one of the most generally useful medicines for children with which I am acquainted.

Saline Mixture.

Diffolve a drachm of the falt of tartar in four ounces of boiling water; and, when cold, drop into it fpirit of vitriol till the effervescence ceases; then add, of peppermint-water, two ounces, fimple fyrup, one ounce.

Where fresh lemons cannot be had, this mixture may occasionally supply the place of the faline julep.

Squill Mixture.

Take of fimple cinnamon-water, five ounces; vinegar of fquills, one ounce; fyrup of marshmallows, an ounce and a half. Mix them.

This mixture, by promoting expectoration, and the fecretion of urine, proves ferviceable in afthmatic and dropfical habits. A table fpoonful of it may be taken frequently.

OINTMENTS, LINIMENTS, and CERATES.

NOTWITHSTANDING the extravagant encomiums which have been beflowed on different preparations of this kind, with regard to their efficacy in the cure of wounds, fores, &c. it is beyond a doubt, that the moft proper application to a green wound is dry lint. But though ointments do not heal wounds and fores, yet they ferve to defend them from the external air, and to retain fuch fubflances as may be neceffary for drying, deterging, deflroying proud flefh, and fuch like. For thefe purpoles, however, it will be fufficient to infert only a few of the moft fimple forms, as ingredients of a more active nature can occafionally be added to them.

Yellow Basilicum Ointment.

Take of yellow wax, white refin, and frankincenfe, each a quarter of a pound; melt them together over a gentle fire; then add, of hogs' lard prepared, one pound. Strain the ointment while warm.

This ointment is employed for cleanfing and healing wounds and ulcers.

Qintment

Ointment of Calamine.

Take of olive oil, a pint and a half; white wax, and calamine ftone levigated, of each half a pound. Let the calamine ftone, reduced into a fine powder, be rubbed with fome part of the oil, and afterwards added to the reft of the oil and wax previoufly melted together, continually firring them till quite cold.

This ointment, which is commonly known by the name of *Turner's Cerate*, is an exceeding good application in burns and excoriations from whatever caufe.

Emollient Ointment.

Take of palm oil, two pounds; olive oil, a pint and a half; yellow wax, half a pound; Venice turpentine, a quarter of a pound. Melt the wax in the oils over a gentle fire; then mix in the turpentine, and firain the ointment.

This fupplies the place of *Althæ Ointment*, It may be used for anointing inflamed parts, &c.

Eye Ointment.

Take of hogs' lard prepared, four ounces; white wax, two drachms; tutty prepared, one ounce; melt the wax with the lard over a gentle fire, and then fprinkle in the tutty, continually flirring them till the ointment is cold.

This ointment will be more efficacious, and of a better confiftence, if two or three drachms of camphor be rubbed up with a little oil, and intimately mixed with it.

An: ther.

Take of camphor, and calamine ftone levigated, each fix drachms; verdegrife well prepared, two drachms; hogs' lard, and mutton fuct prepared, of each two ounces. Rub the camphor well with the powder; afterwards mix in the lard and fuet, continuing the triture till they be perfectly united.

This ointment has been long in effecem for difeafes of the eyes. It ought, however, to be used with caution, when the eyes are much inflamed or very tender.

Issue Ointment.

Mix half an ounce of Spanifh flies, finely powdered, in fix ounces of yellow bafilicum ointment.

This ointment is chiefly intended for dreffing bliffers, in order to keep them open during pleafure.

Ointment

Ointment of Lead.

Take of olive oil, half a pint; white wax, two ounces; fugar of lead, three drachms. Let the fugar of lead, reduced into a fine powder, be rubbed up with fome part of the oil, and afterwards added to the other ingredients, previoufly melted together, continually flirring them till quite cold.

This cooling and gently aftringent ointment may be used in all cafes where the intention is to dry and fkin over the part, as in fcalding, &c.

Mercurial Ointment.

Take of quickfilver, two ounces; hogs' lard, three ounces; mutton fuet, one ounce. Rub the quickfilver with an ounce of the hogs' lard in a warm mortar, till the globules be perfectly extinguifhed; then rub it up with the reft of the lard and fuet, previoufly melted together.

The principal intention of this ointment is to convey mercury into the body by being rubbed upon the fkin.

Ointment of Sulphur.

Take of hogs' lard prepared, four ounces; flowers of fulphur, an ounce and a half; crude fal ammoniac, two drachms; effence of lemon, ten or twelve drops. Make them into an ointment.

This ointment, rubbed upon the parts affected, will generally cure the itch. It is both the fafeft and beft application for that purpole, and, when made in this way, has no difagreeable fmell.

White Ointment.

Take of olive oil, one pint; white wax and fpermaccti, of each three ounces. Melt them with a gentle heat, and keep them conftantly and brifkly flirring together, till quite cold.

If two drachms of camphor, previoufly rubbed with a fmall quantity of oil, be added to the above, it will make the White campborated Ointment.

Liniment for Burns.

Take equal parts of Florence oil, or of fresh drawn linsed oil, and lime-water; shake them well together in a wide mouthed bottle, so as to form a liniment.

This

This is found to be an exceeding proper application for recent fealds or burns. It may either be fpread upon a cloth, or the parts affected may be anointed with it twice or thrice a-day.

White Liniment.

This is made in the fame manner as the white ointment, two thirds of the wax being left out.

This liniment may be applied in cafes of excoriation, where, on account of the largeness of the furface, the ointments with lead or calamine might be improper.

Liniment for the Piles.-

Take of emollient ointment, two ounces; liquid laudanum, half an ounce. Mix thefe ingredients with the yolk of an egg, and work them well together.

Volatile Liniment.

Take of Florence oil, an ounce; fpirit of harshorn, half an ounce. Shake them together.

This liniment, made with equal parts of the fpirit and oil, will be more efficacious, where the patient's skin is able to bear it.

Sir John Pringle obferves, that in the inflammatory quinfey, a piece of flannel, moiftened with this liniment, and applied to the throat, to be renewed every four or five hours, is one of the moft efficacious remedies; and that it feldom fails, after bleeding, either to leffen or carry off the complaint. The truth of this obfervation I have often experienced.

Camphorated Oil.

Rub an ounce of camphor, with two ounces of Florence oil, in a mortar, till the camphor be entirely diffolved.

This antifpafmodic liniment may be used in obstinate rheumatisms, and in some other cases accompanied with extreme pain and tension of the parts.

PILLS.

MEDICINES which operate in a fmall dole, and whole difagreeable tafte, or fmell, makes it neceffary that they fhould be concealed from the palate, are most commodioufly exhibited in this form. No medicine, however, that is intended to operate quickly, ought to be made into pills, as as they often lie for a confiderable time on the flomach before they are diffolved, fo as to produce any effect.

As the ingredients which enter the composition of pills are generally fo contrived, that one pill of an ordinary fize may contain about five grains of the compound, in mentioning the dofe we fhall only specify the number of pills to be taken; as one, two, three, &c.

Composing Pill.

Take of purified opium, ten grains; Caffile foap, half a drachm. Beat them together, and form the whole into twenty pills.

When a quieting draught will not fit upon the flomach, one, two, or three of these pills may be taken, as occasion requires.

Fætid Pill.

Take of afafœtida, half an ounce; fimple fyrup, as much as is neceffary to form it into pills.

In hysteric complaints, four or five pills, of an ordinary fize, may be taken twice or thrice a-day. They may likewife be of fervice to perfons afflicted with the affhma.

When it is neceffary to keep the body open, a proper quantity of rhubarb, aloes, or jalap, may occasionally be added to the above mais.

Hemlock Pill.

Take any quantity of the extract of hemlock, and adding to it about a fifth part its weight of the powder of the dried leaves, form it into pills of the ordinary fize.

The extract of hemlock may be taken from one grain to feveral drachms in the day. The beft method, however, of using thefe pills, is to begin with one or two, and to increase the dofe gradually, as far as the patient can bear them, without any remarkable degree of flupor or giddinefs.

Mercurial Pill.

Take of purified quickfilter and honey, each half an ounce. Rub them together in a mortar, till the globules of mercury are perfectly extinguifhed; then add, of Cafile foap, two drachms, powdered liquorice, or crumb of bread, a fufficient quantity to give the mafs a proper confiftence for pills.

When

When ftronger mercurial pills are wanted, the quantity of quickfilver may be doubled.

The dole of thefe pills is different, according to the intention with which they are given. As an alterant, two or three may be taken daily. To raife a falivation, four or five will be neceffary.

Equal parts of the above pill and powdered rhubarb made into a mais, with a fufficient quantity of fimple fyrup, will make a *Mercurial purging Pill*.

Mercurial sublimate Pill.

Diffolve fifteen grains of the corrofive fublimate of mercury in two drachms of the faturated folution of crude fal ammoniac, and make it into a pafle, in a glafs mortar, with a fufficient quantity of the crumb of bread. This mafs muft be formed into one hundred and twenty pills.

This pill, which is the most agreeable form of exhibiting the fublimate, has been found efficacious, not only in curing the venereal difeafe, but also in killing and expelling worms, after other powerful medicines had failed *.

For the venereal difeafe, four of these pills may be taken twice a-day, as an alterant three, and for worms two.

Plummer's Pill.

Take of calomel, or fweet mercury, and precipitated fulphur of antimony, each three drachms; extract of liquorice, two drachms. Rub the fulphur and mercury well together; afterwards add the extract, and, with a fufficient quantity of the mucilage of gum arabic, make them into pills.

This pill has been found a powerful, yet fafe, alterative in obflinate cutaneous diforders; and has completed a cure after falivation had failed. In venereal cafes it has likewife produced excellent effects. Two or three pills of an ordinary fize may be taken night and morning, the patient keeping moderately warm, and drinking after each dofe a draught of decoflion of the woods, or of farfaparilla.

* See a paper on this fubject in the Edinburgh Phyfical and Literary Effays, by the ingenious Dr. John Gardener.

Purging

Purging Pills.

Take of fuccotorine aloes, and Castile foap, each two drachms; of fimple fyrup, a fufficient quantity to make them into pills.

Four or five of these pills will generally prove a fufficient purge. For keeping the body gently open, one may be taken night and morning. They are reckoned both deobstruent and ftomachic, and will be found to answer all the purposes of Dr. Anderfon's pills, the principal ingredient of which is aloes.

Where aloetic purges are improper, the following pills may be used :

Take extract of jalap, and vitriolated tartar, of each two drachms; fyrup of ginger, as much as will make them of a proper confiftence for pills.

These pills may be taken in the fame quantity as the above.

Pill for the Jaundice.

Take of Caffile foap, fuccotorine aloes, and rhubarb, of each one drachm. Make them into pills with a fufficient quantity of fyrup or mucilage.

These pills, as their title expresses, are chiefly intended for the jaundice, which, with the affiftance of proper diet, they will often cure. Five or fix of them may be taken twice a day, more or lefs, as is neceffary to keep the body open. It will be proper, however, during their ufe, to interpole now and then a vomit of ipecacuanha or tartar emetic.

Stomachic Pill.

Take extract of gentian, two drachms; powdered rhu-barb and vitriolated tartar, of each one drachm; oil of mint, thirty drops; fimple fyrup; a fufficient quantity.

Three or four of these pills may be taken twice a-day, for invigorating the flomach, and keeping the body gently open.

Squill Pills.

Take powder of dried fquills, a drachm and a half; gum ammoniac, and cardamom feeds, in powder, of each three drachms; fimple fyrup, a fufficient quantity.

In dropfical and affhmatic complaints, two or three of these pills may be taken twice a-day, or oftner, if the ftomach will bear them.

721

Streng b-

Strengthening Pill.

