THE ENCYCLOPEDIA AMERICANA

Bournemouth, börn'müth, a famous watering-place in the south of England, 30 miles southwest of Southampton, on the English Channel, at the southwest corner of Hampshire, near the boundary of Dorsetshire. It is within the limits of the parliamentary borough of Christchurch, but forms a municipal borough by itself. It is situated on a semicircular bay at the mouth of a small stream, the Bourne, whence it derives its name. It has become very popular as a seaside resort for consumptive and other delicate persons. It is to a large extent laid out in villas and detached houses. The Westover Gardens in the centre of the town are a favorite resort; they include a winter garden, where orchestral concerts are regularly given. There are two piers, three arcades, assembly rooms, baths, etc. The buildings include hospitals, a sanatorium, home for consumptives, and some handsome churches, among the latter being the new Bennett Memorial church and St. Peter's church, both beautiful Gothic buildings. In the churchyard of the latter lie buried William Godwin, Mary Wollstonecraft, and their daughter, the wife of Shelley. Pop. (1901) 47,000.

Bourrienne, Louis Antoine Fauvelet de, loo-ē än-twän fō-ve-lā dé boo-ryën, French historian and diplomatist: b. Sens, 9 July 1769; d. Caen, 7 Feb. 1834. He was educated with Bonaparte at the school of Brienne, where a close intimacy sprang up between them. On their separation in 1785, when Bonaparte set out to attend the École Militaire in Paris, they vowed an eternal friendship. At the age of 19 he proceeded to one of the German universities, with the view of studying law and languages. He returned to Paris in 1792, and renewed his early friendship with Bonaparte, who employed him in drawing up, along with Gen. Clarke, the text of the Treaty of Campo Formio. From this period Bourrienne's diplomatic career commenced. He accompanied Bonaparte as his private secretary on his expedition to Egypt, and afterward continued in that capacity on his elevation to the consulate. In 1804 he was nominated by the emperor his minister-plenipotentiary at Hamburg. In the end of 1813 he returned to France, where he received the ap-

pointment of director of the posts, and in 1814 was made prefect of police. On the abdication of Napoleon he paid his court to Louis XVIII., who, on his restoration, nominated him a minister of state. The revolution of July, 1830, and the loss of his private fortune affected him so much that he lost his reason. He was removed to Normandy, and spent the last two years of his life in a lunatic asylum at Caen, where he died. His 'Mémoires sur Napoléon, le Directoire, le Consulat, l'Empire et la Restauration,' edited by Villemarest (1829-31), contain many interesting particulars of the youth of Napoleon, and also of the history of the directory and consulate, although they are blamed for want of accuracy in many points of detail.

Boursault, Edmé, éd-mā boor-sō, French writer: b. 1638; d. Montluçon, 1701. Having gone to Paris and engaged in literature he both gained and lost the favor of royalty, and produced pieces for the stage with permanent success; among others, 'Esopé à la Ville,' and 'Esopé à la Cour,' which still continue on the stage. His two tragedies 'Marie Stuart' and 'Germanicus' are forgotten. Boursault had the misfortune to quarrel with Molière and Boileau. He wrote a severe criticism on the 'Ecole des Femmes' under the title of 'Le Portrait du Peintre.' Molière chastised him in his 'Impromptu de Versailles.' To revenge himself on Boileau, who had ridiculed him in his satires, he wrote a comedy called 'Satyre des Satyres.'

Boussa, boos-sā. See BUSSANG.

Boussingault, Jean Baptiste Joseph Dieu-onné, zhōn bāp-těst zhō-zéf dyē-dōn-nā boo-sān-gō, French chemist: b. Paris, 2 Feb. 1802; d. there, 12 May 1887. He went to South America in the employment of a mining company, and made extensive travels and valuable scientific researches there. Returning to France he became professor of chemistry at Lyons in 1839, was made a member of the Institute, and then made Paris his chief residence. His works deal chiefly with agricultural chemistry, and include 'Économie Rurale' (translated into English and German); 'Mémoires de Chimie agricole et de Physiologie'; 'Agriculture, Chimie agricole, et Physiologie,' etc.

Boussingaultite, hoo-săn-gô'-tî't, a native hydrated sulphate of magnesium and ammonia, having the formula $(\text{NH}_4)_2\text{SO}_4 \cdot \text{MgSO}_4 + 6\text{H}_2\text{O}$. It has a specific gravity of about 1.7. It occurs with boracic acid (q.v.) in the Tuscan lagoons, especially at the fumaroles of Mount Cerboli. Artificial crystals are prisms belonging to the monoclinic system. A related mineral occurs in soft, white, granular masses in Sonoma, Cal.

Boustrophédon, a kind of writing found on Greek coins, and in inscriptions of the remotest antiquity. The lines do not run in a uniform direction from the left to the right, or from the right to the left; but the first begins at the left and terminates at the right; the second runs in an opposite direction, from the right to the left; the third, again, from the left; and so on alternately. It is called *boustrophedon* (that is, turning back like oxen) because the lines written in this way succeed each other like furrows in a ploughed field. The laws of Solon were cut in tables in this manner.

Boutelle, boo-tél', Charles Addison, American legislator: b. Damariscotta, Me., 9 Feb. 1839; d. 21 May 1901. He served in the navy during the Civil War, entering as an acting master, and being promoted to lieutenant for gallantry in action. In 1870 he became the editor of the *Bangor Whig and Courier*. He was elected to Congress in 1882, and held his seat till December, 1900, when he resigned, and was made a captain on the retired list of the navy. He was chairman of the House Committee on Naval Affairs in the 51st, 54th, and 55th congresses and was author of the bill (1890) authorizing the construction of the first modern battleships of the United States navy.

Bouterwek, Friedrich, fréd'rîit bow-tér-vék, German philosopher: b. 15 April, 1706, at Oker, a village not far from Goslar, in North Germany; d. Göttingen, 9 Aug. 1828. He was at first a follower of Kant, but finally attached himself to Jacobi. His 'Ideen zu einer allgemeinen Apodiktik' was the immediate fruit of his intimate acquaintance with the philosophical views of Fr. H. Jacobi. This work was published in two volumes, 1799. It was afterward completed by the 'Manual of Philosophical Knowledge' (1813), and by the 'Religion of Reason' (1824). In this work, as well as in his 'Aesthetik' (1806-1824), he had to contend with many powerful antagonists. Bouterwek has gained a permanent reputation by his 'Geschichte der neuern Poesie und Beredsamkeit' (History of Modern Poetry and Eloquence) (1801-19), a work which, though unequal in some respects, and in parts, especially in the first volume, partial and superficial, is an excellent collection of notices and original observations, and may be considered one of the best works of the kind in German literature. Among his minor productions, a selection of which he published in 1818, are many essays, which are superior to the best of his larger speculative works; for instance, the introduction to the History, in which he gives an account of his literary labors until that period, with great candor and with almost excessive severity against himself. His 'History of Spanish Literature' has been translated into Spanish, French, and English.

Bouto, boo-tō, or **Tucuxi**, Indian names for the dolphin (*Inia geoffrensis*) of the Amazon

Bouton, John Bell, American author: b. Concord, N. H., 15 March 1830; d. Cambridge, Mass., 18 Nov. 1902. He edited the *Cleveland Plain Dealer* 1851-5, and was connected with the *New York Journal of Commerce* 1857-89. He contributed for ten years to Appleton's *Annual Cyclopaedia*, and published 'Loved and Lost' (1857); 'Round the Block' (1864); 'Treasury of Travel and Adventure'; 'Round about Moscow' (1887); 'Uncle Sam's Church' (1895); 'Memoirs of General Bell' (1902).

Bouts, Dirk, or **Dierick**, dêrk or dê-rik bows, Dutch painter: b. Haarlem, about 1410; d. 1475. He was a brilliant colorist and one of the most prominent members of the Flemish school. Among his works are the 'Martyrdom of St. Erasmus' in the Church of St. Peter, Louvain; and the 'Martyrdom of St. Hippolitus' in the cathedral of Bruges.

Bouts Rimés, boo-ře-mâ (French), words or syllables which rhyme, arranged in a particular order, and given to a poet with a subject, on which he must write verses ending in the same rhymes, disposed in the same order. Ménage gives the following account of the origin of this ridiculous conceit, which may be classed with the eggs and axes, the echoes, acrostics, and other equally ingenious devices of learned triflers. 'Dulot (a poet of the 17th century) was one day complaining, in a large company, that 300 sonnets had been stolen from him. One of the company expressing his astonishment at the number. 'Oh,' said he, 'they are blank sonnets, or rhymes (*bouts rimés*) of all the sonnets I may have occasion to write.' This ludicrous statement produced such an effect that it became a fashionable amusement to compose blank sonnets, and in 1648 a 4to volume of bouts rimés was published. Sarrazin's 'Dulot Vaincu, ou la Défaite des Bouts Rimés,' is an amusing performance.

Boutwell, bowt'well, George Sewell, American statesman: b. Brookline, Mass., 28 Jan. 1818; d. Groton, Mass., 27 Feb. 1905. He was admitted to the bar in 1836; served in the State legislature in 1842-51; governor of Massachusetts 1851-2; was an organizer of the Republican party in 1854, and appointed the first commissioner of the newly established Department of Internal Revenue in 1862. He was representative in Congress 1863-9; one of the managers of the impeachment trial of President Johnson; secretary of the treasury in 1869-73; and a United States senator in 1873-9. Besides numerous speeches he published 'Educational Topics and Institutions' (1859); several works concerning taxation; 'The Constitution of the United States at the End of the First Century' (1806); 'Reminiscences of Sixty Years in Public Affairs' (1902). After 1898 he was especially prominent as a leader of the Anti-Imperialists and vigorous opponent of the Philippine policy of the administration.

Bouvard, Joseph Antoine, zhō-zéf än-twän, French architect: b. Saint-Jean-de-Bournay, 19 Feb. 1840. He was a pupil of Constant Dufeux, whom he assisted in his work connected with the Panthéon, the Law School, and the Palace of the Luxembourg. He was appointed inspector of

public works in Paris, and, in 1879, was city architect, making himself famous by his work on the Théâtre Lyrique, the Church of St. Lawrence and the barracks of the Republican Guard. He transformed the old grain market into a Bourse; constructed the railway stations of Sainte Etienne and Marseilles; was architect of the Pavilion of the City of Paris at the exposition of 1878; and created the magnificent central dome of that of 1889. He had charge of the decoration of Paris at the time of the visit of the emperor of Russia, and won great popularity by the magnificence of the festivals which he arranged. In June 1897, he was appointed director of the newly created administrative direction of architecture and promenades. He was made an officer of the Legion of Honor in 1889. He took an important part in the preparation for the Universal Exposition of 1900, being director of architectural services and chief of the management of fetes, under M. Picard.

Bouvardia, boo-vär'dī-a, a genus of about 25 species of American shrubs or perennial herbs of the natural order *Rubiaceae*, natives mostly of tropical Mexico, some of Arizona and Texas. Several horticultural varieties are largely cultivated in greenhouses for their terminal cymes of long tubular white, red, or yellow, sometimes perfumed blossoms which are very useful as cut flowers during late fall and early winter. The type species are not cultivated commercially.

Bouvard, or **Bouvard**, boo-vär, Alexis, Swiss mathematician and astronomer: b. Haute Savoie, 27 June 1767; d. 7 June 1843. He went to Paris about 1785 to study mathematics and astronomy, and in 1793 obtained a position in the Paris Observatory. He is celebrated for his researches in the theory of planetary motions, especially those of Jupiter and Saturn. Later he took up the theory of Uranus, and was the first to suggest that the discrepancies between the old and new observations could only be reconciled by the hypothesis of another undiscovered disturbing planet, an opinion which he retained till his death, three years before the discovery of Neptune. He published 'Nouvelles tables de Jupiter et de Saturne' (1808); 'Mémoire sur les Observations Météorologiques, faites à l'Observatoire de Paris.'

Bouvé, Pauline Carrington, American novelist: b. Little Rock, Ark.; married Thomas Tracy Bouvé in 1898. Besides the historical novel 'Their Shadows Before' (1900) she has published 'La Toison d'Or' from the French of Amedée Achard (1900).

Bouvet, Joachim, French missionary: b. Mans, about 1662; d. Pekin, China, 28 June 1732. Sent by Louis XIV. to China to study the customs and institutions of that country, he was received with favor at the imperial court at Pekin, employed by the emperor in directing various constructions, and allowed to build a church even within the palace. He returned to France in 1697, with permission to take back with him to China as many missionaries as would undertake the voyage. He presented to Louis XIV. 49 works in the Chinese language, and in 1699 departed again for China with 10 associates, among whom was the learned Parenin. He labored for nearly 50 years with indefatigable ardor to promote the progress of the

sciences in that empire. He gave an account of the state of China in several treatises and letters, and made a dictionary of the language.

Bouvet, Marie Marguerite, American writer of books for young people: b. New Orleans, 14 Feb. 1865. She has published 'Sweet William' (1890); 'Little Marjorie's Love Story' (1891); 'Prince Tip-Tip' (1892); 'My Lady' (1894); 'A Child of Tuscany' (1895); 'Pierette' (1896); 'A Little House in Pimlico' (1898); 'Tales of an Old Château' (1900).

Bouvier, John, American jurist of French birth: b. Codognan, in the department of Gard, 1787; d. Philadelphia, 18 Nov. 1851. He was of a Quaker family, which emigrated to this country and settled in Philadelphia, when he was in his 15th year. He obtained employment for several years in a book store, became a citizen of the United States in 1812, published a newspaper for a short time at Brownsville, in the western part of Pennsylvania, studied law, and was admitted to the bar in 1818. During his studies he made a complete analysis of Blackstone's 'Commentaries.' In 1822 he began the practice of law in Philadelphia, in which city he resided till his death. He published, in 1839, a 'Law Dictionary, adapted to the Constitution and Laws of the United States of America, and of the several States of the American Union,' the fruit of 10 years' labor. In 1841 he published a new edition of Bacon's 'Abridgement of the Law.' His greatest work, published two months before his death, was the 'Institutes of American Law.'

Bovee, George, American politician: b. Saint James, La., 1840; d. El Paso, Tex., 1903. He was one of the first native whites to join the Republican party. He was elected Secretary of State in 1868, but quarrelled with Gov. Warmoth, the head of the administration, and it was this quarrel and the removal of Bovee by Warmoth which led to the political complications in Louisiana, and the dual State government of 1872 to 1876.

Boves, Jose Tomas, military adventurer in Spanish America; d. 5 Dec. 1814. He was born in Castile, and of the lowest extraction. At the age of 30 he was employed as a naval officer to guard the American coast, but betrayed his trust, and was condemned and imprisoned for bribery and prevarication. After his release, he joined the royal forces, but began to wage war on his own account after the defeat of Cagigal at Maturin. Boves established himself at Calabozo, Venezuela, and with 500 men, many of whom were slaves, defeated Mariño, the dictator of the eastern provinces. He defeated the independents twice, slaughtered all his prisoners, and gained for his army the name of the Internal Division. He was defeated by Rivas, and a part of his army, being taken captive, were put to death; but he quickly recovered his strength, resumed the offensive, and in 1814 defeated Bolivar and Mariño at La Puerta. The struggle was prolonged with alternate successes and reverses, and with incessant cruelties. Boves advanced toward Valencia, where the independents were strongly fortified, and after a blockade, forced the town to capitulate. To give a more solemn sanction to the terms of capitulation, a mass was celebrated between the two armies,

and at the moment of the elevation, the royalist general promised a strict and faithful observance of the treaty; but having entered the town, he ordered the republican officers and a large number of the soldiers to be shot. Boves was again victorious at Anguita, and obliged Bolívar to retreat to Carthagena. He now entered Caracas, and shortly after gained a new victory, and killed or wounded 1,500 of the independents. His last triumph was at Urica; he was struck by a lance, and died upon the field of battle. His funeral was celebrated amid bloody commotion, while his troops were putting to death the men, women, and children whom they had made prisoners.

Bovey, Henry Taylor, Canadian engineer: b. Devonshire, England. He was educated at Cambridge University and took up the profession of civil engineering. He was appointed professor of civil engineering and applied mechanics in McGill University in Montreal in 1887 and has since lived in Canada. He is a member of many professional societies both in England, Canada, and the United States, and is the author of 'Applied Mechanics' (1882); 'Theory of Structures and Strength of Materials' (1893); 'Hydraulics' (1895).

Bovidae, one of the most extensive and important families of mammals, characterized pre-eminently by the possession of hollow persistent horns in both sexes, and the form of digestive apparatus which involves chewing the cud. The family consists of the large herbivorous animals with cloven hoofs, which are most prominent as game, and which have supplied nearly all our domestic animals, except horses and camels. This family includes all of the ruminants, except the deer, giraffes, and pronghorn, and embraces five sections or sub-families, namely: the antelopes (*Antilopinae*); the goats (*Caprinae*); the sheep (*Ovinae*); the musk-ox (*Ovibovinae*); and the oxen (*Bovinae*). Although in a general way the members of these sections are easily recognized, all are connected by intermediate examples whose position is assigned with difficulty, so that a general structural likeness covers even such different examples as the delicate antelopes and the heavy cattle. A conspicuous common character is found in the nature of the horns, which gave the name *Cavicornia* to the group in the early classifications. These horns are always in pairs, and consist of sheaths of horn growing from the skin and covering "cores," which are protuberances of bone from the frontal bones of the skull, varying in form in the different groups, and contain hollow spaces, which are extensions of the frontal sinuses. These horns begin to grow soon after the animal is born, and increase until they attain their full size with the maturity of the individual; with very few exceptions they are worn by both sexes, but those of the males, especially among sheep, are often considerably larger and more effective as weapons than those of the females. No animal outside of this family possesses hollow horns of this character, except the pronghorn, and in this case they are branched, and are annually shed, neither of which conditions ever occurs among the Bovidae.

The Bovidae are distributed throughout the whole world, except Australia and South America. They are in the main gregarious, and where

the nature of their habitat permits, as on the plains inhabited by most antelopes and certain bison, they gather into enormous herds. The sheep, goats, and some of the antelopes, are confined to mountain ranges; most of the oxen dwell in forests; and the musk-ox is restricted to Arctic lands. Most of these animals, however, show great adaptability to new climates and conditions, have a high degree of variability, and are susceptible of taming and domestication. In consequence they have furnished to mankind the most important of his aids to agriculture, as the cattle, sheep, and goats, which he has been able to take with him to every part of the world, to train to his service, or to develop by careful improvement into the great resources of food and clothing, which they have become. See **DOMESTIC ANIMALS**, and the names of the various groups and species composing the family.

Bovines, Flanders, a village within a short distance of Lille, celebrated for the memorable victory gained by Philip Augustus of France, over Otho IV. of Germany, and his allies, 27 July 1214. Philip of Valois defeated here, in 1340, 10,000 English troops; and, on 17 and 18 May 1794, the French here defeated the Austrians.

Bovino, Italy, (anciently *Bovinum*), a fortified town in the province of Foggia, 20 miles south southwest of Foggia, near the Cervaro; the seat of a bishopric, suffragan to Benevento. It has a cathedral, two parish churches, and several convents. The Spaniards were defeated here by the Imperialists in 1734. Pop. 7,613.

Bow, the earliest instrument known, and the most generally diffused, among all savage and barbarous people for the propulsion of missiles in the chase or in war. There are two forms of the bow, the long-bow and the cross-bow, the former of which is the earlier, the more general, and by far the more celebrated, as being the weapon of the famous English archers of the Middle Ages, who were popularly said to carry at their belts the lives of four-and-twenty Scots, that being the number of clothyard arrows in their quivers. The long-bow passed out of use as a military weapon with the improvement of firearms; but there were men yet alive in the beginning of this century who remembered that the Highlanders, in the Jacobite rising of 1715, carried bows and arrows; and at the capture of Paris, in 1814, Bashkirs and Circassians, in the service of Russia, were seen in the streets of that city, armed in chain-mail, with bow-cases and quivers. Some of the North American Indians, especially the Comanches and the Apaches were very expert with the bow. Whatever the substance of which the bow is made, whether of wood, horn or steel, its figure is nearly the same in all countries, having generally two inflexions, between which, in the place where the arrow is fixed, is a right line. The Grecian bow was somewhat in the form of the letter Σ : in drawing it, the hand was brought back to the right breast, and not to the ear. The Scythian bow was distinguished for its remarkable curvature, which was nearly semi-circular; that of the modern Tartars is similar to it. The materials of bows have been different in different countries. The Persians and Indians made them of reeds. The Lycian bows were made of

BOVIDAE.

1. Celebes Wild Ox or Anoa.

2. North American Bison or Buffalo.

3. Indian Domestic Buffalo.

the cornel-tree; those of the Ethiopians of the palm-tree. That of Pandarus was made from the horn of a mountain goat, 16 palms in length: the string was an oxhide thong. The horn of the antelope is still used for the same purpose in the East. The long-bow was the favorite national weapon in England. The battles of Crecy (1346), Poitiers (1356), and Agincourt (1415) were won by this weapon. It was made of yew, ash, etc., of the height of the archer. The arrow being usually half the length of the bow, the cloth-yard was only employed by a man six feet high. The arbalest, or cross-bow, was a popular weapon with the Italians, and was introduced into England in the 13th century. The arrows shot from it were called quarrels.

Of the power of the bow, and the distance to which it will carry, some remarkable anecdotes are related. Xenophon mentions an Arcadian whose head was shot through by a Carduchian archer. Stuart mentions a random shot of a Turk, which he found to be 584 yards; and Mr. Strutt saw the Turkish ambassador shoot 480 yards in the archery ground near Bedford Square. Lord Bacon speaks of a Turkish bow which has been known to pierce a steel target or a piece of brass two inches thick. In the journal of King Edward VI. it is mentioned that 100 archers of the king's guard shot at a one inch board, and that some of the arrows passed through this and into another board behind it, although the wood was extremely solid and firm. It has been the custom of many savage nations to poison their arrows. This practice is mentioned by Homer and the ancient historians; and we have many similar accounts of modern travelers and navigators from almost every part of the world. Some of these stories are of doubtful authority, but others are well authenticated. Some poison obtained by Condamine from South American savages produced instantaneous death in animals inoculated with it. The poisoned arrows used in Guiana are not shot from a bow, but blown through a tube. See AIR-GUN; also ARCHERY.

In music it is the well-known implement by the means of which the tone is produced from viols, violins, and other instruments of that kind. It is made of a thin staff of elastic wood, tapering slightly till it reaches the lower end, to which the hairs (about 80 or 100 horse-hairs) are fastened, and with which the bow is strung. At the upper end is an ornamented piece of wood or ivory called the nut, and fastened with a screw, which serves to regulate the tension of the hairs. It is evident that the size and construction of the bow must correspond with the size of the species of viol-instruments from which the tone is to be produced.

Bow Bells, the peal of bells belonging to the Church of St. Mary-le-Bow, Cheapside, London, and celebrated for centuries. One who is born within the sound of Bow Bells is considered a genuine cockney.

Bow Island, an island in the South Pacific Ocean, near the eastern extremity of the Society Isles, in lat. 18° 6' S. and lon. 140° 51' W. It is a low island, of coral formation, about 30 miles in length and 5 miles in breadth. It derives its name from its shape, which is bow-like, the outer edge only being of land, and encircling a great central lagoon. It was discovered by Bougainville in 1768.

Bow Legs, a deformity of the legs in which the knees are far apart and the leg is bowed outward. It is technically known as *genu varum* and is the opposite of knock-knees, or *genu valgum*. Two forms are common, in one the bow is a gradual one, practically the entire leg being bent, in the other the bend takes place quite suddenly just above the ankle. Sometimes the bow is front and back instead of sideways. Bow leg is the commonest of the deformities, making fully 10 per cent of all orthopedic cases. It may be congenital, it is usually due to rickets (q.v.) and perhaps may occur in strong and heavy children who stand too much while very young. In the majority of cases it is outgrown, but in pronounced instances it can be cured only by prolonged correction by means of appropriate braces.

Bow-window, in architecture, properly a window forming a recess or bay in a room, projecting outward, and having for the outline of the plan a segment of a circle. This term is, however, often confounded with bay-window and oriel, which properly designate, the first a similar window with a straight-sided plan, and the second a projecting window not on the ground-floor, and supported on a corbel or other molded base.

Bow-wood. See OSAGE ORANGE.

Bowdich, Thomas Edward, African traveler, one of the victims of the attempts to explore the interior of the Dark Continent: b. Bristol, June 1791; d. 10 Jan. 1824. He was sent to Oxford, but was never regularly matriculated. At an early age he married, and engaged in trade at Bristol. Finding the details of business irksome, he obtained the appointment of writer in the service of the African Company, and set sail for Africa in 1814. In 1816, it being thought desirable to send an embassy to the negro king of Ashantee, Bowdich was chosen to conduct it; and he executed with success the duties of his situation. After remaining some time in Africa he returned home, and soon after published his 'Mission to Ashantee, with a Statistical Account of that Kingdom, and Geographical Notices of other Parts of the Interior of Africa.' Having offended the company in whose service he had been engaged, and having, therefore, no prospect of farther employment, yet wishing ardently to return to Africa for the purpose of visiting its hitherto unexplored regions, Bowdich resolved to make the attempt with such assistance as he could obtain from private individuals. He, however, previously went to Paris to improve his acquaintance with physical and mathematical science. His reception from the French literati was extremely flattering. A public eulogium was pronounced on him at a meeting of the Institute, and an advantageous appointment was offered him by the French government. To obtain funds for the prosecution of his favorite project, Bowdich also published a translation of 'Mollien's Travels to the Sources of the Senegal and Gambia,' and other works; by the sale of which he was enabled, with a little assistance from other persons, to make preparations for his second African expedition. He sailed from Havre in August 1822 and arrived in safety in the river Gambia. A disease, occasioned by fatigue and anxiety of mind, here put an end to his life.

Bowditch, Henry Ingersoll, American physician: b. Salem, Mass., 9 Aug. 1808; d. 14 Jan. 1892. He received his degree at Harvard in 1832; was professor of clinical medicine at Harvard in 1859-67; chairman of the State Board of Health in 1869-79; and president of the American Medical Association in 1877. He announced the law of soil moisture as a cause of consumption in New England; introduced several new features in surgical treatment, and was author of many general and special works in medical science. He was the first to practise chest-puncture in cases of pleurisy.

Bowditch, Henry Pickering, American educator: b. Boston, Mass., 4 April 1840. He was graduated at Harvard in 1861, and subsequently studied chemistry and medicine, and, after the Civil War, in which he reached the rank of major in the Union service, he took a special course in physiology in France and Germany. In 1871-6 he was assistant professor of physiology in the Harvard Medical School, and in 1876 was elected to the full chair but resigned on 9 May 1906. He is a member of the American Academy of Arts and Sciences, as well as of numerous medical societies, and has published many papers on physiological subjects.

Bowditch, bow'dich, Nathaniel, American mathematician: b. Salem, Mass., 26 March 1773; d. Boston, 16 March 1838. The son of a cooper he went to school till 10 years of age, when he entered his father's shop. Later he was apprenticed to the ship chandlery business, which he followed till he went to sea. He studied incessantly, during intervals of business and in morning and night hours. Mathematics was the science in which he was most interested, and he mastered algebra and Latin unaided. He had a teacher for French, and in later life he took up Spanish, Italian, and German. He learned navigation and was an omnivorous reader. In 1795 he made his first voyage as clerk, later as supercargo, and in the course of five long voyages rose to be master. Harvard College gave him the degree of M.A. and offered him the professorship of mathematics, which he declined, as he also did a similar offer from the University of Virginia, and the United States Military Academy. Between 1814 and 1817 he translated Laplace's 'Mécanique Céleste,' and appended to it an elaborate commentary. He contributed largely to scientific periodicals, his articles being principally on mathematics and astronomy. He was admitted as a Fellow to the Royal Society of London.

Bowditch's Practical Navigator, a work on navigation of the highest value and utility to seamen, written by Nathaniel Bowditch (q.v.) and published in 1802.

Bowdler, bō'dler, Thomas, English expurgator: b. near Bath, 11 July 1754; d. Rhyddings, South Wales, 24 Feb. 1825. At the age of 16 he went to St. Andrews to study medicine, but graduated M.D. at Edinburgh in 1776, and, after some years of travel, settled in London, devoting himself mainly to charitable work. He lived for 10 years at St. Boniface, Isle of Wight, and for the last 15 years of his life at Rhyddings, near Swansea. In 1818 he published 'The Family Shakespeare,' in 10 volumes; in which nothing is added to the original text; but those words and expressions are

omitted which cannot with propriety be read aloud in a family. The work had a large sale, and was long popular, despite the ridicule it brought down upon the head of its over-prudish editor, who had the happiness or unhappiness to add permanently to the English tongue the word "bowdlerism" as a synonym for senseless expurgation. The last years of Bowdler's life were given to the task of preparing a purified edition of Gibbon's 'History.'

Bowdlerism. See BOWDLER, THOMAS.

Bowdoin, bō'dōin, James, American statesman: b. Boston, 8 Aug. 1727; d. there, 6 Nov. 1790. Graduating from Harvard in 1745, he inherited in 1747 a large fortune from his father, a wealthy merchant, and was thus provided with means to gratify his taste for scientific investigation. In 1751 he visited Franklin, who explained to him the results of his electrical researches. A correspondence ensued that lasted many years, and Franklin read Bowdoin's letters before the Royal Society of London. He was a prominent figure in the politics of his State, being elected a member of the General Court 1753-6, and of the Council 1756-69. He presided over the Constitutional Convention in 1779, and to him was due the form of some of the most admired sections of the constitution it drew up. As governor, 1785-6, he quelled Shay's Rebellion. In 1788 he was a delegate to the Federal Constitutional Convention. He was a Fellow of Harvard College from 1779 to 1785 and to it he left a legacy of £400. A founder and first president of the American Academy of Arts and Sciences, he bequeathed it his very valuable library. The degree of Doctor of Laws was conferred upon him by the universities of Yale and Edinburgh. Bowdoin College in Brunswick, Me., was named in his honor. He wrote a poetical paraphrase of Dodsley's 'Economy of Human Life' (1759), and several papers which may be found in the first volume of the American Academy's 'Memoirs.' To the 'Pietas et Gratulatio,' a volume of poems published by Harvard on the accession of George III., he contributed an English poem and two Latin epigrams.

Bowdoin, James, American statesman (son of the preceding): b. Boston, 22 Sept. 1752; d. Naushon Island, Buzzard's Bay, 11 Oct. 1811. He was graduated from Harvard in 1771, studied at the University of Oxford, and traveled in Europe. At the outbreak of the Revolution he returned home and became successively a member of the Assembly, the State Senate, and a delegate to the State Constitutional Convention, 1779. In Jefferson's administration he was appointed minister plenipotentiary at the court of Spain, and associate minister to France. During his residence abroad he accumulated a valuable library, a collection of paintings and drawings by old and modern masters, a cabinet of minerals and fossils, together with models of crystallography, all of which he bequeathed to Bowdoin College, of which he was the earliest patron. During his lifetime he gave it 6,000 acres of land and £1,100, and at his death it became, by will, his residuary legatee. He translated Daubenton's 'Advice to Shepherds,' and was the anonymous author of 'Opinions respecting the Commercial Intercourse Between the United States and Great Britain.'

Bowdoin College, located at Brunswick, Me. It is the oldest institution of higher learning in the State, having been incorporated in 1794, while Maine was a part of Massachusetts. It was named for James Bowdoin, governor of Massachusetts, whose son gave largely to the college. It was not opened to students until 1802. It is under the general patronage of the Congregational Church, but is non-sectarian in government and instruction. In addition to the college proper, the organization includes the Medical School of Maine, founded in 1820. The college confers the degree of A. B. for the completion of the regular four years' course. The work is almost entirely elective after the freshman year. A course in shopwork was added to the curriculum in 1902-3. The campus consists of 40 acres, one mile from the Androscoggin River, about three miles inland from Casco Bay. The buildings include Massachusetts Hall (the original building), King Chapel, Memorial Hall, Mary Francis Searle Science Building, Walker Art Building, Hubbard Hall (the library), Adams Hall, Observatory, and the Sargent Gymnasium. The library, in 1904, contained 76,000 volumes; the students numbered 275, and the faculty 35. A number of Bowdoin graduates have been distinguished in literary and public life; among them are Longfellow and Hawthorne, Thomas B. Reed, and Melville Weston Fuller (chief justice).

Bow'ell, Sir Mackenzie, Canadian statesman: b. Rickinghall, Suffolk, England, 27 Dec. 1823. He went to Canada when 10 years old and learned the printing trade, becoming editor of the *Belleville Intelligencer*. He served in the Canadian militia. After the Confederation he served in the Dominion House of Commons for 25 years. In 1878 he entered the MacDonald Cabinet, and in 1894 formed an administration of his own. He relinquished Cabinet office in 1896, and in 1897 he declared his independence of all party affiliation.

Bowen, bō-en, Francis, American educator and author: b. Charlestown, Mass., 8 Sept. 1811; d. Cambridge, Mass., 21 Jan. 1890. He was graduated from Harvard in 1833, and for a time taught mathematics in Phillips-Exeter Academy. He became instructor in natural philosophy and political economy at Harvard, 1835; studied in Europe, 1839-41, meeting Sismondi and De Gerando. Returning to Cambridge in 1843 he took charge of the 'North American Review,' as editor and proprietor, and conducted it with great ability for nearly 11 years. On account of his having taken the unpopular side in the 'Review' on the Hungarian question, the overseers of Harvard refused to concur with the corporation in appointing him professor of history in 1850. When Dr. Walker became president of Harvard in 1853, Prof. Bowen was elected Alford professor of natural religion, moral philosophy, and civil polity, and held that chair until 1888, when he became professor emeritus. He opposed the doctrines of Darwin and accepted those of Sir William Hamilton. He was a clear, forceful, independent thinker, and possessed a style notable for its energy and precision. As a writer he was most industrious, treating with success widely varying topics. The following is a selected list of his publications: 'Documents of the Constitutions of England and America, from Magna

Charta to the Federal Constitution of 1789' (1854); 'The Principles of Metaphysical and Ethical Science applied to the Evidences of Religion' (1855); 'Dugald Stewart's Philosophy of the Human Mind, with Critical Notes' (1854); 'Principles of Political Economy' (1856); 'The Metaphysics of Sir William Hamilton' (1862); 'De Tocqueville's Democracy in America, edited with notes' (1862); 'Logic, or the Laws of Pure Thought' (1864); 'American Political Economy' (1870).

Bowen, Henry Chandler, American editor and publisher: b. Woodstock, Conn., 11 Sept. 1813; d. 24 Feb. 1896. He received a common school education and entered business. In 1848 he helped to found the 'Independent,' in New York, becoming, in 1861, its editor and proprietor, and making the paper famous for its advanced views on public topics.

Bowen, Herbert Wolcott, American diplomatist (son of the preceding): b. Brooklyn, N. Y., 29 Feb. 1856. He was educated at Yale College and at the Columbia Law School. He was appointed United States consul at Barcelona in 1890 by President Harrison, and in 1894 President Cleveland made him consul-general of the same port. At the opening of the Spanish-American war he remained at his post as long as was practicable, and at the conclusion of the war was appointed by President McKinley consul-general at Teheran, and in May 1901 minister plenipotentiary to Persia. He was subsequently appointed minister to Venezuela, and during the hostilities between that country and England and Germany in the opening months of 1903 won general commendation for his skillful diplomacy. He has published 'Verses'; 'Losing Ground'; 'In Divers Tones'; 'De Genere Humano'; 'International Law.'

Bowen, John Wesley Edward, American theologian: b. New Orleans, 3 Dec. 1855. He graduated at Boston University in 1878, and in 1885 received the degree of Ph.D., from the University of New Orleans. He held pastorates in Newark, N. J., Boston, Baltimore, and Washington, 1882-92. Since 1888 he has been professor of the history of theology in Gammon Theological Seminary, Atlanta, Ga. He is a recognized leader in all educational and social movements for the betterment of the colored race, and an example of its possibilities in scholarly attainment. Publications: 'Sermons'; 'Africa and the American Negro'; 'Discussions in Philosophy and Theology'; 'Struggle for Supremacy between the Church and State during the Middle Ages'; 'The Catholic Spirit of Methodism'; 'The Theology and Psychology of the Negro Plantation Melodies'; 'The Psychological Process in the Revelation of Doctrine.'

Bow'er, Archibald, Scottish writer: b. near Dundee, 17 Jan. 1686; d. London, 3 Sept. 1766. He entered the order of Jesuits in 1706. At Macerata, in Italy, according to his own account, he was counselor or judge of the Inquisition. In 1726 he quitted the order of Jesuits and went to Perugia, whence he fled secretly to England and professed himself a convert to the Protestant faith. He obtained respectable patronage, was engaged as a tutor in a nobleman's family, and employed by the

BOWER-BIRDS — BOWERS

booksellers in conducting the 'Historia Literaria,' a monthly review of books, and in writing a part of the 'Universal History,' in 60 vols. 8vo. The money which he gained by these occupations he is believed to have given or lent to the society of the Jesuits, and thus to have purchased his re-admission among them about the year 1744. Subsequently repenting of the engagement he had made with his old associates, he claimed and recovered the property he had advanced. In 1748 he published the first volume of a 'History of the Popes,' which was continued to seven volumes and characterized by the utmost zeal against Roman Catholicism. His money transactions with the Jesuits being at last brought to light, he was generally believed to be a man destitute of moral or religious principle; so that toward the end of his life he had hardly a friend or patron left except Lord Lyttelton. He is said to have died a Protestant.

Bower-birds, a group of birds of the bird-of-paradise family, dwelling in Australia and the neighboring islands, remarkable for the construction of bowers or "play-houses" in addition to their ordinary breeding-nests. All are of moderate size, of dark and plain plumage, having few ornaments of color and none of feather characteristic of other birds-of-paradise, although, like them, they are of aboreal habits, feed mainly upon fruits, and construct rather rude nests for their eggs in branches of trees. In addition to the nest proper, the males of all the bower-birds build upon the ground bowers or shelters of various forms, which serve as places for assembling and holding the series of antics or dances, in rivalry with each other, and as a display of their respective attractions to the females, in which these birds indulge during the season of courtship. These buildings always occupy a little space in the forest which is first carefully cleared of every obstruction, so that they look like small cultivated lawns. A few species are content with such a lawn, but most erect buildings which vary in form according to the species. The satin-bird (*Ptilorynchus violaceus*) of southern Australia forms of twigs, a few inches in length, an oblong, dome-shaped hut, open at each end and floored with twigs. The sides of this hut are formed of slender twigs, planted upright, and leaning inward to form a roof. Its floor, and the ground all about it, are strewn with highly colored feathers and bright objects of all sorts, which the bird brings, day by day, sometimes from a great distance, to add to his store, replacing dull or faded pieces with something better as he finds them. The people of the region are accustomed to search these collections for such lost articles as bits of bright jewelry, which the birds frequently seize and take there. The spotted bower-birds, of the genus *Chlamydera*, form "runs" or avenues about three feet long, formed of a dense platform of sticks fenced in on each side by a hedge of upright twigs, and place near it hundreds of white pebbles, pieces of bleached bone, shells, and bright objects, which they rearrange with incessant activity. One species gathers snail-shells exclusively. Another species make several little huts—a miniature of a village of the black fellows. The most remarkable of these structures, however, is that of a New Guinea species (*Amblyornis inornatus*) which is called "gardener-bird" in the

books. This bird clears a space around the base of a small tree, and then piles up around its base a cone of moss, about 18 inches in height. Outside of this, and at a distance of four or five inches, it plants a circle of twigs, some of which are two feet in length, so that they form a conical hut, covering and enclosing the inner cone. Two doors are left in this outer hut at opposite sides. The twigs of which this "wigwam" is composed are always the thin stems of an epiphytal orchid, which retain their leaves and remain alive and blooming for a long time; and it is believed by Dr. Beccari, who first described this bird, that the orchids are chosen because they will remain alive. He says, however, that this apparent attempt to provide flowers is not restricted to the cabin. Directly in front of the entrance is made a miniature meadow of soft moss, which is kept smooth and clean, and upon which are scattered flowers and fruit of different colors, bright fungi, and brilliantly colored insects, so that the place reminds one of an elegant little garden. Moreover, when these objects have been exposed so long so as to become wilted they are taken away and replaced by others, so that it seems impossible to believe that the birds do not take a real delight in the freshness of their flowers, and the brightness and color of their ornaments. The activity and curiosity of all these bower-birds are strong characteristics, and they seem to derive great amusement, not only from their architectural arrangements, but in gathering, placing, and rearranging their treasures, and in keeping the premises in the neatest and prettiest condition possible. It is difficult to understand how any other purpose is served by these structures than simply that of providing a convenient place for the lively movements by which they display themselves to the females, as has been alluded to above, and for the duels which frequently take place between rival males, sometimes with fatal results; but to this must be added the gratification of an inherited instinct of acquisitiveness, and a real delight in beautiful things. The species of another genus (*Prionadura*) make similar "bowers" four to six feet high.

Detailed descriptions of these and several other similar birds and their works will be found in the books relating to the ornithology of Australia and New Guinea, and especially in the writings of the Italian naturalists, Beccari and Salvadori. An excellent *résumé* may be read in Lydekker's 'Royal Natural History,' Vol. III. (Lond. 1885). Several species have been brought alive to Europe and may usually be seen, with their curious bowers, in the zoological gardens of London, Paris, and elsewhere; while the museums in New York and Washington contain models of some of their ornamental structures.

Bowers, Elizabeth Crocker, American actress: b. Ridgefield, Conn., 12 March 1830; d. Washington, D. C., 6 Nov. 1895. She made her first appearance on the stage at the Park Theatre, New York, in 1846, and in 1847 married David P. Bowers and appeared in Philadelphia as Donna Victoria in 'A Bold Stroke for a Husband.' She was a stock member of the Arch Street company in Philadelphia until her husband's death in 1857. She remarried in 1860, and in the next year made a professional trip to England with great success. She

returned to New York in 1863, and, after fulfilling several engagements, retired from the stage. In 1884 she returned to the stage in 'La Charbonniere,' and in 1886 began a series of performances with her own company at the 14th Street Theatre in New York. She played with Rose Coghlan in 'A Woman of No Importance,' in 1893, and supported Olga Nethersole in her first appearance in the United States in 1894. Her last impersonation was that of Lady Margrave in 'The New Woman' in the early part of 1895.

Bowers, Theodore S., American soldier: b. Pennsylvania, 10 Oct. 1832; d. Garrison's Station, N. Y., 6 March 1866. At the outbreak of the Civil War he was editor of a Democratic paper in Mount Carmel, Ill. After the battle of Bull Run he raised a company for the 48th Illinois Infantry, but declined its captaincy on account of the taunts of former political associates, and went to the front as a private. On 25 Jan. 1862 he was detailed as a clerical assistant at Gen. Grant's headquarters. That officer found him invaluable and kept him near him until the close of the war. He went through the campaigns of Forts Henry and Donelson, and while the army was absent on the Tallahatchie expedition Bowers was left in charge of the department headquarters, having received a regular staff appointment as captain and aide-de-camp. When Van Dorn seized the headquarters at Holly Springs 20 Dec. 1862, Bowers destroyed all the departmental records that would have been of value to the Confederates, refused to give his parole, and made his escape during the night. He was twice brevetted for gallant and meritorious services, and after the war Gen. Grant retained him on his personal staff, having procured his appointment as assistant adjutant-general with rank of major in the United States army, 6 Jan. 1865. He was killed while boarding a moving train.

Bowery, The, a street in New York. It begins at Chatham Square and terminates at Cooper Union. It was long notorious for the resorts located along its length, but its character has undergone improvement.

Bowfin, a fish (*Amia calva*) of the Mississippi Valley. See MUFFISH.

Bowhead, the Greenland or right whale, taking its name from the arched outline of its head. See GREENLAND WHALE.

Bowie, bō'e, James, American frontiersman: b. Burke County, Ga., about 1790; d. 6 March 1836. He took part in the revolt of Texas against Mexico, and fell in the Alamo massacre. He gave his name to the bowie-knife (q.v.).

Bowie-knife, a long knife shaped like a dagger, but with only one edge, named after Col. James Bowie (q.v.). Its use as a weapon was originally confined to Texas, but is now used in almost all the States of the Union. Col. Bowie is said to have had his sword broken down to within about 20 inches of the hilt in a fight with some Mexicans, but he found that he did such good execution with his broken blade that he equipped all his followers with a similar weapon.

Bowker, Richard Roger, American author: b. Salem, Mass., 1848. He has been prominent in politics as an independent and was the ori-

ginator of the independent Republican movement of 1879. He has edited the 'Publisher's Weekly,' the 'Library Journal,' and the 'American Catalogue,' and has published 'Work and Wealth'; 'Economics for the People'; 'Copyright: Its Law and Its Literature'; 'Primer for Political Education'; 'Electoral Reform'; 'The Arts of Life'; 'Civil Service Examination.'

Bowles, Francis Tiffany, American naval constructor: b. Springfield, Mass., 7 Oct. 1858. He was graduated at the United States Naval Academy in 1879, and has ever since been prominent in the work of naval construction, with special reference to the rehabilitated United States navy. He has been in charge of construction at the navy yards in Norfolk and Brooklyn, and was made chief constructor of the navy with the rank of rear admiral in 1901.

Bowles, Samuel, American journalist: b. Springfield, Mass., 9 Feb. 1826; d. 16 Jan. 1878. He was editor and proprietor of the Springfield *Republican* and a prominent factor in public affairs. He wrote 'Across the Continent' and 'The Switzerland of America.'

Bowles, William A., Indian agent and chief: b. Frederick County, Md.; d. 23 Dec. 1805. When 13 years of age he ran away from home and joined the British army at Philadelphia. He afterward went among the Creek Indians, married an Indian woman, and was one of the English emissaries to excite them against the Americans. After the war he went to England, and on his return his influence among the Indians was so hostile to the Spaniards that they offered a price of \$6,000 for his capture. He was taken in July 1792, sent to Madrid, and afterward to Manila. Having obtained leave to visit Europe, he returned among the Creeks and instigated them to renewed hostilities. He was betrayed again into the hands of the Spaniards in 1804, and died in Morro Castle, Havana. His biography was published in London in 1791.

Bowles, William Lisle, English poet: b. King's Sutton, Northamptonshire, where his father was vicar, 1762; d. Salisbury, 7 April 1850. He was educated at Winchester and Oxford, where he gained high honors. In 1789 he composed a series of sonnets by which the young minds of Coleridge and Wordsworth, then seeking for new and more natural chords of poetry, were powerfully affected to such an extent that Bowles is considered to have created, by his influence, the Lake School of Poetry. In 1806 he issued a critical edition of Pope, which led to a memorable controversy (1809-25), in which Byron and Campbell were his opponents. His other works include: 'The Grave of Howard' (1790); 'Coombe Ellen' (1798); 'The Battle of the Nile' (1799); 'The Spirit of Discovery' (1804), his longest poem; and 'St. John in Patmos' (1832).

Bowling (bō'ling) Green, Ky., a city and county-seat of Warren County, 114 miles southwest of Louisville, of prominence as an educational centre. Here are situated Ogden College, founded in 1877; Potter College for women, opened in 1880; the Southern Normal School; Saint Columbia's Academy; and a business college. The city is surrounded by a fertile agricultural region, has an important trade in hogs and mules, and one of the largest horse markets

in the State. It contains two parks, one of 42 acres, and owns and operates its waterworks and electric-lighting establishment. It was incorporated in 1812 and is governed by a mayor elected every four years, and a city council. At the time of the Civil War Bowling Green was of much strategic importance to the Confederate army. Pop. (1900) 8,226.

Bowling Green, Mo., a city and county-seat of Pike County, 90 miles northwest of St. Louis; situated on the Chicago & A. and St. Louis & H. R.R.'s. It was settled in 1820, and incorporated in 1838. Pike College is here located and among the industries of the place are flour and pipe manufacturing. Pop. (1900) 1,902.

Bowling Green, New York City Park, a small open space near the foot of Broadway, originally a village green and an aristocratic centre of the city. Fort Amsterdam, which had formerly stood at the south of the green, was removed in 1787 and the governor's residence took its place. The present Green is a very small enclosed park.

Bowling Green, Ohio, a city and county-seat of Wood County; situated on the Cincinnati, H. & D., and the Toledo & O. C. R.R.'s, 22 miles south of Toledo. It carries on a trade in farm produce and is the centre of a region producing oil and natural gas. Among the other industries are iron smelting, canning and glass-cutting. Private companies operate water-works, gas works, an electric-lighting system, and a hot water heating plant. The city was settled in 1832 and incorporated as a borough 1855 and city in 1900. It is governed by a mayor biennially elected and a board of public service of five members. Pop. (1900) 5,067.

Bowls, Bowling, an American indoor game; also much played in Great Britain, and probably a modification of the English game of skittles (q.v.). It is played in a covered alley of carpenter's work from 65 to 70 feet in length and about 3 feet 6 inches wide. The alley has a gutter on each side, and is slightly convex in the centre, and regularly beveled toward the gutters. At the farther extremity ten pins, generally of ashwood, about 12 inches high, and shaped somewhat like a champagne bottle with a slightly tapering base, are set up in the form of a triangle having its apex toward the bowler; that is, with four pins on the rear or fourth line, three on the third, two on the second, and one on the first line, all being 12 inches apart. The pins are uniform in weight. The balls may never exceed 27 inches in circumference; but smaller sizes are optional. The bowler is entitled to two (formerly three) balls, which he rolls at the pins, the object being to knock down as many pins as possible, the number displaced being registered to the bowler's credit. The first record of a match seems to have been made on 1 Jan. 1840, at the Knickerbocker Alleys, New York; but it was not until 1875 that the bowlers of the principal cities held a convention for the purpose of framing rules for the game, and it was 20 years later when the American Bowling Congress brought the sport into anything like systematic order. The rules of the game in all its varieties are published by the Congress.

Another form of bowls, an ancient English game, is still extremely popular in its own coun-

try. It is played on a smooth, level piece of green sward, generally about 40 yards long, and surrounded by a trench or ditch about 6 inches in depth. A small white ball, usually of earthenware, called the jack, is placed at one end of the green, and the object of the players, who range themselves in sides at the other, is so to roll their bowls that they may lie as near as possible to the jack. Each bowl is much larger than the jack, is made of lignum-vitæ or similar wood, and is biased by being made slightly conical, so as to take a curvilinear course; and in making the proper allowance for this bias, and so regulating the cast of the ball, consist the skill and attraction of the game. The side which owns the greatest number of bowls next the jack—each bowl so placed constituting a point—carries off the victory. The game played in Scotland differs in several respects from that of England; and the latter country, unlike the former, has as yet no national bowling association.

Bowman, bō'mān, Alexander Hamilton. American soldier: b. Wilkesbarre, Pa., 15 May 1803; d. there, 11 Nov. 1865. He graduated from the United States Military Academy 1825, and entered the engineer corps. For a time he was assistant professor of geography, history, and ethics at the academy. He acted as assistant engineer in the construction of the defenses, and of the improvement of harbors and rivers on the Gulf of Mexico, 1826-34, and was superintending engineer of the construction of Fort Sumter, 1838-51. Later he was chief engineer of the construction bureau of the United States treasury, and employed in building custom-houses, post-offices, marine hospitals, etc. During the Civil War he was superintendent of the United States Military Academy, and from 20 June 1865 till his death a member of the board of engineers to carry out in detail the modifications of the defenses in the vicinity of Boston, Mass. He attained his lieutenant-colonelcy in the engineer corps, 3 March 1863.

Bowman, Edward Morris, American organist: b. Barnard, Vt., 1848. His musical education was thorough and varied. He studied in New York under Dr. William Mason, in London under Dr. Bridge, in Berlin under Weitzmann and Bendel, and in Paris under Guilmant. He has been conspicuously successful as an organist, choral conductor, and teacher. In 1895 he took charge of the Temple Choir in connection with the Baptist Temple, Brooklyn, N. Y., and succeeded in making popular a high standard of music, both ecclesiastical and secular. In 1891 he succeeded Dr. F. Ritter as professor of music at Vassar College. He was a founder and for eight terms president of the American College of Musicians. His compositions comprise songs, part songs, anthems, and orchestral numbers, and he has published: 'Bowman-Weitzmann Manual of Musical Theory' (1877); 'Harmony: Historic Points and Modern Methods'; 'Formation of Piano Touch'; 'Relation of Musicians to the Public.'

Bowman, Thomas, American Methodist bishop: b. Berwick, Pa., 15 July 1817. He graduated at Dickinson College 1837, and entered the ministry in the Baltimore conference of the Methodist Episcopal Church. In 1848 he organized the Dickinson Seminary at Williams-

port. Pa., and was its president for 10 years. In 1858 he was elected president of Indiana Asbury University (now DePauw University), remaining there until May 1872, when he became a bishop. He has visited all the conferences in the United States, Europe, India, China, Japan, and Mexico, and is distinguished for his fine pulpit eloquence.

Bowman, Sir William, English anatomist and surgeon: b. Nantwich, 20 July 1816; d. London, 29 March 1892. He was for some time surgeon to King's College Hospital, London, and professor of physiology and anatomy in King's College, and was especially distinguished as an ophthalmic surgeon. He gained the Royal Society's royal medal for physiology in 1842. In 1880 Cambridge, and in the following year Edinburgh, conferred on him the degree of LL.D. He was connected with a large number of scientific societies, both British and foreign, was collaborator with Todd in the great work on the 'Physiological Anatomy and Physiology of Man' (5 vols. 1845-56), and he also wrote 'Lectures on the Eye' (1849); 'Collected Papers' (1892). His baronetcy was conferred on him in 1884.

Bowman's Root, *Gillenia stipulacea*, a hardy perennial herb of the natural order *Rosaceae*, two to four feet tall, found in rich woods from New York to Georgia, and often planted in shrubberies for their graceful foliage and numerous terminal clusters of white or rose-tinted flowers. The name is also applied to its close relative, *G. trifoliata*, which grows farther south and bears a rather close resemblance to it. Both species are also called Indian physic. American ipecac, Indian hippo, and have been used as tonics and emetics. They are the only species of their genus.

Bowne, bown, Borden Parker, American philosophical writer: b. Leonardville, N. J., 14 Jan. 1847. He was religious editor of the New York 'Independent' 1875-6, becoming professor of philosophy at Boston University in 1876. He has written 'Philosophy of Herbert Spencer' (1874); 'Metaphysics' (1882); 'Principles of Ethics' (1892); 'The Christian Life' (1878); 'The Atonement' (1900), etc.

Bowring, Sir John, English statesman and linguist: b. Exeter, 17 Oct. 1792; d. there, 23 Nov. 1872. While still very young he entered a business house in his native town, and in 1811 became clerk to a London firm, on whose business he traveled to Spain. Soon afterward he started on his own account, and made many journeys to the continent. Having extraordinary linguistic ability he made use of his residence in foreign countries to acquire the different languages, and his first publications consisted of translations, especially of the popular poetry of many of the countries he had visited. At the same time he appeared as a supporter of the Radical politics of the time and of the views of Jeremy Bentham, and acted as editor of the 'Westminster Review' from 1824 till 1830. His public life began in 1828, when he was sent to Holland to make a report on the public accounts of that kingdom. He afterward received similar commissions to France, Switzerland, Italy, Egypt, Syria, and Germany, and the Blue-books which appeared from his pen on these separate occasions are considered as models of their kind. He was member of

Parliament for the Kilmarnock burghs from 1835 to 1837, and for Bolton from 1841 to 1849. In the year last mentioned he accepted the lucrative post of consul at Canton, and his services during the four years that he held this post were so appreciated by the ministry that in 1854, the year after his return, he received the honor of knighthood, and was appointed governor of Hong-kong. As governor of Hong-kong he acted with the same energy that he had manifested when consul at Canton; but the step which he took in ordering Canton to be bombarded to punish the Chinese for an insult offered to the British flag, although approved by Lord Palmerston, then at the head of the government, led to his recall, March 1857. The last public commission he received was in 1860, when he was sent to Italy to report on the commercial relations with the new kingdom. He published 'The Kingdom and People of Siam'; and his 'Autobiographical Reminiscences' appeared in 1877. He will, perhaps, be longest remembered as the author of the familiar hymn, 'Watchman, Tell Us of the Night.'

Bowser, Edward Albert, American mathematician: b. Sackville, New Brunswick, 18 June 1845. He graduated at Rutgers College in 1868, and since 1871 has been professor of mathematics and engineering there. Since 1875 he has had charge of the United States Coast and Geodetic Survey of New Jersey. He has published 'Analytical Geometry' (1880; 10 ed. 1888); 'Differential and Integral Calculus' (1880; 9 ed. 1887); 'Analytical Mechanics' (1884); 'College Algebra' (1888); 'Academic Algebra' (1888); 'Plane and Solid Geometry' (1890); 'Elements of Trigonometry'; 'Treatise on Trigonometry' (1892); 'Logarithmic Tables' (1895); 'Hydromechanics'; 'Roofs and Bridges.'

Bowstring Hemp, the fibre of the leaves of an East Indian plant, or the plant itself, *Sansevieria zeylanica*, order *Liliaceae*, so named from being made by the natives into bowstrings. The plant is somewhat like a hyacinth in appearance, and has edible roots. The fibre is fine and silky, but very strong, and may become a valuable article in European manufacture. See **HEMP**.

Bowyer, bō'yēr, Sir George, English law writer: b. Oxford, 1811; d. London, 7 June 1883. He was called to the bar in 1839. Converted to Catholicism in 1850, he represented Dundalk 1852-68, and the county of Wexford 1874-80, when his Home Rule principles estranged him from the Liberal party, and, in 1876 led to his expulsion from the Reform Club. He succeeded his father as seventh baronet in 1860. He was author of several able works on constitutional law and Catholic subjects.

Bowyer, William, English printer and classical scholar: b. London, 19 Dec. 1699; d. 18 Nov. 1777. He was admitted a sizar of St. John's College, Cambridge, but left the university without a degree in 1722, and became an associate in the printing trade with his father. In 1729 he obtained the office of printer of the votes of the House of Commons, which he held nearly 50 years. He was subsequently appointed printer to the Society for the Encouragement of Learning, the Society of Antiquarians, of which

learned body he was admitted a member; and in 1761 Lord Macclesfield procured him the appointment of printer to the Royal Society. In 1767 he was nominated printer of the journals of the House of Lords, and the rolls of the House of Commons. By his will he bequeathed a considerable sum of money, in trust, to the Stationers' Company, for the relief of decayed printers or compositors. His principal literary production was an edition of the New Testament in Greek (1763), with critical notes and emendations. He also published several philological tracts, and added notes and observations to some of the learned works which issued from his press.

Box (*burus*), a genus of about 20 species of evergreen shrubs or small trees of the natural order *Euphorbiaceae*, natives of northern Africa, southern Europe, Central America, and similar climates in Asia. The species have small opposite leaves, inconspicuous monoecious flowers in terminal or axillary clusters and nearly globular fruits containing two shining black seeds. Several species are planted for ornament as edgings of borders, as hedges and as individual specimens, especially for topiary work, either in the open air or as glasshouse specimens in tubs, etc., for which uses some of them are particularly adapted since they stand shearing well. They are of slow growth and are not very hardy where the winters are at all severe. They are propagated by cuttings. *B. sempervirens*, which attains a height of 25 feet or more, has developed several cultivated varieties of which dwarf box, a favorite edging plant, is probably the best known. The very hard, heavy, light yellow wood exported largely from Spain and Portugal is highly valued for turning, carving, and engraving, and for making musical instruments such as flutes, clarinets, etc. The bright yellow wood of *B. balearica*, a larger species than the preceding, native to Turkey and certain islands of the Mediterranean, is largely exported from Constantinople for similar purposes to those of the first mentioned but is inferior.

Box'berry. See GAULTHERIA.

Box-crab, a large thick-shelled crab (*Callinectes flamma*), occurring from North Carolina southward, and not uncommon on the Florida reefs. It is four to five inches across, about an inch and a half deep, with large broad, flat claws, which are folded closely in front. It is admirably adapted to resist the violence of the surf.

Box-elder, or **Ash-leaved Maple** (*Negundo aceroides*), a tree of the natural order *Sapindaceae*, common from the Atlantic coast to the Rocky Mountains. It attains a height of 70 feet, bears pendulous corymbs of staminate flowers and drooping racemes of pistillate blossoms before the pinnate leaves appear. Its wood is inferior for any purposes except for making wood pulp, bowls, pails, etc. It has become very popular in the western United States for windbreaks, fuel, and shade, for which its rapid growth and hardness especially adapt it. It is excellent also to protect other trees until they can care for themselves.

Box-turtle, or **Tortoise**, a turtle of the American family *Cinosternidae*, having a rather long and narrow shell, in which the under part

(plastron) has its front, and usually also its rear lobes hinged to the fixed central part, so that these ends may be lifted up against the carapace, like doors, thus entirely enclosing the animal within the shell. A familiar example is the mud-turtle (*Cinosternum pennsylvanicum*) of the eastern and southern United States, which is four inches long, has a dusky brown shell, and light dots on its head. Eight or 10 other species are known in the southwest, in Central America, and in Guiana. These turtles are mainly aquatic and carnivorous, and lay only a few eggs, which are covered with a glazed shell, thick, but brittle. Another noteworthy species, sometimes placed in a separate genus (*Aromochelys*) because its plastron is only partly movable, is the "musk" or "stinkpot" turtle (*C. odoratum*) of the eastern United States, which emits a musky odor from its inguinal glands. Its dull shell is about 4.50 inches long; it has a long neck, and relatively enormous head marked with two yellow stripes, one above, one below the eye; spends its time mainly in the water; and is disagreeable in odor and disposition. This turtle, however, is kept captive, fattened on swill-milk and eaten in some parts of the country.

Box and Cox, a farce by John M. Morton, the chief characters being the two men from whom the play takes its name. Box and Cox rent from a certain Mrs. Bouncer the same room, but for some time remain ignorant of the fact, as one works by day and the other by night. A holiday discloses the situation, which mutual agreement leaves unaltered.

Box'ers, the name given to the members of a powerful secret society in China. Its avowed object is the driving out from China of all Europeans or other foreigners. The Chinese name for the association is I-ho-ch'uan, which is variously rendered in English. The active efforts of American and European missionaries and the constant encroachments upon Chinese territory by European countries appear to be responsible in great measure for the establishment of the society. The events which precipitated the first demonstrations of the Boxers were the occupation of Kiao-Chau by Germany, the acquisition of Port Arthur by Russia, the taking of Wei-Hai-Wei by England, and the French seizure of Kwang-Chau. Thus the Boxer movement presents itself largely under the aspect of a patriotic uprising against foreign aggression, a fact which goes far to account for the rapidity and thoroughness of its operations in 1900. Early in that year the native population in Shantung were found to be rallying around the standard of the Boxers and adopting its motto, "Uphold the dynasty, drive out the foreigners." The diplomatic corps at Peking called upon the imperial government to suppress the movement. This the court professed its readiness to do, although there was a suspicion, voiced by the British minister, that the Empress Dowager had fallen under the influence of a native party led by Tung Fuh-siang and Yu-hsien, and was temporizing with the Boxers. In May 1900 the Boxers began a concerted movement upon the Chinese capital, which, notwithstanding the protests of the diplomatic corps, remained unchecked by the military forces of the empire. These forces being Manchu troops, their loyalty was open to ques-

BOXING

tion and their sympathies were alleged to be with the Boxer movement. This, at any rate, is the only explanation offered by the Chinese government for its failure to cope with the uprising. The situation had been rendered additionally threatening by the action of the allies in opening fire upon the forts at Taku. On 17 June the warships of the powers were in force at that port; when fired upon by the Chinese they opened a bombardment. The demonstration before Taku had been deprecated by the United States commander, Admiral Kempff, who did not participate in the bombardment. His warning that hostilities would unite the Chinese against the foreigners was justified by events.

In June 1900, Peking was reduced to a state of siege by the Boxers. The position of the foreigners in the capital became precarious. The entire diplomatic corps was cut off from communication with the outside world. In the emergency the powers hurried military and naval forces to the scene, and an international relief column, under the command of Admiral Seymour of the British navy, moved upon Peking. This force was, however, compelled to retreat, when a short distance beyond Tien-Tsin, with a loss of 300 men. The position of the capital now became desperate. Cut off from communication with the rest of the world, Peking was a scene of turbulence and the centre of wild rumor. It was reported that on 7 July the entire diplomatic corps had fallen a prey to Boxer fury. This rumor was later discredited, the aspect of affairs having been rendered incomprehensible by the receipt of a despatch purporting to emanate from United States Minister Conger, and bearing date 18 July. According to this despatch the diplomatic corps had taken refuge in the British embassy, where they remained in a state of siege by the Boxers, anticipating massacre unless speedily relieved. Meanwhile the allies had concentrated their forces upon Tien-Tsin, capturing the place in the middle of July, but suffering severe loss. The 9th Regiment, United States army, had many casualties, including the loss of its colonel and other officers. The movement had spread in all directions among the Chinese, who, on 16 July, invaded Siberia. Russia at once proclaimed a state of siege in its Asiatic dominions. The powers did not, as yet, give formal recognition to a state of war, chiefly in consequence of the attitude of the United States, which took the ground that the Chinese government had been overpowered by an insurrectionary movement. On 20 July the powers made a categorical demand to be placed in communication with their diplomatic representatives. The authorities at Peking professed their readiness to comply at the earliest possible moment. The international situation was more clearly defined on 23 July by the appeal of China to the United States for the good offices of the latter in dealing with the powers. See CHINA.

Boxing, as now practised and popularly defined, is a contest of skill, endurance, and pluck between two contestants striking at each other with the closed hand, or fist, covered with a soft leather glove stuffed with horsehair. Contests of this nature, in various forms, are probably coeval with man. The sport was much in

vogue among the Greek and Roman athletes, but in place of the modern tendency to deprive it of its more brutal characteristics, as by the use of gloves, the ancients made the punishment as severe as possible by arming the fists of the combatants with strips of rawhide (the *cestus*), which were often knotted and loaded with lead or iron. In the first half of the 18th century rules were formulated to govern such contests in England, and from that time onward the practice of fighting with the fists for prizes or for championships has been reduced well-nigh to a "science." Methods of striking, ring tactics, etc., have developed until mere brute force has had to give way before intelligence; in other words, the head has defeated the hands.

In 1719 one Figg, an English pugilist, who attained such celebrity as to have his portrait painted by Hogarth, brought about some system in the conduct of the prize-ring. His work was continued by Broughton, himself for many years champion of England and a great upholder of the sport. Regular contests were held, with prizes of money and an emblem of championship, usually a belt, which was held on the condition of meeting all comers, on penalty of surrendering it if declining the trial or beaten by the adversary. The use of a belt as such emblem is of very ancient origin, dating back at least to the time of the siege of Troy. Homer, in describing the games at the funeral of Patroclus, mentions a belt in this connection. There is an unbroken record of championships from the time of Figg down. But since 1860, when the British champion, Tom Sayers, fought the American John C. Heenan, fighting with bare knuckles, which had hitherto been the custom, was suppressed, and in its place the use of gloves was adopted. The laws were, however, frequently evaded by the use of skin-tight gloves. At the present time gloves weighing four ounces are used for championship matches.

With the use of gloves came also the adoption of new rules, named, from their framer's title, the Marquis of Queensberry's rules. Under these wrestling and hugging (which had previously been permitted) were prohibited; the time of each round was limited to three minutes, with intervals of one minute between each round; and the former space of 30 seconds within which a man knocked off his feet might recover himself and be brought back to the fighting-line was reduced to 10 seconds.

Under the new conditions boxing has taken a leading rank as a sport and exercise. In the former aspect legislation has been found necessary to restrict its tendency to degenerate into brutality and to lend its aid to gambling and other vices. As an exercise, however, it holds a high place. It is considered the best system of gymnastics for bringing all the limbs under perfect command; rendering every part of the body pliant, flexible, and firm; acquiring a perfect power of keeping the true centre of gravity in every position, and of extending the body and limbs to the extreme length and recovering again without pause or difficulty; and developing the power of breathing and the "staying" qualities. The practice of boxing also gives to those proficient in it a remarkable power of calmly looking danger in the eye, and preserving both the temper and the courage under trying circumstances unruffled. It is

alleged by the defenders of this sport that it encourages individual and therefore national courage; that it leads to a general sense and sentiment of fair play and honor; and that it discourages and renders infamous the use of the knife and other deadly weapons.

Amateur boxers are divided into seven classes considered according to weight — 105 pounds, 115, 125, 135, 145, and 158 pounds, all over the latter weight being classed as "heavy" weights. Among the lighter weights the classes are sometimes termed "bantam" weights, "feather," "light," and "middle" weights. The term "catch weights" implies no restriction as to weight.

The laws governing the practice of the sport vary in different States of the Union and in Great Britain, and cannot be accorded space here. The rules and history may be found in such works as the following: 'Boxiana, or Sketches of Ancient and Modern Pugilism,' by Pierce Egan (London, 4 vols. 1818-24); Mitchell's 'Boxing' (Badminton Library 1880); 'Cassell's Book of Sports and Pastimes' (New York 1890); Earl's 'Handbook of Boxing' (1893); B. J. Doran's 'Science of Self-Defense' (Toronto 1893); 'Boxing,' in the Oval Series (New York 1896); 'Encyclopædia of Sport' (New York 1902); 'Handbook on Boxing' (New York 1903).

Boxing the Compass, the recital of all the points of the compass in their proper order.

Boxing-day, in England, the day after Christmas, so called from the practice of giving Christmas-boxes or presents on that day. It was made a bank holiday by the act of 1871.

Boxthorn. See LYCIUM.

Boy Bishop, a boy chosen on St. Nicholas' Day, 6 December, by the votes of his fellow-choristers, to act the part of bishop, retaining office until St. Innocent's Day, 28 December. This custom of the mediæval Church, as practised in England, extended to the schools of Winchester and Eton. Dressed in the Episcopal vestments, with mitre, crozier, and ring, the youthful bishop went about attended by a dean and prebendaries and followed by children; went through the forms of blessing and of preaching, more to the entertainment than edification of his hearers. Boy bishops dying during their incumbency, were buried in their Episcopal attire. The custom of electing a boy bishop came to an end in England during the reign of Queen Elizabeth.

Boyaca, bō-yā-kā', United States of Colombia, the most populous department of the republic, lying on the Venezuelan border, southeast of Santander. Mountainous in the west, and consisting of great plains in the east, it produces emeralds, copper, iron, salt, and various cereals. Horses and cattle are raised on the plains. Area, 33,351 square miles; pop. about 720,000. The capital is Tunja.

Boyaca', a town of Colombia, South America, about 60 miles northeast of Bogota. It is inhabited mostly by Indians, contains extensive lime-kilns, and was the scene of a battle, 7 Aug. 1819, between the Spaniards and Gen. Bolivar, which resulted in the defeat of the former, and the establishment of Colombian independence. A college was established here in 1821. Pop. 7,000.

Bo'yar, or **Boiar**, among the Slavic nations, a free landowner independent of any sovereign. It is synonymous with *cech*, *lech*, or *bojarin*, used by several Slavic tribes, such as the Bohemians and Poles. The word boyar was at first especially used by the Bulgarians, Serbs, and Russians, and then was adopted by the Moldavians and Wallachians. It represented the highest social condition, corresponding in certain respects to that of an English peer. In ancient Russia, the boyars were the next after the princes of the blood, or *knezia*, who were all originally petty sovereigns. The boyars formed a kind of supreme political body in the state, and acted as the council (*duma*) of the grand dukes. All the higher offices, civil and military, including the lieutenantancies in the provinces, were held by them. While Russia was still divided into several petty sovereignties, the boyars enjoyed the right of choosing for themselves and for their dependents the prince whom they wished to serve, and to leave the service at their pleasure, without any previous notification. When the Grand Dukes of Vladimir and of Moscow stripped these petty princes of their sovereign rights, and transformed them from vassals into subjects, the dignity of boyars was granted to their families. The boyars had their own military retinue and their clients; and their influence on the masses of the people often equalled that of the grand dukes. The sovereign ukases always contained the sacramental words, "ordered by the Grand Duke (subsequently it was 'by the Czar'), and approved by the boyars." Precedence among the boyars was reckoned according to the date of the title, which was hereditary, and the observance of it was carried so far that in the 16th and 17th centuries any boyar of an older creation refused to serve under a younger one. This struggle for rank was ended by the czar, Alexis Michailowitch Romanoff, who destroyed the official records and diplomas of the boyars, but they retained their place among the nobility. Peter the Great wholly abolished their power and official privileges, and the name now remains only as a historical distinction, and a recollection of the past, in families which once possessed the dignity. In Rumania boyars still exist.

Boyce, Henry Harrison, American soldier: b. Ohio 1830; d. New York 1904. He served with distinction in the Civil War, being promoted to captain and then to general. He organized in 1894 the Navy League of the United States and became its secretary. For some years he lived in California where he edited the *Los Angeles Tribune*, and was chairman of the Republican State Committee.

Boyce, William, English musical composer: b. London, 1710; d. there, 7 Feb. 1779. He was a pupil of Dr. Maurice Greene, organist of St. Paul's. In 1736 he was chosen organist of the church of St. Michael, Cornhill; and was also appointed composer, and afterward (1758) organist to the Chapel Royal. On his setting to music an ode performed at the installation of his patron, the Duke of Newcastle, he was honored with the degree of Doctor of Music; and in 1755 he became master of the king's band. His greatest work is the scholarly 'Cathedral Music' (3 vols. 1760-78), but he

will be most generally remembered as the composer of 'Hearts of Oak,' which first occurred in Garrick's pantomime of 'Harlequin's Invasion' (1759). Of his musical compositions a serenata entitled 'Solomon' (1743), is the best.

Boycott. What is popularly known as the boycott is a form of coercion by which a combination of many persons seek to work their will upon a single person, or upon a few persons, by compelling others to abstain from social or beneficial business intercourse with such person or persons. Carried to the extent sometimes practised in aid of a strike it is a cruel weapon of aggression, and its use immoral and anti-social, and the concerted attempt to accomplish it is a conspiracy at common law, and merits and should receive the punishment due to such a crime. It is attempted to defend the boycott by calling the contest between employers and employees a war between capital and labor, and pursuing the analogies of the word to justify thereby the cruelty and illegality of conduct on the part of those conducting a strike. The analogy is not apt, and the argument founded upon it is fallacious. There is only one war-making power recognized by our institutions, and that is the government of the United States and of the States in subordination thereto when repelling invasion or suppressing domestic violence. War between citizens is not to be tolerated, and cannot in the proper sense exist. If attempted it is unlawful, and is to be put down by the sovereign power of the State and nation.

The practices common in a boycott would be outside the pale of civilized war. In civilized warfare women and children and the defenseless are safe from attack, and a code of honor controls the parties to such warfare which cries out against the boycott. Cruel and cowardly are terms not too severe by which to characterize it.

The name was first given to an organized system of social and commercial exclusion employed in Ireland in connection with the Land League and the land agitation of 1880, and subsequently. It took its name from Capt. James Boycott, a Mayo landlord, one of its earliest victims, who as agent for Lord Erne evicted many tenants. A landlord, manufacturer, or other person subjected to boycotting, faces a combination to prevent his buying from or selling to anyone employing labor, etc.; and those refusing to join in a boycott are often threatened with similar interference, loss or injury. Boycotts have been frequently employed in the United States as a means of coercion in labor difficulties. The attitude of courts is not altogether uniform in regard to such combinations. A boycott accompanied by violence is a criminal offense, and such conspiracy is sometimes declared unlawful even when not marked by threats and violence.

Boyd, Andrew Kennedy Hutchison, Scotch clergyman and author: b. Auchinleck, Ayrshire, 3 Nov. 1825; d. London, 2 Nov. 1899. He was educated at King's College, London, and Glasgow University; was ordained in 1851, and was incumbent successively of the parishes of Newton-on-Ayr, Kirkpatrick-Irongray, in Galloway, St. Bernard's, Edinburgh, and at the university city of St. Andrews. He early be-

came known as a contributor to 'Fraser's Magazine,' under the signature "A. K. H. B." Many of these contributions were reprinted in book form under the title, 'Recreations of a Country Parson,' of which three series appeared. In 1890 he was moderator of the General Assembly of the Church of Scotland. He also published 'Graver Thoughts of a Country Parson,' 'Counsel and Comfort Spoken from a City Pulpit,' 'Present-Day Thoughts'; 'Memorials of St. Andrew's Sundays'; 'Toward the Sunset'; 'What Set Him Right'; 'The Best Last'; 'Twenty-Five Years of St. Andrew's'; 'St. Andrew's and Elsewhere'; etc.

Boyd, Belle, Confederate spy: b. Martinsburg, W. Va., 9 May 1846; d. Kilbourn, Wis., 11 June 1900. She rendered invaluable aid to the Southern cause by detecting the Federal plans of campaign and revealing them to the Confederates. Gen. "Stonewall" Jackson sent her a letter of thanks.

Boyd, Ellen Wright, American educator: b. Winsted, Conn., 8 Sept. 1833. She has been principal of Saint Agnes' School, at Albany, N. Y., and has published 'Outlines of Religious Instruction'; 'English Cathedrals'; 'Famous Art Galleries.'

Boyd, James P., American lawyer and author: b. Lancaster County, Pa., 20 Dec. 1836. He was admitted to the bar in 1863 and successively edited several Philadelphia newspapers. His published works comprise: 'Lalecca' (1872); 'Envious Merchant' (1874); 'Building and Ruling the Republic' (1884); 'History of the Crusades' (1890); 'Bible Dictionary' (1896); 'Paris Exposition' (1900); and Lives of Grant, Sherman, Sheridan, Blaine, Harrison, McKinley, Emperor William I.; 'Men and Issues' (1892-1900).

Boyd, John Parker, American soldier: b. Newburyport, Mass., 21 Dec. 1764; d. Boston, 4 Oct. 1830. His father was from Scotland, and his mother a descendant of Tristram Coffin, the first of that family who emigrated to America. He entered the army in 1786 as ensign in the 2d regiment, but peace service did not suit his adventurous spirit and in 1789 he went to India. Under Nizam Ali Khan he was given an important command in Madras and at one time had an army of 10,000 men at his disposal. He remained in India several years, in a sort of guerrilla service, and obtaining much favor. Returning home in 1808 he was appointed colonel of the 4th regiment, United States Army. He took part in the battle of Tippecanoe, November 1811; was made brigadier-general 26 August and held that rank throughout the War of 1812. He was at the capture of Fort George, and in the battle of Chrysler's Field, Canada. In 1816 he went to England to secure indemnity for the loss of a valuable cargo of saltpetre captured by an English cruiser, but procured only a single installment of \$30,000. President Jackson appointed him naval officer at Boston in 1830, but his services were almost immediately cut short by his death.

Boyd, Mark Alexander, Scotch writer: b. 1563; d. 1601. He was educated at Glasgow under the superintendence of his uncle, the archbishop of that see, and was equally conspicuous for the alertness of his mind and the turbulence of his disposition. In Paris he reduced himself

to distress by gaming, and then, resuming his studies with ardor, went to Bourges to attend the celebrated civilian Cujacius. To this professor he recommended himself by a compliance with his taste in Latin poetry, which gave a preference to Ennius and the elder Latin poets. After leading a wandering life on the Continent for 14 years he returned to Scotland, and died at his father's seat in Ayrshire. He has received much the same eulogium in regard to graces of person, powers of mind, and various accomplishments as the Admirable Crichton. He is popularly known by his 'Epistolæ Heroïdum,' and his 'Hymni,' published in the 'Deliciae Poetarum Scotorum.'

Boyd, Mary Stuart, Scottish writer. She was married to Alexander S. Boyd, a well-known illustrator, in 1880, and since 1890 has resided in London. Beside numerous contributions to reviews and other periodicals she has published 'Our Stolen Summer' (1900); 'A Versailles Christmastide' (1901); 'With Clipped Wings' (1902).

Boyd, Thomas Duckett, American educator: b. Wytheville, Va., 20 Jan. 1854. He graduated at Louisiana State University, and has held important posts in the educational institutions of Louisiana. Since 1896 he has been president of Louisiana State University.

Boyd, Zachary, Scottish divine: b. Ayrshire, about 1586; d. about 1653. He received the rudiments of his education at Kilmarnock School, and took the academical course in the College of Glasgow. About 1607 he went abroad and studied at the College of Saumur, France. He was appointed a regent in this university in 1611, and is said to have been offered the principalship, which he declined. He spent 16 years in France, during four of which he was a preacher of the gospel. In consequence of the persecution of the Protestants he was obliged to return home in 1621. There he lived successively under the protection of Sir William Scott of Elie and of the Marquis of Hamilton at Kinneil, it being then the fashion for pious persons of quality in Scotland to retain one clergyman at least as a member of their household. In 1623 he was appointed minister of the large district in the suburbs of Glasgow styled the Barony parish, for which the crypts beneath the cathedral church then served as a place of worship. In this charge he continued for the rest of his life. He filled the office of rector of the University of Glasgow 1634-5 and 1645. In 1629 he published his principal prose work, 'The Last Battell of the Soule in Death; whereby are shown the Diverse Skirmishes that are between the Soule of Man on his Deathbed and the Enemies of our Salvation, carefully digested for the Comfort of the Sicke.' This was reprinted at Glasgow in 1831, with a life of the author by Mr. Neil. He published various other works, chiefly devotional, and left a large quantity of manuscript writings, which are preserved in the Glasgow College library. Among the latter is one entitled 'Zion's Flowers,' consisting of poems on select subjects of Scripture history. It is popularly called 'Zachary Boyd's Bible,' and although it abounds in homely and ludicrous passages, it is not without a fine strain of devotional feeling. Boyd left a large legacy to the Glasgow College.

Boydell, John, English engraver, more distinguished as an encourager of the fine arts than on account of his own productions: b. Darrington, Shropshire, 19 Jan. 1719; d. 22 Dec. 1804. He was intended for his father's occupation, which was that of a land-surveyor. Accident having thrown in his way Baddeley's 'Views of Different Country Seats,' he conceived so strong an inclination for engraving that he determined to adopt it as a profession; and accordingly, when above 20, he bound himself apprentice for seven years to Toms, a London engraver. In 1745 he published six small landscapes, and afterward executed as many more views of places in and near London as formed a volume, which he published by subscription. With the profits of this work he established himself as a printseller, and by his liberality to artists in general established a high reputation as a patron of ingenious men. Woollet was employed by him to engrave the celebrated pictures of Niobe and Phaeton, and he furnished other eminent artists with occupation, and was thus enabled to carry on an extensive foreign trade in English prints, which tended greatly to his own emolument and to the credit and advantage of his native country. Having at length established what may be termed an English school of engraving, he next turned his attention to the improvement of the art of painting. With that view he engaged the first artists in the kingdom to furnish the collection of pictures forming the well-known Shakespeare Gallery. The wars arising out of the French revolution having obstructed his continental trade, he was induced in 1804 to solicit an act of Parliament to permit him to dispose of his gallery and paintings by lottery. This he obtained, and lived long enough to see every ticket disposed of, but died before the lottery was drawn.

Boyden, Seth, American inventor: b. Foxboro, Mass., 17 Nov. 1785; d. Middleville, N. J., 31 March 1870. He was brought up on a farm, and attended a district school. Mechanically inclined, he spent much time experimenting in a blacksmith shop. His first invention was a machine for making nails, and in 1809 he undertook to manufacture both nails and files. Soon afterward he invented a machine for splitting leather, and in 1815, he took it to Newark, N. J., where he engaged in the leather business. In 1816 he invented a machine for cutting brads, and followed this by the invention of patent leather, which he manufactured till 1831, when he began making malleable iron castings, on a system of his own. In 1835 he turned his attention to steam engines; substituted the straight axle for the crank in locomotives; and invented the cut-off now used instead of the throttle valve. In 1849 he went to California, but was unsuccessful, and returned to New Jersey, where he applied himself to farming, and developed a variety of strawberry previously unequalled in size or quality. In 1800, a statue was erected to his memory in Washington Park, Newark, N. J., where he spent the greater part of his life.

Boyè, Martin Hans, Danish-American chemist and genealogist: b. Copenhagen, Denmark, 6 Dec. 1812. He was a graduate from the University of Copenhagen in 1832 and from the medical department of the University of

Pennsylvania in 1844. He came to the United States in 1836 and jointly discovered several chemical compounds, as well as perchloric ether in 1841. In 1845 he discovered the first process of refining cotton-seed oil. He was professor of chemistry at the Central High School in Philadelphia, 1845-59, retiring in the year last named. He has published: 'Pneumatics, or the Physics of Gases' (1856); 'Chemistry, or the Physics of Atoms' (1857).

Boyer, bwā-yā, Alexis, French surgeon: b. Uzerches, Limousin, 1 March 1757; d. Paris, 25 Nov. 1833. Although in his younger years he had to struggle against poverty and disease, he attended the lectures of Louis and Desault, and after a brilliant career as a student obtained the degree of Master of Surgery in 1787. He became successively surgeon to the Hospital de la Charité and to the Hôtel-Dieu, and was appointed first surgeon to Napoleon, receiving at the same time the title of baron of the empire, with a dotation of 25,000 francs. He became a member of the Institute in 1825, and was consulting surgeon to Louis XVIII., Charles X., and Louis Philippe. His chief works are: 'Traité d'Anatomie' (1797-9); 'Traité des Maladies Chirurgicales et des Opérations qui leur Conviennent' (11 vols. 1814-26). He also contributed to the 'Journal de Médecine' and the 'Dictionnaire des Sciences Médicales.'

Boyer, Jean Pierre, zhōn pē-ār, president of the Republic of Hayti: b. Port-au-Prince, 28 Feb. 1776; d. Paris, 9 July 1850. He was a mulatto by birth, but came early to Europe, where he obtained a European education. In 1792 he entered the army, and fought with distinction against the English in San Domingo, but was nevertheless obliged to evacuate the island, to which he did not return till 1802. At first he acted as leader of the mulattoes in the war against the negroes, but afterward effected a union between these in order to prepare the way for the complete independence of the island. When Pétion established a free state in the western part of the island, Boyer undertook the command of the troops which were concentrated in Port-au-Prince. After the death of Pétion, Boyer was elected president in 1818. By his skilful military operations, not less than by his adroit diplomacy, he finally succeeded in uniting the eastern part of the island with the republic, and thus effecting the complete separation of the island from France and Spain in 1825. He also purified the internal administration, raised the financial condition of the republic, and bestowed particular care upon its educational institutions. The contest between mulattoes and negroes, however, still went on, and in the end the latter rose in rebellion against him, and compelled him to leave the island in 1843. He never returned to the place of his birth and of his long-continued activity, but lived for the rest of his life first in Jamaica, and afterward in Paris.

Boyesen, boi'è-sèn, Hjalmar Hjorth, American novelist: b. Frederiksvärn, Norway, 23 Sept. 1848; d. New York, 4 Oct. 1895. After completing his university studies at Christiania, he came to the United States in 1869 and was editor of a Norwegian journal in Chicago. He returned to Europe in 1872 and studied Germanic philology at Leipsic two years; then,

returning to this country, he was professor of German in Cornell University for six years, and then of Germanic languages and literature in Columbia College till his death. His story of Norwegian life, 'Gunnar,' published in the 'Atlantic Monthly' (1873), and his 'Idyls of Norway and Other Poems' (1883), give proof of his rare imaginative faculty and his deep human sympathies. Besides these, he wrote: 'Tales from Two Hemispheres' (1875); 'A Norseman's Pilgrimage' (1876); 'Falconberg' (1878); 'Goethe and Schiller: Their Lives and Works' (1878); 'Ilka on the Hill-Top' (1881, dramatized 1884); 'Queen Titania' (1882); 'A Daughter of the Philistines' (1883); 'Story of Norway' (1886). Some of his works have been translated into German, etc. He was a founder of the New York Authors' Club.

Boyle, Charles (FOURTH EARL OF ORRERY), English physicist: b. Chelsea, 1676; d. 28 Aug. 1731. While a student at Christ Church, Oxford, he published a new edition of the epistles of Phalaris, of which Dr. Bentley questioning the authenticity, he wrote an answer entitled 'Dr. Bentley's Dissertation on the Epistles of Phalaris Examined,' which produced the famous Boyle and Bentley controversy. On leaving the university in 1700 he was chosen member for Huntingdon; and on the death of his brother succeeded to the earldom, and was soon after elected a knight of the Thistle, and received the command of a regiment. He was subsequently raised to the dignity of a British peer, under the title of Lord Boyle. He retired from court soon after the accession of George I., and in 1722 was sent to the Tower on suspicion of being concerned in Layer's plot, but was discharged after six months' imprisonment. He constantly attended the House of Peers as before, but never spoke, though often employed in drawing up protests. Besides the edition of Phalaris, he published a comedy called 'As You Find It'; a copy of verses to Dr. Garth upon his Dispensary; and a Prologue to Southerne's play of the 'Siege of Capua.' His name of Orrery was given to an astronomical instrument invented by Mr. George Graham, whom he patronized.

Boyle, David, Canadian ethnologist: b. Greenock, Renfrewshire, Scotland, 1 May 1842. He went to Canada in 1856, and was first a blacksmith and then a teacher. He later took up geology and discovered the fossils *murchisonia boylei*, named in his honor. He has, for 15 years, been curator of the Archæological Museum at Toronto. He has written 'Notes on Primitive Man in Ontario' and similar works.

Boyle, John (EARL OF CORK AND ORRERY), son of Charles Boyle: b. 1707; d. 1762. His earliest publication was a translation of two odes of Horace in 1742, which work was followed in 1751 by his 'Translation of the Epistles of Pliny the Younger, with Observations on Each Letter, and an Essay on Pliny's Life.' This translation advanced his reputation as a polite scholar, but has since been eclipsed by the superior version of Melmoth. In 1754 he made the tour of Italy, and employed himself in collecting materials for a history of Tuscany, which he intended to write in a series of

letters, 12 only of which have been published since his death. They are written in an agreeable manner, and contain some curious information respecting the Medici family.

Boyle, Richard (EARL OF CORK), English statesman: b. Canterbury, 13 Oct. 1566; d. 15 Sept. 1643. In 1588 he went to Dublin with strong recommendations to persons in power, whose patronage he obtained. The state of Ireland at that time having rendered land very cheap, he took advantage of the circumstance to make some considerable purchases, among which was the estate of Sir Walter Raleigh, consisting of 12,000 acres in the counties of Cork and Waterford, which he obtained on easy terms. He was then appointed clerk of the council under Sir George Carew, the president of Munster, whom he accompanied in various expeditions against the Irish insurgents, in opposition to the English government. On these and other occasions he distinguished himself by his talents and activity, and rapidly augmented his political power and influence. King James I. appointed him privy-councilor for Munster, and afterward for the kingdom of Ireland; in 1616 he was made a peer of that realm by the title of Baron Boyle of Youghall, and in 1620 was created Viscount Dungarvan and Earl of Cork. He was now in the height of his prosperity, living in his castle of Lismore in a style of grandeur more resembling that of a sovereign prince than of a private individual. In 1629 he was made one of the lords justices of Ireland, and in 1631 lord-treasurer of that kingdom. Like most of the English rulers of the sister island, he seems to have employed his power rather for the subjugation than the advantage of the native Irish. He built and fortified towns and castles, and introduced among the people arts and manufactures; but put in force the severe laws of Queen Elizabeth against the Roman Catholics, and transported multitudes of the ancient inhabitants from the fertile province of Leinster to the bogs and deserts of Kerry, supplying their place with English colonists. In 1641 the Earl went to England as a witness against Lord Strafford, then under impeachment, having quarreled with that nobleman during his viceroyalty. Soon after his return home the insurrection of the Irish broke out; on which event he displayed his accustomed activity, enlisting his tenantry under the command of his sons, and taking other measures for the defense of the country. Lord Cork is principally memorable as the founder of a family, several individuals of which have highly distinguished themselves as cultivators of literature, science, and the arts; yet it should not be forgotten that he attained a high degree of contemporary fame, and was designated in the age in which he lived—"The great Earl of Cork."

Boyle, Robert, English philosopher: b. Lismore Castle, Waterford, Ireland, 25 Jan. 1627; d. London, 30 Dec. 1691. He was the seventh son of Richard, the great Earl of Cork. In 1638 he went to Geneva, where he continued to pursue his studies for several years, returning to England in 1644. During this period his father had died, leaving him considerable property. He now went to his estate at Stalbridge, where he devoted himself to the study of physics and chemistry. He was one

of the first members of a learned society founded in 1645, which at first went under the name of the Philosophical College. On account of the political disturbances this society retired to Oxford, but was revived after the Restoration under the name of the Royal Society. Boyle occupied himself at Oxford in making improvements in the air-pump. Like Bacon, he esteemed observation the only road to truth. He attributed to matter merely mechanical properties. Every year of his life was marked by new experiments. We are indebted to him, indirectly, for the first certain knowledge of the absorption of air in calcination and combustion, and of the increase of weight which metals gain by oxidation. He studied the chemical phenomena of the atmosphere, and was thus a predecessor of Mayow, Hales, Cavendish, and Priestley. In all his philosophical inquiries he displayed an accurate and methodical mind, relying wholly upon experiments. While endeavoring to settle his faith, he found those defenses of the Christian religion which had been published before his time, unsatisfactory. In order, therefore, to read the original works, which are considered the foundation of Christianity, he studied the Oriental languages, and formed connections with Pococke, Thomas Hyde, Samuel Clarke, Thomas Barlow, etc. The result of his studies was a conviction of its truth, which was manifested not only by his theological writings, but by his benevolence and generous disinterestedness. He instituted public lectures for the defense of Christianity, devoting an annual sum to the payment of a lecturer. Boyle did much for the support of the mission in India, and caused Irish and Gaelic translations of the Bible to be made and printed at his own expense. To his religious principles were united the purest morals, a rare modesty, and an active benevolence. He was interred in Westminster Abbey. Birch published an edition of his works, five volumes, folio, London, 1744.

Boyle, Roger (EARL OF ORRERY), fifth son of the first Earl of Cork, English soldier: b. Waterford, 25 April 1621; d. 16 Oct. 1679. When only seven years old was created Baron Broghill, by which title he is usually known. He commanded a troop of cavalry raised by his father, was employed in the defense of the castle of Lismore, and displayed his courage and ability on many occasions in the service of Charles I.; on the cessation of whose authority he acted under the parliamentary commissioners in Ireland. When the king was put to death he retired for a while from public life; but being courted by Cromwell, he accepted a commission from him, and assisted him materially in reducing the Irish to subjection. He served his new master with zeal and fidelity, and few persons were more trusted or distinguished by him. Oliver becoming Protector, made Lord Broghill one of his privy-council and a member of his House of Lords. In 1656 he sent him to Scotland, with a commission to govern there with absolute authority for one year; and his conduct was such as proved satisfactory both to the Scots and the Protector. On the death of Cromwell, becoming aware of the approaching restoration of regal power, he exerted himself with such dexterity and success in promoting it as to obtain much credit for his conduct.

Charles II. rewarded him with the title of Earl of Orrery, and he was appointed one of the lords justices for Ireland.

Boyle, Virginia Frazer, American novelist: b. Chattanooga, Tenn. She was the daughter of Charles Frazer, a Confederate officer, and married Thomas R. Boyle, a lawyer of Memphis. She has published: 'Brokenburne'; 'Devil Tales' (1900); and has written extensively for periodicals.

Boyle Lectures, a series of discourses so named from the founder, Robert Boyle (q.v.), who left a bequest amounting to \$250 annually for this purpose, the theme of the lectures to be Christian apologetics. The first series was given in 1692 by Richard Bentley. Among Boyle lecturers whose discourses have been published since 1860 are: J. D. Maurice, C. Merivale, E. H. Plumptre, J. A. Hessey, and H. Wace. The lectures of this course are given annually in a series of eight at the Church of St.-Mary-le-Bow, London.

Boyle's Fuming Liquor, so called from having been invented by Robert Boyle (q.v.), a fetid, yellow liquid, obtained by distilling sal ammoniac with sulphur and lime. It is sometimes used in medicine under the name of *liquor fumans boylii*.

Boyle's Law. See GAS ILLUMINATION.

Boylston, Zabdiel, American physician: b. Brookline, Mass., 1680; d. Boston, 1 March 1766. He studied medicine, settled in Boston, and acquired a prosperous practice. In spite of the almost unanimous opposition of the medical profession and part of the public, he introduced the practice of inoculation for smallpox, having become a firm believer in it. Out of 286 persons inoculated in 1721-2 only six died, and he had the satisfaction of seeing the practice become general in New England long before it became so in England. He visited England in 1725 and was elected a Fellow of the Royal Society. Besides some papers published in the Transactions of that Society he wrote: 'Historical Account of the Smallpox Inoculated in New England, Upon All Sorts of Persons, Whites, Blacks, and of all Ages and Constitutions' (2d ed. 8vo London 1726; reprinted, Boston, 1730).

Boyne, boin, a river of Ireland, which rises in the Bog of Allen, County Kildare, and flows northeast through Meath to Drogheda, below which it enters the Irish Sea. It is navigable for barges up to Navan. The Boyne will ever be memorable in English history for the important victory gained on its banks about three miles above Drogheda, 1 July 1690, by the forces under the command of William III., over those of James II. Though James' personal courage was beyond all question, he, on this occasion, allowed the prudence of the sovereign to outweigh the impulses of the soldier. Of his troops 1,500 were killed and wounded, while William lost barely 500 men. In 1736 an obelisk, 150 feet high, was erected at Oldbridge, on the site of the battlefield, in commemoration of this victory. See ORANGE-MEN.

Boynton, Edward Carlisle, American soldier: b. Vermont, about 1825; d. Newburg, N. Y., 13 May 1893. He was graduated from the Military Academy at West Point, N. Y.,

entered the artillery service, and in the war with Mexico was wounded at the battle of Cherubusco. He was professor of chemistry at West Point, 1848-55, and in the University of Mississippi, 1858-61. He wrote a 'History of West Point' (1863); and a 'History of the United States Navy.'

Boynton, Henry Van Ness, American army officer: b. West Stockbridge, Mass., 22 July 1835; d. Atlantic City, N. J., 3 June 1905. He was graduated from Kentucky Military Institute in 1858; and was retained in the faculty of that institution. On the outbreak of the Civil War he resigned his office, and 27 July 1861 was commissioned major in the 35th Ohio Volunteers; was made lieutenant-colonel, 19 July 1863; and commanded the regiment at the engagement of Missionary Ridge, where he was severely wounded. He also commanded at Buzzard's Roost, and was brevetted brigadier-general for gallantry at Chickamauga and Chattanooga. After the war he became a newspaper correspondent. He published 'Sherman's Historical Raid' or 'The Memoirs in the Light of the Record, a Review Based upon Compilations from the Files of the War Office' (1875). He headed the opposition in 1887 to President Cleveland's order for the return of the Confederate battle flags. In 1894 he received a Congressional Medal of Honor for distinguished bravery at Missionary Ridge, and in 1898 was appointed a brigadier-general of volunteers for the war with Spain, and was in command of Camp Thomas, Chickamauga, after 15 August. He became chairman of the Chickamauga and Chattanooga National Military Park Commission and president of the board of education of the District of Columbia.

Boy's Clubs, organizations in which boys constitute the membership. Among clubs formed by boys on their own initiation, those for games and athletics seem to predominate very largely. Clubs for hunting, fighting, etc., are also popular. Sometimes the organizations have a distinctly literary or musical character and sometimes they are chiefly social in their nature. Numbers of clubs are formed for industrial purposes, but judging from statistics secret societies do not meet with as great a degree of favor as would naturally be supposed. These societies for boys are organized by adults; the aims are in general to keep boys from bad surroundings and stimulate them to nobler ideals of life, to refine their taste and encourage them in habits of thrift, industry, and study. Clubs in large cities sometimes have hundreds of members and provide fine buildings, in which opportunity is offered for a variety of activities ranging from manual training and other forms of instruction to social entertainment. The religious interests of the boys are also cared for in various ways. The clubs connected with social settlements are often small, thus affording a better opportunity for reaching the boys personally, an end difficult of achievement in societies with large membership. See Forbush, 'How to Keep Boys' (1900); Forbush, 'The Boy Problem' (1901); Newman, 'The Boys' Club in Theory and Practice' (1900).

Boy'ton, Paul, Irish-American swimmer: b. Dublin, 29 June 1848. He served in the United States navy, 1863-5, and was connected

with the United States life-saving service, 1867-9. He invented a rubber life-preserving suit, in which, in 1874, he leaped from a vessel off the coast of Ireland, and, after remaining seven hours in the water, reached land safely. On 28 May 1875 he crossed the English Channel in this suit, swimming across in 24 hours. In 1876 he made the run from the Bayou Goula to New Orleans, La., 100 miles, in 24 hours. In May, the same year, he descended the Danube from Linz to Budapest, 460 miles, in six days. Later he went from Oil City, Pa., to the Gulf of Mexico, 2,342 miles, in 80 days, being exposed at first to great cold and later to extreme heat. In November 1879, he descended the Connecticut River from Canada to Long Island Sound. On 17 Sept. 1881, he started from Cedar Creek, Mont., to swim to St. Louis, Mo., and accomplished the long journey, 3,580 miles, 20 November. In 1888 he made a voyage down the Ohio River. He published an account of his adventures under the title, 'Roughing It' (1886).

Boz, bōz, a pseudonym used by Charles Dickens in the publication of 'Sketches by Boz.' That the pronunciation of this name now in vogue is not correct is shown by Dickens' explanation of its origin. A younger brother of the author had in childhood received from the latter the nickname Moses, "which being facetiously pronounced through the nose became Bōses, and being shortened became Bōz."

Bozeman, bōz'mān, Mont., a city and county-seat of Gallatin County, on the Northern P. R.R., in the midst of a region of valuable ores, such as gold, silver, coal, and iron. Its industries are breweries, flour and lumber mills, brickyards, stone quarries, and the like, and it contains the State College of Agriculture and Mechanic Arts, opened in 1893. Pop. (1900) 3,419.

Bozen, a town of the Austrian Tyrol, 32 miles northeast of Trent; situated in a hilly region at the junction of the Talfer and Eisak, and on the Brenner Railway. The situation of the town in relation to Germany, Switzerland, and Italy, makes it an important trade centre. There are four annual fairs; the canning of fruit and vegetables is carried on, and manufactures of silk and linen. Among the public buildings are a Gothic church, castle, monastery, and gymnasium. Pop. (1900) 13,632.

Bozman, bōz'mān, John Leeds, American historian and jurist: b. Talbot County, Md., 25 Aug. 1757; d. there, 23 April 1823. He studied law in London, and afterward practised that profession in his native State, where for several years he acted as deputy attorney-general. His legal reputation, however, rests upon the various law tracts which he published from time to time, as legal questions arose in the courts. He wrote a 'Historical and Philosophical Sketch of the Prime Causes of the Revolutionary War,' in which he praised Washington, and condemned Franklin; but it was suppressed. During the administration of Washington and the elder Adams, he wrote much in the journals of the day, and at a later period in Dennie's 'Portfolio.' In 1822 he published at Washington an essay on the colonization society, in which he discussed the question of the origin of races. His literary reputation

chiefly rests on his 'History of Maryland, from the Earliest Settlement in 1633, to the Restoration in 1660,' a posthumous work, published in 1836, under the auspices of the general assembly of that State.

Boz'rah, bōz'ra, an ancient city of Palestine, east of the Jordan, and about 80 miles south of Damascus. It was the capital of Og, king of Bashan, and subsequently belonged to the tribe of Manasseh. Early in the Christian era, it became a flourishing place, and was long a great emporium of trade. It is now a scene of ruins.

Bozzaris, Marcos, mār'cōs bō'tsā-rēs, a hero of the Greek war of Independence against the Turks: b. Suli, in Epirus, about 1790; d. Missolonghi, 1823. He was descended from a Suliote family renowned for its bravery, and after the fall of Suli retired to the Ionian Islands, from whence he made a vain attempt to deliver his native country. He then entered an Albanian regiment in the French service, and in 1813 became a member of the Heteria, a society formed for national regeneration. In 1820, when the Turks were carrying on war against Ali Pasha, the latter sought aid from the exiled Suliotes, and Marcos Bozzaris returned to Epirus. On the outbreak of the war of independence he at once joined the Greek cause, and distinguished himself as much by his patriotism and disinterestedness as by his military skill and personal bravery. In 1822 he took part in the war which was going on in western Greece, and acquired special renown by his defense of Missolonghi. In the summer of 1823, when he held the command-in-chief of the Greek forces in that part, he was dangerously wounded at a night attack on the camp of the Pasha of Scutari, near Karpenisi, and died soon after. His deeds are still celebrated by the Greeks in many popular songs. Through Halleck's spirited poem, 'Marco Bozaris,' his name and fame have been made familiar to several generations of American school boys.

Brabançonne, bra-bān-sūn, the national song of the Belgians during the revolution of 1830, composed by Jenneval, at that time an actor at the theatre of Brussels, and set to music by Campenhout. Every verse of the song ends with the refrain:

"La mitraille a brisé l'orange
Sur l'arbre de la liberté."

Brabançons, bra-bān-sōn, a class of adventurers and lawless soldiers in the Middle Ages, ready to fight for pay on either side and in any quarter. They derive their name from Brabant, the chief nursery of these troops, and were particularly notorious in France in the 12th century.

Brabant, brā'bānt, or bra-bānt', the central district of the lowlands of Holland and Belgium, extending over an area of 4,341 square miles, from the left bank of the Waal to the sources of the Dyle, and from the Meuse and the plains of Limburg to the lower Scheldt. In the Middle Ages it formed a separate independent duchy, called Lower Lorraine. It is divided at present between the kingdoms of Holland and Belgium, into three provinces: (1) Dutch or North Brabant, with an area of 1,980 square miles; (2) the Belgian province

of Antwerp, with an area of 1,093 square miles; (3) the Belgian province of South Brabant, with an area of 1,268 square miles. The country is comprehended in a plain, gently sloping to the northwest, occupied in the north by heathy and marshy tracts, and in the south passing into the gentle rising ground which forms the first ascent of the forest of Ardennes. It is copiously watered by the Meuse in the north and the Scheldt in the south, in the former of which the internal transit is furthered by means of canals, among others the South William and the Breda canals, and in the latter by railways, which have their point of union at Mechlin. Under the influence of a northerly, indeed, and moist, but in general healthful and mild climate, the great fertility of the soil renders agriculture and the raising of cattle the principal and most profitable employment of the inhabitants. With this is associated the general diffusion of an active industry, which supports an extensive trade, consisting chiefly of lace, cotton, woolen, and leather goods.

Through Cæsar's campaigns the Romans became acquainted with the inhabitants of Brabant as a mixed race of Germans and Celts. The Menapians, particularly, inhabiting the country between the Rhine, the Meuse, and the Scheldt, made, as the most powerful and warlike among the various tribes, a gallant though ultimately ineffectual resistance to the Roman arms, by whose conquests this portion of Lower Germany was incorporated with the province of Gallia Belgica. In the 5th century the Franks gained possession of Brabant, which in the sixth was, at the partition of the Frank kingdom, assigned to the primitive country of Austrasia; in the 9th century it was united to Lorraine; and on the division of the latter, in 870, became the property of France, from which, however, in the commencement of the 10th century, it was transferred by Henry I. again to Lorraine; in 959 to Lower Lorraine, and thus to Germany. In the beginning of the 11th century it was separated from Lorraine, on Duke Otho, the son of Charles the Fat, who had been invested by the Emperor Otho with Lower Lorraine, dying childless in 1005. After this several Counts of Ardennes and Godfrey of Bouillon possessed it till 1076; the Emperor Henry V. mortgaged it to Godfrey the Bearded, of the family of the Counts of Louvain and Brussels, whose house reigned over Brabant to the middle of the 14th century. As early as 1190 we find the title of Duke of Brabant, in which the former title of Duke of Lower Lorraine or Lothier was gradually absorbed. Under the government of its own dukes Brabant gained rapidly in power and independence, but was engaged in numerous contests with its neighbors, and shifted much in its leanings between Germany and France. Of the six dukes of Brabant, Henry I., II., and III., and John I., II., and III., there are more especially to be mentioned John I., who, by the celebrated battle of Wöringen (1288), united Limburg to Brabant, and is also renowned in Germany as a minnesinger or troubadour, and John III., who, in 1349, received from the Emperor Charles IV. the important privilege of a free judicature, under the name of the Brabantine Golden Bull, in consequence of which his subjects ceased to be amenable to any foreign

jurisdiction. With John III. the male heirs of the family of the Counts of Louvain became extinct in 1355, and, by the bequest of his daughter, Joanna, who reigned till 1406, and married Wenceslaus of Luxemburg, Brabant came into the possession of the house of Burgundy, and in the first instance to Antony of Burgundy, Joanna's grand-nephew, and second son of Philip the Bold. On Antony's death at the battle of Agincourt, in 1415, and his two successors, his son, John IV., and his brother, Philip, Count of St. Pol, dying childless respectively in 1427 and 1430, Brabant, as the inheritance of Philip the Good, became formally incorporated with the dominions of the house of Burgundy. In this state, however, it did not long continue, and, by the marriage of Mary of Burgundy with the Emperor Maximilian, was transferred to the house of Austria, and subsequently to the Emperor Charles V., who abdicated in favor of his son, Philip II., of Spain. The persecuting edict of the latter, and the Duke of Alva's cruelties, excited a revolt in Brabant, but it was only the northern portion (Hertogenbosch) which succeeded in asserting its independence, and in 1648 was incorporated with the United Provinces under the name of the Generality Territory, while South Brabant remained till 1714 in the possession of the Spaniards. On the extinction of the Spanish-Austrian line in the latter year, Brabant, with the other southern provinces of the Netherlands, reverted to the imperial house of Austria, which, however, was unable long to retain it in peace. On a violent contest breaking out under the Emperor Joseph II., as to the explanation of the provincial privileges which Brabant possessed under the Joyeuse Entrée (q.v.), and the consequent dismissal of the assembly of the states of Brabant and Limburg, the Brabantines assembled of their own authority, and boldly pronounced the separation of Brabant from the supremacy of the house of Austria. Leopold II. settled the dispute after Joseph's death by granting their ancient privileges to the people of Brabant. See BELGIUM.

Bra'bourne, Edward Huggessen Knatch, bull-Huggessen, Lord, English juvenile story writer: b. Mersham Hatch, Kent, 29 April 1829; d. 6 Feb. 1893. His literary fame is due mostly to his stories for children, including: 'Crackers for Christmas' (1870); 'Moonshine' (1871); 'Stories for My Children' (1869); 'Tales at Tea Time' (1872); 'Queer Folk' (1873); 'River Legends' (1874); 'Uncle Joe's Stories' (1878); 'Friends from Fairyland' (1885). He also published 'The Truth About the Transvaal' (1881), and edited the 'Letters of Jane Austen,' his great-aunt (1885).

Braccio da Montone, Andrea, ân-drâ'-a brâ'chō-da-mōn-tō'ně, Italian captain: b. Perugia, of the illustrious family of the Fortebracci, 1368; d. 1424. He early embraced the profession of arms, and entered the service of Ladislas, king of Naples, under the promise that he, if successful, would make him master of Perugia; but when the Perugians, determined to keep out Braccio, offered to open their gates to Ladislas, if he would retain it for himself, he broke faith with Braccio, and accepted their terms. Braccio next served under Florence, afterward attaching himself to

Pope John XXIII., who, on repairing to the council of Constance, where he was deposed, intrusted Braccio with the defense of Bologna. Ladislas being now dead, and the Church without a head, Braccio saw that the moment for which he had waited had arrived; and allowing the Bolognese to redeem their liberty by a money payment, suddenly, in 1416, pounced on Perugia. The Perugians vainly endeavored to resist, and saw themselves, compelled to receive Braccio as their lord. His rule, though firm and occasionally severe, was milder than might have been anticipated; and he soon showed that his wisdom as a statesman was not less than his ability as a captain. Though Braccio had now gained the great object of his life, ambition led him to attempt the conquest of Rome, and he gained several advantages over Sforza, who had long been his rival. Ultimately, however, the new Pope, Martin V., proved more than a match for him, and Braccio, defeated and severely wounded, took the disgrace seriously and would neither take food nor allow his wounds to be examined.

Bracciolini, Poggio Giovanni Francesco, pōđg'ō brā-chō-lē'ē, Italian classical scholar: b. Terra Nuova, near Arezzo, 11 Feb. 1380; d. Florence, 30 Oct. 1459. In 1416 he undertook the laborious task of searching the ancient monasteries for manuscripts, and succeeded in recovering seven orations of Cicero, and a great number of other classical writings. Having impoverished himself in these researches, he accepted an invitation of Cardinal Beaufort to go to England, but, disappointed in his hopes of preferment, and in the literary atmosphere of the country, returned to Italy in 1421, and became apostolic secretary to Martin V. and to several succeeding popes, having served not less than eight popes in the same capacity. On the appearance of the plague at Rome in 1450, he withdrew to Florence, where he was chosen chancellor three years afterward. His 'History of Florence' (translated by his son Jacopo, from Latin into Italian) comprises the period from 1350 to 1455. Among his most finished productions is his 'Dialogue on Nobility.' His writings are on moral, philosophical, and controversial subjects, and comprise many translations, orations, and letters, the latter deriving peculiar interest from their reference to contemporary life. His works have not yet been properly collected, the Basel edition of 1538 being considered imperfect. His biography, by Rev. William Shepherd (1802), was translated into Italian, German, and French.

Brace, Charles Loring, American author and philanthropist: b. Litchfield, Conn., 19 June 1826; d. Campier, Switzerland, 11 Aug. 1890. He graduated at Yale in 1846, and studied theology, but held no pastorate. He devoted himself to philanthropy in New York, and lectured, wrote, and worked to enlist aid for the children of the poor. His books include: 'Hungary in 1851' (New York 1852); 'Home Life in Germany' (1853); 'The Norse Folk' (1857); 'Short Sermons to Newsboys' (1861); 'The Dangerous Classes of New York and Twenty Years' Work Among Them' (1872, 3d ed. 1880); 'Free Trade as Promoting Peace and Good Will Among Men' (1879); 'Gesta Christi' (1883), a review of the achievements

of Christianity from the earliest days in bettering the moral and social condition of the world; and 'To the Unknown God' (1889).

Brace, De Witt Bristol, American physicist: b. Wilson, N. Y., 1859. He graduated at Boston University, 1881; took post-graduate courses at Johns Hopkins, and received his degree of Ph.D., from the University of Berlin, Germany. Since 1887 he has been professor of physics at the University of Nebraska, and has made a special study of radiation and optics. He has written: 'Laws of Radiation and Absorption' (1901).

Brace, Julia, American blind deaf-mute: b. Newington, Conn., 13 June, 1806; d. Bloomington, Conn., 12 Aug. 1884. She lost both sight and hearing at the age of four years and five months, and soon forgot the few words she had learned to speak. At the age of 18 she entered the American asylum for the deaf and dumb at Hartford, then under the care of the Rev. Dr. Gallaudet, in which institution she remained for the greater part of her life. Never prepossessing in her appearance, and at her admission, in consequence of over-indulgence, selfish, sullen, and exacting, her case was one of great difficulty. The existence of the triple infirmity under which she labored was hardly known at that time, and she was regarded, consequently, as a psychological curiosity. As compared with some other blind deaf-mutes, whose history has been recorded within a few years past, she did not seem possessed of any extraordinary abilities, and, but for her misfortune, would probably have passed as a very ordinary woman. In all that concerned the outward and physical nature she manifested much intelligence. She sewed very well, threading her needle readily with her fingers and tongue; was very neat and particular in her dress, and exhibited marked habits of order. She possessed great tenacity of memory and nice powers of discrimination. She kept herself apprised of the progress of time, days, weeks, and months, but in her intellectual education never made much progress. Limited as was her knowledge of the alphabet of religion, she was not wanting in manifestations of the moral sense. She appeared to have a perception of right and wrong, and while tenacious of her own rights, did not knowingly invade those of others.

Brace, a beam or bar employed to stiffen a framed structure. In a roof or bridge truss this bar is placed in an inclined position and serves to bind together the principal members. The tool for holding a bit, which carpenters employ in boring, is called a brace, while in nautical phraseology braces are ropes fastened to the yard-arms by means of which sails are shifted horizontally around the masts to catch a particular breeze. In all forms of construction a brace supports by resistance to compression and is thus opposed to a tie or strut which furnishes support by resistance to tension.

Bracebridge Hall, a series of studies of English life by Washington Irving, published in 1822 with the pseudonym 'Geoffrey Crayon Gent.'

Bracegirdle, Anne, English actress: b. about 1663; d. London, 1748. She appeared on the stage as a child in 'The Orphan,' and from 1688 appeared in many popular plays of that

time, including several tragic roles, although her forte seems to have been comedy. She was noted for her beauty and numbered adorers by hundreds. She left the stage in 1707. See Russell, 'Representative Actors' (1875); Baker, 'English Actors' (1879).

Bracelet, an ornament usually worn on the wrist, the use of which extends from the most ancient times down to the present, and belongs to all countries, civilized as well as uncivilized. The word has come to us from the French and is ultimately derived from *brachium*, the Latin word for the arm. Bracelets were in use in Egypt at a very remote period. They were of different colors, painted on them in enamel in very bright as well as very delicate shades. They were also then as now frequently made of gold, encased with various kinds of precious stones. They were not always worn, as with us, on the wrist, but frequently on the upper part of the arm. The ancient Medes and Persians were well known to be extremely fond of this method of adorning themselves; and in the Bible the bracelet is frequently mentioned as an ornament in use among the Jews, both men and women. Among the ancient Greeks, in historical times, bracelets do not appear to have been worn by the men; but, on the other hand, they were worn by the Greek ladies, made of every variety of material, and in every possible form. A preference was generally given to the spiral form, and a bracelet of this kind is described by Homer in the Iliad. Very frequently the spiral bracelets were made to assume the appearance of snakes, which went round the arm twice or thrice, or even a greater number of times. Among the ancient Italian tribes bracelets were also an ornament of the men. The Sabines often wore very heavy ones on the left arm. Among the Romans it was a frequent practice for a general to bestow bracelets on soldiers who had distinguished themselves by their valor. Roman ladies of high rank frequently wore them both on the wrist and on the upper arm. The Arabs and the Orientals generally use them, chiefly as an ornament for women. Among the ancient heathen Germanic tribes they formed the chief and almost only ornament, as is shown by their being so often found in old graves. The men seem to have used them even more than the women, for bracelets have been found in dozens on the arms of the former. The spiral was the favorite form with the ancient Germans as with the ancient Greeks.

Brachial (bră'kī-ăl) **Artery**. See ARTERIES.

Brachial Plexus. See NERVES.

Brachiopods, or **Brachiopoda**, brăk'-i-ō-pōds, the class of shelled worms, formerly placed among mollusks. The class is named *Brachiopoda* from the feet-like arms, fringed with tentacles, coiled up within the shell, and which correspond to the lophophore of the Polyzoa and the crown of tentacles of the Sabella-like worms. The shell, which lives attached to rocks, is in shape somewhat like an ancient Roman lamp, the ventral and larger valve, being perforated at the base for the passage through it of a peduncle by which the animal is attached to rocks. The shell is secreted by the skin (ectoderm), and is composed of carbonate (Terebratulina) or largely (Lingula) of phosphate of lime.

The body of Brachiopods is divided into two parts, the anterior or thoracic, comprising the main body-cavity in which the arms and viscera are contained, and the caudal portion, that is, the peduncle. The part of the body in which the viscera lodge is rather small in proportion to the entire animal, the interior of the shell being lined with two broad lobes, the free edges of which are thickened and bear setae, as seen distinctly in *Lingula*. The body-cavity is closed anteriorly by a membrane which separates it from the space in which the arms are coiled up. The pallial chamber is situated between the two lobes of the mantle (*pallium*) and in front of the membrane forming the anterior wall of the body-cavity. In the middle of this pallial chamber the mouth opens, bounded on each side by the base of the arms. The latter arise from a cartilaginous base, and bear ciliated tentacles, much as in the worm *Sabella*. In *Lingula*, *Diseina*, and *Rhynchonella*, they are developed, in a closely wound spiral, as in the genuine worms (*Amphitrite*). In *Lingula* the arms can be partially unwound, while in *Rhynchonella* they can not only be unwound but protruded from the pallial chamber. In many recent and fossil forms the arms are supported by loop-like solid processes of the dorsal valve of the shell, but when these processes are present the arms cannot be protruded beyond the shell. The tentacles or cirri on the arms are used to convey to the mouth particles of food, and they also are respiratory in function, there being a rapid circulation of blood in each tentacle, which is hollow, communicating with the blood-sinus or hollow in each arm, the sinus ending in a sac on each side of the mouth.

The digestive system consists of a mouth, œsophagus, stomach, with a liver-mass on each side, and an intestine. The mouth is bordered by two membranous, highly sensitive and movable lips. The stomach is a simple dilatation of the alimentary canal, into which empty the short ducts of the liver, which is composed of masses of cœca. The liver originally arises as two diverticula or offshoots of the stomach. The short intestine ends in a blind sac or in a vent, and is, with the stomach, freely suspended in the perivisceral cavity by delicate membranes springing from the walls of the body.

The nervous system consists of two small ganglia above, and an infraœsophageal pair of larger ganglia, and there are two elongated ganglia behind the arms, from which nerves are given off to the dorsal or anterior lobe of the mantle.

The larva is top-shaped (trochosphere) and is quite active, swimming rapidly about in every direction.

While in their development the *Brachiopoda* recall the larvæ of the true worms; they resemble the adult worms in the general arrangement of the arms and viscera, though they lack the highly developed nervous system of the Annelids, as well as a vascular system, while the body is not jointed. On the other hand they are closely related to the Polyzoa, and it seems probable that the Brachiopods and Polyzoa were derived from common low vermian ancestors, while the true Annelids probably sprang independently from a higher ancestry. They are also a generalized type, having some molluscan features, such as a solid shell, though having

nothing homologous with the foot, the shell-gland or odontophore of mollusks.

In accordance with the fact that the Brachiopods are a generalized type of worms, the species have a high antiquity, and the type is remarkably persistent. The *Lingula* of our shores (*Glottidia pyramidata*) lives buried in the sand, where it forms tubes of sand around the peduncle, just below low-water mark from Chesapeake Bay to Florida. It has remarkable vitality, not only withstanding the changes of temperature and exposure to death from various other causes, but will bear transportation to other countries in sea-water, that has been unchanged. Living *lingulæ* have been carried from Japan to Boston, Mass., the water in the small glass jar containing the specimens having been changed but twice in four months. The living species of this cosmopolitan genus differ but slightly from those occurring in the lowest fossiliferous strata. Between 80 and 90 living species are known, most of them living, except *Lingula*, which is tropical, in the temperate or arctic seas, while nearly 2,000 fossil species are known. The type attained its maximum in the Silurian age, and in Paleozoic times a few species, as *Atrypa reticularis*, extended through an entire system of rocks and inhabited the seas of both hemispheres.

Consult Littel-Eastman, 'Text-book of Palæontology' (New York 1900).

Bracht, brāht, Felix Prosper Eugen, German artist, b. Morges, Switzerland, 1842. He is best known as a landscape artist. He studied at Karlsruhe and Düsseldorf, and in 1882 was appointed a professor in the Berlin Academy. Among notable paintings by him are 'Stormy Evening on Rügen'; 'Moonlight Night in the Desert'; 'Nightfall on the Dead Sea.' The last named work, now in the National Gallery of Berlin, is considered his best.

Brachvogel, Emil, ā'mēl brāh'fō-gēl, German novelist and dramatist: b. Breslau, 1824; d. 1878. He is best known by his drama, 'Narcisse' (1857), which attained many editions and was translated into various European tongues. 'Beaumarchais' (1865); 'Benoni' (1860); and 'Glencarty' (1872).

Brachyura, brāk-ī-ū'ra, a sub-order of decapodous crustaceans, containing those families in which the abdomen is converted into a short jointed tail folding closely under the breast. The common crab is a familiar example of this group. See CRUSTACEA.

Brack'en (*Pterisaquillina*), a well-known species of polypodiaceous fern, forming the type of the sub-family *Pteridæ*. It has a black, creeping rhizome, from which are sent up large, handsome bipinnate fronds. The sori are arranged along the margins of the pinnules, and are covered by a false indusium formed of the reflexed margin. The bracken or brake is very common in Great Britain where it frequently covers large extents of country. Its root-stock was at one time used for food, but it is neither palatable nor nutritious; that of a New Zealand species (*P. esculenta*) is better suited for this purpose. Various medicinal virtues have been at one time or another ascribed to it, but it is not now used in medicine. The ash produced by burning the fronds has been employed in making soap. Other species are met

with in various parts of the world. In verse the word is often loosely employed to indicate ferns in general.

Brack'enbury, Charles Booth, English soldier and military writer: b. Bayswater, Middlesex, 7 Nov. 1831. He served in the Crimean war in 1855; accompanied the Prussian army in the war with Austria (1866), and the Franco-Prussian war (1870-71), and was with the Russian army in the Russo-Turkish war (1877-8). His works include 'European Armaments' (1867); 'The Winter Campaign of Prince Frederick Charles in 1870-71'; 'Reforms of the French Army' (1874), etc.

Brackenbury, Sir Henry, English soldier: b. Bolingbroke, Lincolnshire, September 1837. He entered the Royal Artillery in 1856, served in the central Indian, Ashanti and Zulu campaigns and was made lieutenant-general in 1888, and director-general at the war office in 1899. He has published 'Fanti and Ashanti' (1873); 'Narrative of the Ashanti War' (1874); 'The River Column' (1885).

Brack'enridge, Henry Marie, American author: b. Pittsburg, Pa., 11 May 1786; d. there 18 Jan., 1871. He was educated by his father, H. H. Brackenridge (q.v.) and admitted to the bar 1806. In 1811 he descended the Mississippi River in a "keel-boat" to New Orleans, and was soon appointed deputy attorney-general for the then territory of Orleans, becoming district judge in 1812. In 1817 he was secretary to the commission sent to the South American republics, and in 1821 was appointed U. S. judge for the western district of Florida, holding it until he removed to Pittsburg in 1832. His knowledge of the French and Spanish languages and laws made him of considerable service to the government in all affairs connected with the Louisiana and Florida purchases. He wrote 'Views of Louisiana in 1810' (1812); 'Letter to Mr. Monroe. By an American'; 'Voyage to South America in 1817-18' (1818); 'History of the Late War [1812] between the United States and Great Britain'; 'Recollections of Persons and Places in the West' (1834); 'Essays on Trusts and Trustees' (1842); 'History of the Western Insurrection' (1850), a vindication of his father's share in that affair.

Brackenridge, Hugh Henry, American jurist: b. near Campbellton, Scotland, 1748; d. Carlisle, Pa., 25 June 1816. He came with his father to the United States at the age of five, and was graduated from Princeton in 1771. During the American Revolution he was a chaplain in the army. After being admitted to the bar he removed to Pittsburg, became prominent in his profession, and during the "Whisky Insurrection" (1794) was influential in bringing about a settlement between the government and the malcontents. In 1799 he was appointed to the supreme bench of Pennsylvania. A man of literary tastes, he wrote a number of pieces much thought of in their day. At his graduation he wrote (with Philip Freneau) a poetical dialogue 'The Rising Glory of America.' Other works by him are 'Incidents of the Insurrection in Western Pennsylvania' (1795); 'Law Miscellanies' (1814); 'Modern Chivalry, or the Adventures of Captain Farrago and Teague O'Regan, His Servant,' a political satire and his best work (1st Pt. 1796; 2d, 1806).

Bracket, a short piece or combination of pieces, generally more or less triangular in outline, projecting from a wall or other surface. They may be either of an ornamental order, as when designed to support a statue, a bust, or such like, or plain forms of carpentry, such as support shelves, etc. Brackets may also be used in connection with machinery, being attached to walls, beams, etc., to sustain a line of shafting.

Brack'ett, Anna Callender, American educator: b. Boston, 21 May 1836. She taught in various normal schools, being the first woman principal of such an institution, and was principal of a private school for girls in New York for 20 years. She has published 'Education of American Girls' (1874); 'Philosophy of Education,' from the German (1886); 'Technique of Rest' (1892); 'Woman and the Higher Education' (1893).

Brackett, Frank Parkhurst, American mathematician: b. Provincetown, Mass., 1865. He graduated at Dartmouth College in 1887, and since 1890 has been professor of mathematics and astronomy at Pomona College, Claremont, California. He has written several important mathematical and meteorological papers.

Brackett, Gustavus B., American pomologist: b. Unity, Maine, 24 March 1827. He served in the Civil War, and, at its close, took up the study of horticulture and pomology. He served as an expert at the Paris Exposition (1878) and the Chicago World's Fair (1893), after which he became chief of the Division of Pomology in the United States Department of Agriculture.

Brackett, John Quincy Adams, American lawyer: b. Bradford, N. H., 8 June 1842. After studying law at the Harvard Law School he began the practice of his profession in Boston. He sat for several terms in the Massachusetts legislature (1877-82 and 1884-7), being speaker of the House (1885-7); was lieutenant-governor of the State (1887-90), and governor of Massachusetts (1890-91).

Bracquemond, Joseph Felix, zhō-zěf fā-lěks brāk-mōn, French artist and engraver: b. Paris, 1833. He first exhibited in the Salon of 1852 and his etchings and reproductions of noted masters speedily brought him into notice. His portraits are especially prized and as an etcher he is represented by over 800 plates. He has invented a new method of china decoration and has done much work for the porcelain establishments at Limoges.

Bract, a leaf, from the axil of which a flower or flower-stalk develops, and thus distinguished from the ordinary leaf, from the axil of which the leaf-bud proceeds. Bracts may thus be entirely similar to the ordinary leaves of a plant, in which case they are called leafy bracts; but very commonly they are somewhat changed in form, and although they may be sometimes divided, they are for the most part entire, even when the ordinary leaves are divided. In some cases they are so much changed in form as to be mere scales or threads, and sometimes they are not developed at all, in which case the inflorescence is said to be ebracteate. Owing to the different ways in which the bract appears, it may in some plants be con-

founded with the calyx, in others with the corolla. When the flowers of a plant are sessile, the bracts are often applied closely to the calyx, and are thus apt to be confounded with it; and when the bracts are colored, they are apt to be mistaken for parts of the corolla. When the inflorescence of a plant is branching, subordinate flower-stalks proceeding from one main flower-stalk, bracts are often seen at the base of the former, and these are called bracteoles. A spathe is a kind of large bract.

Brac'teates, thin coins of gold or silver, with irregular figures on them, stamped upon one surface only, so that the impression appears raised on one side, while on the other it appears hollow. They were largely circulated under Otho I., emperor of Germany, and derive their name from *bractea*, signifying leaf of gold or other metal. They are of importance as illustrating history. Bracteated coins, or *bracteati nummi*, is a term used to signify coins or medals covered over with a thin plate of some richer metal. They were usually made of iron, copper, or brass, plated over and edged with gold or silver leaf.

Brac'ton, Henry de, one of the earliest writers on English law, flourished in the 13th century. He studied civil and canon law at Oxford, and about the year 1244, Henry III. made him one of his judges itinerant. Some writers say that he was afterward chief-justice of England; but his fame at present is derived from his legal treatise entitled 'De Legibus et Consuetudinibus Angliæ,' first printed in 1569 (folio). The quarto edition of 1640 was merely a reprint of the first. In 1878-83 Sir Travers Twiss issued a recension and translation in six volumes. See Scrutton, 'Influence of the Roman Law on the Law of England' (1885).

Brad'bury, William Batchelder, American musician: b. York, Me., 6 Oct. 1816; d. Montclair, N. J., 7 Jan. 1868. In 1840 he began teaching in New York and Brooklyn. In 1847-8 he went to Europe, where he pursued musical studies under Hauptmann and others. He is best known as the composer and publisher of musical collections for schools and choirs, 59 separate works being credited to him. His most important works are 'Young Choir' (1841); 'Flora's Festival' (1845); 'The Golden Chain' (1861); 'Pilgrim Song' (1863); 'The Golden Trio' (1864); 'The Shawm' (1864); 'The Jubilee' (1865); 'Temple Choir'; 'Fresh Laurels' (1867), his last work.

Braddock, Pa., a borough in Allegheny County; on the Monongahela river, and on the Pennsylvania, the Baltimore & O., and the Pittsburg & L. E. R.R.'s; 10 miles above Pittsburg. There are extensive blast furnaces and manufactories of steel rails, steel wire, pig-iron, cement, plaster, etc. The four banks and two trust companies have a combined capitalization of \$1,250,000. Braddock has a Carnegie Free Library, a hospital, numerous churches, and public and high schools. The borough was first settled in 1795 on the site of Braddock's defeat and was incorporated in 1867. The government is vested in a burgess and a council of 12 members elected for three years. Pop. (1900) 15,654.

Brad'dock, Edward, British general: b. Perthshire, Scotland, about 1695; d. Great Meadows, Pa., 13 July 1755. Through his

BRADDOCK

father, an officer in the Coldstream Guards, who rose to be a lieutenant-colonel there and major-general of the line, he became in 1710 an ensign in that body, the haughty *élite* of British troops; which had the Duke of Cumberland, captain-general of the whole army, for one of its colonels, men of rank for subalterns, and its very privates chosen by other bodies for commissioned officers. Appointed captain in 1736, he rose to lieutenant-colonel by service on the Continent 1742-5, including Cumberland's battle of Fontenoy in 1745, where the Coldstreams covered themselves with glory; and in 1754 was made major-general of the line, thus paralleling his father. In that year an expedition to destroy the French power in America was resolved on; and on 24 September Braddock was made generalissimo of all the forces there, beyond question as being the officer known to Cumberland who was best able to accomplish the task. But his experience made him overrate formal discipline, and underrate (not only in action but in expert counsel) both foes and allies who lacked it; he could not fully realize new dangers nor appreciate methods of meeting them; he was hot of temper, rough of speech, overbearing in argument, obstinate in opinion; and these, with the martinism natural enough in an officer of 60 after 43 years of the Coldstreams, and which were not vital in a drilled service, fatally alienated those in the new land on whom he had to depend for safety. Yet he was quick to recognize ability, and warm in acknowledging it; he regarded Washington and Franklin, the former but 22, as the greatest men in the colonies; and when the royal order of 1754 ranking all colonial commissions below all English ones prevented Washington from joining him, he sent a handsome letter asking the latter to be one of his military family, and voluntarily promised to use his influence in securing him a regular English commission. Landing at Hampton Roads, Va., 20 Feb. 1755, he attempted to collect men and stores for his expedition against Fort Duquesne (Pittsburg), but was baffled for many weeks by the sloth, rapacity, and unpatriotic local factions of the colonies, who did their best to justify the contempt with which he heartily if injudiciously visited them. The lack of men, supplies, transportation, and money delayed the expedition to its ruin. He tried to secure a large body of Indians for scouts and allies, but only obtained 40 or 50. He let all but eight of them go through bad judgment, and disgusted those so greatly by his manners that one of them deserted, and the rest warned their friends against coming near. The famous Indian hunter, Capt. Jack, wished to join him, but Braddock refused unless he would conform to military discipline, which the old scout would not do. Finally the expedition started from Fort Cumberland (now Cumberland, Md.) the first week in June, with 2,150 men. The march was most toilsome and slow, involving cutting roads, bridging streams, making causeways, passing through swamps, etc.; and on the 18th, at Little Meadows, 1,200 picked men were chosen to continue the expedition, the rest being left behind under Dunbar. On the night of 4 July he halted two days about 25 miles from his destination, to wait the reports of his Indian scouts and convoy of provisions from Dunbar's camp—to his destruction but not to his blame. Reaching Turtle (now Rush) Creek the road

suddenly ended at a precipice impassable for artillery and wagons, and he decided to quit the ridge, where ambuscade was impossible, and make a double fording across an elbow of the Monongahela. Meantime the French commander, Contrecoeur, had decided to withdraw without a blow, but a Capt. Beaujeu asked leave to take a detachment and resist the passage of the second ford, eight miles off. He was given about 200 white troops, and by a brilliant appeal on the morning of the 9th to the Indians, who at first hung back, obtained several hundred of them also. When he came in sight of the English, they had already crossed, and advanced so that both flanks would be exposed for some 200 yards to an enemy who occupied the deep ravines, thick with tangled forest growth and vines, that seamed the river bluff. Braddock's ruinous error was in not beating up ahead on his flanks, as Col. Sir Peter Halket urgently besought him to do the night before; thereby he marched straight into the worst of ambushes. Into these the Indians glided, while the white troops barred the English path in front; and the head of the advancing column went down under a storm of lead. Shaken for a moment, the vanguard moved against the concentric ring; and after another terrible discharge, returned it with a volley that swept away every enemy in sight, and struck Beaujeu and a dozen others dead. The Indians turned to fly; rallied by the other French officers, they returned to cover, and under their unerring fire the English advance broke and retreated; mixing with the rear in the narrow path, both became mingled in a mob which Braddock could not restore to order. Huddled into a 12-foot road, shut in by a forest alive with yells and filled with an invisible foe, they lost all sense or perception, and twice shot down bodies of their own men who had gained slight vantage points, taking their smoke for the enemy's. Fifty Virginians were thus slain at a blow. The regulars refused to charge, though Braddock, with four horses successively shot under him, and the other officers strove to hearten them to invade the wood; the provincials sought to fight Indian fashion behind trees and logs, but Braddock with furious threats and blows drove them back into rank again, where they fell in scores. Washington and Halket begged to have them allowed to leave the ranks, but Braddock still refused. The ammunition began to fail; the baggage was attacked; all Braddock's aides but Washington were shot down; three fourths of the officers, and three fifths of the entire army; and only then would the ill-judging but heroic Braddock give the signal for retreat. Shortly afterward Braddock received a ball through the lungs; not one of the English soldiery would stay to carry him off the field, but one English and two American officers took him from the field to a spot half a mile across the river. Here the dying hero tried to establish a camp for a rallying place, and to care for the wounded and wait for Washington's return from Dunbar; but although the French and Indians had not followed them across, the 100 English soldiers he had induced to stop there stole away again and fled. The officers with their commander marched on till 10 p.m. on the 10th, when they halted and met the convoy from Dunbar, Braddock never ceasing to give calm, skilful, and humane orders; on the 11th he reached

Dunbar's camp, where the news of the rout had set his soldiers also deserting and fleeing in wild panic. Giving up all hope of the expedition in any hands now, he had the stores destroyed to keep them from the enemy, save enough for a flying march; and the remnant of the army proceeded toward Great Meadows, where Braddock expired, leaving his favorite horse and body servant to Washington. Of 1,460 men in the battle, 456 were killed and 421 wounded; 63 out of 89 commissioned officers were killed or injured, and every field officer. The enemy's casualties were about 60. The entire borders were left defenseless and desolated by a fearful Indian war.

Brad' don, Mary Elizabeth (MRS. MAXWELL), English novelist: b. London, 1837, daughter of a solicitor there. She received her education at home, and early showed signs of literary power. After publishing some poems and tales, in 1862 she brought out 'Lady Audley's Secret,' which was almost instantly popular and the first of a long series of clever sensational novels, among which may be mentioned 'Aurora Floyd' (1862); 'John Marchmont's Legacy' (1863); 'Eleanor's Victory' (1863); 'Henry Dunbar' (1864); 'Dead Sea Fruit' (1869); 'Dead Men's Shoes'; 'Rupert Godwin' (1869); 'Hostages to Fortune' (1875); 'Ishmael' (1884); 'The Fatal Three' (1888); 'The Venetians' (1892); 'Thou Art the Man' (1894); 'Sons of Fire' (1895); 'London Pride' (1896); 'Under Love's Rule' (1897); 'In High Places' (1898); 'Rough Justice' (1898); 'His Darling Son' (1899); 'The Infidel' (1900); 'The Conflict' (1903). She conducted the London magazine 'Belgravia' for some time, and some of her stories first appeared there. Her later works do not rely so much on sensational effects for their success as her earlier ones. In all she has published over 60 novels. She is the widow of John Maxwell, a well-known publisher.

Bradford, Alden, American historian and journalist: b. Duxbury, Mass., 19 Nov. 1765; d. Boston, 26 Oct. 1843. Originally a Congregational minister he became secretary of State of Massachusetts (1812-24), and editor of the *Boston Gazette* (1826). He wrote 'History of Massachusetts, 1764-1820'; 'History of the Federal Government'; 'Life of Jonathan Mayhew' (1838); 'New England Chronology' (1843).

Bradford, Amory Howe, American clergyman and author: b. Granby, Oswego County, N. Y., 14 April 1846. He was graduated at Hamilton College 1867, Andover Theological Seminary 1870; studied at Oxford University, England, and became pastor of the First Congregational Church, Montclair, N. J., in the year last named. He has written: 'Spirit and Life' (1888); 'Old Wine, New Bottles' (1892); 'The Pilgrim in Old England' (1893); 'Heredity and Christian Problems' (1895); 'The Growing Revelation' (1897); 'Art of Living Alone' (1899); 'The Return to Christ' (1900); 'Age of Faith' (1900); 'Spiritual Lessons From the Brownings' (1900); 'Ascent of the Soul' (1902).

Bradford, Andrew, American printer, son of William Bradford (1663-1752) (q.v.): b. Philadelphia about 1686; d. 23 Nov. 1742. He was the only printer in Pennsylvania from 1712 to 1723. He published the first newspaper in Philadelphia, 22 Dec. 1719, called the *American*

Weekly Mercury. It was by him that Benjamin Franklin was first employed, on his arrival in Philadelphia in 1723. In 1732 he was postmaster; in 1735 he kept a book store at the sign of the Bible in Second Street. In 1738 he removed to No. 8 South Front Street, to a house which in 1810 was occupied as a printing house by his descendant, Thomas Bradford, publisher of the 'True American.'

Bradford, Gamaliel, American writer and politician: b. Boston, Mass., 15 Jan. 1831. He has been prominent in politics as an independent, being a strong opponent of the Philippine policy of the administration, and is the author of 'Lesson of Popular Government' (1898); 'Types of American Character.'

Bradford, John, Protestant martyr and theologian: b. Manchester about 1510; d. Smithfield, London, 1 July 1555. He obtained a situation in the commissariat, and having been guilty of some defalcation, known only to himself, was so impressed by a sermon of Latimer on restitution, that he determined not only to sell everything he had in order to make up the defalcation, but to renounce an employment which exposed him to dangerous temptations. He afterward studied at Cambridge, where he received the degree of M.A., and on taking orders was appointed chaplain to the Bishop of London, and Canon of St. Paul's. From this time he devoted himself to the duties of his office with so much zeal and success that he became one of the most popular preachers of his day. In 1552 he was appointed chaplain to Edward VI., but under the reign of Queen Mary became a marked man. On the charge of preaching sedition he was committed to the Tower (occupying the same room with Ridley, Cranmer, and Latimer), and being brought to trial, was condemned to death as an obstinate heretic. His life is said to have been offered to him if he would only promise to refrain from preaching, but even this he had the manliness to refuse, and he was burned at the stake. A complete edition of his works, which include sermons, meditations, various treatises, etc., was published 1848-53.

Bradford, Joseph, American journalist and dramatic author: b. near Nashville, Tenn., 24 Oct. 1843; d. Boston, Mass., 13 April 1886. His real name was WILLIAM RANDOLPH HUNTER. Besides satirical verses he wrote a number of poems which were highly esteemed, especially those on the death of Victor Hugo and of Gen. Grant. His plays, 'Our Bachelors,' and 'One of the Finest,' were very successful and are still popular.

Bradford, Royal Bird, American naval officer: b. Turner, Me., 22 July 1844. He was graduated at the United States Naval Academy in 1865 and received promotion through various grades to the rank of commander. He has made a specialty of equipment, and since 1897 has been chief of the Bureau of Equipment at the Navy Department in Washington.

Bradford, William, American colonial governor and author: b. Austerfield, Yorkshire, England, 1590; d. Plymouth, 9 May 1657. He was one of the signers of the celebrated compact on the Mayflower; and, in 1621, on the death of the first governor, John Carver, was elected to the same office, which he continued to fill (with the exception of a brief

period when he declined re-election) until his death. His administration was remarkably efficient and successful, especially in dealing with the Indians. One of his first acts was to adopt measures to confirm the league with the Indian sachem Massasoit. In the beginning of 1622, when the colony was subjected to a distressing famine, a threatening message was received from the sachem of Narragansett in the form of a bundle of arrows bound with the skin of a serpent. The governor sent back the skin filled with powder and ball. This decisive reply finished the correspondence. The Narragansetts were so terrified, that they returned the skin without even inspecting its contents. In return for his kindness and attentions to Massasoit in a dangerous illness, the sachem disclosed to the colony a dangerous conspiracy among the Indians, and it was suppressed. His 'Diary of Occurrences,' covering the first year of the colony, was published in 1622. He left a number of religious compositions in verse; and historical prose writings of great value, the most important being his 'History of the Plymouth Plantation' from the formation of the society in England, in 1602, down to 1647. This disappeared during the American Revolution, but was found in the library of Fulham Palace, England in 1858, and in 1898 was returned to the United States and placed among the archives of Massachusetts. The shorter writings of Bradford will be found in Young's 'Chronicles of the Pilgrims' (1841). See Cotton Mather, 'Magnolia' for life of Bradford; also Tyler, 'History of American Literature' (1898); Walker, 'Ten New England Leaders' (1901).

Bradford, William, the first printer in Pennsylvania: b. Leicester, England, 20 May 1663; d. New York, 23 May 1752. Being a Quaker, he emigrated in 1682 or 1683, and landed where Philadelphia was afterward built, before a house was begun. In 1687 he printed an almanac. The writings of George Keith, which he printed, having caused a quarrel among the Quakers, he was arrested in 1692 and imprisoned for libel. On his trial, when the justice charged the jury to find only the fact as to the printing, Bradford maintained that they were to find also whether the paper was really seditious, and that "the jury are judges in law as well as the matter of fact." He was not convicted, but having incurred the displeasure of the dominant party in Philadelphia, he removed to New York in 1693. In that year he printed the laws of the colony. On 16 Oct. 1725, he began the first newspaper in New York, called the *New York Gazette*. In 1728 he established a paper mill at Elizabethtown, N. J. Being temperate and active, he reached a great age without sickness, and walked about on the very day of his death. For more than 50 years he was printer to the government of New York, and for 30 years the only one in the province.

Bradford, William, American jurist, attorney-general of the United States: b. Philadelphia, 14 Sept. 1755; d. 23 Aug. 1795. He was graduated at Princeton College in 1772, and commenced the study of the law. In the spring of 1776, upon the breaking out of the war with Great Britain, he joined the militia, in which he attained the rank of lieutenant-colonel. In consequence of ill-health he was obliged to

resign at the end of two years, and was admitted to the bar in Philadelphia in 1779. In 1780 he was appointed attorney-general of Pennsylvania. Under the new Constitution he was appointed a judge of the supreme court 22 Aug. 1791. Upon the promotion of Edmund Randolph to the office of secretary of state he received from Washington the appointment of attorney-general of the United States 28 Jan. 1794. In early life he wrote some pastoral poems in imitation of Shenstone; but his principal production was an 'Inquiry how far the Punishment of Death is necessary in Pennsylvania.'

Bradford, William, American painter: b. New Bedford, Mass., 1827; d. New York, 25 April 1892. He entered business early in life, but abandoned it for art. His subjects were the ice fields of the North Atlantic, and well known works of his include 'Steamer Panther in Melville Bay under the Light of the Midnight Sun'; 'Crushed by Icebergs'; 'Arctic Wreckers'; 'Land of the Midnight Sun'; and 'Sunset in the North.'

Bradford, English manufacturing city, in the West Riding of Yorkshire, eight miles west of Leeds. It is pleasantly situated on a feeder of the Aire, at the junction of three extensive valleys, and consists of an ancient and a more modern portion, the latter with spacious, well-built streets. The appearance of the town has been almost completely changed since 1861, the corporation having, at a great expenditure of money, effected most extensive street improvements, widening the principal thoroughfares, improving the gradients, and opening up new streets. Spacious covered markets have been erected at a great cost. Among the public buildings are the town-hall (1873), in French Gothic style; St. George's Hall, erected in 1851, and capable of accommodating about 5,000 persons; an exchange, containing a statue of Cobden; a temperance hall; a mechanics' hall, with lecture rooms and library; a technical college, opened in 1882; free library (1872). The schools include the free grammar-school, endowed by Charles II., the girls' grammar-school, and the board schools. In Airedale College young men are trained for the ministry among the Independents. Among the charitable institutions may be noticed the infirmary, the eye and ear hospital, the children's hospital, St. Catharine's Home, an institution for the blind, and alms-houses. There is a fever hospital, to which patients are admitted at moderate charges, and when persons are too poor to pay, the corporation bears the cost. There is also a small-pox hospital. Bradford has several public parks, some of them finely laid out, besides Baildon Moor (600 acres) reserved for recreation purposes. There is an extensive system of water-works by gravitation, and water, gas, and electric supply undertakings are owned by the municipality. The worsted yarn and stuff trade is the principal industry; there are also alpaca and mohair manufactures (with which Sir Titus Salt's name is connected), manufactures of silk and velvet (the Manningham Mills of Lister & Company), mixed cotton and silk goods; and some cotton factories. In the neighborhood are quarries and iron-works. The town was incorporated in 1847, and its affairs are managed by a mayor, 21 aldermen, and 63 councillors. It was accorded the rank of a city in

1897. The three parliamentary divisions of Central, East, and West Bradford each send one member to Parliament. A United States consulate is established here. Pop. (1901) 279,809.

Bradford, Pa., a city in McKean County, on several railroads; 15 miles northwest of Smethport, the county-seat. It is in an extensive coal, oil, and natural gas region, and is principally engaged in industries connected therewith, besides having machinery, chemical, boiler, and brick and tile works. The city has electric street railroads, daily and weekly newspapers, three national banks, large hospital, several libraries, and is lighted and heated by natural gas. Pop. (1900) 15,029.

Bradford-on-Avon, an ancient market-town of England, in Wiltshire, beautifully situated 28 miles northwest of Salisbury, on both banks of the Lower Avon, here crossed by two bridges—a very old one of nine arches in the centre of the town, and a modern one, Barton Bridge, of four. The town chiefly consists of three regular streets, containing many handsome houses. There is a good parish church of the Holy Trinity, in the Norman and subsequent styles; a town-hall, in Elizabethan style; and some interesting old buildings. Among the latter is the small but unique church of St. Laurence, the only complete specimen of Anglo-Saxon architecture still existing, and of great archaeological interest. It was built in the 8th century by Saint Aldhelm, and consists of a chancel, a nave, and a porch on the north side. Woolen cloth is manufactured, but this industry has declined. Bradford was of some note in Anglo-Saxon times, St. Dunstan having been elected Bishop of Worcester at a synod held in it. Pop. (1901) 4,514. See Perkins, 'Abbey Churches of Bath, Malmesbury, and St. Laurence' (1901).

Bradlaugh, Charles, English secularist: b. London, 28 Sept. 1833; d. 30 Jan. 1891. He made himself known by his writings and lectures, and more especially by his efforts to gain admission to Parliament. Being elected for Northampton in 1880, he claimed the right to make affirmation simply, instead of taking the oath which members of Parliament take before they can sit and vote, but being a professed atheist this right was denied him. Though repeatedly re-elected by the same constituency, the majority of the House of Commons continued to declare him disqualified for taking the oath or affirming; and it was only after the election of a new Parliament in 1885 that he was allowed to take his seat without opposition as a representative of Northampton. He was editor of the 'National Reformer.' Not long before his death Parliament erased from its records its resolution prohibiting him from taking the oaths. See the 'Life' (1894) by his daughter and J. M. Robertson.

Bradlee, Nathaniel, American architect: b. Boston, 1829; d. 1888; began the study of architecture in 1846. He achieved marked success, having been the architect of over 500 prominent buildings in the city of Boston. In 1869 he made a national reputation by moving bodily the large brick structure known as the Hotel Pelham to the corner of Tremont and Boylston streets. The work attracted wide attention,

both in this country and in Europe. He subsequently superintended the removal of the Boylston Market.

Bradley, Arthur Granville, English author, son of George Granville Bradley (q.v.): b. 11 Nov. 1850. He was educated at Marlborough and Trinity College, Cambridge, and has published 'History of Marlborough College' (1893); 'Life of Wolfe' (1895); 'Sketches from Old Virginia' (1897); 'Highways and Byways of North Wales' (1898); 'The Fight with France for North America' (1900); 'Highways and Byways of the English Lake District' (1901); 'Owen Glyndwyr' (1901).

Bradley, Edward (CUTHBERT BEDE), English author and clergyman: b. Kidderminster, 1827; d. Lenton, 12 Dec. 1889. He was graduated at Durham University, and was rector of Denton, Stretton, and finally Lenton from 1883 until his death. He contributed to 'Punch' and other London periodicals, and published the 'Adventures of Mr. Verdant Green, an Oxford Freshman' (London 1855), a humorous picture of college life. His other works include 'Mr. Verdant Green Married and Done For' (1856); 'The White Wife,' a collection of Scottish legends (1864); 'Little Mr. Bouncer and His Friend, Verdant Green' (1873-4); and several books of travels.

Bradley, George Granville, English clergyman, dean of Westminster Abbey, 1881-1902: b. 11 Dec. 1821; d. London, 12 March 1903. He was educated at Rugby and University College, Oxford, and took orders in the Anglican Church. He was assistant master at Rugby 1846-58; master of Marlborough College 1858-70; master of University College 1870-81. In the last-named year he became canon of Worcester and succeeded Dean Stanley as dean of Westminster. He published 'Recollections of Arthur Penryhn Stanley' (1883); 'Lectures on the Book of Job' (1884); 'Lectures on Ecclesiastes' (1885). He resigned the deanery of Westminster a few months before his death.

Bradley, Henry, English scholar and lexicographer: b. Manchester, England, 3 Dec. 1845. He has twice been president of the Philological Society and has been joint editor of the 'Oxford English Dictionary' from 1889. He has published 'The Story of the Goths' (1888); contributed important articles to the 'Dictionary of National Biography'; etc., and edited the E, F, G, and L portions of the 'Oxford Dictionary'.

Bradley, James, English astronomer: b. Sherborne, Gloucestershire, 1693; d. Chalford, Gloucestershire, 13 July 1762. He was educated at Balliol College, Oxford, and took orders, but his taste for astronomy soon led him in a different direction, and in 1721 he was appointed Savilian professor of astronomy at Oxford. Seven years afterward he made known his discovery of the aberration of light. But although this discovery gave a greater degree of accuracy to astronomical observations, yet slight differences remained which he studied during 20 years with the greatest perseverance, and finally discovered that they were fully explained by the supposition of an oscillating motion of the earth's axis, completed during a revolution of the moon's nodes, that is, in about 18 and a half years. He called this phenomenon the "nutations"

of the earth's axis⁹); and published his account of it in 1748. By these two discoveries astronomers were, for the first time, enabled to make tables of the motions of the heavenly bodies with the necessary accuracy. Bradley had already, in 1726, explained the method of obtaining the longitude by means of the eclipse of Jupiter's first satellite. In 1742, at the death of Dr. Halley, he received the office of astronomer royal, and removed to the observatory at Greenwich. Here he spent the remainder of his life, entirely devoted to his astronomical studies. His observations in manuscript appeared under the title of 'Astronomical Observations made at the Observatory at Greenwich, 1750-62' (1798, 1805). From this rich mine have been taken thousands of observations, on the sun, moon, and planets, of the highest astronomical value.

Bradley, John Edwin, American educator: b. Lee, Mass. He was graduated from Williams College in 1865, and was successively principal of high schools in Pittsfield, Mass., 1865-8; Albany, N. Y., 1868-86. He was superintendent of schools at Minneapolis 1886-92, and president of Illinois College 1892-1900. He is the author of 'Science and Industry'; 'School Incentives'; 'Healthfulness of Intellectual Pursuits'; 'Work and Play'; 'Talks With Students.'

Bradley, Joseph Philo, American jurist: b. Berne, N. Y., 14 March 1813; d. Washington, D. C., 22 Jan. 1892. He was graduated at Rutgers College in 1836; admitted to the bar in 1839; and became a justice of the United States supreme court in 1870. As a member of the electoral commission he cast the vote which gave the presidency to Gen. Hays, in 1877. He devoted much time to mathematical study.

Bradley, Milton, American manufacturer: b. Vienna, Me., 8 Nov. 1836. He organized the Milton Bradley Company at Springfield, Mass., in 1863, for the manufacture of kindergarten supplies. He has published 'Color in the School Room' (1890); 'Color in the Kindergarten' (1893); 'Elementary Color' (1895); 'Water Colors in the School Room' (1900).

Bradshaw, John, English judge and regicide: b. Cheshire, England, 1602; d. London, 31 Oct. 1659. He studied law at Gray's Inn, and obtained much chamber practice from the partisans of the Parliament, to which he was zealously devoted. When the trial of the king was determined upon, the resolute character of Bradshaw pointed him out for president, which office, after a slight hesitation, he accepted. His deportment on the trial some describe as lofty and unbending, others as harsh and overbearing. He was subsequently appointed permanent president of the council of state, and received other honors. He rendered himself obnoxious to Cromwell, when the latter seized the protectorate, and was deprived of the chief-justiceship of Chester. On the death of Cromwell in 1658, and the restoration of the Long Parliament, he obtained a seat in the council, and was elected president. He died in 1659, and on his death-bed asserted that, if the king were to be tried and condemned again, he would be the first to agree to it. He was magnificently buried in Westminster Abbey, from which his body was ejected and hanged on a gibbet at Tyburn, with those of Cromwell and Ireton, at the Restoration.

Bradshaw's Railway Guide, a well-known English manual for travelers, first issued by George Bradshaw, a printer and engraver of Manchester, in 1839. It is now published on the first of each month, and contains the latest arrangements of railway and steamboat companies, beside other useful information. There are now many such hand-books in the field, and the idea has since been further developed in the descriptive hand-books of Murray, Baedeker, and others.

Bradstreet, Anne, American poet: b. Northampton (probably), England, 1612; d. Andover, Mass., 16 Sept. 1672. She was the daughter of Gov. Thomas Dudley, and married the future governor, Simon Bradstreet, in 1628. She went with him to New England in 1630. She was the first woman of letters in America, her verse being written in the intervals of household cares, and by her contemporaries was styled "The Tenth Muse." Her volume of poems was published in London in 1650. A more complete edition appeared at Boston in 1678, containing, among other additional compositions, her best poem, entitled 'Contemplations.' A third edition was published in 1758. She was the mother of eight children, to whom she makes the following allusion:

I had eight birds hatch't in the nest;
Four cocks there were, and hens the rest;
I nurs't them up with pains and care,
For cost nor labor did I spare;
Till at last they felt their wing,
Mounted the trees and learned to sing.

Her complete works, edited by J. H. Ellis, were reprinted in Boston in 1867, and again in 1897. See Tyler, 'American Literature' (1898).

Bradstreet, John, English soldier in America: b. 1711; d. New York, 21 Oct. 1774. He was, in 1746, lieutenant-governor of St. Johns, Newfoundland. In 1756, when it was considered highly important to keep open the communication with Fort Oswego, on Lake Ontario, he was placed at the head of 40 companies of boatmen, raised for the purpose of supplying it with stores from Schenectady. On his return, 3 July 1756, with 300 of his force he was attacked from an ambuscade, on the Onondaga River, but repulsed and routed the enemy with great loss. In 1758 he commanded a force of 3,000 men in the expedition against Fort Frontenac, which was surrendered 27 August, with all its military stores, provisions, and merchandise, on the second day after he commenced the attack. In 1764 he advanced with a considerable party toward the Indian country, and made a treaty of peace with the various tribes at Presque Isle. He was appointed major-general in 1772.

Bradstreet, Simon, American colonial governor: b. Horbling, Lincolnshire, England, March 1603; d. Salem, Mass., 27 March 1697. Left an orphan at the age of 14, he was brought up under the care of Thomas Dudley (q.v.), whose daughter Anne he married. For a time he was steward to the Earl of Lincoln, and later to the Countess of Warwick. He, with Dudley and Winthrop, determined to emigrate and form a settlement in Massachusetts. Embarking with his wife on the *Arbella*, 29 March 1630, they anchored off Salem on 12 June. In 1621 Bradstreet was one of those who

commenced building at Newtown, now Cambridge, and he resided there for several years. In 1039 he was granted 500 acres of land at Salem. He was also one of the first settlers of Andover, building in 1644 the first mill on the Cochichewick. After the death of his wife in 1672, he seems to have spent his time mainly in Boston and Salem. He was the colony's first secretary, one of the first commissioners of the United Colonies in 1643, and in 1653 vigorously opposed making war on the Dutch in New York, and on the Indians; and it was prevented by his steady and conscientious opposition and the decision of the general court of Massachusetts. He was deputy-governor from 1672 until his election as governor in 1679, in which office he continued until 1686. When Charles II. demanded the colony's charter, Bradstreet thought it better that it should be surrendered than that it should be taken away by judgment. He opposed the arbitrary proceedings of Andros, and when, in 1689, the people put down his authority, they made their former governor their president, and he continued as the head of the administration till May 1692, when Gov. William Phipps arrived, bringing the new charter, in which Bradstreet was named as first assistant. For 62 years he had been in the service of the colony, and he lived to be the "Nestor of New England," for all who came over from England with him, died before him. He was a popular magistrate and official, a man of integrity and piety, and one of the few who stoutly opposed the witchcraft delusion of 1692. See *New England Historical and Genealogical Register*, Vol. I., pp. 75-6, and Vol. VIII., p. 325, for a reprint of his 'Journal, 1664-83.'

Bradwardine, brād'wér-dīn, or Bredwardine, Thomas (DOCTOR PROFUNDUS), English scholar: b. Hartfield, Sussex, about 1290; d. 1349. He was distinguished for his varied learning, and more particularly for his treatise, 'De Causa Dei Contra Pelagium,' an extensive work against the Pelagian heresy, for centuries a standard authority. He was chaplain and confessor to Edward III., whom he accompanied to France, being present at Cressy and the capture of Calais. Being appointed archbishop of Canterbury, he hastened to England, but died of the black death on reaching London. Other works by him are: 'De Geometria Speculativa'; 'De Proportionibus'; 'De Quadratura Circuli'; 'De Arithmetica Practica.'

Bradwardine, Baron, a character in Scott's novel of 'Waverley.' He is represented as a rather opinionated retired soldier, living at his seat of Tully Vedlan.

Brady, Anthony Nicholas, American capitalist: b. of Irish parentage, Lille, France, 22 Aug. 1843. He came as an infant with his parents to the United States, and at the age of 13 began to make his own way in life. After engaging successfully in the tea business in Albany, and in that of granite quarrying, he became financially interested in gas companies, railway companies and the like, successfully developing the street railway system of New York and amassing a fortune of many millions. He has also been connected with oil and electric lighting interests.

Brady, Cyrus Townsend, American Episcopal clergyman and author: b. Allegheny, Pa., 20 Dec. 1861. He graduated from the United States Naval Academy, 1883, but resigned, studied theology under Bishop Worthington of Nebraska, and was ordained in 1890. For five years he served as a missionary in Colorado, Missouri, and Kansas; was archdeacon of Pennsylvania, 1895-9, and rector at Overbrook, Philadelphia, from 1899 until his resignation to devote himself exclusively to writing, in which he has attained popularity as a writer of stories and novels of adventure, romance, and history. He has written: 'For Love of Country' (1898); 'For the Freedom of the Sea' (1899); 'Stephen Decatur' (1900); 'Recollections of a Missionary in the Great West' (1900); 'American Fights and Fighters' (1900); 'Commodore Paul Jones' (1900); 'When Blades are Out and Love's Afield' (1901); 'Under Tops'ls and Tents' (1901); 'An Apostle of the Plains' (1901); 'Colonial Fights and Fighters' (1901); 'Under the Ban of the Red Beard' (1901); 'Border Fights and Fighters' (1902); 'Hohenzollern' (1902); 'In the Wasp's Nest' (1902); 'Quiberon Touch' (1901-2); 'Woven With the Ship' (1902); 'The Bishop' (1903); 'Conquest of the Southwest' (1903); 'The Southerners' (1903).

Brady, Henry Bowman, English paleontologist: b. Gateshead, England, 1835; d. 1890. He was prominent as a manufacturing pharmacist and his success in business enabled him to devote much time to scientific research, becoming in time the highest English authority regarding foraminifera. He was the author of several monographs on Mesozoic, Cenozoic, and other foraminifera, and of the more important works: 'Report on the Foraminifera Dredged by H. M. S. Challenger, During the Years 1873-6,' and 'Scientific Results of the Challenger Voyage,' Vol. IX. (1888).

Brady, Hugh, American general: b. Northumberland County, Pa., 1768; d. Detroit, 15 April 1851. He entered the United States army as an ensign, 7 March 1792; served with Wayne in his western expedition, after the defeat of St. Clair; was made lieutenant in 1794, and captain in 1799. Having left the military service, he was restored to it in 1808, by President Jefferson, who then began to reform the army. 6 June 1812 he was appointed colonel of the 22d foot, and led his troops in the hard-fought battle of Chippewa. They were almost annihilated, but displayed the greatest courage. Gen. Scott saying in his report, "Old Brady showed himself in a sheet of fire." He displayed equal courage at the battle of Niagara Falls, where he was wounded. He was retained in service, on the reduction of the army, as colonel of the 2d foot, a commission he held until his death. After 1835 he was in command of the department of which Detroit was the headquarters; and while at that place contributed, in no small degree, to the pacification of the frontier, during the Canadian troubles. He was looked on by the army as one of its fathers. He received two brevets, as brigadier-general, 6 July 1822, and as major-general, for long and faithful service, 30 May 1848. Immediately before his death, the chaplain of his corps visited him and sought to speak to him of religious matters. Gen. Brady listened to him,

and said, "Sir, that is all right; my knapsack, however, has been packed, and I am ready to march at the tuck of the drum."

Brady, James Topham, American lawyer: b. New York, 9 April 1815; d. there, 9 Feb. 1869. He was educated by his father, an eminent jurist, and admitted to the bar in 1836. His eloquence, skill, and ability at once brought him reputation and a fine practice. Conspicuous for his knowledge in all departments of law, he won verdicts from judges and jurors alike in important patent cases, such as *Goodyear v. Day*; cases involving questions of medical jurisprudence, like the *Allaire and Parish* will cases, the *Huntington forgery* case, and *Cole homicide* case; divorce cases, like that of *Mrs. Edwin Forrest*, and civil actions of all kinds. He was at his best in criminal cases, where he usually appeared on the side of the defense. At one time he defended successfully in a single week four clients charged with murder. In 1859 he was counsel for Daniel E. Sickles in his trial for the assassination of Philip Barton Key, his opening address for the defense being one of his most notable forensic efforts. Though a States-rights advocate before the War, he supported Lincoln's war measures, making speeches which had considerable influence.

Brady, John, Irish-American ecclesiastic: b. County Cavan, Ireland, 1842. He prepared for the priesthood at All Hallows College in Ireland, was assistant priest in Newburyport, Mass., 1864-8, and since 1868 has been pastor of St. Joseph's Church at Amesbury, Mass. In 1891 he was consecrated auxiliary bishop of Boston and titular bishop of Boston, but still continues his parochial work.

Brady, Nicolas, English prelate: b. Bandon, Ireland, 28 Oct. 1659; d. Richmond, Surrey, 20 May 1726. He was educated at Westminster School, and afterward received the degree of B.A. both at Oxford and at Dublin, and took orders in the Irish Church. Having come to England he obtained several ecclesiastical preferments; among others the rectory of the Church of St. Catharine Cree, London, and that of Richmond, Surrey. This put him in possession of an income which might, but does not seem to have sufficed for his wants, as he thought it necessary to increase it by keeping a school at Richmond. His largest work, a translation of the *Æneid*, was an absolute failure, but he has made his name a kind of household word, at least in England, by executing, in concert with Nahum Tate, the 'New Versions of the Psalms of David' (1695), which soon came to be commonly used in the Episcopal Church.