Take fost extract of the bark, and falt of fleel, each a drachm. Make into pills.

In diforders arising from exceffive debility, or relaxation of the folids, as the *cholorofis*, or green fickness, two of these pills may be taken three times a day.

PLASTERS.

PLASTERS ought to be of a different confiftence, according to the purpoles for which they are intended. Such as are to be applied to the breafts or flomach ought to be foft and yielding; while those defigned for the limbs flould be firm and adhefive.

It has been fuppofed, that plaffers might be impregnated with the virtues of different vegetables, by boiling the recent vegetable with the oil employed for the composition of the plaffer; but this treatment does not communicate to the oils any valuable qualities.

The calces of lead boiled with oils unite with them into a plafter of a proper confiftence, which make the bafis of feveral other plafters. In boiling these compositions, a quantity of hot water must be added from time to time to prevent the plafter from burning or growing black. This, however, should be done with care, left it caufe the matter to explode.

Common Plaster.

Take of common olive oil, fix pints; litharge, reduced to a fine powder, two pounds and a half. Boil the litharge and oil together over a gentle fire, continually flirring them, and keeping always about half a gallon of water in the veffel: after they have boiled about three hours, a little of the plafter may be taken out and put into cold water, to try if it be of a proper confiftence: when that is the cafe, the whole may be fuffered to cool, and the water well preffed out of it with the hands.

This plaster is generally applied in flight wounds and excoriations of the fkin. It keeps the part foft and warm, and defends it from the air, which is all that is neceffary in fuchcafes. Its principal ufe, however, is to ferve as a bafis for other plasters. Adbefire

Adhefive Plaster.

Take of common plaster, half a pound; of Burgundy pitch, a quarter of a pound. Melt them together.

This plaster is principally used for keeping on other dreffings.

Anodyne Plaster.

Melt an ounce of adhefive plafter, and, when it is cooling, mix with it a drachm of powdered opium, and the fame quantity of camphor, previoufly rubbed up with a little oil.

This plaster generally gives eafe in acute pains, especially of the nervous kind.

Bliftering Plafter.

Take of Venice turpentine, fix ounces; yellow wax, two ounces; Spanish flies in fine powder, three ounces; powdered mustard, one ounce. Melt the wax, and while it is warm, add to it the turpentine, taking care not to evaporate it by too much heat. After the turpentine and wax are fufficiently incorporated, fprinkle in the powders, continually flirring the mass till it be cold.

Though this plafter is made in a variety of ways, one feldom meets with it of a proper confiftence. When compounded with oils and other greafy fubftances, its effects are blunted, and it is apt to run; while pitch and refin render it too hard and very inconvenient.

When the bliftering plafter is not at hand, its place may be fupplied by mixing with any foft ointment a fufficient quantity of powdered flies; or by forming them into a pafte with flour and vinegar.

Gum Plaster.

Take of the common plaster, four pounds; gum ammoniac and galbanum, strained, of each half a pound. Melt them together, and add, of Venice turpentime, fix ounces.

This plaster is used as a digestive, and likewise for disculfing indolent tumours.

Mercurial Plaster:

Take of common plaster, one pound; of guin ammoniac, frained, half a pound. Melt them together, and, when cooling, add eight ounces of quick-filver, previoufly extinguilhed by triture, with three ounces of hog's lard,

3 A 2

This

APPENDIX.

This plaster is recommended in pains of the limbs arifing from a venereal caufe. Indurations of the glands, and other violent tumours, are likewife found fometimes to yield to it.

Stomach Plaster.

Take of gum plafter, half a pound; camphorated oil, an ounce and a half; black pepper, or capficum, where it can be had, one ounce. Melt the plafter, and mix with it the oil; then fprinkle in the pepper, previoufly reduced to a fine powder.

An ounce or two of this plafter, fpread upon foft leather, and applied to the region of the flomach, will be of fervice in flatulencies arifing from hyfleric and hypochondriac affections. A little of the expressed oil of mace, or a few drops of the effential oil of mint, may be rubbed upon it before it is applied.

This may fupply the place of the Antihysteric Plaster.

Warm Plaster.

Take of gum plaster, one ounce; blistering plaster, two drachms. Meit them together over a gentle fire.

This plaster is ufeful in the fciatica and other fixed pains of the rheumatic kind: it ought, however, to be worn for fome time, and to be renewed, at least once a-week. If this is found to blifter the part, which is fometimes the cafe, it must be made with a fmaller proportion of the bliftering plaster.

Wax Plaster.

Take of yellow wax, one pound; white refin, half a pound; mutton fuet, three quarters of a pound. Melt them together.

This is generally used instead of the *Melilot Plaster*. It is a proper application after blifters, and in other cales where a gentle digeflive is neceffary.

POWDERS.

THIS is one of the most fimple forms in which medicine can be administered. Many medicinal fubftances, however, cannot be reduced into powder, and others are too difagreeable to be taken in this form.

The

The lighter powders may be mixed in any agreeable thin liquor, as tea or water-gruel. The more ponderous will require a more confiftent vehicle, as fyrup, conferve, jelly, or honey.

Gums, and other fubftances which are difficult to powder, fhould be pounded along with the drier ones; but those which are too dry, especially aromatics, ought to be sprinkled during their pulverization with a few drops of any proper water.

Aromatic powders are to be prepared only in fmall quantities at a time, and kept in glafs veffels clofely flopped. Indeed, no powders ought to be expoled to the air or kept too long, otherwife their virtues will be in great meafure deftroyed.

Astringent Powder.

Take of alum and Japan earth each two drachms. Pound them together, and divide the whole into ten or twelve dofes.

In an immoderate flow of the *menfes*, and other hæmorrhages, one of these powders may be taken every hour, or every half-hour, if the discharge be violent.

Powder of Bole.

Take of bole armenic, or French bole, two ounces; cinnamon, one ounce; tormentil root and gum arabic, of each fix drachms; long pepper, one drachm. Let all these ingredients be reduced into a powder.

This warm, glutinous affringent powder, is given in fluxes, and other diforders where medicines of that clafs are neceffary, in the dofe of a fcruple, or half a drachm.

If a drachm of opium be added, it will make the *Powder of Bole with Opium*, which is a medicine of confiderable efficacy. It may be taken in the fame quantity as the former, but not above twice or thrice a-day.

Carminative Powder.

Take of coriander-feed, half an ounce; ginger, one drachm; nutmegs, half a drachm; fine fugar, a drachm and a half. Reduce them into powder for twelve dofes.

This powder is employed for expelling flatulencies arifing from indigeflion, particularly those to which hysleric and hypochondriac perfons are fo liable. It may likewise be given in small quantities to children in their food, when troubled with gripes.

Diuretic

Diuretic Powder.

Take of gum arabic four ounces; purified nitre, one ounce. Pound them together, and divide the whole into twenty-four dofes.

During the first flage of the venereal difease, one of these cooling powders may be taken three times a-day, with confiderable advantage.

Aromatic Opening Powder.

Take of the beft Turkey rhubarb, cinnamon, and fine fugar, each two drachms. Let the ingredients be pounded, and afterwards mixed well together.

When flatulency is accompanied with coffivenels, a teafpoonful of this powder may be taken once or twice a-day, according to circumflances.

Saline Laxative Powder.

Take of foluble tartar, and cream of tartar, each one drachm; purified nitre, half a drachm. Make them into a powder.

In fevers, and other inflammatory diforders, where it is neceffary to keep the body gently open, one of these cooling laxative powders may be taken in a little gruel, and repeated occasionally.

Steel Powder.

Take filings of ficel, and loaf-fugar, of each two ounces; ginger, two drachms. Pound them together.

In obfiructions of the *menfes*, and other cafes where field is proper, a tea-fpoonful of this powder may be taken twice a-day, and washed down with a little wine or water.

Sudorific Powder.

Take purified nitre and vitriolated tartar, of each half an ounce; opium and ipecacuanha, of each one drachm. Mix the ingredients, and reduce them to a fine powder.

This is generally known by the name of *Dover's Powder*. It is a powerful fudorific. In obflinate rheumatifms, and other cales where it is neceffary to excite a copious fweat, this powder may be adminifiered in the dole of a fcruple or half a drachm. Some patients will require two fcruples. It ought to be accompanied with the plentiful ufe of fome warm diluting liquor.

Worm

Worm-powders.

Take of tin reduced into a fine powder, an ounce; Æthiops mineral, two drachms. Mix them well together, and divide the whole into fix dofes.

One of thefe powders may be taken in a little fyrup, honey, or treacle, twice a-day. After they have been all ufed, the following anthelmintic purge may be proper.

Purging Worm-powder.

Take of powdered rhubarb, a fcruple; fcammony and calomel, of each five grains. Rub them together in a mortar for one dole.

For children the above dofes must be leffened according to their age.

If the powder of tin be given alone, its dofe may be confiderably increafed. The late Dr. Alfton gave it to the amount of two ounces in three days, and fays, when thus adminifered, that it proved an egregious anthelmintic. He purged his patients both before they took the powder and afterwards.

Powder for the Tape-worm.

Early in the morning the patient is to take in any liquid two or three drachms, according to his age and conflitution, of the root of the male fern reduced into a fine powder. About two hours afterwards, he is to take of calomel and refin of fcammony, each ten grains; gum gamboge, fix grains. These ingredients must be finely powdered and given in a little fyrup, honey, treacle, or any thing that is most agreeable to the patient. He is then to walk gently about, now and then drinking a dish of weak green tea, till the worm is passed. If the powder of the fern produces nausea, or fickness, it may be removed by fucking the juice of an orange or lemon.

This medicine, which had been long kept a fecret abroad for the cure of the tape-worm, was fome time ago purchafed by the French King, and made public for the benefit of mankind. Not having had an opportunity of trying it, I can fay nothing from experience concerning its efficacy. It feems, however, from its ingredients, to be an active medicine, and ought to be taken with care. The dofe here preforibed is fufficient for the frongeft patient; it muft, therefore, be reduced according to the age and conflictution.

SYRUPS.

APPENDIX.

SYRUPS.

SYRUPS were fome time ago looked upon as medicines of confiderable value. They are at prefent, however, regarded chiefly as vehicles for medicines of greater efficacy, and are ufed for fweetening draughts, juleps, or mixtures; and for reducing the lighter powders into bolufes, pills, and electuaries. As all thefe purpofes may be anfwered by the fimple fyrup alone, there is little occafion for any other; efpecially as they are feldom found but in a ftate of fermentation; and as the dofe of any medicine given in this form is very uncertain. Perfons who ferve the public muft keep whatever their cuffomers call for; but to the private practitioner nine-tenths of the fyrups ufually kept in the fhops are unneceffary.

Simple Syrup.

Is made by diffolving in water, either with or without heat, about double its weight of fine fugar.

If twenty-five drops of laudanum, be added to an ounce of the fimple fyrup, it will fupply the place of diacodium, or the fyrup of poppies, and will be found a more fafe and certain medicine.

The lubricating virtues of the fyrup of marshmallows may likewife be supplied, by adding to the common fyrup a sufficient quantity of mucilage of gum arabic.

Thole who chule to preferve the juice of lemons in form of fyrup, may diffolve in it, by the heat of a warm bath, nearly double its weight of fine fugar. The juice ought to be previoufly firained, and fuffered to fland till it fettles.

The fyrup of ginger is fometimes of ufe as a warm vehicle for giving medicine to perfons afflicted with flatulency. It may be made by infufing two ounces of bruifed ginger in two pints of boiling water for twenty-four hours. After the liquor has been firained, and has flood to fettle for fome time, it may be poured off, and a little more than double its weight of fine powdered fugar diffolved in it.

TINCTURES, ELIXIRS, Sc.