Brady, William Maziere, Irish theologian: b. Dublin, 1825. He was for a long period a clergyman in the Established Church of Ireland, but was prominent in the agitation leading to its disestablishment in 1869, and lost several of his preferments by that event. In 1873 he entered the Roman Catholic Church. He has published 'The Episcopal Succession in England, Ireland, and Scotland, 1400-1875' (1876-7); 'Annals of the Catholic Hierarchy in England and Scotland' (1883); 'Anglo-Roman Papers' (1890).

Brady-car'dia, an abnormally slow heart. Brady-cardia occasionally is a family trait, and is then normal. Napoleon is said to have had a heart beat of only 40 to the minute. It may occur during pregnancy, and is often present in the convalescence of fevers, particularly typhoid, acute rheumatism, diphtheria, and pneumonia. It sometimes accompanies disease of the digestive tract; is often present in emphysema, and further present rarely in a number of conditions. Among these may be mentioned fibroid changes in the heart, nephritis, lead, alcohol, tobacco, and digitalis poisoning, in melancholia, general paresis, and in apoplexy. It may mean much or may be insignificant, and its importance is largely measured by its causative factors.

Braekeleer, Ferdinandus dé, fêr-dê-nân'doos dé brâ'kê-lâr, Belgian artist: b. Antwerp, 1792; d. 1883. He was a member of the Antwerp Academy and a director of the Antwerp Museum, and as an instructor was especially successful. Among his works are 'Tobit Burying a Jew by Night' (1817); 'The Baker'; 'Bombardment of Antwerp in 1830'; 'Happy Family'; 'Unhappy Family.'

Braemar, brâ-mâr', Scotland, a mountainous district in the southwest corner of Aberdeenshire. It contains part of the Grampian range, with the heights of Ben Macdhu, Cairntoul, Lochnagar, etc. The district has some fine scenery, valleys, and hillsides covered with birch and fir, but consists largely of deer-forests. The Balmoral Castle, formerly the residence of the late Queen Victoria, is situated here, on the banks of the Dee, midway between Ballater and Braemar village (Castleton of Braemar).

Brag, a game of cards, played with a full-pack. It is so named because each player endeavors to impose upon his neighbor, by "bragging" about his hand, in an endeavor to make his opponents believe it more valuable than it is. The cards rank as in whist, except the nines and knaves, which take their value from the cards with which they are held. Thus an ace, a nine, and a knave are equivalent to three aces. The hands are shown, not played, the strongest one taking the stakes.

Braga, Theophilo, Portuguese philologist and critic: b. San Miguel, Azores, 24 Feb. 1843. He was educated at the university of Coimbra, and became professor of literature in the *Curso Superior de Letras* in Lisbon. He is a very voluminous writer and takes important rank as a historian of the literature of the Iberian peninsula. He is also noted as an exponent of the Comtian philosophy. In politics he has been prominent as an active democrat. In addition to other literary activity, he has published several volumes of poems. Among these may be mentioned: 'Stella Matutina' (1863); 'Tempestades Sonoras' (1864); 'Torrentes' (1868), and a collection entitled 'Alma Portuguesa' (1893). Of his other works may be noted: 'Historia da Litteratura Portuguesa' (1870-81); 'Manual da Litteratura Portuguesa' (1875); 'Parnaso Portuguez Moderno' (1877); a volume on Camôens (1880); 'Traços Geraes de Philosophia Positiva' (1877); 'Contos Tradicionaes do Povo Portuguez' (1883); 'Systema de Sociologia' (1884); 'Historia da Universidade de Coimbra' (1892).

Braga, brä'gä, Portugal, a town in the province of Minho, and its capital, situated on a rising ground between the Cavado and D'Este, about 32 miles north-northeast of Oporto. It is surrounded by walls flanked with towers and defended by a castle. The houses are old, the streets broad, but not well laid out. It is the seat of an archbishop who is primate of Portugal, and contains an archiepiscopal palace, a richly ornamented Gothic cathedral of the 13th century, parish churches, monasteries, a college, etc. The manufactures are of some importance. Braga is supposed to have been founded by the Carthaginians, and there exist remains of a Roman temple, amphitheatre, and aqueduct. On a hill some distance east of the town stands the famous pilgrimage church of Bom Jesus do Monte. Pop. (1890) 23,089.

Bragança, brä-gän'sä, the name of two considerable towns in Brazil: (1) A seaport, 100 miles northeast of Para, at the mouth of the Cate, which is here navigable to the town. Pop. of town and district, 6,000. (2) An inland city of about 10,000 inhabitants, 50 miles north-east of Sao Paulo.

Bragança, or **Braganza**, Portugal, the capital of a district (of the same name) in the province of Tras-os-Montes. It was in former times the capital of the province, and is a place of considerable importance. It has the ruins of an ancient castle, one of the finest feudal remains in Portugal. It is the see of a bishop, and there is an extensive manufactory of velveteens, printed calicoes, and woollens. Bragança has given its name to the present royal family of Portugal. Pop. about 5,500.

Bragança, or **Braganza**, House of, the present reigning house of Portugal, derived from Affonso, Duke of Bragança, a natural son of João I., king of Portugal. The constitution of Lamego, 1139, declares that no foreign prince can succeed to the throne; consequently in 1578, on the death of the Portuguese hero Sebastian, in Africa, without issue, his people had recourse to the illegitimate line of Bragança. Philip II. of Spain, however, claimed the throne, and supported his pretensions by an army under the Duke of Alva, who, though in disgrace, was summoned from his retreat for this express purpose. In 1668 the Portuguese shook off the Spanish yoke. In 1801 Napoleon I. declared that the line of the Bragança sovereigns had ceased. John, regent of the kingdom, withdrew to Brazil in 1807, but returned in 1821. At his death in 1826 his son, Don Pedro, resigned the throne in favor of his daughter, Maria da Gloria, preferring to remain emperor of Brazil, to which office he had been elected by the Brazilians, 18 Nov. 1825.

Bragg, **Braxton**, American military officer: b. Warren County, N. C., 22 March 1817; d. Galveston, Tex., 27 Sept. 1876. He graduated at West Point in 1837; was appointed second lieutenant in the 3d Artillery; served with distinction under Gen. Taylor in the Mexican war; and retired to private life in 1856. At the outbreak of the Civil War he became a brigadier-general in the Confederate army, and was stationed at Pensacola to act against Fort Pickens. In 1862, having been appointed a general of division, with orders to act under Gen. A. S. Johnston, commanding the army of the Mississippi, he took an important part in the two

days' battle of Shiloh. On Johnston's death he was appointed to his command, with the full rank of general, and succeeded Gen. Beauregard as commander of the department in July of the same year. The last command he resigned in December 1863. His chief success was at Chickamauga in September 1863, when he inflicted a defeat on the army of Gen. Rosecrans, but was himself, in turn, defeated by Gen. Grant, which led to his temporary removal from command in January 1864, and he was appointed military adviser to Jefferson Davis. In 1864 he assumed command of the department of North Carolina. After the war he was chief engineer of the State of Alabama, and superintendent of the improvements in Mobile Bay.

Bragg, **Edward Stuyvesant**, American legislator: b. Unadilla, N. Y., 20 Feb. 1827. He was educated at Geneva (now Hobart) College, and admitted to the bar in New York in 1848. He removed to Fond du Lac, Wis., and was admitted to the Wisconsin bar in 1850, to that of Illinois in 1869, and to that of the United States supreme court in 1877. He served in the Union army during the Civil War, and won his way to the rank of brigadier-general. He was a member of the Union convention at Philadelphia in 1866; representative in Congress in 1877-85; and a delegate to the Democratic National Conventions of 1872, 1884, 1892, and 1896. In the convention of 1884 he seconded the renomination of Grover Cleveland, when he uttered the memorable phrase, "We love him for the enemies he has made." In 1888 he was appointed minister to Mexico; from 15 May to 15 Sept. 1902, was consul-general in Havana and since 15 Sept. 1902 at Hong Kong.

Bragi, brä'jē, the Scandinavian god of poetry. He is represented as an old man with a long flowing beard, like Odin; yet with a serene and unwrinkled brow. His wife was Idunna.

Braham, brä'am, **John**, English tenor singer: b. London (of Jewish extraction), 1774; d. 1856. He made his first appearance as a vocalist at the age of 10. On attaining manhood he proceeded to France and Italy with the view of improving himself in his art, and accomplished this so successfully that on his return after an absence of several years he soon rose to the position of the first English singer of his day. He sung much in opera, but gained his greatest triumphs in national songs, such as 'The Bay of Biscay, O', and 'The Death of Nelson,' and till within a few years of his death he continued to appear in public. His sons, Charles, Augustus, and Hamilton, also adopted the musical profession.

Brahe, **Tycho**, tī'kō brä, or brä, Swedish astronomer: b. Knudstrup, near Lund, 14 Dec. 1546; d. Prague, Bohemia, 24 Oct. 1601. The district where he was born was then a province of Denmark, but the family was of Swedish origin. He was sent at the age of 13 to the University of Copenhagen with the intention that he should be educated for government service. He evinced great promise as a Latin scholar, but an eclipse of the sun turned his attention to astronomy. His uncle sent him later to Leipsic to study law, but Brahe, while his tutor slept, busied himself nightly with the stars. He succeeded, as early as 1563, in detecting grave errors in the Alphonsine tables and

the so-called Prutenic (that is, Prussian) tables, and set about their correction. The death of an uncle, who left him an estate, recalled him to his native place in 1565; but he very soon became disgusted with the ignorance and arrogance of those moving in the same sphere with himself, and went back to Germany. At Wittenberg, where he resided for a short time, he lost part of his nose in a duel with a Danish gentleman; but for the lost organ he ingeniously contrived one of gold, silver, and wax, which fitted admirably. After two years spent in Augsburg, he returned home, where, in 1572, he discovered a new and brilliant star in the constellation Cassiopeia. In 1573 he married a peasant girl. After some time spent in travel, Brahe received from his sovereign, Frederic II., the offer of the small island of Hven or Hoëne, in the sound, 10 miles from Copenhagen, as the site for an observatory, the king also offering to defray the cost of erection, and of the necessary astronomical instruments, as well as to provide him with a suitable salary. Brahe accepted the proposal, and, in 1576, the castle of Uranienburg ("fortress of the heavens") was begun. Here, for a period of 20 years, Brahe prosecuted his observations with the most unwearied industry. Here, also, he was visited by astronomers, mathematicians, philosophers, theologians and princes, among the latter being the future James I. of England, who took a lively interest in the astronomer's work. Asking Brahe what gift he should make in return for the other's courtesy, the scholar replied, "Some of your majesty's own verses." So long as his magnificent patron, Frederic II., lived, Brahe's position was all that he could have desired, but on his death in 1588 it was greatly changed. Under Christian IV. Brahe was barely tolerated; but in 1597 his situation had grown so unbearable that he left the country altogether, having been the year before deprived of his observatory and emoluments. After residing a short time at Rostock and at Wandsbeck, near Hamburg, he accepted an invitation of the Emperor Rudolf II.—who conferred on him a pension of 3,000 ducats—to Benatek, a few miles from Prague, where a new Uranienburg was to have been erected for him, but he died shortly after. On his deathbed he solemnly confided his system to his celebrated pupil Kepler, then but 28 years old.

BrahiLOW, **Brailow**, brā'ē-low, or **Braila**, brā'ē-la, Rumania, a town and port on the left bank of the Danube, about 12 miles above Galatz, and over 120 miles from the Sulina mouth of the river. It is accessible by large sea-going vessels, and carries on a great trade in the export of grain, importing coal, agricultural machinery, etc. Both as regards accommodation for shipping and otherwise it has been much improved in recent years. In the Turkish wars of the latter half of the 18th century BrahiLOW was several times besieged and taken by the Russians. In 1828 it had to surrender to the Russians after a gallant resistance, but in 1829 the Peace of Adrianople restored it to the Turks. Pop. (1894) 51,116.

Brahma, the first person in the Triad, or Trimurti, of the Hindus, which consists of Brahma the creator; Vishnu the preserver or redeemer; and Siva the destroyer. He is represented with four heads and as many arms,

holding in his four hands a manuscript book containing a portion of the Vedas, a pot for holding water, a rosary, and a sacrificial spoon. The swan is consecrated to him and in the cave temple of Elephanta he is represented as sitting on a lotus, supported by five swans. He is the god of the fates, master of life and death, and, by some, has been represented as the supreme eternal power; but he is himself created and is merely the agent of Brahmā (a neuter noun), the universal power or ground of all existence. He is considered as the author of the Vedas and the lawgiver and teacher of India. The worship of Brahma is regarded as the oldest religious observance in that country. In modern Hindu religion, however, it has been practically superseded by the worship of Vishnu and Siva. The epithets applied to this divinity are very numerous, some of the most usual being Swayambhu, the self-existing; Parameshti, who abides in the most exalted place; Pitamaha, the great father; Prajāpati, the lord of creatures; Lokesa, the ruler of the world. See INDIA; BRAHMANS.

Brahmagupta, Hindu astronomer and mathematician: b. probably toward the close of the 6th century A.D. His 'Brahma-sphuta-siddhanta' (the Improved System of Brahma) is said to be an earlier work recast: portions of it have been translated into English.

Brahman Bull, a bull of the humped cattle, or zebu breed, of India and eastward, regarded with veneration by devout Hindus, and safe from molestation, even when turned loose by temple priests to forage upon the market stalls in city streets. Adorned with trappings and garlands of flowers, these pampered bulls figure largely in religious ceremonies and processions. See also INDIAN HUMPED CATTLE.

Brahmanas, the ancient theological writings appended to the original four Vedas by the Brahmans, or priests, for the purpose of very greatly magnifying their own office as a caste intrusted with the conduct of sacrifices of every kind. There are some 13 of them, with attachments to different parts of the original four Vedas. The Satapatha-Brahmana is the most important and valuable. It is called Satapatha, or "of the hundred paths," because it consists of 100 lectures. It has a very minute and full account of sacrificial ceremonies in Vedic times, and many legends and historical allusions: Nothing could be more wearisome reading; yet the information which can be gleaned in regard to sacrifices, the priestly caste, and many features of the social and mental development of India, is very valuable. A devout belief in the efficacy of invocation and sacrifice appears in the Vedic hymns. This was taken advantage of by the Brahmans to arrange a regular use of these hymns in the two liturgical Vedas, and to establish a proper offering of sacrifices conducted by themselves. The Brahmans are their endlessly repeated explanations and dictions about sacrifice and prayer.

The third, fourth, and fifth books of the great work presented in these five volumes deal very particularly with the Soma-sacrifice, the most sacred of all the Vedic sacrificial rites. It concerns the nature and use of "a spirituous liquor extracted from a certain plant, described as growing on the mountains." "The potent juice of the Soma plant, which endowed the

feeble mortal with godlike powers and for a time freed him from earthly cares and troubles, seemed a veritable God—bestower of health, long life, and even immortality." The moon was regarded as the celestial Soma, and source of the virtue of the plant. Another branch of the story of sacrifices relates to the worship of Agni, the Fire. It fills 5 out of 14 books, and the ideas reflected in it are very important for knowledge of Brahman theosophy and cosmogony. The ritual of the Fire-altar was brought into close connection with that of the Soma "fiery" liquor.

Brahmans, the first of the four castes of the Hindus. They proceeded from the mouth of Brahma, the seat of wisdom. They form the sacred or sacerdotal caste, whose members have maintained perhaps a more absolute and extensive authority than the priests of any other nation. Their great prerogative is that of being the sole depositaries and interpreters of the Vedas, or sacred books. There are seven subdivisions of the Brahmans, which derive their origin from seven penitents, personages of high antiquity and remarkable purity, who are said to have rebuked the gods themselves for their debaucheries. The great body of the Brahmans pay equal veneration to the three parts of the mysterious trinity, but some attach themselves more particularly to one person of the triple godhead. Thus the Vishnuvites are distinguished by an orange-colored dress, and the mark called *nama* on their foreheads. The devotees of Siva wear the *lingam*, and are distinguished from the former by their great abstemiousness. A Brahman should pass through four states. The first begins at about seven, when the duty of the young novice, or *Brahmachari*, consists in learning to read and write, studying the Vedas, and becoming familiar with the privileges of his caste, and all matters of personal purity. Thus he is taught his right to ask alms, to be exempted from taxes, from capital and even corporal punishment. Earthen vessels belonging to Brahmans, when used by profane persons, or for certain purposes, must be broken. Leather and skins of animals, and most animals themselves, are impure, and must not be touched by them. Flesh and eggs they are not allowed to eat. The Brahman is also taught to entertain a horror of the defilement of the soul by sin; and rules for purification by ablution, penances, and various ceremonies, are prescribed. The second state begins at his marriage, when he is called *Grihastha*. Marriage is necessary to his respectability. His daily duties become more numerous, and must be more strictly performed. Regular ablutions, fasting, and many minute observances, become requisite. The Brahmans, however, engage in secular employments, political, commercial, etc. The third state is that of the *Vana-Prasthas*, or inhabitants of the forest, which is now, however, seldom reached. They were honored by kings, and respected even by the gods. Retiring to the forest, green herbs, roots, and fruit were their food; reading the Vedas, bathing morning, noon, and evening, and the practice of the most rigorous penances were prescribed. "Let the *Vana-Prastha*," says *Manu*, in the *Institutes*, "slide backward and forward on the ground, or stand the whole day on tip-toe, or continue rising and sitting down alternately; in the hot season let him sit exposed to five fires; in the rain let

him stand uncovered; in the cold season let him wear wet garments; then, having stored up his holy fires in his mind, let him live without external fire, without a shelter, wholly silent, and feeding on roots and fruit. When he shall have thus become void of fear and sorrow, and shaken off his body, he rises to the divine essence." The fourth state is that of a *Sannyasi*, in which new and severer penances are to be performed. Suppressing the breath, standing on the head, and other such ceremonies are performed, till the devout patient rises to a participation of the divine nature. It was by the Brahmans that the Sanskrit literature was developed; and they were not only the priests, theologians, and philosophers, but also the poets, men of science, lawgivers, administrators, and statesmen of the Aryans of India. The sanctity and inviolability of a Brahman are maintained, in the eyes of his countrymen, by the most severe penalties. The murder of one of the order, robbing him, etc., are inexpiable sins; the killing of his cow can only be expiated by a painful penance. See *Monier-Williams*, 'Brahmanism and Hinduism' (1887); *Barth*, 'Religions of India'; *Hopkins*, 'Religions of India' (1895).

Brahmaputra, *brā'ma-pō'tra*, a large river of Asia, whose sources, not yet explored, are situated near Lake Manasarovara, in Tibet, near those of the Indus. In Tibet, where it is called the *Sanpo*, it flows eastward north of the *Himalayas*, and, after taking a sharp bend and passing through these mountains, it emerges in the northeast of Assam as the *Dihong*; a little farther on it is joined by the *Dibong* and the *Lohit*, when the united stream takes the name of *Brahmaputra*, literally "the son of Brahma." After entering Bengal it joins the *Ganges* at *Goalanda*, and farther on the *Meghna*, and their united waters flow into the Bay of Bengal. The *Brahmaputra* is navigable by steamers for about 800 miles from the sea, its total length being, perhaps, 1,800 miles. Through the last 60 miles of its course it is from 4 to 5 miles wide, and studded with islands. Its waters are thick and dirty; its banks are mostly covered with marshes and jungles, and are subject to annual inundations. During the season of the overflow, from the middle of June to the middle of September, the level districts of Assam are almost wholly submerged, so that travel is impossible, except on causeways 8 or 10 feet high. The volume of water discharged by the river at such times is immense. Even in the dry season it is equal to 1,46,188 cubic feet a second, while in the same time, and under the same circumstances, the *Ganges* discharges only about 80,000.

Brahmo-Somaj, a religious association of India, founded in 1830 by *Rammohun Roy*, a famous Hindu rajah, who sought to purify Brahmanism from impurities and idolatries, and first styled "The Society of God." The *Brahma-Somaj*, while accepting what religious truth the Vedas may contain, rejects the idea of their special infallibility, and founds its faith on principles of reason. The members do not in principle recognize the distinction of caste, and have made great efforts to weaken this as well as other prejudices among their countrymen. The foremost exponent of its views was the *Babu Keshub Chunder Sen*, who with his

followers founded the "Brahmo-Somaj of India" in 1858. See Mozoondar, 'Life and Teachings of Keshub Chunder Sen' (1887).

Brahms, Johannes, German composer: b. Hamburg, 7 May 1833; d. Vienna, 3 April 1897. His father was a double-bass player in the Stadt-Theater of his native town, and from him he received his first instruction in musical technique; but his artistic taste was developed under the guidance of the eminent musician, Eduard Marsden of Altona. At the age of 14 years he made his first public appearance as a pianist at Hamburg, playing a set of variations composed by himself. In 1853 he traveled with the noted Hungarian violinist Remenyi on a concert tour of Germany as piano accompanist: this tour was critical for his whole career. In the program of the concert given at Göttingen was Beethoven's Kreutzer Sonata. The piano was a half tone below the true pitch, but Brahms straightway remedied the defect, playing the part from memory and transposing it from A to B flat—a feat which won the admiration of the celebrated violinist Joachim, who was in the audience; and who after the performance made himself known to the young musician; thus commenced a warm friendship which lasted during Joachim's life. He gave the young man commendatory letters to Liszt, then at Weimar, and to Schumann at Düsseldorf, and advised him to give up the concert tour. Brahms acted instantly on this counsel, visited Schumann and showed him some of his compositions, with the result that Schumann recognized in the young artist supreme musical genius, and in his enthusiastic admiration hailed him in an article entitled "Neue Bahnen," published in his 'Neue Zeitung für Musik' as already a master, the great composer of the future, and in the words of John the Baptist (Matt. xi. 3) as rendered in the Latin vulgate, as "he that is to come." Brahms, he declared, had not attained mastery by a gradual development, but had "burst upon us fully equipped as Minerva sprung from the head of Jupiter." Yet at this time the young maestro had produced but very few works—a string quartet, a scherzo in E flat, and a few songs, among them the dramatic 'Liebestreue.'

His eminent gifts were now generally recognized, and after giving a concert in Leipsic, two music publishers made an engagement with him to publish his compositions; and in 1854 he was appointed music master and choir conductor to the Prince of Lippe-Detmold. From 1858 to 1862 he resided first in Hamburg and then in Zürich, making musical tours and pursuing his musical studies. Going to Vienna in 1862 he was director of the Singakademie there in 1863, but after a few months resigned that office and quitted Vienna, to resume his concert tours throughout Germany. He took up his residence again in the Austrian capital in 1872, and thereafter till his death Vienna was his home, though for some years he made musical tours occasionally; but toward the close of his life he devoted himself almost exclusively to the work of musical composition. In 1877 the English University of Cambridge apprised him of its senate's intention to honor him with the degree of Doctor of Music, but Brahms seems to have ignored the intended courtesy.

By his 'German Requiem,' produced in the Cathedral at Bremen in 1868, at a solemn re-

ligious function commemorative of the German soldiers who died in the war with Austria, he fully justified the prophetic utterance of Schumann and won for himself a place in the hearts of the whole German people. He called it the 'German Requiem' to indicate the difference in tone and spirit between it and the traditional requiem, which echoes the doleful strains of the 'Dies Iræ.' In the 'German Requiem' buoyant hope and assurance of God's infinite mercy is the keynote. It is one of a class of sacred compositions, 12 in number, among them the 'Triumphlied' (song of triumph), commemorating the German victories in the war with France in 1871-2, also some choral songs and motets. His other compositions, numbering about 150 pieces, are his secular choral works, among these Schiller's 'Nänie' and the 'Gesang der Parzen' (song of the Parcae); concerted vocal works, among them the 'Liebeslieder' (lays of love); orchestral works, among them four symphonies; chamber music; piano-forte solos; four books of Hungarian dances arranged for pianoforte duet. He never seems to have even attempted to compose an opera, and confessed a distaste for that combination of music and drama. He seldom visited the theatre, and on the rare occasions on which he attended operatic performances he nearly always retired before the completion of the last act.

Brahms is ranked with the classic masters of music, as the peer of Beethoven and Mendelssohn, and inheritor of the traditions of the great school of the German composers. Temperamentally and in his mental habit he is essentially modern, original, and spontaneous; he possesses the warmth of imagination and the quick emotionalism which are assumed to be characteristic of the romantic school, and to these he gives free play. But his creations are cast in the classic molds; or rather they appear to come to the birth naturally in classic forms; hence there is no shadow of incongruity between the matter and the form. See Deiters, translated by Newmarch, 'Brahms: a Biographical Sketch' (1888); Dietrich and Widmann, translated by Hecllet, 'Recollections of Johannes Brahms' (1899).

Braid, James, Scotch physician: b. Fife, 1795; d. 25 March 1860. He studied medicine in Edinburgh and settled as a surgeon in Manchester. He is noted for his researches on animal magnetism, which he first called neuro-hypnotism, and afterward termed hypnotism.

Braid'wood, Thomas, Scotch educator: b. 1715; d. 24 Sept. 1798. He studied at the University of Edinburgh, settled as a schoolmaster in that city, and after 1760 became famous as a teacher of deaf-mutes. In 1783 his school was transferred to Hackney, London.

Braille, Louis, loo-ê brâl, or brâ-ê, French educator of the blind: b. Coupvray, 1806; d. 1852. He invented a system of writing with points, used extensively in institutions for the blind. Himself blind almost from birth, at the age of 10 years he was admitted to the Institute for the Blind in Paris, where he soon became proficient in both science and music. In instrumental music he attained a very high rank, becoming one of the most distinguished organists of Paris, and excelling also as a violoncellist. At the age of 20 he had formed the idea of modifying M. Charles Barbier's system of

BRAIN

writing with points so as to render it practicable and convenient, and not long afterward it was introduced into the royal institute, although no account of it was published till 10 years later. It was subsequently adopted in most of the continental schools, and a little later in the United States, where it continues, with some modifications, in successful use. The signs of the original system are 43 in number, embracing the entire alphabet, all the diphthongs, and marks of punctuation. Ten fundamental signs form the basis of all the rest. These signs, representing the first 10 letters of the alphabet and the 10 Arabic numerals, are as follows:

A	B	C	D	E	F	G	H	I	J
·	:	·	:	·	:	:	:	·	:
1	2	3	4	5	6	7	8	9	0

By placing one point under the left side of each fundamental sign, the second series is formed, comprising the next 10 letters. By placing two points under each fundamental sign, the third series, comprising U, V, X, Y, Z, Ç (C soft), É, Á, È, Û, is formed. By placing one point under the right side of the fundamental signs, the fourth series, embracing Â, Ê, Î, Ô, U, Ê, Ì, Û, Æ, W, is formed. Three supplementary signs represent Ì, Æ, and Ò. The marks of punctuation are the fundamental signs placed two lines below. The system has been applied to musical notation in such a manner as to make the reading and writing of music much easier for the blind than for those who see. The seven notes are represented by the last seven of the fundamental signs, and each of these notes may be written in seven different octaves by merely prefixing a sign peculiar to each octave, and thus the necessity of designating the key of each musical sentence in the ordinary way is avoided. The mode of writing is very simple. The apparatus consists of a board with a surface grooved horizontally and vertically by lines one eighth of an inch apart. Over this board a frame is fitted like that of the common map delineator, and one or more sheets of paper being placed over the board, the points are made with a bodkin, through a slip of perforated tin, ::, which contains all the changes used in the system. As the sheet must be reversed to be read, the writing should be from right to left, that it may be read from left to right. Of course, several copies may be made by one operation. For many years books have been printed in points in various countries. See **BLIND**.

Brain, that portion of the nervous system contained, for the most part, within the skull. It is usually divided into two parts. The larger mass is termed the cerebrum, the smaller, the cerebellum; from the lower end of the cerebrum the medulla oblongata tapers down into the spinal cord. The brain is, as π were, the great central station of the nervous system. From the surface of the entire body nerve fibres pass into the spinal cord, up the cord and into the brain; these carry impressions of all kinds—touch, taste, sight, hearing, pain, temperature, etc.—from the surface to the brain. Starting in the brain mass itself there is a corresponding series of fibres that run down into the medulla and spinal cord, out into the nerves and end in some muscle or organ of special character. There are literally thousands of incoming fibres, thousands of outgoing fibres and millions of minute cells in direct association with these fibres. Thus it may be seen that the brain is merely a collection of nerve ganglion cells and their associated fibres, both of which have a characteristic appearance as seen by the naked eye; that portion of the brain that preponderates in cells is the “gray matter,” and that portion richer in fibres is the “white matter.”

Cerebrum.—The larger brain mass, the cerebrum, consists of two symmetrical halves, the hemispheres, separated above by the great longitudinal fissure and held together at the bottom of the fissure by a firm band of fibres, the callosum, and at the base by the cerebral peduncles, which unite below to form part of the pons, and the medulla. All of the fibres passing to and fro go up and down in the peduncles, separating into each hemisphere. The surface of the hemispheres is divided by fissures into several larger areas and a number of smaller ones. Thus in the lower side there is a large fissure, the fissure of Sylvius, below it there are three lobes, the first, second, and third temporal lobes. Running from the great longitudinal fissure, making an angle of about 65° with the Sylvian fissure, the second most marked fissure, that of Rolando, is found. This divides off an anterior region in which the first, second, and third frontal convolutions are to be found. Immediately around the fissure of Rolando are grouped the anterior and posterior parietal lobes, and at the back end of the hemispheres the occipital lobes are situated. All of these lobes are divided into smaller areas by the fissures, the chief end subserved by these fissures being to

BRAIN

increase the amount of outside surface of the hemispheres and thus make room for the enormous number of cells that are located in this outermost gray layer, the cortex. A further function seems to be expressed by this division into lobes and convolutions, namely, a localization of function, a concentration of energy as it were, certain types of brain activity being regulated in certain brain areas. Thus it is assumed that the main function of the frontal lobes is largely that of the reasoning faculties and higher intellectual processes. It is very well established that the cells in the cortex that are grouped up and down both sides of the fissure of Rolando are the cells that govern the motor acts of the body; irritate these, and muscular convulsions in certain groups will occur; destroy them by accident or disease, and paralysis, or loss of muscular function, will result. The localization for certain muscle groups, such as those for the head, arm, eyes, leg, etc., are very well known. In the occipital lobes, particularly in certain areas about the angular gyrus, are the centres for sight memories. Their destruction may result in mind blindness (see *APHASIA*). In much the same manner the memories of sound are located in the temporal convolutions, and there are a large number of areas thus localized. These different areas are all brought into connection, the one with the other, by hosts of fibres, and as already indicated the two hemispheres of the cerebrum are connected by thousands of fibres that are in the callosum. Thus in the adult normal cerebrum all parts of the cortex are brought into close connection with one another and with the other half of the cerebrum; the connections with the cerebellum and with the cord are established as well. The richness of association is an index of the education and intelligence of the individual. These cortical connections are not a helter-skelter, hit-or-miss system; they are all carefully laid down, constituting the human brain one of the most remarkable "switchboards" ever made. Modern anatomy is busy unraveling all the fibres and bundles of fibre tracts, and it will not be many years before the map of the brain will be as well known as that of New York. When that time arrives many unknown problems of nervous and mental disease will be solved and the hideous secrets of the insanities will be laid bare.

In addition to the cortical ganglionic masses of cells, there are a number of similar masses of cells located within the substance of the brain mass. These are subsidiary stations, as it were, for many of the fibre tracts going to and coming from the cortex. These are the caudate and lenticular nuclei, the optic-thalamus, and a number of smaller ones.

Cerebellum.—The cerebellum, or little brain, is situated behind and almost beneath the cerebrum, which partly overlaps it. It is attached to the brain stem by peduncles and its connections with the cerebral centres and those of the cord are many and complex. In minute structure the cerebellum has a number of characteristic features by which it may be recognized under the microscope, but fundamentally the nerve cells are similar, the interstitial connective tissue is the same in kind as in the cerebrum and the blood vessels, veins, and lymphatics have similar properties.

Membranes.—Surrounding the entire brain mass and extending down over the spinal cord there are three coverings. These are an outside strong and thick dura mater, and two inside delicate membranes, the arachnoid and pia mater.

Cavities.—The brain is not a solid organ. It is really a flattened-out expansion of nervous tissue peculiarly grouped about a central cavity. This central cavity at one time was as simple almost as the space occupied by the graphite in a lead pencil, but in the adult brain there are lateral ventricles, third and fourth ventricles, all of which are too complicated to be described here. The ventricles contain a fluid, the cerebrospinal fluid, which also bathes the outside of the brain. The cavities of the brain are continuous with the central cavity of the spinal cord.

This modern conception of the brain as a complicated automatic switchboard may be elaborated to any amount of detail. If one should trace, however, the path of a single impulse from the outside world, be it one of sight, smell, taste, touch, pain, etc., one would trace it, say for pain—first from the point of contact, for instance, of the finger, whence the special nerves of sense would carry it to the spinal cord; here it travels up a definite tract in the cord (for the upward paths of the passages of sensations and the downward ones of messages to act are as definitely known as are the railroads from New York to Chicago); from the cord it passes into the medulla, still in a well-defined path, where only it and its kind travel (about here the fibre tract crosses to the opposite side of the medulla); then through the pons, through the cerebral peduncles, up to the secondary centres, to the cerebellum and the sensory area in the cortex, which is supposed to be situated just behind the motor area. As soon as the sensory impulse reaches the cortex it is felt as pain and referred to the spot in the skin in contact with the irritant. Immediately in the perception of pain, so intimate are the connections of the sensory areas with the motor areas from these motor cells a conscious impulse is flashed down another series of fibres, down the peduncles to the medulla (where the fibres also mostly cross to the opposite side), down the spinal cord, out on a motor nerve to the muscle to cause a muscular act of pulling the hand away from the harmful irritant. This is the long, conscious series. There may also have been a shorter reflex cycle whereby the impulse passed to the spinal cord and an immediate motor connection was made that caused a quick jerking away of the hand, even before the perception of the sensation had taken place. This is the reflex cycle. See *REFLEX ACT*.

The study of the comparative anatomy and physiology of the nervous system is one of the most enchanting departments of human knowledge. To trace the gradual development of this intricate and marvelously adjusted regulator of the entire body, from its simplest terms of "protoplasm irritability" through the isolated ganglionic masses in such animals as the starfish, the gradual chaining of one mass to another as in the worms and insects, thus bringing a certain relation of one part to another, up to the fusion of different ganglionic masses to form a chief mass, the brain, and secondary masses, the spinal cord—this is a story of so many chapters and volumes that it cannot even be sketched here; but it is

HUMAN BRAIN.

Fig. 1.

Fig. 3

Fig. 2

Fig. 4.

very certain that the gradual evolution of the nervous system shows the extreme complexity of man's activities. Although throughout the entire series, nerve cells are alike, it is only in the great multiplicity of co-ordinations and connections that man's brain differs from the nervous system of a jellyfish or a worm. It is only in the animal series beginning with *Amphioxus* that a distinct brain mass commences to be seen. But from this point forward the modification in form, size, and complexity is gradual. While man has the most complex brain, he has not the heaviest brain, although in comparison with his size it is the heaviest. The brain of man is usually heavier than that of woman, although at birth and at the age of 14 the female brain is heavier. Taller and heavier persons have usually heavier brains. Weight of brain, however, has no direct relationship with intelligence, as idiots' brains are known that have weighed as much as those of many of the ablest of men. Intellectual capacity, as already said, consists in the great multiplicity of nerve cell connections. In which connection it might also be added that the shape and size of the outside skull bears no constant relation to the shape and size of the inside brain. Cuvier's brain weighed 84 ounces, Gambetta's only 39 ounces. While it is true that a number of celebrated men of recognized brain power have had large brains, there are many more of equal capacity whose brain weights have not been remarkable. Also see MOTOR AREA; MOTOR CO-ORDINATION; NERVOUS SYSTEM; SPEECH CENTRES; TASTE AREAS.

SMITH ELY JELLIFFE,
Journal of Nervous and Mental Diseases.

Brain, Diseases of. These are so many and so diverse that a general article cannot readily be written upon them. In general they may be divided into: (1) Developmental defects. These are considered under idiocy, imbecility (qq.v.), etc. (2) Acute infections in which the brain itself or its surrounding membranes are attacked by some form of bacterium, such as the influenza bacillus, the pneumococcus, that ordinarily is the main cause of pneumonia, the typhoid organism, or certain forms of cocci. These diseases are discussed under the heads, encephalitis, meningitis, cerebral abscess, epidemic cerebro-spinal meningitis (qq.v.). (3) Acute and chronic poisoning, including delirium tremens in alcoholism (q.v.), toxic manias (q.v.), etc. (4) Diseases of the blood vessels of the brain. Here is to be classed the general disease apoplexy. This is really three different diseases due to cerebral hemorrhage, cerebral thrombosis, or cerebral embolism. These are discussed here. In all, the symptoms are much alike, as similar areas in the brain may be affected by each. In hemorrhage there is a bursting of one of the cerebral blood vessels, with pouring out of blood into adjacent brain tissue and destruction. A certain blocking of the artery also results. In thrombosis, the walls are diseased and a soft mass collects on the inside of the blood vessel in the brain and blocks it up. This shuts off the circulation in a certain area supplied by the artery and there is degeneration in that area with softening perhaps and cyst formation. In embolism some foreign

body from some other part of the arterial system is swept into a blood vessel of the brain and blocks it up. In all three forms of apoplexy the attack may be very slight, if the cause is slight, a temporary loss of consciousness, or a paralysis in one limb, or a hemiplegia that is transitory—these may be all that is noted. But the usual attack of apoplexy is much more severe. The patient is rendered unconscious, the face is purple or congested, there may be voiding of urine and feces, the breathing is slow and snoring in character, the pulse is usually slowed to 50, and often soft and full; nausea and vomiting and lowered temperature may also occur. The pupils may be dilated and the eyes may appear crossed. There is usually noted a difference in the two sides of the face, one side of the body is different from the other, and on lifting the limbs there is a change in their resistance. The patient may remain in this condition and die very soon, or he may have a rising temperature for a week and then die, or he may recover consciousness to find that one entire side of his body is paralyzed, or incapable of being moved by the will. If the right side is involved the patient usually has defects in his speech (aphasia, q.v.). After a few days, this paralysis may pass away, but it usually persists for life in some form or other. Almost invariably the paralyzed limbs improve greatly; at first the leg and later the arm, and the improvement may be very great so that only a slight trace of what was a disabling affliction remains. The shades and variations in symptoms and in the outcome are numberless. The treatment of an attack of apoplexy requires prompt attention. Heat to the extremities, mustard bath to the feet, absolute quiet, removal of constricting bands about the neck, placing the patient on the non-paralyzed side, in many cases blood-letting; these are the generally recognized things to do. The outlook is always serious. Hemorrhage is apt to occur in those over 50, thrombosis in those affected with syphilis, and may occur at any age, embolism usually accompanies some infectious disease, such as pneumonia, rheumatism, scarlet fever, childbirth fever, etc.; and may affect old or young (see DIPLEGIA; HEMIPLEGIA; MONOPLEGIA). (5) Accident or injury to the brain. These may occasion various forms of hemiplegia: diplegia, particularly in the injuries of childbirth; epilepsy, etc. (6) Tumors of the brain (see TUMOR). (7) Organic disease of the brain functions. Here the various insanities may be classed. Softening of the brain is a term denoting either a dementia (q.v.) of old age, or the insanity known as general paresis (q.v.). The insanities in their various forms and phases are treated in their appropriate relations under one inclusive head. See INSANITY.

Brain Fever. See BRAIN, DISEASES OF.

Brainard, David Legge, American soldier and explorer: b Norway, N. Y., 1856. Entering the United States army in 1876 he served in Indian campaigns and subsequently accompanied the Greely Arctic expedition 1881-2. He was sergeant in the signal service, served in the Alaskan relief expedition in 1897 and went to the Philippines in 1900 as a major in the subsistence department of the regular army.

BRAINARD — BRAINTREE RESOLUTIONS

Brainard, John Gardiner Calkins, American poet and journalist: b. New London, Conn., 21 Oct. 1796; d. 26 Sept. 1828. After graduation at Yale in 1815 he studied law and practised at Middletown, Conn. In 1822 he went to Hartford and edited the *Connecticut Mirror*, in which many of his early poems appeared. In 1827 he was forced by failing health to resign his editorship. For a time he resided on Long Island, whence he returned to New London to end his days. He issued a volume of poems in 1825, a second and fuller edition of which, under the title of 'Literary Remains,' was published in 1832, with a biographical sketch by John Greenleaf Whittier.

Braine, Daniel Lawrence, American naval officer: b. New York, 18 May 1829; d. 30 Jan. 1898. He entered the United States navy in 1846 and became a rear admiral. He served with distinction through the Mexican and Civil wars. In 1873 he obtained the surrender by Spain of 102 survivors of the *Virginus* prisoners.

Braine-le-Comte, brân-lè-könt, Belgium, a small and ancient town of the province of Hainaut, about 20 miles southwest of Brussels. It contains a handsome church, founded in the 13th century, and a large well-built château. The Southern Railway branches off from this town, on the west side to Mons and Quiévrain, east to Namur and Charleroi. Among its manufacturing are breweries, wire-works, dyeworks, oil-, cotton-, and corn-mills. At one time it manufactured and dealt extensively in tin wares, but this branch of trade is almost if not entirely extinct. Pop. (1899) 8,891.

Brainerd, David, a missionary to the Indians: b. Haddam, Conn., 20 April 1718; d. Northampton, Mass., 9 Oct. 1747. Early impressible by religious influences, he felt himself suddenly converted while taking a walk, 12 July 1739, and the same year entered Yale College to prepare himself for the ministry. Instead of graduating in the regular course he was expelled from the institution in 1742 for having said, in his zeal, of one of the tutors, that he had no more of the grace of God than a chair. He was, however, licensed in July as a preacher, and received an appointment from the society for the propagation of Christian knowledge, as missionary among the Indians near Stockbridge, Mass. He was ordained in 1744, and took up his work among the Indians at the forks of the Delaware in Pennsylvania, making two visits to the Indians of the Susquehanna. He met, however, with but little success, until, after a year, he went to reside among those at Crossweeksung, near Newark, N. J. Here he is said to have produced a great change among the savages, and to have baptized 78, of whom 38 were adults. Having worn out his health by his labors, he set out on a journey to Boston in the spring of 1747, and thence to Northampton, where he died after a short stay in the family of President Edwards, by whom his biography was soon afterward written. His published works are: 'Wonders of God Among the Indians,' and 'Grace Displayed.'

Brainerd, Minn., a city and county-seat of Crow Wing County, 115 miles west of Duluth, situated on the east bank of the Mississippi River and on the Brainerd & N. R.R. It lies in a fertile farming region and trades in grain

and other agricultural produce. Lumber and furs are also exported. Here are situated the extensive shops of the Northern P. R.R. There are foundries, flour-mills, a large saw-mill, etc. There is a United States signal service station, a hospital for employees of the Northern P. R.R., and another for lumbermen, a public park, waterworks, electric street railway, electric lighting plant, etc. The city is governed by a mayor, elected biennially, and a city council. Pop. (1900) 7,524.

Brain'stone Coral, a madreporé of the genus *Mcandrina*, so named from the general resemblance to the brain of man exhibited in its large rounded mass and numerous winding depressions. When the hemispherical mass is broken, the ridges which bound its furrows (each of which represents the place of a polyp) may be traced inward through its substance.

Braintree, Mass., a town in Norfolk County, on the New York, N. H. & H. R.R., 10 miles south of Boston. It contains the villages of South and East Braintree; is connected by electric street railroads with the principal neighboring towns and villages, and its industries include granite-quarrying, and the manufacture of rails, tacks, shoes, wool, rubber goods, fans, etc. John Adams, John Quincy Adams, and John Hancock were born in a part of Braintree now within the limits of Quincy. The town was settled about 1629 and was incorporated in 1640. Pop. (1900) 5,981.

Braintree Resolutions, The. There were instructions given by the town of Braintree, Mass., on 24 Sept. 1765, to its representative in the Massachusetts General Court, Ebenezer Thayer, relative to his action in the matter of the Stamp Act. They were drawn by John Adams, one of a committee appointed by the Braintree town meeting for that purpose, accepted unanimously, and published in the *Boston Gazette*. Some 40 Massachusetts towns subsequently adopted them verbatim as their instructions to their own representatives; and John Adams says that Samuel Adams copied several paragraphs into his own draft for the Boston town-meeting. The resolutions declared the tax, even if legal, an unbearable burden and a vexatious interference with the business of a poor and sparsely settled province; that moreover, it was contrary to British common law, and the "foundation principles of the British constitution, that we should be subject to any tax imposed by the British Parliament, because we are not represented in that assembly in any sense, unless it be by a fiction of law"; that to put the cases in the decision of one judge without a jury was "an alarming extension of the power of courts of admiralty," and repugnant to the Great Charter itself, especially as the judges held office only during the pleasure of the Crown, and moreover had a commission on the goods condemned. They enjoin the Braintree representative to "comply with no measures or proposals" for executing the law, but "by all lawful means" obstruct it; to favor entering on the public records "the most clear and explicit assertion of our rights and liberties"; and—most significant of all—"to agree to no steps for the protection of the stamped paper or the stamp officers, because any addition to the laws for preserving the peace would only exasperate the people and endanger public tranquillity."

Braith, Anton, ä'n'tōn brīt, German painter: b. Biberach, Württemberg, 1836. He was educated at the Stuttgart Art School and the Munich Academy, and soon obtained distinction by his skill in landscape and animal painting. Among his best works are 'A Yoke of Oxen'; 'A Grazing Herd'; 'Going to Drink'; 'Herd Overtaken by a Storm'; 'After the Storm.'

Brake, Bracken, common names for a fern (*Pteris aquilina*) of the family *Polypodiaceæ*, widely distributed in Europe, Asia, and North America, where it often dominates the vegetation of heaths, neglected meadows, etc. It does not fall when the top is killed by frost, and affords excellent cover for small game. From its long, creeping rootstocks, naked stalks, 6 to 20 inches in length, are sent up. Each stalk produces three branches with numerous fern-like pinnate leaves, along the covered edges of which are borne the sori, or spore-producing organs. The rootstock, which is bitter, has been used as a substitute for hops in beer-making, and is still somewhat employed in dressing chamois and kid leather. The tops are often used for bedding animals, and are sometimes mixed with hay as fodder. Although land covered with brake is considered inferior, many such soils, when cultivated, are found to be good. By frequent mowing, or by plowing, the land is readily freed from brake. Several other species of *Pteris* have been called brake and bracken, and some are cultivated as ornamental plants in greenhouses and window-gardens. The rootstocks of a New Zealand species (*P. esculenta*) are often used for food, and are better suited for such use than those of the first-named species, which have served such a purpose only when ordinary food-supply has been scarce.

Brake, a mechanical device for retarding or arresting by means of friction the motion of a wheel or shaft. A wood or metal block, so arranged as to be pressed by levers against the rim of a wheel, constitutes a shoe-brake, the kind used in checking ordinary vehicles, such as wagons. A band passing around a wheel, and which, by tightening, retards its motion, forms a band-brake. The air-brake is the form of mechanism generally used on railroads. See AIR-BRAKE.

Brakelonde, Jocelin de, English chronicler: b. Bury St. Edmunds, in the 12th century. In 1173 he entered the convent of St. Edmunds and began his chronicle which extends over a period of nearly 30 years. The character of the abbot, Samson, described in these annals, influenced Carlyle in the writing of 'Past and Present.'

Bramah, brä'mä, Joseph, inventor of the Bramah lock, the Bramah press, etc.: b. Stainborough, Yorkshire, England, 1749; d. 1814. He was first apprenticed to a carpenter and joiner, but finally established himself in business in London as manufacturer of various small articles in metal-work. His subsequent life was distinguished by a long series of inventions, many of which have been found of great utility. Beside those already mentioned, he invented the apparatus used in public houses to bring liquors from the cellar to the bar, and ingenious printing machines. He also made improvements in fire-engines, steam-engines, the manufacture of paper, etc.

Bramante, brä-män'të, Donato d'Agnolo, Italian architect: b. Monte Asdroaldo, near Urbino, about 1444; d. 11 March 1514. He applied himself first to painting, but his passion for architecture soon gained the ascendancy, and he shares with Brunelleschi the credit of restoring this art. While yet a young man he went to Milan, where his time was mainly spent at the cathedral. Pope Alexander VI. named him as his architect, and Julius II. made him superintendent of his buildings. At the command of the latter he united the Belvidere with the palace of the Vatican. He persuaded the Pope to order the Church of St. Peter to be torn down, and another to be erected in its place, which should be without an equal in the world. In 1513 the foundation of the present St. Peter's was laid, according to the plan of Bramante. It yet remains the greatest achievement of modern architecture. Bramante did not live to see this work completed. He had begun the edifice with incredible dispatch, but his successors, Raphael, Julius of San Gallo, Peruzzi, and Michael Angelo, altered the original plan, and left nothing of Bramante's workmanship standing except the arches which support the tower of the dome. His writings, in prose and verse, first discovered in 1756, were printed in the same year at Milan.

Bramathërium, a genus of antilopidæ, consisting of a gigantic species with four horns. It is allied to sivatherium, which also is four-horned. Both occur in the Upper Miocene, or Lower Pliocene beds of the Sewälk Hills in India.

Brambach, Kaspar Joseph, kas'par yō'zëf bräm'bah, German composer: b. Bonn, 14 July 1833. He was a pupil at the Conservatory in Cologne (1851-4), and at Frankfort-on-the-Main he studied under Ferdinand Hiller. In 1859 he became a teacher at the Cologne Conservatory, and in 1861 went to Bonn as state musical director. Giving up that position in 1869, he devoted himself to the work of composing and private teaching. His best works are his cantatas, including 'The Eleusinian Festival'; 'A Hymn to Spring'; 'The Power of Song'; 'Alcestis'; 'Prometheus'; 'Colombus'; and 'Lorelei.' He has also written an opera, 'Ariadne,' and several minor pieces.

Brambanan, bräm-bä'nän, a district of the province of Surakarta, Java, rich in remains of Hindu temples, of which there are six groups, with two apparently monastic buildings. The edifices are composed entirely of hewn stone, and no mortar was used in their construction. The largest is a cruciform temple, surrounded by five concentric squares, formed by rows of detached cells or shrines, embracing an area 500 feet square. In several of these *dagobas* the cross-legged figures of Buddha remain, but the larger figures which must have occupied the central temples have disappeared from all but one.

Bramble, a common, but, in America, little used name for various species of the genus *Rubus*, including blackberry, raspberry, and dewberry. In Europe it is more restricted to *R. fruticosus*, which, from its abundance and its weedy character, has not received the attention of horticulturists.

Brambling, or Mountain Finch, a large migratory finch (*Fringilla montifringilla*), found throughout Europe and in Asia, where it breeds

in the northern parts. It is a brightly colored bird, and nearly related to the chaffinch (q.v.).

Bramhall, brām'hól, **John**, Anglican prelate in Ireland: b. Pontefract, Yorkshire, England, 1594; d. 25 June 1663. He was educated at Cambridge, and was on the road to high preferment when he went to Ireland as Wentworth's chaplain in 1633. He soon became archdeacon of Meath, and was consecrated bishop of Derry in 1634. When the civil war broke out, for safety he crossed to England, but the Royalist disasters soon drove him to the Continent. At Paris he disputed with Hobbes on necessity and the freedom of the will. At the Restoration he was given the metropolitan see of Armagh. Bramhall closely imitated Laud in policy, and even resembled him in person, but was far his inferior in intellect. Not strong, but merely obstinate in purpose, the so-called Athanasius of Ireland by his impolitic intolerance sealed the doom of Episcopalian supremacy in Ulster.

Bramley, Frank, English artist: b. near Boston, Lincolnshire, 6 May 1857. He was educated at Lincoln and studied art at Antwerp. Among his works are 'Domino' (1886); 'Old Memories' (1892); 'For of Such is the Kingdom of Heaven' (1891); 'A Mute, Inglorious Milton' (1898); and several notable portraits.

Bran, the husks of ground corn, wheat, rye, or other cereals, separated from the flour. The nutritive value of these husks increases as we proceed from the outside of the grain toward the interior. The outer skin, or coarse bran, is very indigestible, owing to the presence of a layer of silica. The inner skins, called pollards, are more nutritious, containing from 12 to 15 per cent of nitrogenous matter, and from 20 to 30 per cent of starch. Unless ground very finely, however, they are apt to occasion irritation of the bowels and diarrhoea. Though rich in nitrogen, bran appears to possess but little nutritive power. It may be of use to the well fed, who need a laxative, but to the poor who need nourishment it is of very little use. It is, however, of some commercial value, being largely employed in the feeding of horses and cattle, and in brightening goods during the processes of dyeing and calico printing.

Branca, Ascanio, Italian statesman: b. 1840. He studied law at Naples and did journalistic work, and in 1870 was elected to the Italian Chamber of Deputies. He was later made secretary of the ministry of commerce but withdrew from this position in 1885, disapproving of the policy of the ministry. In 1891-2 he was minister of public works in Rudini's cabinet; in 1896-8 minister of finance, and in 1900-2 again minister of public works. He has written 'International Banking and Credit' (1871).

Branch, John, American statesman: b. Halifax County, N. C., 4 Nov. 1782; d. Enfield, N. C., 4 Jan. 1863. He graduated at the University of North Carolina (1801), studied law, became a judge of the superior court, State senator (1811-17). He was governor of his State (1817-20), and a member of the United States Senate (1823-9). He was appointed secretary of the navy by President Jackson, and held this office till the breaking up of the Cabinet in 1831. In 1835 he was a member of the convention to

revise the State constitution, and in 1843 was appointed governor of the Territory of Florida, serving until the election of a governor under the State constitution, when he retired to private life. See Lanman: 'Biographical Annals of the Civil Government of the United States.'

Branch, Mary Lydia Bolles, American writer of stories for young people: b. New London, Conn., 13 June 1840. She was married to John L. Branch in 1870. Her published works include 'The Kanter Girls' (1893); 'The Old Hempstead House' (1896).

Branch, that portion of a plant produced from a lateral leaf bud on the primary axis or stem. It is looked upon as part of the stem, and not as a distinct organ. A branch generally produces secondary branches, and these give rise to minor ramifications, called branchlets or twigs. The different modes in which branches spring from the stem give rise to the various forms of trees; such as pyramidal, spreading, and weeping. Thus, in the cypress, the branches are erect, forming acute angles with the upper part of the stem; in the oak and cedar, they are spreading, each forming nearly a right angle; in the weeping ash and elm, the angles are oblique; while in the weeping willow and birch, the branches are pendulous, from their flexibility. The comparative length of the upper and under branches also gives rise to great differences in the contour of trees, as seen in the conical form of the spruce, and in the umbrella-like shape of the Italian pine.

Branchial Cysts and Fistulas. In early fetal life the human being possesses a series of four gills or branchi, and five clefts on each side of the head and neck, which in the course of development give rise to the upper and lower jaw and other structures. Should a cleft fail to completely fill in as the body grows it leaves a cavity or branchial cyst, which may at any time become inflamed or develop an abscess. If the opening on the neck persists it is a branchial fistula.

Branchiata, a name applied to all those marine arthropod animals which breathe by gills. The groups include the trilobites, merostomes, and crustacea, but excludes the arachnida. On this account the branchiata is believed by the best authorities to be an artificial group, and the term has therefore been abandoned.

Branchidæ, the name of an hereditary family, the descendants of Branchus; also of a place founded by them. Their original seat was a little south of Miletus in Ionia, where was the famous temple of Apollo Didymæus. After the destruction of the temple, probably toward the close of the 5th century B.C., an attempt was made to rebuild it, but on so colossal a scale that the project was never completed. Its ruins are of great interest to archaeologists. Some of the statues, formerly erected along the road leading to the temple, have been removed to the British museum.

Branchiopoda, a division of crustacea of the division *Entomostraca*. They are for the most part microscopic, and are chiefly distinguished by having the gills attached to the legs, which are generally numerous. The body is sometimes naked, but more frequently is enveloped by a buckler, which in some covers only the head and thorax, and in others the whole

body. Some have two or even three eyes, but a greater number have one only. They are all free and continually in motion. Among the *Branchiopoda* are the water-fleas and brine-shrimps, and some also rank the trilobites among them.

Branchiosaurus, an extinct genus of *Amphibia* (q.v.), whose remains have been found very abundantly and very perfectly preserved in the Permian shales of Saxony. It is of especial interest among fossil amphibians because it has been possible to study every stage of its development from embryo to adult. The animal was but a few inches long, proportioned like a salamander, with four limbs and five toes on each foot. Like the modern tadpole, the larva breathed by external gills which were replaced by lungs in the adult.

Branco, Rio, a river of north Brazil, the chief tributary of the Rio Negro. It is 400 miles in length, but 250 miles from its confluence with the Rio Negro navigation is blocked by falls.

Brand, Sir Jan Hendrik, Boer statesman: b. Cape Town, 6 Dec. 1823; d. 15 July 1888. He studied law in Leyden and in 1849 began to practice in the supreme court at Cape Town. In 1853 he became professor of law in the South African College. He early became prominent in public affairs, his sympathies being strongly pro-British. His influence prevented any participation of the Orange Free State in the movement to check British policy in South Africa. In 1863 he was elected president of the Orange Free State and was re-elected every five years until his death. Queen Victoria knighted him in recognition of his aid. Brandford was named in his honor, and Ladybrand was named in honor of his wife.

Brande, William Thomas, English chemist: b. London, 11 Feb. 1788; d. Tunbridge Wells, England, 11 Feb. 1866. He was educated at Westminster School, studied medicine and became an assistant to Sir Humphry Davy, succeeding him in 1813 in the chair of chemistry at the Royal Institution. In 1828 he became a superintendent in the mint. He wrote several standard books on chemistry. His chief works are: 'A Manual of Chemistry,' 'Outlines of Geology,' and an 'Encyclopædia of Literature, Science, and Art' (1842).

Brandeis, Frederick, American organist: b. Vienna, Austria, 1835; d. New York, 1899. At Vienna he studied under Fischof and Czerny. In 1851 he settled in New York, and between 1865-98 filled positions as organist at the Catholic churches of St. John the Evangelist and St. James, and the 44th Street Synagogue, and the Church of Saint Peter and St. Paul in Brooklyn. He composed numerous instrumental and vocal pieces, but is best remembered for his song, "My Love is Like the Red, Red Rose."

Brandenburg, a province of Prussia, surrounded mainly by Mecklenburg and the provinces of Pomerania, Posen, Silesia, and Prussian Saxony. The soil consists in many parts of barren sands, heaths, and moors; yet the province produces much grain, as well as fruits, hemp, flax, tobacco, etc., and supports many sheep. The forests are extensive. The principal streams are the Elbe, the Oder, the Havel, and the Spree. Brandenburg carries on an active trade in manufactured articles, and includes, besides some

other districts, the greater part of the former Mark of Brandenburg, which formed the cradle of the Prussian monarchy, and the centre round which the present extensive kingdom has grown up. It is divided into the three administrative divisions of Berlin, Potsdam, and Frankfort, and has a total area of 15,381 square miles. The most of the inhabitants are Lutherans; the rest are chiefly Roman Catholics and Jews. From 1685 to 1688 many French refugees, Walloons, and inhabitants of Lorraine and of the Palatinate, settled in the Mark. At present Brandenburg is the most important of the Prussian provinces, including as it does the capital (Berlin), and the governments of Potsdam and Frankfort. The first people who are known to have inhabited Brandenburg were the Suevi. They were succeeded by the Slavonians, a barbarous people, whom Henry I. conquered and converted to Christianity in the early part of the 10th century. The government was first conferred on a Saxon count, and did not become hereditary till the time of Albert, whose son succeeded to the dignity of elector in 1180. This race becoming extinct, Charles IV. assigned the electorate to his son Sigismund, who became emperor in 1415, and sold the region to Frederick, burgrave of Nuremberg, the ancestor of the present reigning family. Frederick William the Great made various accessions to the territories of his ancestors, and obliged the king of Poland, in 1656, to declare Prussia an independent state. The Old Mark was ceded to Napoleon in 1807, and formed part of the kingdom of Westphalia; but it was restored to Prussia in 1814. The elector of Brandenburg held the seventh rank among the electors of the empire, and had five votes in the Council of Princes. Pop. (1900) 3,107,951. See PRUSSIA.

Brandenburg, a Prussian city, on the Havel, 35 miles west of Berlin, formerly the residence of the reigning family of Prussia. The Havel here expands into a lake, and divides Brandenburg into the Old Town, the New Town, and the Cathedral Island, the last containing a castle and the cathedral. The latter is a late Romanesque building (1170-1318), restored in the 19th century. The industries embrace woolen yarn, silk goods, baskets, leather, etc., and the building of boats is also carried on. Pop. (1900) 49,263.

Brandenburg, Confession of, a confession of faith issued in 1614 by the elector of Brandenburg. It was an attempt to reconcile the religious controversies growing out of the differences in Lutheran and Calvinistic doctrine.

Brandenburg, New. See NEU BRANDENBURG.

Brandes, Georg Morris Cohen, Danish literary critic of Jewish family: b. Copenhagen, 4 Feb. 1842. He graduated at the University of Copenhagen in 1864, and taught there, 1872-7. Several books on æsthetic and philosophic subjects brought on him a charge of skepticism which was not removed by an epoch-making series of lectures, delivered before large audiences, and published under the title, 'The Main Literary Currents of the Nineteenth Century' (1872-82); for his description of the later intellectual position of Europe, as broken away from the orthodoxy and romanticism of the beginning of the century, brought on him the bitter attacks of all the reactionary forces in Denmark. His 'Danske Digtere,' a masterpiece

of psychological analysis, appeared in 1877; but the hostility of his enemies induced him in the same year to leave Denmark, and settle in Berlin, where he published, among other works, critical biographies of Lasalle (1877); Esaias Tegnér (1878); and Lord Beaconsfield (1879). Then a lecture tour through Norway and Denmark brought a powerful party to his side, and in 1882 he returned to Copenhagen, his countrymen having guaranteed him an income of \$1,000, with the one stipulation that he should deliver public lectures on literature. Among his later works are: 'Den Romantiske Skole i Frankrig' (1882); a biography of Ludvig Holberg (1885); a valuable study of Shakespeare, published in an English translation in 1899; 'Impressions of Russia' (1888); 'Poems' (1899); 'Berlin as an Imperial Court.' Brandes is not only the foremost critic of Denmark, but one of the great literary critics of his age. His works have been translated into German and also into English and French.

Branding, a form of punishment once in use for various crimes, but abolished in England in 1823. It was performed by means of a red-hot iron, and the part which was branded was the cheek, the hand, or some other part of the body. When the practice of arresting judgment in criminal cases by Benefit of Clergy was in force, it was customary to brand on the left thumb any layman who received this benefit, since it was not permitted to a layman to enjoy it more than once. Even after branding had been abolished in all other cases it was for a long time retained in the army as a punishment for desertion, the letter D being marked on the left side of a deserter two inches below the armpit. It was not, however, properly speaking, branded on his side, but marked with ink, gunpowder, or some other substance which would leave a stain that could not be obliterated without destroying the skin at the part. This also has been abolished. In mercantile law the term refers to the stamping of some distinguishing mark upon manufactured articles. (See TRADE MARK.) In cattle-raising districts in the United States, Australia, etc., cattle are branded with the mark of the owner.

Brandis, Christian August, German philologist and historian of ancient philosophy: b. Hildesheim, 13 Feb. 1790; d. Bonn, 24 July 1867. After a course of philological and philosophical studies at Kiel and Göttingen, he graduated from the University of Copenhagen in 1812, and for a short time delivered lectures on philosophy. He was induced by Niebuhr in 1816 to accompany him to Rome as secretary to the Prussian embassy. From 1819 to 1821 he was engaged in conjunction with Immanuel Bekker in collecting materials for a new edition of Aristotle, published in four volumes at Berlin (1831-6). In 1821 he was appointed ordinary professor of philosophy at Bonn, and his professional duties at this university were continued during the rest of his life, being only interrupted by a residence of three or four years in Greece, where he was acting as counselor to King Otho. After his return from Greece he published an interesting and instructive work, for which his residence in that country had furnished him with materials, entitled 'Mittheilungen über Griechenland' (Communications on Greece) (1842), and at

the same time resumed his professorship at Bonn. His two most important works are his 'Handbuch der Geschichte der Griech.-Röm. Philosophie' (1835-60); and 'Geschichte der Entwicklungen der Griech. Philosophie' (1862-4).

Brandon, Canada, a city in Manitoba on the right bank of the Assiniboine River, 132 m. west of Winnipeg, on the Canadian Pacific Railway. The name was given first in 1794 to Brandon House, a trading-post on the Assiniboine, 13 m. east of the present location, and also to the range of hills to the south. Brandon is the railway centre for a fertile farming country and is the second city in size and importance in the province. It stands on the gravelly slopes of the south bank of the river and has excellent sewerage and water systems. Both the business and residence portions are well-built. It has fine churches, schools and public buildings, Brandon College, a Baptist educational institution, and a general hospital. Its manufacturing industries include a large binder-twine factory, machine works, and woolen, flour and saw mills. Across the valley is the Manitoba Experimental Farm of 670 acres; and on the same side of the valley, the Indian Industrial School and one of the Provincial Asylums for the Insane. Pop. (1901) 5,380; (1904 est.) 6,200.

Brandon, Vt., a township of Rutland County, 16 miles northwest of Rutland, on the Central Vt. R.R., near Otter Creek. It contains an academy, two parks, a fine hotel, marble quarries, flour mills, and manufactories of carriages, castings, paint, etc. Pop. (1900) 2,759.

Brandstetter, Hans, Austrian sculptor: b. Hitzendorf, near Graz, 25 Jan. 1854. He first studied wood-carving in Graz and later went to the Academy at Vienna where he was a pupil of Hellmers. His three earliest works won the prize given by the Academy; these are 'Lot's Flight from Sodom,' 'The Flute-player,' and 'Plato.' Among his other works may be mentioned his bronze 'Forest Lily,' 'Prometheus,' 'The Return of the Prodigal Son,' and the busts of Hamerling and Rosegger.

Brandt, Carl Ludwig, kärke lood'vig bränt, German-American painter: b. near Hamburg, Germany, 22 Sept. 1831; d. Savannah, Ga., 19 Jan. 1905. He studied art in European art galleries, came to the United States in 1852, and thereafter painted portraits and historical scenes. He became a member of the National Academy in 1872, and was a director of the Telfair Academy of Arts and Sciences at Savannah, Ga.

Brandt, Gerhard, Dutch Arminian clergyman: b. Amsterdam, 1626; d. there, 1685. After completing his studies and making himself a thorough Hebrew and Greek scholar, he became pastor of the Remonstrants, first at Nieukoop and afterward at Amsterdam. His works, almost all written in Dutch, include a 'Life of Admiral Michel Ruyter,' which has been translated into French; a 'Narrative of the Trial of Barneveld, Hoogerbeets, and Grotius'; and a 'History of the Reformation.' The last work, on which his fame chiefly rests, has been translated into English. It is remarkable for the elegance of its style, but written too much in the spirit of partisanship.

Brandt, Hermann Carl George, German-American educator: b. Vilsen, Germany, 15 Dec. 1850. He graduated from Hamilton College,

Clinton, N. Y., in 1872; was instructor there (1874-6), associate professor of German at Johns Hopkins University (1876-82); and since 1883 professor of German at Hamilton. He has published a 'German-English and English-German Dictionary' (1879); 'German Grammar' (1884); a 'German Reader' (1889); and an edition of Lessing's 'Nathan der Weise.'

Brandt, Josef von, Polish painter: b. Szczebrzeszyn, 11 Feb. 1841. He first studied engineering at Paris, then took up painting at Munich as a pupil of Franz Adam and Karl Piloty and opened his own studio. His pictures mostly illustrate the soldier life of the 17th century, though he has painted also some excellent pictures of Polish peasant life. His works include 'Polish Peasants at the Inn,' 'Episode of the Thirty Years' War,' 'The Battle with the Turks near Vienna, 12 Sept. 1683,' 'Cossack Camp,' 'Tartar Battle,' 'Cossacks on the March,' 'Cossacks' Triumphant Song,' and 'Defense of a Farmyard by Polish Cavalry.'

Brandt, Marianne (family name, MARIE BISCHOF), German opera singer: b. Vienna, 12 Sept. 1842. She received her education at the Vienna Conservatory and won her first success on the stage as Recha in 'The Jewess.' She was at Gratz for a short engagement, and in 1868-82 was connected with the Royal Opera in Berlin; in 1876 and 1882 she assisted at the Wagner musical festivals at Bayreuth. After 1882 she made a number of tours and sang at the German Opera in New York for several seasons. She ranks very high both as a singer and an actress, her voice being a contralto.

Brandt, Max August Scipio von, German diplomatist: b. Berlin, 8 Oct. 1835. He served for a short time in the army, but was sent on diplomatic business to the East in 1860 and was resident in Japan as German diplomatic representative (1862-75). From 1875 to 1893 he was German minister at Peking. He has published 'Aus dem Lande des Zopfes' (1894); 'Die Zukunft Ostasiens' (1895); 'Sittenbilder aus China' (1895).

Brandt, Nicholas, German chemist of the 17th century, usually considered the discoverer of phosphorus. Leibnitz mentions him as a chemist of Hamburg, who, during a course of experiments on urine, for the purpose of discovering a solvent which would convert silver into gold, accidentally produced phosphorus, in 1667 or 1669. He communicated or sold his discovery to Kunkel, who showed it to Leibnitz. Boyle, securing a piece of the phosphorus, and knowing from what material it had been obtained, after various experiments succeeded in preparing it, and thus made an independent discovery of the method.

Brandy, the name most commonly applied to the spirit distilled from the juice of the grape, but also given to liquors distilled from other fruits, such as apples, cherries, peaches, etc. All these brandies differ from each other only in the essential oil which they contain, and which gives to each its different flavor and aroma. The alcohol in brandy generally constitutes 50 per cent of the whole, the remaining substances being water, amyl, propyl, and isobutyl, alcohols, glycerol, etc. The aroma is due to ceanthic ether and some volatile oils. A brandy highly esteemed is that of Cognac, exported from southwestern France, and obtained by distilling white

wines of the finest quality. An inferior kind of spirit is frequently prepared from the "marc" of grapes and the refuse of wine vats. When first distilled it is as colorless as alcohol, and continues so if kept in bottles or jars. When stored in casks, however, it acquires from the wood a pale amber tint, and in this state is sold as pale brandy. The dark color of brown brandy is produced artificially, to please the public taste, by means of a solution of caramel, and this is frequently added in excess to give a rich appearance to a brandy of low quality. A large proportion of the brandy sold in the United States is simply raw grain spirits flavored and colored. The spirit is imported into France, where it is redistilled and converted into French brandy. Brandy improves in flavor by being kept, but loses in strength. Genuine Cognac brandy has always been both costly and difficult to obtain in this country (the more so on account of the high import tariff collected thereon), the price for the liquor reaching \$20 or more per gallon. Of late years the development of viticulture in the western States, particularly in California, has enabled American enterprise to produce a brandy that is everywhere a formidable rival to the French article, and for purity and excellence infinitely preferable to the compounded and doctored spirit for which we have been accustomed to pay so high a price. Genuine brandy consists of alcohol and water, with small quantities of ceanthic ether, acetic ether, and other volatile bodies produced in the process of fermentation. The value of brandy as a medicine depends on the presence of these ethers and other volatile products; when, therefore, it is adulterated with raw grain spirit and water, the amount of these ethers is so reduced that the brandy becomes almost valueless for medical purposes. Imitation brandy is prepared either by flavoring highly rectified spirit with essence of Cognac or by distilling the spirit with bruised prunes, acetic ether, argol, and a little genuine brandy, and adding to the distilled spirit tincture of catechu and spirit coloring. This is said to be greatly improved by keeping. See ALCOHOL; BEVERAGES; DISTILLED LIQUORS.

Brandy Station, Va., a village of Culpeper County, southwest of Alexandria, notable as the scene of several minor battles during the Civil War. The earliest, on 20 Aug. 1862, was distinguished by a fierce cavalry charge on the Federal side; the second, 9 June 1863, resulted in the defeat of the Federal cavalry under Gens. Buford and Pleasanton by the Confederate commander Stuart. See FLEETWOOD, or BRANDY STATION, BATTLE OF. Other battles were fought near here, 13 Sept. 1863; 11 Oct. 1863; and there were also several skirmishes here.

Brandywine Creek, a small river of Pennsylvania and Delaware, formed of two forks, the east and west, which effect a junction in Chester County of the first named State, and, taking a southeasterly course, empties into Christiana Creek two miles below Wilmington. At Chadd's Ford on the Brandywine, 11 Sept. 1777, was fought a severe battle between the British and German troops, 18,000 strong, under Howe, and the Americans, numbering 13,000 men, under Washington, in which the latter were defeated. The consequence of this battle was the occupation of Philadelphia by the British troops.

Branford, Conn., a borough of New Haven County, situated on Long Island Sound, and on the New York, N. H. & H. R.R., about seven miles southeast of New Haven. The harbor admits small vessels. The oyster-beds of Branford form an important industrial feature. Among other occupations are the quarrying of granite, and the manufacture of locks and iron-fittings. The Blackstone Memorial Library, one of the most notable of the smaller American public library buildings, is located here. The place was settled in 1643, and in 1667 a large number of the inhabitants removed to New Jersey, settling at Newark. Branford was named for Brentford, England, and was incorporated in 1893. Pop. (1900) township, 5,706; borough, 2,473.

Brangwaine, the name of the nurse of Yseult in the legend of Tristan. The name appears as Brangäne in Wagner's opera, 'Tristan and Isolde.'

Branicki, Jan Klemens, yän klá'měnz' brá-nits'kě, Polish statesman: b. 1688; d. 9 Oct. 1771. In his youth he served in the French army. In 1715 he returned to Poland. He rose to the highest dignities, was an opponent of Augustus II., and the zealous champion of the nobility. After the death of Augustus III., he officiated as great constable and first senator of the kingdom, and stood at the head of the Republican party, but defended the privileges of the nobility. He was offered the crown by a great majority of the nobles who constituted the nation. But the party of the Czartoryskis, backed by Russia, was triumphant. Poniatowski was elected, and Branicki was outlawed and escaped to Hungary. As his wife was a sister of the new king, he soon returned and recovered his dignities. He was called by the nation the last patriot, and at his funeral was performed for the last time the mediæval ceremony of the ancient chivalry, that of breaking the coat of arms, and entombing it with the body of the last member of a noble line.

Brank, an instrument formerly in use for the punishment of scolds. It consisted of an iron frame which went over the head of the offender like a common horse-bridle, and had in front an iron plate, which was inserted in the mouth, where it was fixed above the tongue and kept it perfectly quiet. Such instruments are still preserved in the Ashmolean Museum, Oxford, the National Museum of Antiquities at Edinburgh, and in other museums, municipal buildings, and churches in England and Scotland.

Bran'an, John Milton, American soldier: b. Washington, D. C., 1819; d. New York, 17 Dec. 1892. He graduated at the United States Military Academy in 1841, and entered the 1st Artillery. During the Mexican war he took part in the battles of Cerro Gordo, Contreras, and Churubusco, and in the siege of Vera Cruz and the capture of the city of Mexico, where he was severely wounded. He was brevetted captain for gallant and meritorious conduct at Contreras and Churubusco. He served against the hostile Seminoles in Florida, and at the outbreak of the Civil War commanded the forces engaged in the reduction of the Confederate works on St. John's River, compelling the evacuation of Jacksonville. He commanded a

division in the Army of the Cumberland 1863-4, taking part in the advance on Tullahoma, served through the Atlanta campaign and all its operations, and was in the battles of Hoover's Gap, Chickamauga, Missionary Ridge, Kenesaw Mountain, and the siege of Atlanta. On 13 March 1865 he was brevetted major-general of volunteers for gallant and meritorious services during the War. He was stationed at various posts from 1866 until his retirement, 19 April 1882, as colonel of the 4th Artillery.

Bran'ner, John Caspar, American geologist: b. New Market, Tenn., 4 July 1850. He graduated at Cornell University in 1882, and in 1885 took his degree of Ph.D. at the University of Indiana. He was assistant geologist of the Imperial Geological Survey of Brazil 1875-8; special botanist for Thomas A. Edison in South America 1880-1; special agent of the United States Department of Agriculture for investigating cotton and the insects affecting it in Brazil 1882-3; topographical geologist of the Pennsylvania geological survey, anthracite district 1883-5; professor of geology at the University of Indiana 1885-91; State geologist of Arkansas 1887-92. In 1892 he was elected professor of geology at Leland Stanford Jr. University, and since 1899 has been its vice-president. He has written a large number of papers and reports on geology and physical geography, and is associate editor of the 'Journal of Geology.'

Brannon, Henry, American jurist: b. Winchester, Va., 26 Nov. 1837. He studied law and practised his profession in West Virginia 1859-81, becoming circuit judge in 1880, and judge of the State supreme court in 1888. He has published 'Treatise On Rights and Privileges Under 14th Amendment to the Constitution of the United States.'

Brant, Joseph (THAYENDANEGEA), Mohawk chief: b. Ohio, about 1742; d. 24 Nov. 1807. He was sent by Sir William Johnson to a school at Lebanon, Conn., from which grew Dartmouth College. Joining the Episcopal Church he taught religion to the Mohawk Indians, translating into their language parts of the New Testament and the Prayer Book. His services against Pontiac and in the French and Indian war were highly valued. After Sir William Johnson's death, he became, in 1774, secretary to George Johnson, superintendent of Indian affairs, and when the American Revolution began he incited the Indians against the colonies. His presence at the massacre of Wyoming is authoritatively disproved, but he took part in that of Cherry Valley, and in other savage engagements. He was received with great distinction on his tour to England in 1786, and was attached to the military service of Sir Guy Carleton in Canada. He opposed the confederation of the Indians which led to the expedition of Gen. Wayne, and did all he could to prevent peace between the Indians and the United States. He was zealously devoted to the welfare of his own people, a brave warrior, and noted for his ability. In England he collected funds with which he built the first Episcopal Church in Upper Canada. One of his sons, in the War of 1812, was the leader of a body of Canadians and Indians against the United States. The life of Brant has been written by Col. W. L. Stone of New York.

Brant, brânt, or **Brandt**, Sebastian, German poet; b. Strassburg, 1458; d. there, 10 May 1521. He studied law at Basel, took the doctor's degree, and delivered lectures on jurisprudence for many years. In 1501 he was state councillor at Strassburg, and state recorder in 1503. Some of his writings brought him to the notice of Emperor Maximilian, who entrusted him with several important commissions in the interests of the state. He translated Virgil, Terence, and other Latin writers, and wrote a number of law treatises as well as poetry. The work which brought him fame is a poem called 'The Ship of Fools,' first published in Basel 1494, in which he satirizes the vices and follies of his age. This became immediately popular; four editions appeared in one year, and it was translated into Low German, Latin, French, and English. In Germany it was so esteemed that the celebrated preacher Geiler of Kaisersburg delivered public lectures on it from the pulpit at Strassburg. Later editions have been printed, of which the best are by Zarncke (1854), and by Goedecke (1872). The English translations are by Alexander Barclay (1509), and by Henry Watson, the latter reprinted in 1874.

Brant, a small wild goose of the genus *Branta*. The most familiar species, the "common brant" (*Branta bernicla*) is found widely distributed throughout the United States. Its plumage, chin, and cheeks are glossy black, fading into gray at the sides, with its under parts entirely white, and white streaks on the sides of the neck. In its markings it is distinguished from the "black brant" (*Branta nigricans*) of the Pacific coast, which is entirely black underneath. Brants generally travel in flocks, and their comparative sluggishness enables the hunter to procure a larger number in the short time they are present, than of any other sort of goose. They feed on vegetable matter, their chief food consisting of the "eel-grass," for which they dive at low tide. The brant is chiefly a marine bird, rarely seen in the interior of the United States, and breeds in the far North, well within the Arctic Circle. Its nest is made on the ground from grass, mosses, etc., and its four eggs are dirty white in color. The name is sometimes given to other species of goose, as for instance the "snow goose" (q.v.) is sometimes termed "white brant" because of its similarity in size. See **GEESE**.

Brant-bird, or **Beach-robin**, common names among American gunners for the shore-bird (*Streptopelia interpres*), called "turnstone" by British sportsmen and in most books, because of its habit of moving aside pebbles in order to get at the beach-fleas and other small creatures hiding beneath them, upon which it feeds. It also makes a special food upon our shores of the eggs of the "horsefoot," or king crab, which it scratches out of the sand; hence it is known to some as "horsefoot snipe." It stands between the plovers and sandpipers, having a comparatively short bill and legs, and less active manners than most of the latter. It is, perhaps, the most beautiful of the beachbirds, having a highly variegated plumage much alike in both sexes. The bill is black; feet orange; head and sides of neck black and white, with a black band across the breast; throat, lower parts and tail coverts, white; remainder of the plumage chestnut and brown, mottled with black

and set off by a white band on the wing. This is one of the most cosmopolitan of birds, wandering to all parts of the world, yet nowhere, perhaps, numerous.

Brantford, Canada, city, port of entry, and county-seat of Brant County, Ontario; on the Grand River, at the junction of several branches of the Grand Trunk Railway, 70 m. southwest of Toronto and 60 m. east of London. It is named from the Mohawk chief, Joseph Brant (q.v.), to whom a fine monument, a colossal statue, was unveiled in Victoria Square, 13 Oct. 1886. The Grand River is navigable to within about two miles of the city, and is connected therewith by a canal, affording water communication with Lake Erie. A United States consular agent is stationed here. The city is lighted by electricity, and has handsome churches, schools, and private buildings, a stone courthouse, hospital, house of refuge, etc. It is the seat of the Ontario Institution for the Education of the Blind and of Wickliffe Hall. Brantford is the trade centre of a large and fertile agricultural region; has branches of all the principal banks; and daily and weekly newspapers. The buildings and shops of the Grand Trunk Railway occupy more than 12 acres. The manufactures comprise metal and stoneware, engines, machinery, sash and blinds, agricultural implements, etc. Pop. (1901) 16,619.

Brantôme, Pierre de Bourdeille, pē-âr dé boof-dâ-ê brân-tôm, (LORD OF THE ABBEY OF BRANTÔME): b. Périgord, Gascony, about 1540; d. 1614. In his epitaph, composed by himself, he relates in a vaunting manner how he first bore arms under the great Francis of Guise, and afterward served the king, his master. At an early age he received the abbey of Brantôme, but his life was mostly spent in war and gallantry. After the death of Charles IX. he withdrew to his estates and wrote his memoirs, which have a great deal of vanity and self-complacency, mingled with much that is interesting. Brantôme was personally acquainted with the great characters of the time, and an eye-witness of all the important events which then took place, and in some was an actor. He was a courtier, regardless of right or wrong; who does not blame the great, but observes and relates their faults and crimes as ingenuously as if he were uncertain whether they deserve praise or blame; as indifferent about honor and chastity in women as about integrity in men. He places us in the middle of that century when expiring chivalry was contending with the forming and as yet unsettled manners of later times. Brantôme, in the midst of his wandering life, had acquired more learning than most of his fellow soldiers. He has left 'Vies des grands Capitaines Français'; 'Vies des grands Capitaines Etrangers'; 'Vies des Dames Illustres'; and 'Vies des Dames Galantes' (together called 'Recueil des Dames'); besides other works.

Brasenose, one of the colleges of Oxford University, founded by William Smith, bishop of Lincoln, and Sir Richard Sutton, in 1509. The origin of the name is unknown, farther than that it was transferred to the college from the previously existing Brasenose Hall. Anthony à Wood states that Brasenose Hall had as its sign a nose of brass, being probably a

knocker. The college is very rich in endowments, which, however, have suffered owing to the decreased revenue from land.

Brashear (brāsh'ér) **City.** See MORGAN CITY.

Brash'er, Abraham, American army officer: b. New York, 22 Dec. 1734; died in exile during the revolution, in 1782. He was one of the most active associates of the "liberty boys" of his native city. He wrote many of the popular ballads of the revolutionary period, and was a constant contributor to the newspapers of his day. Among his poetical productions were 'Another New Year's Address,' and the 'General's Trips to Morristown,' both of which were favorites in the American camp.

Bras'idas, Spartan general who distinguished himself in the first half of the Peloponnesian war by his courage and his military skill: d. 422 B. C. He first distinguished himself by repelling the attack of the Athenians on the fortress of Methone (431 B.C.). In 429 he was sent to assist Cnemus and participated in the unsuccessful attack on the Piræus; in 427 accompanied the admiral Alcidas to Coreyra; in 425 was severely wounded in the assault on Pylos; and subsequently was elected by his fellow-countrymen to be the leader of an expedition intended to carry the war into Thrace. In 424 he relieved Megara, and passing through Thessaly effected a junction with Perdiccas of Macedon. Within a short time he had gained possession of Arrhibæus, Acanthus, Stagira, Amphipolis, Torone, and Scione. In 423 a truce was agreed upon, and in the same year Mende revolted and Brasidas immediately seized the town. The Athenians had, however, sent a new armament into the field consisting of two armies, and Brasidas, receiving no reinforcements from Sparta, was later forced to surrender the town to one of these armies. Cleon, the leader of the second army, allowed himself to be drawn into a battle at Amphipolis, and was totally defeated, he himself being in the number of the slain. But the Spartan victory was purchased with the loss of their general, who received a fatal wound during the engagement. Brasidas was buried at Amphipolis, within the walls, and long after his death his memory was honored as that of a hero, by the celebration of yearly sacrifices and games. The Greek writers speak highly of Brasidas. Thucydides notices his eloquence, unusual in a Spartan, his justice, liberality, and wisdom, while Plato compares him to Achilles; but circumstances are not wanting to show that he was endowed with as much Spartan duplicity as Spartan courage.

Brass, Sally, in Dickens' 'Old Curiosity Shop,' an evil and cruel woman who was her brother's law partner and assisted him in carrying out his schemes.

Brass, Sampson, in Dickens' 'Old Curiosity Shop,' an attorney of evil reputation, whom Quilp uses as a tool.

Brass. The quality of brass depends upon the proportions of its two constituents, copper and zinc. The greater the quantity of zinc the lighter the color and the more brittle and springy the alloy; while on the other hand, the greater the quantity of copper, the redder the

color and the tougher but softer the alloy. Technically, the term brass is extended to include compounds of copper and tin, as in *brass ordnance*, the *brasses* or bearings of machinery, etc.; but such alloys of copper and tin, though styled *hard brass*, are more strictly varieties of bronze. *Brass foil*, frequently not more than 1-50,000 of an inch in thickness and known as *Dutch leaf*, is made by beating out sheets of very thin brass containing a large proportion of copper. Copper and zinc alloys resembling brass are well known in the trade as *gilding metal*, *mannheim gold*, *pinchbeck*, *bath metal*, *Bristol brass*, *Muntz sheathing metal*, *spelter solder*, and *mosaic gold*.

In the manufacture of brass, either of two processes may be followed. The direct method is to fuse the zinc in a crucible and gradually add the copper in pieces. But this process is attended with disadvantage, owing to the volatile and oxidizable nature of zinc. The direct method of forming brass is generally followed; it consists in heating in crucibles or pots a mixture of calamine (carbonate of zinc), charcoal, and thin pieces of scrap or grain copper. For ordinary purposes brass is first cast into plates of about 100 pounds weight ($\frac{1}{4}$ to $\frac{1}{2}$ inch thick) which can be readily broken up, remelted, and cast in a mold of any desirable shape or size.

The following are the usual proportions in the several varieties of brass: Red brass—4 parts copper to 1 part zinc; Yellow brass—2 parts copper to 1 part zinc; Muntz metal—3 parts copper to 2 parts zinc; Spelter solder—1 part copper to 1 part zinc. For brass wire the mixture generally used is five parts copper to three parts zinc, but the proportions vary greatly, according to the purpose for which the wire is to be used. For some purposes, such as the manufacture of pins, where rigidity is of more importance than toughness, and cheapness is essential, it is possible to use Muntz metal; while for drawing into very fine gauges and weaving into the gauze that is used largely in paper-making machinery, much richer grades are employed.

The alloying of copper and spelter is performed in crucibles, generally made 16 inches in depth and 10 inches in diameter at the top tapering to about 9 inches in diameter at the bottom, the thickness of the walls being about 1 inch. These crucibles are heated in "wind furnaces." This furnace is fired with solid fuel and has a natural draft, the height of the chimney stacks varying from 40 feet, where each furnace has its separate stack, to 150 feet where a number of furnaces are connected to one stack. Gas furnaces are also used in combination with generators, in which case producer gas, or sometimes water gas is burned in place of the solid fuel; in these it is usual to heat 10 or 12 crucibles in one furnace or chamber. Reverberatory and tilting furnaces are employed for large castings in sand molds, but for casting ingots in metal molds it is usual to employ a crucible furnace of the "wind furnace" type, the fuel commonly used being coke. Tilting furnaces are largely used in America. The oldest method of making brass, still largely used, is as follows: The metal is cast into long narrow ingots of about 1 cwt. each, and from 3 to 4 inches wide. The molds are generally

BRASSARTS — BRASSES

made of cast iron, cast in halves, which are clamped together with wrought-iron rings. The molds are placed below the surface of the floor of the casting shop, and are supported against the side of the pit at an angle of about 60 degrees. Boards are placed across for the caster to stand upon while pouring the metal from the crucible into the mold. The metal, after careful skimming, is poured into the mold at the top, and when it has set the rings are slipped off the mold and the upper half removed, leaving the casting or ingot exposed. Before the metal is poured into the mold the inside of the mold is well brushed and dressed with resin and cotton-seed oil to prevent adhesion, or carbon in a fine state and whale oil are used, which give the mold an even surface. The ingots are next rolled when cold between ordinary flat rolls until the desired thickness is obtained.

The best process of *slitting* commonly employed in America, for grades of brass which can only be rolled cold, consists of casting the brass in the form of long bars, either square or round, from $1\frac{1}{4}$ to $1\frac{1}{2}$ inches thick. Each of these bars is rolled down separately in the cold state into a rod about $\frac{3}{8}$ inch in diameter, or sometimes less, which is afterward drawn into wire. Pieces weighing from 60 lbs. to 70 lbs. can thus be obtained. The advantage of this process over the old one is that longer lengths are obtained, and labor in the drawing is to some extent saved. A process brought out some years ago in the north of England consisted in casting in a centrifugal mold about 18 inches in diameter, and mounted on a vertical axis revolving at a high speed, so as to produce a casting in the form of a hoop. This was rolled down in open-ended rolls brought together with hydraulic pressure, and working in the same manner as those used for rolling out the tires for locomotives and other railway stock. A large thin hoop about 3 inches wide resulted, which was then cut in circular shears helically, forming a long strip, and this was drawn in the usual way. The great advantage of this method lay in the fact that a heavy piece was obtained, at the same time having a small section ready for drawing. In France a method often employed of making the "slittings" is to roll the metal down into large sheets, which are cut into strips spirally. Another method tried in America consists in casting a solid billet, which is pierced with a suitably constructed mandril to form a cylinder, which is afterwards cut up helically and drawn in the usual way.

In recent years continuous drawing machines have come very much into use. With these machines, instead of winding the wire on to a block, after drawing through one die at a time, the wire is drawn through one die, then wound two or three times round a block, and taken through another die, and so on, the friction on each drum being sufficient to carry the wire forward, and the circumferential speed of the drums being varied to suit the elongation of the wire. Owing, however, to brass being very quickly hardened by drawing, it is not possible to carry on this process *ad infinitum*, unless the wire be annealed periodically. When once it has been annealed it is possible to effect a very large reduction at one draught, the actual amount varying with the composition of the brass, the larger the proportion of copper the

greater the reduction at one draught. (See BRASS AND COPPER INDUSTRY).

The following table shows the weight in pounds of sheet brass of various thicknesses:

Thickness in inches	Weight of sheets per square foot	Thickness in inches	Weight of sheets per square foot
$\frac{1}{16}$	2.7	$\frac{1}{8}$	45.95
$\frac{1}{8}$	5.41	$\frac{3}{16}$	48.69
$\frac{3}{16}$	8.12	$\frac{1}{4}$	51.4
$\frac{1}{4}$	10.76	$\frac{5}{16}$	54.18
$\frac{5}{16}$	13.48	$\frac{3}{8}$	56.85
$\frac{3}{8}$	16.25	$\frac{7}{16}$	59.55
$\frac{7}{16}$	19.....	$\frac{1}{2}$	62.25
$\frac{1}{2}$	21.65	$\frac{9}{16}$	65.....

1.....	43.29	2.....	86.75

Bras'sarts, or **Brassards**, jointed plates of steel, protecting the upper arm, from the shoulders, which were covered by poldrons, to the elbows, where they were met by the gauntlets. These pieces of armor were not used in the chivalric ages, or in full suits of knightly armor, but in the half armor worn during the wars of Gustavus Adolphus, Wallenstein, and the Low Countries, in the times of Cromwell, when plate armor was going out of use.

Brasses, **Monumental** or **Sepulchral**, plates of brass, or of a mixed metal resembling brass, called *laton*, or *latten*, used as memorials of the dead. They were often made of life size and were cut to the shape of the figure, the details of armor, costume, features, etc., being worked out in incised lines from an eighth to a quarter of an inch in depth. Others, again, are found of much smaller dimensions, and rectangular in form, bearing in miniature the effigies of several figures. Such a plate of the 16th century, in the abbey church of Whalley, Lancashire, England, shows in the middle foreground the effigy of a knight in plate armor, kneeling with his hands clasped as if in prayer, and opposite him, in a similar devotional attitude, that of his wife; while behind the father range the kneeling figures of several sons, distinguished by their costumes as soldiers, priests, etc., and behind the mother a similar row of daughters, the family numbering in all some 20 persons. Underneath is an inscription recording the names of the knight and his wife, with dates, and a statement that he had built the chantry in which the plate was placed. Such *brasses* are often found affixed to the walls of a church, but it is sometimes uncertain whether they were so placed originally, many plates having been removed in the course of restorations.

The larger outline figures are usually found riveted or leaded into slabs of stone which form part of the church floor, the shallow depressions which hold the plate being cut to the figure. Such an one is the brass of Sir Roger de Trumpington, in Trumpington Church, near Cambridge, England, here shown. It is an excellent and well-preserved delineation of the armor of its day. The date of death is 1289, and this is believed to be the second oldest monumental brass in England; the older example being that of Sir John d'Aubernoun, in the church of Stoke d'Aubernoun, Surrey, bearing date 1277. The

BRASSEUR DE BOURBOURG

earliest brass of which there is any record in England is that of Simon de Beauchamp, of about the beginning of the 13th century; but the figure is no longer in existence. The incised lines were sometimes filled in with a hard enamel, often of varying colors, though in most cases the enamel has disappeared. By the use of these colors it was possible to display the heraldic tinctures of the shield or tabard.

Brass of Sir Roger de Trumpington, Trumpington Church, Cambridge.

or those of soldiery rest them from their settings for purposes of gun-founding or revenge.

There are some handsome specimens of brasses mounted on altar-tombs. A fine instance is that of Robert Pursglove, suffragan bishop of Hull, England, in the chancel of St. Mary's Church, Tideswell, Derbyshire. The figure of the bishop is in full vestments, and a quaint inscription records his education by his uncle in Tideswell, and his subsequent career. It is a comparatively modern creation, however, of about the 16th or 17th century. A very handsome altar-tomb in the parish church of Skipton, Yorkshire, was designed by Sir Gilbert Scott,

after the more ancient models. On the top of the tomb are plates depicting a knight and lady of the Clifford family, and at the corners are the symbols of the four Evangelists. A brass fillet around the slab bears an inscription.

Some modern brasses are to be found, incised and enameled in colors with symbolic devices; but they lack the historic value and interest of the mediæval effigies, to which appeal has often been taken for the solution of some question of detail of costume, armor, or heraldry.

Information concerning monumental brasses may be found in Haines' 'Manual of Monumental Brasses'; The Oxford Architectural Society's 'Manual for the Study of Monumental Brasses'; Bontell's 'Monumental Brasses of England'; Waller's 'Series of Monumental Brasses from the 13th to the 16th Century'; Belcher's 'Kentish Brasses'; Creoney's 'Monumental Brasses on the Continent'; Gough's 'Sepulchral Monuments'; Cotman's 'Suffolk Brasses'; Dugdale's 'Monasticon Anglicanum';

The art of engraving monumental brasses appears to have been introduced into England from the Continent, where it was much practised, and where some very fine specimens are to be found. (The ecclesiastical figure here shown is in a church at Bonn.) There are still a very large number of brasses in English churches, but empty hollows in stones bear witness to-day of the times of the Reformation, the civil wars, and the Puritans, when the hands of fanatics tore away these fine memorials as being "popish,"

Brass of an Ecclesiastic, Bonn, Germany.

English county histories; and the publications of the Royal Societies of Antiquaries and of Archæologists.

Brasseur de Bourbourg, Charles Etienne, shârl â-tê-ën bra-sêr dè boor-boor, French writer on American history, archæology, and

ethnology: b. 1814; d. 1874. He entered the priesthood, was sent to North America by the Propaganda, and lived and traveled here and in Central America for a number of years, partly in the performance of ecclesiastical functions. Among his works are 'Histoire du Canada'; 'Histoire des Nations civilisées du Mexique et de l'Amérique Centrale'; 'Gramatica de la Lengua Quiche'; 'Monuments anciens du Mexique'; 'Études sur le Système graphique et la Langue des Mayas.'

Brassey, Lady Anne, English descriptive writer: b. London, about 1840; d. 14 Sept. 1887. After her marriage she spent half of her life at sea on Lord Brassey's yacht, the Sunbeam. Her travels are interesting, popular, and have passed through many editions. They are 'Natural History of a Voyage on the Sunbeam'; 'Sunshine and Storm in the East'; 'Tahiti'; 'In the Trades, the Tropics, and the Roaring Forties,' and 'Three Voyages in the Sunbeam.'

Brassey, Thomas, English engineer and railroad contractor: b. Baerton, Cheshire, 7 Nov. 1805; d. Hastings, 8 Dec. 1870. After receiving an ordinary education he was, at the age of 16 years, apprenticed to a surveyor, whom he succeeded in business. After building parts of the Grand Junction and the London and Southampton railways, he contracted, in 1840, in partnership with another, to build the railway from Paris to Rouen. In a few years he held under contract, in England and France, some 10 railways, involving a capital of \$180,000,000, and employing 75,000 men. In partnership with Betts and Peto he undertook the Grand Trunk of Canada, 1,100 miles in length, including the great bridge at Montreal. His army of men were employed in nearly every part of Europe, South America, Australia, India, etc. He amassed great wealth, but continued to be generous to the needy, and modest and simple in his tastes and manners. Sir Arthur Helps wrote his 'Life' (1872).

Brassey, Sir Thomas, English politician, first Baron Brassey, son of Thomas Brassey (q.v.): b. Stafford, 11 Feb. 1836. He was educated at Rugby and University College, Oxford, and entered Parliament for Devonshire in 1865, subsequently sitting for Hastings 1868-86. He served as civil lord of the admiralty 1880-4, and was secretary to the admiralty in 1884-5. In 1886 he was elevated to the peerage as Baron Brassey. From 1895 to 1900 he was governor of Victoria. He has published 'Work and Wages' (1872); 'The British Navy' (1882-3); 'Lectures on the Labor Question' (1878).

Brattleboro, brät't'l-bür-ō, Vt., a town in Windham County on the Connecticut River in the southeastern part of the State, on the Boston & M., and Central Vermont R.R.'s. The town was first settled in 1724 at Fort Dummer by a garrison from Massachusetts. The settlement at Fort Dummer was the first permanent civilized settlement in Vermont. The town was chartered in 1753 and incorporated as a village in 1832. Its present form of government is by a board of three selectmen elected annually in March and five village bailiffs elected annually in May. The town is situated in a picturesque rich farming region, is the trade centre of south-

east Vermont and contains the State Asylum for the Insane, Brooks Public Library and has many fine churches, Brattleboro Academy and an excellent system of high and graded schools. The city has 4 banks, 2 national with a capital of \$550,000; deposits \$1,500,000; 2 savings, deposit \$4,500,000, surplus \$450,000. Brattleboro has many manufactures, chief of which is the factory of the Estey Organ Company. Pop. (1903) 6,000.

O. L. FRENCH,

Editor *Vermont Phoenix.*

Braun, August Emil, ow'goost ä'mël brown, German archæologist and writer on art: b. Gotha, 19 Aug. 1809; d. 12 Sept. 1856. He received his early education at his native town, and continued his studies at Göttingen. From 1832 to 1833 he resided at Dresden, whence he went to Rome in company with Gerhard, with whom he had formed a close intimacy. In the same year he was appointed first librarian and then assistant secretary to the Archæological Institute, and in 1834 became editor of the 'Bulletin,' and in 1837 of the 'Annali' of that institution. His chief works are: 'The Judgment of Paris'; 'The Artistic Representations of the Winged Bacchus'; 'Ancient Works in Marble' 1st and 2d decades; 'The Greek Doctrine of the Gods'; 'The School of Art Mythology,' with 100 copperplate engravings, translated into English by Grant; 'The Ruins and Museums of Rome,' constituting an excellent guide-book for artists and antiquaries.

Braun, Kaspar, German wood-engraver: b. Aschaffenburg, 1807; d. Munich, 29 Oct. 1877. He studied engraving in Munich and in Paris under Prévère. In Munich he founded, with Dessauer, a xylographic institute, which later became a school of engraving. In 1843 he, in association with Friedrich Schneider, founded the 'Fliegende Blätter.' The chief works which Braun has illustrated are 'Die Nibelungenlied'; the 'Volkskalender'; 'Götz von Berlichingen'; and 'Münchner Bilderbogen.'

Braun, Ludwig, German painter: b. Schwäbisch Hall, 23 Sept. 1836. He was educated at Munich and Paris, and a number of water colors of the Schleswig-Holstein war were the means of obtaining him a contract to paint a cycle of pictures illustrating the history of the family of the Count of Hunolstein. His favorite subjects are battle scenes, and he accompanied the Austrian army in the Danish war and the Germans in the Franco-Prussian war. Among his works are 'The Capitulation of Sedan'; 'The Entry of the German Army Into Paris'; and 'The Germans in Versailles.' He has also painted several very successful panoramas, including 'The Battle of Sedan'; 'The Battle of Mars-la-Tour'; and the 'Battle of Lützen.'

Braunsberg, browns'bërk, Prussia, a town in the province of eastern Prussia, and government of Königsberg, on the Passarge, about four miles from its junction with the Frische Haff. It is the residence of the bishop of Ermeland, and has a Roman Catholic Lyceum, a gymnasium, a seminary for priests, a normal school; and manufactures of linen, woolens, and leather; and a good trade. Pop. (1904) 13,000.

Brauronia, (1) a name sometimes given to the Greek goddess, Artemis, from her shrine at Brauron, Attica; (2) a Greek festival in

honor of Artemis held every four years at Brauron, in which every Attic woman must take part before she could marry. The rites were performed by girls from 5 to 10 years old, and a part of the ceremony consisted in their imitation of the actions of bears.

Brauer, brow'ér, or **Brouwer**, **Adrian**, Dutch painter: b. Haarlem, or Oudenarde in East Flanders, 1608; d. Antwerp, 1640. He made designs of flowers and birds, which were stitched upon caps and bonnets sold by his mother, a poor woman, to the peasants. Francis Hals, a distinguished painter of Haarlem, happening to see some of these, was so struck by the talent which they evinced that he invited the young artist to receive instructions at his house, where he kept him hard at work in a garret, and appropriated to himself the proceeds of his pictures. Here Brauer remained for many months, ignorant of the estimation in which his talent was held abroad, until by the assistance of his fellow pupil, Adrian van Ostade, he was enabled to escape to Amsterdam. The discovery of the reputation he had acquired seems to have crushed rather than incited his ambition. Perceiving the prices which his pictures commanded, and his own facility in executing them, he yielded to a natural taste for gross pleasures, and painted only when it was necessary to procure money to indulge in dissipations. During the wars with Spain he started on a journey to Antwerp, but being unprovided with a passport he was imprisoned on suspicion of being a spy. The Duke d'Areberg, a fellow prisoner, recognizing his talent, induced him to paint something. The subject was a group of soldiers playing at cards, which the artist sketched from his prison window, and the picture being shown to Rubens he at once pronounced it a work of Brauer, whose release he immediately procured, and whom, from admiration of his genius, he received as an inmate into his house. Brauer's longing for his old life, however, soon induced him to leave his protector, and after a brief career of reckless dissipation he died in the public hospital of Antwerp.

Bravi, brá'vè, the name formerly given in Italy, and particularly in Venice, to those who were ready to hire themselves out to perform any desperate undertaking. The word had the same signification in Spain, and both the word and the persons designated by it were found in France in the reign of Louis XIII. and during the minority of Louis XIV. At the end of the 15th century they are described as being armed to the teeth, with an arquebuse in their hands, a cutlass at their side, masked by a bushy beard and enormous moustaches, and wearing a long and thick forelock called a *ciuffo*, which they used to bring down over their face when they wished to conceal it entirely.

Bravo, **Leonardo**, lā-ō-nār'dō brá'vō, Mexican revolutionary patriot: b. near San Luis de Potosi, 1766; enlisted in the revolutionary cause, and died of prison fever, in the hands of the Spaniards, in the city of Mexico, in 1812. The Spanish commander had repeatedly offered him his liberty on condition of taking service in the royal army, but, though the fever caused by confinement in a filthy dungeon was wearing out his life, he steadily refused to save it on such conditions.

Bravo, brá'vō, **Nicholas**, Mexican statesman, son of Leonardo Bravo: b. Chilpanzingo, 1790; d. 22 April 1854. He participated in the revolution against Spain (1810-17), and later aided Iturbide in establishing a republic, and supported him until 18 May 1822, when Iturbide proclaimed himself emperor. To this step Bravo was opposed, and he contributed in no small degree to Iturbide's deposition. He again became a member of the provisional government which remained from 1 April 1822 till 10 Oct. 1824, when the federal constitution took effect, under which he was elected to be vice-president until 1 April 1829, Guadalupe Vittoria being president. The politics of Mexico had now become involved in a controversy in which the order of freemasons, divided into two parties, one known as the *Escoses* and the other as *Yorkinos*, contended at once for the Scotch and ancient York rituals, and the one for a centralized, and the other for a federal, form of government. Bravo was grand master of the Scotch division, and when the federal system prevailed he became a leader of the opposition. Notwithstanding this, he had been elected vice-president; but when, on 23 Dec. 1827, the standard of revolt was raised at Otaviba, he became the head of the movement. The purpose of the *pronunciamiento* was to replace the actual members of the executive government with men of the *Escoses*, and to dismiss Mr. Poinsett, then United States minister in Mexico, who was charged with too actively favoring the other party. Bravo was defeated and expelled, but was recalled in 1830 by President Bustamante, and sent by him against the insurgent Guerrero, who was taken in arms and executed by Bravo's orders, 14 Feb. 1833. After this Bravo remained in retirement until July 1839, when, as president of the council, he was charged with the supreme administration of the government during an interim of a week. Again from 26 Oct. 1842, till March 1843, he was substituted as president by Santa Anna, during his absence as dictator at the head of the army. For the last time he held executive power as temporary president from 29 July to 4 Aug. 1846, when he was deposed by a revolution. On the commencement of the war between Mexico and the United States, he took up arms in behalf of his country, and participated in the battle of Cerro Gordo. In the autumn of 1853 he was accused by the ministers of Santa Anna of having secretly joined Juan Alvarez in the insurrection he had set on foot; but he at once denied the accusation and declared that he had retired from public life forever.

Brá'vo, **The**, a novel by James Fenimore Cooper, is a tale of Venice in the 16th century, full of mystery and intrigue, and the high-sounding language which years ago was thought the natural utterance of romance. Don Camillo Monforte, a Paduan noble, has a right by inheritance to a place in the Venetian Senate. He becomes obnoxious to the Council, and a bravo is set on his track to kill him. He has fallen in love with Violetta, a young orphan heiress designed for the son of an important senator; and she consents to elope with him. A priest marries them, but by a trick she is separated from him and carried off. The Bravo, sick of his horrible trade, has refused to take a hand in the kidnaping of Violetta; and confesses to Don Camillo all he knows of it, promising to help

him recover his bride. Jacopo, the Bravo, finds her in prison and contrives her escape to her husband; but is himself denounced to the Council of Three, and pays for his treachery to them with his head. The romance is of an antiquated fashion; and has not the genuineness and personal force of Cooper's sea stories and 'Leatherstocking Tales,' which grew out of an honest love for his subjects.

Bravo-Murillo, Don Juan, dōn hoo-än' brá'vō-moo-rē'lyō, Spanish statesman: b. Badajoz, June 1803; d. Madrid, 11 Jan. 1873. In 1825, he entered the College of Advocates at Seville, and showed great devotion to the monarchy. When the Progressistas came into power he went to Madrid, and founded a law magazine, the 'Boletín de Jurisprudencia.' In 1836, he became secretary of the Department of Justice under Señor Isturiz. In 1847 he became minister of Trade and Public Instruction, and, in 1849-50, of Finance. In 1851 he formed a cabinet, with himself as premier, but, in 1853, it was superseded by that of Gen. Lersundi. The oppressive measures adopted by Bravo-Murillo and his successors led to the revolution of 1854, and the attainment to power of Marshals Espartero and O'Donnell.

Bravura (bra-voo'ra) **Air**, an air so composed as to enable the singer to show her skill in execution by the addition of embellishments, striking cadences, etc. It is sometimes used for the style of execution.

Brax'ton, Carter, signer of the Declaration of Independence: b. Newington, King and Queen County, Virginia, 10 Sept. 1736; d. 10 Oct. 1797. He inherited several plantations, and passed the early part of his life in the enjoyment of his fortune in his native State, and in England, where he resided some years. In 1765 he took an active part in the eventful session of the house of burgesses of Virginia, in which the resolutions of Patrick Henry were adopted, and in the subsequent assemblies which were dissolved by the governor. He was next a member of the conventions which were the first step toward the substitution of popular for the royal government; and on 15 Dec. 1775, was elected delegate to the continental congress, as successor of Peyton Randolph, and as such affixed his name to the Declaration of Independence. He did not remain long in Congress, but served in the legislature of Virginia until 1786, when he became one of the executive council. The close of his life was embittered by pecuniary embarrassments, and the entire wreck of his fortune.

Brax'y, or Dysentery in Sheep, inflammation of the coats of the intestines. It is often preceded by diarrhœa, and attended by fever and constitutional disturbances. A sudden change of pasturage, more particularly from a succulent to a high and dry pasture, is one of the most frequent causes, and to this may be added exposure to wet and cold after traveling. It is a much more serious disease than simple diarrhœa, and often becomes fatal in the course of a few days. The name is also applied to a blood disease resulting from plethora, which is considered by some to be the true braxy. In this case also a sudden change of pasturage is the most frequent cause of the disease, but the change which generally produces it is the reverse of that which produces the

former, namely, a change from a low diet to rich and nourishing food. This disease is even more fatal than the former, and runs its course in a few hours. As there is no means of saving an animal which is once attacked, the only course is to avoid the causes which lead to the disease.

Bray, Anna Eliza, English woman of letters: b. London, 25 Dec. 1790; d. there, 21 Jan. 1883. Her maiden name was Kempe; she studied for the stage, but in 1818 was married to Charles A. Stothard, son of the famous artist, and, after his death, became the wife of the Rev. Edward A. Bray, vicar of Tavistock. From 1826 to 1874 she wrote a series of novels, one of which, 'The Talba, or the Moor of Portugal,' brought her the acquaintance of Southey. In 1884 they were collected in a 12-volume edition. She wrote the 'Life of Thomas Stothard' (1856), and many books of travels. Her letters addressed to Southey, on the superstitions and scenery of Tavistock, entitled 'The Borders of the Tamar and the Tavy' (1836; new ed. 1879), and 'A Peep at the Pixies; or, Legends of the West' (1854), are much esteemed. Mrs. Bray's 'Autobiography' appeared in 1884.

Bray, Sir Reginald, English architect: d. 1503. He was the second son of Sir Richard Bray, one of Henry VI.'s privy councilors, and stood high in the favor of Henry VII., for whom he is understood to have designed, if he did not actually execute, the beautiful chapel at Westminster which bears that monarch's name. Another of his works, and now his final resting-place, is the almost equally beautiful chapel of Saint George's at Windsor.

Bray, Thomas, English clergyman: b. Marton, Shropshire, 1656; d. London, 15 Feb. 1730. Having entered the ministry of the Established Church he founded in 1698 the Society for Promoting Christian Knowledge and in 1700 organized the Anglican Church in Maryland. In the following year he secured a charter for the Society for the Propagation of the Gospel in Foreign Parts. He was rector of Saint Botolph's, Aldgate, London, from 1706. He devised a system of lending libraries for parish purposes and in 1723 established the still existing society of Associates of Dr. Bray, which carries on his benevolent undertakings. He published a 'Directorium Missionarium' (1726); 'An Essay Toward Promoting All Necessary and Useful Knowledge' (1697), and several lesser works.

Bray, The Vicar of (SIMON ALEYN), incumbent of a small English parish near Maidenhead, Berkshire, from 1540 to 1588, during the reigns of Henry VIII., Edward VI., Mary, and Elizabeth. He kept his vicarage by changing his faith according to that of the state for the time being, becoming a Protestant with Henry, Catholic again in the reign of Mary, and Protestant again on the accession of Elizabeth. His principle was to live and die Vicar of Bray, and to it he adhered. The modern ballad, 'In Good King Charles' Golden Days,' makes the versatile vicar live in the reigns of Charles II., James II., William III., Anne, and George I. The parish is 23 miles west of London and has a population of 5,750.

Bray, a maritime town of Ireland, partly in county Dublin and partly in Wicklow, though

mainly in the latter, picturesquely situated on both banks of the Bray, which here forms the boundaries of these two counties, 12 miles southeast of Dublin. The town, which has been popularly designated "the Irish Brighton," has been much improved in recent years, new houses being built, and a broad esplanade formed. Pop. (1901) 7,000.

Brayera, also known as *Cusso* or *Koussou*, a handsome ornamental tree of Abyssinia belonging to the rose family. Its scientific name is *Hagenia Abyssinica*. The leaflets number 6 to 12 to each leaf, and its stamens are in separate flowers from its pistils. The bunches of pistillate flowers, made into an infusion, are used in medicine for the expulsion of worms, especially the tape worm. The taste is bitter and unpleasant. The active principle is kosin, which is sometimes given by itself.

Brayman, Mason, American soldier and lawyer: b. Buffalo, N. Y., 1813; d. 1895. He learned the printer's trade in early life, but took up the study of law and was admitted to the bar in 1836. Removing to Illinois he was employed by that State to settle the difficulties with the Mormons of Nauvoo, and secured their removal in 1844. He served in the Federal army during the Civil War, and at its close was brevetted major-general. He was territorial governor of Idaho 1876-81, and after the last named date practised his profession at Ripon, Wis., until his death.

Brazen Sea, the copper basin or vase which King Solomon placed in the priest's court for the uses of the servitors. It was 5 cubits high and 30 in circumference, and was supported on 12 oxen facing outward. It seems probable that its original purpose was symbolical rather than practical. King Ahaz removed it to a stone pedestal and it was finally destroyed by the Chaldeans, who carried off the copper to Babylon.

Brazen Serpent, a bronze or copper figure which Moses is said to have made and set up before the Israelites for the healing of all who had been bitten by venomous serpents. As this was subsequently superstitiously adored by the Israelites it was destroyed by King Hezekiah. Among the Phœnicians the serpent was regarded as the symbol of the god of healing.

Brazil (The United States of Brazil), a republic bordering upon all of the South American countries except Chile, shares to a greater or less extent the natural resources and physical characteristics of each. But even more than its neighbors it requires, for the development of these resources on an adequate scale throughout its length (2,500 miles), and breadth (4,000 miles), both immigration and new industrial enterprises. The central fact concerning the vast Amazon region, stretching across the continent from a few degrees north to about 16° south of the equator, is that its rank vegetation defies the efforts of casual settlers, and nothing less than a teeming population could properly subdue it to human uses. The total area of Brazil, according to the most recent computation, is 3,218,130 square miles; and this includes the largest compact body of fertile and habitable territory that yet remains unimproved, and even, in part, unexplored. Nearly the entire population of the republic is still found on a com-

paratively narrow strip of land extending southward along the Atlantic coast from Para, below the mouth of the Amazon, to the line of Uruguay. In other words, the white people have clung to the fringe of the continent which their ancestors took possession of in the 16th century in the fashion we shall presently describe; and no civilizing conquest and occupation of the interior, such as occurred in North America, have been effectively undertaken. Except along or comparatively near the coast, the Brazilian states have less than one inhabitant per square mile. The number of inhabitants in the entire country was estimated at 21,565,000 in 1900, distributed as follows among the 20 states of the republic, and including 750,000 for the federal district:

State	Population	State	Population
Minas Geraes.....	4,277,000	Para	652,000
Bahia	3,335,000	Parahyba	596,000
San Paulo.....	2,520,000	Sergipe	450,000
Pernambuco	2,089,000	Piauhv	425,000
Rio Grande do Sul	1,350,000	Rio Grande Norte	407,000
Rio de Janeiro.....	1,300,000	Santa Catharina..	405,000
Ceara	1,000,000	Parana	380,000
Alagoas	781,000	Goyaz	340,000
Maranhao	660,000	Amazonas	240,000
		Espirito Santo....	201,000
		Matto Grosso....	157,000

There were 2,705,000 foreigners in Brazil, namely, Italians, 1,300,000; Portuguese, 800,000; Germans, 300,000; Spanish, 100,000; Poles, 80,000; French, 10,000; English, 5,000; North Americans, 500; other nationalities, 110,000.

Comparing the above figures with those given a decade earlier, we conclude that the estimate for 1900 is probably too high. The total population in 1890, including 600,000 uncivilized Indians, was stated to be only 14,333,915.

History.—Brazil was discovered in 1500 by a companion of Columbus, Vicente Pinzon, who made no settlement, and, indeed, would not have been justified in doing so. The bull of Pope Alexander VI. (4 May 1493) had bestowed upon Portugal the lands which should be found east of the line of demarcation, and commissioners of Spain and Portugal had agreed, on 7 June 1494, that the position of the line of demarcation should be changed so that it should pass, north and south, 370 leagues west of the Cape Verde Islands, instead of at a distance of only 100 leagues west of those islands, where the Pope had established it. Accordingly Spain was precluded by her own act from claiming the eastern portion of the continent of South America. A Portuguese commander, Pedro Alvarez Cabral, when on his way around the Cape of Good Hope to the Far East, in 1500, encountered severe storms which drove his vessels from their course; and through this mischance he reached the Brazilian coast in April. Mass was celebrated there on Easter Day; the country was declared a dependency of Portugal, and a stone cross was erected. There Cabral himself embarked for India, but first sent a vessel to Lisbon with a report of this important discovery. As soon as practicable after receiving the account of his new possession, Dom Manuel placed three vessels under the command of Amerigo Vespucci, instructing this Florentine to make good Portugal's claim to the land which a Spaniard had discovered. Thus, from the beginning, Brazil was marked out as a field for international competition. Vespucci's first voyage being unsuccessful, a second was undertaken

with better results. He remained for five months at a point he named "All Saints," and when it became necessary to return left 12 men as a garrison in a small fort. The impression created by the experiences of the early adventurers was not highly favorable. Poor and unattractive, indeed, did this land seem in comparison with India and Africa. During the years that followed Portuguese merchants dispatched vessels to trade for Brazil-wood, and the Portuguese government jealously resisted French and Spanish attempts to gain a foothold or carry on commerce eastward of the line of demarcation; but the court at Lisbon continued to prefer the profits to be won along the course that Vasco da Gama had opened up. The first settlements, therefore, were not made by the government, but by grantees whom the government induced to colonize by assigning to each leader a splendid possession, or "captaincy"—no less than 50 leagues of coast, with feudal powers and the privilege of extending his domain as far inland as he desired. Thus the province of San Paulo was settled by an expedition under Piratinga; next Affonso de Sousa explored the coast from Rio de Janeiro (so called because it was discovered 1 Jan. 1531) to the Rio de la Plata. Lopes de Sousa received two allotments of 25 leagues each, one being near Pernambuco and Paraiba. Fernandez Coutinho and Pedro da Campo Tourinho established themselves near the spot where Cabral landed. Francisco Pereiro Coutinho received a grant of a captaincy, extending from Rio San Francisco to Bahia. The captaincy of Pernambuco was given to Duarte Coelho Pereira; and so the most attractive portions of the coast were distributed. Cattle and sugar-cane being introduced from Madeira, the systematic cultivation of the latter began; though some authorities maintain that both sugar-cane and coffee are indigenous to Brazilian soil. Enormous difficulties were encountered from the first by proprietors and planters. Only men of large means (including some of those adventurers who had amassed fortunes in India), were able to equip and maintain such a considerable force as was necessary if these undertakings were to be successful. The natives were, as a rule, extremely mistrustful, besides being the most savage of their kind, as Southey has shown in his elaborate description of them. ('History of Brazil,' by Robert Southey, 1810). Cannibalism was universally practised. In general, the nature of these Indians appears to have been far more debased, and their practices more revolting than the nature and customs of the Red Men of North America; the task of civilizing them seemed more utterly hopeless. Yet one striking exception to the general experience may be noted. The first settler in Bahia was Diogo Alvarez, a young man of noble family, who was wrecked on the shoals near that port. "Part of the crew," says Southey, "were lost, others were eaten by the natives." Diogo secured the favor of the Indians by recovering things from the wreck. Afterward he led them in battle, using his musket to such good effect that he became their sovereign, and took daughters of the chiefs of the savages to be his wives. "The best families in Bahia," we are told, "trace their origin to him."

By the middle of the 16th century the captaincies of those men whose names have been mentioned, and still other adventurers, were

scattered along the coast from the mouth of the Amazon to the mouth of the Rio de la Plata. The great mineral wealth of the country had not been discovered at that time, and the settlements were chiefly devoted to the cultivation of sugar. What with savages surrounding these widely separated posts; Spaniards threatening them from the rear (the Spanish troops then holding the regions afterward to be known as Paraguay and Argentina); and the French from time to time attempting to establish themselves on the coast; it was found necessary to provide for the common defense by concentrating the Portuguese power in the hands of a governor-general. The feudatories had to submit to the revocation of some of their privileges, though they remained on the soil which they owned.

The first governor-general was Trome da Sousa, and his capital was Bahia. In 1549 he was reinforced by a fleet of six vessels with 320 soldiers and officials, 400 convicts, 300 free colonists, and 6 Jesuits. At different times wards of the Crown, female orphans of good family, were sent out, provided with portions from the royal estates, and given to the provincial officers in marriage. The establishment of the College of San Paulo in Piratinga followed hard upon the arrival of the first bishop of Brazil in 1552, and of a number of Jesuits in 1553. Avowed friends and protectors of the natives, these members of the Society of Jesus took upon themselves the pioneers' task, and their college became a centre of influence. Intrusive French settlers at Rio de Janeiro were driven out by the governor, and a Portuguese colony was founded there in 1567. But the progress of Brazil, in so far as it was dependent upon the aid of the mother country, was checked, if not entirely arrested, during a period of 60 years. Philip II. of Spain acquired the crown of Portugal in 1578-80, and the union of the two countries—or rather, the subordination of the weaker nation—continued until 1640. Brazil received little attention during all these years, in part because she was identified with Portugal, but still more for the reason that her inferiority to the Spanish possessions in mineral wealth was taken for granted. The transfer of allegiance invited attack by English fleets. In 1586 Witherington sacked Bahia; Cavendish, in 1591, burned San Vicente; Lancaster, in 1595, captured Olinda. A futile attempt to found a permanent colony was made by the French (1612-18), and the Dutch dispatched a fleet against Bahia in 1624.

The Dutch in Brazil.—Most important were the efforts made at this time by an association of Dutch merchants, the famous Dutch West India Co., which commissioned Count Maurice of Nassau to promote the interests of his countrymen in South America. The enormous power of this corporate company, which, as Bancroft says, was "given leave to appropriate continents," and, when "invested with a boundless liberty of choice, culled the rich territories of Guiana, Brazil, and New Netherland," was exerted in a large part of the region lying between Maranhão and Bahia. After the revolution of 1640, Brazil was, indeed, no longer Spanish, but the new Portuguese executive of the house of Bragança was too poor and weak to adopt such vigorous measures as were required. Accordingly a suggestion offered by a native of Madeira named Vieira was welcomed, inasmuch as this plan re-

lieved the government of the obligation to fight the Dutch West India Co. Vieyra proposed the establishment of a commercial company at Lisbon similar to that which had its headquarters at Amsterdam. The Brazil Co. of Portugal was organized, and in 1649 sent out its first fleet. After five years of severe fighting, the Portuguese merchants overcame the Dutch merchants.

For half a century Brazil was permitted to remain at peace. In 1710, however, a French squadron under Duclerc attacked Rio de Janeiro and suffered defeat. On 12 September of the following year Admiral Duguay Trouin arrived off Rio with a new fleet and 6,000 men. The governor was compelled to capitulate and to pay a large sum of money. A great change in the industrial conditions of the southern districts was produced by the discovery of diamonds at this time (1710-30), and by the rush to the gold regions opened up by the enterprise of the colonists of San Paulo—a hardy race, doubtless with a large admixture of Indian blood, much addicted to adventurous raids into the interior. Their explorations extended westward into Paraguay and northward into Minas, Goyaz, and Cuyabá in the state of Matto Grosso. Gold was discovered in the regions last mentioned; by the beginning of the 18th century there were five towns of considerable importance in Minas Geraes; and that state is now, as we have seen, the most populous of the republic. Laborers were withdrawn from the sugar industry by the superior attractions of mining, and Brazil lost her leading position as a sugar-producing country. The conspiracy of Minas in 1789 was the first sympathetic movement in Brazil occasioned by the Revolutionary War in North America. Inspired by the success of the English colonies in achieving independence, the inhabitants of Minas formed a project to throw off the Portuguese yoke, but the plot failed, the leader was hanged, and the conspirators were banished to Africa, from which continent slaves were being imported in large numbers. It was an unprofitable exchange for America. The French Revolution, among its extraordinary consequences, promoted Brazil from the humble position of a colony to be the seat of government of the Portuguese power, and the only American monarchy. In 1807 the threat of the invasion of Portugal by Napoleon sent the prince regent, afterward King John or Dom João VI., across the ocean (29 November). With him went the queen, the royal family, the great officers of state, and members of the nobility. He created many new offices, and otherwise made the machinery of government in Brazil much more elaborate than it had ever been; and, to meet the increased expenses that these changes involved, at first imposed new taxes, and afterward, by debasing the money standard, inaugurated the long period of financial error that has impeded the advancement of the country. On the other hand, Brazilian ports were declared open to the commerce of all nations at peace with Portugal. Thus John favored industrial development and injured it at the same time. Numbers of artisans and manufacturers from England, Germany, France, and Sweden came to take advantage of the new opportunity. In 1816 the School of Fine Arts was founded by French painters and sculptors. The occupation of Portugal by French troops was offset in

the new world by the incorporation of French Guiana with Brazil (1809); but the treaty of Vienna in 1815 restored Guiana to France. On 16 Jan 1815, the title of kingdom was conferred upon Brazil; and an important extension of the domain of this unique American monarchy was effected six years afterward, when Uruguay was united with it under the title of the Cisplatine State. But this union, like the occupation of French Guiana, was destined to be temporary, owing to the policy adopted by Argentina. See ARGENTINA.

Independence Proclaimed.—The general movement in favor of independence that transformed the Spanish colonies north, south, and west of Brazil into republics, produced conspiracies and plots in Bahia and Pernambuco. Troops were brought out from Portugal to restrain every violent manifestation of the republican spirit; meanwhile, however, in Portugal itself the revolution of 1820 had led to a modification of the old autocratic system, and the forces from that country, openly sympathizing with the aspirations of the Brazilian people, compelled King John to yield. The latter withdrew from America soon afterward (26 April 1821), leaving his son, Dom Pedro, to work out the problem in Brazil as best he might. The attitude of the Cortes of Portugal in this crisis was exceedingly unwise; instead of offering concessions, it directed the dissolution of the central government, and ordered Dom Pedro to return to Portugal. Assured of the support of the people of Rio de Janeiro and San Paulo, who requested him to disobey this command, Dom Pedro proclaimed the independence of Brazil, 7 Sept. 1822. He became constitutional emperor the following month. In the hostilities which ensued the Brazilians were so successful that independence was assured before the end of 1823. The constitution of the empire was adopted on 25 March 1824. But a peculiar situation in the ruling family remained to be disposed of. Since October 1822, Dom Pedro had been emperor of Brazil, while his father was king of Portugal. The dramatic climax occurred 25 Aug. 1825, when a treaty was signed in London by virtue of which King John first assumed the title of emperor of Brazil and then immediately abdicated in favor of his son. As the popularity of Dom Pedro I. was due to the disposition he showed at first to accede to the wishes of the liberals, so it is necessary to ascribe his loss of popularity in the years 1826-31 to his unwillingness to trust the people more and more, as their demand for participation in the government steadily increased. The statement found in some recent histories, to the effect that Pedro I. was a brutal tyrant, whose reign ended in public disgrace, is positively incorrect, and inculcates false views of this entire period. It was his tact that saved the monarchy in 1821; but the growth of republicanism in the next decade was much more rapid among the people than at his court, and finally the breach became so wide that no course was left to him but to surrender his crown before the succession of his son, the second Pedro, should be disputed, and to take ship for Lisbon, where it had become a duty to defend the claim of his daughter, Maria II., to the throne of Portugal. At any time after 1810 outrageous tyranny on the part of Portuguese rulers would have thrown Brazil into the advancing column of revolutionary states. The

BRAZIL

significant facts are, that Pedro I. was able to postpone the inevitable change for 10 years, and that Pedro II. (whose majority was proclaimed 23 July 1840) succeeded in maintaining the monarchical form in America until 15 Nov. 1889. The regency by which the affairs of Brazil were administered (1831-40) was much like a republican government, especially after 1834. Probably it would have been impossible to revert to a monarchy if the weakness and misconduct of the regents had not brought discredit upon everything savoring of democracy; certainly the rôle of emperor in the largest American country could not have been sustained so long except by a sincere advocate of progress, and an enlightened patron of every humanitarian and scientific enterprise. Such was Pedro II. The suppression of the revolution of 1848; the discontinuance of the importation of slaves, in 1853; and the creditable part taken by Brazil in thwarting the ambitious designs of the Argentine dictator, Rosas (See ARGENTINA)—these are the chief events before 1855. In that year a Brazilian squadron was sent to settle a dispute with Paraguay as to the right of way for Brazilian vessels on the Paraná River, which, rising in Brazil, flowing through Paraguay, and finally through the territory of Argentina, should be open to the commerce of all three nations equally. The warships failed to accomplish the desired result, and for a decade vexatious restrictions were placed upon the vessels of Brazil, Argentina, and the United States. In 1864 an outrage by Señor Lopez, the dictator of Paraguay, brought on a war in which Brazil, Argentina, and Uruguay were allied against the offending country. (See PARAGUAY). This bitter struggle, protracted until 1870, cost Brazil the lives of many thousands of her citizens, and in money about \$300,000,000. In the year following the restoration of peace a law was enacted for the abolition of the institution of slavery, the growth of which had been checked, as we have seen, in 1853. It was provided that thenceforth every child born of slave parents should be free.

Brazil a Republic.—A bloodless revolution terminated the reign of Dom Pedro II., and the Federal republic was proclaimed, 15 Nov. 1889. A provisional government, instituted for this purpose, published (24 Feb. 1891) the constitution of "The United States of Brazil," resembling that of the United States of America in nearly every respect, though Brazilian senators serve for nine years, like those of Argentina, while the president's term of office is but four years. Marshal Deodoro da Fonseca, head of the provisional government, was confirmed in the presidency by the constitutional congress, and Gen. Floriano Peixotto was elected vice-president. The next president (15 Nov. 1894) was Prudente de Moraes Barros. The third president, Dr. Manoel Ferraz de Campos Salles, was elected for the term beginning 15 Nov. 1898. His successor, Señor Francisco de Paula Rodrigues Alves, inaugurated 15 Nov. 1902, made a statement of the national policy in his inaugural address which should receive general attention. It may be summarized as follows: A good financial condition in the republic is of prime importance; but scarcely less essential are reforms in the laws applicable to civil suits and elections. Agricultural and commercial conditions must be improved, and endeavors made to

attract immigration and capital. Modern systems of sanitation must be installed at the ports, including Rio de Janeiro. The augmentation of the army and navy may be undertaken when the condition of the treasury warrants such expenditures.

It will be readily understood that the circumstances to which reference has been made in this sketch—such as the issuance of large amounts of paper currency, which it was formerly the fashion to call irredeemable; the change from the basis of slave to free labor; the overthrow of the monarchy; foreign wars, and rebellions in one state after another—have combined to depress Brazilian credit and retard industrial development. To these unfavorable influences must be added the decline in the prices of coffee, Brazil's staple product, and of sugar, her chief reliance in times past. On the other hand there is observable a tendency toward greater stability in the national policy; a large amount of paper money has been called in and destroyed; and at least a moderate interest has been shown recently in efforts to develop the enormous natural resources of the country.

The complete statistics of the import and export trade of Brazil for the year 1901 (the latest which can be satisfactorily analyzed), show the following results: Imports were valued at £19,702,758, exclusive of bullion; exports were £40,621,993. The imports from Great Britain formed 31.389 per cent of the entire import trade; exports to the same country and its possessions, 12.951 per cent of total export trade. Imports from the United States amounted to £2,463,938; exports to the United States, £17,462,650, being 43.116 per cent of the whole merchandise exported from Brazil. Imports from Germany were £1,868,751; exports to Germany, £6,014,812. France imported Brazilian goods to the value of £4,761,907. Argentina exported to Brazil merchandise of the value of £2,651,287. The balance of trade in favor of Brazil is seen to depend chiefly upon the exchange of products with the United States. An estimate for the year 1900 shows imports from the United States, \$11,516,681; exports to the United States, \$64,914,507. In 1902, the imports from the United States appear to be somewhat less than in 1900, while the exports to the United States show a considerable increase. During the 30 years preceding 1902, the United States has purchased from Brazil goods to the amount of \$1,762,622,527, and sold to her goods to the amount of only \$303,813,166—the balance of trade in favor of Brazil for that period being \$1,458,809,361, contributed by the United States alone. Keeping these figures in mind, we now examine the last message of President Campos Salles (3 May 1902), which shows the improvement in the financial situation by comparison of the year 1898 with 1902. In the former year, he says, gold payments were suspended; the paper money in circulation amounted to 788,364 centos; the rate of exchange average 7 3-16; amount required for the redemption of the funding loan was 115,997 centos; Brazilian bonds were at 50 per cent discount; the amount due on the 1897 loan was £1,122,083; treasury notes to the amount of 20,350 centos of reis were in circulation; the treasury owed 11,000 centos of reis to the Banco da Republica: £274,694 were due for war material. To meet these various debts there were in the treasury 5,500 centos, and £81,713 in the agency

BRAZIL

at London. In 1902 gold payments had been reduced; the paper money in circulation was reduced by 107,000 centos of reis; the rate of exchange was 12d.; the paper money in circulation, which formerly was worth only £23,500,000, had increased in value to £34,000,000; Brazilian bonds abroad were quoted 35 per cent higher; the rest of the 1897 loan had been paid; not a single treasury bill was in circulation. There were £2,000,000 in cash in London, besides 1,000,000 in consols, and 12,000 centos deposited in the Banco da Republica. "Finally, the era of deficits has been banished, and that of surpluses has been instituted." The enormous advantage of Brazil in her trade with the United States makes such results possible, and places much more ambitious financial achievements easily within her reach. The total debt of the republic, expressed in gold of the United States, was stated to be \$440,701,893 in 1901.

Army and Navy.—The Brazilian navy in 1901 comprised: 2 battleships of the old style; 2 coast-defense vessels, comparatively modern; 2 old monitors; 7 small cruisers, of which number 3 were unarmored; 6 gunboats, armored, and 18 unarmored; 24 torpedo-boats of all classes; 4 torpedo-cruisers; 2 submarine boats. To man these vessels there were 4,000 seamen, 1,000 stokers, and 450 marine infantry. The army included 484 staff officers; 1,573 officers and 9,035 men in the infantry, and, in the cavalry and engineers, 606 officers and 3,179 men, and 1,400 cadets. The only serious war-cloud at the beginning of 1903 arose out of a dispute with Bolivia over Acre. See ACRE RIVER.

Climate.—The rainy season begins for the hot lowlands of the north in December or January and continues until May or June, the remaining half of the year being dry. In the highlands of the southern and central regions the four seasons of the year are well defined. Throughout the Amazon basin the seasonal variation of temperature is small—from 75° to 90°; and the prevailing winds, the "trades" from the east, mitigate the equatorial conditions. In the high plains of the states of Rio Grande do Sul and San Paulo the mercury sometimes falls to the freezing point. Except in the neighborhood of swamps, marshy or undrained districts, etc., the climate is moderately healthful, and the mortality in the best of the towns does not compare unfavorably with that of cities in the United States.

Resources.—In 1902 the exports of coffee to the United States amounted to 764,658,963 pounds, valued at \$47,004,453. The total exports of rubber from the Amazon valley (lower, upper, and Iquitos districts) in 1901 were 46,992 tons. Tobacco, cotton, cacao, Brazil nuts, rice, sugar—these are some of the vegetable products. There is practically no limit to the number of agricultural enterprises that can be successfully carried on in the table-lands, the broad, open valleys, and the lowlands forming the basin of the Amazon. In the higher regions and mountains the mineral wealth of the republic is being developed. During the first seven months of 1901, 2,435,866 grams of gold, 37,015 tons of manganese, and precious stones to the value of 464 centos, were exported from the state of Minas Geraes. The iron-ore regions are situated within a zone of about 3,200 square miles, from 3,000 to 5,000 feet above the level of the sea, and about 310 miles from Rio de Janeiro, which is the nearest port. The output

of diamonds and carbons in the state of Bahia is of special interest. Prior to the discovery of the South African mines this was the greatest diamond-producing centre, and the Paranguacu district is the only place in the world where carbons are found of marketable size. An excellent statement is made by Señor Fontoura Xavier, consul-general of Brazil in New York, who enumerates the gems found in Goyaz, Matto Grosso, Paraná, Rio Grande do Sul, and San Paulo, as well as in the states mentioned above. Black diamonds, emeralds, sapphires, rubies, beryls, amethysts, garnets, opals, chalcedonies, sapphirines, agates, and cornelians are found, some of them in great abundance. "One of the carboniferous basins of Brazil is in the state of Santa Catarina. In the state of Rio Grande do Sul there have been discovered four large outcrops of coal. Bitumen exists in nearly all of the states." Native sulphur, nitrate, salt, sulphate of magnesia are also mentioned. The average annual value of the gold and diamonds exported is said to be about \$7,400,000. In Rio Grande do Sul are copper mines, in Paraná quicksilver mines; galena and lead mines in widely separated regions.

Finances.—The revenues of Brazil for the fiscal year 1903 were estimated at 40,967,942 *milreis*, gold, and 248,018,000 *milreis*, paper.

The various sources of the receipts and their amounts in *milreis* were as follows:

	Gold	Paper
Revenues from imports.....	31,420,000	122,722,000
Internal revenue.....	1,337,669	36,743,000
Consumption taxes.....		32,660,000
Extraordinary revenues.....	180,276	6,755,000
Paper-money redemption fund.....		2,150,000
Paper-money guaranty fund.....	7,870,000	
Lease of Government railways.....	160,000	1,658,000
Amortization of internal debt.....		5,200,000
Port-improvement fund.....		2,530,000
Total.....	40,967,942	248,018,000

The expenditures for the same period were estimated at 41,399,062 *milreis*, gold, and 244,462,545 *milreis*, paper, and distributed as follows:

	Gold	Paper
Department of Justice and Internal Affairs.....		16,424,481
Department of Foreign Relations.....	905,500	631,920
Navy Department.....		26,700,664
War Department.....		47,569,437
Department of Industry, Communications, and Public Works.....	3,783,315	68,039,477
Department of Finance.....	36,710,247	85,105,565
Total.....	41,399,062	244,462,845

MARRION WILCOX,
Authority on Latin-America.

Brazil', Ind., a city and county capital of Clay County, 16 miles northeast of Terre Haute. It is an important railroad centre and in its vicinity are rich mines of block coal. Inexhaustible deposits of clay and shales are also found here and the city contains manufactures of pumps, tiles, machinery, etc. Brazil was incorporated in 1873, is governed by a mayor, elected quadrennially, and a city council; has a public library and controls its own waterworks. Pop. (1900) 7,786.

Brazil-cabbage, or Chow Caraibe (*Caladium sagittifolium* or *Xanthosoma sagittifolium*), a West Indian plant of the natural order *Araceae*, widely cultivated in the tropics for its starchy edible tubers, which are used like potatoes, and its succulent leaves, which are cooked like spinach. The plant almost entirely lacks the acrid principle which characterizes other members of the order.

Brazil-nut, Castanea, Cream Nut, Nigger-toe, Para Nut, the seeds of two species of Brazilian trees, the only ones of their genus, of the natural order *Myrtaceae*. The better known species, *Bertholletia excelsa*, is a tree which often attains a height of 150 feet and a diameter of four feet. It has bright green, leathery leaves, two feet long and six inches wide, and cream-colored flowers followed by very hard-shelled

fruits about six inches in diameter, containing about 20, three-sided, wrinkled seeds which are largely exported from Para and from ports of French Guiana. They are used for dessert and confectionery and for the manufacture of an expressed oil used in oil painting, lubricating, and lighting. Though of stately dimensions, the tree is of little decorative use. It covers extensive tracts in northern Brazil, and is especially abundant along the Amazon and Orinoco rivers. The seeds of the monkey-pot tree, known as sapucaia nuts (q.v.), are considered superior to Brazil-nuts, but are not yet commercially important, owing to the distance they must be transported from the interior country.

Brazil Tea, a drink prepared from the leaves of *Ilex paraguensis*.

Brazil-wood. A dark-red or brown dye-wood exported from the West Indies, Brazil, and other South American countries. Various grades appear in the market under diverse names, such as Pernambuco wood (*Casalpinia echinata*), St. Martha wood, and All Saints' wood, which are most valued. Except in a few cases botanists have not definitely determined the species which furnish the different grades, but large quantities are derived from *C. brasiliensis*, a small tree, bipinnate leaves, and flowers in panicles. It is indigenous in rocky ground, especially in the West Indies. The valuable part is the heart-wood, of which there is but little when compared with the thick, valueless sap-wood. This useful part is at first light colored, but becomes dark when exposed to light, air, moisture, etc. Formerly it was largely used in dyeing, but coal-tar dyes and other manufactured dyes have generally supplanted it. It is still used in ink-making. The name is said to be derived from Braxilis, not Brazil, since sappan wood, which is believed to be identical, was used prior to the discovery of America.

Brazilian Grass, an incorrect name popularly applied to a substance used in the manufacture of a very cheap kind of hats, known as Brazilian grass hats, and also as chip hats. It consists of strips of the leaves of a palm, *Chamærops argentea*, which are imported for this manufacture, and chiefly from Cuba.

Brazilian Pebble, a colorless and transparent variety of quartz, used for high-grade lenses.

Braz'ing, or Brass-soldering, the process of uniting two pieces of brass, two pieces of copper, or one of each by means of a hard solder, that is, a solder which fuses at a comparatively high temperature. The solder is applied in the form of a coarse powder, and is always mixed with borax, to prevent the oxidation of the metals soldered together. It is usual to moisten this mixture with water before spreading it over the surfaces to be joined. When the solder has been applied in this state, the pieces of metal are slowly heated, by which the water is made to evaporate, leaving a crust of the solder on the parts where it is required. The pieces are then exposed to a stronger heat, until the borax melts and fluxes the solder, which suddenly flushes the joints of the pieces of metal, and thus unites the two surfaces, making them into one piece. The whole is now allowed to cool, and is afterward dressed with a file. Pieces of metal united in this way are held together as firmly as if they were only one piece.

Brazos, brä'zōs, formerly called **Brazos-de-Dios**, a large river in Texas, rising in the elevated region of northwestern Texas, once known as the Staked Plain, between the parallels of 33° and 34°. It flows southeastward between the Colorado and Trinity, and after a course of about 900 miles falls into the Gulf of Mexico, between Quintana and Velasco, 40 miles west-southwest of Galveston. It is navigable by steamers during the wet season for about 300 miles. Among the towns on its banks the chief is Waco, about halfway from its mouth, now an important railway centre. The cotton plantations on the Brazos are highly productive.

Brazos de Santiago, da sän-te-ä'gō, Texas, a village 30 miles east of Brownsville, on the northern bank of the Rio Grande, in Cameron County. The battles of Palo Alto and Resaca de la Palma, in 1846, were fought about half way between Brazos and Matamoras. It carries on much coasting and foreign trade, although a shifting sand bar is a serious obstacle to its commerce.

Brazza, brät'sa (ancient BRACHIA), an island of Austria, in the Adriatic Sea, belonging to Dalmatia, of which it constitutes a separate administrative district; lat. 43° 16' N.; lon. 16° 37' E. It is 24 miles long, and from five to seven broad; contains 20 villages, and is separated from the mainland by a channel 12 miles broad, which affords excellent anchorage for shipping. The island is mountainous and well wooded; and in the valleys vines are grown, from which are made the best wines in Dalmatia. It produces also good oil, almonds, and saffron, and grain in small quantity. Much attention is paid to the cultivation of bees and silk-worms. The chief town, St. Pietro di Brazza, has a small port, defended by a mole. Pop. (1900) 24,465.

Brazza-Savorgnan, Pierre Paul François Camille, pē-är pōl frañ-swä kä-mēl brät-sä-sä-vör-nyän, French explorer; b. on board ship, off Rio de Janeiro, Brazil, 26 Jan. 1852; d. Dakar, French West Africa, 15 Sept. 1905. He entered the French navy in 1875, after becoming a naturalized French citizen, and during 1876-8 explored the Ogowe and Congo regions of Africa, and made treaties between France and the natives, founding Franceville and several other villages. In 1886 he was made governor of the French Congo and Gaboon colonies, which he had thus secured. Brazzaville on the Congo River is named after him. After a sojourn in France, he returned to Africa in 1890 as commissioner-general of the whole of French Congo. The next six years were spent in explorations and securing of French authority in central Africa, after which, in 1897, he returned to France.

Brazzaville, brät'sa-vēl, a town on the French side of the Congo at the lower end of Stanley Pool. It stands nearly opposite Leopoldville, in the Congo Free State. See BRAZZA-SAVORGNAN.

Breach, the aperture or passage made in the wall of any fortified place, by the ordnance of the besiegers, for the purpose of entering the fortress. They should be made where there is the least defense, that is, in the front or face of the bastions. In order to divide the resistance of the besieged, breaches are commonly

made at once in the faces of the attacked bastions and in the ravelin. This is effected by battering, and at such places as the cannon do not reach, by the aid of mines. The breach is called practicable if it is large enough to afford some hope of success in case of an assault. This is generally considered to be the case if it allows a passage to 14 men abreast. Frequently, however, a breach of much less extent, even of half that width, may be entered.

Breach, any violation of law or obligation. A continuing breach is one where the condition of things constituting a breach continues during a period of time, or where the acts constituting a breach are repeated at brief intervals. In pleading, a breach is that part of the complaint in which the violation of the defendant's contract is stated. It is usual in assumpsit, where the common-law rules of pleading are still in force, to introduce the statement of the particular breach, with the allegation that the defendant, contriving and fraudulently intending craftily and subtly to deceive and defraud the plaintiff, neglected and refused to perform, or performed the particular act, contrary to the previous stipulation. In debt, the breach or cause of action complained of must proceed only for the non-payment of money previously alleged to be payable; and such breach is very similar whether the action be in debt on simple contract, specialty, record, or statute.

Breach of Promise of Marriage.—An action lies for this on the part of either man or woman, though, as a rule, only the latter is believed to be substantially injured or deserve damages. There must be a legal and valid consideration, but as there are always mutual promises they are a sufficient consideration for each other. The minds of the parties must meet; that is, there must be a request or proposition on the one side and an assent on the other. If the communications between the parties are verbal, the only questions which usually arise relate to evidence and proof. The exact words or time or manner of the promise need not be proved, but it may be inferred from the conduct of the parties and from the circumstances which usually attend a promise to marry. (15 Mass. 1; 2 Penn. St. 80.) When the parties are at a distance from each other, and the offer is made by letter, it will be presumed to continue for a reasonable time for the consideration of the party addressed, and if accepted within a reasonable time, and before it is expressly revoked, the contract is then complete.

A promise of marriage is not within the third clause of the fourth section of the statute of frauds, relating to agreements made upon consideration of marriage; but if not to be performed within one year it is within the fifth clause, and must therefore be in writing in order to be binding. If no time be fixed and agreed upon for the performance of the contract, it is in contemplation of law a contract to marry within a reasonable period after request, and either party may call upon the other to fulfill the engagement, and in case of default may bring an action for damages. If both parties lie by for an unreasonable period, and do not treat the contract as continuing, it will be deemed to be abandoned by mutual consent. The defenses which may be made to an action for breach of promise of marriage are, of course, various; but

BREACH

it is only necessary to notice in this place such as are in some degree peculiar. Thus, if either party has been convicted of an infamous crime, or has sustained a bad character generally, and the other was ignorant of it at the time of the engagement; or if the woman has committed fornication, and this was unknown at the time to the man who promised to marry her; or if the woman is deeply involved in debt at the time of the engagement, and the fact is kept secret from her intended husband; or if false representations are made by the woman, or by her friends in collusion with her, as to her circumstances and situation in life and the amount of her fortune and marriage portion,—any of these facts, if properly pleaded, will constitute a good defense. If after the engagement either party is guilty of gross misconduct, inconsistent with the character which he or she was fairly presumed to possess, the other party will be released. If the woman insists upon having her property settled to her own personal use, it is said that this will justify the man in breaking off the engagement. So, if the situation and position of either of the parties as regards his or her fitness for the marriage relation is materially and permanently altered for the worse (whether with or without the fault of such party) after the engagement, this will release the other party.

Breach of Warranty.—In sales of personal property an express warranty is one by which the warrantor covenants or undertakes to insure that the thing which is the subject of the contract is, or is not, as there mentioned; as that a horse is sound, that he is not five years old, etc.

An implied warranty is one which, not being expressly made, the law implies by the fact of the sale. For example, the seller is understood to warrant the title of goods he sells, when they are in his possession at the time of the sale. (1 *Ld. Raym.* 593.) In general there is no implied warranty of the quality of the goods sold. The rule of the civil law was that a fair price implied a warranty of quality. This rule has been adopted in Louisiana and South Carolina. There may be an implied warranty as to character, and even as to quality, from statements of the seller, or a purchase for a specified purpose. Any substantial failure, in the article supplied to the buyer in pursuance of the contract of sale, to come up to the quality warranted, amounts to a breach of the warranty, and proof of it establishes the buyer's right to an action therefor. This rule applies to all cases where the remedy sought is by an action on the warranty for damages, or by way of set-off in a suit for the purchase-money: in such cases the buyer is bound to prove the breach and the damages suffered by him in consequence of it, and can recover only to the extent of the damage so proved. A warranty of soundness does not extend to a visible defect. A vendor of personal property is not liable for latent defects, known to him, but unknown to the purchaser, unless he has used some artifice to deceive the purchaser in regard to such defects or has warranted the article. Where an article is warranted as fit for a certain purpose, the seller is liable for an injury sustained by the vendee in consequence of its unfitness. Under an executory contract to sell goods *in transitu*, the vendor is obliged to tender a merchantable article. On a sale of an article known to be intended for food there is an implied warranty that it is sound, wholesome,

and fit to be used as an article of food. (15 *Hun.* 504.) The authority of an agent to warrant goods sold will be implied where it is usual in the market to give a warranty on the sale of such goods; such authority, however, will be implied only as to goods sold at the time of the warranty, which will not extend to subsequent sales in the absence of express warranty.

Breach of Duty.—The non-performance of a duty, or the performance of it in such a manner that injury is done to one's employer, through want of integrity or due diligence and skill. It is assumed that there is an implied contract between an employer and the person that he employs, according to which the latter agrees to perform the duties entrusted to him in such a manner that the interests of his employer shall not suffer. In case of breach of duty, what is called an action of *assumpsit*—that is, an action for the recovery of damages for the non-performance of a promise, which, though not under seal, is yet founded on proper consideration—may be brought by the one who has sustained an injury, against the persons by whom the breach has been committed.

Breach of Peace.—The taking part in any riot, affray, or tumult, which is destructive to the public tranquillity, or the causing others to do anything to injure the public tranquillity. The former are actual, the latter constructive breaches. In both cases the breach of the peace may be either felonious or not felonious. The felonious breaches of the peace are three in number: (1) The riotous assembling of 12 or more persons, and not dispersing upon proclamation; (2) the riotous demolishing of churches, houses, buildings, or machinery; (3) maliciously sending, delivering, or uttering, or directly or indirectly causing to be received, knowing the contents thereof, any letter or writing threatening to kill or murder any person. The remaining offenses are not felonious, and include: (1) affrays; (2) riots, routs, and unlawful assemblies, which must have at least three persons to constitute them; (3) tumultuously petitioning; (4) forcible entry or detainer, which is committed by violently taking or keeping possession of lands or tenements with menaces, force, and arms, and without the authority of the law; (5) riding, or going armed, with dangerous or unusual weapons, terrifying the good people of the land; (6) spreading false news; (7) false and pretended prophecies, with intent to disturb the peace. Finally, there are two constructive breaches of the peace, namely, challenging another to fight, or bearing such a challenge, and the making public by either printing, writing, signs, or pictures, malicious defamations of any person, especially a magistrate, in order to provoke him to wrath or expose him to public hatred, contempt, and ridicule.

Breach of Trust.—A violation of duty by a trustee, executor, or any other person in a fiduciary position. A trustee is not permitted to manage an estate entrusted to him, in such a manner as to derive any advantage to himself, and at the same time he is bound to manage it in such a manner that the person for whom he has it in trust shall reap from it the greatest possible advantage. Accordingly money held in trust by a trustee must be invested by him in government stock, or in certain other special securities, for the behoof of him for whom he has the money in trust; and if he has not done

BREAD AND BREAD MAKING

so he is, as a general rule, liable for interest on the trust funds. Formerly it was the duty of the trustee to invest money in government securities alone, but under certain acts (unless the trust deed expressly forbids) a number of other sound investments are allowed. A trustee who has grossly mismanaged his trust may have to repay money lost, with interest, and sometimes compound interest. (See TRUSTEE.) The court of chancery has adopted two rules to guide the decisions with respect to the liability consequent upon a breach of trust. The purport of the first is, that with a view not to strike terror into persons acting for the benefit of others, the court will deal leniently with trustees who have endeavored fairly to discharge their duty, and in case of any misapplication of the trust money the court will not hold the trustees liable on slight grounds. The second rule is, that care must be had to guard against any abuse of their trust on the part of the trustees. A fraudulent misuse of trust funds is punishable as a misdemeanor with fine and imprisonment.

Bread and Bread Making. Bread is the product obtained by baking a mixture made of wheat flour or the meal from any cereal and water alone, milk, or milk and water, shortening and yeast, or baking powder. Unleavened bread is that made without yeast or other leavening agent. Ordinarily, the term bread is applied to the product made from wheat flour, but other cereals either alone or mixed with wheat are used for bread-making purposes, as rye, corn, and, to a limited extent, barley. Wheat and rye, however, are the only cereals which yield a gluten specially adapted to retaining gas and producing a light, porous dough and bread.

Bread making is an ancient art. In prehistoric times there is abundant evidence of the baking and use of cereals as food. The earliest historians speak of bread and bread making. Bread is frequently mentioned in the Bible, particularly unleavened bread, suggesting that leavened bread was known at that time. It was in Egypt that bread making first reached any degree of perfection. The art of bread making has kept pace with the advance of civilization, the more perfect the system of bread making, the higher the grade of civilization. From Egypt, bread making was introduced into Greece and from there into Italy, and later it followed with the advance of Roman civilization. Among the more civilized American Indian nations, particularly the Aztecs and cliff-dwellers, bread making reached a comparatively high grade.

Methods of bread making vary considerably among different nations, although the underlying principles with all are essentially the same. The main differences are in the way in which the yeast or ferment material is employed, and the method of manipulation. During recent years, study of the yeast plant has resulted in improved methods of bread making. The purity of the yeast and the quality of the flour are the two most essential features for the production of bread of good quality.

Yeast is a unicellular plant which readily reproduces itself by the process of "budding" when added to a batter containing small amounts of saccharine, mineral, and nitrogenous matter. Flour contains all of the food required for the propagation of the yeast plant, which secretes a number of chemical compounds called enzymes which are active agents in bring-

ing about the chemical changes that take place in bread making. Pasteur in his work on fermentation states: "In introducing a quantity of yeast into a saccharine wort, it must be borne in mind that we are sowing a multitude of minute living cells, representing so many centres of life, capable of vegetating with extraordinary rapidity in a medium adapted to their nutrition. This phenomenon can occur at any temperature between zero and 55° C. (131° F.), although a temperature between 15° C. and 30° C. (59° F. and 86° F.) is the most favorable to its occurrence." The individuality of the yeast plant, the nature and amount of its food supply and the conditions under which it develops determine the value of the yeast. When compelled to work in the presence of or to contend with other ferment bodies, the yeast is contaminated and is of lessened value for bread-making purposes. Yeast, like plants of higher orders, is often poorly nourished. Yeast used for brewing purposes is developed from healthy, vigorous, well-nourished yeast plants, and is called high yeast. See BREWING.

The different forms in which yeast is used, as dry cakes, sour dough, compressed soft cakes, brewers' yeast, etc., are simply different ways for preserving and introducing the yeast into the dough so as to leaven the entire mass. The different kinds of yeast vary with the individuality and character of the yeast plants.

Air takes an important part in bread making; its action upon yeast is briefly summarized by Pasteur as follows: "Fermentation by means of yeast appears, therefore, to be essentially connected with the property possessed by this minute cellular plant of performing its respiratory functions, somehow or other, with oxygen existing combined in sugar. Its fermentative power varies considerably between two limits, fixed by the greatest and least possible access to free oxygen which the plant has in the process of nutrition. If we supply it with a sufficient quantity of free oxygen for the necessities of life, nutrition, and respiratory combustions; in other words, if we cause it to live after the manner of a mold, properly so called, it ceases to be a ferment; that is, the ratio between the weight of the plant developed and that of the sugar decomposed, which forms its principal food, is similar in amount to that in the case of fungi. On the other hand, if we deprive the yeast of air entirely, or cause it to develop in a saccharine medium deprived of free oxygen, it will multiply just as if air were present, although with less activity, and under these circumstances its fermentative character will be most marked; under these circumstances, moreover, we shall find the greatest disproportion, all other conditions being the same, between the weight of yeast formed and the weight of sugar decomposed. Lastly, if free oxygen occur in varying quantities, the ferment power of the yeast may pass through all the degrees comprehended between the two extreme limits of which we have spoken."

According to Brown, "yeast cells can use oxygen in the manner of ordinary aerobic fungi, and probably require it for the full completion of their life-history; but the exhibition of their fermentative functions is independent of their environment with regard to free oxygen."

From the investigations of Pasteur, Brown, and others, it would appear that during knead-

BREAD AND BREAD MAKING

ing and aeration, the fermentation process is changed from anaerobic to aerobic form, which appears necessary in order that the full development and complete workings of the yeast cells can take place.

The principal chemical changes which take place in bread making are: (1) production of carbon dioxide and alcohol; (2) change of insoluble carbohydrates to soluble form; (3) production of lactic and other acids; (4) formation of volatile hydrocarbon derivatives; (5) change of solubility and molecular structure of the proteid compounds; (6) formation of amide and ammonium compounds from proteids; and (7) partial oxidation of the fat. The agents which bring about these chemical changes are ferments and heat. The yeast plant, as previously stated, secretes a number of enzymes or chemical products which are active agents in producing chemical changes. Diastase and invertase act upon the carbohydrates forming dextrose sugars which undergo alcoholic fermentation. This results in the production of about one per cent each of carbon dioxide and alcohol. During the process of baking, nearly all of the alcohol is expelled, as only traces of alcohol have been obtained in fresh bread. The joint action of the yeast and heat upon the starch granules results in changing about 6 per cent of the starch to soluble forms as dextrin and dextrose sugars. Some of the starch grains are ruptured, others are partially disintegrated by the ferment action, while many appear to be unaltered. These physical changes of the starch granules render bread more susceptible to the action of the digestive fluids.

Lactic, acetic, and occasionally butyric and other acids are formed during bread making, particularly if the alcoholic ferment becomes inactive and sour dough is formed. From .3 to .4 per cent of acid, calculated as lactic acid, is formed and unites with the gluten proteids during the baking process. The amount of volatile hydrocarbon derivatives formed during bread making is small, less than .10 of a per cent. These compounds give the characteristic aroma to freshly baked bread.

The wheat proteids undergo a number of chemical changes during bread making. (See WHEAT; WHEAT FLOUR.) While the proteids of wheat are mainly in the form of insoluble glens, small amounts are present as albumin and globulin. Wheat gluten is composed of two substances: gliadin, a glue-like body, and glutenin, a gray powder to which the bands of gliadin adhere. Gliadin constitutes the binding material of the flour, and enables the dough to retain the carbon dioxide gas formed during fermentation and this leavens the bread. An excessive amount of gliadin produces a soft sticky dough, while an excess of glutenin reduces the power of expansion of the dough. In hard wheat flours, the gluten is composed of about 35 per cent glutenin and 65 per cent gliadin. The ratio of gliadin to glutenin determines very largely the quality of the bread. The removal of the gliadin proteid from flour results in a loss of bread-making properties, as the dough fails to expand. Any interference with the gliadin-glutenin ratio in flour affects its bread-making qualities.

Yeast is employed in bread making, not only to produce gas and expand the dough, but also

to produce other chemical changes as formation of acid bodies that combine with the proteids to form acid proteids which frequently favorably affect the gliadin-glutenin ratio. Because of the difference in the amounts of gliadin and glutenin in flours, the methods of bread making must be varied to meet the requirements of different kinds of flour.

In average bread making, from 1½ to 2 per cent of dry matter is lost by fermentation and the formation of volatile products as carbon dioxide, alcohol, volatile hydrocarbons, and ammonium products. The losses fall alike upon both the carbohydrates and proteids. With prolonged fermentation, the losses of dry matter may amount to 5 per cent or more.

Bread varies in chemical composition according to the quality of the flour from which it is made. Some flours contain 12 per cent and more of proteids, while others contain 8 per cent and less, according to the composition of the wheat from which the flour has been milled. (See WHEAT.) Flours of high protein content contain proportionally less starch than low protein flours. The starch and protein content of flour and bread vary inversely.

COMPOSITION OF BREAD.

Bread made from white straight grade flour of:	Water Per cent	Protein Per cent	Starch and Carbohydrates Per cent	Ash Per cent	Fat Per cent
(1) High protein content	36.97	10.12	51.70	.45	.76
(2) Average protein content	32.90	9.57	55.44	.51	1.28
(3) Low protein content	32.10	7.21	59.29	.52	.88

When either whole or skim milk is used, the bread contains more protein. The use of milk in bread making is desirable because of its increasing the nutritive value of the bread product. The amount of fat in bread varies with the amount of lard, butter, or other form of shortening used in the making. Occasionally a large amount of lard is used to prevent the bread from drying out too rapidly.

The composition of bread is influenced also by the method of milling the wheat. The outer and aleurone layers of the wheat kernel contain more nitrogen, fat, and ash than the floury portion, hence their addition, as in graham and entire-wheat flours causes the bread to be richer in these compounds. When milled from the same lot of wheat, graham, entire-wheat, and white flours have the following composition:

	Protein Per cent	Fat Per cent	Carbohydrates Per cent	Ash Per cent
Straight (white flour) ..	11.99	1.61	75.36	.50
Entire-wheat flour.....	12.26	2.24	73.67	1.02
Graham flour.....	12.65	2.44	74.58	1.72

Digestion experiments have shown that the finer grades of white flour are more digestible than either graham or entire-wheat flour; the

BREAD AND BREAD MAKING

comparative digestibility of the three kinds of flour being as follows:

	Per Cent Digested		
	Protein	Carbo- hydrates	Calories
White bread.....	85.3	97.5	90.1
Entire-wheat bread...	80.4	94.1	85.5
Graham bread.....	77.6	83.4	80.7

The higher degree of digestibility of the white bread results in its furnishing a larger amount of available nutrients to the body than is supplied by either graham or entire-wheat. The available nutrients in the three kinds of flour milled from the same lot of wheat are as follows:

	Protein Per Cent	Carbo- hydrates Per Cent	Calories Per gram
White flour.....	10.2	73.5	3.650
Entire-wheat	9.9	69.3	3.445
Graham	9.8	66.3	3.350

White bread when properly made from a glutinous flour has a high degree of digestibility, and with the exception of some of the oat preparations supplies the body with more available nutrients than is secured from any other cereal.

Bread is not generally subject to adulteration, although various forms of sophistication have been practised. The most common form of adulteration is the use of a small amount of alum with damaged and inferior grades of flour. Occasionally rye bread is in part prepared from wheat flour. Wheat bread also has been prepared from flour of mixed cereals, as corn and wheat. During recent years this practice has practically ceased in the United States owing to national laws regulating the taxing and branding of wheat flours when mixed with other cereals or materials.

During the process of baking, the temperature of the oven may range from 225° to 260° C.; the interior of the loaf, however, does not reach 100° C. Various forms of ovens, heated in different ways and with different kinds of fuel are in use. Modern bake ovens are usually so constructed as to secure the highest efficiency from the fuel consumed and to prevent unnecessary losses of heat by radiation. Some ovens are provided with self-registering thermometers and thermostats for the regulation of the temperature, also devices as tricks, racks, and trays for receiving the bread. The bake-ovens in use in different countries vary widely in form and method of heating. Before stoves were used, bread was baked in special ovens usually adjacent to open fireplaces. In some localities, brick bake-ovens were built out of doors. A fire was made in the oven and when the bricks were sufficiently heated, the coals were removed and the unbaked bread was placed in the hot oven, where it readily baked. This plan of heating ovens is even now in use in some European countries. For home bread-making purposes in the United States stoves provided with bake-ovens are used almost exclusively.

Bread, as offered in the market, is made in loaves of various forms, which usually weigh about one pound. In some countries laws regulating the weight of the bread are rigidly enforced, and bakeries are subject to sanitary inspection. During the process of doughing flour will absorb from 40 to 60 per cent of water. During the baking process a part of this water is expelled as steam. On account of the additional water absorbed, a pound loaf of bread can be made from .65 to .75 pounds of flour. A barrel of flour weighing 196 pounds will make from 275 to 300 pound loaves of bread, which will contain about 170 pounds of dry material. Since bread readily loses water, allowance is usually made in baking for subsequent shrinkage in weight. Because of greater power for absorption of water, some flours are more valuable for bread-making purposes than are others. The larger the amount of gluten which a flour contains, the greater is the power to absorb water and to produce a large number of loaves per barrel. A low gluten content influences the moisture content of bread more than it does the size of the loaf. Flour which contains a well-balanced gluten can have 10 or even 20 per cent of starch or other material added without influencing the size of the loaf, and on the other hand, the addition of moist gluten to dough does not materially increase the power of expansion or the size of the loaf. Flours which possess poor qualities of expansion are often improved by blending with those of different character. In many larger bakeries, special machinery has been devised for the blending of different qualities of flour. In some bakeries, one kind of flour is used for making the sponge which is then mixed with another kind in making the dough. Some of the more expensive and higher grades of flour are often used in this way to impart quality to the bread product. Comparative baking trials are made when flours are tested for technical purposes, the same weight of flour, yeast, water, and other materials being used. From the tests the physical properties of the bread are determined, as color, size of loaf, weight, odor, and taste.