R ECTIFIED fpirit is the direct menftruum of the refine and effential oils of vegetables, and totally extracts thefe active principles from fundry fubflances, which yields them to water, either not at all, or only in part. It It diffolves likewife thofe parts of animal fubflances in which their peculiar fmells and taftes refide. Hence the tinflures prepared with rectified fpirits form an ufeful and elegant clafs of medicines, poffeffing many of the moft effential virtues of fimples, without being clogged with their inert or ufelefs parts.

Water, however, being the proper menftruum of the gummy, faline, and faccharine parts of medicinal fubftances, it will be neceffary, in the preparation of feveral tinctures, to make ule of a weak fpirit, or a composition of rectified fpirit and water.

Aromatic Tincture.

Infuse two ounces of Jamaica pepper in two pints of brandy, without heat, for a few days; then firain off the tincture.

This fimple tincture will fufficiently answer all the intentions of the more cofly preparations of this kind. It is rather too hot to be taken by itfelf; but is very proper for mixing with fuch medicines as might otherwise prove too cold for the flomach.

Compound Tincture of the Bark.

Take of Peruvian bark, two ounces; Seville orange-peel and cinnamon, of each half an ounce. Let the bark be powdered, and the other ingredients bruifed; then infufe the whole in a pint and a half of brandy, for five or fix days, in a clole veffel; afterwards ilrain off the inclure.

This tincture is not only beneficial in intermitting fevers, but allo in the flow, nervous and putrid kinds, especially towards their decline.

The dofe is from one drachm to three or four, every fifth or fixth hour. It may be given in any fuitable liquor, and occafionally fharpened with a few drops of the fpirit of vitriol.

Volatile Fætid Tincture.

Infuse two ounces of afafætida in one pint of volatile aromatic fpirit, for eight days, in a close bottle, frequently fhaking it; then ftrain the tincture.

This medicine is beneficial in hyfteric diforders, efpecially when attended with lownefs of fpirits, and faintings. A tea-fpoonful of it may be taken in a glafs of wine, or a cupof penny-royal tea.

Volatile

Volatile TinElure of Gum Guaiacum.

Take of gum guaiacum, four ounces; volatile aromatic fpirit, a pint. Infufe without heat, in a veffel well flopped, for a few days; then firain off the tincture*.

In rheumatic complaints, a tea-fpoonful of this tincture may be taken in a cup of the infufion of water trefoil, twice or thrice a day.

Tineture of Black Hellebore.

Infufe two ounces of the roots of black hellebore, bruifed, in a pint of proof fpirit, for feven or eight days; then filter the tincture through paper. A femple of cochineal may be infufed along with the roots, to give the tincture a colour.

In obfiructions of the *menfes*, a tea-fpoonful of this tincture may be taken in a cup of camomile or penny-royal tea twice a-day.

Aftringent Tinflure.

Digeft two ounces of gum kino, in a pint and a half of brandy, for eight days; afterwards flrain it for ufe.

This tincture, though not generally known, is a good aftringent medicine. With this view, an ounce, or more, of it may be taken three or four times a-day.

Tinclure of Myrrb and Aloes.

Take of gum myrrh an ounce and a half; hepatic aloes one ounce. Let them be reduced to a powder, and infufed in two pints of rectified fpirits, for fix days, in a gentle heat; then firain the tincture.

This is principally used by furgeons for cleanfing foul ulcers, and refiraining the progress of gangrenes. It is also, by fome, recommended as a proper application to green wounds.

TinEture of Opium, or Liquid Laudanum.

Take of crude opium, two ounces; fpirituous aromatic water, and mountain wine, of each ten ounces. Diffolve the opium, fliced, in the wine, with a gentle heat, frequently flirring it; afterwards add the fpirit, and flrain off the tinflure.

* A very good tincture of guaiacum, for domefic ufe, may be made by infufing two or three ounces of the gum in a bettle of rum or brandy.

3

As twenty-five drops of this tincture contain about a grain of opium, the common dole may be from twenty to thirty drops.

Sacred Tinclure, or Tinclure of Hiera Picra.

Take of fuccotorine aloes in powder, one ounce; Virginian fnake-root and ginger, of each two drachms. Infufe in a pint of mountain wine, and half a pint of brandy, for a week, frequently fhaking the bottle, then firain off the tincture.

This is a fafe and uleful purge for perfons of a languid and phlegmatic habit; but is thought to have better effects, taken in fmall dofes as a laxative.

The dole, as a purge, is from one to two ounces,

Compound Tincture of Senna.

Take of fenna, one ounce: jalap, coriander feeds, and cream of tartar, of each half an ounce. Infufe them in a pint and a half of French brandy for a week; then firain the tincture, and add to it four ounces of fine fugar.

This is an agreeable purge, and answers all the purposes of the Elixir Salutis, and of Daffy's Elixir.

The dofe is from one to two or three ounces.

Tincture of Spanish Flies.

Take of Spanish flies, reduced to a fine powder, two ounces; fpirit of wine, one pint. Infuse for two or three days; then firain off the tincture.

This is intended as an acrid flimulant for external ufe. Parts affected with the palfy or chronic rheumatifm may be frequently rubbed with it.

Tincture of the Balfam of Tolu.

Take of the balfam of Tolu, an ounce and an half; rectified fpirit of wine, a pint. Infufe in a gentle heat until the balfam is diffolved; then firain the tincture.

This tincture poffeffes all the virtues of the balfam. In coughs, and other complaints of the breaft, a tea-fpoonful or two of it may be taken in a bit of loaf fugar. But the beft way of ufing it is in fyrup. An ounce of the tincture, properly mixed with two pounds of fimple fyrup, will make what is commonly called the *Balfamic Syrup*.

Tinsture

Tinsture of Rhubarb.

Take of rhubarb, two ounces and a half; leffer cardamon feeds, half an ounce; brandy, two pints. Digeft for a week, and firain the tincture.

Thole who chule to have a vinous tincture of rhubarb may infule the above ingredients in a bottle of Lifbon wine, adding to it about two ounces of proof fpirits.

If half an ounce of gentian root, and a drachm of Virginian fnake-root be added to the above ingredients, it will make the bitter tincture of rhubarb.

All thefe tinctures are defigned as flomachics and corroborants as well as purgatives. In weaknefs of the flomach, indigeflion, laxity of the inteflines, fluxes, cholicky and fuch like complaints, they are frequently of great fervice. The dofe is from half a fpoonful to three or four fpoonfuls or more, according to the circumflances of the patient, and the purpofes it is intended to anfwer.

Paregoric Elixir.

Take of flowers of benzoin, half an ounce; opium, two drachms. Infufe in one pound of the volatile aromatic fpirit, for four or five days, frequently flaking the bottle; afterwards ftrain the elixir.

This is an agreeable and fafe way of administering opium. It eafes pain, allays tickling coughs, relieves difficult breathing, and is ufeful in many diforders of children, particularly the hooping cough.

The dofe to an adult is from fifty to a hundred drops.

Sacred Elixir.

Take of rhubarb cut fmall, ten drachms; fuccotorine aloes, in powder, fix drachms; leffer cardamom feeds, half an ounce; French brandy, two pints. Infuse for two or three days, and then firain the elixir.

This uleful flomachic purge may be taken from one ounce to an ounce and a half.

Stomachic Elixir.

Take of gentian root, two ounces; Curaffao oranges, one ounce; Virginian fnake-root, half at ounce. Let the ingredients be bruifed, and infufed for three or four days in two pints of French brandy; afterwards firain out the clixir. Thia

VINEGARS.

This is an excellent flomach bitter. In flatulencies, indigeflion, want of appetite, and fuch like complaints, a fmall glafs of it may be taken twice a-day. It likewife relieves the gout in the flomach, when taken in a large dofe.

Acid Elixir of Vitriol.

Take of the aromatic tincture, one pint; oil of vitriol, three ounces. Mix them gradually, and after the fæces have fubfided, filter the elixir through paper, in a glafs funnel.

This is one of the beft medicines which I know for hyfteric and hypochondriac patients, afflicted with flatulencies arifing from relaxation or debility of the flomach and inteftines. It will fucceed where the moft celebrated flomachic bitters have no effect. The dole is from ten to forty drops, in a glafs of wine or water, or a cup of any bitter infufion, twice or thrice a-day. It floud be taken when the flomach is moft empty.

Campborated Spirit of Wine.

Diffolve an ounce of camphor in a pint of rectified fpirits.

This folution is chiefly employed as an embrocation in bruifes, palfies, the chronic rheumatilm, and for preventing gangrenes.

The above quantity of camphor, diffolved in half a pound of the volatile aromatic fpirit, makes Ward's Effence.

Spirit of Mindererus.

Take of volatile fal ammoniac, any quantity. Pour on it gradually diffilled vinegar, till the effervefcence ceafes.

This medicine is uleful in promoting a difcharge both by he fkin and urinary paffage. It is also a good external application in firains and bruifes.

When intended to raife a fweat, half an ounce of it in a cup of warm gruel may be given to the patient in bed every hour till it has the defired effect.

VINEGARS.

VINEGAR is an acid produced from vinous liquors by a fecond fermentation. It is an ufeful medicine both in inflammatory and putrid diforders. Its effects are, to cool cool the blood, quench thirfl, counteract a tendency to platrefaction, and allay inordinate motions of the fyftem. It likewife promotes the natural fectetions, and in fome cafes excites a copious fweat, where the warm medicines, called alexipharmic, tend rather to prevent that falutary evacuation.

Weaknefs, faintings, vomitings, and other hyfleric affections, are often relieved by vinegar applied to the mouth and nofe, or received into the flomach. It is of excellent ufe alfo in correcting many poilonous fubflances, when taken into the flomach; and in promoting their expulsion, by the different emunctories, when received into the blood.

Vinegar is not only an ufeful medicine, but ferves likewife to extract, in tolerable perfection, the virtues of feveral other medicinal fubflances. Most of the odoriferous flowers impart to it their fragrance, together with a beautiful purplifth or red colour. It also affilts or coincides with the intention of fquills, garlic, gum ammoniac, and feveral other valuable medicines.

These effects, however, are not to be expected from every thing that is fold under the name of vinegar, but from fuck as is found and well prepared.

The best vinegars are those prepared from French wines.

It is neceffary for fome purpofes that the vinegar be diftilled; but as this operation requires a particular chemical apparatus, we shall not infert it.

Vinegar of Litharge.

Take of litharge, half a pound; firong vinegar, two pints. Infufe them together in a moderate heat for three days, frequently flaking the veffel; then filter the liquor for use.

This medicine is little ufed, from a general notion of its being dangerous. There is reafon, however, to believe, that the preparations of lead with vinegar are poffelfed of fome valuable properties, and that they may be ufed in many cafes with fafety and fuccefs.

A preparation of a fimilar nature with the above has of late been extelled by Goulard, a French furgeon, as a fafe and extensively uleful medicine, which he calls the *Extract of Saturn*, and orders to be made in the following manner:

Take of litharge, one pound; vinegar made of French wine, two pints. Put them together into a glazed earther pipkin,

734

WATERS BY INFUSION, &c. 735

pipkin, and let them boil, or rather fimmer, for an hour, or an hour and a quarter, taking care to flir them all the while with a wooden fpatula. After the whole has flood to fettle, pour off the liquor which is upon the top into bottles for ule.

With this extract Goulard makes his vegeto-mineral water *, which he recommends in a great variety of external diforders, as inflammations, burns, bruiles, fprains, ulcers, &cc.

He likewife prepares with it a number of other forms of medicine, as poultices, plafters, ointments, powders, &c.

Vinegar of Roses.