Special trade names are given to different kinds of bread. In some bakeries, a bread known as home-made or domestic bread is made. Different kinds of bread are usually due to differences in manipulation, as extent of fermentation, kneading, lightness of dough, etc. For domestic purposes, a moist loaf of good quality is usually preferred to one that is extremely porous and readily dries. Different names are applied to various bread products, as Vienna bread, a high-grade white bread made with yeast, milk, shortening, salt, and in some instances a small amount of sugar. Various other ingredients are sometimes used in bread making, as potatoes, potato starch, potato water, barley water, buttermilk, molasses, etc. These materials take only a secondary part in the process, influencing the taste and flavor more than the composition, unless used in large amounts. The flavor of bread is due to the small amount of ethereal products formed during fermentation by the action of the ferments in the yeast and the soluble ferments or enzymes in the flour. Undesirable as well as the desirable flavoring products are developed during the process of fermentation in case the yeast is of poor quality or the flour is unsound.

BREAD-FRUIT — BREAD-NUT

There are many different kinds of bread made from the different cereals, as pumpernickel, which is made from the graham of rye, flat bread made in large flat cakes without yeast from wheat flour, and baked on the top of a hot stove. This bread is extensively used in the Scandinavian countries. Black bread is used by the peasantry in many European countries.

Aerated bread is made by forcing carbon dioxide through the dough instead of securing a like result by fermentation with yeast, etc., as in the ordinary method of bread making.

For home bread making, Miss Shepperd in her 'Hand-Book of Household Science,' gives the following directions: "Bread with Home-Made Yeast.—One cup of good home-made yeast, one cup of milk and water (one half cup of each) and two level teaspoonfuls of salt. Have the temperature of liquid and flour 75° F. and make into a dough stiff enough to handle without flour, let rise three hours, or until double in size, keeping always at 75° F., and when risen, mold into loaves, let stand one hour and bake." The home-made yeast is made as follows: "Stir one half pint of flour to a smooth batter with one half pint of cold water. Over this pour one quart of boiling water, pouring slowly and stirring rapidly. Place over the fire, and cook four or five minutes. Add two level tablespoonfuls of sugar and one of salt. When cooled to 75° F., add one ounce of compressed yeast, or one pint of home-made yeast. Keep as nearly 75° F. as possible for 24 hours, stirring down once in four or five hours. Keep in a glass jar in a cool place. The jar must be thoroughly washed and scalded before putting fresh yeast into it."

"Compressed Yeast Bread.—To make bread with compressed yeast, break a one-half ounce cake of compressed yeast into small pieces in a cup, and cover with cold water. Place in a bowl one pint of liquid—one half milk and one half water. Make the temperature of the mixture 75° F. Into this liquid put two level teaspoonfuls of salt, stir in a cup of sifted flour; stir the yeast and water in the cup, and pour into this; put in another cup of flour and beat it well. Continue to stir in flour, keeping sides of bowl clean, and kneading with the spoon until nearly stiff enough. Then bathe the hands, wipe them dry, flour the board, and knead the dough until it ceases to adhere to the hands or board, when no flour is used. Grease the bowl with some nice-flavored fat and treat the top of dough after putting into the bowl in the same way. Cover the bowl with a white cloth and allow the dough to rise. See that the air is not cooler or warmer than 75° F. Let the dough rise three hours, or until it is double its original size, knead well and mold into loaves, put in greased pans, grease over the top, let rise one hour, when it will again double its size if properly manipulated, then bake."

These methods of making bread are particularly adaptable to hard wheat flours. For soft wheat flours, other methods in which more salt is used, a longer time allowed for fermentation, and a stiffer dough is made, will be found to give better results. Because of differences in the composition of the various kinds of flour, no directions can be given which are alike applicable to all. The method of bread making which is suited to one flour does not necessarily give the best results with other flours. In fact,

it is necessary to vary the conditions of preparation according to the kind of flour used.

HARRY SNYDER,

Chemist, University of Minnesota.

Bread-fruit (*Artocarpus incisa*), a tree of the natural order *Urticaceae*, native of the Indian Archipelago and of the southern Pacific Islands. It attains a height of 30 or 40 feet; is often limbless for half its height, bears leathery, glossy dark green, three- to nine-lobed leaves, one to three feet long; has compact, club-shaped, yellow catkins of male flowers, 9 to 15 inches long, and sub-globular heads of female flowers with spongy receptacles; and usually seedless, spheroidal fruits, at first green, later brown, and lastly yellow, six inches or more in diameter, hanging by short thick stalks singly or in clusters of two or three from the smaller branches. The rough rind is irregularly marked in squares and other figures with raised centres. The unripe fruit contains a milky juice, and when in the edible stage it resembles fresh bread, being white and mealy. It is then slightly tart. Later it becomes yellow, juicy, and tastes of decay. In tropical countries where it has been introduced and particularly in its original home, the fruit is highly valued as a nutritious food, being prepared for use in various ways. When baked it resembles plantain rather than wheaten bread, being sweetish, slightly astringent, but otherwise almost tasteless. When fresh fruits cannot be procured, it is sometimes slightly fermented, beaten to a pasty mass, and so used. Another common way of preparing it is to beat it to a paste with coconut milk and to serve it mixed with bananas, plantains, etc. Since the trees produce two or three crops annually, and since the bearing seasons of different varieties overlap more or less, the fruit may be obtained during the greater part of the year. Not alone for the fruit is the tree valuable; in the South Sea Islands its fibrous inner bark is woven into cloth resembling, but inferior in softness and whiteness, to that made from the paper mulberry which is similarly employed in those islands; the gummy exudation from the bark, boiled with coconut oil is used for caulking canoes, pails, etc.; and the beautiful yellow wood is light and soft, but when exposed to the air becomes dark like mahogany, and is used for canoes, furniture, and the interior work in houses. The tree has been cultivated to a slight extent in southern Florida, but the fruits rarely appear even in the most southern markets of the United States, because they do not bear shipment well, and unless used very soon after being gathered become hard and disagreeable in taste. For an account of the introduction of the bread-fruit tree into the West Indies in the last decade of the 18th century, when such feats were more difficult and less common than a century later, see Curtis, 'Botanical Magazine' (pp. 2860-71). A near relative of the bread-fruit tree is the jack (q.v.).

Bread Making. See BREAD.

Bread-nut (*Brosimum alicastrum*), a tree of the natural order *Urticaceae*, a native of the West Indies and closely related to the bread-fruit. The tree, which is very large, bears shining lance-shaped leaves; globose catkins of male and female flowers on different trees; and yields a gummy, milky juice from its bark. The round, yellow fruits (drupes), which are about three inches in circumference, contain each a single

seed. When roasted or boiled they are used like bread, and, having a flavor which resembles hazel nuts, form a pleasant food. In the United States the tree has not been cultivated.

Bread Riot in New York, The, a riotous demonstration in New York, 13 Feb. 1837. The financial policy of President Jackson had created an era of wild-cat banks, currency inflation, extravagant speculation, and high prices which bore cruelly on the poor, flour being \$12 a barrel, partly owing to a short crop the year before, and other prices in proportion. In New York the general distress was intensified by the great fire of 15-16 Dec. 1835, which destroyed nearly 700 business and other buildings, covering some 13 acres in the heart of the city and occasioning a loss of \$20,000,000. For some time the Jacksonian press had been denouncing the grain dealers as the cause of the famine prices, mentioning especially Eli Hart, the leading commission merchant, and the houses of Meech and Herrick, although as they were commission dealers their stocks were obviously not private hoards. On 13 Feb. 1837, just before Jackson's term expired, these papers announced a public meeting in City Hall Park at 4 P.M., the call being headed "Bread, Meat, Rent, Fuel! Their prices must come down!" The call was signed by eight men, two of whom — Moses Jacques and Alexander Ming, Jr. — were well-known and very violent demagogues. Jacques was made chairman, and with Ming, and others, made furious speeches inflaming the passions of the crowd. Some one at length indicated Hart's store, on Washington Street, between Dey and Cortlandt, as a vast hoard of provisions to relieve their distress, and the crowd surged toward it. The police were swept away and beaten, and although two of the three iron doors held, the centre one was battered in, and the crowd began throwing flour barrels and sacks of grain into the street, staving in and tearing open such as did not burst by their own fall, and as one of the papers remarked, "lowering prices by leaving less on the market." A fresh onslaught by the police was repelled; and it was not till well into the evening that a body of militia dispersed the mob, which by this time had thrown into the street about 500 barrels of flour and 1,000 bushels of wheat, the most of it relieving no one. Herrick's stock was somewhat damaged also, and Meech's store attacked. The disturbance was attributed to the foreigners, but although the two ringleaders were foreign, four of the eight names signed to the call were American, and the natives certainly looked on at the mob without trying to assist the officers.

Bread-root (*Psoralea esculenta*), a leguminous plant with edible, farinaceous tubers. It is the *Pomme blanche* or *Pomme de terre* of the French pioneers. It is common on the higher prairies from Texas through Iowa to Wisconsin.

Bread-winners, The, a brief novel, appeared anonymously in 1883. The kindly interest shown by Alfred Farnham, a retired army officer, in Maud Matchin, the handsome but vulgar daughter of a master carpenter in a western city, turns her head, and she confesses her love to him, which is not reciprocated. Maud's rejected lover, Sam Sleeney, journeyman in Matchin's employ, is jealous of

Farnham. Dominated by Offitt, a demagogue, he joins a labor organization. Farnham loves Alice Belding, who refuses him, but still returns his love. During a strike Farnham organizes patrolmen. The mob attacks his house, and Sleeney assaults Farnham, but fails to kill him. Offitt, who now pays his addresses to Maud, enters Farnham's home, assaults and robs him, and Alice and Mrs. Belding come and nurse him. Offitt turns suspicious to Sleeney, hastens to Maud, and urges her to fly with him. Suspecting, she refuses, gets and reveals his secret. Sleeney, who has been arrested, breaks jail, and at Maud's home meets Offitt and kills him. Sleeney is tried for killing Offitt, and acquitted upon the ground of temporary insanity. The book is a brilliant presentation of the conditions of "labor" at that period. Its authorship was acknowledged in 1902 by John Hay.

Breadalbane, brēd-āl'bān, a district in the western part of Perthshire, in the centre of the Grampians, which here cover a large tract of the county in length and breadth. This district is a complete mixture of high and low hills, yielding pasture for large flocks of sheep and shelter for game, with intermediate valleys, some of which are susceptible of cultivation, while others are merely areas of peat and heath. Loch Tay lies in the centre of the district. Kenmore and Killin are the largest villages.

Breadth, a term in art, used to denote means or effects whereby an artist becomes distinguished for largeness and mastery of treatment. Breadth of style in art is shown in work which gives the impression of these qualities, manifested in simplicity, comprehensiveness, and due subordination of detail. In a work of art possessing the true characteristics of breadth, the eye, passing from one feature to another, takes in, as it were, the whole subject and meaning at a single glance.

Break-Circuit Chronometer, the name applied to a box-chronometer to which a device has been attached for breaking an electric circuit at stated intervals, usually once in two seconds.

Break'er. See COAL MINING.

Breakespere, brāk'spēr. See ADRIAN IV.

Breaking Bulk, the act of breaking open of a bundle, parcel, etc., and taking the contents, so as to constitute in law a conversion or the like.

Breakwater, an obstruction of any kind raised to oppose the action of the waves, and make safe harbors and roadsteads. The outer mole of the harbor of Civita Vecchia was built by the Emperor Trajan for this purpose; and the piers of ancient Piræus and of Rhodes are of the same class of structures. Herod, it is stated by Josephus, in order to form a port between Dora and Joppa, ordered mighty stones to be cast into the sea in 20 fathoms water, to prepare a foundation; the greater number of them 50 feet in length, 9 feet deep, and 10 feet wide, and some were even larger than these. In the use of such immense blocks of stone, the true principles of constructing a permanent barrier to the waves, appear to have been better understood than they were 17 centuries afterward. Breakwaters are generally solid and made of stone, but there are also floating breakwaters which serve the same purpose. These

BREAKWATER

are built of strong open woodwork, divided into several sections, and secured by chains attached to fixed bodies. The breakers pass between the beams of such a structure as if through a sieve, and in the passage nearly all their force is destroyed. It is estimated that a breakwater of this description will last for 25 years. Stone breakwaters are usually constructed by sinking loads of unwrought stone along the line where they are to be laid, and allowing them to find their angle of repose under the action of the waves. When the mass rises to the surface, or near it, it is surmounted with a pile of masonry, sloped outward in such a manner as will best enable it to resist the action of the waves, or it is covered, as at Plymouth, England, with large blocks of stone, which do not rise high above the surface of the water. Sometimes the breakwater has to be constructed of solid masonry from its foundation. The breakwater at Dover, England, is built in this way, there being no stone in the neighborhood to form a base of the kind described. The most gigantic breakwater ever constructed is that which was erected by French engineers to protect the harbor of Cherbourg. The history of the building of this

base, and 339 feet at the top, the angle of the slope being 60° . This was strengthened by an interior concentric cone, 5 feet 10 inches within the outer one. The frame of each was made of 80 large upright timbers 24 feet long and 1 foot square. On these were erected 80 more of 14 feet in length, making, for the 2 exterior and 2 interior portions, 320 of these uprights. The machine was then planked, hooped, and firmly bolted together. The first cone was built and floated at Havre, then taken to pieces, transported to Cherbourg, and floated off and sunk on 6 June 1784; and the second on 7 July following, in the presence of 10,000 spectators; but before the cavity of this one could be filled with stones, its upper part was demolished in a storm of five days' continuance in August, and the stones it contained were spread over the bottom, interfering with the placing of the next cone. The original plan was to set 90 of these cones, of 150 feet diameter at base, 60 at top, and 65 feet high, in succession, and fill them with loose stones or masonry, and the spaces between them with a network of iron chains, to break the force of the waves. Several modifications of the plan were attempted, the net

breakwater affords an amusing and instructive example of the folly of ignoring experience and the laws of nature. When Louis XVI. appointed commissioners to report upon the best locality for establishing, opposite the English coast, a port and naval arsenal, they recommended the construction of a dike over two miles in length, in water 70 feet deep, in front of the harbor of Cherbourg, by sinking a vast number of ships filled with masonry as a basis, and covering these with heavy stones to within 18 feet of the surface. And when at last four of the ablest naval officers and engineers of France were appointed to execute the work, which was regarded as one of the most stupendous operations, certainly the greatest piece of hydraulic architecture ever undertaken by man, the plan they adopted was one which proved impracticable after having been prosecuted from the year 1784 to 1789, at enormous expense. This plan was the construction of huge truncated cones of timber, which, of the reduced size at which they were actually built, measured 36 feet in height, with a circumference of 472 feet at the

result, after years of labor and an expense of upward of \$6,000,000, being a number of isolated mounds of stone, extending in a crescent for about $2\frac{1}{2}$ miles. In 1830 the work was again taken up, and completed in its present form about 1856. For a full account of this stupendous work, consult Cresy's 'Encyclopædia of Civil Engineering.'

There are many important breakwaters in the United States, and each decade finds an increasing number of them as the demands of trade, and the liberality of the government demands and permits their construction. The latest of these (1903) is the great breakwater at Buffalo, N. Y., built to form a harbor for the immense lake traffic centring at that city. This structure forms the most important section of a long line of breakwaters that extend for $4\frac{1}{2}$ miles along the water-front. At the time that the present work was undertaken there existed the north breakwater, which is built of concrete and extends for 2,200 feet, with a light at its southerly end. Opposite this light and to the westward of it is the northerly end of what is

known as the old breakwater, a timber and concrete structure 7,608 feet long. There is a light at the northerly end of the old breakwater, with a harbor entrance between it and the southerly light of the north breakwater. To the south of the old breakwater is the new structure now being considered. It consists of a stone breakwater 7,261 feet in length, which connects with a timber and concrete structure extending south for another 2,739 feet, with a light at its southerly extremity. Parallel with the previous structure, and slightly to the westward of it, is a timber crib breakwater, 2,803 feet long, which runs northerly from Stony Point. It has a light on its northern extremity, and the opening between this and the last named breakwater forms the south harbor entrance, the opening between the stone breakwater and the old breakwater being known as the middle harbor entrance. The 7,261-foot stretch of the new breakwater is of the rubble mound type, stone-topped, while the southerly end of it, 2,739 feet, is of timber crib construction, to enable vessels to moor alongside of it inside of the harbor.

The new breakwater is built in the open waters of Lake Erie, parallel with the shore, 1,500 feet out from the pierhead line of the harbor, and in 30 feet of water. The first operation was to deposit two parallel ridges of small rubble on the lake bottom, one on the lake side and one on the shore side of the proposed breakwater, the intervening space being filled in with gravel. Another five feet of rubble ridges were added and again filled in with gravel, the mound thus formed being raised to within 10 feet of the surface of the water. The breakwater was then built up for the remaining 10 feet to the surface of the lake by dumping upon it large rubble stones. The slopes of the structure were covered with a revetment of large stones, lowered into place in close touch with each other, so as to completely cover the rubble stone, the object of these heavy quarried stones being to prevent displacement of the rubble by the action of the water. Then came the important work of covering the mound with large capping stones, quarried to prescribed dimensions, many of the stones measuring as much as six feet in thickness. These stones were carried out by five large floating derricks, each with a lifting power of 20 tons. The capping stones were laid snugly together, the finished top and side of the breakwater presenting a fairly even and true appearance. The illustration shows very clearly the way in which the top of the breakwater is finished, the heavy top angle stones serving by their weight and friction to prevent the heavy seas from taking hold of the rubble mound, loosening it and washing it away. A cross section of the breakwater as thus constructed shows it to be normally about 140 feet wide at the bottom and 14 feet wide at the top.

While the masonry breakwater was being constructed, the work of building the timber-crib structure was also going on apace. As compared with the rubble-mound type, the timber and concrete form has the advantage of being cheaper in construction. In building it the first step was to prepare a foundation and for this purpose a powerful clam-shell dredge built especially for the work was used to dredge a trench along the line of the breakwater in the

bottom of the lake 95 feet in width, and 50 feet in depth through the clay. Then through the centre of this trench another excavation was dredged out which was 50 feet in width and extended everywhere to solid rock. The next task was to fill in the trench thus formed with gravel which was brought to the spot in scows and dumped in, a bed of gravel 30 to 40 feet in depth being formed in this way. Upon this was placed an embankment of rubble stone eight feet high, which formed a foundation for the timber cribs. These cribs were built of sawn timber and were 36 feet wide, 22 feet high, and from 60 to 180 feet long. They were towed to position over the foundation and sunk by loading with stone. The superstructure was built in 3 benches, the first 6 feet, the second 10 feet, and the third 12 feet above the mean water level of the lake. Each bench was 12 feet wide. As shown in the illustrations, a certain portion of the crib breakwater, as finished, is of this construction; but the larger portion of it has been capped with concrete. This was done to strengthen the structure, the heavy gales of 12 Sept. and 21 Nov. 1900, in the latter of which the wind reached a velocity of 80 miles an hour, having loosened up and broken the above-water timber coping and finish. In repairing the ravages of the storm, the damaged superstructure was removed and the cribs cut down to an elevation of two feet below the mean lake level. Upon this, concrete blocks, forming longitudinal and cross walls, were placed, and the pockets thus formed filled in with rubble stone, and roofed in with heavy concrete work, which was carried up to the level of the original breakwater. In place of the three benches of the crib superstructure, the reconstructed portion shows a parapet and a banquette. The parapet which is exposed to the lake side covers a width of 27 feet and its crest is 12 feet above mean lake level. The banquette is 8 feet wide and is uniformly 4 feet above the lake level. The new breakwaters have taken some six or seven years to construct, and the cost has been \$2,200,000. Consult: 'Reports of the Chief of Engineers U. S. A.'; Spon, 'Dict. of Engineering'; Stevenson, 'The Construction of Harbors'; De Cordemoy, 'Les portes modernes.'

Bream, a sluggish fresh-water fish (*Abramis brama*) of the carp family, common in European lakes and rivers, and especially numerous in the English fens, where it finds all the conditions most favorable, and reaches a weight of seven or eight pounds. It is edible, but too lethargic to afford sport. Another species (*A. blicca*), is smaller, silvery white, and a favorite with those who enjoy quiet angling. In the United States the term "bream" is given rather indefinitely to several minnows and sunfish; and to various marine fishes, better known as sea-brems (q.v.).

Brearley, William Henry, American journalist and author: b. Plymouth, Mich., 18 July 1846. He served in the Michigan infantry during the Civil War, was connected with several Detroit papers 1870-92; founded the Detroit Museum of Art 1883. He has published 'Recollections of the East Tennessee Campaign'; 'Wanted, a Copyist'; 'Leading Events of the American Revolution.'

Breast, in female animals, a glandular structure, containing vessels for the secretion of milk, and excretory ducts, which open by small orifices in the nipple, and discharge the secreted fluid for the nourishment of the child. At the centre of each breast there is a small projection, the nipple, and this is surrounded by a dark ring termed the areola. The nipple is the part which the infant seizes in its mouth, and through the passage of which the milk flows into the mouth of the child in the act of suction. The glandular structure of the breast is covered by fat, except at the forepart of the nipple and the integument. The breast is liable to many diseases, from irritation during nursing, bruises of the part, undue pressure from tight clothes, and from constitutional causes. Inflammation of the breast is very common during nursing, or from a superabundant secretion of milk. After delivery, the nourishment of the infant being from the breast, there is an increased determination of blood to that part to enable it to perform the necessary function, and thus, when there is any cause of irritation, there is a tendency to increased action in that part, which frequently terminates in inflammation. Lacteal swelling is another troublesome disease of the breast. It is confined to the nipple, and consists of a large collection of milk in one of the lactiferous tubes, the orifice of which has been closed from inflammation. See MAMMARY GLANDS.

Breast-wheel. See WATER-WHEEL.

Breasted, James Henry, American Egyptologist: b. Rockford, Ill., 27 Aug. 1865. He studied at Yale and Berlin, and has been a professor of Egyptology and Semitic languages at the University of Chicago from 1894. He has published 'An English Edition of Erman's Egyptian Grammar' (1898); 'De Hymnis in Solem sub Rege Amenophide IV. Conceptis' (1894); 'A New Chapter in the Life of Thutmose III.' (1900).

Breastplate, a piece of defensive armor covering the breast, originally made of thongs, cords, leather, etc. (hence *lorica*, *cuirass*), but afterward of brass, iron, or other metals. It may be considered as an improvement of the shield or buckler, which was borne on the left arm, and moved so as to protect successively all parts of the body. It being perceived that the free use of both hands in the employment of offensive weapons was important, the defensive armor was attached to the body, and received different names from its position, use, etc., as for instance, breastplate, cuisses, greaves. These different species of defensive armor are of little use against firearms, and have therefore generally fallen into disuse in modern war. (See *CUIRASS*.) Breastplate, in Jewish antiquity, was a folded piece of rich, embroidered stuff worn by the high-priest. It was set with 12 precious stones bearing the names of the tribes. It was also called the breastplate of judgment, because it contained the Urim and Thummim.

Breastwork, in the military art, every elevation made for protection against the shot of the enemy. Wood and stone are not suitable for breastworks, on account of their liability to splinter. The best are made of earth; in some circumstances, of fascines, dung, gabions, bags of sand, and of wool. The thickness of the

work must be in proportion to the artillery of the enemy. In general it ought not to be less than 10, nor more than 18, or at most 24 feet thick. The rule of Cugnot is, that the breastwork should be so high that nothing but the sky and the tops of trees can be seen within cannon-shot from the interior of the intrenchments. If this rule cannot be followed on account of the height of neighboring mountains, the interior of the fortification ought to be secured by traverses.

Breath (A.S. *braed*, odor, breath). The ordinary breath has a slight odor, and contains nitrogen, oxygen, carbon dioxide, ammonia, water, and organic impurities. In quiet breathing it probably never carries microbes. In diseases of the mouth, and teeth, nose, throat, lungs and stomach, in constipation, and in fevers the breath may become offensive. Should a simple antiseptic mouthwash or a laxative fail to remove the trouble an underlying disease must be sought out and treated. A suitable mouthwash is Dobell's solution or listerine. Deodorizers, like coffee, cardamon, cloves, etc., may be resorted to for temporary sweetening of the breath, but they have little effect in permanently removing the condition.

Breathing and Health. Essential to continuance of physical being are food, water, and air, and the most important is air. The supply of food may be cut off for days or weeks and life remain in the body. The quality may be poor and amount reduced, and, while it affects health and perhaps reduces strength, life will not go out for a long time. Cut off the supply of air completely for 14 minutes and life becomes extinct. Change from purity of air to that which is only slightly contaminated and in an hour vitality lessens. Headache and nausea appear, and unless there is return to fresh and pure air, disintegration of tissue and physical break-down follow. These facts are patent to all, and are referred to as a starting point to consider how breathing may be used for the establishment and continuance of perfect health. The diseases most dreaded by the medical fraternity are those of a pulmonary nature. They are, in many cases, the result of insufficient air supply and inefficient means of securing it. Diseases affecting digestion follow close upon those relating to the lungs, and these, too, can be regulated by and through breathing. Nervous disorders, likewise, succumb very readily when breathing is properly ordered.

The act of breathing is, then, so important that it should have the attention of every individual. To use it to its best advantage every one must know something of its action and of the parts directly affected by it. There is instinctive breathing and mentally directed breathing. Every one breathes. Instinctive breathing begins at birth and continues through life. If we could always be in fresh air and have little to do we would need no more knowledge of the operation than has any animal. Even for great physical activity instinctive breathing would be sufficient, because every physical exertion would increase the rapidity and breadth of the instinctive act. But we are thinking animals, and we live in conditions requiring more than ordinary physical action. Excitement, nervous movements, high living, and attributes of mind cause us to throw off poisons and gases which the

BREATHING AND HEALTH

breathing apparatus must take care of. To dispose of these we must go beyond instinctive breathing and adopt mentally directed action.

Breath is air taken through the nose and mouth into the lungs, which are elastic sacks made of microscopic vessels suspended on the bronchial tubes in the chest. They expand and collapse as they are acted upon by organs made of muscle. When they expand they draw air into the body; when they collapse they expel air. The muscles which operate them are those of the chest. The chief one is the floor of the chest, called the diaphragm. Those next in importance are the costal muscles, located in the ribs. The next, the dorsal muscles, located in the back. Last, the pectoral muscles in the upper chest in front. The muscles already noted are those which dilate the lungs and draw air into the body. Their action produces inspiration of breath, and that action expands the chest. Their return to normal position permits the collapse of the air-cells of the lungs. Such return is, however, insufficient to cause complete collapse of air-cells and the expulsion of all air. Return is assisted, and expulsion made complete, by calling into use the abdominal muscles and those in the ribs below the diaphragm. It becomes, then, very important to know the location of the diaphragm. This organ is attached in front to the end of the breast bone. One should find this location by pressing with his fingers. Men find it easily because the ribs spread quickly where they leave the breast bone. Women find it less easily as the ribs are close together. But follow up to the point where the very end of the breast bone is located. The diaphragm attaches at the sides to the ribs. One can tell where by placing the hand flat on the side and inhaling a deep breath; that which pushes first against the hand from within is the diaphragm, which is from one to two inches lower than the level of the end of the breast bone. It attaches to the sides all around and into the small of the back, where it is a little lower than at the sides. One should study the location of the diaphragm day after day, until it is definitely fixed in mind. Many who have supposed they knew how and where to take breath by using the diaphragm will find their conception has been that it is lower than it is. The real reason for having the correct location clearly in mind is to avoid desultory and, possibly, harmful practice. The reason for repeating the examination of location so many times is that the mind may go instantly to it in order to direct voluntary inspiration and expiration. Another common error is to suppose the lungs to be located in the upper chest. Ask one if his lungs are sound and he will pound high in front. The largest portion of the lungs is in the sides and back. He pounds over the space occupied by the heart. This common error leads many who practise voluntary breathing into misdirected effort, which is liable to be harmful.

Breathing divides into inspiration and expiration. Inspiration ('breath taking') is instinctive and involuntary. The latter is like the former, but it is greatly amplified and extended. Our attention now goes to voluntary inspiration. Its primary physical act is expansion of the diaphragm. Evidence of that is discovered wherever that organ connects with outer parts of the chest, in the generous expansion of those parts, and by quite a little expansion of parts of the body

below the diaphragm. The latter action is caused by the pressure of the centre of the diaphragm (quite in the middle of the body) downward upon the abdominal viscera. Deep breathing, or taking large draughts of air, is always accompanied by generous spread of the body at the level of the diaphragm, and considerable spread of the portion just below that level. Few adults will do this upon the first attempt at mental direction of inhalation, because they have lost the natural habit. If they will study for a few minutes quiet instinctive (not directed) breathing, they will find they really do breathe as described above. But this is not enough for "breathing for health." It must be amplified through mental direction; on the line of instinctive breathing, only much more extensively.

The custom of taking deep breath can be developed into habit in a short time, and it should be used daily. Direct the thought during inhalation to generous expansion of the body in the neighborhood of the diaphragm, and after such expansion has begun, enlarge the sides and back above the diaphragm. Fill the lungs fully, retain the air a few seconds and exhale completely. Such complete exhalation implies that breath shall be forced out by drawing in the abdomen. After repeating the act of inspiration and expiration four or five times, which, by the way, should never be done violently, one can feel the more active rush of blood through the body. This demonstrates that the cleansing process of the circulatory system is accomplishing its work. When a good glow is established refrain from further exercise for the time, but resume it when quietness is again restored. Five or ten minutes given to this practice every morning and evening will, in a month, establish physical strength. Followed through a term of years it will rebuild the body and make it almost invulnerable against the attack of disease. Persons with weak lungs or sluggish circulation can, by this means, become rugged and very active. So far-reaching is the result that great physical strength is acquired. Even the usually expected elements of decay, as manifested in carious teeth and falling hair, are arrested or prevented. The success of all physical treatment lies in the regularity and persistence with which it is followed. In a few weeks or even in one week, the benefit will be observed, but the rebuilding of a body requires persistent practice for a year at least.

Practice of the above nature increases the lung space. Probably no new air-cells can be created, although some authorities claim that there are. The expanding power of existing air-cells is enlarged, and the muscles which cause the expansion greatly increase their power. Such expansion can be measured. It is well to take the bust measure, passing the tape-measure around the body just below the arm pits, and take measurement on the first day of each month thereafter. Comparison with previous measure will show constant increase for a full year. How great an increase to expect depends upon the person. From two to five inches in a year is usual. A more perfect measure of development is given by the spirometer which, as its name implies, is a breath-measure. It records the vital capacity of the lungs. Test measurements in over 500 students proved that every one gained in size of lungs, and many made marvelous changes in their physical condition. The spirometer records the cubic inches of air space

in the lungs. Such capacity varies in accordance with the height, and is greater in men than in women. Tall people have largest lungs, ordinarily, and those who are slim, rather than stout, increase most through practice. Records show that the increase in air capacity in one year averages from 25 to 33 per cent. All this has direct bearing on health. In the lungs the air-cells are surrounded by minute blood vessels. All the blood, after its course through the body, passes to the lungs to discharge its gatherings and to receive the supply of oxygen necessary for life. It is evident that if the air supply is increased 25 per cent, cleansing and oxygenation take place more quickly and more thoroughly. It is recognized among physicians that the purity of the blood is the most important element in keeping well. Meeting the attack of bacilli is the triumph of medical science. The germ of disease is found in the blood, and in modern science inoculation for destroying such germ is the keynote. In the practice of breathing every individual has nature's method of doing what medical science does. It goes beyond that, in that breathing provides prevention as well as cure. The ounce of prevention is the most valuable. Disease germs can hardly find lodgment, and they certainly cannot propagate, in a body which is perfectly well. A feeling of lassitude and "run down" is the admonition which shows that germs are at work. Your doctor tells you to take long walks in the open air. He says in other words that oxygen must be supplied to the lungs. Much surer are we to respond to health-laws if such training as all can have has made the taking of large draughts of air possible.

Above we have described inhalation and exhalation. While we have not sought to formulate a complete system of training, we have given enough to show what may be done. At first, daily practice should be gentle. This will bring into correct use all physical organs which govern breathing. When one realizes ease in action he should make the dual act of inspiration and expiration more generous. Expiration should now be made more complete. That is, make exhalation forceful by drawing in the abdominal muscles and lower ribs greatly. This will also cause broader inspiration. Thus the two sets of muscles will be powerfully increased, and the expanding power of the lungs will be enlarged.

When breath is imbibed in large quantities it should be retained a little time that it may purify the blood. Three or four seconds are long enough at first, but the time may be increased gradually until one can hold it 30 or more seconds. The physical act of holding the breath consists of arresting the inspiratory muscles when they have drawn breath in and refusing to allow them to return to their relaxed position. The very act of thus commanding adds to their strength. It is one of the contributing factors toward strengthening the whole body. The tendency of modern life to greater physical activity accentuates the need of symmetrical development of the lungs and their controlling forces.

FRANK HERBERT TUBBS,
Editor 'Music Life.'

Brébeuf, Jean de, zhōñ dè brā-bèf, Jesuit missionary: b. Bayeux, France, 25 March 1593; d. 16 March 1649. He set sail in 1625 with Champlain, arrived at Quebec when but a single house was seen there, and fixed his residence

among the Hurons. He learned their language, and gained their confidence. In 1649 they were suddenly attacked by the Iroquois, and Brébeuf fell into the hands of the latter, by whom he was put to death with frightful tortures. His 'Catechism Translated into the Language of the Hurons' was published at Paris in 1652.

Breccia, br'èçhà, a conglomerate composed of angular pieces of the same or of different rocks, united by a cement or matrix, which, according to its nature, forms the several varieties of calcareous, silicious, etc. The conglomerate known by the name of pudding-stone differs from that of breccia only in having the composing fragments rounded. Calcareous breccia is often found in the form of fine marble, apparently composed of fragments produced by some disrupting force, and then united by the infiltration of carbonate of lime among them. The angular form of the fragments seems to indicate that they have never been exposed to much friction, and have therefore probably originated at no great distance from their present site. In some cases a kind of spurious breccia has been formed by the breaking up of calcareous beds, and their subsequent union by means of infiltration, without any change of their original position. Marble breccia thus formed is remarkable for the size of its fragments. In the calcareous districts of many countries caverns and extensive fissures are seen filled with a reddish mass, composed of lime, sand, and oxide of iron, enclosing angular fragments of different rocks, and a great number of bones more or less broken. To such masses the name of osseous breccia has been given. They are most frequently met with on the shores of the Mediterranean.

Brèche de Roland, brèsh dè rō-lān, "the breach of Roland," a defile in the Pyrenees, between France and Spain, which, according to a well-known legend, was opened up by Roland, one of the paladins of Charlemagne, with one blow of his sword Durandal, in order to afford a passage to his army. It is an immense gap between the walls of a mountain barrier rising to the height of 9,500 feet above the level of the sea, and from 300 to 600 feet above the bottom of the defile. The defile itself varies in width from 200 to 300 feet. It lies about 43 miles north of Huesca, from which it can at times be seen.

Brechin, brè'ìn, a parliamentary and municipal burgh of Scotland, in Forfarshire, is romantically situated on the left bank of the South Esk, 12½ miles northeast of Forfar, and eight west of Montrose. It is a very ancient royal burgh, and was formerly walled. The chief industry is the manufacture of linens, and the neighborhood exports a considerable quantity of grain. In ancient times there was an abbey of Culdees in this place, and in 1150, when Brechin was constituted an episcopal see by David I., it is supposed that the site of this establishment was that chosen for the foundation of the cathedral. The cathedral church of St. Ninians, which now forms the parish church, is situated on the north edge of a precipitous ravine, which separates the burgh-lands from those of Brechin Castle. The ancient round tower, which is the leading architectural feature of the town, stands at the southwest angle of the church. Such towers are common

in Ireland, but are seldom seen in Scotland. The Mechanics' Institution is a handsome building, with a beautiful hall, and there is a valuable public library. Pop. (1901) 8,941.

Breck, James Lloyd, American clergyman: b. Philadelphia, 27 June 1818; d. Benicia, Cal., 30 March 1876. He graduated at the University of Pennsylvania in 1838, and at the General Theological Seminary, New York, in 1841. The same year he went to Wisconsin, and aided in the formation of the diocese there in 1847. He was one of the founders of the Nashotah Theological Seminary, remaining as instructor there until 1850, when he went to St. Paul, Minn., as a missionary. There he established an associate mission, and assisted in supplying mission stations for 80 miles around. From 1852 to 1857 he was engaged in missionary work among the Chippewa Indians. In 1858 he established church services at Faribault, Minn., and founded the Seabury Divinity School. He prepared the way for building church institutions there, and was the forerunner of Bishop Whipple. In 1867 Dr. Breck went to Benicia, Cal., where he established church enterprises similar to those at Nashotah and Faribault.

Breck, Samuel, American soldier: b. Middleborough, Mass., 25 Feb. 1834. He is descended from Edward Breck, who came to Dorchester, Mass., from Ashton, England, about 1630. He graduated at West Point 1855, and took part in the Seminole war of 1855-6. During the Civil War he was assistant adjutant-general of McDowell's division, and afterward of the 1st Army Corps, being engaged in the occupation of Fredericksburg and in the Shenandoah Valley expedition, to intercept the retreat of the Confederate forces under Gen. Jackson in 1862. From July 1862 to 1870 he was assistant in the adjutant-general's office at Washington, in charge of rolls, returns, books, blanks and business pertaining to the enlisted men of the regular and volunteer forces, and engaged in the preparation and publication of the 'Volunteer Army Register.' He became brigadier-general and adjutant-general in 1867, and was retired by operation of law, 25 Feb. 1868.

Breck'enridge, Hugh Henry, American artist: b. Leesbury, Pa., 1870. In 1892 he was awarded the European scholarship of the Pennsylvania Academy of the Fine Arts, and studied in Paris under Bouguereau, Ferrier, and Doucet. Since 1894 he has been an instructor, and secretary of the faculty in the Pennsylvania Academy of the Fine Arts, and in 1898 organized the Darby School of Painting. His work was awarded a medal at Atlanta in 1895, and received honorable mention at the Paris Exposition of 1900.

Breckenridge, Minn., a village and county-seat of Wilkin County, on the Red River of the North, about 50 miles south of Fargo, North Dakota. It is reached by the Northern Pacific and Great Northern railroads and is the centre of a very fertile region. It contains flour mills, grain elevators, etc., and steamboats ply between it and the Red River towns in Manitoba. Pop. (1900) 1,282.

Breck'inridge, Clifton R., American legislator and diplomatist: b. Lexington, Ky., 25 Nov. 1846. He is a son of John Cabell Breckinridge (q.v.), and received a public school edu-

cation and served in the Confederate army and navy. After the war he attended Washington College (now Washington and Lee University) for three years, and engaged in mercantile business in Pine Bluff, Ark. He was elected to Congress in 1882 as representative-at-large, as a Democrat; was re-elected in 1884, 1886, 1889, 1890, 1892 and 1894, and served on the Committee on Ways and Means during the greater part of his congressional life. He was United States Minister to Russia 1894-7.

Breckinridge, or Breckenridge, John, American statesman: b. Augusta County, Va., 2 Dec. 1760; d. Lexington, Ky., 14 Dec. 1806. In 1795 he was made attorney-general of the new State of Kentucky, and he served in its legislature from 1797 to 1800. He entered the United States Senate in 1801, becoming four years later attorney-general in Jefferson's cabinet, in which office he died.

Breckinridge, John, American clergyman: b. Cabell's Dale, Ky., 1797; d. 1841. He entered the Presbyterian ministry, and was chaplain of the National House of Representatives, 1819-21. He was pastor at Lexington, Ky., 1823-6, and in Baltimore 1826-31. He was subsequently professor of theology at Princeton Theological Seminary, and was chosen president of Oglethorpe University, Georgia, just prior to his death. He is remembered for a famous theological debate held with Rev. John Hughes, subsequently archbishop of New York, published under the title 'Roman Catholic Controversy' (1836).

Breckinridge, John Cabell, Vice-President of the United States, grandson of John Breckinridge (1760-1806, q.v.): b. near Lexington, Ky., 21 Jan. 1821; d. Lexington, Ky., 17 May 1875. He practised law in Lexington until 1847, when he was chosen major of a volunteer regiment for the Mexican war. He sat in Congress in 1851-5, and in 1856 was elected Vice-President, with James Buchanan as President. In 1860 he was the pro-slavery candidate for the presidency, but was defeated by Abraham Lincoln. A United States senator from March to December 1861, he then entered the Confederate army, was appointed a major-general in 1862, and held some important commands during the Civil War. He was secretary of war in Jefferson Davis' cabinet, at the close of the struggle, and escaped to Europe, whence he returned in 1868, and resumed his law practice.

Breckinridge, Joseph Cabell, American military officer, nephew of John Cabell Breckinridge (q.v.): b. Baltimore, Md., 14 Jan. 1842. He practised law in Danville, Ky., till the beginning of the Civil War, when he joined the Union army. He was made a first lieutenant in the regular army 1863, captain in 1874, brigadier and inspector-general in 1880, and major-general of volunteers, 4 May 1898. He served in the Santiago campaign and had a horse shot from under him.

Breckinridge, Robert Jefferson, Presbyterian clergyman and theological writer, brother of John Breckinridge (1797-1841, q.v.): b. Cabell's Dale, Ky., 8 March 1800; d. 27 Dec. 1871. He was originally a lawyer. He was president of Jefferson College in 1845-47; from 1847 he was pastor at Lexington, Ky. He was an old-school leader in the division of the Presbyterian

Church in 1837 into Old and New schools. He was a strong supporter of the Union during the Civil War. His chief works were 'Knowledge of God, Objectively Considered' (1857): 'Knowledge of God, Subjectively Considered' (1859).

Brec'on, or Brecknockshire, a county of South Wales, with an area of 719 square miles; pop. (1901) 59,906. It is one of the most mountainous counties of the principality, and presents much bold and magnificent scenery. Near its centre rises the mountain called the Van or Beacon, belonging to the Black Mountains, which traverse its southern portion. It has a height of 2,901 feet, and is the culminating point of South Wales. The river Wye forms a natural boundary between this county and Radnor, and the Usk, rising in the Black Mountains, crosses the county and flows through a fine valley toward the town of Brecon. About two miles east from the latter is Brecknock Mere, one of the largest lakes in South Wales, abounding in otters, pike, tench, perch, and eels. A considerable quantity of agricultural produce is sent to the markets in the neighboring English counties. The chief manufactures are coarse woollens, stockings, and other worsted stuffs; there are also extensive ironworks. Chief towns, Brecon, Builth, Crickhowell, Hay, and Llanely.

Brecon, or Brecknock, Scotland, the capital of Brecknockshire, stands in an open valley at the confluence of the Honddu and Usk, and consists chiefly of three principal and several minor streets. Three bridges span the Honddu and one the Usk. The principal edifices are the county hall, county jail, barracks, Christ's College (an important educational institution on the model of the large public schools), the Independent Theological College, and several of the places of worship. St. John's Church is a fine old building, cruciform, with a massive tower, partly early English, partly in later style. At Brecon the celebrated actress, Mrs. Siddons, was born. Pop. (1901) 5,875.

Breda, Jan van, yān vān brā-dā', Flemish painter: b. Antwerp, 1683; d. 1750. He studied at first under his father, who had acquired some reputation, but afterward became a close imitator of Breughel de Velours and Wouvermans, of whose works he made copies, which the most practised eye is scarcely able to distinguish from the originals. He resided several years in England, where he enjoyed a high name, and was much employed by the king and the nobility. On his return in 1725 he was appointed director of the Academy of Antwerp, and was so highly valued by his townsmen that his paintings were often the objects of keen competition.

Breda, Holland, a town in the province of North Brabant, 24 miles southwest of Bois-le-duc, on the Merk, being a strong frontier fortress, it was formerly of the greatest importance to Holland, as the chief point of the line of fortresses in front of the Meuse. The fortifications consisted of 15 bastions, as many ravelins, and five horn-works, besides the citadel. These being removed, the chief strength of the place now lies in its marshy environs, which may easily be laid under water. Breda received city rights in 1534; and since that time has often been a subject of contention between the Dutch, Spaniards, and French. It was delivered by treachery into the hands of the Duke of Parma

in 1581, but was retaken by Maurice of Orange in 1590. The latter capture was accomplished by means of a boat loaded with turf, in which 70 Dutch soldiers were concealed. Spinola took Breda in 1625, after a siege of 10 months, but it was retaken by the Dutch under Frederick Henry of Orange, in 1637. During the French Revolutionary War Dumouriez made himself master of the city and fortress in February 1793, and would thereby have prepared the way for the conquest of Holland had he not been forced, by the loss of a battle at Neerwinden, to evacuate the city and fortress, 4 April. In September 1794 Breda was attacked by the army of Pichegru, but did not surrender till all Holland was conquered, in the winter of 1794. On the approach of the Russian vanguard, under Gen. Benkendorf, in December 1813, the French garrison made a sally, and the patriotic citizens, profiting by the occasion, rose *en masse*, shut the gates, and prevented the French from returning into the town. A peace was concluded at Breda between England and Holland in 1667. Pop. (1899) 26,097.

Breda, Declaration of, a proclamation of amnesty issued by Charles II. of England, 4 April 1660.

Bredahl, brā-dāl', Christian Hviid, Danish poet: b. Hellestrup, 1784; d. 1860. He was educated at the gymnasium and the university of Slagelse. Owing to his love for an out-door life, he turned his attention to agriculture and in 1824 he bought a small piece of land near Sorø, which he cultivated himself. His great work is 'Dramatic Scenes,' which was published in six volumes, the first volume appearing in 1819. He also published several polemical works, directed against the Danish romanticism and the realistic writings of the time. In all his works, he shows a love for nature and the natural conditions of life, and a dislike for modern culture; his 'Dramatic Scenes' attacks both the nobility and the priesthood.

Breden, brā-dēn, Christine (ADA CHRISTEN), Austrian poet: b. Vienna, 6 March 1844. She was at first an actress, but in 1864 settled in Vienna and began her literary career. In 1873 she married Adalmar Breden, but still used her pseudonym. Her first publication was a collection of poems entitled 'Lieder einer Verlorenen' (1868); her other works include 'Treasures'; 'Our Neighbors'; 'The Virgin Mother, a Story of the Vienna Suburbs' (1892); a novel, 'Ella' (1873); and a drama, 'Faustina' (1871).

Brederode, brā'de-rō-de, Hendrick (COUNT), Dutch patriot: b. 1531; d. 1568. He joined with Counts Egmont and Horn in opposing the tyranny of Cardinal Granvella, the Spanish governor of the Netherlands. In 1566, he presented to Margaret of Parma, who had succeeded Granvella, the famous 'Request,' which gave rise to the insurrection of the *Gueux*, or 'Beggars.' Under the grinding oppression of the Duke of Alva's administration in the Low Countries, he was obliged to retire to Germany.

Brederoo, Gerbrant Adriaenzoon, gār-brānt ā'drē-ān-zōn brā-dā'rō, Dutch dramatist and poet: b. Amsterdam, 16 March 1585; d. there, 8 July 1618. His best poems are 'The Meditative Song Book' and 'The Great Fountain of Love,' collections of grave and gay pieces, all of which have been very popular, and

since his time often reprinted. His lyrics are admired for their musical verse and their tender sensibility; but his masterpiece is unquestionably the 'Jerolimo' ('Spaansche Brabander Jerolimo'), a comedy based upon a French version of one of Mendoza's plays. Another comedy, 'Moortje,' is an adaptation from Terence. See Ten Brink, 'Gerbrand Adriaenszoon Brederoo' (1859).

Bredow, Gabriel Gottfried, gā'brī-ēl gōt'-frēd brā'dō, German historian: b. Berlin, 14 Dec. 1773; d. Breslau, 5 Sept. 1814. He was for a time professor at Eutin, and a colleague of the celebrated Voss; afterward professor at Helmstädt, and still later at Frankfort-on-the-Oder, whence he went to Breslau on the removal of the university to that place. He was distinguished for his patriotism and his literary works. His 'Handbuch der alten Geschichte' (Manual of Ancient History) passed through five editions, the fifth of which appeared in 1825. He was the author of 'Chronik des Neunzehnten Jahrhunderts' (Chronicle of the 19th Century); 'Epistolæ Parisienses'; 'Untersuchungen über Geschichte, Geographie, und Chronologie' (Researches in History, Geography, and Chronology); and of the very useful 'Historische Tabellen' (Historical Tables), which were translated into English.

Brée, brā, Matthæus Ignatius van, Belgian painter: b. Antwerp, 1773; d. there, 1839. He chiefly excelled in historical painting, for which he gained a prize in 1797. His characteristics are said to have been originality and vigor of conception and patience in execution, yet he worked with great rapidity, as he presented to Napoleon in a few hours a tableau of the manoeuvres of the fleet on the Scheldt before Antwerp. His first work which attracted attention was the 'Death of Cato.' Among his principal works are 'Rubens Dictating his Dying Testament'; 'The Tomb of Nero at Rome, with a group of Itinerant Musicians and Lazzaroni'; 'Death of Count Egmont'; 'Van der Werff Addressing the Famished Populace During the Siege of Leyden in 1576'—the burgomaster is represented as saying, "Take my body and divide it amongst you." Van Brée had the title of painter to the Empress Josephine, and represented many scenes connected with the French occupation of Belgium. He replaced Herreyns as director of the Academy of Fine Arts at Antwerp, and gained a high reputation by his teaching. He also evinced a capacity to excel in sculpture and lithography.

Breech and Breech-loader. The breech of a gun is that portion of a gun immediately behind the bore, and which in modern small-arms and artillery is removed to enable the process of loading to be effected. The chief advantages of this method, over muzzle-loading, are that it greatly increases the quick-firing capacity of the weapon, and adds to the length of range and accuracy of aim, while affording much facility for cleaning. Though it has only been successfully adopted in quite modern times, the breech-loading principle is nothing new, as some of the earliest cannon were so constructed. The first weapon of this description utilized as a regular military arm was the needle-gun adopted by the Prussian government so long ago as 1841, though its efficacy and superiority for warlike purposes was not demonstrated till the success-

ful campaigns of Prussia against Denmark and Austria in 1864 and 1866. Other nations also speedily armed their troops with breech-loading rifles, the French having adopted the Chassepôt breech-loader in 1866, and in Britain the old Enfield rifle having been converted into a breech-loading weapon and supplied to the troops the same year. In 1871 the Snider or converted Enfield began to be superseded by the Martini-Henry rifle, and this again has been superseded in the British army by the Lee-Netford magazine rifle. Other European nations have also adopted different forms of breech-loading rifles. The principle of breech-loading has also been applied to artillery, the names of Armstrong and Krupp being associated with some of the first modern guns of this type. See ARTILLERY; MUSKET; RIFLE; SMALL ARMS.

Breeches, a garment for the legs, especially, as distinguished from trousers, for covering the upper portions of the legs. In England they were formerly called hose. Breeches or hose were in use even among the ancient Babylonians, and with them were made so as to cover the foot and supply the place of stockings. In Europe we find hose first used among the Gauls, hence the Romans called a part of Gaul breeched Gaul (*Gallia braccata*). In the 5th century they had become fashionable in Rome. In the time of Queen Elizabeth and James I. the breeches had assumed enormous dimensions, being stuffed out with various materials, as wool, hair, etc. King James' partiality for such breeches is well known, and we find him represented in an old engraving with wide stuffed breeches tapering to the knee, slashed and adorned with lace. In the reign of Charles I. they took the form of short trousers, loose at the knee, and ornamented with ribbons, lace, etc. In the time of William III. the tight knee-breeches came in, and have been supplanted by trousers only in the 19th century.

Breeches Bible, a name given to a Bible printed in 1579, and so called from the reading of Gen. iii. 7: "They sowed figge tree leaves together and made themselves breeches." As a matter of fact this Bible has no more distinctive right to the name than Wyclif's version, in which the same words are also found.

Breeches Buoy. See LIFE SAVING SERVICE.

Breeching, a rope used to secure the cannon of a ship of war, and prevent them from recoiling too much in the time of battle. It is of sufficient length to allow the muzzle of the cannon to come within the ship's side to be charged.

Breede, brā'dē, a river in Cape Colony, which rises in the Warm-Bokkeveld, and flows chiefly in a southeasterly direction through the district of Zwelldam, entering the Indian Ocean at St. Sebastian's Bay, about 60 miles northeast of Cape Agulhas, the most southerly point of Africa. It is navigable for vessels drawing not more than 10 feet of water to a distance of 40 miles, and drains a very fertile district.

Breeding, the process of procreation as applied to any or all classes of organisms. In this article the term is largely used to describe the breeding of domesticated animals. Originally the different variations of types or breeds had their origin in the accident of circumstance

BREEDING

and the natural tendency of all animal life toward variation; but since man began to exercise control, and to appropriate various breeds or types to his own use, reproduction has been almost entirely along the lines of natural and artificial selection. Thus we may very properly limit the definition of breeding as discussed in this article to the art by which domestic breeds are obtained. Probably the best-known as well as the most ancient maxim of "breeding," and one which has been expressed in one form or another by every ancient writer on husbandry and agriculture of which there is any record, is the familiar aphorism that "like produces like." A natural result of this was the practice of breeding from the best type-specimens. There does not seem at first to have been any consistent system of selection, and as the standard of excellence varied with the passing periods there was no real progress in breed-development, as we understand it to-day. About the middle of the 18th century Robert Bakewell, an Englishman, originated a system of breeding live stock based upon the idea that the principle of "like begetting like" went much farther than the general similarity of the offspring to the parents, and extended to the minutest details of the organization. He made a special study of the form and proportions of animals, and formulated a definite standard of excellence representing the form and internal qualities that he desired to obtain. This standard governed his actions when making selections for breeding purposes. He succeeded so far in molding the plastic forms of the cattle upon which he experimented as to arouse the interest of other breeders, with the result that to-day there are many varieties of improved breeds, all of them of remarkable excellence, but each differing from the others in the characteristics that have been bred into them, to adapt them to special purposes or conditions of environment.

Hereditv in Breeding.—There is good reason to believe that not only the external characteristics of the parents are reproduced in the offspring, but that internal structure and functional activity, and in fact every peculiarity of the organization of the parents are also transmitted. Innumerable illustrations from every department of organic life confirm this theory, and if further proof be needed, the hereditary transmission or predisposition to disease will supply it. For instance, it sometimes happens that mares affected with such diseases as ring-bone, navicular disease, etc., in consequence of which they are unfitted for work but are kept as breeders, have colts in which are combined all the good qualities of the parents, but which at the age of five or six years develop diseases similar to those of the disabled parents. Not only are the hereditary characteristics of conformation, temperament, and disease transmitted, but frequently also, the habits and characteristics which have been developed by special conditions of environment, or because of some particular training they have received from man. Illustrations of this may be found in the tendency of well-bred short-horns to mature early and acquire fat rapidly; and the ability of Jerseys and other dairy breeds to secrete a large supply of milk. With the horse, the English thoroughbred racer and the American trotter furnish the most convincing illustrations of what breeders consider the transmissior of acquired

characters. It is the various breeds of dogs, however, that form the best examples. It is a common experience of the hunter to discover a setter, pointer, or retriever that has never been "shot over" before, but which "works" with as much skill and steadiness as the most experienced sporting dog. The transmission of *abnormal characteristics of structural conformation* is another fruitful source of the variation of types, as for instance the Dorking fowls, whose characteristic of a fifth toe has been inherited, it is claimed, from a five-toed fowl brought to Britain by the Romans. Similar instances of the working of this law may be found in abundance in every branch of organic life. It does not follow, however, that the immediate offspring of a parent marked by some abnormalism will develop the same characteristic; but that it will make its reappearance in some subsequent generation is an indisputable fact. This phenomenon is technically known as "atavism" (q.v.), but it is more generally described as "throwing-back," "breeding-back," etc. Instances of characteristics that have been extinct for half a century, but which reappear with all the peculiarities of the original breed are in the experience of every breeder. In brief, an offspring may unite in itself the prominent characteristic of one or both parents, or it may resemble a grandparent, or even a remote ancestor; but it is equally the offspring of all its ancestors and, within its own organization in a latent condition are the characteristics of all preceding generations, any one of which may be duplicated in its own offspring. It is at this point that the "law of co-relation" asserts itself, which Miles in his 'Stock Breeding' defines as "any peculiarity in the development of one organ or set of organs, usually accompanied by a corresponding modification or suppression of organs belonging to some other part of the system." With regard to domestic animals, whose flexibility or plasticity of organization is perhaps greater than other animals, we find that the principal causes of animal variation are climate, food, and habit, and that the distinguishing characteristics of the different breeds have been the result of the modifying influences of the environment to which they have been subjected. Thus the small breeds of sheep and cattle in mountainous countries are in decided contrast to those of the same species obtaining their food-supply in the lowlands or fertile valleys. Indeed the relation of the size of animals to their food-supply has been commented upon by writers from the earliest times.

The function of reproduction in the animal organization is also affected by the conditions above mentioned. The procreative ability of many wild species becomes weak or extinct if the animals are subjected to confinement; yet in direct contrast to this we find domesticated varieties more prolific than the wild species—for example, tame ducks deposit more eggs than wild ones; and the same fact is true of dogs, swine, rabbits, pigeons, etc. All authorities are agreed that this greater fecundity is due to the better food-supply and the security generally of domestic conditions. It has been observed that throughout the entire animal kingdom the smaller species of animals are more prolific than the larger ones, and certain it is that they breed at an earlier age, at shorter intervals, and have a greater number of young at each birth.

BREEDING

Breeding from close affinities is known as "in-and-in breeding," the best definition of which is that of Randall, ('Practical Shepherd,') "breeding between relatives, without reference to degree of consanguinity." Possibly no other practice in breeding has been fought over so much as that of "in-and-in" breeding. The opponents of the practice assert that the offspring of closely related parents are born with a predisposition to disease, and that in any event they will suffer from a lack of fecundity. Before going farther into this question, it will be well to state that while high-breeding implies the breeding from animals within the family limits, yet all high-bred animals are not necessarily "in-and-in" bred, although they must be closely bred to a greater or less extent. When a breeder wished to secure a type representing the highest standard of excellence, he has found it necessary to select animals for breeding-stock that possessed the characters he wished to reproduce in the offspring. It followed, therefore, seeing that it is only animals descended from a common ancestor, and having the same hereditary tendencies that possess the desired variations, he was usually compelled to breed together animals that were more or less closely related. No matter how right or how wrong the practice of "in-and-in" breeding may be, it is an indisputable fact that all the successful breeders have practised it more or less in order to retain and fix in their animals the desired tendencies and characters. The most cursory examination of herd-books and breeding-registers will show how closely related all the most valuable animals have been to each other. What may be considered to be the opposite of "in-and-in" breeding, is the practice of pairing together animals belonging to distinct breeds. This is known technically as "cross-breeding." It frequently happens that the offspring of a first-cross between distinct species possess very desirable qualities, but their sterility prevents the formation of a new or intermediate race, so that the cross has to be repeated to secure another such offspring. The mule is the most familiar example of such a cross. Cross-bred cattle while not sterile as is the case with mules, are yet incapable of transmitting their good qualities to their offspring.

The period of gestation in all mammals is determined by causes yet unknown. That it would seem to have some relation to the size of the animal may be gathered from the following examples: Elephant, 20 to 23 months; giraffe, 14 months; dromedary, 12 months; the different varieties of buffalo, from 10 to 12 months; ass, 12 months; mare, 11 months; cow, 285 days; bear, 6 months; reindeer, 8 months; monkey, 7 months; sheep and goat, 5 months; sow, 4 months; beaver, 4 months; lion, 108 days; dog, fox, and wolf, 62 days; cat, 50 days; rabbits, 30 days; squirrel and rat, 28 days; guinea pig, 21 days. The same rule may be traced in the periods of incubation in birds.

To sum up, the art of breeding consists in the exercise of judgment and skill in the matter of selection. The parents must be chosen in accordance with some well-defined purpose and for the conditions under which they will be placed. High-bred males have been found to impress their own good points upon their offspring, more than do high-bred females. In the opinion of many successful breeders, the dan-

gers of "in-and-in" breeding are considerably lessened when a high-bred sire, rather than an inferior animal, is employed. Miles, ('Stock-Breeding,') lays down the rule that "in the improvement of grades as well as pure-bred animals, the selection of breeding-stock must go hand in hand with a judicious system of feeding and management, as the artificial characters which are impressed by the male upon his offspring can only be retained through the influence of essentially the same conditions that originally produced them."

Breeding, Plant. The fundamental principles of plant breeding are simple and may be stated in few words; the practical application of these principles demands the highest and most refined efforts of which the mind of man is capable, and no line of mental effort promises more for the elevation, advancement, prosperity, and happiness of the whole human race. Every plant, animal, and planet occupies its place in the order of nature by the action of two forces—the inherent constitutional life force with all its acquired habits, the sum of which is hereditary; and the numerous complicated external forces or environment. To guide the interaction of these two forces, both of which are only different expressions of the one eternal force, is, and must be, the sole object of the breeder, whether of plants or animals. When we look about us on the plants inhabiting the earth with ourselves and watch any species day by day, we are unable to see any change in some of them. During a lifetime, and in some cases perhaps including the full breadth of human history, no remarkable change seems to have occurred. And yet there is not to-day one plant species which has not undergone great and to a certain extent constant change. The life forces of the plant in endeavoring to harmonize and adapt the action of its acquired tendencies to its surroundings may, through many generations, slowly adapt themselves to the necessities of existence; yet these accrued forces may also produce sudden and, to one not acquainted with its past history, most surprising and unaccountable changes of character. The very existence of the higher orders of plants now inhabiting the earth has been secured to them only by their power of adaptation to crossings, for through the variations produced by the combination of numerous tendencies, individuals are produced which are better endowed to meet the prevailing conditions of life. Thus, to nature's persistence in crossing we owe all that earth now produces in man, animals, or plants; and this magnificently stupendous fact may also be safely carried into the domains of chemistry as well, for what is common air and water but nature's earlier efforts in that line, and our nourishing foods but the result of myriad complex chemical affinities of later date.

Natural and artificial crossing and hybridizing are among the principal remote causes of nearly all otherwise perplexing or unaccountable sports and strange modifications, and also of many of the now well-established species. Variations without immediate antecedent crossing occur always and everywhere from a combination of past crossings, and environments for potential adaptations often exist through generations without becoming actual, and when we fully grasp these facts there is nothing mysterious in the sudden appearance of sports; but

BREEDING

still further intelligent crossings produce more immediate results and of great value, not to the plant in its struggle with natural forces, but to man, by conserving and guiding its life forces to supply him with food, clothing and innumerable other luxuries and necessities. Plant life is so common that one rarely stops to think how utterly dependent we are upon the quiet but magnificently powerful work which plants are constantly performing for us. It was once thought that plants varied within the so-called species but very little, and that true species never varied. We have more lately discovered that no two plants are exactly alike, each one having its own individuality, and that new varieties having endowments of priceless value and even distinct new species can be produced by the plant breeder with the same precision that machinery for locomotion and other useful purposes is produced by the mechanic. The evolution and all the variations of plants are simply the means which they employ in adjusting themselves to external conditions; each plant strives to adapt itself to environment with as little demand upon its forces as possible and still keep up in the race. The best endowed species and individuals win the prize, and by variation as well as persistence. The constantly varying external forces to which all life is everywhere subjected demand that the inherent internal force shall always be ready to adapt itself or perish. The combination and interaction of these innumerable forces embraced in heredity and environment have given us all our bewildering species, none of which ever did or ever will remain constant, for the inherent life force must be pliable or outside forces will sooner or later extinguish it. Thus, adaptability as well as perseverance is one of the prime virtues in plant as in human life. Plant breeding is the intelligent application of the forces of the human mind in guiding the inherent life forces into useful directions by crossing to make perturbations or variations of these forces and by radically changing environments, both of which produce somewhat similar results, thus giving a broader field for selection, which, again, is simply the persistent application of mental force to guide and fix the perturbed forces in the desired channels. Plant breeding is in its earliest infancy. Its possibilities, and even its fundamental principles, are understood but by few. In the past it has been mostly dabbling with tremendous forces which have been only partially appreciated, and has yet to approach the precision which we expect in the handling of steam or electricity; and notwithstanding the occasional sneers of the ignorant, these silent forces embodied in plant life have yet a part to play in the regeneration of the race which, by comparison, will dwarf into insignificance the services which steam and electricity have so far given. Even unconscious or half conscious plant breeding has been one of the greatest forces in the elevation of the race. The chemist and the mechanic have, so to speak, domesticated some of the forces of nature, but the plant breeder is now learning to guide even the creative forces into new and useful channels. This knowledge is a most priceless legacy, making clear the way for some of the greatest benefits which man has ever received from any source by the study of nature. A general knowledge of the relations

and affinities of plants will not be a sufficient equipment for the successful plant breeder. He must be a skilful botanist and biologist, and, having a definite plan, must be able to correctly estimate the action of the two fundamental forces—inherent and external—which he would guide.

The main object of crossing genera, species or varieties is to combine various individual tendencies, thus producing a state of perturbation or partial antagonism by which these tendencies are, in later generations, dissociated and recombined in new proportions, which gives the breeder a wider field for selection. But this opens a much more difficult one,—the selection and fixing of the desired new types from the mass of heterogeneous tendencies produced,—for by crossing, bad traits, as well as good, are always brought forth. The results now secured by the breeder will be in proportion to the accuracy and intensity of selection and the length of time they are applied. By these means the best grains, fruits, nuts, and flowers are capable of still further improvement in ways which to the thoughtless, often seem unnecessary, irrelevant or impossible. When we capture and domesticate the various plants, the life forces are relieved from many of the hardships of an unprotected wild condition, and have more leisure, so to speak, or, in other words, more surplus force to be guided by the hand of man under the new environments into all the useful and beautiful new forms which are constantly appearing under cultivation, crossing and selection. Some plants are very much more pliable than others, as the breeder soon learns. Plants having numerous representatives in various parts of the earth generally possess this adaptability in a much higher degree than the monotypic species, for, having been subjected to great variations of soil, climate and other influences, their continued existence has been secured only by the inherited habits which adaptation demanded; while the monotypic species, not being able to fit themselves for their surroundings without a too radical expensive change, have only continued to exist under certain special conditions. Thus, two important advantages are secured to the breeder who selects from the genera having numerous species—the advantage of naturally acquired pliability, and in the numerous species to work upon by combination for still further variations. The plant breeder, before making combinations, should with great care select the individual plants which seem best adapted to his purpose, as by this course many years of experiment and much needless expense will be avoided. The difference in the individuals which the plant breeder has to work upon are sometimes extremely slight. The ordinary unpractised person cannot, by any possibility, discover the exceedingly minute variations in form, size, color, fragrance, precocity and a thousand other characters which the practised breeder perceives by a lightning-like glance. The work is not easy, requiring an exceedingly keen perception of minute differences, great practice and extreme care in treating the organisms operated upon; and even with all the naturally acquired variations added to those secured by crossing and numerous other means, the careful accumulation of slight individual differences through many generations is imperative, after which sev-

eral generations are often but not always necessary to thoroughly "fix" the desired type for all practical purposes.

The above applies to annuals or those plants generally reproduced by seed. The breeder of plants which can be reproduced by division has great advantage, for any individual variation can be multiplied to any extent desired without the extreme care necessary in fixing by lineal breeding the one which must be reproduced by seed. But even in breeding perennials the first deviations from the original form are often almost unappreciable to the perception, but by accumulating the most minute differences through many generations the deviation from the original form is often astounding. Thus, by careful and intelligent breeding any peculiarity may be made permanent, and valid new species are at times produced by the art of the breeder, and there is no known limit to the improvement of plants by education, breeding, and selection.

The plant breeder is an explorer into the infinite. He will have "no time to make money," and his castle,—the brain,—must be clear and alert in throwing aside fossil ideas and rapidly replacing them with living, throbbing thought, followed by action. Then, and not until then, shall he create marvels of beauty and value in new expressions of materialized force, for everything of value must be produced by the intelligent application of the forces of nature which are always awaiting our commands. The vast possibilities of plant breeding can hardly be estimated. It would not be difficult for one man to breed a new rye, wheat, barley, oats, or rice which would produce one grain more to each head, or a corn which would produce an extra kernel to each ear, another potato to each plant, or an apple, plum, orange, or nut to each tree. What would be the result! In five staples only in the United States alone the inexhaustible forces of nature would produce annually without effort and without cost:

15,000,000 extra bushels of wheat,
5,200,000 extra bushels of corn,
20,000,000 extra bushels of oats,
1,500,000 extra bushels of barley,
21,000,000 extra bushels of potatoes.

But these vast possibilities are not alone for one year, or for our own time or race, but are beneficent legacies for every man, woman, or child who shall ever inhabit the earth. And who can estimate the elevating and refining influences and moral value of flowers with all their graceful forms and bewitching shades and combinations for color and exquisitely varied perfumes? These silent influences are unconsciously felt even by those who do not appreciate them consciously, and thus with better and still better fruits, nuts, grains, and flowers will the earth be transformed and man's thoughts turned from the base destructive forces into the nobler productive ones, which will lift him to higher planes of action toward that happy day when man shall offer his brother man not bullets and bayonets, but richer grains, better fruits, and fairer flowers. Cultivation and care may help plants to do better work temporarily, but by breeding plants may be brought into existence which will do better work always, in all places and for all time. Plants are to be produced which will perform their appointed work better, quicker, and with the utmost precision. Science sees better grains, nuts, fruits,

and vegetables all in new forms, sizes, colors, and flavors, with more nutrients and less waste, and with every injurious and poisonous quality eliminated, and with power to resist sun, wind, rain, frost, and destructive fungus, and insect pests; fruits without stones, seeds or spines; better fibre, coffee, tea, spices, rubber, oil, paper and timber trees, and sugar, starch, color, and perfume plants. Every one of these and ten thousand more are within the reach of the most ordinary skill in plant breeding. Man is slowly learning that he, too, may guide the same forces which have been through all the ages performing this beneficent work which he sees everywhere, above, beneath, and around him in the vast teeming animal and plant life of the world.

LUTHER BURBANK,
American Pomological Society.

Breed's Hill, Mass., a slight elevation in the Charlestown district of Boston, about 700 yards from Bunker Hill. Although the famous engagement of 17 June 1775 is known as the Battle of Bunker Hill, the fighting was done on Breed's Hill. Here was located the American redoubt, against which the British made their three historic charges, and here Warren fell. Bunker Hill monument stands on Breed's Hill.

Breese, Kidder Randolph, American naval officer: b. Philadelphia, 14 April 1831. He entered the navy in 1846 and served in the Civil War. In 1861 he commanded the third division of Porter's mortar flotilla in the attacks on New Orleans and Vicksburg; in 1863 and 1864 he was lieutenant commander on the Mississippi and took part in the most important engagements; in 1865 he was fleet-captain at the attack on Fort Fisher. He was made captain in 1874.

Breeze-fly. See BOT-FLY.

Brefeld, Oskar, ös'kär brä'fělt, German botanist: b. Telgte, Westphalia, 19 Aug. 1839. He was educated at Halle, Munich, and Würzburg. In 1875 he was a lecturer at Berlin; in 1878 he became professor at Eberswald, in 1884 at Münster, and in 1898 at Breslau. His investigations have been chiefly in mycology and he introduced a number of new methods in the study of this science, particularly the use of "gelatine cultures." He has written 'Researches in the Field of Mycology.'

Bregenz, brä-gěnts' (Latin, *Brigantium*), a town of Austria-Hungary, in Vorarlberg, 77 miles west by north of Innsbruck. It occupies a beautiful site on a slope which rises from the Lake of Constance and terminates on Mount Gebhard, where the ruins of the ancient stronghold of the Counts of Montfort are still seen. It consists of an old town, very poorly built, and a modern, which is more attractive. Among its edifices are three churches and two monasteries, a town hall, and a museum of Roman antiquities, found in the vicinity. Its chief manufacture is framework and other wooden fittings for houses, and it trades in corn, fruit, wine, butter, and cattle. There are saltpetre works, blast furnaces, and coal mines in the vicinity. Pop. (1900) 7,600.

Bregma. In the infant, a little behind the forehead in the middle line of the skull there is a diamond-shaped opening where the bones have not yet closed together. This situation is known as "bregma," and is taken as a landmark in medical and anthropological measurements.

Bre'hon (Irish, *breitheamh*, a judge), an ancient magistrate among the Irish. These magistrates seem to have been hereditary, and before the introduction of Christianity probably combined the offices of judge and priest. They administered justice to their respective tribes—each tribe had one brehon—seated in the open air upon some sods placed on a hill or eminence. The poet Spencer, in his 'View of the State of Ireland,' refers to the Brehon law as an unwritten code handed down by tradition. He was, however, mistaken in regarding it as an unwritten code. Patriarchal as was the administration of the Brehon law, its transmission was not left to tradition. In the earliest manuscripts extant it is said to have been revised by St. Patrick and other learned men, who expunged from it the traces of heathenism, and formed it into a code called the *Senchus Mor*, about 440, and it is implied that a previous written code existed. The Brehon law was exclusively in force in Ireland until 1170. Various ineffectual attempts were made by the English government to suppress it, and it was finally abolished by James I. in 1605. The Brehon laws, like other laws passed at the same period of European history, contained, with some rude principles of justice, many barbarous institutions. The state of society indicated in them seems to be a sort of transition from the communal ownership and periodical repartition of the land, found among several Teutonic nations, to a manorial organization. Several distinct social ranks are indicated, ranging from the nobles to the serfs. They had regular courts, with the right of appeal from lower to higher ones. Most offenses, even including murder, could be commuted by fines, which were fixed with minute precision; but the fines were paid in kind, since coined money was unknown. The laws also carefully provide for and regulate the raising of the children of the upper classes by members of the subordinate classes. The marriage laws were of a very loose character, and the law of inheritance is obscure and complicated. Until recently these laws have been involved in great obscurity. A commission was appointed in 1852 to superintend the publication and translation of the ancient laws of Ireland; and between 1865 and 1885 an edition of the *Senchus Mor* was published in five volumes. See Maine, 'Early History of Institutions' (1875).

Breisach, brī-zāh, or **Alt Breisach**, a town of Baden, on an isolated basalt hill (804 feet) on the right side of the Rhine, 14 miles west of Freiburg. The Mons Brisiacus of Caesar, it was taken by Ariovistus when he invaded Gaul; being regarded as the key to western Germany, it figured prominently in the wars of the 17th and 18th centuries. The minster is a 13th century structure. It carries on an active trade in lumber and cattle, and manufactures beer, wall paper, wine, etc. Pop. (1900) 3,500.

Breitbach, brīt'bāh, **Karl**, German painter: b. Berlin, 14 May 1833. He was educated at the Berlin Academy and in Paris under Couture. He first devoted himself to landscape painting, but later became both a genre and a portrait painter. Among his works are: 'Mill of St. Quen near Paris'; 'The Trianon Park'; 'Sunrise in the Bavarian Highlands'; 'Kirmess—Joy'; 'Kirmess—Sorrow'; 'Village Children

Bathing'; 'At the Fortune Teller's'; and portraits of Weber and others. He has also painted interior decorations.

Breitenfeld, brīt'en-fēlt, a village of Saxony, four miles north of Leipsic. Here two battles were gained by the Swedes during the Thirty Years' War. In the first, fought on 7 Sept. 1631, Gustavus Adolphus, joined by the Saxons, defeated Tilly and Pappenheim; in the second, on 2 Nov. 1642, Torstenson, who had succeeded on the death of Baner to the command of the Swedish army in Germany, again defeated the Imperialists under the Archduke Leopold and Piccolomini, who had advanced to the relief of Leipsic, invested by the Swedes. Leipsic surrendered after the battle. Breitenfeld was also the scene of a portion of the battle of Leipsic, won by the allies against Napoleon, 16-19 Oct. 1813.

Breitkopf, Johann Gottlob Immanuel, yō'hān göt'lōb im-mān'oo-ēl brīt'kōpf, German printer and publisher: b. Leipsic, 1719; d. 1794. He was educated in the university of his native city, and following out a scientific study of printing, he evolved improvements in musical notation and in German text. To him is probably due the present form of modern printed music. In 1764 he established in Leipsic the publishing house known as Breitkopf and Härtel from 1795. He was the author of 'Ueber die Geschichte der Erfindung der Buchdrucker-kunst' (1779); 'Ueber den Druck der Geographischen Karten' (1777-9).

Breitman, Hans, hānts brīt'mān. See **LELAND, CHARLES GODFREY**.

Brekelenkam, brā-kē-lēn'kām, **Quirin**, Dutch painter: b. Zwammerdam, near Leyden, about 1620; d. Leyden, 1668. He was to some extent an imitator of Dou, and perhaps his pupil. His subjects are from the life of the people, and his treatment marked by fidelity to nature and breadth of style. Among his most characteristic paintings are: 'The Fireside'; 'Monk Writing'; 'Interior'; 'The Sandwich'; 'Game of Cards'; and 'A Brazier.'

Bremen, brā'mēn, Germany, a port and free city, and an independent member of the empire, one of the three Hanse towns, is situated on the Weser, about 50 miles from its mouth, in its own small territory of 98 square miles, besides which it possesses the town and port of Bremerhaven at the mouth of the river. The town is divided into the old town (Altstadt), on the right bank of the river; the new town (Neustadt), on the left bank of the river, and the extensive suburbs (Vorstädte). The first is separated from the suburban quarters adjoining by the ramparts of the city, now converted into walks and pleasure-grounds, and forms a sort of semicircle on the right bank of the river. The new town lies on the left bank of the river opposite the old, with which it is connected by three bridges, two of them crossing the main stream, and the third crossing an arm of it called the Little Weser, besides a railway bridge. Extensive suburbs lie on this side also. The streets of the old town are generally narrow and crooked, and lined with antique houses in the style of the Middle Ages. This is the business quarter of the city, and contains the chief public buildings, including the cathedral, the old Gothic council-house, with the famous wine

cellar below it, the modern town-hall, the Schütting or merchants' house, the old and the new exchange, etc. The new town has straight, well-built streets, lined mostly with dwelling-houses and shops. The suburbs also consist chiefly of dwelling-houses, and as these often have gardens in front, the streets have a very pleasant aspect. The chief ecclesiastical building is the cathedral, a Romanesque edifice, founded in 1044, subsequently added to at various times, and in 1888-93 provided with two new western towers. There are several other old and interesting churches, as those of St. Ansgar, St. Stephen, and St. John. Among buildings of recent erection are the court-house, savings bank, and railway station. There are several squares and open spaces, and besides the pleasure-grounds formed from the ramparts, a large public park has been laid out on the north side of the town. Bremen is well supplied with schools and other educational institutions, and possesses a museum, a library (120,000 volumes), an observatory, etc. The manufacturing establishments include tobacco and cigar factories, sugar-refineries, rice-mills, iron-foundries, and machine works, rope and sail works, and ship-building yards. It is from its commerce, however, that Bremen derives its importance. Its situation renders it the emporium of Hanover, Brunswick, Hesse, and other countries traversed by the Weser, and next to Hamburg it is the principal seat of the export and import trade of Germany. The Weser has been deepened so that sea-going ships drawing 17 feet of water can now ascend to the Bremen docks, but the great bulk of the shipping trade centres in Bremerhaven and Geestemünde. Bremerhaven is now a place of over 18,000 inhabitants, and is provided with excellent docks capable of receiving the largest vessels; it is connected by railway with Bremen, where the chief trading companies, merchants, and brokers have their offices. The greater portion of the German trade with the United States passes through Bremen, and it is the chief port of emigration on the Continent. The chief imports are tobacco, raw cotton, and cotton manufactures, wool and woolen manufactures, rice, coffee, grain, petroleum, etc., which are of course chiefly re-exported to other parts of Germany and the Continent. Next to Liverpool, Bremen is to-day the leading European cotton market. Before the organization of the cotton exchange in 1872, the German merchants had been getting their product chiefly from Havre and Liverpool, very little being imported direct. To become independent of British ports, it was necessary to get the patronage of the inland spinners. This proved no easy task. Not until a decade had passed did the Bremen exchange cease to be a local institution and acquire a standing of national importance; but ever since the development has been phenomenal. While the importation of cotton in the year 1870 amounted to only 157,689 bales, it ran up to 307,998 bales in the year 1880. Ten years later there were 812,538 bales and the year 1900 showed the enormous figure of 1,567,045 bales. The new cotton exchange opened in 1902 is said to be not only the most imposing structure of this nature in the world, but also the most complete in the appointments necessary for carrying on the business of buying and selling cotton and supplying the leading merchants and brokers with office and sample rooms.

Bremen first rose into note about 788, when it was made the seat of a bishopric by Charlemagne. It was afterward raised to the dignity of an archbishopric, and by the end of the 14th century it had become virtually a free imperial city. At the Treaty of Westphalia in 1648 the archbishopric was secularized, and became a duchy under the supremacy of Sweden. In 1731, when the elector of Brunswick gained possession of the duchy, the privileges of Bremen as a free city were confirmed. From 1810 to 1813 it formed part of the French empire. The constitution is in most respects republican. The legislative authority is shared by the senate, a body of 18 (12 of whom must be lawyers, and 5 merchants) elected for life, and presided over by two of their own number alternately, who have the title of burgomaster; and by an assembly of 150 citizens elected for six years. The executive power is intrusted to the senate and senatorial committees. Pop. of the total territory (including Bremerhaven) (1902) 224,700.

Bremer, brä'mër, **Fredrika**, Swedish novelist: b. Tuorla, Finland, 17 Aug. 1801; d. Arsta, 31 Dec. 1865. At 17 she was taken on a tour through Germany, Switzerland, and France. In 1828 appeared the first volume of her 'Sketches of Everyday Life,' but the second volume, 'The H. Family' (1833; English translation, 1844), first revealed her power. From this time she devoted herself to writing stories that quickly became popular in translations far beyond the bounds of Sweden, and she varied her literary labor by long journeys in Italy, England, the United States, Greece, Palestine, which supplied the materials for her 'Homes of the New World' (1853), and 'Life in the Old World' (1862), full of fine descriptions of scenery and vivid pictures of social life, with sound views on political and moral questions. The admirable translations of Mary Howitt had preceded her in the United States as well as England, and insured her an equally warm welcome on both sides of the Atlantic. On her return to Sweden she gave herself up to philanthropy, but more particularly to the education and emancipation of women, and the consequent propagandist character of her later novels, 'Bertha,' and 'Father and Daughter' (1859), was detrimental in no small degree to their literary value. Her religious views she set forth in her 'Morning Watches' (1842). She has been called the Jane Austen of Sweden. Of her stories perhaps the most perfect is 'The Neighbors' (1837). 'The Diary,' 'The President's Daughters,' 'Brothers and Sisters,' and 'Strife and Peace, or Scenes in Dalecarlia,' are only less popular.

Bremerhaven, brä'mër-hä-fën, the port of Bremen, Germany, on the east shore of the Weser estuary, nearly 10 miles from the open sea, and 39 north-northwest of Bremen. It was founded by Bremen, in 1827, on ground acquired from Hanover, and rapidly became a thriving place. A second dock was opened in 1866, a third in 1874, and in 1888 a great port, with docks, was undertaken at Nordenham, on the opposite bank. Bremerhaven was the scene, in 1875, of a dynamite explosion on board a mail steamship, by which 60 persons were killed. The Geeste separated Bremerhaven from Geestemünde. Pop. (1900) 20,300.

Brend'amour, brän-da-moor, **Franz Robert**, German engraver: b. Aix-la-Chapelle, 16 Oct.

1831. He was educated in his art at Cologne under Stephan. In 1856 he went to Düsseldorf and established a xylographic studio, which rapidly became well known and one of the leading institutions of its kind. He later set up similar studios in Berlin, Leipsic, Brunswick, Stuttgart, and Munich, to conducting which he devoted most of his time. Among his best works are a collection, 112 engravings, after drawings by Rudolf Elster; illustrations for several works, including Immermann's 'Der Oberhof,' and Count Waldersee's 'Der Jäger'; 'The Odyssey,' after drawings by Preller, and eight frescoes in the Rathhaus at Aix-la-Chapelle.

Bren'dan, or Brenainn, Saint, of Clonfert: b. 484 at what is now Tralee in Kerry; d. 577. He was educated under his relative, Bishop Eric, and St. Jarlath of Tuam, and was ordained by the former. Shortly afterward he went on a seven years' voyage in search of "the mysterious land far from human ken"; but without success. Later he visited and lived in Brittany for a time, and after his return he again set out to seek the distant paradise, which he ultimately found. When he again reached Ireland he founded the monastery of Cluain Fearta (Clonfert), and he seems to have visited Scotland at this time. His two voyages form the basis of the celebrated medieval legend of the 'Navigation of St. Brendan'; but in the legend they are united into one and combined with other stories. Where Brendan's voyages really led him we do not know. The Book of Lismore contains a life of St. Brendan.

Another Irish saint of the same name was born about 490 and died in 573. He was a friend of Columba, and founded a monastery at Birr (Parsonstown) in King's County.

Brendel, Heinrich Albert, hīn'ri:n āl'bĕrt brĕn'dĕl, German painter: b. Berlin, 7 June 1827; d. 1895. He studied at the Berlin Art Academy under Krause, and in Paris as a pupil of Couture and Palizzi. After traveling in Italy and Sicily, he lived in Paris, 1854-64; he then returned to Germany and lived in Berlin and Weimar, becoming director of the Art School at the latter place. He devoted himself almost entirely to animal painting, and his pictures of sheep are considered especially fine. His works include: 'Peasant's Farm,' 'Interior of Sheep Stable,' 'Sheep Leaving Stable.'

Bren'eman, Abram Adam, American chemist: b. Lancaster, Pa., 28 April 1847. He graduated at Pennsylvania State College in 1866, and after service as an instructor, was full professor of chemistry 1869-72. From 1875 to 1882 he was assistant, lecturer, and professor of industrial chemistry at Cornell. Since then he has resided in New York, engaged in professional work as a writer, analyst, and chemical expert. He is the inventor of the Breneman process of rendering iron non-corrosive, and has made a special study of water and its contaminations. He has written: 'Manual of Introductory Laboratory Practice' (1875); 'Report on the Fixation of Atmospheric Nitrogen' (1890); and numerous contributions to chemical and other journals.

Brenham, brĕn'ām, Texas, a city and county-seat of Washington County, on the Gulf, C. & S. F. and the Houston & T. C. R.R.'s, west of Houston. It is the centre of an agricultural

and cotton region, and has two cotton compresses, a cotton factory, and a cottonseed-oil mill, as well as other manufacturing interests. It is the seat of the Blim Memorial and Evangelical Lutheran colleges, has a library, two parks, and fair grounds. Pop. (1900) 5,968.

Bren'nan, Thomas Francis, Irish Catholic prelate: b. Tipperary, 1853. He was educated at Allegheny College, Pa., at Rouen, and Innsbruck. He was engaged in missionary work in Pennsylvania and was later made bishop of Dallas, Texas. In 1893 he went to Labrador, and in 1894-5 was auxiliary bishop of Newfoundland; since then he has been acting auxiliary bishop of Albano and Frascati, Italy.

Bren'ner, Mount, a mountain in the Tyrol, situated between Innsbruck and Sterzing, and between the rivers Inn, Aicha, and Adige, forming part of the Tyrolese Alps, 6,777 feet high. The road from Germany to Italy traverses this mountain. It reaches the elevation of 4,658 feet, and is about 12 miles long. This is one of the lowest roads practicable for carriages over the main chain of the Alps, and also one of the most ancient, having been used by the Romans. In 1867 a railway over the Brenner Pass was opened, so that Italy and Germany were connected by an unbroken line of rails.

Bren'nus, the name or title of several princes of the ancient Gauls, supposed to be derived from the Kymrian *brēnhiu*, a king. A leader of the Senones, a Gallic nation in the upper part of Italy, the most famous personage who is mentioned under this name, made an invasion into the Roman territory about the year 390 b.c. A battle was fought near the river Allia, the Romans were totally defeated, and Brennus took possession of the city, which had been previously abandoned by the inhabitants. The capitol only was provided with a garrison, but several aged citizens of rank, amounting in the whole to about 80, had resolved to remain in the city and devote themselves to the infernal deities. Attired in their sacerdotal, consular, and triumphal robes, they seated themselves in their chairs of office in the middle of the forum, awaiting death. When Brennus arrived at the forum, he was struck with astonishment at their venerable aspect. The Gauls looked upon them as so many statues of deities, and feared to go near them, but ultimately they were all massacred. Rome was sacked, and all the inhabitants who yet remained in their houses were slain. Brennus then assaulted the capitol, and being repelled with considerable loss, he set fire to the city and leveled it with the ground. While the garrison of the capitol was in great distress Brennus attempted a surprise by night, in which he would have succeeded had not the cackling of the geese, sacred to Juno, alarmed the garrison, in consequence of which the Gauls were repulsed. After six months Brennus offered to raise the siege and leave the Roman territory for 1,000 pounds of gold. When the gold was weighed, Brennus threw his sword into the scale beside the weights and cried out, "Woe to the vanquished!" According to Polybius the Gauls returned home in safety with their booty. According to the Roman legend followed by Livy, Brennus was defeated, and his army entirely destroyed by Camillus, a distinguished

Roman exile who had retired to the city of Ardea, and who arrived with succor in time to save the capitol.

Another Brennus in 279 B.C. advanced into Greece with an enormous force, said to have amounted to 150,000 foot and 61,000 horse. After ravaging Macedonia he entered Thessaly and marched toward Thermopylæ, where an army of 20,000 Greeks was assembled, supported by an Athenian fleet on the coast. The Gauls were repulsed in a sanguinary battle, but, in order to separate the Greeks, they dispersed themselves to plunder the country. Brennus himself attacked the temple of Delphi, which was defended by only 4,000 men, but was again repulsed, and carried out of the battle fainting with his wounds. Unwilling to survive his defeat, he put an end to his life by copious draughts of wine. The Greeks attributed their victory to the assistance of Apollo.

Brent, Charles Henry, American clergyman: b. Newcastle, Ontario, Canada, 1862. He was graduated at the University of Trinity College in 1884, ordained deacon in the Protestant Episcopal Church in 1886, priest in 1887, and consecrated the first bishop of the Protestant Episcopal Church for the Philippine Islands in December 1901. He served in the ministry of St. Paul's Pro-Cathedral, Buffalo, 1887-8; removed to Boston in the latter year, where he had charge of the parish of St. John the Evangelist, and later of that of St. Stephen's Church, devoting himself entirely to the missionary work of the latter parish. He has performed considerable literary work; was on the editorial staff of the New York *Churchman* for some time, and is the author of 'With God in the World,' and other books.

Brent Goose. See BRANT.

Bren'ta (ancient MEDOACUS MAJOR), a river in north Italy. Its source is Lake Caldonazzo in the Tyrol, eight miles southeast of Trent, whence it flows southeast, with a winding course of 112 miles, and falls into the Adriatic through the canal of Brenta-nova or Brentono, at Brondolo. Formerly its embouchure was at Fusina, opposite Venice. The old course has been formed into a canal, and is the chief means of communication between Padua and Venice, the new channel being comparatively little used.

Brentano, brĕn-tă'nō, Clemens, German poet: b. Frankfort-on-the-Main, 8 Sept. 1778; d. Aschaffenburg, 28 July 1842. He studied at Jena, and resided by turns there and at Frankfort, Heidelberg, Vienna, and Berlin. In 1818 he retired to the convent of Dülmen, in Münster, and the latter years of his life were spent at Ratisbon, Munich, and Frankfort-on-the-Main. These frequent changes were due to a restless disposition, combined with morbid and misanthropic views, which gave a peculiar character to his writings. With a powerful imagination, his genius was tinged with mysticism, eccentricity, and a strong tendency to sarcasm. He was the brother of Elizabeth von Arnim, Goethe's "Bettina." Among his principal works are 'Satires and Poetical Fancies' (1800); 'The Mother's Statue' (1801), an ultra-romantic production, which he himself calls a very wild romance; 'The Joyous Musicians' (1803); 'Ponce de Leon' (1804); 'The Founding of Prague' (1816), said to be his most successful drama; 'Gokel, Hinkel, und Gakeleia' (1838),

a satire on the times; 'History of the Brave Caspar and the Beautiful Annerl' (2d ed. 1851), which is considered a masterpiece as a novelette.

Brentano, Franz, German philosopher: b. Marienberg, 16 Jan. 1838. He was professor of philosophy at Würzburg, but in 1873 resigned his position on account of the doctrine of the infallibility of the Pope; and was professor at Vienna, 1874-80. He has written 'Psychology of Aristotle,' 'New Riddles,' and 'Psychology from an Empirical Standpoint' (in agreement with Lotze and the English empirical psychologists).

Brentano, Lorenz, German American politician: b. Mannheim, 4 Nov. 1813; d. Chicago, 18 Sept. 1891. He studied law at Heidelberg, represented Mannheim in the Lower House of Baden, and was a member of the National Assembly in 1848. He withdrew from this body with the majority of the radical party in 1849. He was placed at the head of the revolutionary government of Baden, but suspected of treachery to his party, was forced to flee to Switzerland. In 1850 he came to the United States, lived for a time on a farm in Michigan, and then went to Chicago. Here he practised law and established the Illinois *Staatszeitung*, which he made one of the most influential papers in the northwest in the interest of the Federal government. He was a member of the Illinois legislature in 1862; United States consul at Dresden 1872-6, and member of Congress from Illinois in 1876.

Brentano, Lujo, loo'yō, German political economist: b. Aschaffenburg, Bavaria, 18 Dec. 1844. He studied at Dublin and at four German universities; and, after attaining a post in the Royal Statistical Seminary in Berlin, went to England to study the condition of the working classes, and especially trades' associations and unions. The outcome of this was his work, 'On the History and Development of English Guilds' (1870); 'Die Arbeitergilden der Gegenwart' (1871-2). He has been professor at Breslau (1873), Strasburg, Vienna, Leipsic, Munich (1891). He supports the "Socialists of the Chair" (*Kathedersozialisten*) against the German free-trade school, and has written works on 'Wages' (1877); 'Labor in Relation to Land' (1877), and 'Compulsory Insurance for Workmen' (1881), on the English Chartists, on the Christian Socialist movement in England, and numerous polemical pamphlets.

Brent'ford, the county town of Middlesex, England, seven miles west of London. It has a weekly market and two annual fairs. Here Edmund Ironside defeated the Danes, under Canute, in 1016; and Prince Rupert a part of the parliamentary forces, under Col. Hollis, in 1642. Sion House, the magnificent edifice of the Duke of Somerset, where Lady Jane Grey resided, now belonging to the Duke of Northumberland, was built here on the site of a suppressed nunnery. Brentford has a considerable retail trade, a soap manufactory, and extensive sawing and planing mills. Pop. (1891) 13,738; (1901) 15,171.

Brenton, William, colonial governor: b. England, early in the 17th century; d. Newport, R. I., 1674. His family came to Rhode Island from Hammersmith, England, where they were of good social standing. Between 1635 and 1669 Brenton was the colony's representative at

Boston, lieutenant-governor, president of the colony, and governor under the Charles II. charter 1666-9. He was one of the nine original proprietaries of Rhode Island; he selected and surveyed the site of Newport, and built a large brick residence where Fort Adams now stands. Brenton's Point and Brenton's Reef in Narragansett Bay preserve his name. See 'Rhode Island Colonial Records,' Vols. I. and II., *passim*.

Brenz, Johann, yō'hān brēnts, German reformer: b. 1499; d. 1570. He was one of the authors of the *Syngamma Suevicum*, bearing upon the controversy with Zwingli and Œcolampadius, on the subject of the Lord's Supper. He was the most resolute among the opponents of the interdict of Charles V., escaping death only by resorting to flight.

Brereton, Austin, English journalist: b. Liverpool, England, 13 July 1862. He went to London in 1881, has been dramatic critic of 'The Sphere' from 1901, and prior to that date was connected with 'The Stage'; 'The Theatre'; Sydney (N. S. W.) *Morning Herald*; and the 'Illustrated American,' New York. He has published Henry Irving's 'A Biographical Sketch' (1883); 'Some Famous Hamlets' (1884); 'Dramatic Notes' (1886); 'Shakespearean Scenes and Characters' (1886); 'Romeo and Juliet on the Stage' (1890); 'Sarah Bernhardt' (1891); 'Gallery of Players' (1894); 'Short History of the Strand Theatre' (1899); 'Cheltenham' (1899); 'By the Silent Highway' (1901); 'Peg Woffington, On and Off the Stage' (1901); 'The Well of St. Anne' (1901); 'A Ramble in Bath' (1901).

Brescia, brē'shā (Latin, *Brixia*), an episcopal city of Lombardy, Italy. It is situated at the foot of the Alps, 40 miles northwest of Verona, on a fertile and beautiful plain on the banks of the rivers Mella and Garza. It is the capital of the province of the same name, and is a handsome and flourishing city, of a square form, about four miles in circuit, and surrounded by walls. Its streets are spacious, and its public buildings numerous, particularly its churches, which are further remarkable for the number and value of the paintings with which they are enriched. A few of them only, however, have much pretension to architectural beauty; among those that have are the cathedral, a handsome structure of white marble, and the Church of San Domenico. But, however plain in exterior appearance most of the Brescian churches may be, they are all richly decorated within with the most beautiful frescoes, and other creations of taste and art. The other buildings most worthy of notice are the Palazzo della Loggia, and the Broletto. The first was intended for the palace of the municipality, or city hall. It is composed of the richest marbles, and was worked upon by the first architects of the 15th and 16th centuries successively. The Broletto, the ancient palace of the republic, combines the characters of fortress and city hall, and is surmounted by a great tower, whose deeply cleft Italian battlements produce a singularly grand effect. The whole is in a colossal style, and marked by the peculiar characteristics of the age in which it rose — supposed to be about the end of the 12th, and beginning of the 13th century. The city contains also a lyceum, two gymnasia, an athe-næum, a college, with a museum of antiquities,

and a botanic garden; a public library, with 30,000 volumes; a theological seminary, a handsome theatre, a corn exchange, an extensive hospital, and other educational and charitable establishments. There are 72 public fountains in the streets and squares, besides some hundreds of private ones. Outside the town is a cemetery, begun in 1815, designed by Vantini.

Brescia is a place of considerable trade and manufacturing industry. Near it are large iron-works, and its firearms are esteemed the best that are made in Italy. It has also silk, linen, and paper factories, tan-yards, and oil-mills, and is an important mart for raw silk. But it derives its greatest interest from its fine Roman remains, having been at one time the seat of a Roman colony. These first attracted attention in the 17th century; although, so far as regards inscriptions, they had been objects of especial care to the citizens of Brescia for two centuries before this period, but it was not till 1820 that any very earnest efforts were made to bring the buried remains of entire buildings to light. Since that period some remarkable discoveries have been made, embracing besides numerous statues and inscriptions the beautiful marble temple of Vespasian, and a number of noble and magnificent Corinthian columns, with many fragments of moldings and ornaments, some gilt, and all of great elegance. Brescia was the seat of a school of painting of great merit, to which many eminent artists belonged, including Alessandro Bonvicino, commonly called "Il Moretto," who flourished in the 16th century, and was remarkable for the deep devotional feeling which he threw into his sacred subjects, as well as for his excellence as a portrait painter. The city is of great antiquity, having been the chief town of the Cenomani, a Gallic tribe, who were conquered by the Romans. It became the seat of a Roman colony under Augustus about 15 B.C., and afterward a municipium. In the year 412 it was burned by the Goths; and was soon afterward destroyed by Attila; but was rebuilt about the year 452. It was taken by Charlemagne in 774. In 936 Otho I. of Saxony declared it a free city, and it so remained for nearly three centuries, taking an active part in the feuds of the Guelphs and Ghibellines, and ultimately put itself under the protection of Venice in 1426. In 1796 it was taken by the French, and was assigned to Austria by the general treaty signed at Vienna 9 June 1815. In 1849 it was involved in the commotions of continental Europe; its streets were barricaded, but the city was eventually captured by the Austrians under Gen. Haynau. It was ceded to Sardinia by the Treaty of Zürich in 1859. Pop. (1896) 67,500; (1901) 70,618.

Breslau, brēs'lōw, a city of Germany, the second in size in the Prussian dominions, being exceeded in population only by the capital, Berlin; the capital of the province of Silesia. It is situated in a spacious plain at the confluence of the Ohlau and the Oder, the latter dividing in into two main portions (the largest on the left bank), which, with islands in the river, are connected by a large number of bridges. The streets of the older quarters are narrow, those of the newer broad. There are electric and other tramways. The public squares and buildings are handsome. The fortifications which surrounded the old or inner city have been con-

verted into promenades, and the ditch into an ornamental sheet of water. The cathedral, built in 1148-1680, and restored in 1875, the Protestant churches of St. Elizabeth and St. Mary Magdalene, the Rathhaus or city-hall, a Gothic structure of the 14th and 15th centuries, the municipal buildings, the government buildings, the building for the provincial diet, the royal residence, court-houses, exchange, and university buildings are among the most remarkable buildings. The university was founded in 1702 as a Roman Catholic institution, with which was combined the Protestant university at Frankfort-on-the-Oder, transferred hither in 1811. The university has attached to it a museum of natural history, a cabinet of antiquities, a library of 320,000 volumes, including many old works and manuscripts, an observatory, a picture gallery, a botanic garden, etc. The number of students is about 1,500. There are numerous other educational institutions, as well as hospitals and asylums. Breslau carries on an extensive trade in the products and manufactures of Silesia, principally in corn, wool, metals, glass, coal, and timber. The Oder is navigable and there is a connection with Berlin by the Oder-Spree Canal. The industries comprise iron-founding, bell-founding, the manufacture of machinery, railway carriages, organs, and other musical instruments, cigars, oil, spirits, etc., brewing, and glass-painting. There are two annual wool-fairs, which are largely attended. Breslau was the seat of a bishopric by the year 1000; an independent duchy from 1163 to 1335; was ceded to Austria, after many wars and calamities, in 1527. It was conquered by Frederick II. of Prussia in 1741. It was from this time the scene of frequent warfare, being successively attacked by Austrians, French, Russians, and Prussians. It was twice occupied by the French, in 1807 and 1813. Its fortifications were destroyed by Napoleon in 1807, but it finally remained in the hands of Prussia. Pop. (1895) 405,041; (1900) 422,738; (1903) 433,350.

Bressani, Francesco Giuseppe, frän-chës'kō joo-sëp'pë brës-sä'ne, Italian missionary: b. Rome 1612; d. Florence 9 Sept. 1672. He labored during nine years among the Huron Indians of Canada, was captured and ill treated by the Iroquois, and afterward sold to the Dutch and kept in bondage until 1644, when he was ransomed. On his return to Italy, he published a book on the Jesuit missionaries in Canada.

Bressay, brës'sä, one of the Shetland Islands, lying east of the mainland, and separated from it by Bressay Sound, about six miles long and one to three in breadth. Its line of coast is rocky and deeply indented; the interior is hilly, rising in the Wart of Bressay to 742 feet, and is to a great extent covered with peat-moss. There are a number of small streams and small lakes. On the south there are three bold headlands, the Ord, the Bard, and the Hammar. The inhabitants are mostly crofters, sailors in the merchant service, or fishermen. Hosiery is the only manufacture. Bressay Sound forms a safe harbor (Lerwick Harbor), one mile or more in breadth, having Lerwick on its west side. Pop. (1891) 802; (1901) 1,686.

Brest, a fortified seaport and naval station of France, in the department of Finistère, in the former province of Brittany, situated at the

mouth of the Penfeld, 320 miles south by west from Paris. It has one of the best harbors in France, and a safe roadstead, capable of containing 500 men-of-war in 8, 10, and 15 fathoms at low water, and it is the chief station of the French marine. The coast on both sides is well fortified. The entrance to the roads, known as Le Goulet, is narrow and difficult, with covered rocks that make it dangerous to those not well acquainted with it. There are immense magazines, workshops, barracks, roperies, etc., and the dockyard employs from 8,000 to 9,000 men. Several docks are cut in the solid rock. Brest, which in the Middle Ages was of so much importance that it was said, "He is not Duke of Brittany who is not lord of Brest," had sunk by the beginning of the reign of Louis XIII. to little more than a village. Richelieu resolved to make it the seat of a vast naval arsenal, but little was done till the beginning of the reign of Louis XIV., when Duquesne came to superintend the works. Vauban followed him, and fortified it. In 1694 the combined fleets of England and Holland disembarked a force which attempted to take Brest, but was repulsed with great loss. On 1 June 1794 the French fleet was beaten off Brest by the British, under Howe, who took from them six ships of the line, and sunk a seventh. The manufacturing industry of Brest is inconsiderable, but its commerce is extensive. Its chief exports are cereals; its principal imports colonial produce and naval stores. Pop. (1896) 74,538.

Brest-Litovski, brěst-le-tōfs'kē, a fortified town of Russia, in the government of Grodno, on the Bug, 120 miles east of Warsaw. Brest-Litovski was a possession of Poland till 1795, and is one of the oldest Slav towns. The place is an important railroad centre and of considerable commercial importance because of its situation, and has a large trade in cloths, leather, and soap. It is a fortress of the first rank, with vast magazines and military stores. Pop. (1897) 46,542.

Bretagne. See BRITANY.

Bretèche, a name common to several wooden, crenellated, and roofed erections, used in the Middle Ages in sieges by the assailants to afford protection while they were undermining the walls, and by the besieged to form defenses behind breaches. Later, the name was given to a sort of roofed wooden balcony or cage, crenellated and machicolated, attached by corbels, sometimes immediately over a gateway.

Breteuil, Louis Charles Auguste le Tonnellier, loo-ë ô-goost lê tōn-nël-yä brë-të-y' (BARON DE), French diplomatist: b. 1730; d. 2 Nov. 1807. After a period of military service he became in 1758 minister plenipotentiary at Copenhagen, and afterward occupied similar posts in Sweden, Austria, Naples, and again in Vienna. His embassy to Vienna explains his attachment to the Queen Marie Antoinette. As minister and secretary of state after Necker's dismissal in 1789, he was a zealous defender of the monarchy; he was therefore considered as one of the greatest enemies of the Revolution. After the capture of the Bastille, he escaped by a hasty flight. In 1700 Louis XVI. entrusted him with secret negotiations for his restoration to the throne, at the principal northern courts. The convention issued a decree against

him. In 1802 he returned, with the permission of the government, to France.

Brethren, Bohemian, a Christian sect of Bohemia, formed from the remains of the stricter sort of Hussites in the latter half of the 15th century. They took the Scriptures as the ground of their doctrines throughout. Being persecuted, they fled into Poland and Prussia. See **BOHEMIAN BRETHREN**; **MORAVIAN CHURCH**; **UNITED BRETHREN**.

Brethren of the Christian Schools, an order established at Rheims by the Saint Jean Baptiste de La Salle (q.v.). The object of the order was to provide instruction for the poorer classes of the population, and hence the name. The members take upon themselves the vows of chastity, poverty, and obedience. Their costume is a coarse black cassock, and a small collar or band around the neck, for the house, and a hooded cloak and a wide hat for outdoor purposes. Their teaching is mainly rudimentary, although in some of their schools Latin and the higher mathematics form part of the course. They have modified their instruction from time to time to make it meet the wants of the classes whom they teach. Thus, in 1831 they opened evening schools for adults, wherein they received and taught mechanics and other poor laborers who had no time to devote to learning in the day. The Brethren of the Christian Schools are sometimes improperly called the "Christian Brothers." The latter have nearly the same rule and object, but form an independent order. See **BROTHERS OF THE CHRISTIAN SCHOOLS**; **ORDERS, RELIGIOUS**.

Brethren of the Free Spirit, a sect which sprang up on the upper Rhine near the beginning of the 13th century. They are frequently confounded with the Lollards, Beguards, or Beguins. They held that the universe was a divine emanation; that man, so far as he gave himself to the contemplative life, was a Christ, and as such, free from law, human or divine (Romans viii. 2, 14). Many edicts were published against this sect, but it continued to exist under various names, such as Picards and Adamites, till about the first quarter of the 15th century.

Brethren of the Holy Trinity, a religious society, founded in France near the close of the 12th century, whose members pledged themselves to give a third part of their revenues to procuring the redemption of Christians who had fallen captive to the infidels, and were in Mohammedan slavery. It was established by John of Matha, a Parisian theologian, and Felix de Valois.

Brethren of the Lord, The. Great controversy has existed concerning the expressions in the New Testament relating to the "brethren of Jesus," and theologians have been divided on the question of the perpetual virginity of Mary the mother of Jesus. The term "brethren of the Lord" occurs but once in the New Testament (1 Cor. ix. 5), but there are several other passages that refer apparently to actual brothers of Jesus (Gal. i. 19; Matt. xii. 46-50, etc.). Some have claimed that the brethren referred to were later sons of Mary by Joseph, the reputed father of Jesus; others have contended that they were sons of Joseph by a former marriage, and others again have sought to prove that these brethren were sons of Alphæus, the

husband of a sister of Mary, and therefore the cousins of Jesus.

Brethren of the Strict Observance, the stricter Franciscans, or Regular Observatines.

Bretigny, brë-tën-yë, a village of France in the department of Eure-et-Loire, six miles southeast of Chârtres, on the Paris & O. R.R. By the treaty of Bretigny, concluded on 8 May 1360, between Edward III. of England and John II. of France, the latter, who had been taken prisoner at the battle of Poitiers, recovered his liberty on a ransom of 3,000,000 crowns, to be paid in six years. Edward renounced his claim to the crown of France, and relinquished a portion of his conquests and possessions in that country, including Anjou and Maine, and the greater part of Normandy; receiving the cession in independent sovereignty of the duchy of Aquitaine, with all its dependencies; Gascony, Poitou, Saintonge, Aunis, Agenois, Périgord, Limousin, Quercy, Rouergue, Angoumois, together with Calais, the counties of Ponthieu and Guines, and the viscounty of Montreuil.

Breton, Jean Baptiste Joseph, zhöñ báp-tëst zhö-zëf brë-töñ, French journalist: b. Paris 16 Nov. 1777; d. 6 Jan. 1852. His public career as journalist and stenographer was nearly parallel with representative government in France. He was present as stenographer at the session of 10 Aug. 1792, when the power passed from the hands of an individual to those of an assembly; and of 2 Dec. 1851, when it passed from the hands of an assembly to those of an individual. His services were also in constant requisition at the courts as an interpreter for English, German, Italian, Spanish, Dutch, and Flemish suitors. He was a frequent contributor to the 'Dictionnaire de la Conversation,' and among other papers wrote the article on stenography.

Breton, Jules Adolphe, zhül ä-dölf, French painter: b. Courrieres 1 May 1827; d. Paris 5 July 1906. He was educated at St. Omer and at Douai, and studied under Félix Devigne and at Drölling's atelier in Paris. The subjects of his earlier pictures, such as 'Misère de Désespoir' (1849), were taken from the French revolutionary period; but he soon turned to the scenes from peasant life which he has treated in a most poetic and suggestive manner, with an admirable union of style with realism. In 1853 he exhibited 'La Retour des Moissonneurs' and in 1855 his celebrated 'Les Glaneuses.' He is represented in the Luxembourg by 'La Bénédiction des Blés' (1857), admirable for its rendering of sunlight; 'Le Rappel des Glaneuses' (1859); and 'Le Soir' (1861). His later works were simpler in their component parts and larger in the scale of their figures, and of these 'La Fontaine' is a typical example. Breton was also known as a poet.

Breton, de los Herreros, brä-tön' dā lōs ä-rä'rōs, Don Manuel, Spanish dramatist: b. Quel, province of Logroño 19 Dec. 1800; d. Madrid 13 Nov. 1873. He was the most notable Spanish poet of the first half of the 19th century. He gave to the Spanish stage 150 plays, some of them original, others derived from ancient Spanish sources, or translated from French or Italian. In him the old French comedy finds not so much an imitator as its last true representative. Among his best original

comedies are: 'I'm Going Back to Madrid,' 'Here I am in Madrid,' 'This World is All a Farce,' 'Die Once and You'll See.' He was less successful in the historic drama than in comedy.

Bret'on Literature. See CELTIC LANGUAGE AND LITERATURE.

Brets, Brettys, or Brits, Britons, the name given to the Welsh or ancient Britons in general; also to those of Strathclyde, as distinguished from the Scots and Picts.

Bretschneider, brët'shni-dër, Heinrich Gottfried von, German writer: b. Gera, 6 May 1739; d. 1 Nov. 1810. He was educated at the institute of Herrnhuters at Ebersdorf, entered the army as a cornet in the regiment of Count Brühl, was present at the battle of Kolin, and afterward became captain of a Prussian free-corps, and was made prisoner by the French. During his forced stay in France he acquainted himself with the language, and with the spirit of the people. On his return he was appointed governor of Usingen in Nassau. This government being shortly suppressed, he traveled in England and France, and became associated with Count Vergennes, who employed him in diplomatic missions. He returned to Germany in 1772, and was shortly afterward engaged in the service of Austria, where he was first named vice-governor of the banat of Temesvar. This banat having been incorporated in Hungary in 1778, he obtained the appointment of librarian to the University of Buda. Here his hostility to the monks, and especially to the Jesuits, led him into trouble; although the Emperor Joseph II., who held the same views, declared himself his protector. He was obliged to retire from Buda, and was appointed librarian at Lemberg, and also counselor to the government. In 1809 he retired with the title of aulic counselor. His views were liberal and somewhat sceptical, and with his active opposition to the monastic orders, gained him many enemies. His principal works are: 'Reise nach London und Paris' (1817); 'Almanach der Heiligen' (for the year 1788); 'Walters Leben und Sitten' (1793).

Bretschneider, Karl Gottlieb, German theologian: b. Gersdorf, Saxony, 11 Feb. 1776; d. Gotha, 22 Jan. 1848. He studied theology at Leipsic, was appointed pastor at Schneeberg in 1807, general superintendent at Gotha in 1816, and afterward counselor of the Upper Consistory there. Bretschneider established a reputation as a sound and judicious thinker of rationalistic bias, and his theological writings are admitted to have a permanent value. In 1820 appeared his 'Probabilia de Evangelii et Epistolarum Johannis Apostoli Indole et Origine,' an attack upon the Johannine authorship from internal evidence, and in 1824 his 'Lexicon Manuale Græco-Latinum in Libros Novi Testamenti.' Another work of importance is his 'Handbuch der Dogmatik' (4th ed. 1838). Bretschneider also wrote on many other theological questions and controversies.

Bret'ten, a town of Baden, Germany, the birthplace of Melancthon, 16 miles east-northeast of Carlsruhe by rail. The house in which Melancthon was born belongs now to a foundation bearing his name for the support of poor students, established in 1861. A monument was erected in 1867. Pop. (1900) 4,800.

Bretts and Scots, Laws of, the name given in the 13th century to a code of laws in use among the Celtic tribes in Scotland, the Scots being the Celts north of the Forth and Clyde, and the Bretts being the remains of the British inhabitants of the kingdom of Cambria, Cumbria, or Strathclyde, and Reged. Edward I. issued in 1305 an ordinance abolishing the usages of the Scots and Bretts. Only a fragment of them has been preserved.

Bretwalda, brët'vål-da, a title applied to one of the Anglo-Saxon tribal chiefs or kings, who, it is supposed, was from time to time chosen by the other chiefs, nobility, and ealdormen to be a sort of dictator in their wars with the Britons. The following are mentioned by Bede, but Hallam and other historians doubt whether any sovereign in those early times possessed such authority: 492 A.D., Ella, king of Sussex; 571, Ceawlin, king of Wessex; 594, Ethelbert, king of Kent; 615, Redwald, king of the West Angles; 623, Edwin, king of Deira; 634, Oswald, king of Bernicia; 643, Oswy, king of Bernicia.

Breughel, brë-nël, the name of a celebrated Dutch family of painters, the first of whom adopted this name from a village not far from Breda. This was Pieter Breughel, also called, from the character and subject of most of his representations, the "Droll" or the "Peasants' Breughel." He was born in 1510 (according to Mechel, in 1530), was a pupil of Peter Koeck van Aelst, traveled in Italy and France copying the beauties of nature, and after his return fixed his residence at Antwerp, where he was received into the Academy of Painters in that place. He subsequently married the daughter of his instructor, Koeck, and removed to Brussels, where he died in 1570 (according to some in 1590). In his rural weddings, his rustic feasts and dances, he strikingly represents the gaiety of the villagers, as he himself had frequently observed them, in disguise, in his youth. He also etched, but many of his pictures have been engraved by others. He left two sons—Pieter and Jan. The former (called the Younger Breughel), preferring subjects affording striking contrasts, painted many scenes in which devils, witches, or robbers are the principal figures. This particular turn of genius procured him the name of "Hell Breughel." Among his pieces are: 'Orpheus Playing on his Lyre Before the Infernal Deities,' and also 'The Temptation of St. Anthony.' The former picture hangs in the gallery of Florence. The second brother, Jan, was distinguished by his landscapes and small figures. From his usual dress he received the title of "Velvet Breughel." He also painted for other masters landscapes as backgrounds to their pieces, and sometimes little figures in them. He was a very prolific artist. In connection with Rubens he represented Adam and Eve in Paradise. The figures in this picture are painted by Rubens. This piece, his 'Four Elements,' also 'Vertumnus and Pomona,' which were all executed jointly with Rubens, are among his principal performances. He is said to have been born in 1568; other authorities say 1569, 1575, or 1589. He visited Italy, and enriched his imagination with beautiful scenery. He is said to have died in 1642, or by other authorities 1625. Other members of this family, belonging to a later period,

are Ambrose, who was director of the Antwerp Academy of Painting between 1635 and 1670; and Abraham, who for a time resided in Italy, and died in 1690; the brother of the latter, John Baptist, who died in Rome; and Abraham's son, Caspar Breughel, known as a painter of flowers and fruits.

Breve, brēv, a note of the third degree of length, and formerly of a square figure, as \square ; but now made of an oval shape, with a line perpendicular to the stave on each of its sides: $\boxed{\text{Z}}$. The breve, in its simple state, that is, without a dot after it, is equal in duration to one quarter of a large, or to two semibreves, and is then called imperfect; but, when dotted, it is equal to three eighths of a large, or to three semibreves, which being the greatest length it can assume, it is then called perfect. It is now chiefly used at the close of passages or compositions.

Brevet', a term borrowed from the French, and applied in the United States and Great Britain to rank in the army conferred upon officers on account of special and long service, and higher than that for which regimental pay is received. Thus a brevet-major serves as captain in his regiment, and draws pay as such.

Breviarium of Eutropius, the only existing work by Eutropius. It is a treatise in 10 brief books or chapters, recounting the history of Rome from the foundation of the city to the time of Valens, 364 A.D. Its style is notably good and the work has been much drawn upon by later writers. The best critical edition of 'The Breviarium' is that by Droysen.

Breviary (from the Latin *brevariū*), a summary or abridgment of prayers. The breviary is the book containing the daily offices which all who are in orders, or enjoy any Catholic benefice, are obliged to read. It is an abridgment of similar offices previously in use. The breviary contains prayers or offices to be used at the seven canonical hours of matins and lauds, prime, tierce, sext, nones, vespers, and compline. It is not known at what time the use of the breviary was first enjoined. In the Acts of the Apostles we find the third, sixth, and ninth hours especially mentioned. From Clement of Alexandria, Tertullian, Cyprian, and others, we learn that the observance of these hours was general among Christians. St. Basil, St. Jerome, and St. Ambrose speak of the seven hours called canonical. The services in use in the convents and monasteries in the early ages were very exhaustive from their great length. A council held at Tours in 567 enjoined that matins and vespers should never have less than 12 psalms each, and that the former should have 30 in Lent. It was under Pope Gregory VII. (1073-85) that the abridgment of the offices began to be considered necessary. In 1241 a breviary revised by Haymon obtained the approbation of Gregory IX., and was introduced in all the churches of Rome under Nicholas III. In 1568 Pius V. published a breviary which has remained, with few modifications, to the present day. The Roman breviary, however, was never fully accepted by the Gallican Church, which persisted in maintaining its own offices. The Ultramontane party there had long struggled in vain for the introduction of the Roman breviary, but from 1840 to 1864, by a final and vigorous effort, the opposition of the Gal-

lican party was overcome, and the uniformity of usage generally established, though to the dissatisfaction of a large number of French Catholics.

The Psalms occupy a large place in the breviary, the order of the reading being so arranged that in general 100 psalms shall be recited in a week. Passages from the Old and New Testament and from the fathers have the next place. All the services are in Latin, and their arrangement, which is adapted to the various seasons and festivals of the Church, is very complex. The English Book of Common Prayer is based on the Roman breviary. There is a translation of the breviary into English by the Marquis of Bute (1880).

Breviary of Alaric, a compendium of Roman law dated from the first decade of the 6th century and compiled at the command of Alaric II., king of the Visigoths. It consisted of abridgements of the code and novels of Theodosius, the institutes of Gaius, etc., and contained a detailed commentary styled the 'Interpretatio.' It was intended for the Roman subjects of the Visigothic ruler, and must not be confused with the 'Forum Judicum' or 'Judicum Liber,' which Alaric put forth for his barbarian vassals. See Lee, 'Historical Jurisprudence' (1900).

Brevipen'nes, a family or subdivision of birds, but occupying a different position in different systems. Cuvier makes it a family of the order *Gralla* or waders. In more modern systems it corresponds to the order of Cursorial birds or *Ratite*. It includes at least two genera, the ostrich and the cassowary. The Dodo and Apteryx are also referred to it. The Brevipennes have a resemblance in several of their distinctive characteristics to the *Gallinacea*. Their pectoral muscles are reduced to extreme tenuity, and the sternum has no ridge, while the muscles of the thighs are of great strength and thickness. They are thus fitted for walking or running, rather than for flying. As their name implies their wings are short.

Brevoort', James Renwick, American artist: b. Westchester County, N. Y., 20 July 1832. His art studies were made chiefly in Europe, where he spent several years sketching scenes in England, Holland, and Italy. In 1861 he was elected an associate of the National Academy, and in 1863 a full member. Since 1872 he has been its professor of perspective. His specialty as a painter is landscape work, and the following pictures of his are well known: 'Lake of Como' (1878); 'Storm on English Moor' (1882); 'New England Scene'; 'Morning in Early Winter' (1884); 'The Wild November Comes at Last'; 'Windy Day on a Moor' (1886).

Brewer, David Josiah, American jurist: b. Smyrna, Asia Minor, 20 June 1837. He graduated at Yale College 1856, at Albany Law School 1858. He studied law in the office of his uncle, David Dudley Field, and was admitted to the bar in New York in 1858. Removing to Kansas, he became prominent in his profession. He was judge of the supreme court of Kansas 1870-81, and was appointed United States judge for the 8th circuit in 1884. He rendered a memorable decision on the Kansas Prohibition Law, affirming the right of liquor manufacturers to compensation, for which he was

severely criticised by the Prohibitionists. President Harrison elevated him to the supreme court of the United States in 1889. He was made a member of the Venezuelan commission by President Cleveland in 1896, and was chosen its chairman.

Brewer, John Hyatt, American musician: b. Brooklyn, N. Y., 1856. He studied piano, organ, and theory under local teachers, particularly Dudley Buck. He has filled the position of organist at the Church of the Messiah and the Clinton Avenue Congregational Church, Brooklyn, and since 1881 at the Lafayette Avenue Presbyterian Church in that borough, where he is also professor of vocal music at Adelphi College. His compositions include church music, vocal music, and works for the piano, organ, and orchestra.

Brewer, Leigh Richmond, American Protestant Episcopal bishop: b. Berkshire, Vt., 20 Jan. 1839. He was ordained in 1867, and after serving as rector of Grace Church, Carthage, N. Y., 1866-72, and Trinity Church, Watertown, N. Y., 1872-80, was consecrated missionary bishop of Montana in the year last named.

Brewer, Thomas Mayo, American ornithologist: b. Boston, Mass., 21 Nov. 1814; d. 23 Jan. 1880. He was graduated at Harvard College in 1835, and was editor of the Boston *Atlas* in 1840. He edited Wilson's 'Ornithology' and 'Birds of North America,' and, in conjunction with Baird and Ridgway, wrote 'A History of North American Birds.'

Brewer, William Henry, American agricultural scientist: b. Poughkeepsie, N. Y., 14 Sept. 1828. He was graduated from the Sheffield Scientific School, New Haven, in 1852, and has been professor of agriculture there from 1864. He has been a member of the National Academy of Sciences from 1880, of the Connecticut State board of health from 1892, and of the State board of agriculture for a long period. He has been one of the most prominent American leaders in agricultural research and is a valued authority on all related topics. Besides contributing to the 'Report on Cereal Production' in the United States Tenth Census (1883), he has edited the 'Botany of California' (1886).

Brewerton, Henry, American soldier: b. New York, 1801; d. Washington, D. C., 17 April 1870. He was graduated with the class of 1819 at West Point. Commissioned second lieutenant in the corps of engineers, he first served as assistant in determining the 45th degree of north latitude at Rouse's Point, N. Y. He was assistant and professor of engineering at West Point (1819-21). Thereafter he was almost continuously engaged in such important engineering works as repairing the fortifications in New York harbor, construction of Fort Jackson, La., of Fort Adams, Newport, R. I., of the defenses of Charleston harbor, S. C., of the fortifications and improvements of Baltimore harbor (1861-4), and of Forts Monroe and Wool, for the defense of Hampton Roads, Va. He was brevetted brigadier-general in the United States army, 13 March 1865, for long, faithful, and meritorious services, and was retired from active service 7 March 1867, "having been borne on the Army Register more than 45 years." Dickinson College conferred the degree of LL.D. upon him, 8 July 1847.

Brewing and Malting. Brewing is the process of making fermented drinks, such as ale, beer, cider, etc. See BEER.

MALTING.—Malting is the preparing of cereals by germination or growth for the process of mashing. Barley is the grain commonly used for making malt for lager beer, ale, stout, vinegar and yeast-makers' or distillers' mash, etc., while wheat malt is used to a large extent in the production of weiss beer.

The barley is first cleaned in order to remove foreign seeds, straw, broken kernels, etc., by means of sieves and blower fans. As the character of the beer depends largely upon that of the malt, and as the latter's character can be determined during malting, it follows that there are various methods of details in malting. The following are the general manipulations employed:

Steeping.—Malting is in reality an artificial or forced growth of a seed, the changes taking place being similar to those when the seed is planted in the soil. The first requisite is moisture. This is given to the grain by placing it in steep tanks containing water of a certain temperature. Steep tanks are cylindrical iron vessels having conical bottoms so that all the grain will drop out when tank is emptied. They are generally placed on the top floor of the malthouse. The grain remains in the steep tank until it has absorbed the desired amount of water, the time differing for different kinds and quality of grain or the process of the maltster. For barley the duration of steeping is generally from 36 to 60 hours, averaging about 48 hours.

Growing or Germinating Floors.—The malthouse usually consists of several floors. The water in the steep tank is drained off and the

Floor Malt House with Power Shovel, and Bucket Elevator for Green Malt.

wet barley dropped upon these floors below. The barley is now spread in heaps of about 12 to 14 inches high (occupying rather more than one third and less than one half of the floor space). The barley now dries out somewhat and begins to sprout or grow and small hair-like fibres, called rootlets, begin to show. As heat is generated during growth, which is undesirable above a certain temperature, and as further

BREWING AND MALTING

proper growth requires pure air, it is necessary to aerate the growing barley (now called green-malt). This is done by what is called "turning the heap," which consists of reshoveling the green malt in such a manner that the lower kernels of the old heap will be at the top in the new heap. (During turning, the green malt is thrown through the air in a thin sheet or stream, whereby it is aerated and cooled. The new heap now occupies a larger floor space, is consequently of less height on the floor.) This turning is repeated at regular intervals so that at the end of the growing period the heap covers the entire floor to a height of from five to six inches. This growth usually takes about five days, during which time water is sprinkled upon the heap whenever it becomes too dry.

Kilning or Drying.—After the green malt shows the desired degree of sprouting, it is necessary to quickly check further growth. This is done by drying it upon the kiln. The green malt is shoveled by means of a power shovel to one end of the floor where it drops through an opening into a bucket elevator and is conveyed to the kiln. The kiln usually has two floors placed one above the other made of strips of wire or perforated sheet metal and heated by means of an open fire from below. Above the upper floor, in the dome, drafts are placed to carry off the vapors, but in modern constructions suction fans are used to promote drying. The green malt is spread evenly upon the upper kiln floor about 18 inches high, where it remains for 24 hours, during which time it is only partially dried. It is now dumped or dropped upon the lower floor (commonly by mechanical dumping floors which turn open in sections on an axis or bearing like the grate in a furnace). The malt on this lower kiln is again spread evenly and then subjected to a higher temperature until the desired degree of dryness is obtained, which usually takes from 20 to 24 hours.

Malt Cleaning.—The malt as it comes from the lower kiln is not yet suitable for brewing as it contains the rootlets and some kernels that were crushed or injured on the floors or during conveying. The malt now passes through cleaning machines consisting of sieves and blowers which remove the rootlets, dust and small and broken kernels.

Mechanical Malting.—As floor malting is restricted to only the cooler months of the year and possesses other disadvantages as to cost of labor and buildings, mechanical systems are coming more and more into use. The steeping of the grain as well as the kiln drying, however, remain generally the same as in the floor system.

Pneumatic Floor Malting.—This system employs box-shaped compartments to hold the grain during the growing period. Through this receptacle air that has been purified and given the proper degree of moisture, as well as cooled or warmed to the proper temperature, is circulated. The conditions of temperature and humidity can thus be made the same all the year round no matter what the conditions of weather may be outside. The green malt in this system is not turned by hand, but by a series of screws or propellers driven by power, traveling through it at regular intervals.

Drum Malting.—The advantages here are similar to those stated above. The drums con-

sist of two concentric cylinders having the same ends. In the space between the cylinders the steeped grain is placed, this space not being filled quite full. The cylinders are perforated with small holes so that moistened or heated or cooled air can be forced through the grain from the centres or sucked through from the outside. By revolving the drum the grain is constantly tumbling, that is, the kernels nearest the inside cylinder fall against the outside cylinder, and this in connection with the air current passing through gives the same turning and aeration to the grain as in turning a heap in floor malting, and requires no labor. There are several systems of malting drums, differing principally in the manner in which the air is warmed and moistened and the direction in which it is forced through the drum.

BREWING.—Brewing Materials.—The materials used in the United States are principally the following: Barley malt is the most important and generally used. It gives to the beer not only its substances, but also to a great extent its character. Malt also supplies peptase and diastase, two substances that change the nature of certain other constituents during mashing. Peptase changes the insoluble albuminoids of the malt into soluble or desirable ones. Diastase changes the unfermentable starch contained in the malt and other materials into fermentable sugars and dextrins.

Caramel and black malt, consisting of ordinary malt that has been treated differently during malting, are used to impart color to the wort in order to produce darker beers, also to impart to the beer a more pronounced malt aroma or flavor. Only a small amount, proportionately, of these are used mixed with other materials.

Malt adjuncts or other starch containing materials, and brewing sugars are used for the triple purpose: of producing more durable beers, since these adjuncts contain very little albumen; of producing paler beers than could be made with malt alone; and for reducing the cost of production. These are rice and corn products, such as corn grits, corn meal, corn starch, corn flakes, and brewing sugars, glucose, etc. Flakes are made by steaming corn grits and passing them through hot steel rollers in order to change them so as to dissolve better during mashing. Flakes and sugars, such as grape sugar, glucose, etc., are sometimes used, instead of corn grits or rice (which require cooking) when a cooker is not installed. Flakes are added directly to the mash in the mash tub, and sugars to the wort in the kettle. Brewing sugars are used to a moderate extent only as a brewing material for lager beers, finding more extended use in the production of English beers such as ale, stout, etc.

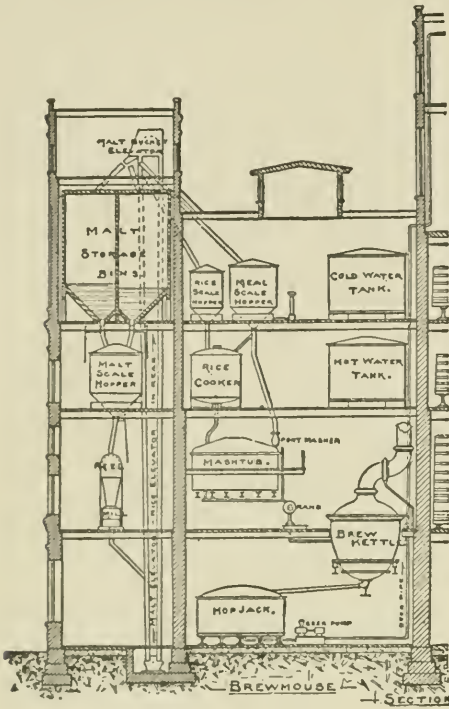

Hops are added to the boiling wort for the purpose of imparting (1) tannin, which aids in the elimination of undesirable albuminoids in the wort; (2) hop oil, which gives the beer its hop aroma, and (3) hop resin, which gives the beer its bitter taste and furthermore tends to preserve it. Water acts as a solvent for the substances contained in the beer. Its composition has considerable influence on the character of the beer produced. It must contain certain mineral substances. See Hops.

Brewing Operations.—Modern breweries are usually divided into three departments, namely

BREWING AND MALTING

the elevator or mill house where the materials are prepared and weighed; the brew house, where the wort is produced, and the cellars

ferred to the storage hoppers in the brew house ready for use. Rice and corn goods are either stored in the mill house, weighed in bulk and elevated to a storage hopper in the brew house, or dumped (usually in smaller breweries) directly from the sacks into the cooker.

Mill and Brew House.

Gravity or Tower Brewery Cellars.

where the wort is fermented and treated to produce the finished beer. The arrangement is on the gravity plan, that is, in each department the material of wort or beer is elevated or

Brew House.—The brew house generally contains the following vessels: hot and cold water tanks; malt and cereal (rice or corn) hoppers; the cereal cooker, mash tub, kettle, and hop jack and cooler.

Malt Mill and Screening Reel.

pumped only once to the top and from there descends through the different stages of manufacture by gravity.

Elevator or Mill House.—Here the malt is cleaned and stored. The desired amount of malt for the beer is weighed out in a scale hopper, and from thence passes through the malt mill where it is crushed so as to loosen the starch in the kernels. The crushed malt is then trans-

Hot Water Tank, Sectional View.

Mashing in Cereal Cookers.—Cookers are of two kinds; open ones or, as they are usually called, rice tubs, and closed or pressure cookers.

BREWING AND MALTING

In these vessels rice or corn (grits or meal) is boiled for a certain length of time in order to loosen up or soften the hard flinty condition of their starch so as to render it able to be more completely dissolved or acted upon in the mash tub. Crushed malt to the amount of about one quarter the weight of corn goods is added in the open cookers. The mashing method in the

than in open cookers. Hereby a more complete softening or dissolving of the starch is obtained and consequently a better yield or extraction of the materials.

Mashing in Mash Tubs.—The mash tub, like the open cooker, has a stirrer, and a heating coil, but is further supplied with a strainer or perforated false bottom for clarifying the wort, and a sprinkling device or sparger for washing out the grains. In the mash tub the mash is started and, when the mash from the cooker has been added, the combined mash is finished. The mashing method here varies considerably depending upon the character of the beer that is to be produced, and is consequently one of the most important of the brewing operations.

The method of mashing for the production of a beer of average character is approximately as follows: The crushed malt and water are mixed so as to have a temperature of 30° R. (100° F.) and the mash allowed to rest at this temperature

Cooker, showing Stirrer and Steam Connection.

open cooker varies somewhat among different brewers, the following being about the average method: The materials are mixed with water so as to have a temperature of 30° R. (100° F.). The mash is held at this temperature for about 15 minutes then run up to 56° R. (158° F.), and held for 30 minutes, then heated quickly to boiling and boiled from 45-75 minutes for corn goods depending on the fineness of the material, and 30 minutes for rice. The cereal mash is then run down to the mash tub where the mash is finished. Pressure cookers are used to some

Brew Kettle, showing Liquid Gauge, Steam Jacket, and Steam Connections.

for one hour. The temperature of the mash is now raised to 54° R. (153° F.) to 55° R. (156° F.), in about 15 to 20 minutes, by running in the boiling corn or rice mash from the cooker (with the addition of steam should same be necessary). This temperature is held for 10 to 15 minutes, during which time the stirrer is operated continuously. It is at this stage that the diastase in the malt inverts or changes both the starch contained in the malt as well as that in the corn or rice into unfermentable dextrin and fermentable sugars.

The mash is now heated with steam and hot water, in 15 to 20 minutes, to 59° R. (165° F.) and the stirrer stopped. The mash is now allowed to rest from 30 minutes to one hour in order to allow the hulls of the malt to settle so as to act as a filtering material for the wort, after which the wort is run into the kettle.

Mash Tub with Foremasher, Liquid Gauge, Attemperating Device and Three-way Cock.

extent, but not generally, in American breweries. They differ from the open cookers in that, being closed the mash can be boiled under pressure and consequently, at a higher temperature

BREWING AND MALTING

After the wort has run off, the solid substances remaining in the mash tub, called grains, are washed out or sparged with water in order to recover as much of the wort contained in them as possible. The grains are then thrown out of the mash tub and sold as cattle feed.

Boiling the Wort in Kettle.—The kettle consists of a pear-shaped copper vessel having a double or jacketed bottom for heating the wort,

Hop Jack, Sectional View.

and a vent pipe to roof for conducting off the vapors generated during boiling. The steam outlet of the coil or jacketed bottom is connected to a steam trap which automatically discharges the water condensed in the coil or jacket without materially reducing the pressure of the steam. The wort as soon as it runs clear from the mash tub is collected in the kettle. Steam is turned on in the kettle as soon as the jacketed bottom is covered with wort. This wort, and that continuously running in is then heated to and kept at about 70° R. (190° F.) in order to destroy the action of the diastase and prevent further saccharification in the wort taking place. When the kettle is full or nearly so, steam is further turned on and the wort brought to boiling and boiled for one hour when it should show a good "break." During this boiling the undesirable albuminoids are precipitated in finely divided form, rendering the wort turbid. Upon continued heating these albuminoids unite or lump together and leave the wort between these lumps clear and transparent. This clarification is called the "breaking" of the wort.

Hops are now added, usually about two fifths of the total amount used, after which addition the wort again becomes turbid due to the further precipitation of albuminoids by the tannic acid contained in the hops. After about 40 minutes further boiling the wort should again clarify or show its second break when another two fifths of the hops are added and the wort boiled about 20 minutes. The remaining one fifth of the hops are added and the wort run out of kettle into hop jack immediately. This last quantity of hops is usually of a better quality and is not boiled with the wort as its addition is for the purpose of imparting the hop aroma to the wort. This aroma is due to the hop oil of the hops which is volatile at boiling

temperature and would escape, and be rendered useless, if the wort were boiled for any considerable time. All or part of this last hop addition is sometimes placed in the hop jack and the boiling wort run upon it.

Wort in Hop Jack.—The hop jack consists of a round or square iron tank, having a perforated false bottom or strainer and a sparger or sprinkler similar to that of the mash tub. The wort, with the hops, is run into the hop jack and allowed to rest until the hops have settled so as to form a filtering material for the clarification of the wort. As soon as this takes place the wort is pumped to the surface cooler or beer tank located at the top of the cellars. After the wort has all been removed the hops are washed out or sparged with hot water in order to recover as much of the absorbed wort as possible.

Surface Cooler and Beer Tank.—The surface cooler consists of a shallow iron pan of a length and width very large in proportion to its depth so as to give the wort as much surface as possible. Hereby the wort is cooled quite rapidly and aerated.

The beer tank, an iron cylindrical vessel closed at the top, is rapidly supplanting this cooler, since the latter, by the large surface it presents, endangers the wort to infections by impurities or germs always more or less present in the air. As soon as the wort on the surface cooler or in the beer tank cools to about 50° R. (145° F.) the danger of its infection by impurities, bacteria, etc., begins. From this stage until the beer is finally marketed, months later, it requires the daily, almost hourly vigilance of the brewer to keep it pure and free from contamination.

Baudelot Cooler.—This consists of a series of pipes or tubes arranged in vertical tiers, over the outside of which the wort flows, while through them the cooling medium is circulated.

Baudelot Cooler.

It is usually made in two sections, the upper being of copper tubes, containing cold water, and the lower of steel containing ammonia.

The Cellars.—The wort after cooling enters the cellars, where it is fermented, stored kraeusened bunged, fined, filtered, and racked ready for the market.

Fermentation of Wort.—The wort as it comes from the cooler is run into fermenting tubs in which the yeast has previously been placed. Sometimes the yeast is added after the tubs are filled with wort. The yeast, from one to

BREWING AND MALTING

one and a half pounds to the barrel of wort, is usually given, not in its natural state, but first mixed with an equal quantity of wort and thoroughly aerated.

The fermentation now begins. Within 15 to 24 hours white bubbles appear on the surface around the sides of the tub. The wort at this time is covered with a head of thick, lumpy consistency composed largely of albuminoid matter. The whole surface now soon becomes covered with a fine white froth, which soon changes to a frizzled appearance called "kraeusen" stage. The froth head then moves toward the centre, the fermentation becomes more active, the froth head rises higher and becomes darker and the fermentation now passes into the "high kraeusen" stage, generally after about 70 to 80 hours. This stage is maintained for about 48 to 72 hours when the head begins to collapse and deepens in color to the end of the fermentation. The temperature is then gradually reduced by means of cooling attempters to 3° R. (39° F.) in the next 3 or 4 days. Total duration of fermentation, 10 to 11 days.

Storage of Beer.—After the wort is fermented the beer is filled into storage vats (closed at the top) where it is stored at a temperature near the freezing point for about two or three months. During this storage period there is a slight progress of secondary or after fermentation and the yeast settles, and, what is most important in bottle beer that is to be pasteurized, there is a further precipitation of albuminoids.

Chip Cask Treatment.—When sufficiently matured in storage the beer is run or pumped into the chip casks, so called because in them wooden chips are placed to retain the sediment produced by the finings. In the chip cask, two properties must be imparted to the beer that it did not possess during storage, namely, life or proper amount of carbonic acid gas contents, and brilliancy. Life is given the beer by addition of 8 to 10 per cent of kraeusen, (that is, young beer in the first, or kraeusen stage of fermentation). This when added to the old "flat" storage beer continues to ferment, and, as the casks are closed the gas generated gives life to the whole amount of beer contained.

For bottle beer, kraeusen made from grape sugar is used, as grape sugar contains no albuminoids as does the kraeusen from regular fermenting worts.

Brilliancy is given to the beer by removing the yeast and other particles in suspension by means of finings made from isinglass. After bunging the cask, a certain pressure only (4½-5 pounds) is desired and any excess pressure generated above this is automatically removed by an automatic blow-off device called the bunging apparatus.

Filtration of Beer.—Although beers will generally become clear in the chip cask if they are left there long enough, they are now almost universally filtered after they have become moderately fine (clear) in the chip cask. Thereby much time is saved, also a large part of the finings and chips. Furthermore, filtration furnishes a more brilliant beer than can generally be obtained by chip cask treatment only. Modern beer filters differ considerably in construction, but are all alike in that they contain several or

many compartments or cells filled with filter mass or pulp (a substance similar to blotting paper) through which the beer is forced. The filter mass or pulp can be used again and again, being washed after each use to remove the beer and sediments it collects during filtration. The operation of filtration is as follows: The bunging apparatus is disconnected and air pressure (15 to 20 pounds) is put on the chip cask and the beer thereby forced through the filter.

Racking of Beer.—From the filter the beer passes to the racking bench which must be placed at a higher level in order to cause a back pressure upon the filter and prevent foaming. The racking device consists of two or more faucets of which one is always open so as to give a steady flow of beer.

Carbonating.—Beer is often carbonated. This is the mechanical forcing of carbonic acid gas into the beer by which time, labor, space, and cost of chip casks are saved, besides obtaining a more durable beer.

Pitching and Varnishing.—In order to prevent the beer in wooden vessels from soaking into the wood, they are coated on their insides with an inert or insoluble substance. This is shellac varnish for the large brewery vessels, and pitch for the trade packages.

BREWING INDUSTRY IN AMERICA

Brewing Industry in America. To narrate the history of the art of beer-making is to tell a story that is as old as the human race. To trace the art of brewing from its early days down to the present time it is necessary that one should pass through all the ages of antiquity, for the art that was practiced so crudely by the prehistoric peoples was followed with less primitive methods by both the Egyptians and the Assyrians. Later, the Greeks and Romans made their brews, while, from the earliest recorded times, the Teutonic races have pursued this art so successfully that praise of their skill has long taken the form of poem and prose, in song and story, while the tributes of esteem that are everywhere paid to Gambrinus, the acknowledged patron saint of brewing, is but another method by which the lovers of beer strive to testify their appreciation of the beverage for which his name stands synonymous.

As far as America is concerned the history of the brewing industry may be traced to 1620, for when the Pilgrim Fathers landed on Plymouth Rock they brought with them considerable knowledge as to the best methods of making their favorite beverages, the fiery potions which even they loved to drink, "and not a man afraid," as well as the lighter, but still sturdy brews with which every true Englishman sometimes made "merrie." Homebrewed as this beer was in the beginning, the natural growth of the colonies soon suggested that it be put to a more practical use, and it was thus that their knowledge of the brewing craft finally resulted in the establishment of the industry of beer-making.

In the New England colonies, where people were more addicted to the use of stronger spirits than beer, the colonial lawmakers adopted a statute by which they granted immunity from taxes and an additional prize in money to any brewer who should be sufficiently energetic to manufacture more than 500 barrels of "honest beer" in a single year, for they held that beer was a beverage which not only added to the prosperity of the country by giving the farmer a profitable market for the grain he might be able to raise, but which supplied the people with a drink of such mild form that, instead of leading to intoxication, it actually contributed to the spread of that temperate spirit upon which the "good order" of the colony so much depended. It was thus that the infant brewing industry was established and fostered by the colonial officials of Massachusetts, and, though the growth of the industry was slow compared to what one would imagine it should have been, it had expanded sufficiently by 1795 to produce nearly 2,000,000 gallons of beer per annum.

The great adversary against which the brewing industry has been obliged to contend has almost invariably been the result of matters of legislation. Ever since the days of the Egyptians the growth or decline in the art of beer-making may be traced directly to this cause. Under liberal laws, in-

telligently administered, the industry has prospered, while the legislative enactments inspired by ignorance or fanaticism have hampered the expansion of the trade more seriously than it could have been retarded by any other influence. Thus, while we have no reason to believe that any laws directly adverse to the brewing craft were passed prior to 1795, the fact that the legislation that was enacted was more favorable to the cheap distribution of distilled liquors had a tendency to give an advantage to the manufacturers and dealers in strong beverages against which the makers of the milder beers found it difficult to contend. It is true that some of the greatest minds in the country recognized the value of the brewing industry as an aid to the promotion of national temperance, and sought to aid it in every way in their power, but they were opposed by strong influences from several quarters, from the few who were opposed to the drinking of even such a mildly alcoholic beverage as beer, to the strong clique which represented the interests of the manufacturers of and dealers in the more potent liquors. During the Washington administration, Congress, in its consideration of the first federal revenue law, recognized the importance of fostering the brewing industry as an aid to public morality; again, in 1789 Madison publicly expressed the hope that the industry of brewing would extend its influence into every State of the Union, while Thomas Jefferson's firm stand in regard to the liquor question will never be forgotten. "No nation is sober," he said, "where the dearness of fermented drinks substitutes ardent spirits as a common beverage."

Prior to the middle of the 19th century, the term "beer" in the United States generally implied that beverage that is now more commonly known to us as "ale." In 1810, when the production of malt liquors in this country amounted to less than 6,000,000 gallons per annum, the 129 breweries which were manufacturing this product made practically nothing but ale and porter, and it was not until about 1846, when the increasing German immigration created the demand for the favorite beverage of these people, lager beer, that any brewer found it necessary to manufacture such a drink. With them, of course, the Germans had brought a practical knowledge of the art of lager beer-making, and as they were not satisfied with the native brews of the Americans, it was not long before lager beer breweries began to spring into existence in every community in which the German population was sufficiently numerous to support such an enterprise. In the beginning, of course, the Americans were inclined to be suspicious of this new beverage. It was milder than their brews, and, at first, they did not take kindly to it, but, gradually, as time passed, their prejudices were overcome, and, to-day, beer, or in other words, lager beer, has become so thoroughly the national beverage of the American people that the production of ale and porter in the United States does not now exceed 1,000,000 barrels per annum.

BREWING INDUSTRY IN AMERICA

It was the outbreak of the Civil War that brought about the financial exigencies which resulted in the adoption of excise measures more favorable to the production of the lighter beverages. To raise a revenue sufficient to save the Government from the disasters which threatened required heroic measures. It was no time for the display of fanaticism; it was no time for race prejudices to come to the front. What was required was money, and, as the result, the internal revenue laws were created. As these threw burdens of taxation chiefly upon the manufacturers of ardent spirits, the industry of brewing took a new lease of life, and the effect of the passage of these laws, in July, 1862, may be seen in the development of the industry even up to the present day.

It was in 1862, at the moment when it was seen that there was to be an opportunity for the advancement of the brewing industry, that the Brewers' Association was formed. While this organization owed its existence partly to selfish interests, to the desire for self-protection and the better advancement of the trade, its fundamental purpose was a more patriotic one, its members binding themselves together to aid the Government in the perfection of the revenue laws so far as they applied to the manufacture of malt liquors, and to assist by their influence in the collection of such revenues, as well as to secure themselves against the possibility of unjust discrimination. Thus, from the beginning of its history, the Brewers' Association has remained true to its traditions, and, when the throes of the great struggle for national unity had ended, it still continued to co-operate with the Government in all matters relating to the internal revenue. When we remember the meagre 2,000,000 gallons of malt liquors that were produced in the United States in 1795, the following table of statistics indicate the steady development of this industry during the past century more eloquently than any words of mine could picture it:

PRODUCTION OF BEER, 1863—1904.

YEAR	Number of barrels	YEAR	Number of barrels
1863.....	2,066,625	1881.....	23,776,619

1883.....	17,717,812	1904.....	43,208,131

Whereas, in 1810, there were but 129 breweries in the United States there are now

more than 2,250 such establishments, ranging in size from the little breweries which have been established by enterprising proprietors of German gardens to the enormous beer manufactories with an individual output of more than 1,000,000 barrels per annum. Some few of the breweries make ale, or porter, but the greater number make nothing but the favorite drink of the Germans, the lager beer which must now be considered as one of the great commercial factors in the United States. Moreover, while the American brewers formerly catered exclusively to a restricted local market, within the past 30 years the art of beer-making has attained such a point of perfection that this product can now be shipped, both in barrels and in bottles, from one end of the country to the other, while a further idea of the immense importance of this trade may be gathered from the facts that while the capital invested in this country in the beer industry is not less than \$415,284,468, according to the figures reported by the 1900 census, the annual output of the country shows an aggregate value of more than \$237,000,000. More than 50,000 men are directly engaged in the interests of brewing, and its contributions to the support of the United States, in internal revenue taxes alone, amount to more than \$33,000,000 per annum. That the bottling branch of the industry has also assumed proportions which entitle it to serious consideration is shown by the fact that the product of one brewery alone now amounts to more than 42,000,000 bottles per annum.

While such figures are valuable in the sense that they are reliable manifestations of the growth of the brewing industry, there is a deeper and broader side to the question of its development that is a matter of far greater importance, for the modern brewer, while he is proud of the fact that his craft has grown to be one of the great industries of this great nation, still takes even greater pride in the knowledge that the science of brewing has made more marked scientific advancement during the past 35 years of its history than it had made in all the years that had previously elapsed since those days of "merrie England" when Falstaff and his coterie of jolly fellows joked together over their generous tankards of some foaming brew.

For example, we may say that it has been only within the past 35 years that anything approaching scientific principles have ever been applied to the art of brewing. Since 1870, however, the establishment of brewers' schools to teach the higher knowledge of the craft have brought theory and practice into such close association that a field of competition has been opened that had never existed prior to that time. Thus, during the sixties the principles governing the production of beer were practically the same as those which had been followed by our forefathers in their breweries in 1005, for while every branch of applicable science, including chemistry, bot-

BREWING INDUSTRY IN AMERICA

any and mechanics had experienced marvelous development, these changes meant nothing to the art of brewing, except in the general sense that they were preparing the foundation upon which the more scientific art might be constructed.

The first great improvement in the art of brewing, and especially that portion of it to which the physiology of fermentation may be applied, was the result of the labors of Pasteur in Paris, and Hansen at Copenhagen. From the earliest days beer has been known to be a perishable product, but the character of the causes which made it spoil was a problem that nobody had been able to solve. By his discoveries of the physiology of the organisms of fermentation, Pasteur not only proved that these diseases of beer might rationally be traced to a sort of bacteria, but indicated the manner in which such diseases might be avoided through the application of a process of wort cooling and fermentation, while Hansen went a step farther by not only finding another cause for such diseases in the brewers' yeast, which might easily become, by contact, under certain circumstances, with similar organisms closely resembling it, far more injurious than any bacteria, but brought his labors to a most logical conclusion by developing a process of cultivating yeast in large quantities and in such absolute purity from a single germ that he prevented the introduction of wild yeast into the brew. The immediate adoption of these innovations by the leading brewers of the United States resulted in some very material changes in the practical operations of the breweries. Thus, the discovery of the principle of preventing infection brought about the substitution of suitably closed apparatus in place of the old-fashioned open cooler, but this improvement was simply one step in the efforts of the manufacturers to meet the requirements of the new scientific methods of brewing. It was followed by more ingeniously constructed machinery, all tending toward a cleaner and better product. There were processes for the production of filtered air; there were other processes for the sterilization of water, for everything that now entered into the product must be germ-proof, absolute protection against infection being the keynote of the new science. Under the present methods, therefore, from the very moment that the beer leaves the brew-kettle, to pass over the coolers, and through the process of fermenting and lagering, and even up to the very moment that it is served as a refreshing and revivifying beverage, no effort is spared to protect it from infection. See BREWING and MALTING.

Physiology and theoretical chemistry have also exerted their influence to bring about the present wonderful development in the science of brewing. During the past few decades the most complicated processes in the malting of barley, in mashing and in fermentation have been so thoroughly explored that the knowledge derived from these researches has created a magnificent foundation upon which the malster and the brewer have been able to build more solidly than ever before in the history

of the craft. In this connection, moreover, reference must be made to an invention which has effected more radical changes in the brewing industry than almost any one single factor, for without it many of the innovations and improvements which are regarded as of such vital importance to-day could never have been made. This invention is the ice machine, without which artificial refrigeration upon any extraordinarily extensive scale, such as exist in many of the big brewing plants at this time, would have been entirely impracticable. It was since 1870 that the imperfect ice-making machine which was shown by the French inventor, Carre, was regarded as so great a curiosity that persons who were interested in such things traveled long distances to inspect it. To-day, however, conditions have changed so materially that it is only the very insignificant brewing establishments that are not equipped with model ice machines.

One of the distinctly American innovations which have tended so greatly to improve the science of brewing during the past few decades is the new method of collecting and utilizing in its purity all the carbonic-acid gas formed during the process of fermentation. By the discovery of this purely American method it has been possible to abandon the old-fashioned "kraeusen" process of carbonating, which was formerly the only method in general use. In other words, the finished product of the brewery may now be charged with the best and purest natural carbonic-acid gas that it is possible to obtain, and as this method of collecting this by-product of fermentation produces such a superabundance of the carbonic-acid gas that it may readily be liquefied, there is no reason why every other product of that kind should not eventually be crowded out of the market.

As this is not the only occasion upon which the American ingenuity has solved problems relating to the science of brewing over which some of the greatest European authorities have experimented vainly for many years, it is not strange that the brewers of the United States should be able to produce some of the best, and, at the same time, some of the most durable beer in the world. Not only have the latest and most scientific methods in brewing that can be credited to the European investigators been in use in the country, almost from the very moment of their discovery, but several of the processes which have actually originated in this country have since been accepted by foreign scientists as the most rational methods known. In 1893, Prof. Delbrueck of Berlin, and Prof. Schwackhoefer of Vienna, were sent to America by their respective governments to make a detailed inquiry into American brewing methods. Naturally every facility was offered them, and in their special report, they gave the brewers of the United States much of the credit which they deserve for having developed the primitive craft to such a high standard of perfection.

JOHN A. MANZ,
Graduate of the Royal Brewing Academy, Weihenstephan, Bavaria; Atlantic City Brewing Co.

BREWSTER — BRIALMONT

Brewster, Benjamin Harris, American lawyer: b. Salem County, N. J., 13 Oct. 1816; d. Philadelphia, 4 April 1888. He graduated at Princeton in 1834, was admitted to the Philadelphia bar (1838), and for nearly half a century practised with ardor and success the profession he loved. In 1846 he was one of a commission to adjudicate the claims of the Cherokee Indians against the United States; in 1867 he became attorney-general of Pennsylvania, and in December 1881 President Arthur made him attorney-general of the United States. Shortly after the death of President Garfield, Attorney-General Wayne MacVeagh retained Brewster to assist in the prosecution of the "Star Route" conspirators. In boyhood he was severely injured by burns received while bravely attempting to rescue his sister from a fire into which she had fallen. He was an impressive orator, and possessed scholarly attainments of a high order. Both Princeton and Dickinson colleges conferred the degree of LL.D. upon him.

Brewster, Chauncey Bunce, American bishop: b. Windham, Conn., 5 Sept. 1848. He is a direct descendant of Elder Brewster of Plymouth Colony fame. He graduated at Yale in 1868, Berkeley Divinity School, 1872, and was ordained priest, 1873. He was rector of Christ Church, Rye, N. Y., 1873-81; Christ Church, Detroit, 1881-5; Grace Church, Baltimore, 1885-8; Grace Church, Brooklyn, N. Y., 1888-97. On 8 June 1897 he was elected coadjutor-bishop of Connecticut, and consecrated in New Haven, 28 Oct. 1897. Upon the death of Bishop Williams, in 1899, Bishop Brewster became diocesan of Connecticut. Beside sermons and pastoral charges, he has written 'The Key of Life' (1885); 'Good Friday Addresses' (1894); 'Aspects of Revelation' (1901), being the Baldwin lectures before the University of Michigan. Yale and Trinity colleges, have conferred the degree of D.D. upon him.

Brewster, Sir David, Scottish natural philosopher: b. Jedburgh, 11 Dec. 1781; d. Allerly, near Melrose, 10 Feb. 1868. He entered the University of Edinburgh, where the lectures of Robison and Playfair attracted him to scientific pursuits. His first investigations were on the subject of the polarization of light, upon which he communicated some important observations to the 'Transactions of the Royal Society of Edinburgh.' In 1808 he became editor of the Edinburgh 'Encyclopedia,' to which he contributed a number of valuable articles. In 1816, while repeating the experiments of Biot on the action of fluids on light, he made those observations which resulted in the invention of the kaleidoscope. In 1819, in conjunction with Jameson, he founded the Edinburgh 'Philosophical Journal,' of which he was sole editor (1824-32). Brewster was one of the founders of the British Association, whose first meeting was held at York in 1831, and he presided over it on the occasion of its 20th meeting, held at Edinburgh in 1850. In 1832 he received the honor of knighthood along with a pension from the government. Both before and after this time his services to science obtained from many quarters the most honorable recognition. The French Institute, of which he had been a corresponding member since 1825, appointed him one of its eight foreign associates, 4 Jan. 1849.

and he was also among the members of the academies of St. Petersburg, Berlin, Vienna, Stockholm, and Copenhagen. From Prussia he received the Order of Merit in 1847, and in 1855 the cross of an officer of the Legion of Honor was bestowed on him by Napoleon III. From 1838 to 1859 he was principal of the united colleges of St. Leonard's and St. Salvador at St. Andrews, and in the latter year he was unanimously chosen principal of the University of Edinburgh—an office which he continued to hold till his death. His chief works are: 'Treatise on the Kaleidoscope'; 'Letters and Life of Euler'; 'Letters on Natural Magic'; 'Treatise on Optics'; 'Martyrs of Science'; 'More Worlds than One'; 'Memoirs of the Life, Writings, and Discoveries of Sir Isaac Newton' (1855); besides numerous communications to the Royal Societies of London and Edinburgh, contributions to the 'Encyclopedia Britannica,' the Edinburgh and North British 'Reviews,' and other periodicals.

Brewster, Frederick Carroll, American lawyer: b. Philadelphia, Pa., 15 May 1825; d. Charlotte, N. C., 30 Dec. 1898. He graduated at the University of Pennsylvania, read law with his father, and was admitted to the Philadelphia bar, 1844, of which he became a leader and one of its brightest ornaments. He was elected city solicitor (1862); judge of the court of common pleas (1866-9); attorney-general of the State (1869-70). He was successful as counsel in the famous Stephen Girard will case, and secured the decision in the Chestnut Street bridge case, wherein a decree was entered in the United States supreme court allowing the city of Philadelphia to cross the Schuylkill River by bridge. He published 'Reports of Equity, Election, and other Cases in the Courts of the County of Philadelphia' (1869); 'Digest of Pennsylvania Supreme Court Cases' (1869); 'Brewster's Blackstone, with Annotations of Decisions on the Rule in Shelly's Case' (1887); 'A Treatise on Practise in the Pennsylvania Courts' (1887-8).

Brewster, William, elder of the Plymouth pilgrims: b. Scrooby, England, 1560; d. Plymouth, Mass., 16 April 1644. He was educated at Cambridge, and entered the service of William Davison, ambassador in Holland, but presently retired to Scrooby manor house in Nottinghamshire, where his attention was chiefly occupied by the interests of religion. He was one of the company who with William Bradford attempted to find an escape to Holland, and were thrown into prison at Boston. Having obtained his liberty, he first assisted the poor of the society in their embarkation, and then followed them to Holland. Here he opened a school at Leyden, for instruction in English, and also set up a printing press. He was chosen a ruling elder in the Church at Leyden, and came to New England in 1620 with the first company of the Pilgrims. Until 1629 the principal care of the Church at Plymouth devolved upon him, though, as he was not a regular minister, he could never be persuaded to administer the sacraments. See Steele, 'Chief of the Pilgrims'; 'Life of William Brewster' (1857).

Brewster's Law. See LIGHT.

Brialmont, Henri Alexis, òn-rē à-lèk-sē brè-al-mòñ, Belgian military writer: b. Venlo, 25 May 1821. He entered the army in 1843 as

lieutenant of engineers, and in 1877 became lieutenant-general. Among his works are 'Considérations Politiques et Militaires sur la Belgique' (1851-2); 'Précis d'Art Militaire' (1850); 'Histoire du Duc de Wellington' (1856), translated into English by Gleig; 'Études sur la Défense des États et sur la Fortification' (1863); and many works on fortification. He has fortified Namur, Bucharest, Liège, and other places.

Bri'an (surnamed **BOROIMHÉ** or **BORU**): b. 926; d. 23 April 1014. He figures in early Irish annals as a celebrated chieftain, and son of Kennedy, king of Munster. He succeeded to both Munsters, nearly identical with counties Tipperary and Clare, in 978. Having defeated the Danes of Limerick and Waterford, he turned his arms against O'Maolachaghlin, or Malachi, who had a nominal supremacy over the whole island, and became king in his stead, levying tribute, or *boroimhé*, from which circumstance he derived his surname from the rulers of all the different provinces. He distinguished himself as much in peace as in war, contributed greatly to the progress of civilization, and made many internal improvements. He fell at Clontarf, after gaining a signal victory over the Danes, who had leagued with a revolted chief called Maclmora.

Brianchon, Charles Julien, shärl zhü-lë-än brë-än-shôn, French mathematician: b. Sèvres, 1785; d. 1865. Besides some important papers contributed to French mathematical journals, he has left small treatises on lines of the second order (1817), and the application of the theory of transversals (1818). He is best known by a theorem, the correlative of Pascal's which he published in 1806. The theorem is: If a hexagon is circumscribed to a conic, the straight lines joining the three pairs of opposite vertices are concurrent.

Brianchon, brë-än-sôn, a town in France, in the department of Hautes-Alpes, on the right bank of the Durance, 35 miles northeast from Gap, and near the Italian frontier. It is a fortress of the first class, occupying an eminence at the foot of the Col de Genève, 4,284 feet above the level of the sea, and has sometimes been called the Gibraltar of the Alps, forming, as it does, a central point from which troops can be marched to all their most important passes. Brianchon is a town of great antiquity. According to Pliny it was founded by the Greeks. Pop. (1896) 7,177.

Briansk, bryänsk, a town in Russia, in the government of, and 70 miles west-northwest from Orel, on the right bank of the Desna. It is surrounded with an earthen rampart, contains 16 churches, a monastery, with a seminary, and two poorhouses. It has a considerable trade in grain, hemp, hemp-oil (sent to St. Petersburg and Riga), honey, and wax; and in linen, cables, and cordage, ironware, bark, mats, lime, and tar, which are sent to Kherson, Odessa, and other parts of the Black Sea. It contains imperial building-yards, for which the oak forests in the neighborhood supply material. Near it are a cannon-foundry and a manufactory of small arms. Pop. (1897) 23,520.

Briare, brë-är, a town of France, in the department of Loiret, on the Loire, 25 miles south of Montargis. The canal, to which the

town is indebted for its importance, is the oldest work of the kind in France, having been begun in the reign of Henry IV., though it was not finished till 1740. It establishes, by means of its junction with the canal of Loing at Montargis, a communication between the Loire and the Seine, and conveys the various products of the province, watered by the former, to Paris.

Briareus, brî-ä're-üs (also called **ÆGÆON**), a giant with 100 arms and 50 heads, the son of Uranus and Gæa. His two brothers, Cottus and Gyes, were formed in a similar manner, and their formidable appearance struck their father with such terror that he imprisoned them at their birth in the bowels of the earth. In the war with the Titans Jupiter (Zeus) set them free, and by their assistance gained the victory. When Juno, Neptune, and Minerva conspired to bind the sovereign of the gods, Thetis brought Briareus from the depths of the sea (how he came there is not known) to the relief of the trembling Jove. Virgil places Briareus in the vestibule of hell. He was employed with his hundred-handed brothers in watching the Titans in Tartarus. Various other fables are told of these gods, who are supposed to be personifications of the extraordinary phenomena of nature manifested in volcanoes, earthquakes, and other commotions.

Bribe, a reward given to a public officer or functionary, to induce him to violate his official duty for the benefit or in compliance with the wishes of the party by whom or on whose behalf the bribe is given or promised. Bribery, at common law, is the receiving or offering any undue reward by or to any person whomsoever, whose ordinary profession or business relates to the administration of public justice in order to influence his behavior in office and to incline him to act contrary to his duty and the known rules of honesty and integrity. Certain writers limit bribery at common law to persons concerned in the administration of justice. The offense is much broader than this according to the weight of authority. It is said by Bishop to be the voluntary receiving or giving of any thing of value in payment for an official act done or to be done, and that it is not confined to judicial officers or other persons concerned in the administration of justice, but that it extends to all officers connected with the administration of the government, executive, legislative, and judicial, and under the appropriate circumstances, military. In nearly all of the States of the American Union, however, the offense is now defined by statute, so that a resort to common law is not often necessary, except for general principles. Bribery may be committed with respect to officers *de facto* as well as officers *de jure*. The offense of the giver and of the receiver of the bribe has the same name. For the sake of distinction, that of the former — that is, the briber — might be called active bribery; while that of the latter — that is, the person bribed — might be called passive bribery. The thing offered or accepted need not be money, but may be property, services or anything else of value. It must be of some value, but as the essence of the offense is its tendency to prevent justice in any of the departments of government, executive, legislative, or judicial, the degree of value of the bribe is not essential. It has been held, however, in Indiana, under a statute prohibiting the giving or receiv-

ing anything of value, that an officer who received a note could not be convicted, because the note, not being enforceable, was of no value.