Take of red roles, half a pound; ftrong vinegar, half a gallon. Infuse in a close vessel for several weeks, in a gentle heat; and then strain off the liquor.

This is principally used as an embrocation for headachs, &c.

Vinegar of Squills.

Take of dried fquills, two ounces; diffilled vinegar, two pints. Infufe for ten days or a fortnight in a gentle degree of heat, afterwards frain off the liquor, and add to it about a twelfth part its quantity of proof fpirits.

This medicine has good effects in diforders of the breaft, occafioned by a load of vifcid phlegm. It is alfo of ufe in hydropic cafes for promoting a difcharge of urine.

The dole is from two drachms to two ounces, according to the intention for which it is given. When intended to act as a vomit, the dole ought to be large. In other cafes, it must not only be exhibited in fmall doles, but also mixed with cinnamon water, or fome other agreeable aromatic liquor, to prevent the naufea it might otherwife occasion.

WATERS BY INFUSION, Gc.

Lime Water.

POUR two gallons of water gradually upon a pound of fresh burnt quicklime; and when the ebullition ceases, fir them well together; then fuffer the whole to stand at resh, that the lime may settle, and afterwards filter the liquor through paper, which is to be kept in vessels closely stopt.

* See Collyrium of Lead.

The lime-water from calcined oyfter-fhells, is prepared in the fame manner.

Lime-water is principally ufed for the gravel; in which cafe, from a pint to two or more of it may be drunk daily. Externally it is ufed for washing foul ulcers, and removing the itch, and other difeafes of the skin.

Compound Lime Water.

Take fhavings of guaiacum wood, half a pound; liquo4 rice root, one ounce; faffafras bark, half an ounce; cori4 ander feeds, three drachms; fimple lime-water, fix pints.

Infufe without heat for two days, and then firain off the liquor.

In the fame manner may lime-water be impregnated with the virtues of other vegetable fubfiances. Such impregnation not only renders the water more agreeable to the palate, but alfo a more efficacious medicine, efpecially in cutaneous diforders and foulnefs of the blood and juices.

It may be taken in the fame quantity as the fimple water.

Sublimate Water.

Diffolve eight grains of the corrofive fublimate in a pint of cinnamon water.

If a fironger folution be wanted, a double or triple quantity of fublimate may be used.

The principal intention of this is to cleanfe foul ulcers, and confume proud flefh.

Styptic Water.

Take of blue vitriol and alum, each an ounce and a half; water, one pint. Boil them until the falts are diffolved, then filter the liquor, and add to it a drachm of the oil of vitriol.

This water is used for flopping a bleeding at the nose, and other hæmorrhages; for which purpose cloths or doffils dipt in it must be applied to the part.

Tar Water.

Pour a gallon of water on two pounds of Norway tar, and flir them firongly together with a wooden rod: after they have fload to fettle for two days, pour off the water for use

Though

Though tar-water falls greatly flort of the character which has been given of it, yet it posses for medicinal virtues. It fensibly raises the pulse, increases the fecretions, and fometimes opens the body, or occasions vomiting.

A pint of it may be drank daily, or more, if the flomach can bear it. It is generally ordered to be taken on an empty flomach, viz. four ounces morning and evening, and the fame quantity about two hours after breakfaft and dinner.

SIMPLE DISTILLED WATERS.

A GREAT number of diffilled waters were formerly kept in the fhops, and are flill retained in fome Difpenfatories. But we confider them chiefly in the light of grateful diluents, fuitable vehicles for medicines of greater efficacy, or for rendering difgufful ones more agreeable to the palate and flomach. We fhall therefore infert only a few of thofe which are beft adapted to thefe intentions.

The management of a flill being now generally underflood, it is needless to spend time in giving directions for that purpose.

Cinnamon Water.

Steep one pound of cinnamon bark, bruifed, in a gallon and a half of water, and one pint of brandy, for two days; and then diftil off one gallon.

This is an agreeable aromatic water, poffeffing in a high degree the fragrance and cordial virtues of the fpice.

Pennyroyal Water.

Take of pennyroyal leaves, dried, a pound and a half; water, from a gallon and a half to two gallons. Draw off by diffillation one gallon.

This water poffeffes, in a confiderable degree, the fmell, tafte, and virtues of the plant. It is given in mixtures and juleps to hyfteric patients.

An infusion of the herb in boiling water answers nearly the fame purposes.

Peppermint Water.

This is made in the fame manner as the preceding.

Spearmint Water.

This may also be prepared in the fame way as the pennyroyal water.

Both

737

Both thele are useful flomachic waters, and will formetimes relieve vomiting, effectally when it proceeds from indigettion, or cold vifeid phlegm. They are likewife useful in fome colicky complaints, the gout in the flomach, &c. particularly the peppermint water.

An infufion of the fresh plant is frequently found to have the fame effects as the diffilled water.

Rofe Water.

Take of roles fresh gathered, fix pounds; water, two gallons. Difil off one gallon.

This water is principally valued on account of its fine flavour.

Jamaica Pepper Water.

Take of Jamaica pepper, half a pound ; water, a gallon and a half. Diftil off one gallon.

This is a very elegant diffiled water, and may in most cafes supply the place of the more coftly fpice waters.

SPIRITUOUS DISTILLED WATERS.

Spirituous Cinnamon Water.

TAKE of cinnamon bark, one pound; proof fpirit, and common water, of each one gallon. Steep the cinnamon in the liquor for two days; then diffil off one gallon.

Spirituous Jamaica Pepper Water.

Take of Jamaica pepper, half a pound ; proof fpirit, three gallons ; water, two gallons. Diftil off three gallons.

This is a fufficiently agreeable cordial, and may fupply the place of the Aromatic. Water.

WHEYS.

Alum Whey.

BOIL two drachms of powdered alum in a pint of milk till it is curdled; then firain out the whey.

This whey is beneficial in an immoderate flow of the *menfes*, and in a *diabetes*, or exceffive difcharge of urine.

The dole is two, three, or four ounces, according as the flomach will bear it, three times a day. If it flould occafion vomiting, it may be diluted.

Mußard

WINES.

Mustard Whey.

Take milk and water, of each a pint; bruifed muflardfeed, an ounce and a half. Boil them together till the curd is perfectly feparated; afterwards firain the whey through a cloth.

This is the moft elegant, and by no means the leaft efficacious method of exhibiting muftard. It warms and invigorates the habit, and promotes the different fecretions. Hence, in the low flate of nervous fevers, it will often fupply the place of wine. It is allo of ufe in the chronic rheumatifm, palfy, dropfy, &cc. The addition of a little fugar will render it more agreeable.

The dole is an ordinary tea-cupful four or five times a-day.

Scorbutic Whey.

This whey is made by boiling half a pint of the fcorbutic juices in a quart of cow's milk. More benefit, however, is to be expected from eating the plants, than from their expected juices.

The fcorbutic plants are, bitter oranges, brooklime, garden fcurvy-grafs, and water-creffes.

A number of other wheys may be prepared nearly in the fame manner, as orange whey, cream of tartar whey, &cc. Thefe are cooling pleatant drinks in fevers, and may be rendered cordial, when neceffary, by the addition of wine.

WINES.

THE effects of wine are, to raife the pulfe, promote perfpiration, warm the habit, and exhilarate the fpirits. The red wines, befides thefe effects, have an aftringent quality, by which they firengthen the tone of the flomach and inteflines, and by this means prove ferviceable in reftraining immoderate fecretions.

The thin fharp wines have a different tendency. They pafs off freely by the different emunctories, and gently open the body. The effects of the full-bodied wines are, however, much more durable than those of the thinner.

All fweet wines contain a glutinous fubflance, and do not pafs off freely. Hence they will heat the body more than an equal quantity of any other wine, though it should contain fully as much spirit.

From

From the obvious qualities of wine, it must appear to be an excellent cordial medicine. Indeed, to fay the truth, it is worth all the reft put together.

But to answer this character, it must be found and good. No benefit is to be expected from the common traft that is often fold by the name of wine, without posses of the grape. Of the juice of the grape. Perhaps no medicine is more rarely obtained genuine than wine.

Wine is not only used as a medicine, but is also employed as a menfruum for extracting the virtues of other medicinal fubflances; for which it is not ill adapted, being a compound of water, inflammable fpirit, and acid; by which means it is enabled to act upon vegetable and animal fubflances, and also to diffolve fome bodies of the metallic kind, fo as to impregnate itfelf with their virtues, as fleel, antimony, &c.

Anthelmintic Wine.

Take of rhubarb, half an ounce; worm-feed, an ounce. Bruife them, and infufe without heat in two pints of red port wine for a few days, then firain off the wine.

As the ftomachs of perfons afflicted with worms are always debilitated, red wine alone will often prove ferviceable: it muft, however, have fill better effects when joined with bitter and purgative ingredients, as in the above form.

A glafs of this wine may be taken twice or thrice a-day.

Antimonial Wine.

Take glafs of antimony, reduced to a fine powder, half an ounce; Lifbon wine, eight ounces. Digeft, without heat, for three or four days, now and then flaking the bottle; afterwards filter the wine through paper.

The dole of this wine varies according to the intention. As an alterative and diaphoretic, it may be taken from ten to fifty or fixty drops. In a large dole it generally proves cathartic, or excites vomiting.

Bitter Wine.

Take of gentian root, yellow rind of lemon-peel, frefh, each one ounce; long pepper two drachms: mountain wine, two pints. Infufe without heat for a week, and firain out the wine for ufe.

In complaints arifing from weaknefs of the flomach, or indigeftion, a glafs of this wine may be taken an hour before cinner and fupper.

Ipecacuanha

740

Ipecacuanha Wine.

Take of ipecacuanha, in powder, one ounce; mountain wine, a pint. Infuse for three or four days; then filter the tincture.

This is a fafe vomit, and answers extremely well for such perfons as cannot swallow the powder, or whole stomachs are too irritable to bear it.

The dofe is from one ounce to an ounce and a half.

Chalybeate or Steel Wine.

Take filings of iron, two ounces; cinnamon and mace³ of each two drachms; Rhenifh wine, two pints. Infufe for three or four weeks, frequently flaking the bottle; then pass the wine through a filter.

In obstructions of the *menses*, this preparation of iron may be taken, in the dose of half a wine-glass twice or thrice a-day.

The medicine would probably be as good if made with Lifbon wine, fharpened with half an ounce of the cream of tartar, or a fmall quantity of the vitriolic acid.

Stomach Wine.

Take of Peruvian bark, großly powdered, an ounce; cardamom feeds, and orange peel, bruifed, of each two drachms. Infufe in a bottle of white port or Lifbon wine for five or fix days; then ftrain off the wine.

This wine is not only of fervice in debility of the flomach and inteffines, but may alfo be taken as a preventive, by perfons liable to the intermittent fever, or who refide in places where this difeafe prevails. It will be of ufe likewife to thofe who recover flowly after fevers of any kind, as it affifts digettion, and helps to reflore the tone and vigour of the fyftem.

A glass of it may be taken two or three times a-day.

GLOSSARY.

742]

A LTHOUGH terms of art have been feduloufly avoided in the composition of this treatife, it is impossible entirely to banifh technical phrafes when writing on medicine, a feince that has been lefs generally attended to by mankind, and continues therefore to be more infected with the jargon of the fchools, than perhaps any other. Several perfons having expressed their opinion that a Glosfary would make this work more generally intelligible, the following concile explanation of the few terms of art that occur, has been added in compliance with their fentiments, and to fulfil the original intention of this treatife, by rendering it intelligible and useful to all ranks and claffes of mankind.

Α.

Abdomen. The belly.

14.

Abforbents. Veffels that convey the nourifhment from the inteffines, and the fecreted fluids from the various cavities into the mafs of blood.