At common law and under the statutes, in order to constitute bribery there must be a corrupt intent to influence the officer or other person, or on his part, to be influenced, in the discharge of his official duties. It is not essential, however, unless specially required by a statute, that the act induced, or sought to be induced, shall favor, aid, or benefit the person giving the bribe himself. The act which is induced or sought to be induced by the bribe must be an act in discharge of a legal duty. It is not bribery if the act is in discharge of a mere moral duty. Bribery is regarded in the United States as being of such a serious nature that it is made a felony in nearly all of the States, and the punishment for the various species of bribery may be, in New York, and many other States, imprisonment for a period not exceeding 10 years. "Bribery at common law, in a judge in relation to a cause pending before him, was regarded as an offense of so grave a nature that it was sometimes punished as high treason before the 25 Edw. III., and at this day is certainly a very high offense, and punishable not only with forfeiture of the offender's office of justice, but also with fine and imprisonment," etc. Bribery in England is punished in inferior officers with fine and imprisonment, but in judges, especially the superior ones, it has always been looked upon as a heinous offense. In the United States in many jurisdictions bribery at elections, either effected or attempted, is a disqualification for office, and an election procured by bribery is void. An attempt to bribe, though unsuccessful, has been held to be criminal, and is punished in many States as severely as the substantive offense. The reason for the law is plain. The offer is a great temptation to the weak or the depraved. It tends to corrupt, and as the law abhors the least tendency to corruption, it punishes the act which is calculated to debase, and which may affect, viciously, the morals of the community.

Brice, Arthur John Montefiore, English barrister and traveler: b. 27 June 1859. He founded and for some time edited the 'Educational Review,' and has traveled extensively in Europe, Asia, the Arctic regions, and North and South America. He has published 'Stanley, the African Explorer' (1888); 'Florida and the English' (1888); 'David Livingstone' (1889); 'Leaders into Unknown Lands' (1891); 'Geographical Methods' (1895); 'The Great Frozen Land' (edited 1895).

Brice, Calvin Stewart, American capitalist: b. Denmark, Ohio, 17 Sept. 1845; d. New York, 15 Dec. 1898. He practised law in Cincinnati from 1866 to 1880, when he became interested in railroad and various other financial undertakings. He was presidential elector on the Tilden ticket in 1876 and the Cleveland ticket in 1884 and chairman of the Democratic National Committee in 1888. In 1890 he was elected United States Senator from Ohio, and served on the Appropriations, Pensions, Pacific Railroad, and Public Buildings and Grounds committees. Shortly before his death he formed a syndicate which secured vast railroad and mining concessions in China.

Brice, Saint, French prelate: b. Tours; d. there, 13 Nov. 444. He is commemorated on 13 November. On the death of Saint Martin he was made Bishop of Tours. St. Brice's Day, 1002, is memorable in old English history for a great massacre of the Danes. It was believed that it was a concerted attempt to exterminate all the Danes in England; but, failing of its bloody purpose, it led to reprisals by the Danish King Sweyn.

Brick, Jefferson, a figure in Dickens' 'Martin Chuzzlewit,' intended as a caricature of an American journalist of 60 years ago.

Brick, a rectangular mass of clay, dried in the sun or baked in a kiln, and used for building purposes. To mold wet clay into cubes for the erection of walls and houses was one of the first efforts of man at architecture. There still exist in perfect preservation sun-dried bricks made by the Babylonians and Egyptians over 4,000 years ago. On some of these are valuable inscriptions relating to the cause of their making, family history, etc. In many cases straw was mingled with the clay in order to give it greater coherence. The story of the Egyptian taskmasters and the brick-making Israelites told in Exodus i. 14; v. 4-19, is too well known for further reference here. Scarcely less ancient than these Babylonian and Egyptian bricks are the "adobe" bricks of Yucatan and Mexico. There still exist in Colorado, Arizona, New Mexico, Texas, and California hundreds of these 'dobe' houses, some of them more than 300 years old and still inhabited. The Aztecs and other American aborigines were adepts at using this material, and constructed wonderful architecture out of it. The present Indian town of Laguna, in New Mexico, illustrates the decadence of this art, which the Spanish found so perfect in Old Mexico.

The modern methods of building-construction in America, by which towering skeletons of steel are used as a framework, compel the use of vast quantities of brick as "filler." Not even the manufacturers can give an accurate estimate of the number of bricks made in the United States annually, but a conservative figure would be 25,000,000,000. Of this enormous output about \$1,000,000 worth is exported. At Peterborough, England, 800,000,000 brick are made annually.

Varieties.—There are about 100 different varieties of brick now made in the United States, so marvelously has this industry grown of late. One can now order bricks of almost any conceivable size, shape, or hardness. The material varies. Common brick for rough wall work and filling comes from the soft sand clays along the Hudson and in New England, Kansas, and the Far West. Fine face-brick for the fronts of buildings is usually made from the better clays of Staten Island, New Jersey, and Pennsylvania. Powerful machinery now grinds up shale, fire-clay, quartz, spar, calcine, lime, ochre, and like hard materials to form the imperishable fire-brick and vitrified brick. The former is used between the beams and joists of the modern "skyscraper," to make the building impervious to fire, as this brick has been already so heated that further heat, even in a mighty conflagration, affects it little. Vitrified brick is used mostly for street pavements; some cities, like

New Haven, Conn., being paved almost entirely with it. This material wears for years, and is probably the most economical paving known. Terra-cotta tiling and pipe for drains are also included as part of their output by many brick manufacturers, as well as the beautiful colored and glazed bricks used for mantels and ornamental work. Probably 80 per cent of all the brick made is the rough and semi-rough for wall work. Some of the largest American cities have stringent fire laws which compel all buildings in the corporate limits to be built of brick, stone, or iron. Denver, Col., and other western cities are in this class, a majority of their houses being of brick.

Manufacture.—Scattered over almost every part of the United States and Canada are brick-yards. There are about 12,000 manufacturers of brick in the United States, 8,000 of whom are large concerns using more or less machinery. Some of these latter have yards in which 10 machines are working, each machine capable of turning out 100,000 finished bricks per day. This means 1,000,000 bricks a day for one yard. As the average period of work per year is eight months, such a yard can (and usually does) produce 200,000,000 bricks each season. Scarcely any of the larger firms but has at least one of these machines. One enormous plant just established at Dover Point, Mass., covers a vast area, and has huge traveling cranes which move 20-ton loads of brick with gentleness and precision. Electric lights and power thus enable a few men to do the work of a hundred by the old methods.

Brick-clay consists largely of hydrated silicate of alumina, with iron in varying quantities, and sand, or free silica. It varies greatly in adhesiveness, hardness, and value. The hand method of working the clay into brick is still used by about 4,000 small yards in the United States. By it one or two men can mold and kiln about 50,000 rough bricks in a season, though under favorable conditions they may make considerably more. The clay is usually dug in the autumn and allowed to freeze and thaw until spring, thus disintegrating the mass thoroughly through the action of frost. It is then either spaded until all lumps are removed, or put into a horse-power pug-mill, where it is ground up more thoroughly. The mold is simply a box, open at both ends, the size of the brick desired. The protruding clay is planed off with a straight-edge, and the cube of wet clay is then allowed to dry in sheds for some hours before it is placed in a kiln for firing. This latter process usually takes from 10 to 15 days, and must be carefully attended to, so that the brick shall not become cooled until the operation is finished. After cooling, stacking, and counting, they are ready for the market.

Of the 8,000 concerns in the United States who may properly be termed manufacturers, about 50 per cent use what is known as the "stiff plastic" process of making brick, which is now recognized as the best and most economical of all. It saves from 20 per cent to 40 per cent in labor and makes a perfectly homogeneous brick. If the material to be worked is of a hard or flinty nature (shale), it is first ground in a "dry-pan," after which it is raised by means of a cup elevator and passed through a screen to the pug-mill, or mixer, the tailings from the screens being returned to the dry-pan. If the material is sufficiently open, as

good brick-clay should be, it can be run direct to the pug-mill with little disintegration or grinding. The pug-mill is usually 10 or 12 feet long and contains a series of mixing knives, by which the clay and water are mixed to a proper consistency. From this mixer the clay passes into the brick machine, where it is compressed by a heavy auger into a solid and continuous column, being forced on to the cutting-table through a die of proper size to form the length and width of the brick. The cutting is done by fine steel piano-wires on a revolving wheel, working automatically. One of these machines is capable of turning out an average of 100,000 bricks per day. A belt traveling a little faster than the column is moving, separates the severed cubes and carries them to the re-press. This latter squares their corners and edges, gives them a smooth, polished surface, and imprints upon them any lettering or design desired. The cubes are not put through the re-press unless intended for front- or face-brick. The common, rough brick go immediately from the cutting-table to the dryer, which consists of a series of tunnels built of brick 4 feet wide and 5 feet high by 120 feet long. These tunnels are heated by a furnace underneath, by steam pipes, or (in large plants) by a blower which conveys the waste heat from the cooling kiln. The cubes are loaded on little cars and run into these tunnels, where they remain till drawn out at the end of 24 hours thoroughly dried. Each tunnel holds about 5,000 bricks. The bricks are then ready for the kilns, which are of various designs. The down-draft is a favorite modern method of construction. This requires small structures, round, 10 or 12 feet high and 30 feet in diameter, held in place by heavy iron bands to prevent warping from the intense heat. The floors are made of perforated blocks. Superheated air from the furnaces is forced from the top down through the brick piled within, through the floor, and either out through a chimney or into other kilns or dryers. The interior of these kilns under fire is a solid sheet of twisting flame and heat, turning the brick a cherry red, if of common clay, and white, if of harder material. This is kept up for from six to ten days, when the fires are drawn and the mass allowed to cool. The continuous kiln of from 16 to 22 chambers has been tried considerably of late, and has produced some exceptionally economical results. This stiff plastic method enables the handling of the clay cubes as they leave the cutter without preliminary drying. This and its simplicity make it very popular, and it is rapidly superseding all other methods. The machine is being made for export to Spain and other countries, and is in use in most of the larger yards in America.

About 40 per cent of the 8,000 manufacturers mentioned above are compelled by the nature of their material to use the "soft-mud process." Clays of a short, sandy nature, or those with a disposition to excessive lamination, are readily treated by this system, and beautiful sand-faced brick results. As a rule the Hudson River yards have to use this system, as well as many in New England and the Middle West. The clay passes first through the separator to free it of lumps, whence it is elevated to the pug-mill compartment of the brick machine. In the pug-chamber it is thoroughly mixed, and water added to make it of the proper consistency to

BRICK-LAYING — BRICK-MAKING MACHINERY

mold easily. The machine presses it into wooden molds, which are sanded inside to prevent adhesion of the clay to the mold, and are removed automatically. They are then placed on a revolving dumping-table, where they are dumped on to pallets, the empty mold being again sanded and passed to the machine for use again. Then the brick goes to the dryer and afterward to the kiln. It takes much longer to make brick by this mold method, but a very fine brick is produced, with a perfectly homogeneous body to it.

Not more than 10 per cent of the manufacturers can or do use the expensive "dry press" method, which takes the finer clays and presses them with a force of 20,000 pounds to the square inch into steel molds. The clay is nearly dry when this is done, so that the cakes can be handled with ease at once. The objection urged by some against this method is that the brick resulting is too porous and apt to absorb moisture, and "sweat" or disintegrate. Still, for the finer clays this method possesses advantages which will cause it to be used for a long time, and it may never be abandoned. The beautiful clays of Staten Island and in portions of New Jersey and Pennsylvania are nearly white, very fine, and smooth in texture. These work up into most artistic front- or face-brick for the exterior of fine buildings, or for decorative mantel and chimney work in the interiors. It is the most costly brick known to the trade. The machinery used in this process is simple, consisting of presses, dies, and molds. It naturally requires less time to dry and kiln these bricks, but the process is not a rapid one.

Fire-brick, paving-brick, fire-proof lathing, and other forms of excessively hard brick are made from shale, quartz, and difficult material generally. This has to be ground up by ponderous dry-pans before it can be cast into shape. The mold system is of necessity most used in making this class of goods, though some excellent work is turned out by the stiff plastic method above described. The lathing contains a proportion of sawdust to enable nails to be driven into it. In this category should come the terra-cotta brick for roofing, etc. Enormous quantities of fire-proof brick are now being made for the huge new buildings of our modern cities. Its manufacture is a distinct trade in itself. Modern American-made brick, of whatever design or quality, is 10 times harder and more durable than that of most other countries, though produced at a fraction of the cost. But for the great weight of brick our exports would be enormous. Each year American ingenuity perfects additional machinery enabling better and cheaper brick to be made. The brick of to-day will outwear five of those made even 10 years ago, as a rule. For further information regarding the uses of brick, see BUILDING MATERIALS; BRICK-MAKING MACHINERY; CLAY-WORKING MACHINERY; etc.

Brick-laying and Brick-work. See MASONRY AND BUILDING.

Brick-making Machinery, machines and structures employed to prepare, mold, and dry, plastic clay into rectangular blocks of various sizes which, after being hardened by baking in ovens or kilns, are commercially known as bricks, and are extensively used for building purposes.

For information relative to the sizes, composition, qualities, and various uses of bricks, and the general history of brick-manufacture, see BRICK.

The different types of brick-making machines are exceedingly numerous, but they may be conveniently divided into three classes: soft-clay molding machines, die-working machines, and dry-clay working machines. In the soft-clay molding machines, which are also known as sand-molding machines, clay taken directly from the bank is mixed with water and tempered in the machine, and then pressed into sanded molds which are fed in automatically beneath the press-box. The molds thus filled under pressure are then moved forward to a delivery table, where they are emptied and then returned for refilling. This process makes bricks of a fine homogeneous quality, but is slow, and the machines are as a rule used by the smaller manufacturers.

Die-working machines are of two types: those in which the clay is moved out continuously by means of a rotating auger, and those in which the clay is pressed out in bars of specific lengths by the reciprocating motion of a plunger.

These machines are employed in what is commonly known as the stiff-tempered process of brick-making, the product of which is, perhaps, that most generally approved by brickmakers, builders, engineers, and architects. In both types, the bar of clay is cut up into bricks of the desired size by wires which, according to the mechanical contrivances adopted to operate them, give to these machines the additional designations — end-cut and side-cut.

FIG. 1.—Auger Brick Machine.

Fig. 1 shows a modern auger machine. It consists essentially of a hopper (a) entering the tempering case (b) which contains the tempering shaft (c) carrying the tempering knives (d) on its side, and the expressing screw (f) on its end opposite to the forming die (g). The hopper is square, but larger at the bottom than at the top, in order to prevent jamming, and being provided with rounded corners, prevents the clay from sticking in them. It opens into the tempering case at one side of its centre line, so that the clay fed into the machine is forced into contact with the revolving tempering knives on the upward part of their motion. This tends to agitate the clay in the hopper, thus preventing clogging and an irregular supply of clay to the tempering device. Additional clogging of clay in the hopper is obviated by the use of an irregular faced cast-iron roller situated at the bottom of the hopper immediately above the line of tempering knives, and on the side towards which the knives revolve. The tempering knives force the clay against the roller to which it adheres, thus enabling them to cut through the solid mass of fine clay and lumps, but, as this roller revolves about once every minute, the adhering clay is brought within the path of the

BRICK-MAKING MACHINERY

knives which carries it off and tempers it, and also effectually cleans the throat of the hopper of the most sticky and tenacious clays.

The tempering part of the machine consists of a strong cast-iron, cone-shaped case within which the tempering device revolves. This device consists of a horizontal shaft into which are set radially and spirally, strong tempering knives of wrought-iron or steel. The revolution of the shaft forces the knives through the clay, which being free from much water, and therefore quite stiff, does not slip before the knives, but is cut by them through and through and thus thoroughly tempered, the air escaping back through the untempered clay. The spiral position of the knives also forces the clay forwards so that by the time it reaches the smaller end of the tempering case it is ready to be formed into bricks.

At this point the clay is taken up by the expressing screw, and is slid forward within the steam-heated screw-case and delivered as a solid round column to the forming-die from which it issues in the form of a continuous bar of clay of the required dimensions.

Since, in accordance with the laws governing the movement of fluids under pressure, the clay as it moves through the die is retarded by friction at the corners, and moves more freely at the centre, a peculiar shaped "former" is employed to facilitate the flow of the clay to the corners, and retard it opposite to the long sides of the die, thus re-enforcing the angles of the bar of clay and ensuring square and well defined corners to the bricks. This former is secured to the screw-case by a hinge and swinging-bolt which enables it to be quickly opened for the removal of stones, and like the screw-case,

FIG. 2.—Automatic Wire Cutter for End-cut Bricks.

being heated by steam, facilitates the sliding and the forming of the clay. As the bar of clay emerges from the forming-die, it passes through a small chamber called the "sander," filled with fine dry sand which adheres to the surface of the bar, and renders the bricks when green, much nicer to handle and prevents them from sticking together on the barrows, in the hacking, or on the drying cars, and improves their color when burnt.

Of the various devices employed to cut the clay bar thus formed, into bricks, the automatic end-cut wire cutter is probably the best. (See Fig. 2.) It consists of a regulating frame or table on to which the bar of clay is carried from the sander and by which the cut-off is controlled. The belt carrying the bar of clay runs around a measuring wheel which determines the exact lengths to be cut according to the desired size of bricks. The cut-off wires are strained on

steel bows or springs to a tension, which while sufficient to cut, yet yields readily to obstructions such as stones, either cutting around them, or springing over them and operate hour in and hour out automatically and without any trouble. A broken wire may be replaced at once without stopping the machine. The wires are carried by their springs on a sprocket-wheel over and through the bar of clay, and are guided so as to make a square cut, by a cam encased in an oil-tight case. The partly severed brick is supported and held against the unsevered bar until completely cut off, when it is dropped on to the off-bearing belt which immediately carries it off, the cutting wire returning above the bar between the brick and the uncut end of the bar.

Off-bearing belts are of the endless type and may be arranged to carry the bricks cut off from the continuous clay bar, to distances as great as two hundred feet across the yard, from which they may be wheeled to convenient points for hacking (the stacking up of green bricks on platform cars for artificial drying), or loaded directly upon the dryer cars as may be required.

An auger end-cut machine of this type is capable of an average daily product of 75,000 bricks. Its weight complete is about 20,000 pounds, and it is equipped with a friction-clutch driving-pulley 48 inches diameter, by 12 inches face. Its length from outer edge of driving-pulley to end of 16-foot length off-bearing frame is about 52 feet, and the rear end of the machine occupies a floor space of 8 feet. (See Fig. 2.)

Of side-cut devices, the rotary cutter is perhaps the most simple in construction, and the most reliable in operation. Its action is entirely automatic and extremely sensitive to regulation. It produces bricks of uniform thickness and smooth angles. Being independent of reciprocating action, the cutter may be run at any desired speed, and as the wires always move downwards and forwards, making an angle with the top surface and outer edge of the bar, all obstructions are pushed from the surface into the body of the bar, thus preventing the ruffled edges common to many side-cut bricks.

In the machine shown in Fig. 3, the pair of bevel gears (a) are encased in a dirt tight case when the machine is in operation. These gears together with the measuring wheel situated immediately under the bar of clay, forms the con-

FIG. 3.—Automatic Side-cut Brick Machine.

nection between the cutting reel and the origin of motion of the moving bar of clay, and enables the revolving cutter to instantly and auto-

BRICK-MAKING MACHINERY

matically adapt itself to any changes of speed in the movement of the clay bar. The bar of clay is supported on the bottom face and at one side thus ensuring a smooth sharp cut. The slit through which the wire passes is just wide enough to accommodate the thickness of the wire used. The two vertical side-plates (b) are hinged so that they will open outward if a stone or other hard substance is pushed against them by the cutting wire, and after expelling the same return instantly to the normal position of support. The measuring wheel is of a given diameter for each thickness of brick, thus requiring a change of the wheel if a change in the size of the brick is desired. Such a change is generally accomplished in about half an hour. Recent improvements have developed cutters that enable manufacturers of paving bricks, to make "builders" and "pavers" simultaneously. For example, two bricks out of every six cut at each revolution of the cutter may be 2 inches thick, and the other four 4 inches thick, or any other combination that may be desired. The adjustable variations in thickness are by graduations of sixteenths of an inch, and the scope of the cutter runs from bricks 2 inches thick to blocks 5 inches in thickness. The large ring (c) is turned with a 2-inch V groove in its outer edge, and is supported by the two smaller wheels (d) engaging in the groove so that the weight of the larger wheel is entirely supported by them, thus relieving the cutting wires from all strains other than that due to the cutting of the bricks. The looped wires (e) are about 12 inches long, and are attached to tempered steel springs which while keeping the wires taut, yet permit a necessary amount of flexibility. A wiper, not shown in the illustration, automatically cleans the wires between each cut. The slow motion of seventeen turns per minute of the cutting reel, cuts one hundred bricks per minute, and may be operated to cut twice that number with perfect safety.

An auger machine equipped with the side-cut device of the type described has a capacity of about 50,000 bricks per day.

FIG. 4.—Board Delivery Cutting Table.

Of the various forms of cutting devices, the delivery cutting table may be described as a general third type. (See Fig. 4.) This table cuts 12 bricks at a time, automatically drawing a smooth board under the bricks as they are cut. The upper portion of the table travels forwards upon a track while the wires are being drawn through the bar of clay, thus compensating for its forward motion, while a slight pressure upon the lever during its return stroke brings the table to its original position and places the board loaded with bricks ready for removal.

The apparatus weighs about 900 pounds, and measures about 9 feet in length, including hand lever in operating position. Modifications of this table are employed for cutting chimney blocks and hollow ware of large section. Diagrams (a), (b), (c) of Fig. 4, illustrate in the order given, the operation of the device—(a) beginning of cut, (b) end of cut, (c) delivery of the bricks.

Automatic indenting cutters are employed to produce round edged bricks or blocks for street paving purposes. It appears to be a matter of some controversy as to whether any advantage other than the rounding of corners or edges is gained by the practice of repressing bricks for paving purposes. It is the general opinion that repressing breaks the original bond formed between the particles in molding the material into shape in the brick machine and fails to establish a new bond equally as good. The automatic indenting cutter is calculated to do away with the repress in this particular class of bricks.

To facilitate the handling of bricks in their green condition and to prepare them for the drying and burning processes, various appliances are employed which ensure more or less economy in time and labor. The brick-edger is an attachment, 5 feet 8 inches long, which may be placed on end-cut brick machines to automatically turn the bricks on edge as they are being transferred to the off-bearing belt. Such an attachment will save the labor of one man on an output of 30,000 bricks per day.

The pallet carrier is from 16 to 32 feet in length, and is employed to facilitate the transfer of the bricks from the off-bearing belt to pallets of either wood or metal. If the clay worked is somewhat soft, so that the resulting bricks will not bear piling up on each other without defacement, pallets, each holding about eight bricks on edge may be used, and the bricks dried in this position in cars or in racks under the drying sheds.

The head-sander and brusher is a device, which in connection with a regular brick machine, is employed to produce head-sanded stretcher or stock-bricks. It consists of a continually moving belt carrying a series of angle-iron supporting pieces, corresponding in length to the bricks. The operator stands at the head of the head-sander and close to the automatic cut-off, and transfers to the supporting pieces on the belt only those bricks which are free from stone or other disfigurement. The bricks thus guided and supported, are carried by the belt between two pairs of revolving circular brushes. Dry sand in a box is kept constantly against the faces of these brushes, so that when they revolve against the horizontal motion of the bricks, the sand is brushed into both heads of each brick, thus producing a stiff-tempered end-cut brick with sanded faces and heads, so that the heads burn the same color as the faces. The capacity of the machine is about twenty-five bricks per minute, and it may also be used to sand bricks that are intended for repressing.

Repressing is a process employed to produce bricks suitable for fronts of buildings, ornamental tablets and corner pieces with designs in relief, or intaglio, and other shapes of any desired design. The great many varieties of ma-

BRICKS WITHOUT STRAW — BRIDE AND BRIDEGROOM

chines used for this purpose are called presses, and are operated either by steam or hand power.

The hand press shown in Fig. 5, is equipped with a very powerful lever, and has a steel-lined box with a top-plate and plunger faced with

FIG. 5.— Hand-brick Repress.

steel, conveniently arranged for refitting whenever necessary. It weighs about 900 pounds; occupies floor space 20 inches by 3 feet 6 inches, exclusive of the lever, and may be readily moved upon the rollers under the forward end, from place to place about the works.

Power represses are made with one or two sets of plungers or pressure shafts, and are built with a capacity to exert pressures up to 45,000 pounds. A machine with two sets of plungers working against the mold-box, has a repressing capacity of 15,000 fine front bricks, or 20,000 street pavers per day.

FIG. 6.— Power Repress.

Fig. 6 shows a repress in which a single plunger acts against the molding die, the pressure of the brick being taken on a solid base instead of a moving cam or plunger. It is capable of being readily adjusted to any thickness of brick, and the pressure can be regulated by the hand-wheel on the top of the plunger or

shaft. Various kinds of dies can be used, and these changed with very little loss of time. Roman, Norman, or Pompeian brick can be pressed upon it as well as the smaller sizes, also a great variety of ornamental brick, shape brick, and tiles. It has an estimated weight of about 7,000 pounds; is equipped with a friction-clutch pulley 36 inches diameter, 8-inch face, which in operation runs at the rate of about 80 revolutions per minute, and is capable of turning out about 28,000 standard size bricks per day.

The dimensions adopted by the National Brick Manufacturers' Association in the United States, for standard hard-burnt common building brick, are $8\frac{1}{4} \times 4 \times 2\frac{1}{4}$ inches, and for a pressed front brick, $8\frac{3}{8} \times 4 \times 2\frac{3}{8}$ inches. All modern brick machines are capable of producing bricks of these sizes. See BRICK; CLAY-WORKING MACHINERY; KILNS; PIPE, MANUFACTURE OF.

W. MOREY, JR.,
Consulting Engineer, New York.

Bricks Without Straw, a novel by Albion W. Tourgée, containing a modern application of the Biblical phrase. The words are an allusion to the darkest days of the Hebrew bondage in Egypt, when the toilers were ordered to furnish their own straw without diminishing the number of bricks produced in a given time.

Bridal Wreath. See SPIRÆA.

Bride, Saint. See BRIDGET.

Bride and Bridegroom, words of Anglo-Saxon origin applied from very early times to a newly married wife and husband, the more common form at present being bride and groom. It has been usual from the earliest period of antiquity to pay especial honors to a bride and groom, and in every age and among every people, the wedding-day has been devoted to joyous and solemn ceremonies. It was celebrated among the Athenians by offerings made in the morning to particular divinities, to Zeus and Hera, and especially to Artemis, who was thought to look with disfavor upon marriages. At nightfall she was conducted to the bridegroom's house, in a chariot drawn by a pair of mules, and furnished with a kind of couch, on which she sat between her husband and one of his nearest friends. The bridal procession moved on, greeted and accompanied by friends bearing nuptial torches and singing songs. Then followed the marriage feast, to which, contrary to the usual Greek practice, women as well as men were invited; and at its close the bride was conducted by the bridegroom to her apartment, where a law of Solon required that they should eat a quince together. On the day after the marriage, presents were made to the newly married couple by their friends. Among the Romans the same custom prevailed, in memory of the rape of the Sabines. The wedding day was fixed, at least in early times, by consulting the auspices. The Roman marriage was usually, though not always, unattended by religious rites. The bride was conducted to the house of the bridegroom by a procession and bore in her own hands the emblems of diligence, a distaff and a spindle with wool. The bridegroom received her within with fire and water, a symbol, perhaps, of purification, and the ceremonies of the day were concluded by a repast given to friends and relatives. The bridal

apartment, to which she was conducted by ma- trons who had not had more than one husband, was magnificently decked with flowers, and min- strels and friends sang without during the night.

In the days of our ancestors various ceremonies, often "more honored in the breach than the observance," were followed. The bride was undressed and put to bed by the bridesmaids, and the bridegroom submitted to the same operation, at the hands of the groomsmen. Then the posset, a drink made of milk, wine, yolks of eggs, sugar, cinnamon, and nutmeg, had to be served. Then there was sometimes another dilatory proceeding in the sewing of the bride in a sheet. The arraying of the bride in white, the wedding feast, and the giving of presents are ancient customs. As early as the time of James I., the presents received by the bride of Sir Philip Herbert amounted in value to \$12,500, a notable expenditure of the kind for those days, but frequently surpassed at the present time by the value of a single bridal gift. The bridal kiss is of unknown antiquity. The old missals, which date long before the "common prayer book," enjoined it as an essential part of the marriage ceremony. Moreover, it was always done in church. The priest, too, at one time, enjoyed the privilege of kissing the bride. Groomsmen claimed and took it for a long period. The ordinary accessories of the weddings of our days may mostly be traced to ancient times. The marriage ring probably encircled the finger of the wife of the first Pharaoh, and was certainly used in the Roman ceremonies under the emperors. Its heathen origin nearly led to its abolition by the Puritans of Cromwell's time. The wedding ring is always put and worn on the fourth finger of the left hand, because it was supposed in ancient times that an artery ran from this part directly to the heart. The bride- cake is no less sanctified by antiquity than the ring. It is a symbol of plenty, and is intended to express the hope that the newly married pair may be always supplied with an abundance of the good things of this life. In ancient days wheat was sprinkled upon the head of the bride with the same intent. At present this custom is superseded by the scattering of rice upon the bride and groom as they leave the house after the reception. The throwing of an old shoe after the couple shows traces of an old superstition. Passing bits of the cake through the wedding ring nine times, and putting them under the pillow to dream upon, was a practice in vogue long before our great-grandmothers lived and loved. Putting up the slices in white paper boxes is an innovation of later times. Wine was an invariable accompaniment of all marriages, long before the marriage feast at Cana. In times past it was customary to drink it in the church, the priest having first blessed the cup, however, to suit it to the holiness of the place. The Jews universally hold to the custom of wine-drinking on the occasion of a marriage. After the bride and groom have drunk from the glass it is broken to remind them of mortality.

Modern custom lengthens out the privileges of bride and bridegroom beyond the wedding day. In former times, when the religious ceremony and the attendant festivities were over, all bridal honors ceased. These are now prolonged by the bridal tour. The term honeymoon, formerly applied to the first month of married life, is now more vaguely used and is sometimes

given to the entire period of the bridal tour, even when that is extended over many weeks.

Bride of Abydos, The, a poem by Lord Byron, published in 1813. From this a melo- drama was adapted a few years later by Dimond.

Bride of Lammermoor, The, by Sir Walter Scott, one of the group of 'Waverley Novels' called 'Tales of my Landlord.' The scene is laid on the east coast of Scotland, in the year 1700. The hero is Edgar, Master of Ravenswood, a young man of noble family, pen- niless and proud. He has vowed vengeance against the present owner of the Ravenswood estates, Sir William Ashton, lord keeper, whom he considers guilty of fraud; but foregoes his plans on falling in love with Lucy, Sir William's daughter. There is a secret betrothal; the ambitious Lady Ashton endeavors to force her daughter to marry another suitor; and in the struggle Lucy goes mad, and Ravenswood, thinking himself rejected, comes to an untimely end. The most famous character in the book is the amusing Caleb Balderstone, the devoted old steward of Ravenswood, who endeavors constantly to save the family honor and to conceal his master's poverty by ingenious devices and lies, and whose name has become the sym- bol of "the constant service of the antique world." Though sombre and depressing, the 'Bride of Lammermoor' is very popular, and the plot has been used by Donizetti in the opera 'Lucia di Lammermoor.'

Bride of Messina, The, a tragedy by Schiller, based on Sophocles' 'Œdipus Tyrannus.' It was brought out in 1803.

Bride of the Sea, a poetical name given to the city of Venice in allusion to the custom of wedding the Adriatic Sea with a ring. This pic- turesque ceremony was annually observed by the doges.

Bridewell, formerly a famous house of correction in Blackfriars, London. The name originally belonged to a well dedicated to St. Bride. Henry VIII., built on this site, in 1522, a palace for the accommodation of the Emperor Charles V., which became a residence of Wolsey, and under Edward VI. was, in 1553, converted into a workhouse for the poor, and a house of correction for the idle and vicious. Prisoners here were made to work during their confinement, as in most other houses of correction. From this, as one of the earliest houses of cor- rection, there originated the generic term, "a bridewell"—a house of correction. It was gov- erned by a keeper who was independent of the sheriff of London.

Bridge, Horatio, American naval officer: b. Augusta, Me., 8 April 1806; d. Athens, Pa., 18 March 1893. He graduated at Bowdoin Col- lege in the famous class of 1825, which included Longfellow, Hawthorne, J. S. C. Abbott, and G. B. Cheever. He was admitted to the bar in 1828, and for 10 years was in practice at Skowhegan and Augusta, Me. In 1838 he entered the United States navy as paymaster; made a cruise in the Cyane (1838-41); in the Saratoga upon the coast of Africa (1843-4), some account of which was published in 1845 under the title 'Journal of an African Cruiser,' edited by his friend, Haw-

thorne. From 1854-69 he was chief of the bureau of provisions and clothing. In 1873 he was retired as pay-director with the relative rank of commodore. He wrote 'Personal Recollections of Nathaniel Hawthorne' (1893).

Bridge, Sir John Frederick, English organist and composer: b. Oldbury, Worcestershire, 5 Dec. 1844. He was organist of Trinity Church, Windsor, Manchester Cathedral, and in 1875 became full organist of Westminster Abbey. He was also made professor of harmony at Owens College, Manchester, and afterward professor of harmony and counterpoint at the Royal College of Music. Among his works are the oratorio, 'Mount Moriah'; the cantata, 'Boadicea'; the cantata, 'Callirhoë'; the oratorio, 'The Repentance of Nineveh'; etc. He has set many hymns to music, notably Gladstone's Latin version of 'Rock of Ages.'

Bridge, a game of cards. It is played with one pack of cards, and the four players are styled the dealer, the leader, the dummy, and the pone. Bridge is allied to whist, and like that game is played in more than one way. See De La Rue, 'The Laws of Bridge' (1889); Foster, 'Bridge' (1901); Dunn, 'Bridge, and How to Play It' (1901); Steele, 'Simple Rules for Bridge' (1902).

Bridge. In its broadest sense, the term signifies any kind of a connecting structure. Specifically, it defines a structure erected for the purpose of continuing a roadway over a stream, valley, or any other natural or artificial obstruction.

The origin of the term is difficult to trace, and the art of bridge-building itself is so ancient, that its beginning lies in the efforts of primitive man who felled trees, or swung jungle vines across the streams to facilitate his movements on his hunting trips, or when engaged in trade from village to village.

The construction of a bridge, however, as an engineering structure, although quite elemental in its engineering features, may be traced back more or less accurately to the Chinese who appear to have been the first people to employ the masonry arch for the purpose of continuing roadways across streams.

The art of bridge-building, however, as developed in the various countries was not evolved from the earlier Chinese practice, but independent effort characterizes its development in each country, and by the very nature of the structures built in the past, the present-day investigator is enabled to formulate very clear and accurate ideas as to the character, customs, and importance of the peoples who built them.

The Egyptians seem to have had but little use for bridges, and none have survived among the structures of their ancient civilization. Similar conditions appear to have obtained among the Babylonians and the Assyrians, and the earliest examples that remain, other than those of the Chinese, appear to belong to the "Hittite" and "Pelagic" tribes, who inhabited the shores of the Mediterranean Sea during a pre-historic period antedating that of the building of Troy. Their engineering methods appear to have been imitated by the Cretans, whose cities in Asia Minor, Greece, and Italy, and in the countries bordering on the Mediterranean, were connected

by macadamized roads which required bridges that were constructed by a high order of engineering skill. They were somewhat similar to the one built at a later period across the Euripus in Euboea, a province of Greece, and consisted of massive abutments and piers of masonry with a connecting superstructure of planks. The typical Greek method is shown by the bridge at Assos, in which parallel stone lintels doweled together are employed to connect the piers and abutments.

On the other hand, the engineering genius of the "Pelagic" tribes was inherited and developed by the Etruscans and the Romans in the application of the basic principles of the arch.

The bridges at Vulci, Bieda, and Cora, in Italy, in which true round arches are employed to connect the piers, are a class of structures which were probably unknown to the Greeks. These were built during the seventh and sixth centuries B. C., and the Roman bridge-building methods were carried through stages of greater and greater perfection until the fourth century B. C., when the Roman policy of constructing great military roads to bind their possessions together, permitted the highest development of their engineering skill, in structures of this kind.

The brilliant and unrivalled career of bridge and viaduct construction thus inaugurated by the building of the famous Via Appia, and culminating in the erection of the eight great bridges of Rome, has furnished models for all the succeeding centuries, and are applicable today to the construction of stone structures.

Some of the bridges of the Republican period still remain. Of these, the Ponto Lupo, and the viaduct for the Anio Vetus Aqueduct was built about 143 B. C., and consists of great stone arches of tufa and travertine; while the viaduct near Gabii, built about 122 B. C., consisting of seven arches about 292 feet long, is still in use. Within Rome itself, the Æmilian bridge, built in 179-142 B. C. across the Tiber, is supposed to have been the first stone bridge to span that stream, all the others having been constructed of wood, a material which continued in use until quite a late period for bridges across wide rivers. Another, the Sublician bridge built by Ancus Martius across the Tiber between the Janiculum and the Aventine Mountain was famous for its defense by Horatius Cocles against the great army under Lars Porsena. The only one of the urban bridges of Rome that remains intact, is the Fabrician Bridge, or "Ponte Fabricio," built in 62 B. C., but the greater part of the most magnificent of them all, the Ælian Bridge, or "Ponte Sant' Angelo," built by Hadrian in 136 A. D., also remains. The former consists of two round Roman arches of peperino and tufa, faced with massive blocks of travertine; the latter consist of eight arches, arranged to give an upward grade toward the center of the structure, thus adding greatly to its architectural effect.

Of the important bridges built on the great military roads of the Empire—the Appia, the Aurelia, the Flaminia, the Via Salaria or Pont Salario, the Cassia, the Valeria, the Latina, and the Æmilia, those built during the Augustan period were the most remarkable. The Flaminia commenced at the Mulvian Bridge and ended at the Ariminum (Rimini) Bridge. The latter, which consists of five great arches with a total

BRIDGE

length of 236 feet, is the best preserved of them all; but vestiges of a great many others still remain, the most important being those near Narni and Borghetto, the great one of Vincenza, rebuilt at Verona, and those near Aosti and Calzi.

With the expansion of the Empire many bridges were built upon the fine macadamized roads which connected the various provinces with the Eternal City, by the Roman legions under the direction of their skillful military engineers. Of these, the greatest was the bridge across the Danube, built in 103 A. D., by the engineer Apollodorus, to enable the Emperor Trajan to conquer Dacia. It consisted of massive stone piers connected together by a superstructure of wood with a total length of 4,770 feet. It was subsequently destroyed by Hadrian, but the great piers are still standing.

Prior to its construction, intervals of such enormous length had been spanned by temporary bridges of boats, a practice handed down from a period reaching farther back than that of Xerxes, Darius, Hytarpus, or Cyrus—in the sixth century B. C., and illustrates effectively the consummate daring of the Roman engineer. It is interesting to note in this connection, however, that the most celebrated bridges built by the Romans were not generally distinguished for the great span of their arches, their great total length, or the peculiar lightness of their piers, but for their excellence of construction, and durability. The span of their arches seldom exceeded 70 or 80 feet, and their height was nearly half the span, thus giving them a semi-circular form, or what constituted a segment of that form.

In all the countries which formed the provinces of the Roman Empire, with the exception of the Spanish Peninsula, most of the bridges built by the Romans were allowed to fall to pieces during the Dark Ages, so that very few of them have survived. The ruins and foundations of some still exist near Vairon, and Chateau Neuf, in France, but are not of sufficient size to convey much of an idea of the special characteristics of the structures. In Spain, however, the high culture of the Moors insured the preservation of these superb examples of Roman engineering. Of these, the best examples are the bridges at Cuenca, Evora, Martorell, Merida, Chavas, Alconetar, Orense, Olloniego, Almazan, Ona, and Salamanca. The greater number of them were built by Trajan, and that of Salamanca is the most magnificent of all. Many of these structures were adorned by triumphal and memorial arches at each end, or in the center, which, while adding greatly to their architectural effectiveness, also served the purpose of a toll gate, or a fortification. Interesting examples of these are the bridges at Saint Chamas, in France, and the Ponte Salaro at Rome.

The Moors not only preserved the Roman structures, but imitated them and built many bridges fully their equals in size and elaborateness of design. The bridge at Cordova, across the Guadalquivir, is one of the most notable examples of their work, and also that of Alcantara, across the Tagus, built by Lacer during the reign of Trajan. It consists of six granite arches of a total length of 600 feet, with a

width of 26 feet, which carries the roadway at a height of 45 feet above the level of the river.

The early history of Oriental bridge-building appears to extend back to the days and works of Semiramis, who is credited by Diodorus Siculus, with the construction of a bridge across the Euphrates at Babylon about 776 B. C., and is described by him as a movable drawbridge, 30 feet wide, supported by stone piers.

The earliest existing examples of Oriental work, however, appear to be the bridges at Dizfel and Shuster, in Persia, which were probably built during the rule of the later Achaemid Kings over Iran, about 350 B. C. Their design embodies the wide pointed arch characteristics of later Mohammedan architecture, and are still in a fair state of preservation.

It is noteworthy, that, while the culture and continuity of the Byzantine and Mohammedan civilizations maintained in good condition the bridges already built, and created new ones of equal usefulness and magnitude, the science and art of bridge-building was practically lost in the European countries during the six centuries which comprised the Dark Ages. In the 12th century, however, the architectural and engineering sciences felt the awakening impulses which culminated in the magnificent structural creations of the Renaissance. The revival was first experienced in Italy and France. Bridges were built not only by the governing authorities but also by the churches—the building of a bridge being considered in the nature of a pious undertaking. Bridges were built at Tours, Orleans and Vienna, and many other large cities, and the Rhone was spanned at Lyons and Avignon by two fine bridges, the last-named being about 3,000 feet in length. It was built during the years 1178–88, by Benezet, a shepherd mason, who subsequently founded an association of bridge-builders which was known as the *Frères Pontiers*, or “Brethren of the Bridge”. It is remarkable on account of the elliptical curvature of the arches, the radius of which is shorter at the crown than at the haunch, and, therefore, conforms more nearly to the linear equilibrated arch, than the modern elliptical arch which has the longer radius at the crown. It consisted of 19 arches. The span of the largest arch was 110 feet 9 inches, with a height of 45 feet 10 inches. Four of the arches still remain.

The bridges built in southern France were particularly fine. The Saint Esprit, the Beziers, the Montauban and the Pont Valentré; at Cahors, are some of the best examples of those built during the period covered by the later part of the 13th and the earlier part of the 14th centuries. The application of the system of end and central towers for purposes of fortifications, received the highest development at this time. This was especially true in France where the mediæval social conditions made such fortifications an absolute necessity. In this respect, Germany and Spain were far behind France, although the monumental bridge across the Danube at Ratisbon, built by the Germans in 1135, and the bridge across the Elbe at Dresden, were very fine examples of this kind. Also, the Spanish bridges at Zomora, Tudela, Lograno, and Palencia, built during the period 1135 to 1192. These bridges are of the pointed arch

BRIDGE

type, some of them consisting of as many as 20 arches.

Of the Italian bridges built during this period, the best examples are the Ponte Vecchio in Florence, built in 1362, the bridge at Mantua, and the Rialto Bridge over the Grand Canal in Venice, built in 1588. These bridges were of the covered type, that is, they had a covered gallery which was flanked by a double line of booths and small shops in which all kinds of merchandise were exposed for sale. In Italy, the use of wood as a material of construction was generally adhered to until the 13th century, although in France, and in the other countries of northern Europe it had been generally supplanted by masonry. Yet, at the close of the 15th century, Italy had some fine stone structures—the bridges at Mossa and Signa in Tuscany, and the Ponte del Diavolo near Lucca; while France had many large wooden bridges at several important points.

The engineers of the Renaissance returned to the round arch typical of the Roman bridges, but they showed great boldness in their designs, by increasing the span of the arches. The bridge across the Adda at Trezzo, built under the orders of Bernabo Visconti, Duke of Milan, during the latter part of the 14th century, consisted of a single arch of granite with a span of 251 feet; while the bridge over the Ticino at Pavia, consisted of seven pointed arches of brick work, each 70 feet in span, and 64 feet in height.

Of the smaller Italian bridges, the most famous is the Bridge of Sighs at Venice, built during the latter part of the 16th century, to connect the Ducal Palace with the prison.

In England, the use of stone as a material of construction may be traced back to the middle of the 10th century, by records which authorized the building of a triangular pointed arch stone bridge at Croyland, Lincolnshire, in 943. The present structure, known as the Croyland Bridge, however, although one of the oldest stone bridges in England, appears to have been built about the latter part of the 14th century. It is also triangular in form, and consists of three pointed arches which span the waters of the Welland, the Nyne, and the Catwater drain. On account of its steep grade it can be used only by foot passengers.

The work of the "Brethren of the Bridge" order, carried the art of bridge-building up to the 17th century, and a great many fine structures were built in all parts of Europe. In France, the most important were the Trilpot, Tours, Gignac, Neuilly, and Blois Bridges, and in England, the Blackfriars, Westminster, Winston and Kelso. The date of the building of the first London bridge across the Thames is quite uncertain; but, there is very little doubt that it was built of timber and had to be frequently reconstructed. The so-called great London Bridge was built of stone, between the years 1176 and 1209, by an architect sent from France for that purpose. It had a covered gallery which was lined on both sides by shops, like a regular street. It consisted of nine pointed arches, each 60 feet in span, and had a total length of about 700 feet. It was supplanted by the structure now known as "Old London Bridge," in 1831. This structure consists of five elliptical arches, of which the center arch has a span of 152 feet, with a height of 29½

feet above high water mark. The other arches are 140 feet in span, with a height of 27½ feet. The total length of the structure is 1005 feet, and it carries a roadway 53 feet wide between the parapets. The Blackfriars Bridge across the Thames was built between the years 1760 and 1770. It consists of nine elliptical arches. The central arch has a span of 100 feet, and the others decrease gradually from 98 feet in those next to the center, to 70 feet in those at the ends. The Westminster Bridge was built between the years 1738 and 1750. It consists of 15 arches, of which the center arch is 76 feet in span, and the span of the others decreases at the rate of four feet for each succeeding arch, except the two shore arches, each of which have a span of 25 feet. Other notable English stone bridges built during the 18th century, are the Winston Bridge over the River Tees, and the Kelso Bridge over the Tweed. The former has a superb arch 109 feet in span, while the latter consists of five arches, each of which are 72 feet in span. Perhaps the most notable stone arch bridge built in any country during the 18th century, is the Pont-y-tu-prydd, across the River Taff in Wales. It was built by William Edwards, an ordinary stone mason, in 1750, after two failures due to excessive weight of the haunches, which in the third and successful attempt were lightened by the introduction of pierced spandrels. It consists of a segmented arch 140 feet in span, with a height of 35 feet, and its most curious feature is the gradual increase of its width from 14½ feet at the crown of the arch to 16 feet at the abutments.

The most remarkable bridges constructed in France during the 18th century, were the work of the famous Department of Ponts et Chaussées. The best examples of their work are the Blois Bridge over the Loire, the construction of which was commenced in 1720, and which consists of 11 elliptical arches, ranging from about 55 feet to 86 feet in span; the bridge over the Loire at Tours, the construction of which was commenced in 1755, and which consists of 15 elliptical arches, each 80 feet in span, and separated by piers 16 feet thick; the Trilport Bridge over the Maine, built in 1760, consisting of three skew arches, the middle arch of which has a span of 81 feet, and the side arches, spans of about 77 feet; the Neuilly Bridge across the Seine, built between the years 1768 and 1774, and which consists of five elliptical arches, each 128 feet in span; and the Gignac Bridge over the Herault, built in 1793, and which consists of an elliptical center arch about 107 feet in span, flanked by two semi-circular arches, each of which have a span of 83 feet.

Although the masonry and stone arch bridges of the 19th century cannot be considered as showing much, if any, structural improvement over those of preceding times, it is a fact that the engineers of the 19th century have used their better knowledge of the theory of those structures, obtained from the progress of the science of statics, to increase the spans of the arches far beyond the limits set by the earlier practice.

Of these later productions, the largest stone arch in the world is that of the Luxemburg Bridge, completed in 1901; it is 277 feet in span,

BRIDGE

and rises to a height of about 138 feet above the level of the water. Other modern stone arches of magnitude are the Grosvenor Bridge over the River Dee at Chester, England, consisting of a single arch with a span of 200 feet, and the Cabin John Bridge near Washington, D. C., built in 1853-1859, to carry the Washington aqueduct, which consists of a single arch with a span of 220 feet.

This brief enumeration of the notable 19th century stone arch bridges may be terminated very appropriately with the mentioning of the Waterloo Bridge across the Thames. It consists of nine elliptical arches of Aberdeen granite, of 120 feet span each, with a rise of 32 feet. The total length of the structure, including the approaches, is 2,456 feet, and it carries a horizontal roadway 41½ feet wide between the parapets.

About the beginning of the 19th century, metal began to be extensively introduced as a material of construction, and although the masonry arch was superior in beauty and durability, the metal bridge gave greater strength in proportion to the weight of the structure; was capable of being built more quickly and cheaply, and therefore, being better adapted to keep pace with the tremendous activity of modern railway construction, it soon almost completely supplanted the stone structures.

The first structure in which the new material was used appears to be the bridge across the Severn near the town of Ironbridge, Shropshire, England. It was built by Abraham Darby, the owner of the iron-works of Coalbrookdale, in 1779, and consists of a single arch 100 feet in span, with a rise of 45 feet. The arch is composed of five cast-iron ribs which form the segment of a circle. The successful construction of such a structure being thus clearly demonstrated, several others, of bolder design, were built during the last quarter of the 18th century, of which the Wearmouth Bridge, over the Wear at Sunderland, completed in 1796, is the most elegant example of the type. As originally constructed, it consisted of a single arch 236 feet in span, with a rise of 34 feet above the springing lines, which were 95 feet above the level of the river.

From these beginnings, the evolution of various types of metal arch structures was rapid. A larger percentage of wrought iron was employed in the material of construction, affording greater flexibility in the methods of construction and design, and the capability of spanning greater intervals with single spans. The most notable of the structures built about this time (the early part of the 19th century) was the Southwark Bridge across the Thames, erected in 1810. It consists of three arches, of which the central arch is 240 feet in span, and the side arches 210 feet each. They are composed of massive cast-iron arch ribs, which being set without any provisions to counteract the effects of expansion, and being much heavier than is necessary to sustain the loads to which they are subjected, gives a structure which is merely the imitation of one of stone, with the additional fault of a great wastefulness of the material of construction. Its construction, however, served a valuable purpose in the development of metal arch engineering. It suggested the principle of hinged arches, which was subsequently taken under consideration by the mathematicians of

Europe in 1841, and developed into a perfect theory, which made the metal arch a statically determinate structure on absolutely immovable foundations, and one that was provided against distortion and rupture under conditions of varying temperature.

Although the fine cast-iron bridges such as the Westminster and the Blackfriars, built across the Thames during the period covered by 1860 to 1870, consisted of arches with spans as great as 185 feet, the metal hinged-arch bridges built since 1873, have surpassed them greatly, not only in the length of the spans, but in the economy of the material of construction.

An exception to this statement, however, must be noted in the case of the bridge across the Mississippi, at St. Louis, Missouri, which was completed in 1874. It consists of three unhinged structures the center arch being 520 feet in span. Of the hinged-arch bridges the following are the most notable. The Alexander III. Bridge across the Seine at Paris, built in 1899, consisting of a single arch with a span of 362½ feet, composed of arch-ribs made up of wedge-shaped cast-steel sections bolted together; the steel-arch railway bridge across the Niagara River, built in 1897, consisting of a single arch with a span of 550 feet; and the highway and foot-bridge completed in 1899 across the Niagara Gorge, just below the Falls, consisting of a single steel arch with a span of 840 feet, which makes it the largest single span steel-arch bridge in the world, and is approximated to in size only by the steel-arch of the Viar Viaduct in France, which is 762 feet in span.

Some of the other handsome and important structures of the metal hinged-arch type well worthy of mention are the following: The Washington Bridge over the Harlem River, at New York, completed in 1889, which consists of two magnificent arches, each 510 feet in span, flanked by four masonry arches at one end, and three at the other, each 50 feet in span; the German steel-arch bridges across the Rhine at Bonn and Düsseldorf, the former with a central arch of 614 feet span, and two side arches each 307 feet in span, and the latter with two arches each 595 feet in span; the Pia Mia Bridge over the Douro at Oporto, Portugal, consisting of a main steel arch, 525 feet in span with a rise of 123 feet; and the steel arch on Garabit Viaduct over the Truzere, in central France, which has a span of 540 feet with a rise of 170 feet.

As the tensile strength of wrought iron and steel was greatly increased by improved processes of manufacture, greater feats of bridge-construction were dared by the bridge engineers, and various types of suspension and cantilever bridges, especially suitable for very long spans, were designed and successfully erected. Even the more important wire cable and chain structures of the early 19th century, such as the Schuylkill River Bridge, at Philadelphia, built in 1816, with a span of 408 feet; the bridge across the Menai Strait, between the Island of Anglesey and Carnarvonshire, in Wales, completed in 1826, with a span of 580 feet, and Fribourg Bridge, in Switzerland, built in 1834, with a span of 870 feet, were completely overshadowed by the works of the American engineers during the period dating from 1848 up to the present time. Of these magnificent struc-

BRIDGES.

tures, the most notable are the following: The bridge at Wheeling, West Virginia, erected by Charles Ellet, in 1848, with a suspension span of 1010 feet; the Niagara Bridge, built by John A. Roebling, in 1855, with a clear span of 821 feet, and particularly distinguished as the first railway suspension in the world; the Cincinnati and Covington Bridge, built by the same engineer, in 1867, with a clear span of 1057 feet, and a total length of 2252 feet; and the last creation of the same engineer, the 1st New York and Brooklyn Suspension Bridge, across the East River, which was completed in 1883. This structure consists of a main suspension span of 1595½ feet, and two shore spans of 930 feet each. Four steel-wire cables, each 15¾ inches in diameter, support the roadway platform and the stiffening trusses at a height of 135 feet above the level of the water, at the center of the span. It has a total length of 5989 feet, of which 2492 feet belong to the New York approach, and 1901 feet to that on the Brooklyn side. The roadway, 85 feet in width, is divided into five sections — the two on the outer sides for vehicles and electric cars, the two on the inner side for the electric cars of the Brooklyn Rapid Transit Elevated Railway system and the "bridge cars" operated by cables, and the central division for foot passengers. The cables are carried over saddles on the tops of two stone towers, each 278 feet high, and anchored at each end in solid cubical structures of stone masonry 119 feet by 132 feet, which rise to a height of 90 feet above high water mark, and weigh 60,000 tons each. The suspension span has a weight of 7000 tons, which is supported by the four cables already described, each of which are estimated to have an ultimate strength of 11,200 tons. The total cost of the structure was \$9,000,000. The second suspension bridge connecting the Boroughs of Manhattan and Brooklyn, of the City of Greater New York, crosses the East River at a point about two miles above the New York and Brooklyn Bridge already described, and was completed in 1904. This structure is commonly known as the Williamsburg Bridge. It has a clear span of 1600 feet and a total length of 7200 feet between the terminals. Four steel-wire cables, each 17½ inches in diameter, swung from two steel towers each 235 feet high, support the roadway platform and the stiffening truss at a height of 135 feet above the water level at the center of the span. The roadway platform 118 feet in width accommodates two elevated railway tracks, four electric surface-car tracks, a driveway for ordinary vehicles, two bicycle tracks, and two foot-paths. It differs from the First East River Bridge in that the towers are of steel instead of masonry; that the shore spans are supported independently of the cables, and in the use of the riveted instead of the pin-connected method of construction in the stiffening truss.

The suspension principle has been far more extensively employed in America, and especially in the United States, than in foreign countries. Some of the European suspension bridges, however, are of great beauty of design, such as the structure across the Danube at Budapest in Austria-Hungary, which is considered to be the handsomest bridge in the

world; but, they are entirely outclassed in magnitude by the almost marvelous creations of American engineering genius already described.

Bridges built on the cantilever or balanced span principle, rank with those of the suspension and girder-and-arch type, for the purpose of spanning great intervals.

In order to trace the evolution of the cantilever-bridge from the girder, and to understand its relation to the truss, a brief mention of the tubular bridges which were originated by Robert Stevenson, engineer of the Chester and Holyhead Railway, England, to carry that railway across the Menai Strait is necessary.

A series of experiments conducted by Stevenson in conjunction with Fairbairn, demonstrated that a rectangular tube with a cellular top and bottom, gave a girder in which the greatest strength was derived from the least amount of material. The result was the construction of the Conway and Britannia Bridges, the former across the Conway River and the latter across the Menai Strait, in 1846 and 1847, respectively. The Conway tube consisted of a single span of 400 feet, and the Britannia of four spans, two of 460 feet each, and two of 230 feet each in the clear. The example set by Stevenson was followed in a few other cases, the most important of which was the Victoria Bridge across the St. Lawrence, near Montreal, Canada, built in 1854. It consisted of 24 spans ranging in length from 242 to 247 feet each, and one span of 330 feet. It had a total length of 9144 feet, or nearly one and three-quarter miles, and required about 9000 tons of iron for the construction of the tubes. It was replaced in 1898-99, by a pin-connected truss bridge of 24 spans of 254 feet each, and one span of 348 feet, which represented a total weight of 20,000 tons of steel, but which was capable of sustaining a load five times greater. The Victoria Bridge was the last important structure of this type. It simply disappeared from engineering practice when the special conditions which developed it ceased to exist; but, it led the way to the plate girder bridges. It taught the engineer to cut away all the useless material in his structures and retain only the effective working skeleton, and thus inaugurated a truly scientific method of metal construction, by which the weight of the structure was greatly reduced, and consequently the cost of construction.

In the meantime, the principle of the truss, first enunciated by Palladio, the famous Italian architect, about 1560, and subsequently developed still further, and without doubt independently, by such genius' as Ulric Grubermann, Timothy Palmer, Lewis Wernway, Theodore Burr, William Howe, Wendall Bollman, and others of equal merit, during the period extending from 1754 to 1851, was diverted from its application to wooden bridges, and used in the construction of metal structures. The combining of the truss and the girder was the next logical step in the evolutionary process, and to Roebling belongs the credit of demonstrating the practicability of building long span braced girder or truss bridges with iron and steel as the material of construction. As the cantilever bridges are a class of structures actually composed of hinged continuous braced girders, their intimate rela-

BRIDGE

tion to the girder and truss bridges is quite obvious. They were, however, not much used until the last quarter of the 19th century. The construction of the Kentucky Viaduct in 1876, and the Niagara Cantilever in 1883, demonstrated the ease with which they could be built without the use of costly false work, and soon afterwards many bridges were built both in Europe and America. The most important of these are the following. The bridge across the Hudson at Poughkeepsie, New York, built in 1880, which consists of five river spans ranging from 546 to 548 feet in length, and a total length of 6767 feet; the Red Rock Cantilever Bridge across the Red River in California, built in 1890 with a center span of 660 feet, and a total length of 990 feet; the Memphis Bridge across the Mississippi River at Memphis, Tennessee, built in 1892, with a truss span of 621 feet, and two cantilever spans of 700 feet each, which are the longest of the kind in the United States; the St. John River Cantilever in New Brunswick, built in 1895, with a main span of 477 feet, and a total length of 813 feet; the great Forth Bridge across the Frith of Forth, in Scotland, which was completed in 1890, and consists of two shore spans of 680 feet each, and two main spans of 1710 feet each, which were the longest cantilever spans in the world until the building of the Quebec Cantilever across the St. Lawrence River, the construction of which began in 1900, and which has a clear span of 1800 feet.

All bridge structures, regardless of the materials of construction, may be divided into three classes—"Beam Bridges," "Suspension Bridges," and "Arch Bridges," which in turn may be subdivided into several other classes according to their modern uses,—such as Railway Bridges, Highway Bridges, Movable Bridges, Pontoon Bridges and Military Bridges.

Modern railway bridges are almost exclusively constructed of steel, and consist of trusses or plate girders designed to sustain uniform loads ranging from 3000 to 4800 pounds per linear foot of track, according to the length of span and the service required.

Highway bridges include all bridges used for roadway purposes alone. They may be constructed of wood, metal, masonry, or concrete, and are usually designed to sustain uniform loads ranging from 1000 to 1800 pounds per linear foot of track, according to the length of span and the service required.

Movable bridges or drawbridges include the various types of structures over rivers, that can be moved in order to allow a clear passage-way for vessels.

The modern structures of this type may be divided into the following classes: (1) Swing Bridges; (2) Rolling Bridges; and (3) Lift Bridges; of which the first are the most commonly used.

A swing bridge consists of a wooden or metal truss supported at the center by a pier located in the middle of the stream, so that when the bridge is closed, the ends of the truss rest upon abutments on the shores on either side. It is operated by a turntable, upon which it rests, which is revolved by a rack and pinion arrangement worked by hand power, steam, or electricity.

A rolling bridge consists of a single truss mounted on rollers, and which is pushed out

from one side across the span, or of two trusses, on each side of the span which are pushed out and connected at the center of the span where the water ends are locked together when the bridge is closed. It is operated by the rope and drum method, and is not used to any great extent.

Lift bridges are of various kinds—the "vertical lift," the "hinged lift," and the "rolling lift" bridges. The simplest is the vertical lift bridge consisting of a truss which is raised vertically to the desired height, both ends rising in guides arranged on towers. The hinged lift bridge is raised by being revolved in a vertical plane around hinges at one end. The rolling lift bridge is also lifted in a vertical plane, but has in addition a limited rolling motion. All lift bridges usually have a counter-weight to assist the lifting effort, and are generally designed to move quickly—one minute being frequently specified as the time of opening or closing at points where land and water traffic is heavy.

The longest swing bridges ever constructed are the Interstate Bridge at Omaha, Nebraska, which has a total length of 520 feet; the Thames River Drawbridge at New London, Connecticut, which has a length of 503 feet; and the Anthur Kill Drawbridge between Staten Island, New York, and New Jersey, which has a swing span of 496 feet.

The most notable of the hinged or pivot-basculé bridges are the Tower Bridge across the Thames, near the Tower of London, England, which consists of a suspension and drawbridge combined with a central basculé span of 200 feet, formed by two leaves or trusses, hinged at the opposite towers; and the bridges at Chicago, Milwaukee, Buffalo, and Boston, in the United States.

The modern pontoon bridges are a development of the ancient bridge-of-boats principle. The most notable example of the type is the pontoon bridge across the Hooghly River, at Calcutta, India, which briefly described will serve to convey a very satisfactory idea of such structures. It is 1530 feet in length between the abutments on each bank of the river, and consists of a superstructure carried on 14 pairs of pontoons in the form of rectangular iron boxes with rounded bilges and wedge-shaped ends, which are held in position across the river by means of chain cables laid across, and anchors laid up and down the stream. The superstructure consists of trestle-work, which carries a plank roadway and foot-path platform having a total width of 62 feet at a height of 27 feet above the surface of the river. This height is sufficient to allow ordinary boat navigation, but the passage of large vessels is provided for by arrangements which permit the opening of a span 200 feet wide, by the temporary removal of four of the pontoons and the superstructure carried by them, twice a week.

Military bridges are temporary structures erected to facilitate the movements of troops, their supplies, and their armament, during the course of extensive field operations. The proper equipment of a modern army includes the material required for the construction of pontoon bridges of a limited length. This material consists of the necessary cables, and pontoons of canvas, the metal or wooden frames of which

BRIDGE OVER THE RHINE AT BONN, PRUSSIA (Upper).
BRIDGE OVER THE AARE AT BERN, SWITZERLAND (Lower).

are capable of being "knocked down" and packed for transportation. Spar bridges are usually made with round timbers cut near the location of the bridge. The most efficient and useful are those built in the form of trestles consisting of timber frames on which the stringers carrying the roadway are placed. The most notable examples of military bridge construction in the United States are the pontoon bridge built across the Potomac at Harper's Ferry, under the direction of General Banks, in February, 1862, which was composed of 60 boats, and the trestle 80 feet high and 400 feet long, built at another period of the Civil War across the Potomac Creek, Virginia, for railroad purposes.

For further information see articles entitled *BRIDGE CONSTRUCTION, AMERICAN; BRIDGE CONSTRUCTION, MODERN METHODS OF; FOUNDATION; etc.*

WILLIAM MOREY, JR.

Consulting Civil and Mechanical Engineer.

Bridge-Building Brotherhood, a fraternal religious order formed in the 12th century in southern France. Its object was the building of bridges and the keeping of ferries. Tradition connects its origin with St. Bénézet, through whose efforts a bridge across the Rhone at Avignon was begun in 1117. After the completion of this bridge in 1185 the order received the sanction of Clement III. The order was dissolved by Pius II.

Bridge Construction, American. The application of scientific principles to the construction of bridges is more complete to-day than ever before. This statement applies to the specified requirements which the finished structure must fulfill, the design of every detail to carry the stresses due to the various loads imposed, the manufacture of the material composing the bridge, the construction of every member in it, and finally the erection of the bridge in the place where it is to do its duty as an instrument of transportation.

A close study of the economic problems of transportation in the United States and the experimental application of its results led the railroad managers to the definite conviction that, in order to increase the net earnings while the freight rates were slowly but steadily moving downward, it was necessary to change the method of loading by using larger cars drawn by heavier locomotives, so as to reduce the cost of transportation per train mile. While these studies had been in progress for a number of years and there was a gradual increase in the weight of locomotives, it is only within the past five years that the test was made, under favorable conditions and on an adequate scale, to demonstrate the value of a decided advance in the capacity of freight cars and in the weight of locomotives for the transportation of through freight. The test was made on the Pittsburg, B. & L. E. R.R., which was built and equipped for the transportation of iron ore from Lake Erie to Pittsburg, and of coal in the opposite direction.

When the economic proposition was fairly established, it was wonderful to see how railroad managers and capitalists met the situation, by investing additional capital for the newer type of equipment, and for the changes in road bed and location necessarily involved by that in the rolling stock. Curves were taken out or dimin-

ished, grades were reduced, heavier rails were laid, and new bridges built, so that practically some lines were almost rebuilt. The process is still going on and money by the hundred millions is involved in the transformation and equipment of the railroads. Some impression of the magnitude of the change in equipment may be gained from the single fact, that one of the leading railroads has within a few years expended more than \$20,000,000 for new freight cars alone, all of which have a capacity of 100,000 pounds.

The form of loading for bridges almost universally specified by the railroads of this country consists of two consolidation locomotives followed by a uniform train load. These loads are frequently chosen somewhat larger than those that are likely to be actually used for some years in advance, but sometimes the heaviest type of locomotives in use is adopted as the standard loading. The extent to which the specified loadings have changed in eight years may be seen from the following statement based on statistics compiled by Ward Baldwin and published in the 'Railroad Gazette' for 2 May 1902.

Of the railroads whose lengths exceed 100 miles, located in the United States, Canada, and Mexico, only 2 out of 77 specified uniform train loads exceeding 4,000 pounds per linear foot of tracks in 1893, while in 1901, only 13 out of 103 railroads specified similar loads less than 4,000 pounds. In 1893, 37 railroads specified loads of 3,000 pounds and 29 of 4,000 pounds, while in 1901, 4,000 pounds was specified by 50, 4,500 pounds by 14, and 5,000 pounds by 17 railroads. The maximum uniform load rose from 4,200 in 1893 to 7,000 pounds in 1902.

In a similar manner in 1893 only 1 railroad in 75 specified a load on each driving wheel axle exceeding 40,000 pounds, while in 1901 only 13 railroads out of 92 specified less than this load. In 1893 only 21 of the 77 railroads specified similar loads exceeding 30,000 pounds. The maximum load on each driving wheel axle rose from 44,000 pounds in 1893 to 60,000 pounds in 1901.

The unusual amount of new bridge construction required caused a general revision of the standard specifications for bridges, the effect of which was to include the results of recent studies and experiment, and to eliminate some of the minor and unessential items formerly prescribed.

Meanwhile another movement was in progress. Experience having shown the great advantage of more uniformity in various details and standards relating to the manufacture of bridges both in reducing the cost and the time required for the shop work, an effort was begun to secure more uniformity in the requirements for the production and tests of steel, which is the metal now exclusively employed in bridges.

With greater uniformity in the physical, chemical and other requirements for steel, as determined by standard tests, the unit stresses to be prescribed for the design of bridges will naturally approach to a corresponding uniformity. To what extent this is desirable may be inferred from the fact that the application of several of the leading specifications to the design of a railroad bridge under a given live road yields results which may vary by an amount

BRIDGE CONSTRUCTION

ranging from zero to 25 per cent of the total weight.

In the revision of specifications a decided tendency is observed to simplify the design by making an allowance for impact, vibration, etc., by adding certain percentages to the live load according to some well-defined system. It needs but relatively little experience in making comparative designs of bridges under the same loading, to show the advantage of this method over that in which the allowance is made in the unit stresses according to any of the systems usually adopted in such a case. Not only are the necessary computations greatly simplified, but the same degree of security is obtained in every detail of the connections as in the principal members which compose the structure.

Experiments on a large scale are very much needed to determine the proper percentage of the live load to be allowed for the effect of impact, so as to secure the necessary strength with the least sacrifice of true economy. An investigation might also be advantageously made to determine the proper ratio of the thickness of cover plates in chord members which are subject to compression, to the transverse distance between the connecting lines of rivets. The same need exists in regard to the stiffening of the webs of plate girders, concerning which there is a wide variation in the requirements of different specifications.

A movement which has done much good during the past decade and promises more for the future is that of the organization of bridge departments by the railroad companies. The great economy of making one design rather than to ask a number of bridge companies to make an equal number of designs, of which all but one are wasted, is the first advantage; but another of even greater significance in the development of bridge construction is that which arises from the designs being made by those who observe the bridges in the conditions of service and who will naturally devote closer study to every detail than is possible under the former usual conditions. The larger number of responsible designers also leads to the introduction of more new details to be submitted to the test of service, which will indicate those worthy of adoption in later designs. In order to save time and labor and secure greater uniformity in the design of the smaller bridges, some of the railroads prepare standard plans for spans varying by small distances. For the most important structures consulting bridge engineers are more frequently employed than formerly, when so much dependence was placed upon competitive designs made by the bridge companies.

An investigation was made by a committee of the Railway Engineering and Maintenance of Way Association in regard to the present practice respecting the degree of completeness of the plans and specifications furnished by the railroads. It was found that of the 72 railroads replying definitely to the inquiry, 33 per cent prepare "plans of more or less detail, but sufficiently full and precise to allow the bidder to figure the weight correctly and if awarded the contract to at once list the mill orders for material"; 18 per cent prepare "general outline drawings showing the composition of members, but no details of joints and connections"; while 49 per cent prepare "full specifications with survey plan only, leaving the bidder to submit a

design with his bid." If, however, the comparison be made on the basis of mileage represented by these 72 railroads, the corresponding percentages are 48, 24, and 28 respectively. The total mileage represented was 117,245 miles. A large majority of the engineers and bridge companies that responded were in favor of making detail plans.

The shop drawings, which show the form of the bridge, the character and relations of all its parts, give the section and length of every member, and the size and position of every detail whether it be a reinforcing plate, a pin, a bolt, a rivet, or a lacing bar. All dimensions on the drawings are checked independently so as to avoid any chance for errors. The systematic manner in which the drawings are made and checked, and the thorough organization of every department of the shops, make it possible to manufacture the largest bridge, to ship the pieces to a distant site, and find on erecting the structure in place that all the parts fit together, although they had not been assembled at the works.

The constant improvement in the equipment of the bridge shops, and the increasing experience of the manufacturers who devote their entire time and attention to the study of better methods of transforming plates, bars, shapes, rivets, and pins into bridges, constitute important factors in the development of bridge construction.

As the length of span for the different classes of bridges gives a general indication of the progress in the science and art of bridge building, the following references are made to the longest existing span for each class, together with the increase in span which has been effected approximately during the past decade.

In plate girder bridges the girders, as their name implies, have solid webs composed of steel plates. A dozen years ago but few plate girders were built whose span exceeded 100 feet, the maximum span being but a few feet longer than this. To-day such large girders are very frequently constructed. The longest plate girder span was erected on the Mahoning division of the Erie R.R. in 1902 and measures 128 feet 4 inches between centres of bearings. The longest ones in a highway bridge are those of the viaduct on the Riverside Drive in New York, erected in 1900, the span being 126 feet. The heaviest plate girder is the middle one of a four-track bridge on the New York C. R.R. erected in 1901 near Lyons, N. Y. Its weight is 103 tons, its span 107 feet 8 inches and its depth out to out 12 feet 2 inches.

The large amount of new construction and the corresponding increase in the weight of rolling stock have combined to secure a more extensive adoption of plate girders and the designs of many new details for them. These affect chiefly the composition of the flanges, the web splices, the expansion bearings and the solid floor system. Although solid metal floors built up of special shapes were first introduced into this country 15 years ago, their general adoption has taken place largely within the past decade on account of their special adaptation to the requirements of the elevation of tracks in cities. Solid floors may not only be made much shallower than the ordinary open type, thereby reducing the total cost of the track elevation, but they also permit the ordinary track con-

BRIDGE CONSTRUCTION

struction with cross-ties in ballast to be extended across the bridge, thus avoiding the jar which otherwise results as the train enters and leaves the bridge, unless the track is maintained with extraordinary care.

The necessity for bridges of greater stiffness under the increased live loads has also led to the use of riveted bridges for considerably longer spans than were in use six or seven years ago. The use of pin-connected trusses for spans less than about 150 feet is undesirable for railroad bridges, on account of the excessive vibration due to the large ratio of the moving load to the dead load or weight of the bridge itself.

While riveted bridges are now quite generally used for spans from 100 to 150 feet, they have been employed to some extent up to 181½ feet. The recent forms of riveted trusses do not, however, conform to the general character of European designs, but embody the distinctively American feature of concentrating the material into fewer members of substantial construction. With but rare exceptions the trusses are of the Warren, Pratt, and Baltimore types with single systems of webbing. At a distance where the riveted connections cannot be distinguished, the larger trusses have the same general appearance as the corresponding pin bridges.

The recent examples of viaduct construction with their stiff bracing of built-up members and riveted connections exhibit a marked contrast to the older and lighter structures with their adjustable bracing composed of slender rods. The viaduct which carries the Chicago & N. W. R.R. across the valley of the Des Moines River, at a height of 185 feet above the surface of the river is 2,658 feet long. It was built in 1901, is the longest double-track viaduct in the world, provided those located in cities be excluded, and is an admirable type of the best modern construction. The tower spans are 45 feet long and the other spans are 75 feet long. Four lines of plate girders support the two tracks. Along with this viaduct should be mentioned the Viaduct Terminal of the Chesapeake & O. R.R. at Richmond, Va., whose length, including the depot branch, is 3.13 miles. A large part of this is not very much higher than an elevated railroad in cities. The excellent details and clean lines of this substantial structure give it a character which is surpassed neither in this country nor abroad. It may be added that the highest viaduct in this country, and which was rebuilt in 1900, is located 17 miles from Bradford, Pa., where the Erie R.R. crosses the Kinzua Creek at a height of 301 feet. It has a length of 2,053 feet.

While the elevated railroads which have been built recently also embody many of the characteristics of the best viaduct construction, special study has been given to improve their æsthetic effect. The use of curved brackets, of connecting plates whose edges are trimmed into curves so as to reduce the number of sharp angles, and of rounded corners of posts, constitute some of the means employed. The results are seen in the structures of the Boston Elevated R.R. and in some of the latest construction in Chicago.

The longest span of any simple truss in America is that of the bridge over the Ohio River at Louisville, erected in 1893. Its span

centre to centre of end pins is 546½ feet. Since that time several other bridges of this kind have been built which are considerably heavier, although their spans are somewhat shorter. The most noteworthy of these are the Delaware River bridge on the Pennsylvania R.R. near Philadelphia, and the Monongahela River bridge of the Union R.R. at Rankin, Pa., both of which are double-track bridges. The Delaware River bridge was erected in 1896, each one of its fixed spans having a length of 533 feet and containing 2,094 tons of steel. The Rankin bridge was erected in 1900. Its longer span has a length of 495 feet 8⅞ inches between centres of end pins and contains about 2,800 tons of steel. It may also be added that the locomotive and train load for which this bridge was designed is the heaviest that has yet been specified. The heaviest simple span in this country is the channel span of the double deck bridge over the Allegheny River at Pittsburg, Pa., on the Pennsylvania lines west of Pittsburg, erected in 1902. It has four trusses and weighs about 3,000 tons.

The recent changes in the details of pin-connected truss bridges have been mainly the result of efforts to eliminate ambiguity in the stresses of the trusses, to reduce the effect of secondary stresses, and to secure increased stiffness as well as strength in the structure. Double systems of webbing have been practically abandoned so far as new construction is concerned. The simplicity of truss action thus secured permits the stresses to be computed with greater accuracy and thereby tends to economy. Before the last decade very few through bridges and those only of large span were designed with end floor beams in order to make the superstructure as complete as possible in itself and independent of the masonry supports. Now this improved feature is being extended to bridges of small spans. Similarly dropping the ends of all floor beams in through bridges so as to clear the lower chord and to enable the lower lateral system to be connected without producing an excessive bending movement in the posts has likewise been extended to the smaller spans of pin bridges and is now the standard practice. The expansion bearings have been made more effective by the use of large rollers and of bed plates so designed as to properly distribute the large loads upon the masonry. In the large spans of through bridges the top chord is curved more uniformly, thereby improving the æsthetic appearance. These chords are also given full pin bearings, thus reducing the secondary stresses.

The stiffness of truss bridges has been secured by adopting stiff bracing in the lateral systems and sway bracing, instead of the light adjustable rods formerly used. At the same time adjustable counter ties in the trusses are being replaced in recent years by stiff ones, while in some cases the counters are omitted and the main diagonals designed to take both tension and compression.

Some of the same influences referred to above have led to much simpler designs for the portal bracings by using a few members of adequate strength and stiffness in general character to those of the trusses.

Such steady progress in the design and construction of railroad bridges of moderate span has, unfortunately, no adequate counterpart in

BRIDGE CONSTRUCTION

highway bridges. The conditions under which highway bridges are purchased by township and county commissioners are decidedly unfavorable to material improvements in the character of their details. It is a comparatively rare occurrence that the commissioners employ a bridge engineer to look after the interests of the taxpayers by providing suitable specifications, making the design, inspecting the material, and examining the construction of the bridge to see that it conforms to all the imposed requirements. These provisions are only made in some of the cities, and accordingly, one must examine the new bridges in cities to learn what progress is making in highway bridge building.

The lack of proper supervision in the rural districts and many of the smaller cities results in the continued use of short trusses with slender members built up of thin plates and shapes, whose comparatively light weight causes excessive vibration and consequent wear, as well as deterioration from rust. Under better administration plate girders would be substituted for such light trusses, making both a stiffer structure and one more easily protected by paint. The general lack of inspection and the consequent failure to protect highway bridges by regular repainting will materially shorten their life and thereby increase the financial burden to replace them by new structures. Some progress has been made by adopting riveted trusses for the shorter spans for which pin-connected trusses were formerly used, but the extent of this change is by no means as extensive as it should be, nor equal to the corresponding advance in railroad bridges.

The channel span of the cantilever bridge over the Mississippi River at Memphis, Tenn., was for some years the longest one of any bridge of this class in America. It measures $790\frac{1}{2}$ feet between centers of supports. This bridge was finished in 1892, or only two years after the close of the seven-year period of construction and erection of the mammoth cantilever bridge over the Firth of Forth in Scotland. See BRIDGE (*Cantilever Bridges*). The cantilever bridge erected in 1903 over the Monongahela River in Pittsburg has a span a little longer than that of the Memphis bridge. It is on the new extension of the Wabash R.R. system, and the distance between pier centres is 812 feet. There is another one being built which will not only have a longer span than any other cantilever bridge in this country, but longer than that of any other bridge in the world. It is located near Quebec, Canada, and its channel span over the St. Lawrence River is to have the unprecedented length of 1,800 feet, or nearly 100 feet longer than that of the Forth cantilever bridge and 200 feet longer than the Brooklyn suspension bridge. The towers will have a height of 360 feet above high tide. It will accommodate a double-track railroad, besides two electric railway tracks and highways. In the piers the courses of masonry are four feet high and individual stones weigh about 15 tons each. The character of its design and the simplicity of its details will permit its construction with unusual rapidity and economy for a bridge of this magnitude.

The Brooklyn bridge, completed in 1883, is still the largest suspension bridge in the world, its span being $1,595\frac{1}{2}$ feet. More people cross

this bridge than any other in any country. The Williamsburg Bridge (q.v.), completed in 1904, has a span of 1,600 feet, and its capacity will be very much greater than that of the Brooklyn Bridge. Each of its four cables has a safe strength of over 10,000,000 pounds in tension. See BRIDGE (*Suspension Bridges*).

One of the most interesting developments relating to the subject under consideration is the construction of a considerable number of metallic arch bridges in recent years and the promise of their still greater use in the future. On account of their form they constitute one of the handsomest classes of bridges.

The first important steel bridge in the world was completed in 1874. It is the arch bridge which in three spans crosses the Mississippi River at St. Louis. Its arches are without hinges and their ends are firmly fixed to the piers. This is one of the most famous bridges in existence. For a long time after its construction no metallic arches were erected in this country, although many were built in Europe. In 1888, however, the highway bridge across the Mississippi River at Minneapolis was erected, consisting of two spans of 456 feet each and which still remains the longest span of any three-hinged arch. The following year the Washington bridge over the Harlem River in New York was completed. It consists of two spans of 510 feet in the clear and has the largest two-hinged arch ribs with solid web plates. See BRIDGE.

These were followed by a number of arches of various types, the most noted of which are the two arch bridges over the Niagara River. The first one is a spandrel-braced, two-hinged arch with a span of 550 feet, and replaced the Roebling suspension bridge in 1897. It accommodates the two tracks of the Grand Trunk R.R. on the upper deck and a highway on the lower deck. The other bridge has arched trusses with parallel chords and two hinges. It replaced the Niagara and Clifton highway suspension bridge in 1898, and as its span is 840 feet, it is the largest arch of any type in the world. The manner in which this arch was erected furnishes an illustration of the effort which is made by engineers to conform to the actual conditions so far as possible to the theoretic ones involved in the computation of the stresses. Since the stresses in an arch having less than three hinges are statically indeterminate, stresses of considerable magnitude may be introduced into the trusses if the workmanship be imperfect, the supports not located with sufficient precision, and the arch closed without the proper means and care.

The Niagara and Clifton arch was first closed as a three-hinged arch and then transformed into a two-hinged arch by inserting the final member under the sum of the computed stress due to the weight of the truss, and that due to the difference between the temperature at which the closure was made and that assumed as standard in the stress computations. This stress was secured in the member by inserting it when the hydraulic jack which forced apart the adjacent ends of the shortened chords registered the required amount of pressure. The arch had been erected as a pair of cantilevers from each side extending 420 feet out beyond the supports, and when the closure was made the two arms came together

BRIDGE CONSTRUCTION

within a quarter of an inch of the computed value. Such a result involving the "accuracy of the calculation and design of the entire steel work, the exactness with which the bearing shoes or skewbacks were placed, and the perfection of the shopwork" has been truly characterized as phenomenal. In order to reduce secondary stresses to a minimum the members were bolted up during the cantilever erection and the bolts replaced by rivets after the closure of the arch rib.

The past decade witnessed the introduction and extensive development of arches of concrete and of concrete-steel construction. In the latter kind a small amount of steel is embedded in the concrete in order to resist any tensile stresses that may be developed. During this period more than 150 concrete-steel bridges have been built in this country. In the same year in which the largest metallic arch was completed, the five concrete-steel arches of the bridge at Topeka, Kansas, were finished. The largest one has a span of 125 feet and still remains the largest span of this type in America, although it has been exceeded in Europe. Considerably larger spans are included in the accepted design for the proposed Memorial bridge at Washington.

It is the smaller steel structures which are destined more and more to be replaced by arches of this material. The steel bridges require repainting at frequent intervals, constant inspection, occasional repairs, and finally replacing by a new structure after a relatively short life, on account of rust and wear, unless it is required even sooner on account of a considerable increase in the live load. The concrete arch requires practically no attention except at very long intervals.

The safety of operating the traffic makes it desirable to have as few breaks as possible in the regular track construction of a railroad, and this constitutes an additional reason why concrete or stone arches are being substituted for the smaller openings. The decreasing cost of concrete tends to an extension of this practice to openings of increasing size. In 1901, however, a bridge was completed which marks a decided departure from previous practice. The Pennsylvania R.R. built a stone bridge, consisting of 48 segmental arches of 70 feet span, at the crossing of the Susquehanna River at Rockville, Pa. It is 52 feet wide, accommodates four tracks and cost \$1,000,000. This bridge has not only the advantage of almost entirely eliminating the cost of maintenance, but it also has sufficient mass to withstand the floods which occasionally wreck the other bridges on that river. In 1903 the same railroad built a similar bridge over the Raritan River at New Brunswick, N. J.

Of movable bridges the largest swing span existing was erected in 1893 at Omaha over the Missouri River. Two years later a four-track railroad swing bridge was built by the New York C. R.R. over the Harlem River in New York, which is only 389 feet long between centres of end pins, but which weighs about 2,500 tons, and is accordingly the heaviest drawbridge of any class in the world.

During the past decade a remarkable development was made in drawbridge construction by the modification and improvement of some of the older types of lift bridges and the

design of several new types. At South Halstead Street a direct-lift bridge was built in 1893 over the Chicago River, in which a simple span 130 feet long and 50 feet wide is lifted vertically $142\frac{1}{2}$ feet by means of cables to which counterweights are attached. Formerly, only very small bridges of this kind were used, as those, for instance, over the Erie Canal.

In 1895 a rolling-lift bridge over the Chicago River was completed. In this new design as each leaf of the bridge rotates to a vertical position it rolls backward at one end. When closed the two leaves are locked at the centre, but they are supported as cantilevers. This form has been found to have so many advantages for the crossings of relatively narrow streams, where an unobstructed waterway is required and the adjacent shores are needed for dock room, that a score of important structures of this class have been built in different cities. The largest span that has been designed is 275 feet between centres of supports, while the widest one is to accommodate eight railroad tracks crossing the Chicago Main Drainage Canal.

About the same time and under similar conditions another type of bascule bridge was built at Sixteenth Street, Milwaukee, in which, as each leaf moves toward the shore, one end rises and the other falls, so that its centre of gravity moves horizontally, thus requiring a very small expenditure of power to operate the bridge.

Several improved forms of hinged-lift bridges have also been designed and built in Chicago and elsewhere. In a small bridge erected in 1896 on the Erie R.R. in the Hackensack meadows there is only a single leaf hinged at one end and lifted by a cable attached to the other end. The counterweight rolls on a curved track so designed as to make the counterbalance equally effective in all stages of opening and closing the bridge.

A novel bridge was built in 1902 over the ship canal at Duluth which is different from any other type in this country. The general scheme is similar to that of a design made by a French engineer who built three of the structures in different countries. It consists of a simple truss bridge 393 feet 9 inches long, supported on towers at a clear height of 135 feet above high water. Instead of supporting the usual floor of a highway bridge it supports the track of a suspended car which is properly stiffened against wind pressure and lateral vibration, the floor of the car being on a level with the docks. This ferry is operated by electricity. The loaded car, its hangers, trucks, and machinery weigh 120 tons. In the French design a suspension bridge was used instead of the simple truss bridge.

A bridge across the Charles River between Boston and Cambridge deserves especial mention and marks a decided advance in the growing recognition on the part of municipal authorities of the importance of æsthetic considerations in the design of public works. It consists of 11 spans of steel arches whose lengths range from $101\frac{1}{2}$ to $188\frac{1}{2}$ feet. Its width is 105 feet between railings. It is claimed that this bridge "will be not only one of the finest structures of its kind in this country, but will be a rival of any in the Old World." Its length between abutments is $1,767\frac{1}{2}$ feet, and it is estimated to cost about \$2,500,000.

BRIDGE CONSTRUCTION

The problems incident to the replacing and strengthening of old bridges frequently tax the resources of the engineer and demonstrate his ability to overcome difficulties. Only a few examples may be cited to indicate the character of this work. In 1900 the Niagara cantilever bridge had its capacity increased about 75 per cent by the insertion of a middle truss without interfering with traffic. In 1897 the entire floor of the Cincinnati and Covington suspension bridge was raised four feet while the traffic was using it. It may be of interest to state that the two new cables, $10\frac{1}{2}$ inches in diameter, which were added to increase the capacity of the bridge, have just about three times the strength of the two old ones, $12\frac{2}{3}$ inches in diameter, and which were made a little over 30 years before. In the same year the old tubular bridge across the St. Lawrence River was replaced by simple truss spans without the use of false works under the bridge and without interfering with traffic. On 25 May 1902 the Pennsylvania R.R. bridge over the Raritan River and canal at New Brunswick, N. J., was moved sidewise a distance of $14\frac{1}{2}$ feet. Five simple spans 150 feet long and a drawbridge of the same length, weighing in all 2,057 tons, were moved to the new position and aligned in 2 minutes and 50 seconds. The actual times that the two tracks were out of service were respectively 15 and 28 minutes. On 17 October 1897, on the same railroad near Girard Avenue, Philadelphia, an old span was moved away, and a new one, 235 feet 7 inches long, put in exactly the same place in 2 minutes and 28 seconds. No train was delayed in either case. HENRY S. JACOBY,
College of Civil Engineering, Cornell.

Bridge Construction, Modern Methods of:

An instructive exposition of these methods requires a brief consideration of the principles of design and the controlling factors therein.

All framed structures may be divided into two classes—those designed to sustain only a permanent or “dead load,” which acts with unvarying forces, and those which sustain not only the dead load consisting of their own weight, but also the action of a “live load” applied by the movement of railway trains, ordinary vehicles and horses, men, etc., over them.

Roof trusses, cranes, cantilevers, etc., are of the first class, while bridges belong to the second.

All bridge structures may be conveniently divided into three classes—(1) “beam bridges,” (2) “suspension bridges,” (3) “arch bridges.” The first exert only vertical pressures upon the supporting piers and abutments; the second exert a horizontal pull on the towers and anchorages; while the third exert a horizontal push in addition to the vertical pressures.

“Beam bridges” are of a great variety of forms, including those commonly known as simple bridges, drawbridges, continuous bridges, and cantilever bridges. Over 90 per cent of the modern bridges are simple bridges, of which there are two classes—truss bridges and girder bridges. In the former the floor is supported by two or more frame structures, called trusses; in the latter, the floor is supported by solid built-up beams. Girder bridges are generally used for short spans, seldom exceeding 100 feet; but the truss bridges are used for larger spans, and also for spans as short as 50 feet.

A simple framed structure or truss is one composed of straight “members” or parts joined together by pins or rivets, so as to form a rigid framework. The most rigid form is that of a triangle, as it is the only figure the shape of which cannot be altered without changing the length of its sides. It is, therefore, the “truss element,” and all framed structures, no matter how complicated in construction, may be treated as a combination of triangles when no superfluous members are present.

The forces such structures are designed to resist are those of tension, compression, and shearing. These forces when external are called “strains,” while the corresponding internal forces developed in the several members of the structure to resist the strains, are called stresses.

Owing to the frequent confused and indiscriminate use of the terms strain and stress by some authors, a great deal of popular misunderstanding exists as to their exact designations. According to the best authorities, however, a strain is the distortion of a body under the action of one or more external forces, and it is the immediate cause of the stress developed in the body to resist that distortion. Under certain conditions, however, a stress may by reaction and transmission act as an external force, as in the case of the stresses in the masonry supports of a bridge which react upon the superstructure and are in effect external forces and have to be treated as such. In solid bodies, within certain limits, the intensity of the stress is equal to the amount of the strain, and as enunciated by Hooke’s Law, equal increments of one develop equal increments of the other; but, it is evident that stresses cannot thus continue to increase indefinitely in proportion to the strains, and a point is necessarily reached when a greater increment of distortion is required to develop a given increment of stress. This point is known as the “elastic limit.” Below this point, a distorted body returns to its original form and size when the straining force ceases to act; but, beyond the limit, the strain increases more rapidly than the stress, or than the straining force which is always the equal of the stress, and the body does not return to its original dimensions, since a portion of the distortion remains as a “permanent set.”

In the designing of a truss, the members are guarded against “taking a set,” by keeping the working stresses well within the elastic limit of the material of construction.

A bridge truss is designed to act as a beam and it is, therefore, usually subjected to longitudinal strains of tension or compression only, and develops in its members corresponding tensile or compressive stresses. Fig. 1 shows a

FIG. 1.—Simple Truss.

simple bridge truss with its several members designated as struts, ties or tie-rods, etc., according to the character of the stresses developed in them by the combined action of the dead and live loads.

BRIDGE CONSTRUCTION

In the "struts" the stresses are compressive; in the "ties" tensile. The upper and lower "chords" are placed in compression or tension according to the direction of action of the external forces applied to the structure. In a truss supported at the ends and bearing a downward acting load, the upper chord is always in compression, and the lower chord always in tension. "Counterbraces" are designed to resist both

structure, provided all the members are properly designed to carry their respective loads.

The economy and the efficiency of the truss lies in the panel or quadrilateral system. Fig. 5 shows its development from the triangular

FIG. 5.

king-post truss by the addition of the side panels. It appears that this system was first introduced by Palladio about 1570, but was little used until the close of the 18th century, when it was re-discovered by Burr, and came into extensive use in the United States and is the progenitor of nearly all the forms of bridge trusses now in use in this country, its most valuable feature—a constant angle for the inclined members and its panel system being transmitted to the "Long," "Pratt," "Howe," and to many other later forms of trusses.

The "Bollman," "Warren," and "Fink" trusses, embodying the pure triangular types

FIG. 6.—Bollman.

FIG. 7.—Warren.

FIG. 8.—Fink.

(see Figs. 6, 7, and 8), preceded those of the quadrilateral system. They were, however, unstable under the action of a live load which subjected their members to different strains alternately, with a consequential deterioration of the material and a shortening of the life of the

FIG. 9.—Post.

FIG. 10.—Baltimore.

FIG. 11.—Kellogg.

structure. These considerations led to the development of the quadrilateral type in which each member is required to resist a strain of only one particular character. Of these, the more important other than those already men-

FIG. 2.

tensile and compressive strains alternately, as they may be applied by the changing positions of the load. No truss-member can act simultaneously in full tension and compression, but may do so partially, since the stress developed in any member by the strains of two or more external forces is equal to and of the same sign as the algebraic sum of all those forces. Thus a tie may resist a compressive strain without becoming a counterbrace, or a strut may resist a tensile strain without becoming a tie, so long as the contrary strains are smaller than those for which the member is designed, and which continue to act at the same time.

Fig. 2 shows the action of a truss. As already stated, a truss acts as a beam, and a load applied at (h) will be carried to the abutments at (a) and (v) along the several members as indicated by the arrows, leaving the post (hi), the ties (ij) (kl) (mn), and the hanger (cb) and (tw) idle, and they may be removed without weakening the truss under that particular loading, since it would still remain a combination of triangles properly joined. Fig. 3 shows the conditions with the load applied at (j), with the ties (ij) and (jm) under stress, and the ties (hk) and (kl) idle. Fig. 4 shows

FIG. 3.

FIG. 4.

two equal loads applied at the middle points (j) and (l). Since the part of the load at (j) going to (v) is just balanced by the part of the load at (l) going to (a), there is no stress in (jk) (lm) (jm) and (kl), nor in the counter ties (hk) and (mn).

From an inspection of these conditions it is obvious that a truss is not weakened on account of a lack of symmetry in the arrangement of its individual members, or as a whole

BRIDGE CONSTRUCTION

tioned, are the "Post," "Baltimore," "Kellogg," and "Whipple-Murphy," shown by Figs. 9, 10, 11, 12, respectively. The "Whipple-Murphy" was the first to approach to the modern iron truss-bridges. The first bridge of this type, a span of 146 feet, was built by Whipple in 1852, near Troy, N. Y., on the Rensselaer and Saratoga Railway.

FIG. 12.

In 1861, Linville introduced wide forged eye-bars and wrought iron posts in the web system, while two years later, Murphy substituted wrought iron for all of the compression members, and established in this country the distinctive practice of eye-bars and pin connections, which is still applied to long span steel truss-bridges. The credit of originating the correct theory of truss action, however, belongs to Whipple.

In Europe, the prevailing method of construction is the riveted system, which in this country is limited to plate girders and lattice

FIG. 13.—Parabolic-Bowstring.

FIG. 14.—Double-Bowstring or Lenticular.

FIG. 15.—Pegram.

trusses of less than 200 feet span. In this system the chords are formed of angles or channel and plates riveted together with splice

joints, thus making them continuous from one end to the other. The web members are riveted to the chords directly, or by means of special plates, which are riveted to both.

Other forms of bridge trusses than those already described, which have many claims to economy and excellence of design, are the "parabolic bowstring," the "double bowstring" or "lenticular," the "Pegram," and the "Petit" trusses, shown by Figs. 13, 14, 15, and 16.

FIG. 16.—Petit.

A plate girder bridge consists of two or more girders connected by systems of lateral and transverse bracings. In its simplest form a plate girder is composed of a vertical web plate to the top and bottom of which are riveted pairs of horizontal angle irons, forming the flanges, and to the ends, vertical angles which transmit the load to the support. The structural forms of girders are modified in many ways to adapt them for different purposes. Increase in the ratio of the depth of the web to its thickness necessitates the addition of "stiffeners." These are vertical angles riveted on to the web in pairs on opposite sides at intervals along the span. As the span increases, two or more web plates are used, spliced end to end. In long spans the flanges also require splicing. See Fig. 17.

FIG. 17.—Plate-Girder Web-Splice.

There are three general classes of truss and girder bridges used for railroad and highway purposes: (1) "through-bridges," in which the roadway or floor is carried directly by and attached to the bottom chord joints or web plates, and the lateral bracing joins the upper chord joints, and encloses a space for the passage of the load; (2) "deck bridges," in which the roadway is carried on the tops of the girders; and (3) "pony trusses," for short spans, carrying the roadway at the bottom joints but too low to allow upper lateral bracing, so that the trusses are held in place by bracing incorporated with the floor systems. In short spans the girders are arranged to slide upon their supports, base plates being riveted to their

BRIDGE CONSTRUCTION

bottoms and bed-plates to the supports. In spans 75 feet or less, expansion and contraction due to changes in temperature are provided for by the use of hinged bolsters, while for longer spans rollers are introduced between the base and bed-plates. The thickness of the webs and the composition of the flanges of plate girders, relative to the increased stresses developed by greater loads and longer spans, is accurately fixed by experience. In railroad bridges, the web plates ought not to be less than three eighths of an inch in thickness, while those in highway bridges ought not to be less than five sixteenths of an inch; but, in the general design of plate girders, it is well to exceed these values.

In the composition of the flanges, each pair of angles ought to be riveted to the web plate, with their backs projecting a little beyond it, to counteract any lack of straightness in the edge of the web plate, thereby allowing anything to rest upon the flange fairly. When required, additional flange area is obtained by riveting one or more cover plates to the horizontal limbs

FIG. 18. FIG. 19. FIG. 20. FIG. 21.

of the angles; their number, however, ought to be so limited that the length of the rivets used are not more than five times their diameter. Since the stress in the web plate is transmitted to the covers through the angles, the sectional area of the angles ought to be equal to or greater than that of the cover plates. In a girder, the bending moment requires cover plates of different lengths. This necessitates the notching of the cross-ties which is obviated by various modifications of the flange—by using a narrow outer cover extending the whole length of the girder and placing filler plates under it, or by the use of two small angles, the cross-ties being notched to fit the vertical legs of the angles. See Figs. 18, 19, 20, 21.

Other methods are illustrated by Figs. 22 and

FIG. 22. FIG. 24. FIG. 23.

23, while Fig. 24 shows the section of a flange at the end of a girder.

The functions of intermediate web stiffeners are in a rather undetermined condition, and the

practice in their use varies considerably. It may be broadly stated, however, that the general practice is to use stiffeners $3\frac{1}{2}'' \times 3\frac{1}{2}'' \times \frac{3}{8}''$, angles for spans below 50 feet; $5'' \times 3\frac{1}{2}'' \times \frac{3}{8}''$, angles for spans from 50 to 100 feet, and $6'' \times 4'' \times \frac{3}{8}''$ angles for spans over 100 feet.

The size and weight of web plates are limited by the processes of manufacture and available equipment. Therefore, large girders require several web splices. In their simplest form they consist of plates equal in length to the clear distance between the flange angles, and are riveted to each of the two abutting web plates by two or more rows of rivets, with a pair of stiffener angles attached.

For spans less than 60 feet, splices in the flanges may usually be avoided, as angles and cover plates of sufficient length can be readily obtained. In any case it is more economical to reduce the number of splices to a minimum, even at the additional cost of the extra length angles and cover plates. Flange angles are usually spliced with cover-angles with rounded roots which fit into the fillets of the other angles, while the cover splices are so arranged that the outer cover near the splices may be extended so as to form the splice plate. Fig. 25 shows a very efficient splice, designed in accordance with the best specifications so as to develop the full strength of the net section of the web. The main splice plates extend from flange to flange, and two flats are riveted over the vertical legs of the flange angle, thereby reaching parts of the web not reached directly by the other plates, and adding greatly to the strength of the whole splice. Since the efficiency of a rivet to resist bending strains at a joint is proportional to the square of its distance from the neutral surface, therefore, in a splice of this type, with a web $\frac{7}{16}$ inch thick and 84 inches deep, and the unit stress in the outer fibre 17,000 pounds per square inch, the resisting moment of the gross section of the lower half of the web is equal to 4,373,000 pound-inches, and that of the net section 3,538,200 pound-inches.

The upper and lower flanges of the two or more girders constituting a bridge are held in line by a series of braces, each of which is composed of one or two angles. These braces and the flanges form horizontal trusses, which are called the upper and lower lateral systems. The Warren type, in which the panel points of the upper system are directly above the middle points between the panel points of the lower system, is the one most frequently employed.

Rigid cross frames, each consisting of two struts and two diagonals connected with a stiffener on each end girder, are placed at the ends of the girders and at intermediate points and constitute what is known as transverse or sway bracing.

The floors of "through" railroad plate-girder bridges may be constructed by a system of floor beams and stringers, or made solid. The former method is the one most extensively employed. The floor beams are simply plate-girders of short spans, and are usually placed from 12 to 18 feet apart, and riveted to the main girders, the web splice plates of which are extended to the inner side of the nearest stringers, so as to reinforce the web plate of the floor beams. From each end of the floor beams a triangular gusset plate riveted to the girder extends to the top flange. The outer edge of the gusset plate

BRIDGE CONSTRUCTION

is stiffened by a pair of angles, which are bent over at the upper ends and riveted to both the flange and stiffener angles.

Either I beams or short plate girders may be used for stringers. In the latter case no cover plates are used and the web plates are allowed to project above the flange angles, the cross-ties being carried upon the top flanges. The arrangement of a floor system, in which the ties rest upon horizontal shelf angles, riveted to the web near the lower flange, or one in which the cross-ties rest on the bottom flanges, which are weakened and the lateral bracing loosened by the spring of the floor, is very objectionable. According to the best practice the cross-ties in deck bridges rest directly upon the top flanges of the two girders supporting each track.

Solid floor construction includes many different types. In some, continuous metal floors support the rails on ordinary cross-ties in bal-

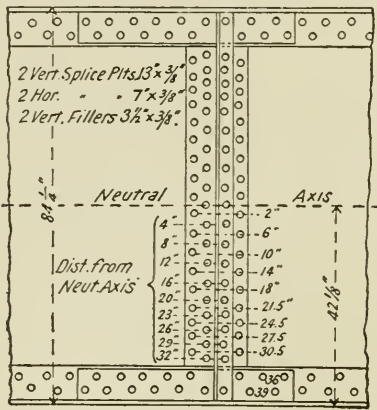

FIG. 25.

last, while in others the ballast is omitted and the cross-ties rest on the metal floor, or the rails rest directly on the metal floor. Solid floors were built as early as 1874, the track rails being laid close together on top of the girders and overspread with the ballast. This gave a

FIG. 26.

continuous track practically free from the objections applicable to the crossing of wooden bridge floors supported on stringers. Floors

consisting of metal troughs were introduced in 1887. They were constructed by riveting together alternately inverted trough plates, as shown in Fig. 26, with the cross-ties laid directly in the troughs or imbedded in ballast. In 1888, the New York Central & Hudson River Railroad adopted this system as a standard for through bridges, and have retained it as such up to the present time for bridges of a limited depth of floor. The necessity for very shallow floors for elevated tracks in large cities, and for plate girders at street crossings, have led to the production of several designs employing I beams and continuous cover plates. The solid floors of highway bridges usually consisted of either a continuous metal floor or one in which the metal was used in combination with concrete or some other material for the permanent foundation upon which the street and sidewalk paving was laid. The latest development in this line is the extensive use of reinforced concrete for both highway and railroad bridges.

Examples of bridges with reinforced concrete floors are quite numerous, and the application of the system is being widely and rapidly extended both in the United States and Europe. Fig. 27 shows the section of a bridge floor constructed of Monier arched plates, and Fig. 28 the floor of a foot-bridge in Lincoln Park, Chicago. The floor beams are placed at the panel points, 18 feet apart, with two beams placed close together, with expansion joints between them, at the centre of the span. From these beams a series of two groups of quadruple steel

FIG. 27.

FIG. 28.

wires are carried longitudinally over the intermediate floor beams to the ends of the span. Transversely across the bridge they are spaced horizontally one foot apart and are filled around with concrete composed of one part Dyckerhoff cement, two parts fine torpedo sand, and four parts blast slag rammed into place as soon as the wires are adjusted. In constructing, the longitudinal joints of the false work were placed directly under the points (a), and covered with boards, upon which were placed the forms for making the corrugation. The wires were then stretched under a tension of 60 pounds and secured in the proper position by hook bolts attached to the bottoms of the joints.

BRIDGE CONSTRUCTION

These bolts were removed when the concrete filling was firmly set.

The use of reinforced concrete is not limited to the construction of solid bridge floors. Many concrete-steel arch bridges have been built in the United States, and a much greater number of girder bridges in Europe. The usual girder construction is monolithic, and consists of a slab stiffened with ribs or girders on the under side. Unstiffened slabs are used only for very short spans, such as ordinary box culvert work; while rib-stiffened slabs are applied to spans ranging from 25 to 50 feet. For spans exceeding 50 feet the arch type is almost universally employed, and many concrete-steel arches exceeding 150 feet have already been built, and much larger spans are now being planned. The reinforced concrete arch bridge occupies a medium position between the metal and the stone arch bridges, being almost as light as the former and very nearly as durable as the latter. It is particularly suitable for the foot and highway bridges across railway tracks and small streams and canals, where the requirements of light weight, freedom from corrosion, and low cost are important factors. In the earlier methods of construction only the arch ring was reinforced, but now the reinforcement is applied to the spandrel and parapet walls also; being practically steel skeletons imbedded in concrete. In the earlier bridges the arch was built plain, but the present practice in the United States is in the direction of ribbed arch construction, while in Europe hinged arches are also being used, and the Monier method of construction appears to be the one most extensively used. (a)—Fig. 29 shows a Monier arch at Nymphemburg, Bavaria. It has a span of 87 feet, a total width of 33 feet, and carries a roadway 21 feet

FIG. 29.

wide, paved with wood blocks, which rest directly on the arch ring at the crown and on the concrete filling over the haunches. The structure is designed to sustain wagon loads of 26 tons. The reinforcement consists of continuous steel nets at both the extrados and the intrados of the arch ring. This is known as the "double reinforcement" type, but it is not used so extensively as that shown by (b)—Fig. 29, in which the intradosal net is continuous, but the extradosal extends up the haunches only to a limited distance from the skewback.

In the Wunsch form of construction the reinforcement consists of a series of forms of double T-shaped members, of which the extradosal are placed horizontally, with the flanges upward, and the intradosal conforming to the curve of the arch and placed with the flanges downward. Their webs overlap at the crown of the arch and are riveted together, while the ends are connected by vertical tie rods which extend downward into the pier or masonry abutment, and is anchored to a transverse girder

FIG. 30.

extending along the bridge. These frames are placed parallel to each other longitudinally across the arch, at intervals ranging from 18 to 24 inches apart, the ratio of the reinforcement cross-section to that of the concrete at the crown being about 2 to 100. Fig. 30 shows the Emperor Bridge at Sarajevo, Bosnia—a Wunsch arch of about 82 feet span, with a width of 23 feet, one of the longest spans of its kind, and all of the details of construction.

In the Hennebique ribbed arch system, the reinforcement consists of longitudinal arched ribs which carry a floor slab stiffened by trans-

FIG. 31.

verse joints between the ribs. In short spans up to 60 feet the arched ribs are placed from 5 to 10 feet apart, and form the sole reinforcement of the slab. In spans exceeding 60 feet, the arch ring is stiffened intradosally as shown by Fig. 31. The longest span reinforced con-

BRIDGE CONSTRUCTION

crete bridge up to date was built under this system across the Vienne at Châtelleraut, France, in 1899. It has a centre span of 164 feet, and two side spans of 131 feet each, making a total length of 443 feet. The arch rings are about 19½ feet wide and carry a roadway platform 26¼ feet in width. It cost about \$35,000.

The "Melan" system employs a series of arched steel ribs placed parallel to each other, at intervals ranging from 2½ to 3½ feet apart. Their shape corresponds closely to that of the depth and profile of the arch ring, which is usually the only portion of the structure reinforced. In short spans the ribs are simply rolled I beams bent to the curve of the arch ring, but in the larger spans they are in the form of lattice steel arches. Perhaps the finest example of foot-bridge construction by this system is the bridge from Laurel Hill to the Ice

FIG. 32.

Glen, at Stockbridge, Mass., shown in Fig. 32. It has a span of 100 feet, is 7½ feet wide, and is reinforced with four parallel I beams bent to the curves of the arch, with their ends bolted to transverse angles in the abutments. Over 125 bridges, with spans ranging from 12 to 136 feet, have been built in the United States since the introduction of the system by Emperger in 1884. The credit for the most successful introduction of reinforced concrete bridges in the United States, however, belongs to Edwin Thacher, who was the first American engineer to design them according to the elastic theory or the law of flexure in solid arches. His system employs a series of flat steel bars in pairs, placed parallel to each other at proper distances apart. The top and bottom of each pair conform to the curve of the extrados and intrados respectively, and extend for some distance into the abutments or piers. The bars of each pair are not connected with each other, but are provided with rivet head projections spaced at close intervals, which are designed to increase the adhesion of the concrete to the steel. They act in a manner similar to the flanges of an imbedded beam and serve to assist the concrete to resist the thrusts and bending moments applied to the arch. A greater number of concrete steel bridges are built by the Thacher system in the

FIG. 33.

United States than by any of the others described. The most notable example is the Thacher Y bridge at Zanesville, Ohio, completed in 1901. It is built at the confluence of

the Muskingum and Licking rivers and has three branches which radiate from the triangular central pier to the three opposite banks. Two of the branches have three spans and the other, two spans, having a total length of 828 feet. The thickness of the arch ring at the crown varies from 18 inches for the short spans of 81 feet to 30 inches for the longer spans of 122 feet, with a width of 43 feet over the arches, and 42 feet between the walls of the parapets. See Fig. 33.

Other important examples are the Jacaguas bridge in Porto Rico and the Green and Goat Island bridges at Niagara Falls, N. Y. The former carries the military road from San Juan to Ponce, across the Jacaguas River at Juana Diaz. It has three spans—a central span of 120 feet and two side spans of 100 feet each, with a width of 20 feet. The Green and Goat Island bridges were constructed in 1900—one from the mainland to Green Island and the other from Green Island to Goat Island. The former, which is the larger of the two, consists of three spans, having a total length of 371 feet, and an over-all width of 44 feet, reinforced by 12 pairs of Thacher bars in each arch ring. It cost a little over \$102,000.

One of the latest systems of reinforcement employs a top and bottom row of corrugated steel bars, ranging from ½ to 1½ inches square placed longitudinally of the arch, and following the curves of the extrados and intrados respectively, with the corresponding bars of the two layers in the same vertical plane.

Increased reinforcement when necessary is obtained by doubling the number of extradosal bars, or by the introduction of transverse bars in each layer of longitudinal bars, so as to form a square-mesh network. The longitudinal bars are usually spaced from 5 to 8 inches apart, and the transverse bars 24 inches apart. In the Seely Street bridge over Prospect Avenue, in the borough of Brooklyn, New York city—a fine example of the method—additional reinforcement is obtained by stirrups of vertical tie bars, which are located at the intersections of the longitudinal and transverse bars, and connect the longitudinal bars of the extradosal and intradosal layers.

The use of reinforced concrete in the construction of bridges has proved so satisfactory that concrete steel spans of much greater length than those already built have been designed by several well-known engineers, of which perhaps the most interesting and instructive is one by William H. Burr, professor of civil engineering, Columbia University, for a memorial bridge across the Potomac at Washington, D. C. The design was submitted in competition with others at the request of the chief of engineers of the United States army and was awarded the first prize. It calls for a bridge proper composed of a centre-draw span of steel, 159 feet long, flanked on each side by three segmental arches of concrete steel, 192 feet long, with a rise of 29 feet. They are of the ribbed type, with exterior ribs of granite masonry, and interior ribs of concrete steel 30 inches deep at the crown, and 7 feet 3 inches deep at the springing lines.

The great value of reinforced concrete has not only been satisfactorily demonstrated in its application to bridge work, but also as a mate-

BRIDGE CONSTRUCTION

rial for many other forms of structures usually built of iron or steel and steel and masonry combined. It is well known that the average life of iron or steel railroad bridges is about 20 years at the most, while a great many deteriorate rapidly under the influence of heavy traffic, atmospheric conditions, and the effects from gases from the locomotives, and have to be replaced in a much shorter time; but, although they cannot compete in durability with masonry structures, the cheapness of iron and steel ren-

In designing any one of these forms of trusses the calculations may be grouped according to their application, to the web system composed of the upper and lower chords, the vertical and end posts, the suspenders and the main and counter diagonals; to the floor systems; and to the lateral bracing and sway bracing. It is not practicable to give in this article detailed descriptions of the various members composing those systems, but Fig. 34 is introduced to show the complete details of a 100 foot

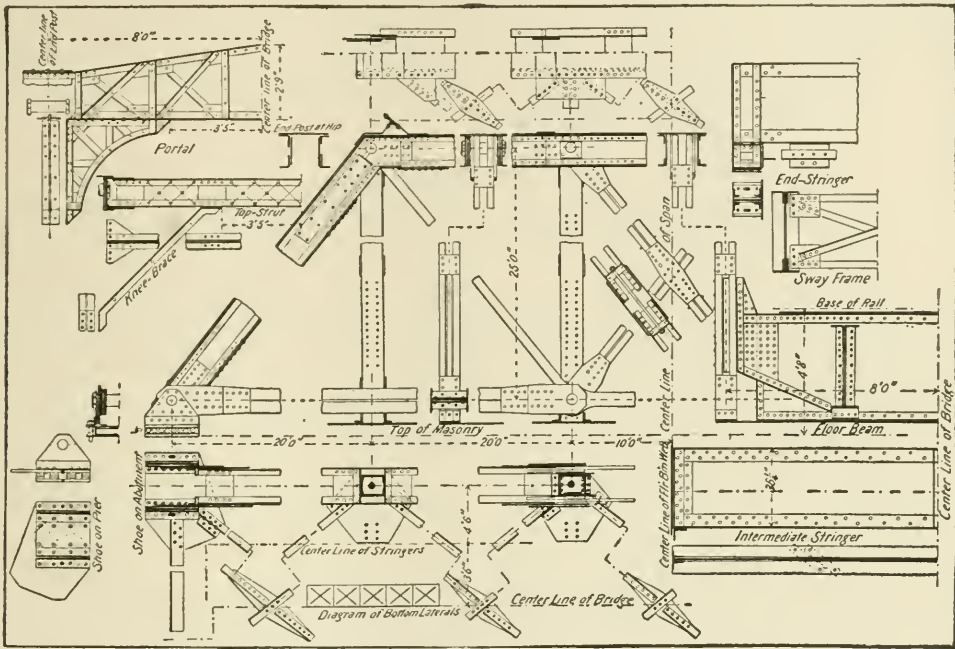

FIG. 34.

ders them more economical, while for bridges of long spans no other material is available. Many roads, however, are replacing their short span iron or steel bridges with arches of masonry or reinforced concrete, which is also applied extensively to the construction of culverts. For further information on the use of reinforced concrete for other purposes than that of bridges and culvert work, see articles on BUILDINGS, CONDUITS, DAMS, FOUNDATIONS, RESERVOIRS, and SEWERS.

According to the best specifications for standard American railroad bridges, the forms of metallic trusses most suitable for various spans may be generalized as follows: Plate-girders for spans ranging from 15 to 75 feet; riveted trusses for spans ranging from 75 to 120 feet; and pin-connected trusses for spans from 120 to 200 feet and over. Riveted trusses are usually of the Warren type, but for spans under 180 feet the pin-connected Pratt truss with inclined end posts is the most economical. As the span increases from 180 to 250 feet it is modified by curving the upper chord and takes the form of a single intersection truss. For longer spans ranging from 250 to 450 feet the newer simple truss bridges employ the Petit or the Baltimore trusses.

span pin-connected truss for a single track through bridge, and will serve to convey a very accurate idea of the design of such a structure.

"Draw bridges" may be classified as "swing bridges," "rolling bridges," and "lift bridges." Swing bridges are of the simple or double type and may be constructed of trusses or girders, so as to be wholly or partially continuous. The earlier forms had a tower over the central pier from which chains extended to the ends of the truss, or the platform. These ends rested freely upon the abutments so that a live load on one

end lifted the other, and the arrangement was entirely bad, approximating to that of the triangular truss shown in Fig. 35, and is now obsolete, while the modern swing bridges are of the

BRIDGE CONSTRUCTION

type shown in Fig. 36. In this design, when the bridge is fully loaded the position of the members (a b) is such that the members (b c) carry the greater part of the load to the turn-table, and insure a better distribution of the load thereon. They are generally known as "centre-bearing" or "rim-bearing," according to the method of supporting the turn-table on the centre pier. Fig. 37 shows the centre-bearing method where the entire weight is carried on the central pivot. It is applicable to short spans. Fig. 38 shows the rim-bearing method where the entire load is carried on a circular drum which moves upon a series of wheels or rollers arranged around the circumference of the turn-

FIG. 37.

FIG. 38.

table. As a general rule plate-girder swing bridges have a centre-bearing and truss bridges a rim-bearing, but the style of bearing is usually determined by the available vertical height under the bridge, or the distance from the base of the rail to the top of the pier. There is one serious objection, however, to a purely rim-bearing bridge, which has led to a great deal of thought relative to the proper distribution of the load upon the turn-table. In a purely rim-bearing turn-table no load is carried by the centre pin, and as the rollers, instead of moving in the proper circle get out of line constantly, the centre pin is subjected to more or less lateral displacement. This is partially obviated in the latest designs by so distributing the weight that a portion of it is carried by the centre pin, which not only relieves the weight on the rim, but assists in keeping the rollers in their proper place. Plate-girder swing bridges are the most suitable up to a length of 200 feet. They are stiffer under moving loads, simpler in construction, and more economical than lattice girders or pin-connected trusses.

The machinery employed for operating swing bridges consists of devices for raising and lowering the ends and for turning the bridge. The motive power may be supplied by steam or gas engines, or by electricity, but it is usually in the form of hand power. This power is expended in lifting the ends, in overcoming the inertia of the structure or putting it in motion, and in turning the bridge out of and into position. The simplest way to apply the power to turn a swing-bridge is to exert a pull on its ends by means of an attached rope, and it is a good auxiliary method to be kept for use at any time when the regular driving machinery happens to fail; but in the design of a bridge the operating machinery and the kind of motive power to be employed need to be considered only in connection with the space allowance necessary to house the motor and the attachments to the motor shaft. In general practice these conditions are very well satisfied; but, in the American swing-bridges, the end lifting arrangements are far from being satisfactory, and

it is quite exceptional to find one properly equipped for that purpose when it is closed. A truss acts as a beam, and to be able to determine its reactions by the application of the equations of the "Theorem of Three Moments," it is necessary that it should be supported rigidly at three points. It is obvious that this is not the case if the ends are not raised in the closed position, and entails the greatest difficulty in the determination of the stresses under varying temperatures, so much so that the ends may be thrown out of line to an extent sufficient to derail a train moving on to the bridge, and to

FIG. 39.

make the bridge dangerous at all times. The practice of lifting the ends by wedges as soon as the bridge is closed is objectionable on account of the resulting reactions under a dead load, and the only satisfactory arrangement appears to be the method of locking the ends by bolts or pins, so that no reactions are produced when the bridge is unloaded, or by the construction of double swing bridges as shown in Fig. 39.

"Cantilever bridges" were developed through the decisions resulting from the discussion of the merits and demerits of the continuous bridges built in Europe prior to 1870. It was noted that in a continuous bridge a slight variation in the height of one of the supports produced great changes in the strains and stresses, and that if the chords were cut near the inflection points for full loads those for partial loads would occur at those points also and thus render the reactions statically determinate. In 1860 Ritter proposed to avoid the disadvantages of continuity by cutting or hinging one chord of a three-span truss at its four inflection points, as shown by Fig. 40. His proposition involved

FIG. 40.

FIG. 41.

FIG. 42.

the fundamental principle of the modern cantilever, but the proposed truss was defective owing to its being cut at too many places. A three-span truss has four supports and consequently four reactions under a load. To determine these reactions four conditions are necessary. The principle of statics gives two—the sum of the vertical forces is zero, and that the sum of their moments about any centre is zero. The other two conditions may be established by hinging the chord in two places since the moment of each of the hinges is zero, so that the forms shown by Figs. 41 and 42 are made statically determinate relative to strains and stresses, and not subject to change by a slight change in one support. Furthermore, since their shear and moment diagrams, and that

BRIDGE CONSTRUCTION

of a continuous truss are the same, they preserve the advantages of continuity relative to the distribution of the strain possessed by the continuous truss system, while they eliminate its greatest disadvantages.

The practicability of building out long-span cantilever beams from the opposite banks of a stream until they connected at the middle point was first considered in connection with the principle of the suspension system, in which the truss is supported by cables and stays. Trow-bridge proposed to do away with the cables and depend altogether upon the stays for support; but, as it was impracticable to extend the stays conveniently and effectively to the middle of the centre span, he arranged to bridge the interval between the water ends of the anchor spans with a simple truss, as shown in Fig. 43.

FIG. 43.

In the practical application of the principle to the modern cantilever bridges the towers are supplanted by balanced anchor spans, the ends of which are connected by a simple truss. In the simplest form they consist of three spans, as shown in Fig. 44, with the anchor trusses supported at the piers on a single point; but

FIG. 44.

a better condition of reactions is obtained by supporting the trusses on the pier at two points, as shown in Fig. 45. The disadvantages of a continuous structure are thus avoided, and by omitting the diagonals in the panel over the pier the reactions at the points a and bc are ren-

FIG. 45.

dered positive for all loads on the cantilever arm.

The cantilever system is best adapted to long spans where the ratio of dead to live load is great, and is not economical for short spans where that ratio is small. For spans ranging from 500 to 1,500 feet it is as economical as the arch and the suspension bridges; but, for spans

FIG. 46.

exceeding 1,500 feet, it cannot be built as economically as the latter, notwithstanding the fact that the Forth bridge in Scotland, one of the most important of its kind, has spans of 1,700 feet, since many considerations relative to

the construction of the piers and the erection of the trusses lead to the conclusion that its selection was practically a mistake. In comparison with continuous structures, the cantilever system has the same advantages possessed by the former over a series of simple trusses of equal spans; that is, in the preservation of the uniform distribution of the moments, and the susceptibility of being erected, panel by panel, where false work is impracticable.

"Suspension bridges" are the type of structures best adapted for long spans. They were very economical when the ultimate strength of steel wire was 160,000 pounds per square inch, and the structures were dimensioned for a working load of 40,000 pounds per square inch, but now, since high grade steel wire having an ultimate tensile strength of 225,000 pounds per square inch is available for suspension cables, the economy and practicable spans of suspension bridges has been greatly increased, and several large structures rivaling those already constructed—notably the Brooklyn bridge, completed in 1883, which has a central span of 1,595 feet, and the Manhattan bridge, the second across the East River, completed in 1904, which has a central span of 1,600 feet, are in the course of erection, or being definitely planned, their economy and other superlative advantages for spans exceeding 1,500 feet, where false work cannot be used, being very clearly recognized. The most notable of the structures now being built or proposed are the third bridge across the East River, between the Brooklyn and Manhattan bridges, the tower foundations of which are already established, and a proposed bridge with a span of 3,200 feet across the Hudson River, to connect New York city with the Jersey shore. The modern improvements in the methods of construction are such that although the last named bridge will be more than twice the size of the Brooklyn bridge, which consumed 13 years of labor in its construction, it is estimated that the proposed structure could be built in about six years. Up to date only three suspension bridges have been completed and used for railroad traffic—the Niagara, the Brooklyn, and the Manhattan. The Niagara bridge, built in 1854, sustained the wear and tear of heavy railroad traffic for 43 years, its only fault being its large deflection which required slow speed in crossing. The others have proved entirely satisfactory for all the purposes for which they were designed. In the construction of a suspension bridge, see Fig. 46, the anchorages and towers are erected first, then the cables are swung between the towers over which they pass from the anchorages, then the vertical hanger rods are attached to the cables, and finally the stiffening truss which actually car-

ries the floor of the bridge is built out, panel by panel, from each tower and secured to the hangers. It is common practice to use a system of secondary cables called "stays," which extend from the top of the towers, and are at-

BRIDGE CONSTRUCTION

tached at intervals to the bottom of the stiffening truss out to a distance of one fourth the span, at which point their inclination is tangential to the main cables at the tops of the towers. These stays are superfluous members, as the stiffening trusses can be properly designed to sustain safely all the moments and shears to which they may be subjected, without the aid of the stays, and it is probable that they will be omitted in the structures of the future. As commonly employed, their purpose is to prevent oscillations in the truss under the effects of wind strain or unsymmetrical loads. The use of the stiffening truss may be briefly explained as follows: A suspended cable sustaining only its own weight assumes the curve known as the elastic catenary. In the case of a bridge the weight of the roadway and the live load is much greater than the weight of the cables and produces stresses and elongations which cause them to deflect from the theoretical curve, while additional deflections are produced by the sag of the cables, which increases or decreases with the rising or falling of temperature, and which together with the oscillations caused by wind and the application of unsymmetrical loads make the structures unstable to the point of actual destruction due to a lack of rigidity. It is the office of the stiffening truss to supply this rigidity, and to distribute the effects of partial loads uniformly over the cables. The stiffening truss is necessary only between the towers. In some bridges it extends from tower to tower without breaks in the chords, while in others the upper chord is cut at the middle of the span, or the chords are fitted with sliding joints at that point to allow for the effects of live loads and changes of temperature. Additional rigidity in the structure is obtained by giving the stiffening truss an upward camber in the form of a parabolic curve, the sustaining hangers being provided with sleeve nuts at their lower ends permitting them to be adjusted in length so that the tension upon them is equal under a uniform load. These hangers are all equal in size and are dimensioned to resist a tension equal to the maximum floor load applied to them. They are provided with eye-loops at the upper end, by which they are connected with a bolt to bands that encircle the cables. These cables, instead of hanging in vertical planes, as might be supposed, are "cradled"; that is, they are drawn together at the middle of the span, so that the distance between them at that point is less than at the towers, resulting in slightly decreasing the sag and giving an additional stiffness to the bridge against lateral oscillations, at the expense of only a very small percentage of increase in the stresses of the cable. On the tops of the towers the cables rest freely in movable saddles through which the strains due to loads on the main span are transmitted to the anchorages upon the slightest motion of the saddles on their rollers. See Fig. 47. As this motion cannot occur until the friction of the rollers has been overcome, the strain on the parts of the cables between the towers and the land is less than the strain on the parts between the towers themselves, when the main span only, is covered with a live load. The effect of the difference of the horizontal components of these strains on the tops of the towers is to pull them over toward each other.

To transmit these strains to the anchorages, see Fig. 48, the wires of the cables are passed around pins or terminated in sockets at (a), which are attached to a series of eye-bars, connected with the anchor plate (b), imbedded in the masonry of the anchorages. These eye-bars vary in their inclination until they become vertical at the plate, and are provided with special blocks of iron and stone at the connecting pins at the points of change in direction to resist the strains due to the angular deviation. The

FIG. 47.

FIG. 48.

stresses in the anchor bars decrease with the decrease of the inclination from the vertical, therefore the upward pull on the anchor plate is much less than the strain on the cables. The exact amount of this upward pull is difficult to determine, since the anchor bars are closely surrounded with masonry and concrete, so as to secure the greatest degree of stability and to protect them from corrosion, and are therefore unreachable; but it is supposed that the variation in stress is similar to that occurring in a belt passing around a portion of a pulley. Relative to methods of cable connections, it has been proposed to connect the cables directly to terminal sockets on the water sides of the towers and to connect the back stays in a similar manner to their land sides. The special advantages of the method, however, have never been practically determined.

Many novel methods have also been suggested for stiffening the cables. A system of trussing by which the cables are connected with the roadway has been used to some extent in short span bridges. In such cases, however, it has been found more practicable to make the cables of links or eye-bars, therefore the structures cannot be considered true suspension bridges. Another method provides for a main span hinged at several points, thus converting it into a two-hinged arch if hinged at (a) and (b); into a three-hinged arch if hinged at (a), (c), and (b), and into a cantilever bridge if the system of hinges is applied to the land spans also. See Fig. 49. Two other methods may

FIG. 49.

be mentioned, although in both cases the structures are inverted arches. Fig. 50 shows a cable trussed on its upper side by bracing which connects it with two straight chords extending from the tops of the towers to the middle of the span. Fig. 51 shows two parallel cables or wire link chains, connected by a system of bracing. This method has been embodied in a plan for the bridge across the Hudson River, which has already been mentioned as one of the great proposed suspension bridges to be built in the near future. It is an open question as to whether the braced cable or the unstiffened

BRIDGE CONSTRUCTION

cable system is the more advantageous for long span bridges. Trussing the cables undoubtedly possesses the advantages due to an increase in the stiffness of the structure under a live load, and the reduction in weight of the roadway trusses; but, since they are actually inverted arches, they possess such elements of uncertainty and complexity due to temperature conditions and live load that they do not appear to be a step in the right direction in the construction of long span bridges.

Fig. 50.

Fig. 51.

“Metallic arch bridges” may be grouped into three principal classes, according to their mode of support or the number of hinges in each truss. (1) Two-hinged arches, with a hinge at each abutment, and continuous throughout; (2) three-hinged arches, with a hinge at each abutment and one at the crown; and (3) continuous arches with the ends fixed rigidly to the abutments. One-hinged arches with the hinge at the crown have been built, but are obsolete on account of their theoretic disadvantages. The simplest and most efficient type is the three-hinged arch, usually composed of a horizontal upper chord, which is united to a curved or broken lower chord by vertical and diagonal bracing, and when thus connected it is designated as “spandrel-braced,” and the hinge at the crown is placed in the lower chord, and the floor system is supported directly by the upper chord at the panel points. See Fig. 52. The arch ribs are either metallic built-up girders

Fig. 52.

with solid webs, or with diagonal bracing connecting the flanges. The relative merits of the three types may be briefly stated as follows, together with a reference to one or more of the most notable structures of each type:

In the two-hinged arches the strains and stresses cannot be determined except by taking into account the deformation of the material which is always supposed to occur within the elastic limit; therefore they possess all the disadvantages of continuous structures, and although they require the most careful work in their construction, it is impossible to predict their degree of security under the action of loads that may develop stresses exceeding the

elastic limit of the material. On the other hand, they have a reduced deflection at the crown; their deformation due to temperature is less, and being stiffer than the three-hinged arch, are better adapted than the latter for long spans designed to sustain heavy railroad traffic. The largest two-hinged arches with solid webs ever built are those of the Washington bridge over the Harlem River at New York city, completed in 1889. They have a clear span of 510 feet and a clear rise of 92 feet. The largest steel trussed two-hinged arch in this country is that of the structure which replaced the Niagara Falls and Clifton suspension bridge in 1898. It has a clear span of 840 feet, and a clear rise of 150 feet. The largest arch of this type abroad is that of the Garabit viaduct in France, which has a span of 541 feet and a rise of 213 feet.

Practically all of the remarks applied to the two-hinged arches also apply to arches with fixed ends. The finest example of this type is the Saint Louis bridge, over the Mississippi River, completed in 1874. Its central arch has a clear span of 520 feet and a rise of 47 feet, while the adjacent arches have a span of 520 feet and a rise of 44 feet.

The three-hinged arches are statically determinate structures, in which the reactions and stresses due to any loading can be found without any assumption derived from the theory of elasticity, as exactly as those of a simple beam or truss. Subject to more deflection and deformation, and therefore not as stiff as are the other types, it is unsuitable for heavy railroad traffic, but is eminently satisfactory for highway bridges, and the roofs of train sheds and exposition buildings, where the span is too great for the economical employment of simple roof trusses. The largest arches of this type ever constructed were those of the Liberal Arts Building, at the Columbian Exposition at Chicago, in 1893.

The latest important addition to the list of metallic arch bridges is the structure just completed across the Zambesi, in central Africa, on the line of the proposed Cape to Cairo railroad. It is situated at a short distance below the famous Victoria Falls, and consists of a combination girder and arch, three-span structure, of a total length of 650 feet, the central arch of which has a span of 500 feet, and carries the roadway at a height of 420 feet above the level of the water. All the material was shipped from England and the structure was built in a year.

BRIDGE DESIGNS

Bridge Designs, Railway. Bridges have been in use from prehistoric times. Even the scientific forms, now looked upon as most modern, were developed in a crude way by the ancients, timber cantilever structures being built by the Chinese in the time of Confucius.

Bridge design, of necessity, continued in an elementary stage as long as timber and masonry were the only materials in use, and long spans were impracticable with such materials, though the "Towne" lattice spans, built entirely of plank connected with hard wood pins, were as nearly perfect as was possible without the use of iron, and some of these spans are still doing effective duty after 80 years of continued use.

The earliest use of iron in bridges began with the use of cast-iron posts and cast-iron arches, but this material was not found entirely satisfactory for long-span bridges. The first real development began with the use of wrought-iron, which was first used in this country in vertical tension members in the "Howe" truss about 1840, and in inclined tension members in the "Pratt" truss about 1845. The use of wrought-iron tension members with wood and cast-iron compression members continued until about 1860, when Howard Carroll, an Irish engineer, assistant to Chief Engineer Gray, of the New York Central, introduced the riveted lattice bridge, built entirely of wrought-iron, which was developed by his successors on that road, and used until very recent years. Wrought-iron plate girders were also first built about 1860.

J. H. Linville, between 1850 and 1860, introduced on the Pennsylvania Railroad a type of truss with flat diagonals and hexagonal rolled-iron posts, and about this same time Bollman and Fink introduced on the Baltimore & Ohio their multiple suspension types of trusses with flat diagonals and vertical iron posts. John W. Murphy adopted Whipple's ideas and developed a truss on Whipple's lines with cast-iron posts and square bar tension members with loop eyes.

A long step in the evolution of properly designed compression members was made by David Reeves about 1864, when he began the use of the rolled iron, round segmental "Phoenix" column, and about that date he also developed the hydraulic upset-end on tension members, which were made by the Phoenix Iron Company, first on round rods and afterwards developed into eyes on flat bars, and these two features were combined in the "Phoenix" bridge, which was far in advance of any bridge construction at that date, and quickly came into very general use. While it still preserved the use of cast-iron for connections, it permanently did away with any further use of cast-iron for compression members, and its simplicity and ease of erection made it by far the best type developed up to that time. Many of these bridges are still in use, and those that have been replaced have generally been removed on account of the great increase of rolling loads to be carried, and not on account of inherent defects in the design.

With the use of "eye bars" the pin-connected type of truss came into practically universal use in this country, since it had great advantages over riveted bridges in many respects; but owing to its ease of erection, it

was in many cases carried to ridiculous extremes, and spans as small as 25 and 30 feet were constructed with individual members so light and insignificant that the structure had no rigidity. In recent years there has been a very general disuse of this type of construction for spans under 150 feet, and the best engineering practice now calls for riveted structures for small spans, though American engineers still use the pin-connected type for long spans almost universally.

The general principles of railroad bridge construction have not undergone much change in the last 20 years, as practically all spans are built on the general lines of the "Pratt" truss, with vertical compression members and inclined tension members, or on the lines of the "Warren" truss, with all main web members inclined, but the constantly increasing weight of the locomotives in use has tended to the use of heavier and more rigid structures with long panels and as few members as possible, more substantial details, solid floors, stiff lateral and vibration bracing, and other features of present engineering practice, which reduce vibration and add to the rigidity of the structure.

The rapidly increasing capacity of American bridge building shops and their ability to fabricate and handle single members of sizes impossible to obtain a few years ago, has enabled the American engineer to design bridges with practically no shop limitations, and he has thus been free to make designs solely with the idea of producing a structure with the maximum strength and rigidity and the minimum weight of material.

The rapid advance thus brought about would have been impossible had not the ingenuity of the erecting engineer kept pace with that of the designing engineer, but this specialty of erection has reached such an advanced stage that spans of 1,800 feet, with single members weighing 120 tons, are now erected as rapidly as any smaller span.

One of the recent tendencies of American practice has been to substitute plate girder spans for all short bridges, in place of the various types of lattice girders and pin-connected spans heretofore in general use, and very few engineers use any type of steel structure except a plate girder for spans under 90 or 100 feet. Some engineers prefer this type for spans as long as 125 feet. To summarize general practice, it can be said that this type of span is used for spans from 20 to 100 feet, spans under 20 feet being either arches or rolled beams, and spans over 100 feet running into riveted trusses. Plate girders are frequently built with solid floors, with the ties bedded in ballast, and the latest floors of this kind are built of reinforced concrete slabs or arches, as the older trough floors and buckle plate floors have been found unsatisfactory, owing to the impossibility of preventing rapid deterioration from rust. Plate girder spans over 70 feet long generally rest on pin bearings at each end, to allow for deflection, and have cast-steel end shoes.

The usual present practice is to build all spans between 100 feet and 175 feet with riveted trusses, and the old style, multiple-intersection, riveted span has entirely given way to the riveted, single-intersection truss with long panels. For deck spans, the old practice of supporting the ties directly on the upper

BRIDGES, RAILWAY.

4. 820-foot Proposed Arch for Henry Hudson Bridge over Harlem River, New York City.

chord has largely disappeared, and either a solid ballasted floor is used, or a regular floor system is laid, consisting of cross floor beams resting on the upper chords, and longitudinal stringers framed between floor beams.

For through spans the ordinary practice is to use a floor system with cross floor beams riveted in between the vertical posts and longitudinal stringers riveted between the floor beams, but in many cases a solid ballasted floor is used, in which case the lower chords are reinforced against bending by supporting them at their middle points from a sub-panel in the truss, or by making deep lower chords capable of withstanding the bending in addition to the direct stress. Fig. 3 shows a 135-foot double track through span with solid floor built with deep lower chord sections.

Spans over 175 feet are usually built with pin connections and, where the span is long, the upper chord is generally curved so as to give a maximum depth at the centre, and truss depths are proportioned so as to give a practically uniform upper chord section throughout. Upper and lower laterals and transverse bracing are now universally built of riveted members, and the older form of tension rods used for purposes of wind and vibration bracing has entirely disappeared. Simple truss spans of this character have been built to a maximum length of 550 feet, which is the length of the channel span over the Ohio River at Louisville, Ky., this being the longest span of its kind in the world, though the 675-foot suspended span of the Quebec cantilever bridge, now under construction, will largely exceed this.

Such spans could and would be built of much greater length if it were not for the fact that in navigable rivers of a magnitude requiring such spans, the government will not allow the waterway to be even temporarily obstructed with falsework, so that for long spans it is more economical to use a cantilever or some other type of structure that can be erected without placing any obstruction in the main channel.

In draw spans, the recent changes in practice have been in the same direction as for through spans, as far as the trusses, floor and bracing are concerned. The practice of counter-bracing the trusses by means of diagonal counter rods has been abandoned, and stiff riveted diagonals are used, capable of carrying either tension or compression where reverse stresses occur. For draw spans of short span or in cities or other situations where there is not plenty of room for a swing bridge, the "rolling lift" bridge has been adopted and has proved most efficient. For long draw spans, the centre pier revolving span is still the type in common use, and for spans up to 400 feet a central pivot bearing is generally used. For spans over 400 feet a rim-bearing turntable drum rolling on a circle of conical, cast-steel wheels has been found most satisfactory, and for very heavy spans two concentric drums and circles of wheels are used.

The use of steam as an operating power for swing bridges has almost disappeared, being replaced by electric motors, which are more economical and do away with many difficulties encountered in the use of steam engines and their boilers.

Fig. 2 shows the 415-foot draw span of the Central Bridge, carrying Seventh Avenue over the Harlem River in New York City, together with the lattice girder approach spans thereto.

The metal arch bridge is a type of structure developed almost wholly in recent years, and there are various modifications of this type, some being built as spandrel arches, in which the web members connect a horizontal top chord with an arched lower chord, having the floor system supported on the top chord or framed in between vertical posts at the top chord level, while others are built as braced ribs, having both chords arched and connected together with the web members, and the floor supported on vertical posts resting on the braced rib at panel points. Each of these types of arch spans is further varied by being built by some engineers with two pin bearings at the two supports, and by others with the addition of a third pin bearing at the crown. It is contended by the advocates of two hinges that the omission of the centre hinge adds considerably to the rigidity of the span, but it has not yet been conclusively demonstrated that the third hinge adds appreciably to the vibration, and this third hinge disposes of the great uncertainty of temperature stresses, and allows the exact calculation of the true stresses and sections by static methods, so that it has considerable advantage and is more in use than the two-hinged type. Many long spans have been built of this type, the longest span being the upper span over the Niagara River, which is a braced rib arch of 840 feet span.

Fig. 4 shows the proposed Henry Hudson Memorial Bridge over the Harlem River in New York City, with a steel arch span of 820 feet.

Suspension bridge design has not been changed as much as other types in recent years, owing perhaps to the fact that this type has not been adopted to any extent for railroad bridges on account of its flexibility, for while a flexible cable can be made sufficiently stiff for comparatively light highway loads, it would require so much material in the stiffening trusses to satisfactorily provide for heavy railroad moving loads that some other type of structure would prove more economical. However, in the few spans of this type which have been recently built, there have been some radical improvements over older designs. The stiffening trusses have been greatly increased in depth and strength, and rocking steel towers with the cables made fast to the top have taken the place of rigid towers with the cables supported on rolling shoes over the top. The three large suspension bridges over the East River between New York and Brooklyn are excellent types of the evolution of this form of structure, and, while the Williamsburg Bridge is the longest span of its kind in existence, having a span of 1,600 feet, the Manhattan Bridge, now being built, is the most modern span.

The cantilever bridge has come into very general use in recent years, not because of the economy in metal required, as this type weighs more than a simple truss or an arch of equal span, but because of the great advantage that it can be erected without putting falsework in the main channel. Since the government now prohibits even temporary interference with nav-

BRIDGE DESIGNS

igation, it has made this type practically mandatory for long spans, as, if any other type is adopted, the span must be erected with additional material, causing it to act temporarily as a cantilever, and this additional erection material overbalances the saving of any type adopted. When the erection is considered, therefore, it has been found that the cantilever is the most economical of all types for long spans, and while some engineers claim that a suspension bridge is cheaper for very long spans, it is certain that equal rigidity cannot be obtained for equal cost by using a suspension bridge on a span of less than 1,500 feet, and even considerably above this span the cantilever will in all probability prove the most economical. For this reason the cantilever has practically become the standard type for all long spans, and several very notable bridges of this kind have recently been completed and are now under construction. The cantilever over the Saint Lawrence River at Quebec, having a span of 1,800 feet, is the longest span of any kind in the world.

Cantilever bridges are comparatively new, but even in the few years in which they have been in use they have been greatly improved in their general arrangement, details, and erection devices. The capacity of the bridge shops to manufacture eye bars as large as 16 inches X 2 inches and 83 feet long, centre to centre of eyes, with pin holes 13 inches in diameter, and heads as large as 36 inches in diameter, as well as to build and ship single compression members weighing 100 tons, together with the ability of the erecting gangs to put these huge pieces in place with moving travelers, has given the designing engineer practically unlimited opportunities, and has brought about the construction of several very large spans of this type in the last two years, notably the 1,800-foot span at Quebec, the 1,182-foot span at Blackwell's Island, N. Y., and the 812-foot span over the Monongahela River at Pittsburgh, Pa. The first two bridges are not yet completed, but the Pittsburgh cantilever is shown in Fig. 1.

Stone arch bridges are an excellent type for short spans, where the owners can afford the first cost, as the repairs are practically nothing, but this type has not changed in recent years, though in the modified form of the reinforced concrete arch it is being introduced quite generally for ornamental bridges in parks and cities where the æsthetic requirements are more important than economy, and it is an excellent type for this use, but cannot be economically used for long spans carrying heavy loads.

The many wide navigable rivers in this country have given the American bridge engineer unequalled opportunities to show his ability in the design, construction and erection of long spans, and that he has made good use of these opportunities is proved by the fact that the longest span of every type of bridge has been, or is being, constructed by American bridge engineers. In all probability the maximum length of spans has not yet been reached, as it has been proved to be practical to build spans up to 1,800-feet, and there is nothing to prevent the construction of much longer spans, if they are found to be paying investments.

The following is a partial list of the largest spans of various types of steel bridges now built or building:

TRUSS SPANS.

- 675 feet — Suspended span of the Cantilever over the St. Lawrence River at Quebec, Can.
- 630 feet — Fixed span of the Blackwells Island Cantilever, New York City.
- 621 feet — Fixed span of the Cantilever over the Mississippi River at Memphis, Tenn.
- 550 feet — Span over the Ohio River at Louisville, Ky.
- 548 feet — Span over the Ohio River at Cincinnati, Ohio.
- 535 feet — Span over the Delaware River near Philadelphia, Pa.

DRAW SPANS.

- 520 feet — Draw over the Missouri River at Omaha, Neb.
- 503 feet — Draw over the Thames River at New London, Conn.
- 491 feet — Draw over the St. Louis River at Duluth, Minn.
- 415 feet — Draw over the Harlem River, New York.

ARCHES.

- 840 feet — Arch over Niagara River at Niagara Falls, N. Y.
- 721 feet — Arch over Viaur River, France.
- 614 feet — Arch over Rhine at Bonn, Germany.
- 595 feet — Arch over Rhine at Dusseldorf, Germany.
- 591 feet — Arch Kaiser Wilhelm Bridge over Wuppur River, Mungsten, Germany.
- 550 feet — Arch over Niagara River at Niagara Falls.
- 541 feet — Arch Garabit Viaduct over Truyere River, France.

CANTILEVERS.

- 1800 feet — Cantilever over St. Lawrence River at Quebec, Can.
- 1710 feet — Cantilever over Firth of Fourth, Scotland.
- 1182 feet — Cantilever over Blackwells Island Channel, New York City.
- 820 feet — Cantilever, Lansdown Bridge, India.
- 812 feet — Cantilever over Monongahela River, Pittsburgh, Pa.
- 790 feet — Cantilever over Mississippi River at Memphis, Tenn.

SUSPENSION BRIDGES.

- 1600 feet — Span of Williamsburg Bridge, New York City.
- 1595 feet — Span of Brooklyn Bridge, New York City.
- 1470 feet — Span of Manhattan Bridge, New York City.

The three first mentioned truss spans are parts of large cantilever structures, so that the longest independent truss span is the 550-foot span over the Ohio river at Louisville.

The Viaur Arch in France is not a true arch, as it is a combination of an arch over the central opening, counterbalanced by two semi-arches extending back over each of the shores.

The Arch spans over the Rhine at Bonn and Dusseldorf, are through spans with the floor suspended from the arch ribs, while all the other arches are deck structures with the floor above the crown of the arch.

This list might be indefinitely extended and many structures might be added which are notable for particular features, such as the extremely flat arch of the Alexander III bridge in Paris, having a span of 362 feet with a rise of less than 10 feet. Many viaducts might also be added, which are notable not from any great length of spans, but from the extreme heights above the gorges they cross. The greatest of these is the Gokteik Viaduct in Burmah, where the track is 825 feet above bottom of gorge.

HENRY W. HODGE,
Consulting Engineer, New York.

Bridge Foundations. See FOUNDATIONS.

Bridge Shops and Shop Practice. The working plant of a bridge company is composed of several shops and departments so arranged in their relation to each other, that the movement of the material handled by them is continuous and in one direction—the rough material entering at one end of the plant and passing out as a finished product at the other. This arrangement insures the reduction to a minimum the time lost in handling, and also the greatest possible economy in the cost of production.

Each of these shops is under the immediate charge of a foreman or superintendent who reports daily to the general superintendent or manager of the plant, who makes out the programme of work, and prescribes the dates upon which the different pieces of work are expected to be completed, the desideratum being to keep the various shops continually working, and to complete the various parts of the bridges in the order in which they are required at the place of erection.

The buildings of the various shops are usually of fireproof construction and conform to the requirements of larger size, good lighting, heating, and ventilation. They are connected by narrow-gauge railway tracks, which run lengthwise through them so as to facilitate the transportation of the material from one part of the works to another with the least amount of handling. Ample yard-room is provided at the ends of the buildings and also around them for the storage of partially completed material awaiting their turn for the finishing touches before shipment. These yards are usually laid out so that the carrying distance is as short as possible, and the work of carrying is accomplished by overhead traveling cranes.

These shops may be designated and described as follows:

(1) "Power Plant," consisting of large batteries of boilers for generating steam, and engines for driving the dynamos through which power and light are furnished to all parts of the works, and other engines for operating the air-compressors which furnish the power for the portable pneumatic drills, riveters, hammers, and reamers, and also the compressed air used for the draft of rivet furnaces, and blacksmith forges; for the cleaning of finished material, and for painting them by means of spraying devices.

In some cases, the hydraulic pumps and accumulators which supply the water to the hydraulic presses and riveters are also located in the buildings of the power plant, all the machinery of which is installed in duplicate so that in case of an accident it would not necessitate the shutting down of the entire plant during the time consumed in making repairs.

Although the first cost of a centralized power plant is comparatively high, its advantages over that of a scattered system may be briefly summed up as follows: Cheap grades of fuel may be used under the boilers, and mechanical stokers may be employed and thus reduce the number of firemen required by the several boilers of the scattered plants. The number of engine attendants is also greatly reduced, their places being filled by a few electricians to keep the wiring and motors in working condition. The power may be transmitted to every part of the plant with the smallest amount of loss.

(2) "Receiving Yard," where the material for each bridge is properly selected, classified, and stored.

(3) "Straightening Department," where the irregularities in the material, due to the shortcomings of the rolling mill processes, are corrected by more accurate methods. The buckles in the plates, and the deviations from true alignment in the plates are eradicated by passing them through a series of rolls usually consisting of six sets. These rolls are so arranged that the vertical distance between them can be made less at one end than at the other, so that by passing a plate through them several times, it can be stretched unequally and any imperfections in the alignment of its edges thus corrected. Beams, channels, Z-bars, and other odd shapes are best straightened by the application of local pressure to the parts out of line either by screw presses, or by the action of a plunger operated by a power-driven cam. Badly sprung shapes and plates may be straightened by being hammered cold, or after being heated; it is, however, very destructive to the material and should be employed only as a last resort.

(4) "Templet and Pattern Shop," in which the templets for striking the positions of the rivet and pin holes, and the mold patterns for iron and steel castings are made.

A templet is a board or framework of boards, one side of which is an exact representation of one of the sides of the metal shape or piece required to be made. On it, the positions for all the rivet holes, pin holes, bevells and notches are accurately marked, and these are subsequently transferred to the metal piece by punching, scratching or other means, preparatory to the final operations of punching, boring, drilling, reaming, shearing, etc. Templets are usually made of soft white pine boards $\frac{7}{8}$ inch in thickness. When very accurate fitting is required, they are laid out full size on the floor of the shop; but, for small and general work, they are made in separate pieces from the detail drawings. As a rule, as many parts as possible of a structure are designed to be in duplicate so that the number of templets required will be as small as possible, and the final fitting and assembling of the work facilitated and simplified.

(5) "Laying-out Shop," where each individual metal shape, plate, and piece is accurately marked in accordance with the templets.

(6) "Punch and Shear Shop," where the various plates, shapes and pieces are sheared or cut to the required length and bevel, and the holes marked from the templets are punched by suitable machines. See article under title METAL WORKING MACHINERY in this encyclopedia.

When the thickness of the pieces is greater than the diameter of the punch, punching will unduly strain the material, and the holes will not be straight and smooth. The holes in such plates and shapes are usually drilled, although the process is much slower and more expensive. Single and gang drills are used for this purpose.

Wrought iron and soft and medium steel when of the proper thickness may be easily punched; but, hard steel must always be drilled as it cannot be punched without cracking.

Since the diameters of the edges of a

BRIDGE SHOPS AND SHOP PRACTICE

punched hole corresponds to the diameters of the punch and die respectively, and gives the hole a tapering instead of a cylindrical form, the usual practice is to require all holes, and especially those in the tension members to be reamed to a diameter $\frac{1}{8}$ inch larger than that of the punch, so as to remove all of the material injured by the process of punching.

After passing through this shop, all the material is completely ready to be fitted together and riveted to form the final bridge members for which they were designed to form a part. Each piece when completed is marked with a number or letter designating its proper position in the finished member, and all the pieces belonging to the same structure are marked by a job number so that they may be easily identified in the assembling shop.

(7) "The Assembling Shop." This is usually arranged so that all the heavy work is handled on one side, and the small work on the other. All the different pieces which make up the various members are assembled, fitted and bolted together, and then turned over to the

(8) "Riveting Shop" where the riveting is accomplished by various forms of compressed-air, steam and hydraulic riveters.

When the member exceeds ten tons in weight, it is more economical to use portable riveters than stationary riveting machines. As a rule, hydraulic riveters are the most efficient. They do not get out of order easily, and always exert their full pressure upon the rivets; but, in their portable form they are very cumbersome, and therefore, the pneumatic portable riveters are found to be the most convenient in such cases.

Rivets are made of soft steel, and their lengths ought to be such that when put into the holes they will project enough to furnish a sufficient amount of metal to fill the holes completely when they are compressed. Before insertion they are heated to a cherry red, great care being taken, however, not to burn the metal in the heating, and thereby render them hard and brittle. On the other hand, if driven when they are too cold they will not fill the holes completely, and although apparently all right will be weak in the head. All rivet heads ought to be smooth and free from cracks, and concentric with their holes.

(9) "The Machine Shop" is equipped with an endless variety of metal working machines such as planes, borers and turning machines, etc., which are employed to finish the bearing surfaces of the riveted members, and other parts which are used in their construction such as pins, rollers, beds and sole plates, anchor bolts and the various bearing parts of turntables.

The material for the pins and rollers as usually received from the mills has a diameter $\frac{1}{8}$ inch greater than that of the finished pins, and has to be turned down to the required size and the threads cut on the ends for the pin nuts. The planers are employed to smooth off the faces of the bed and sole plates of the expansion joints.

(10) "The Forge Shop" is equipped to turn out three classes of work—the manufacture of rivets, the general smith work required in a steel structure, and the forging of eye-bars.

The soft-steel bars of which the rivets are

made are first heated and then passed into the rivet making machine where they are upset, headed and cut into the required length at one operation. The rivets most generally employed in structural work range from $\frac{3}{4}$ to $\frac{7}{8}$ inch in diameter.

The operations designated as general smith work consist of the bending of plates, shapes and angles in accordance with the requirements of the drawings, the upsetting of the ends of adjustable tension members, the making of clevises and loop eye-rods, and all forgings such as punches, drift pins, and riveting cups that may be needed by the plant.

All the large tension members of pin-connected structures are made in this shop. The steel flats from which these eye-bars are made are handled as follows: About four feet of one end of the bar is heated to a cherry red in the forge and then placed in the up-setting machine which forms a solid head very nearly the size of the finished head. It is then reheated and placed in the die of the steam hammer and hammered out to the proper size and thickness, and a hole punched in the centre of the head to facilitate the finish boring. A careful watch is kept for flaws, and all of those discovered are cut out since they prevent a perfect weld, and are, no matter how small, a source of weakness in the bar. The head on the other end of the bar is formed in a similar manner. A number of bars are then placed in the annealing furnace and brought gradually to a cherry red temperature, after which they are allowed to cool gradually so as to remove local stresses that might have been induced by the processes employed in upsetting and forging the head. The exactitude required in this work is indicated by Cooper's Specifications, 1901, according to which, Chord pins are required to fit the pin holes within $\frac{1}{50}$ of an inch for pins less than $4\frac{1}{2}$ inches diameter; while for larger pins, the clearance may be $\frac{1}{32}$ of an inch. It is also required that the bars must be bored to lengths within $\frac{1}{32}$ of an inch for each 25 feet of the total length.

(11) "The Painting and Shipping Department" consists of sheds and yards where the material after being inspected and stamped is painted and prepared for shipment.

There are many different kinds of paint employed for this purpose consisting of compounds with mineral, asphaltum, and graphite bases; but, the shop painting required by the usual specifications is one coat of boiled linseed oil which after drying makes a first class base for the final painting in the field after erection. The best method of applying the paint is by the hand with a brush. Spray painting by means of compressed-air has the advantage of greater rapidity, but it is quite wasteful, and unless very carefully done, will not distribute the paint evenly.

After leaving the shops, and before shipment, the material is carefully examined in detail to see that it conforms in every particular to the drawings and specifications, by the inspectors of both the bridge company and the purchaser. A large percentage of this work is done by inspection companies. These companies employ a large number of inspectors who are sent from one place to another to examine the work on hand. The inspection companies bid for the

BRIDGE OF ALLAN—BRIDGEPORT

inspection work at so much per ton of material. Although these companies usually keep a permanent inspector at the works of a large bridge concern, and are therefore able to greatly reduce the cost of inspection to the purchaser, the system is subject to many objections, the principal one being the fact that the actual inspector is personally unknown to the purchaser. The exceedingly satisfactory services rendered by these companies, however, is clearly demonstrated by the large amount of work handled by them, and their high professional reputation.

The general method of inspection may be briefly stated as follows: When the inspector of the purchaser arrives at the works of the bridge company, he is furnished with a set of the plans and drawings of the bridges to be inspected, and starts in at once to familiarize himself with the shops and working methods of that particular plant. He then ascertains the rolling mills from which the rough material for the structures will be obtained, and begins the work of actual inspection at that point. All the material is carefully examined for flaws and surface defects, and tested for strength, and when found satisfactory is stamped by him with a hammer, and then forwarded to the works of the bridge company. Subsequently, he keeps a general oversight of the material as it passes through the various shops and departments of the bridge works until it has passed out of them and is ready for the final examination.

For methods of testing see article under title **TESTING MACHINE** in this encyclopedia.

WILLIAM MOREY, JR., C. E.,
*Consulting Civil and Mechanical Engineer,
New York.*

Bridge of Allan, a town of Scotland, in Stirlingshire, on the border of Perthshire, on the banks of the Allan, about three miles north of Stirling, with which it is connected by the Caledonian Railway and a line of tramway cars. Owing to the mildness of its climate and the beauty of its situation, Bridge of Allan is a favorite spring and summer resort for invalids. It is built partly on a plateau of considerable height and partly on low ground on the banks of the river, and is finely laid out with trees and public walks. It is frequented partly on account of its mineral wells.

Bridge of Sighs, a bridge in Venice, dating back to 1597. It spans the Rio della Paglia, connects the ducal palace with the prisons, and forms a graceful structure 32 feet above the water, enclosed at the sides and arched overhead. It contains two passages, through which prisoners were led for trial, judgment, or punishment.

Bridgeport, Conn., a city, port of entry, and county-seat of Fairfield County, on Long Island Sound, and on the New York, N. H. & H. R.R.; 18 miles southwest of New Haven, and 58 miles northeast of New York. It is the third city in the State. The city and town are conterminous, and about 15 square miles in area. Pop. (1900) 70,996.

Bridgeport harbor is the estuary of a small tidal river, the Pequonock, and a tidal inlet called Pembroke Lake, with a peninsula between them on which East Bridgeport, the chief manufacturing section, is built. Below the junction the harbor is about two miles long to the Sound,

and a mile wide. The main city lies along the west side to its mouth, the business centre opposite the peninsula; the shore is a plain, rising on the west to an elevation of about 70 feet called Golden Hill, the finest residence section, and commanding a beautiful view of the Sound and city. Down the Sound about three miles is the suburb of Black Rock, a favorite summer resort, with its island-guarded harbor, a great yachting rendezvous. There are three handsome parks, about 250 acres in all: Beardsley, left in great measure to its wild state, and the more charming therefor; Washington, and Seaside, of some 75 acres, on the shore west of the harbor, with a sea-wall and a two-mile drive, and monuments to the soldiers and sailors of the War, and to Elias Howe and P. T. Barnum, the sewing-machine of the one and the business enterprise of the other having largely developed the city. Of the cemeteries, the finest is Mountain Grove, of some 75 acres, near the western boundary; others are Lakeview, in east Bridgeport, and Park, in North Bridgeport. There are also two Roman Catholic cemeteries. The most notable public buildings are the government building, with the post-office and custom-house; the county court-house; the Barnum Memorial Institute, bequeathed to the Historical Society and the Scientific Society in common; the Young Men's Christian Association and the Burroughs Library buildings. Very interesting is the Barnum & Bailey circus in its winter home.

Bridgeport, like all the cities of western Connecticut, is primarily an immense gathering of the manufacturing departments of New York salesrooms; but many of them started as local Bridgeport institutions, and have remained identified with the city. These establishments are multiplying with great rapidity. By the census of 1900, there were 832, employing 20,462 workmen and supervisors, using \$33,066,890 capital, paying \$10,622,558 in wages and salaries, \$9,133,236 for materials, and turning out \$37,883,721 in products. Of these, no figures are given for the two most noted products, sewing-machines and ammunition, from their being concentrated in two or three establishments, mainly the Wheeler & Wilson Company with its 10 acres of works, and the Union Metallic Cartridge Company; but \$4,147,452 was brass castings, \$3,224,198 corsets, \$2,412,796 foundry and machine-shop products, \$1,007,244 hardware, cutlery and edge tools, \$633,577 rubber goods, \$366,585 carriages and wagons. Other products are steel bridges, ordnance and firearms, monumental bronze, bicycles, wire, velvet and plush, silk, belting, undertakers' goods, ice, fur goods, lamps, leather goods, musical instruments and graphophones, britania, pottery, sporting goods, typewriters, carriages, and many more. The city's transportation facilities aid this growth. The railroad trackage is ample; a new station is to be built and the tracks raised, at an expense of some \$3,000,000. The harbor is safe and admits quite large vessels; there are daily steamer lines to New York, and much barge and coasting business. The river, creeks, and Pembroke Lake are spanned by two or three dozen strong bridges. Electric railway service is thoroughly developed, continuous lines running to New Haven and New York.

Education, Churches, Charities, etc.—The public school system has 22 grammar schools and

BRIDGER'S PASS — BRIDGET

a high school; in 1900 the attendance was 10,255. There is a free public library, organized in 1881, with about 40,000 volumes; four daily and several weekly newspapers. The city has the extraordinary number of 57 churches, the chief denominations being the Methodist (11), Congregationalist (10), Roman Catholic (9, with three convents), Baptist and Episcopal (6 each), and Lutheran (4), with a Jewish synagogue, a Russian Orthodox Greek and a Hungarian Orthodox Greek Catholic. Of many charitable organizations and institutions, the chief are the Young Men's Christian Association and Young Women's Christian Association, the Bridgeport Hospital, the United States Marine Hospital, and the Widows' Home. Secret societies are in great number. The oldest Masonic lodge, St. John's, dates from 1762.

Government and Finance.—The mayor is elected for two years. The city has a council and administrative boards, with a single commissioner of public works, all appointed by the mayor excepting the popularly elected school board. The city's assessed valuation is about \$64,000,000, its debt \$1,275,000, and its tax rate \$13 per \$1,000. The annual outlay is about \$1,000,000, the largest item being \$170,000 for schools. There are five national banks.

Population.—1810, 1,089; 1820, 1,500; 1830, 2,800; 1840, 3,294; 1850, 7,560; 1860, 13,209; 1870, 18,969; 1880, 27,643; 1890, 48,866; 1900, 70,996, of whom 22,281 were foreign-born.

History.—The first settlement was made in 1639, on lands bought from the Paugusset Indians, who in 1659 were relegated to a reservation on Golden Hill. It was called Pughquannock or Pequonnock, and formed a parish in the towns of Fairfield and Stratford, where the inhabitants went to church till they built their own first one in 1695. In 1694 they petitioned to have it renamed Fairfield; the legislature chose Fairfield Village instead; they rejected it and the next year fixed on Stratfield, which, however, was not legalized till 1701. In 1703 the first school building was erected, previous teaching having been in the church on week-days. In 1707 the first services of the Episcopalians were held; in 1748 their first church was built. In 1775 a company from here joined Arnold's expedition to Quebec; and there was much privateering from this place in the Revolution. In 1795 the first newspaper, the *American Telegraph*, was issued. In 1800 the borough of Bridgeport was incorporated, including the village of Newfield, which had grown up at the water-side, the old settlement being along the Boston and New York turnpike, or "Old Stage Road," now in part North Avenue. In 1806 the first bank, Bridgeport Bank, was organized. In 1821 the town of Bridgeport was set off, having then 1,700 inhabitants, 218 dwellings, 73 stores and warehouses, and an assessed valuation of \$24,701. On 28 Sept. 1824, the first steamer ran from Derby past Bridgeport to New York; 16 April 1832, the first Bridgeport steamer, the *Citizen*, began regular trips. The Housatonic Railroad was opened to New Milford in February 1840; the New York, N. H. & H. began running to Fairfield, 2 Sept. 1848, to New York, 1 Jan. 1849. This ushered in the period of real city development, 1850-60. Gas was introduced December 1861; water, 1854-5; P. T. Barnum bought large tracts of land in East Bridgeport and opened it

up after 1850; in 1856 the Wheeler & Wilson Company removed here from Watertown and greatly enlarged their plant; the Howe Company came in 1863, and the Union Metallic Cartridge Company in 1865. In 1870 the city annexed a part of Fairfield; in 1899 Summerfield, and West Stratford across Pembroke Lake. (See Orcutt's 'History of Stratford and Bridgeport,' 1886.)

FRANK STAPLES,

Treasurer Board of Trade.

Bridger's Pass, a Rocky Mountain defile in southern Wyoming, several miles in length and having a high elevation. Its walls, almost perpendicular, rise from 1,000 to 2,500 feet. Before the opening of the Pacific Railroad it was an important feature of the overland stage route.

Bridges, Fidelia, American artist: b. Salem, Mass., 19 May 1835. She studied art under William T. Richards in Philadelphia; has been associate member of the National Academy of Design from 1869, and of the American Water Color Society from 1870. She has done much landscape work, her earlier paintings being mainly executed in oil, while her later ones are usually in water colors.

Bridges, Robert, American iron-worker. Extremely little is known of him personally. He settled at Lynn, Mass., and in 1643 organized a company to work the deposits of "bog iron-ore" in that vicinity. He went to London, and organized a "Company of Undertakers for the Iron Works," comprised of wealthy Englishmen, who advanced £1,000 for the work. Foundrymen were brought from England and Scotland, a plant was established on the Saugus River, and for several years furnished most of the iron used in this country, though ultimately the undertaking failed, owing to the scarcity of money and difficulty of making collections. In 1645 Bridges was a commissioner to confer with the governors of the French provinces in Canada. The Colonial records show him to have been a member of the general court, and its speaker in 1646.

Bridges, Robert, English poet: b. 23 Oct. 1844. Educated at Eton and Corpus Christi College, Oxford, he afterward studied medicine and held several hospital appointments, retiring from the active exercise of his profession in 1882. He is one of the most scholarly of modern English poets and has published, usually privately, eight plays and several collections of poems. Among his works are 'Prometheus'; 'Achilles in Scyros'; 'Eros and Psyche'; 'Shorter Poems'; 'Milton's Prosody.'

Bridges, Robert, American author: b. Shippenburg, Pa., 13 July 1858. After graduating at Princeton he joined the staff of the *New York Evening Post*, and later became assistant editor of 'Scribner's Magazine.' For many years he wrote the keen and witty book reviews in *Life* under the signature of DROCH. His work in book form has appeared as follows: 'Humours of the Court, a Comedy, and Other Poems' (1893); 'Overheard in Arcady' (1894); 'Suppressed Chapters and Other Bookishness' (1895); 'Bramble Brae' (1902), a volume of poems.

Brid'get, the name of two saints in the Roman Catholic Church.

I. SAINT BRIGET, or SAINT BRIDE, b. Fochard, Armagh, Ireland, about the beginning of the 6th

century. She was exceedingly beautiful, and to avoid the offers of marriage and other temptations to which this worldly advantage exposed her, implored God to render her ugly. The prayer was granted, and, retiring from the world, Bridget built herself a cell under a large oak, hence the name Kill-dara or Kildare, the cell of the oak. Hither she was followed by numerous other virgins, and an order of nuns was established which spread into different countries and flourished for centuries. Saint Bride is one of the chief Irish saints, and was held in great reverence in Scotland.

2. SAINT BRIDGET, BIRGIT, or BRIGITTE, daughter of a Swedish prince: b. about 1302; d. Rome, 1373. At the age of 16 she married Ulf Gudmarsen, afterward seneschal of Nericia, by whom she had eight children. Her husband and she then made a vow of mutual continence. On her husband's death she founded the convent of Wadstena, in East Gothland, under the rules of Saint Augustine. She made a pilgrimage to Palestine, and died on her return. She was canonized in 1391. She had left, under the title 'Revelations,' a series of mystic writings, which, after due examination by the proper authorities, were pronounced inspired by Gregory XI. and Urban VI. These writings have been translated into Latin and French. The order of St. Bridget, called also sometimes that of St. Saviour, or the Holy Saviour, continued in Sweden till the Reformation, and still includes some religious houses in Italy, Portugal, and other countries. Her youngest daughter, Catherine, was also canonized, and became the patron saint of Sweden.

Bridgeton, a city, port of entry, and county-seat of Cumberland County, N. J., on the Cohansey River, and on the New Jersey C. and the West Jersey & S. R.R.'s, 38 miles south of Philadelphia. It is a very old settlement, having been a place of considerable importance before the Revolutionary War. Its surroundings are agricultural, and it has manufactures of glass, gas-pipe, nails, machinery, flour, oil-cloth, woolen goods, shoes, and shirts, and also large fruit and vegetable canning interests. It has a public park, Tumbling Dam, which contains a picturesque lake and a fine field for athletics. The city contains the South Jersey Institute, the West Jersey Academy, Ivy Hall Seminary, Seven Gables Seminary, a public high school, two national banks, good water and sewerage systems, and electric lights and street railroads. Its excellent climate and scenic attractions have made the city a popular resort for summer tourists and residents. Pop. (1900) 13,913.

Bridgetown, the capital of the island of Barbados, in the West Indies. It extends along the shore of Carlisle Bay, on the southwest coast of the island, and is nearly two miles long, and about a half mile broad. On entering the port, its appearance is very pleasing, the houses being embosomed in trees, while hills of moderate height rise behind, studded with elegant villas. Many of the houses have balconies, painted in gay colors, which give them a lively and cheerful appearance. The town contains a handsome square, called Trafalgar Square, in which there is a bronze statue of Lord Nelson, placed there with great ceremony in 1813. The principal buildings include the Church of St. Michael, now the cathedral of the diocese; the Church of St.

Mary; the Jewish Synagogue; the Central School; Harrison's Free School; a handsome market-place; the barracks at the south extremity of the city; and the military hospitals. Bridgetown has been at several periods much damaged by fire. The last calamity of that kind occurred in 1845, when a large portion of the town was destroyed. Pop. over 21,000.

Bridgewater, Francis Egerton (THIRD DUKE OF), British nobleman: b. 1736; d. 8 March 1803. He was the youngest son of Scroop, fourth Earl and first Duke of Bridgewater, and succeeded his elder brother, the second Duke, in 1748. His estate of Worsley contained valuable coal mines, and with the view of establishing communication between these and Manchester, seven miles distant, he conceived the idea of a navigable canal. Having accidentally made the acquaintance of James Brindley, and perceived his great engineering talents, he employed him in the construction of this work, which, after encountering much opposition and ridicule, was at last triumphantly carried through. To the execution of this scheme the Duke devoted all his energies and fortune, restricting his expenditure for many years to £400 per annum.

Bridge'water, Francis Henry Egerton (EIGHTH EARL OF), English clergyman: b. London, 11 Nov. 1756; d. Paris, 11 Feb. 1829. He held several preferments in the English church, but his later years were spent in Paris, where he lived with a family of cats and dogs dressed as men and women, who accompanied him upon his drives. By his will he left \$40,000 to be invested in the public funds to be awarded to the author of the best treatise 'On the Power, Wisdom, and Goodness of God as Manifested in the Creation.' The selection of the author was left to Davies Gilbert, then president of the Royal Society, who decided to divide the sum among eight persons for as many treatises on various aspects of the theme. The Earl was the author of several scientific, historical, and other works, and bequeathed all his manuscripts to the British Museum with \$60,000 to keep up and extend the collection. See BRIDGEWATER TREATISES.

Bridgewater, or Bridgwater, a municipal borough and port, in the county of Somerset, England, on the Parret. Although the town is about 10 miles from the sea, vessels drawing 19 feet of water can come up to the quay at spring-tides; but great inconvenience is sometimes caused by the bore. The river divides the town into two parts, which are connected by an elegant iron bridge of one arch. The houses are generally well built, and chiefly of red brick. Among the chief buildings are the parish church (St. Mary Magdalene's), a handsome ancient structure, with a tower and spire; St. John's Church; the town hall, a handsome building in the Venetian style; corn exchange; borough jail; market-house; and custom-house. There is a free grammar school, an infirmary, and almshouses. A considerable shipping trade is carried on, chiefly coastwise. The tonnage entered and cleared annually is usually about 180,000 tons. The imports are timber, grain, coal, tallow, wine, esparto, linseed, etc.; exports, timber, bricks, etc. The chief manufacturing industry is that of bath-bricks which are made here (and indeed nowhere else) in great quantities. Ordinary bricks are also largely made, and

there are engineering establishments, breweries, tanneries, foundries, oil-mills, etc. Bridgewater obtained its name, Burgh-Walter, from its having belonged to Walter de Douay, one of William the Conqueror's followers. In the civil war the inhabitants embraced the cause of Charles I., and defended the town resolutely against the Parliamentarians, but surrendered (1645) to Fairfax. In the castle built by King John, the Duke of Monmouth lodged, and was here proclaimed king in 1685, before the battle of Sedgemoor, which was fought about three miles from the town. Bridgewater then became the theatre of Feversham's and Jeffreys' barbarity. Up till 1870, when it was disfranchised for bribery, Bridgewater returned two members to Parliament. Pop. (1901) 15,209.

Bridgewater, a town in Plymouth County, Mass., on the New York, N. H. & H. R.R., 27 miles south of Boston. It contains five villages and has a State normal school, the State Farm, State Almshouse, a public library, a savings bank, and manufactures of iron, nails, tacks, boots, shoes, and brick. Pop. (1900) 5,806.

Bridgewater Treatises, The, works which grew out of a singular contest in compliance with the terms of the will of the last Earl of Bridgewater, who died in 1829. He left \$40,000 to be paid to the author of the best treatise 'On the Power, Wisdom, and Goodness of God, as Manifested in the Creation.' The judges decided to divide the money among the authors of the eight following treatises: 'The Adaptation of External Nature to the Moral and Intellectual Constitution of Man,' by Dr. Thomas Chalmers (1833); 'Chemistry, Meteorology, and the Function of Digestion,' by William Prout (1834); 'History, Habits, and Instincts of Animals,' by William Kirby (1835); 'Geology and Mineralogy,' by Dean (William) Buckland (1836); 'The Hand . . . as Evincing Design,' by Sir Charles Bell (1833); 'The Adaptation of External Nature to the Physical Condition of Man,' by John Kidd, M.D. (1833); 'Astronomy and General Physics,' by William Whewell (1833); 'Animal and Vegetable Physiology,' by Peter Mark Roget (1834). All these essays were published as Tracts for the Times, and have had a great circulation and influence.

Bridge Whist. See WHIST.

Bridgman, Elijah Coleman, American missionary: b. Massachusetts, 1801; d. Shanghai, China, 1861. He graduated at Amherst College, 1826, and at Andover Theological Seminary, 1829, and immediately joined Dr. Morrison at Canton. He soon attained a wonderful mastery of the Chinese language, becoming in 1839 official interpreter to Imperial Commissioner Lin, and in 1844 interpreter and secretary to the United States Minister, Caleb Cushing. He founded 'The Chinese Repository,' a magazine of the greatest value and interest for all subjects relating to the Flowery Kingdom. He compiled a Chinese 'Chrestomathy' in the Canton dialect, a quarto volume of 734 pages, and the first practical manual of that dialect prepared in China.

Bridgman, Frederick Arthur, American artist: b. Tuskegee, Ala., 10 Nov. 1847. He studied at the Brooklyn Art School, and at the National Academy of Design, New York, and was a pupil of J. L. Gérôme, and at the Ecole

des Beaux Arts, in Paris. In 1872 he went to Africa and began to paint subjects belonging to that part of the world, somewhat in the manner of Gérôme, but with a greater mastery in color. He has long resided in Paris, where he has exhibited his works with great success. He is noted for figure pieces and Oriental and archaeological pictures. Among his paintings are: 'An American Circus in Normandy'; 'L'Arabe'; 'Pharo'; and 'Burial of a Mummy,' which was awarded a prize at the Paris Exposition of 1878. He is a member of the National Academy of Design, New York, and a Chevalier of the Legion of Honor.

Bridgman, Herbert Lawrence, American journalist and explorer: b. Amherst, Mass., 1844. Graduating at Amherst College in 1866, he entered journalism and became associate editor of the Brooklyn *Standard Union*. In 1894 he accompanied and wrote an account of the Peary auxiliary expedition; in 1897 he was with Prof. Libbey of Princeton when the latter scaled the "Enchanted Mesa" of New Mexico; and in 1899 he commanded the Peary auxiliary expedition on the steamship *Diana*.

Bridgman, Laura Dewey, American blind deaf-mute: b. Hanover, N. H., 21 Dec. 1829; d. 24 May 1889. She was a bright, intelligent child, but at two years of age her sight, hearing, and smell were entirely destroyed by fever. Yet she learned to find her way about the house and neighborhood, and even to sew and to knit a little. In 1839 Dr. Samuel G. Howe, of Boston, undertook her care and education at the Perkins Institution. The first attempt was to give her a knowledge of arbitrary signs, by which she could interchange thoughts with others. Then she learned to read embossed letters by touch; next, embossed words were attached to different articles, and she learned to associate each word with its corresponding object. The next step was to procure her a set of metal types, with the letters cast at the ends, and a board with square holes for their insertion, so that they could be read by the finger. In six months she could write the names of most common objects, and in two years had made great bodily and mental improvement. Her touch grew in accuracy as its power increased; she learned to know people almost instantly by touch alone. In a year or two more she was able to receive lessons in geography, algebra, and history. She received and answered letters from all parts of the world, and was always employed, and, therefore, always happy. She learned to write a fair, legible hand, to read with great dexterity, to think and reason well, and at last became a teacher to others afflicted like herself. See her biography by Mary S. Lamson (1878).

Bridle, the headstall, bit, and reins, by which a horse is governed. It is an instrument of high antiquity. Pliny ascribes the invention of the bridle to Pelethronius, king of the Lapithæ. The first horsemen guided their horses with a rope or stick, and the sound of the voice. A cord drawn through the nose is sometimes used for other animals. The ancient Thessalian coins often represent a horse with a long rein trailing on the ground. The Romans were trained to fight without bridles, as an exercise in the manege. On Trajan's Column soldiers are thus represented at full speed. The parts of a modern bridle are the snaffle or bit; the head-

stall, or leathers from the top of the head to the rings of the bit; the fillet, over the forehead and under the foretop; the throat-band, which buttons under the throat; the reins; the nose-band, buckled under the cheeks; the trench, the cavasan, the martingal, and the chaff-halter.

Brid'lington, or **Burlington**, a town of Yorkshire, England, incorporated in 1899. It is situated on a beautiful bay, 37 miles northeast from York, on the Hull and S. R.R., and consisting of one principal and several smaller streets. It is a favorite watering-place, with a fine harbor. The parish church forms part of an ancient priory of elegant architecture, but now much defaced. There are several Dissenting chapels and a free grammar school. A considerable trade is carried on in corn. Pop. (1901) 12,473.

Bridport, a seaport and municipal borough, in Dorsetshire, England, lying between the rivers Bride, or Brit, and Asker, in a fertile valley surrounded by hills, 15 miles west from Dorchester and about 1½ miles from the sea. The Bride and Asker unite a little below the town, the united stream being called the Brit, and form a safe and commodious harbor for vessels not over 250 tons. Bridport consists mainly of three spacious streets, containing many well-built modern houses, chiefly of brick. In the centre of the town is the town hall and market-house, a handsome building in the Grecian style. The parish church of St. Mary's is a beautiful structure, cruciform, with a central tower, and contains a fine organ. At the northern entrance to the town is the more recent and less attractive St. Andrew's Church. There are, besides, several Dissenting chapels, schools, a library and scientific institute; and extensive manufactures of shoe-thread, ropes, cordage, sail-cloth, fishing-nets, etc. Bridport was a parliamentary borough from the reign of Edward I. to the passing of the Redistribution Act of 1885, when it was disfranchised. Pop. (1901) 5,710.

Brie, brē, a former province of France, lying between the Seine and the Marne, and now contained in the departments of Aisne, Marne, and Seine-et-Marne. It was divided into Brie Française, which belonged to the government of Ile de France, and Brie Champenoise, which was divided into upper and lower Brie, and comprised in the government of Champagne. A third division once existed, called Brie Poilleuse; this was afterward incorporated with Brie Champenoise. The latter was the largest of the divisions, and had for its capital Meaux, the most important town in the whole province. Its chief wealth was in vineyards and pastures; and its butter and cheese acquired and still retain a wide celebrity. Brie Française produced grain in great abundance, and was likewise a good grazing country. In ancient times this province was partly covered by a vast forest, portions of which are still to be seen. It was subjugated by the Franks, who annexed it to the kingdom of Neustria. In the ninth century it was ruled by its own counts. One of these, having obtained the earldom of Troyes or Champagne, in 968, united the two provinces, which thenceforth shared the same fortunes. Both passed into the possession of the Crown in 1361.

Brief (from the Latin *brevis*, short), a brief or short statement or summary, particularly the summary of a client's case which the solicitor draws up for the instruction of counsel. In American practice a brief is an abridged statement of a party's case. It should give the names of the parties to the action, their residence and occupation, and tell the character in which they sue and are sued, and wherefore they prosecute or resist the action. It should contain an abridgement of all the pleadings; a chronological and methodical statement of the facts, in language easily understood; a summary of the questions in issue, and of the evidence which is to support each of the issues; the names of the witnesses by whom the facts are to be proved, or if there be written evidence, an abstract of such evidence; a description of the personal character of the witnesses, whether morally good or bad, whether they are naturally timid or overzealous, firm or wavering, and the like. It should contain also a summary of the evidence of the opposite party, if known, and such facts as are adapted to oppose, confute, or repel it. The object of the brief is to inform the person who tries the case of the facts important for him to know. In some of the State courts and in the supreme court of the United States it is customary or requisite to prepare briefs of cases for the perusal of the court. These are usually printed. Briefs vary according to the purposes for which they are to be used. The points in a brief intended for the court should be printed in a bold, heavy-faced letter, although subordinate matter may be put in capitals, italics, and common type, according to its importance. A brief intended for the court must be in decorous language, and respectful to a judge from whose decision an appeal has been taken, and to the opposite party and counsel and all other persons named therein.

Brief, Papal, a pastoral letter in which the Pope gives his decision on some matter that concerns the party to whom it is addressed. The brief is an official document, but of less public character than the bull. It usually deals with matters comparatively private and subordinate, not, as the bull, with matters affecting the Church at large, or an entire nation. It is not signed by the Pope himself, but by an officer called "Il Segretario de' Brevi," and is sealed on red wax with the Pope's private seal, the fisherman's ring. Briefs are of two kinds: apostolical, those which issue from the Pope himself; and penitentiary, issuing from the office which bears that name.

Briel, brêl, or **Brielle**, brê-êl', sometimes The Brill, a fortified seaport town on the north side of the Island of Voorne, near the mouth of the Meuse, in the province of South Holland, Netherlands. It contains a government arsenal and military magazines, and possesses a good harbor. The tower of St. Peter's Church serves as a lighthouse. Its male inhabitants are chiefly engaged as pilots and fishermen. Briel may be considered as the nucleus of the Dutch republic, having been taken from the Spaniards by William de la Marck in 1572. This event was the first act of open hostility to Philip II., and paved the way to the complete liberation of the country from a foreign yoke. The celebrated admirals De Witt and Van Tromp were natives of Briel. Pop. about 4,500.

Brienne, brē-ën, **John of**, celebrated crusader: b. 1148; d. 1237. He was the son of Erard II. Count of Brienne; was present at the siege of Constantinople in 1204, and afterward, in 1209, married the granddaughter and heiress of Amaury, king of Jerusalem. Brienne thus obtained an empty title, and having been crowned at Tyre in 1210, defended himself, though with a very inferior force, against the attacks of the Saracens. The Emperor Frederick II., having engaged to join the crusade, provided the sovereignty of the Holy Land were ceded to him, Brienne abdicated in his favor, and gave him his eldest daughter, Yolande, in marriage. He afterward, in 1222, married Berengaria, sister of Ferdinand of Castile, as his second wife, and retired from the East; but the state of affairs there again brought him on the stage. He was crowned Emperor of the East in 1231, and continued to defend his dominions against all aggressors, more especially against the united forces of Vataces, emperor of Nicæa, and Azan, king of Bithynia.

Brienne, brē-ën, or **Brienne-le-Château**, lê-shā-tô, or **Brienne-Napoléon**, nā-pô-lē-ôn, a small town of France, department of Aube (Upper Champagne), about 23 miles northeast of Troyes, was the seat of the military academy at which Napoleon received his first instruction in the military art. Brienne-le-Château was afterward celebrated as the scene of a portion of the final struggle in 1814, in which the empire was overthrown, Napoleon being here defeated by the allies under Blücher.

Brienz, brē-ents, a town of Switzerland, in the canton of Bern, beautifully situated on a narrow ledge at the foot of the Bernese Alps, and on the northeast shore of the Lake of Brienz. Its church, built in 1215, together with some old ruins and a handsome school, is finely situated on a height. Brienz is noted for its cheese, and as the centre of the Oberland wood-carving industry. The Lake of Brienz, one of the most picturesque in Switzerland, is formed by the river Aare, and discharges its water through the valley of Interlaken into Lake Thun, lying 24 feet below it. The lake has daily steamboat service between Brienz and Interlaken, and by this route many tourists visit the famous Giessbach Fall.

Brier Creek, a small stream rising in Warren County, Ga., flowing southeast for about 100 miles, and entering the Savannah River a few miles east of Jacksonborough. It is noted for a battle during the Revolutionary War. After the American victory on Kettle Creek, in February 1779, Gen. Ashe was sent by Lincoln at the head of about 1,500 troops to drive the British from Augusta. The British, under command of Gen. Campbell, evacuated the city, retreated to Brier Creek, and after crossing destroyed the bridge. Ashe pursued them, arrived at the creek 27 February, and there, 3 March, he was surprised by 1,800 British under Gen. Prevost. The American troops were hastily called to arms, and as the British advanced opened upon them a heavy fire, but an unfortunate movement in their line gave the enemy an advantage which decided the fortune of the day. The Americans were put to flight, many were drowned in trying to swim the Savannah, or were lost in the swamps. Their total loss was about 200 killed and wounded, and as many

others taken prisoners. The British had only 5 killed and 11 wounded.

Brierley Hill, a market-town of Staffordshire, England, on the Stour, nine miles west of Birmingham. It has several churches, a town hall, and a free library. The district abounds in coal, ironstone, and clay. The inhabitants are mostly employed in the iron rolling-mills and boiler-works, and in the making of bricks, nails, chains, anchors, spades, glass, pottery, etc. Pop. (1901) 12,040.

Brierly, Bob, the 'Ticket-of-Leave-Man,' in Tom Taylor's play of that name.

Briec, brē-ê, **Saint** (*Briocum*), France, a town in the department of Côtes du Nord, about a mile above the mouth of the Gouët, in the Bay of Saint Briec. It is very poorly built, but contains an ancient cathedral, a diocesan seminary, a school of hydrography, and a library of over 20,000 volumes. Its port, in the village of Légue, at the mouth of the river, admits vessels of 300 to 400 tons, and the town is engaged to some extent in the Newfoundland cod-fishery. On a height near it are the remains of the Tower of Cesson, which is visible 15 miles at sea. Pop. over 16,000.

Brig, a square-rigged vessel with two masts. The term is sometimes used as equivalent to brigantine, but modern American usage makes a difference. See BRIGANTINE.

Brigade, in general, an indeterminate number of regiments or squadrons. In the British army a brigade of infantry is generally composed of three regiments; a brigade of horse, of from 8 to 12 squadrons; and one of artillery, of five guns and a howitzer. A number of brigades form a division, and several divisions an army corps. A brigade-major is the chief of the brigade-staff. A brigadier-general commands a brigade. In the United States army three regiments of infantry or cavalry usually constitute a brigade, but there may be two regiments only, or more than three. The American brigade, like the British, is commanded by a brigadier-general. The brigade combination was introduced by Gustavus Adolphus, whose example was followed by Turenne, who formed brigades of 3,000 to 4,000 men. The use of the term in the French service is somewhat equivocal. In the gendarmerie, as formerly in the cavalry, a brigade is the small fraction of an army under the command of a subaltern officer. In the regular army a brigade now contains two or three regiments of infantry or cavalry, or else a mixed body.

Brigadier-General, a military officer of intermediate rank between a major-general and a colonel; the officer in the army of the United States who commands a brigade.

Brigandine, a piece of mediæval armor, consisting of thin jointed scales of plate, generally sewed upon linen or leather, the whole forming a coat or tunic.

Brigands, a name first given during the imprisonment of King John in Paris (1358) to the mercenaries who held the city, and whose misbehavior rendered them obnoxious. Froissart applied it to a kind of irregular foot soldiery, from whom it was transferred to simple robbers. It is now used especially of such of these as live in bands in secret mountain or forest retreats. In this sense the pest has been

common to most countries, by whatever name the robbers may have been known—whether the escaped slaves and gladiators of Rome, the pre-Islamite brigands of Arabia, English outlaws and highwaymen, German robber nobles, the later banditti of Mediterranean countries and of Mexico, American stage-coach robbers, Australian bushrangers, or the dacoits and hill robbers of Asia. It has ever flourished under weak or corrupt governments, and patriotism at times has swelled its ranks, always largely recruited from those disposed readily to join in any political movement, and has transformed them into guerrilla companies, who have carried on a bitter warfare against the invader. Such Spanish bands harassed the French during the Peninsular war; in Italy the Austrian troops were frequently engaged in expeditions against the banditti led by the daring Bellino ("*Il Passatore*"), and in Greece the Klephts rendered brave and worthy service in the war of independence. In Cuba, in 1888, political discontent was made the excuse for the brigandage then rampant in the island, where four provinces were on this account declared in a state of siege. Religious persecution also has encouraged brigandage; in Bosnia, which has always produced the most perfect specimens of bandits, it was formerly very common, the unhappy Christians, who were reduced by the Turks to the condition of serfs, frequently taking to the mountains in despair, and then wreaking vengeance on their oppressors. Generally speaking, in countries with a notably scanty population, which is yet in many districts as notably overcrowded, brigandage will be found still in existence. Vigorous steps have been taken during the last 50 years to repress the practice, and in some countries with signal success. In Greece, organized companies of brigands, as distinguished from bands of highway robbers, fortuitously collected, have disappeared; and, in Italy, the chiefs with whom princes made treaties are found only in history. Nevertheless, brigandage is by no means obsolete. In Hungary, where it has flourished from time immemorial, and where even the free towns in the 15th century enrolled companies for organized rapine, and thus raised it to the height of an institution, it has found a stronghold in the shades of the Bakony Forest, whose swineherds are said to be in league with the bétarys, and even to do an occasional stroke of business on their own account. In Sicily it is to be feared that this is still the only trade which really prospers in the island (see *MAFIA*); and the bands that infest the Turkish frontier are notoriously dangerous to the wayfaring merchant and the defenseless tourist. In 1887 special attention was attracted by the boldness of brigands in the Pyrenees, Tuscany, Servia, Macedonia, Asia Minor, and Mexico.

Brigantes, brī-gān'tēz, the name of the most powerful of the old British tribes, inhabiting the country between the Humber and the Roman wall.

Brig'antine, a sailing-vessel with two masts, the foremast rigged like a brig's, the mainmast rigged like a schooner's; also called "hermaphrodite brig." The term is applied to different kinds of vessels by mariners of different countries. The term "brigantine" was formerly applied to a light, flat, open vessel, with 10 or 15 oars on a side, furnished also with

sails, and able to carry upward of 100 men. The rowers, being also soldiers, had their muskets lying ready under the benches. Brigantines, being very fast sailers, were frequently made use of, especially in the Mediterranean, for the purpose of piracy, from which fact they derived their name.

Briggs, Charles Augustus, American clergyman and author: b. New York, 15 Jan. 1841. For a number of years he was pastor of the Presbyterian church at Roselle, N. J. In 1874 he was appointed professor of Hebrew in Union Theological Seminary, New York. He was tried for heresy in 1892, and was acquitted. In 1897 he formally severed his connection with the New York Presbytery and became a clergyman of the Protestant Episcopal Church. He is one of the foremost Biblical scholars in the world, and the Episcopal Church in this country might be searched in vain to find his equal as a teacher of Hebrew and the cognate languages and as an authority in that department of learning, or even one who is entitled to be put in the same class with him. Among his works are: 'American Presbyterianism' (1885); 'The Bible, the Church, and the Reason' (1892); 'The Higher Criticism of the Hexateuch' (1893); 'The Messiah of the Gospels' (1894); 'The Messiah of the Apostles' (1895).

Briggs, Charles Frederick, American author and journalist: b. Nantucket, Mass., 1804; d. Brooklyn, N. Y., 20 June 1877. Throughout his life he was engaged in journalism in New York, and under the pseudonym of HARRY FRANCO was widely known. In 1844 he founded the 'Broadway Journal,' and for a time Edgar Allan Poe was his associate editor. He was connected with 'Putnam's Magazine' (1853-6); the New York *Times*, the *Evening Mirror*, the Brooklyn *Union*, 1870-4, and the 'Independent.' Publications: 'Harry Franco; a Tale of the Great Panic' (1837); 'The Haunted Merchant' (1843); 'Working a Passage' (1844); 'Trippings of Tom Pepper' (1847); 'Seaweeds from the Shores of Nantucket' (1853); and in collaboration with Augustus Maverick, 'The Story of the Telegraph, and a History of the Great Atlantic Cable' (1858).

Briggs, George Nixon, American politician: b. Adams, Mass., 13 April 1796; d. Pittsfield, Mass., 12 Sept. 1861. He was governor of Massachusetts from 1844 to 1851, and one of the founders in that State of the Republican party. He spent one year at an academy, studied law, was admitted to the bar in 1818, and soon established a reputation as one of the best criminal lawyers in the State. From 1831-43 he was a representative in Congress, serving through one Congress as chairman of the Post-Office Committee. During his term as governor extraordinary efforts were made to induce him to pardon Prof. Webster, the murderer of Dr. Parkman, but he refused to interpose. For 16 years he was a trustee of Williams College, and at all times a noted advocate of temperance. His death was the result of an accident received from a gun. His life has been written by W. C. Richards under the title of 'Great in Goodness.' (1866).

Briggs, Henry, English mathematician: b. Warley Wood, Yorkshire, 1561; d. Oxford, 26 Jan. 1631. He entered St. John's College, Cambridge, and distinguished himself by his ac-

quirements in mathematics. In 1596 he was appointed first lecturer on geometry in the newly elected establishment of Gresham House or College, London, and in 1619 became in like manner first Savilian professor of geometry at Oxford. This professorship he held till his death. Briggs' great works are his 'Logarithmorum Chilias Prima' (1617); 'Arithmetica Logarithmica' (1624); 'Trigonometria Britannica' (1633).

Briggs, Le Baron Russell, American educator: b. Salem, Mass., 11 Dec. 1875. He was graduated from Harvard University in 1875, was assistant professor of English there, 1885-90, and professor from 1890. Since 1891 he has been dean of the university. He has written 'Old Fashioned Views of Modern Education'; 'Original Charades'; 'School, College, and Character.'

Brigham, brig'am, Amariah, American physician: b. New Marlborough, Mass., 26 Dec. 1798; d. Utica, N. Y., 8 Sept. 1849. He began practice at Enfield, Mass., about 1821, but soon removed to Greenfield, where he became widely known for his skill as a surgeon. In 1828 he went to Europe and spent a year studying in the hospitals. In 1831 he settled in Hartford, Conn., and in 1840 was appointed superintendent of the retreat for the insane there. Two years later he accepted a similar position at the State Lunatic Asylum, Utica, N. Y., where he remained till his death. He was a skilful business man, an able physician, and was frequently called to act as an expert in the courts. Publications: 'Treatise on Epidemic Cholera' (1832); 'Influence of Mental Cultivation on the Health' (1833); 'Influence of Religion upon the Health and Physical Welfare of Mankind' (1835); 'Inquiry Concerning the Diseases and functions of the Brain, the Spinal Cord, and Nerves' (1840); 'The Asylum Souvenir' (1849); 'Mental Exertion in Relation to Health' (1866). See C. E. Goodrich, 'Sermon on the Death of Amariah Brigham' (1850).

Brigham, Sarah J. (LATHBURY), American illustrator and writer for young people: b. Manchester, N. Y., 1835. She was married to J. R. Brigham in 1854. She has written: 'Under Blue Skies' (1886); 'Leopold and His Wheel' (1896); 'The Pleasant Land of Play' (1898); 'The Bond of Honor.'

Brigham, William Tufts, American ethnologist: b. Boston, Mass., 24 May 1841. He was admitted to the Massachusetts bar in 1867, was for a year botanical instructor at Harvard and served for a time on the Boston school board. He removed to Honolulu in 1888, and has since been in charge of the Bishop Museum of Ethnology there. He has published: 'Cast Catalogue of Antique Sculpture'; 'Guatemala, the Land of the Quetzal'; 'Volcanic Manifestations in New England.'

Bright, Charles, English civil engineer: b. London, 25 Dec. 1863. He is the youngest son of Sir Charles Tilston Bright, who laid the first Atlantic cable, and has been himself employed in cable-laying in many parts of the world, as well as on various surveying expeditions. He has published 'Science and Engineering During the Victorian Era'; 'Submarine Telegraphs'; 'Underground Cables'; 'Ancient Methods of Signalling'; 'The Evolution of the Electric Telegraph, 1837-97'; 'The Life of Sir Charles

Bright'; 'Imperial Free Trade'; 'Imperial Telegraphy.'

Bright, James Franck, English historical writer: b. London, 29 May 1832. He was educated at Rugby, and University College, Oxford, and was master at Marlborough College and head of the modern department there for 16 years. Since 1874 he has been dean of University College, and honorary Fellow of Balliol from 1878. He has written 'History of England to 1880'; 'Joseph II.' (1897); 'Maria Theresa' (1897).

Bright, Jesse D., American politician: b. Norwich, N. Y., 18 Dec. 1812; d. Baltimore, Md., 20 May 1875. He received an academic education, was admitted to the Indiana bar (1831), and became a circuit judge, State senator, and lieutenant-governor. From 1845 to 1857 he was a United States senator and president of the Senate during several sessions. Re-elected in 1857, he was expelled for alleged disloyalty, 5 Feb. 1862, the chief evidence against him being a letter addressed to "His Excellency, Jefferson Davis, President of the Confederation of States," recommending a friend who had an improvement in firearms to dispose of. Bright maintained that at the date of the letter (March 1861) he had no idea that there would be war, and wrote it to get rid of the inventor. Subsequently, he settled in Kentucky, and in 1866 was elected to the State Senate.

Bright, John, English statesman and orator: b. Greenbank, Rochdale, Lancashire, 16 Nov. 1811; d. 27 March 1889. His father, Jacob Bright, who belonged to a Quaker family originally connected with Wiltshire, migrated to Rochdale early in the century, and there established himself as a successful cotton-spinner and manufacturer. John Bright, who was the second of 10 children, was educated at Rochdale, Ackworth, York, and finally at Newton, near Clitheroe. At the age of 15 he entered the cotton-spinning business of his father, where, even at that early age, he showed much shrewdness and practical energy. Not satisfied, however, with merely mercantile affairs, he took an enthusiastic interest in such public questions as the abolition of slavery and the Reform Bill of 1831-2, while he diligently educated himself in public speaking at the debates of the Rochdale Literary and Philosophical Society. In 1835 he traveled in Greece, Egypt, and Palestine, and gave an account of the journey in a series of lectures delivered in his native town; but his career as a notable public speaker began with the free-trade movement. To relieve the pressure upon the working population of England occasioned by commercial depression and a bad harvest, it was proposed to cheapen bread by the repeal of the corn duty, and in an association formed for this purpose at Manchester in 1838 Mr. Bright was made a member of committee. In the following year this association, at a meeting in London, was widened into the famous Anti-Corn Law League, with Richard Cobden and John Bright as its two most prominent members. Yet it was not until after the death of his first wife, in 1841, that the latter put all his strength into the repeal campaign. In the autumn and winter of that year he organized branches of the League and addressed meetings in nearly all the large towns of England. It was inevitable that such a prom-

inent politician should find a place in Parliament, and accordingly, in 1843, he was elected as representative of the city of Durham. Having entered Parliament, he made his maiden speech in August of the same year on a motion in favor of carrying out the recommendations of the Import Duties Commission of 1840. Thereafter he seized every opportunity to press this question of repeal. The opposition from both of the great parties in the house was dogged, and the controversy might have lasted long but for the widespread sympathy occasioned by the Irish famine. In January 1846 Parliament was summoned, and Sir Robert Peel announced that his government was prepared to reduce and almost abolish the corn duties. This resolution was carried, but on the question of Irish coercion the government was defeated, and at the general election which followed (1847), John Bright was elected for Manchester. The corn duty question having been satisfactorily settled, he now turned his attention to such subjects as a reform in the affairs of Ireland and India, an extension of the suffrage, the adoption of voting by ballot, and the establishment of a national system of education. At the dissolution of Parliament in 1852 he was re-elected for Manchester, but by his strenuous denunciation of the Crimean war (1854), and his equally decided disapproval of the Chinese war (1856), he was rejected by his constituency at the general election of 1857. This result was made known to him at Florence, where he had retired to recruit after a serious illness, but the disappointment which it caused him was mitigated in a few months by his election for Birmingham, and in 1858 he returned to public life after an absence of two years. During the American Civil War he sturdily advocated the abolition of slavery, and gave his passionate adherence to the cause of the North, although as a Lancashire cotton-spinner his business suffered severely from a continuance of the struggle. About this time, also, his name became closely identified with reform in the electoral representation, and he had the satisfaction of seeing the principles for which he had contended embodied in the Reform Bill (1867) passed by Mr. Disraeli. He had no desire for office, but his presence in the cabinet councils of the Liberal party had now become so necessary that he was constrained to accept the presidency of the Board of Trade in Mr. Gladstone's government (1868), and in this position he gave powerful assistance in passing the act for the disestablishment of the Irish Church, the Irish Land Act, and the Elementary Education Act. Owing to ill health he retired from office in 1870, but re-entered the ministry as chancellor of the duchy of Lancaster in 1873. When the Liberal party returned to power in 1880 he again accepted this position, but two years later he found it necessary to resign because he disagreed with his colleagues on their Egyptian policy and the bombardment of Alexandria. At this time and for some years previously he had not appeared often upon public platforms, but in 1883 he delivered a notable speech when installed as lord rector of Glasgow University, and another in Birmingham in the same year when celebrating the 25th anniversary of his connection with that city. In 1886 he opposed the Home Rule Bill introduced by Mr. Gladstone, and until his death he strongly identified himself with the Unionist party in its efforts to defeat the Home Rule policy. This

opposition was weighted with the same characteristics which had secured his success in previous movements—a transparent sincerity of purpose which found its fearless exposition by pen and speech in direct, racy, idiomatic English. As an orator his platform manner was remarkable for its ease and unstudied simplicity; the richness and lucidity of his diction, abounding in happy epithets, often edged with irony or glancing with humor; a spirit of outspoken truthfulness breathing through all his utterances; while he was possessed of a voice which laid a spell upon his audience by its clear, round, sonorous fullness. Perhaps the most splendid expression of his sympathetic nature is found in the speeches in which he pleaded for justice to the oppressed populations whether in Ireland or India, while the same broad humanity, even more than the doctrines which were his Quaker birthright, animated his denunciations of war. He was a member of the Society of Friends, and was married first to a Miss Priestman, who died in 1841, and again to a Miss Leatham, who died suddenly in 1878. His life and speeches in two volumes were published in 1881 by G. Barnett Smith, and his public letters by H. J. Leech in 1885.

Bright, Richard, English physician: b. Bristol, 28 Sept. 1789; d. 16 Dec. 1858. He studied at Edinburgh, Berlin, and Vienna. His name is associated with Bright's disease (q.v.), he being the first who investigated its character.

Brightly, Frederick Charles, American lawyer: b. Bungay, England, 26 Aug. 1812; d. Germantown, Pa., 24 Jan. 1888. He came to the United States in 1831, and was admitted to the Philadelphia bar (1839). In 1870 he retired to devote himself to legal writing and compilation, for which he had pre-eminent gifts. His private law library of 5,000 volumes was one of the best collections in America. Publications: 'Law of Costs in Pennsylvania' (1847); 'Reports of Cases Decided by the Judges of the Supreme Court of Pennsylvania' (1851); 'Equitable Jurisdiction of the Courts of Pennsylvania' (1855); 'Analytical Digest of the Laws of the United States, 1780-1860' (1865-9); 'Digest of the Decisions of the Federal Courts' (1868-73); 'Bankrupt Law of the United States' (1871); 'Leading Cases on the Law of Elections' (1871); 'Digest of the Laws of Pennsylvania, 1700-1883' (1883); and other works.

Brighton (formerly BRIGHTHELMSTONE), a maritime town and favorite watering-place in England, county of Sussex, 50½ miles south of London. It is situated on a gentle slope, and is a clean and well-built town, with handsome streets, terraces, squares, etc., and a massive sea-wall, with a promenade and drive over three miles in length, one of the finest in Europe. The buildings of note are entirely modern, and not numerous. The most remarkable is the Pavilion, built by George IV. (then Prince of Wales), between 1787 and 1825. It cost upward of \$5,000,000. It is a building in the Oriental style of architecture, with a handsome stone front 300 feet in length, and a large Oriental dome 84 feet high in the centre. The Pavilion was discontinued as a royal residence by Queen Victoria in 1841, and was purchased of the Crown by the town of Brighton in 1850. Pop. (1901) 123,478.

Bright's Disease. See KIDNEY.

Brigittines, or Order of Our Saviour, a branch of the Augustinians, founded about the year 1344 by Saint Bridget of Sweden, and approved by Urban V. in 1370. It owes its origin to the monastery built by Bridget at Wastain, near Linköping, in Sweden. It embraces both monks and nuns, who occupy contiguous buildings. The prioress is superior in temporal concerns, but spiritual matters are managed by the monks. All the houses of the order are subject to the bishop of the diocese, and no new one can be founded without express permission of the Pope. The number of male religious in each monastery was fixed by the rule at 25, and that of females at 60; but this regulation has ceased to be strictly enforced. Indeed, there are few establishments for both sexes now existing, though some are yet maintained in Germany, Flanders, and other countries; most of them, including the parent house at Wastain, were destroyed at the Reformation. There are two rich convents of Brigittines at Genoa, into one of which only ladies of high family are admitted. The only house of the order in England was the rich institution known as Sion house, founded by Henry V. on the Thames, 10 miles from London. It was one of the first suppressed by Henry VIII. After passing through the hands of the dukes of Somerset and Northumberland, it was restored to the religious by Queen Mary, and again dissolved under Elizabeth. The nuns then left England, and after various troubles established themselves in Portugal.

Bril, the name of two Dutch painters, (brothers), who distinguished themselves as landscape artists. (1) MATTHEW, b. Antwerp, 1550; d. 1584. When a very young man he went to Rome, and was so much esteemed by Gregory III. that he was employed on the galleries and salons of the Vatican. (2) PAUL, b. about 1556; d. about 1626. He was much superior to Matthew, and hearing of his success at Rome joined him there. The two brothers appear for some time to have worked together on the same pieces; but after Matthew's early death Paul was employed by Sixtus V., and executed six large paintings in his summer palace.

Brilliant. See DIAMOND.

Brimstone. See SULPHUR.

Brindisi, bren'dē-sē, (ancient BRUNDISIUM), a seaport and fortified town in the province of Lecce in southern Italy, 45 miles east-northeast of Taranto. In ancient times Brundisium was one of the most important cities of Calabria. It was one of the chief cities of the Sallentines, and the excellence of its port and commanding situation in the Adriatic were among the chief inducements to the Romans to attack them. The Romans made it a naval station, and it was the scene of important operations in the war between Cæsar and Pompey. Virgil died here 19 B.C. On the fall of the western empire it declined in importance. In the 11th century it fell into the possession of the Normans, and became one of the chief ports of embarkation for the Crusades. Its importance as a seaport was subsequently completely lost, and its harbor blocked. In 1870 the Peninsular & Oriental Steam Navigation Company put on a weekly line of steamers between Brindisi and Alexandria, and Brindisi

is now an important station for passengers and mails to and from India and the East. There is also a trade with British, Austrian, and other ports. Latterly, the harbor accommodation has been considerably improved. The chief exports are wine, olive-oil, and figs; the chief import, coal. Pop. (1901) 25,317.

Brindley, James, English engineer: b. Thornsett, Derbyshire, 1716; d. Turnhurst, Staffordshire, 30 Sept. 1772. At 17 he became apprentice to a millwright, and on the expiration of his indentures began business as an engineer, and in 1752 displayed great talent in contriving a water-engine for draining a coal-mine. Several important inventions introduced him to the patronage of the Duke of Bridgewater, then occupied in planning a communication between his estate at Worsley and the towns of Manchester and Liverpool by water. This immense work, ridiculed by scientific men of the period as impracticable, Brindley undertook and carried out by means of aqueducts over valleys, rivers, etc. The first portion of the Bridgewater Canal (to Manchester) was opened in 1661, the whole system being complete in the end of 1772. See Smiles, 'Lives of the Engineers' (1861-2).

Brine Shrimp, the only animal, except a species of fly (*Ephydra*), which lives in the Great Salt Lake of Utah. It is a phyllopod crustacean, with stalked eyes, a delicate, slender body, which is provided with 11 pairs of broad, paddle-like or leaf-like feet. It is about one quarter of an inch long. Similar forms live in brine vats in various parts of the world. *Artemia fertilis* abounds in Great Salt Lake. It may often be seen swimming about in pairs and has a nauplius young like that of the brine shrimp of Europe. It produces young by budding (parthenogenesis), as well as from eggs. A species observed near Odessa produced females alone in warm weather; and only in water of medium strength were males produced. The eggs of *A. fertilis* have been sent in moist mud from Utah to Munich, Germany, and specimens raised from the eggs by Siebold, proving the great vitality of the eggs of these Phyllopods, a fact paralleled by the similar vitality of the eggs of the king-crab. *A. gracilis* of Verrill has thus far only been found in tubs of concentrated salt water on railroad bridges in New England.

Brinjaree, brin'ja-rē. Dog, the East Indian greyhound.

Brin'ton, Daniel Garrison, American surgeon, archæologist and ethnologist: b. Thornbury, Pa., 13 May 1837; d. Atlantic City, N. J., 31 July 1899. During the Civil War he was a surgeon in the Union army, and from 1867 to 1887 was editor of the 'Medical and Surgical Reporter.' In 1884 he was appointed professor of ethnology at the Academy of Natural Sciences in Philadelphia; and, in 1886, professor of American linguistics and archæology in the University of Pennsylvania. Among his many works are notes on the 'Floridian Peninsula' (1859); 'The Myths of the New World' (1868); 'American Hero Myths' (1882); 'Aboriginal American Anthology'; 'Primer of Mayan Hieroglyphics' (1896); 'Religions of Primitive Peoples' (1897); etc. He edited 'The Library of Aboriginal American Literature' in eight volumes (1882-5), and was a high authority on all American archæological topics.

Brinton, John Hill, American surgeon: b. Philadelphia, 1832. He graduated at the University of Pennsylvania (1850), and at the Jefferson Medical College (1852), serving through the Civil War as a surgeon. In 1882 he was appointed professor of the practice of surgery and clinical surgery at Jefferson Medical College. He has written 'Consolidated Statement of Gunshot Wounds' (1863); with J. H. Porter, 'History of the Organization of the Medical Department of the United States Army' (1864), a MS. in the surgeon-general's library at Washington; 'Description of a Valve at the Termination of the Right Spermatic Vein in the Vena Cava' (1856); 'Operative Surgery in General' (1881); 'The March of Surgery' (1882).

Brinwilliers, Marie Madeleine Marguerite d'Aubray, mǎ-rē mǎd-lēn mǎr-gā-rēt dō-brā brān-ve-yā (MARQUISE DE), French poisoner: b. Paris, about 1630; executed 16 July 1676. She was the daughter of a civil-lieutenant of Paris, and married in 1651 the Marquis of Brinwilliers. About 1659 the Marquis introduced to his house a young cavalry officer, named Godin de Sainte-Croix, for whom his wife conceived a violent passion. The Marquis, occupied with his own pleasures, seemed indifferent, but her brothers remonstrated, and her father, scandalized at her misconduct, had Sainte-Croix openly arrested in her carriage and taken to the Bastille in 1665. Sainte-Croix remained in prison about a year, and made there the acquaintance of an Italian, who taught him the art of preparing poisons. On his liberation he imparted his discoveries to Madame de Brinwilliers, who had in the meantime assumed an air of piety, visiting the hospitals, and ministering to the sick, and had thus reconciled herself to her family; but the affront offered her by her father remained in her mind, and she had resolved to revenge it. Sainte-Croix, apparently from cupidity, seconded her design. He supplied her with poisons, with which she experimented first on the patients in the hospital. She occupied eight months in administering poison to her father, and at last killed him suddenly without being suspected. By the aid of Lachaussée, an old domestic of Sainte-Croix, whom she caused to enter their service, she also succeeded in poisoning her brothers. She is said to have attempted her husband, with a view to marry Sainte-Croix, but did not succeed. Sainte-Croix died suddenly, it is said from the falling off of a mask of glass which he used to protect himself in preparing a subtle poison. A packet addressed to Madame Brinwilliers, containing poisons labelled with descriptions of their effects, revealed their conspiracy. Among a number of letters there was one containing a promise of \$6,000, which Sainte-Croix had exacted as the price of his assistance. Madame Brinwilliers fled to Liége, and took refuge in a convent. Her extradition being obtained, she was inveigled from the convent by a pretended lover, brought to Paris, and on the evidence of Lachaussée, together with her own confession, condemned to be beheaded and afterward burned. See Pirot, 'La Marquise de Brinwilliers' (1883).

Brion, Friederike Elizabeth, frē-dēr-ē'kē ā-lē'zā-bēt brē-ōn, German lady: b. Nieder-rödern, Alsace, 1752; d. 1813. To her Goethe dedicated several lyrics and she is the supposed

original of Maria, in 'Götz von Berlichingen,' as well as of other Goethean heroines. She figures in a well-known episode in Goethe's 'Dichtung und Wahrheit,' and is often styled from her place of residence, FRIEDERIKE VON SESENHEIM.

Brion, Gustave, French artist: b. Rothau, Alsace, 24 Oct. 1824; d. Paris, 4 Nov. 1877. He is noted for his Alsatian scenes and many of his works are to be found in American collections. Among them are: 'A Marriage in Alsace' and 'The Sixth Day of Creation.' He illustrated Hugo's 'Les Misérables' and 'Notre Dame de Paris.'

Brion, Luis, loo-ēs' brē-ōn', Colombian admiral: b. Curaçao, 6 July 1782; d. 20 Sept. 1821. He was sent at an early age to Holland to receive his education, his father being a native of that country, and there entered the Dutch army. He was offered a commission in 1799, but being recalled by his parents, returned to Curaçao. Receiving permission from his parents, he visited the United States, where he studied navigation. Upon the death of his father, who bequeathed him a large fortune, he bought a vessel and made several voyages; entering into speculation on his own account, he was very successful, and returned to Curaçao in 1804, where he established a mercantile house. The political events in Venezuela of 1808-10 brought Brion rapidly into notice; he volunteered his services to the republic of Caracas, and in 1811 was appointed captain of a frigate. He now devoted all his resources and his energies to the patriotic cause. At his own expense he fitted out a fleet of vessels, and attacked the Spanish forces at the island of Marguerite, where he gained a signal victory. Brion distinguished himself at the conquest of Guiana, and also at Santa Marta and Cartagena. During a residence at Savanilla he reduced the custom house duties; this coming to the ear of Bolivar, he directly countermanded the order, which so preyed upon the mind of Brion, that he became ill, and leaving the squadron returned to Curaçao, and soon died in poverty.

Briosco, Andrea, ān-drā'a brē-ōs'kō, Italian sculptor and architect: b. 1470; d. 1532. He designed the Church of Santa Justina at Padua as well as a celebrated candelabrum in the Church of San Antonio there; and the Delle Torre tombs in San Fermo at Verona.

Brioude, brē-ood, a French town in the department of Haute Loire, capital of the arrondissement of the same name, situated near the left bank of the river Allier, on the site of the ancient town of Brivas. The old bridge at La Vieille Brioude, long celebrated as being the widest in span of any known, fell down in 1822. In the 16th century, many of the inhabitants of Brioude rose in favor of Lutheranism, but were afterward subdued by the Roman Catholic party. To Americans the town is of interest as the birthplace of Lafayette. A considerable traffic in grain, hemp, and wine is carried on here. Pop. (1891) 4,928.

Brique, brē-kēt', the name, originally French ("small brick"), given to a comparatively new form of fuel, made mostly from waste coal dust, and used, not merely for household purposes, but in various industries.

A briquette is simply an admixture of coal dust with pitch, molded under pressure and heat, the pitch or some similar substance being introduced to form the cementing material.

Brisach. See BREISACH, ALT.

Brisbane, briz'bān, Sir Thomas Mac-Dougall, Scottish general and astronomer: b. Brisbane, near Largs, the seat of his family, 23 July 1773; d. there, 27 Jan. 1860. He entered the army and in 1793 took part in all the engagements of the campaign in Flanders. In 1796 he was sent to the West Indies, and in 1812 commanded a brigade under the Duke of Wellington in Spain. He took part in the battles of Vittoria, Orthes, and Toulouse, and received the thanks of Parliament for conspicuous bravery at the battle of the Nive. On the abdication of Napoleon he was sent to America. In 1821 he was appointed governor of New South Wales, which post he continued to occupy for four years. His administration was active and intelligent, and tended greatly to promote the prosperity of the colony. He introduced at his own expense a good breed of horses, and promoted the cultivation of the vine, as well as of sugar, cotton, and tobacco. At the same time he devoted himself with great diligence to the study of astronomy. He had an observatory erected at his residence of Paramatta, and catalogued 7,385 stars, until then scarcely known to astronomers. For this great work, known as the 'Brisbane Catalogue of Stars,' he received the Copley medal of the Royal Society. On his return to Scotland he devoted himself entirely to science. He had an astronomical, and later a magnetic observatory established at his residence at Makerstoun. The observations which he made there, with the aid of able assistants, fill three large volumes of the published 'Transactions' of the Royal Society of Edinburgh, of which he was president from the death of Sir Walter Scott. He founded two gold medals for scientific merit, one in the gift of the Royal Society, the other in that of the Society of Arts.

Brisbane, the capital of the colony of Queensland, Australia, on the Brisbane River, about 25 miles by water from its mouth in Moreton Bay, and about 500 miles north of Sydney. It was named in honor of Sir Thomas Brisbane (q.v.). Of the four parts into which the town is divided, North Brisbane is situated in the heart of the city, on the north bank of the river, and South Brisbane faces it on the south. Fortitude Valley is a large division on the north bank, to the east and northeast of North Brisbane, mostly situated on a peninsula formed by the winding of the river. The fourth division, Kangaroo Point, is on the south bank, comprising a point of land projecting between North Brisbane and the above peninsula. The streets are laid out as regularly as the tortuous course of the river will permit. The chief buildings are situated in North Brisbane, among them being Parliament House, where the legislature sits; Government House, in the Botanic Gardens; the government offices; the supreme court; the post-office; the technical college; the treasury buildings, a large structure of great architectural beauty; the old and the new town-hall; and the customs-house. Many of the banks have fine edifices, particularly the Queens-

land National Bank. The chief educational institutions are the Normal School, the boys' and girls' grammar schools, and the school of the Christian Brothers. Other buildings and institutions are the masonic and temperance halls; the School of Arts, with a good library; the museum; the Queensland Club; the large general hospital, and several special hospitals; an orphanage and a large jail in South Brisbane; the Opera House, one of the best theatres in Australia. The Victoria Bridge connects South with North Brisbane. It cost upward of \$555,000, and replaces an older one destroyed by a flood in 1893. It consists of six steel spans supported on five cast-iron cylinders filled with concrete, the abutments being of masonry and concrete; and the total length is about 1,041 feet. Much of the cross-river traffic is carried on by the ferries. The leading parks and gardens are the Botanic Gardens, with the Queen's Park, in North Brisbane, at the river-side, finely laid out; Victoria Park, to the north of North Brisbane; Albert Park, Mount Coot-tha, Bowen Park, and the gardens of the Acclimatization Society in Fortitude Valley; and Musgrave, Dutton, and Woollongabba parks in South Brisbane. There is extensive wharf accommodation, and South Brisbane has a dry-dock. There is regular steamer connection with Sydney, London, and elsewhere, and adequate railway communication with Sydney and other chief towns in Australia. The climate is dry and healthy, but the temperature is often very high during the summer. Among the industrial establishments are a sugar-refinery, tobacco factories, flour-mills, etc. The trade is important, among the exports being gold, wool, sugar, etc. Originally founded as a penal settlement in 1825, Brisbane was incorporated in 1859. A United States consul is stationed here. Pop. (1896) estimated at 100,913.

Briscoe, Margaret Sutton. See HOPKINS, MARGARET SUTTON BRISCOE.

Brise'is, a girl of Lynessus, called also HIPPODAMIA. When her country was taken by the Greeks, she fell to the share of Achilles in the division of the spoils. Agamemnon afterward took possession of her, and Achilles thereupon made a vow to absent himself from the field of battle at Troy. This incident Homer makes one of the chief features of his 'Iliad.'

Brisgau, brēz'gow, or **Breisgau**, a district of the grand-duchy of Baden, between the Rhine and the Black Forest, which, with the district of Ortenau, formerly constituted a land-graviate in the southwestern part of Swabia. This is one of the most fertile parts of Germany. Though chiefly in possession of Austria since the 15th century, it was governed by its own laws. At the Peace of Lunéville (1801) Austria ceded Brisgau, one of the oldest possessions of the House of Hapsburg, to the Duke of Modena, after whose death it fell to his son-in-law, the Archduke Ferdinand of Austria, as Duke of Brisgau. By the Peace of Presburg (1805) it was assigned to Baden, with the exception of a small part, and still belongs to the grand-duchy.

Brissac, brē-sāc, **Count de.** See COSSÉ, CHARLES DE.

Brisson, Barnabé, bar-na-bā brē-sōn, French jurist: b. 1531; d. 15 Nov. 1591. Henry III. commissioned him to collect and edit the ordinances of his predecessors and his own, which appeared under the title 'Code de Henri III.' In 1589, he was made first president of the parliament, and after Henri's death, in August of the same year, proclaimed the Duke de Mayenne, the Chief of the League, lieutenant-general of the kingdom. Brisson soon after became suspected by the faction of the "Sixteen," who ruled in Paris, and who thought that he was favorable to Henri IV. He was accordingly arrested and summarily hanged. Among his works of importance are: 'De Verborum Orne ad Jus Pertinent Significatione, etc.' (1557); 'Observationum Divini et Humani Juris Liber' (1564); 'De Formalis et Solemnibus Populi Romani Verbis, etc.' (1583), still in use; 'Opera Minora' (1606).

Brisson, Eugène Henri, è-zhān òn-rē, French politician and journalist: b. Bourges, 31 July 1835. He entered the chamber of deputies in 1871, and won much attention by urging amnesty for the Communists and other political offenders. Since then he has been one of the foremost members of the Radical party. He was elected president of the chamber in 1881, and retained that office until the overthrow of the Ferry ministry, in 1885, when he accepted the premiership. He was re-elected to the presidency of the chamber in 1894, and, in 1895, he retired from the ministry and was a conspicuous candidate for the presidency of France. In 1898 he again accepted the premiership, but his cabinet was soon overthrown. On 8 June 1906 he was elected president of the House.

Brisson, Mathurin Jacques, ma-too-rān zhāk, French savant: b. Fontenay-le-Comte, 30 April 1723; d. Versailles, 23 June 1806. He was instructor to the children of the royal family of France in physics and natural history. He was also censor royal, member of the Academy of Sciences, and of the Institute, and succeeded Nollet in the chair of natural philosophy at the College of Navarre. He translated Priestley's work on 'Electricity,' although he opposed his theories, and still more those of Franklin. The most able of his writings are on specific gravity and on ornithology. Buffon quotes frequently from Brisson's 'Ornithologia' (1760). He published in 1800 a 'Dictionnaire raisonné de physique.'

Brisson de Warville, Félix Saturnin, fā-lēks sā-toor-nān brē-sō dé vār-vēl, French animal painter: b. Sens, 1818. His paintings are renowned for their truthful representations of nature, their scenes being laid chiefly in Touraine and Normandy, or in the forests of Fontainebleau and Compiègne. Among them are: 'The Thicket' (1881); 'Return of the Flock' (1885); 'A Corner of the Sheepfold' (1888).

Brisson de Warville, Jean Pierre, zhōn pē-ār brē-sō dé vār-vēl, French political writer, and one of the leaders of the Girondists: b. Ouarville, near Chartres, 14 Jan. 1754; executed, Paris, 30 Oct. 1793. He took the name D'Ouarville, which he afterward anglicized into De Warville, from the village of Ouarville, where he was born. He was designed for the law, and placed with a procurator in Paris; but early turned his attention to public affairs, asso-

ciating himself with such men as Pétion, Robespierre, Marat, etc. In 1780 he published his 'Théorie des Lois Criminelles,' and two years afterward an important collection called the 'Bibliothèque des Lois Criminelles.' During this period he edited for a time, at Boulogne-sur-Mer, the 'Courier de l'Europe', a translation from an English journal. He also visited England, where he endeavored to found a lyceum and establish a journal in connection with it. Failing in this enterprise, he returned to Paris, where his works had already classed him among the philanthropic theorists of the day. He was suspected of the authorship of an anonymous pamphlet, and thrown into the Bastille. On his liberation he engaged with Clavières and Mirabeau in some works on finance, which appeared under the name of the latter. Threatened with a new arrest, he escaped to England, and being there introduced to the Society for the Abolition of Negro Slavery, resolved to form a similar society in Paris. This society, which numbered many distinguished names among its members, and ultimately accomplished its object, he founded along with Clavières, Mirabeau, and others, and undertook a voyage to the United States to study on its behalf the problem of emancipation. On his return the Revolution was about to break out, and Brissot embraced it with ardor. He was not a member of the States-general, but was elected to the National Assembly for Paris and to the Convention for the department of the Eure et Loir. As leader of the Girondist party, his history belongs henceforward to the history of France. He voted, out of policy, for the death of Louis XVI., subject to confirmation by the vote of the people; and he caused war to be declared against Holland and England in February 1793. This was his last political act. Until the close of his career he was engaged in defending himself against the Montagnards. Brissot was inferior to Vergniaud as an orator, but his writings exercised a powerful influence on the Revolution. In the early part of his career his opinions were very extreme. In a passage, afterward used against him, he carried his advocacy of individual rights so far as to justify not only theft, but cannibalism. Proudhon was accused of having borrowed from him the maxim, "La propriété c'est le vol." His 'Mémoires pour servir à l'histoire de la Révolution' appeared in 1830.

Brissonots, brē-sō-tān. See GIRONDISTS.

Bristed, Charles Astor, American author: b. New York, 1820; d. Washington, D. C., 15 Jan. 1874. He was the son of the Rev. John Bristed, and grandson of John Jacob Astor, founder of the Astor Library. He graduated with high honors at Yale in 1839, and then spent five years at Trinity College, Cambridge, England, where he took a number of prizes and became a foundation scholar. He traveled extensively, and contributed many papers on light social topics and ephemeral subjects to the magazines of England and America. His wide culture and exact scholarship made his work attractive to all cultivated readers. He wrote 'Selections from Catullus' (1849); 'Letter to Horace Mann' (1850), a reply to certain attacks on Stephen Girard and J. J. Astor; 'The Upper Ten Thousand' (1852); 'Five Years in an English University' (1852), his most impor-

BRISTLE-TAILS—BRISTOL

tant book; 'Pieces of a Broken-Down Critic' (1857); 'Letter to Dr. Henry Halford Jones (that is, Dr. J. G. Holland), editor of the Wintertown Democrat (that is, Springfield Republican), concerning his habit of giving Advice to Everybody and His Qualifications for the Task' (1864); 'The Interference Theory of Government' (1867). Most of his work was published, under the pseudonym of CARL BENSON.

Bristle-tails, wingless insects of the order *Thysanura*. These agile creatures have a long flattened body, with metallic scales, in form somewhat like those of butterflies. The antennæ are very long, setiform, many-jointed; the mouth-parts are free, with long palpi; the maxillary palpi being seven-jointed and the labial palpi four-jointed. The mandibles are stout, sunken in the head, and armed with teeth for gnawing. The prothorax is very large, and all the rings of the body are of much the same size, so that the insect bears a general resemblance to the myriapods. The anal stylets are long and large, which, with the smaller ones inserted on the subterminal rings of the abdomen, aid greatly in locomotion, though these insects run with great rapidity and do not leap like the *Poduride*, and thus remind us, as well as in their general appearance, of certain wingless cockroaches. Like cockroaches in one of its habits also is *Thermobia domestica*, which abounds in the chinks and crannies of the rouges of houses, and comes out at night, shunning the light. The "silver witch" (*Lepisma saccharina*) is not uncommon in old, damp houses, where it has the habits of the cockroach, eating cloths, tapestry, etc. In general form, *Lepisma* may be compared to the larva of *Perla*, a net-veined neuropterous insect. The body is long and narrow, covered with rather coarse scales, and ends in three many-jointed anal stylets, or bristles, which closely resemble the many-jointed antennæ, which are remarkably long and slender. They undergo no metamorphosis. Consult: Packard, 'Our Common Insects' (1873); Sharp, 'Insects' (1899).

Bristles, the stiff hairs which grow upon the back of the hog, and are used to a great extent in the manufacture of brushes. They are of several varieties of color and quality, distinguished as black, gray, yellow, white, and lilies. The last is the soft, silvery quality used for shaving-brushes. Russia and Germany are the chief sources of supply, but they are also obtained from France and Belgium, and large quantities of inferior quality have recently been received from China. The quality of bristles depends on the length, stiffness, color, and straightness—white being the most valuable. The best bristles are produced by hogs that inhabit cold countries.

Bristol, Augusta Cooper, American writer and lecturer: b. Croydon, N. H., 17 April 1835. She was State lecturer to the Patrons of Husbandry of New Jersey (1881-4), and is the author of 'Poems' (1868); 'The Relation of the Maternal Function to the Woman Intellect' (1876); 'The Philosophy of Art' (1880); 'The Present Phase of Woman's Advancement' (1880); 'Science as the Basis of Morality'; 'The Web of Life,' a collection of poems, (1895).

Bristol, Conn., a town in Hartford County, on the New England R.R., 17 miles west of Hartford. It has a public library, electric light and street railroad plants; national and savings banks; manufactories of clocks, brass goods, table ware, tools, bells, woolen and knit goods. It was incorporated as a borough in 1893. Pop. (1900) 6,268.

Bristol, a city of England, situated partly in Gloucestershire, partly in Somerset, but forming a county in itself. It stands on the confluence of the rivers Avon and Frome, whence the Avon pursues a course of nearly seven miles to the Severn. The Avon is a navigable river and the tide rises in it to a great height. Bristol is 118 miles due west from London, or two hours by rail. It stands partly on a number of eminences, partly on the lower ground at their foot. The manufacturing and business parts are on the lower levels, while the hills are now almost wholly covered with private houses. The districts of Clifton, Redland, and Cotham, situated within the limits of the borough and in the midst of charming scenery, are studded with mansions and villas, the attractions of these portions of the city being greatly increased by the Clifton and Durdham Downs. The bed of the river Avon is situated about 315 feet below the summit of Clifton Down, from which a handsome suspension bridge is thrown across the river, uniting the two counties. Its length from the centres of the piers is 703 feet, its height above high water mark 245 feet.

Area.—By the Boundaries Extension Bill of 1904 the city covered an area of 17,004 acres, and contained an estimated population of 364,000 with a ratable value of £1,820,683. As compared with the period of the Municipal Corporations Reform Act of 1835 when the area was increased from 755 to 4,461 acres, it will be seen that the size of the city has increased nearly fourfold in less than three-quarters of a century.

Geology.—The geological features of Bristol are of varied interest. Within a radius of five miles a complete series of rocks from the upper part of the old red sandstone to the top of the coal measures, and from the new red sandstone to the inferior oolite, is directly accessible to study in numerous quarries, and the fine cliffs of the Avon Gorge. The geology of Bristol may be studied in the 'Memoirs of the Geological Survey for 1876' in Sanders's Geological Map of Bristol, and in the Geological Survey Maps.

Churches, Hospitals, Etc.—Bristol is rich in ancient architecture, both ecclesiastical and domestic. The Cathedral, founded in 1142, was originally an abbey church. It exhibits various styles of architecture, the chapter house and its vestibule being Norman; the Lady chapel early English; the chancel and choir, the Berkeley and Newton chapels decorated; the groining of the transepts, the central tower, and cloisters perpendicular. The nave, its aisles, and western towers are modern additions, having been erected at intervals since 1865. There are several fine old churches, but they are all excelled by Saint Mary Redcliffe, perhaps the finest parish church in the kingdom. It is commonly said to have been founded by Simon de Burton, about 1293, but part of it is considerably older than this, and is believed to be

BRISTOL

as old as 1200. It is cruciform, with western tower and spire. The western door is the principal entrance, but there are also porches on the northern and southern sides. The south porch, the south transept, the tower, and much of the lower part of the church belong to the decorated style, and the north porch is an excellent specimen of it, the interior in particular being very beautiful. The remainder of the church, including the Clerestory, is of the Perpendicular Period. William Canynge, five times Mayor of Bristol, whose name is so prominent in the Chatterton controversy, is said to have restored this church about 1445-7. Other churches worthy of mention are Temple Church, with its leaning tower; Saint Stephen's, All-Saints', Saint Mary-le-Port, Saint Philip's, Saint James, and Saint John. Under the tower of this last church was one of the entrances to the ancient City of Bristol, and the gateway still exists. The Independents, Baptists, and Wesleyans have some noteworthy chapels. The Roman Catholics have a pro-Cathedral in Clifton, and several chapels and convents; altogether between 200 and 300 separate buildings in the city are dedicated to the cause of christianity.

Saint Peter's Hospital adjacent to the church of Saint Peter, the seat of the poor law administration, is a very fine example of early domestic architecture. The buildings of various banks, and insurance offices in Corn street and Clare street are worthy of notice from a modern architectural point of view.

Libraries.—The most modern public building is the Bristol Central Library adjoining the Bristol Cathedral, completed in 1906, from designs by Mr. Percy Adams, F. R. I. B. A. A public library existed in Bristol early in the 15th century, and as no other record can be found of any such library prior to this in any part of England, the claim of the earliest in the kingdom must belong to Bristol. The Library was that of the Kalendars, a brotherhood of clergy and laity who were attached to the Church of All-Hallows or All-Saints', still standing in Corn street. In 1613 the existing City Library was founded. Dr. Tobias Mathew, Archbishop of York at this time gave a number of books, to which he added subsequently a considerable portion of his library "for the free use of merchants and shopkeepers of the city." In 1740 the building still standing in King street was erected, minus the wing. In 1874 the Public Libraries Act was adopted and two years later the building was opened under the Act as the Bristol Central Library. The year 1906 saw the opening of the New Central Libraries in Cottage Green, a palatial building erected by the munificent bequest of a wealthy citizen, Mr. Vincent Stuckey Lean. The salient features of the historic King Street Library are preserved in this building in the "Bristol Library," an apartment exactly reproducing the original room in King street with the self-same old oak presses and wonderfully carved chimney piece of Grinling Gibbons. Here are shelved books dealing with the history of the city; the books of Archbishop Mathew, and other notable gifts of books by Bristol citizens, amongst them being the Collectanea of Proverbs, Folk lore, etc., collected by Mr. Vincent Stuckey Lean and presented to the city by

his executors. This collection is made accessible by means of an exhaustive catalogue compiled under the direction of the City Librarian of Bristol, Mr. E. R. Norris Mathews, F. R. Hist. S. F. R. S. L.; the early printed books and illuminated MSS. being separately catalogued. The public library movement in Bristol has advanced with rapid strides from small beginnings. The system is extended by means of commodious branches to all parts of the city, nine branches serving respective wards and circulating 750,672 volumes in the course of a year, whilst the various newsrooms and reading rooms are visited annually by a number of persons exceeding 2,500,000.

Art Galleries.—The Bristol Art Gallery was presented to the city by Sir William Henry Wills, now Lord Winterstoke. The building adjoins and communicates with the museum and was opened to the public in February, 1905. Internally a large and lofty top lighted central hall is surrounded by rooms on the ground floor devoted to the display of antiquities, a spacious marble staircase leads to picture galleries which form a splendid suite of communicating apartments.

Museum.—The Bristol Museum, originally a private proprietary institution, became the property of the citizens of Bristol in 1893. It is especially rich in objects illustrative of mineralogy, geology and palæontology; no less than 200 "types" and figured fossils are preserved here, described by such men as Agassiz, Riley, Stutchbury, Fitton, Huxley, Owen, and many others. The zoological collections are likewise of importance.

Electric Lighting.—The Bristol Corporation is responsible for the electric lighting of the city. The first instalment of public street lighting in 1893 consisted of 96 lamps, the total number now is 677 arc lamps. For private lighting purposes the demand has reached the total of 185,897 lamps. The use made of electricity for power purposes is increasing rapidly. The electric tramways of Bristol are controlled by a private company. The overhead trolley system is in use, and a service of motor cars has recently been instituted to connect the sections, and to open up outlying districts.

Industries, Etc.—Bristol has long been famous for its glass works, potteries, soap works, tanneries, tobacco factories, chocolate factories, and chemical works, as well as for ship building and machinery yards. Coal is found and worked extensively within the limits of the borough. Bristol carries on an export and import trade with all parts of the world. Cereals and flour are the most important imports, others being cheese, butter, bacon, cattle, sugar, timber, petroleum, hides. The total value of imports and exports in 1905 was \$14,776,044. The total tonnage entered and cleared at Bristol in 1905 was 2,084,503. The present dock system comprises a dock of 10 acres at Avonmouth on the Gloucestershire bank of the Avon, and of 12 acres (deep water area) at Portishead on the Somerset bank of the river, two miles below Avonmouth; and a floating harbor of 70 acres in the heart of the city. The latest enterprise in dock construction is that of the Royal Edward Dock at Avonmouth which covers an area of 30 acres, and provides accommodation for vessels much larger than

BRISTOL

any afloat. The first sod was cut on 5 March 1902; it was opened in 1908. The depth of water on the inner sill is at mean spring tides 40 feet and at mean neap tides 30 feet. The length of the dock is 1,120 feet and the width 1,000 feet. The entrance lock is 875 feet long, and 100 feet wide. On each side are piers at which steamers land mails and passengers, who reach London over an almost straight line in 2½ hours. Bristol traders colonized Newfoundland and established commerce with the West Indies and the American colonies. The city has long been known for its ship building interests, and the Great Western, the first steamship to cross the Atlantic, was built at Bristol in 1838. A United States Consul is stationed here.

Education.—The principal institution for the higher education is the University College, opened in 1876, and having a medical school attached to it. A movement is on foot to make it the central seat of learning for the West and South of England with the power of conferring degrees. The university claims the honor of being the first to open its door to women students.

The Grammar School dates from pre-Reformation days. In 1532 it was endowed by Robert and Nicholas Thorne. The Cathedral School likewise dates back to the Reformation, it being part of the Cathedral Corporation established by Henry VIII. in 1538. The City School, or Queen Elizabeth's Hospital for boys, was founded in 1586, and owes its existence to John Carr, a wealthy Bristol citizen. The Red Maids School for girls is the foundation of Alderman Whitson by bequest in 1627. The Clifton College, opened in 1862, has for many years ranked high as an English Public School. The College buildings and grounds occupy a large area East of Clifton Downs. The Merchant Venturers' Technical College was originally a trade school. In 1875 the endowed schools commissioners appointed the Society of Merchant Venturers as trustees. The building—a monument to the liberality of that society—was almost totally destroyed by fire in October 1906, and is now in course of re-erection. Other educational establishments are: The Clifton, and the Redland High Schools for girls; Clergy Daughters' School; about 45 Council schools directed by the education committee of the Bristol Corporation, inclusive of three higher grade and science schools; a day industrial school; a school for cookery; truant school; and an institution for the deaf and dumb. The Congregationalists erected in 1906 a commodious college building at Cotham for the training of students for the ministry.

Charity.—The charitable institutions of Bristol are so numerous and of such importance that adequate mention of them here is impossible. The invested funds devoted to charitable work yield a revenue exceeding \$300,000 per annum, which sum supports almshouses, asylums, homes, and schools, and provides for pensions and gifts of all descriptions. The name most familiar in a long list of benefactors is that of Edward Colston, whose name is handed down to successive generations by three great commemorative societies instituted to perpetuate his grand philanthropy. These societies are instrumental in raising funds by voluntary

subscriptions amounting to upwards of \$15,000 per annum. The charities, formerly regulated by the Corporation, are now by decree of the Charity Commissioners, administered by trustees. The Merchant Venturers' Society, which, as early as the 7th year of Edward IV., claimed to be an ancient guild, has endowed and supports others, whilst denominational bodies are mainly responsible for the remainder, one of the most remarkable being the Ashley Down Orphanages, founded in 1830 by the Rev. George Müller.

Government.—The city is governed by a Council consisting of 22 aldermen, and 66 councillors, the former being elected for a term of six years, and the latter for a term of three years, agreeably with the provisions of the Municipal Corporations Act. The Mayoral list of Bristol extends in unbroken sequence from the year 1216, when «the King (Henry III.) with his counsellors and tutors came to Bristol as to a safe place, at which time he permitted the town to choose a Mayor after the manner of London.» In June, 1899, or more than 600 years after the institution of the office, Queen Victoria was graciously pleased to direct that the Mayor of the City of Bristol should in future bear the style and title of Lord Mayor.

History.—The celtic name of Bristol was *Caer Oder*, or the City of the Chasm (namely, through which the Avon flows). The name Bristol is derived from the Anglo-Saxon *bricg*, a bridge, and *stow*, a place. It was early a place of commerce. Between 1239 and 1247 a new channel was dug from the Frome in order to provide better accommodation for shipping. In the reign of Edward II. Bristol rebelled against the royal authority and was held by the citizens against the sovereign for four years. In 1373 it was constituted a county of itself, by Edward III. It was made the seat of a bishopric by Henry VIII. in 1542. During the Civil War between Charles I. and the Parliament it declared in favor of the latter, but was stormed and taken by the Royalists under Prince Rupert. After the battle of Naseby it was taken by Fairfax, and its formidable castle was razed to the ground. In 1831 the Reform agitation gave origin to riots that lasted for several days. The rioters destroyed various public and private buildings, among which was the bishop's palace, and a number of them lost their lives. Bristol was united as a bishop's see to Gloucester in 1837. The first bishop of Bristol and Gloucester united was James Henry Monk, created in 1837. By the Bristol Bishopric Act Bristol was again separated from Gloucester, and Dr. Forrest Browne was enthroned, 28 Oct. 1897. Sabastian Cabot, Chatterton, and Southey were natives of Bristol. The city returns four members to Parliament.

E. R. NORRIS MATHEWS,
L. ACKLAND TAYLOR.

Bristol, N. H., a town in Grafton County, 32 miles north from Concord. It is at the junction of the Pemigewasset and New Found rivers; is the terminus of the Bristol branch of the Boston & M. RR., and has become a place of summer resort. It has a public library, and flannel, wooden ware, and paper manufactories. Pop. (1900) 1,600.

Bristol, Pa., a borough in Bucks County; on the Delaware River, the Pennsylvania RR., and the Pennsylvania Canal; 21 miles northeast of Philadelphia. It has a national bank, high school, electric light and street railroad plants, a noted mineral spring, and manufactories of carpets, hosiery, and foundry products. It is in a rich fruit and truck farming region, and is the centre of considerable trade. It was originally called Buckingham, and was settled in 1681. A ferry connects it with the town of Burlington on the New Jersey side of the Delaware. Pop. (1900) 7,104.

Bristol, R. I., a town and county-seat of Bristol County, on Narraganset Bay, and the New York, N. H. & H. R.R., 15 miles southeast of Providence. It has an excellent harbor, facilitating a large daily passenger and freight service for Fall River and Providence. It is the seat of the widely known Herreshoff ship-building works, where a number of noteworthy sailing and steam yachts and torpedo boats have been constructed; and also of the Saunders & West yacht-building yards. The town has a handsome brown stone library building containing some 15,000 volumes, eight churches, 17 public schools, large market gardening and coast trade interests, and manufactories of rubber, woolen, and cotton goods. Bristol is the site of the residence of King Philip, the great Narraganset chief. Pop. (1900) 6,901.

Bristol, Tenn. and Va. (post-office, Bristol, Tenn. or Va.), a city in Sullivan County, Tenn., and Washington County, Va., adjoin and to all intents and purposes are one place, the centre of State street being the boundary line between the two States, running due east and west. Bristol is the centre of several railroads and is contiguous to the great coal, iron, and timber regions of Southwest Virginia, East Tennessee, Western North Carolina, and Eastern Kentucky, and is the seat of King College (Presbyterian), for males; Sullins College (Southern Methodist), and Virginia Institute (Baptist), for girls; Bristol Normal College for colored people (Presbyterian), and six public schools, three on each side of the town, four white and two colored. Bristol is principally engaged in the manufacture of furniture, leather, flour, lumber, iron, staves, wood pulp, barytes, bark extract, and patent medicines, with a number of smaller industries. Bristol is situated in a beautiful valley surrounded by lofty mountains, is 1,760 feet above the sea level, and is the headquarters for two railroads, V. I. C. & C. Co., three daily newspapers, thirteen wholesale houses, and has a Government building. The present city charter provides for two city councils, one for each State, and a mayor, elected biennially. Pop. (1900) 9,850.

A. C. SMITH,
Editor *(Bristol News.)*

Bristol Bay, an arm of Bering Sea, lying immediately to the north of the peninsula of Alaska. It receives the waters of two large

lakes, by which communication with the interior is opened up for a considerable distance.

Bristol Brick, or **Bath Brick**, a kind of brick used for cleaning steel, manufactured for some years exclusively in Bridgewater and Bristol, England. A small vein of the sand required for this purpose was found near Liverpool, but was soon exhausted. One of the owners or operatives, who had been concerned in the works at Bristol, visited the United States in 1820, where by accident he discovered that the same kind of sand which was used for the Bristol bricks might be procured at South Hampton, N. H. Since that period, bricks fully equal to the imported article have been manufactured in this country.

Bristol Channel, an arm of the Irish Sea, extending between the southern shores of Wales and the western peninsula of England, and terminating in the estuary of the Severn. It is about 90 miles long, and from 15 to 50 miles wide. It is remarkable for its high tides and the rapidity with which they rise. At Chepstow spring-tides rise as high as 60 feet. On its coast are situated the towns of Cardiff, Swansea, Ilfracombe, Tenby, etc. It receives the waters of the Usk, Severn, Wye, Avon, Parrott, Taw, and Torridge rivers. At the entrance of the channel is Lundy Island.

Bristow, Benjamin Helm, American lawyer: b. Elkton, Ky., 20 June 1832; d. 22 June 1896. He was admitted to the bar in Kentucky in 1853. He served with distinction in the Civil War, and at its close was appointed United States district attorney of Kentucky. In 1874 he became secretary of the treasury, and made his name memorable by the exposure and prosecution of a notorious whiskey ring. He removed to New York in 1876, and had an extensive legal practice there.

Bristow, George Frederick, American musician: b. Brooklyn, N. Y., 1825; d. New York, 1898. From 1851 to 1862 he was the conductor of the New York Philharmonic Society, and later of the Mendelssohn Union. The greater part of his life was spent as an organist in the churches, and as a teacher in the public schools of New York. He wrote 'Rip Van Winkle,' an opera produced in New York 1855; 'Daniel,' an oratorio (1867); 'Arcadian Symphony' (1874); and 'The Great Republic,' a cantata (1880).

Bristow, Joseph L., American politician: b. Flemingsburg, Ky., 1859. He was educated for the ministry, but became editor of the *Salina, Kan., Republican*, and soon after entered politics. He was secretary of the Republican State Committee in 1896, and in 1898 was appointed fourth assistant postmaster-general. In 1900 he became active in exposing frauds in the post-office department.

Bristow Station, now **Bristoe**, Va., a village in Prince William County, four miles southwest of Manassas Junction. On 27 Aug. 1862 a drawn battle took place here between the Federal army under Gen. Hooker, and a Confederate one under Gen. Early, and on 14 Oct. 1863, the Federal troops under Gen. Warren repulsed with severe loss a Confederate attack under Gen. A. P. Hill.

Britain. See GREAT BRITAIN.

Britain, Ecclesiastical History of, by the Venerable Bede, or Bæda (673-735). Bede was

by far the most learned Englishman of his time; one of the greatest writers known to English literature; in a very high sense "the Father of English History"; an extensive compiler for English use from the writings of the Fathers of the Church; an author of treatises representing the existing knowledge of science; and a famous English translator of Scripture. A recent authority calls him "the greatest name in the ancient literature of England"; and Green's 'History' says of him: "First among English scholars, first among English theologians, first among English historians, it is in the monk of Jarrow that English literature strikes its roots. In the 600 scholars who gathered round him for instruction, he is the father of our national education." It was in point of view and name only that Bede's great work was an ecclesiastical history. It covered all the facts drawn from Roman writers, from native chronicles and biographies, from records and public documents, and from oral and written accounts by his contemporaries. It was written in Latin; first printed at Strasburg about 1473; King Alfred translated it into Anglo-Saxon; and it has had several editions and English versions in recent times.

Britain, New. See NEW BRITAIN.

Britan'nia, the ancient name of Britain. Under the name of Britannia, Great Britain is personified as a helmeted woman seated on a globe or an insulated rock, leaning with one arm on a shield, and the other grasping a spear or trident.

Britannia Metal, an alloy that has come into very general use in modern times, many domestic utensils, such as spoons and teapots, being made of it. Such articles are commonly electro-plated, and made to resemble real silver. It consists chiefly of tin and antimony, but often contains also a small quantity of copper, zinc, and bismuth. A common proportion is 140 parts of tin, three of copper, and nine of antimony; but the best alloy is composed of 90 parts of tin and 10 of antimony. The copper is used mainly to impart color to the combination. The manufacture of the metal was introduced into England about 1770. Queen's metal is one of the varieties of Britannia metal.

Britannia Tubular Bridge, an iron tubular bridge across Menai Strait, which separates Anglesea from Wales, about one mile from the Menai suspension bridge. It has two principal spans of 460 feet each over the water, and two smaller ones of 230 feet each over the land; constructed 1846-50. See BRIDGE.

Britan'nicus, the son of the Roman emperor, Claudius, by Messalina: b. about 42 A.D.; poisoned 55 A.D. He was passed over by his father for the son of his new wife Agrippina. This son became the Emperor Nero, whose fears that he might be displaced by the natural successor of the late emperor caused him to murder Britannicus.

British America, the general name for the whole northern part of the North American continent beyond the territory of the United States. It extends from lat. 41° to 78° N., and from lon. 52° to 141° W. The frontier line between British America and the United States was determined by the conventions of 1830 and 1846. It is bounded east by the Atlantic Ocean, Davis Strait, and Baffin Bay; north by the

Arctic Ocean; northwest by Alaska; west by the Pacific Ocean; and south by the United States. In its broadest sense British America includes Upper and Lower Canada, the Hudson Bay, and Northwestern territories, Nova Scotia, Newfoundland, Cape Breton, Prince Edward Island, and New Brunswick, with Vancouver Island in the Pacific, but all British possessions on or near the American continent. Each of these will be treated under its own title.

British Association for the Advancement of Science, a society first organized in 1831, mainly through the exertions of Sir David Brewster. Its first meeting was held at York, 27 Sept. 1831. Its objects are thus described in the preamble to the rules of the association: "To give a stronger impulse and a more systematic direction to scientific inquiry; to promote the intercourse of those who cultivate science in different parts of the British empire with one another and with foreign philosophers; to obtain a more general attention to the objects of science and a removal of any disadvantages of a public kind which impede its progress." The second meeting took place at Oxford in 1832, under the presidency of Dr. Buckland, and since then a meeting has been held every year up to the present. All the principal towns of the United Kingdom have on one or more occasions formed the place of rendezvous, a different locality being chosen every year. In 1884 the meeting took place at Montreal, in 1897 at Toronto, and in 1902, the 72d annual meeting was held in Belfast, Ireland. The meeting for 1903 will be held at Southport and that for 1904 at Cambridge. The sittings extend generally over about a week. The society is divided into sections, which, after the president's address, meet separately during the sittings for the reading of papers and conference. Soirees, conversaciones, lectures, and other general meetings are usually held each evening during the meeting of the association. The sections are: A. Mathematics and Physics; B. Chemistry; C. Geology; D. Zoology; E. Geography; F. Economic Science and Statistics; G. Mechanical Science; H. Anthropology; I. Physiology; K. Botany; and L. Educational Science. Local committees are formed to arrange for meetings, etc. The important national benefits conferred by the labors of various members of the association have long been duly recognized. Among these may be mentioned more especially the experiments on electricity and magnetism which have achieved such important consequences in the establishment of the electric telegraph and a more thorough knowledge of the laws which govern the weather and other meteorological phenomena. In mechanical science also the labors of members of the British Association have been productive of the most important results. As the funds which the society collects at each meeting are more than sufficient to cover its expenses, it is enabled each year to make direct grants for the pursuit of particular scientific inquiries, which otherwise could not be conducted so efficiently, if at all; but besides this direct encouragement, its indirect influence on the promotion of science is undoubtedly great in many ways. Among the presidents of the association have been many distinguished men, including Dr. Whewell (1841), the Earl of Rosse (1843), Sir John Herschel (1845), Sir R. Murchison (1846), Sir

BRITISH CENTRAL AFRICA PROTECTORATE—BRITISH COLUMBIA

David Brewster (1850), Sir George Airy (1851), Sir Richard Owen (1858), Prince Consort (1859), Lord Armstrong (1863), Sir Charles Lyell (1864), Sir J. D. Hooker (1868), T. H. Huxley (1870), Lord Kelvin (1871), J. Tyndall (1874), Sir John Lubbock (1881), Lord Rayleigh (1884), Lord Playfair (1885), Sir William Huggins (1891), Sir A. Geikie (1892), and Sir W. Crookes (1898).

British Central Africa Protectorate, The, a portion of British Central Africa, lying around the shores of Lake Nyassa, and extending to the banks of the Zambesi. It includes all British Nyassaland, as well as the Shire Highlands, and the greater part of the basin of the river Shire. The expenses of administering the Protectorate are partly met out of revenue locally raised, and further by an annual grant from the Imperial government. The administration is in the hands of a commissioner acting under the foreign office. The port of British Central Africa is Chinde, at the mouth of the Zambesi, where a small concession has been granted by the Portuguese government. The area of the Protectorate is about 40,000 square miles; the European inhabitants number about 500, and the native inhabitants are about 850,000.

The principal occupation of the European settlers is planting; and many thriving plantations of coffee, sugar, cinchona, and tobacco have been established. The chief towns, Blantyre, Zomba, Fort Johnston (the principal port on Lake Nyassa, and naval depot), Karonga (north end of Lake Nyassa), the starting point for Tanganyika, and Kotakota (west coast of Lake Nyassa). The Protectorate is divided into 12 districts, managed by a number of collectors and assistant collectors, judicial officers, etc. There is at least one judicial officer, and in some cases two or three, in each district. Almost the entire trade of British Central Africa is with the United Kingdom. There is telegraphic connection through Umtali with the South African system.

Bibliography.—Scott Keltie, 'The Partition of Africa' (1895); Deele, 'Three Years in Savage Africa' (1897); Johnson, 'British Central Africa' (1897).

British Columbia, the most westerly province of the Dominion of Canada, lies on the Pacific Ocean, and has a series of coast-line fiords or passages unexcelled on any shore in the world. The province extends from south to north from lat. 49° N. to lat. 60° N. Its eastern boundary follows the crest of the Rocky Mountains as far as 55° N. and then follows lon. 120° W. up to lon. 60° N. British Columbia has an area of some 383,000 square miles, being thus more than three times the extent of the British Isles.

Climate.—The climate of British Columbia is as varied as the terrane. The Japan current on the Pacific Ocean acts in the same way as the Gulf Stream on the Atlantic, and makes a mild, though at certain seasons a very wet, climate. The writer has seen roses blooming in the garden at Christmas in Victoria. But the damp breezes from the Pacific Ocean having deposited their moisture on the west slope of the Coast Range pass over eastward as dry Chinook winds, so that 150 miles from the coast regions are found the Okanagan and

Thompson River valleys where irrigation is required. As water is plentiful on the mountain slopes, fruit growing is carried on successfully in this irrigated region. Every variety of climate is thus obtainable in British Columbia, from the humid flats of the Pacific islands to the dry plains of the interior, and then to the icy cold and perpetual snow of the Rocky Mountain slopes. The valleys thus grow cereals in some parts, on the lower lands luxuriant grasses, and fruit of every kind in many places. The climate of Victoria, on Vancouver Island, has the balmy and delightful sweetness of the Lotus-Eaters' land.

Physical Geography and Mining.—The greater part of British Columbia is made up of mountains, including the Rockies and Selkirks on the east and the Coast and Island ranges on the west, with an average height of about 8,000 feet. To the west of the great ranges there is a wide and elevated plateau in which is to be found chief agricultural areas. From and through these great mountains run a variety of large rivers—the Columbia, the Fraser, the Skeena, the Stikine, the Liard and the Peace. Naturally the initial resources and development of such a region would be minerals, timber, fish and similar products. The total mineral products of the province up to and including 1904 has been \$226,201,851. The first gold production was in the placer-mining period from 1862 onwards, when the banks of the "golden" Fraser and other creeks or rivers yielded some \$50,000,000. Then commenced (about 1895) the serious lode mining which is now running into the five millions yearly. The total production of placer and lode gold up to the end of 1904 was \$98,255,359; that of silver \$21,716,870; of lead \$12,559,139; of copper \$21,381,791; of coal and coke \$68,274,893; of other minerals \$4,013,799. The total production of the mines in 1895 was \$1,266,954; in 1900 it was \$4,732,105; in 1904 it was \$5,747,000.

The country is divided into districts. Kootenay has an area of 15,000,000 acres and contains a large amount of agricultural land requiring, however, irrigation. The name is synonymous with the idea of mineral wealth and its mountains are rich in gold, silver, coal, lead and copper. In the last few years a number of towns have grown up around and in connection with these mines—Revelstoke, Nelson, Kaslo, Rossland, Trail, New Denver, Sandon, Slocan City, Fernie, etc. Yale has about the same area and includes the rich valleys of the Okanagan, the Nicola, the Similkameen and the Kettle River country. It has large cattle ranges and fruit farms as well as the Boundary mineral region. Lillooet contains some 10,000,000 acres, is bisected by the Fraser River, and well adapted for cattle raising and dairying. Big game is common and there is still some placer mining. Westminster is about half the size of Lillooet and includes the Fraser River valley, which has the second largest compact area of agricultural land in the province. Lumbering is an important industry and salmon-canning its best known business. Cariboo has about 93,000,000 acres and was the centre of the great placer mining excitement of the sixties, when so much gold was taken out of its creeks. Hydraulic enterprises are in process of development and some

BRITISH COLUMBIA

half a dozen companies are now operating upon a large scale. Cassiar has 105,000,000 acres and is largely unexplored. There have been gold discoveries, however, in Omenica, in the vicinity of Dease Lake and recently in the Atlin country. Comox includes the northern part of Vancouver Island and contains the chief logging camps of the province. It is rich in timbers, fish, minerals and agricultural land, though, as yet, very sparsely populated. This latter description, outside of Victoria and its vicinity, will apply to the whole of Vancouver Island. The gross output of its collieries in 1904 was 1,023,013 tons.

Lumber and Fishing.—The timber resources of British Columbia are enormous and include birch, hemlock, cedar, maple, oak, spruce and pine. The trees are large in size and the Douglas pine is, in particular, an important native product. Up to 1871 the lumber cut of the province was estimated at 250,000,000 feet and from 1871 to 1888 at 595,000,000 feet. In the latter year there were 25 saw-mills with an area under lease of 135,063 acres and a lumber cut of 31,868,884 feet; in 1898 there were 45 saw-mills with a leased area of 1,576,000 acres and a cut of 124,546,658 feet; in 1902 there were 105 mills, an area under lease of 453,251 acres, and a product of 281,945,866 feet, with a net revenue to the province of \$215,275. The shipments abroad in 1902 were 57,121,435 feet, while, in 1904 the two great milling concerns—the Hastings and the Chemainus saw-mills—shipped a total of 43,033,782 feet, worth \$535,545. The chief subject of complaint for some years past in connection with the lumber industry has been the United States duty of \$2.00 per 1,000 feet which Canadian concerns have to face while their own markets are free to American dealers.

The fisheries of the province are also extensive and resourceful. In 1902 the salmon pack of the Fraser River was 327,095 cases; of the Skeena River, 154,875 cases, of other rivers and inlets 144,012 cases—a total of 625,982 cases. For various reasons, however, the industry has not been a growing one of late years. In 1896 the yield was 601,570 cases, in 1897 it reached the point of 1,015,477 cases; in 1901 the production was 1,236,156 cases; in 1904 it was only 465,849 cases. But the waters of British Columbia teem with many other kinds of fish, including halibut, black-cod, the oolachan, cod and bass, sturgeon, shad, oil-fish, white fish and trout. The total value of the yield of its fisheries between 1876–1903 was \$75,000,000; the yield in 1903 alone was valued at \$4,748,365. In this connection the sealing industry has a greater place in international discussion than it holds in local production. From 1871 to 1903 the total result of Canadian pelagic sealing was 798,109 seal skins. The number of seals killed in 1883 was 9,195; in 1893, 70,592; in 1903, 20,496.

Miscellaneous Affairs of the Province.—The imports of the province in 1903 were \$11,141,068, and in 1905 \$12,565,019. The exports were, respectively, \$15,604,896 and \$16,677,882. The revenues of British Columbia in 1902–3 were \$2,044,630 and the net expenditure \$3,393,182. In 1903–4 they were, respectively, \$2,638,260 and \$3,030,237. Between 1892 and 1903 the total revenues were \$16,121,785 and the expenditures

\$24,743,377. The provincial liabilities on 30 June 1904 were \$11,382,786, incurred largely in the development period of a country whose riches had not been made easily accessible by nature. The area of British Columbia is, in acres, 236,922,177, the number of houses, according to the census of 1901, was 36,938, the families, 38,445, the male population 114,160, and the females 64,497. As to origin 104,589 were English, Irish or Scotch, 25,488 were Indian and 19,482 Chinese or Japanese. There were 10,088 persons classed as "Americans" in the province and 17,164 who had been born in the United States. The Church of England had 40,689 adherents, there were 25,047 Methodists, 34,081 Presbyterians, 33,639 Roman Catholics and 10,027 Buddhists. The rural population was 87,825 and the urban 89,447. The chief railway is, of course, the Canadian Pacific Railway, with various branch lines, but the Grand Trunk Pacific will enter the province within a few years, the Great Northern of the United States has already reached Vancouver, and the Canadian Northern expects to cross the mountains before many years. Other and small lines are under construction or being actively promoted. The annual income of the province is placed at \$51,801,119 divided as follows: Fisheries, \$4,546,377; animals, \$14,987,174; forest and furs, \$2,835,555; farm dairy products, \$1,240,226; field crops, \$3,100,577; fruits and vegetables, \$453,938; wool, \$8,288; eggs, \$426,629; manufactures, \$24,202,355.

Early History and the Hudson's Bay Company.—When Sir Francis Drake sailed up and down the Pacific coast of North America in 1578–9 and took possession of what is now the State of California, in the name of Queen Elizabeth, he is said to have sailed as far north as the entrance of the Strait of Juan de Fuca. In 1592 the Spaniard whose name is borne by those straits entered them and sailed a good distance up the Strait of Georgia, between Vancouver Island and the mainland of British Columbia. Juan Perez, another Spaniard, in 1774 and Behring, the Danish navigator, in 1748, touched at points of this territory. But it remained for Captain Cook in 1778, under instructions from the British government, to really explore its coasts and give names to places since well known to history.

Other explorers followed—Hanna, Meares, Portlock, Dixon, Haro, Duncan and Barkley—until in 1792 Captain George Vancouver came with instructions to carry out a thorough survey of the intricate coast lines of the future province. After this period, for many years, Great Britain ceased to show any interest in the country. To the aggressive, enterprising traders of the Hudson's Bay Company was due the fact that the British flag was kept flying at all and that it was not eventually replaced by that of the United States, as in Oregon and Washington. In this connection the arrival of the company's steamer *Beaver* by way of Cape Horn, in 1835, marked an important era in the history of the province. Of the overland explorers the chief were Sir Alexander Mackenzie, 1793, Lewis and Clark, 1804–6, Thompson in 1807, Simon Fraser in 1808, the Astor expedition of 1810–11. From this time until the middle of the 19th century the history of what was

BRITISH COLUMBIA

then called New Caledonia is a record of Hudson's Bay fur-trading, occasional international or inter-company disputes, the building of dozens of forts, the maintenance of law and order amongst the Indians. Exclusive trading privileges were given the company in 1838, Alaska was leased by it in 1839, the Oregon boundary was fixed in 1846, and Vancouver Island was ceded in 1848 for a brief period.

Gold Discoveries and Early Constitutional History.—In 1858 a rumor reached San Francisco that gold had been found in the Fraser River. A party left at once for that region and the result of their success was a stampede from the Pacific coast city to the golden banks of the Fraser. The Horsefly discoveries and the rich bars of the Quesnelle, were the next attractions. In 1861, the celebrated Williams' Creek was found and turned out to be one of the richest discoveries of the kind in history. Many claims paid dividends of from \$20,000 to \$60,000 a year, and all its diggings paid well. One claim of 300 feet of ground produced \$300,000. For a time the placer mines of Cariboo repeated the history of California in 1849, and then came a gradual exhaustion, not, however, before some \$50,000,000 worth of gold had been extracted.

Meanwhile, and up to 1849, the government of Vancouver's Island and the mainland of New Caledonia had been that of the great fur-trading company under its royal charter of 1670. In 1849, however, special terms were made with the company as to Vancouver Island and it was declared a crown colony. A governor was appointed with a council of seven members and with authority to call an assembly elected by the inhabitants. This legislature, which first met in 1856, had full power to impose taxes and regulate affairs subject to and with the final assent of the governor. Mr. R. Blanshard was the first holder of this post, but from 1851 to 1856 the practical ruler of the country was Mr. (afterwards Sir) James Douglas, a man of remarkable character and capacity, and who combined in himself the functions of chief factor of the Hudson's Bay Company with those of acting—and from 1856 to 1864 actual—representative of the crown. On 17 Nov. 1866 the mainland, which was now known as British Columbia and had been under separate government since 1858, was united with Vancouver Island. The first legislature of the united province met in Victoria in 1868, though, as yet, it was only partially elective in composition.

Confederation with Canada.—During this period the British colonies on the Atlantic and on the great lakes of British America had combined in 1867, after prolonged agitation, in a confederated system. Ambitious extension had brought them, in 1869–70, the rights and territory of the Hudson's Bay Company in Rupert's Land and the western prairies. Further and greater ambition was expressed in current expectation of a transcontinental line to the Pacific coast. At this point British Columbia came into consideration. Isolated behind an apparently insuperable barrier of great mountain ranges and with vast plains stretching for 800 miles between those mountains and the outposts of Canadian civilization, union was a dream without the prospect of a railway. With it the subject became practicable.

After much discussion of the subject throughout the province, the passing of resolutions by the provincial legislature and prolonged consideration at Ottawa the terms of union agreed upon included six members in the House of Commons and three in the Senate; construction, to be commenced by the Dominion: within two years, of a railway connecting eastern Canada with the Pacific coast; a land grant from the province to the Dominion government through the entire extent of British Columbia for the railway and not to exceed 20 miles on either side of the line; payment in return of \$100,000 per annum to the province for the use of these lands; assumption by the Dominion of the charge of the Indians and their lands; complete responsible government and an entirely elective assembly to be established in the province whenever desired by the people. In November 1870 a provincial election was held and the terms of union approved. The new legislature met on 5 Jan. 1871, the proposals were unanimously ratified and, on 20 Jan. 1872, British Columbia entered confederation. The constitution was then re-organized upon a popular basis and in 1871, the elections under the new system took place.

Later Political Events.—Hon. J. W. Trutch was appointed the first lieutenant-governor and Hon. J. F. McCreight the first premier. Succeeding prime ministers were Amor de Cosmos, G. A. Walkem, A. C. Elliott, J. Walkem, Robert Beaven, Wm. Smithe, A. E. B. Davie, John Robson, Theodore Davie, J. H. Turner, C. A. Semlin, Joseph Martin, James Dunsuir, E. G. Prior and Richard McBride. Following the entry into confederation came prolonged and at one time acute differences with the Ottawa government over the non-completion of the Canadian Pacific Railway. For some eight years, while that great undertaking was in the struggling stages of inception and preliminary construction, the discontent in the province was very great. There were even threats of secession and talk of annexation to the United States. Meantime, however, construction went on slowly and surveys continuously. The imperial authorities were complained to and missions came from Eastern Canada and others went to London. Finally, Lord Carnarvon, as colonial secretary, suggested terms of settlement which were agreed to by both parties and which involved the construction and completion of the Canadian Pacific Railway by 1 Jan. 1891. It was completed in 1885. A visit of Lord Dufferin, as governor-general, to the coast in 1876 had, meantime, done much to smooth asperities and promote the settlement of this vexed and vital question.

Government.—British Columbia has a lieutenant-governor appointed by the Dominion government. The supreme court has a chief justice and four judges. There are six county court judges. The province is represented in the Dominion Parliament by three senators and seven members of the House of Commons. The local legislature consists of one chamber of 42 members. Victoria is the capital of the province. Its government building is among the finest in Canada.

J. CASTELL HOPKINS,

Author of 'Canadian Annual Review of Public Affairs.'

BRITISH EAST AFRICA—BRITISH EMPIRE

British East Africa, a name defining a vast district lying between German East Africa and the Italian protectorate of Somaliland. Its area is vaguely estimated to be over 1,000,000 square miles. The territory contains the valley of the Upper Nile and the mountainous region of equatorial Africa. The inhabitants comprise Bantu tribes, among which are the Waganda and Wangoro, Musai, and Galla tribes, Swahili on the coast, and negroes on the Nile. Ivory, gum, India rubber, sesame seeds, coconuts, copra, coir maize, rice, and hides are exported. The government is principally vested in the British East African Protectorate, but in 1894, Uganda (q.v.), north of Victoria Nyanza, was made a separate British protectorate and received a separate administration. The government is rapidly opening up the country, constructing roads and telegraphs, and taking steps to suppress slavery and the slave trade. The coast is unhealthy for Europeans, but most of the interior plateaus are salubrious. The British East African Protectorate extends for about 400 miles along the north coast from Umba at the mouth of the Umba River and has a total area of about 300,000 square miles. See EAST AFRICA, BRITISH; EAST AFRICA PROTECTORATE.

British Economic Association, a society established in London in 1890 with the design of advancing economic investigations through the medium of a quarterly styled 'The Economic Journal.' This periodical is the most valuable one of its class and is open to the expression of very diverse views upon economic questions. Viscount Goschen has been the president of the association from its founding. It gives an annual dinner in London, but holds no regular scientific meetings.

British Empire, the aggregation of states, dependencies, and controls which is subject in the last resort to the British Parliament. Officially it was not entitled to the name till 1876, when Queen Victoria assumed the title Empress of India; but the term was in current use long before. It is the largest body of land and of people under any one jurisdiction on the globe, comprising about one fourth of the earth's surface, and of its inhabitants: over 11,500,000 square miles, exclusive of Egypt, and Egyptian Sudan, or 12,500,000 with them, and 400,000,000 population. Extensive portions of it lie in each of the five grand divisions of the globe: about 121,000 square miles in Europe, 3,700,000 in America, 1,865,000 in Asia, 2,700,000 in Africa, 3,175,000 in Australasia. Its organization is entirely different from that of any other "empire" in history. The control of the central government over the outlying sections varies from its autocracy to their virtual independence; the most valuable parts are the least controlled, and have become the most valuable largely by that freedom. None of them pay any taxes into the imperial treasury, and the mother country derives her profit from them solely through trade relations, and as furnishing employment for the overflow of British youth. Indeed, movements for independence are forestalled by the concession of whatever privileges are claimed by the self-governing dependencies, even to the imposition of discriminating duties on British goods; and it is a postulate of British politics that no

forcible resistance shall be offered if any of these wishes to withdraw altogether.

The nucleus of the empire is the United Kingdom of Great Britain and Ireland, ruled nominally by a hereditary sovereign; actually by a parliament with one chamber popularly elected and the other composed of hereditary peers. Even the latter in practice always yields to the popular house when that body is firmly set on a given policy.

The subordinate portions fall under six classes: (1) Wholly self-governing communities: their sole ties to the mother country being an ornamental governor whose real functions are social and argumentative, the right of appeal from their supreme courts to the English Privy Council (even that curtailed in Australia), and the home government's nominal right of vetoing their laws, which, in fact, is never exercised. Canada, Australia, and Cape Colony are the chief exemplars. (2) Those where the home government appoints part of the legislative body as well as the governor. This is entirely composed of the Channel Islands, Malta, Cyprus, Ceylon, Mauritius, Jamaica, the Leeward Islands, British Guiana, and Rhodesia. (3) "Crown colonies," where the ruling body, an executive and council (sometimes two councils, executive and legislative), are wholly appointed by the home government, without local representation, and are directly responsible to the colonial secretary, except with India, the greatest of this type, which is under a special secretary of state and home council. Of the others, the chief are the new conquests of the Boer states (this form of government being avowedly provisional for them); the British settlements on the west coast of Africa—Sierra Leone, Nigeria, the Gold Coast, Gambia, and Lagos; the Straits Settlements, and Hong Kong; in America, British Honduras, Trinidad, the Windward and Falkland islands; in Australasia, Fiji. The titles of these imperial rulers and of the group following are various: governor, commissioner, high commissioner, resident, etc. (4) Those administered by a single official under the colonial secretary, without a council. Such are Gibraltar and Aden, Ascension (under the control of the admiralty); in Africa, Basutoland, Bechuanaland, and the protectorates of British Central and Eastern Africa, and British Somaliland—administered respectively by the consul-general at Zanzibar, a resident commissioner, and a consul-general at Berbera. (5) Government by a trading corporation, licensed and supervised by the home government, formerly the chief colonial system in Europe, and the only intelligible object of colonization. Great Britain has now but one dependency of this type: British North Borneo, where the company's governor must be confirmed by the colonial secretary. (6) Mere control of a native government by a resident commissioner, or power to interfere if judged advisable, or sometimes scarcely more than the marking out of a "sphere of influence" within which other nations are debarred from meddling. The chief types of this class are 50 or 60 native states of India, Zanzibar, Uganda, and the native states of the Malay peninsula. A seventh type is so peculiar that its *locus* is not usually classed as part of the British empire at all, although in fact one of the most firmly held and decisively administered:

1. City of Victoria from Parliament Buildings

2. House of Parliament

Egypt, where the province is nominally part of Turkey, the official position of Lord Cromer is consul-general and minister plenipotentiary, and the title of Great Britain to possession is that of surviving partner of an international financial control.

In detail, the components of the empire, the dates and method of acquirement, and the title by which they are held, are as follows:

Europe.—1. The United Kingdom. England in its modern sense, though much restricted toward the north, first owned a common overlord in 827; broken up by the Danes, it became a wholly Danish kingdom in 1013, again an English one in 1042, part of an Anglo-French system in 1066, and was practically restored to itself in 1214, with its northern limits as now. Wales was finally subjugated by Edward I., after a long war with Llewellyn ap Iorwerth, in 1284. Scotland, a kingdom owning overlordship to England, received a king by English arbitration in 1291, revolted and was conquered, revolted again and won its independence in 1314; with the accession of its king, James I., to the English throne in 1603 the two crowns were united, and in 1707 the Scotch parliament was abolished and Scotland incorporated with England. The Isle of Man, a Scandinavian lordship, was ceded to Scotland in 1266 and to England in 1290. The Orkneys and Shetlands were pledged by Denmark to James III. of Scotland in 1468, as security for his wife's dowry, and never redeemed. Ireland was invaded by Strongbow in 1169, and nominally annexed to England by right of conquest in 1172; but only a small cantele of it, "the Pale," was effectively occupied till the time of Elizabeth, and the island as a whole was first effectively subjugated by Cromwell. It was governed by its own parliament till 1800, when the Act of Union incorporated it with Great Britain. 2. The Channel Islands (Guernsey, Jersey, etc.), in the bay of Avranches off the French coast, are the sole remnants of the French possessions of the Angevin house. 3. The fortress rock of Gibraltar, and the small plain at its foot on which the town is built, were taken from Spain in 1704, during the war of the Spanish succession. 4. Malta, with Gozo, etc., islands south of Sicily, were taken from France in 1800, during the Napoleonic wars. Malta is the chief British naval station in the central Mediterranean.

Asia.—1. India, with Burma. For the component parts of this mighty possession, three fifths the size of the United States without Alaska, and for its government, see its name. Its nuclei were three factories of the East India Company: Fort St. George, now Madras, built 1639; Bombay, received from Portugal in 1662 as part of the dowry of Catharine of Braganza, queen of Charles II.; and Fort William, now Calcutta, founded by Job Charnock in 1686. The attempt of the French to build a colonial dominion on the ruins of the Mogul empire, in the 18th century, forced the company's local officers to act in self-defense; with the result that north-eastern India fell into their hands, the decisive event being the battle of Plassey (1757). Wars, cessions, annexations, protectorates, residencies, etc., have gradually brought all the rest of the peninsula under English control. The company ceded its rights to the English government in 1858. 2. Ceylon, the tip of the Indian peninsula, is independently governed. It was taken by England from the Dutch in 1796, during the

French wars, but not ceded to her till the Peace of Amiens in 1802. 3. Cyprus, an island south of Asia Minor: was ceded by Turkey in 1878, as a result of the Russo-Turkish war, in return for a treaty by which Great Britain agreed to defend Turkey against further territorial demands from Russia. 4. Aden, on the south coast of Arabia: was taken by the British in 1839 as a coaling station, in compensation for the maltreatment of shipwrecked British sailors by the natives. The island of Socotra to the east, off the mainland of Africa, was annexed in 1888; and the two—with Perim Island at the mouth of the Gulf of Aden, and the Kuria-Murias on the east coast of Arabia—form one administration, a dependency of the Bombay presidency. 5. The Straits Settlements: This group, comprising the end of the Malacca peninsula, was transferred in 1867 from the control of the Indian government to that of the colonial secretary. It consists of (1) Penang, formerly called Pulo Penang and later Prince of Wales Island, originally received by a British adventurer as dowry with a native chief's daughter, then turned over to the East India Company in 1786; (2) Malacca, occupied by the British in 1795, but not formally ceded to them by the sultan of Johore till 1824, along with (3) the island of Singapore, the capital of the whole. Some of the native Malaccan states are also under British protection. 6. Hong Kong, China, was occupied by the British in 1841, as a result of the opium war, and ceded to them in 1843. 7. Labuan, an island off Borneo, of which Great Britain obtained the cession in 1846, with great hopes of its coal mines and harbor not borne out by experience; it has also been a convict settlement. 8. British North Borneo, ceded to a commercial company by native sultans in 1877, but taken under British protectorate in 1888. 9. Brunei and Sarawak, southwest of the above, are governed by native rulers, but under British protection.

Africa.—1. Sierra Leone, on the west coast: was started as a settlement of freed negro slaves in 1787; transferred to the Crown in 1807. 2. The Gold Coast: settlement of 1672 by the Royal African Company, made a dependency of Sierra Leone on the dissolution of that company in 1822, formally ceded by the Dutch in exchange for trade privileges in 1872, and made a Crown colony in 1874. 3. Gambia: settlement united with Sierra Leone in 1822, like the Gold Coast; made a separate colony 1843, reunited to Sierra Leone 1868, then included in the British West African Settlements colony till 1888, when it was again made a separate colony. 4. Lagos, West Africa: the town was an old slave mart destroyed by the British in 1851; the colony was ceded to them by the native rulers in 1861. 5. Nigeria: the Niger coast protectorate was constituted in 1884, old trading rights having been previously exercised for generations; the present protectorate of Nigeria was set up 1 Jan. 1901. 6. Cape Colony: taken possession of as a derelict in 1796, the settlement having thrown off Dutch rule; administered for seven years, then returned to the Dutch; again captured in 1806, Holland having become part of Napoleon's empire; retained till the general peace of 1815, then bought from Holland for \$30,000,000. 7. Natal and Zululand: taken from the Dutch settlers and annexed 1843. 8. Basutoland: annexed to Cape Colony 1871, as the result of an appeal by the Basutos from the claims

of the Orange Free State; separated as a special protectorate 1884. 9, 10. The Transvaal and the Orange River Colony: conquered 1900. 11. Zanzibar and Pemba. Pemba was ceded to the British East African Company in 1888 by the sultan of Zanzibar. The latter island was given over to a German protectorate in 1886 by an Anglo-German convention; in 1890 transferred to England in exchange for the island of Heligoland off the German coast, possessed by England and a thorn in the German flesh. 12. East Africa protectorate: recognized by Germany and France in 1890, with that of Zanzibar, for considerations as above and trading rights, and the recognition of the French protectorate over Madagascar. 13. Central Africa protectorate: organized 1891 from the territories of the British South Africa Company. 14. Bechuanaland, constituted a protectorate over native South African tribes in 1895. 15. Rhodesia: the territories of the Royal South Africa Company, chartered in 1889, were brought under the colonial office in 1898, with Matabeleland and Mashonaland. 16. British Somaliland, completing the circle around Africa up to Socotra and Aden; protectorate under the East India Company 1884, constituted a Crown colony 1898.

North America.—1. The Dominion of Canada is the chief. Its nucleus was the territory which fell under British sway by the French and Indian War 1755–60, definitely ceded in 1763. This was divided in 1791 into Upper Canada and Lower Canada, the latter as a real settlement founded by loyalist refugees from the United States, who also founded New Brunswick. England also held north of the United States: (1) Nova Scotia, conquered from the French in 1713, after a previous occupancy 1654–67; (2) Cape Breton, conquered 1748, and restored to France, conquered again in 1758 and ceded by France in 1763, when it was annexed to Nova Scotia; again separated 1784, again united 1820; (3) Prince Edward's Island, till 1799 called Isle St. Jean or St. John Island, then changed in honor of the Duke of Kent; captured from the French 1745, restored, again taken and held in 1758, ceded 1763 and annexed to Nova Scotia, in 1773 again separated. (4) Newfoundland, an old fishing station, ceded by France in 1713. In 1841 Upper and Lower Canada were united. In 1867 the united province was joined with Nova Scotia and New Brunswick into the Dominion of Canada. In 1871 this was joined by British Columbia, formed 1866 out of the older British Columbia and Vancouver Island, the former organized 1858 from the old Hudson Bay territory of New Caledonia; the latter a Hudson Bay territory made a Crown colony in 1849. In 1873 Prince Edward's Island also came into the dominion. Meantime, in 1869, it had acquired the Northwest Territories, and in 1870 set off Manitoba and at once admitted it into the dominion; Keewatin district was created in 1876; Assiniboia, Alberta, Saskatchewan, and Athabasca in 1882. 2. Newfoundland, which still refuses to join the dominion: its history is outlined above. Labrador forms a part of Newfoundland for administrative purposes. 3. The Bermuda Islands: settled 1609. 4. The Bahama Islands: ceded by Spain 1783, after alternate conquest and reconquest. 5, 6. The Windward Islands and the Leeward Islands: taken by the English in the general agreement with France for partitioning

the West Indies in 1660. 7. Jamaica, with Turk's Island and Caicos Island: taken from the Spaniards in 1655. 8. Barbados: colonized 1625, made a Crown colony in 1663. 9. Trinidad, with Tobago: captured in 1797 during the French wars. 10. British Honduras: settled early in the 18th century, but not ceded to Great Britain by treaty from Spain till 1783, formerly known as Balize or Belize. 11. British Guiana: partitioned off from the other Guianas in 1803, and formerly ceded by treaty in 1814.

South America.—The Falkland Islands, east of the southern tip of the continent: fought for by British, French, and Spanish for many years; then nominally controlled by Argentina till 1833, when the British took possession of them for a finality, and established a colony in 1851; it includes also South Georgia to the eastward.

The South Atlantic.—In the No-Man's Land between South America and Africa, and unrelated to either, the British hold three islands. 1. St. Helena: definitively secured from the Dutch by the East India Company in 1673, transferred to the home government in 1834. 2. Ascension: 700 miles northwest of St. Helena, settled in 1815 after Napoleon's deportation. 3. Tristan d'Acunha: a triad of little islands about half-way from the Cape of Good Hope to South America, garrisoned by the British in 1816 while Napoleon was at St. Helena.

Australasia.—1. The Confederation of Australia, formed 1901. The first colony in Australia was the convict settlement of New South Wales, made a self-governing colony in 1841. Western Australia was founded in 1829, South Australia in 1836. Victoria, settled in 1835 as Port Philip, was set off from New South Wales in 1851. Queensland was settled from Moreton Bay in 1825. Tasmania was a convict settlement of the island of Van Diemen's Land from 1803 on, but in 1852 the convict deportation there was stopped, and the colony made self-governing as Tasmania. 2. New Zealand was colonized in 1845. 3. The Fiji Islands came under British sway in 1874 by voluntary cession from Thakombau, the leader of the native chiefs. 4. British New Guinea was delimited and formally annexed in 1884. 5. There are a considerable number of islands in the western Pacific which have come into British hands at various periods, by occupation. The largest are: the Tongas, part of the New Hebrides and the Solomons, Ellice, Gilbert, Union, Cook, and Monahiki.

British Legion, The, a corps raised in Great Britain in 1835, numbering 10,000 men, under the command of Gen. De Lacy Evans, to assist Queen Isabella of Spain in the war with Don Carlos. They rendered much assistance to the queen, defeating her Carlist rivals in several battles, notably at Ayetta, during the two years of their campaign. Gen. Evans was himself defeated at Hernani in 1837, but subsequently captured that place and also several others. He acted in conjunction with a naval force under Lord John Hay.

British Museum, a national depository of science, literature, and art, which owes its origin to the will of Sir Hans Sloane, an eminent phy-

sician and naturalist, who, dying in 1753, bequeathed to the nation his collection of medals and coins, antiquities, seals, cameos, drawings, and pictures, and his library, consisting of 50,000 volumes and manuscripts, on the condition of the payment of \$100,000 to his heirs. This offer was agreed to by Parliament, which authorized a lottery of \$500,000 to implement the bargain, as well as to purchase other collections. Montague House, which was bought for the purpose, was appropriated for the museum, which was first opened on 15 Jan. 1759. The original edifice having become inadequate, a new building was resolved on in 1823, the architect being Sir R. Smirke, whose building was not completed till 1847. It forms a hollow square, facing the cardinal points. The south, or Russell Street front, is the principal one, having an imposing columnar façade of the Ionic order. This, as well as the other three, looks into the central square court, which measures about 320 feet by 240. There are two stories of galleries and rooms round the greater part of the building. Smirke's designs were no sooner completed than it was found that additional accommodation was needed in various departments, and several new rooms were provided; but the library accommodation being wholly inadequate for the accommodation of the readers, as well as for the reception of new books, a grant was obtained from Parliament for a new library building in 1854, and it was completed and opened in 1857, at a cost of \$750,000. It was erected in the interior quadrangle, and contains a circular reading-room 140 feet in diameter, with a dome 106 feet high. The whole arrangements have been completed with the utmost economy in regard to space, and besides ample accommodation for books, the reading-room now contains accommodation for 300 readers comfortably seated at separate desks, which are provided with all necessary conveniences. More recently, the accommodation having become again inadequate, it was resolved to separate the objects belonging to the natural history department from the rest, and to lodge them in a building by themselves. Accordingly a large natural history museum has been erected at South Kensington, and the specimens pertaining to natural history (including geology and mineralogy) have been transferred thither, but they still form part of the British Museum. Externally this building is somewhat heavy in character, but the interior has been treated in a most artistic manner. The British Museum is under the management of 48 trustees, among the chief being the Archbishop of Canterbury, the lord-chancellor, and the speaker of the House of Commons. In all the staff of the institution numbers over 320 persons. The museum is open daily, free of charge. Admission to the reading-room as a regular reader is by ticket, procurable on application to the chief librarian, there being certain simple conditions attached. In 1900 there were 108,566 persons using the reading-room, and 689,249 visitors in addition. The institution contains something like 2,000,000 volumes in the department of printed books. A copy of every book, pamphlet, newspaper, piece of music, etc., published anywhere in British territory, must be conveyed free of charge to the British Museum. There are various catalogues and handbooks prepared by the officers of the museum, and containing classified descriptions of the con-

tents of the different departments. Of these there are eight, namely, the department of (1) printed books, maps, charts, plans, etc.; (2) of manuscripts; (3) of natural history; (4) of Oriental antiquities; (5) of Greek and Roman antiquities; (6) of coins and medals; (7) of British and mediæval antiquities and ethnography; (8) of prints and drawings.

British North America, the Dominion of Canada and the island of Newfoundland, with the portion of Labrador belonging to the latter. The Bermudas may also be included.

British Somaliland, a territory on the west coast of Africa under the protection of Great Britain, lying along the Gulf of Aden from about lon. 43° to 49° E., and extending from about lat. 11° to 8° N. On the east and south-east it is bounded by Italian Somaliland, on the south and west by Abyssinia, and on the north-west by French Somaliland. It has an area estimated at nearly 70,000 square miles, lacking in fertility largely on account of a lack of natural irrigation. The surface is in great part mountainous. The climate is more healthful in the interior than along the coast where there is more dampness. Among the chief products are sheep, cattle, skins, ostrich feathers, myrrh, and incense. The principal ports are Bulhor, Zeyla, and Berbera. The latter, which is the capital, has a good harbor and is in winter the scene of considerable commercial activity. The combined imports and exports are valued at about \$2,500,000. The protectorate, created in 1884, is administered by a consul-general under control of the Crown. In 1894 the boundary between this protectorate and Italian Somaliland was defined. In the spring of 1903 an agitation in this region in favor of the Mad Mullah (q.v.), led to a considerable loss among the British troops and their withdrawal in April. The inhabitants are related to the Abyssinians and Gallas, and on account of their nomadic habits there are no accurate statistics of population. See Peel, 'Somaliland' (1899); Swayne, 'Seventeen Trips Through Somaliland' (1900); Hendeber, 'Au pays des Somalis et des Comoriens' (1901).

British South Africa Company, a corporation established in 1889, with a royal charter, by Cecil Rhodes and others, for the purpose of controlling, settling, administering and opening up by railways and telegraphs, etc., certain districts in Central South Africa. Mashonaland was first settled, and, in 1893, Matabeleland was annexed and settled after the defeat of King Lobengula. In 1895, North Zambesia, in British Central Africa, was added, as well as a strip of territory in the Bechuanaland Protectorate. This territory has been called Rhodesia, or British Zambesia; area, about 500,000 square miles. In consequence of the filibustering raid of Dr. Jameson, an officer of the company, near the close of 1895, Rhodes resigned his connection with the company in 1896, and a joint administrator of the territory was appointed by the British crown. See RHODESIA.

British West Indies. See WEST INDIES.

Britomar'tis, a nymph of Cretan mythology, fabled to have been raised by Artemis into a deity, on the occasion of drowning herself to escape from the pursuit of Minos. She was presented as patroness of hunters and fishermen.

The name was chosen by Spenser to represent in the 'Faerie Queene' the personification of chastity, and thus contained an allusion to the Virgin Queen, Elizabeth.

Brittany, or **Bretagne**, formerly one of the largest provinces of France, being a peninsula washed by the Atlantic on all sides except the east, where it joined Poitou, Anjou, Maine, and Normandy. It now forms five departments, Finistère, Côtes-du-Nord, Morbihan, Ille-et-Vilaine, Loire-Inférieure, containing, in 1896, 3,175,961 inhabitants on 13,130 square miles. It is supposed to have received its name from those Britons who were expelled from England and took refuge here at various periods between the 5th and 7th century. Before that time it bore the name of Armorica. It formed one of the duchies of France, and was held by sovereigns nearly independent and often at war with the French monarchs till it was united to the crown by the marriage of Louis XII. with Anne of Brittany, the widow of Charles VIII., in 1499. It was given by Louis XII. to Claude, Countess of Angoulême, who married Francis I., and was reunited to the crown in 1532. The province was divided into Upper and Lower Brittany. Agriculture in this territory is very backward, and it is estimated that about one half of the surface lies waste. Corn and wine are produced in small quantities. Flax and hemp, apples, and pears are abundant and of good quality. Cider is the principal drink. Salt is made on the coast, and coal, lead, and iron are found in various parts. There are manufactures of hemp, flax, and iron. The fisheries also employ many of the inhabitants. The people of Brittany still retain their ancient language, which is closely allied to Welsh, and is exclusively used by the peasantry in the western part of the province. Many Celtic remains are found throughout the country.

Brittle Star, also called **Snake Star**, and **Sand Star**, a member of the order of *Ophiurida*, class *Asteroidea*, of the phylum *Echinodermata* (q.v.). It is characterized by the body forming a flattened disk, with cylindrical arms, the stomach not extending into the arms, and there is no intestine or anal opening. The ambulacral furrow is covered by the ventral shields of the tegument, so that the ambulacral feet project from the sides of the arm. It moves faster than the true star-fish, the arms being more slender and flexible. An ophiuran which has accidentally lost an arm can reproduce it by budding. In species of *Ophiothela* and *Ophiactis* the body divides in two spontaneously, having three arms on one side and two on the other, while the disk looks as if it had been cut in two by a knife, and three new arms had then grown out from the cut side.

The ophiurans in most cases undergo a decided metamorphosis like that of the star-fish. The larva, called a "pluteus," is free-swimming, though in some species the young, in a modified larval condition, reside in a pouch situated above the mouth of the parent, finally escaping and swimming freely about.

Our most common brittle star is *Ophiopholis aculeata*, which may be found at low-water mark, and especially among the roots of *Laminaria* thrown upon the beach. It is variable in color, but beautifully spotted with pale and brown, its

general hue being a brick-red. Ophiurans are widely distributed, and live at depths between low-water mark and 2,000 fathoms. Fossil ophiurans do not occur in formations older than the Upper Silurian, where they are represented by the genera *Protaster*, *Palæodiscus*, *Acroura*, and *Eucladia*: generic forms closely like those now living appear in the muschelkalk beds of Europe (Middle Trias).

Britton, John, English archæologist: b. 7 July 1771; d. London, 1 Jan. 1857. In 1787 he came to London, and was employed for six years as cellarman in the Jerusalem Tavern, Clerkenwell, and afterward served in the same capacity in the London Tavern. He next entered the employment of a hop merchant in Southwark, and then an attorney's office in Gray's Inn. During all this period he had sedulously cultivated his taste for reading during his leisure hours, and took part in the proceedings of several debating societies. In 1799 he accepted an engagement from a Mr. Chapman to write, sing, and recite for him at a theatre in Pantion Street, Haymarket, at a salary of three guineas per week. From this period his literary career may be said to have commenced, developing itself at first in the form of pamphlets, song-books, and similar minor subjects. He soon advanced, however, to a higher grade, and in 1801 appeared the first two volumes of the 'Beauties of Wiltshire,' by J. Britton and E. W. Brayley. These collaborators, with others, subsequently completed a similar work for all the other counties of England (1801-16, 18 vols.; 1825, 26 vols.). In 1805-14 Britton published his 'Architectural Antiquities of Great Britain' in four volumes, supplemented in 1818-26 by another entitled 'Chronological History and Graphic Illustrations of Christian Architecture in England.' These were followed by his 'Cathedral Antiquities,' in 14 volumes (1814-35); and the 'Dictionary of the Architecture and Archæology of the Middle Ages' (1832-8).

Britton, Nathaniel Lord, American scientist: b. New Dorp, Staten Island, N. Y., 15 Jan. 1859. He was professor of botany in Columbia School of Mines in 1888-96, and later director of the New York Botanical Garden. He has written 'Geology of Staten Island' (1880); 'Catalogue of the Flora of New Jersey' (1882); and collaborated in preparing 'An Illustrated Flora of the Northern United States, Canada.'

Britzka, a Russian traveling carriage, the head of which is always a movable calash, having a place in front for the driver, and a seat behind for servants. The body is so arranged that the traveler can sleep therein at night.

Brives-la-Gaillarde, brev-la-yârd (ancient BRIVA CURRETIA), a town in France, department of Corrèze, situated amidst vineyards and orchards, on left bank of the Corrèze, surrounded by a fine avenue of elms. The houses are substantially built of stone, but the streets are narrow, and the public squares indifferent. It contains a church of St. Martin dating from the 12th century, some ancient houses in the Gothic style, and a library. Its industries include the manufacture of leather, cotton goods, pottery, wax candles, etc., and it also carries on an active trade in truffles, wool, wine, and nuts. Pop. (1896) 18,111.

Brix'ham, an English town in Devonshire, situated on the English Channel, 23 miles south of Exeter. It covers the sides of two hills, and is divided into Upper and Lower Brixham. The parish church is a large ancient structure, in the Perpendicular style. The trade of Brixham is chiefly in fish, and is of considerable extent, London, Bath, and Bristol receiving supplies from this place. The port possesses also a number of vessels engaged in the coasting and foreign trade; those in the latter plying chiefly to the Mediterranean. Ship-building and the manufacture of sails, ropes, paint, etc., are among the other industries. Brixham is celebrated in history as the place where the Prince of Orange, afterward William III., landed, 4 Nov. 1688. In 1858 a cave was discovered on Windmill Hill, containing the bones of extinct mammals, some flint implements, etc. Pop. (1901) 8,090.

Bri'za, a genus of grasses, commonly called quaking-grass, maiden's-hair, or lady's-tresses. There are about 30 species, chiefly found in South America. *B. media* is a native of the United States, and is found occasionally in pastures in the eastern States.

Broach, or **Baroach**, India, a seaport town in Guzerat, Bombay, situated on the Nerbudda, about 30 miles from its mouth. The river here is crossed by a railway bridge, and for about a mile in front of the town is lined with a massive stone wall. Broach is surrounded with ruinous walls, and has narrow streets, with houses mostly of two stories and built of brick. There are no buildings of interest. It is an ancient place, and one of the oldest seaports of western India, and was formerly famous for its cotton manufactures. The town was taken by storm by the British in 1772, and, with the district, ceded to them by treaty with Scindiah in 1803. Formerly it had a great export of cotton, and it still carries on a trade in cotton, grain, and seeds with Bombay and Surat. Pop. (1901) 42,300 (including many Parsees). The district of Broach lies on the east side of the Gulf of Cambay. Broach cotton holds the highest place in the Bombay market. Area, 1,453 square miles; pop. about 350,000.

Broad Arrow, a government mark placed on British stores, guns, etc., to distinguish them as public or Crown property. It was the cognizance of Henry, Viscount Sydney, Earl of Romney, master-general of the ordnance, 1693-1702, and was at first placed only on military stores. Persons in possession of goods marked with the broad arrow forfeit the goods and are subject to a penalty, and it is made felony by statute to obliterate or deface it. The mark is also used in the Ordnance Survey maps to denote points from which measurements have been made.

Broad Arrow.

Broad Church, a name given originally to a party in the Church of England, regarded as being midway between the Low Church or Evangelical section and the High Church or Ritualistic; now widely applied to the more tolerant and liberal section of any denomination.

Broad-headed Snake. See DEATH-ADDER.

Broad Mountain, an elevation in the anthracite coal region of Pennsylvania; a plateau of conglomerate rock, about three miles wide and 2,000 feet above the sea, undulating just enough to contain three shallow coal-basins intermediate between the Pottsville and Mine Hill on the south, and the Mahoning and Shamokin coal-fields on the north.

Broad Piece, a term applied to some English gold pieces broader than a guinea, particularly Caroluses and Jacobuses.

Broad River, a stream of North and South Carolina, rising at the foot of the Blue Ridge, in the western part of the former State, and entering York district in South Carolina. It then takes a southerly course through a rich and highly productive tract of country covered with fields of maize and cotton, and finally unites with the Saluda to form the Congaree River. The city of Columbia is at their junction. The river is about 225 miles in length, and is navigable for shallow-draft boats for upward of 140 miles.

Broad Seal War, 1838-9, a disputed-election case in New Jersey and in Congress; turning in New Jersey on the power of a county official, in collusion with the State executive, to nullify the result of a State vote; in Congress on the right of the clerk to base official action on information not before Congress. New Jersey then elected her six congressmen on general ticket, and in 1838 that of the Democrats carried the State by an average of about 100; but the Whig county clerk of Middlesex County threw out the vote of South Amboy, with 252 Democratic majority, for lack of the election-clerk's signature, and for other irregularities, giving the Whigs five of the six seats. The Democrats claimed that such technicalities had been repeatedly waived, and were counter-vailed by like ones in Whig towns; and, even so, that by law the governor and council, as a canvassing board, must send at once for any missing return and pass on its validity. Those officials were Whigs, however, and they decided that they could not go behind the clerk's certificate, and issued credentials to the Whig candidates under the "broad seal" of the State. This would have made only the usual party broil, but that the national House stood 119 Democrats to 118 Whigs without the New Jersey members, so that the decision carried with it control of the organization of Congress. The Democratic clerk of the House, H. A. Garland, of Virginia, on its meeting 2 Dec. 1839, omitted the New Jersey members in his roll-call, on the ostensible ground that their seats were to be contested and he must leave the decision to Congress; really because excluding them gave his party the speaker and the committees, and incidentally secured himself the clerkship however the contest was decided. This was utterly illegal, as there could be no contest till a congress was organized to bring a contest before; but he doubtless felt it as legitimate as the trick by which the Whig members were sent there, and that party could hardly complain of unfairness. For three days there was helpless rage and anarchy in the House, the clerk refusing to put the question upon any of the motions to bring order out of the chaos. Finally on the 5th the leaders of both parties called in John Quincy Adams (q.v.), the one member who had

no party or affiliations of any sort, and who was respected as at once immutably just, unshrinkingly courageous, and of the highest parliamentary knowledge. He called upon the meeting to organize itself, offered a resolution ordering the clerk to call the names of the New Jersey members with credentials, and on the clerk's refusal announced that he would put the question himself. He was at once elected speaker *pro tem.*, and for six days more the fight went on to choose a permanent speaker, with both New Jersey delegations voting. On the 11th a motion was carried that neither delegation had a right to vote till the contest was decided; on the 16th a compromise was made by which R. M. T. Hunter, of Virginia, a Whig who favored the Democratic sub-treasury scheme, was chosen speaker. On 10 March 1840 the Democratic contestants were seated; on 16 July the majority report of the committee on the case, declaring them duly elected, was accepted by a vote in which all but 22 Whigs refused to take part, on the ground that the report and testimony were too long to examine. The political prize at stake had caused the parties to exchange principles, as they did earlier on the Louisiana Purchase and later on the Electoral Commission; the Democrats, though strict-constructionists, disregarded State certificates and insisted on going behind the returns; the Whigs, though upholding equity against forms, clung to the sanctity of a State certificate however obtained.

Broad-top Mountain, a trapezoidal plateau of semi-bituminous coal measures, in Huntingdon and Bedford counties, Pennsylvania. The highest point is about 2,600 feet above the sea. It is surrounded by a red shale valley, and an outside ring of Devonian rocks, called Terrace, Harmer, and Sidelong mountains. Through gaps in this ring flows the Raystown branch of the Juniata. The mountain contains two principal coal basins. It contains in its deepest troughs about 900 feet of coal measures, and takes in the Pittsburg coal bed, with one of the limestones above it. Coal was mined here for blacksmithing nearly 100 years ago. The coal is a semi-bituminous steam coal, containing from 12 to 18 per cent of volatile matter, and of the same qualities as Cumberland coal.

Broad'ent, Sir William Henry, English physician: b. Yorkshire, 23 Jan. 1835; d. London, 10 July 1907. He was educated at the Royal School of Medicine in Manchester and at Paris. He was at first appointed physician to the Western General Dispensary; then physician to the London Fever Hospital and the Saint Mary's Hospital successively. He was physician extraordinary to Queen Victoria, 1898-1901; and in the latter year was appointed physician-in-ordinary to King Edward VII. He was a member of the Medical Society of London and was censor of the Royal College of Physicians, 1888-9, and 1895-6. He wrote 'The Pulse' and 'The Heart.'

Broad'casting, a mode of sowing grain by which the seed is cast or dispersed upon the ground with the hand, or with a machine devised for sowing in this manner; opposed to planting in drills or rows.

Broad'head, Garland Carr, American geologist: b. Albemarle County, Va., 30 Oct. 1827. He studied at the University of Missouri and

was long the State expert in geology. He was professor of geology at the University of Missouri, 1887-97, and he is considered an authority on the Missouri coal measures. His writings include 'Geological Survey of Missouri Iron Ores and Coal Fields'; 'Geological Survey of Missouri'; and 'Illinois Geological Survey Report.'

Broad'hurst, Henry, English politician and labor organizer: b. Oxfordshire, 13 April 1840. As a boy he worked in a blacksmith's shop; then as a stone mason till 1872. He has been prominent in the labor movement; in 1875 he was secretary of the Labor Representative League and of the parliamentary committee of the Trades Union Congress. He has been a member of Parliament for Stoke-upon-Trent, 1880-5; for Bordesley, 1885-6; for Nottingham, 1886-92. He was under-secretary in the Home Department in 1886, and has served on several royal commissions for the investigation of the condition of the laboring class. He wrote 'Handy Book on Leasehold Enfranchisement' (with Sir R. T. Reid).

Broad'mouth, or Broad'bill, one of about a dozen species of small lethargic, songless birds of the family *Eurylamida*, having a notable breadth of beak. Flocks of these birds are distributed through the woods from the Himalayas to the Philippines. The broadmouths are brilliant in plumage, and mainly fruit-eaters, with the exception of two species of the genus *Calyp-tonema*, which are insectivorous.

Broads, The Norfolk, England, a series of lakes, usually said to be formed by the widening or broadening out of the rivers. The broads *par excellence* are those of the Bure or North River (which empties into the sea at Yarmouth), and its tributaries, the Ant and the Thurne. The broads have grown greatly in favor with holiday-makers in recent years.

Broad'side, in a naval engagement, the whole discharge of the artillery on one side of a ship of war, above and below. The fighting power of a ship was formerly estimated by the weight of her broadside. The term is also applied to any large page printed on one side of a sheet of paper, and, strictly, not divided into columns. In this sense it is sometimes called a broadsheet.

Broad'stairs, England, a watering-place in the Isle of Thanet, Kent, two miles northeast of Ramsgate. It is said that the name is derived from the width of the passage leading down to the sea. Pop. (1901) 6,460.

Broad'sword, a sword with a broad blade, designed chiefly for cutting, formerly used by some regiments of cavalry and Highland infantry in the British service. The claymore or broadsword was formerly the national weapon of the Highlanders.

Broad'way, the chief thoroughfare, and the principal business street of New York. Starting from Bowling Green at the lower extremity of the island, it runs nearly due north to 14th Street, whence it takes a westerly diagonal course to 78th Street, at which point it again runs due north to 103d Street. Taking the westerly trend again to 108th Street, it thence runs north again, and, following the course of the old post road, is continued under the name of Broadway as far as Albany. Its continuous

LOOKING DOWN LOWER BROADWAY, NEW YORK.

course is interrupted by two public squares; Union Square at 14th Street, and Madison Square at 23d Street. Below Madison Square it is devoted mainly to office buildings and wholesale establishments. Above Madison Square (where it intersects Fifth Avenue and 23d Street) are theatres and the chief hotels. Its length below 59th Street is about five miles, and is traversed by an electric railway. A portion of the subway is excavated under the part of Broadway which is above 42d Street, and also that part below Park Place.

Broadwood, John, English pianoforte manufacturer; b. Cockburnspath, Scotland, 1732; d. 1812. Going to London, he entered into partnership with a Swiss maker of harpsichords, named Burkhardt Tschudi, the firm being known as Tschudi & Broadwood. In 1769 his partner retired, and on his death four years later his son became a partner with Broadwood; but from 1783 till 1795, when Broadwood's son entered into partnership with him, he had the sole control of the business. The firm has long been known as John Broadwood & Sons. By the skill of Broadwood and those associated with him many improvements were introduced in the construction of the pianoforte, and for a long time the history of the firm was practically the story of the progressive development of that instrument.

Broddingnag, an imaginary country described by Dean Swift in 'Gulliver's Travels.' The inhabitants are represented as being of enormous size and the details of their environment in proportion; whence has arisen the adjective "broddingnagian."

Broca, Pierre Paul, pē-ār pōl brō-kā, French surgeon and anthropologist; b. Sainte-Foy-la-Grande, department of the Gironde, 28 June 1824; d. Paris, 9 July 1880. In 1841 he began the study of medicine at Paris, became hospital surgeon in 1844, anatomical assistant in the Faculty of Medicine in 1846, preparator in anatomy in 1848, and professor in 1867. Between 1861 and 1865 he carried out his famous researches on the localization of cerebral functions. He gained great distinction in anthropology, and in 1859 founded the Paris anthropological society. During the Franco-German war he engaged in hospital work at La Pitié, but when peace was concluded he resumed his teaching. In 1872 he founded the 'Revue d'Anthropologie,' and four years later he established the Ecole d'Anthropologie, which formed the nucleus of the later Institut Anthropologique. His writings are numerous and important.

Brocade', a fabric having a pattern of raised figures; often a stuff of silk, enriched with a raised pattern of flowers, foliage, and other ornaments. Formerly it signified a stuff woven all of gold or silver threads, or in which silk was mixed with such threads; at present all stuffs are so called if they are worked with raised flowers or other figures, and especially when the figures are in more than one color. Brocade is in silk what damask is in wool. Brocatelle, in which cotton and wool are used instead of silk, is an imitation of brocade.

Brocatelle'. See BROCADE.

Brocchi, Giovanni Battista, jō-vān'nē bāt-tēs'tā brōk'kē, Italian mineralogist and geologist; b. Bassano, 18 Feb. 1772; d. Khartum,

25 Sept. 1826. In 1808 his valuable researches upon iron mines and metalliferous mountains procured him the office of inspector of mines in the newly established kingdom of Italy. In 1814 he published a work on the structure of the Apennine range, with an account of the fossils of its strata. He corrected the erroneous view of Brieslak, who supposed Rome to occupy the site of an extinct volcano, to which he ascribed the tufa and other volcanic materials found on the seven hills. Brocchi, on the other hand, satisfactorily showed that they are derived either from Mont Albano or Monte Cimino. Both of these are extinct volcanoes, the first 12 miles, the other still farther, to the north of the city. In 1823 Brocchi sailed for Egypt with the view of exploring the mineral resources of that country. He received a commission from Mehemet Ali to examine his recent conquest of Sennaar, but the climate proved too much for his constitution.

Broccoli, a variety of the cauliflower, hardier and with more color in the flower and leaves. The chief varieties are green, purple, and dwarf broccoli. It is inferior in flavor to cauliflower, but serves as a substitute for it when the latter cannot be obtained. See CAULIFLOWER.

Brochantite, brō'shōn-tit (from BROCHANT DE VILLIERS, a French mineralogist), an orthorhombic transparent or translucent mineral, with hardness 3.5-4; specific gravity, about 3.90; lustre vitreous, pearly on one cleavage face. It is a basic copper sulphate having the formula $\text{Cu SO}_4 \cdot 3 \text{Cu (OH)}_2$. It much resembles atacamite, like which it occurs in many copper mines, notably in the Urals, in Cornwall, England, and in Chili. In the United States its most important localities are in Utah and Arizona.

Brochs, brōchs, class of edifices peculiar to Scotland, particularly in the northern counties, including Orkney, Shetland, and the Western Isles, more than 300 in all being known. A broch is a hollow circular tower of dry-built masonry, rarely more than 70 or less than 40 feet in total diameter, occasionally at least 50 feet high, and enclosing a circular court or area from 25 to 45 feet in diameter. The wall, which may be from 9 to 20 feet thick, is carried up solid for about 10 feet, except where pierced by the narrow passage giving entrance to the interior court, or where chambers are hollowed within its thickness and opening off the court. Above this height there are horizontal galleries in the wall, each about 6 feet high and 3 feet wide, running completely round the tower, except where crossed by the stair giving access to them, and having windows placed above each other, and all looking into the central area. The only external opening is a doorway about 5 or 6 feet high, and rarely more than 3 feet wide. The passage varies from 9 to 18 feet in length, and about 4 feet from its outer entrance is the door. Many of the brochs are found in naturally strong positions, such as a precipitous eminence or a promontory projecting into a loch, and further defenses are afforded by ditches and embankments, earthen ramparts, and dry stone walls. Hence it is clear that they were intended to serve as places of shelter and defense, for which purpose they are admirably contrived, as they form a series of

strongholds that could be reduced only by a regular siege, the inmates being safe against missiles and even against fire, from the height and strength of the walls. Provided with a sufficiency of food, and obtaining water from a well inside the enclosure, the people thus sheltered could hold out for an indefinite time. The relics found in the brochs, like the structures themselves, are Celtic in character, and belong to post-Roman times. The Brochs were probably built as places of refuge from the Scandinavian vikings that for centuries were a scourge to many of the European coasts, but little or nothing of their history is known. The relics include swords, spears, knives, axes, and chisels of iron, with rings, bracelets, pins, and other articles of bronze or of brass. Numerous articles made of bone and horn are also found, with stone implements, as querns, mortars, pestles, bowls and cups, lamps, etc. Pottery of various kinds is also found. Spinning and weaving were evidently practised by the broch-builders. Agriculture, hunting, and fishing furnished subsistence; and animal food was furnished by the stag, roe, reindeer, ox, sheep, goat, and pig, as well as by the whale, porpoise, cod, haddock, and other denizens of the sea.

Brock, Sir Isaac, English soldier: b. Guernsey, 6 Oct. 1769; d. Queenston, Canada, 13 Oct. 1812. He was educated at Southampton and Rotterdam, and entered the army as ensign in the 8th Regiment in 1785. In 1791 he transferred to the 49th Infantry, and saw service in the West Indies. In 1802 he went to Canada at the head of that regiment, returning three years afterward; but in 1806 he was again in North America. He became major-general in 1811, and in the following year compelled the surrender of the American general Hall at Detroit. For this service he received knighthood in the Order of the Bath, but he did not live long to enjoy the honor; for during an attack on Queenston by another American force, only three days after he was knighted, he was mortally wounded. The sum of £1,575 was voted by the House of Commons for a monument to Brock, which now stands in the south transept of St. Paul's Cathedral, London. There is another monument to him at Queenston, erected at public cost in 1842.

Brock, Thomas, English sculptor: b. 1847. He studied with J. H. Foley and finished after the latter's death a number of his works. Among his productions is the Longfellow bust in Westminster Abbey. He is a member of the Royal Academy.

Brockedon, brö'k'dën, William, English artist and inventor: b. Devonshire, 1787; d. London, 1854. He was the discoverer of a method by which plumbago and its dust (previously thrown away as valueless) could be freed from impurities and re-solidified, so as to make a superior description of lead pencils, of various degrees of hardness, well adapted for artists' use. Mr. Brockedon was a painter, and author of 'The Passes of the Alps,' with over 100 folio engravings from drawings by himself. He also produced 'Italy, Classical and Picturesque' (1842-3); and 'Egypt and Nubia' (3 vols. 1846-9).

Brock'en, a mountain in Germany, popularly known as Blocksberg, the highest summit

of the Harz Mountains (about 3,745 feet), in the Prussian government of Magdeburg. It was known to the Romans as Mons Bructerus. The bare, treeless summit is covered with snow from November to June; and on it are a hotel and an observatory. Under certain atmospheric conditions the visitor may see a gigantic figure of himself reflected on the clouds (the "Spectre of the Brocken"). According to a popular legend the German witches used to assemble here on Walpurgis Night (q.v.) for an annual orgy. Two driving-roads and a railway lead up the mountain. Many tourists visit the Brocken during the summer, and in clear weather an extensive view may be obtained.

Brocket (Fr. *broche*, a "spit" or "tine"), a book-name given to Brazilian deer of the sub-genus *Coassus*, because of their spike-like antlers. There are three species, varying in height from 19 to 27 inches, namely: (1) Guazuviva (*Coassus nemorivagus*), or Brazilian deer; (2) Pita (*Coassus rufus*); (3) A similar form, the pudu (*Pudua humilis*) of the Chilean Andes, the smallest of all deer, having spike horns only about two inches long.

Brockett, Linus Pierpont, American author: b. Canton, Conn., 16 Oct. 1820; d. Brooklyn, 13 Jan. 1893. He graduated at the Yale Medical School in 1843, and practised medicine for a few years. Later he devoted himself to editorial and other literary work. He wrote a 'History of Education'; 'Men of Our Day'; 'The Year of Battles'; 'Epidemic and Contagious Diseases'; 'The Great Metropolis'; etc.

Brockhaus, Friedrich Arnold, frëd'rih ä'r-nöld brö'k'hows, German publisher, founder of the publishing firm of Brockhaus in Leipsic: b. Dortmund, 4 May 1772; d. Leipsic, 20 Aug. 1823. He was educated at the gymnasium of his native town, and in 1793 went to Leipsic, where he devoted two years to the acquisition of scientific knowledge and the principal modern languages of Europe. In 1795 he established at Dortmund a mercantile house for the sale of English manufactures, which he removed to Arnheim, in the Netherlands, in 1801, and to Amsterdam in 1802. Although he managed his business with success, he abandoned it out of distaste for mercantile pursuits in 1804, and entered into the book trade at Amsterdam. After the annexation of Holland to the French empire (1810), Brockhaus returned to Germany, and re-opened his establishment in Altenburg (1811). In 1813 the firm received the title of F. A. Brockhaus. In 1808 Brockhaus had purchased the copyright of the German 'Conversations-Lexikon,' which had been begun in 1796. In 1809-10 he completed the first edition by the publication of two supplementary volumes. In 1812 he began to publish the second edition of this work, which was finished under his own editorship. It was favorably received and had an extensive sale. The business now rapidly extended, and was removed to Leipsic in 1817. It still is carried on by the grandsons of the founder, and there are now chief branches in Berlin and Vienna. Among the literary undertakings of the house have been several important critical periodicals and some large historical and bibliographical works. The 'Conversations-Lexikon,' distinctively associated with the name of Brockhaus, has now reached a 14th edition.

Brockhaus, Hermann, German Orientalist: b. Amsterdam, 28 Jan. 1806; d. Leipsic, 5 Jan. 1877. He was educated at Amsterdam and at Göttingen and Bonn, where he devoted himself to Oriental languages. He lived for a long time in France and England and then settled in Dresden. In 1839 he went as professor to Jena, and in 1841 to Leipsic, where he became professor of Sanskrit, a position he held until his death. He published many works on Oriental literature, and edited the great 'Allgemeine Encyclopädie' of Ersch and Gruber.

Brockton, Mass., a city in Plymouth County, situated on the N. Y., N. H. & H. R.R.; 20 miles south of Boston. It is one of the largest boot- and shoe-manufacturing places in the country, and beside these articles has extensive manufactories of rubber goods, shoe machinery and supplies, tools, and bicycles. It contains the villages of Campello, Montello, Marshall's Corner, Brockton Heights, Clifton Heights, and Salisbury Square. It was settled in 1700, was incorporated as a town in 1821, and chartered as a city in 1881. There are two national and two savings banks, a public library, with over 26,000 volumes; public school property valued at over \$500,000; and a property valuation exceeding \$26,000,000. Pop. (1900) 40,063.

Brockville, Canada, port of entry, and the chief town of the united counties of Leeds and Grenville, Ontario, on the Saint Lawrence River below the Thousand Islands and on the Grand Trunk Railway. It is 125 miles by rail south of Montreal and 40 miles by water below Kingston and is a terminus of the Canadian Pacific Railway, and of the Brockville, Western & Sault Ste. Marie Railway. It is a port for the Saint Lawrence steamers and is connected by ferry with Morristown, New York State. Brockville is lighted by gas and electricity and has excellent sewerage systems. It has numerous churches and public buildings, a collegiate institute, 4 public schools, 1 separate school, a manual training school, and an art school. The manufactures comprise stoves, carriages, agricultural implements, hats, cigars, chemicals, lumber, flour, gloves, tools, machinery, and foundry products. It is named after General Sir Isaac Brock (q.v.). Pop. (1904) 9,044.

Brockway, Zebulon Reed, American penologist: b. Lyme, Conn., 28 April 1827. His connection with prison administration began at the Connecticut State Prison. He was connected successively with the penitentiaries of Albany and Monroe counties, N. Y., and with the House of Correction, Detroit, Mich. He is best known in connection with the penal-reform methods introduced during his superintendency of the New York State Reformatory at Elmira, a position which he filled from 1876-1900. He has written numerous papers and magazine articles on penology.

Broderick, brōd'rick, David Colbreth, American legislator: b. Washington, D. C., 4 Feb. 1820; d. Lake Merced, Cal., 16 Sept. 1859. He was defeated for Congress in New York in 1846; went to California, and was elected a member of the Constitutional Convention of 1849; served as speaker of the Senate; and was elected to the United States Senate in 1856, where he opposed the admission of Kansas.

Broderip, brōd'rip, William John, English naturalist: b. Bristol, 21 Nov. 1789; d. London 27 Feb. 1859. He graduated from Oriel College, Oxford, in 1812; studied law, and was called to the bar in 1817; and subsequently occupied several legal posts. In 1851 he became treasurer of Gray's Inn, with which office was combined that of librarian. He was an enthusiastic naturalist, and made many fine collections, his conchological cabinet being purchased for the British Museum. In 1847 he published 'Zoological Recreations,' and five years later appeared 'Leaves from the Note-Book of a Naturalist.'

Brodhead, John Romeyn, American historian: b. Philadelphia, 2 Jan. 1814; d. New York, 6 May 1873. He graduated at Rutgers College in 1831. He was author of a 'History of the State of New York,' and he made in Europe a valuable collection of documents bearing upon American history, that was published by the State of New York.

Brodiaea, brō-dī-ē'a, a small genus of western American corm-rooted plants of the natural order *Liliaceae*, which are popular as garden flowers. The species are of low growth, and have several purple, red, white, or yellow funnel-shaped flowers on a scape. According to some authors several related genera are grouped in this, and cultural methods vary in consequence. For list of species and cultural directions consult: Bailey and Miller, 'Cyclopedia of American Horticulture' (N. Y. 1900-02).

Bro'die, Sir Benjamin Collins, English surgeon: b. Winterslow, Wiltshire, 9 June 1783; d. Broome Park, Surrey, 21 Oct. 1862. His father superintended his education till he was 18, after which he went to the Hunterian School of Anatomy. In 1803 he became a pupil of Sir Everard Home at St. George's Hospital, and in 1805 was appointed assistant to Mr. Wilson, demonstrator of anatomy. In 1809 he became a lecturer of the school and assistant surgeon of the hospital. In 1810 he was elected Croonian lecturer to the Royal Society, and the excellence of his papers caused him to be elected a Fellow, and in the following year he received the Copley medal. His reputation as a distinguished surgeon was now established, and his professional career became one of uniform success. From 1819 to 1823 he was professor of anatomy at the Royal College of Surgeons. In 1822 he was elected a full surgeon at St. George's. He continued giving clinical lectures there till 1830, when the increasing demands of his profession compelled him to discontinue them. In 1832 he succeeded Sir Everard Home as sergeant-surgeon to William IV., and was made a baronet by patent in 1834. Queen Victoria continued him in the same appointment. From 1835 to 1846 he was a member of the Court of Examiners of the College of Surgeons, and in 1844 he was president of the court. In 1858 he was elected president of the Royal Society, which honor he held till 1861. For some years before his death his sight failed, and for about two years he was almost totally blind. As a professional practitioner his gains exceeded those of almost any man of like profession in his time. In 1851 he republished a selection of his earlier essays, entitled 'Physiological Researches.' His work on 'Pathological and Surgical Observations on Diseases of the Joints' (1818) was

esteemed of great value both in Great Britain and on the Continent, and went through many editions. In 1854 he published a work in a colloquial form entitled 'Psychological Inquiries.' The dialogue is not controversial, and the work contains the mature opinions of the author on various speculative subjects.

Brod'rick, George Charles, English educator: b. Castle Rising, Norfolk, England, 5 May 1831. He was educated at Eton and Balliol College, Oxford, and University of London. He was called to the bar in 1859. From 1877-9 he was a member of the London School Board. In 1881 he became warden of Merton College. Among his works are: 'Political Studies'; 'English Land and English Landlords'; 'Memorials of Merton College'; 'Short History of Oxford University'; and 'Memories and Impressions.'

Brodrick, William St. John Freemantle, English statesman: b. 14 Dec. 1856. He was educated at Eton and at Balliol College, Oxford. From 1880-5 he was member of Parliament for West Surrey; 1886-92, financial secretary to the war office; 1895-8, under-secretary of state for war; 1898-1900 under-secretary of state for foreign affairs; afterward becoming secretary for war.

Brod'sky, Adolf, Russian violinist: b. Taganrog, South Russia, 21 Feb. 1851. He first played in public at the age of nine, and later went to Vienna to pursue his musical studies. In 1879 he became director of the symphony concerts in Kieff, and later held a professorship in the Leipsic Conservatory. As a soloist he appeared in concerts in several of the leading cities of Europe. He came to the United States and taught for a time in Scharwenka's Conservatory, New York, but returned to Leipsic. In 1895 he was made director of the Royal College of Music, Manchester, England.

Bro'dy, Austria, a town in Galicia, near the Russian frontier, 58 miles east-northeast of Lemberg, on a swampy plain. It has broad streets, houses mostly built of stone, an old castle, three churches, Jewish synagogue, etc. About two thirds of its inhabitants are Jews, who have a hospital for themselves and a college for the instruction of artists and mechanics. The commerce, carried on principally by Jews, is important, the town being favorably situated for the interchange of goods between Austria and Russia, and Turkey. Pop. about 20,000.

Brogie, brô-lê, a family distinguished in the annals of French wars and diplomacy, which derives its origin from Piedmont. Among its members are:

1. **FRANÇOIS MARIE, DUC DE**, French soldier: b. Paris, 11 Jan. 1671; d. Ferrières, 22 May 1745. From 1689 he fought with distinction in the Netherlands, Germany, and Italy. He was also employed in diplomatic affairs, and concluded a treaty between France, England, and Prussia in 1725. He rose by degrees till in 1734 he became marshal of France. In the war of the Austrian succession he had the chief command of the armies in Bavaria and Bohemia.

2. **VICTOR FRANÇOIS, DUC DE**, French soldier: b. (the eldest son of the preceding), 19 Oct. 1718; d. Münster, 1804. He commenced his career under his father in the battles of Guastalla and Parma (1734); was engaged in all the wars of France, and was created marshal in 1759.

Jomini considered him the only French general who had shown constant ability during the Seven Years' war. He was engaged in the battles of Hastenbeck, Rossbach, Sondershausen, and Lützelberg, and, being appointed to the chief command, defeated the Prussians and Hessians at Bergen in 1759, for which Francis I. of Austria created him a prince of the empire. In 1760 he gained another victory at Corbach, but was defeated, together with the Prince of Soubise, at Willingshausen, in the following year. In consequence of this and the favor of Soubise at court he was exiled. He was recalled in 1764, and in 1789, when the Revolution broke out, Louis XVI. appointed him minister of war; at the same time he received the command of the troops that were to keep Paris in check. The desertion of the National Guard rendered all his efforts vain, and Broglie left France. In the campaign of 1792 he commanded a division of the *émigrés* without success. After its close he withdrew entirely from public life.

3. **VICTOR CLAUDE, PRINCE DE BROGLIE**, French soldier: b. (third son of the preceding), 1757; d. Paris, 27 June 1794. He entered at first into the views of the revolutionary party. He was deputy of the nobility of Colmar to the States-General in 1789. After the dissolution of the Constituent Assembly he was appointed field-marshal in the army of the Rhine, but upon his refusal to acknowledge the decree of 10 August, suspending the royal authority, was deprived of his command, summoned before the revolutionary tribunal, and led to the guillotine.

4. **ACHILLE CHARLES LÉONCE VICTOR, DUC DE**, French statesman: b. Paris (son of the preceding), 1 Dec. 1785; d. Paris, 25 Jan. 1870. In 1816 he married a daughter of Madame de Staël and was made a member of the chamber of peers. After the Revolution of 1830 the Duc de Broglie and Guizot were the heads of the party known as *doctrinaires*. He was minister of public instruction for a short time in 1830, and minister of foreign affairs from October 1832 to April 1834. In 1849 he was a conservative member of the Legislative Assembly, and after the *coup d'état* he continued a bitter enemy of the imperial régime. His later years were devoted to philosophical and literary pursuits.

5. **JACQUES VICTOR ALBERT, DUC DE**: b. Paris (son of the preceding), 13 June 1821; d. 1901. In 1846 he became secretary to the embassy at Madrid, whence he was transferred to that at Rome, but the revolution of 1848 caused him to give up public life. From that time he became known as an able writer in political reviews. In 1856 he published 'L'Histoire de l'Eglise et de l'Empire,' in six volumes, a work which gained him a chair in the Academy. In 1871 he was elected to the National Assembly for the department of Eure, and in the same year became ambassador at London. He led the opposition to Thiers during 1872-3, and finally succeeded in defeating him. In the latter year he became minister of foreign affairs and president of the council, but in 1874 he suffered defeat. In 1885 he again gave up political life and devoted himself to his historical studies. Among his works are 'Le Secret du Roi Louis XV.' (1878); 'Frédéric II. et Marie-Thérèse' (1883); 'Maurice de Saxe et le Marquis d'Argenson' (1891); 'La Paix d'Aix-la-Chapelle' (1892); 'Le Père Lacordaire' (1895); 'Malherbe' (1897); etc.

Brogny, Jean Allarmet, zhōn ăl-lār-mā bīōn-yē, Italian cardinal: b. Brogny, near Annecy, Savoy, 1342; d. Rome, 16 Feb. 1426. Although a swineherd in his youth, he attained, by his learning and virtues, a position of great influence and eminence in the Church. He was successively made bishop of Viviers, of Ostia, archbishop of Arles, and bishop of Geneva, and finally cardinal and chancellor of the Church of Rome. During the great schism which divided the Church for more than 40 years Brogny devoted himself to the work of conciliation. The Council of Constance being called for that purpose by John XXIII. and the Emperor Sigismund, the former was deposed at the sixth session, after which Brogny presided as senior cardinal until the 41st, when Cardinal Colonna was elected Pope, 14 Nov. 1417, chiefly through Brogny's influence, under the name of Martin V., and the holy see was once more established at Rome. As president of the Council of Constance he had to pronounce the sentence of death upon Huss, to whom he had shown great kindness during the trial, having visited him several times in his prison and exhorted him, but in vain, to save his life by recanting his creed. The cardinal was the founder of the hospital of Anney, and of the College of St. Nicolas at Avignon.

Brogue, brōg (Ir. and Gael. *brog*), a coarse and light kind of shoe made of raw or half-tanned leather, of one entire piece, and gathered round the foot by a thong, formerly worn in Ireland and the Highlands of Scotland. The term is also used of the mode of pronunciation peculiar to the Irish, but whether the word in this sense is the same as in the other is doubtful.

Broiling, the cooking of meat or fish on a gridiron above a fire, or by laying it directly on the coals, a very wholesome method of cookery. See **COOKERY**.

Broke, Sir Philip Bowes Vere, British admiral: b. Ipswich, 9 Sept. 1776; d. 2 Jan. 1841. He entered the navy in 1792, and, after he had seen much active service, distinguished himself in 1813 as commander of the frigate Shannon, in the memorable action which that vessel, in answer to a regular challenge, fought with the Chesapeake off the American coast. The Shannon, carrying 38 guns and 330 men, in an engagement of only 15 minutes boarded and captured the Chesapeake, carrying 49 guns and 440 men. Sir Philip, who was severely wounded in the action, was immediately made a baronet, and in 1815 Knight Commander of the Bath. He became rear-admiral in 1830.

Broken Hill, Australia, a mining town in the western part of New South Wales, south of Stanley Range, about 925 miles west of Sydney. It stands in a district which contains many silver mines; and asbestos, lead, gold, copper, etc., are also found here. One of the silver mines, the Proprietary, is the most productive in the world. It is connected with Silverton and Adelaide by rail. Pop. about 20,000.

Broken-wind, a disease in horses, often accompanied with an enlargement of the lungs and heart, which disables them for bearing fatigue. In this disease the expiration of the air from the lungs occupies double the time that the inspiration of it does; it requires also two

efforts rapidly succeeding each other, attended by a slight spasmodic action, in order fully to accomplish it. The disease is caused by rupture of the air-cells, and there is no known cure for it. See **HEAVES**.

Broker (Lat. *abrocator*, perhaps from the Saxon *abroccon*, to break up, from which is derived "abbroachment," the breaking up of goods or selling at retail). The early use of this term designated a retailer of goods, generally supposed to belong to another person, and thence applied to any one making a bargain as the agent of another for the sale or purchase of goods. The distinctive character of a broker was that he acted in behalf of another and in his name; at least, when the contract came to be consummated, the name of the principal was in the ordinary course disclosed. It was a further incident of a broker's employment that he did not have possession of the goods sold, or receive possession of the goods purchased, in which respect he differed from a factor. And these principles still apply. But the office of broker has been vastly extended by the increasing exigencies of commercial business.