Acrimony. Corrolive fharpnefs.

Acute. A difeafe, the fymptoms of which are violent, and tend to a fpeedy termination, is called acute.

Adult. Of mature age.

Adust. Dry, warm.

Antifpafmodic. Whatever tends to prevent or remove fpafm. Apthæ. Small whitifh ulcers appearing in the mouth.

Afriction. A tightening or leffening.

Atrabilarian. An epithet commonly applied to people of a certain temperament, marked by a dark complexion, black hair, fpare habit, &c. which the ancients fuppofed to arife from the *atra bilis*, or the black bile.

Bile, or Gall. A fluid which is fecreted by the liver into the gall-bladder, and from thence paffes into the inteffines, in order to promote digeftion.

C.

Cacochymie. An unhealthy flate of the body.

Caries. A rottennels of the bone,

Chyle. A milky fluid feparated from the aliment in the inteflines, and conveyed by the abforbents into the blood

to fupply the wafte of the animal body.

Chronic. A difease whose progress is flow, in opposition to acute.

Circulation. The motion of the blood, which is driven by the heart through the arteries, and returns by the veins.

Comatofe. Sleepy.

Conglobate Gland. A fimple gland.

Conglomerate. A compound gland.

Contagion. Infectious matter.

Cutis. The fkin.

Cutaneous. Of or belonging to the fkin.

Crifis. A certain period in the progrefs of a difeafe, from whence a decided alteration either for the better or the worfe takes place.

Critical. Decifive or important.

Critical Days. The fourth, fifth, feventh, ninth, eleventh, thirteenth, fourteenth, feventeenth, and twenty-firft, are by fome authors denominated critical days, becaufe febrile complaints have been obferved to take a decilive change at these periods.

D.

Debility. Weaknefs.

Delirium. A temporary diforder of the mental faculties.

Diaphragm. A membrane feparating the cavity of the cheft from that of the belly.

Diuretic. A medicine that promotes the fecretion of urine. Draffic. Is applied to fuch purgative medicines as are violent or hardh in their operation.

E.

Empyema. A collection of purulent matter in the cavity of the breaft.

Endemic.

Endemic. A difeafe peculiar to a certain diffrift of country. *Epidemic.* A difeafe generally infectious. *Exacerbation.* The increase of any difeafe.

F.

Faces. Excrements.

Fætid. Emitting an offenfive fmell.

Fætus. The child before birth, or when born before the proper period, is thus termed.

Flatulent. Producing wind.

Fungus. Proud flefh.

G،

Gangrene. Mortification.

Gummata Venereal excrefcences.

Gymnaflic. Exercife taken with a view to preferve or retiore health.—The ancient phyficians reckoned this an important branch of medicine.

H.

Hestic Fever. A flow confuming fever, generally attending a bad habit of body, or fome incurable and deep-rooted difeafe.

Hæmorrhoids. The piles.

Hamorrhage. Discharge of blood.

Hypochondriacifm. Low fpirits.

Hypochondriac vifcera. The liver, fpleen, &c. fo termed from their fituation in the hypochondriac or upper and lateral parts of the belly.

I.

Ichor. Thin bad matter. Impositume. A collection of purulent matter. Inflammation. A furcharge of blood, and an increased action of the veffels, in any particular part of the body.

L.

Ligature. Bandage. Lixivium. Ley.

M.

Miliary Eruption. Eruption of fmall pullules refembling the feeds of millet.

Morbific.

744

Morbific. Capfing difeafe, or difeafed.

Mucus. The matter discharged from the nose, lungs, &c. Mysentery. A double membrane which connects the inteftines to the back bone.

N.

Nervous. Irritable.

Nausea. An inclination to yomit.

Nodes. Enlargements of the bones produced by the venereal difeafe.

Ρ.

Pectoral. Medicines adapted to cure difeafes of the breaft.

Pelvis. The bones fituated at the lower part of the trunk ; thus named from their refembling in fome measure a bafon.

Peritonœum. A membrane lining the cavity of the belly and covering the inteffines.

Pericardium. Membrane containing the heart.

Perspiration. The matter discharged from the pores of the fkin in form of vapour or fweat.

Phlogifton. Is here used to fignify fomewhat rendering the air unfit for the purpofes of refpiration.

Phlegmatic. Watery, relaxed.

Plethoric. Replete with blood. Polypus. A difeated excretcence, or a fubflance formed of coagulable lymph, frequently found in the large blood veffels.

Pus. Matter contained in a boil.

R.

Regimen. Regulation of diet.

Rectum. The flraight gut, in which the forces are contained.

Respiration. The act of breathing.

s.

Saliva. The fluid fecreted by the glands of the mouth.

Sanies. A thin bad matter, discharged from an ill conditioned fore.

Scirrhous. A state of diseased hardness.

Slough. A part feparated and thrown off by fuppuration.

- Spafm. A difeafed contraction.
- Spine. The back bone.

Styptic.

Styptic. A medicine for flopping the difcharge of blood. Syncope. A fainting fit attended with a complete abolition of fenfation and thought,

т.

Tabes. A fpecies of confumption.

Temperament. A peculiar habit of body, of which there are generally reckoned four, viz. the fanguine, the bilious, the melancholic, and the phlegmatic.

U.

Vertigo. Giddinefs.

Ulcer An ill conditioned fore.

Ureters. Two long and fmall canals which convey the urine from the kidneys to the bladder.

Urethra. The canal which conveys the urine from the bladder.

Braidwood, Mr. his fkill in teaching the dumb to fpeak, 461, note. Brain, inflammation of, who molt liable to it, with its caules and fymptoms, 254. Regimen, 256. Medical treament, 257. Bread, proper food for children, as foon as they can chew it, 17. A cruit of, the beft gum-flick, *ibid*. The beft modes of preparing it in food for children, 18. Good, the qualities of, and for what purpofe adulterated by the bakers, 70. Toafted, a decoftion of, good to check the vomiting in a cholera morbus, 310. A furfeit of, more dangerous than any other food, 652. The fineft not always the beft adapted for nutrition, *ibid*. Houfehold bread the moft wholefome, 653. Wheat flour apt to occafion conflipation, 654. Different kinds of grain make the beft bread, *ibid*. Confumption of bread increafed by drinking tea, 655. Indian corn the beft food when boiled, 660. Buck wheat highly nutritious, 661. Various fubftitutes for bread, 670.

Brimflone. See Sulphur.

Broth, gelatinous, recommended in the dyfentery, how to make, 347.

Broths and Soups, various ingredients in the composition of, 670, 671. General observations on, 672. The most wholefome diet for the poor, 673. Warmly recommended by Count Rumford, *ibid*. Brown soup recommended for breakfast in place of tea. 675.

Bruifes, why of worfe confequence than wounds, 582. Proper treatment of, *ibid*. The exfoliation of injured bones a very flow operation, 583. How to cure fores occafioned by, *ibid*.

Buboes, two kinds of, diffinguished with their proper treatment, 504.

Burdens, heavy, injurious to the lungs, 40.

Burgundy pitch, a plafter of, between the fhoulders, an excellent remedy in a cough, 281. In a hooping-cough, 288. And for children in teething, 560.

Burials, the dangers attending their being allowed in the midft of populous towns, 76.

Burns, flight, how to cure, 580. Treatment of, when violent, ibid. Extraordinary cafe of, 581. Liniment for, 717.

Butchers, their profeffional artifices explained, and condemned, 65. Butter, ought to be very fparingly given to children, 21. Ufed

in large quantities very injurious to the ftomach, having a conflant tendency to turn rancid, 661. Bread made with butter not eafily digelled, 664. Paflies of every kind improper for children, *ibid*.

C.

Calbage leaves, topical application of, in a pleurify, 167.

Campbor, why of little use in eye-waters, 696.

Camphorated oil, preparation of, 718.

Campborated fpirit of wine, 733.

Camps, the greatest necessity of confulting cleanlines in, 103.

Cancer, its different flages defcribed, with the producing caufes,

466. Symptoms, 467. Regimen, and medical treatment, 468.

468 Dr. Storck's method of treating this diforder, 469. Cautions for avoiding it, 472.

Cancer foroti, a diforder peculiar to chimney-fweepers, owing to want of cleanlinefs, 100, note.

Carriages, the indulgence of, a facrifice of health to vanity, 82. Carrot, wild, recommended in the flone, 328.

Carrot poultice for cancers, how to prepare, 471.

Carrot, properly manured, may fupply the place of bread, 670.

Cafualties, which apparently put an end to life, neceffary cautions respecting, 600. 608. 613. 631.

drowning, 609.

noxious vapours, 613.

----- extremity of cold, 616.

extreme heat, 618.

Cataplafms, their general intention, 693. Preparation of the difcutient cataplafm, *ibid*. Ripening cataplafm, *ibid*.

Cataraa, the diforder and its proper treatment described, 458.

Cattle, ftall fed, are unwholefome food, 64. . Over-driven, are killed in a high lever, *ibid*. The artifices of butchers exposed, 65.

Cellars, long flut, ought to be cautioufly opened, 78. And funk flories of houfes, unhealthy to live in, 130. Of liquors in a flate of fermentation, daugerous to enter, 614. How to purify the air in, *ibid*.

Celfus, his rules for the prefervation of health, 134.

Chancres, deferibed, 506. Primary, how to treat, *ibid*. Symptomatic, 507.

Charcoal fire, the danger of fleeping in the fume of, 613.

Charity, the proper exercise of, 43.

Cheefe, as a diet, injurious to health, 664.

Cheyne, Dr. his perfualive to the ule of exercife, 83. His judgment of the due quantity of urine, not to be relied on, 124. Strongly recommends Æthiops mineral in inflammations of the eyes, 263. His obfervations on barrennefs, 543, note.

Chilblains, caufe of, 556. How to cure, ibid.

Child-bed women, how to be treated under a miliary fever, 210. Child-bed fever. See Fever.

Child-birth, the feafon of, requires due care after the labour pains are over, 533. Medical advice to women in labour, 534. Ill effects of collecting a number of women on fuch occations, 535, note. How to guard against the miliary fever, 538. Symptoms of the puerperal fever, *ibid*. Proper treatment of this fever, 530. General cautions for women at this feafon, 541, 542.

Children, their difeases generally acute, and delay dangerous, G. Their diforders lefs complicated, and eafier cured, than thole of adults, *ibid*. Are often the heirs of the difeases of their parents, 7. Thofe born of difeased parents, require peculiar care in the nurfing, 8. Are often killed or deformed by injudicions 3 C clothing, clothing, ibid. How treated in Africa, 11, note. The ufual caules of deformity in, explained, ilid. Their clothes ought to be fastened on with ftrings, 13. General rule for clothing them, 14. Cleanlinefs, an important article in their drefs, ibid. The milk of the mother the moft natural food for, 15. Abfurdity of giving them drugs as their first food, 16. The beft method of expelling the meconium, ibid. How they ought to be weaned from the breaft, 17. A cruft of bread the beft gum-flick for them, *ibid*. How to prepare bread in their food, 18. Cautions as to giving them animal food, *ibid*. Cautions as to the quantity of their food, ibid. Errors in the quality of their food more frequent than in the quantity, 19. The food of adults improper for children, *ibid.* Strong li-quois expose them to inflammatory diforders, *ibid.* Ill effects of unripe fruit, 20. Butter, 21. Honey, a wholefome article of food for them, ibid. The importance of exercise to promote their growth and firength, ibid. Rules for their exercife, 22. Poverty of parents occasions their neglect of children, 23. The utility of exercise demonstrated from the organical structure of children, 24. Philosophical arguments fhewing the neceffity of exercise, ibid. Ought not to be fent to school too soon, 25. Nor be put too soon to labour, 28. Dancing an excellent exercife for them, 29. The cold bath, ibid. Want of wholefome air destructive to children, 30. To wrap them up close in cradles pernicious, 32. Are treated like plants in a hot-house, ibid. The usual faulty conduct of nurfes pointed out, 34. Are crammed with cordials by indolent nurfes, 35. Eruptions ignorantly treated by nurfes, ibid. Loofe flools, the proper treatment of, ibid. Every method ought to be taken to make them ftrong and hardy, 37. Indications of the fmall-pox in, 214.