The most important kinds of brokers are here enumerated. Bill and note brokers negotiate the purchase and sale of bills of exchange and promissory notes. They are paid a commission by the seller, and it is not their custom to disclose the names of their principals. There is an implied warranty that what they sell is what they represent it to be, and should a bill or note sold by them turn out to be a forgery, they are held to be responsible; but it would appear that by showing a payment over to their principals, or other special circumstances attending the transaction proving that it would be inequitable to hold them responsible, they will be discharged. (Edwards, Bills, 291; 4 Duer, 79). The authorities, however, are not in harmony upon this question. (See 3 Allen 258; 1 Hill 287; 21 E. C. L. 379.) Exchange brokers negotiate bills of exchange drawn on foreign countries, or on other places in this country. It is sometimes part of the business of exchange brokers to buy and sell uncurrent bank notes and gold and silver coins, as well as drafts and checks drawn or payable in other cities; although, as they do this at their own risk and for their own profit, it is difficult to see the reason for calling them brokers. Insurance brokers procure insurance, and negotiate between insurers and insured. Merchandise brokers negotiate the sale of merchandise without having the possession or control of it, as factors have. Pawnbrokers lend money in small sums, on the security of personal property, at usurious rates of interest. They are licensed by the authorities, and excepted from the operation of the usury laws. Real estate brokers are those who negotiate the sale or purchase of real property. They are a numerous class, and, in addition to the above duty, sometimes procure loans on mortgage security, collect rents, and attend to the letting and leasing of houses and lands. Ship brokers negotiate the purchase and sale of ships and the business of freighting vessels. Like other brokers they receive a commission from the seller only. Stock brokers are those employed to buy and sell stock in incorporated companies. The stock brokers are associated together in the larger cities under the name of the Board of Brokers.

BROMAL HYDRATE — BROMIDROSIS

(See STOCK EXCHANGE.) This board is an association, admission to membership in which is guarded with jealous care. Membership is forfeited for default in carrying out contracts, and rules are prescribed for the conduct of the business, which are enforced on all members. The purchases and sales are made at sessions of the board, and are all officially recorded and published by an officer of the association. Stock brokers charge commission to both buyers and sellers of stocks.

Bro'mal Hydrate is prepared by adding bromine to iced alcohol, distilling and combining with water. Its crystals resemble those of chloral hydrate in appearance and chemical properties, and are soluble in water. The drug has a sedative action tending to produce sleep, and is employed in nervous conditions and to diminish the attacks in epilepsy. It has little effect on pain, and should not be used when the heart is weak or the stomach upset.

Bro'mamide, a volatile crystalline substance without odor or taste and containing bromine. It is insoluble in water and is employed as a sedative in acute and chronic rheumatism and neuralgia.

Bromberg, bröm-bärn, Prussia, a town in the province of Posen, 69 miles northeast of the city of that name; situated on the Brahe six miles west of its confluence with the Vistula. It is well built, has two Protestant and two Roman Catholic churches, a synagogue, asylum for the blind, a gymnasium, and a real-gymnasium. Pop. (1895) 46,417.

Brome, Alexander, English poet and dramatist: b. 1620; d. 1666. He seems to have been a lawyer by profession, and at one time attorney to the court. He is best known as the author of many royalist songs and epigrams. He published 'The Cunning Lovers,' a comedy (1654); 'Fancy's Festivals' (1657); 'Songs and Poems' (1661); 'Translation of Horace' (1666).

Brome, Richard, English dramatist: d. about 1652. He was at first the servant and afterward the friend of Ben Jonson, who encouraged him in his literary work, and on whose style his plays are modeled. The best and most popular of his dramas, some of them comedies dealing with the everyday life of his time and others of a more romantic character are: 'The Court Beggar' (acted 1632); 'The Love-sick Court' (published 1659); 'The Queen and Concubine' (published 1659); 'The Northern Lass' (printed 1632); 'The Sparagus Garden' (acted 1635); 'The Antipodes' (acted 1638), and 'A Jovial Crew' (acted 1641).

Brome-grass, the common name of the genus *Bromus*. Nearly 200 species have been described, occurring in both the Old and the New World. They are known by having their spikelets many-flowered, two awnless glumes to each floret, two paleæ or valves, the lowermost of which has a rough, straight, rigid awn proceeding from below the tip of the valve. These grasses have great power of resisting drought, and have proved themselves valuable forage plants on the high, dry plains of the western United States. Some species are cultivated for hay in the eastern States, but are not much relished by cattle. The giant brome-grass is known as cheat or chess, and is found in wheat-fields. This has been introduced from Europe.

Bromelia, a genus of about 25 species of monocotyledonous, stemless herbs of the natural order *Bromeliaceæ*, natives of tropical America, introduced into other warm climates for the sake of the fibre obtained from their leaves, and cultivated in greenhouses to some extent for ornament. The species have stiff leaves like the pineapple, and flowers in panicles. *B. pinguin*, the wild pineapple or pinguin, a native of the West Indies, is perhaps best known because of its use as a tropical hedge-plant, for which its numerous sword-shaped, spiny, rigid leaves, three to six feet long, and two inches wide, specially adapt it. The leaves are also ornamental, being bright green at first and turning red with age. The reddish pubescent flowers in compact panicles are followed by edible fruits as large as plums. These fruits are used to make a pleasant cooling drink. *B. sylvestris*, which has smaller leaves, furnishes a fibre said to be superior to the preceding species. Other species also yield a fibre of greater or less value.

Bro'mic Acid (HBrO_3), a monobasic acid, forming salts called bromates. When bromine is dissolved in caustic potash a mixture of bromide and bromate of potassium is obtained, which can be separated by crystallization, $3\text{Br}_2 + 6\text{KHO} = 5\text{KBr} + \text{KBrO}_3 + 3\text{H}_2\text{O}$. Free bromic acid can be prepared by passing chlorine into bromine water, $2\text{Br} + 10\text{Cl} + 6\text{H}_2\text{O} = 2\text{HBrO}_3 + 10\text{HCl}$. The acid is best obtained by decomposing potassium bromate by argentic nitrate, and acting on the resulting argentic bromate by bromine, $5\text{AgBrO}_3 + 3\text{Br}_2 + 3\text{H}_2\text{O} = 5\text{AgBr} + 6\text{HBrO}_3$. Bromic acid is a strongly acid liquid, reddening and then bleaching litmus paper. On concentration at 100° it decomposes into bromine and oxygen. It is decomposed by sulphur dioxide (SO_2), by sulphide of hydrogen (H_2S), and by hydro-bromic acid (HBr). Bromates are with difficulty soluble in water, and are decomposed on heating into oxygen and bromides.

Bromide, brö'mid, a combination of bromine with a metal or a radical. Bromides are soluble in water, except silver and mercurous bromides; lead bromide is very slightly soluble. They are detected in analysis by the following reactions: Argentic nitrate gives a yellowish precipitate of AgBr , insoluble in dilute nitric acid, and soluble in strong ammonia. Chlorine liberates bromine, and, if the liquid is shaken up with ether, a yellow ethereal solution floats on the liquid. Heated with sulphuric acid and MnO_2 , bromides yield vapors of Br , which turns starch yellow.

Bromidro'sis (bromos, a bad odor + hidros, sweat), malodorous or stinking perspiration, usually excessive in quantity and due mostly to bacterial decomposition of the sweat. The parts most affected are the arm-pits and the feet, but the latter are not attacked in persons who go barefoot. The victims are mostly anæmic, nervous persons. Very hot water, formaldehyde, salicylic acid, and boric acid are the most used applications, the latter being dusted in shoes and stockings. The sweat also sometimes smells of certain odoriferous substances, not necessarily offensive, which have been taken; for example: asafoetida, copaiba, denzoic acid, musk, onion, or garlic. It also may develop a peculiar odor in cholera, smallpox or typhoid fever, and smell

BROMINE — BRONCHITIS

of urine in uremia. Rarely it gives a pleasant odor of violet or pineapple. The sweat in some colored races has a distinctive, unpleasant smell.

Bro'mine, a non-metallic element. Symbol Br; atomic weight, 79.4 for $H=1$, or 80.0 for $O=16$. Bromine was discovered in 1826 by Balard, in the salts obtained by the evaporation of sea water. Bromine is liberated from the sodium and magnesium salts by the action of free chlorine, and is separated by ether, which dissolves the bromine. This red-colored solution is removed, saturated with potash, evaporated, and heated to redness, and the bromide of potassium is heated with manganese dioxide and sulphuric acid. The bromine is liberated in the form of a deep red vapor, which condenses into a dark, reddish-black liquid. Specific gravity, 2.97. It boils at 63° , and its vapor density is 5.54 times that of air. It has an irritating smell, and when inhaled is poisonous. It dissolves in 30 parts of water, and the solution has weak bleaching properties. Bromine and hydrogen do not unite in the sunlight, but do when they are passed through a red-hot porcelain tube, forming hydrobromic acid (HBr), which is also obtained by the action of phosphorus and water on bromine. It is a colorless, fuming gas, which liquefies at 73° , very soluble in water. The concentrated solution contains 47.8 per cent of HBr; it boils at 126° , and has powerful acid properties; it neutralizes bases, forming bromides and water. Hypobromous acid, $HBrO$, is only known in solutions; it has bleaching properties. Bromine can displace chlorine from its compounds with oxygen, while chlorine can liberate bromine from its compounds with hydrogen. Free bromine turns starch yellow.

Bromine has been applied externally as a caustic but rarely. Its chief officinal preparations are bromide of ammonium, useful in whooping-cough, infantile convulsions, and nervous diseases generally; and bromide of potassium, now very extensively used, especially in epilepsy, hysteria, delirium tremens, diseases of the throat and larynx, bronchocele, enlarged spleen, hypertrophy of liver, fibroid tumors, etc. Also, as an antaphrodisiac, for sleeplessness, glandular swellings, and skin diseases. The alterative properties of bromide of potassium are similar to, but less marked than, those of the iodides. Its preparation is the same as iodide of potassium, substituting an equivalent quantity of bromine for iodine— $6KHO + Br_2 = 5KBr + KBrO_3 + 3H_2O$. It has a pungent saline taste, no odor, and occurs in colorless cubic crystals, closely resembling the iodide. As a hypnotic its usefulness is much increased by combining it with morphia or chloral hydrate.

Bro'mipin, a yellow, bland liquid of simple oily taste, and composed of oil of sesame with 10 per cent of bromine. It is easily borne by the stomach and does not readily produce bromism, therefore in some cases it is substituted for the bromides which it resembles in its action on the nervous system.

Bro'mism, a condition which results from the accumulation of bromides in the system, owing to the ingestion of greater quantities than the body can get rid of. The breath is fetid, the skin breaks out in an acne eruption, the throat is insensitive to touch so that it may be tickled with a feather, and there is loss of memory,

heaviness of intellect, great sleepiness, and depression of spirits. If the drug is still continued there may be paralysis, loss of sight and hearing, inability to speak above a whisper, and various symptoms of mental derangement. The symptoms usually quickly subside on stopping the drug.

Bromley, England, a town of Kent, 10 miles south-southeast of London. It has a market square with a large market-house, and has rapidly increased by the erection, in its vicinity, of large groups of houses occupied by London merchants. The most notable place of worship is the modern church of St. Peter and St. Paul. Pop. (1901) 27,358.

Bro'moform, a clear, heavy, volatile liquid of ethereal odor and sweetish taste, soluble in alcohol or ether though not in water. It is analogous to iodoform and chloroform, and is made like the latter from alcohol or acetone. It is somewhat anesthetic and has been used like chloroform, but its special use is in "whooping-cough," in which a few drops are given in solution or mixture several times a day.

Bro'mol, the precipitate formed when bromine water is added to a solution of carbolic acid. It occurs in crystals, is antiseptic, and may be taken internally for diarrhoea or cholera morbus, or applied to wounds or ulcers in the form of a salve.

Brompton, England, a suburban district of London, in Kensington, associated with the names of Burke, Canning, and other eminent men.

Bromus. See BROME GRASS.

Bromvogel, the South African name for the hornbill (q.v.).

Bronchi, bröng'ki, the two branches into which the trachea or windpipe divides in the chest, one going to the right lung, the other to the left, and ramifying into innumerable smaller tubes—the bronchial tubes. See LUNGS.

Bronchitis (Gk. bronchia, the bronchial tubes + itis, a suffix denoting inflammation), inflammation of the bronchi. Acute bronchitis is a "cold in the chest," and may be simple or may accompany typhoid fever, malaria, influenza, whooping-cough, or tuberculosis. It is very common in young children, in the aged, and in those whose work involves the inhalation of fumes or dust. Sedentary indoor occupations and overheated rooms are predisposing conditions. In some people the bronchi are very susceptible, and "catching cold" means an attack of bronchitis. The mucous membrane of the bronchi is red, swollen, and inflamed, and after the first day or two exudes large quantities of mucus which must be coughed up. There may be a sudden onset with pains in the back and limbs, a feeling of languor and restlessness, tightness or pain in the chest, and fever. The cough is at first dry, but soon is accompanied by much sputum. Often the symptoms are very slight, lasting only a day or two, but the usual duration is one or two weeks. Complete return to health may be much delayed. In infants and old people pneumonia frequently supervenes. At the onset a hot foot-bath, hot lemonade to produce free sweating, a mustard plaster to the chest, and a cathartic may cut short an attack. Later ipecac, senega, squills, ammonia, etc., are

given to loosen the mucus and relieve the congestion. Codeine will allay the cough. Chronic bronchitis occurs most frequently in middle life or old age, and commonly accompanies disease of the heart, liver or kidneys, and gout. Cold and changeable weather brings on the symptoms year after year, so that a person will "take cold every time the weather changes." The mucous membrane is atrophied, or in places thickened, and the tubes are irregularly dilated. There may be shortness of breath on exertion, asthmatic attacks, spells of coughing, profuse expectoration, and occasionally spitting of blood. Fever is rare. The general health is not impaired to the extent that it is in tuberculosis, but a change to a dry, bracing climate may be advisable. Turkish baths, creosote, ipecac, and potassium iodide are among the favorite remedies. A form of acute or chronic bronchitis, in which membranous casts of the bronchial tubes are formed and coughed up, is known as fibrinous bronchitis. Consult Allbutt's 'System of Medicine'; and Osler's 'Principles and Practice of Medicine.'

Bronchocele, bröng'kō-sēl, an indolent tumor on the forepart of the neck, caused by enlargement of the thyroid gland, and attended by protrusion of the eyeballs, anæmia, and palpitation.

Bronchotomy, bröng-kōt'ō-mī, in surgery, an incision into the windpipe or larynx, between the rings, to afford a passage for the air into and out of the lungs when any disease prevents respiration in the usual way, or to extract foreign bodies which have got into the trachea, or in cases of suffocation, drowning, etc. It is known as tracheotomy or laryngotomy, according as the windpipe or the larynx is operated on.

Bronco, or **Broncho**, the small horse of the plains in western United States and in Mexico. In Texas it is called "Mustang." It is descended from the horses of Arabian stock, brought to America by the early Spaniards, and exhibits still certain Arabian features due to this ancestry. Many of the Spanish horses were captured by the Indians, and some escaped from their owners. Of the former, great numbers deserted their Indian captors, and roamed with their free companions over the plains of the Southwest, where they multiplied rapidly, and adapted themselves to the local conditions of climate and vegetation. Thus they returned to a wild state in this country, which has been considered as the original habitat of the horse family, but which presents nowhere, unless on the pampas of South America, an aboriginal type of horse. These wild horses have more recently been captured, and bred in captivity; and have been modified by admixture of blood with horses from the eastern United States. They are famous for their endurance, despite their rather weak hind quarters. Their heads are proportionately very large, and not handsome, but the little animals are extremely intelligent and serviceable.

Brondel, John B., American clergyman: b. Bruges, Belgium, 1842. He studied in the American College of the University of Louvain and was ordained to the Catholic priesthood in 1864. He came to America and from 1867-77

was rector at Steilacoom, Wash., and at Walla Walla, 1877-8. In 1879 he became bishop of Vancouver Island, and was appointed, in 1883, administrator apostolic of Montana, becoming later bishop of Helena. Bishop Brondel is especially known for his labors among the Indians.

Brongniart, Adolphe Théophile, ä-döf tã-ö-fēl brö-nyär, French botanist, son of Alexandre Brongniart: b. Paris, 14 Jan. 1801; d. there, 19 Feb. 1846. He first studied medicine, and received his diploma of doctor of medicine in 1826; but afterward turned his attention to the physiology of plants and antediluvian phytology. In 1834 he was elected a member of the Academy of Sciences, as successor to Desfontaines; and in 1839 professor of botany at the Museum of Natural History in Paris. His researches were various, and among his numerous works are 'Histoire des végétaux fossiles' (1828-47); 'Essai d'une classification naturelle des champignons' (1825); 'Mémoire sur la structure et les fonctions des fenilles' (1871).

Brongniart, Alexandre, ä-lēks-ändr, naturalist and mineralogist: b. Paris, 5 Feb. 1770; d. there, 7 Oct. 1847. He turned his attention at a very early age to the study of the ceramic art; and after having served for some time in the army on the medical staff, was appointed, in 1800, director of the porcelain manufactory at Sèvres, where he revived the art of painting on glass. In 1807 appeared his 'Traité Élémentaire de Minéralogie'; and about the same time his labors in the department of natural history brought him into contact with Cuvier, whom he aided materially in classifying the newly discovered fossils of Montmartre. Along with Cuvier he engaged in the composition of the 'Essai sur la Géographie Minéralogique des Environs de Paris,' first published in 1811, and afterward in 1822, much enlarged, under the title of 'Description Géologique des Environs de Paris.' In 1844 appeared his 'Traité des Arts Céramiques.' He succeeded Haüy as professor of mineralogy in the Museum of Natural History in 1822.

Broni, brö'nē, a town of northern Italy, with mineral springs, 11 miles southeast of Pavia. Near by is the castle of Broni, where Prince Eugène obtained a victory over the French in 1703.

Bronn, Heinrich Georg, hīn-rīn gā-ōrn brōn, German naturalist: b. Ziegelhausen, 1800; d. 1862. He was educated at the University of Heidelberg, where he was nominated professor in 1833, and appointed lecturer on zoology in succession to Leonhard. Among his various scientific works may be named 'A System of Antediluvian Zoöphytes' (1827); 'Lethæa Geognostica,' an important geological work (1837); 'History of Nature' (1841-9); and 'Universal Zoölogy' (1850).

Bronsart, Hans von, hänts fōn brōn-sār (properly SCHELLENDORFF, HANS VON BRONSART), German musician: b. Berlin, 1830. He studied in Berlin and Weimar, becoming a pupil of Liszt. After tours to European cities he directed concerts in Berlin. From 1867-87 he was intendant of the Royal Theatre in Hanover, and from 1887-95 filled a similar position in Weimar. His compositions for the piano are among the best known of his works. He wrote also the orchestral pieces, 'Christnacht' and 'Frühlingsphantasie.'

A PITCHING BRONCHIO.

BRONTE

Bronte, brōn'tā, Anne (Acton Bell). See BRONTE, CHARLOTTE, EMILY AND ANNE.

Bronte, Charlotte, Emily, and Anne, English novelists. Their father, Patrick Brontë (1777-1861), belonged to a family of Irish protestants named Prunty or Brunty. He was born in the village of Emdale, in County Down, Ireland. By schoolmastering he earned money enough to take him to the University of Cambridge, where he graduated B.A., at Saint John's College, in 1806. Ordained the same year to a curacy in Essex, he subsequently migrated to Yorkshire, and in 1811, obtained the living of Hartshead-cum-Clifton, to the east of Halifax. There he met his future wife, Maria Branwell of Penzance, then on a visit to her friends in the north. They were married on 29 Dec., 1812. Both husband and wife, it is interesting to note, had a zest for writing. A little manuscript in Mrs. Brontë's hand is still extant; and Mr. Brontë published between 1811 and 1818 two volumes of meditative verse and two didactic stories, one of which follows the lines of Richardson's 'Pamela.' In 1815 Hartshead was exchanged for Thornton, another small parish near Bradford, in a bleak and lonely district. To this new home the Brontës brought with them two children, Maria and Elizabeth. At Thornton were born Charlotte (21 April 1816), Patrick Branwell (26 June 1817), Emily Jane (30 July 1818), and Anne (17 Jan. 1820).

A month after the birth of their last child, the Brontës moved to Haworth, near Keighley, a village that then consisted mainly of a street of gray stone houses running irregularly up a hillside by the church and the graves to the parsonage near the summit. As perpetual curate of the parish, the elder Brontë there passed his life; and there the children all grew up within sight of the broad and sweeping moors, wild and bleak in winter but grand and glorious in summer. Mrs. Brontë, a frail woman like her daughters, died in September, 1821, worn out by the birth and care of six children; and the next year, Miss Branwell, an unmarried sister, came to Haworth to manage the household with the aid of the faithful old servant "Tabby." After the death of his wife, Mr. Brontë, always eccentric and austere, grew morose; and Miss Branwell seems to have been rather prim and reserved. Wherefore the children were left much to themselves. In 1824 the daughters were placed in a school at Cowan Bridge, a hamlet on the road between Leeds and Kendal, where they remained for about a year to their great discomfort. Just after leaving school Maria and Elizabeth died of consumption, brought on, Charlotte thought, by bad food and brutal treatment.

Soon after this, Charlotte, Emily, and Branwell—for so they always called their brother—began to write "original compositions" in a curious microscopic hand, which they stitched into booklets and covered with brown paper. The specimens of Charlotte's stories, such as 'The Adventures of Ernest Alembert,' which have been printed as literary curiosities, show a facile pen and a remarkable command of vague and ornate phrases. She, and no doubt Emily and Branwell, had been reading Scott and the Gothic romances. In January, 1831,

Charlotte was sent to a school kept by Margaret Wooler at Roehad, between Leeds and Huddersfield. Though she remained there but a year, she formed a strong attachment for Miss Wooler and several of the girls, especially for Ellen Nussey, with whom she kept up a life-long correspondence. In 1835, she returned to Roehad as a teacher, in company with Emily as a pupil. After three months Emily became homesick and her place was taken by Anne. Charlotte stayed on with Anne till Christmas, when both returned to Haworth. Charlotte was completely worn out by the work for which she was ill adapted. During the next years Emily remained at home, while Anne and Charlotte went out as governesses. Charlotte had a hard time of it in her first position, but received better treatment on a second trial in 1841. In the meantime, she rejected two offers of marriage. With a view to setting up a school of their own, Charlotte and Emily went over to Brussels in 1842 to prepare themselves, especially in French and German, at the Pension Héger, a large school under the management of M. Paul Héger and his wife. They advanced rapidly in their studies, receiving high praise from their master. Called home within a year by the death of Miss Branwell, Emily remained with her father, but Charlotte returned for a year as teacher of English. Homesickness and anxiety for her father, whose eyesight was failing, brought Charlotte back to the parsonage. Brief as was the sojourn abroad, it was of the greatest value to the sisters. Without that experience, neither of them would likely have written novels that are still read.

In 1846, Charlotte, Emily, and Anne published jointly a volume of 'Poems' under the names of Currer, Ellis, and Acton Bell. The little volume was hardly noticed, though it contained Emily's fine stanzas on the 'Old Stoic.' At this time each of the sisters was getting ready a novel. After travelling from publisher to publisher, Emily's 'Wuthering Heights,' and Anne's 'Agnes Grey' were accepted, and published together in December, 1847, under the authors' pseudonyms, and "on terms somewhat impoverishing." Fifty pounds was advanced to Newby, the publisher, on account and never returned. Charlotte's 'Professor,' which became detached from the other two novels in the long journey, was everywhere rejected; but Smith and Elder intimated to her that they were willing to consider "a novel of a more striking and exciting character." 'Jane Eyre,' by Currer Bell, already completed, was at once accepted and published in October, 1847, two months before her sisters' novels came out. In January, 1848, it went into a second edition with a dedication to Thackeray. Charlotte Brontë at once took her place among the great novelists of the period.

The next year appeared Anne's second novel, the 'Tenant of Wildfell Hall.' By this time sorrow and death were settling over the Yorkshire parsonage. Branwell, who had started out in life with the intention of becoming a portrait painter, fell into evil ways and slowly degenerated through long years under the eyes of his sisters. After several attacks of delirium

BRONTE

tremens, the end came in September, 1848. When he felt the approach of death, he rose to his feet and died standing in order to prove that as long as there is life there is strength of will to do as one chooses. Emily drooped and died on 19 December, refusing to see a physician till just before the end. Among the poems she left unpublished were the memorable 'Last Lines,' and several other stanzas which Matthew Arnold justly placed by the side of Byron's poems for vehemence, passion, and pain. Anne, long in declining health, was taken over to Scarborough where she died of consumption on 28 May 1849, within sight and sound of the sea she passionately loved. She lies buried in the Scarborough churchyard. Like Emily, she also left behind "last verses" in a noble but more subdued key. Charlotte lived on with her father in great loneliness, publishing 'Shirley' in 1849 and 'Villette' in 1853. She visited London several times, and on two occasions she met Thackeray, with whom she was greatly puzzled. To Mrs. Elizabeth Gaskell the novelist, who made her acquaintance among the lakes of Westmoreland in 1850, she seemed like one from whom suffering had taken "every spark of merriment" and "to be shy and silent from the habit of extreme, intense solitude." After a courtship of some years, broken off by her father, she married on 19 June 1854, the Rev. Arthur Bell Nicholls, who had served as curate at Haworth. Her married life, which promised much happiness, was brief. She passed a few months on her husband's estates in Ireland and then returned to Haworth to die on 31 March 1855. She was buried in the church by the side of Emily and Branwell. Two years after her death, the 'Professor,' nine times rejected, was published with a note by Mr. Nicholls. The fragment of a story called 'Emma,' which had been begun in 1854, appeared in *Cornhill Magazine* for April 1860, along with Thackeray's beautiful tribute under the title of the 'Last Sketch.' Settling permanently in Ireland, Mr. Nicholls died there in 1906.

A glamour rests over these children of an Irish clergyman who had strayed to the Yorkshire moors. What Charlotte said of Emily and Anne may be said of herself also: "For strangers they were nothing; for superficial observers less than nothing; but for those who had known them all their lives * * * they were genuinely good and truly great." In them all, except perhaps Charlotte, lurked consumption; and they all died young. Two were endowed with unusual talents and two were geniuses. Much, no doubt, that has been reported of Branwell is legendary, but he certainly possessed the Brontë taste for art and letters. A beautiful reproduction of his portrait of Emily was engraved from a photograph for the Haworth edition of 'Wuthering Heights' (1900). At one time he aspired to win a name in literature. A letter of his to Wordsworth, inclosing a few stanzas of verse and asking for the poet's opinion of them, is as pathetic as remarkable in tone and style. "From the day of my birth," he said, "to this the nineteenth year of my life I have lived among secluded hills, where I could neither know what I was or what I could do. I read for the same reason that I ate or

drank, because it was a real craving of nature. I wrote on the same principle as I spoke—out of the impulse and feelings of the mind; nor could I help it, for what came, came out, and there was the end of it."

That pressure of utterance which opium and alcohol brought to naught in this case, was characteristic of the sisters. They wrote because they could not help it. Anne possessed less of the Brontë fire. Fragile and gentle like her mother, she was "the prettiest * * * with light brown hair, violet eyes, and pencilled eyebrows." Without the outlook that came to Emily and Charlotte from their stay abroad, she moved in the narrowest circle of experience easily imaginable. Her novels, in consequence, suffer much by comparison. They are, however, storehouses of biographical incident relating to the family, and for themselves they are interesting, notwithstanding their crudeness, as transcripts of Yorkshire ways and manners at a time when the daughters of clergymen were forced to become governesses.

Emily's genius towered far above the rest. Of the poems the sisters published together, only hers cling to the memory. Under more favorable surroundings she should have become a poet ranking with Christina Rossetti and Mrs. Browning. One may pick flaws enough in 'Wuthering Heights.' It is ill put together and perhaps the author has not fully realized her aim. It is no doubt brutal where it was intended not to be. But it displays the same intense power of utterance as the poems. It is one of the great things in English fiction, not much like any romance before or since its time. Over it hangs the mystery of the moors and their solitary wanderer.

'Wuthering Heights,' however, has never gained the popularity of Charlotte's novels. To many it is nightmarish and repellent. It is not softened by the humanity of Charlotte who mingled more with the world. 'Jane Eyre' was based upon Charlotte's experiences as school-girl and governess. As a picture of the life of the times in the north, it came as a startling revelation. Its characters were drawn on hard and unconventional lines totally unlike the run of novels women were then writing. Against the author was brought the charge of coarseness and brutality, though no mind was ever cleaner than hers. The novel was really the wail of a human soul compelled to haunt the Yorkshire moors. 'Shirley' was quieter in tone; but it caused a stir in the north, for the characters were easily recognized portraits, among which was a superb study of Emily as Shirley Keeldar of quivering lip, dilating nostrils, and wild, fascinating eyes, when moved to passion or strange, Titanic visions. 'Villette,' which is the 'Professor' worked over, was founded on Charlotte's life in Brussels. Though it suffers somewhat from its foreign setting, it is perhaps her masterpiece. Lucy Snowe and Paul Emanuel are her most elaborate characters, and nowhere else has Charlotte Brontë so subtly analyzed states of mind verging into madness.

Bibliography.—'The Life of Charlotte Brontë' by Mrs. Elizabeth Gaskell (London 1857, afterwards revised and frequently reissued) is among the finest biographies in the English language. It should be supplemented, however,

From the drawing by Richmond

CHARLOTTE BRONTË

BRONTOTHERIUM—BRONZE AGE

by C. K. Shorter, 'Charlotte Brontë and her Circle' (London 1896) and 'Charlotte Brontë and her Sisters' (New York 1905). Interesting but less valuable biographies of Charlotte Brontë have been written by T. W. Reid (London 1877), and A. Birrell (London 1887). Consult also 'Emily Brontë' by A. Mary F. Robinson in the 'Eminent Women Series' (Boston 1883); Swinburne's 'A Note on Charlotte Brontë' (London 1877); F. A. Leyland's 'The Brontë Family' (London 1886); Wright's 'The Brontës in Ireland' (New York 1893); and the 'Publications' of the Brontë Society. The 'Life and Works of the Sisters Brontë' with a preface by Mrs. Ward, and introduction and notes to Mrs. Gaskell's 'Life' by C. K. Shorter (7 vols. London and New York 1899-1900) is the best complete edition yet published. Charlotte Brontë's 'Adventures of Ernest Alembert' is included in Nicholl and Wise, 'Literary Anecdotes of the Nineteenth Century' (Vol. II. London 1896).

WILBUR L. CROSS,

Professor of English, Yale University.

Brontotherium, or **Titanotherium**, a genus of the extinct mammals first found in the Bad Lands of South Dakota, and later in Nebraska and Colorado. The formation is Miocene and the genus is but one of an extinct family of herbivorous mammals. It had the following features: The skull was long and depressed, with a large pair of horn cores, placed transversely on the maxillary bones, in front of the orbits; the nasal bones, which were greatly developed and firmly co-ossified, protruded over the nasal orifice; the brain cavity was small and did not extend over the cerebral hemispheres or the cerebellum, and but little over the olfactory lobes; the neck was of medium length and stout; axis was large and extended transversely, being massive, with odontoid process stout and conical; lumbar were slender and not as large as the dorsals, and there were four sacral vertebrae; a long and slender tail, indicated by the caudals; limbs somewhat shorter than the elephant's; radius separated from the ulna; carpal bones short and supporting four toes; tibia separated from the fibula; three toes of almost equal size on the hind foot.

Bronze, an alloy consisting of proportions of copper and tin, varying according to the purpose desired, to which lead, zinc, and silver also, are sometimes added for the purpose of giving greater brilliancy to the compound, or rendering it more fusible, the zinc being introduced in the form of brass. In some of the modern bronzes, brass is used instead of tin; these are then nothing more than brass, consisting of very large proportions of copper. Bronze was used by the ancient Assyrians and Egyptians. Layard brought many ornaments and other articles of this metal from Assyria. It is more fusible, as well as harder than copper, and has also a fine-grained metal, taking a smooth and polished surface; hence its universal use, both in ancient and modern times, in making casts of all kinds, medals, bas-reliefs, statues, etc. Its color is a reddish-yellow, and is darkened by exposure to the atmosphere. It has been found, on examination, that the bronze weapons of the Greeks and Romans were of the best composition for securing the greatest density in the alloy, and

the cutting edges were brought to the highest point of tenacity by hammering. Gun-metal consists of about 90 parts of copper to 9 or 10 of tin. Old cannon are frequently used for casting statues, for which the proportions are similar. Bell-metal consists of 78 of copper and 22 of tin. For edge-tools—copper, 100 parts; tin, 14. For medals—copper, 89; tin, 8; zinc, 3, are used. For ornamental articles, zinc and lead are frequently added. These four metals are usually contained in the bronzes of France. There is some difficulty in making bronze, from the liability to the loss of tin, zinc, etc., by oxidation. A greenish color is imparted to ancient bronzes by oxidation, which is imitated in modern bronzes by chemical appliances. An alloy called phosphor-bronze, consisting of about 90 per cent of copper, 9 of tin, and from .5 to .75 of phosphorus has been found to have peculiar advantages for certain purposes. The addition of phosphorus increases the homogeneity of the compound, and by varying the proportion of the constituents, the hardness, tenacity, and elasticity of the alloy may be modified at pleasure. Great hardness and tenacity with little elasticity can be conferred on it for the making of ordnance, and hardness and tenacity combined with permanent elasticity can be given to it for the making of parts of machines, etc. In the elastic condition it is peculiarly well adapted for the bearings of machinery, since it produces very little friction. The addition of phosphorus has another important effect. When the proportion exceeds .5 per cent it gives a warmer color to the bronze, making it resemble gold largely alloyed with copper. This form of the alloy is therefore largely used for works of art. The name of steel-bronze is given to bronze condensed and hardened artificially, as in the making of cannon the bore of which is enlarged by forcing in several strong steel cylinders of different sizes in succession. Aluminum-bronze is a gold-colored alloy of copper and aluminum, manganese-bronze, a bronze containing manganese and iron, possessing valuable properties. See BRONZES.

Bronze Age, the period represented by archaeologists as intervening between the Stone Age and the Iron Age. The demarcations of these periods, however, are far from being clearly defined, and overlap to some extent. The use of stone for weapons, utensils, etc., naturally preceded the use of metals by primitive man, and the order in which the different metals would come into service would depend upon several factors. The nearness of the metallic deposits to the surface of the earth, the relative degree of purity in which they are usually found, and ease in smelting and working, would all affect the sequence of their introduction. The study of the traces of the Bronze Age in Europe apparently leads to the conclusion that throughout that continent the introduction of copper and its alloys was nearly synchronous, but the transition to the Iron Age took place more or less slowly in different regions, the new metal being introduced from the south and superseding bronze soonest where the paths of early commerce were most numerous or most frequently trodden. In Great Britain and Scandinavia the Bronze Age lingered much longer, according to certain archaeologists, than in Italy, France,

BRONZE WING—BROOK FARM

and Spain. In Greece, the use of bronze distinguishes the Mycenaean period, especially in its earlier days. In the New World, especially in Peru, the existence of the Bronze Age is indicated. The chronology of the three ages presents marked difficulties, and the periods should be regarded as stages of evolution in civilization still exemplified among races of slow development. The Bronze Age in Europe may be approximately placed between 2000 B.C. and 1800 B.C.

Bronze Wing, Bronzewing Pigeon, or Bronze Pigeon, any of several different species of the genus *Phaps*, found in Australia, Tasmania, and New South Wales. These are birds of beautiful plumage, obtaining their name from the lustrous bronze color with which the wings are variously marked. The most familiar species is the "common bronzewing" (*Phaps chalcoptera*), a plump, deliciously edible bird, weighing about a pound, and distributed throughout Australia. It nests on low branches on trees near swamps. The "brush bronzewing" (*P. cle-gans*) of southern Australia and Tasmania, is a groundkeeping bird and resembles a partridge in its habits. Another species is the "harlequin bronzewing" (*P. histrionica*), found in great flocks in the northwestern part of New South Wales. Sometimes the ground-pigeons of the genus *Geophaps* are called "bronzewings."

Bronzes, in archæology, works of art cast in bronze. Egyptian idols of bronze are contained in the British Museum. The most celebrated antique bronze statues are, the 'Sleeping Satyr'; the two youthful athletes; the colossal equestrian statute of Marcus Aurelius, at Rome; the Hercules of the capitol; the colossal head of Commodus; the statue of Septimius Severus in the Barberini Palace. Bas-reliefs, vaults, and doors of public edifices were ornamented with decorations of the same metal. Urban VIII. took from the Pantheon alone 450,000 pounds of bronze, which he used for the ornaments of St. Peter's, and for the cannon of the castle of St. Angelo. One of these was composed wholly of bronze nails taken from the portico, and bore the inscription, *Ex clavis trabalibus porticus Agrippæ*. Bronze was considered by the ancients as sacred to the gods; and the Roman emperors who struck gold and silver coins could not strike them of bronze without the permission of the Senate; hence the inscription S. C. (*Senatus consulto*). The words *moneta sacra* are found only on bronze medals. All the instruments of sacrifice and sacred vessels of the ancients were of bronze. (For the method of casting in bronze among the ancients, see Winckelmann's 'History of Art,' book ii.) The moderns have also made much use of bronze, particularly for statues exposed to accidents or the influence of the atmosphere, and for casts of celebrated antiques. The molds are made on the pattern, of plaster and brick-dust. The parts are then covered on the inside with a coating of clay as thick as the bronze is intended to be. The mold is now closed and filled on its inside with a nucleus or core of plaster and brick-dust, mixed with water. When this is done the mold is opened, and the clay carefully removed. The mould, with its core, is then thoroughly dried, and the core secured in its position by bars of bronze, which pass into

it through the external part of the mold. The whole is then bound with iron hoops, and the melted bronze being poured in through an aperture left for the purpose fills the cavity previously occupied by the clay, and forms a metallic covering to the core. It is afterward made smooth by mechanical means.

Bronzing. Bronze of a good quality acquires by oxidization a fine green tint, called *patina antiqua*, or, by the Romans, *arugo*. Sal-ammoniac and salt of sorrel dissolved in vinegar, and applied with a soft rag or brush, will produce this result. The process must be repeated several times to have its full effect. The proportions given by Dr. Ure are three fourths of an ounce of sal-ammoniac and a drachm and a half of salt of sorrel to a quart of vinegar. Bronzing is also the process by which a body of plaster, wood, or metal is made to receive a bronze-like surface. Brass castings are bronzed by the application, after cleaning and brightening them, of vinegar and sal-ammoniac. A variety of liquid solutions are prepared for bronzing copper and other metals, in which verdigris, sal-ammoniac, salt of sorrel, cinnabar, alum, and common salt are employed. To bronze wood and other articles, waste gold-leaf, ground in with honey and washed, or mosaic gold ground with bone ashes, is applied, with size or oil varnish. Gypsum casts are bronzed with black-lead.

Bronzino, Agnolo, or Angilo, ăn'yō-lō, or ăn'yē-lō brōn-zē'nō, Italian painter of the Florentine school: b. Monticelli, near Florence, 1502; d. 1572. He was a pupil of Jacopo da Pontormo, and an admirer and imitator of Michael Angelo. One of his best paintings is a Christ in the church of Santa Croce, at Florence.

Brooch, an ornament worn on the dress, to which it is attached by a pin stuck through the fabric. Brooches are of great antiquity, and were formerly worn by men as well as women. They were used by both sexes among the Greeks and Romans, and also in the Middle Ages. Among the Highlanders of Scotland there are preserved, in several families, ancient brooches of rich workmanship and highly ornamented. Some of them are inscribed with characters to which particular virtues were attributed, and seem to have been used as a sort of amulet or talisman.

Brook Farm, a community organized in 1841 near West Roxbury, Mass. Under the leadership of George Ripley and his wife an association was formed with a few stockholders, and a farm of 200 acres was purchased. Among the members of this association were Nathaniel Hawthorne, Charles A. Dana, John S. Dwight, and George P. Bradford; other prominent people connected with Brook Farm were Ralph W. Emerson, Amos B. Alcott, Theodore Parker, George W. Curtis, and Margaret Fuller. The ideal of the association was to promote the re-organization of society in accordance with the principles of co-operation. The life of the community was very simple; every one had some share of the work to do, the rate of pay being practically the same for all kinds of work; and all had a share in the educational advantages and the social enjoyments. There were a number of industrial employments besides the tilling of the farm, and the surplus product was

MODERN BRONZE WORK.

sold to outsiders. The school was also an important feature, furnishing instruction in all grades, including college subjects; pupils outside the community were received on the payment of a small fee. In 1843 the association, coming under the influence of Albert Brisbane, adopted the organization of the phalanx according to the plan of Fourier, and established the three "primary departments" of agriculture, domestic industry, and mechanic arts; it became also a centre of the Fourierist propaganda. After this change the prosperity of Brook Farm declined rapidly; on 3 March 1846 the new building, the Phalanstery, was burned, and the association finally dissolved in October 1847.

Bibliography.—Codman, 'Brook Farm, Historic and Personal Memoirs'; Frothingham, 'Life of George Ripley'; Noyes, 'History of American Socialisms'; Swift, Lindsay, 'Brook Farm, Its Members, Scholars, and Visitors.'

Brooke, Francis Key, American Protestant Episcopal bishop: b. Gambier, Ohio, 2 Nov. 1852. He was graduated from Kenyon College in his native town in 1874, and entering the Episcopal ministry was successively rector in the Ohio towns of College Hill, Portsmouth, Piqua, and Sandusky; and in St. Louis, Mo.; and Atchison, Kan. In 1893 he was consecrated bishop of Oklahoma and Indian Territory.

Brooke, Henry, Irish dramatist and novelist: b. Rantavan, Ireland, about 1703; d. Burrator, Devonshire, 10 Oct. 1783. He was educated at Dublin University, and began to practice at the bar; but his taste was decided for poetry and general literature, and he came forward as an author by publishing a tragedy called 'Gustavus Vasa,' which was remarkably popular at the time, and was translated into French, though it is now almost forgotten. He wrote several other tragedies, and also several novels, one of which, the 'Fool of Quality,' possesses considerable merit, and was re-published with a preface by Rev. Charles Kingsley. The death of his wife, and the loss of a favorite child, completely broke his spirit, and he lived for a short time in a state of second childhood.

Brooke, Sir James, English rajah, celebrated as the Rajah of Sarawak: b. Bengal, 1803; d. Burrator, Devonshire, 11 June 1868. He was brought at an early age to England, and having completed his education there obtained a cadetship in the Indian army. He distinguished himself in the Burmese war (1826), and subsequently sailed to China. On this voyage there rose in his mind the idea of ridding the Eastern Archipelago from the scourge of piracy, and ameliorating the condition of the inhabitants. Having come into the possession of a large fortune by the death of his father, he bought one of the royal yachts, and set sail for the East (October 1838). Having directed his course to the island of Borneo, he found Muda Hassim, uncle of the king of Borneo, and Rajah of Sarawak, a district on the northwest coast of the island, engaged in suppressing a revolt. The rajah being hard pressed, agreed to make him his successor in return for his assistance. The offer was accepted, Brooke took command of the rajah's army, and speedily reduced the rebels to submission. Being now established in the government, and recognized as Rajah of Sarawak by the sultan of Borneo (1841), he endeavored to induce the Dyak na-

tives to abandon their irregular and piratical mode of life, and to turn themselves to agriculture and commerce. For this end he published a code of laws, establishing free trade and personal equality, and declaring piracy a crime punishable with death. His efforts were wonderfully successful. In conjunction with the British naval commanders he carried on war against the pirates with great vigor. A sum of money was paid by government for the head of each pirate, and under this system the Malay rovers were soon almost extirpated. On his return in 1847, Mr. Brooke was received with general favor, his position was recognized by the government, he received the honor of Knight Commander of the Bath, and was made governor of Labuan, an island near Sarawak which had been acquired by the British. After his return to Borneo he continued to labor as before for the extension of British influence. In 1850 he went as ambassador to Siam, and not long after gave up his post as governor of Labuan. On the outbreak of the war with China in 1857, his residence was suddenly attacked by about 4,000 Chinese, and he himself only escaped by swimming across the river. His adherents soon rallied, however, and at the head of a large body of Malays and Dyaks he drove the Chinese from Sarawak with the loss of half their number. In 1863 he finally returned to England, leaving the government in the hands of his nephew, Charles Brooke. Whatever may be thought of the policy of Sir James Brooke, there can be no doubt as to the benefits derived from it by the people of Sarawak. He established civilization and opened up a trade where previously they had scarcely any existence. Under his administration Sarawak increased from a village of 1,000 inhabitants to a town of 16,000, while the trade increased in the same proportion.

Brooke, John Rutter, American military officer: b. Pottsville, Pa., 21 July 1838. He entered the army as captain in a volunteer regiment on the breaking out of the Civil War in 1861, and resigned in February 1866, with the rank of brevet major-general. He became colonel in March 1879; brigadier-general, 6 April 1888, and major-general, 22 May 1897. After the declaration of war against Spain, he was placed in command of the 1st Provisional Army Corps, and subsequently distinguished himself in the campaign in Porto Rico, and was made a member of the joint military commission to arrange the cession of the island to the United States. On 13 Dec. 1898, he was appointed military and civil governor of Cuba, a post which he held till April 1900, when he was succeeded by Gen. Leonard Wood. On 10 May following, he succeeded Maj.-Gen. Wesley Merritt as commander of the Military Department of the East, with headquarters in New York.

Brooke, Stopford Augustus, English clergyman and author: b. Letterkenny, Donegal, Ireland, 14 Nov. 1832. After a brilliant course at Trinity College, Dublin, he was ordained in the Anglican Church in 1857. From that year till 1859 he officiated as curate of St. Matthew's, Marylebone (London); and in 1876, after having held various other clerical appointments, he became minister of Bedford Chapel, Bloomsbury, where he officiated till his retirement from regular ministerial work in 1894. In 1872 he

was appointed one of the chaplains-in-ordinary to the queen. Having become a Unitarian in his views, he left the Church of England in 1880, but till 1894 still continued to occupy the same pulpit, Bedford Chapel being private property. He has gained a high reputation as a preacher and writer on religious subjects, and also as a poet, but more especially as a literary critic and historian of English literature. His chief works are 'Life and Letters of the Late Frederick W. Robertson of Brighton' (1865); 'Christ in Modern Life' (1872); 'Theology in the English Poets' (1874); 'Primer of English Literature' (1876), an admirable little work; 'Riquet of the Tuft' (1880), a love drama; 'The Early Life of Jesus' (1888); 'Poems' (1888); 'History of Early English Literature: from Its Beginning to the Accession of Alfred' (1892), the only work in English treating adequately its special subject; 'Tennyson: His Art and Relations to Modern Life' (1894); 'The English Poets from Blake to Tennyson' (1894); 'Jesus and Modern Thought' (1894); 'The Old Testament and Modern Life' (1896); 'The Gospel of Joy' (1898); besides several volumes of sermons. His son, Stopford Wentworth Brooke, was pastor of the First (Unitarian) Church in Boston, Mass., 1886-98.

Brookhaven, Miss., a city and county-seat of Lincoln County; on the Illinois C. R.R.; 56 miles south of Jackson, the State capital. It is the seat of Whitworth Female College (Methodist), one of the most popular educational institutions in the South, and St. Francis School (Roman Catholic), and is the trade centre for a large farming, cotton, and yellow pine lumbering region. An electric light and power plant is owned by the city. Pop. (1904) 4,000.

Brookings, S. D., a city and county-seat of Brookings County; on the Chicago & N. R.R.; 60 miles north of Sioux Falls. It is chiefly a dairying place; has electric lights, waterworks, and several mills; and is the seat of the South Dakota Agricultural College and of the United States Experiment Station. Pop. (1900) 2,346.

Brookite, a mineral only known in the form of orthorhombic crystals. It is an oxide of titanium, having the formula TiO_2 . It is found in a variety of colors, red, yellow, black, and brown. It has a hardness of 5.5 to 6.0, and a specific gravity of 3.9 or 4.0. It occurs in Switzerland, in the Tyrol, and in Wales. In the United States it is found (in stout black crystals known as "arkansite") at Magnet Cove, Ark.; also at Paris, Maine, in Ulster County, N. Y., and in North Carolina. The mineral was named for the English mineralogist, H. J. Brooke.

Brooklime (*Veronica Beccabunga*, and *V. americana*), two species of speedwell, perennial plants of the natural order *Scrophulariaceae* common in ditches and wet places in Europe and America respectively, and attractive for their axillary racemes of bluish flowers, for which they are grown in damp places for ornamental purposes.

Brookline, Mass., a town in Norfolk County, on the Charles River, and the Boston & A. R.R.; three miles west of Boston, with which it is connected by electric railroad. It contains the villages of Cottage Farm, Longwood, and Reservoir Station; has a granite town house,

public library (64,000 volumes), and manufactories of electric motors, and philosophical instruments, but is chiefly a place of suburban residence, being the most beautiful and wealthy suburban town in the country. It was first settled in 1634, and was known as "the hamlet of Muddy River" until its incorporation as Brookline in 1705. Consult Bolton, 'Brooklyn: the History of a Favored Town' (1897). Pop. (1904) 23,500.

Brooklyn, N. Y., the second largest of the five boroughs of New York city. It includes the entire area of the county of Kings and was, until 1898, when it was consolidated with New York, the fourth largest city in point of population in the United States. It covers the western extremity of Long Island, is situated in lat. 40° 41' 50" N., lon. 73° 59' 50" W., and has an area of 77.52 square miles, extending from the East River, an arm of the sea which separates it from the borough of Manhattan, the old city of New York, to the Atlantic Ocean and to Newtown Creek and Queens County on the east. Its extreme length from Newtown Creek to Brighton Beach, on the Atlantic shore, is 11 miles, and its average width is over 7 miles. It appears to have been formed by nature to be the site of a great city, for so many natural advantages are rarely to be found within a similar area for the building up of a great industrial and commercial community. The island of Manhattan is the centre of the business activity of the American metropolis, and it may retain that primacy for all time, but its restricted area limits its capacity and forbids its expansion. The tendency has been for some years to expand skyward and to utilize to the utmost the ground area of the island by the erection of lofty buildings, many of them exceeding 20 stories in height, but there is a limit to expansion in this direction, and there seems no possibility of adding to the amount of Manhattan waterfront available for purposes of commerce, while the high price of land caused by the imperious demands of trade compels those engaged in business in Manhattan to seek their homes elsewhere. Brooklyn has profited during the greater part of its history from this compulsion, and its population has increased at a constantly accelerated ratio as the demands of business have made property more valuable in the older portion of the city. Since 1860 Brooklyn has advanced in population more rapidly than any other American city, although the period of its most rapid growth dates from the opening of the first bridge across the East River in 1883. Brooklyn's large territorial area, much of which is still devoted to market gardening, must, for many years to come, keep the cost of a home within the resources of people of moderate means, especially as regards the outlying sections, which are thoroughly covered by electric railways. The character of the soil and the freedom from any rocky hills makes nearly every foot of ground admirably suited to building purposes. The greater part of the borough is situated at a considerable elevation above tide-water. A low range of sand-hills, from 50 to 200 feet high, runs north and east through its centre, which slopes gently down on both sides to the East River and the Atlantic Ocean.

The natural configuration of the site simplifies drainage and other similar municipal problems to a material extent, while the loca-

WATER TOWER AND ENTRANCE TO PROSPECT PARK.

MEMORIAL ARCH, PLAZA ENTRANCE TO PROSPECT PARK.

tion of the borough, between ocean, river, and bay, mitigates the extremes of winter cold and summer heat, and makes it a desirable place of residence throughout the year.

Its advantages as a centre of commerce and industry are no less than those which made it famous as a city of homes before its consolidation with the metropolis. Its water-front available for shipping comprises two miles on Newtown Creek, including its basins, and nearly 10 miles on the East River and New York Bay. The construction of large docks, such as those of the Atlantic and Erie basins—the latter being the chief point of entry of the canal barges that bring great cargoes of grain from the distributing centre at Buffalo to the Brooklyn grain-elevators—have largely increased the wharfrage facilities of the borough.

Most large cities grow by the absorption of outlying suburbs and adjacent villages, and in this respect the experience of Brooklyn has been striking. The name of Brooklyn, which was derived from the town of Breucklen, in Holland, the home from which came most of the earliest settlers, was first attached to a small trading-village that grew up on the shores of the East River near what is now the Fulton ferry to Manhattan. There were several other villages in the county which for a long time retained their individuality and developed along their own lines. Across the Wallabout swamp, to the eastward—"Wallabout" being derived from a settlement of Walloons—a village was laid out in 1827 which was incorporated under the name of Williamsburg and in 1851 became incorporated as a city. Then Williamsburg swallowed up the older and adjacent villages of Bushwick and Greenpoint, just as Brooklyn had already swallowed up Bedford and Gowanus. In 1854 Brooklyn and Williamsburg were consolidated. The town of New Lots, including the village of East New York, came next, and the work of absorption, as far as Brooklyn was concerned, was completed in 1894, when the towns of Flatbush, New Utrecht, Gravesend, and Flatlands were made part of the city, the corporate limits of which then included all of Kings County. It was a natural process, but usually, when a large city is surrounded by suburbs that are destined to absorption, the lines of development of the suburbs are indicated and set in accordance with their inevitable destiny, and annexation entails no confusion. It was different with Brooklyn. Williamsburg, Flatbush, Canarsie, Bushwick, and East New York—more than 20 villages and hamlets all told, that are now a part of the borough of Brooklyn—had each its own plan and its own system of nomenclature. The result has been hopeless and to a large extent irremediable confusion. Duplication of street names may be corrected by the substitution of new names for the old, and much has already been done in that direction, but the confusion resulting from the multiplicity of independent plans on which the various parts of the borough were originally laid out have never been wholly corrected, and Brooklyn will continue to be a puzzle to strangers and even to old residents.

It is as a city of homes—of middle-class homes—that Brooklyn has gained its distinctive character among American cities. The

very wealthy can afford to live in Manhattan, and the very poor have no alternative but to crowd into its hive-like tenements, but it may be said that, as a rule, the palace and the tenement—using the latter word in its ordinary, not its technical sense—are alike unknown in Brooklyn. No place of like population is freer from those congregations and nurseries of crime and disease known as "slums," and in no city is a larger proportion of the population housed under decent and sanitary conditions. It is for this reason, and because the growth of Brooklyn has kept pace in other respects with its growth in numbers, that the population increased from 279,122 in 1860 to 599,495 in 1880; 1,166,582 in 1900, and 1,291,597 in 1903.

The earliest settlement of the Dutch in Kings County was made in 1619, but it was not until more than a century later that Brooklyn had any organized existence. It was the scene of Washington's first battle and defeat during the American Revolution. That battle was fought only about six weeks after the American Congress in Philadelphia had adopted the Declaration of Independence. Washington's army, as yet raw and totally unused to warfare, was massed among Brooklyn's hills, while Gen. Howe, with 30,000 seasoned fighting men, occupied Staten Island. The British crossed to Long Island, landing on the plains of New Utrecht, and on the morning of 27 Aug. 1776, a general advance was made on the American lines. The attack was made at three points. One division advanced through the marshes of Gowanus, and, despite a gallant resistance, drove back the Maryland regiment to the main body of American troops. A second point of attack was through what is now known as Battle Pass, in Prospect Park, where the Americans were forced back on the entrenched position at Fort Green, but the heaviest blow was struck through the advance of a strong flanking party. It had early that morning passed along the northern base of the ridge of hills in what is now the Twenty-fourth ward, stopping at the Howard House, a tavern in East New York, and impressing its owner as a guide. It then advanced upon Washington's forces from the east. A misty night fell, with no general engagement, and by morning Washington had withdrawn his troops, under cover of fog, across the East River. The British retained possession of Brooklyn until the evacuation of New York at the close of the war. Brooklyn's most memorable association with Revolutionary history, however, lies in the fact that the British prison ships—the Jersey and its consorts—were moored in Wallabout Bay, and the bones of 11,000 victims of British severity who died in those floating slaughter-pens are buried at Fort Green, where a worthy monument to their patriotic devotion is soon to be erected.

Brooklyn was incorporated as a village in 1801, and at about that time the federal government made its first purchase of land at the Wallabout for navy-yard purposes. The Brooklyn navy yard is now the best equipped in the possession of the U. S. government. It covers an area of over 100 acres, with a capacious dry-dock, and a mechanical plant capable of ship-building on the most extensive scale. Some of the finest ships in the United States navy have been constructed here, and its great repair shops

BROOKLYN

are kept constantly at work. A splendidly equipped naval hospital occupies a fine site in connection with the yard.

Brooklyn village was incorporated as a city in 1834, with George Hall as its first mayor. In 1854 came consolidation with Williamsburg, and thereafter the growth of the city was steady and rapid. Street railway enterprises opened highways through outlying farm districts, and these speedily became transformed into great thoroughfares, and Brooklyn has now 713 miles of streets, of which the principal ones are paved with asphalt.

The surface and elevated railroad lines, all operated by electricity, have 549.7 miles of tracks, and in 1902 carried 324,898,322 passengers. The growth of Brooklyn, so largely accelerated by the bridge opened in 1883, seems likely to be further stimulated by the early completion of the two additional bridges now in course of construction. The tunneling of the East River, under direction of the New York Rapid Transit Commission, will also tend materially toward Brooklyn's further growth.

It has been generally assumed that Brooklyn is merely "the sleeping-place of Manhattan." It is undoubtedly true that many thousands of those who are engaged in business in Manhattan find their homes in Brooklyn,—the number has been estimated at between 65,000 and 100,000; but the fact remains that Brooklyn itself is one of the greatest manufacturing centres of the United States. In many important branches of industry it leads all its competitors. Its most important industry, at the time of the last census, was foundry and machine-shop products, in which there was \$13,725,518 invested, and wages to the amount of \$5,641,132 were paid to 7,753 workmen. Brooklyn's sugar-refining industry is by far the most important in the United States, nine tenths of the sugar consumed in the country being refined here. In this and in the closely allied coffee-roasting industry, the amount of capital invested is nearly \$20,000,000, the annual value of the finished product being, sugar, \$16,629,982; coffee, \$12,247,162. The manufacture of chemicals is another industry in which much capital is invested, and in which 2,984 people find employment. Some of the leading publishers of the United States have located their printing and bookbinding establishments in Brooklyn. It is also the seat of jute manufacture, glass and porcelain factories cordage works, and other important industries.

Brooklyn's public-school system, up to the date of consolidation with New York, held a high place in the esteem of public educators. In 1897 it was merged in the public-school system of the greater city, but it still possesses many of the characteristics that formerly distinguished it, and few if any cities in the world have a better equipped galaxy of public schools. It has six high schools, of which one is devoted to manual and technical instruction, while another is wholly given over to commercial instruction. Its 133 grammar schools are crowded almost beyond their capacity every day in the school year. Many of the schools in the poorer neighborhoods are kept open during the summer months as recreation schools for the benefit of children who remain in the borough during the ordinary school vacation, and who

are taught many things outside of the ordinary school curriculum.

Brooklyn has no university, but it has many excellent private schools and academies, some of which, such as the Polytechnic Institute, Adelphi Academy, and St. John's College, hold collegiate rank and may grant degrees. The parochial schools also hold high rank, while the Pratt Institute affords thorough technical training to hundreds of pupils.

The Brooklyn Public Library, with which the excellent Brooklyn Library has recently been incorporated, maintains an extensive system of branch libraries throughout the borough; and when this is supplemented by the system of libraries recently presented by Mr. Andrew Carnegie, no community in the United States will be better equipped in this direction.

One of the most notable of the educational institutions in Brooklyn is the Brooklyn Institute of Arts and Sciences. This valuable and practically unendowed institution is, as regards its present buildings, situated upon high ground adjacent to Prospect Park, on what is known as the East Side Park lands, of which 111 $\frac{1}{10}$ acres have been leased to the trustees for 100 years. It is the development of a school of arts and sciences founded during the middle of the 19th century by Augustus Graham, a philanthropist of English extraction. It has expanded under the direction of Prof. Franklin W. Hooper and a public-spirited board of trustees into what is likely to prove the nucleus of a great national academy. It already has a well-furnished museum, which is especially rich in prehistoric American relics, and departments of archaeology, architecture, astronomy, botany, chemistry, domestic science, electricity, engineering, entomology, geography, geology, law, mathematics, microscopy, mineralogy, music, painting, pedagogy, philology, philosophy, photography, physics, political science, and psychology, each of which is presided over by an expert in the science. Only the first section of the museum building has as yet been erected, but when completed the entire structure will cover a large area, with four interior courts to provide light for the central portions of the building. It will contain on the first floor rooms for collections illustrating the general history of the arts and architecture; on the second floor rooms for the illustration of the practical arts and sciences; and on the third floor galleries for the illustration of the history of painting, engraving, etching, and decorative art. It is expected that before long the splendid library of the Long Island Historical Society will find accommodations within the museum building.

Brooklyn's public park system has been developed on a scale altogether commensurate with the character of the borough, and full advantage has been taken of the cheapness of land to make provision for the needs of the future in the matter of breathing places and pleasure grounds. The oldest and best known, although not the largest of these, is Prospect Park, which includes 516 acres of rolling land, with picturesque lakes and an unrivaled growth of old forest trees. Prospect Park is beautifully laid out, special care having been taken during the 40 years of its existence as a park to preserve its natural characteristics. Its statuary includes figures of J. S. T. Stranahan, one of the pioneers in the matter of providing public

parks; John Howard Payne, Thomas Moore, Washington Irving, Beethoven, and Mozart. There is also, at the foot of Lookout Hill, a memorial shaft in honor of the Maryland soldiers who fell in the battle of Long Island.

Another notable pleasure ground is Brooklyn Forest, which includes 536 acres on the crown of the ridge of hills on the Queens County border. Except for the laying out of walks and paths it has been left in its natural state. It affords splendid views of the Atlantic Ocean and Jamaica Bay, Sunset Park, a reserve of 14 acres on the shores of New York Bay, and the Coney Island Concourse, which runs along the Atlantic shore and contains 70 acres, are unique in their location. In addition there are nearly 40 small parks and recreation grounds in the borough. The system of parkways and boulevards under the care of the park department covers 42 miles of well-paved roadways, to which additions are constantly being made.

W. C. BRYANT,

Editor Brooklyn Times.

Brooks, Charles William Shirley, English journalist, editor of 'Punch': b. London, 29 April 1816; d. there, 23 Feb. 1874. He settled in London, wrote dramas, contributed to the leading periodicals and journals, and for five sessions wrote the 'Parliamentary Summary' for the *Morning Chronicle*. By its proprietors he was sent, in 1853, on a mission to report on the condition of labor and the poor in Russia, Syria, and Egypt, and a result of his observations appeared in 'The Russians of the South' (1856). He wrote political articles, attracted attention by several dramas and burlesques, and in 1854 joined the staff of the London 'Punch.' In 1870 he succeeded Mark Lemon as its editor. His novels, which include 'Aspen Court' (1855); 'The Gordian Knot' (1860); 'The Silver Cord' (1861); 'Sooner or Later,' with illustrations by Du Maurier (1866-8); 'The Naggeltons' (1875), show keen observation. He also wrote 'Amusing Poetry' (1857). His son, REGINALD SHIRLEY, collected Brook's 'Wit and Humor from Punch' (1875).

Brooks, Elbridge Gerry, American Universalist clergyman: b. Dover, N. H., 29 July 1816; d. Philadelphia, Pa., 8 April 1878. His first pastorate was at West Amesbury, Mass., in 1837, and he was subsequently in charge of churches at East Cambridge, Mass., Lowell, Mass., Lynn, Mass., New York, and Philadelphia.

Brooks, Elbridge Streeter, American author, son of Elbridge Gerry Brooks (q.v.): b. Lowell, Mass., 14 April 1846; d. Somerville, Mass., 7 Jan. 1902. He was the author of more than 40 books for young people, intended to familiarize them with American history, among which are 'Historic Boys'; 'Chivalric Days'; 'The Story of the American Indian'; 'The Story of New York'; 'Heroic Happenings' (1893); 'The True Story of George Washington' (1895); 'The Century Book of Famous Americans' (1896); 'Stories of the Old Bay State' (1899); 'A Godson of Lafayette' (1900); 'Under the Allied Flags' (1901). He edited the 'Wide Awake Magazine' for several years, and was the literary adviser of the Boston publishing house of D. Lathrop Company from 1895 until his death.

Brooks, James Gordon, American poet: b. Claverack, N. Y., 3 Sept. 1801; d. Albany, 20 Feb. 1841. He studied law, and removed in 1823 to New York, where he became editor of the 'Minerva,' a literary journal, and afterward of the 'Literary Gazette,' the 'Athenæum,' and the *Morning Courier*, continuing in all these papers the publication of his verses. In 1828 he married Mary Elizabeth Aikin, who had written under the signature of Norma, and the next year appeared the 'Rivals of Este, and Other Poems,' by James G. and Mary E. Brooks.

Brooks, John, American soldier, and governor of Massachusetts: b. Medford, 1752; d. 1 March 1825. While pursuing the study of medicine he displayed a love for military exercises, and having settled as a medical practitioner at Reading undertook the drilling of a company of minute men, with whom, on the news of the expedition to Lexington, he marched in time to see the retreat of the British. Promoted soon after to the rank of major in the Continental service, he assisted in throwing up the fortifications on Breed's Hill, and was especially serviceable to the army as a tactician. He was made lieutenant-colonel in 1777, and in the battle of Saratoga stormed the intrenchments of the German troops. He was a faithful adherent of the commander-in-chief during the conspiracy at Newburg. Washington requesting him to keep his officers within quarters, that they might not attend the insurgent meeting, his reply was: "Sir, I have anticipated your wishes, and my orders are given." Washington took him by the hand, and said: "Col. Brooks, this is just what I expected from you." After the peace he resumed the practice of the medical profession in Medford, and was for many years major-general of the militia of his county. In the War of 1812 he was adjutant-general of Massachusetts, and in 1816 was elected governor of that State, an office to which he was re-elected annually till 1823, when he declined being again a candidate.

Brooks, John Graham, American lecturer on economics: b. Acworth, N. H., 19 July 1846. He was graduated from the Harvard Divinity School in 1875, and subsequently studied in the universities of Berlin, Jena, and Freiburg. He was for a time in the work of the Unitarian ministry, and was for several years a lecturer in the extension department of the University of Chicago. For two years he served as an expert in the department of labor at Washington, making a report in 1893 upon workmen's insurance in Germany. He has published 'Charity and the Unemployed'; 'The Pope and the Encyclical on Labor'; 'The Social Unrest' (1903).

Brooks, Maria Gowan, (MARIA DEL OCCIDENTE), American poet: b. Medford, Mass., about 1795; d. Matanzas, Cuba, 11 Nov. 1845. She spent her youth in Charlestown, Mass., and the rest of her life in London, New York, and Cuba. Her chief poem is 'Zophiel, or the Bride of Seven,' the first canto of which appeared in Boston in 1825, and the rest was finished under Southey's supervision in 1833. 'Idomen, or the Vale of Yumuri,' is an autobiography (1843).

Brooks, Noah, American journalist and author: b. Castine, Maine, 30 Oct. 1830; d. Los Angeles, Cal., 16 Aug. 1903. From 1850 he was connected with newspapers in Massachusetts, California, Washington, and New York.

He published many popular books for boys, among which are 'The Fairport Nine' (1880); 'Our Baseball Club' (1884); 'How the Republic is Governed'; 'American Statesmen' (1893); 'Short Stories in American Party Politics' (1896); 'The Boys of Fairport'; 'The Mediterranean Trip.'

Brooks, Peter Chardon, American merchant: b. Medford, Mass., 6 Jan. 1767; d. Boston, 1 Jan. 1849. He began his business career as secretary in a marine insurance office in Boston, and presently became its principal. He rapidly acquired a fortune, retiring in 1803, and for the remainder of his life took an active interest in municipal and philanthropic affairs. He was the president of several benevolent associations, a member of the first city council of Boston, and sat in both houses of the State legislature. He was one of the most prominent opponents of the lottery schemes then countenanced by many respectable persons. One of his daughters married Rev. H. L. Frothingham (q.v.), and several prominent Boston families of to-day claim him as an ancestor. See Everett, 'Life of Peter C. Brooks.'

Brooks, Phillips, American Protestant Episcopal bishop: b. Boston, Mass., 13 Dec. 1835; d. there, 23 Jan. 1893. He inherited the best traditions of New England history, being on the paternal side the direct descendant of John Cotton, and his mother's name, Phillips, standing for high learning and distinction in the Congregational Church. Born at a time when the orthodox faith was fighting its bitterest battle with Unitarianism, his parents accepted the dogmas of the new theology, and had him baptized by a Unitarian clergyman. But while refusing certain dogmas of the orthodox Church they were the more thrown back for spiritual support upon the internal evidences of evangelical Christianity. Transition to the Episcopal Church was easy; the mother became an Episcopalian, and the future bishop received all his early training in that communion. But heredity had its influence, and in after life he declared that the Episcopal Church could reap the fruits of the long and bitter controversy which divided the New England Church only as it discerned the spiritual worth of Puritanism, and the value of its contributions to the history of religious thought and character. Such were the early surroundings of the man, and the subsequent influences of his life tended to foster this liberal spirit. When he entered Harvard, he came into an atmosphere of intense intellectual activity. James Walker was the president of the college, and Lowell, Holmes, Agassiz, and Longfellow were among the professors. He graduated with honor in 1855, and soon after entered the Episcopal Theological Seminary at Alexandria, Va. The transition from Harvard to this college was an abrupt one. The standards of the North and South were radically different. The theology of the Church in Virginia, while tolerant to that of other denominations, was uncompromisingly hostile to what it regarded as heterodox.

When the Civil War was declared he threw himself passionately into the cause of the Union. Yet his affection for his Southern classmates, men from whom he so widely differed, broadened that charity that was one of his finest characteristics, a charity that respected conviction wher-

ever found. No man, in truth, ever did so much to remove prejudice against a Church that had never been popular in New England. To the old Puritan dislike of Episcopacy and distrust of the English Church as that of the oppressors of the colony, was added a sense of resentment toward its sacerdotal claims and its assumption of ecclesiastical supremacy. But he nevertheless protested against the claim by his own communion to the title of "The American Church," he preached occasionally in other pulpits, he even had among his audiences clergymen of other denominations, and he was able to reconcile men of different creeds into concord on what is essential in all. The breadth and depth of his teaching attracted so large a following that he increased the strength of the Episcopal Church in America far more than he could have done by carrying on an active propaganda in its behalf. His first charge was the Church of the Advent, in Philadelphia; in two years he became rector of Holy Trinity Church in the same city. In 1869 he was called to Trinity Church, Boston, of which he was rector until his election as bishop of Massachusetts in 1891.

It is impossible to give an idea of Phillips Brooks without a word about his personality, which was almost contradictory. His commanding figure, his wit, the charm of his conversation, and a certain boyish gayety and naturalness, drew people to him as to a powerful magnet. He was one of the best-known men in America; people pointed him out to strangers in his own city as they pointed out the Common and the Bunker Hill monument. When he went to England, where he preached before the queen, men and women of all classes greeted him as a friend. They thronged the churches where he preached, not only to hear him but to see him. It was said of him that as soon as he entered a pulpit he was absolutely impersonal. There was no trace of individual experience or theological conflict by which he might be labeled. He was simply a messenger of the truth as he held it, a mouthpiece of the Gospel as he believed it had been delivered to him. Although in his seminary days his sermons were described as vague and unpractical, he was as great a preacher when under 30 years of age as at any later time. His early sermons, delivered to his first charge in Philadelphia, displayed the same individuality, the same force and completeness and clearness of construction, the same deep, strong undertone of religious thought, as his great discourses preached in Westminster Abbey six months before his death. His sentences are sonorous; his style was characterized by a noble simplicity, impressive, but without a touch showing that dramatic effect was strained for. He passionately loved nature in all her aspects, and traveled widely in search of the picturesque; but used his experience with reserve, and his illustrations are used to explain human life. His treatment of Bible narratives is not a translation into the modern manner, nor is it an adaptation, but a poetical rendering, in which the flavor of the original is not lost though the lesson is made contemporary. He used figures of speech and drew freely on history and art for illustrations, but not so much to elucidate his subject as to ornament it. As might be expected of one who, in the world's best sense, was so thoroughly a man, he had great influence with young men and was one of the

most popular of Harvard preachers. It was his custom for 30 alternate years to go abroad in the summer, and there, as in America, he was regarded as a great pulpit orator. He took a large view of social questions, and was in sympathy with all great popular movements. His advancement to the episcopate was warmly welcomed by all parties, except one branch of his own church with which his principles were at variance, and every denomination delighted in his elevation as if he were the peculiar property of each. His works include 'Lectures on Preaching' (1877); 'Sermons' (1878-81); 'Bohlen Lectures' (1879); 'Baptism and Confirmation' (1880); 'Sermons Preached in English Churches' (1883); 'The Oldest Schools in America' (Bos. 1885); 'Twenty Sermons' (N. Y. 1886); 'Tolerance' (1887); 'The Light of the World, and Other Sermons' (1890); and 'Essays and Addresses' (1894). His 'Letters of Travel' show him to have been an accurate observer, with a large fund of spontaneous humor. See Allen, 'Life and Letters of Phillips Brooks'; Howe, 'Phillips Brooks' (1902).

Brooks, Preston Smith, American politician and legislator: b. Edgefield, S. C., 4 Aug. 1819; d. Washington, D. C., 27 Jan. 1857. He was graduated at South Carolina College in 1839; elected to the legislature of his native State in 1844; raised a company for the Mexican war and led it as captain in the famous Palmetto regiment. He was sent to Congress in 1853, made his first speech in February 1854, on the subject of the Nebraska bill; speaking also in June of the same year on the Pacific railroad bill. On 22 May 1856, Senator Sumner, of Massachusetts, having employed in a speech in the Senate various expressions which had greatly incensed the members of Congress from South Carolina, Brooks entered the Senate chamber, after the Senate had adjourned, while Sumner was seated at his desk engaged in writing, and with blows on the head from a gutta-percha cane struck the Senator to the floor, where he left him insensible. On 2 June a committee of the House of Representatives reported in favor of Mr. Brooks' expulsion. In the final action upon the report there were 121 votes in favor of and 95 opposed to it, which, being less than the requisite two thirds vote, prevented the House from agreeing to the resolution. Mr. Brooks, however, resigned his seat, and, 8 July, pleaded guilty before the court at Washington upon an indictment for assault, and was sentenced to a fine of \$300. Having addressed his constituents on the subject of the assault, he was re-elected to Congress by a unanimous vote, and made, on 7 Jan. 1857, a second speech on the Nebraska bill.

Brooks, Shirley. See BROOKS, CHARLES WILLIAM SHIRLEY.

Brooks, William Keith, American zoologist: b. Cleveland, Ohio, 25 March 1848. He has been a professor of zoology in Johns Hopkins University from 1876. Among his published books are 'Handbook of Invertebrate Zoology' (1882); 'Hereditv' (1884); 'The Development and Protection of the Oyster in Maryland' (1884); 'A Monograph of the Genus Salpa' (1893); 'Foundation of Zoology' (1898).

Brooks, William Robert, American astronomer: b. Maidstone, Kent, England, 11 June 1844. He was educated in the United States,

and in 1874 founded the Red House Observatory at Phelps, N. Y., where he discovered 11 comets. Since 1888 he has been in charge of the Smith Observatory at Geneva, N. Y., where he has discovered 12 more comets. In 1887 he was elected a Fellow of the Royal Astronomical Society of Great Britain.

Brooks of Sheffield, a fictitious personage alluded to in Dickens' 'David Copperfield.'

Brooks's, a noted London Club founded in 1764. It was originally a sporting establishment, managed by Almack, and its second proprietor was named Brooks, the club subsequently taking its name from him. It is situated at No. 60 Saint James Street, and is political in character.

Broom, various shrubs of the closely allied genera *Genista*, *Cytisus*, and *Spartium*, of the natural order *Leguminosæ*, natives mostly of the warm and temperate parts of the Old World. The name is not applied to species which do not have the long, slender twigs, but is restricted to those characterized by these slender branches and numerous axillary flowers. *Genista monosperma* (*Spartium monospermum* of some botanists), a Spanish and north African species, attains a height of 10 feet; has almost leafless, grayish branches; small, simple, linear, silky leaves; fragrant white flowers in short lateral racemes; and one-seeded pods. It is planted in shrubberies and is grown in greenhouses in preferably loose, dry soil. *G. tinctoria*, dyer's greenweed, a native of Europe and western Asia, is an erect shrub about three feet tall with somewhat pubescent branches and many flowered axillary racemes which are terminally paniced. Its branches, leaves, and blossoms are used to dye wool yellow, or, when mixed with wood, green. *Cytisus scoparius*, Scotch or common broom, a native of middle and southern Europe, attains a height of 20 feet, but usually much less, has erect, slender branches, short petioled leaves, generally large, solitary, long-stalked, drooping yellow flowers and brownish black pods. It has been largely introduced into the United States for ornament, and is hardy almost as far north as Washington. It succeeds on dry soils, and produces an abundance of bloom in late spring and early summer. The stems and leaves, which are very bitter and nauseous tasting and smelling, have been used in dyeing and tanning, and the fibre of the former used to make cloth and paper. The wood of large specimens is highly valued for turning and cabinetmaking. *C. albus*, white or Portugal broom, a native of the Mediterranean region, which attains a height of three feet, sometimes even 20 feet, has fascicles of axillary flowers, for which it is frequently planted in shrubberies. Many other species are valued for ornamental planting, for pasturage, and since their flowers yield abundant nectar, for bee forage. *Spartium junceum*, Spanish broom, a native of southern Europe, is an upright shrub, 10 feet tall, with slender, green branches, fragrant yellow flowers which appear continuously during summer, and in California where the plant has been introduced, almost throughout the year. It grows on dry soils and in rocky places. Its fibre is used to some extent in Spain, Italy, and France for rope- and cloth-making, and even for making some kinds of lace. See CYTISUS; GENISTA; SPARTIUM.

Broom-corn, (1) (*Sorghum vulgare*, millet or Guinea-corn), a plant of the order of grasses, with a jointed stem, rising to the height of 8 or 10 feet, extensively cultivated in North America, where the branched panicles are made into carpet-brooms and clothes-brushes. The seed is used for feeding poultry, cattle, etc. (2) *Sorghum saccharata*, from which a kind of syrup or molasses is made.

Broom Rape (*Orobancha ramosa*), an annual parasitic plant of the natural order *Orobanchaceæ*, a native of Europe but established in America, especially in tobacco and hemp fields, where it often does great damage by sucking the juices of the plants which it eventually kills. Its slender, brownish or straw-colored stems attain a height of 6 to 15 inches, bear small scales instead of leaves, and light blue sessile flowers, followed by an abundance of minute seeds which rapidly spread the pest. Clean seed, clean cultivation and change of crops upon the land for several years are the only safeguards and remedies.

Broom-sedge. See ANDROPOGON.

Brooms and Brushes, Manufacture of, in the United States. Europeans use to this day a broom made from hickory withes for rough sweeping, and the long-haired brush for house-work, and it was not until about 1850 that Americans discovered the valuable properties of a variety of the indigenous Indian maize for broom making. The industry was for a time carried on in a desultory way, but the first factory established for the manufacture of brooms from corn was opened in 1859, by Ebenezer Howard, at Fort Hunter, Montgomery County, N. Y. Factories were also soon started in Fort Hunter by John D. Blood, who formed the firm of Blood & Herrick, and by Ebenezer Howard, who formed that of Howard & Bronson. All of the broom factories established at Fort Hunter have since become absorbed by the American Broom and Brush Company, and all are in operation to-day. The broom and whisk-broom industry is now carried on in the Eastern States almost entirely by the American Broom and Brush Company, which, besides the factories named, also have works at Buffalo, N. Y., Dallas, Pa., Baltimore, Md., and Richmond, Va. The business in the Western States is in the hands of the Cupples Woodenware Company, of Saint Louis, and Roseboom & Company, of Chicago. In 1880 there were in the United States 980 establishments for the manufacture of brooms and brushes, with a capital of \$4,186,897, and a product valued at \$10,560,855. In 1900 there were reported 1,526 establishments, with a capital of \$9,616,780, and a product valued at \$18,490,847. Many brooms are made by hand in various penitentiaries throughout the country. There are also many brooms made in blind asylums, as the work is found especially adapted to blind men.

Broom Tops, the fresh and dried tops of *Cytisus scoparius* (common broom). There are two official preparations; the decoction (*decoctum scoparii*), consisting of a pint of distilled water to an ounce of the dried tops, and the juice (*succus scoparii*), made of three ounces of the fresh expressed juice to a pint of rectified spirits. They are valuable diuretics, especially

in cardiac dropsies. Scoparine and sparteia are the two active principles; the action of sparteia is analogous to that of conia.

Brose (Gaelic *brothas*), a dish sometimes used in Scotland, made by pouring boiling water, milk, or the liquor in which meat has been boiled, on oatmeal, and mixing the ingredients by immediate stirring. Butter may be added, and sweet milk when the brose is made with water. It is kail brose, water brose, or beef brose, according to the liquid used. Athole brose, a famous Highland cordial, is a compound of honey and whiskey.

Brother Jonathan, a name of personification applied to the people of the United States, as "John Bull" is to the people of England. The most widely accepted explanation of its origin rests on the tradition that Washington, on assuming command of the New England Revolutionary forces, being in great straits for arms and war material, and having a high regard for the judgment of his friend the governor of Connecticut, Jonathan Trumbull, said in that emergency, "We must consult Brother Jonathan." This expression, being repeated on other difficult occasions, came into common use, and at last was extended to the entire people of the country. See NATIONAL NICKNAMES.

Brotherhood of Andrew and Philip, a religious order founded in 1888, and which has spread among the churches of 19 denominations and is represented in a large proportion of the States. Its official organ is 'The Brotherhood Star.' The pledge of service is similar to that of the Brotherhood of Saint Andrew (q.v.). The name of the society contains an allusion to the fact that Andrew, the first of the 12 disciples to become a follower of Christ, immediately after entering upon his discipleship sought out his brother Philip and brought him to the Master.

Brotherhood of Saint Andrew, a religious organization of the Protestant Episcopal Church, founded in 1883 in St. James' Parish, Chicago. It has more than 1,200 active chapters, exclusive of the junior department. The society has extended to Canada, England, Scotland, Australia, the West Indies, and South America. The official organ of the brotherhood is 'St. Andrew's Cross,' published monthly. There are two rules, one of prayer and one of service. The pledge of service binds every member to make an earnest effort to bring at least one young man each week within the hearing of the gospel.

Brotherhood of Saint Paul, a fraternity of the Methodist Episcopal Church, founded in 1895, for the spiritual and social benefit of its members. Of the three orders into which it is divided — the Order of Jerusalem, the Order of Damascus, and the Order of Rome — the first is for new members and those who are not professing Christians; the second for members of the Methodist Episcopal Church, and the third for advanced Christians. The brotherhood has a ritual and a regalia.

Brothers of the Christian Schools, commonly called Christian Brothers. This is a Society of men belonging to the Roman Catholic Church who devote themselves exclusively to the education of youth. The Society was

founded in 1680 by Jean Baptiste de la Salle, Canon of the Metropolitan Church of Rheims, who, in the year 1900, was canonized by Pope Leo XIII.

The Society spread rapidly in France, partly because the Brothers made French the language of the schools instead of Latin, and partly because they did away with the individual system of teaching by grouping the pupils together into distinct classes. They abandoned the lecturing style in all their instructions for the Socratic method, introduced object-lessons and added museums to the equipment of the school.

These bold innovations in education met with popular favor and official recognition, and did more than anything else to bring about a general system of primary instruction in France. In consequence of these reforms in the traditional methods of teaching, the Christian Brothers have come to be considered the founders of primary education in Europe. In due time, the Society spread to Italy, Belgium, Germany, Austria, England, and Ireland; and also to Canada, the United States, South America, India, and South Africa.

The general methods of teaching followed by the Brothers, are explained in the 'Government of the Christian Schools,' while the qualities which they should possess as teachers are expounded in the 'Twelve Virtues of a Good Master.' Besides these two manuals, the Society has published for the benefit of its members numerous works on education and pedagogy together with a series of text-books on all subjects taught in the schools, including logic, ethics, literature, philosophy, methodology, mathematics, physics, etc.

The Christian Brothers established a College for the training of teachers in 1684, which was the first of its kind in Europe. They opened Sunday Schools in 1690, also the first of their kind, in which secular as well as religious instruction was given in the afternoon. They have novitiates in every "province" of the Society for the religious formation, and scholasticates for the pedagogical training of their members. They direct schools of all grades from the primary to the college; they have agricultural and technical schools as well as Normal Colleges, orphanages and "protectories." In the United States, they have 6 colleges and 90 other institutions taught by 980 Brothers. Altogether, the Society had in September 1904, 1,570 schools with 15,500 Brothers and 321,000 pupils.

The Society was suppressed in 1792 at the beginning of the French Revolution, was restored in 1803 by order of Napoleon I., and incorporated with the University of France in 1808. It was again officially suppressed, in France in 1904 during the war against religious Congregations waged by Premier Combes, but continued to live and flourish in other countries.

The Christian Brothers wear a distinctive religious habit and take the three vows of religion. As they do not take "orders," they are free to devote themselves entirely to the work of education.

BROTHER POTAMIAN,

Professor of Physics in Manhattan College.

Brothers of the Sacred Heart, a Roman Catholic congregation established in Lyons, France, in 1820 by Père André Coindre, of the Society of Missionaries. In 1847 five Brothers

came from France to this country to take charge of parish schools and asylums. They have establishments in the diocese of New Orleans, Natchez, Mobile, Natchitoches, Savannah, Trenton, Indianapolis, Manchester, Providence, Boston, Indian Territory, and over 30 places in Canada. In September 1900 at a general Chapter of the Congregation held in France, two provinces were formed, one for the United States and the other for Canada. The object of the Brothers is the Christian education of youth in schools, asylums and colleges. A novitiate for the province of the United States was opened in Metuchen, N. J., June 1901.

Brothers of Our Lady of Lourdes. This congregation was founded by Very Rev. S. M. Gloriux in 1830. Its object is the Christian education of youth, especially the poor, the care of orphan asylums, and the nursing of the sick and old people in hospitals. Pope Leo XIII. approved the congregation and its rule 18 July 1892. The Brothers conduct a House of Studies and a boarding and day school at South Park, Wash., and a protory for Homeless Boys at Pittsburg and New Derry, Pa.

Brothers of Charity, a congregation founded for the purpose of securing the sanctification of its members by the practice of the three simple vows and the observance of its constitution. Its special object is the ministry of charity in maintaining and ministering to the aged, the sick and the insane, in sheltering the poor, in educating poor children and performing any other work of charity to which they may be called. The congregation was founded in Belgium about 1809 by Rev. I. Triest, Canon of Saint Bavon, Ghent.

Brothers of the Christian Instruction, a Roman Catholic Institute founded at Saint Brieuc, France, by the Abbé John Mary De la Mennais, and approved by the Holy See in 1891. The Order was established in Canada in 1886 and has 12 establishments in the archdiocese of Montreal; one in the archdiocese of Ottawa, one in the diocese of Saint Hyacinth, two in the diocese of Three Rivers, and one in the diocese of Valleyfield. The object of the Order is the Christian education and instruction of youth. General motherhouse at Ploermel, France; Provincial House and Novitiate at La-prairie, near Montreal.

Brotherhoods, Religious. See ORDERS, RELIGIOUS.

Brothers and Clerks of the Common Life, an institute founded by Gerhard Groot, a deacon of Deventer in 1384 for the purpose of providing a home for men who desired to live an austere Christian life without taking perpetual vows. See COMMON LIFE, BROTHERS OF THE.

Brotherton, Alice (WILLIAMS), American author and lecturer: b. Cambridge, Ind. She married William Ernst Brotherton, 18 Oct. 1876. She has lectured on Shakespeare and other subjects in English literature, contributed to magazines, and published the volumes: 'Beyond the Veil' (1886); 'The Sailing of King Olaf' (1887); and 'What the Wind Told the Tree-tops' (1888).

Brough, John, American statesman: b. Marietta, Ohio, 17 Sept. 1811; d. Cleveland 29

Aug. 1865. In his youth he was a printer's apprentice. He studied at the Ohio University and later entered journalism. As a Democratic orator he became well-known. In 1846 he entered the legal profession. In 1864 the Republican Union party nominated him for governor and he was elected by a joint vote of all electors advocating war. He has been called the "war governor" of his State.

Brougham, Henry (BARON BROUGHAM AND VAUX), British statesman and jurist: b. Edinburgh, 19 Sept. 1778; d. Cannes, 7 May 1868. His father, Henry Brougham, belonged to an old Westmoreland family, and his mother, Eleonora Syme, was a niece of Robertson the historian. He was educated at the High School and the University of Edinburgh, entering the latter at the age of 16. At the age of 18 he wrote an essay, 'Observations on the Phenomena of Light,' which, being sent to the Royal Society, was printed in its 'Transactions' for 1796. He also contributed a paper to each of the next two volumes of the Royal Society's 'Transactions.' On leaving college he devoted himself to the study of law at Edinburgh, and was admitted a member of the Society of Advocates in 1800. As a member of the Speculative Club he was brought into contact with Jeffrey, Horner, and others afterward famous; and along with the above-mentioned writers and Sydney Smith bore a chief part in the starting of the 'Edinburgh Review' in 1802, to which he contributed a great number of articles. In 1803 appeared his 'Inquiry into the Colonial Policy of the European Powers,' a work which showed a wide extent of knowledge in the author, and drew upon him considerable attention. In it he expressed his decided hostility to the slave-trade. Finding too circumscribed a field for his abilities in Edinburgh, he removed to London, and in 1808 was called to the English bar. One of the first occasions on which he distinguished himself in his professional capacity was in 1810, when he spoke before the House of Lords in behalf of some Liverpool merchants who wished the repeal of the orders in council prohibiting trade with the states subject to France. The same year he entered Parliament as member for the rotten borough of Camelford, joined the Whig party, which was in opposition, and soon after obtained the passing of a measure making the slave-trade felony. He also succeeded, before the dissolution of Parliament, in getting the orders in council repealed. At the general election in 1812 he endeavored to get himself elected as one of the members for Liverpool, but was defeated by Canning, and remained without a seat till 1816, when he was returned for Winchelsea. He represented this borough up to 1830. On his return to Parliament he began his life-long efforts in the cause of education by obtaining the appointment of a committee to inquire into the state of education among the poor of the metropolis. In 1819 he and his friends established a model school for the children of the poorer classes in London. In 1823 he was instrumental in founding the first mechanics' institute. In 1825 he published his 'Practical Observations upon the Education of the People,' which ran through 20 editions. The same year he was elected lord rector of Glasgow University; and also introduced a bill into Parliament for the incorporation of the

London University, of which he may be considered one of the chief founders. He also bore an active part in establishing the Society for the Diffusion of Useful Knowledge in 1827, the first publication of which was his 'Discourse on the Objects, Pleasures, and Advantages of Science.' Meantime his reputation as a brilliant speaker and able advocate had been gradually increasing, and his fearless and successful defense of Queen Caroline in 1820-1 placed him on the pinnacle of popular favor. Two of the speeches spoken by him in this course are looked upon as classic specimens of English eloquence. But the part he took in the defense of the queen brought him into disfavor with the king, and delayed his promotion for some years, so that it was not till 1827 that he was made a king's counsel. In Parliament he continued to speak against negro slavery, and in favor of what may be considered the most valuable of the reforms that we owe to him; namely, the amendment of the common law and of the judicial administration. On this subject he delivered a famous speech of six hours' duration, on 7 Feb. 1828. At the general election of 1830 he was returned for the large and important county of York, an honor which he attributed chiefly to a celebrated speech delivered by him shortly before on the slave-trade. In the ministry of Earl Grey he accepted the post of lord chancellor, and 22 Nov. 1830, was raised to the peerage, with the title of Baron Brougham and Vaux. The Reform Bill of 1832 received his warmest support in the House of Lords. In 1834, when the Whig ministry were dismissed, Lord Brougham of course lost the chancellorship, and this proved the end of his official life, as he was never afterward a member of any ministry. Henceforth he devoted himself chiefly to legal and social reforms, maintaining his hostile attitude toward slavery, and continuing his labors in the cause of popular education. He was a zealous opponent of the corn laws. In connection with the acts of his later years, we may mention his presidency of the Law Amendment Society, and of the Social Science Association. He latterly resided much at Cannes, in the south of France. He married, in 1819, Mary Anne Eden, and had two daughters, one of whom died in infancy in 1820, the other in 1839, at the age of 17. Lord Brougham accomplished a large amount of literary work, contributing to newspapers, reviews, and encyclopedias, besides writing several independent works; and he had no mean reputation in mathematics and physical science. His works, collected by himself, and published in 10 volumes (Edin. 1855-7), include: 'Lives of Men of Science, Time of George III.'; 'Lives of Men of Letters, Time of George III.'; 'Eminent Statesmen'; 'Natural Theology'; 'Rhetorical and Literary Dissertations and Addresses,' 'Rhetorical and Political Dissertations'; and 'Speeches on Social and Political Subjects.' He also, along with Sir Charles Bell, brought out an edition of Paley's 'Natural Theology'; translated the oration of Demosthenes 'On the Crown'; and in 1855, conjointly with Mr. E. J. Routh, published an 'Analytical View of Sir Isaac Newton's Principia.' He was president of University College, London, chancellor of Edinburgh University, D.C.L. of Oxford, and a member of the Institute of France. Lord Brougham must be looked upon as one of the most remarkable

men of his century. His energy and industry were enormous, his versatility surprising. He was a mathematician, a historian, a biographer, an essayist, a moral and political philosopher, a lawyer, an orator, and a statesman. As an orator and parliamentary debater he was inferior to Canning alone.

Brougham, John, Irish actor and playwright: b. Dublin, 9 May 1810; d. New York, 7 June 1880. He was at first a student of surgery, but when thrown on his own resources he adopted the stage as a profession. After a short experience as actor, playwright, and manager, he came to America in 1842. Eighteen years later he returned to England, but in 1865 he again came to the United States, and remained here till his death. He wrote about 100 plays, including 'The Game of Love'; 'Romance and Reality'; 'Love's Livery'; 'The Duke's Motto,' etc., and contributed largely to periodicals.

Brougham, a close four-wheeled carriage with a single inside seat for two persons, or a four-wheeled close carriage with two seats, accommodating four persons. Each type is glazed in front and has a raised seat for the driver. Named after Lord Brougham.

Broughton, Hugh, English Biblical scholar: b. Owlbury, Shropshire, 1549; d. London, 4 Aug. 1612. He was educated at Cambridge, and early became distinguished for his familiarity with the learned tongues. He entered the Church, but his views coming under ecclesiastical disapproval, he went to the Continent for a time. For several years he preached to an English congregation in one of the cities of Holland. He wrote: 'A Concert of Scripture'; and an 'Explication of the Article of Christ's Descent into Hell.' Ben Jonson in two of his plays holds up to ridicule this Puritan preacher.

Broughton, brow'ton, Lord (JOHN CAM HOBHOUSE), Baron, English statesman and writer: b. Bristol, 27 June 1786; d. London, 3 June 1869. He was educated at Westminster School and Trinity College, Cambridge, where he graduated B.A. in 1808, and M.A. in 1811. He was an intimate friend of Lord Byron, and accompanied him in his travels to Greece and Turkey in 1809. In 1812 appeared his 'Journey Through Albania and Other Provinces of Turkey.' In the years 1813 and 1814 he accompanied the allied armies in Germany, and was present at the battle of Dresden. He also accompanied Byron to Italy in 1816-17, and visited Rome and Venice with him. He suggested an extension of the fourth canto of 'Childe Harold,' which Byron dedicated to him, and by arrangement with the poet he undertook to write for it a series of notes, for which his observations during their journey furnished materials. These notes were written at Venice, and ultimately formed a separate work, 'Historical Illustrations of the Fourth Canto of Childe Harold,' published by Murray in 1818. Hobhouse was an advanced liberal in politics, and on his return took an active part in the advocacy of reforms. In 1816 he published anonymously the 'Hundred Days in Paris,' which from its hostility to the Bourbon cause, gave great offense to the governments of France and England, and a French translator and the publisher of it were fined

and imprisoned for writing an anonymous pamphlet, the 'Trifling Mistake.' Broughton was committed to Newgate, and there lay for almost three months. That year he was returned for Westminster, and became a supporter of liberal measures, as the Reform Bill of 1832, the repeal of the Test and Corporation acts, the removal of Catholic disabilities, etc. In February 1832, he entered Lord Melbourne's ministry as secretary of war, and became a privy councillor. In 1833 he was made chief secretary for Ireland, but lost his seat in seeking re-election. In 1834, he was made chief commissioner for woods and forests, and the following year became president of the board of control. He lost his seat for Nottingham in 1847, but a seat was found for him at Harwich, which he continued to occupy till he was raised to the peerage in 1851. He had succeeded his father as baronet in 1831. As he left no male issue, the title became extinct, the baronetcy passing to his nephew.

Broughton, Rhoda, English novelist: b. North Wales, 29 Nov. 1830. Much of her life has been passed at Oxford. Her novels, especially the earlier ones, show great cleverness, and are very popular. They include 'Cometh Up as a Flower' (1867); 'Not Wisely but Too Well' (1867); 'Red as a Rose Is She' (1870); 'Goodbye, Sweetheart, Goodbye' (1872); 'Nancy' (1873); 'Belinda' (1883); 'Doctor Cupid' (1886); 'Alas!' (1890); 'A Beginner' (1894); 'Seylla or Charybdis?' (1895).

Brouncker, or Brounker, William, British mathematician: b. 1620; d. 1684. He became Viscount Brouncker of Castle-Lyons, in Ireland, inheriting the title from his father. He was strongly attached to the royal cause, and in 1660 was one of the first to sign the declaration which hailed Monk as the restorer of the laws and privileges of the nation. At the Restoration he was appointed to several lucrative offices, and on the formation and incorporation of the Royal Society became its first president. This honorable office he continued to hold for 15 years. His mathematical attainments must have been of a high order, as he is admitted to have been the discoverer of continued fractions, and of an important theorem relating to the quadrature of the equilateral hyperbola. He also published experiments on the recoiling of guns, and a translation of Descartes' 'Musicae Compendium,' with notes.

Broussa, brö'sa. See BRÜSSA.

Broussais, François Joseph Victor, French physician: b. Saint Malo, 17 Dec. 1772; d. 17 Nov. 1838. Educated at the college of Dinan, he entered the army and soon attained the rank of sergeant; but a severe illness caused him to give up a military career and devote himself to medicine. He studied at Brest and Paris, and in 1820 obtained a professorship at Val-de-Grâce, a chair which he exchanged in 1831 for that of general pathology in the faculty of medicine at Paris. His first important work was his 'Recherches sur la Fièvre Hectique' (1803), which was followed by the more celebrated 'Histoire des Phlegmasies ou Inflammations Chroniques' (1808), and 'Examen de la Doctrine Médicale Généralement Adoptée' (1816). In these works he propounded what is known as the physiological system of medicine. According to him irritation or excitation is the funda-

mental property of all living animal tissues, and diseases are produced by an undue increase or diminution of that property. Broussais also taught and wrote on phrenology.

Brousson, Claude, French martyr: b. Nismes, 1647; d. Montpellier, 4 Nov. 1698. He was educated for the law, and practised as an advocate first at Castres and Castelnaudary, and afterward in the Parliament of Toulouse, where the Protestants, to whom he belonged, were often indebted to him for the zeal and ability with which he defended their cause. In 1683, when the government had resolved on recalling the edict of Nantes, and trying the effect of persecution as a means of suppressing the Reformation, it was at Brousson's house the deputies from all the churches assembled, and resolved that, even were their churches destroyed they would still hold their meetings, though it should be under the canopy of heaven. His part in this and other important movements marked him out as one of the first objects of attack; and on receiving warning of an intention to arrest him, he sought an asylum at Lausanne, where he published several works, exposing the persecutions to which the Protestants of France were subjected, and awakening the sympathy of their brethren in all other parts of Europe. Nor was he satisfied merely to aid the cause with his pen. At the hazard of his life he returned to France, and continued for four years among the recesses of the Cevennes, preaching the gospel. In 1693 he repaired to Holland, where a pension was given him by the States-General; but the sufferings of his persecuted countrymen were ever uppermost in his mind, and he visited many courts of Europe to plead their cause, and more than once went to France for their instruction and encouragement. He was on a mission to France when, a price having been set on his head, he was arrested at Oleron, tried at Montpellier, condemned to be broken on the wheel, and executed accordingly.

Broussonet, Pierre Marie Auguste, French naturalist: b. Montpellier, 28 Feb. 1761; d. there, 27 July 1807. In Paris he studied natural history; went to England and pursued ichthyology, and after three years' residence there returned and was assistant in the College of France. At this period he communicated a number of valuable papers to the Academy of Sciences, of which he became a member. In 1785 he was appointed secretary to the Paris Agricultural Society. Merino sheep and the Angora goat are said to have been first introduced by him into France. The Revolution breaking out, he became connected with the Girondists. On the downfall of that party he was arrested at Montpellier, but having escaped, crossed the Pyrennes under the pretext of botanizing, and arrived in Spain destitute. Later he went to Africa and resumed his botanical studies, making some important collections. Returning to France, after executing various missions he was appointed, in 1805, to the chair of botany at Montpellier. In the same year he became a member of the Corps Législatif. He died from the effects of a fall by which the brain had been seriously injured. Besides his *Ichthyologiæ Decas Prima* (1872), his publications include important memoirs of ichthyology and botany.

Broussonetia, a genus of trees. See MULBERRY.

Brouwer, or Brauwer, Adrian. See BRAUWER, ADRIAN.

Brower, Daniel Roberts, American physician: b. Philadelphia, Pa., 1839. In 1864 he was appointed assistant surgeon of the United States volunteers and has since been medical superintendent of the Eastern Lunatic Hospital of Virginia, 1868-75, and professor of nervous diseases in the Rush Medical College of Chicago, and in the Woman's Medical College of the Northwest University at Evanston, Ill. He has published a *Manual of Insanity*.

Brower, Jacob Vradenburg, American explorer and archaeologist: b. York, Mich., 21 Jan. 1844; d. 1905. He served in the cavalry and the navy during the Civil War, was a member of the Minnesota legislature, 1867-73, and discovered numerous prehistoric mounds at Mille Lac and other points in Minnesota. He published *The Mississippi River and Its Source* (1893); *Prehistoric Man at the Head Waters of the Mississippi* (1895); *The Missouri River and Its Utmost Source* (1896); *Quivira* (1898); *Harahey* (1899); *Mille Lac* (1899).

Brown, Aaron Venable, American politician: b. Brunswick County, Va., 15 Aug. 1795; d. 1859. He studied law, and commenced practice in Nashville, Tenn. He was partner in business with President Polk, until the latter entered upon his congressional career; served in almost all the sessions of the legislature of Tennessee between 1821 and 1832; was a member of the House of Representatives in Congress from 1839 to 1845; and was in that year elected governor of Tennessee. He was a delegate to the southern convention held at Nashville in 1850, and submitted a report to that body known as the Tennessee platform. He was also a member of the convention of the democratic party at Baltimore in 1852, to which he reported the platform adopted by them. In 1857 he became a member of President Buchanan's cabinet, in which he held the office of postmaster-general.

Brown, Abbie Farwell, American writer for young people: b. Boston, about 1875. She has published *The Book of Saints and Friendly Beasts* (1900); *In Days of Giants* (1902); *The Lonesomest Doll*; *Star Jewels* (1905).

Brown, Abram English, American historical writer: b. Bedford, Mass., 21 Jan. 1849, and has ever since resided there. He is the author of *Beneath Old Roof Trees* (1896); *Beside Old Hearthstones* (1897); *History of Bedford* (1892); *Glimpses of New England* (1894); *Flag of the Minute Men* (1894); *Faneuil Hall and Market*; *John Hancock*.

Brown, Alexander, American historian: b. Glenmore, Nelson County, Va., 5 Sept. 1843; d. 29 Aug. 1906. He served in the Confederate army during the Civil War and from 1880 devoted himself to literature. He wrote *New Views of Early Virginia History* (1886); *The Genesis of the United States* (1890); *The Cabells and Their Kin* (1895); *The First Republic in America* (1898); *The History of Our Earliest History* (1898); *English Politics in Early Virginia* (1901).

Brown, Alice, American novelist and writer of short stories descriptive of phases of New England life: b. Hampton Falls, N. H., 5

Dec. 1857. She taught school for several years, but has given herself entirely to literary pursuits for some years. Her work is most careful and conscientious in character, displaying equal literary skill and sympathetic insight into character. She has published: 'Fools of Nature'; 'Meadow Grass' (1895); 'By Oak and Thorn,' a volume of English travels (1896); 'The Road to Castaly,' a work of verse (1896); 'The Day of His Youth' (1896); 'Tiverton Tales' (1899); 'King's End'; 'Margaret Warren'; 'Mercy Otis Warren,' a biography; 'The Mannerings'; 'High Noon.'

Brown, Benjamin Gratz, American politician; b. Lexington, Ky., 28 May 1826; d. St. Louis 13 Dec. 1885. He practiced law in Missouri, and was a member of the State legislature in 1852-8. In the Civil War he served in the Union army, recruiting a regiment, and becoming a brigadier-general of volunteers. In 1863-7 he was United States Senator from Missouri, and in 1871 was elected governor of his State. He was the candidate for the vice-presidency of the United States on the ticket with Horace Greeley in 1872.

Brown, Caroline Virginia (KROUT), American novelist; b. Crawfordsville, Ind. She has published 'Knights in Fustian' (1900); 'Bold Robin and His Forest Rangers' (1905); 'On the We-A Trail' (1905).

Brown, Charles Brockden, American novelist; b. Philadelphia 17 Jan. 1771; d. 22 Feb. 1810. He descended from a family of Quakers, was remarkable in his childhood for his attachment to books, and at the age of 16, after having received a liberal education, had already formed plans of extensive literary works. The delicacy of his constitution incapacitated him for the bustle of business and all athletic amusements. During frequent visits to New York he became intimate with a literary club, who fostered his devotion to letters, and increased his eagerness to be conspicuous as a writer. He kept minute journals, indited essays and dissertations, and cultivated, with unremitting assiduity, the arts of composition. The first novel which he wrote was entitled 'Sky Walk,' subsequently incorporated in 'Edgar Huntley.' ('Wieland,') his first published novel, appeared in 1798. It soon acquired the reputation of a powerful and original romance. The next was 'Ormond, or the Secret Witness' (1799), which had neither the success nor the merit of the other, but still exhibits uncommon powers of invention and description. At this time Brown had begun no less than five novels, two of which—'Arthur Mervyn' and 'Edgar Huntley,—were completed and sent forth almost immediately. In the former the ravages of the yellow fever, which the author had witnessed in New York and Philadelphia, are painted with terrific realism. All these works abound in both excellencies and faults, and are strikingly original. In 1801 he published another novel,—'Clara Howard,'—less open to exception, but also less deserving of praise. Its form is different from that of the others, being epistolary. The last of his novels was 'Jane Talbot' (1804). It is deficient in interest, and indeed in all respects inferior to its predecessors. In April 1799, Brown published the first number of the 'Monthly Magazine and American Review.' This work he continued until the end of the

year 1800, writing abundantly for it. Circumstances compelled him to relinquish it; but in 1805 he commenced another journal, with the title of the 'Literary Magazine and American Register,' and in this undertaking persevered for five years. In 1806 he entered upon a new work, a semi-annual 'American Register,' five volumes of which he lived to complete and publish. It is now and must long be consulted as a valuable body of annals. In 1809 it was discovered that his lungs were seriously affected, and he then consented to travel for the recovery of his health. The remedy, however, was applied too late. In November of that year he betook himself to his chamber, as he thought, for a few days; but his confinement lasted until February, and ended only with his life. His writings are characterized by rich diction, variety of incident, and vivid representation, but he deals too much in the extravagant and the horrible.

Brown, Charles Rufus, American clergyman and Hebrew scholar; b. East Kingston, N. H., 22 Feb. 1849. He was graduated at the United States Naval Academy in 1869, at Harvard in 1877, and at Union Theological Seminary in 1879. He was ordained a Baptist minister in 1881 and held pastorates at Salem and Worcester, Mass. He has been professor of Hebrew at Newton Theological Institution since 1886, and has written 'An Aramaic Method' (1884-1893) and text-books in the Oriental languages.

Brown, Elmer Ellsworth, American educator; b. Kiantone, N. Y., 28 Aug. 1861. After holding several professional posts he became professor in the University of California in 1893, was professor of the theory and practice of education there from 1898 and in 1906 became U. S. Commissioner of Education. He wrote 'Democracy in the Universities' (1891); 'The Making of Our Middle Schools' (1903); 'Origin of American State Universities' (1905); etc.

Brown, Emma Elizabeth, American author and artist; b. Concord, N. H., 18 Oct. 1847. She was educated in the Concord common schools. She has written lives of Washington, Grant, Garfield, Holmes, and Lowell; 'From Night to Light,' 'Child Toilers,' and much verse, besides contributing papers to leading magazines.

Brown, Ernest William, American mathematician; b. Hull, England, 29 Nov. 1866. He was educated at Christ's College, Cambridge, England, and was a professor of mathematics at Haverford College, Pa., 1891-1906, and since 1906 at Harvard University. He is a fellow of the Royal Society of England, and the author of 'Treatise on the Lunar Theory.'

Brown, Ford Madox, English painter, grandson of Dr. John Brown of Edinburgh, the author of the Brunonian system of medicine; b. Calais, France, 16 April 1821; d. London 6 Oct. 1893. He studied at Bruges, Ghent, and Antwerp, and after a three years' residence in Paris he went to England about 1845. In 1844 and 1845 he contributed (unsuccessfully) cartoons of the 'Finding of the Body of Harold,' 'Justice,' and other subjects to the competitive exhibition for the frescoes of the Houses of Parliament. In 1865 he opened in London an exhibition of many of his pictures, including 'The Last of England' (1852); 'The Autumn Afternoon'; and 'Work' (1865); the last named having occupied him for several years. Only

BROWN

a month before his death he completed the last of the 12 Manchester town-hall frescoes, on which he had been engaged for a long time. Among his other works are 'Lear and Cordelia' (1849); 'Pretty Baa-Lambs' (1851); 'Chaucer at the Court of Edward III.' (1851); and 'Cordelia's Portion.' He is generally rated as a pre-Raphaelite, but though a close intimacy existed between him and the brotherhood, he never actually joined them. See Hueffer, 'Ford Madox Brown: a Record of His Life and Work' (1896).

Brown, Francis, American scholar: b. Hanover, N. H., 26 Dec. 1849. He was graduated from Dartmouth College in 1870, and the Union Theological Seminary, New York, in 1877. He was instructor in biblical philology in the latter institution 1879-81, and associate professor of the same 1881-90. Since the year last named he has been professor of Hebrew there. He is the author of 'Assyriology: Its Use and Abuse in Old Testament Study' (1885); 'The Teaching of the Twelve Apostles' with Hitchcock; 'Hebrew and an English Lexicon of the Old Testament' with Driver and Briggs (1891-1901).

Brown, Sir George, English military officer: b. near Elgin, Scotland, 1790; d. 1865. He served in the Peninsular war, and in the American campaign of 1814, being wounded at the battle of Bladensburg. He became lieutenant-general in 1851; and distinguished himself in the Crimean war at Alma, Inkermann, and Sebastopol. He was made K. C. B. in 1855.

Brown, George, Canadian statesman: b. Edinburgh, Scotland, 19 Nov. 1818; d. 9 May 1880; educated at the high school there. He emigrated to the United States with his father, and assisted in the management of a newspaper at New York; but in 1843 removed to Toronto, Canada, where he founded a newspaper, *The Globe*, which was very successful. In 1852 he was returned to Parliament, and rapidly rose to the first rank as a debater and advocate of reforms. In 1858 he was called to the office of premier, and formed an administration which, however, owing to an adverse vote of the Assembly, lasted only three days. In 1864 he joined the coalition government as leader of the reform section, and took an active part in the conferences held at Charlottetown and Quebec on the subject of the federation of the North American colonies; but resigned his office as minister in December 1865. He was called to the Senate in 1873, and the year after went to Washington along with Sir Edward Thornton to negotiate a commercial treaty with the United States. He died of a gunshot wound inflicted by a discharged employee. See Mackenzie, 'Life and Speeches of the Hon. George Brown' (1882).

Brown, George, American rear-admiral: b. Indiana, 19 June 1835. He entered the navy in 1849 and served with distinction in the Federal navy during the Civil War. He was in command of the Norfolk navy yard, 1866-97, being appointed a rear-admiral in 1893.

Brown, George Douglas, Scottish novelist: b. Ochiltree, Ayrshire, Scotland, 1869; d. London, 28 Aug. 1902. He was educated at the universities of Glasgow and Oxford and was successively reporter for a London journal and

literary adviser to a publishing house. His novel of Scottish life, 'The House with the Green Shutters,' published in 1902, attracted great attention in England and the United States. See 'Life' (1903).

Brown, George Loring, American landscape artist: b. Boston, 2 Feb. 1814; d. 25 June 1889. He went abroad at 16 and on his return, two years later, was a pupil of Washington Allston. In 1840 he went to Paris to study under Isabey. Among noted pictures by him are 'Doge's Palace and Grand Canal'; 'Bay of Naples'; 'Moonlight Scene'; 'The Crown of New England'; and 'The Bay of New York,' the two latter acquired by Edward VII. when visiting the United States as Prince of Wales.

Brown, George William, American jurist: b. Baltimore, Md., 1812; d. 1890. After studying law he was admitted to the bar and in 1860 was elected mayor of his native city. At the time of the passage of troops through Baltimore, 19 April 1861, he placed himself at the head of the 6th Massachusetts regiment then on its way to Washington, and did everything in his power to suppress the riot which the appearance of the soldiers had occasioned. He was chief justice of the Maryland supreme court, 1873-88, and with two others compiled the first 'Digest of the Decisions of the Maryland Court of Appeals' (1847).

Brown, Glenn, American architect: b. Fauquier County, Va., 13 Sept. 1854. He has practised his profession in Washington, D. C., since 1878. He is the author of 'Water Closets: a Historical, Mechanical and Sanitary Treatise' (1884); 'Healthy Foundations for Houses' (1885); 'Trap Syphonage' (1886); 'History of the United States Capitol' (1900).

Brown, Goold, American grammarian: b. Providence, R. I., 7 March 1791; d. Lynn, Mass., 31 March 1857. He is known as the author of 'Brown's Grammar,' a school text-book widely used for some generations, and still in circulation. He published 'First Lines of English Grammar' (1823); 'Grammar of English Grammars' (1850-1); etc. He taught an academy in New York for 20 years.

Brown, Harvey, American army officer: b. Rahway, N. J., 1795; d. Clifton, Staten Island, 31 March 1874. He graduated at West Point in 1818 and was in constant service for more than 45 years. In the Black Hawk expedition, the Seminole Indian campaigns, in the Army of Occupation in Mexico, and to the time of the Civil War, he did gallant duty, for which he received several brevets. In 1862 he was brevetted a brigadier-general in the regular army and promoted colonel, and in 1863 was promoted to major-general, and retired.

Brown, Helen Dawes, American novelist and lecturer upon English literature: b. Concord, Mass., 1857. She has published 'Two College Girls' (1886); 'The Petrie Estate' (1893); 'Little Miss Phoebe Gay' (1895); 'Phoebe Gay in Her Sixteenth Year'; 'A Civilian Attache.'

Brown, Henry Billings, American jurist: b. Lee, Mass., 2 March 1836. After studying law in the Yale and Harvard law schools he went to Detroit and was there admitted to the bar in 1860. In 1875 he was appointed United States district judge for eastern Michigan,

retaining this post till 1890, when he became an associate justice of the supreme court of the United States. He retired in 1906. He has compiled a volume of admiralty reports.

Brown, Henry Kirke, American sculptor: b. Leyden, Mass., 24 Feb. 1814; d. Newburg, N. Y., 10 July 1886. He made the equestrian statue of Washington in Union Square, New York, the altar piece for the Church of the Annunciation in the same city, portrait busts of William Cullen Bryant, Dr. Willard Parker, Erastus Corning and other New York men, and the statue of De Witt Clinton in Greenwood cemetery. The last named was the first bronze statue cast in the United States. Mr. Brown brought skilled workmen from Europe and did the first work in bronze casting attempted in this country. Some of his other well-known works are a statue of Lincoln in Prospect Park, Brooklyn, and equestrian statues of Gen. Scott and Nathanael Greene for the national government.

Brown, J. Appleton, American artist: b. Newburyport, Mass., 24 July 1844; d. 1902. He studied art in Boston and Paris, and after having a studio in Boston for some years removed to New York in 1890 and became a member of the Society of American Artists. Noted works by him are 'Old Road near Paris'; 'On the Merrimac at Newburyport'; 'The Grain Field' (1902).

Brown, Jacob, American general: b. Bucks County, Pa., 9 May 1775; d. Washington, 24 Feb. 1828. He was descended from members of the Society of Friends; supported himself in early life by teaching school; was also employed for some time as a surveyor of public lands in Ohio; and settling in Jefferson County, N. Y., in 1799, became one of the pioneers in that part of the country. He next joined the militia service as a militia general in 1812; was soon after appointed brigadier-general in the regular army, and in 1814, major-general; assisted in the defense of Sackett's Harbor in 1813; exhibited much bravery in the battle of Chippewa, in that of Niagara Falls, and at the siege of Fort Erie; received the thanks of Congress and a gold medal, "emblematical of his triumphs"; and finally, at the termination of the war, continued in the army as major-general, and in 1821 succeeded to the supreme command.

Brown, James, American book-publisher: b. Acton, Mass., 19 May 1800; d. 10 March 1855. He began life as a servant in the family of Prof. Hedge, of Cambridge, who gave him instructions in the classics and in mathematics. He next entered, as shop boy, the service of William Hilliard, and in due time was taken into the Boston publishing firm of Hilliard, Gray & Company. Upon its dissolution, by the death of some of the partners, he became one of the firm now known as Little, Brown & Company, and remained in this connection until his death. The special province of the firm was the publication of law books and importation of foreign editions in the general trade, in which departments his scholarly accomplishments and taste were conspicuous and of good service in improving the style of book-making in America.

Brown, John, Scotch covenanting martyr: b. about 1627. He is said to have fought against the government at Bothwell Bridge in 1679, and to have been on intimate terms with the leaders

of the persecuted party. He was shot by Claverhouse and a party of his dragoons at Priestfield, or Priesthill, in the upland parish of Buirkirk, Ayrshire, where he cultivated a small piece of ground and acted as a carrier, in 1685.

Brown, John, Scottish biblical scholar: b. Carpow, Perthshire, 1722; d. 19 June 1787. By his own intense application to study he became acquainted with the French, Italian, German, Arabic, Persian, Syriac, and Ethiopic languages, as well as the Greek and Hebrew. He became pastor at Haddington, Scotland, in 1751, and remained in that relation till his death, though called to a pastorate in the Dutch Reformed Church in New York in 1784. In general he preached three sermons every Sabbath day. He was appointed professor of theology to the Associate Synod in 1768. His most important works are: 'The Self-interpreting Bible'; 'Dictionary of the Bible'; 'Explication of the Assembly's Catechism'; 'The Christian Journal'; 'Explication of Scripture Metaphors'; 'System of Divinity'; 'General History of the Church'; 'Particular History of the Churches of England, Scotland, and Ireland'; and 'Harmony of Scripture Prophecies.' His 'Dictionary of the Bible,' and 'Self-Interpreting Bible,' so called from the copious marginal references to other passages of Scripture by which it is distinguished, have gone through many editions.

Brown, John, Scottish physician, author of the Brunonian system in medicine: b. Buncele, Berwickshire, 1735; d. London, 17 Oct. 1788. His parents were in a very humble sphere in life, his father being merely a day laborer. Like the children of other Scottish cottars, however, he received the advantage of being educated at the parish school, where he was very soon distinguished for his abilities, and the rapid progress he made in his studies. His father having died, his mother married a weaver, and young Brown was bound an apprentice to that business; but the distaste he evinced for it was so great as to induce his stepfather to cancel his indentures, and remove him to the grammar school of Dunse, where he was looked upon as a prodigy—reading all the Latin authors with the greatest facility, and soon making considerable progress in Greek. In 1755 he went to Edinburgh, with the intention of studying divinity and entering the Church, but soon abandoned his theological studies. Having been employed by a medical student to translate his thesis into Latin, he succeeded so well that the elegance and purity of the language attracted the notice and encomiums of the professors and led to his commencing the study of medicine. In the year 1765 he married, and opened a boarding house for the accommodation of medical students; but being irregular and intemperate in his habits was soon reduced to bankruptcy. Having taken the degree of doctor in medicine at St. Andrew's, he commenced practice in Edinburgh, and produced his celebrated work, entitled the 'Elements of Medicine.' He then commenced lecturing on the practice of physic, and made use of this work as his text-book. He divided all diseases into two classes, those resulting from a deficiency, and those resulting from an excess of excitement; the one class to be treated with stimulants, the other with debilitating medicines. Becoming involved in pecuniary embarrassments he removed to London in 1786. The sys-

tem of physic which he taught, though no longer accepted as a system, had a distinct influence on subsequent practice.

Brown, John, American merchant: b. Providence, R. I., 27 Jan. 1736; d. there, 20 Sept. 1803. A man of energy and enterprise, he developed the industry and extended the trade of his native city in a notable degree, being, it is said, the first merchant in Rhode Island to carry trade to China and the East Indies. Though having large interests at stake in the existing order of things, he was a leader in the cause of the American Revolution, and headed the party which destroyed the *Gaspée* in Narragansett Bay, 17 June 1772. He was chosen a delegate to the Continental Congress in 1784, but did not take his seat in that body. When Rhode Island refused to adopt the national Constitution, he did more than any other man toward securing the final reversal of that opposition. From 1799 to 1802 he was a representative in Congress. He at all times fostered the interests of the Baptist Church, contributed largely to the endowment of the present Brown University, laid the cornerstone of its original hall, and was its treasurer from 1775 to 1796.

Brown, John, American soldier: b. Sandisfield, Mass., 19 Oct. 1744; d. Stone Arabia, N. Y., 19 Oct. 1780. He graduated at Yale 1771, studied law in Providence, R. I., and in 1773 settled in Pittsfield, Mass., where he identified himself actively with the patriot cause. In 1775 he was a delegate to the provincial Congress, and was with Ethan Allen at the capture of Ticonderoga. In the same year he assisted in the capture of Fort Chambly, planned the attack on Montreal which resulted disastrously, and was at the storming of Quebec. Congress commissioned him a lieutenant-colonel in 1776, and in 1777 he conducted an expedition against Ticonderoga and the posts in its vicinity, releasing one hundred American prisoners and capturing large quantities of stores and provisions. Soon after this he retired from the service on account of his detestation of Arnold. At Albany in the winter of 1776-7 he published a handbill denouncing Arnold, predicting that he would become a traitor, and closing with the remarkably prophetic words, "Money is this man's God, and to get enough of it he would sacrifice his country." Brown was afterward employed in the Massachusetts service, and in the autumn of 1780, with the Berkshire militia, marched up the Mohawk valley for the relief of Schuyler and to act as circumstances might require. He was killed in ambush with 45 of his men at Stone Arabia, in Palatine, on his birthday.

Brown, John, Scottish clergyman: b. Whitburn, Linlithgowshire, 12 July 1784; d. Edinburgh, 13 Oct. 1858. He was ordained pastor of the burgher congregation at Biggar in 1806. In 1821 he removed to the care of the United Secession Church, Edinburgh, and afterward that of the Broughton-place Church. The burgher and anti-burgher seceders having come together in 1820, under the name of the united associate synod, he was chosen one of their professors of divinity in 1835. He took the part of the parent society on the division in the British and Foreign Bible Society, concerning the circulation of the Apocrypha, and the voluntary side on the question of church establishments. Having, by residence within the royalty of the

city of Edinburgh, become liable to the payment of an annuity tax, which was levied upon him, for the support of the city ministers, he refused to pay, and suffered his goods to be distrained; and in reply to the proceedings of the civil authorities, he preached and published two sermons on the "Law of Christ Respecting Civil Obedience, Especially in the Payment of Tribute," which, with notes and additions, became finally an octavo volume. In 1847 he and his congregation entered the United Presbyterian Church. Other works of his are: 'The Resurrection of Life' (1852); 'Expository Discourses on the Epistle of Saint Peter' (1848); 'Discourses and Sayings of Christ' (1850).

Brown, John, American abolitionist leader: b. Torrington, Conn., 9 May 1800; d. 2 Dec. 1859. His paternal ancestry was of Mayflower stock, his grandmother of Welsh, his mother of Dutch. His grandfather was a captain in the Revolution. His father, who drew his abhorrence of slavery from Jonathan Edwards, an anti-slavery champion, shared in the forcible rescue of fugitive slaves in 1798. The son found his warrant against slavery in the Bible, where its defenders found their warrant for it. From the age of five he grew up in Ohio. He was an exceedingly active and adventurous boy, who loved play-fights, but not real ones, disapproved of war, and in manhood paid annual fines rather than perform militia duty. His detestation of slavery was confirmed by witnessing the abuse of a slave boy; he swore in his own words, "eternal war against slavery"; and throughout his career he never lost sight of this life-work. His 12 children who grew to maturity (out of 20 he had by two wives) were ingrained with his spirit, pledged themselves to him in prayer to spend their lives making it operative, and bore great privations to furnish him the means of so doing. He became a farmer and leather-dresser, surveyor, shepherd, and wool dealer; unfixed, unprosperous, and esteemed "shiftless." This was certainly not due to indolence or lack of honor; his immense family and want of money-getting faculty were partly responsible, his absorption in a fixed idea and lack of interest in money-getting still more. By 1834, then in Pennsylvania, he had devised an association of abolitionist families to educate colored youth, believing that it would force the South into speedy emancipation. Seeking co-operation in this plan, he removed to Ohio in 1835, and to Massachusetts in 1846; in 1840 he made surveys of Oberlin College lands in Virginia, and projected a negro colony there. In 1846 Gerrit Smith (q.v.) offered 100,000 acres of northern New York lands in small farms to colored families who would clear them; and in 1848, to work among them, Brown bought a farm in North Elba, where his family lived till his death, working with and for him. History can hardly parallel so large a family's unanimity of self-sacrifice for a social ideal, in whose behalf they stinted themselves ungrudgingly; a testimony to the father's commanding nobility of soul. From thence, by grace of contributions from abolitionists who had come to know and respect him, he traveled often on errands of organizing resistance to slavery. In 1850, after the passage of the Fugitive slave law, he visited Springfield, Mass., his former residence, and formed a "League of Gileadites," sworn to stand by each other in the rescue of fugitive slaves.

In 1854 Kansas had become, in the eyes of both South and North, the decisive battle ground of the two systems, and five of Brown's sons living in Ohio set out thither to swell the free-soil ranks; they settled a few miles from Ossawatimie, and Brown joined them in October 1855, against his intention. The family were among the most stalwart defenders of the Territory for the next two years against the fraud and terrorism by which the Border Ruffians plunged it into anarchy and bloodshed. John Brown's career there brought him into national prominence, from the conspicuousness of the stage rather than the magnitude of the actions. Its most dramatic incidents were the retaliatory murder of five pro-slavery men at Pottawatomie, 24 May 1856, the capture of Capt. Pate at Black Jack, 2 June, and the magnificent defense of Ossawatimie against a crushing force of Missourians in August. It has never been narrated, even by Northerners without sympathy for the slavery cause, except with strong partisan bias pro or con, and from its very nature, it probably never can be. The judgment passed on it depends not merely on the view taken of his cause (of which an impartial estimate is not impossible), but on the questions whether that cause would have succeeded in any event, and whether he helped or harmed it. No proof of either is possible, and favor or disfavor toward fanatical enthusiasts is one of the deepest lines of cleavage among human spirits. As the victory for freedom was won, it is the fashion to assume that it never was in doubt; that active warfare was needless; that the influx of free settlers would soon have caused the pro-slavery invaders to desist in despair; that Brown acted as a lawless ruffian who justified the other party, and that he only discredited and hampered his own side. But it is still quite rational to maintain the older view, of which the premises are certainly correct, whatever the deduction may be. The pro-slavery party had no such illusions; from the first they openly proclaimed the struggle for Kansas a war for life or death, and carried it on by the machinery of war. They constituted a government by open fraud and maintained it by open violence; sacked towns, burnt houses, assassinated some of their opponents, and illegally imprisoned others; while the United States courts dispersed their foes by legal anathema, and the United States troops acted as their army. If no resistance had been offered, it is not apparent why these methods should have been less employed or less successful in 1858 than in 1856; the prize would not have been less and the incentive would have grown greater. It is certain that such peaceful submission of the free-soilers would have been hailed by the Pierce and Buchanan parties as proof incontestable that the Republican charges of illegality and outrage were mere libels. It is therefore at least arguable that it was Brown, Montgomery, Lane, and the other fighters, by their stubborn and "lawless" defiance to sheer foreign conquest, plunging Kansas into open and bloody anarchy, who shamed the government into withdrawing its help to the invaders, and convinced the slavery party that force was no longer available. Incidentally, they gave the non-combatants a free community in which to decry their champions.

Whatever may be the judgment now, the Eastern abolition leaders at that time had no

thought of suppressing him; they furnished him some moneys and supplies for whatever plan he privately deemed best, feeling sure at least of some bold heartening stroke for the cause. For many years he had entertained the project of establishing, in the Maryland or Virginia mountains, a stronghold for fugitive slaves, where they could withstand attacks and if necessary reach Pennsylvania. He thought the knowledge of this refuge might stimulate the slaves into a dash for freedom, and the insecurity of slave property might drive the South into emancipation. That he could suppose the United States would allow such a guerrilla fortress and firebrand within its jurisdiction for a day, seems scarcely compatible with sanity, but Brown was insane only as all religious, intense idealists tend to become so. At the last, his plan developed into one for a stroke that should startle the country into action, draw recruits to him, and leave no chance for compromise or delay. Characteristically, he seems not to have doubted that the country would stand by him. He chose to assault the United States arsenal at Harper's Ferry, thus not only securing arms for his presumed fugitives, but making the country ring; without reflecting that this was open war against the nation, and that even the abolitionists could not uphold him. In 1857 he began drilling a small band of adherents at Tabor and Springfield, Iowa, but his trusted drillmaster, Forbes, gave the alarm, and the scheme was postponed. At length, in June 1859, he and some of his men hired a farm near Harper's Ferry, and two of his women came to keep house there; he gradually collected the remainder, 22 men besides himself, with some arms; and late Sunday evening, 16 October, with 18 men, seized the armory and took possession of the village. He made hostages of some leading citizens, and had a few neighboring planters and their slaves brought in. But the remaining citizens armed themselves, assailed and shot several of Brown's men, and surrounded the rest, and on Monday evening Col. Robert E. Lee came from Washington with a company of marines, and cooped Brown and his six remaining men into the engine-house. Brown fought there till the two sons with him were killed, and himself supposed to be mortally wounded, before he would surrender. Why he had not retreated to the mountains on capturing the arsenal was never explained, even by himself. He was tried before a Virginia court, but defended by Massachusetts counsel, sentenced as was inevitable and just, and hanged at Charlestown, W. Va. His testimony on the trial, and his demeanor and language all through, produced an ineffaceable impression on the North, revealing a character of heroic simplicity, purity, and grandeur; if his action was mad, he himself was not; and even his adversary, Gov. Wise, of Virginia, admired his "clear head, courage, fortitude, and simple ingenuousness," and felt him to be wholly truthful. The actual importance of the Harper's Ferry raid, in determining or hastening secession, has always been exaggerated, by his friends as praise and by his foes as detraction: to suppose that secession would not have come after Lincoln's election, had there been no such raid, is to ignore all American history for many years previous. But the revolt of the slave power seemed to justify his prevision and action; he became the popular

incarnation of the spirit of liberty, its great pioneer and martyr; and the slogan of the North was: "John Brown's body lies a-mouldering in the grave, but his soul goes marching on!" His nature had something of the sublime; and great natures have their function and service as well as great intellects. No community could exist with such men for statesmen; perhaps none can be great without some such men for prophets.

Brown, John, Scottish physician and essayist, son of John Brown (1784-1858 q.v.): b. Biggar, 22 Sept. 1810; d. Edinburgh, 11 May 1882. He graduated in 1833 and began practice as a physician. His leisure hours were devoted to literature, many of his contributions appearing in the 'North British Review,' 'Good Words,' and other periodicals. His collected writings, published under the title of 'Horæ Subsecrivaæ, (leisure hours) (1858-82), embrace papers bearing on medicine, art, poetry, and human life generally. Several of his sketches, such as 'Rab and His Friends,' 'Our Dogs,' 'Pet Marjory,' 'Jeems the Doorkeeper,' on which his fame chiefly rests, have been published separately. Humor, tenderness, and pathos are his chief characteristics. See Peddie, 'Recollections of Dr. John Brown' (1893).

Brown, John George, Anglo-American painter: b. Durham, England, 11 Nov. 1831. He was educated in the common schools in Newcastle-on-Tyne, and came to the United States in 1853. He studied in the schools of the National Academy of Design; was elected an academician in 1863; received honorable mention at the Paris Exposition in 1899; and in 1900 was president of the American Water Color Society. He is best known for his pictures of bootblacks and street urchins. Among his famous pictures are: 'A Merry Air with a Sad Heart'; 'The Stump Speech'; 'The Passing Show'; 'Be Mine'; and 'Training the Dogs.'

Brown, John Hamilton, American inventor: b. Liberty, Maine, 28 July 1837. At the age of 18 he was apprenticed to a gunsmith and in 1857 entered business in Haverhill, Mass. He served in the Civil War as a sharpshooter, and in 1882 was a member of the American Rifle Team at Wimbledon. He began in 1883 to perfect the invention of a weapon for military use later known as the Brown segmental wire-wound gun, which, after numerous government tests, was pronounced a success.

Brown, John Howard, American editor: b. Rhinebeck, N. Y., 8 Nov. 1840. After studying law in New York and engaging in journalism in Washington, D. C., and Augusta, Ga., he became a publisher in New York. In 1896 he removed to Boston to become editor-in-chief of 'Lamb's Biographical Dictionary of the United States.' He is the author of 'American Naval Heroes' (1898), and of numerous contributions to periodical literature.

Brown, John Lewis, French artist: b. Bordeaux, 16 Aug. 1829; d. 1892. He studied under Belloc and Roqueplan and was famous as an impressionist painter of military and hunting scenes, as well as of studies of horses and dogs. Among his numerous works are: 'Steeple Chase' (1861); 'At the Outposts' (1865); 'Relay of Omnibus Horses' (1884); 'Hohenlinden' (1887).

Brown, John Newton, American Baptist clergyman: b. New London, Conn., 29 June 1803; d. 1868. He studied at what is now Colgate University, Hamilton, N. Y., and filled successive pastorates at Buffalo, N. Y.; Providence, R. I.; Malden, Mass.; and Exeter, N. H. While at Exeter he commenced his literary labors by editing the 'Encyclopædia of Religious Knowledge' (1835). In 1838 he became a professor of exegetical theology and ecclesiastical history in the New Hampton theological institution, N. H., where he remained till 1845. He edited 'The Christian Chronicle and National Baptist' (1849-68), and was the author of 'The New Hampshire Confession' (1852).

Brown, John W., American author: b. Schenectady, N. Y., 21 Aug. 1814; d. Malta, 9 April, 1849. He graduated at Union College in 1832, and was settled as an Episcopal minister at Astoria, N. Y. In 1845 he became editor of the 'Protestant Churchman.' He was the author of the 'Christmas Bells, a Tale of Holy Tide, and Other Poems,' and of several prose tales of a religious character.

Brown, John Young, American lawyer: b. Claysville, Hardin County, Ky., 28 June 1835; d. Henderson, Ky., 11 Jan. 1904. He graduated at Center College, Danville, 1855, studied law, and was admitted to the bar. In 1859 he was elected to Congress, but not having attained the constitutional age, could not take his seat. He was again elected to Congress in 1868, but his seat was refused him by the House because of political disabilities. Finally he served in Congress (1873-7). He retired to the practice of law and during 1891-5 he was Democratic governor of Kentucky.

Brown, Joseph Emerson, American statesman: b. Pickens County, S. C., 15 April 1821; d. Atlanta, Ga., 30 Nov. 1894. He was educated at Calhoun Academy, and graduated at Yale in 1846. He settled in Canton, Ga.; served in the State legislature, and was elected governor in 1857; serving three terms. As war governor he opposed Jefferson Davis in the matter of the conscription laws and raised 10,000 recruits to oppose Sherman's march to the sea; but would not allow them to leave the State. After the war he gave hearty support to the reconstruction measures, and supported Gen. Grant for the presidency. He was Chief-Justice of Georgia in 1868, and United States Senator in 1880-91.

Brown, Lancelot, English landscape gardener, sometimes called "Capability Brown": b. at Kirkharle, 1715; d. 1773. He commenced life as a kitchen gardener, but, by his industry and genius, rose rapidly in public estimation till he came to be regarded as a kind of oracle in taste in regard to all rural improvements, agricultural, horticultural, and even architectural. His extensive employment enabled him to realize a handsome independence, and he adorned the station to which he had worked his way with more graces and virtues than are often displayed by those who have been born to it. He obtained the dignity of high sheriff of Huntingdon in 1770. He avoided the stiff formality of the older landscape gardens, but is charged with having often sinned against good taste by endeavoring to reform natural scenery, and force it, under all circumstances, to assume

the form of clumps, belts, and serpentine canals. His architectural performances are remarkable for their interiors.

Brown, Moses, American naval officer: b. Salisbury, Mass., 1742; d. at sea 1804. He was a sailor in early life, and commanded the United States privateer *General Arnold*. He was the first commander of the sloop of war *Merrimac*, having the rank of captain U. S. N. He was retired by Thomas Jefferson and re-entered the merchant service.

Brown, Nicholas, American merchant and philanthropist: b. Providence, R. I., 4 April 1769; d. there, 27 Oct. 1841. He graduated at Brown University, 1786. Through the death of his father in 1791, he inherited a handsome fortune, formed a partnership with his brother-in-law, Thomas P. Ives, and became one of the most successful and best-known merchants of America. He was a nephew of John Brown (1736-1803, q.v.). In 1792 he gave \$500 to Brown University with which to purchase law books. This was the beginning of a long series of endowments and benefactions to that institution, which took its present name in honor of him in 1804, when he endowed a professorship of oratory and *belles-lettres*. In 1822 he built Hope College, at an expense of \$20,000; Manning Hall in 1834, at a cost of \$18,500; and a president's house in 1840, costing \$7,000. The total of his various gifts amounted to \$160,000. He was a trustee from 1791 to 1825; a fellow, 1825-41, and a most efficient treasurer from 1796 to 1825. He was also a generous donor to the Providence Athenæum and Butler Hospital for the Insane. He served several terms in the State legislature, and in 1840 was a presidential elector.

Brown, Oliver Madox, English artist, son of Ford Madox Brown (q.v.): b. 1855; d. 1874. From early boyhood he showed remarkable capacity both in painting and literature, especially prose fiction and poetry. His two most promising pictures were 'The Tempest—Prospero and the Infant Miranda' (exhibited in 1871 at the International Exhibition, South Kensington), and 'A Scene from Silas Marner' (1872). 'Gabriel Denver' (1873), and some other unfinished novels, besides sonnets and other poems, show wonderful literary power in one so young. His 'Literary Remains' were published in 1876.

Brown, or Browne, Robert, English clergyman, the founder of a religious sect first called "Brownists," and afterward "Independents": b. Tolethorpe, Rutlandshire, about 1550; d. Northampton, about 1633. He studied at Cambridge, from whence, in 1572, he removed to London. Here he supported himself by teaching; but soon returned to Cambridge and began openly to attack the government and liturgy of the Church of England as anti-Christian. He first ascended the pulpit at Norwich in 1581, where he succeeded in converting a number of Dutch, who had a congregation there, to his opinions. He then went to Middleburg, in Holland, with his followers, and wrote a book called 'A Treatise of Reformation without Tarrying for any Man.' In 1586 he returned to England, and, as he still labored to gain converts, was excommunicated by the Bishop of Peterborough. This censure, joined perhaps

with the evaporation of his zeal, induced him to submit, and in 1586 he became master of Stamford Grammar School, a post which he occupied till 1590, when he was presented to the living of Acworth, in Northamptonshire. He died in Northampton jail, where he had been sent for assaulting a constable. The sect of Brownists, far from expiring with their founder, soon spread so as to become a subject of great alarm; and a bill was brought into Parliament which inflicted on them very severe pains and penalties. In process of time, however, the name Brownists was merged in that of Congregationalists, or Independents, under the latter of which titles they formed a powerful party in the commonwealth.

Brown, Robert, Scottish botanist: b. Montrose, 21 Dec. 1773; d. London, 10 June 1858. He finished his education in 1795, when he became ensign and assistant surgeon in a Fife-shire fencible regiment, which he accompanied to Ireland, remaining there till 1800. He was then, through the influence of Sir Joseph Banks, appointed naturalist to Capt. Flinders' surveying expedition to Australia or New Holland. The whole continent of Australia was circumnavigated, the coast at various points examined, and Brown remained in the colony, visiting various parts of New South Wales and Van Diemen's Land, till 1805. He returned with nearly 4,000 species of plants, was shortly after appointed librarian to the Linnæan Society, and was now able to devote himself to the systematic study of his plants. He continued to make the result of his investigations known in communications to the Linnæan and Royal societies. One of his earliest papers was on a group of the family of plants named by Jussieu *Apocynæ*, which he succeeded in establishing as a separate family under the title already given them by Jussieu of *Asclepiadææ*. In 1810 he published the first volume of the great work he had been preparing on the plants of Australia and Tasmania, entitling it 'Prodromus Floræ Novæ Hollandiæ et Insulæ Van Diemen.' No second volume of it ever appeared. He was the first English writer on botany who adopted the natural system of classification which has since entirely superseded that of Linnaeus. In 1814 he published a botanical appendix to Capt. Flinders' account of his voyage, entitled 'General Remarks, Geographical and Systematical, on the Botany of Terra Australis.' In 1828 he published a brief 'Account of Microscopical Observations on the Particles Contained in the Pollen of Plants, and on the General Existence of Active Molecules in Organic and Inorganic Bodies.' He was the first to call attention to the presence of these active molecules. The movement of the granules of the foveilla (or semi-fluid matter contained in the pollen grains) which he believed to be purely physical, or non-organic, has on the Continent acquired the name of the Brownian or Brunonian movement. He also wrote botanical appendices for the voyages of Ross and Parry, the African exploration of Denham and Clapperton and others, and described, with Dr. Bennet, the plants collected by Dr. Horsfield in Java. In 1810 he received the charge of the collections and library of Sir Joseph Banks, which were afterward bequeathed to him for life. He transferred them in 1827 to the British Museum, and was appointed

keeper of botany in that institution. He became a Fellow of the Royal Society in 1811, D.C.L. of Oxford in 1832, a foreign associate of the French Academy of Sciences in 1833. He had the Copley medal in 1839, and was appointed president of the Linnæan Society in 1849. He also received the decoration of the highest Prussian order of civil merit, presided over by Baron Humboldt, who called him *Botanicorum facile princeps*. As a botanist Brown occupied the very highest rank. He made the microscope and the study of development the basis of his classification; and by his skill in the application of ascertained facts to the elucidation of obscure and the explanation of doubtful phenomena, greatly advanced our scientific knowledge of the vegetable kingdom. His works, contained chiefly in the 'Transactions' of learned societies and other inaccessible forms, are not of a nature to be popular.

Brown, Robert, Scottish scientist: b. Campster, Caithness-shire, 1842; d. 1896. He explored the coast of Spitzbergen, Greenland, and the western shore of Baffin Bay in 1861, made charts of the interior of Vancouver, and with Whymper, in 1867, made discoveries as to the inland ice of Greenland, since borne out by those of Peary. He traveled extensively in the Barbary States, lectured on scientific themes in Glasgow and Edinburgh, and was a member of learned societies in Europe and America. He published 'Manual of Botany' (1874); 'Peoples of the World' (1882-5); 'Science for All' (1877-82).

Brown, Sir Samuel, English engineer: b. London, 1776; d. Blackheath, Kent, 15 March 1852. After serving with honor in the English navy he was made a retired captain in 1842. He is remembered for his system of making iron chain cables, and as the designer and builder of the earliest iron suspension bridge in England, at Berwick-on-Tweed. The famous chain pier was designed by him. He was knighted in 1838.

Brown, Samuel, Scottish chemist and poet: b. Haddington, 23 Feb. 1817; d. Edinburgh, 20 Sept. 1856. He graduated from the University of Edinburgh with extraordinary attainments, began his public career by delivering, in 1840, in association with his intimate friend, Edward Forbes, a course of lectures on the philosophy of the sciences, and having established among his auditors, as he had before among his teachers, the conviction that he was destined to great achievement, renounced all else that he might have won, to devote himself to the slow experimental realization of a great scientific conception. In 1849 he delivered in Edinburgh a series of lectures on the history of chemistry, tracing its progress from its playful childhood among the Greeks, through the Oriental and Mediæval alchemists, with most fascinating sketches of Roger Bacon and Paracelsus; passing thence through the epoch of Stahl and Priestley, till the young and unfortunate Lavoisier changed the whole form of chemical science, opening a new path to all succeeding philosophers. In 1850 he published the 'Tragedy of Galileo.' Many of his lectures and essays have been collected since his death, under the title of 'Lectures on the Atomic Theory, and Essays Scientific and Literary.'

Brown, Samuel Robbins, D.D. (1810-80), American scholar, educator and missionary: b. East Windsor, Conn., 16 June 1810; d. Munson, Mass., June 1880. He established the first Christian Protestant school in China, brought the first Chinese students to America for education, and was the chief instrument in establishing (at Elmira, N. Y.) the first woman's college in America, chartered as such, and translated the New Testament into Japanese 13 days after the formation of the American Board of Commissioners for Foreign Missions. His mother was Phoebe Hinsdale, one of the first and best known of American hymnologists. Educated at Munson Academy, Yale College and the Theological Seminary at Columbia, S. C., he supported himself most of the time by teaching music, one of his pupils being Miss Bulloch, who became the mother of President Theodore Roosevelt. He sailed with his young bride in 1838 to China and at Macao organized and taught in the school of the Morrison Education Society, which was later removed to Hong Kong, where Dr. Brown was wounded by pirates. He returned to America in 1847, bringing with him Yung Wing (who afterward brought 120 Chinese students to America) and Wong, who became a famous physician. Most of Dr. Brown's Chinese pupils rose to positions in the Imperial Customs and other Government services, which required a knowledge of English. Remaining in America until 1859, as pastor and teacher at Owasco Lake, N. Y., he went out to Japan to found the mission of the Reformed Church in America. He trained up a native ministry and many Japanese pupils who have since become editors, statesmen, scholars, presidents of colleges, or otherwise active in the remaking of the Japanese Empire. He wrote the first Grammar of Colloquial Japanese and other works for the mastery of the language, and made scholarly translations besides the whole of the New Testament. See his life, 'A Maker of the New Orient' (1902), by William Elliot Griffis.

Brown, Sanger, American physician: b. Bloomfield, Ontario, 16 Feb. 1852. He was graduated from the Bellevue Hospital Medical College, New York, 1880, and has since held several important professional posts, becoming professor of neurology in the Post Graduate Medical School of Chicago in 1890. He was the earliest to demonstrate that the occipital lobe is the centre of vision in monkeys.

Brown, Thomas, Scotch metaphysician: b. Kirkmabreck, Kirkcudbright, 9 Jan. 1778; d. London, 2 April 1820. He was educated at the University of Edinburgh, where he obtained the professorship of moral philosophy. He distinguished himself, at a very early age, by an acute review of the medical and physiological theories of Dr. Darwin, in a work entitled 'Observations on Darwin's Zoonomia.' But he chiefly deserves notice on account of his metaphysical speculations, his chief work being 'Lectures on the Philosophy of the Human Mind' (1822). His system reduces the intellectual faculties to three great classes — perception, simple suggestion, and relative suggestion, employing the term suggestion as nearly synonymous with association. His development of the theory of cause and effect was first suggested by Hume.

Brown, Thomas Edward, English poet: b. Isle of Man, 1830; d. Clifton, England, 29 Oct. 1897. After a brilliant career at Christ Church College, Oxford, he became assistant master at Clifton College, Bristol, in 1862, resigning in 1892. His work, though strong and remarkably original, failed to attract general attention during his lifetime, but when collected in 1900, contemporaneously with two volumes of his 'Letters,' they drew forth extended notices from leading critical reviews and journals in England and the United States. His poems, which are written in Anglo-Manx dialect for the most part, are chiefly narrative, and include 'Betsy Lee' (1873); 'Fo'c's'le Yarns, including Betsy Lee' (1881); 'The Doctor and Other Poems' (1887); 'The Manx Witch and Other Poems' (1889); 'Old John and Other Poems' (1893).

Brown, Sir William, English merchant and philanthropist: b. Ballymena, Ireland, 1784; d. 1864. In 1800 he removed with his parents to Baltimore, Md., and became the partner of his father in the linen trade there. In 1809 he set up a branch of the business in Liverpool and subsequently founded the famous mercantile house of Brown, Shipley & Company. He sat in Parliament four years from 1846, advocated free trade and decimal coinage, gave \$200,000, in 1857, to establish a free public library in Liverpool, and built the original library building and museum there.

Brown, William Garrott, American writer: b. Marion, Ala., 24 April 1868. He graduated at Harvard in 1891, taking highest honors in history, and became assistant in the Harvard Library. In 1892 he took an active part in the Presidential campaign, serving on various committees and stumping Massachusetts in behalf of Cleveland. He has made a special study of Southern history, and since 1900 has devoted himself to writing and lecturing on this topic, contributing chiefly to the 'Atlantic Monthly.' His writings in book form are: 'Andrew Jackson' (1900); 'History of Alabama' (1901); 'The Lower South in American History' (1902); 'Stephen A. Douglas' (1902); 'Golf' (1902); 'History of the United States Since the Civil War' (1903); 'A Gentleman of the South' (1903).

Brown, William Montgomery, American Protestant Episcopal bishop: b. Orrville, Ohio, 6 Nov. 1855. He entered the Episcopal ministry, became archdeacon of Ohio in 1891, and in 1898 was consecrated coadjutor bishop of Arkansas, becoming bishop of that diocese in the year following.

Brown-Séquard, Charles Edouard, shärl ä-dd-är brown-sä-kär, Franco-American physiologist and physician: b. Mauritius, 1818; d. Paris, 1 April 1894. His father was a sea captain from Philadelphia, who married on the island a lady named Séquard. The son studied in Paris and graduated M.D. in 1846. He devoted himself mainly to physiological research, and received numerous prizes, French and British, for the results of valuable experiments on blood, muscular irritability, animal heat, the spinal cord, and the nervous system. In 1864 he became professor of physiology at Harvard, but in 1869 returned to Paris as professor of pathology in the School of Medicine. In 1873 he

became a medical practitioner in New York, treating especially diseases of the nervous system; and in 1878 succeeded Claude Bernard as professor of experimental medicine at the Collège de France. He repeatedly lectured in England. His publications include lectures on 'Physiology and Pathology of the Nervous System' (1860); on 'Paralysis of the Lower Extremities' (1860); and on 'Nervous Affections' (1873).

Brown, the color produced when certain substances — wood or paper, for example — are scorched or partially burned. Brown is not one of the primary colors in a spectrum. It is composed of red and yellow, with black, the negation of color. It is also the name of a genus of colors, of which the typical species is ordinary brown, tinged with grayish or blackish. The other species are chestnut brown, deep brown, bright brown, rusty, cinnamon, red brown, rufous, glandaceous, liver-colored, sooty, and lurid.

Brown Bear. See BEAR, BROWN.

Brown Coal, a variety of bituminous coal, and formed like it of vegetable remains, but more woody or fibrous in its formation. It usually belongs to later formations than the common coal, and on this account has been called modern coal. Brown coal is at first hardly to be distinguished from common coal, but it has a brown streak when scratched, and when exposed to the air rapidly deteriorates, falling to powder in a few months, while the kind called lignite tears and splits. Brown coal contains much more water than common coal, and is thus less valuable as fuel. Where better fuel is scarce, however, it is largely used. See LIGNITE.

Brown Spar, a name given to the brown varieties of dolomite whose color is due to the presence of iron carbonate.

Brown Thrush, or Thrasher. See THRASHER.

Brown University, an educational institution in Providence, R. I. Its charter was granted by the General Assembly of the State in 1764 and the institution was opened in Warren in 1765 as Rhode Island College. Its founding was due to the wish of the Baptists to have a college under their own control and it has ever since been affiliated with the Baptist Church, although remaining unsectarian. The college was removed to Providence in 1770 and in 1804 its name was changed to Brown University in honor of Nicholas Brown (q.v.), whose various gifts to the college were not far from \$160,000 in amount. Under its fourth president, Francis Wayland (q.v.), 1827-55, the university was practically reorganized. Under President Elisha Benjamin Andrews (q.v.), 1880-98, the number of students increased from 268 to 860. In 1891 the Woman's College was founded, and in 1897 this was accepted by the corporation as the Woman's College in Brown University. Since the presidency of the Rev. W. H. P. Faunce began in 1899, the institution has grown very rapidly; a \$2,000,000 endowment has been secured; and several large and important buildings have been erected, including the John Carter Brown Library, the Administration Building, the Engineering Building, Caswell Hall, and Rockefeller Hall.

At the end of 1906 there were 86 professors and instructors, 935 students and about 6,100 graduates; in 1905 the productive funds were \$2,988,866, income, \$671,918, and there were 150,000 volumes in the library. F. T. GUILD,

Registrar and Secretary of Faculty.

Browne, Charles Farrar (**ARTEMUS WARD**), American humorist: b. Waterford, Me., 26 April 1834; d. Southampton, England, 6 March 1867. He learned the printer's trade, and while working on the *Carpet Bag*, a Boston comic weekly, began his career as one of the most widely popular of American writers and lecturers. 'Artemus Ward's Sayings,' written for the *Cleveland Plain Dealer*, extended his fame as a clever and witty writer. His humorous lectures, especially those on Mormonism, proved most successful in this country and in England. He died of consumption while on a lecture tour in the latter country. Browne's humor had a quality of its own, and was essentially democratic and American. His winning personality never failed to put an audience in a receptive mood. His works in book form are: 'Artemus Ward: His Book' (1865); 'Artemus Ward: His Travels Among the Mormons' (1865); 'Artemus Ward: His Book of Goaks' (1865); 'On the Rampage' (1865); 'Artemus Ward Among the Fenians' (1865); 'Artemus Ward in London' (1867); 'Artemus Ward's Lecture at Egyptian Hall' (1869). While in England he made several contributions to 'Punch,' beginning with the number for 1 Sept. 1866. Compare M. D. Landon's biographical sketch, prefixed to 'Artemus Ward, His Works Complete' (1875).

Browne, Charles Francis, American artist: b. Natick, Mass., 21 May 1859. He studied at the Boston Art Museum, the Philadelphia Academy of Fine Arts, and the Paris Ecole des Beaux Arts. He has been for some years lecturer and instructor in the history of art in the Chicago Art Institute, and has exhibited both in this country and Europe.

Browne, Edward Granville, English Orientalist: b. Uley, England, 7 Feb. 1862. He was educated at Eton and Pembroke College, Cambridge. He traveled in Persia (1887-8), becoming lecturer in Persian at Cambridge in the year last named. He has published 'A Traveler's Narrative, Written to Illustrate the Episode of the Báb,' Persian text and English translation with notes (1891); 'The New History of Mirzá and Ali Muhammad the Báb' (1893); 'A Year Amongst the Persians' (1893).

Browne, Edward Harold, English prelate: b. Aylesbury, Buckinghamshire, 6 March 1811; d. Winchester, Hampshire, 19 Dec. 1891. He was educated at Emmanuel College, Cambridge, took orders in the Anglican Church in 1836, and was consecrated Bishop of Ely in 1864. In 1873, he was transferred to Winchester, resigning this bishopric in 1891. He was a prominent advocate of the old Catholic movement in Germany and one of the Old Testament company of revision of the King James version of the Bible. He published 'An Exposition of the XXXIX. Articles' (1850-3); 'Sermons on the Atonement and Other Subjects' (1859); 'The Messiah Foretold and Expected' (1862); 'The Pentateuch and the Elohistic Psalms in Reply to Bishop Coleíno' (1863); 'The Stripe, the Victory, and the Kingdom' (1872); 'Position

and Parties of the English Church' (1875); 'Commentary on Genesis' in the 'Speaker's Commentary.'

Browne, Frances, Irish poet: b. Stranorlar, Donegal, Ireland, 16 June 1818. When she was 18 months old she lost her sight from small-pox. From her brothers and sisters attending the village school she obtained as much information as they were acquiring, and listened to such books as they would read to her. 'Robinson Crusoe' and 'Mungo Park's African Adventures' were among these works. The prose writings of Sir Walter Scott, with which she became familiar from their being read to her, deeply influenced her mind. In 1841 she commenced contributing verse to the 'Athenæum,' edited at that time by Mr. T. K. Hervey. He became interested in her story, related it with considerable effect in the 'Athenæum,' paid her for her writings, and introduced her to other publications, from which she also derived pecuniary benefits. In 1844 the 'Star of Atteghel' and other poems appeared in a small volume, which was well received. Among the advantages accruing to the poet from it, was her being placed on the pension list for £20 a year by Sir Robert Peel, prime minister.

Browne, Francis Fisher, American editor and author: b. South Halifax, Vt., 1 Dec. 1843. During the Civil War he served in the 10th Massachusetts Volunteers. He edited the 'Lakeside Monthly,' 1869-74, and in 1880 became editor of 'The Dial,' Chicago, which under his direction has come to be one of the two or three American literary journals worthy of being ranked with the best English periodicals of similar scope. Publications: 'Every-day Life of Abraham Lincoln' (1886); 'Volunteer Grain' (1896), poems. He has edited 'Golden Poems by British and American Authors' (1881); 'Golden Treasury of Poetry and Prose' (1883); 'Bugle Echoes: a Collection of Poems of the Civil War' (1886).

Browne, George Forrester, English bishop: b. York, England, 1833. He was educated at St. Catharine's College, Cambridge, and ordained 1858. He was appointed theological tutor and bell lecturer in ecclesiastical history in the Episcopal Church of Scotland, 1862; fellow and lecturer at St. Catharine's, 1863-5; secretary and chief organizer of the Cambridge local examinations. He was rector of Ashley, 1869-75; Disney professor of archaeology, 1887-92; canon of St. Paul's, 1891-7; bishop of Stepney, 1895-7, whence he was transferred to the see of Bristol. He is the author of 'Ice Caves of France and Switzerland' (1865); 'The Venerable Bede' (1879); 'University Sermons' (1878-80); 'The Ilam Crosses' (1880); 'Early English Church History' (1893); 'The Church at Home Before Augustine' (1894); 'Augustine and His Companions' (1895); 'Conversion of the Heptarchy' (1896); 'Theodore and Wilfrid' (1897); 'History of St. Catharine's College' (1902); 'Life and Works of St. Aldhelm,' and various publications of the Church History Society (1894-7).

Browne, George Waldo, American author: b. Deerfield, N. H., 8 Oct. 1851. For five years he edited 'American Young Folks,' and is a well-known writer for young people. He has written over 100 serials and several hundred short stories and articles for the leading juve-

nile periodicals. Of his books the best known are: 'The Woodranger' (1899); 'Two American Boys in Hawaii' (1899); 'Pearl of the Orient' (1900); 'Legends of the Hills' (1901). His most recent juveniles include 'For Honor and Honor' (1902); 'From Switch to Lever' (1902); 'Zip the Acrobat' (1902); 'Comrades Under Castro' (1903); 'With Roger's Rangers' (1905).

Browne, Hablot Knight, English caricaturist, better known by his pseudonym of **PHIZ**: b. London, 15 June 1815; d. Hove, Brighton, 8 July 1882. He was educated at a private school, and at an early age began to draw caricatures with great spirit. In 1835 he succeeded Seymour as the illustrator of Dickens' 'Pickwick,' and so happy and successful was his pencil that he was engaged to illustrate 'Nicholas Nickleby'; 'Dombey and Son'; 'Martin Chuzzlewit'; 'David Copperfield,' and other works of that great novelist. He subsequently contributed many graphic illustrations to the novels of Lever, Ainsworth, Scott (the Abbotsford edition of the Waverley Novels), and to an illustrated edition of Byron, besides sending many comic sketches to the illustrated serials of the time. See Thompson, 'Life and Labors of H. K. Browne' (1884).

Browne, Isaac Hawkins, English poet: b. Burton-on-Trent, Staffordshire, 1706; d. 1760. He was educated at Trinity College, Cambridge, and called to the bar, but he did not practise. He wrote 'Design and Beauty'; 'The Pipe of Tobacco' (in which he imitates Pope, Young, Swift, and others); and a Latin poem, 'De Animi Immortalitate,' modeled on Lucretius and Virgil. The last-named received high commendation from the scholars of his time, and has been several times translated into English. Browne had a great reputation as a wit and conversationalist.

Browne, John Ross, American author and traveler: b. Ireland, 1817; d. Oakland, Cal., 9 Dec. 1875. He came to America when a child, his father settling in Kentucky. At the age of 18, having learned stenography, he went to Washington, and for several years was employed as shorthand reporter in the Senate. His desire for travel led him to take a whaling cruise, in the course of which he visited the greater part of the world. In 1849 he was a government commissioner in California, and reported the State Constitutional Convention proceedings. In 1851, and again in 1861, he traveled extensively in Europe and the Holy Land, visiting Iceland, Russia, Poland, and other countries. Commissioned by the government to study the mineral resources west of the Rocky Mountains, he presented an elaborate report, reviewing the mines, climate, topography, agriculture, commerce, etc., of that region. His books of travel were illustrated with humorous drawings of his own. He was United States minister to China in 1868-9. Publications: 'Etchings of a Whaling Cruise' (1846); 'Yusef: a Crusade in the East' (1853); 'Adventures in the Apache Country' (1869); 'The Land of Thor' (1866); 'Adventures of an American Family in Germany' (1867); 'Crusoe's Island, with Sketches of Adventures in California and Washoe' (1864); 'Resources of the Pacific Slope' (1869).

Browne, Junius Henri, American journalist: b. Seneca Falls, N. Y., 14 Oct. 1833; d. New

York, 2 April 1902. He was a graduate of Saint Xavier College, Cincinnati. In 1861 he became war correspondent for the New York *Tribune*, was wounded at Fort Donelson, and taken prisoner while engaged in an abortive expedition to run the Vicksburg batteries. After an imprisonment of 20 months in seven different prisons, he eluded his guard at Salisbury, N. C., traveled 400 miles through a hostile country, and reached the Union lines 14 Jan. 1865. His list of Union soldiers who died at Salisbury, published in the *Tribune*, is the only authentic account of their fate. After the War he served as correspondent of the New York *Tribune*, *Times*, and other journals, and contributed many articles to leading periodicals. His best-known works are: 'Four Years in Secessia' (1865); 'The Great Metropolis: A Mirror of New York' (1869); 'Sights and Sensations in Europe' (1872). A series of articles on women, which he wrote for the 'Galaxy,' created a sensation in literary circles. His 'Four Years in Secessia' was hastily prepared and lacked much grace and elegance in its literary form, but its descriptions of various incidents of the war and particularly its information concerning the conditions of the Southern prisons and the Northern soldier confined in them, render the book especially valuable.

Browne, Sir Thomas, English prosaist, scholar, and physician: b. 19 Oct. 1605, London, parish of Saint Michael, Cheapside; d. Norwich, 19 Oct. 1682. His father, who had been a mercer at Upton, in Cheshire, and came of an ancient and honorable family, died early; and Browne's mother soon married Sir Thomas Dutton. Browne received his early education at Winchester College, and in 1623 was sent as a fellow-commoner to Broadgate Hall (now Pembroke College) Oxford. Here he graduated B.A., 21 June 1626, and M.A., 11 June 1629. Early becoming interested in the natural sciences, he devoted most of his time at Oxford to the study of medicine, and for some time after graduation practised medicine in Oxfordshire. Later on, he accompanied his step-father to Ireland on a tour of inspection of its forts and castles. After this, Browne continued his travels through France and Italy, spending some time at the celebrated schools of physic at Montpellier and Padua, and doubtless acquiring some of the "six languages" which, "besides the jargon and patois of several provinces," he later stated that he understood. On his way back to England he traveled through Holland, where in 1633 the University of Leyden conferred upon him the degree of Doctor of Medicine. After his return, he established himself as a physician at Shipden Hall, near Halifax. He was much "resorted to for his skill in physic," and spent his leisure hours in study and contemplation.

At Shipden Hall, 1635-36, Browne composed the beautiful contemplative soliloquy known as the 'Religio Medici.' It was written for his "private exercise and satisfaction," and was not intended for publication. It was, however, widely circulated in manuscript among his literary friends, and was at last surreptitiously published in 1642 by Andrew Cooke. Browne, in self-defense, published a correct edition in 1643; and almost simultaneously appeared a series of

"Observations" on the work, penned in 24 hours by the eminent Sir Kenelm Digby. The book at once became immensely popular, both at home and abroad. In 1664, John Merryweather published a Latin version of it; and Dutch, French, and German translations appeared in 1665, 1668, and 1680 respectively. Because of the "daring skepticism" which it combined with "implicit faith in revelation," it was placed in the Index Expurgatorius of the Catholic Church. Between 1642 and 1881, the treatise ran through 33 English editions.

In 1637 Browne moved to Norwich, where he practised medicine and pursued his literary studies till his death. On 10 July 1637, he was incorporated Doctor of Physic at Oxford. He married, 1641, Dorothy, fourth daughter of Edward Mileham, of Burlingham St. Peter. She bore him 12 children, and survived him three years. Throughout the civil wars he remained at heart a Royalist, and ever regretted what he called "the horrid murder of King Charles I." But his calm spirit "quietly rested under the drums and trappings" of the revolution, and he took no active part in the upheaval of the times.

Browne's reputation for learning and research was greatly increased in 1646 by the publication of his elaborate work, "Pseudodoxia Epidemica; or, Enquiries into very many received tenets and commonly presumed truths, which examined prove but Vulgar and Common Errors." This treatise is encyclopedic in scope, and must have grown to its final extent through many years of slow accretion. It was soon translated into Dutch, German, and French; and attracted no little attention among scholars by the vast and recondite learning it displayed. Browne's advice and assistance soon became sought by scholars engaged in scientific and antiquarian pursuits. Among the best known men of the time who sought his acquaintance was John Evelyn, with whom in 1658 he began a correspondence which lasted through his life. In October 1671, Evelyn journeyed to Norwich to visit Browne; and wrote, in his diary, an account of Browne's surroundings. The house and garden were "a paradise and cabinet of rarities, and that of the best collections, especially medals, books, plants, and natural things." Evelyn noticed particularly Browne's extensive collection of birds' eggs.

In 1658 Browne composed the solemn "Hydriotaphia, Urn-Burial; or, A Discourse of the Sepulchral Urns lately Found in Norfolk." At the same time he published the most fantastic of his writings, "The Garden of Cyrus; or, The Quincuncial, Lozenge, or Network Plantations of the Ancients, Artificially, Naturally, Mystically Considered." In December 1664, he was created *socius honorarius* of the College of Physicians, and received the diploma of the institution on 6 July 1665. On 28 Sept. 1671, he was knighted by Charles II., on the occasion of a royal visit to Norwich. Although Browne's literary activity continued unabated until his death, he published nothing after 1658. He died on his 77th birthday, and was buried in the church of St. Peter Mancroft, Norwich. In 1840, some workmen who were making a new grave accidentally fractured the lid of Browne's coffin with a pickaxe. The skeleton was thus

exposed, and the sexton took possession of the skull. It is now on exhibition in the Norfolk and Norwich Hospital.

Many of Browne's manuscript writings were published posthumously. In 1684 his friend Archbishop Tenison brought out a collection of 'Miscellany Tracts' on subjects ranging from the ancient monuments of Norwich to the plants mentioned in the Bible and the fishes eaten by our Saviour with his disciples after his resurrection from the dead. In 1690 his son, Dr. Edward Browne, published his beautiful 'Letter to a Friend, upon occasion of the death of his intimate friend,' which forms a sort of prelude to the careful dissertation on 'Christian Morals'—intended perhaps as a continuation of the 'Religio Medici'—which was first published in 1716 by Archdeacon Jeffrey. A collection of the 'Posthumous Works of the learned Sir Thomas Browne, Knt., M.D., late of Norwich,' was published by an unknown editor in 1712. It contains, among other tracts, a striking fragment of an essay on "Dreams."

Browne belongs to the class of mystical soliloquists who love to discourse to themselves about fantastic subtleties too fine to excite the curiosity of vulgar minds, but who yet are not too self-engrossed to allow the friendly reader to overhear their musings. He loves to "turn the world round" not only for his own, but also for his reader's "recreation," and to lead the reader with him through a labyrinth of fancy until both "lose themselves in a mystery." His works are lacking in design, uneven, whimsical, and capricious; but they reveal a personality serene, altruistic, tolerant, mystical, reverent, and friendly. Furthermore, he commands a style that for lordly eloquence and orchestral harmony remains unrivaled in the entire history of English prose.

Browne's greatest work is the 'Religio Medici.' In this treatise, which combines the meditations of many leisure hours, he has revealed all of the emotional affluence of his soul. It is a mystical acceptance of the creed of the Anglican Church, leavened with a touching tolerance of other beliefs. Paradoxically it combines an imaginative scepticism with a naive credulity. Browne believed in witches, for example; and refused to accept the Copernican system of astronomy because it contradicted the literal statements of the Hebrew Scriptures. But there is no narrowness in Browne's most characteristic mood. He rises on the wings of exaltation until he soars into the presence of Infinity and glows with a religious ecstasy known of all nations and of all times.

The 'Pseudodoxia' is a less worthy work. It is a vast chaos of recondite lore, bewildering by the very extent of its voluminous observation. It opens with an inquiry into the sources of error not a little resembling Bacon's famous arraignment of "Idols"; But Browne had no true sense of natural law, as Bacon understood it, and often fallacies pursue him in his pursuit of fallacy.

'The Garden of Cyrus' is a fanciful dissertation on the quincunx, that geometrical arrangement of five points familiar in the five of a domino. As Coleridge said, Browne finds "quincunxes in heaven above, quincunxes in

earth below, quincunxes in the mind of man, quincunxes in tones, in optic nerves, in roots of trees, in leaves, in everything."

The grandeur of Browne's style is displayed most fully in 'Hydriotaphia.' Some Roman sepulchral urns accidentally unearthed in Norfolk furnished him with the suggestion for this eloquent monody, which, beginning with an historical discussion of ancient modes of burial, soon develops into a solemn homily on death and the vicissitudes of worldly fame. The style shows an eloquent spontaneity rather than a conscious mastery of art. It would not be a serviceable model for a modern writer; it is hyper-latinised and capricious; but it is incomparable for pompous rhythm and resonant harmony.

Bibliography.—The standard edition of Browne's works is that edited by Simon Wilkin (4 vols. 1835-6) which has been called the best edited book in the language; it contains a life by Dr. Johnson. The posthumous works (ed. 1712) contain also a life and Whitefoot's minutes. Consult: S. T. Coleridge, 'Literary Remains'; Edward Dowden, 'Puritan and Anglican Studies'; Edmund Gosse, 'Sir Thomas Browne'; W. A. Greenhill, introductions (to separate vols. of Browne) 'Golden Treasury Series'; Walter Pater, 'Appreciations'; Sir Leslie Stephen, 'Hours in a Library' (vol. I); J. A. Symonds, introduction, 'Camelot Series.'

CLAYTON HAMILTON,

Sometime Tutor in English, Columbia University.

Browne, Thomas Alexander (ROLF BOLDREWOOD), Australian romancer: b. London, England, 6 Aug. 1826. He is a son of Capt. Sylvester Browne, a founder of Melbourne, Australia. He was educated in Sidney College, and has written 'Ups and Downs: a Story of Australian Life' (1879); 'Robbery Under Arms: Life and Adventures in the Bush' (1888); 'A Squatter's Dream Story' (1890); 'The Miner's Right' (1890); 'A Colonial Reformer' (1890); 'A Sydney Side Saxon' (1891); 'A Modern Buccaneer' (1894); 'The Crooked Stick' (1895); 'The Sphinx of Eaglehawk' (1895); 'The Sealskin Cloak' (1896); 'My Run Home' (1897); 'Plain Living' (1898); 'A Canvas Town Romance' (1898); 'The Babes in the Bush' (1900); 'In Bad Company' (1901); 'Ghost Camp' (1902).

Browne, Ulysses Maximilian (COUNT VON), Austrian military officer: b. Basel, 23 Oct. 1795, of an Irish Jacobite family; d. 26 June 1757. He entered the Austrian service at the age of 12, and became one of the foremost field marshals in the army of Maria Theresa. As governor of Silesia (1739-42), he had to face the first of Frederick the Great's attacks, and in the Seven Years' War he commanded the Austrians at Lobositz (1756). He was mortally wounded at the battle of Prague.

Browne, William, English poet: b. Tavistock, Devonshire, 1591; d. Ottery Saint Mary, Devonshire, about 1643. He was educated at Oxford, and spent a quiet, tranquil life. His poetry is graceful and fanciful, and abounds in beautiful pictures of English scenery. Browne has always been much admired by the poets.

His chief work is 'Britannia's Pastorals' (1613-16). 'The Shepherd's Pipe' (1614) is a collection of eclogues, and 'The Inner Temple Masque' (1614-15) tells the story of Ulysses and Circe. His minor poems are very fine. The best modern editions are by Hazlitt for the Roxburghe Club, and by Gordon Goodwin, 'The Muse's Library.'

Browne, William George, English traveler: b. London, 25 July 1768; d. northern Persia, 1813. In several expeditions he traveled through Egypt and some parts of the interior of Africa, and through Asia Minor and Armenia. In 1812 he proposed a more extensive journey through central Asia. He had already, in 1813, arrived at Tabreez, on his way to Tartary, when his party was attacked by banditti and himself murdered. He was the author of 'Travels' in Africa, Egypt and Syria (1800).

Browne, William Hand, American author: b. Baltimore, 31 Dec. 1838. He studied medicine and graduated M.D. at the University of Maryland, but soon turned his attention to English literature, in certain departments of which he came to be an authority. He edited the 'Southern Review' (1867-8), and the 'Southern Magazine' (1870-5); he was librarian at Johns Hopkins University from 1879 to 1891, when he became professor of English literature. He has translated F. Spielhagen's 'Hammer and Anvil' (1870); Turgenieff's 'Spring Floods' (1874); and Falke's 'Greece and Rome' (1882). In collaboration with R. M. Johnston he wrote 'Historical Sketch of English Literature' (1872); and a 'Life of Alexander H. Stephens' (1878); with J. T. Scharf, 'History of Maryland' (1878); and with S. S. Haldeman he compiled 'Clarendon Dictionary: Concise Hand-Book of the English Language' (1882). He has also written 'George Calvert and Cecilus Calvert, Barons Baltimore'; 'Maryland: the History of a Palatinate' (1884); and has edited 'Archives of Maryland: Proceedings and Acts of the General Assembly, 1637-44' (1883); and 'Selections from the Early Scottish Poets.'

Browne, William Hardcastle, American lawyer and author: b. Philadelphia, 14 Nov. 1840. In 1865 he was admitted to the Philadelphia bar, where he has since practised, but he is best known for his legal and literary compilations, chief of which are: 'Digest of the Law of Divorce and Alimony in the United States' (1890); abridged editions of Blackstone's 'Commentaries' (1894); and Kent's 'Commentaries' (1895); 'Law of Negligence in Pennsylvania' (1896); 'Law on Decedents' Estates in Pennsylvania' (1897); 'Witty Sayings by Witty People' (1898); 'Odd Derivations of Words and Phrases' (1900); 'Waverley Novels,' abridged (6 vols. 1901), and others.

Brownell, Clarence Ludlow, American journalist and author: b. Hartford, Conn., 6 June 1864. He studied at Harvard University and Stevens Institute of Technology, and for five years was English instructor in government and private schools in Japan. For some years he has been a constant contributor of articles on Japanese life, etc., to American magazines and newspapers, and is steadily at work on a history of Japan and Buddhism in that country. He has written: 'Tales from Tokio' (1900).

Brownell, Franklin P., Canadian artist: b. New Bedford, Mass. He makes specialties of portraits and figure-painting. For some years he has been principal of the Ottawa Art School. His canvas, 'The Photographer,' is in the National Gallery at Ottawa.

Brownell, George Griffin, American educator: b. Fairfield, N. Y., 2 July 1898. He graduated at Syracuse University, 1893, and studied at the Sorbonne, Paris, 1893-4, and at Johns Hopkins University, 1894-8, when he was appointed professor of Romance languages at the University of Alabama. He wrote for *Harper's Weekly* 'The Lone Star Republic' (1894), and 'The Vale of Andorra' (1895); he has edited for college use the Spanish texts 'El Capitán Veneno' (1901), and 'El Pájaro Verde' (1901); and has contributed frequently to 'Modern Language Notes' on subjects relating to the Romance languages and literatures.

Brownell, Henry Howard, American poet and historian: b. Providence, R. I., 6 Feb. 1820; d. East Hartford, Conn., 31 Oct. 1872. His first essay in poetry was a spirited versification of Farragut's 'General Orders' to the fleet below New Orleans. Afterward he was appointed to an honorary place on the Hartford, flagship, and had opportunity to observe actual naval warfare. In 'The Bay Fight' he describes, with truth and force, the battle of Mobile Bay. He collected and published his many occasional verses in 'Lyrics of a Day; or, Newspaper Poetry by a Volunteer in the United States Service' (1864).

Brownell, Thomas Church, American Protestant Episcopal bishop: b. Westport, Mass., 19 Oct. 1779; d. Hartford, Conn., 13 Jan. 1865. He was graduated from Union College, Schenectady, N. Y., in 1804. The next year he accepted the post of tutor in Latin and Greek in that institution; in 1807 was appointed to the chair of belles-lettres and moral philosophy; and in 1809 was chosen the first professor of chemistry and mineralogy. He entered the Episcopal ministry in 1816, and in connection with his professional duties gave himself to the work of a missionary in Schenectady. In 1818 he became an assistant minister in Trinity Church, New York. He was consecrated Bishop of Connecticut, 27 Oct. 1819, and removed at once to his new field of labor. During his long episcopate of 45 years, Bishop Brownell was actively and efficiently engaged in the duties of his station. Washington (now Trinity) College, at Hartford, Conn., took its rise under his auspices in 1824; and he became its first president, resigning in 1831. In 1852 he became presiding bishop in the American Episcopal Church. He published 'The Family Prayer Book' (1823); 'Religion of the Heart and Life' (1839-40); 'Consolation for the Afflicted'; 'The Christian's Walk and Conversation'; etc. A bronze statue of Bishop Brownell has been placed on the campus of Trinity College.

Brownell, William Crary, American essayist and critic: b. New York, 30 Aug. 1851. Having graduated from Amherst, he devoted himself to critical and editorial work in New York city. He became an editor of 'Scribner's Magazine', and among his writings are: 'French Traits: an Essay on Comparative Criticism' (1889); 'French Art' (1892); 'Newport' (1896); and other works.

Brownie, a spirit of goblin, in old popular superstitions of Scotland, supposed to haunt old houses, especially those attached to farms. He might be called the Robin Goodfellow of Scotland. In the night he helped the family, and particularly the servants, by doing many pieces of drudgery, performing domestic labors while the inmates of the household slept. If offered food or any other recompense for his services, he decamped and was seen no more.

Browning, Elizabeth Barrett, English poet: b. Durham, 6 March 1806; d. Florence, Italy, 29 June 1861. Her father, Edward Moulton, or Moulton-Barrett, as soon after her birth he began to write his name, was a country gentleman who resided at the foot of the Malvern Hills, and in this beautiful retreat Elizabeth's girlhood was passed. She early began to commit her thoughts to writing, and in 1826 appeared her volume entitled 'An Essay on Mind and Other Poems,' anonymously published. Viewed as the production of a young lady of 20, this book is indeed a remarkable one; but in after years its author was so dissatisfied with it that she omitted it in the collected editions of her poems. In 1833 appeared a translation by her of the 'Prometheus Bound,' of Æschylus. A collection entitled 'The Seraphim and Other Poems' was produced in 1838, the principal piece being a lyric drama shadowing forth the feelings and emotions which may be supposed to have been excited in an angelic being by the spectacle of the crucifixion. Both in this and in a subsequent work, 'The Drama of Exile' (1840), she chose for her theme the fall and redemption of man, subjects on which Milton had already employed his genius, and in the treatment of which, though exhibiting much grandeur and sublimity, Mrs. Browning can scarcely be said to have approached him. Always feeble in health, she was now nearly brought to the verge of the grave by the rupture of a blood vessel, and having been taken to Devonshire to promote her recovery, received there a severe shock from the drowning of a favorite brother. For several years she was confined to a darkened chamber, and saw only a few of her most intimate friends, but nevertheless continued to busy herself with study and composition. Her health was at length partially restored, and in 1846 she was married to Mr. Robert Browning, a gentleman already well known in the literary world as a poet and dramatist. After their union they went to Italy, and continued subsequently to reside for the most part in Florence. In 1850 a collected edition of Mrs. Browning's works appeared in two volumes, including several new poems, and among others 'Lady Geraldine's Courtship,' one of the finest of her productions, and remarkable, it is said, as having been composed in the incredibly short space of 12 hours. Her 'Sonnets from the Portuguese,' included in this volume, were written after her engagement, and first privately printed. They have no parallel for excellence in their peculiar kind in our literature. 'Casa Guidi Windows,' a poem on the struggles of the Italians for liberty in 1848-9, appeared in 1851. The longest and most finished of all her works, 'Aurora Leigh,' a romantic narrative and didactic poem in blank verse, was published in 1856. Her last volume, 'Poems Before Congress,' appeared in 1860, and cannot be said to have added greatly to her reputation.

Several detached pieces of hers appeared from time to time in the 'Cornhill Magazine,' up to the period of her death. 'Last Poems,' by Mrs. Browning, published by Robert Browning in 1862, and 'Greek Christian Poets and the English Poets,' translations and essays of hers published by Mr. Browning in 1863, were followed in 1866 by his publication of 'Selections from the Poems of Elizabeth Barrett Browning' (2d series 1880). The 'Letters of E. B. Browning,' edited by Frederick G. Kenyon (1897), are a definitive presentation of her character and career in a selection from a very large mass of correspondence collected by Mr. Browning himself. It is a chronicle, and practically a life, by reason of the character of the letters and the addition of connecting links of narrative. The letters give an unusually full and interesting revelation of the course of her life. The poetry of Mrs. Browning is characterized by much pathos and depth of feeling, combined with great vividness and powers of description. It partakes eminently of the modern English school, as represented by Tennyson and others, at times obscure and transcendental, but animated throughout by the most noble and exalted sentiments, and illuminated from time to time by flashes which, in their bearings on the unseen world of mind and spirit, seem almost supernatural. In their married life she and Robert Browning found mutual happiness and help, the good influences of which are reciprocally manifested in their writings.

Browning, Orville Hickman, American politician: b. Harrison County, Ky., 1810; d. Quincy, Ill., 10 Aug. 1881. While performing the duties of clerk in the office of the county and circuit clerk of Bracken County, he pursued a course of classical studies at Augusta College. Admitted to the bar in 1831, he settled in practice at Quincy, Ill., where he subsequently resided. In 1832 he served through the Black Hawk war, and was a member of the Illinois legislature, 1836-43. In conjunction with Abraham Lincoln he organized the Republican party in Illinois at the Bloomington convention. When the Civil War broke out he warmly supported the government, and in 1861 was appointed to the United States Senate to fill the vacancy caused by the resignation of Stephen A. Douglas. President Johnson made him secretary of the interior in 1866, and for one year from March 1868 he also acted as attorney-general. In 1869 he was elected to the State Constitutional Convention, and after that he retired to the practice of his profession.

Browning, Oscar, English author: b. London, 17 Jan. 1837. He was educated at Eton and at King's College, Cambridge, where he was graduated with classical honors in 1860. From 1860 to 1875 he was a master at Eton, and since 1876 has been lecturer in history and political science at Cambridge. He has also served as principal of the University Training College for teachers, and in other educational capacities. Twice he has been an unsuccessful candidate of the Liberal party for Parliament. He is a voluminous writer on subjects of education, history, biography, etc., and among his works are: 'Cornelius Nepos' (1868); 'Netherlands in the 16th Century' (1866); 'Thirty Years' War' (1870); 'Modern England' (1879); 'Modern France' (1880); 'History of Educational

Theories' (1881); 'History of England' (1890); 'Life of George Eliot' (1890); 'Goethe: Life and Works' (1891); 'The Citizen: His Rights and Responsibilities' (1893); 'Life of Peter the Great' (1898); 'Wars of the 19th Century' (1899); 'History of Europe, 1814-43' (1901); 'Letters from India' (1902).

Browning, Robert, English poet: b. Camberwell, a suburb of London, 7 May 1812; d. Venice, 12 Dec. 1889. His father, Robert, who was a clerk in the Bank of England, and was himself a lover of books, a classical scholar and ready at versifying, had the boy educated in a school at Peckham, after which he attended lectures at University College. His father's family being dissenters, his mind was trained and his character formed under influences less peculiarly English than those to which youths are exposed in the great public schools and the two leading universities of that country. At the age of 20 he traveled on the Continent and resided for some time in Italy, where he made diligent study of the mediæval history of that country, so fruitful in themes for poetry such as his genius was to produce. In 1833 he published anonymously his first book, 'Pauline'; spent some months in Russia, in 1834; and in the following year issued 'Paracelsus,' a dramatic poem in five parts. In 1837, at the suggestion of Macready, he wrote the tragedy of 'Strafford,' which was produced at Covent Garden in May of the same year, with no marked success. His next poem, 'Sordello,' was printed in 1840, and the obscurity of its introspective subtleties injured the poet's reputation with the critics. Notwithstanding this, he published (1841-6) the 'Bells and Pomegranates' series, in which were included the three plays, 'Pippa Passes,' 'King Victor and King Charles,' and 'Colombe's Birthday'; the four tragedies, 'The Return of the Druses,' 'A Blot in the 'Scutcheon' (produced by Macready at Drury Lane in 1843), 'Luria,' and 'A Soul's Tragedy'; while among the lyrics were 'The Pied Piper of Hamelin,' 'How They Brought the Good News from Ghent to Aix,' and 'The Lost Leader.' In 1846 he married Elizabeth Barrett (q.v.), and settled with her in Florence, where they remained for nearly 15 years. During his residence there he published 'Christmas Eve and Easter Day' (1850), and 'Men and Women' (1855), the latter containing such characteristic poems as 'Andrea del Sarto,' 'Fra Lippo,' 'Childe Roland,' 'Evelyn Hope,' 'One Word More,' and 'Up at a Villa.' When the poet's wife died in 1861 he returned to London, and entered upon his richest literary period by publishing 'Dramatis Personæ' (1864). These dramatic monologues, of which there were 17, include 'Rabbi Ben Ezra,' 'Abt Vogler,' 'Prospice,' 'Caliban upon Setebos,' and 'A Death in the Desert.' Recognition of his literary fame, which came slowly, was made in 1867, when he was elected an honorary Fellow of Balliol, an M.A. of Oxford, and later an LL.D. of Cambridge. It was not, however, until 1869, that 'The Ring and the Book' was published, and this poem, which accentuates every characteristic of the poet, still remains his central achievement. The poem, which is epic in length if not in method, is the story of a murder told 10 times over in wide variety of intention by various persons connected with the tragedy. His next publication was the short poem of 'Hervé Riel,' the pro-

ceeds from which were devoted to the relief of Paris after the siege in 1871. Following this came 'Balaustion's Adventure' (1871), including a translation of Euripides' 'Alcestis'; 'Prince Hohenstiel-Schwangau, Saviour of Society' (1871), an imaginary conception of how Louis Napoleon might justify his policy; 'Fifine at the Fair' (1872), in which the relations of the sexes are discussed; 'Red-Cotton Night-Cap Country' (1873), a story of love, penitence, and suicide, the scene of which is laid in Normandy; 'Aristophanes' Apology' (1875); 'The Inn Album' (1875), a story of a woman's wrongs; 'Pacchiarotto and Other Poems' (1876), in which 'Pacchiarotto, and How He Worked in Distemper' conveys an implication of Browning's own method in the poetic art; 'The Agamemnon of Æschylus' (1877); and 'La Saisiaz' (1878), in which immortality is discussed. As a kind of new departure he published a first set of 'Dramatic Idylls' (1879), and a second series (1880), of which the more important are 'Martin Relph,' 'Pheidippides,' and 'Ivan Ivanovitch.' The volumes which have followed are 'Jocoseria' (1883); 'Ferishtah's Fancies' (1884); 'Parleyings with Certain People of Importance in Their Day' (1887), and 'Asolando' (1889). The latter volume was published when the author was on his death-bed, and an account of its favorable reception was almost the last information he received. His body was brought from Venice to England, where, in national recognition of his genius, it was buried in Westminster Abbey between Cowley and Chaucer. In such fashion, and in ungrudging completeness, was his poetic greatness acknowledged at the last. Its too tardy recognition by the popular voice was largely due to the prevailing belief that poetry is for the mental dalliance of a lazy hour, and also to the persistency with which Browning had mocked at this belief in the athletic hardness of mind which he required in his readers. Moreover he seemed always inclined, to the dismay of the public, to press forward into service the superficial defects of his solid interior qualities. Thus, at times, his wide scholarship strayed off into pedantry; his secure skill in verse dropped ever and again into grotesque Bohemian robustness of phrase and rhyme; his swift intuitive glance into the problems of life seemed to create in him an artistic impatience of detail which, in the structure of his verse, became a thrifty brusqueness of expression tending toward cipher; and, above all, his most notable gift of analysis, his power to track the most hidden motive to its last retreat, seemed ever tending to lapse into an introspective subtlety akin to the cobwebberies of the schoolmen. Yet, aside from these occasional shortcomings, there remain his learning, his humor, his mastery of artistic expression, his immense range of sympathy, his spiritual insight, and the height and strength of his ideals to make him one of the greatest of modern poets.

Brownism. See BROWN, ROBERT.

Brownists, a name given during the latter part of the 16th century to those who were afterward known in England and Holland under the denomination of Independents, called Brownists from Robert Brown (q.v.). See also INDEPENDENTS.

Brownlee, William Craig, American clergyman: b. Torfoot, Lanarkshire, Scotland, 1784; d. New York, 10 Feb. 1860. His paternal ancestors for many generations were the "Lairds of Torfoot." He graduated M.A., at the University of Glasgow, was licensed to preach, and came to America in 1808. For a time he taught Latin and Greek in Rutgers College, but in 1826 was installed as one of the ministers of the Collegiate Reformed Dutch Church in New York city. He was a vigorous controversialist, earnestly opposing the Quakers and Roman Catholics. His writings include: 'Inquiry into the Principles of the Quakers' (1824); 'The Roman Catholic Controversy' (1834); 'Treatise on Popery' (1847); 'Lights and Shadows of Christian Life' (1847); 'Deity of Christ'; 'History of the Western Apostolic Church'; and some minor religious tracts and pamphlets.

Brownlow, William Gannaway, American clergyman, journalist, and politician: b. Wythe County, Va., 29 Aug. 1805; d. Knoxville, Tenn., 29 April 1877. Early left an orphan and penniless, he earned enough as a carpenter to give himself a fair education, and in 1826 became an itinerant Methodist preacher. He began his career as a political agitator in 1828 by advocating in Tennessee the re-election of President John Quincy Adams, and in Calhoun's own district in South Carolina he publicly opposed nullification. From 1838 until its suppression by the Confederates in 1861, he published and edited at Knoxville a paper called *The Whig*, his fiery editorials causing him to become known as "the fighting parson." He upheld slavery but opposed secession, a course which subjected him to much persecution. He refused to take the Confederate oath of allegiance, and in consequence was imprisoned on a charge of treason, but finally released and sent into the Union lines, 3 March 1862. On the reconstruction of Tennessee in 1865 he was elected governor and served two terms. He advocated the removal of the negroes to a separate territory and opposed giving them the ballot. In 1869 he was elected to the United States Senate and served until 1875, during which time he was a member of the committees on pensions and revolutionary claims. He wrote: 'The Great Iron Wheel Examined' (1858), a defense of Methodism; 'Sketches of the Rise, Progress, and Decline of Secession: With a Narrative of Personal Adventures Among the Rebels' (1862); and, with Prynne, 'Ought American Slavery to be Perpetuated? A Debate at Philadelphia, September 1858,' in which Brownlow took the affirmative side (1858).

Brownson, Henry Francis, American lawyer and author: b. Canton, Mass., 7 Aug. 1835. He graduated at Holy Cross College, Worcester, Mass., and was admitted to the bar September 1856, after having studied for some years in Paris and Munich. From June 1861 to January 1871 he served in the United States army, chiefly in the artillery, and attained the rank of brevet-major. He wrote various articles for 'Brownson's Quarterly Review' (1853-61), but has chiefly devoted himself to editing the works of his father, Orestes A. Brownson; namely, 'Works of O. A. Brownson' (1883-7); 'Literary, Scientific, and Political Views of O. A. Brownson' (1893). He has also written 'Religion of Ancient Craft Masonry' (1890);

'Faith and Science' (1895); 'Equality and Democracy' (1897); 'Early, Middle, and Latter Life of O. A. Brownson' (1898-1900).

Brownson, Orestes A., American publicist: b. Stockbridge, Vt., 1803; d. 1876. His writings embrace philosophical, political, sociological and theological subjects. As a child he displayed deep religious feeling and a keen intellectual interest in all theological questions. He was brought up without any strictly defined creed, but at the age of 19 formally joined the Presbyterian Church. This move was the beginning of a long series of religious variations, which terminated in his reception into the Catholic Church in 1843. Soon becoming dissatisfied with Presbyterianism he sought refuge in Universalism, abandoning, as he himself says, Supernaturalism for Rationalism. After leaving Presbyterianism, in 1825, he applied for and received a letter of fellowship as a preacher from the General Convention of Universalists. It was shortly after this that he fell in with the socialistic theories of Robert Owen, who had come to this country to establish his communistic colony at New Harmony, Indiana. Under the influence of Owen's ideas, Brownson co-operated in founding and establishing the Workingman's Party to advance Socialism in the sphere of practical politics. Through Owen Dr. Brownson also came in contact with Frances Wright, who lectured throughout the United States in the interest of the Socialist propaganda. But Brownson's enthusiasm in the political side of the question was short-lived and he soon abandoned the political movement, and returned to his pulpit, but as an independent preacher, responsible to no church, sect or denomination. In 1832 he came under the influence of Dr. Channing, to whom he pays a grateful but discriminating tribute in his work 'The Convert,' written after his conversion to the Catholic Church. In 1836 he went to Boston to preach to the laboring classes, and becoming convinced of "the necessity of a new religious organization of mankind," established for that purpose "The Society for Christian Union Progress," whose object was the union and progress of mankind on broad humanitarian lines. The "new doctrine" inculcated and preached during this period by Dr. Brownson was a mixture, in part drawn from the Eclecticism of Cousin and from the Communism of the Saint-Simonians, a philosophico-religious sect then recently sprung up in France. Brownson's attitude was at this time ultra-radical; he utterly denied the Church and the Priesthood in the religious order, and the distinction of classes in the social order, and would have made all government but the instrument to level men and their institutions to the lowest terms of the socialistic idea. But by 1840 he began to retrace his steps, and after much study and reflection, and after having read for the first time, as he himself tells us in 'The Convert,' Aristotle on Politics, "came to see that the condition of liberty is order, and that in this world we must seek not equality, but justice." Up to this point in his career Dr. Brownson had followed negative lines in his religious and intellectual life from a belief in a supernatural Christianity, as represented by Presbyterianism, to the broadest Socialism which denied the supernatural life of man altogether. He

now began an advance forward to a positive and supernatural conception of the world. "I had now settled in my mind," he says, "that the progress of man and society is effected only by supernatural assistance, and that this assistance is rendered by Almighty God, in perfect accordance with nature and reason, through providential men." With this conception as his premise, after some four years of struggle and study, he arrived at the conclusion that he must logically accept the Catholic Church as the divinely established institution for the supernatural guidance and direction of mankind. After receiving instruction from Bishop Fitzpatrick, of Boston, Dr. Brownson was baptized a Catholic in 1844, and died in the Catholic communion. After his entrance into the Catholic Church he became its ardent and vigorous champion, though sometimes in the advocacy of his views he came into conflict with ecclesiastical authority. He was a vigorous and trenchant writer, bold and uncompromising in his views, when he believed them logical, and often in controversy unsparing in his method against an adversary. His temperament was polemical and fearless, his interest keen, and his advocacy enthusiastic of whatsoever cause he might be pleading. He was a sincere lover of truth and unflinching in pursuing his conclusions. He was perhaps the greatest publicist whom America has produced. His writings are voluminous, covering a vast variety of subjects, and have been published in 20 volumes (1882-87) by his son, Henry F. Brownson. A 'Life' in 3 volumes by the latter appeared in 1900. CONDÉ B. PALLEN,

Editorial Staff, 'Encyclopedia Americana.'

Brownstone, the reddish-brown sandstone of the Triassic Age, so named originally in the Eastern United States, where it occurs in New Jersey and Connecticut. The name is now generally used for any brown sandstone adapted for building purposes, but the most important stones included under this name are those just mentioned, which are quarried at Portland and Middletown, Conn., and the Cambrian or Pre-Cambrian sandstones that are worked near Marquette, Mich. The use of brownstone has greatly diminished in recent years, granite and limestone having largely superseded it in public favor.

Brownsville, Texas, a city, port of entry, and county-seat of Cameron County, situated on the Rio Grande River, and the Rio G. R.R., opposite Matamoras, Mexico. It contains the cathedral of the Immaculate Conception, the Convent and Academy of the Incarnate Word, a United States government building, and a national bank, and has a large trade with Mexico. In the suburbs is Fort Brown, a garrisoned United States post. In May 1846 Brownsville was occupied and fortified by a small body of United States troops, who maintained their position in the face of a heavy bombardment that lasted for 160 hours, and in November 1863 it was taken from the Confederates by a Federal army under Gen. Banks. Pop. (1900) 6,305.

Brownwood, Texas, a city and county-seat of Brown County, situated on the Gulf, C. & S. F., and the Fort Worth & R. G. R.R.'s, 140 miles northwest from Austin. It was settled in 1866 and incorporated in 1878. It trades in wheat, hay, cotton, cattle, hides, and pecan nuts.

There are flour mills, cottonseed-oil mills, and manufactories of wire-fencing, saddle and harness, ice, etc. Here are located the Daniel Baker College, under Presbyterian auspices, and the Howard Payne College, controlled by the Baptists. The city owns its waterworks. Pop. (1900) 3,965.

Brozik, Vaczlav, Bohemian artist: b. near Pilsen, 1852; d. 1901. He was a pupil at the Prague Academy, and also of Piloty. Most of his subjects were taken from the history of Bohemia, and as a historical painter he won high rank. Among his works may be mentioned the 'Embassy of Ladislav of Bohemia to Charles VII. of France'; 'The Execution on the White Mountain'; 'The Ballad Singer'; and 'The Imperial Councilors Thrown Out of the Window at Prague.' His 'Columbus at the Court of Ferdinand and Isabella' is in the Metropolitan Museum, New York.

Bruce, a noble family of Scotland, two members of which occupied the throne after one had pretended to it in vain. Distinguished members were:

1. **ROBERT**, seventh lord of Annandale: b. 1210; d. 1 April 1295. He was one of the 13 claimants of the crown in 1290, when, by the demise of Margaret, the "maiden of Norway," the posterity of the last three kings of Scotland had become extinct, and the succession reverted to the posterity of David, Earl of Huntingdon, and younger brother of King William, the Lion. The question of succession speedily resolved itself into a simple alternative between two competitors, John Baliol, the great-grandson of David by his eldest daughter, Margaret, and Robert Bruce, the grandson of David by his second daughter, Isabel. The contest was, by mutual consent, referred for decision to King Edward I. of England, who pronounced, in accordance with principles that would not now be disputed, that "in all indivisible heritages the more remote in degree of the first line of descent is preferable to the nearer in degree of the second," and thus gave the kingdom to Baliol, from whom he required homage and fealty. Bruce now retired to England, took service in the English army, and fought against Baliol in the war which resulted in the subjugation of Scotland to England. He returned to his English estates soon after the resignation of Baliol, and died about 1296.

2. **ROBERT**, son of the preceding, Earl of Carrick and Annandale: d. 1304. He constantly followed the fortunes of Edward, and fought bravely against Wallace and the patriot party of Scotland. After having assisted in defeating Wallace at Falkirk, he is said to have slackened his zeal for England, but did so little for the national cause that he was able to make his peace with Edward, when, a little later, after the capitulation at Irvine, Wallace was driven with his adherents into the northern mountains.

3. **ROBERT**, son of the preceding, Earl of Carrick, and afterward king of Scotland: b. 21 March 1274; d. 9 July 1329. He acted at first as Edward's liegeman, but vacillated between the two parties, taking no very active part in the struggle between Wallace and England, but inclining to the national cause when a gleam of success enlivened the hopes of the patriots, and, at the approach of Edward, making his peace with the conqueror. He was one of those con-

sulted by the king in the settlement of Scotland as an English province, and was permitted to retain the extensive lands of his ancestors unalienated. In 1306, Comyn, the son of Baliol's sister, a nobleman distinguished by his efforts to recover the independence of his country, arrived in Dumfries about the same time with Bruce. By appointment he met Bruce alone in the church of the Minorites, who there stabbed him with his dagger; whether by premeditated treachery or in a sudden fit of passion cannot now be ascertained. Bruce now assumed the title of king, summoned the Scots to his standard, and was crowned, without any opposition, at Scone. Edward immediately sent Aymar de Valence, Earl of Pembroke, with a great army to chastise the rebels. The force of Bruce was almost immediately destroyed, six of his best knights made prisoners, and he himself, thrown from his horse, was rescued only by the devotion of Seaton. For two months, with his brothers and the ladies of his household, he wandered to and fro in the Grampian Hills, till his party being discovered, defeated, and forced to separate, he buried himself for concealment in the island of Rathlin, on the north of Ireland. His three brothers, and others, were captured; and the brothers were soon after hanged at Carlisle. In the spring of 1307 Bruce returned from his retreat, surprised his own castle of Carrick, defeated small parties of English in many skirmishes, and was enabled to maintain himself among the hills and forests until Edward called out an army and marched toward the borders, but died on his way, leaving to his son a charge not to bury his bones till he had borne them in triumph from Berwick bounds to the utmost highlands. For three years Edward II. paid no attention to his father's advice or the Scottish war, but in the autumn of 1310 he marched into Scotland as far as the Forth without encountering an enemy, for Bruce wisely declined to give him battle. In the next year he sent his favorite Gaveston to renew the war, who penetrated beyond the Forth, but still gained no advantage, Bruce constantly retreating before him, keeping the hills, where he could not be assailed, and harassing the English by constant petty skirmishes in which he mostly worsted them. The following years were passed by Edward in ignoble contentions with his Parliament, and by Bruce in gradually but surely recovering all that he had lost in Scotland, until, in 1314, the strong hill fortress of Stirling alone held out for the English, and even that the governor, Mowbray, had been forced to consent to surrender if it should not be relieved before the feast of St. John the Baptist. This at length aroused Edward, who, at the head of a large army, encamped in the neighborhood of the beleaguered fortress, and was there met by Bruce at the head of 30,000 picked men, on the eve of the festival fixed for his surrender. The battle of Bannockburn, which succeeded, was the bloodiest defeat which the English ever suffered at the hands of their Scottish neighbors. It fixed the crown securely on the head of Bruce, and at once enabled him to exchange his prisoners, who were of the highest rank in England, against his wife, his sister, and his other relatives, who had long languished in captivity. After this success the Scottish people assumed the offensive and invaded Ireland, where they at first gained considerable successes, and of which island Edward

Bruce was crowned king. While the dissensions lasted between Edward II. and his barons, Robert Bruce repeatedly devastated the borders and all the north of Yorkshire, even to the walls of York, into which he on one occasion chased the English king in disgrace, narrowly failing to make him prisoner. In 1323 this bloody war, which had raged, with few pauses, for 23 years, was brought to a close by a truce concluded between the two kingdoms for 13 years, to remain in force even in the event of the death of one or both of the contracting parties. Four years after this Edward II. was compelled to abdicate in favor of his son, Edward III., and Bruce, seeing his occasion in the distracted state of England, renewed the war, with the avowed intention of forcing Edward to renounce his claim of sovereignty over the crown of Scotland. In 1328 this renunciation was made; Scotland was declared sovereign and independent; Jane of England, the sister of Edward, was affianced to David, prince of Scotland; and Robert Bruce paid £20,000 sterling to defray the expenses of the war. He died the next year, having, after a life of incessant toil and warfare, secured the independence of his country, and won the crown, which he left undisputed to his son.

4. EDWARD: d. 1318. He was a brother of Robert I., of Scotland, who, after distinguishing himself in the Scottish war of independence, crossed in 1315 to Ireland to aid the native septs against the English. After many successes he was crowned king of Ireland at Carrickfergus, but fell in battle near Dundalk.

5. DAVID, son of the preceding, king of Scotland: b. about 1320; d. 22 Feb. 1371. Shortly after his accession, at the age of nine years, his kingdom was invaded, and his crown wrested from him by Edward Baliol, son of that John Baliol whom Edward I. had compelled to resign the crown. In support of his claim Edward III. maintained a fierce strife on the borders, in active though undeclared hostilities to the Scots. David, with his young queen, Jane of England, escaped to France, where he resided till 1341, when, the nobles Murray, Douglas, and Stuart having expelled Baliol from the throne into the northern counties of England, he ventured to return. In 1346, while Edward III., with the flower of his army, was absent in France, David suddenly invaded England at the head of 33,000 men. He was met at Neville's Cross, Durham, by a force of 11,200 irregular troops under Queen Philippa. The Scottish troops were totally defeated, leaving 15,000 men dead on the field of battle and their king a prisoner. From this time until 1357 David was detained a prisoner in the Tower of London, when he was liberated after the battle of Poitiers, on agreeing to pay 100,000 marks in 20 half-yearly instalments.

Bruce, Blanche Kelso, American colored politician: b. Prince Edward County, Va., 1841; d. 1898. Born in slavery but educated with the son of his master, and subsequently a student at Oberlin College, he became a planter in Mississippi in 1869. Entering politics he became a United States senator from Mississippi in 1875, the first negro member of the National Senate. He was appointed register of the United States Treasury in 1881, holding office till 1885, and was reappointed to the same office by President McKinley in 1897.

Bruce, Catherine Wolfe, American patron of science: b. New York; d. there 13 March 1900. She was a cousin of Catherine Lorillard Wolfe, from whom she inherited a fortune, which she used in furthering astronomical study. She gave \$50,000 to the Harvard Observatory in 1888. The Bruce Memorial Telescope at Arequipa, Peru, was her gift. In 1897 she established a gold medal fund for the Astronomical Society of the Pacific.

Bruce, James, Scottish traveler: b. Kin-naird House, Stirlingshire, 14 Dec. 1730; d. there 27 April 1794. He became a wine merchant in 1754, but on the death of his wife he took up the study of languages, and availed himself of the opportunities of his trade to visit Spain, Portugal, and the Netherlands. In 1758 he inherited his father's estate, and he consequently relinquished the wine trade in 1761. Lord Halifax, appreciating Bruce's character, proposed to him a tour of discovery, in which he promised him his protection and support. He pointed specially to the exploration of the coast of Barbary, in completion of the labors of Shaw, and hinted also at the discovery of the sources of the Nile. In the meantime Halifax offered him the consulship of Algiers, which was accepted. His consulship lasted for two years, and on its expiration in 1765 he visited successively Tunis, Tripoli, Rhodes, Cyprus, Syria, and several parts of Asia Minor, where, accompanied by an able Italian draughtsman, he made drawings of the ruins of Palmyra, Baalbec, and other remains of antiquity. Having now formed his plan for visiting Abyssinia, he set out for Cairo in June 1768, after about a year spent in Syria, navigated the Nile to Syene, crossed the desert to the Red Sea, passed some months in Arabia Felix, and reached Gondar, the capital of Abyssinia, in February 1770. On 14 Nov. 1770, he succeeded in reaching the sources of the Abai, then considered the main stream of the Nile. His 'Travels to Discover the Source of the Nile' appeared in 1790 in five large quarto volumes. The authority of the work, in regard to facts of natural history and human manners, was questioned on its first appearance; but the truth of his descriptions, however, has been amply confirmed by travelers who have visited the same regions. This enterprising traveler lost his life in consequence of an accidental fall down stairs.

Bruch, brooh, Max, German composer: b. Cologne 6 Jan. 1838. He studied at Bonn under Breidenstein, and at Cologne as a special pupil of Hiller, in 1853-7. During this period he completed several of his musical compositions. In 1865 he was director of the musical institute of Coblenz; and from 1870 to 1880 lived in Berlin and Bonn. In 1880 he went to Liverpool to become director of the Philharmonic Society; in 1883 he came to the United States and conducted his own oratorio 'Arminius' in Boston; in 1887 he was made a member of the Berlin Academy; and in 1890 obtained the title of royal professor. Bruch ranks among the foremost of the modern composers. His best works include: 'The Flight of the Holy Family'; 'Ulysses'; 'Arminius'; 'Lied von der Glocke' (words by Schiller); 'Achilles'; 'Scenes from the Frithjof's Saga'; 'Roman Triumph Song'; 'Salamis,' etc.

Bruchési, broo-kā'zē, Napoléon Paul, Canadian Roman Catholic prelate: b. Montreal,

20 Oct. 1855. He pursued his theological studies at Paris and Rome, being ordained priest in 1878. In 1887 he was made a canon at the cathedral in Montreal. He was successively vicar at St. Bridget's and St. Joseph's churches in Montreal, and in 1897 was appointed archbishop of Montreal to succeed the late Monsignor Fabre.

Bruchsal, brooń'säl, a town of Baden, on both sides of the Salzbach, 12 miles from Karlsruhe, now an important railway centre. It is an ancient town, was a common residence of the prince-bishops of Spires from the 12th century, and the residence formerly occupied by them is still standing. This is a building in the rococo style, erected in 1720-70, and in connection with it is a fine garden with fountains. In the Church of St. Peter the prince-bishops were buried. Soap, paper, cigars, etc., are made. Pop. (1900) 13,567.

Bru'chus, a genus of beetles belonging to the section tetramera, and the family *Rhynchophora* or *Curculionida*. The antennæ are 14-jointed, and are filiform, serrate, or pectinated, not geniculated as in the more normal *Curculionida*. It contains small beetles which deposit their larvæ in the germs of leguminous plants, and, when hatched, devour their seed. *B. pisi* is destructive to the garden pea.

Brucine, broo'sin (from Brucea), an alkaloid discovered in 1819, and obtained in the preparation of strychnine, from which it is separated by boiling alcohol. It crystallizes in white and transparent prisms, with a rhomboidal base. It has a very bitter taste, but no smell, and is less poisonous than strychnine. It is insoluble in ether, and dissolves in a mixture of 850 parts of cold and 500 parts of boiling water. Nitric acid gives it a scarlet, and sulphuric acid a rosy tint, but both turn gradually to yellow. A solution of copper turns it to violet. These reactions distinguish brucine both from strychnine and morphine. The salts of brucine are tolerably numerous, and are prepared by double decomposition, or by direct combination of the brucine with the acid. They are for the most part crystallizable, and like the base have a bitter taste. They are not used in medicine. Symbol $C_{25}H_{29}N_2O_4 + 4H_2O$.

Bruccioli, or **Bruccioli**, Antonio, än-tō'nē-ō broo-chē-ō'lē, Italian reformer and scholar: b. Florence, about 1500; d. after 1554. In 1522, having become implicated in a conspiracy against Giuglio di Medici, who then governed Florence in the name of Leo X., he took refuge in France, where he became acquainted with the doctrines of the reformers, and probably embraced them. On the expulsion of the Medici in 1527 he returned to Florence, but, by his free declamation against monks and clergy, brought his orthodoxy in question, and was imprisoned on several charges, among which that of heresy was included. He would have been executed but for the interference of powerful friends, who obtained a commutation of his sentence into banishment. He retired to Venice with two brothers, who were printers, and availed himself of their press to publish a great number of works, of which the most celebrated is a translation of the Bible into Tuscan. The boldness of his annotations caused it to be ranked as a heretical work. Bruccioli was living in 1554, but the exact date of his death is not known. The

number of his volumes is said to have exceeded that of his years. Among his works are Italian translations of Pliny, Aristotle, and Cicero, and annotated editions of Petrarca and Boccaccio.

Bru'cite, a native hydrate of magnesia, having the formula $Mg(OH)_2$. It has a hardness of 2.5 and a specific gravity of about 2.4. Its color is white, often tinted blue or green. At Texas, Pa., it crystallizes in hexagonal (rhombohedral), tabular plates whose bases show pearly lustre while the edges are vitreous to waxy. A fibrous, pearly variety occurs at Hoboken, N. J. Delicate blue and green crystals were found at Tilly Foster, N. Y. Brucite was named for Dr. A. Bruce, an American mineralogist who first described it as a species.

Bruck, Karl Ludwig, kärl lood'-vīg brook (BARON), Austrian statesman: b. Elberfeld, 8 Oct. 1798; d. Vienna, 23 April, 1860. In 1821 he went to Trieste in order to take part in the war for Grecian independence, and remaining there several years, founded the Trieste Lloyd (later the Austrian Lloyd), a combination of insurance societies. In 1848 he was a member of the German National Assembly; after the Vienna revolution of October 1848 he became minister of commerce and public works. In this office he introduced a number of reforms in the industrial policy of the government, established important telegraph lines, built a number of highways and railroads, and founded the Austro-German postal union. In 1849 the emperor gave him the rank of baron, but in 1851 he was compelled to resign his ministry. In 1855 he became minister of finance; he was not able to introduce the reforms he wished, and when a period of general financial disaster resulted from the Italian war, Bruck was personally blamed. He accordingly obtained his dismissal from the emperor and the next day committed suicide. He was officially declared innocent one month after his death.

Brucker, Johann Jakob, yō'hän yā-kōb brook'ēr, German historian: b. Augsburg, Bavaria, 22 Jan. 1696; d. there, 26 Nov. 1770. He was educated at Jena, and in 1744 became pastor at Augsburg. His most important work is a 'Critical History of Philosophy' (1741-4), in Latin, which was the first complete history of the different philosophical schools. It contains biographical matter of great value.

Bruckner, Anton, än'tōn brook'nēr, Austrian organist and composer: b. Ansfelden, 4 Sept. 1824; d. 11 Oct. 1896. He was mostly self-educated, but after serving as organist in the cathedral at Linz he studied for a time in Vienna under Simon Sechter, whom he succeeded as court organist. He later became professor at the Vienna conservatory and lecturer on music at the University. Bruckner is to some extent an imitator of Wagner; his best known compositions are his symphonies; he has written also some religious music, including a Te Deum and several masses.

Brueis, or **Bruys d'Aigalliers**, François Paul, French admiral: b. Uzès, 11 Feb. 1753; d. 1 Aug. 1798. He entered the navy at an early age, and gradually rose in the service. In 1798 he was employed to convey Bonaparte and his army, which were to effect the conquest of Egypt and the East, and having managed to elude the vigilance of Nelson, who had been

long watching for him, reached the Bay of Abukir, and disembarked the troops in safety. Bruce moored his fleet in a position naturally so strong that he deemed it impregnable; but by the heroic daring of Nelson, he found the precautions which he had taken turned to his disadvantage. In the battle which ensued, he fell fighting boldly, a little before his ship, the *Orient*, of 100 guns, blew up. See **ABUKIR**.

Bruges (Flemish, *Brugge*), a city of Belgium, capital of West Flanders, situated about 60 miles northwest of Brussels, about 8 miles from the sea, surrounded and intersected by canals which connect it with Ostend and other places. By these canals fairly large vessels can reach Bruges; and a ship canal to connect it with the sea at Zeebrugge, a port on the North Sea, $7\frac{1}{2}$ miles distant, was begun 25 Feb. 1900. This will allow ships of 25 feet draft to reach the wharves of the city. Bruges has over 50 bridges, all opening in the middle for the passage of vessels. The Halles (containing cloth and other markets) is a fine old building, with a famous belfry or tower 350 feet high, in which is a fine carillon of 48 bells. Bruges has also a beautiful town hall dating from the 14th century; a palace of justice, noted for a magnificently adorned fireplace; an academy of painting, sculpture, and architecture; a public library, etc., and many valuable specimens of architecture and sculpture. In the Church of Notre Dame, which has a spire 290 feet high, are the splendid tombs of Charles the Bold and of Mary of Burgundy, his daughter, constructed in 1550, besides many other artistic treasures. The cathedral of Saint Sauveur dates from the 13th and 14th centuries, and is unattractive externally, but has a fine interior, and there are other notable churches. Philip the Good here founded the order of the Golden Fleece in 1430; and the celebrated Jan Van Eyck, or John of Bruges, the supposed inventor of painting in oil, was born here. From the 7th century Bruges was rapidly acquiring importance. It was fortified by Count Baldwin in 837, walled first in 1053, and again in 1270. During the government of the rich and powerful counts of Flanders, who resided there from the 9th to the 15th centuries, its woolen manufactures grew and flourished to an amazing extent. The wealth of the citizens was enormous; a single merchant gave security for the ransom of Jean sans Peur, the last count of Flanders, to the amount of 400,000 crowns of gold. Under the Austrian dynasty, at the close of the 15th century, the rebellious conduct of the inhabitants of Bruges called upon it such destructive vengeance that henceforth its greatness died away, its trade was transferred to Antwerp, and the religious persecution and ferocity of the Spanish under Philip II. and the Duke of Alva completed the process of its ruin. The remains of ancient buildings, abandoned monasteries, and streets half deserted from the diminished population of the modern city, give Bruges an antiquated and venerable appearance. Many of the houses are very old, but in a state of excellent preservation. Bruges is still, by means of its canals, an entrepôt of Belgian commerce. The chief articles manufactured here are lace, linen, damasks, light woolen goods, cottons, mixed stuffs, beer, etc. It exports agricultural produce and manufactured goods, and imports wine, oil,

colonial produce, etc. Pop. (1900) 52,867. See Gilliat-Smith, 'Bruges' in 'Medieval Towns Series' (1901).

Brugg, a town in the Swiss canton of Aargau, on the right bank of the Aar, and near the mouth of the Reuss, 36 miles east-southeast of Basel by rail. Near it is the site of Vindonissa, the chief Roman station in Helvetia; and it was also the cradle of the house of Hapsburg, whose ruined castle, founded in 1020, crowns a wooded height two miles distant. Nearer is the abbey of Königsfelden (1310; converted in 1872 into an asylum), in the vaults beneath which are interred many of the members of the Austrian royal family. Zimmermann, the philosopher, was born here in 1728. Pop. (1900) 2,629.

Brugmann, Friedrich Karl, frēd'-rīū kārī broog-man, German philologist; b. Wiesbaden, 16 March 1849. He was educated at Halle and Leipsic; was instructor in the gymnasium at Wiesbaden and at Leipsic; and in 1872-7 was assistant at the Russian institute of classical philology at the latter place. In 1877 he was lecturer at the University of Leipsic, and in 1882 became professor of comparative philology there; in 1884 he took the same position at the University of Freiburg, but returned to Leipsic in 1887 as successor to Curtius. He is one of the chief representatives of the new school of philologists and his researches have done much to revolutionize the study of philology. As joint editor with Curtius of 'The Studies in Greek and Latin Grammar,' he wrote an article for this work on 'Nasilis Sonans,' in which he defended theories so radical that Curtius afterward disclaimed them. His conclusions are now generally accepted. His most important work, summarizing his conclusions, is 'Outline of the Comparative Grammar of the Indo-Germanic Languages' (translated into English); he also wrote 'Morphological Researches in the Indo-Germanic Languages' (with Osthoff); 'A Problem of Homeric Textual Criticism' (1870); 'Lithuanian Folk Songs and Tales' (1882); 'The Present Position of Philology'; 'Greek Grammar'; and 'Short Comparative Grammar' (1902). Brugmann was knighted by the king of Saxony, and in 1896 received the degree of LL.D. from Princeton University.

Brugsch, Heinrich Karl, German Egyptologist; b. Berlin, 18 Feb. 1827; d. Charlottenburg, 9 Sept. 1894. A work entitled 'Scriptura Ægyptiorum Demotica,' published in 1848, gained him the favor of Alexander von Humboldt and Frederick William IV., the latter of whom enabled him to complete his studies by visiting the museums of Paris, London, Turin, and Leyden. In 1853 he made his first visit to Egypt and assisted Mariette in his researches, being appointed on his return in the following year assistant in the Berlin Egyptian Museum. He accompanied the Prussian embassy to Persia in 1860, and four years later became consul at Cairo. Returning in 1868, he was appointed to the chair of Egyptology at Göttingen, but soon resigned in order to take charge of the Cairo School of Egyptology. He was soon raised to the rank of bey, and some time afterward to that of pasha. In 1876 he came to the United States as Egyptian commissioner to the Centennial Exposition at Philadelphia. In 1883

he traveled in Egypt, Syria, Greece, and Italy, with Prince Frederick Charles of Prussia, and in 1885-6 he twice visited Persia, partly on official business. He was again in Egypt in 1891, and in the following year he made a journey to the Libyan desert. Brugsch's chief work is the *Hieroglyphisch-demotisches Wörterbuch* (1867-82). His other writings include *Reiseberichte aus Ägypten* (1855); *Grammaire Démotique* (1855); *Monuments de l'Égypte* (1857); *Geographische Inschriften altägyptischer Denkmäler* (1857-60); *Histoire d'Égypte* (1859); *Recueil des Monuments Égyptiens* (1862-85); *Reise der königlich Preussischer Gesandtschaft nach Persien* (1862-3); *Hieroglyphische Grammatik* (1872); *Geschichte Ägyptens unter den Pharaonen* (1877); *Dictionnaire Géographique de l'ancienne Égypte* (1877-80); *Religion und Mythologie der alten Ägypter, nach den Denkmälern* (1888); *Thesaurus Inscriptionum Ægyptiacarum* (1883-91); *Die Ägyptologie* (1890); *Aus dem Morgenlande, Altes und Neues* (1893); etc. His *History of Egypt from the Monuments* has appeared in English. In 1894 his autobiography appeared under the title *Mein Leben und Wandern*.

Brühl, Heinrich (COUNT VON), Saxon politician: b. Weissenfels, Prussia, 13 Aug. 1700; d. Dresden, 28 Oct. 1763. As a page he gained the favor of Frederick Augustus I. of Poland, and on the death of the king in 1733, the crown of Poland with the other regalia being, through the good fortune of Brühl, intrusted to him, he carried them immediately to the new elector, Augustus III., and showed the greatest activity in promoting his election. He had cunning and skill sufficient to govern his master and get rid of his rivals and succeeded in keeping everybody at a distance from the king. No servant entered his service without the consent of Brühl, and even when he went to the chapel all approach to him was prevented. Brühl kept 200 domestics; his guards were better paid than those of the king himself, and his table more sumptuous. Frederick II. says of him, "Brühl had more garments, watches, laces, boots, shoes, and slippers, than any man of the age. Cæsar would have counted him among those curled and perfumed heads which he did not fear"; but Augustus III. was no Cæsar. When this idle prince loitered about smoking, and asked, without looking at his favorite, "Brühl, have I any money?" "Yes, sire," was the continual answer; and to satisfy the king's demands he exhausted the state, plunged the country into debts, and greatly reduced the army. At the beginning of the Seven Years' War it comprised but 17,000 men, and these were compelled to surrender at Pirna from want of the necessary supplies. Brühl fled with the king, the pictures, and the china, to Poland; but the archives of the state were left to the victor. He was no less avaricious of titles and money than of power. An examination after his death showed that he owed his immense fortune to the prodigality of the king rather than to unlawful means of accumulation. His own profusion was often beneficial to the arts and sciences.

Bruhns, bröns, Karl Christian, German astronomer: b. Plön, Holstein, 22 Nov. 1830; d. Leipsic, 25 July 1881. He was the son of a locksmith, going in 1851 as locksmith and mechanic to Borsig, and then to Berlin with Sie-

mens and Halske, he attracted the attention of Encke by his remarkable powers as a computer, and was appointed in 1852 as assistant, and in 1854 as observer, in the Berlin Observatory, and in 1859 as instructor in the university. In 1860 he was called to Leipsic as professor of astronomy and director of the new observatory to be constructed there, which, under his skilful direction, grew into one of the finest structures of its kind in Europe. He is known as the discoverer of five comets, an able computer of cometary and planetary orbits, and for his important work in geodesy in connection with the European triangulation.

Bruise, or Contusion, an injury caused by a blow or sudden pressure, in which the skin is not wounded, and no bone broken or dislocated. Both terms, but more particularly the latter, are employed in surgery to include all such injuries from a black eye to a thoroughly crushed mass of muscle. In the slighter forms of this injury, as in ordinary simple bruises, there is no tearing, but only a concussion of the textures, the utmost damage done being the rupture of a few small blood vessels, occasioning the discoloration always observed in these cases. In more severe contusions, the subjacent structures—muscles, connective tissue, vessels, etc.—are more or less ruptured, and in extreme cases are thoroughly crushed and usually become gangrenous. The quantity of blood extravasated depends chiefly upon the size and number of the ruptured blood vessels, but partly also on the nature of the textures of the injured part. Thus, a lax tissue, as that of the eyelids, favors the escape of blood into the surrounding parts. Simple and not very severe bruises require little treatment other than the rest necessary for the avoidance of pain; but the removal of the swelling and discoloration may be hastened by the application of various local stimulants, which seem to act by accelerating the circulation through the bruised part, and promoting the absorption of the effused fluid. Friar's balsam, compound soap liniment, or poultices made with the roots of black bryony beaten to a pulp, are popular remedies of this class. Tincture of arnica has a great reputation; but experiments have made it very doubtful whether it is any more efficacious than simple spirit of the same strength. A solution of sulphurous acid, and hazeline and other preparations of the American witch-hazel are of more value. They should be kept constantly applied to the bruised part on lint or cotton wool. Pugilists, who are probably better acquainted with ordinary bruises than any other class of men, are in the habit of removing the swelling of the eyelids that often naturally occurs during a prize fight to such an extent as to close the eyes, by at once puncturing the eyelids at several points with a lancet; and their favorite remedy for a black eye or other bruise on the face is a fresh beefsteak applied locally as a poultice. Bruises of a more severe nature, as when there is much breaking or crushing of the tissues, must, of course, at once be referred to the care of a surgeon.

Brüll, Ignaz, Austrian pianist and composer: b. Prossnitz, 7 Nov. 1846. He was educated at Vienna under Epstein and Dessoff and played at concerts there and in London. His first composition appeared in 1861 and since then

he has been instructor at a school of music in Vienna and has won distinction as a composer. His works include several numbers for the piano; orchestral pieces and operas, among them, 'The Beggar of Samarkand'; 'The Golden Cross'; 'Bianca'; 'Queen Marietta'; 'The Heart of Stone'; and 'The Hussar.'

Brumaire, brü-mâr', the second month of the year in the French revolutionary calendar. It commenced on 23 October and ended on 21 November, thus comprising 30 days. It received its name from the fogs that usually prevail about this time. The 18th of Brumaire, VIII. year (9 Nov. 1799), is celebrated for the overthrow of the directory and the establishment of the sway of Napoleon. See CALENDAR.

Brumidi, broo-mě'dě, **Constantine**, Italian painter: b. Rome, 20 June 1805; d. Washington, D. C., 29 Feb. 1880. After study in his native city he was given many important commissions, and some of his best works are found in the Vatican and the more modern Roman palaces. The occupation of Rome by the French caused him to emigrate to America, and in 1852 he became a citizen of the United States. After settling in this country he executed much of the decoration of the national capitol, and began work on a series of historical paintings, forming a belt about the base of interior of the dome, the first frescoes in America.

Brummagen, Joe. See CHAMBERLAIN JOSEPH.

Brummel, George Bryan ("BEAU BRUMMEL"), English dandy: b. London, 1778; d. Caen, 29 March 1840. He was educated at Eton and Oxford, at both of which places he acquired great distinction by his taste in dress, which afterward made him the autocrat in the world of fashion. At the age of 16 he casually made the acquaintance of the Prince of Wales, afterward George IV., who conceived a wonderful fancy for him and made him a cornet in his own regiment, the 10th Hussars. Brummel was now introduced into the most aristocratic society in England, and through the favor of the prince had rapid promotion in the army, though his carelessness was such that he often did not know his own troop. The death of his father in 1794 put him in possession of a fortune of £30,000, which he expended in a course of sumptuous living, extending over a period of 21 years, during which his dicta on matters of etiquette and dress were received in the *beau monde* as indisputable. He kept a magnificent bachelor establishment, gave splendid dinners, and basked in all the sunshine that youth, money, and princely favor could bestow. But the fickle temper of the prince regent at last tired of Brummel, and an estrangement took place. The beau's creditors now began to be clamorous, and in 1814 he crossed the channel to Calais, where he resided for many years, partly supported by the remains of his own fortune and partly by remittances from friends in England. In 1824, when George IV. passed through Calais on his way to Hanover, Brummel ventured again to address himself to him, but was unceremoniously repulsed. Subsequently to this he was appointed consul at Caen, but after holding this office for a few years it was abolished as unnecessary, and he was reduced to absolute poverty. His mind, too, gave way, and he died in a lunatic asylum.

Brun, or **Brunn**, **Malte-Conrad** (generally known as **MALTE-BRUN**), Danish geographer: b. Thisted, Jutland, 12 Aug. 1775; d. 14 Dec. 1826. While yet very young he produced some poems which gave great promise of his rising to eminence as a poet, though his father had destined him for the Church. About this time the French Revolution called forth a host of ardent champions of the cause of progress throughout Europe, and the young poet embraced it with enthusiasm. He abandoned the Church for the bar, and subsequently became editor successively of two journals, in which his advocacy of liberal principles provoked a state prosecution that compelled him to take refuge in the Swedish island of Hven, once the residence of Tycho Brahe. From this he shortly afterward received permission to return to Copenhagen; but some fresh attacks on the government again made him an exile, and he retired first to Sweden and then to Hamburg, where a wealthy merchant entrusted him with the education of his children. Not long after, his admiration of Napoleon Bonaparte, then rapidly advancing to the head of affairs, prompted him to take up his abode in France; but the elevation of his idol to the post of consul for life opened Brun's eyes to his ambitious designs. He had the courage openly to blame the weakness of the senate in yielding to them, and for the time withdrew from the pursuit of politics. He now directed his attention to the science of geography. In 1803 he published, along with Mentelle and Herbin, the commencement of 'Géographie Mathématique, Physique, et Politique de toutes les Parties du Monde,' a work which was completed in 16 volumes in 1807, and in the composition of which Brun's share amounted to about a third. Before the completion of this work his reputation as a writer had been firmly established, and in 1806 he received an appointment on the staff of the *Journal des Débats*, for which he continued to write articles on foreign politics until his death. In 1808 appeared his 'Tableau de la Pologne,' and the same year he joined M. Eyriès in starting the 'Annales des Voyages, de la Géographie, et de l'Histoire,' which proved the introduction into France of regular periodical geographical literature. In 1810 was published the first volume of his 'Précis de la Géographie Universelle,' completed in eight volumes in 1829, and reissued in 12 volumes in 1831. During the Hundred Days Brun adhered to the legitimist cause, and published an 'Apologie de Louis XVIII.' Toward the end of 1821 he lent powerful assistance in establishing the Société de Géographie. Besides the works already mentioned, he was the author of various geographical and political treatises too numerous to particularize.

Brunai, broo-nā'ē. **Brunei**, broo-nā'ē, or **Bruni**, broo'nē, Borneo, a territory on the northwest part of the island, situated between Sarawak and British North Borneo, under the protection of Great Britain. It has an area of about 18,000 square miles. It exports sago, gutta-percha, rubber, etc. Until 1888 it was nominally an independent Mohammedan territory, whose sultan was formerly overlord of the whole island. Its population is variously estimated at from 50,000 to 125,000, divided into trade castes. The capital, Brunai, on a river

of the same name, about 14 miles from its mouth, is a miserable, dirty town, built on piles, with some 30,000 inhabitants, who trade with Singapore.

Brunanburgh, broo-năn-bur'ō, Scotland, the scene of a battle in which Athelstan and the Anglo-Saxons defeated a force of Scots, Danes, etc., in 937; locality very doubtful. The battle forms the subject of one of the oldest Anglo-Saxon poems.

Brunck, Richard Francois Philippe, riñ'ärt frantz fê-lêp broonk, French critic: b. Strasburg, 30 Dec. 1729; d. same place, 12 June 1803. He made rapid progress in learning when he studied with the Jesuits in Paris, but neglected study as soon as he entered into active life. While in winter quarters at Giessen, as commissary of war during the French campaigns, he resided with a professor who, by his advice and example, revived his love of letters and led him to the study of the classics. When Brunck returned to Strasburg he devoted all his leisure time to Greek, and at the age of 30, and while holding public office, attended the lectures of the Greek professor of the university. The zeal which had encouraged him to undertake this laborious study was increased by the pleasure of overcoming difficulties, and he became fixed in the conviction that all the instances of apparently careless writing in the Greek poets were only errors of the transcribers. Entertaining this opinion, he altered whatever displeased him, overthrew the order of the verses, and permitted himself liberties which criticism must needs reject. To this rage of altering he gave himself up, particularly in the marginal comments of his books, and in the numerous copies which he made of the Greek poets, more for his own pleasure than for use. This arbitrary process is so visible, even in the editions he has published, that much caution is required in using them. Brunck has nevertheless been of essential service to Greek literature, and since the revival of letters few scholars have so effectually promoted it. He published a valuable edition of Virgil. Of his Greek editions mention may be made of those of the 'Analecta,' 'Apolonius Rhodius,' 'Aristophanes,' 'The Gnomie Poets,' and his masterpiece, 'Sophocles,' for which the king allowed him a pension of 2,000 francs. At this time the French Revolution interrupted his studies. He adopted the new ideas with enthusiasm, but without deviating from the principles of moderation. He was arrested at Besançon during the Reign of Terror, and did not obtain his liberty until after the death of Robespierre. In 1791 and again in 1801 economical reasons obliged him to sell part of his library. As he was passionately fond of his books, and his former fortune had enabled him to collect an excellent library, this was a severe privation. From this time Greek became his aversion; but he prepared an edition of Terence, and had Plautus ready for publication when he died in 1803. Many of his papers are in the library at Paris.

Brundu'sium, or **Brundis'ium**, now BRINDISI, brin-dê'sê, Italy, a city of Calabria, on the shores of the Adriatic. It was taken by the Romans 267 B.C., and became a colony of the republic 244 B.C. During the Illyrian war, 229 B.C., it was the naval and military station for the

Roman fleet and army, and its fine harbor rendered it on many subsequent occasions the centre of warlike operations. Vergil died here 19 B.C.

Brune, Guillaume Marie Anne, gē-yōm mǎ-rê ân broon, French soldier: b. Brives la Gaillarde, 13 March 1763; d. 2 Aug. 1815. While young he went to Paris to study law. At the breaking out of the Revolution he was a printer and had made himself known by some small pieces of his own composition. He now devoted himself ardently to politics, was connected with Danton, and played an active part in the tempests of that period. Till 10 Aug. 1792 he was engaged in publishing a daily newspaper. Afterward he went as civil commissary to Belgium. In 1793 he entered the military service in the revolutionary army in the Gironde. He aided Barras to put down the Jacobins, who had assaulted the camp of Grenelle, 10 Oct. 1795. Afterward he distinguished himself as general of brigade in the Italian army, in the battle of Arcola and in the attack on Verona. When the directory of Switzerland declared war Brune received the chief command of an army, entered the country without much opposition in January 1798, and effected a new organization of the government. In 1799 he received the chief command in Holland, defeated the British, 19 September, near Bergen, and compelled the Duke of York to agree to the treaty of Alkmaar, 18 October, by which the British and Russians were to evacuate the north of Holland. In January 1800, he was made a councillor of state, and was placed at the head of the Army of the West, in occupation of La Vendée, and contributed greatly to the re-establishment of tranquillity in the revolted province. He was appointed commander-in-chief of the Italian army 13 August. Toward the end of December he led his troops over the Mincio, conquered the Austrians, passed the Adige 8 Jan. 1801, took possession of Vicenza and Roveredo, and concluded an armistice, 16 January at Treviso, with the Austrian general Bellegarde, by which several fortified places in Italy were surrendered to the French troops. When peace recalled him to the council of state toward the end of November 1802, he laid before the legislative body for confirmation the Treaty of Peace with the court of Naples. Next year he went as ambassador to Constantinople. He prevailed there at first over the British party, and received from the Turkish ministry the highest marks of honor; but when new dissensions arose between the two powers he left Turkey. During his absence, 19 May 1804, he was appointed marshal of the empire. At the end of 1806 Napoleon appointed him governor-general of the Hanseatic towns, and soon after commander of the troops in Swedish Pomerania against the king of Sweden. This monarch invited the marshal to a personal interview, in which he endeavored to convert him to the cause of Louis XVIII. Brune refused every proposal. After the revolution of 1814 he acknowledged Louis XVIII., and received the cross of Louis, but no appointment. This was the cause of his declaring himself for Napoleon immediately upon his return. He received the chief command of an important army in the south of France and was made a peer. When circumstances changed again he delayed a long time before he gave up Toulon, which was in his possession in 1815, to the troops of

Louis XVIII., and sent in his resignation to the king. This circumstance, the severities exercised by his command, and a report that he was the murderer of the Princess Lamballe, excited popular feeling against him. While retiring from Toulon to Paris he was recognized at Avignon by a royalist mob, which broke into his hotel and shot him. His body was exposed to the most shameful insults, and then thrown into the river Rhone.

Brunei, or Bruni. See BRUNĀĪ.

Brunel, broo-nēl', Isambard, ī'sam-bārd, Kingdom, English engineer: b. Portsmouth, (son of Sir Mark Isambard Brunel, q.v.), 9 April 1806; d. 15 Sept. 1859. He was educated at the Henri IV. College at Caen, France. The bent of his genius was toward mechanical pursuits, and at the age of 20 he commenced practical engineering under his father at the Thames Tunnel, for which he acted as resident engineer. During the progress of the works he was more than once in imminent danger of his life by the breaking in of the river, and only saved himself by swimming. His attention was mainly directed to steam navigation and railway engineering, and of his works in these departments may be mentioned, among others, the Great Western, Great Britain, and Great Eastern steamships; the entire works on the Great Western Railway, to which he was appointed engineer in 1833; and the railway viaduct over the Tamar at Saltash. He was also the engineer of the Hungerford suspension bridge. The genius of the younger Brunel was undoubted, but in carrying through his operations he was like his father, too apt to regard merely the attainment of a grand and brilliant result without taking into consideration the losses and expense which might thereby be occasioned to those who had invested their capital in the undertaking. This was more especially the case with the Great Western Railway. It was remarked, in contrasting him with George Stephenson, that the works of the former never paid, while those of the latter always did. While on board the Great Eastern—his last work—the day before she quitted the Thames on her first disastrous cruise, Mr. Brunel was suddenly seized with paralysis and had to be carried home. In a week afterward he expired. He became a Fellow of the Royal Society in 1830, and D.C.L. of Oxford in 1857.

Brunel, SIR Mark Isambard, English engineer: b. Hacqueville, near Rouen, 25 April 1769; d. 12 Dec. 1849. He was the son of a Normandy farmer, and educated at the seminary of St. Nicaise, Rouen. From early boyhood he displayed a decided turn for scientific and mechanical pursuits, amusing himself with the construction of ships, musical instruments, and machines of different sorts. At the age of 15 he went to Rouen, where he took a course of lessons in drawing, perspective, and hydrography. In 1786 he entered the French naval service and made several voyages to the West Indies, in which he distinguished himself both by his inventive mechanical genius and the attention and ability with which he discharged the duties of a seaman. In 1793 he returned to France, and, having paid a visit to Paris, and taken part in the proceedings at one of the political clubs, he narrowly escaped proscription by venturing to oppose the ferocious doctrines then

current, and was obliged to make his escape to America. Shortly after his arrival there he joined a party of Frenchmen in an expedition to explore the regions around Lake Ontario, and in 1794 he was appointed one of the surveyors of the canal now connecting Lake Champlain and the river Hudson. He was afterward employed, both as engineer and architect, on various undertakings in the city of New York, including the erection of forts for its defense and the establishment of an arsenal and foundry. In 1799 he went to England and settled at Plymouth, where he married Miss Sophia Kingdom, whom he had formerly known at Rouen. His first work in this country was the construction of a copying-machine; and he soon established his reputation as a mechanician by the invention of a machine for making the block-pulleys for the rigging of ships, which effected an immense saving in labor and expense and is still in full operation in English naval dockyards. Of Brunel's subsequent achievements may be mentioned more especially the erection of the steam saw-mill in Chatham dockyard; a machine for making seamless shoes for the army; machines for making nails and wooden boxes, for ruling paper and twisting cotton into hanks; and lastly, a machine for producing locomotion by means of carbonic acid gas, which, however, though partially successful, was ultimately abandoned. But the great work by which his name will be transmitted to posterity was the Thames tunnel, which, though almost a complete failure as a commercial speculation, was nevertheless a wondrous monument of engineering skill and enterprise. It was commenced in March 1825, and opened to the public in 1843, after a multitude of disasters and obstacles had been endured and surmounted. He was elected a Fellow of the Royal Society in 1814, and vice-president from 1832-3. In 1811 the honor of knighthood was conferred on him.

Brunelleschi, Filippo di Ser Lappi, fē-lēp' pō dē sār lāp'pē broo-nēl-lēsh'ē, Italian architect: b. Florence, 1377; d. same place, 15 April 1446. He first studied painting and sculpture, and brought the art of perspective to perfection; but as an architect he gained most distinction, having, according to his countrymen, revived the Doric, Ionic, and Corinthian orders. He invented various ingenious mechanical contrivances. He applied himself particularly, however, to architecture; and learned the art of drawing to make his architectural plans; statuary, to adorn them; and mechanics, that he might be able to raise the materials. He was also profoundly versed in mathematics and geometry. He is said to have drawn views of the finest monuments in Florence in perspective—an art which then excited much astonishment. This varied knowledge prepared him for bold and difficult undertakings, and he gained the name of the restorer of architecture. As a statuary he was much indebted to his intimate connection with Donatello, who was then very young but very able. Both went to Rome. Here Brunelleschi conceived the idea of restoring architecture to the principles of the Greeks and Romans in the hope of making the revived classic forms supersede the Gothic then in vogue. When the architects assembled in 1407 at Florence to consult on the building of the dome of the Cathedral of Santa Maria, the plan which

Brunelleschi proposed received but little attention, and he went back to Rome.

It was necessary, however, to have recourse to him, as the undertaking far surpassed the powers of the other architects. He engaged to erect a dome which, by its own weight and by the strong connection of its parts, should hang suspended. This proposal seemed so wonderful that the author was regarded as insane. As all other plans, however, failed to answer the expectations of the magistrates, Brunelleschi was again recalled, and ordered to explain the mode in which he intended to execute his plan. This he refused to do, but built two small chapels according to his new system. On this the charge of erecting the dome was committed to him. Aided only by his own genius he accomplished the work, which remains one of the boldest creations of the human mind. But the ingenious lantern, which formed the upper part of the dome, was not finished when he died in 1444. It was completed, however, according to his first design. Few monuments of architecture are so noble as this wonderful building. Only the dome of St. Peter's in Rome, which was built since, excels it in height, but is inferior to it in lightness and grandeur of style. Michael Angelo said it was difficult to imitate Brunelleschi and impossible to excel him. Brunelleschi was the author of a great number of other masterpieces of architecture.

Brunet, Jacques Charles, zhāk shārl broon-nā, French bibliographer: b. Paris, 2 Nov. 1780; d. same place, 14 Nov. 1867. He began his bibliographical career by the preparation of several auction catalogues, of which the most interesting is that of the Count d'Ourches (Paris 1811), and of a supplementary volume to Cailleau's and Duclos' 'Dictionnaire Bibliographique' (Paris 1802). In 1810 was published the first edition of his 'Manuel du Libraire et du l'Amateur de Livres,' in three volumes, which gained such universal applause that in 1814 a second, and in 1820 a third edition, of four volumes each, were demanded. This work showed him the worthy successor of the meritorious Debure. A sixth edition of his great work appeared between 1860 and 1865 in six volumes, the last containing a Table Méthodique, or classified catalogue, in which the works are arranged in classes according to their subjects.

Brunetière, Ferdinand, French critic: b. Toulon 19 July 1849; d. Paris 9 Dec. 1906. He was editor of the *Revue des Deux Mondes* and became a member of the French Academy in 1893. In criticism he inclined to the idealist as opposed to the naturalist school, and was a severe critic of literary fads. His principal works are: 'History and Literature' (1884); 'The Naturalist Romance' (1883); 'Essays on Contemporary Literature' (1892); 'Epochs of the French Theatre' (1892). In 1897 he delivered a series of lectures in Harvard, Johns Hopkins, and Columbia universities.

Brunhilda, broon-hil'da, the name of (1) a legendary, (2) a historical person.

1. In the 'Nibelungenlied,' the young and stalwart queen of Iceland, wife of Gunther, the Burgundian king. She passionately hated Kriemhild and her husband, Siegfried, who had once been her own lover; and she caused his murder by the hands of Hagen. Originally she was identical with the Norse Walkyrie Bryn-

hildr, who, for a fault, was stripped of her divinity by Odin and sank into a charmed sleep, from which she was awakened by Sigurd (Siegfried).

2. The daughter of the Visigothic king Athanagild, who married King Sigbert of Austrasia in 567, and afterward, as regent of her two grandsons, Theodebert II., king of Austrasia, and Theodorik II., king of Burgundy, divided the government of the whole Frankish world with her rival Fredegunda, who governed Neustria for the youthful Clotaire II. On the death of Fredegunda in 598, she seized on Neustria, and for a while united under her rule the whole Merovingian dominions, but was overthrown in 613 by a combination in their own interests of the Austrasian nobles under the nominal leadership of Clotaire II., and put to death by being dragged at the heels of a wild horse.

Bruni, broo'nē, Bru'no, or Bru'nus, Leonardo, lä-o-nār'do ('ARETINO,' from his birth-place), Italian humanist: b. Arezzo, 1370; d. Florence, 9 March 1444. He studied law and philosophy at Florence, but under the influence of the Greek scholar Chrysoloras finally took up the study of the classics. In 1405 he obtained a position as papal secretary, an office which he held under four Popes, Innocent VII., Gregory XII., Alexander V., and John XXIII. He went with the latter to the council of Constance in 1414, but in 1415 he moved to Florence, where he devoted himself to literary work. Here he wrote his history of Florence in 12 volumes, for which service he obtained the right of citizenship and was made state secretary there in 1427. He translated the works of Aristotle, Plato, Plutarch, Demosthenes, and Æschines. He wrote also 'Commentarius Rerum Suo Tempore Gestarum': 'De Origine Urbis Mantuæ'; 'De Romæ Origine'; and 'Epistolæ Familiares.'

Bruni, brōō'nē, Island, Australasia, an island off the southern part of the east coast of Tasmania, from which it is separated by D'Entrecasteaux Channel. It has a length of 32 miles, a varying breadth of 1 to 11 miles, and an area of 160 square miles. Coal is mined.

Brunings, Christian, Dutch engineer: b. Neckerau, 1736; d. 1805. In 1769 the states of Holland appointed him general inspector of rivers. This introduced him to a share in several important commissions; for instance, that for the improvement of the dike system in 1796; that for draining the tracts between Nieuwskogs and Zevenhoven in 1797, etc. His most important works were his improvements in the diking of the lake of Haarlem, the improved diking and deepening of the Oberwasser, which at high tides often inundated vast extents of country, together with the change in the course of the Waal and the canal of Panneerde, by which the beds of the Rhine, the Waal, and the Leck were improved.

Brunn, Heinrich von, hīn'rīn brun, German archæologist: b. Wörlitz, Anhalt, 23 Jan. 1822; d. Munich, 23 July 1894. He was professor of archæology at Munich, and published several works of high repute among scholars.

Brünn, Austria, the capital of Moravia, and of a circle of the same name, situated on the railway from Vienna to Prague, 70 miles north-by-east of Vienna, and nearly encircled by the rivers Schwarza and Zwitawa. It con-

sists of an older portion in the centre, surrounded by fine promenades and pleasure-grounds that have taken the place of the old walls and ramparts, and of extensive newer quarters and suburbs surrounding this. It contains a cathedral and other handsome churches; a landhaus, where the provincial Diet meets; several splendid palaces, a gymnasium, polytechnic institute, museum, botanic garden, etc. It has extensive manufactures of woollens, which have procured for it the name of the Austrian Leeds, and in some 70 works employs about 12,000 hands. Other industries embrace cotton, linen, jute, machinery, hardware, chemicals, soap, and candles; beer and spirits. It is the centre of the Moravian commerce, a great part of which is carried on by fairs held at Brünn every three months. Near it is the fortress of Spielberg, on a hill about 930 feet high, in which Baron Trenck and Silvio Pellico were confined, and which now serves only as a prison. It is surrounded with finely laid-out grounds. Brünn was formerly a free imperial city, an important fortress, and the residence of the margraves of Moravia. It was unsuccessfully besieged by the Taborites in 1428; by Torstenson in 1645; by the Prussians in 1742. It was occupied by the French in 1805, and Napoleon made it his headquarters after the battle of Austerlitz. It was taken again by a division of the French army in 1809, when it suffered severely. In 1866 it was occupied by the Prussians. Pop. (1900) 109,000

Brunne, brün, Robert of, the name by which ROBERT MANNING, a monk of the order founded by St. Gilbert of Sempringham, is usually designated. His monastery was in Lincolnshire, near the modern town of Bourn, and he lived in the reigns of Edward II. and Edward III. His chief work is his 'Handlyng Synne,' a free and amplified translation into English verse of William of Waddington's 'Manuel des Pechiez,' with such judicious omissions and excellent additions as made his version much more entertaining than the original. The purpose of the book was to convey religious instruction to the people in the agreeable form of moral anecdotes. It is of great importance from the linguistic point of view, as one of our best landmarks in the transition from the early to the later Middle English. He also made a new version in octosyllabic rhyme of Wace's 'Brut d'Angleterre,' and added to it a popular translation of the French rhyming chronicle of Peter Langtoft of Bridlington. Robert deliberately wrote in English instead of French, in order to reach the common people, to give them the means "for to haf solace and gamen, in felasch-ship when tha sit samen (together)."

Brunnow, broo'nöff, Philipp (COUNT VON), Russian diplomatist: b. Dresden, 31 Aug. 1797; d. Darmstadt, 12 April 1875. He entered the Russian service in 1818. He was present in a civil capacity in the campaigns of 1828 and 1829 against the Turks, and in 1839 was sent on a special mission to London, where, in the following spring, he was accredited as permanent ambassador. In this capacity he soon acquired distinction as a diplomatist. After retiring from London on the outbreak of the Crimean war, in 1854, he represented Russia in Frankfurt, and, together with Count Orloff, was sent to the Conference of Paris in 1856. He was afterward

appointed to the court of Prussia; but in 1858 he returned to his old place in London, where he represented Russia at the conferences in 1864 and 1871. He was raised to the rank of count in 1871, and in 1874 retired to Darmstadt.

Bru'no, St., the name of two saints of the Roman Catholic Church.

1. The apostle of Prussia: b. about 970; d. 1008. He entered the order of St. Benedict and accompanied St. Adalbert on his mission to Prussia. He was appointed chaplain to the emperor, Henry II., and was a zealous missionary in Poland, Russia, and Hungary. Having been taken by the pagans of Lithuania, he had his hands and feet cut off, and was afterward beheaded.

2. The founder of the Carthusian order: b. Cologne about 1030; d. Della Torre, Calabria, 1101. He was educated in the school of the collegiate church of St. Cunibert, in which he afterward received a canonship, and then studied at Rheims, where he so distinguished himself that Bishop Gervais appointed him to superintend all the schools of the district. He attracted many distinguished scholars, and among others Odo, afterward Pope Urban II. Subsequently he was offered the bishopric of Rheims, but the immorality of his times induced him to go into solitude. In 1084 or 1086 he repaired with six friends of a like disposition to a narrow, bleak valley, called Chartreuse, about 15 miles from Grenoble, where they built an oratory and separate cells, and founded one of the severest orders of monks, named from their location Carthusians. In the meantime Urban II. became Pope, and in 1089 invited his former instructor to his court. Bruno reluctantly obeyed, but refused every spiritual dignity, and in 1094 received permission to found a second Carthusian establishment in the solitude of Della Torre, in Calabria, where he died. Leo X., by whom he was beatified, in 1514, permitted the Carthusians to celebrate a mass in honor of him; and Gregory XV., who ordered the process of his canonization, in 1623 extended it to the whole Roman Catholic Church.

Bruno, Giordano, jör-dä'nō broo'nō, Italian philosopher: b. Nola, Naples, about 1550; d. Rome, 16 Feb. 1600. He entered the order of Dominicans and became distinguished by the originality and poetical boldness of his speculations. In 1580, probably on account of the persecutions which he drew upon himself by his religious doubts and his satires on the monks he was forced to take refuge at Geneva. Here, however, he was soon persecuted by the Calvinists for his paradoxes and his violence. In 1583 he stood forth at Paris as the antagonist of the Aristotelian philosophy, and as teacher of the *ars Lulliana*. His disputes with the Aristotelians caused him to leave Paris, and he then went to London, where he published several of his works, and to Oxford, where he taught for a short time. In 1585 he went by way of Paris and Marburg to Wittenberg, and from 1586 to 1588 taught his philosophy there. He then went to Helmstadt, where, protected by Duke Julius of Wolfenbüttel, he remained till 1589. He was then engaged at Frankfort-on-the-Main with the publication of some works, particularly 'De Monade, Numero, et Figura,' but left this city in 1592, and returned to Italy. He remained

peacefully in Padua until 1508, when the inquisition of Venice arrested him and transferred him to Rome. After an imprisonment of two years, that he might have opportunity to retract his doctrines, he was burned for apostasy, heresy, and violation of his monastic vows. This death, which he might have averted eight days before by a recantation, he suffered with fortitude. While his violent attacks on the prevailing doctrines of the Aristotelian philosophy, and on the narrow-minded Aristotelians themselves, everywhere created him enemies, his rashness and pride threw him into the hands of his executioners. His philosophical writings, which have become very rare, display a classical cultivation of mind, a deep insight into the spirit of ancient philosophy, wit, and satire, as well as a profound knowledge of mathematics and natural philosophy. In 1585 appeared at Paris his famous 'Spaccio della Bestia Trionfante' (a moral allegory, with many satirical strokes on his own times); also his work 'Della Causa, Principio ed Uno' (Venice and London 1584); besides 'Del Infinito, Universo, e Mondi.' The former contains the foundation, the latter the application of metaphysics to the natural world. The doctrine is a pure Pantheism, connected with very peculiar notions of God—*Deus est monadum monas, nempe entium entitas*—a more complete Pantheistical system than had been previously exhibited, and which, since his time, Spinoza only—who, like Descartes, borrowed his ideas—has reduced to a more systematic form. The notion that God is the soul of the universe, and the world endowed with organization and life, might have been forgiven by his contemporaries; but his inference that the world is infinite and immeasurable, and his doctrine of the plurality of worlds, at the moment when the new system of Copernicus was attacked from all quarters, could not but be looked upon as a crime. His writings are mostly in the form of dialogues, without any methodical order. His language is a strange mixture of Italian and Latin. His style is violent and fiery. The originality and loftiness of his ideas take a powerful hold on those who can understand him. His logical writings, in which he boldly and skilfully applies Raymond Lully's art of topical memory, are more obscure and less interesting. His belief in magic and astrology, notwithstanding his enlightened views of the nature of things, is to be attributed to the spirit of his age. He also wrote poems, among others, 'Degli Eroi Furori,' and a satirical comedy, 'Il Candelajo.' A collection of his Italian works by Wagner appeared at Leipsic in 1830. A biography by Domenico Berti (Florence 1868), is of special interest and importance on account of the new papers it brings to light regarding the official examination of Bruno before the Inquisition of Venice.

Bruno the Great, German ecclesiastic: b. 925; d. Rheims, 11 Oct. 965. He was the Archbishop of Cologne, third son of Henry the Fowler, and brother of the Emperor Otho I. He had a great share in the events of his time, and surpassed all the contemporary bishops in talents and knowledge. He was made Archbishop of Cologne in 953, and Duke of Lorraine in 954, and had much trouble in bringing into due subjection his unruly subjects. A numerous train of learned men from all countries, even from Greece, continually followed him, and his

excellent example was imitated by many prelates. Commentaries on the five books of Moses, and the biographies of some saints, are ascribed to him.

Brunonian Theory, an hypothesis framed by Dr. John Brown, 1735-88 (q.v.), according to which the living system was regarded as an organized machine endowed with excitability, kept up by a variety of external or internal stimuli, that excitability constituting life. Diseases were divided into sthenic or asthenic, the former from accumulated and the latter from exhausted excitability. Darwin, author of the 'Zoonomia,' adopted the theory with enthusiasm, and Rasori introduced it into Italy, where it flourished for a time, and then had to be abandoned, as it ultimately was everywhere.

Brunswick, Ferdinand, Duke of, German soldier: b. Wolfenbüttel, 11 Jan. 1721; d. Brunswick, 3 July 1792. He was the fourth son of Duke Ferdinand Albert, and was educated for the military profession. In 1739 he entered the Prussian service, was engaged in the Silesian wars, and became one of the most eminent generals in the Seven Years' War (q.v.). He commanded the allied army in Westphalia, where, always opposed to superior forces, he displayed superior talents. He drove the French from Lower Saxony, Hesse, and Westphalia, and was victorious in the two great battles of Crefeld and Minden. After the peace he resigned his commission on account of a misunderstanding with the king. From that time he lived at Brunswick, the patron of art and literature.

Brunswick, Friedrich Wilhelm, Duke of, German soldier: b. 9. Oct. 1771; d. Quatre Bras, 16 June 1815. He was the fourth and youngest son of Duke Karl Wilhelm Ferdinand of Brunswick (q.v.). He was educated for the army, and in 1786 was appointed by the king of Prussia successor of his uncle, Frederick Augustus, Duke of Oels and Bernstadt. He then went to Lausanne, remained two years in Switzerland, and upon his return was made captain in a Prussian regiment of foot. During the war against France in 1792 and the following year he fought in the Prussian armies and was twice wounded. In 1806 he took part in the war against France with all the fire which the oppression of Germany and his father's unhappy fate had kindled in him. He finally joined the corps of Blücher, and was made prisoner with him at Lübeck. On the death of his eldest brother he would have succeeded to the dukedom, as his other brothers were incapacitated by disease, but Napoleon prohibited his succession. He raised a free corps in Bohemia to operate against the French, but though he gained a victory over 4,000 Westphalians he was unable to make an effectual stand on the Continent. He embarked his troops for England, landed in 1809, and was received with enthusiasm. His corps immediately entered the British service, and was afterward employed in Portugal and Spain. The Parliament granted him a pension of £6,000 until he returned to his hereditary dominions, 22 Dec. 1813. The events of 1815 called him again to arms, and he fell at Quatre Bras.

Brunswick, House of, a royal German house, the true founder of which was Albert Azo II., Marquis of Reggio and Modena, a descendant, by the female line, of Charlemagne, who had also extensive domains in Lombardy,

BRUNSWICK-LUNEBURG

and in 1047 married Cunigunda, heiress of the Counts of Altorf, and thus united the two houses of Este and Guelph. The previous history of the Este family is uncertain. Guelph, the son of Azo, was created Duke of Bavaria, in 1071. He married Judith of Flanders, who was descended from Alfred the Great of England. The most powerful of this line was Henry the Proud, who succeeded in 1125, and by his marriage with the daughter of Lotharius II. acquired Brunswick and Saxony. Brunswick ultimately fell to a younger branch of the family, and Otho, the great-grandson of Henry by this branch, was the first who bore the title of Duke of Brunswick (1235). John, eldest son of Otho, founded the house of Lüneburg. Albert the Great, a younger son of Otho, conquered Wolfenbüttel, and on his death (1278) his three sons divided his dominions. Henry founded the house of Grubenhagen. Albert became Duke of Brunswick, and William Duke of Brunswick-Wolfenbüttel. Henry Julius, of this last branch, inherited Grubenhagen (1599). Ernest of Zell, of the second branch, who succeeded (1532), conquered the territories of Wolfenbüttel, and left two sons, by whom the family was divided into the two branches of Brunswick-Wolfenbüttel (II.) or Brunswick-Lüneburg, and Brunswick-Hanover from the latter of which comes the present royal family of Great Britain. The former was the German family in possession of the duchy of Brunswick down to 1884, when this line became extinct on the death of the last duke, Wilhelm I., who ascended the throne of the duchy in 1831. Ernest Augustus, of the Brunswick-Hanover House, was created Elector of Hanover in 1692. He married Sophia, daughter of Elizabeth, the daughter of James I. of England. Their son George succeeded his father as Elector of Hanover in 1698, and was called to the throne of Great Britain as George I. in 1714, under the Act of Settlement of 1701, which invested the succession in the heirs of the Princess Sophia, being Protestants. The British sovereigns continued to rule Hanover till the accession of Victoria, when the Duke of Cumberland succeeded. The present Duke of Cumberland, titular Duke of Brunswick and king of Hanover, would have become ruler of Brunswick but for the events which transferred Hanover to Prussia; and Prince Albert of Prussia was elected regent of Brunswick instead.

Brunswick-Lüneburg, Karl Wilhelm Ferdinand (DUKE OF), German soldier: b. (eldest son of the reigning duke, Charles of Brunswick, and of a sister of Frederick the Great) 9 Oct. 1735; d. Ottensen, near Altona, 10 Nov. 1806. He was carefully educated, and his military ambition was early kindled by the achievements of Frederick II. He commanded the Brunswick troops in the allied army in the Seven Years' war, and in the fatal battle at Hastenbeck, 28 July 1757, he recaptured a battery that had been taken by the French; calling forth from Frederick a statement that "he showed that nature had destined him for a hero." He was instrumental in deciding the victory of Crefeld. He took the most active part in all the enterprises of his uncle Ferdinand; and Frederick's esteem for him continued to increase. In 1764 he married the Princess Augusta of England. He practised the greatest economy, living mostly retired from public business, and devoted to

the arts and sciences. In 1773 he entered the Prussian service and became general of infantry, but had no opportunity of displaying his military talents. After the death of his father (1780) he entered upon the government with zeal and activity. Anxious for the improvement of the finances, he diminished his household, discharged the debts of the state, encouraged agriculture, extended the liberty of commerce, undertook or assisted in the erection of considerable buildings, and by causing Italian operas, masquerades, etc., to be exhibited gratis, provided also for the amusement of the public. Yet, with the best intentions, he was often unsuccessful. This was the case with his plans for the improvement of public education. He invited men of learning into the country at great expense, but the projected reformation having met with innumerable obstacles, they became a burden to the state. In 1787 he commanded a Prussian army for the support of the stadtholder of Holland. When the wars of the French Revolution broke out, he received the chief command of the Austrian and Prussian army, and issued at Coblenz, 15 July 1792, a manifesto, drawn up in a very haughty style, which did more injury to the allied forces than a hostile army could have done. The duke designed to press forward from Lorraine to Paris to cut off its supplies, and thus force it to surrender by famine. Longwy was taken, 23 August, and Verdun, 2 Sept. 1792. But in Champagne, a country of itself unproductive, the transport of provisions for the army from the frontiers was rendered difficult by mountains and forests. Dumouriez was encamped in the vicinity of St. Menchould, and skirmishes took place daily; but the skilful dispositions of Dumouriez culminated in the defeat of the Germans by Kellermann at Valmy, 20 Sept. 1792, and Brunswick-Lüneburg was obliged to conclude an armistice and evacuate Champagne. Custines took Worms and Spire during this retreat, and captured the fortress of Mainz, 21 October, and soon afterward Frankfort, which latter city, however, was retaken by the Prussians and Hessians, 2 December. The endeavors of the Germans, therefore, were principally directed to the recapture of those places. To this end the Duke, in conjunction with the Austrians, opened the campaign on the upper Rhine, in 1793, took the fortress of Königstein 7 March, conquered Mainz 22 July, and prepared to attack the strong fortress of Landau, then in the power of the French. The French, on the other hand, 14 September, made a general attack on the Duke and Wurmser, from Strasburg to Saarbrück. On that day the Duke had a sanguinary engagement with Moreau in the vicinity of Pirmasens, a town belonging to the landgraviate of Hesse-Darmstadt. The French were driven from their camp near the village of Hornbach as far as the Saar. A month later the Duke, having formed a union with Wurmser, succeeded, 13 October, in his attack on the lines of Weissenburg and his attempt to draw nearer to Landau. In order to gain another strong point of support he ventured, on the night of 16 November to make an assault upon the mountain-fortress of Bitch, which is the key of the Vosges, as the roads from Landau, Pirmasens, Weissenburg, and Strasburg unite at that place. This attempt miscarried. Between the 28th and the 30th of November, however, he defeated

a division of the army of the Moselle at Lautern, which was pressing through the mountains, under the command of Hoche, with the intention of relieving Landau. But the daily attacks of Hoche and Pichegru, without regard to the sacrifice of men, and the successful attempt of the latter to break the Austrian lines near Franschweiler, 22 December, forced the Austrians to retreat beyond the Rhine, and occasioned the retreat of the Duke also. As some difficulties had already risen between Austria and Prussia, he laid down the chief command of the army in the beginning of the year 1794. The Duke continued to labor for the welfare of his country until 1806. Although now of such an age that he might have retired without reproach from public life, yet he assumed burdens beyond his powers. At the beginning of the year 1806, commissioned by the king of Prussia, he made a journey to St. Petersburg relative to the war that soon broke out with France. He was then placed at the head of the Prussian army. But his physical strength was not equal to his moral energy, as was proved by the battles of Jena and Auerstädt, in the latter of which he was mortally wounded.

Brunswick, Ga., a city and county-seat of Glynn County, situated on St. Simon's Sound, eight miles from the Atlantic Ocean; on the Plant System and the Southern R.R.'s; 80 miles south-southwest of Savannah. Its settlement dates back more than 100 years, and its importance as a commercial port has been developed since the close of the Civil War. It has an admirable and spacious harbor, provided with a brick lighthouse; is connected with New York, Fernandina, and Savannah by regular steamship lines; and exports large quantities of cotton, phosphates, tar, turpentine, and pine lumber. The city is the seat of a U. S. marine hospital and is a popular summer and winter resort, with fine hotels. Pop. (1900) 9,081.

Brunswick (Ger., BRAUNSCHWEIG), Germany, a duchy and sovereign state in the north-west part of the Germanic empire, comprising an area of 1,425 square miles. It is divided into eight districts—three larger and five smaller, detached from each other and surrounded by foreign possessions. About one half of the land is arable. Of the cultivated area of Brunswick 75 per cent belongs to private persons, 14 per cent to corporations, and 11 per cent to the state. The minerals are of some importance, including iron, lead, copper, some gold and silver, salt, asphalt, peat; besides marble, granite, sandstone, and other kinds of stone. The forests cover a considerable area, and over 72 per cent of this is in the hands of the state. The most important cultivated crops are grain, flax, hops, tobacco, potatoes, the sugar-beet, and fruits. A good deal of attention has been given in recent times to the improvement of the breeds of cattle, sheep, and horses. The industrial occupations are varied if not individually important, and embrace beet-root sugar, tobacco and cigars, paper, glass, flax, jute, and woolen goods, hats, wooden wares, chemicals, porcelain, sewing and other machines, lacquered wares, sal-ammoniac, chicory, and madder. The lacquered wares and porcelain of Brunswick are famous even in foreign countries. Brunswick, the capital, is the centre of trade. In 1806 the duchy was annexed by Napoleon to the kingdom of

Westphalia, but its native prince, Frederick William, was restored in 1813. In the German Confederation Brunswick held the 13th rank, with two votes in the Assembly and one along with Nassau in the Diet. It was afterward a member of the North German Union, formed after the dissolution of the old confederation by the victories of Prussia in the short campaign of 1866. As a state of the German empire it now sends two members to the Bundesrath and three deputies to the Reichstag. In its internal government Brunswick is a constitutional monarchy. The Representative Assembly consists of 21 deputies of the principal taxpayers, 10 of towns, 12 of communes, and 3 of the clergy. The estimated revenue and expenditure for 1898-9 were respectively \$3,686,250 and \$3,610,000; the debt \$15,571,600. The prevailing religion is the Lutheran. Pop. (1895) 434,213.

Brunswick, Germany, capital of the duchy of the same name (q.v.), situated on the Ocker, and on the railway from Hanover to Berlin. It was formerly one of the free cities of Germany, but it is now subject to the duke, and has been the ducal residence since 1754. The principal buildings are the new ducal palace, the mint, the house in which the Diet assembles, the town-house, the arsenal, the cathedral, museum, and picture gallery, and the public wine cellars. The ramparts of the old fortifications have been levelled and formed into a promenade. The older streets are narrow and tortuous, and antiquated in appearance. The Collegium Carolinum was founded in 1745, and intended as a medium between the common schools and the universities. It has enjoyed a high reputation even in foreign countries, particularly in England and Russia. The principal manufactures are wool, yarn, linen, porcelain, pasteboard, paper-hangings, and chemical preparations. There is a large commerce in grain, woollens, and manufactured articles. The traffic in home produce, and the carrying trade, have been much increased by the system of railways. The Brunswick fairs, though now declining, were formerly of great importance. Pop. (1895) 115,938.

Brunswick, Me., a town in Cumberland County, situated on the right bank of the Androscoggin, 26 miles northeast of Portland; pop. of township in 1891, 6,012. The falls of the Androscoggin afford excellent seats for several mills and manufactories. Bowdoin College (q.v.) is located here, and connected with it is the Medical School of Maine, established in 1820. Pop. (1900) 6,800.

Brunswick Black, a quick-drying varnish, made of turpentine, asphaltum, and linseed oil. It is used as a lacquer for roughly coating finished iron work, and also in the preparation of microscopic slides.

Brunswick Green, a green pigment, prepared by exposing copper turnings to the action of hydrochloric acid in the open air. It is a pale bluish-green, insoluble, cupric oxychloride, $\text{CuCl}_2 \cdot 3\text{CuO} \cdot 4\text{H}_2\text{O}$. It derives its name from Brunswick, Germany, where it was first made by Gravenhorst.

Brun'ton, Mary (BALFOUR), Scotch novelist: b. Barra Island, in the Orkneys, 1778; d. 1818. In her 20th year she married Dr. Alexander Brunton, minister at Bolton, near Hadding-

ton; afterward at Edinburgh. She wrote 'Discipline' and 'Self-Control,' two novels which met with favor. At her death she left 'Emmeline,' a tale, and other pieces, which were published by Dr. Brunton, with a biographical sketch.

Brush, Charles Francis, American scientist: b. Euclid, Ohio, 17 March 1849. He graduated at the University of Michigan in 1869. He invented the modern arc system of electric lighting and founded the Brush Electric Company. He was decorated by the French government in 1881 for his achievements in electrical science. In 1891 he won a long contest in the Federal courts over the rights to the manufacture and sale of storage batteries; and in 1900 he was awarded the Rumford medal by the American Academy of Arts and Sciences.

Brush, Edward N., American physician: b. Glenwood, Erie County, N. Y., 23 April 1852. He was educated at the University of Buffalo, edited the 'Buffalo Medical Journal' (1874-89), and was assistant in the State Lunatic Asylum at Utica, 1878-84, and in the Pennsylvania Hospital for the Insane at Philadelphia, 1884-91. In the year last named he became physician-in-chief of the Shepard and Enoch Pratt Hospital, Baltimore. He has written much upon the subject of insanity and was associate editor of the 'American Journal of Insanity' 1878-84, and also from 1897.

Brush, George De Forest, American artist: b. Shelbyville, Tenn., 28 Sept. 1855. He studied under Gérôme in Paris and first attracted attention by his pictures of Indian life. His later work is almost entirely figure composition. He exhibited 'The Artist,' and 'Mother and Child,' at the Paris Exhibition of 1900, and received its gold medal. He is a member of the Society of American Artists and an associate of the National Academy of Design.

Brush, George Jarvis, American mineralogist: b. Brooklyn, N. Y., 15 Dec. 1831. He received a public school education and graduated at Yale, where he studied science in 1852. He subsequently studied in Germany. Since 1855 he has held professorships at Yale—that of metallurgy down to 1864, and that of mineralogy since that date. He has been a leading official of the Sheffield Scientific School since 1864. His writings on mineralogy are authoritative.

Brush, an instrument used for painting, or for removing dirt by light rubbing, from floors, furniture, etc. They are generally made of hair, bristles, whalebone, or of various vegetable fibres, and are divided into two classes—simple and compound. Simple brushes are composed of a single tuft, and compound brushes consist of several tufts inserted in a handle. Painters' brushes are examples of the former, and ordinary hair brushes of the latter.

Brush-bird. The scrub-bird (q.v.) of Australia.

Brush-grass (*Andropogon gryllus*), a grass of South Europe, with stiff wiry roots which are used for making brushes.

Brush-turkey, a mound-building game-bird of Australia, *Catheturus lathamii*. See MEGAPODES.

Brus'sa, or **Brous'sa**, Asia Minor, a Turkish city, and capital of the vilayet of Khodavendikyar, situated in a fertile and finely wooded plain, which is enclosed by the ridges of Olympus, and abounds in hot, sulphurous and chalybeate springs, which are much frequented. A railway runs between Brussa and Mudania, its port, on the Sea of Marmora. The inhabitants are Turks, Greeks, Armenians, and Jews, engaged in commerce, in the culture of the vine, and in the manufacture of carpets, gauze, etc. A considerable number of persons are employed in mulberry culture, the reeling of silk, and silk manufacture, Brussa silks being in great demand throughout the Orient, though much raw silk is sent to Lyons to be manufactured. Caravans passing from Aleppo and Smyrna to Constantinople promote the commerce of the town. Before the earthquake of 1855 it contained close upon 150 mosques, and was adorned with an immense number of fountains; but from the earthquake and a terrible conflagration the former splendor of the town suffered greatly. It is a picturesque and interesting place, however, gardens, groves, and streams of running water being interspersed among the buildings. The castle, which is about a mile in circumference, is supposed to represent the Prusa of the ancients. Brussa was long the capital of Bithynia, and one of the most flourishing towns in the Greek empire of Constantinople. In 1326 it was taken by Orkhan, son of Othman, founder of the Ottoman dynasties; and from that epoch it was the residence of the Turkish sovereigns until the seat of empire was transferred to Adrianople. Pop. about 76,000.

Brussels (Flem. BRUSSEL; Fr. BRUXELLES), of the province of South Brabant, Belgium, a city of which it is the capital, and also the capital of the country. It is situated on the small river Senne, about 50 miles southeast of the German Ocean; lat. 50° 51' N.; lon. 4° 22' E. Brussels is built partly on the acclivity of a hill, partly on the plain, in a country agreeably diversified by sloping heights. Like many other Continental towns whose political situation has changed, its old fortifications have been transformed into boulevards. These surround the older portion of the city, extending for nearly five miles; they are planted with elms and linden trees in four rows, and form a wide and agreeable promenade commanding an extensive view of the surrounding country. The numerous gates, most of which bear the names of the principal high roads or railways which traverse the kingdom, are nearly all modern, but the Porte de Hal, built in 1379, is a remnant of the ancient fortifications, a large military tower of remarkable construction, which in later days was long used as a prison. The city now extends far beyond the boulevards. The Senne enters it by two branches, great part of one of these being now covered over. The stream is not navigable, but Brussels possesses water communication by means of canals with Charleroi, Mechlin, Antwerp, and the ocean. In many quarters within the boulevards Brussels still presents a series of twisted streets. That part of the upper or new town inside the boulevards, which contains the royal palace, is the principal exception. The suburbs, outside the boulevards, especially in the upper town, are large, and have recently greatly increased. The principal are the

BRUSSELS CONFERENCE

Quartier Leopold and the Quartier Louise, which are regularly and elegantly built. The principal buildings of the new town are the king's palace, the palace of the chambers, the palace of justice (a magnificent new building of colossal proportions in the classical style), the palace of the fine arts, the public library and museum, etc. The upper town is ornamented with a fine park of 17 acres, with fountains and statues, around which most of the principal buildings are situated. The lower town is rich in ancient architecture. The hôtel de ville (built 1401-55), one of the finest municipal buildings in Belgium, is an imposing Gothic structure with a spire 364 feet high. The square in front of it is perhaps the most interesting of all the public places of Brussels. The cathedral of St. Gudule is the finest of many fine churches, richly adorned with sculptures and paintings. It was founded in 1010, and its reconstruction, commenced in 1226, was carried on till the 17th century. The churches of Notre-Dame-de-la-Chapelle and Notre-Dame-des-Victoires are also edifices of great beauty. The monuments of Brussels, and the specimens of painting and sculpture with which its public buildings are adorned, are too numerous to mention.

The manufactures and trade of Brussels are greatly promoted both by its canal communications and by the network of Belgian railways. Printing, type-founding, and all the other departments of bookmaking give employment to a large section of the population. Until 1852 the reprinting of French contemporary works was extensively carried on, but in that year a treaty with France gave protection to works of literature and art. Lace was an ancient manufacture, and is still of some importance; the printing of cotton and woolen fabrics, muslins, etc., and many minor manufactures are carried on. Brussels carpets are chiefly made at Tournai, but some are manufactured in the city. There are breweries, distilleries, sugar refineries, foundries of iron and brass, steam engine factories, etc. The trade carried on by the canals and railways is that of a capital city and manufacturing town, for the supply of internal wants and the distribution of its own products. The languages spoken in Brussels are French, and Flemish or Dutch, the former principally spoken in the new town, the latter chiefly in the old. English is also a good deal spoken, owing to the number of English residents and visitors.

The scientific, literary, artistic, and benevolent institutions of Brussels comprise a free university, founded in 1834, a proprietary institution, with about 60 professors and assistants, comprising four faculties, mathematical and physical sciences, belles-lettres, law, and medicine; a school of geography, founded in 1830, with an extensive museum, embracing geology, chemistry, and natural history; one of the finest observatories in Europe, the Belgian Royal Academy of Sciences, Letters, and Fine Arts, and the Royal Academy of Fine Arts; the public library, containing 350,000 volumes and 30,000 valuable manuscripts; the picture gallery, with the finest specimens of Flemish art; the Royal School of Medicine; many institutions for elementary education; societies of horticulture and other natural sciences; several hospitals; an infirmary; a philanthropic society, etc.

During the Middle Ages Brussels did not attain the extent or importance of several other cities of the Low Countries. The Emperor Otho dated a decree from Brussels in 976. It was walled by Baldric, Count of Louvain, in 1044. It was more completely fortified in 1380, the wall then following nearly the line of the present boulevard. During the 15th century it was twice burned and once ravaged by the plague. It was the scene, in 1568, of the execution of Counts Egmont and Horn. It was bombarded and burned by the French in 1695, and was the headquarters of Marlborough after the battle of Ramilies. It was taken by the French in 1794, and retained till 1814, when it became the chief town of the department of the Dyle. From 1815 to 1830 it was one of the capitals of the kingdom of the Netherlands, and in 1830 it was the chief centre of the revolt which separated Belgium from Holland. Since then it has been the capital of the Belgian kingdom, and one of the centres of European civilization, being especially distinguished, far beyond its relative importance, for the cultivation and patronage of art. The population of Brussels, including the suburbs, 1 Dec. 1897, was 551,011. The foreign element is prominent, especially the French.

Brussels Conference, the current name of two abortive international conferences: one on the usages of war, July-August 1874; the second on bimetallism, in the autumn of 1892.

1. The harsh treatment of prisoners and non-combatants in the Franco-German war aroused a humane feeling in protest. At the Congress of Universal Alliance in Paris, June 1872, a Society for the Improvement of the Condition of Prisoners of War was formed, which sent a circular to the chief European powers asking them to appoint delegates to a congress on this subject at Paris. England and France declined, because the request came from no official source; but Russia substituted a project of her own, and Gortchakoff invited the powers to a conference at Brussels, ostensibly to lay before them a proposal for "a code to determine the laws and usages of warfare, and to limit the consequences and diminish the calamities consequent upon war, as far as it may be possible or desirable." England, however, sent but one delegate, the United States none, and the South American states were refused any share. To the dismay of the promoters, the meeting was at once turned into an engine for the exact reverse of their intentions. The dominating force throughout was that of Germany and Russia, whose views and purposes were identical; and it soon became clear that the real object of the call was to strengthen their hands as militant states by throwing overboard the entire fabric of international law on the obligations of humanity, and substituting the baldest assertion of the naked rights of irresponsible force. The original topic of prisoners of war, when brought up, was refused discussion by the Russian delegate, Jomini, on the ground that the governments did not wish to hamper themselves. The question of revising the articles of the Geneva Convention (q.v.) on the treatment of the sick and wounded, and the neutrality of clergymen, physicians, etc., attending them, was also thrown out by him, on the ground that for military reasons it was necessary to revise the whole convention, and that the states "most apt in the

BRUSSELS LACE—BRUSSELS SPROUTS

initiative of war" should have the right to "insist on their necessities." The question of what constitutes "effective occupation" was still more vital. The obvious interest of aggressive states was to insist, as did Germany, that it "need not manifest itself by visible signs," so that a town once occupied should still be considered so even if the troops were removed, and any rising of the inhabitants be punishable as treason; and that it was sufficiently established by "flying columns," or as defined by a satiric German, "three Uhlands and a trumpet." This denial of all rights of self-defense against invasion was almost unanimously rejected by the other delegates, however; and the principle substituted that there must be actual occupation by adequate force, and lines of communication kept open; that it "exists only when the territory is placed actually under authority of the hostile army, extends only to the territory where such authority is established, and exists only so long as the belligerent is able to exercise it." The right of *levée en masse*, or armed insurrection of the body of a people, is linked with this; and naturally the states itching for conquest wished to confine belligerent rights to regularly enrolled armies, and oblige the rest of the people to submit when these are defeated. Of course no such rule adopted by the belligerents themselves would ever bind a people who wanted to rise, but it would form a plea for much political murder before it was repealed. Jomini said that war had so changed its nature in modern times that it was necessary to "regulate the inspirations of patriotism," for fear they might be "more disastrous to the country itself than to the oppressor"; and that "those grand explosions of patriotism which took place in the beginning of the century cannot continue to occur in our day, at least not in the same form." On this head it was proposed that any inhabitant of a country under occupation who should give information to the "enemy" (his own people) should be handed over to "justice." But this philanthropic repression of self-defense in its own interest, and outlawry of the means by which Prussia gained her own independence, was not agreed to. All these assaults on natural right were opposed by the British delegate. An attempt was made to discuss reprisals or retaliation, but it was refused. Restriction of bombardment of the interior of towns without harming the fortifications was sought, but flatly refused by Germany and Russia, on the ground that "experience had shown it (the bombardment) to be one of the most efficient means of securing the objects of a war," which is true of sack, massacre, and other things banned by civilization. Finally a proposal was made that, at the option of the belligerent, neutrals should be obliged to receive and care for (at the belligerent's expense) the wounded; in other words, that a strong power could make its neutral neighbors depots to keep its armies in condition.

2. The change in relations between gold and silver, which has produced so much financial and political demoralization in the last quarter century, was the subject of three international conferences within that time; at Paris, August 1878 and April 1881, and at Brussels, November 1892. The last named was called by President Harrison for both business and political reasons. The accumulation of silver under the Sherman

Act of 1890 was threatening the country with a fall to the single silver standard, only averted by the bond sales of 1893 and the repeal of the act; and the free-coinage movement which convulsed the country in 1896 was making headway, had been approved by the platform on which Harrison was elected, and demanded some recognition. Abroad, the recent adoption of the gold standard by state after state was raising gold to a premium, and arousing the fear that it was too scarce for the sole money of ultimate payment; the fall in silver was causing much loss and dislocation of trade, and many believed that its demonetization was the sole cause of this, and of the low price of commodities (which they called the high price of gold), and that its restoration by common agreement would raise its price again and restore equilibrium of commerce. The call was accepted by all the European states and Mexico, 20 with the United States; and all the 50 delegates were present, but those of Germany, Austria, and Russia were forbidden to debate or vote. The president was Montefiore Levi, of Belgium; vice-president Edwin H. Terrell, United States minister to Belgium. The United States delegation drew up the order of business, and offered a resolution that "it is desirable that some means should be found for increasing the use of silver in the currency systems of the nations," and, while stating their own belief in general bimetallism, suggested two plans short of this, to which Mr. Alfred Rothschild, of the British delegation, added a third. The resolution was favored by most of the delegations, who indeed would not otherwise have been sent there; but was too general to be of any service, and was laid on the table and not taken up. A special committee reported on the three schemes before it: (1) That of A. Soetbeer, too involved for international agreement; (2) Rothschild's, as altered in committee, essentially, that all Europe should buy 30,000,000 ounces of silver yearly, the United States to keep on buying 54,000,000; unlimited free coinage to be established in British India and Mexico; the agreement to run for five years unless silver rose to an agreed price before that; (3) Moritz Levy's, laid before the conference of 1881, to withdraw from circulation all gold coin and notes under 20 francs. The British delegation refused to support this unless joined with something like the Rothschild plan of maintaining the gold price of silver; the Latin Union members would not have this because it involved fresh purchases of silver; nor the United States, because of its unfairness to us; and Rothschild withdrew his plan. Thereupon the conference began discussing bimetallism till they adjourned, 15 December, for the holidays, to reconvene the following May if the governments thought it advisable; but the election of President Cleveland meantime had taken it out of the immediate political field as an adjunct, and it did not meet again. See INTERNATIONAL LAW; U. S., DIPLOMACY OF THE

Brussels Lace. See LACE.

Brussels Sprouts, a garden vegetable (*Brassica oleracea* var. *gemmifera*), derived from the same species as cabbage and cauliflower, like which it is cultivated as an autumn crop more widely in Europe than in America.

Brut, Roman de, a poem in eight-syllable verse, composed by Robert Wace, but indirectly modeled upon a legendary chronicle of Brittany, entitled 'Brut y Brenhined' (Brutus of Brittany), discovered in Armorica by Walter, archdeacon of Oxford, and translated into Latin by Geoffrey of Monmouth. Wace presented his poem to Eleonore of Guyenne in 1155, and it was translated into Anglo-Saxon by Layamon.

The poem relates that after the capture of Troy by the Greeks, Æneas came to Italy with his son, Ascanius, and espoused Lavinia, daughter of King Latinus; she duly presented a son to him. This son, as well as Ascanius, succeeded to the throne, which devolved at last upon Silvius, son of Ascanius, who became the father of Brutus, from whom the 'Roman' takes its name. Brutus slew his father with a misdirected arrow, and fled. First he went to Greece, where he delivered the Trojan captives; next he conquered the Armorican Isles, to which he gave the name of Britain. Afterward he made war upon the king of Poitou and founded the city of Tours, which he named in honor of his son. From Poitou he returned to the Armorican Isles, overcoming the giants in possession, and re-named it Britain. He founded the city of London and reigned long and gloriously there.

The narrative now concerns itself with the descendants of Brutus. The adventures of Lear, of Belin, of Brennus who voyaged to Italy, of Cassivellaunus who so bravely resisted Cæsar, of all the bellicose chiefs who opposed the dominion of the Roman emperors, are minutely related. King Arthur, however, is the real hero of the 'Roman de Brut.' Arthur performs prodigies of valor, is the ideal knight of his order of the Round Table, and finally departs for some unknown region, where it is implied he becomes immortal, and never desists from the performance of deeds of valor. In this portion of the narrative figure the enchanter Merlin; the Holy Grail, or chalice in which were caught the last drops of the Saviour's blood as he was taken from the cross; Lancelot of the Lake; Tristan and his unhallowed love; Perceval and his quest of the Holy Grail. The 'Roman' became unprecedentedly popular, and it was publicly read at the court of the Norman kings.

Brütt, Ferdinand, German painter: b. Hamburg, 13 July 1849. He was educated at the Weimar art school and settled in Düsseldorf in 1876; was professor at the art school there in 1893; and in 1900 went to Cronberg. The subjects of his earlier pictures were from the life of the modern peasants or from the history of the 18th century, but in later years he has painted scenes from the life of the city. His works include: 'Peasant Delegation'; 'The Prince on the Promenade'; 'At the Exchange'; 'In the Art Gallery.'

Bruttii, an ancient people of Italy, living in the southwestern peninsula, now Calabria. The Greeks had several flourishing colonies on the coast and had to some extent conquered the inhabitants of the interior; the Lucanians also made themselves masters of some portions of the interior. But about 350 the people revolted, and, assisted by the Lucanians, gained their independence and captured several Greek cities. At this time they were called by the Greeks Bruttii (rebels). They remained independent till they

united with Pyrrhus against Rome and were subdued by the Romans in 272 B.C. In the second Punic war they sided with Hannibal, and after his expulsion from Italy were heavily punished by the Romans, robbed of considerable of their territory, entirely deprived of their independence, and not allowed to bear arms.

Brutus, or Brute, in the fabulous history of Britain, the first king of the island, according to Geoffrey of Monmouth. He is said to have been the son of Silvius, and grandson of Ascanius, the son of Æneas, and to have been born in Italy. He landed at Totness, in Devonshire, destroyed the giants who then inhabited Albion, and called the island from his own name. At his death the island was divided among his three sons: Lochrine had England, Cumber Wales, and Albanact Scotland.

Brutus, Decimus Junius, Roman soldier: d. 43 B.C. He served under Cæsar in the Gallic war, and in the civil war he commanded the fleet destined to besiege Massilia. Cæsar afterward appointed him to the government of further Gaul. Nevertheless he joined the conspiracy against Cæsar, and volunteered, on the memorable Ides of March, to conduct his friend and benefactor to the place of slaughter. When the tragedy was consummated, Decimus Brutus retired to Cisalpine Gaul, and there maintained himself for some time, but was ultimately deserted by his troops, betrayed to Antony, and put to death by order of that general.

Brutus, Lucius Junius, a Roman patriot, sometimes called the Elder, to distinguish him from Marcus Junius, the slayer of Cæsar, lived about 500 B.C. According to the legend, he was the son of Marcus Junius and the elder daughter of Tarquin the Proud, the last king of Rome, and is represented as having saved his life from the cruelty of that prince by feigning idocy, whence he received the surname of Brutus (Stupid). Yet the king associated him with his own sons, Aruns and Titus, in a mission which he sent to Delphi to inquire into the meaning of a portent, which had caused much alarm at Rome. After receiving the reply to the question they were charged to propound, the young men enquired of the oracle which of the three should be king in Rome, no one of them being, it is observable, heir to that dignity. To this the reply was, "Whichever shall first kiss his mother." So, on their return to Italy, Titus and Aruns ran to kiss the queen mother; but Lucius Junius, as he landed from the galley, pretending to slip, fell prostrate and kissed the soil of Rome, in the belief that by "mother" the oracle had meant mother earth. When Lucretia, the wife of Collatinus, plunged a dagger into her bosom that she might not outlive the insult which she had suffered from Sextus, the son of Tarquin, Brutus is said to have drawn the dagger from the wound, and to have sworn vengeance against the Tarquins whose banishment he then demanded and procured. Then (about 509 B.C.) he is said to have been chosen one of the two first consuls. According to the legend, a conspiracy to restore the monarchy having been supported by the two sons of Brutus, he, after the crime had been proved, ordered the lictors to execute the law, and did not leave the assembly till after the execution. At length Tarquin marched against Rome. The consuls advanced to meet him. Brutus led the cavalry; Aruns,

son of Tarquin, commanded the body opposed to him. They pierced each other with their spears at the same moment, and both fell. The Romans conquered, and Brutus was buried with great splendor. The details of the story of Brutus, which may be regarded as a poetical legend, have been shown by Niebuhr to be irreconcilable with history.

Brutus, Marcus Junius, Roman republican: b. 85 B.C.; d. 42 B.C. He was the son of that Marcus Junius Brutus whom Pompey caused to be murdered, and of Servilia, the half sister of Cato. He lost his father when he was only eight years old, but his mother and uncles carefully directed his education. On the outbreak of the civil war he followed the example of Cato, and joined the Pompeians, notwithstanding his aversion to their leader. After the unfortunate battle of Pharsalia, he surrendered himself to Cæsar, who received him generously, allowed him to withdraw from the war, made him in the following year governor of Cisalpine Gaul, and afterward conferred on him the government of Macedonia. Notwithstanding these benefits, Brutus allowed himself to be drawn by Cassius and others into the conspiracy against Cæsar, who had now made himself master of the supreme power in the state. Cæsar was assassinated in the senate house. In public speeches Brutus explained the reasons of this deed, but he could not appease the dissatisfaction of the people, and retired with his party to the capitol. Antony succeeded in exciting the popular indignation against the murderers of Cæsar, and they were compelled to flee from Rome. Brutus went to Athens, raised a large force, and also gained over the troops in Macedonia. Thus, master of all Greece and Macedonia, he stood at the head of a powerful army. He went to Asia and joined Cassius, whose forces were also strong. At Philippi they fought the army of Antony and Octavius. Cassius was beaten by Antony, and caused himself to be killed. Brutus repulsed Octavius, by whom, however, he was soon afterward totally defeated. Seeing his cause ruined, he ended his life by falling upon his sword. Brutus was a man of little independent judgment, a mere student, liable to be swayed by others, and he was in no sense a martyr to a genuine patriotism. He was the author of philosophical and historical treatises, orations, etc., none of which now survive.

Bruyas, Jacques, zhāk brü-ya, French Jesuit: b. 1637; d. 1712. In 1666 on coming to Canada he went as a missionary to the Iroquois, and later established one of the earliest missions among the Mohawk Indians. He was a student of their language, and wrote in Latin a valuable work on the 'Mohawk Radicals.'

Bruyère, Jean de la, zhõn dè la brü yâr. See LA BRUYÈRE.

Bruyn, Barthel, bär'tël broin, German painter: b. Cologne, 1493; d. about 1556. His earlier works show the influence of some of the German masters, but later he imitated Michael Angelo and other Italian painters. His masterpiece is the altarpiece for the Church of St. Victor at Xanten. His numerous works are mostly in Cologne and Munich; among them are: 'Martyrdom of St. Ursula'; 'Adoration of the Magi'; 'Corpus Christi'; 'Saint Catherine'; and a number of portraits.

Bryan, Mary Edwards, American author: b. Jefferson County, Florida, 1844. She began writing at an early age, and before the war was a regular contributor to the 'Southern Field and Fireside,' and other journals. Her published books are: 'Manch' (1879); 'Wild Work' (1881), a story of Louisiana reconstruction; 'The Bayou Bride'; 'Kildee' (1886); 'Uncle Ned's White Child'; 'Ruth, an Outcast'; 'His Legal Wife'; 'The Girl He Bought'; 'My Own Sin'; 'His Wife's Friend.'

Bryan, William Jennings, American political leader: b. Salem, Ill., 19 March 1860. He was graduated at Illinois College, Jacksonville, in 1881, and at the Union College of Law, Chicago, in 1883. He practised law at Jacksonville from 1883 to 1887, when he moved to Lincoln, Neb. He was elected to Congress in 1890, and again in 1892. From 1894 to 1896 he was editor of the Omaha *World-Herald*. In 1896 he was nominated for President by the Democratic National Convention at Chicago, and also by the People's party and Free Silver Republicans, on a platform demanding the free and unlimited coinage of silver by the United States at a ratio of 16 to 1, regardless of the action of other nations, a financial policy which he had for some time advocated with much earnestness and eloquence of both tongue and pen. He was defeated at the polls by McKinley. During the war with Spain, he was colonel of a Nebraska regiment of volunteers, but saw no field service. In 1900 he was a presidential candidate, of the Democrats, Populists, and Free-Silver Republicans, upon an anti-imperialistic and anti-trust platform, with a reiterated demand for free-silver. He was again defeated by William McKinley. Soon after the election he established *The Commoner*, a political weekly. He wrote 'The First Battle: a Story of the Campaign of 1896' (1896), which contains some of his speeches and a biographical sketch by his wife; besides he published numerous articles in periodicals.

Bryant, Edwin Eustace, American lawyer and author: b. Milton, Vt., 10 Jan. 1835; d. Toronto, Can., 1903; educated at the New Hampton Institute; removed to Wisconsin 1858. He served in the Civil War and from 1868-72 was private and executive secretary to the governor of Wisconsin. In 1878 he was elected to the legislature of the State; in 1882 was adjutant-general of Wisconsin, and from 1885-80, assistant United States attorney-general for the post-office. He was the author of several well-known law books.

Bryant, Henry Grier, American explorer and geographer: b. Allegheny City, Pa., 7 Nov. 1859. He graduated at Princeton, 1883, and from the law department of the University of Pennsylvania, 1886. He has contributed literary articles to various magazines and encyclopædias. In 1891 he organized and conducted an exploring expedition to the Grand Falls of Labrador, was second in command of the Peary Relief Expedition in 1892, and in 1897 led an exploring expedition to the Mount Saint Elias region of Alaska. In 1895 and 1897 he was a delegate to international geographical congresses in London and Berlin.

Bryant, Jacob, English philologist and antiquary: b. Plymouth, 1715; d. 1804. He studied at Eton and King's College, Cambridge, became afterward tutor of the sons of the famous Duke of Marlborough, the eldest of whom he also accompanied to the Continent as his secretary. After his return he received, by the influence of his patron, a lucrative post in the ordnance, which gave him leisure for his researches into Biblical, Roman, and Grecian antiquities. His most important work is the 'New System of Ancient Mythology' (1774-6). He was engaged in a famous dispute on the veracity of Homer and the existence of Troy, in which he endeavored to show that there never was such a city as Troy, and that the whole expedition of the Greeks was a mere fiction of Homer. The object of one of his earlier treatises, which appeared in 1767, is to show that the island Melita, on which Saint Paul was wrecked, was not Malta, but situated in the Adriatic. He endeavored to illustrate the Scriptures by explanations drawn from Josephus, from Philo the Jew, and from Justin Martyr; but in this, as in all his writings, his learning and his ingenuity are misled by his love of controversy and paradox.

Bryant, John Howard, American poet: b. Cummington, Mass., 22 July 1807; d. Princeton, Ill., 14 Jan. 1902. He was a brother of William Cullen Bryant (q.v.). He studied at the Rensselaer Polytechnic Institute, Troy, N. Y., removed to Illinois in 1831, and from 1832 until his death lived on his farm at Princeton, performing the greater part of its work with his own hands. He held numerous local offices, served in the State legislature in 1842, and 1858; was a Free-soil candidate for Congress in 1854; and a delegate to the convention which organized the Republican party in 1856. He was an intimate friend of Abraham Lincoln, who appointed him collector of internal revenue for the Fifth Illinois district, 1862-6. The poems which were the product of his leisure hours show him as a lover of nature, which he described minutely and effectively, and a man of refined tastes and kindly feelings. His first printed poem, 'My Native Village,' appeared in the 'United States Review and Literary Gazette' in 1826, his brother William then being editor of that journal. His collected work may be found in 'Poems' (1855), and 'Poems Written from Youth to Old Age, 1824-84,' privately printed at Princeton, Ill., in 1885.

Bryant, Neil, American actor and minstrel performer: b. Keesville, N. Y., 1835; d. Brooklyn, N. Y., 6 March 1902. He was the youngest of three brothers, long prominent in the negro minstrel entertainment business. He made his first appearance on the minstrel stage in 1845, and soon became the champion American flute-player. With his brothers he opened a theatre at 472 Broadway, New York, in 1857, which they retained for 10 years. The oldest brother having died in 1867, the others continued in the same business in other locations in New York, but after the death of the second brother in 1875, Neil became unsuccessful and lost the most of what he had acquired. He retired from the stage in 1883 and was subsequently employed in the coast survey.

Bryant, William Cullen, American poet and journalist: b. Cummington, Mass., 3 Nov.

1794; d. New York, 12 June 1878. His father, Dr. Peter Bryant, a physician, was a man of much literary culture, as well as large experience in public affairs. He prepared, when he was but 14, a collection of poems, which were published in Boston in 1809. In that volume appeared 'The Embargo,' the only poem dealing with the politics of the day he ever wrote. In the following year Bryant entered Williams College as a student of law, but left without taking a degree in 1815, when he was admitted to the bar. In that year he became a contributor to the 'North American Review,' in which appeared the following year his 'Thanatopsis,' a poem in blank verse, which from the first has commanded profound admiration. Six years later he published a second collection of poems, which brought him into a wide fame. The principal piece, 'The Ages,' is a didactic poem, in which he sketches the past progress of the world, concluding with a glowing picture of America, and its occupation by the new race. He definitely abandoned law for literature in 1825, and went to New York, where he founded the 'New York Review,' and a year after became the editor of the *Evening Post*, an old established paper with which he was connected till his death. In 1832 he issued another collection of poems, which was republished in Great Britain with a preface by Washington Irving. In the summer of 1834, accompanied by his family, he went to Europe, and traveled through England, France, Germany, and Italy, remaining in the latter country for a considerable time. In 1845 he again visited Europe, and still again in 1849, when he extended his journey to Egypt and the Holy Land. The incidents of these and subsequent travels, both in Europe and America, were described in letters written to the *Evening Post*, which were reprinted in separate volumes, entitled 'Letters of a Traveler,' and 'Letters from Spain and Other Countries.' A complete edition of his poems up to 1855 was published in that year, and in 1863 appeared a small volume entitled 'Thirty Poems.' His last works of importance are his translations of the 'Iliad' (1870) and the 'Odyssey' (1872), translations which many American critics rank above any that had hitherto appeared in the English language. Early in 1878 appeared 'The Flood of Years,' his last poem of any great length, in which the poet, in strains that remind the reader of 'Thanatopsis,' reviews the life of man as the ridge of a wave ever hurrying on to oblivion the forms that appear on its surface but for a moment, concluding, however, with the expression of a confident hope in the future of mankind, even though the present is most dark and drear. At the time of his death he was engaged, in conjunction with Sydney Howard Gay, on a popular history of the United States, the first volume of which appeared in 1876.

Bryaxis, Greek sculptor: flourished in the 4th century B.C. He cast a statue in bronze of Seleucus, king of Syria, and assisted in adorning the mausoleum with bas-reliefs. He also executed five gigantic statues at Rhodes, a statue of Pasiphææ, and other works. According to Clemens Alexandrinus, two of his statues were attributed by some to the celebrated Phidias.

Bryce, George, Canadian clergyman and educator: b. Mount Pleasant, Ontario, 22 April 1844. He was graduated at the University of

WILLIAM CULLEN BRYANT.

Toronto in 1867, and was ordained to the Presbyterian ministry in 1871. His great work was the foundation of Manitoba College and in assisting the foundation of Manitoba University. He has written: 'Manitoba, Its Infancy, Growth, and Present Condition' (1882); 'A Short History of the Canadian People' (1886); and 'Canada and the Northwest' (1887).

Bryce, James, British historian and politician: b. Belfast, 10 May 1838. His father, James Bryce, LL.D., was a Scotchman, well known as a distinguished teacher and geologist, and a master in the high school of Glasgow from 1846 to 1874. He received his early education at the high school and University of Glasgow, and latterly at Trinity College, Oxford, where he graduated B.A. with a double first-class in 1862, being in the same year elected a Fellow of Oriel College. In 1867 he became a barrister of Lincoln's Inn. From 1870 till his resignation in 1893, he was regius professor of civil law at Oxford. He entered Parliament in 1880 as member for the Tower Hamlets division of London, and since 1885 he has represented South Aberdeen as a Liberal and Home Ruler. He was chancellor of the duchy of Lancaster and a member of the cabinet in the Liberal ministry of 1892, and two years later he became president of the Board of Trade, a post which he held till the change of government ensuing upon the general election of 1895. In 1905 he became Chief Secretary for Ireland and in December 1906 ambassador to the United States. He is D.C.L. of Oxford, LL.D. of Edinburgh and Glasgow; in 1894 he was elected a Fellow of the Royal Society, and many foreign honors have been conferred on him. His two most important works are: 'The Holy Roman Empire' (1864, afterward enlarged and republished) and 'The American Commonwealth' (1888), a very full exposition of the American Constitution, system of government, and administration, political machinery, etc. He has also written: 'Transcaucasia and Ararat' (1877); 'Impressions of South Africa' (1897); and 'Studies in History and Jurisprudence' (1901).

Bryce, Lloyd, American editor and novelist: b. Long Island, N. Y., 1852. From 1889 to 1896 he was editor of the 'North American Review.' His works include: 'Paradise'; 'A Dream of Conquest'; 'The Romance of An Alter Ego'; 'Friends in Exile.'

Bryden, Henry Anderson, English author: b. 3 May 1854. He was educated at Cheltenham College, and later studied for the bar. In early life he won a national reputation as an athlete, especially as runner. His travels in South Africa have been extensive. Among his books are: 'Kloof and Karroo: Sport, Legend, and Natural History in Cape Colony'; 'Gun and Camera in Southern Africa'; 'Tales of South Africa'; 'The Victorian Era in South Africa'; 'Nature and Sport in South Africa'; 'An Exiled Scot' (1899); 'Animals of Africa' (1900); 'From Veldt Camp Fires' (1900).

Brymner, Douglas, Canadian archivist: b. Greenock, Scotland, 1823. Trained for a mercantile career, he was engaged in business until 1856, when ill health compelled his retirement. He emigrated to Canada in 1857, and engaged in journalism, becoming editor of the Presbyterian and associate editor of the Montreal *Herald*.

In 1872 he was appointed historical archivist of Canada, and for 30 years labored tirelessly in collecting and arranging the historical records and documents of the Dominion. His series of annual reports, each entitled 'Report on the Canadian Archives,' constitute a rich treasury of original documents for every phase of Dominion history.

Bryn Mawr College, an educational institution for women, at Bryn Mawr, Pa.; founded in 1880 by Joseph Taylor. Its standard of admission is very high; its system of undergraduate studies combines required courses and varied elective groups. At the end of 1902 it reported: Professors and instructors, 38; students, 339; volumes in the library, 32,000; productive funds, \$1,000,000; income, \$131,000; benefactions, \$25,000.

Bry'ony (*Bryonia*), a genus of seven climbing perennial herbs of the natural order *Cucurbitacea*, natives of Europe and Asia. Common bryony (*B. dioica*), which attains a height of from 6 to 12 feet, has long, white, branching, ill-smelling, fleshy roots, one half inch thick; five-lobed roundish leaves; racemes of staminate flowers and axillary, greenish-white, pistillate, short-stemmed flowers in corymbs, followed by red berries as large as peas. Probably because of its repulsive odor the plant has been reputed as poisonous, but is used to some extent medicinally. The young shoots of this and the following species are often used like spinach. Common bryony is frequently planted for ornament in Europe, but like its relatives has not become very popular in the United States for this purpose. White bryony (*B. alba*) attains a height of from 6 to 12 feet, has thick, yellowish tuberculate roots, long-stemmed leaves and long-stemmed pistillate flowers in racemose corymbs. Abyssinian bryony (*B. abyssiniana*), which by some botanists is considered a species of the genus *Coccinia*, yields edible roots. Black bryony (*Tamus communis*), belongs to the natural order *Dioscoreacea*.

Bryophyl'lum, a small genus of succulent herbs of the natural order *Crassulariacea*, natives of warm climates. *B. calycinum*, the only species cultivated in greenhouses, is a native of the Maluccas and Mexico. It is two to four feet high with reddish stems, fleshy leaves, and compound panicles of pendulous flowers. Both calyx and corolla are reddish green and cylindrical, the former about an inch long, the latter two inches or more. The plant is specially interesting since the leaves when laid on damp sand or moss or placed in moist air, produce new plants from the notches in their margins. In Bermuda, where they are called "floppers," in some of the West Indian islands, and parts of the southern United States, the plant is a weed in fence rows, upon stone walls, etc., and sometimes a pest in fields. Its leaves are said to be tart in the morning, tasteless at noon, and bitterest in the evening, from the absorption of oxygen at night and its release in daylight.

Bryozo'a, the name given by Ehrenberg to a class of molluscoid animals, the peculiarities of which had been previously observed by J. V. Thompson, who had called them polyzoa. See POLYZOA.

Brzesc Litewski, b-zětch lĭ-těff'skĭ, or **Brest Litovsky**, Russia, a fortified town in the government of Grodno, on the right bank of

the river Bug, about 110 miles south of Grodno. It was formerly the capital of a Lithuanian palatinate, and contains an old castle, a high school, three churches, and a synagogue, and has a considerable transit trade. It is at the junction of railroads from Odessa to Königsberg and Moscow to Warsaw, and two fairs are held here annually. In 1794 Suwaroff gained here a victory over the Poles. Pop. (1897) 46,500.

Bua, boo'a, a small island in the Adriatic, belonging to the Dalmatian district of Spalatro, Austro-Hungary; is connected with the town of Trau by a bridge. During the latter period of the Roman empire many political offenders and heretics were confined here. It contains six villages, of which Santa Croce, or Bua, is the principal. The productions of the island comprise dates, wine, olives, and particularly asphaltum, of which there is a remarkable well.

Buache, Philippe, fê-lêp bü-âsh, French geographer: b. Paris, 7 Feb. 1700; d. 24 Jan. 1773. He spent seven years in arranging a new repository of maps and charts. In 1729 he became chief geographer to the king, and in the following year a member of the academy of sciences, in which he had been the means of instituting a professorship of geography. His notions of geography were in some respects peculiar. He asserted that there was a vast continent about the South Pole, traversed by lofty mountains and gigantic rivers. The suggestion, that at Bering Strait a connection between Asia and America might be traced, came from him. He published 'Considerations géographiques et Physiques sur les Nouvelles Découvertes au nord de la Grande Mer' (1753); 'Atlas Physique' (1754).

Buansuah, boo-an-soo', a wild dog (*Cyon primævus*), found throughout India, especially in the forests along the foothills of the Himalayan Mountains. It is smaller than a wolf, but similar in habits, and reddish in color. It hunts in companies, and a pack of these dogs is able to overcome any of the wild beasts in the jungle, except the elephant and rhinoceros, but they are very shy of mankind. It is generally known in the south as the dhole. See Dog.

Bubach. See INSECT POWDER.

Bu'balis or **Bubale**, a North African antelope (*Alcelaphus bubalinus*), thought to be the bubalus of the ancients. It is one of the hartbeests (q.v.), and equals a large stag in size, with an ox-like head and muzzle, and lyrate horn, heavily ringed. It is bay in color, with a black tuft on the end of the tail.

Bubas'tis, or **Bubastus**, a city of ancient Egypt, now in ruins; mentioned in the Old Testament as Pi-Beseth, now known as Tel-Basta; situated in the delta of the Nile, southwest of Tanis; was built in honor of the goddess Pasht, called by the Greeks Bubastis. This goddess was represented by the figure of a cat, and many mummied cats have been found in the tombs of Bubastis. On the north side of the city began the canal between the Nile and the Red Sea, constructed by Pharaoh Neco. Bubastis was taken by the Persians 352 B.C., and its walls dismantled. Among the ruins of this city have been found remains of costly and magnificent temples. Here were celebrated solemn feasts to the goddess Pasht.

attended by people from all parts of Egypt, even to the number of 700,000 at one time, as is stated by Herodotus.

Bubble Shell, the thin, inflated bubble-like shell of a gastropod mollusk (*Bulla*), the shell usually without a spire. On each side of the head is a large swimming flap (epipodium), and one species flits about in shallow pools on mud flats. Our eastern Atlantic coast species are *Bulla occidentalis* and *Haminea solitaria*, the latter found in Vineyard Sound. They mostly live in rather deep water, at least below low-tide mark.

Bubna und Littitz, boob'na, lît-tîtz', **Ferdinand** (COUNT OF), Austrian field marshal: b. Zamersk, Bohemia, 1768; d. Milan, 6 June 1825. He was early in life the chamberlain of the emperor of Austria, afterward entered the military service, and after distinguishing himself on various occasions, at Manheim, in the defense of Bohemia (1800), and at Austerlitz, gained at Wagram, in 1809, the rank of field-marshal-lieutenant. In the war of 1813 he commanded an Austrian division with much honor, was present at the battles of Lützen, Bautzen, Dresden, and Leipsic, and in 1814 received the chief command of the Austrian army which was to pass through Geneva to the south of France. He advanced upon Lyons, but was unsuccessful, till the corps of Bianchi and Hessen-Homburg came to his assistance. Bubna remained at Lyons till the return of the allied forces, and then retired to Vienna. After the landing of Napoleon in 1815, he again led a corps against Lyons, and in Savoy opposed Marshal Suchet, till Paris was conquered, and the marshal retreated beyond Lyons. He then took possession of Lyons without opposition, established a court-martial to punish the disturbers of public order, and proceeded with greater severity than on his former campaign. In September he marched back to Austria, and received for his services valuable estates in Bohemia from the emperor. In the insurrection of Piedmont, 1821, the Count de Bubna received the chief command of the Austrian troops destined to restore the ancient government. After the accomplishment of this commission, he was appointed general commandant of Lombardy.

Bu'bo, a genus of birds belonging to the family *Strigida*, or owls. They have a small ear aperture, two large feathered tufts like horns on the sides of the head, and the legs feathered to the toes. *B. maximus* is the eagle owl, or great owl. It is a native of Europe. The corresponding American species is *B. virginianus*.

Bubo, a hardening and enlargement of lymphatic glands, generally the inguinal, as in the Oriental or Levantine plague, syphiloid gonorrhœa, etc., always, unless dissipated by medical interference, followed by suppuration. In cases of true infecting syphilis a suppurating bubo is a rare complication, although induration of the glands in the later forms of the disease is almost invariably present. See BUBONIC PLAGUE.

Bubon'ic Plague, a disease supposed to be identical with the plague known as the Black Death, which had its origin in China, and made its first appearance in Europe 543 A.D., at Constantinople. It derives its modern name from the fact that it attacks the lymphatic glands in the neck, armpits, groins, and other parts of

BUBONIC PLAGUE

the body. The swollen parts are extremely sensitive to the touch, the patient suffers from headache, vertigo, high fever, vomiting, and great prostration. Another feature is the appearance of purple spots and a mottling of the skin. In severe cases death generally ensues in 48 hours, and, at best, recovery is slow. It is now generally agreed that this plague is a germ disease. The bacillus has been identified by Indian bacteriologists as well as by European and American investigators. It is found without trouble in the blood of the patient, and cultures are made in beef tea or glycerine preparations. The bacilli resemble those of chicken pox, and are said not to survive more than four days of desiccations. At the Hoagland laboratory in Brooklyn, N. Y., extensive experiments have been made, both in the culture of the germs and in an anti-toxin, by means of which immunity from this scourge may be obtained. The disease has been called "the poor's plague," from the fact that it first attacked the half-starved masses who congregate in the slums of the cities. This was the case in Bombay, where so fatal were its ravages that a panic ensued and more than 450,000 people, one half the population, left the city. Pure air, wholesome food, the free external use of cold water, and proper sanitary regulations modify to some extent the attacks of the plague, and, more than anything else, have been the cause of the comparative exemption of Europeans from it. It has, however, visited some of the cities of Europe.

History.—The first authentic description of the bubonic plague is contained in the writings of Rufus of Ephesus, who described the disease as having existed in northern Africa during the 3d or 4th century B.C. He presented the testimony of physicians of that period to corroborate his arguments. Since that time the disease has been variously described by writers under the name of Levantine, Oriental, and Bubonic Plague, and the black plague, or black death. These designations are more or less open to criticism and lack scientific foundation. In the reign of Justinian, 542 A.D., the disease appeared in Egypt, and within a year extended to Constantinople, where it is said to have caused the death of 10,000 persons in one day. In 1352 the plague spread through the whole of Europe and nearly one fourth of the population died. It is estimated by Hecker that during this reign of terror, out of 2,000,000 inhabitants of Norway, but 300,000 survived. It was estimated by Pope Clement VI. that the mortality from black death for the entire world was 40,000,000. This outbreak lasted about 20 years. During the great plague of London, in 1665, there were 63,506 deaths out of a population of 460,000. It was believed the infection was introduced by bales of merchandise from the Levant. The sanitary condition of London, at the time, was notoriously bad. It is a significant fact that those who lived out of town and on barges and ships on the Thames did not contract the disease.

Characteristics.—The bacillus of the bubonic plague was discovered and studied by Kitasato and Yersin, working independently, and at about the same time, in 1894, during the epidemic of the plague at Hong Kong. It is found in large numbers in the pus, in the lymphatic glands, and occasionally in the internal organs. It is apparently present in the blood only in the acute

hemorrhagic types of the disease, and shortly before death. An anti-plague serum injected into a young Chinaman at the Catholic mission at Canton in June 1896, who was attacked with a severe type of the disease, was effective. It is believed the plague is transmitted solely through infection from previous cases. What part, if any, the soil plays in propagating the disease has not been settled. The natives of Eastern countries are strongly impressed with the belief that the germ is contained in the ground. Exactly what influence the climate and temperature have in the propagation of the plague is not known. It is apparent, however, that hot, dry air is fatal to the disease, and that moist, warm air is favorable to it. It even may be very active in cold weather. This was shown by the outbreak that occurred on the Volga River, in Russia, in the severe winter of 1878. Like typhus fever, the plague is unknown in the tropics, and, like typhus, again, usually selects its victims from the lowest class, and thrives on filth and famine. The usual period of incubation is from three to six days. In the usual or severe forms, the earlier symptoms are similar to those that usher in typhus fever. The invasion is abrupt, associated with chills, great depression, blunted condition of the intellect, pains in the bones and high fever. Death frequently occurs within 48 hours, and even earlier. When life is prolonged for five or six days the prognosis is more favorable. The germ can be carried in rags, general merchandise and clothing. Rigid quarantine with disinfection of all articles should be strictly enforced when it appears in any country.

Remedies.—The chief causes of the plague are famine and filth. Serums seem to be unavailable against these obstacles, as is even the use of antipyretics or stimulants. As a preventive serum, that of Prof. Haffkins has proven the most effectual. See SERUM THERAPY. The compulsory evacuation of infected cities and districts has accomplished much. Indeed, this was the most available remedy during the epidemic in the Punjab district in 1896-7, and is the first preventive of a spread in case of an outbreak. The cities of India lie close to the river, the same being sacred, and the population multiplying upon their banks. As the river bottoms prevent proper drainage this militates largely in favor of the disease. The miserable "chawli," or huts, of the natives, squat low on the alluvial soil, which absorbs all drainage and gives out pestilential gases. The Hindu has little or no vitality to battle with the disease. His state of demoralization makes a livelihood impossible, and famine fosters the plague. The Mohammedans, unlike the Hindus, do not burn their dead bodies; nor like the Parsees, place them in the Towers of Silence, on Malabar Hill, to be eaten by the vultures. By burying in shallow graves, they aid the spread of the disease, contaminating all underground supplies of water.

Animals also spread the plague. Mice, rats, cats, and monkeys have been known to infect a ship and bring the scourge from a foreign port. Excessive precautions are taken at all ports leading from Asia, that of the Suez Canal being the most dangerous and carefully guarded highway into Europe. Every ship and, indeed, every passenger and piece of baggage is scrutinized, with a view to discovering the first symptoms of the plague in the victim or suspicious article of

merchandise that may lead to infection. Precautions, however, are quite impossible in the incipient stages of the disease, as the evidences may not appear in the victim till he or she is already marked for death. Fever, swelling of the lymphatic glands, and utter prostration are soon superseded by the appearance of the bubos in groin, neck, and face, when death occurs in 90 cases out of a possible 100, within a period varying from five hours to as many weeks, depending upon the constitution of the victim. The white races are more immune than any other. The mode of life in civilized countries is conducive to successful battle with the plague. As it is rather sporadic than epidemic, even in the East, there should be little fear of its securing a foothold on western soil. Two cases of the disease were brought into New York harbor, 18 Nov. 1899, from Santos, Brazil, on the British steamship *J. W. Taylor*. The infected vessel was refused a landing, but was placed in quarantine and steps instantly taken to make sure and complete the isolation of the disease. Health Officer Doty, of New York, announced that the chances of the bubonic plague reaching this country through the ports of New York were extremely remote. Active measures were also taken in the summer of 1900 to disinfect the Chinese quarter of San Francisco in which the plague had appeared. In Honolulu heroic measures were adopted to stamp out the infection.

Bucaramanga, boo-ka-ra-mán'ga, the capital of the department of Santander, in Colombia, South America, 185 miles north-northeast of Bogota. It is an important coffee centre, and in the neighborhood are mines of gold, copper, and iron. A United States consul is resident here. Pop. 16,000.

Bucareli y Urzua, Antonio Maria, än-tō'nē-ō mā-ré'ā boo-cā-rá'lē ē ūrt-zoo'ā, Spanish soldier and administrator: b. Seville, 24 Jan. 1717; d. Mexico City, 9 April 1779. He was governor of Cuba in 1760-71, and viceroy of New Spain (Mexico) from 1771 till his death.

Buccaneer, The, a narrative poem by Richard Henry Dana. It was first published in 1827, and the scene of a portion of the work is laid in Block Island, Rhode Island.

Buccaneers', a name applied to various bands of English and French freebooters in America, whose exploits form a remarkable part of the history of the 17th century. The origin of these associations of buccaneers seems to have been the arrogant pretensions of the Spaniards to the dominion of the whole of America. The English and French settlers combining against them for mutual defense, acquired from their precarious life in the vicinity of the Spanish settlements, adventurous and lawless habits, and became ultimately, in some of the islands of the Caribbean Sea, little better than pirates. The earliest association of this kind began about 1525, but they afterward assumed greater magnitude. After the assassination of Henry IV. in France in 1610, several Frenchmen sought a residence on the island of St. Christopher, one of the Antilles. Driven thence in 1630, some of them fled to the western coast of San Domingo, others to the small island of Tortugas, in the vicinity. Several Englishmen, led by a similar disposition, associated themselves with the latter. The fugitives at San Domingo employed

themselves especially in the chase of wild cattle, of which there were large herds on the island. They sold the hides to the mariners who landed on the coast, and as they cured the flesh by smoking it before the fire, like the American savages, they were called buccaneers, from the Caribee *boucan*, a place for smoke-drying meat. These hunters lived in the rudest state of nature, enjoying in common all that they had taken in the chase or acquired by robbery. The Spaniards, who could not conquer them, determined to extirpate all the cattle on the island, and thus obliged the buccaneers either to cultivate the land as husbandmen, or to join the other freebooters on the island of Tortugas. These bold adventurers attacked, in small numbers and with small means, but with an intrepidity which bade defiance to danger, not only single merchant vessels, but several of them together, and sometimes armed ships. Their common mode of attack was by boarding. They directed their efforts especially against the Spanish ships which sailed for Europe laden with the treasures of America. By the repeated losses which they suffered, the Spaniards were at last so discouraged that they seldom offered a serious resistance. It happened once that a ship of the buccaneers fell in with two Spanish galleons, each of which had 60 cannon, and 1,500 men on board. To escape was impossible, and the pirates could not think of surrender. Their captain, Laurent, made a short speech to them, sent one of his men to the powder room with orders to set fire to it upon the first sign which he should give him, and then placed his men in order of battle on each side. "We must sail between the enemy's ships," cried he to his crew, "and fire upon them to the right and left." This manœuvre was executed with extraordinary rapidity. The fire of the pirate killed so many people on board both ships that the Spaniards were struck with a panic, and let him escape. The Spanish commander was afterward put to death on account of the disgrace which he had brought upon his nation. Their frequent losses greatly reduced the trade of the Spaniards with America. The buccaneers now began to land on the coast, and to plunder the cities. Their manner of dividing the booty was remarkable. Every one who had a share in the expedition swore that he had reserved nothing of the plunder. A false oath was of extremely rare occurrence, and was punished by banishment to an uninhabited island. The wounded first received their share, which was greater according to the severity of their wounds. The remainder was divided into equal parts, and distributed by lot. The leader received more than the others only when he had particularly distinguished himself. Those who had perished in the expedition were not forgotten. Their part was given to their relations or friends, and in default of them, to the poor and to the Church. Religion was strangely blended with their vices, and they began their enterprises with a prayer. The wealth acquired was spent in gambling and debauchery, for it was the principle of these adventurers to enjoy the present and not care for the future. The climate and their mode of life gradually diminished their number, and the vigorous measures of the British and French governments at last put an end to their outrages, which had, perhaps, been purposely tolerated. From this band of pirates arose the French set-

tlements on the western half of San Domingo. In the beginning of the 18th century the piracies of the buccaneers had entirely ceased. See Burney, 'History of the Two Indies'; Burney, 'History of the Buccaneers'; Stockton, 'Buccaneers and Pirates of Our Coasts' (1898).

Buccari, book'ka-rē, or **Bakar**, an Austro-Hungarian free port on the Gulf of Quarnero, a few miles east of Fiume. It stands on the slope of a hill with a castle at the top, and its harbor, though small, is safe. Fishing, ship-building, and linen manufacturing are carried on here, the tunny fisheries being of the greatest importance. The wine of the district is also exported. Pop. (1890) 1,950.

Buc'cinator, the trumpeter's muscle, one of the maxillary group of muscles of the cheek. They are the active agents in mastication. The buccinator circumscribes the cavity of the mouth and, aided by the tongue, keeps the food under the pressure of the teeth; it also helps to shorten the pharynx from before backward, and thus assists in deglutition.

Buccin'idæ, a family of mollusks belonging to the order *Prosobranchiata*, and the section *Siphonostomata*. They constitute part of Cuvier's *buccinoïda*. They have the shell notched in front, or with the canal abruptly reflected so as to produce a varix on the front of the shell. The leading genera are *buccinum terebra*, *eburna*, *nassa*, *purpura*, *cassis*, *dolium*, *harpa*, and *oliva*. These shellfish are much valued as the source of the dye commonly called royal purple.

Buccinum, the typical genus of the family *Buccinidæ*. In English they are called whelks, which are not to be confounded with the periwinkle, also sometimes called whelk. *B. undatum* is the common whelk. Species of the genus exist in the cretaceous rocks, but it is essentially Tertiary and recent.

Bucleugh, бүк-klü', the title (now a dukedom) of one of the oldest families in Scotland, tracing descent from Sir Richard le Scott in the reign of Alexander III. (latter half of the 13th century), and first becoming conspicuous in the person of the border chieftain Sir Walter Scott, of Branxholm and Bucleugh—the latter an estate in Selkirkshire. The son of Sir Walter, bearing the same name, was raised to the peerage, in 1606, as Lord Scott of Bucleugh, and his successor was made an Earl in 1619. In 1663 the titles and estates devolved upon Anne, daughter of the second Earl, who married the Duke of Monmouth, illegitimate son of Charles II., the pair, in 1673, being created Duke and Duchess of Bucleugh, etc. Subsequently the dukedom of Queensberry passed, by marriage, into the family. The sixth Duke of Bucleugh, William Henry Walter Montagu Douglas-Scott, succeeded to the title in 1884.

Bucen'taur, a mythological being, half man and half ox or ass. The splendid galley in which the Doge of Venice annually sailed over the Adriatic on Ascension Day also bore this name. Dropping a ring into the sea, he espoused it in the name of the republic, with the words, "Desponsamus te, mare, in signum veri perpetuæ dominii." The custom originated in 1176, when the doge, having refused to deliver up the Pope, who had taken refuge in Ven-

ice, to the emperor, encountered and defeated the imperial fleet which was sent to reduce the Venetians.

Buceph'alus, the horse of Alexander the Great, which he bought for 13 talents (about \$5,000). Philonicus, a Thessalian, offered to sell him to King Philip; but Philip, who considered the price too great, commanded the unmanageable steed to be led away, when the young Alexander offered to mount him. He mounted accordingly, and to the astonishment of all, the horse obeyed him, and willingly submitted to his guidance, though he had never before obeyed a rider. Alexander, from this circumstance, conceived such an affection for him that he never rode upon any other horse; and Bucephalus also, when caparisoned for battle, suffered no other rider. He died of a wound, and Alexander caused him to be buried near the Hydaspes, and built over his grave a city, which he called Bucephala.

Bucer, bü'sér, or **Butzer**, **Martin**, German Protestant theologian: b. Schelestadt, Alsace, 11 Nov. 1491; d. Cambridge, 28 Feb. 1551. He entered the Dominican order in 1506, but in 1521 left the order, and became a convert to Lutheranism. He was at first preacher at the court of Frederick, the elector of the Palatinate, afterward in Strasburg, and at the same time professor in the university there for 20 years. He took part in the conference of Marburg with the hope of reconciling Luther and Zwinglius. In 1548 King Edward VI. of England, at the suggestion of Archbishop Cranmer, invited him to Cambridge, where he was professor of theology. In 1557 Queen Mary caused his bones to be burned. The Cardinal Contarini called him the most learned divine among the heretics. He wrote a commentary on the Psalms under the name of Aretius Filinus, and many other works. See Baur, 'Capito and Butzer' (1860); Tollin, 'Servet und Butzer' (1880); Mentz and Erichsen, 'Zur 400-jährigen Geburtsfeier Martin Butzer' (1891).

Buch, **Leopold von**, lä'ö-pöld fön boor, German geologist: b. Stolpe, Prussia, 26 April 1774; d. Berlin, 4 March 1853. He studied under the celebrated Werner in the mining school of Freiberg in Saxony, where Alexander von Humboldt was his fellow-student, and early began to distinguish himself by his geological writings. His first works were Descriptions of the Mineralogy of Landeck, and of the Geognosy of Silesia. Up to 1798 he had adopted the Neptunian theory of Werner, with some modifications; but now saw cause to abandon it, and to recognize the volcanic origin of the basalts. He saw Vesuvius for the first time in 1799; but afterward, in 1805, had an opportunity, along with Humboldt and Gay Lussac, of witnessing its actual eruption. In 1802 he examined the extinct volcanoes of Auvergne in the south of France. The results of all these geological travels were given to the world in a work entitled 'Observations During Travels in Germany and Italy' (1802-9). Indefatigable as an observer, Von Buch turned his steps from the south of France in 1806, and proceeding to Scandinavia spent two years in examining its physical constitution. This furnished the materials for his well-known work entitled 'Travels in Norway and Lapland.' In 1815 he visited the Canary Isles. These volcanic isles furnished

the starting point from which Von Buch commenced a regular course of study on the production and activity of volcanoes. This is attested by his standard work on the subject, entitled 'Physical Description of the Canary Isles' (1825). On his return from the Canaries he visited the basaltic group of the Hebrides and the coasts of Scotland and Ireland. His geological excursions, even in countries which he had repeatedly visited before, continued without interruption at a very advanced age, till within a few months of his death. Alexander von Humboldt, who had known him intimately for a period of more than 60 years, called him the greatest geologist of our period. He was unmarried, and lived aloof from the world, entirely devoted to scientific pursuits. Besides the works already mentioned he was the author of many important tracts on paleontology, as, 'On the Ammonites' (1832); 'On the Terebratulæ' (1834); 'On the Ceratites' (1841); and 'On the Cystide' (1845). Another of his works not to be omitted is his 'Geological Map of Germany.'

Buchan, bŭk'ān, Alexander, Scottish meteorologist: b. Kinnesswood, Kinross-shire, Scotland, 11 April 1829. He was a teacher in Edinburgh, 1848-60, becoming in the latter year secretary to the Scottish Meteorological Society and in 1878 curator of the library and museum of the Royal Society of Edinburgh. He has published 'A Handy Book of Meteorology' (1867); 'Introductory Text-Book of Meteorology' (1871). He contributed to the Encyclopædia Britannica, 9th edition, the article on 'Meteorology.'

Buchan, David, English voyager and explorer: b. 1780; d. about 1837. He obtained a lieutenant's commission in the navy in 1806, and in 1810 his admiral, Sir John Duckworth, dispatched him to the river Exploits, for the purpose of exploring the interior and opening a communication with the natives. He reached the mouth of the river in January 1811, and with 34 men and 3 guides penetrated through the greatest difficulties 130 miles into the country. Buchan afterward became high sheriff of Newfoundland. On a subsequent expedition he was lost with his ship Upton Castle. In 1818 Buchan was appointed to the command of an Arctic expedition. The admiralty fitted out two expeditions that year—one to discover the northwest passage, the other to reach the North Pole. The Dorothea and Trent were the vessels selected for the second expedition, under Capt. Buchan and Lieut. (afterward Sir John) Franklin. Latitude 80° 34' N. was the most northerly point gained by this expedition.

Buchan, John, Scottish novelist: b. Perth, Scotland, 26 Aug. 1875. He was educated at Glasgow University and Brasenose College, Oxford. His published books include 'Sir Quixote' (1895); 'Musa Piscatrix' (1896); 'Scholar Gipsies' (1896); 'Sir Walter Raleigh' (1897); 'John Burnet of Barns' (1898); 'A History of Brasenose College' (1898); 'Grey Weather' (1899); 'A Lost Lady of Old Years' (1899); 'The Half-hearted' (1900); 'The Watcher by the Threshold' (1902).

Buchan, Elspeth (SIMPSON), Scottish religious enthusiast, founder of a sect: b. near Banff, 1738; d. near Dumfries, 1791. She was educated in the Scottish Episcopal Church, but

on her marriage to Robert Buchan, in Glasgow, became, like him, a burgher seceder. In 1779, or thereabout, she broached dogmas of her own, soon deserted her husband and moved to Irvine, where she made a number of converts, among them Mr. Hugh Whyte, a relief clergyman. In 1784, the people assaulted Mr. Whyte's house, which the Buchanites had made their tabernacle. They then, 46 persons in all, set up a sort of community at a farm-house 13 miles from Dumfries, waiting for the millennium or the day of judgment, fasting for weeks in the expectation that they would be fed like the young ravens that cry, and adjuring all fleshly vanities. A few left, accusing Mrs. Buchan of tyranny and dishonesty, but the majority of her votaries were faithful to her to the last. She called her disciples around her death-bed and communicated to them, as a secret, that she was the Virgin Mary, who had been wandering through the world since the Saviour's death, and that she was only going to sleep now, and would soon conduct them to the new Jerusalem. Her disciples, in the expectation of her re-appearance, refused to bury her until ordered by a justice of the peace. The sect became extinct in 1848. See BUCHANITES.

Buchan, William, Scottish physician: b. Ancrum, Roxburghshire, 1729; d. 1805. He commenced practice at Edinburgh, and having for a considerable time directed his attention to a digest of popular medical knowledge, published in 1769 his work entitled 'Domestic Medicine; or, the Family Physician,'—an attempt to render the medical art more generally useful by showing people what is in their own power, both with respect to the prevention and cure of diseases. It is constructed on a plan similar to that adopted by Tissot in his 'Avis au Peuple.' It appealed to the wants and wishes of so large a class of the community, that, considering it to have been the first work of the kind published in Britain, there is no wonder that it should have attained success. Before the death of the author 19 large editions had been sold. Duplanil of Paris, physician to the Count d'Artois (Charles X.), published a translation in five volumes, with notes, which rendered the work so popular on the Continent that in a short time no language in Christendom wanted its translation. It would almost appear that the work met with more undivided applause on the Continent than in Britain. While many English and Scottish physicians conceived that it was as apt to generate as to cure or prevent diseases, by inspiring the minds of readers with hypochondriacal notions, those of other countries entertained no such suspicions. Among the testimonies of approbation which Dr. Buchan received from abroad was a huge gold medalion, sent by the Empress Catherine of Russia, with a complimentary letter. The work became more popular in America and the West Indies than in the older hemisphere. Buchan published two other works: 'A Treatise on Gonorrhœa'; 'An Advice to Mothers on the Subject of their own Health, and on the Means of Promoting the Health, Strength, and Beauty of Their Offspring.' He was buried in Westminster Abbey.