Chincough. See Cough.

Cholera morbus, the diforder defined, with its caufes and fymptoms, 309. Medical treatment, 310.

Churches, the feveral circumftances that render the air in, unwholefome, 76.

Churching of women after lying in, a dangerous cuftom, 542.

Church yards, the bad confequences of having them in large towns, 76.

Cities, large, the air in, contaminated by various means, 76. The bad effects of burying the dead in, *ibid*. Houfes ought to be ventilated daily, 77. The danger attending fmall apartments, 78. All who can ought to fleep in the country, *ibid*. Diforders that large towns are peculiarly hurtful to, 79. Cleanline's not fufficiently attended to in, 101. Should be fupplied with plenty of water, 105, *note*. The beft means to guard againft infection in, 100.

Clare, Mr. his method of applying faline preparations of mercury in venereal cafes, 512,

Cleanline s,

Gleanlinefs, an important article of attention in the drefs of children, 14; and to fedentary artifts, 52. Finery in drefs often covers dirt, 93. Is neceffary to health, 100. Diforders originating from the want of, *ibid*. Is not fufficiently attended to in large towns, 101. Nor by country peafants, 102. Great attention paid to, by the ancient Romans, *ibid*. note. Neceffity of confulting cleanlinefs in camps, 103. Was the principal object of the whole fyftem of the Jewilh laws, *ibid*. Bathing and wafhing greatly conducive to health, 104. Cleanlinefs peculiarly neceffary on board of fhips, *ibid*. and to the fick, *ibid*. General remarks on, 105. Many diforders may be cured by cleanlinefs alone, 140. The want of, a very general caufe of putrid fevers, 196. Is a great prefervative againft venereal infection, 517; and againft galling in infants, 550. Cutaneous diforders proceed from a want of, 650.

Clergy, exhorted to remove popular prejudices against inoculation, 231. Might do great good by undertaking the practice of it themfelves, 236.

- Clothing, the only natural ufe of, 9. That of children, has become a fecret art, 10. Ought to be faftened on infants with firings inflead of pins, 13. Pernicious confequences of flays, 14. Importance of cleanlinefs to children, *ibid*. The due quantity of, dictated by the climate, 94. Should be increafed in the decline of life, *ibid*. and adapted to the feafons, *ibid*. Is often hurtful by being made fubfervient to the purpofes of vanity, 91. Pernicious confequences of attempting to mend the fhape by drefs, *ibid*. Stays, *ibid*. Shocs, *ibid*. Garters, buckles, and other bandages, 92. The perfection of, to be eafy and clean, 93. General remarks on, *ibid*. Wet, the danger of, and how to guard againft it, 127.
- Clyfters, a proper form of, for an inflammation of the ftomach, 291. And for an inflammation of the inteflines, 293. Of tobacco fmoke, its efficacy in procuring a ftool, 300, note. Of chicken broth falutary in the cholera morbus, 310. Their use in fuppreflom of urine, 323. Ought to be frequently administered in the puerperal fever, 530. Of tobacco, to excite a vomit, 606. Of tobacco fumes, to thimulate the inteflines, 610. The general intention of, 69.4. Preparation of the emollient clyfter, 695. Laxative clyfter, *ibid.* Carminative clyfter, *ibid.* Oily clyfter, *ibid.* Starch clyfter, 696. Turpentine clyfter, *ibid.* Vinegar clyfter, *ibid.*

Caliac paffion, proper treatment for, 351.

Coffee berries recommended in the ftone, 328.

Cold, extreme, its effects on the human frame, 616. The fudden application of heat dangerous in fuch cafes, *ibid*. How to recover frozen or benumbed limbs, 617, Cold Bath. See Bath.

3 C 2

Coldes

- Colds, frequently occafioned by imprudent changes of clothes at the first approaches of fummer, 90, note. Various caufes of, fpecified, 126. Their general caufes, 276. Proper regimen on the fymptoms of, appearing, *ibid*. Danger of neglecting the diforder, 278. The chief fecret for avoiding, 280.
- Celie, different fpecies of, 296. Medical treatment of, according to their fpecies and caufes, 297. Bilious colic, 298. Hyfferic colic, 299. Nervous colic, *ibid*. Cautions necefiary to guard against the nervous colic, 300. General advice in colics, 301.
- Collyria. See Eye-waters.
- Commerce often imports infectious diforders, 107. Means fuggested to guard against this danger, 108, note.
- Confections often very needlefsly compounded, 697. Preparation of the Japonic confection, 698.
- Conferves and Preferves, general remarks on, and their composition, 698. Of red rofes, *ibid*. Of floes, 699. Candied orange-peel, *ibid*.
- Conflictution, good or bad, the foundation of, generally laid during infancy, 1.
- Confumptions, the increase of this diforder may be attributed to hard drinking, 97. Who most liable to, and its causes, 174. Symptoms, 176. Regimen, 177. Riding, *ibid*. Much benessit to be expected from going a long voyage, 178. Travelling, *ibid*. Diet, 179. Great efficacy of milk in, *ibid*. Medical treatment, 182.

Symptomatic, the treatment of, must be directed to the producing cause, 187. Convultions, why new-born infants are fo liable to, 12. Those

- Convultions, why new-born infants are fo liable to, 12. Thole preceding the eruption in the final-pox favourable fymptoms, 217. The general caufes of, 565. Proper treatment of, 566. Extraordinary recovery of an infant feemingly killed by, 629. Farther inflructions in like cafes, 630.
- Cook, Captain, the circumnavigator, his means of preferving the health of his men, 46, note.
- Cookery, the arts of, render many things unwholefome, that are not naturally fo, 67. Roafting meat, a walteful mode of, 673.
- Cordials, ought not to be given to infants, 16. Are the common refuge of nurfes who negled their duty to children, 35. Are often fatal in an inflammation of the ftomach, 290. When good in the colic, 297. Ought not to be given to a pregnant woman during labour, 534.

Corn, damaged, will produce the putrid fever, 195.

Corys in the feet are occafioned by wearing tight floes, 91. Cortex. See Bark, Cofficiencia. Cofficeness, a frequent recourse to medicines for the prevention of, injurious to the conflictuation, 122. Is rather to be removed by diet than by drugs, 123. Its general caufes and ill effects, 414. Regimen, *ibid.* Remedies for, 416.

- Cough, the proper remedies for, 280. A plaster of Burgundy pitch laid between the shoulders an excellent remedy for, 281. The stomach cough, and cough of the lungs, diflinguished, 282. Treatment for the nervous cough, 283.
- Cough, hooping, who most liable to, with its disposing causes, 284. Remedies, 285. Is infectious, *ibid*. Vomits, their use, and how to administer them to children, 286. Garlic ointment a good remedy for, 287.
- Cough, phthifical, incident to fedentary artificers, from their breathing confined air, 49.

Cradles, on many accounts hurtful to children, 32.

Cramp, proper remedies for, 451.

- Cramp of the flomack, who most fubject to, 438. Medical treats ment of, ibid.
- Crotchets, how to use for extracting substances detained in the gullet, 603.
- Croup in children, described, 557. Its fymptoms and proper treatment, ibid.

Cyder, the ill confequences of making it too weak, 69.

D.

Dancing, an excellent kind of exercise for young perfons, 29.

Daucus Sylvestris. See Carrot.

- Deafnels, when a favourable symptom in the putrid fever, 198, note. Methods of cure, according to its caules, 46t.
- Death, the evidences of, fometimes falacious, and ought not to be too foon credited, 601. 608. 612. 631. The means to be used for the recovery of perfons from, nearly the fame in all cafes, 632.
- DecoSions, general remarks on, 699. Preparation of the decoction of althæa, *ibid*. Common decoction, 700. Of logwood, *ibid* Of bark, *ibid*. Compound decoction of bark, *ibid*. Of farfaparilla, 701. Of fencka, *ibid*. White decoction, *ibid*.
- Deformity, often occafioned by the injudicious manner of dreffing children, 9. Is feldom found among favage nations, 10. The ufual caufes of, explained, *ibid*.

Dews, night, dangerous to health, 128.

Diabetes, who most liable to this diforder, 319. Its caufes and fymptoms, *ibid*. Regimen, and medical treatment, 320. Diftinguished from incontinency of urine, 322.

Diet, will often answer all the indications of cure in difeafes, 138. Illuftrations, 139. General observations on, 647. Improper diet affects the mind as well as the body, 650. Vegetable ought to preponderate over animal food, 651. See Aliment.

Digeflion,

Diarrhæa. See Loofenefs.

Digeflion, the powers of, equally impaired by repletion or inanition, 72.

- Difeafer, hereditary, cautions to perfons afflicted with, 8. Peculiar diforders attending particular occupations, 38. Many of them infectious, 106. The knowledge of, depends more upon experience and obfervation than upon fcientifical principles, 135. Are to be diffinguified by the most obvious and permanent symptoms, *ibid*. The differences of fex, age, and conflictution, to be confidered, 136. Of the mind, to be diffinguified from thofe of the body, *ibid*. Climate, fituation, and occupation, to be attended to, 137. Other collateral circumftances, *ibid*. Many indications of cure, to be answered by diet alone, 138. Cures often effected by frefh air, by exercise, or by cleanlinets, 139. Nervous diffeafes, of a complicated nature, and difficult to cure, 420.
- Diflocations, fhould be reduced before the fwelling and inflammation come on, and how, 587. Of the jaw, 588. Of the neck, 589. Of the ribs, 590. Of the fhoulder, *ibid*. Of the elbow, 591. Of the thigh, 592. Of the knees, and toes, *ibid*.
- Diuretic infusion for the Drotfy, how to prepare, 377, 378.
- Dog, fymptoms of madnefs in, 477. Ought to be carefully preferved after biting any perfon, to afcertain whether he is mador not, 478. Is often reputed mad when he is not fo, *ibid*. Symptoms of the bite of a mad dog, 479. The poifon cannot lie many years dormant in the body, as is fuppofed, *ibid*. Dr. Mead's receipt for the bite, 480. The famous Eaft Indian fpecific for, *ibid*. Other recipes, 481. Vinegar of confiderable fervice in this diforder, *ibid*. Medical courfe of treatment, recommended, *ibid*. Regimen, 481. Dipping in the fea not to be relied on, 483. Dr. Tilfot's medical courfe for the cure of the hydrophobia, 484. Remarks on the Ormfkirk medicine, 485, note.
- Dofes of medicines, the relative proportions of, for different ages. 687. Drams ought to be avoided by performs afflicted with nervous diforders, 423.
- Draught, is the proper form for fuch medicines as are intended for immediate operation, 702. How to prepare the anodyne draught, *ibid*. Diuretic draught, *ibid*. Purging draught, *ibid*. Sweating draught, 703. Vomiting draught, *ibid*.

Drefs. See Clothing.

Drinking, perfons who are feldom intoxicated may neverthelefs injure their conflictions by, 97. The habit of drinking frequently originates from misfortunes, 98. Frequently defroys the powers of the mind, 99. Perfons often forced to it by milfaken hofpitality. *ibid.* note. Leads to other vices. *ibid.*

mittaken hofpitality, *ibid. note.* Leads to other vices, *ibid.* Drop/y, the feveral diffinctions of, with its caufes, 374. Symptoms, 375. Regimen, 376. Medical treatment, 377. Tapping a fale and fimple operation, 379. Drophy of the brain. See Water in the head.

Drowned

Drowned perfons, ought not to be rashly given up for dead, 608. Proper trials for the recovery of, ibid. Endeavours ought notto be suspended upon the first returns of life, 612. Success of the Amsterdam fociety for the recovery of, 631.

Drunkennels. See Intoxication.

Dumb perfons may be taught to read, write, and difcourfe, 461, note. Dy/entery, where and when most prevalent, 345. Its caufes and fymptoms, ibid. Regimen, 3.46. Fruit, one of the belt remedies for, 348. Proper drink for, 349. Medical treatment, ibid. Cautions to prevent a relapfe, 350.

\mathbf{E}_{2}

Ear, the feveral injuries it is liable to, 460. Deafnefs, medical treatment of, according to its caufes, 461. Ought not to be tampered with, 462.

Ear-ach, its caufes, and proper treatment for, 360. How to drive infects out of, ibid.

Education of children, should be begun at home by the parents, 25, note. That of girls hurtful to their conflictution, 27.

Effluvia, putrid, will occasion the spotted fever, 195.

Electricity beneficial in the palfy, 431.

- Electuaries, general rules for making, 703. Preparation of lenitive electuary, 704. Electuary for the dyfentery, *ibid*. For the epilepfy, *ibid*. For the gonorrhœa, *ibid*. Of the bark, For the piles, ibid. For the palfy, ibid. For the 705. rheumatifm, ibid.
- Elixir, paregoric, how to prepare,732. Sacred elixir, ibid. Stomachic elixir, ibid. Acid elixir of vitriol, 733.
- Emulfions, their ufe, 706. Preparation of the common emultion, ibid. Arabic emultion, ibid. Camphorated emultion, ibid. Emulfion of gum ammoniac, ibid. Oily emultion, 707.
- Engleman, Dr. his account of the German method of recovering perfons from fainting fits, 622.

Entrails. See Intestines.

- E ilepfy, the diforder defined, 432. Its caufes and fymptoms, 433. Due regimen, 434. Medical treatment, ibid.
- Eruptions in children often free them from bad humours, but are miftaken and ill-treated by nurfes, 35. Ought never to be flopped without proper advice, 36. In fevers, how to be treated, 193. 201. 207. 209. In the imall-pox, 217. 221. In children, the caufes of, 551. How to cure, 554.
- Eryfipelas, a diforder incident to the laborious, 41. Its caufes explained, and who most subject to it, 249. Its symptoms, Regimen, 250. Medical treatment, 253. The fcoribid. butic eryfipelas, ibid. Instructions for those who are fubject to this diforder, ibid.

Evacuations of the human body, the principal, specified, 121. By ftool, ibid. Urine, 123. Perspiration, 125.

Exercife, the importance of, to promote the growth and ftrength of children, 21. All young animals exert their organs of 3 C 4 motion

motion as foon as they are able, 22. The utility of, proved from anatomical confiderations, 24. And from philosophical deductions, *ibid.* Military exercise recommended for boys, 26. Benefits of dancing, 29. Is better for fedentary perfons under lownefs of fpirits than the tavern, 52. Gardening the beft exercife for the fedentary, 53. Violent, ought not to be taken immediately after a full meal, 61. Is as neceffary as food for the prefervation of health, 81. Our love of activity, an evidence of its utility, 82. Indolence relaxes the folids, ibid. The indulgence of carriages as abfurd as pernicious, ibid. Is almost the only cure for glandular obstructions, 83. Will prevent and remove those diforders that medicine cannot cure, ibid. Is the beft cure for complaints in the ftomach, 84. How to be taken within doors, when not to be done in the open air, 85. Active fports better than fedentary amufements, ibid. The golf, a better exercife than cricket, ibid. note. Exercife fhould not be extended to fatigue, 86. Is as neceffary for the mind as for the body, 118. Is often of more efficacy than any me-dicine whatever, 139. The best mode of taking it in a confumption, 177. Is of the greatest importance in a dropfy, 376. Mulcular, for the gout, 385. Is neceflary for the althmatic, 408. Is fuperior to all medicine in nervous diforders, 423. And in the palfy, 432. Is proper for pregnant women, unlefs they are of a very delicate texture, 533. Want of, the occafion of rickets in children, 563.

- Extrads, general rules for making; but are more conveniently purchafed ready made, 707.
- Eyes, inflammation of, its general caufes, 258. Symptoms, 259, Medical treatment, 260. How to be treated when it proceeds from a fcrophulous habit, 263. Advice to thofe who are fubject to this complaint, 264. Are fubject to many difeafes which are difficult to cure, 456. The means by which they are frequently injured, 457. General means of prevention, *ibid.* The feveral difference of, with their medical treatment, 458.
- *Eye-waters*, general remarks on, and their principal intentions, 696. Collyrium of alum, 697. Vitriolic collyrium, *ibid*. Collyrium of lead, *ibid*.

Fainting-fits, how to cure, 441. 618. Cautions to perfons fubject to them, 623.

Falling fickness. See Epilepsy.

Fafling, long, injurious to those who labour hard, 43. Is hurtful both to old and young, 73.

Fathers, culpably inattentive to the management of their children, 5. Their irregular lives often injure the conftitution of their children, 7.

Fear

F.

Fear, the influence of very great, in occasioping and aggravat-

ing difeafes,112. Its various operations, 113. Feet, injured by wearing tight thoes, 91. The washing of, an agreeable article of cleanlines, 104. Wet, the danger of, 127. Bathing them in warm water, a good remedy in a cold, 279. And in the hooping-cough, 288.

Fermentation, the vapour of liquors in a flate of, noxious, 614.

- Fevers, of a bad kind, often occafioned among labourers by poor living, 43. Frequently attack fedentary perfons after hard drinking, 52. Nervous, often the confequence of intense fludy, Putrid and malignant, often occafioned by want of clean-57. linefs, 100. The most general caufes of, enumerated, 140. The diftinguishing symptoms of, 141. The feveral species of, ibid. Is an effort of nature, which ought to be affifted, 142. Cordials and fweetmeats im-How this is to be done, 143. proper in, 144. Freshair of great importance in, 145. The mind of the patient ought not to be alarmed with religious terrors, ibid. Cautions as to bleeding and fweating in, 146. Longings, the calls of nature, and deferve attention, ibid. Cautions to prevent a relapfe, 147.
- Fever, acute continual, who most liable to, 157, Causes, ibid. Symptoms, 158. Regimen, ibid. Medical treatment, 161. Symptoms favourable and unfavourable, ibid. Regimen to be observed during recovery, 162.
- Fever, bilious, general time of its appearance, 247. Proper treatment of, according to its fymptoms, 248.

Fever, intermitting, See Ague.

- Fever, miliary, from what the name derived, and its general appearances, 205. Who most liable to it, *ibid*. Caufes, *ibid*. Symptoms, 206. Regimen, 207. Account of a miliary fever at Straßburgh, 208, note. Proper medical treatment, 200. Cautions for avoiding this diforder, 210. How to prevent, in child-bed-women, 538.
- Fever, milk, how occafioned, 537. How to prevent, 541.
- Fever, nervous, why more common now than formerly, and who most liable to it, 188. Its caufes, ibid. Symptoms and proper regimen, 189. Medical treatment, 191.
- Fever, puerperal, or childbed, the time of its attack, aud fymptoms, 538. Medical treatment of, 539. Cautions for the prevention of this fever, 541.
- Fever, putrid, is of a peftilential nature, and who most liable to it, 195. Its general caufes, ibid. Symptoms of, 196. Other fevers may be converted to this, by improper treatment, 197. Favourable and unfavourable fymptoms of, ibid. Regimen, 198. Medical treatment, 201. Cautions for the prevention of this diforder, 203.
- Fever, remitting, derivation of its name, 210. It causes and fymptoms, 211. Proper regimen, 212. Medical treatment, 213. Cautions for avoiding this fever, ibid.

Ferier

Fever, fearlet, why fo named, and its usual feafon of attack, 215, Proper treatment of, 246. Is fometimes attended with putrid and malignant fymptoms, ibid. Medicines adapted to this ftage of the malady, ibid. Hiftory of a fever of this kind at Edinburgh, 247, note.

Fever, fecondary, in the fmall-pox, proper treatment of, 224.

Flatulencies in the flomach, remedies againft, 363. The feveral caufes of, 443. Medical treatment of, 444.

- Flatulent colic, its caufes, and feat of the diforder, 206. Remedies for, ibid.
- Flower-de-luce, the yellow water, the root of, recommended for the tooth-ach, 358.

Fluor albus described, with its proper treatment, 529.

- Fomentations, how to make and apply, 707. General intentions of, *ibid.* Anodyne fomentation, 708. Aromatic fomentation, *ibid.* Common fomentation, *ibid.* Emollient fomentation, ibid. Strengthening fomentation, ibid. Food. See Aliment.
- Forgivene/s of injuries, ought to be practifed from a regard to our own health, 112.

Fractures. See Bones. broken.

Frozen limbs, how to recover, 617.

- Fruit, unripe, very hurtful to children, 20. One of the beft medicines, both for the prevention and cure of a dyfentery, 348. Fruits occasional substitutes for bread, 665. The plantain tree ufed for that purpole in warm climates, ibid. Yams, a proper fublitute for bread in the Weft Indies, 666.
- Funerals, the great number of vifitors attending them, dangerous to their health, 107.

G.

Galling, in infants, the caufe and cure of, 550.

Gangrene, proper treatment of, 574.

Gardening, a wholefome amufement for fedentary perfons, 52.

Gargles for the throat, how to make, 267. 270. 274. General intentions of, 709. Method of making the attenuating gargle, ibid. Common gargle, ibid. Detergent gargle, ibid. Emol-

lient gargle, ibid. For the mouth of infants in the thrush, 548.

Garlic ointment, a North British remedy for the hooping-cough, how to apply it, 287.

Generals of armies, how they ought to confult the health of the men they command, 44.

Gilders. See Miners.

Ginger, fyrup of, how to prepare, 728.

Girls, the common mode of education prejudicial to their conflitution, 27. Means of rectifying it recommended, ibid.

Gleet, how occasioned, and its fymptoms, 500. Method of cure, ibid. Regimen, 501. Obstinate gleets cured by mercurial inunctions, 502. How to apply bougies, ibid.

Glover,

- Glover, Mr. his courfe of treatment for the recovery of a hanged man, 628.
- Gonorrhaa, virulent, the nature of, and its fymptoms, 491. Regimen, 492. Medical treatment, 493. Is often cured by aftringent injections, ibid. Cooling purges always proper in, Mercury feldom neceffary in a gonorrhœa, 496. 494. How to administer it when needful, 497.

Hydrops pectoris. See Dropfy.

Hypochondriac affections, frequently produced by intenfe fludy, 58. Their caufes, and who most subject to them, 452. The general intentions of cure, *ibid*. Regimen, 454.

Hyfterics, a diforder produced by the habitual use of tea, 66. General causes of, 447. Symptoms, 448. Proper treatment of, *ibid.* Regimen, 449. Medicines adapted to, 450.

Hyfteric colic, fymptoms and treatment of, 299.

6

Jails,

Jails, why malignant fevers are often generated in them, 77. Often foread in infection by being fituated in the middle of populous towns, 108. Ought to be removed, 110.

Janin, M. his relation of the recovery of an overlaid infant, 627. And of a man who had hanged himfelf, 628.

Jaundice, the different flages of its appearance, with the caufes of this diforder, 370, 371. Symptoms and regimen, 371. Medical treatment, 372. Jesuits Bark. See Bark.

Jews, the whole fyftem of their laws tending to promote cleanlinefs, 103. 107.

Iliac paffion, a particular kind of inflammation of the inteffines, 292.

Imposthume in the breast, in confumptions, how to make it break inwardly, when not to be difcharged by other means, 185. Impolthumes after the fmall-pox, proper treatment of, 227.

Incontinency of urine, diffinguished from a diabetes, 322. Expedient for relief, ibid.

Indigestion, is one confequence of intense fludy, 56. General caufes, and remedies for, 416.

Indolence, its bad effects on the conflictution, 82. Occasions glandular obstructions, 83. Ill confequences of too much indulgence in bed, 84. Is the parent of vice, 86. Is the general caufe of most nervous diforders, 455.

Infancy, the foundation of a good or bad conflictution, generally laid in this feafon of life, 1.

Infants, nearly one half of those born in Great Britain die under twelve years of age, 1. Perifh mostly by art, 2. Ought not to be fuckled by delicate women, 3. Importance of their being nurfed by their mothers, 4. Often lofe their lives, or become deformed, by errors in clothing them, 9. How the art of bandaging them became the province of the midwife, 10. How treated in Africa, 11, note. Philosophical observations on their organical firucture, and on the caufes of deformity, ibid. Why they fo frequently die of convultions, 12. Why exposed to fevers, 13, And colds, 14. Rules for their drefs, ibid. Their food, 15. Reflections on the many evils they are exposed to, 544. Why their first diforders are in their bowels, ibid. How to cleanfe their bowels, 545. The meconium, 546. Thrush, 547. Acidities, 548. Gripes, 549. Galling and excoriations, 550. Stoppage of the nofe, *ibid.* Vomiting, 551. Loofenefs, 552. Eruptions, 553. Scabbed heads, 555. Chilblains, 556. The croup, 557. Teething, 559. Rickets, 562. Convultions, 565. Water in the head, 567. How to recover infants feemingly dead, 622. Ought never to fleep in the fame bed with their mothers or nurfes, 626, note. Cafe of the recovery of an overlaid infant, 627. Cafe of an infant fant feemingly killed by a firong convultion fit, and recovered, 620. See *Children*.

Infection, the danger of, incurred by injudicious or unneceffary attendance on the fick, 106. And on funerals, 107. Is often communicated by clothes, *ibid*. Is frequently imported, 108, Is fpread by hofpitals and jails being fituated in the middle of populous towns, *ibid*. How to prevent infection in fick chambers, 109. Phyficians liable to fpread infection, *ibid*. note. In what refpects the fpreading of infection might be checked by the magifirate, 110. Bleeding and purging increafe the danger of, by debilitating the body, 204. Small-pox, 214, Of the fmall-pox may be received again, 218, note.

Inflammations, how the laborious part of mankind expose themielves to, 42. Proper treatment of, 574.

Inflammation of the bladder. See Bladder.

_____ of the brain. See Brain.

_____ of the eyes. See Eyes.

----- of the inteffines. See Inteffines.

------ of the kidneys. See Kidneys.

------ of the liver. See Liver.

------ of the lungs. See Peripneumony,

------ of the ftomach. See Stomach.

------ of the throat. See Quinfey.

------ of the womb. See Womb.

Infufions, advantages of, over decocitions, 676. How to obtain rich infufions from weak vegetables, *ibid*. Preparation of the bitter infufion, *ibid*. Infufion of the bark, *ibid*. Infufion of carduus, 677. Of linfeed, *ibid*. Of rofes, *ibid*. Of tamarinds, and fenna, *ibid*. Spanifh infufion, 678. For the palfy, *ibid*.

Inns, the great danger of meeting with damp beds in them, 128. The fheets in, how treated to fave washing, 129.

Inoculation of the fmall pox, more favourably received here than in neighbouring countries, 227. Cannot prove of general utility while kept in the hands of a few, 228. No myflery in the procefs, *ibid.* May fafely be performed by parents or nurfes, 220. Various methods of doing it, *ibid.* The elergy exhorted to remove the prejudices againft the operation, 231. Arguments cited from Dr. Mackenzie in favour of inoculation, *ibid. note.* Ought to be, rendered univerfal, 233. Means of extending the practice of, 234. Two obffacies to the progrefs of, flated, 235. Might be performed by elergymen, or by parents themfelves, 236. The 'proper feafons and age for performing it, 239. Will often mend the habit of body, *ibid.* Neceffary preparation and regimen for, *ibid.*

Infetts, when they creep into the ear, how to force them out, 361. Pollonous, the bites of, how to be treated, 486. Intemperance, one great caule of the difeates of feamen, 45. The danger of, argued from the conftruction of the human body,

94.

94. The analogy in the nourifhment of plants and animals, *ibid.* Is the abufe of natural paffions, *ibid.* In diet, 95. In liquor and carnal pleafures, *ibid.* The bad confequences of, involve whole families, 96. Effects of drunkennefs on the conflictution, *ibid.* Perfons who feldom get drunk, may neverthelefs injure their conflictutions by drink, '97. The habit of drinking frequently acquired under misfortunes, 98. Is peculiarly hartful to young perfons, 99. Leads to all other vices, *ibid.*

Intermitting fever. See Ague.

- Inteflines, inflammation of, general caufes from whence it proceeds, 291. The fymptoms, regimen, and medical treatment, 292. Cautions to guard against it, 295.
- Intoxication produces a fever, 66. Fatal confequences of a daily repetition of this vice, *ibid*. Perfons who feldom get drunk, may neverthelefs injure their conflitution by drinking, *ibid*. Getting drunk, a hazardous remedy for a cold, 277. Often produces fatal effects, 623. Proper cautions for treating perfons in liquor, 624. The fafeft drink after a debauch, *ibid*. Remarkable cafe, 625.
- Johnson, Dr. extraordinary recovery of an infant seemingly killed by a strong convulsion fit, related by, 629.
- Iffues, how to make them take the beft effect, 430.
- Itch, the nature and fymptoms of this difeafe defcribed, 403. Subhur, the belt remedy againft, *ibid*. Great danger of the injudicious ufe of mercurial preparations for, 405. Cleanlinefs the beft prefervative againft, 406, *note*.
- Juleps, the form of, explained, 678. Preparation of the camphorated julep, *ibid*. Cordial julep, 679. Expectorating julep, *ibid*. Muſk julep, *ibid*. Saline julep, *ibid*. Vomiting julep, *ibid*.

Κ,

- Kermes mineral, recommended by Dr. Dupland for the hoopingcough, 287, note.
- Kidneys, inflammation of, its general caules, 301. Its fymptoms and proper regimen, 302. Medical treatment, 305. Where it proceeds from the from and gravel, *ibid*. Cautions for those fubject to this diforder, *ibid*. See Gravel.

King's Evil. See Scrophula.

L.

Laborious employments, the peculiar diforders incident to, 40. The folly of men emulating each other in trials of ftrength, 41. Difadvantages attending their dict, *iiid*. How they expofe themfelves to inflammations, 42. Danger of fleeping in the fun, *ibid*. Long fafting hurtful to them, *ibid*. Injuries arifug from poor living, 43. Many of the difeafes of labourers, not only occalioned, but aggravated, by poverty, *ibid*.

Labour,

Labour should not be imposed too early on children, 28.

- Labour in child-bed, medical advice for, 534. Inconveniencies of collecting a number of women at, 535, note.
- Laudanum, its efficacy in fits of an ague, 149, note. How to be adminiftered in a cholera morbus, 311. In a loofenefs, 313. In a diabetes, 321. When proper for the head-ach, 356. How to apply, for the tooth-ach, 358. Will eafe pain in the gout, 384. How to adminifter for the cramp in the flomach, 438. Is good for flatulencies, 444. Effects of an over-dole of, 470. Medical treatment in this cafe, 476.
- Leading-firings, injurious to young children, 23.

Leacher, may be fuccefsfully applied to inflamed tefficles, 503, note. And to difperfe bubces, 505, note. Are proper to apply to children where inflammations appear in teething, 560. Objections to bleeding with them, 572.

- Leeks, a proper ingredient in foups, 670.
- Lemons. See Oranges.
- Leprofy, why lefs frequent in this country now than formerly, 398. Requires the fame treatment as the foury, *ibid.*
- Lienary, proper treatment for, 351.
- Life may frequently be reftored, when the appearances of it are fufpended by fudden cafualties, 601. 608. 613. 631.
- Lightning, perfons apparently killed by, might poffibly be recovered by the ufe of proper means, 631.
- Line-water recommended to prevent gravel in the kidneys from degenerating to the flone in the bladder, 326. Is a good remedy for worms, 368. Happy effects of, in the cure of obfluate ulcers, 685.
- Lind, Dr. his prefeription to abate fits of an ague, 149, note. His directions for the treatment of patients under putrid remitting fevers, 212, note.
- Liniment for burns, preparation of, 717. White liniment, 718. For the piles, *ibid*. Volatile liniment, *ibid*.
- Liquors, fitrong, expose children to inflammatory diforders, 19. Fermented, the qualities of, examined, 68. The bad confequences of making them too weak, 69. Why all families ought to prepare their own liquors, *ibid*. Cold, the danger of drinking, when a perfon is het, 131.

Liver, fchirrous, produced by fedentary employments, 56.

- Liver, inflammation of, its caufes and fymptoms, 3c6. Regimen and medical treatment, 307. Abfcefs in, how to be treated, 308, Cautions in the event of a fchirrous being formed, *ibid.*
- Lobelia, an American plant used by the natives in the venereal difease, 514.
- Lochia, a suppression of, how to be treated, 537.

Longings, in difeafes, are the calls of nature, and often point out what may be of real ufe, 146.

Loofene S.

- Loofenes, habitual, general directions for persons subject to, 122. Its general caufes, 312. A periodical loofenefs ought never to be flopped, 313. Medical treatment of, according to its vari-ous caules, *ibid.* Means of checking it when neceffary, 314-In children, proper treatment of, 552.
- Love, why perhaps the ftrongeft of all the paffions, 110. Is not rapid in its progrefs, and may therefore be guarded against at its commencement, *ibid*. To pretend to it for amufement, cruelty to the object, ibid. Children often real martyrs between inclination and duty, 120, note.
- Lues, confirmed, fymptoms of, 510. Mercury the only certain remedy known in Europe for this difeafe, 511. Saline preparations of mercury more efficacious than the ointment, 512. How to administer corrolive sublimate, ibid. American method of curing this difeafe, 513. Lungs, injured by artifts working in bending poftures, 50. Stu-
- dious perfons liable to confumptions of, 56.

Luxury, highly injurious to the organs of talle and fmell, 463.

M.

Mackenzie, Dr. his arguments in favour of inoculating in the fmall-pox, 231, note.

Mad dog. See Dog.

Magnefia alba, a remedy for the heart-burn, 419. Is the beft medicine in all cafes of acidity, 549.

Magnets, artificial, their reputed virtue in the tooth-ach, 359.

Malt liquors, hurtful in the afthma, 407. See Beer.

Man, why inferior to brutes in the management of his young, I. Was never intended to be idle, 87.

- Manufactures, the growth of, produced the rickets in children, 21. More favourable to riches than to health, 28. Some, injurious to health by confining artifts in unwholefome air, 37. Cautions to the workmen, 38. Compared with agriculture, 48. Are injurious to health from artifts being crowded together, 49. And from their working in confined poftures, ibid. Cautions offered to fedentary artifts, 50. Sedentary arts better fuited to women than to men, 83, note.
- Matrimony ought not to be contracted without a due attention to health and form, 8.