Buchanan, bū-kān'ān, Andrews Hays, American educator: b. Washington County, Ark., 28 June 1828. He was graduated at Cum-

berland University in 1853; and took a special course in civil engineering and mathematics in Lincoln University; taught civil engineering in 1854-61; was military topographical engineer in the Confederate army during the Civil War; and became professor of mathematics and civil engineering in Cumberland University in 1869. He was employed by the superintendent of the United States Coast and Geodetic Survey to take charge of the triangulation of Tennessee, on which work he was engaged for four months in every year from 1876 to 1896. He was the author of 'Plane and Spherical Trigonometry'; etc.

Buchanan, Claudius, Scottish missionary clergyman: b. Cambuslang, Scotland, 1766; d. 1815. He took orders in the Church of England, and was appointed chaplain to the East India Company in 1795. From this time the remainder of his life was occupied in missionary labors in India, and in forwarding the translation of the Bible into the Indian languages. In 1800 he was appointed professor of Greek, Latin, and English in the College of Fort William. He returned to Europe in 1808, afterward visited the Holy Land, and was engaged at his death in a translation of the New Testament into Syriac. He published 'Christian Researches in Asia, with a Notice of the Translation of the Scriptures into the Oriental Languages' (1811), and several other works.

Buchanan, Francis, Scottish traveler: b. Stirlingshire, 15 Feb. 1762; d. 1829. He traveled extensively in the East Indies, making collections illustrative of the botany, zoology, etc., of the countries which he visited, and published 'A Journey from Madras Through the Countries of the Mysore, Canara, and Malabar, Performed Under the Orders of the Marquis Wellesley for the Purpose of Investigating the State of Agriculture, Arts, and Commerce, etc., History, Antiquities, etc., in the Dominions of the Rajah of Mysore' (1807). He contributed largely to the scientific journals of the day, and in 1819 published a 'History of the Kingdom of Nepal,' and in the same year a 'Genealogy of the Hindu Gods,' which he had drawn up some years before with the assistance of an intelligent Brahmin. In 1822 appeared his 'Account of the Fishes of the Ganges,' with plates.

Buchanan, Franklin, American naval officer: b. Baltimore, 17 Sept. 1800; d. Talbot County, Md., 11 May 1874. At an early age he entered the navy, becoming lieutenant in 1825 and master-commandant in 1841. The organization of the United States Naval Academy was committed to him in 1845 and he was made the first superintendent. During the Mexican war he took part in the siege of Vera Cruz. In Commodore Perry's expedition to Japan he had command of the flagship. In 1855 he was raised to the rank of captain, and in 1861 resigned from the United States navy, intending to follow his State in secession, but later asked to be restored. Upon the refusal of his request, he entered the Confederate navy. In command of the Merrimac in Hampton Roads, he sank the Congress and the Cumberland, being severely wounded during the engagement. In 1863 he commanded the naval defenses at Mobile, Ala., there constructing the ram Tennessee. After promotion to the rank of admiral in the Confederate navy

he was for some time senior officer in the Confederate navy and commanded at the battle of Mobile Bay, where he was defeated by Farragut, lost a leg, and was made prisoner. At the close of the War he became president of the Agricultural College of Maryland.

Buchanan, George, the chief representative of humanism in Scotland: b. near Killearn, Stirlingshire, February 1506; d. Edinburgh, 28 September 1582. He came of Celtic stock, and his family though poor was of honorable descent, tracing connection, some five generations back, with the great houses of Albany and Lennox. His father died while George was a child, and the family of five sons and three daughters was brought up by his mother, born Agnes Heriot of Trabroun in Haddingtonshire. His early education was gained at the common schools, tradition naming those of Killearn and Dumbarton; and at the age of 14 he was sent by his maternal uncle to the University of Paris, then in the throes of the struggle between humanism and Lutheranism on the one hand, and scholasticism and Catholicism on the other. He remained here for two years, his principal academic occupation being the writing of Latin verse. At the end of these two years, the death of his uncle and his own serious illness compelled his return to Scotland. In the autumn of 1523 he took part in an abortive expedition against England, led by the Regent Albany. In the spring of 1525 he went to Saint Andrews, where he graduated in October of the same year, the fee for his Bachelor's certificate being remitted on account of poverty. He returned to Paris in 1526, and, after two years as a bursar of the Scots College there, he took his Master's degree. Beginning in 1529, he taught for three years as "regent" in the College of Ste. Barbe, one of the most fully equipped and most liberal in the University, receiving food and lodging from the College and fees from the students. Here he was already known as a writer of stinging epigrams. He resigned his regentship to become tutor to the young Earl of Cassillis, a post he occupied for five years, living at first in Paris, but returning to Scotland with his pupil in 1535. It was during the latter part of this engagement that he first roused the antagonism of the Franciscan order by his 'Somnium,' a Latin poem paraphrasing the well-known Scots satire 'How Dunbar was desyrit to be ane Fryer.' At the conclusion of his period with Cassillis, he was appointed tutor to one of the natural sons of James V., and through this came into close relations with the court. At the instance of the King he produced two more short satires against the Franciscans, and began his 'Franciscanus', a brilliant and elaborate piece of invective, finished much later. The wrath roused by these attacks forced Buchanan to flee from Scotland to save his life; and after a short sojourn in England, where he addressed poems to Henry VIII. and Cromwell, he returned to Paris. There he found Cardinal Beaton, who had been the chief agent in driving him out of Scotland, and for safety he was glad to accept a position in the Collège de Guyenne at Bordeaux, under André de Gouvéa, formerly his colleague at Ste. Barbe. He remained here three years, counting among his pupils

the celebrated Montaigne, and among his acquaintances, J. C. Scaliger. While at Bordeaux Buchanan translated into Latin the 'Medea' and the 'Alcestis' of Euripides, and composed his two original dramas, 'Jephthes' and 'Baptistes.' Leaving Bordeaux in 1542 or 1543, he seems to have returned to Paris, where he may have taught till about 1545 in the Collège du Cardinal Lemoine; but the record of these years is obscure, and for the next three we are altogether without evidence as to his residence or occupation. In 1547 we find him in Portugal, again under André de Gouvéa, teaching in the College of Arts of the University of Coimbra. On Gouvéa's death, the College fell into the hands of the Jesuits, who proceeded to accuse Buchanan of heresy. After a persecution of a year and a half, he was shut up for some months in a monastery to be instructed in the true faith by the monks. There he made most of his famous Latin translations of the Psalms, and during the same period produced his poems to Leonora. On his liberation in 1552, he spent a short time in England, then returned to France, where for a while he held once more the office of regent, this time in the Collège Boncourt. In 1555 his patron, Charles du Cossé, Comte de Brissac, appointed him tutor to his son Timoleon, whom he instructed from the age of 12 to that of 17, living sometimes in France, sometimes in Italy. During these years Buchanan seems to have given closer attention than formerly to the religious controversies of the day; and when he returned to Scotland about 1561, he took the side of the reformed Church of Scotland. In spite of this decision for Protestantism, we find him soon after his return acting as tutor to Queen Mary, and writing court masques and complimentary poems. He received an annual pension of 250 pounds Scots, a sum apparently inadequate to his needs. In 1564 the Queen bestowed on him a pension of 500 pounds Scots from the income of the Abbey of Crossraguel, but this he seems to have had difficulty in collecting. His friendly relations with Mary continued till the murder of Darnley in 1567, which turned him into her open enemy. He wrote the virulent 'Detectio Mariæ Reginae Scotorum,' the work which was the chief means of spreading throughout Europe a belief in the guilt of the Queen. Meantime Buchanan had become an important figure in the Scottish Church, and in 1567 he was Moderator of the General Assembly which demanded Mary's abdication in favor of her son. About this time he produced his two most important vernacular writings, the 'Admonition to the Trew Lordis', a pamphlet in support of the party of the young King James and against the house of Hamilton; and the 'Chamæleon,' an attack on Maitland of Lethington.

In 1566 Buchanan was appointed Principal of Saint Leonard's College of Saint Andrews University; but he resigned his Principalship in 1570 to take charge of the education of the young King, James VI., then four years old; and he continued to superintend his instruction for about eight years. During this period he was for a short time Director of Chancery, and later Keeper of the Privy Seal. In spite of these appointments, he does not seem to have held, or to have sought, a leading position

in politics. The most important writings of his later years were a dialogue, 'De Jure Regni apud Scotos,' a defence of Scotland's treatment of Mary; and his 'Rerum Scotticarum Historia,' published in 1582. In September of that year he died, and was buried in Grayfriars Churchyard in Edinburgh.

The comparative obscurity into which Buchanan's name and writings have sunk to-day is in striking contrast to the splendor of his contemporary reputation. Throughout the latter part of the sixteenth century he was regarded by men of letters in Europe as easily the most distinguished representative of humanism in Britain, and this reputation continued for more than a century after his death. The contrast is explained by the medium in which he wrote. Like most of his learned contemporaries, he had no doubt that Latin was to be the universal language of the future, and almost all his writings are in that language. His mastery of Latin remains the admiration of scholars, but for the world in general his works are dead.

By genius and temperament he was a poet, and his Latin verses represent his best work. These belong to the conventional types of his age. Of his satires, the most notable are those already mentioned, against the Franciscans. To modern taste they pass the bounds of decency; but in brilliance and point they stand in the first rank of post-classical productions. His epigrams are entitled to the same blame and the same praise. He wrote complimentary poems to most of the persons of distinction with whom he came in contact, and an epithalamium on the marriage of Mary and the Dauphin, containing a famous passage in praise of the Scots. More genuinely poetical is his piece on 'The First of May.' His love-poetry need not be taken as having any relation whatever to his experience. Such poems as those to Leonora and Neera are merely academic exercises in the fashion of the Renaissance on the model of Catullus and Tibullus. Of his dramatic efforts, the most artistic is 'Jephthes,' a play which still holds a place among the best of the attempts to revive the drama of antiquity. 'Baptistes,' under the guise of the story of John the Baptist, is a thinly veiled parable expressing Buchanan's views on kingship. His most ambitious poem is the 'De Sphæra,' an elaborate exposition of the Ptolemaic system of astronomy; and his most popular production is his Latin translation of the Psalms into a variety of classical metres. The last continued to be used as a schoolbook in his native country into the nineteenth century.

Of his prose works, his 'De Jure Regni' sets forth explicitly and with special reference to Scotland the same doctrine of the sovereignty of the people which was shadowed in 'Baptistes.' Both this work and his history earned the distinction of being later suppressed by the government. The 'Historia' covered the history of Scotland from the earliest times till 1580; and while far from being a critical work in the modern sense, is much more discriminating than most of the chronicles that preceded it. Its chief value is for the period of his own life, and here his authority is that of the honest partisan.

The general impression left by his work is

JAMES BUCHANAN,
FIFTEENTH PRESIDENT OF THE UNITED STATES.

BUCHANAN

that of an acute, vigorous, and independent mind, poetical rather than practical or philosophical; of a temperament capable of strong emotion; of a character showing some of the defects common to most men of his age, but on the whole straightforward and robust. And if the use of Latin has caused his writings to cease to be read to-day, it is to be remembered that for the Europe of his own time he was the foremost man of letters in Britain, and in the opinion of such judges as the Scaligers and Montaigne, the first Latin poet in Europe.

Bibliography.—Buchanan's complete works were collected by T. Ruddiman (re-edited by Peter Burman, 2 vols., Lugduni Batavorum, 1725). The vernacular writings have been issued by the Scottish Text Society, with life and notes by P. Hume Brown (Edin. 1892). The 'Lives' by Irving and Chalmers are now superseded by P. Hume Brown's 'George Buchanan' (Edin. 1890). Shorter sketches are those of D. Macmillan (Edin. 1906), and of Robert Wallace, 'Famous Scots Series' (Edin. 1900). His portraits are discussed in Drummond's 'Portraits of Knox and Buchanan' (1875). Bibliographies are given by Ruddiman and Irving.

WILLIAM A. NEILSON,

Professor of English, Harvard University.

Buchanan, George, Scottish surgeon: b. Glasgow, 1827. He became surgeon of the Western Infirmary of Glasgow and later served as civil surgeon with the British army in the Crimean war. In 1888 he was elected president of the surgical section of the British Medical Association, and in 1900 was appointed professor of clinical surgery in the Glasgow University. He was the author of 'Camp Life in the Crimea'; 'On Lithotrity, with Cases'; 'Clinical Surgery'; 'Radical Cure of Inguinal Hernia in Children'; 'Talipes Varus'; 'Faure's Storage Battery and Electricity in Surgery'; and 'Anæsthesia Jubilee, a Retrospect.' He was one of the editors of the 'Glasgow Medical Journal,' and also edited the 10th edition of the 'Anatomist's Vade Mecum.'

Buchanan, James, fifteenth President of the United States: b. Stony Batter, Franklin County, Pa., 22 April 1791; d. Lancaster, Pa., 1 June 1868. His father was by birth an Irishman, who had quitted Europe in 1783, and established himself on a farm at Stony Batter. The son was educated at Dickinson College, Carlisle, where he graduated. He subsequently entered the office of James Hopkins of Lancaster to study law, and was admitted to the bar in 1812. Although holding Federalist opinions at this time he supported the War of 1812. In 1814 he was elected to the legislature of Pennsylvania, and in 1820 was sent to Congress, of which he continued a member till 1831, being re-elected four times. He then entered upon a career of diplomacy, being charged by President Jackson with a special mission to Russia for the conclusion of a commercial treaty. On his return, in 1833, he was elected to the Senate. About this time the anti-slavery agitation began to assume importance. Buchanan wished to prevent the agitation reaching Congress, by declaring its incompetency to deal with it. He held that constitutionally it was a question for the individual States, and that it was better for all parties, even for the slaves themselves, that

it should remain so. Under the presidency of Polk, 1845-9, Buchanan was intrusted with the functions of secretary of state. The annexation of Texas and the war with Mexico were the chief events of his administration. During the presidency of Gen. Taylor he retired from public life. In 1853 Gen. Pierce, on being elected President, named him ambassador of the United States at London. He held this appointment till 1856. The Central American boundary and the project of the annexation of Cuba were the principal subjects discussed during his embassy. With Mason and Soulé he signed the Ostend manifesto which recommended the acquisition of Cuba. While maintaining with ability the views of his own country, he gained the esteem of that to which he was deputed by the prudence and moderate tone of his diplomacy. He returned to America in 1856, being chosen as candidate for the presidency by the Democratic party. He was elected by a large majority over Fremont, the Republican candidate, and inaugurated in March 1857. His foreign policy inclined to the aggressive views he had always advocated, but the questions of slavery and State-rights were at this period approaching a crisis which made home administration of much greater importance. As President he deferred constantly to pro-slavery leaders and was unduly influenced by their threats of secession. His character for statesmanship suffered greatly from his vacillation in dealing with the first measures of the seceders; but it must be considered that the position of a ruler holding office as the *locum tenens* of his successor is not favorable to a vigorous administration in a difficult crisis. He took up the position that while the States had no right to secede, the nation had no power to prevent their doing so. He supported the administration of Lincoln, and lent his influence to the vigorous prosecution of the War, declaring that the North would sustain the administration almost to a man, and that it ought to be sustained at all hazards. Consult his own defense of his course, 'Mr. Buchanan's Administration on the Eve of the Rebellion' (1866); Curtis, 'Life of James Buchanan' (1883).

Buchanan, Robert Christie, American soldier: b. Baltimore, about 1811; d. Washington, 29 Nov. 1878. He graduated at the United States Military Academy in 1830, and served in the Black Hawk war in the rank of second lieutenant. From 1837-8 he served in the Seminole war, and from 1845-6 in the military occupation of Texas. During the Mexican war he was promoted for gallantry. In 1856 he was placed in command of the military district of Oregon and northern California. Early in the Civil War he was promoted lieutenant-colonel. He fought in the Peninsular campaign, and on the Rappahannock, winning at Gaines Mills the rank of brevet-colonel, and at Malvern Hill that of brevet-brigadier-general. He was in the battles of Antietam and Fredericksburg, and was promoted brevet-major-general. In 1864 he was assistant provost-marshal for New York. In 1870 he retired from active service.

Buchanan, Robert Williams, English poet and novelist: b. Caverswall, Staffordshire, 18 Aug. 1841; d. London, 10 June 1901. He received his education in Glasgow, and while young went to London to engage in literature.

His attack upon Dante Gabriel Rossetti, 'The Fleshly School of Poetry,' drew a famous letter from that poet on 'The Stealthy School of Criticism,' and a scathing pamphlet from Swinburne, 'Under the Microscope' (1872). It should be added that in later life he regretted his course in this matter. His poems include 'Undertones' (1863); 'Idylls and Legends of Inverburn' (1865); 'London Poems,' his best effort (1866); 'North Coast Poems' (1867); 'Book of Orm, the Celt' (1868); 'St. Abe and His Seven Wives' (1871); 'Napoleon Fallen: a Lyrical Drama' (1871); 'The Drama of Kings' (1871); 'Ballads of Love, Life and Humor' (1882); 'The City of Dreams' (1888); 'White Rose and Red'; 'The Wandering Jew' (1893). His best novels are 'The Shadow of the Sword' (1876); 'A Child of Nature' (1879); 'God and the Man' (1881); 'The Martyrdom of Madeline' (1882); and 'Foxglove Manor' (1884).

Buchanan, William Insko, American diplomat: b. near Covington, Ohio, 10 Sept. 1852. Educated in country schools, living on a farm in early life; removed to Sioux City, Iowa, 1882. In 1894 he was appointed United States minister to the Argentine Republic; in 1903 was appointed United States minister to the Republic of Panama.

Buchana'nia, a genus of *anacardiaca*, named after Dr. Buchanan Hamilton, a well-known Indian botanist. *B. latifolia* is a large Indian tree, the kernel of the nut of which is much used in native confectionery.

Buchanites, *bük'an-its*, a sect of enthusiasts who sprung up at Irvine, in the west of Scotland, about 1783. Rev. Hugh White, the minister of a congregation of the Relief Church in that town, having been invited to preach in the neighborhood of Glasgow, Elizabeth Buchan, the wife of a painter, was captivated with his eloquence, and writing to him, announced that he was the first who had spoken to her heart, and requested permission to pay him a visit at Irvine, that the work of her conversion might be perfected. On her arrival she was joyfully received by the members of the congregation, engaged without intermission in religious exercises, went from house to house, conducted family worship, answered questions, resolved doubts, explained the Scriptures, and testified that the end of the world was at hand, and that it was the duty of every Christian to abandon the concerns of time and prepare for the reception of Christ. White was complained of to the presbytery, by which he was deposed from his ministry. Thus a distinct party was formed, the meetings of which were commonly held at night, and on these occasions the new prophetess indulged in her reveries, styling herself the Woman of the Twelfth of Revelations, and White her first-born. Such gross outrage on the common sense of the inhabitants occasioned a popular tumult, to save her from the fury of which the magistrate sent her under escort to some distance; after which, with her clerical friend, and about 40 deluded followers, she wandered up and down the country, singing, and avowing that they were travelers for the New Jerusalem, and the expectants of the immediate coming of Christ. They had a common fund, and did not consider it necessary to work, as they believed God would not suffer them to want. See BUCHAN, ELSPEETH.

Bucharest, *boo-ka-rést'*, or **Bukarest** (Rumanian, *Bucuresci*, that is, "city of joy"), formerly the chief city of Walachia, now the capital of the kingdom of Rumania, on the Dimbovitza, 37 miles from its mouth. It is the most populous city of southeastern Europe after Constantinople and Budapest, and is spoken of by the Rumanians as the Paris of the East. Besides being the seat of government, Bucharest is the residence of a Greek archbishop. The houses are mostly of one story, built of brick, pointed externally, and have metal roofs. The streets are mostly narrow and crooked, the most important being the Boulevard, running from east to west, the Calea Victoriei, the Lipscani, and the Karlsstrasse. There are statues to Joan Heliade-Radulescu, the father of Rumanian literature; George Lazar; and others. Twelve bridges, five of iron, and seven of stone, cross the Dimbovitza, a small, muddy stream that formerly caused a good deal of damage by inundations. From 1885 till 1896 extensive fortifications were erected, there being now 18 forts in the circle of defense. The inhabitants nearly all belong to the Greek Church. The churches are very numerous, but few of them are architecturally noteworthy; the chief being the metropolitan cathedral, built in 1656, restored in 1834, and standing on a hill, and the Roman Catholic cathedral, built in 1875-84, one of the chief ornaments of the city. Bucharest has a university, and connected with it a public library and a museum of natural history and antiquities. There are four lycæums, two gymnasias, some technical and military schools, a conservatory of music, girls' schools, and other educational institutions. There are a few fine public buildings, of which the most conspicuous is the royal palace, recently rebuilt; among the others being the new Palace of Justice, the National Theatre, the athenæum, the post-office, and several fine hotels. What chiefly distinguishes Bucharest is the magnificence of the public gardens. There is a mixture in the population of eastern habits, with European civilization among the upper classes. The manufactures comprise iron goods, earthenware, leather, linen, soap, paper, beer, etc., but they are of no great importance. There is an active trade, Bucharest being an entrepôt both for the kingdom of Rumania and for adjacent countries. It imports manufactured goods, and exports grain, wool, honey, wax, tallow, and cattle, the produce of the country. In 1698, when it became the capital of Walachia, it was only a village. It was pillaged by the Servians in 1716; taken by the Russians in 1769 and 1806; occupied by them again in 1828-9 and 1853-4; by the Austrians in 1774, 1789, and 1854; was partly destroyed by fire in 1847; and became the capital of Rumania in 1862. Peace congresses were held here, 1772-3, and in 1812, and in 1886 peace was concluded here between Servia and Bulgaria. Pop. (1899) 282,071. See BUCHAREST, PEACE OF; BUCHAREST, UNIVERSITY OF.

Bucharest, Peace of, a treaty signed 28 May 1812, between Russia and the Porte. In November 1806 the Emperor Alexander took up arms for the protection of Moldavia and Walachia, and on account of the violation of the free navigation of the Bosphorus. He occupied Moldavia, upon which the Porte declared war against Russia, 7 Jan. 1807. An armistice, now-

ever, was agreed upon at Slobosia, 24 Aug. 1807, and after the expiration of the truce in April 1808, it was tacitly continued; but in April 1809 the war was renewed. The Russians advanced to Bulgaria, and after two fierce campaigns remained masters of the Danube. The Porte now offered terms of peace. A congress was opened at Bucharest in December 1811. Napoleon did all in his power to induce the Porte to continue the war; but the interposition of Great Britain and Sweden, as well as the concessions of Russia, and the distrust of the Porte toward Napoleon, brought to a conclusion the Peace of Bucharest. The Porte gave up to Russia all Bessarabia and a third of Moldavia, with the fortresses of Choczim, Bender, Ismail, and Kilia, so that the Pruth, as far as its confluence with the Danube, became the boundary between the two powers, and from thence the left bank of the Danube as far as Kilia, and even to its entrance into the Black Sea. The Russians gave back the rest of their conquests. In Asia the boundaries were established as before the war. The boundary then settled between Russia and Turkey was modified in favor of the Porte at the Peace of Paris, 30 March 1856.

Bucharest, University of, a university in the city of Bucharest, under the control of the state government of Rumania. It was founded in 1864. In addition to the usual academic, scientific, and professional departments, with courses followed by about 4,300 students, there is a school of pharmacy. There are museums and laboratories connected with the university.

Bücheler, Franz, fränts bük'ê-lêr, German philologist: b. Rheinberg, 3 June 1837. He studied at Bonn and has been professor there from 1870. His specialty has been in the field of ancient Italian dialects. He has published 'Grundriss der lateinischen Deklination' (1866), and other important works, and since 1878 has been an associate editor of the 'Rheinisches Museum für Philologie.'

Booker, Anton von, än'tōn fōn booh'êr, German polemical writer: b. Munich, 8 Jan. 1746; d. 1817. He was educated in the Latin schools of the Jesuits, studied at Goldstadt, and was consecrated priest in 1768. In his different offices as a public teacher he did a great deal in his day to instruct and enlighten his country. He incurred the enmity of the Jesuits by his satirical attacks upon them. His contributions to the history of the Jesuits in Bavaria (Beiträge zur Geschichte der Jesuiten in Baiern) are of great historical value. His collected works appeared in 1819-20.

Buchez, Philippe Joseph Benjamin, fê-lêp zhô-zêf bōn-zhâ-mân bü-shâ, French philosopher: b. Matange-la-Petite (now in Belgium), 31 March 1796; d. Rodez, France, 12 Aug. 1865. He gave himself up to the study of the natural sciences, and in particular to medicine, receiving his doctor's degree in 1825. He was bitterly hostile to the government of the Restoration, and was one of those who, in 1821, founded the French Society of Carbonari. He became chief editor of the 'Journal des Progrès des Sciences et Institutions Médicales,' and in 1826 assisted in editing the 'Producteur,' a weekly paper which advocated the doctrines of Saint-Simonism. In 1831 he founded a journal of moral and political science, called 'L'Européen,' in which he expounded those doctrines which owe

their origin chiefly to himself, and have been collectively denominated 'Buchezism.' The fundamental idea of his system is that of the progress and development of the human race. But progress presupposes an aim, and this aim must be pointed out beforehand, or *revealed*. Thus the idea of progress leads him to the orthodox belief in revelation. This theory is worked out in his 'Introduction à la Science de l'Histoire' (1833); and his 'Essai d'un Traité Complet de Philosophie au Point de Vue du Catholicisme et du Progrès' (1839). Along with his predilections for the Catholic Church he still retained his strong democratic and republican opinions, and with M. Roux-Lavergne published 'Histoire Parlementaire de la Révolution Française, ou Journal des Assemblées Nationales, depuis 1789 jusqu'en 1815' (40 vols. 1833-8). After the revolution of 1848 he was elected to the constituent National Assembly, of which he was soon appointed president. Thenceforth he held aloof from public life, prosecuting his studies and writing several works, among which is the 'Histoire de la Formation de la Nationalité Française' (1859).

Buchholz (booh'hälts) Family, a series of sketches by Julius Stinde, representing life among the middle-classes of the German capital. The books are entertainingly written, and are very popular in Germany.

Büchner, Friedrich Karl Christian Ludwig, frêd-rih kârl krês'ti-ân lood-vîg bü'n'êr, German physician and materialist philosopher: b. Darmstadt, 29 March 1824; d. Darmstadt, 1 May 1899. He studied at Giessen, Strasburg, Würzburg, and Vienna; became a lecturer at Tübingen University; and, in 1855, published 'Kraft und Stoff' (14th ed. 1876; English translation, 'Force and Matter' 1870), in which he attempted scientifically to establish a materialistic view of the universe. A violent controversy was raised; and Büchner saw himself compelled to resign his university post, and begin medical practice in Darmstadt. He wrote numerous contributions to periodicals on physiological and pathological subjects, as also in support of his atomistic philosophy; published in the latter department 'Natur und Geist' (1857); 'Aus Natur und Wissenschaft' (1862-84); as well as works on Darwinism, the idea of God, the intelligence of animals, etc.; and has translated Lyell's 'Antiquity of Man' (1864).

Büchner, Georg, gâ'örg, German poet, brother of F. K. C. L. Büchner (q.v.): b. Godd-leau, near Darmstadt, 17 Oct. 1813; d. Zurich, Switzerland, 19 Feb. 1837. In 1834 he entered the political arena with a manifesto entitled 'The Rural Messenger,' and bearing the motto: 'Peace to the cabin; war to the palace.' To escape arrest he fled to Strasburg, where he studied the philosophies of Descartes and Spinoza. He wrote a drama in 1834, on 'The Death of Danton,' the work of a genuine but undisciplined poet. His 'Complete Works,' with biography, was published in 1879.

Buchner, Hans, hänts booh'n'êr, German scientist: b. Munich, 1850. After studying at the universities of Strasburg and Giessen, he became lecturer on hygiene at Munich in 1880 and professor in 1892. He has made many important researches in bacteriology.

Büchner, Luise, loo-ēz bū'n'ēr, German poet and novelist, sister of Georg Büchner: b. 12 June 1821; d. Darmstadt, 28 Nov. 1877. Her first publication, 'Women and Their Calling' (1855), was followed by many others on the "woman's rights question"; it commanded much attention, and reached a fifth edition (1883). She wrote a volume of tales, 'From Life' (1861); 'Poet-Voices of Home and Foreign Lands'; several original poems; 'Woman's Heart'; some 'Christmas Stories'; etc.

Büchner, Max, German traveler and scientist: b. Hamburg, 25 April 1846. After serving as surgeon in the German army and navy, he traveled around the earth (1875), and spent some time in New Zealand. In 1878 he bore presents from the emperor to Muatiamvo, in the kingdom of Lunda, in equatorial Africa. After several vain attempts to break through toward the north, he returned to the coast. In 1884 he accompanied Nachtigal in founding the colonies of Togo and Kamerun, in western Africa, where he acted temporarily as representative of the German empire, fought the natives, and concluded treaties with chiefs in the interior. In 1888, as conservator of the Ethnographical Museum of München, he traveled in Australia, Guinea, and East Asia. He wrote 'A Trip Through the Pacific Ocean' (1878); and 'Kamcrun' (1888).

Buchon, Jean Alexandre, zhōñ ä-lëks-ändr bū-shōñ, French historical writer: b. Ménetou-Salon, 21 May 1791; d. 30 April 1846. Having gone to Paris, he became collaborateur on several liberal journals, and early took part in the opposition to the restoration. He was in consequence several times prosecuted by the government, and his writings, such as his 'Vie de Tasse' (1817), were interdicted. In 1821 he gave a course of lectures in the Athenæum on the history of dramatic art in England; and in the following years he traveled over the greater part of Europe for the purpose of collecting documents to illustrate the history of France during the Middle Ages. After his return he published his 'Collection des Chroniques Nationales Françaises, écrites en Langue Vulgaire du XIII^eme au XVI^eme Siècle' (47 vols. 1824-9), which he began with the 'Chroniques de Froissart' (15 vols. 1824-6). He was appointed inspector of the archives and libraries of France in 1828, and in 1829 inspector-general of the departmental and communal archives; but soon lost his office through a change of ministry. In addition to the works of this indefatigable writer already mentioned, may be named his 'Histoire Populaire des Français' (1832); 'La Grèce Continentale et la Morée' (1843); 'Histoire des Conquêtes et de l'Établissement des Français dans les Etats de l'ancienne Grèce sous les Ville-Hardouin' (1846); besides his editions of Brantôme, etc., and his articles in cyclopedias and magazines.

Buchtel, book'tél, Henry Augustus, American clergyman and educator: b. Akron, Ohio, 30 Sept. 1847. He was educated at Asbury (now De Pauw) University, entered the Methodist ministry, and held pastorates in various parts of Indiana, New York, New Jersey, and Colorado. Since 1900 he has been chancellor of the University of Denver. In 1906 he was elected governor of Colorado.

Buchtel College, a co-educational institution in Akron, Ohio, founded in 1871, under the auspices of the Universalist Church, and named for John R. Buchtel, who gave it \$500,000. In 1905 its productive funds were \$190,000, and income \$19,206 and the value of the buildings and grounds about \$300,000. It had 17 professors, and 243 students, and some 9,000 volumes in its library.

Buchu, bū'kü, a South African name for several species of *barosma*, especially *B. crenata*, *crenulata*, and *serratifolia*. They belong to the order *Rutaceae*, and the section *Endiosmea*. They have a powerful and usually offensive odor, and have been recommended as antispasmodics and diuretics.

Buck, Carl Darling, American philologist: b. Bucksport, Me., 2 Oct. 1866. He graduated from Yale in 1886; took the degree of Ph.D. there in 1889; and was a member of the American School of Classical Studies at Athens in 1887-9. In 1892, he became professor of Sanskrit and comparative philology at the University of Chicago. He has written 'Vocalismus der Okischen Sprache'; 'Discoveries in the Attic Deme of Ikaria' (in 'Papers of the American School of Classical Study, Athens,' Vol. V.); 'The Oscan-Umbrian Verb System'; 'Latin Grammar' (with W. G. Hale); and several papers in the 'American Journal of Philology.'

Buck, Dudley, American organist and composer: b. Hartford, Conn., 10 March 1839. After musical study at home and in Leipsic, whence he returned in 1862, he became organist at Park Church, Hartford, and successively at St. James' Church, Chicago, Music Hall, Boston, and St. Ann's Church, Church of the Holy Trinity, and Plymouth Church, Brooklyn, retiring in 1903. He has written several books: 'A Dictionary of Musical Terms'; a work on 'The Influence of the Organ in History' (1882), etc. The 'Centennial Cantata,' for the opening of the Exposition of 1876, by appointment of the U. S. Centennial Commission, the 'Forty-sixth Psalm' the 'Legend of Don Munio,' the 'Golden Legend,' and the 'Marmion' symphonic overture, are among his larger works with orchestra. He has also composed chamber music, songs, and male-voice pieces. Among his later works may likewise be mentioned 'The Voyage of Columbus,' 'The Light of Asia,' 'The Christian Year,' and 'Deseret,' a comic opera.

Buck, Jirah Dewey, American physician and theosophist: b. Fredonia, N. Y., 1838. He graduated in 1864 from the Cleveland Homœopathic College, became professor in that institution and later settled in practice in Cincinnati. He was afterward made professor of therapeutics in the Pulte Medical College. He is well-known for his theosophical studies and has been elected president of the Theosophical Society in America. Among his works are 'The Nature and Aims of Theosophy'; 'A Study of Man and the Way to Health'; 'Mystic Masonry'; 'Browning's Paracelsus and Other Essays'; 'Why I Am a Theosophist.'

Buck, a name sometimes distinctively appropriated to the adult male of the fallow deer, the female of which is a doe. The term is often also applied to the male of other species of deer, as of the roebuck, although never to that of the red deer, which, when mature, is a stag or a hart.

Buck-bean, Bog-bean, or Marsh-trefoil (*Menyanthes trifoliata*), a beautiful plant belonging to the *Menyanthea*, a subdivision of the natural order of the *Gentianaceae*. It is common in spongy, boggy soils, throughout the northern temperate lands, and flowers about the latter end of May and early June. It has a procumbent stem rising to a height of 6 to 12 inches, and covered by the sheaths of the leaves, and a creeping jointed root. The leaves are trifoliate (like those of clover), with obtuse, ovate leaflets. The flower-stalk terminates in a thyrse of white flowers, rose-colored outwardly. The calyx is five-parted, the corolla funnel-shaped, spreading, and clothed on the inner surface with a coating of dense fleshy hairs. The fruit consists of a one-celled, two-valved capsule containing numerous seeds. The whole plant, the root especially, has an intensely bitter taste, and an extract of it ranks as a valuable tonic quite equal in its effects to gentian. It is not so frequently employed now, however, as it used to be. It is said to be beneficial in intermittent fevers, gout, liver complaints, dropsy, scurvy, etc. In the north of Europe it is sometimes used instead of hops to give bitterness to beer; and in Lapland an unpalatable kind of bread is made from the powdered roots.

Buck'board, a four-wheeled vehicle having the seat mounted on an elastic board instead of springs. Buckboards were intended originally for rough and hilly roads and were rather primitive in construction, but became so popular that the styles at present employed are greatly improved in form and finish.

Buckets, in water-wheels, are a series of cavities into which the water is delivered, on the circumference of the wheel to be set in motion. By the revolution of the wheel the buckets will be alternately erected so as to receive water and inverted so as to discharge it; the loaded side will descend, and present the empty buckets in succession to the current, and thus keep up a constant revolution of the wheel. Buckets made of wood and of various metals, are also used for many other mechanical purposes, as in grain-elevators, dredges, etc.

Buckeye. The name in the central and southern United States for native species of trees of the horse-chestnut genus, especially the sweet buckeye (*Æsculus octandra*), abundant in Ohio and southward. See HORSE-CHESTNUT.

Buckeye State, a nickname applied to the State of Ohio.

Buck'ham, Matthew Henry, American educator: b. Leicestershire, England, 1832. He came to the United States in infancy. In 1851 he graduated from the University of Vermont and later became principal of the academy of Lenox, Mass. After studying and traveling in Europe, he became professor of Greek in the University of Vermont, and in 1871, president. He has written numerous sermons, addresses, and reviews.

Buckhound. See DEERHOUND.

Buckingham, būk'ing-ām, George Villiers, Duke of, British courtier: b. Brookesby, Leicestershire, 20 Aug. 1592; d. Portsmouth, 24 Aug. 1628. He was the unworthy favorite of James I. and Charles I. His family went to

England from Normandy in the time of William the Conqueror. His father was George Villiers, Knight; his mother was descended from the ancient family of Beaumont. His father died when he was 13, and at 18 he was sent to France, where he resided three years, and acquired great skill in all bodily exercises. This, together with his beauty of person and graceful manners, made so great an impression on James I., who gave him the familiar name of Steenie, that in less than two years he was made a knight, a gentleman of the bed-chamber, baron, viscount, Marquis of Buckingham, lord high admiral, lord warden of the Cinque Ports, etc., and at last dispenser of all the honors, offices, favors, and revenues of the three kingdoms, according to the dictates of his ambition, his cupidity, and his caprice. The nation was indignant at seeing merit undervalued, the people trampled upon, the nobility humbled, the crown impoverished and degraded, to elevate and enrich a weak and insolent favorite. Such rapid and undeserved promotion likewise caused many private jealousies. In 1623 he engaged in a romantic adventure with Charles, Prince of Wales, in connection with which traitorous views have been attributed to him. The Earl of Bristol was negotiating a marriage for the prince with the Infanta of Spain. Buckingham persuaded the prince to go to Madrid, and carry on his suit in person. They set out incognito, passed through various adventures, and saw on their way the Princess Henrietta Maria of France, whom Charles afterward married. The result of this journey is well known. The marriage was broken off, war declared with Spain, and Bristol was impeached. Buckingham was created a duke during his absence, and whatever misconduct may have been associated with the design or execution of his mission, his favor with the king and prince remained unimpaired. James died in March 1625, and in May of the same year Buckingham was sent to France as proxy for Charles I., to marry the Princess Henrietta Maria. In the following year the unpopularity of the war with Spain, and the failure of the expedition to Cadiz, caused his impeachment, from the consequences of which he was saved by his favor with the king. His intrigues soon after brought on war with France, and he was intrusted with an expedition to succor the Rochelle, but they refused his aid, and he carried his forces to the Isle of Rhé, where, after three months spent in unskilful operations, he suffered a defeat in re-embarking which cost 2,000 men. Notwithstanding this proof of incapacity, a large force was again intrusted to him to renew the attempt on Rochelle. He went to Portsmouth to superintend the preparation, and there was assassinated by John Felton, a lieutenant who had withdrawn from the army in consequence of being disappointed in promotion.

Buckingham, George Villiers, Duke of, son of the preceding: b. Westminster, 30 Jan. 1628; d. Kirkby Moorside, Yorkshire, 16 April 1687. After studying at Trinity College, Cambridge, he traveled abroad, and on his return home, after the commencement of the civil war, he was presented to the king at Oxford. He served in the royal army, under Prince Rupert and Lord Gerard. His estate was seized

BUCKINGHAM

by the Parliament; but having obtained the restoration of it, he traveled with his brother into France and Italy. In 1648 he returned to England, and was with Charles II. in Scotland, and at the battle of Worcester. He followed that prince abroad, and served as a volunteer in the French army in Flanders. He afterward returned to England, and in 1657 married the daughter of Lord Fairfax, by which means he repaired the ruin of his fortune in the royal cause. He, however, preserved the favor of Charles II., and at the Restoration was made master of the horse. He also became one of the king's confidential ministers, who were designated by the appellation of the "Cabal" (1667-73). His political conduct was, like his general behavior, characterized by unprincipled levity and imprudence. In 1666 he engaged in a conspiracy to effect a change of the government; notwithstanding which, he recovered the favor of King Charles, which he repeatedly abused. The profligacy of his private life was notorious. He seduced the Countess of Shrewsbury, and killed her husband in a duel; and he was more than suspected of having been the instigator of the infamous Col. Blood to his brutal outrage against the Duke of Ormond, whom he attempted, with the assistance of other ruffians, to carry to Tyburn and hang on the common gallows. In 1677 he was, together with the Earls of Shaftesbury and Salisbury and Lord Wharton, committed to the Tower for a contempt, by order of the House of Lords, but on petitioning the king, they were released. He plotted against the government with the Dissenters, and made himself an object of contempt to all parties. Pope ('Moral Essays,' epistle 3d) has more strikingly than accurately described his death. His abilities were far superior to those of his father; and among his literary compositions the comedy, or rather the witty burlesque, of 'The Rehearsal' may be mentioned as a work which displays no common powers, and which greatly contributed to the correction of a corrupted public taste.

Buckingham, James Silk, English traveler and editor: b. Flushing, Cornwall, 25 Aug. 1786; d. London, 30 June 1855. He made three voyages to Lisbon while yet a mere boy. In 1815 he went to Bombay, and in the following year, after many vicissitudes, to Calcutta, where he established the *Calcutta Journal*, but the censorship of the press was then in full force in India, and Buckingham, having offended government, his printing presses were seized, and he himself compelled to quit the presidency of Bengal and return to England, where he began to deliver lectures in London in favor of free trade to the East, and the extinction of the East India Company's monopoly. He also established in London, 1824, the *Oriental Herald*, and four years later the *Athenæum*, now one of the foremost English weeklies, and prepared for the press the manuscript journals of his travels. In 1822 appeared 'Travels in Palestine'; in 1825, 'Travels in Arabia'; in 1827, 'Travels in Mesopotamia'; and in 1830, 'Travels in Assyria and Media.' In 1832 he was chosen member of Parliament for Sheffield, and retained his seat till 1837. Subsequently to this he made a tour of three years in America, resulting in the publication of eight volumes on the United States, and one on British North America. In 1843 he became secretary to

the British and Foreign Institute—a literary club which he had mainly contributed to form; but in this capacity he unfortunately drew upon himself the animadversions of 'Punch,' which at last fairly extinguished the society. In the later years of his life he delivered lectures in various parts of the country. He was a zealous promoter of the temperance cause, and president of the London Temperance League. In 1849 appeared his 'National Evils and Practical Remedies.' He also published two volumes on Belgium, the Rhine, and Switzerland, and two on France and Piedmont, the result of tours on the Continent. His last work was his 'Autobiography,' two volumes of which appeared in 1855, but its completion was prevented by the author's death. A few years before this the East India Company had granted him a pension, which was afterward continued to his widow, and he had also a pension of £200 a year from the civil list.

Buckingham, Joseph Tinker, American journalist: b. Windham, Conn., 21 Dec. 1779; d. Cambridge, Mass., 11 April 1861. His father exhausted his whole property in supporting the American army during the Revolution, and died leaving a family without means of support. At Worthington, Mass., Joseph was apprenticed to a farmer, with whom he remained for several years, during which he made himself acquainted with the rudiments of an English education. At 16 he entered a printing-office and became acquainted with the elements of the profession in which he was afterward to gain distinction. In Boston, 1806, he began life for himself by the publication of 'The Polyanthus,' a monthly magazine, which, after one year, was discontinued and not resumed until 1812. In 1809 he published for six months the 'Ordeal,' a weekly. In 1817 he began the publication of 'The New England Galaxy and Masonic Magazine,' which he continued until 1828. From 1831 to 1834 he published 'The New England Magazine.' In 1824 he published the first number of the Boston *Courier*, which he continued to edit until 1848. Mr. Buckingham was several times elected to the legislature, serving in both Houses. Among his publications deserving mention are: 'Specimens of Newspaper Literature, with Personal Memoirs, Anecdotes and Reminiscences' (1850); and 'Personal Memoirs and Recollections of Editorial Life' (1852).

Buckingham, William Alfred, American politician: b. Lebanon, Conn., 28 May 1804; d. Norwich, 3 Feb. 1875. He was educated in the common schools; worked on his father's farm; was also a school-teacher, and at Norwich, 1825, began business in dry-goods, becoming later a manufacturer and something of a capitalist. In 1849 he was elected mayor of Norwich, to which office he was repeatedly chosen. For nine years (1858-66) he was governor of Connecticut, and as one of the most efficient of the "war governors" achieved a national fame. He served as United States senator from 1869 till his death. He was active in the temperance cause, and a liberal giver to Yale College and to many benevolent objects.

Buckingham, or Bucks, an inland county, England, bounded north and northwest by Northampton; northeast and east by Bedford and Hertford; southeast by Middlesex; southwest by Berks, and west by Oxford. Its length,

BUCKINGHAM PALACE, LONDON, ENGLAND.

HAMPTON COURT, LONDON.

north to south, is about 45 miles; greatest breadth, east to west, 23 miles; area, 746 square miles. The vale of Aylesbury, stretching through the centre of the county, and celebrated for its fertility, furnishes rich pasturage for vast numbers of cattle and sheep. The total area under all kinds of crops, bare fallow, and grass is somewhat more than 400,000 acres, of which considerably more than half is in permanent pasture. The chief cereal crops are wheat, barley, and oats, each occupying annually from about 22,000 to 30,000 acres. Between 4,000,000 and 5,000,000 pounds, or about 1,000 tons of butter, are annually made in this county. The breeding and fattening of cattle are largely carried on, Herefords and short-horns being favorite breeds. The manufactures of Buckinghamshire are unimportant. Among them are straw-plaiting and the making of thread lace, wooden articles, such as beechen chairs, turnery, etc. There are also paper-mills, silk-mills, and other manufactories. The mineral productions of this county are of no great importance. The county is watered by the Ouse, the Thame, the Thames, and other streams, and is intersected by the Great Western and Northwestern R.R.'s. Buckingham is nominally the county town, but Aylesbury is the assize town. Buckinghamshire used to contain three parliamentary boroughs, namely, Aylesbury, Buckingham, and High or Chipping Wycombe, which now give name to corresponding parliamentary divisions. The county thus returns three members to the House of Commons. It gives the title of earl to the family of Hobart Hampden. Pop. (1901) 195,234.

Buckingham, a municipal and formerly a parliamentary borough of England, capital of the county of its own name, 50 miles northwest of London, situated on a peninsula formed by the Ouse, which is here crossed by three stone bridges. The town hall and jail are large and commodious buildings. The parish church, erected in 1781, is a spacious structure, with a square tower, surmounted by an elegant spire, and there are also several other places of worship, and a free grammar-school, founded by Edward VI. Malting and tanning are carried on to some extent; and a good deal of business is done in wool and hops. In the vicinity are several limestone quarries, and one of marble. Pop. about 3,500.

Buckingham Palace, a royal palace in London, facing St. James's Park. It is the town residence of the king.

Buckland, Cyrus, American inventor: b. Manchester, Conn., 10 Aug. 1799; d. 26 Feb. 1891. After learning the trade of a machinist, he assisted in building the machinery for the first cotton-mills erected at Chicopee Falls, and became, in 1828, pattermaker in the United States army, Springfield, where he remained for 28 years, becoming master mechanic. He designed machinery and tools for the manufacture of firearms; remodeled old weapons and designed new ones; perfected a lathe for turning out gun-stocks; invented machines to bore and turn gun-barrels and for rifling muskets, and many other novelties in the manufacture of firearms and ordnance. Much of his machinery was adopted by foreign governments. As he received nothing for his labor at the armory, excepting his salary, Congress voted him

\$10,000 when ill-health compelled him to resign. In all he received from Congress for his inventions \$70,000.

Buckland, Francis Trevelyan, English naturalist: b. Oxford, 17 Dec. 1826; d. London, 19 Dec. 1880. He was the son of William Buckland (q.v.); graduated at Christ Church, Oxford, and having studied medicine in Paris and London, he was for some time house surgeon to St. George's Hospital, when he joined the 2d Life Guards as assistant surgeon, a post which he held for nine years. His strong passion for natural history soon absorbed all his thoughts, and he became a constant contributor to 'Field' and other periodicals. Latterly he devoted himself with enthusiasm to pisciculture, a subject on which he was long the leading authority. His advice on the subject was sought by several foreign governments, and he was the means of introducing salmon and trout into the Australian and New Zealand waters. He was appointed inspector of salmon fisheries in 1867, and his reports as commissioner led to the passing of several useful acts of Parliament. Besides a great quantity of pleasant gossip articles contributed to various periodicals, he published 'Curiosities of Natural History' (1857-72); the 'Logbook of a Fisherman and Zoologist' (1876); a 'Natural History of British Fishes' (1881); and other works.

Buckland, William, English geologist: b. Axminster, Devon, 12 March 1784; d. 15 Aug. 1856. He was educated first at Winchester, afterward at Corpus Christi College, Oxford, took his degree of B.A. in 1803, and obtained a fellowship in 1808. From early childhood he had been familiar with the ammonites and other fossils in the lias quarries near his native town, and with advancing years the bent of his mind to geological pursuits was developed and confirmed. In 1813 he was appointed reader in mineralogy at Oxford, and in 1818 a readership of geology was instituted for him. In 1825 he was presented by his college to the living of Stoke Charity, near Whitechurch, Hants, and the same year he became one of the canons in the Christchurch Cathedral, Oxford. He was one of the eight selected to write the celebrated 'Bridgewater Treatises,' and in 1836 his essay was published, under the title of 'Geology and Mineralogy Considered with Reference to Natural Theology.' In 1845, he was made dean of Westminster, and in 1847 one of the trustees of the British Museum. His papers contributed to various societies and periodicals were very numerous. He was a fellow and twice president of the Geological Society of London, and of the Royal Society from 1818.

Bucklandia, a handsome evergreen Javanese and East Indian tree (*B. populnea*), of the natural order *Hamamelidaceae*, the only species of its genus. It is said to attain considerable height, often more than 30 feet without branches, and occasionally a circumference of more than 20 feet at the height of a man's chest from the ground. Its timber is widely used in the East.

Bucklandite, the name of two minerals: (1) Bucklandite of Hermann, a variety of epidote; (2) Bucklandite of Levy, a variety of allanite distinguished by being anhydrous. It occurs in small black crystals having the form

BUCKLE — BUCKNELL UNIVERSITY

and physical properties of allanite in an iron mine near Arendal, Norway.

Buckle, Henry Thomas, English historian: b. Lee, Kent, 24 Nov. 1822; d. Damascus, 29 May 1862. He was the son of a wealthy merchant, and received his education partly at home, and partly at Dr. Halloway's School, Gordon House, Kentish Town. His delicate health prevented his remaining long at school, but his love of learning and indefatigable industry as a student supplied any deficiencies in his training, and he was to a great extent self-educated. At an early age he entered his father's counting-house, but he displayed no aptitude for business; and when at the age of 18 his father's death left him an ample fortune, he devoted himself entirely to study. The only thing he allowed to distract him from his more serious pursuits was his favorite game of chess, in which he attained such excellence as to be recognized as one of the first English masters of the game; but even this he gave up when he found it encroached too much on his time. He had formed a plan, to which he dedicated his life, of writing the 'History of Civilization in England' in conformity with certain philosophical principles, and with an exhaustive treatment in regard to details which he deemed indispensable to historical accuracy, which made the work he had undertaken one of almost incalculable magnitude. He only succeeded in finishing two volumes. The first, published in 1858, stated with copious illustrations the plan of the work; the second, issued in 1861, contained a digression on the histories of Scotland and Spain, intended further to illustrate his design, and demonstrate the principles on which it was based. These works gave rise to much controversy, but it has been generally agreed that they exhibit great boldness and originality of design, with profound and accurate scholarship, and possibly also with a good deal of what was the object of the historian's strongest aversion in others, dogmatism. His death occurred when he was on a voyage undertaken for the restoration of his health.

Buckle, a metal instrument consisting of a rim and tongue, forming a clasp, used for fastening straps or bands in dress, harness, etc. In making buckles, both brass and iron are used, and the chief kinds are called tongue, roller, brace, and gear buckles. The use of buckles, instead of shoe-strings, was introduced into England during the reign of Charles II. They soon became very fashionable, attained an enormous size (the largest being called Artois buckles, after the Comte d'Artois, brother of the king of France), and were usually made of silver, set with diamonds and other precious stones. In the latter half of the 18th century the manufacture of buckles was carried on most extensively in Birmingham, there being at one time not less than 4,000 people directly employed in that city and its vicinity, who turned out 2,500,000 pairs of buckles annually. When the trade was at its height, however, fashion changed, and in 1791 buckle-makers petitioned the Prince of Wales for sympathy, on the ground that, owing to the introduction of shoe-strings, their trade was almost ruined. The prince promised to assist them as far as he could by wearing buckles himself, and enjoining his household to do the same; but fashion

was too strong even for him, and before the close of the century, a great staple trade of Birmingham had become extinct, though shoe-buckles are still by no means unknown.

Buckler, a kind of small shield formerly worn on the left arm, a piece of armor varying in form and material, among the latter being wickerwork, wood covered with leather, a combination of wood and metal, etc.

Buckley, James Monroe, American clergyman and editor: b. Rahway, N. J., 16 Dec. 1836. He was educated at Pennington Seminary and Wesleyan University, and studied theology at Exeter, N. H., and in 1858 entered the ministry of the Methodist Episcopal Church. He has had charges at several places, including Detroit, New York, and Brooklyn, the last of which he retained from 1866 to 1880. Since 1880 he has been editor of the New York *Christian Advocate*. He has published 'Two Weeks in the Yosemite and Vicinity' (1873); 'Christians and the Theatre' (1876); 'Oats or Wild Oats' (1885); 'Travels in Three Continents' (1895); 'Extemporaneous Oratory' (1899); and other works.

Buckley, Samuel Botsford, American botanist and geologist: b. Torrey, Yates County, N. Y., 9 May 1809; d. Austin, Texas, 18 Feb. 1884. He graduated from Wesleyan University in 1836. During his travels in the Southern States he investigated the botany, conchology, etc., of those regions, discovering many new species of plants and shells. Among the flora was the new genus *Buckleya*, which was named in his honor. He determined the height of Mount Buckley, North Carolina, and of several other summits. From 1860-1 he was connected with the State survey of Texas and from 1866-7 was State geologist of Texas. He wrote many papers of a scientific nature and a work on the trees and shrubs of the United States.

Buckminster, Joseph Stevens, American clergyman: b. Portsmouth, N. H., 26 May 1784; d. 9 June 1812. His father, Joseph Buckminster, a scholarly and eloquent preacher, sent the son to Harvard, where he was graduated in 1800, afterward becoming a teacher in Phillips Exeter Academy, among his pupils being Daniel Webster. In 1804 he entered upon the work of the ministry as pastor of the Brattle Street Church, Boston, and at once took his place as a writer and preacher of the finest gifts, to grow in power and public esteem until the day of his premature death. He was a member of the Anthology Club of Boston, and a contributor to the 'Monthly Anthology.' His pulpit influence aided to develop a more literary style of sermon, while his oratorical ability was equal to his skill in composition. He was a representative of the Liberal Congregationalism, which, soon after his death, became Unitarian in belief. His works, in two volumes, were published in 1839. See also his 'Memoirs,' by his sister (1851).

Bucknell University, a co-educational institution in Lewisburg, Pa.: organized in 1846, under the auspices of the Baptist Church; reported in 1901: Professors and instructors, 31; students, 500; volumes in the library, over 19,000; grounds and buildings valued at more than \$350,000; endowment, \$425,000; president, John H. Harris, LL.D.

Buck'ner, Simon Bolivar, American soldier and politician: b. Kentucky, 1 April 1823. He was graduated at West Point in 1844, taught there, as assistant professor, during the next two years, and served in the Mexican war, 1846-8, under Gens. Taylor and Scott. He was brevetted first lieutenant, and also captain, for gallantry at the battles of Churubusco and Molino del Rey. From 1848 to 1850 he served at West Point as assistant instructor in infantry tactics. In 1855 he resigned from the army and engaged in various occupations, civil and military, in Illinois and Kentucky. When the Civil War began he joined the Confederate army as a brigadier-general. Afterward he rose to distinction, attaining the rank of lieutenant-general, and taking a prominent part in several important events of the war, notably in the defense and surrender of Fort Donelson, 16 Feb. 1862. He was one of the pall-bearers at Gen. Grant's funeral in 1885, by the personal selection of the great soldier himself, who had been warmly attached to him for many years. In 1896 he was nominated for vice-president by the National (Gold) Democrats, having previously served a term as governor of Kentucky.

Buckram, a coarse fabric, linen or cotton, sized with glue. It is used in making garments to give them, by stiffening, the form intended, and as a cover in bookbinding.

Buck's shot, a leaden shot larger than swan-shot. About 160 or 170 of them weigh a pound. They are especially designed to be used in hunting deer and other large game.

Buckshot War, 1838, a disputed-election case in Pennsylvania, of national importance as bearing on the nature of the "domestic violence," from which the Constitution requires the Federal government to protect the States. As usual, fraud under legal forms was met by retaliation in defiance of them. The legislature that year had to elect a United States senator; and the return of Democratic candidates in Philadelphia gave that party a majority on joint ballot, though the Senate was 22 Whig (Anti-Masonic) to 11 Democratic. But the Democratic congressional candidate in one of the city districts was defeated; his party charged it to frauds in the Northern Liberties district (now in Philadelphia), and the 10 Democratic election judges threw out its entire vote of some 5,000, giving him the certificate of election. At once the seven Whig judges met and gave the certificate not only to their candidate, but to their legislative candidates who were not elected even with the Northern Liberties vote: obviously to fight till their congressman was restored. The secretary of State was chairman of the Whig State committee, received the Whig certificate first (professedly at least), refused to acknowledge any others, and publicly advised his party to claim the election and hold out. Armed crowds of both parties collected at Harrisburg "to see fair play" when the legislature met, 4 December; and for some days the sessions were held with a roaring mob outside. The Whig returns alone were handed in by the secretary of State; the Whig senate organized, and then adjourned on account of the mob; one member is alleged to have threatened them with "ball and buckshot," whence the name. In the Representatives' hall both parties organized and chose speakers, the Whigs, T. S. Cunningham,

and the Democrats, William Hopkins; the former then adjourned, whereupon the latter held the hall with a guard and the Whigs had to meet outside. The Whig governor, Joseph Ritner, called on the State militia to be ready to rescue the capital from a "lawless mob," and appealed to the commandant, at Carlisle, and next to President Van Buren, for help against "domestic violence," which was refused on the ground that this phrase referred only to insurrection against lawful authorities, whereas this was only a political struggle to determine who the lawful authorities were, in which the government could not decently interfere. (The same excuse was afterward made for leaving Kansas at the mercy of the Border Ruffians, though the Federal court put the United States soldiery into their hands.) About 1,000 militia were brought to Harrisburg; but after a fortnight's stay departed, as the city was entirely quiet, and the rival houses holding regular sessions. The cooler Whigs, however, saw that the secretary of State could not justify his assumption of power; enough Cunningham members joined the Hopkins House to give it a majority, and on the 25th the senate acknowledged it as the true one, whereupon the other broke up and its members gradually drifted in—all but Thaddeus Stevens (q.v.), who would not take his seat during the session. The legislature elected as senator Daniel Sturgeon, then State treasurer, who as such refused to honor Ritner's bill for the employment of the militia. See U. S., DISPUTED ELECTIONS IN THE.

Buck'skin, a soft leather of a yellowish or grayish color, made originally from deer-skin, but now usually from sheepskin. The softness which is its chief characteristic is imparted by using oil or brains in dressing it. The name is also given to a kind of twilled woolen cloth without a pile or "face."

Buck'stone, John Baldwin, English actor and playwright: b. London, 14 Sept. 1802; d. 31 Oct. 1879. From 1823 to 1853 he was a well-known London comedian. He became manager of the Haymarket Theatre, and produced nearly 200 plays, which were all successful, largely owing to his knowledge of stage effect and humor. He made a visit to the United States in 1840. Among the best of his pieces are: 'The Wreck Ashore'; 'Victorine'; 'Green Bushes'; 'The Flowers of the Forest'; 'Married Life'; 'Leap Year'; 'Second Thoughts'; and 'Nicholas Flam.'

Buckstone, Lucy Isabella, English actress (daughter of John Baldwin Buckstone): b. 1858; d. London, 17 March 1893. After acting for a time in the provinces, she appeared on the London stage in 1875 in the play of 'David Garrick.' Among her best known roles were those of Annette in 'The Bells' and Lucy Ormond in 'Peril.'

Buck'tails, the New York State Democrats opposed to De Witt Clinton, 1812-28; originally the members of the Tammany Society in New York, from the buck's tail worn in their hats as a badge. Their factional opposition to Clinton, under Martin Van Buren and other important local leaders, extended to his advocacy of the Erie Canal, authorized 15 April 1817; the Tammany men were fiercest in opposition to it, and the name "Bucktails" was given to all the anti-Canal Democrats. Clinton was an ungracious

and tactless politician, and in 1824 the Bucktails carried the State and ousted him from the office of canal commissioner; which primitive bit of "spoils," in a community not then hardened to it, created a reaction that gave him two terms more in the governorship. His death in 1828 dissolved his party, and the "Bucktails," under Van Buren and the other members of the "Albany Regency" (q.v.), became the Democratic party in the State.

Buck'thorn (*Rhamnus catharticus*), a shrub, native of Great Britain, naturalized in the United States, where it is cultivated for hedges in the Mississippi valley and westward. It is not very common in the States east of the Alleghanies. The stem is covered with a dark-brown bark, and divides into numerous branches with strong spines. It grows to seven or eight feet. The leaves are elliptical and serrated. The male and female flowers are on different plants. The calyx is of a greenish yellow. There is no corolla. The fruit is a round black berry, containing four seeds. It flowers in May, and the seeds ripen in September. The berries are medicinal. They form a powerful purgative, but, being harsh in action, are seldom used in modern practice. The juice of the ripe berries, mixed with alum, forms the sap-green of artists. The bark yields a beautiful yellow dye.

Buck'wheat (*Polygonum fagopyrum*, Linn.), a species of grain supposed to be a native of Asia, and called *blé Sarrasin*, or *Saracen wheat*, by the French, after the Saracens or Moors, who are believed to have introduced it into Spain. It thrives on poor soils, comes rapidly to maturity, and is most frequently planted in tracts that are not rich enough to support other crops. It is extremely sensitive to cold, being destroyed by the least frost, but it may be planted so late and reaped so early as to incur no danger from that source. Its flowering season continues for a long time, so that it is impossible for all the seeds to be in perfection when it is reaped, and the farmer must decide by careful observation at what period there is the greatest quantity of ripe seeds. Buckwheat does not exhaust the soil, and by its rapid growth and its shade it stifles weeds, prevents their going to seed, and leaves the field clean for the next year. As a grain, buckwheat has been principally cultivated for oxen, swine, and poultry; and although some farmers state that a single bushel of it is equal in quality to two bushels of oats, others assert that it is a very unprofitable food. Mixed with bran, chaff, or grain, it is sometimes given to horses. The flour of buckwheat is occasionally used for bread, but more frequently for cakes fried in a pan. In Germany it serves as an ingredient in pottage, puddings, and other food. In the United States it is very extensively used throughout the winter in griddle-cakes. Beer may be brewed from it, and by distillation it yields an excellent spirit. It is used in Danzig in the preparation of cordial waters. Buckwheat is much cultivated by the preservers of game as a food for pheasants. If left standing it affords both food and shelter to the birds during winter. With some farmers it is the practice to sow buckwheat for the purpose only of plowing it into the ground as a manure for the land. The best time for plowing it in is when it is in full blossom, allowing the land to rest till it

decomposes. While green it serves as food for sheep and oxen, and mixed with other provender it may also be given with advantage to horses. If sown in April two green crops may be procured during the season. The blossoms may be used for dyeing a brown color. It is frequently cultivated in this country in the Middle States, and also in Brabant, as food for bees, to whose honey it imparts a flavor by no means unpleasant. The principal advantage of buckwheat is that it is capable of being cultivated upon land which will produce scarcely anything else, and that its culture, compared with that of other grain, is attended with little expense.

Buckwheat-tree, an evergreen shrub of the genus *Cliftonia*, natural order *Cyrtillaceæ*; also called *titi*. It is a native of the southern United States, where it is found in the neighborhood of water. It bears fragrant white flowers, followed by drooping fruits, which suggest the name.

Bucol'ic, a term derived from a Greek word meaning "herdsman." It is equivalent to the word *pastoral*, derived from the Latin, and is applied to pastoral poetry of the kind especially descriptive of rural life as led by cow-herds and mountain shepherds. Of this class of poetry Theocritus and Vergil left the highest examples. See PASTORAL POETRY.

Buc'crane, an ornamental design carved in relief on the altars of Greece and Rome. It represented an ox skull with garlands depending. This decoration is sometimes seen as an architectural detail with other animals' heads introduced in place of the original ox-head.

Bucyrus, Ohio, city and county-seat of Crawford County, situated on the Sandusky River and on the Pennsylvania, the Ohio C., and Sandusky division of the Pa. R.R.'s. Stockraising and farming are carried on in the surrounding region and the city is actively engaged in manufacture. Among the products of the mills and shops are machinery, ventilating apparatus, plows, vehicles, and furniture. There are school and county buildings, a reservoir, and waterworks. There is a park in the city, and numerous mineral springs in the surrounding region. Bucyrus was settled in 1818 and incorporated in 1829. Pop. (1900) 6,560.

Bud, a modified shoot in which, owing to the non-development of the axis, the lateral organs become crowded together. It contains the rudiments of future organs, as stems, branches, leaves, and organs of fructification. The usual form of a bud is an elongated ovoid, and according to their position they are described as terminal, that is, formed at the end of a branch, or axillary, that is, produced in the axils of a leaf. Besides the rudimentary organs found in the interior, buds are in cold or temperate climates often covered externally with a viscous and resinous coating, and furnished internally with a downy tissue, destined to defend the enclosed organs from the rigor of winter. No envelopes of this kind are observed on the buds of the greater number of tropical plants. Buds on exogenous plants are in their commencement cellular prolongations from the medullary rays, which force their way through the bark. The cellular portion is surrounded by spiral vessels, and covered with rudimentary

leaves. When the vascular part of the bud develops the central cellular portion remains as pith, enclosed in a medullary sheath, which isolates it from the parent stem. Thus it remains till the second year. The bud here described, which contains the rudiments of future leaves, branches, etc., is called a leaf-bud. Sometimes more than one bud is found in or near the axil of a single leaf, in which case all but the proper axillary bud are called accessory buds. The buds begin to show themselves as soon as the leaves have taken their full development. They are then very small, as the developed leaves absorb the nutritive juices of the plant, leaving them little nourishment. On the fall of the leaf they enlarge, and take the form they are to retain during winter, in which season they are stationary. On the return of spring they begin to swell, and burst the scales which form their external covering, and the young shoots which these have served to protect now make their appearance. The external scales of the bud are usually deciduous, that is, they fall off when the young shoot appears; sometimes, however, they are persistent. These scales sometimes represent leaf-blades, as in lilac; sometimes stipules, as in the beech; or petioles, as in the horse-chestnut. Flower-buds are produced in the axil of leaves called floral leaves or bracts. They are not capable of extension by the development of the central cellular portion, and instead of the conservative organs of plants, leaves, and branches, they produce the reproductive organs, flowers, and fruit. Perennial herbaceous plants spring from a subterranean bud called the turio, which is developed annually, and from which the new stem is produced. The bulb is a species of bud of this kind. The arrangement of the leaves in a leaf-bud is called its vernation; of the petals and sepals in a flower-bud, its æstivation.

Bud Moth. An apple pest. See APPLE.

Budæ'us. See BUDE, GUILLAUME.

Budapest, boo'da-pëst, the united towns of Buda or Ofen, and Pest or Pesth, the one on the right, the other on the left of the Danube, forming the capital of Hungary, the seat of the Hungarian parliament and supreme courts, about 135 miles southeast from Vienna. Buda, which is the smaller of the two, and lies on the west bank of the river (here flowing south), consists of the fortified Upper Town on a hill, the Lower Town or Water Town at the foot of the hill, and several other quarters, including Old Buda farther up the river. Among the chief buildings are the royal castle and several palaces, the arsenal, town hall, government offices, etc.; the Church of St. Matthew, dating from the 13th century, during the Turkish occupation a mosque for 150 years, and recently rebuilt; and the finest Jewish synagogue in the empire. Pest, or the portion of Budapest on the left or east bank of the river, consists of the inner town of Old Pest on the Danube, and a semicircle of districts—Leopoldstadt, Theresienstadt, Elizabethstadt, etc.—which have grown up around it. The river is at this point somewhat wider than the Thames at London, and the broad quays of Pest extend along it for from two to three miles. It is spanned by fine suspension and other bridges. Pest retains, on the whole, fewer signs of antiquity than

many less venerable towns. Its fine frontage on the Danube is modern, and includes the new houses of parliament, opened in 1896, the academy of science, with a library of 180,000 volumes, exchange, custom house, and other important buildings. The oldest church dates from 1500; the largest building is a huge pile used as barracks and arsenal. Other buildings include the old and the new town house, national museum, National theatre, university buildings, various palaces, the Royal Opera House, etc.

Budapest contains the most important of the three universities of Hungary, attended by about 4,500 students, and having over 220 professors, lecturers, etc. Another important educational institution is the technical high schools, with 60 teachers and 1,100 to 1,200 students, and a library of 60,000 volumes. In commerce and industry Budapest ranks next to Vienna in the empire. Its chief manufactures are machinery, gold, silver, copper, and iron wares, chemicals, textile goods, leather, tobacco, etc. A large trade is done in grain, wine, wool, cattle, etc. At Budapest are the largest electrical works in all Europe. Engineers employed there have brought to perfection the science of applying electricity to motors. They constructed there the first successful underground trolley lines. The city contains the important parks of the Stadtwäldchen, about 1,000 acres in extent, and Margaret Island. It is divided into 10 municipal districts, three on the Buda side of the river, and seven on the Pest side. The Elizabeth suspension bridge over the Danube River was completed and formally opened for traffic 10 Oct. 1903. It was named in commemoration of the late Queen Elizabeth of Hungary. The bridge was originally planned in 1893 by the Budapest Board of Trade. It has two piers, one on each side of the river, built on substantial ground. Its clear span over the river Danube is 951½ feet. There are land approaches on each side of the river, each having a length of 40 meters, thus giving the entire bridge a total length of fully 3,014 feet. The two piers have a total height of 212 feet each over the zero level of the water. Both of them are made of steel and rest upon granite foundations. The highest point at the centre of the bridge is 59 feet from the zero level of the river. The bridge has a total width of 59 feet, 36 feet of which is carriageway, and 11½ feet for each of two footways. Budapest is strongly Magyar in character and sentiment, and as a factor in the national life may almost be regarded as equivalent to the rest of Hungary. Old Buda was founded by the Romans about 150 A.D., and was known as Aquinicum. Pest is of much later origin, first being heard of in the 13th century. The citadel of Buda was captured by the Turks after Mohacs in 1526. From 1541 to 1686 Buda was the seat of a Turkish pasha, the Turks being then driven out. The towns were united as one municipality in 1873. It was not until 1799 that the population of Pest began to outdistance that of Buda; but from that date its growth was very rapid and out of all proportion to the increase of Buda. In 1799 the joint population of the two towns was little more than 50,000; in 1890 it was 506,384; in 1900, 732,322.

BUDDHA

Buddha, bood'ā, or būd'ā (to know, intelligence), the generic name for a deified teacher of the Buddhists. These hold that innumerable Buddhas have appeared to save the world, among them one in the present period, also known as Sākya-muni, or Saint Sākya, who is believed by some to have been the ninth incarnation of Vishnu; by others the son of the moon, and regent of the planet Mercury. He was a reformer of Brahminism, introducing a simple creed, and substituting a mild and humane code of morality for its cruel laws and usages. His personal name was Siddhartha, and his family name Gautama; and he is often called also Sakya-muni (from Sakya, the name of his tribe, and muni, a Sanskrit word meaning solitary). His father was king of Kapilavastu, a few days' journey north of Benares. Siddhartha was early filled with a deep compassion for the degeneracy and misery of the human race, and a deep feeling of the vanity of earthly things. His melancholy thoughts would not be stifled in the enjoyments of his father's court: he must find peace for his own soul and bestow it on others. To this end he left his father's court and after having attended the schools of the Brahmans without profit and lived for years a life of solitude and asceticism, he at last, by dint of profound meditation, acquired clear notions on the life of man and his relations to the universe, and found out the true path which was to lead his fellow-creatures to the goal of life. It was then that he became the Buddha, and began to teach his new faith in opposition to the prevailing Brahmanism. The first place at which he taught, or, in the mystic phrase of Buddhism, "turned the wheel of the law," was Benares. He soon made many converts, especially among the lowly and oppressed, for his teaching was addressed to all alike, without distinction of person or caste. Many of the Brahmans also joined him, wearied with the severe and oppressive observances of their own religion, which contrasted so unfavorably with the simplicity of the new faith. Among his earliest converts were the monarchs of Magadha and Kosala, in whose kingdoms he chiefly passed the latter portion of his life, respected, honored, and protected.

The theory of the "four sublime verities" lies at the foundation of the doctrines of the Buddhists. The first verity is that pain is inseparable from existence, inasmuch as existence brings old age, sickness, and death; the second, that pain is the offspring of desire, and of faults which desire has made us commit in previous states of existence (for Sakya-muni adopted fully the prevailing doctrine of Brahmanism with regard to the transmigration of souls) or in the present; the third verity tells us that existence, and therefore pain, can only cease through Nirvana; the fourth, that in order to attain Nirvana our desires and passions must be suppressed, every obstacle to the extinction of desire must be set aside, the most extreme self-renunciation must be practised, and we must, in short, forget our own personality so far as possible. The last verity is the most important in its practical

application, as pointing out the way to salvation and providing a rule of conduct. The way to salvation consists of eight parts or conditions that a man must fulfil. The first is in Buddhistic language right view; the second is right judgment; the third is right language; the fourth is right purpose; the fifth is right profession; the sixth is right application; the seventh is right memory; the eighth is right meditation. The five fundamental precepts of the Buddhist moral code are not to kill, not to steal, not to commit adultery, not to lie, and not to give way to drunkenness. To these there are added five others of less importance, and binding more particularly on the religious class, such as to abstain from repasts taken out of season, from theatrical representations, etc. There are six fundamental virtues to be practised by all men alike, namely, charity, purity, patience, courage, contemplation, and knowledge. These are the virtues that are said to "conduct a man to the other shore." The devotee who strictly practises them has not yet attained Nirvana, but is on the road to it. The Buddhist virtue of charity is universal in its application, extending to all creatures, and demanding sometimes the greatest self-denial and sacrifice. There is a legend that the Buddha in one of his stages of existence (for he had passed through innumerable transmigrations before becoming "the enlightened") gave himself up to be devoured by a famishing lioness which was unable to suckle her young ones.

There are other virtues, less important, indeed, than the six cardinal ones, but still binding on believers. Thus not only is lying forbidden, but evil speaking, coarseness of language, and even vain and frivolous talk, must be avoided. Buddhist metaphysics are comprised in three theories — the theory of transmigration (borrowed from Brahmanism), the theory of the mutual connection of causes, and the theory of Nirvana. The first requires no explanation. According to the second, life is the result of 12 conditions, which are by turns causes and effects. Thus there would be no death were it not for birth; it is therefore the effect of which birth is the cause. Again, there would be no birth were there not a continuation of existence. Existence has for its cause our attachment to things, which again has its origin in desire; and so on through sensation, contact, the organs of sensation and the heart, name, and form, ideas, etc., up to ignorance. This ignorance, however, is not ordinary ignorance, but the fundamental error which causes us to attribute permanence and reality to things. This, then, is the primary origin of existence and all its attendant evils. Nirvana is eternal salvation from the evils of existence, and the end which every Buddhist is supposed to seek. It is not so easy to determine exactly what this Nirvana means, however; but the best authorities (Burnouf, Turnour, Spence Hardy, Barthélemy Saint-Hilaire, etc.) affirm that it means the complete annihilation of the thinking principle. Sakya-muni did not leave his doctrines in writing; he declared them orally, and they were carefully treasured by his disciples,

THE ELIZABETH SUSPENSION BRIDGE AT BUDAPEST.

and written down after his death. The determination of the canon of the Buddhist scriptures as we now possess them was the work of three successive councils, and was finished two centuries at least before Christ. The religion soon spread through Hindustan, though it was afterward (probably through persecution) entirely banished from it. Many rock temples, inscriptions, etc., testify to its former prevalence in this region. From Hindustan it spread in all directions—to Ceylon, Java, Cochin-China, Laos, Burma, Pegu, Nepal, Tibet, Mongolia, Tartary, China (where Buddha is called Fo), and Japan, in which countries it still prevails. At present it is professed by perhaps a third of the human race.

Buddhism, Esoteric. See THEOSOPHY.

Buddhist Architecture. See INDIAN ART.

Bud'ding, in gardening, the art of multiplying plants by causing the leaf-bud of one species (or, more commonly, variety) to grow upon the branch of another. The operation consists in shaving off a leaf-bud, with a portion of the wood beneath it, which portion is afterward removed by a sudden jerk of the operator's finger and thumb, aided by the budding-knife. An incision in the bark of the stock is then made in the form of a **T**; the two side lips are pushed aside, the bud is thrust between the bark and the wood, the upper end of its bark is cut to a level with the cross arm of the **T**, and the whole is bound up with netting or worsted, the point of the bud alone being left exposed. In performing the operation, a knife with a thin flat handle, and a blade with a peculiar edge is required. The following conditions are essential to the success of the operation: First, the bud must be "ripe," that is, fully formed—which is known by its plumpness and hardness. If too young, it will not succeed, because it has not acquired vitality enough to depend upon its own resources, until that new growth has taken place which attaches it to the stock. If too old, "sprung," or beginning to grow, it is also unfit for use, because the new organs belonging to the young growth need an instant and uninterrupted supply of food, which in the beginning the bud cannot obtain from the branch. Secondly, the bark of the stock must "run freely," that is, must separate readily from the wood below it. This separation is necessary in order that the bud may be inserted beneath the bark; and is always attended by the presence of a large quantity of the viscid

matter called cambium, which is in fact a mixture of young tissue in the act of organizing and of organizable matter. The bud coming in contact with this substance, young and full of vitality, readily forms an adhesion with it, and thus the operation is complete. On this account young branches should always be chosen, since the bark never runs so freely, that is, there is never so great a collection of cambium under it in old branches. Those of the year in which the operation is performed are the best, provided they are advanced toward maturity. Shoots far advanced in a second year's growth are, however, often used, and with success. With regard to the time of performing the operation, autumn is preferred in this country, but it may be practised also in spring. Buds take better in autumn, because the stock has at that period ceased growing, and is chiefly occupied in storing up the organizable material required for the nutrition of the young organs, of which the bud, by the act of insertion, has become one. It ought to be borne in mind that the nearer the constitution of the stock approaches that of the bud, the greater is the success that attends this operation. If they are in any considerable degree dissimilar, the operation becomes precarious; if very different, it is impracticable.

In animals, a form of reproduction, as of the hydra, the sea-anemones, the coral polyps, ascidians, etc. The nature of the process, due to rapid cell-division developed locally, is best seen in the hydra (q.v.), where young hydras arise from protusions, well called "buds," from the side of the parent stock, and later are constricted off and become free individuals. In the corals, as a result of throwing out lateral buds from the base, arises a colony, or compound coral like most of the reef-building forms, such as the brain-coral (*Meandrina*). In the hydra and other animals the new individual arising by budding becomes free from the parent.

Buddleia, būd-lé'ya, or **Buddlea**, a genus of about 70 species of shrubs or trees of the natural order *Loganiaceæ*, natives of the tropics and warmer temperate regions of the world. A few of the hardiest species, none of which are quite hardy in the northern United States, are cultivated as ornamental plants, for which purpose they are specially fitted by their attractive, usually deciduous, but sometimes almost persistent woolly foliage and panicles and their cluster or racemes of tubular or bell-shaped flowers produced abundantly during the summer. The flowers, which in some species are fragrant, range in color from yellow to red, white to purple, and in some cases have more than one color in individual flowers. They may be propagated from seed or cuttings and are found to thrive in well-drained soil in sunny situations. They are popular in the southern United States and the West Indies.

Budé, Guillaume, gē-yōm bū-dā, French scholar, more generally known under the Latin form *Budeus*: b. Paris, 1467; d. 1540. He was royal librarian and master of *requêtes*. From his 24th year he devoted himself to study with the greatest zeal, in particular to belles-lettres,

to mathematics, and to Greek. Among his philosophical, philological, and juridical works, his treatise 'De Asse et Partibus ejus,' and his commentaries on the Greek language, are of the greatest importance. By his influence the Collège Royal de France was founded. He enjoyed, not only as a scholar, but also as a man and citizen, the greatest esteem. His works appeared at Basel (1557). See E. de Budé, 'Vie de Guillaume Budé' (1884).

Bude (būd) **Light**, an exceedingly brilliant light, produced by directing a current of oxygen gas into the interior of the flame of an argand-lamp or gas-burner, by which intense combustion is established and a dazzling light obtained. This plan of lighting was adopted in the House of Commons in 1840 and continued till 1852, when another system of lighting was introduced. It was invented by Mr. Gurney of Bude, in Cornwall, and hence the name.

Budg'ell, Eustace, English miscellaneous writer: b. Exeter, 19 Aug. 1686; d. London, 4 May 1736. He was educated at Trinity College, Oxford, went to London, and entered the Inner Temple. He was a relative of Addison, who in 1717, when principal secretary of state in England, procured for Budgell the place of accountant and comptroller-general of the revenue in Ireland. He lost these places when the Duke of Bolton was appointed lord-lieutenant, in 1718, apparently through some dispute. He then returned to England, where, in 1720, he lost \$100,000 by the South Sea bubble. In 1733 he commenced a weekly paper, called 'The Bee,' which was very popular. On the death of Tindal, the author of 'Christianity as Old as the Creation,' a will was produced by which \$10,000 was left to Budgell. This sum was so disproportionate to the testator's circumstances (his whole estate did not amount to so much), and the legacy so contrary to his known intentions, that suspicions arose respecting the authenticity of the testament; and Budgell's reputation was completely blasted. Ruined in fortune and character, he ended his life by drowning himself in the Thames. He wrote 37 papers in the 'Spectator' signed X.; also others in the 'Guardian,' etc.

Budgerigar', the dealer's name for the Australian grass-parakeet (q.v.). This small parrot has become a common cage-bird in all parts of the world, and goes by a great variety of names, among which "zebra," "shell," and "warbling grass-parakeet" are perhaps the most common.

Budg'et, the annual statement relative to the finances of a country, made by the proper financial functionary, in which is presented a balance sheet of the actual income and expenditure of the past year, and an estimate of the income and expenditure for the coming year, together with a statement of the mode of taxation proposed to meet such expenditure. In the United States the budget is in effect made up in the House of Representatives, to which, at the opening of each congressional session, the secretary of the treasury submits a list of estimates of expenditures for the coming year. Upon these the appropriation bills are based by separate committees. The term "budget," however, is not commonly employed in this country. In England the chancellor of the exchequer sub-

mits to Parliament a yearly statement of necessary governmental expenditures.

Budweis, *bood'vís* (Czech Budejovice), a town of Bohemia, on the navigable Moldau, 133 miles northwest of Vienna by rail. It has a cathedral with a detached belfry dating from about 1550, manufactures of stoneware, porcelain, machines, lead pencils, saltpetre, etc., besides a brisk trade in grain, wood, coal, and salt. In its many educational institutions, including two gymnasia, high, agricultural, trade, industrial, and other schools, instruction is given in both German and Bohemian. In the neighborhood is Schloss Frauenberg (1840-7), the seat of Prince Schwarzenberg. Pop. (1900) 39,400.

Buel, Clarence Clough, American editor and author: b. Laona, Chautauqua County, N. Y., 29 July 1850. He was connected with the New York *Tribune* from 1875 to 1881, when he joined the staff of the 'Century Magazine'; and, in 1883, in conjunction with Robert Underwood Johnson, began the editing of the celebrated 'Century War Articles,' which were afterward expanded into the notable 'Battles and Leaders of the Civil War' (1887).

Bu'el, Samuel, American clergyman: b. Troy, N. Y., 11 June 1815; d. New York, 1 Feb. 1891. He was graduated from Williams College in 1833, and from the General Theological Seminary, New York, in 1837. He was rector successively in Marshall, Mich., Schuylkill Haven, Pa., Cumberland, Md., Poughkeepsie, N. Y., and New York until 1866. From 1866 to 1869 he was professor of ecclesiastical history in the Seabury Divinity School, Faribault, Minn., and professor of divinity there, 1869-71, when he was elected to the chair of systematic divinity and dogmatic theology in the General Theological Seminary, a position which he held until his retirement as professor emeritus in 1888. He wrote 'The Apostolical System of the Church Defended, in a Reply to Dr. Whately on the Kingdom of Christ' (1844); 'Eucharistic Presence, Sacrifice, and Adoration' (1874); 'A Treatise of Dogmatic Theology' (1890); and translated F. H. Reusch's 'Conference at Bonn: Proceedings, August 1875. Between Old Catholics, Orientals, Members of the Anglican and American Churches, from Europe and America' (1876).

Buell, Don Carlos, American military officer: b. Lowell, Ohio, 23 March 1818; d. near Rockport, Ky., 19 Nov. 1898. He was graduated at West Point in 1841, and served in the Mexican war. When the Civil War broke out he was adjutant-general of the regular army, and was made a brigadier-general of volunteers and attached to the Army of the Potomac. In November 1861 he succeeded Gen. W. T. Sherman in command of the department of the Ohio. He resigned from the volunteer service on 23 May 1864, and on 1 June following, also resigned his commission in the regular army. He was president of the Green River (Ky.) Iron Works from 1865 to 1870, when he engaged in coal mining. From 1885 to 1890 he served as United States pension agent at Louisville.

Bu'ell, Marcus Darius, American Methodist clergyman: b. Wayland, N. Y., 1 Jan. 1851. He was graduated at New York University, 1872; studied theology at Boston University,

BUEN AYRE — BUENOS AYRES

and at the universities of Cambridge, England, and Berlin, Germany, being admitted to the New York East Conference of the Methodist Church, 1875. He was pastor at Portchester, N. Y., Brooklyn, N. Y., and Hartford, Conn., from 1875 to 1884, when he was appointed professor of New Testament Greek and exegesis in Boston University. Since 1889 he has been dean of the theological faculty there. He has written 'Studies in the Greek Text of the Gospel of St. Mark' (1890).

Buen Ayre, bwān īrā, or **Bonaire**, a small island off the coast of Venezuela, belonging to the Dutch. It is 50 miles in circumference, and inhabited chiefly by Indians, with a small mixture of Europeans; mountainous; producing a few cattle, goats, large quantities of poultry, and a considerable quantity of salt. It has springs of fresh water. On the southwestern side is a good harbor. Pop. 4,926.

Buena Vista, bwā'na vēs'tā, a village of Mexico, seven miles south of Saltillo, where, on 22-23 Feb. 1847, some 5,000 United States troops, under Taylor, defeated 20,000 Mexicans under Santa Anna. The American army engaged at Buena Vista consisted in large part of volunteers, most of whom had no military experience; and on account of the unequal daring and composure displayed by them at different times the battle would have been lost again and again but for the heroic conduct of the regular artillery. The Americans had taken a strong position on the 21st and were attacked on the 22d, though the main battle did not begin till the 23d, continuing with only slight intermission throughout the day. Santa Anna's attacks were successfully repulsed and on the 24th he was compelled to retreat. The American losses were 746 killed and wounded and the Mexican about 2,000. This battle practically closed the campaign in the north. See MEXICAN WAR. Consult Carleton, 'The Battle of Buena Vista' (1848), Howard, 'Gen. Taylor' (1892).

Buenaventura, bwā-ṇa-ven-tū'ra, a seaport of Colombia, on the Bay of Choco, on a small island at the mouth of the Dagua, 200 miles southwest of Santa Fé de Bogota. It is the port of Santa Fé de Bogota, Popayan, and Cali.

Buendia, Juan, hoo-ān' bwān'de-ā. Peruvian general: b. Lima, 1814. He was put in command of the Army of the South in the Chilean war in 1879, and attacked 10,000 Chileans on the heights of San Francisco, 8 November, where he was defeated with terrible loss. He was court-martialed, but freed from blame and afterward served in the defense of Lima.

Buenos Ayres, bwā'nōs īrās, one of the provinces of Argentina, lying west of the La Plata and Atlantic Ocean, and separated from Patagonia by the Rio Negro. The chief rivers are the Paraná, with its tributary, the Plata River, and the Rio Salado. The province presents nearly throughout level or slightly undulating plains, known as the pampas of Buenos Ayres. They are covered with tall, waving grass, which affords pasture to vast numbers of sheep, cattle, and horses. These constitute the chief wealth of the inhabitants; and their products, along with wheat, are the chief exports. The climate is generally healthy. For judicial purposes the province is divided into four dis-

tricts, and for administrative ones into 100. The capital is La Plata. The executive power resides in a governor and vice-governor, indirectly elected for three years, and the legislative power in a Congress, composed of a Chamber of Deputies of 100 members, biennially elected, and a Senate of 50, elected biennially. The Congress sits from 1 May to 31 August. Pop. about 1,500,000.

Buenos Ayres. Federal capital and principal port of importation and exportation of the Argentine Republic, and the largest of all the cities of the southern hemisphere. From its population (over one million inhabitants in 1906) it occupies the second place among the Latin cities of the world, coming directly after Paris. It is situated 34° 36' 21" 4 latitude south, which in the northern hemisphere corresponds to the latitudes of Los Angeles (California) and Yokohama (Japan); its longitude is 58° 21' 33" 3, west from Greenwich: it is situated 20 metres above the level of the sea, upon the right bank of the La Plata River, which is at this point about 30 miles wide, and distant 172 miles from its mouth where it empties into the Atlantic Ocean. It is the metropolis, commercially, politically, and socially, of the extreme south of the continent. Distant 5,220 miles from London and 4,370 miles from New York, it is the terminal port for 10 transatlantic lines of steamships which unite it with European ports, and it is also the centre from which radiate 6,600 miles of railroads, which end in Patagonia in the south, and in the west and north connect it with the frontiers of Chile and Bolivia. It is also the principal port for all the river traffic for a distance of 3,400 kilometres (2,250 navigable miles), extending the whole length of the rivers La Plata, Uruguay, Paraná, and tributaries, connecting it with Montevideo, capital of the eastern Republic of Uruguay, and with Asuncion, capital of Paraguay. Its climate is one of the most changeable in the world, though its annual average temperature corresponds to those of Genoa (Italy): San Francisco (California); Tokyo (Japan); Sydney (New South Wales).

General Topography.—The city is spread out upon a plain on the right bank of the Rio de la Plata, 125 miles west of the city of Montevideo, which lies on the north margin of the estuary. Buenos Ayres extends 11¼ miles from north to south, and 15½ miles from east to west, with a circumference of more than 38 miles.

The plan of the city is quadrangular, similar to a chess-board. In the central part the streets are 32 feet wide and the blocks are 420 feet in length. By municipal regulations the height of the front of the buildings cannot exceed one and one-third times the width of the street. In 1892 the Avenue de Mayo was completed and opened. This avenue is 100 feet wide and a mile and a half long, and divides from east to west the oldest and most densely populated part of the city. It is well paved with asphalt and has in the centre three safety islands, with double electric light posts, facing each block, and a row of plane trees extending the entire length. The buildings along this avenue vary in materials and in the number of stories. At the extreme eastern end it opens upon the Plaza de Mayo with an area of more than four acres, beautified with trees and flanked with public

BUENOS AYRES

buildings;—the "Casa Rosada" ("Pink House") or Executive Palace, the old House of Congress, the Commercial Exchange, the Cathedral, the municipal buildings, the "Bank of the Nation," and other establishments of importance. At the extreme western end is the recently inaugurated Palace of Congress, of monumental proportions, which cost \$6,000,000.

The district of the Boca (about 100,000 inhabitants) in the city of Buenos Ayres, upon the left bank of the Riachuelo, and the district of Avellaneda (12,000 inhabitants) in front of Barracas to the south, upon the right bank, in the jurisdiction of the Province of Buenos Ayres, are united by a draw-bridge and other similar devices, and the people living there are for the most part occupied in the traffic of the harbor, and represent a business capital of \$150,000,000 invested in this traffic. Moreover, the railroads to the west and to the south, which assist in this traffic, represent a capital of \$201,500,000.

Harbors, Wharves, Markets, etc.—The location of the city, owing to the shallowness of the river, demanded the construction of an extensive harbor. Its facilities are as follows:—inner harbor, comprising the north and south basins and docks and the Boca del Riachuelo; outer harbor, comprising the outer roads and channels through which shipping enters; the south channel, 11 miles long, having a depth of 17 to 22 feet; and the north channel, with a depth of from 20 to 23 feet. Both channels are 350 feet wide at entrance and marked by buoys.

This harbor was built in 11 years (from 1886 to 1897) and cost \$35,000,000 gold. It covers a superficial area of 165 acres and consists of two canals (about 21 feet deep), one from the entrance and the other from the outlet (both provided with luminous buoys), which nevertheless do not satisfy the demands of traffic; two shipyards, four docks, and two dry docks; 24 warehouses with a capacity, roughly estimated, of 20,000,000 cubic feet, which can hold 24,000,000 tons of merchandise, and which extend for 1½ miles fronting the wharves, the latter having a length of 6 miles (the same length as the harbor of Antwerp). It has grain elevators whose capacity amounts to 200,000 tons. Within the circumference of the harbor are 3½ miles of railroad. The wharf for animals on foot has room for 40,000 sheep and more than 1,500 beeves.

The Boca del Riachuelo has a depth of 18 feet and is bordered by wharves for 3 miles, and has a movement of 1,200,000 tons of merchandise per annum.

Facing these wharves on the right bank is the "Central Fruit Market," the largest warehouse in the world; it occupies an area equal to nine square blocks in New York. The cost of its construction was \$4,155,000. In the year 1904 it stored 188,930 tons of wool, hides, and other products of the cattle industry. It is the principal exchange for all business pertaining to the exportation of the fruits of the country.

The southern railroad has its own dock, on the right bank of the Boca del Riachuelo, 23 feet deep, with 1½ miles of wharves, for the exportation of agricultural and cattle products from the southern part of the Province of Buenos Ayres.

Commerce.—Compared with the principal

harbors of the world, the harbor of Buenos Ayres stands in eleventh place, and is second after New York in foreign commerce in all America. In 1905 there entered and cleared 27,279 steamships and sailing vessels, with a total register of 10,771,947 tons. At the time of its greatest activity, the port harbors as many as 1,400 steamships and sailing vessels moving in and out. In 1904 the general movement of passengers was 142,525 outgoing, and 241,971 arriving, making an increase from immigration of 100,000 persons (exactly 99,446). The harbor of Buenos Ayres receives 84 per cent. of the importations for the entire country, and sends away 51 per cent. of the national exports. About \$17,000,000 are to be spent in enlarging and widening this harbor to enable it to meet the expected development of commerce of the city and of the industries of the country.

Parks.—Buenos Ayres has 79 parks and squares, with an area of 2,320 acres, one of the finest park systems in the world; the Zoo is one of the largest and the best kept in the whole continent; the Botanical Garden is only second to Rio Janeiro's; squares, with profusion of flowers and handsome trees, are beautified with monuments to heroes of the Independence.

Schools, Libraries, etc.—As in many other cities the school buildings do not have the needed space for games and outdoor activities such as school gardening, etc. Already it is thought that the school buildings to be erected in the future should be located in the centre of the parks and public gardens, as in Japan. The school buildings in Buenos Ayres, with much ornamented façades, are quite unfitted for their purpose, having not the proper accommodations in the interior; Italian architects imported the scheme of treating the façade as a mere screen, disregarding modern hygienic exigencies for educational plants. In 1904 there were 238 public schools in which 117,483 scholars were enrolled. There were 2,973 teachers (2,050 women) in the elementary grades. The number of pupils from 6 to 14 years of age was 188,271, there now being only 15 per cent. illiterate against 20 per cent. in 1895. In the secondary institutions of instruction (except the normal) 2,638 pupils were enrolled. The number of attendants in the seven normal schools of the city was 2,282, and a business college counted 668 pupils. The university has 2,380 students. The public libraries were consulted by 35,358 persons and possessed 48,876 books.

Press.—More than 200 newspapers are published in the city of Buenos Ayres,—most of them in Spanish; but some are in Italian, English, French, Scandinavian, Russian, Hebrew, and Arabic. "La Nacion" and "La Prensa" have a daily circulation of over 100,000 copies and have the most extensive telegraph services in the world. "La Prensa" is a kind of institutional newspaper. The beautiful building, one of the handsomest in the city, is endowed to social services, and contains library, free evening schools for commerce and for music, offices for free medical assistance, free legal aid, free chemical laboratory, etc. "La Nacion" is entering the same line.

Sanitation.—The sanitary system (running water and sewers) is excellent and has cost the city \$46,875,180. When in 1875 these works were proposed, there had been few years that

BUENOS AYRES.

1. Plaza de Mayo (May Square), Showing City Hall and Catholic Cathedral.
2. Plaza de Mayo (May Square), Showing Government House.

BUENOS AYRES

the city had not suffered through terrible epidemics, cholera morbus in 1865 and 1873, and yellow fever in 1871. Since 1885, thanks to the extension of these works of sanitation, to the efforts of the Board of Health in the inspection of foods, and the struggle against tuberculosis and other contagious diseases, the mortality has been reduced from 44 per 1,000 in 1875 to 22.7 in 1894 and to 14.2 in 1906. There has likewise been a considerable reduction in the death rate of infants under one year of age, which in 1889 was 195 for each 1,000 born, and dropped to 141 in 1894, to 102 in 1899, and to 83 in 1904. In the same year the proportion in Christiania was 100, 111 in Paris, 146 in London, 162 in New York, 166 in Hamburg, and 202 in Berlin. The birth rate in Buenos Ayres is 33.5 per cent. and has diminished rapidly from 35 per cent. in 1903, 37 per cent. in 1902, 39.5 per cent. in 1901, 41 per cent. in 1899, 44.5 per cent. in 1893 and 46 per cent. in 1891.

The sewage of the city is handled by the circulating or dynamic sewage system. Drainage works costing over \$35,000,000 discharge into the estuary of La Plata near Quilmes, 15.5 miles southeast of Buenos Ayres.

Another question which occupies the Argentine hygienists is to find a type of sanitary dwelling which will correspond to the change of customs and to the increase of population. Buenos Ayres is the only city in the world with buildings suited to a mild climate which suddenly had to face modern conditions demanding a congested population and the rapid distribution of a heavy traffic, resulting from its being an important seaport. As they are now, the city blocks are not adapted to meet these demands. They have an area of more than four acres and there is no provision for an empty space in the centre. Therefore, the city lots are too long, the houses receiving light and air from a court or *patio*, which in the case of a many-story building does not provide for either. Besides, long houses do not afford privacy or comfort and are heated with difficulty—a serious detriment in a city where the temperature falls as low as 28° F., together with great moisture in the air.

Public Utilities.—The principal streets are lighted with electric lights, are well paved with asphalt, blocks of wood and granite, and are kept in good repair, cleaned, and sprinkled. The internal business of the city is very considerable. In 1904 there were 315 miles of street car lines, of which 166 miles were electric and 149 miles were horse-car lines; the latter power is gradually being exchanged for electric traction. During the year 1905 there were constructed 111½ kilometres of electric roads. In 1905 the street railroads carried 171,243,538 passengers, 22,262,849 more than during the previous year. In 1905 there were 19,248 carts, 5,126 carriages, of which 2,300 were for hire, and 300 automobiles, 125 more than in 1904. In 1904 the five railroad stations handled 13,734,238 passengers and 3,566,998 tons of merchandise. The post-office handled 83,104,000 letters and 76,062,000 packages and pamphlets.

Water required for general purposes is drawn from the estuary five miles above the city. The water works consist of two tunnels, subfluvial and subterranean, 18,702 feet in length, with two

pumps capable of raising 6,073,320 cubic feet of water to a height of 49.2 feet every 24 hours. The filtered water is carried to a central reservoir at the highest point in the city. This distributing reservoir is provided with forcing pumps having three distinct flows: there are 12 tanks, elevated in groups one above another at 39.3, 55.7, and 72.1 feet respectively. It is the most noticeable iron construction in the city; 16,000 tons of iron were used in building it. The exterior is of pressed brick and vitrified tiles and presents a very handsome architectural appearance. The annual consumption of water is 11,000,000 gallons or a daily average of 33.5 gallons per capita.

The telephone service is very deficient. In 1903 it had 6,500 subscribers and had connections with the cities of La Plata (38 miles), Rosario (186 miles), and by cable with Montevideo (125 miles).

Industries.—Buenos Ayres is not especially industrial. There are not more than 90,000 workmen in its factories and workshops, where they work hides, wood, metals, clay for bricks, chemical products, constructive materials, manufactures pertaining to lights, furniture, carpets and hangings, clothes, preserved foods, etc.; and this production is stimulated by the protection of the custom-house, in spite of which Buenos Ayres is well supplied with articles made in Europe and America. According to the last industrial census taken in 1904 in the city of Buenos Ayres, there were 8,877 industrial establishments as follows:

Industries	Capital	Value of Output	Employees		Motors—H. P.
			Men	Women	
Food	\$8,000,000	\$16,000,000	6,184	234	3,713
Building.....	3,900,000	7,500,000	7,873	..	2,643
Clothing and toilette.....	8,000,000	14,500,000	10,711	4,739	1,640
Wood, furniture, etc.....	3,750,000	6,000,000	6,035	286	1,064
Metals.....	6,350,000	5,000,000	7,936	96	1,976
Arts and ornaments.....	1,700,000	2,000,000	1,722	151	283
Graphic arts...	3,300,000	3,500,000	3,684	259	882
Textiles and leather.....	7,200,000	15,000,000	5,393	5,084	4,315
Chemicals.....	1,600,000	3,000,000	1,644	849	787
Various.....	5,500,000	18,500,000	4,253	1,383	2,555
Total.....	\$49,300,000	\$291,000,000	55,435	13,077	16,858

Banking, Finance, etc.—Buenos Ayres supports 16 banks of discount with a joint capital of \$80,000,000. Of those 10 are foreign and represent all the principal places of the world except New York, notwithstanding that in 1905 the business transacted with the United States amounted to \$44,637,901, having increased 110 per cent. during the last 5 years; all of this business had to be done through London banks. In 1904 the Bolsa de Comercio (Chamber of Commerce) transacted business to the amount of \$174,061,251, and the Clearing House passed through \$2,875,924,788.35. The municipal taxes amounted to \$7,500,000, 41 per cent. of which is devoted to loans for new undertakings, 29 per cent. for direct taxes, and 11½ per cent. for indirect taxes.

In 1904 landed property was sold to the value of \$42,500,000, against \$26,000,000 in 1903 and

Buenos Ayres, University of — Buff Leather

\$19,800,000 in 1902. The value of buildings constructed in 1904 amounted to \$12,000,000. In 1904 there were transfers of real estate amounting to \$42,240,000. There were 133 fires with a loss of \$366,000. The insurance paid was \$1,100,000. During the first semester of 1906 the Minister of Justice recognized the authorized agents of 55 miscellaneous societies, with a joint capital of \$44,000,000.

Population, Social Conditions, etc.—The census of 1869 gave the population of Buenos Ayres as 187,346 inhabitants, and prophesied 900,000 for 1919; in 1895 it had 663,854 and in December 1906 had reached 1,111,000. The increase has been at the rate of 40 per cent. in a decade (inferior alone to Chicago). Buenos Ayres has more than 440,000 foreign residents, of whom 230,000 are Italians, 105,000 Spanish, 28,000 French, 6,000 English, and 6,000 German. The greater part of the landowners of the Province of Buenos Ayres and the Pampas prefer to live in the city of Buenos Ayres, enjoying the rent of their land or hoping that the improvements on their neighbors' lands will increase the value of their own. In this respect, that province and this territory are to the city of Buenos Ayres what Ireland has been to London. Because of this and because the city is the seat of the national government, also because of the many commercial establishments engaged in foreign trade, Buenos Ayres is a centre, where the light and splendor of a great capital never die out. It has 20 theatres where in the single season of 1905 appeared Saint-Saëns, Puccini, Sara Bernhardt, Coquelin, Rejane, Tina di Lorenzo, Jeanne Hading, Novelli, Caruso, etc. Nevertheless, this wealth, which is the result of the absenteeism above referred to, retards the progress of the country districts and gives birth to a close, feudal plutocracy. Such a social condition is not best fitted to call forth a truly democratic public spirit. However, the spirit of association commences to enjoy a broader outlook, there being a constant increase in the number of educational and civic associations whose object is to make all classes participate in social well-being. The charitable institutions are disposed more and more to abandon their cut-and-dried methods, and instead of lessening the effects of poverty, they endeavor to prevent its causes through a collective social crusade, hoping that before long a law against child-labor will be passed and that model reformatories and juvenile courts will be established to better the condition of children.

In 1904 there were 5,110 persons in the asylums. The free municipal lodging house gave lodging and board to 41,578 persons, the Salvation Army to 40,305, the French Charity Association to 5,046. The criminals arrested in 1904 for each 1,000 inhabitants from 15 to 70 years of age, were divided as to nationality as follows:—German 4.23; Argentine, 8.70; Spanish, 8.26; French, 3.40; English, 4.93; Italians, 6.61; Uruguayan, 8.65. The criminals of the decade 1895-1904 are divided according to ages thus: less than 16 years, 8 per cent.; from 16 to 20 years, 17 per cent.; from 21 to 25, 22.5 per cent.; from 26 to 30, 18.7 per cent.; from 31 to 35, 12.9 per cent.; from 36 to 40, 9.1 per cent.; from 41 to 45, 5.2 per cent.; from 46 to 50, 3.2 per cent.; from 51 to 60, 2.4 per cent.; over 60, 0.8 per

cent. The number of suicides was 239, the causes being as follows;—family quarrels, 18.5 per cent.; tired of life, 13.4 per cent.; physical suffering, 12.5 per cent.; crossed in love, 5.4 per cent.

In 1895 there were 929 births for each 10,000 foreign women. In 1895 for each 10,000 foreign women from 15 to 50 years of age were born 929 children of a foreign mother; and for each 10,000 Argentine women were born 1,926 children, or it may be a share of 1,605 for each 10,000 women of the entire birth rate. In 1904 these figures decreased to 850, 1,300, and 1,403 respectively. In 1904 there were 74 marriages and 146 deaths for each 10,000 inhabitants.

Government.—The communal government of the city is a kind of government by commission, composed of an Intendente and a deliberating council appointed by the national executive authority. The amount of expenditures for the year 1905 was \$8,126,660.

As is evident, it can hardly be said that Buenos Ayres enjoys self-government, strictly speaking. Nevertheless the government possesses considerable prestige, resembling in this respect an aristocratic city. For this reason the public employees seek for the reward of public opinion, and it has been said that there is not a city in the world where so much is accomplished for the same amount of money. On the other hand, as a consequence of paternal government, apathy is to be found in furthering official action. The *Asistencia Publica*, or Board of Health, can truly be called the best in the world. The 18 hospitals are well kept, many in very appropriate buildings. The sale of food in the 35 markets of the city is scrupulously controlled.

JUAN A. SENILLOSA,

Former Argentine Consul General to Canada.

Buenos Ayres, University of (Universidad Nacional de Buenos Aires), the national university of Argentina and the largest institution of learning in South America. Its students number nearly 2,380, and its courses cover law and government, mathematics, science, and philosophy.

Buff, a mixed color, something between pale pink and pale yellow. It was adopted by the English Whig party, in combination with blue, as their distinctive color; and, possibly in consequence of that circumstance, the Whig party having been opposed throughout to all the measures of government which led to the American Revolution, was chosen as the national uniform of the Americans at the opening of the Revolutionary War.

Buff Leather, a leather prepared by saturating the hides with some aluminous substance, and afterward with oil. Leather prepared in this way is softer and more flexible than any other kind, and on that account it is much used for soldiers' cross-belts, gloves, and other military accoutrements. Its color is naturally light yellow, but it is in some cases bleached before being used. The buff leather used in former times to make the jerkins, worn under coats of mail to deaden the pressure of the metal on the body, and to prevent any contusion from a blow, was made from the hide of the urus, or wild bull of central Europe, the common name of which was buffe, whence the name of the leather was derived.

THE HARBOR OF RIO.

MAY AVENUE, BUENOS AIRES.

The Government House is in the distance. The street's pavement is of Trinidad asphalt laid by an American Company

BUFFALMACCO — BUFFALO

Buffalmacco, boo-fal-māk'kō (assumed name of BUONAMICO CHRISTOFANI), Italian painter who flourished according to Vasari during the first half of the 14th century. The same authority attributes to him the frescoes depicting the Passion in the hall of the Campo Santo in Pisa, and states that he worked in Arezzo, Florence, Bologna, and Cortona. He is mentioned by Boccaccio in the 'Decameron.'

Buffalo Bill. See CODY, WILLIAM F.

Buffalo, N. Y., county-seat of Erie County, the second city in the State and eighth in the United States; situated at the eastern end of Lake Erie and on its outlet the Niagara River. Its centre is 24 miles south of Niagara Falls, and its important suburbs, the Tonawandas, are half-way between. It lies due west 297 miles by rail from Albany and 499 from Boston; northwest 425 miles from New York, and 417 from Philadelphia; about 410 southwest of Montreal; and 540 east of Chicago. It is, therefore, about a midway point from the East to Chicago. It extends about 10 miles along the lake and river front, and half as far east; area, 42 square miles.

Buffalo, which began at the mouth of Buffalo Creek, has spread mainly north and east up a gradual rise, to a great plateau some 80 feet above the lake and 620 above sea-level. It is laid out in wide rectangular streets, beautifully shaded and decorated with shrubbery, and more completely than any other city in the world: No less than 335 miles of its over 700 miles of streets are asphalted, 105 are stone-paved, and many more are macadamized. The chief business streets are Main, running north and northeast from the lake to the city limits; Delaware Avenue, parallel with it; Niagara, north and northwest along the lake and river front to Tonawanda; and Broadway, which with Genesee and Sycamore widen spoke-like from the heart of the business district around Lafayette and Niagara Squares. Each of these is several miles long. The finest residence streets are Delaware Avenue and North Street, crossing it at right angles a mile north of the centre; they are set with large separate mansions, with great lawns, gardens, and shrubberies, a fashion followed in the new residence streets to the north.

Municipal Service and Improvements.—The street cleaning and sprinkling services, costing \$180,000 a year, and the garbage collection, costing \$110,000, are notably efficient; the sewage collected through over 420 miles of mains is emptied into Niagara River and carried swiftly away; the first public bath house erected in New York State under the law of 1895 was opened here in 1897. All these things, with the cool summer climate which attracts many visitors, enable Buffalo to claim the distinction of being the cleanest and healthiest city in the United States, its death rate in 1900 being 14.8 and in 1901 12.25. The waterworks, built in 1888, are supplied from the lake; they cost \$9,100,000, and are owned by the city; the reservoirs have a storage capacity of 200,000,000 gallons a day, the average consumption is about 100,000,000, and there are over 500 miles of mains; the service costs \$650,000 a year. Electric lighting is almost universal in business houses and the finer residences, from the cheap power furnished by Niagara Falls. The police department numbers 785 men, with 13 stations

and a harbor patrol steamer, and costs nearly \$800,000 a year. The fire department has 26 steam fire engines, 6 chemical engines, and 23 hose companies, with three fire boats, the latest systems of storage and signal boxes, and 498 men; the cost is \$675,000 a year. An important municipal improvement has been the transfer of telegraph and telephone, police, and fire-alarm wires, from overhead poles to subways. The street-car service of Buffalo was the first in the United States to equip itself with electricity, and to give free transfers; it has seven companies, and covers over 200 miles of line, extending to all the suburbs, down the river to Niagara Falls, and across it to Canada. More than 50 miles of the track is in the city, which has also a steam belt line of the N. Y. C. along the lake and river front, and west and north to above Delaware Park.

Public Parks and Cemeteries.—The park system includes six large parks of 1,149 acres in all, connected by a magnificent system of boulevards, parkways, speedways, and approaches, covering 224 acres, and 74 acres of minor places and squares. Much the largest is Delaware Park, on the north side, of 362 acres, with a lake ("Gala Water") of 46½ acres in the western part; here and in the adjacent grounds the Pan-American Exposition of 1901 was held. It is continued by Forest Lawn Cemetery of 239 acres on the south—by far the greatest of the 26 cemeteries of the city, and containing the monuments to the Indian chief Red Jacket and to President Fillmore—and by the fine grounds of the State Insane Hospital, with 203 acres, on the west. On the southeast is Humboldt Park of 56 acres. Overlooking the lake at the river entrance is "The Front," a bold bluff 60 feet high, and the site of Fort Porter, where several companies of United States soldiery are stationed. The Parade Ground here has 48 acres, and is a favorite promenade from its superb view. On the south side of the creek are South Park, 155 acres, Cazenovia Park, 106 acres, Riverside Park, 22 acres, and Stony Point Park, 22½ acres, on the lake front. There are several attractive parks and squares in the centre of the city, among them Lafayette, Niagara, Franklin, Washington, and Delaware. Lafayette contains the Soldiers' and Sailors' Monument, costing \$50,000.

Chief Buildings.—Among the many fine structures in the city, the first place must be given to Ellicott Square, the largest and most magnificently equipped fireproof office building in the world; it occupies an entire block, and contains over 400,000 feet of floor space, or over nine acres, with 16 elevators. Of the others, besides churches, cathedrals, and institutional buildings mentioned elsewhere, the most notable are the two handsome buildings preserved from the Exposition—the Albright Art Gallery, and the New York State Building, housing the Buffalo Historical Society; the new Federal Building, containing the post-office and the custom-house, a large freestone structure which cost \$2,000,000; the city and county hall on Franklin Street, of granite, in the shape of a Latin cross, with a tower 245 feet high, completed in 1880 at a cost of about \$1,400,000; the Music Hall and the Board of Trade building, both noble edifices; the State Arsenal; the Old and New Armories; the Masonic Temple and Y. M. C. A. building; the Grosvenor Library; the

BUFFALO

Normal School and the three High Schools; the Erie County and Buffalo Savings Banks; the Erie County Penitentiary; and the mammoth grain elevators.

Trade and Commerce.—Buffalo's position as the eastern terminal of the commerce of the Great Lakes, and the distributing point from the East to its ports, has made it the greatest city built up on them except Chicago and Cleveland, and one of the great world-ports in the volume and variety of produce trans-shipped, although ice-bound for one third of the year. In 1902, 4,781 vessels arrived at this port, with a gross tonnage of over 6,000,000; and the customs receipts were over \$900,000. Naturally, its foremost handlings are of western produce, grain, flour, provisions, and live stock; its average annual receipts of grain, though varying with the crop, are about 150,000,000 bushels, of flour 14,000,000 barrels. Next to this is its live-stock business; it handles more horses and sheep than any other American port, and ranks among the first in cattle and swine. It receives some 15,000,000 pounds of fish yearly, largely from Georgian Bay off Lake Huron, and sends it to inland parts not only East, but as far west as the Rocky Mountains. Lumber is another immense interest, its receipts amounting from 150,000,000 to 250,000,000 feet a year; and it receives some 1,500,000 tons of iron ore. Of these last two a large part goes to Tonawanda, whose business, however, is really part of Buffalo's. The coal traffic is also enormous; some 10,000,000 tons are received yearly by rail, two thirds anthracite, of which about 3,000,000, nearly all anthracite, is shipped westward by water. About 100,000 tons of salt are among its exports, and nearly \$10,000,000 worth of packed meat. The total export trade is now over \$16,000,000 a year.

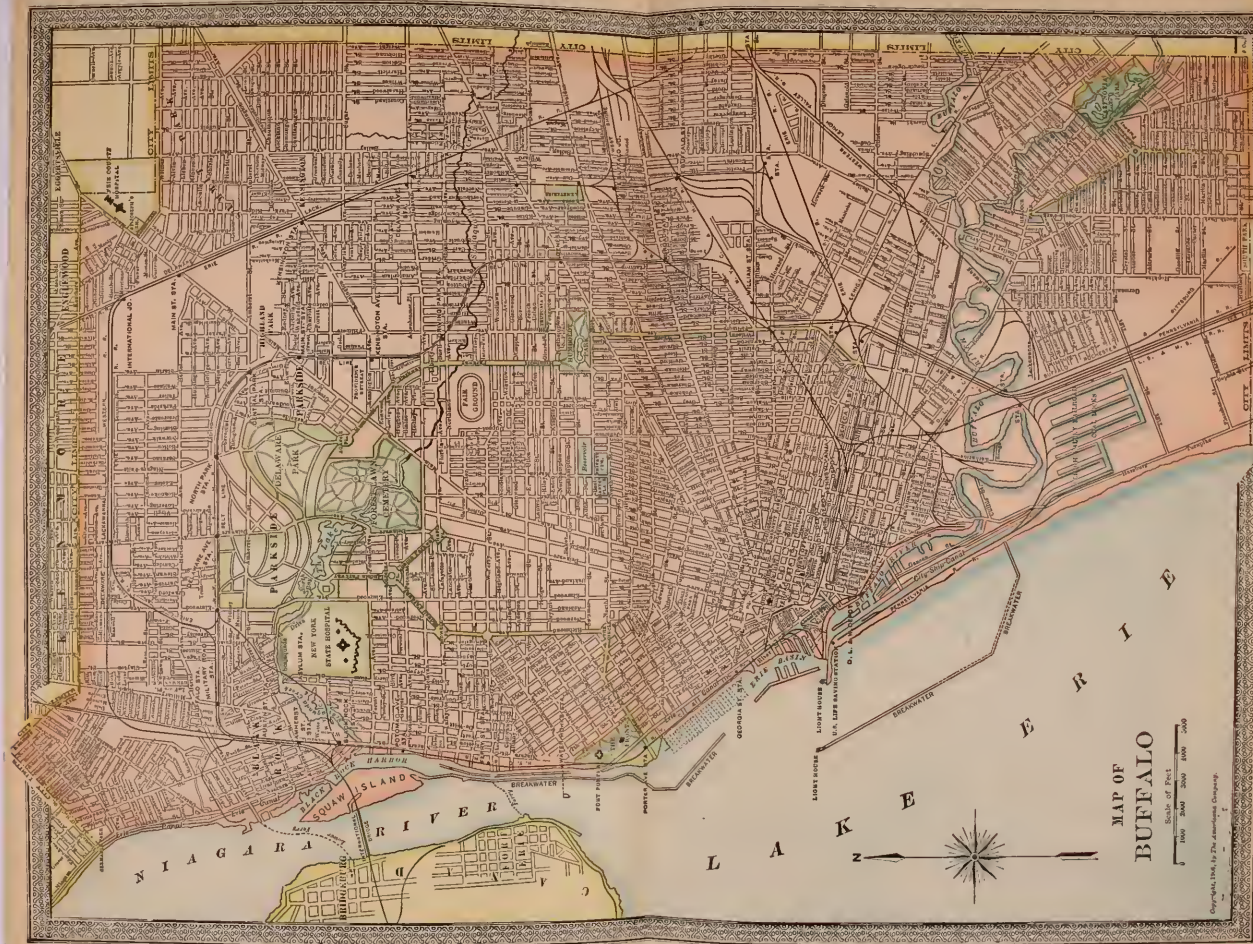

This immense development has been made possible by a vast co-operation of United States, State, and municipality in facilities for handling the business—breakwaters, stone piers, basins, canals, railroads, etc. Originally, as with all the lake ports, the harborage was only the shallow mouth of a small river, Buffalo Creek, navigable now for two miles inward. But the government has built a great series of stone and cement breakwaters, four miles long, costing over \$2,000,000, and forming an inner and an outer harbor, the best on the lakes; this is extended to Stony Point, four miles above the mouth of the creek. The State has built Erie Basin, with a breakwater and stone docks, at the end of Erie Canal just below the mouth of the creek; and the city has deepened the creek and built a ship canal two miles long between it and the lake, one of two such, at the end of which are the Lehigh coal docks. No less than 16 steamship and steamboat lines run from Buffalo to different points on the lakes, besides summer excursion routes. The Welland Canal about 20 miles west, across the neck of land between Erie and Ontario, connects it with the latter and the St. Lawrence. The Erie Canal makes a waterway through the heart of the State to the Hudson River. As to railroads, it is the terminal of the main line or some spur of every trunk road from Philadelphia to Quebec from the east, in the United States, the New York Central, main line and West Shore; Erie; Lehigh Valley; Delaware, Lackawanna & Western; Pennsylvania; Buffalo, Rochester & Pittsburgh;

Buffalo & Susquehanna; from the west, the Lake Shore & Michigan Southern; Michigan Central; New York, Chicago & St. Louis; Wabash; from Canada, Canadian Pacific; Grand Trunk; Canada Southern. There are 250 passenger trains a day; 700 miles of railroad track within the city limits, and six of the city's square miles are owned by the railroads. To the Canada side at Fort Erie and Bridgeburg there are several ferry lines, and the great International Bridge from Squaw Island to Bridgeburg, completed in 1873 at a cost of \$1,500,000. The internal conveniences for carrying on this traffic are correspondent. There are nearly 50 grain elevators, fixed and floating and transfer towers, with a storage capacity of 28,000,000 bushels, and able to take care of 5,000,000 bushels a day. Some of these are among the largest in the world; the chief one, the Great Northern, with a capacity of 3,000,000 bushels. The first elevator in the world was built here in 1843. The largest coal pocket in the world is that of the D., L. & W. here, 5,000 feet long; the coal docks can handle 29,000 tons a day; the railroad coal-stocking trestles are in the east part. Their stock yards, 75 acres in extent, are in East Buffalo.

Manufactures.—Two great advantages of Buffalo in manufacturing are natural gas, for which the city has laid mains; and the electric power furnished from Niagara, whose tunnels are within 20 miles. At present, about 50,000 persons are employed in manufacturing industries in the city, in 4,000 establishments. By the census of 1900, the figures were: Establishments, 3,962; capital, \$103,939,655; employees, 476,902; wages paid, \$19,915,817; cost of materials, \$73,359,466; value of products, \$122,230,061. The principal industries apart from food, mason, and carpenter work, tinsmithing and jobbing, etc., were—wholesale slaughtering and meat packing, \$9,631,187; foundry and machine-shop products, \$6,816,057, —but to this should be added iron and steel, architectural and ornamental iron work, and hardware, \$3,685,063, making a total of \$10,501,120, for iron products altogether, or the most important single branch; the Lackawanna Steel Company, capitalized at \$40,000,000, has the largest and most capacious individual plant in the world, with a separate breakwater a mile long and a capacious private harbor—linseed oil, \$6,271,170, partly used in its \$753,519 of paint making; malt and malt liquors, \$6,229,940; railroad cars, \$4,553,333; soap and candles, \$3,818,571; flour and grist-mill products, \$3,263,607; planing-mill products, \$3,095,760; factory-made clothing, \$3,067,723; chemicals, \$1,939,378; patent medicines and compounds, \$1,855,808; leather and leather goods, \$1,756,084; factory-made furniture, \$1,644,671; besides over \$1,000,000 each of carriages and confectionery, and large quantities of jewelry, saddlery and harness, tobacco products, and other articles, embracing some 200 different industries in all. Notice should be taken of fine printing, lithographing, and engraving, in which Buffalo ranks high artistically.

Finances and Banking.—The assessed valuation of the city has increased in 30 years from about \$38,000,000 to over \$250,000,000, nearly all real estate, with a tax rate of 17.12. The bonded debt is some \$16,000,000, with an annual interest charge of about \$650,000; but there is a sinking fund of about \$1,250,000, and the city owns property valued at about \$21,000,000. Also,

MAP OF
BUFFALO

1" = 2000'

Copyright, 1914, by The Rand McNally Company

BUFFALO

of this debt \$3,754,382 is for water bonds, on which an income is earned. The city expenses are some \$6,000,000 a year. The post-office receipts are over \$1,000,000 yearly, and the internal-revenue receipts about \$2,000,000. There are nine banks of discount (five national), with about \$8,000,000 capital and surplus and \$45,000,000 deposits; two trust companies, with \$1,400,000 capital and surplus; and four savings banks, with over \$35,000,000 deposits and \$6,000,000 surplus.

Churches.—Buffalo is the seat of a Roman Catholic and of an Episcopal bishop, and has two handsome and impressive cathedrals; the Catholic cathedral being a Gothic structure of blue stone trimmed with white, and has a set of 42 chimneys. Besides these there are 37 Catholic churches, 13 chapels, and 12 convents; and 171 Protestant, besides 16 missions and chapels, the most numerous being the Methodist Episcopal (24 English, 3 German). Baptist (25 churches and 5 missions), Lutheran (13 German, 5 English, 3 Scandinavian), Presbyterian (18), Protestant Episcopal (16, with 11 missions), and German United Evangelical (15). There are also nine synagogues. Of the church buildings, besides the cathedrals, the most notable are Trinity (Episcopal) and the First Presbyterian.

Charities.—There are 12 children's refuges in Buffalo, and 9 homes and refuges for adults; besides a S. P. C. C. and S. P. C. A., and many religious associations for relieving distress; 18 hospitals, besides the United States Marine Hospital; the Erie County almshouse; lodging and supply stations for the temporary relief of the indigent; a city physician, a district nursing association, and diet kitchens; a German Y. M. A. and the Y. M. C. A.; and a Women's Educational and Industrial Union. Of the children's institutions, the most notable is the free Fitch Institute for poor children, a combined orphanage, crèche—day nursery for children of poor working mothers—training school for nursemaids, etc.; all managed by the Charity Organization Society (organized 1877, the first in the United States), with its home in the building. Of the other institutions, special note may be made of the Buffalo Orphan Asylum, St. John's Orphan Home, the Home for the Friendless, St. Vincent's and St. Joseph's orphanages (Roman Catholic), St. Mary's Asylum for Widows and Foundlings and St. Mary's Institution for Deaf Mutes, the Church Home for Aged Women, and the Ingle-side Home for Erring Women.

Education and Intellectual Associations.—The city in 1903 had 67 grammar schools, with about 100 school buildings, some 1,300 teachers, and an average attendance of about 60,000; a truant school; 33 Catholic parochial schools, with an estimated attendance of some 20,000; two high schools, third one building—the Central with two annexes, and the Masten Park—with attendance of some 2,400; 25 private schools and academies; and some 20 free kindergartens (partly in connection with the schools), orphan-asylum schools, etc. Of the higher institutions, the chief is Buffalo University, organized in 1845, with affiliated law, medical, and dentistry schools, and a cancer laboratory, 80 professors, and 700 students; others are Niagara University, Canisius' (1870) and St. Joseph's Colleges, the Academy of the Sacred Heart and Holy

Angels' Academy (the last four Catholic), the German Martin Luther Seminary (Evangelical Lutheran, 1854), and the Buffalo College of Pharmacy. All the hospitals have training schools for nurses. The Fine Arts Academy (1862) is located in the public library building; the Buffalo Historical Society (1862), with interesting relics and a large library, in the former New York State Building of the Exposition of 1901, now belonging to the society; the Buffalo Society of Natural Science (1861), with a valuable museum of natural history, in the Buffalo Library building. There are many other art and literary associations; 8 dramatic and 13 musical clubs, besides 23 social clubs; and 8 theatres.

Libraries.—The two chief ones are the Buffalo Public Library, installed in a handsome new building in 1897, with about 175,000 books and 16,000 pamphlets; and the Grosvenor, for reference only, with 65,000 books and 4,000 pamphlets. Besides these, there are many institutional, private, and special libraries: the chief being that of the Historical Society, with 12,000 volumes and 23,000 pamphlets; others are the Lord Library of 5,000 volumes in the same building; the State Law Library, with about 15,000 volumes; the Catholic Institute, with over 11,500 volumes and 500 pamphlets; the Medical Library of the University, with 6,000 volumes; the Lutheran and the German Y. M. A., the Polish and the Adam Mickiewicz, the North Buffalo Catholic Association and the St. Michael's Y. M. Sodality, the Erie Railway Employees' Association, the Harugari, etc.

Newspapers.—In 1903 there were published in Buffalo 88 regular periodicals: 11 dailies, 31 weeklies, 6 Sunday, 2 fortnightly, 35 monthly, and 3 quarterly.

Government.—A four-years' mayor; an alderman from each of the 25 wards, and nine councilmen at large; a city clerk appointed by the council, and health, fire, park, police, and civil-service boards appointed by the mayor; the remaining officials elected by the people.

Population.—In steadiness of rapid growth, Buffalo ranks among the foremost of American cities. It first appears in the census in 1820, with 2,095; 1830, 8,668; 1840, 18,213; 1850, 42,261; 1860, 81,129; 1870, 117,714; 1880, 155,134; 1890, 255,664; 1900, 352,387; 1903, about 385,000. It will be noticed that the last 20 years have brought a great increase instead of decrease in its rate of development, and there are no signs of falling off. In 1890 it was eleventh, in 1900 eighth, among our cities; and as it was twin with New York for third in rate of growth among cities of 300,000 and over, it may rise higher yet. The foreign-born population numbered 104,252, or 29.6 per cent; the native-born of foreign parents, 155,716; and only 90,860 of its people, or little over one fourth, were native whites of native parentage. Of the foreign-born, about 50,000, or nearly half, were German, 13,000 being Polish-German Jews; 11,000 were Irish; but 23,400 were Englishmen from England or Canada, which should be added to the citizenship of English blood. In 1878, of all children born in the city, 1,075 were of German descent, against 2,056 of all other descents.

History.—The site of Buffalo was originally a basswood forest, amid which an Indian tribe, the Kahkwias, between the Neutrals and the Eries, hunted and fished along the creek; it was

BUFFALO

exterminated by the Iroquois before 1651, and not a single Indian lived there again for more than a century and a quarter. In 1679 La Salle passed the spot in his 60-ton sloop the Griffin, the first sailing vessel ever on Lake Erie, built at Cayuga Creek below. In 1687 the Baron La Hontan recommended it to the French government as the proper site for a fort to command the fur trade down the Niagara, and marked a "fort supposé" on his map; but no attention was paid to him. In 1764 Col. Bradstreet built Fort Erie across the river on his Indian campaign. In 1780 the Senecas, driven from their old haunts by Sullivan's campaign, settled along the creek inland; the next winter an English family captive among them heard them call the creek by a name they translated "Buffalo,"—whether rightly or not is disputed, but probably enough the herds had sought the salt-licks to the east. Their narrative was published in 1784, and in the treaty of Fort Stanwix that year between the English and the Iroquois, the name was used as familiar to the latter. The Indian settlement soon became known as "the village on the Buffalo," currently shortened to "Buffalo village," and presently to "Buffalo," without any official sanction. The land had formed part of the grant of James I. to the Plymouth Company in 1625, and that of Charles II. to the Duke of York in 1664. The consequent dispute between Massachusetts and New York was compromised in 1786, and ultimately the Holland Company of aliens became patentees in trust in 1792, and by legislative permission owners in fee in 1798. Meantime a few settlers had straggled in; a trader named Cornelius Winne in 1789; two families in 1794 and 1796; and in 1797, when there were half a dozen houses, the first white child was born, a girl. A number of others took up residence there by 1803. In that year, by the advice of their surveyor, Joseph Ellicott, the founder of Buffalo, who had assisted his brother Andrew in laying out the city of Washington, and was convinced that here was the site of another great city, the company had him plot a village, and in 1804 sold the first lots. He called it New Amsterdam, and named the streets after the members of the company, but the settlers disregarded all his names and his oxbow line for Main Street, where his own mansion was to be. In 1810 the town of Buffalo was incorporated, including several now separate townships. In 1811 the first newspaper, the *Buffalo Gazette*, was established. In 1813 Buffalo village was incorporated, and received a new charter in 1822. In the War of 1812, after the storming of Fort Niagara by the British in December, a force of British and Indians under Gen. Riall was detailed to destroy Black Rock and Buffalo; on the 29th captured the latter, and the next day burned all but seven or eight houses, coming back 1 January and burning all but three of the rest. The settlers re-occupied their homes to some extent on the 6th, but it was not generally rebuilt till 1815; on 10 April 1814 Gen. Scott put it under military rule. In 1818 the first steamer, Walk-in-the-Water, was launched. For many years, however, supremacy was balanced between it and Black Rock down the river, now the northern part of the city, where at that time was the ferry across the Niagara to the Canada side; but in 1825, after a fierce struggle, the former secured the terminal of the Erie Canal, and in five years

its 2,412 inhabitants had grown to over 8,000, and its future was assured. Long after, however, able capitalists invested heavily in Dunkirk, 48 miles south, in faith that it and not Buffalo was the coming lake port. In 1832, it became a city, and the next year it annexed Black Rock. Buffalo has given two Presidents to the United States, Millard Fillmore and Grover Cleveland, the latter its mayor in 1882. From 1 May to 1 Nov. 1901, the Pan-American Exposition was held here, and on 6 September President McKinley was shot while attending it.

See publications of the Buffalo Historical Society; Smith, 'History of the City of Buffalo and Erie County' (1884); Ketchum, 'History of Buffalo' (1864-5); Powell, 'Historic Towns of the Middle States' (1899).

EDWARD H. BUTLER,
Editor Buffalo Evening News.

Buffalo, a name frequently misapplied to the American bison, but more properly designating a type of heavy oxen, of the tropics of the Old World, long domesticated in the Orient. Buffalo are characterized by their long, angulated horns, broad and flat at the base, so as to form in some cases a shield over the forehead; and by their broad, splay feet, particularly adapted to wading in muddy waters, where they mainly feed on aquatic grasses and other plants. There are three distinct species.

The largest and fiercest buffalo is the black "cape," or South African species (*Bos caffer*) found throughout the entire south of Africa, northward to Abyssinia. It reaches a length of six feet, and in old bulls the relatively short horns join at their bases, so as to form a helmet-like mass, which makes the head almost invulnerable. The horns curve "outward, downward, and backward, and then forward, upward, and inward." This buffalo is bluish-black, and nearly hairless. Its chief enemies are the lion and man, whose combined efforts have greatly decreased its numbers. The buffalo are warned of the approach of danger by the buffalo-birds (q.v.), which constantly hover near them. Another species (*B. pumilus*) is widely scattered throughout the west, and central parts of Africa. It is smaller than the more southern species, and is chestnut in color. The most widely domesticated of the buffalo is that of India (*B. bubalus*), called "arni" (feminine "arna") by the Hindu. It differs greatly in appearance from the African species, having a cow-shaped head, and long, much flattened, triangular horns, covered with transverse wrinkles, which curve regularly outwards and backwards towards the shoulder, and do not form a buckler over the forehead. The bull is ashy-black in color, frequently with white feet, and is smaller than the African buffalo, never exceeding 16 hands at the withers. It is in the wild state an animal of tremendous power and ferocity, and is regarded by sportsmen as one of the most dangerous beasts of the jungle. It has long been employed in the rice-fields of the Orient, as far east as Japan; the ordinary "water-buffalo" or "carabao" of the Philippines is a small variety. It was long ago introduced into Egypt for service in the boggy lowlands of the Delta, and is now extending up the Nile to the lake regions of central Africa. A variety exists in the Niger valley, and another, called "sanga," and distinguished by its very long horns, is do-

BUFFALO BERRY — BUFFALO GRASS

mesticated in Abyssinia. The Indian buffalo is also employed in marshy farming districts in Turkey, Hungary, Italy, and Spain, where it is able to work in ground too wet and soft for the other cattle, and to pasture upon coarse, marsh grasses. Its hide makes good leather, and its milk is excellent, and is greatly used in India for the making of the semi-fluid butter called "ghee."

Buffalo-berry (*Shepherdia argentea*), an American shrub of the natural order *Elaeagnaceæ*, cultivated in the Western plains region for its edible berries, and planted for hedges, wind-breaks, and ornament to some extent elsewhere. The plant, which is sometimes tree-form, attains a height of about 18 feet, has thorny stems, small, silvery foliage, yellowish densely fasciated diœcious flowers at the nodes, and globular, one-seeded, yellow or red tart fruits, about the size of currants. Though introduced into cultivation before the black-berry, this plant gained slowly in popularity until the plains region became settled, where, being perfectly hardy, it took the place of tender fruits in the cold and dry West. The fruits make acceptable jellies and preserves, but seem not to be needed where other bush-fruits can be raised. The plants are readily propagated by means of seeds, cuttings, and occasional suckers. They succeed in any good garden soil.

Buffalo-bird, any of several birds which remain about cattle, and feed upon their parasites. Most of them are starlings (q.v.) of plain dark plumage, with the habit of gathering into noisy flocks. Those of South Africa, almost always seen in company with buffaloes and rhinoceroses, belong to the genus *Buphaga*, and are commonly termed "ox-peckers," "beef-eaters," or "rhinoceros-birds." They cluster upon the backs of these animals while they rest or slowly feed, and pick from them ticks and similar pests; and they also serve as watchmen for their hosts, arousing them by their cries whenever anything suspicious happens. The wild and tame buffaloes of the Orient are similarly attended by the starlings of the genus *Eulabes*. These wait about the villages until the cattle come in from pasture at sunset, when the birds throng about them, and relieve them of troublesome insects, to the manifest comfort of the resting cattle. In Africa the larger mammals are frequently served in the same way by certain small, white herons, also called "buffalo-birds" by the colonists.

Buffalo Bug. See CARPET BEETLE.

Buffalo-fish, a large, coarse, fresh-water fish of which there are four varieties; three inhabiting the waters of the Mississippi valley, and one the river Usumacinto in Mexico. The formation of the head suggests the name, for from the nose to the top of the shoulders it has the high, humpy pitch of the bison. In Louisiana they are known as "gourdheads." The common big-mouthed buffalo-fish (*Ictiobus cyprinella*) reaches a length of three feet and a weight of 50 pounds. In the spring freshets of the Mississippi valley, at spawning time, it swims in great shoals on to the flooded marshes, where the receding waters make it an easy victim to the farmers, who kill great numbers of them for fertilizers. In body they are stout and of a dull, brownish-olive hue, not silvery, with dusky fins. The black, or mon-

grel, buffalo-fish (*I. urus*) has a smaller, more oblique mouth, and a much darker color; the fins being almost black. The small-mouthed or white, buffalo-fish (*I. bubalus*) is the most abundant. It does not run so large as the common buffalo, 35 pounds being its limit. In color it is pale, almost silvery. See Jordan and Evermann, 'American Food and Game Fishes.'

Buffalo-gnat, a fly allied to the black-fly (q.v.), *Simulium pecuarum*, of the family *Simuliidæ*, order *Diptera*, a larger and more formidable species than the black-fly of the northern and subarctic regions. It attacks in the lower Ohio and the Mississippi valley various domestic cattle, horses, sheep, poultry, dogs, and cats, and is especially hurtful to mules and horses, killing many. Hogs show at first the effects of the bite but very little; yet large numbers die soon after the attack, while others die about six weeks after the disappearance of the buffalo-gnats; they usually perish from large ulcerating sores, which cause blood-poisoning. Animals bitten by many buffalo-gnats show all the symptoms of colic, and many people believe that these bites bring on that disease. The animal attacked first becomes frantic, but within a very short time ceases to show symptoms of pain, submits passively to the affliction, rolls over and dies; sometimes all within the space of three or four hours. Animals of various kinds become gradually accustomed to these bites, and during a long-continued invasion but few are killed toward the end of it. The larvæ are found more particularly attached to submerged logs, wholly or partly submerged stumps, brush, bushes, and other like objects in the larger creeks and bayous of the region to which they are common. They cluster together, and fastened by the posterior protuberance or by a minute thread, they wander and sway about, but do not venture above the water. When fully grown the larvæ descend to near the bottom of the stream, sometimes 8 or 10 feet, to make their cocoons. The adult fly, on emergence from the pupa, rises quickly to the surface, runs a few inches over the water, and the wings expanding almost instantly it darts away. The time of appearance of the swarms is regulated by the earliness or lateness of the spring, and consequently it is much earlier in the southern parts of the Mississippi valley. As a rule, they can be expected soon after the first continuous warm weather in early spring. In 1885 the first swarms were observed in Louisiana, 11 March, in Mississippi and Tennessee, 1 May, and in Indiana and Illinois, 12 May. Their presence is at once indicated by the actions of the various animals in the field. Horses and mules snort, switch their tails, stamp the ground, and show great restlessness and symptoms of fear. If not harnessed to plow and wagon they will try to escape by running away. Cattle rush wildly about in search of relief. Consult: Osborn, 'Insects Affecting Domestic Animals' (Bulletin 5 n. ser. United States Department of Agriculture, Division of Entomology, 1896).

Buffalo Grass, a strong-growing North American grass (*Tripsacum dactyloides*), so called from forming a large part of the food of the buffalo, and said to have excellent fattening properties; called also gama grass.

BUFFALO HISTORICAL SOCIETY — BUFFET

Buffalo Historical Society, Buffalo, N. Y. Foremost among institutions of its kind west of New England and the older Atlantic seaboard cities is the Historical Society of Buffalo, N. Y. Founded in the spring of 1862, Millard Fillmore was its first president; and it was at his suggestion that 50 citizens of Buffalo agreed to pay \$20 each per year for five years, thus founding the first maintenance fund of the institution. In President Fillmore's inaugural address, 2 July 1862, the principal objects of the society were stated to be to "discover, procure and preserve whatever may relate to the history of Western New York in general, and of the City of Buffalo in particular." For many years the society occupied various leased quarters with its small museum and library, and its progress was slow; but throughout its more than forty years of existence it has always included among its members the most substantial and representative families of Buffalo. From 1887 to 1902 the society occupied rooms in the Buffalo Public Library building. The need of a building of its own had long been apparent. The nucleus of a building fund had been formed by a gift of \$5,000 from the Hon. James M. Smith, and various building projects had been under consideration, when, in 1900, legislation incident to the construction at Buffalo of a building for New York State at the Pan-American Exposition, opened the way for securing a permanent and worthy home for the society. Through the efforts of Senator Henry W. Hill, aided by Wilson S. Bissell, Andrew Langdon and others, a bill was enacted which enabled the State to expend \$100,000, out of its exposition appropriation of \$300,000, toward the erection of a permanent building, and also providing for adding thereto \$25,000 from the City of Buffalo, and funds from the Historical Society; said building to be placed on park lands, and at the close of the exposition to become the property of the Historical Society, the city being bound to make an annual appropriation toward its maintenance. Under this agreement a building was erected in Delaware Park, at a cost of some \$200,000. The only permanent building connected with the Pan-American Exposition, it has the added interest of being the scene of President McKinley's last public reception, 5 Sept. 1901, prior to that held the next day in the Temple of Music at which he received the wound from which he died, 14 September.

The Historical Society building stands in a beautiful and easily accessible site in Delaware Park, the principal park of Buffalo. It is 130 by 80 feet in dimensions, 50 feet high, perhaps the most notable example in America of the pure Doric order of architecture. It is of white marble, the northern facade faced with three-quarter columns, the south side having a portico 61 by 17 feet, embellished by 10 Doric columns and approached by marble steps 40 feet in width. The columns are of the same proportion as those of the Parthenon, of 3 ft. 6 in. in diameter at the base. Within, the chief structural material is black marble. Situated on sloping ground, the edifice has three available floors, the basement being for the most part but little below the ground level. In the middle of the main floor is the grand hall, two stories high, and lighted, as is the upper floor, by side windows and skylights. The library, lecture hall and

administrative offices are on the main floor, the museums and portrait galleries above. A notable feature of the building is the massive bronze doors, presented by Andrew Langdon; the design by J. Woodley Gosling, the sculptural work by R. Hinton Perry; the principal panels bear female figures typifying "History" and "Ethnology," the bronze transom containing a group showing "Science" and "Art." In the Central Hall is a bronze statue of Lincoln, Charles H. Niehaus, sculptor, a gift to the Society from the Lincoln Birthday Association of Buffalo, now affiliated with it.

Notable features in the museum include the Dr. James coin collection, valued at \$15,000; the Dr. Jos. C. Greene collection of Egyptian and Oriental articles, casts, etc.; the Cottier, Scoville and other Indian collections, the Atkins Alaska collection; the Civil War and Lincoln collection of Julius E. Francis, founder of the Lincoln Birthday Association; and many relics of the pioneer days in Western New York, and on the Great Lakes. Many articles formerly belonging to President Millard Fillmore are here shown, as are relics of Lincoln, Grant, other Presidents and famous men.

The Historical Society library (13,000 volumes, 8,000 pamphlets) is a free reference library. It includes the special collection known as the Dr. John C. Lord library, owned by the City of Buffalo but cared for by the Historical Society; and the private library of Mrs. Millard Fillmore. The Society is also rich in manuscript material, which is being drawn on for its annual volume of publications. (Vol. V., 8vo. pp. 546, 1902). Besides its meetings, lectures and receptions for members, the Society makes its possessions and facilities available free to the public, by means of popular lectures in its own lecture hall on Sunday afternoons, talks and various exercises for clubs and school classes, etc., the aim of the management being to make it as useful as possible to the community. It has a membership of upwards of 700, of which 410 are resident, paying \$5 per year, 140 life members, fee \$100, the rest honorary and corresponding.

ANDREW LANGDON,

President Buffalo Historical Society.

Buffer, any apparatus for deadening the concussion between a moving body and the one on which it strikes. In the United States the buffers used on passenger cars are composed of a head, bar and stem and are placed at the centre of each end of the car. On English railways they are placed in pairs at each end, and are fastened by rods to springs under the framework to deaden the concussions caused when the velocity of part of the train is checked.

Buffet, bū-fā', anciently a little apartment, separated from the rest of the room, for the disposing of china, glass, etc. It is now a piece of furniture in the dining-room, called also a side-board, for the reception of the plate, glass, etc. In France many mansions have a detached room called *buffet*, decorated with pitchers, vases, fountains, etc. The word is very commonly applied to the space set apart for refreshments in public places.

Buffet, bū-fā', Louis Joseph, French politician: b. Mirecourt, Vosges, 26 Oct. 1818; d. 1898. In 1848 he was elected to the Chamber of Deputies from the Vosges, and held the po-

BUILDING OF THE BUFFALO HISTORICAL SOCIETY.

BUFFINGTON — BUFFON

sition of minister of commerce and agriculture under the presidency of Louis Napoleon. He then took a prominent part in the "Tiers Parti," which sought to join liberal reforms to loyalty to the government, later becoming its leader. He became a member of M. Emile Ollivier's cabinet in January, 1870, occupying the portfolio of minister of finance, but after only three months' service resigned. In 1871 he was again elected to the National Assembly, of which he was elected president to succeed M. Jules Grévy, 4 April 1873. In 1875 he formed a new cabinet, becoming himself vice-president of the council and minister of the interior, but owing to his having made himself unpopular with the members of his own party, he failed of re-election to the Assembly, and resigned his seat in the Cabinet in 1876. He was, however, in June of the same year elected a life member of the Senate.

Buffington, Adelbert Rinaldo, American military officer: b. Wheeling, W. Va., 22 Nov. 1837. He was graduated at the United States Military Academy in 1861; entered the ordnance department; was promoted colonel in 1889, and became chief of ordnance with the rank of brigadier-general, 5 April 1899. He had command of the National Armory in 1881-92; is the inventor of a magazine firearm, carriages for light and heavy guns, and parts of models of 1884 Springfield rifles; introduced gas forging furnaces and improved methods in the Springfield armory; and originated the nitre and manganese method in use there for bluing iron and steel surfaces of small arms.

Bufflehead, a small plump duck of American inland waters (*Charionetta albeola*), remarkable for its beauty of coloring. It is about 13 inches in length, and the plumage of the drake is black and white, with the crested head, shaped like a puff-ball, rich, silky, changing green. The female is smaller, and more protectively colored in a dull-brown plumage, with white markings. Its food consists of larvæ, shells, seeds, etc., and it frequents gravelly shores and wooded ponds, breeding in holes of trees and burrows, from the great lakes northward to the Arctic Circle. It lays about 12 large, dark-colored eggs. It is of small value to the sportsman, and requires little skill in shooting, except when on the wing, at which time it is remarkable for the speed with which it flies, and the peculiar whistling sound of its wings. It is sometimes called "butterball," because of its roundness, and "spiritduck," a name derived from the Indians, owing to its faculty for vanishing and reappearing from the surface of the water with amazing skill.

Buffon, George Louis Leclerc, zhôrzh loo-è le-klâr bü-fôn (COMTE DE), French naturalist of distinction: b. Montbard, Burgundy, 7 Sept. 1707; d. Paris, 16 April 1788. He received from his father, Benjamin Leclerc, counselor to the parliament of his province, a careful education. Chance connected him at Dijon with the young Du:ze of Kingston, whose tutor, a man of learning, inspired him with a taste for the sciences. They traveled together through France and Italy, and Buffon afterward visited England. In order to perfect himself in the language without neglecting the sciences, he translated Newton's 'Fluxions,' and Hales' 'Vegetable Statics.' After some time he pub-

lished some works of his own, in which he treated of geometry, natural philosophy, and rural economy. He laid his researches on these subjects before the Academy of Sciences, of which he became a member in 1733. The most important were on the construction of mirrors for setting bodies on fire at a great distance, as Archimedes is said to have done, and experiments on the strength of different kinds of wood, and the means of increasing it, particularly by removing the bark of the trees some time before felling them. Buffon, in his earlier years, was animated only by an undefined love of learning and fame, but his appointment as superintendent of the Royal Garden (now the Jardin des Plantes), in 1739, gave his mind a decided turn toward that science in which he has immortalized himself. Considering natural history in its whole extent, he found no works in this department but spiritless compilations and dry lists of names. There were excellent observations indeed on single objects, but no comprehensive work. Of such a one he now formed the plan, and to aid him in this, by examining the numerous and often minute objects embraced in his plan, he associated himself with Daubenton, and after an assiduous labor of 10 years, the two friends published the three first volumes of the 'Natural History'; and, between 1749 and 1767, twelve others, which comprehend the theory of the earth, the nature of animals, and the history of man and the viviparous quadrupeds. The most brilliant parts of them, the general theories, the descriptions of the characters of animals, and of the great natural phenomena, are by Buffon. Daubenton limited himself to the description of the forms and the anatomy of the animals. The nine following volumes, which appeared from 1770 to 1783, contain the history of birds, from which Daubenton withdrew his assistance. Buffon published alone the five volumes on minerals, from 1783 to 1788. Of the seven supplementary volumes, of which the last did not appear until after his death in 1789, the fifth formed an independent whole, the most celebrated of all his works. It contains his 'Epochs of Nature,' in which the author, in a style truly sublime, and with the triumphant power of genius, gives a second theory of the earth, very different from that which he had traced in the first volumes, though he assumes at the commencement the air of merely defending and developing the former. This great labor, with which Buffon was occupied during 50 years, is, however, but a part of the vast plan which he had sketched, and which has been continued by Lacépède in his history of the different species of cetaceous animals, reptiles, and fishes, but has remained unexecuted as far as regards the invertebrate animals and the plants. There is but one opinion of Buffon as an author. For the elevation of his views, for powerful and profound ideas, for the majesty of his images, for noble and dignified expression, for the lofty harmony of his style in treating of important subjects, he is perhaps unrivaled. His pictures of the sublime scenes of nature are strikingly true, and are stamped with originality. The fame of his work was soon universal. It excited a general taste for natural history, and gained for this science the favor and protection of nobles and princes. Louis XV. raised the author to the dignity of a count, and D'Argivil-

liers, in the reign of Louis XVI., caused his statue to be erected, during his life, at the entry of the Royal Cabinet of Natural Curiosities, with the inscription "Majestati naturæ par ingenium." The opinions entertained of Buffon as a natural philosopher and an observer have been more divided. Voltaire, D'Alembert, Condorcet, have severely criticised his hypotheses and his vague manner of philosophizing from general views. But although the views of Buffon on the theory of the earth can no longer be defended in detail, he will always have the merit of having made it generally felt, that the present state of the earth is the result of a series of changes which it is possible to trace, and of having pointed out the phenomena which indicate the course of these changes. His theory of generation has been refuted by Haller and Spallanzani, and his hypothesis of a certain inexplicable mechanism to account for animal instinct is not supported by facts; but his eloquent description of the physical and moral development of man, as well as his ideas on the influence which the delicacy and development of each organ exert on the character of different species of animals, are still of the highest interest. His views of the degeneracy of animals, and of the limits prescribed to each species by climates, mountains, and seas, are real discoveries which receive daily confirmation, and furnish to travelers a basis for their observations, which was entirely wanting before. The most perfect part of his work is the 'History of Quadrupeds': the weakest, the 'History of Minerals.' Buffon was of a noble figure, and of great dignity of manners. His conversation was remarkable for a simplicity which strikingly contrasted with the style of his writings. The best edition of his 'Natural History' is that published from 1749 to 1789, in 36 volumes.

Buffoon (Italian Buffone), a comic singer in the opera buffa, or the Italian intermezzo. The Italians, however, distinguish the buffo cantante, which requires good singing, from the buffo comico, in which there is more acting. Buffoonery is the name given to the jokes which the buffoon introduces. The word is no doubt borrowed from the Low Latin, in which the name buffo (cheeked) was given to those who appeared on the theatre, with their cheeks puffed up, to receive blows on them, and to excite the laughter of the spectators. Afterward the name came to signify a mimic, a jester in general.

Bufo, bū'fō, a genus of batrachians, the type of the family *Bufo*nida. The body is inflated, the skin warty, the hind feet of moderate length, the jaws without teeth, the nose rounded. At least 20 species are known.

Bu'fonite, literally, toad-stone; a name given to the fossil teeth and palatal bones of fishes belonging to the family of *Pycnodonts* (thick teeth), whose remains occur abundantly in the Oolitic and Chalk formations. The term bufonite, like those of serpents' eyes, batrachites, and crapaudines, by which they are also known, refers to the vulgar notion that those organisms were originally formed in the heads of serpents, frogs, and toads.

Bu'ford, John, American soldier: b. Kentucky, 1825; d. Washington, D. C., 16 Dec. 1863. He was graduated at West Point in 1848; was appointed to the 1st Dragoons, and served in the Sioux expedition, 1855, in the Kansas distur-

ances of 1856-7, and in the Utah expedition, 1857-8. On 12 Nov. 1861 he was appointed major in the inspector-general's corps, attached to Gen. Pope's staff, 26 June 1862, made a brigadier on 27 July, and commanded a cavalry brigade under Hooker in the northern Virginia campaign. He was chief of cavalry in the Maryland campaign, and succeeded Gen. Stoneman on McClellan's staff. He took part in the engagement at South Mountain, Antietam, Fredericksburg, and Beverly Ford; and at Gettysburg began the attack before Reynold's arrival on 1 July, and rendered important services at Wolf's Hill and Round Top. After the engagement at Culpeper he pursued the enemy across the Rapidan, and cut his way to rejoin the army north of the Rappahannock. His coolness, fine judgment, and splendid courage were notable, and in a few months he acquired an influence over men as remarkable as it was useful. His military sagacity was far-reaching and accurate, and made him one of the most trusted and respected officers in the service, and his death, caused by disease contracted during months of active service and constant exposure, was widely lamented in the army. A major-general's commission reached him the day he died, and a monument to his memory was placed on the Gettysburg battlefield in 1895.

Buford, Napoleon Bonaparte, American soldier: b. Woodford County, Ky., 13 Jan. 1807; d. 28 March 1883. He was graduated at West Point, 1827, did garrison duty in Virginia and Maine as second lieutenant in the 3d Artillery, and was assistant professor of natural and experimental philosophy at the military academy, 1834-5, when he resigned his commission, became an engineer in the service of the State of Kentucky, 1835-42, and a merchant and iron founder at Rock Island, Ill., 1843-61, being president of the Rock Island & P. Ry, 1857-61. He entered the Civil War as colonel of the 27th Illinois Volunteers, took part in the battle of Belmont, 7 Nov. 1861, the attack on Island No. 10 in the Mississippi River, March-April 1862, captured Union City, Ky., 31 March 1862, took part in the expedition to Fort Pillow, the siege and battle of Corinth, and the siege of Vicksburg, February 1863. On 24 Aug. 1865, he was mustered out of service with the rank of brevet-major-general of volunteers, conferred for gallant and meritorious services during the Rebellion. He was special commissioner of Indian affairs during 1868, and for inspecting the Union Pacific Railroad, 1867-9. During the negotiations after the battle of Belmont the Confederate Gen. Leonidas Polk wrote of Buford, whom he had known at West Point: "He is as good a fellow as ever lived and most devotedly my friend—a true Christian, a true soldier, and a gentleman every inch of him."

Bug, an insect of the order *Hemiptera*. Bugs are characterized by the beak-like sucking mouth-parts, composed of the mandibles and maxillæ, which are ensheathed by the large expanded labium; by the free, large prothorax, the usually angular short body, and the irregularly veined wings, the veins being but few in number, while the fore wings are often half coriaceous and thick. The metamorphosis is incomplete. There are many wingless parasitic forms, and many aquatic species.

The triangular head is nearly always sunken into the prothorax, and is small in proportion to the rest of the body; the eyes are small, nearly globular, and very prominent, and the three ocelli are set far back, while the short, bristle-like, or filiform antennæ, with from 5 to 13 or more joints, are inserted below and far in advance of the eyes, so that the front is broad and flat. The parts of the mouth form a four-jointed, solid, hard beak. The mandibles and maxillæ are long and style-like, the latter with out palpi; they are ensheathed at their base by the canalicular labium, which has obsolete palpi. The labium is well developed, being generally acutely triangular. The thorax is like that of beetles, the prothorax being broad above, and the wings, when folded, concealing the rest of the body. The legs are situated close together, with coxæ and trochanters very similar to those of the *Colcoptera*. The body is usually very flat above, or, in the more or less cylindrical species, somewhat broad and flat. The body is less concentrated headwards than in the *Colcoptera*, though much more so than in the *Orthoptera*, and in this respect, as well as in other essential characters, the group is intermediate between these two orders. Both pairs of wings are very equal in size and alike in shape, except in the higher families, where they are very unequal, the hinder pair being very small.

The legs are slender, and often very long, owing to the great length of the femora and tibiæ, while the tarsi, like those of the lowest *Colcoptera*, are two- or three-jointed. The abdomen has six to nine segments apparent, though the typical number is 11. The stigmata are very distinct, being often raised on a tubercle. On the basal ring of the abdomen are two cavities in which are sometimes seated vocal organs, as in the male cicada, and in the metathorax of some species are glands for secreting a foul odorous fluid. In the *Cicadida* and *Phytocoris* the ovipositor is perfect and much as in the saw-flies and wasps.

The active nymphs of the *Hemiptera*, like those of the locusts, resemble closely the imago, differing mainly in possessing the rudiments of wings, which are acquired after the second molting. After two changes of skin (four in all) they assume the pupa state, which differs mainly from that of the larva in having larger wing-pads. While the development of the imago ordinarily occupies the summer months, in the *Aphides* it takes but a comparatively few days, but in the 17-year cicada as many years as its name indicates. An exception to this mode of development is seen in the nymph of the male coccus, which, somewhat as in the higher orders, spins a silken cocoon, and changes into an inactive pupa. Apterous individuals, especially females, sometimes occur, especially in the aquatic *Hydrometra*, *Velia*, and *Limnobates*, and in many other genera the hind pair of wings are often absent. There are about 50,000 species living and fossil. Some species are of great size, especially the *Hydrocores*, a division containing the aquatic genera, *Velia*, *Nepa*, *Belostoma*, and *Notonecta*, and which first appeared in the Jurassic formation. But the oldest known fossil insect (*Protocimex silurica*) was apparently a bug; traces of one wing having been found in the Upper Ordovi-

gian beds of Sweden. Consult: Packard, 'Guide to Study of Insects' (1889); 'Entomology for Beginners' (1899); Comstock, 'A Manual for the Study of Insects' (1895); Sharp, 'Insects' (1899).

Bug, two rivers in European Russia. One rises near the confines of Volhynia, in the northwest of government Podolsk, and proceeds first east and then southeast to Oliwiopol, where it enters government Kherson, which it traverses almost centrally from north to south, and falls into the estuary of the Dnieper, near Kherson. Its chief affluents are the Ingul, Balta, Tcherstal, and Solonicha. It has a course of 500 miles, but its navigation is greatly obstructed by rocks and sandbanks. The second river rises in Galicia and joins the Vistula at the fortress of Novogeorgiosk, about 20 miles north-northwest of Warsaw. It is navigable for nearly 300 miles.

Bugason, boo-ga-sōn', Philippines, a town on the island of Panay. Pop. (1900) about 15,000.

Bugbane, a genus of herbs (*Cimicifuga*), of the natural order *Ranunculaceæ*, tall, perennial plants, of which some 10 species are natives of the northern temperate regions, and are often planted, in spite of their disagreeable odor, for ornamental purposes in hardy borders in exposed places or in partial shade. The species have large decomposed leaves, and racemes of white flowers, which appear during summer and early autumn. In some species the fruits are attractive in appearance. One species, black cohosh, or black snakeroot (*C. racemosa*) is used in domestic and rural medicine as an infusion for various ailments.

Bugeaud de la Piconnerie, Thomas Robert, tō-mā rō-bār bū-zho-dé-lā-pē-kōn-é-rē (Duc n'Isl'y), marshal of France: b. Limoges, 15 Oct. 1784; d. Paris, 10 June 1849. He belonged to an Irish family which had settled in France with James II. on his abdication. He entered the army in 1804 as a grenadier, was corporal at Austerlitz, made the campaigns of Prussia and Poland, and was wounded at Pultusk in 1806. He afterward went into Spain as lieutenant adjutant-major, gained new promotion, and remained with the army of Aragon till 1814. During these long wars he repeatedly distinguished himself, and received honorable mention from Suchet, his commander-in-chief. On the restoration of the Bourbons he gave in his adhesion to them; but on the landing of Bonaparte, followed the general example by deserting to his old master. After the revolution of 1830 he was appointed *maréchal de camp*, and in 1831 obtained a seat in the Chamber of Deputies, where he often displayed great good sense, though in a style of oratory so blunt and rustic as occasionally to excite the risibility of his opponents. He was afterward sent to Algeria, where he gained many advantages over the Arabs, and showed himself possessed of the kind of talents necessary to cope successfully with them and their celebrated leader, Abd-el-Kader. On the revolution of 1848, it is said that, if permitted, he would have effectually put down the insurgents and secured the throne to Louis Philippe. He gave in his adhesion to the republic, but re-

mained unemployed. He was better received by President Louis Napoleon, who appointed him commander-in-chief of the army of the Alps.

Bugenhagen, Johann, called POMERANUS, yō'hän po-mēr-än'ūs boo-gën-hä'gën, or DOCTOR POMMER, German reformer: b. Stettin, 1485; d. Wittenberg, 20 April 1558. He fled from his Catholic superiors to Wittenberg in 1521, where he was made, in 1522, professor of theology. Luther derived assistance from his profound exegetical learning in preparing his translation of the Bible. In 1525 he gave occasion for the controversies about the sacrament, by a work against Zwinglius on the communion. He acquired more reputation by his 'Interpretatio in Librum Psalmorum' (1523). He effected the union of the Protestant free cities with the Saxons, and introduced into Brunswick, Hamburg, Lübeck, Pomerania, Denmark, and many other places, the Lutheran service and church discipline. For the Lower Saxons he translated the Bible into Low German (1533). He was a faithful friend to Luther, and delivered his eulogy. Together with Melancthon, he composed the 'Interim of Leipsic.' He wrote also a 'History of Pomerania.'

Bugg, Lelia Hardin, American author: b. Ironton, Miss. She graduated from the Ursuline Academy, Arcadia, Mo., and continued her studies at Trinity College, Washington. She has written: 'The Correct Thing for Catholics' (1893); 'A Lady' (1894); 'Correct English' (1895); 'Orchids: a Novel' (1896); 'The Prodigal's Daughter' (1898); 'The People of Our Parish' (1899).

Bugge, büg-gê, Elseus Sophus, Norwegian philologist: b. Laurvig, 1833; d. Christiania, 8 July 1907. After obtaining an education at the Universities of Christiania, Copenhagen, and Berlin he was made professor of comparative philology and Old Norse, at Christiania. He was an eminent authority on northern languages and among his works are an edition of the songs of the Edda, 'Norroen Fornkvoedi' (1867); 'Gamle norske Folkeviser' (1858); 'Norroene Skrifter of sagnhistorik Indhold' (1864-73); and a notable edition of the Volsunga and Herwarar sagas.

Bugge, Thomas, Danish astronomer: b. Copenhagen, 12 Oct. 1740; d. 15 June 1815. After Tycho Brahe, he was the greatest astronomer of Denmark. First officiating as professor, he afterward spent most of his time in traveling abroad, and was sent to Paris in 1798 to confer with the commission of the French institute on the subject of the introduction of uniform weights and measures, on which occasion he was made a member of that learned body.

Buggy, a name given to several species of carriages or gigs: In the United States, a light one-horse four-wheeled vehicle with or without a hood or top; in India, a gig with a large hood to screen those who travel in it from the sun's rays; in England, a light one-horse two-wheeled vehicle without a hood.

Bugiardini, Giuliano, joo-lê-ä'nō boo-jär-dē'nē, Italian painter (also known under the Latinized form of his name, as JULIANUS FLORENTINUS): b. Florence, 29 Jan. 1475; d. 16 Feb. 1554. He studied under Ghirlandajo and Albertinelli, and collaborated with Michael Angelo.

Among his best works are: 'The Martyrdom of St. Catherine'; 'Betrothal of St. Catherine'; 'John the Baptist'; 'Virgin with Saints'; 'Virgin with John the Baptist.'

Bugis, boo'jēz, a people of the Indian archipelago, chiefly inhabiting Macassar and Boni, in the island of Celebes. They are muscular, middle-sized, and of a light-brown color, some being even fair. Their dress consists of a piece of red or blue striped cotton, which they wrap about their loins, and pass between their legs. They bind their jet-black hair very tastefully, in a red or blue cotton handkerchief. They pluck out the hair of their beards, and ornament their arms and legs with brass wire above the wrists and ankles, and to these the children attach bells. They are, to a notable degree, proud, passionate, revengeful, and crafty; yet they are regarded as the most civilized of the natives of Celebes, and are the chief trading people in the Malay archipelago. Their fondness for commerce has led to their settling in many places out of Celebes, and a "Bugis quarter" is to be found in most of the large towns of the different islands. They build ships of 50 or 60 tons burden, and their voyages extend from Sumatra to New Guinea. From Macassar the voyage begins with the east monsoon, the prahus trading as they proceed west until they reach Rhio, and even Malacca and Acheen, when they are prepared to return with the change of the season. They take with them native cotton cloths, gold-dust, nutmegs, silver dollars, birds'-nests, camphor, benzoin or frankincense, and tortoise shell; and return with European broadcloths and cottons, opium, unwrought iron, and tobacco, which they partly sell at the intermediate ports as they sail homeward. This is their most important voyage, but they make many subordinate ones for collecting birds'-nests, feathers, tortoise shell, trepang, and other articles of commerce.

Bu'gle, a genus of hardy herbs (*Ajuga*), of the natural order *Labiata*, mostly natives of the cooler parts of Europe and Asia, but cultivated for ornament in many temperate countries. The species, which attain heights ranging from 5 to more than 10 feet, have many whorls, usually of blue, purple, pink, or white flowers, and are useful for planting in the rear of borders. They are readily propagated by seeds or division. Some of the species have escaped, and may be found growing wild on moist land and in the borders of woods.

Bugle, a treble instrument of brass or copper, differing from the trumpet in having a shorter and more conical tube, with a less expanded bell. It is played with a cupped mouthpiece. In the original form it is the signal horn for the infantry, as the trumpet is for the cavalry.

Bugle, a shining, elongated glass bead, usually black, used in decorating women's apparel and also in trafficking with savage tribes.

Bu'gloss, a popular name for various species of the genera *Anchusa*, *Lycopsis*, and *Echium*, of the natural order *Boraginacea*.

BUGONG MOTH — BUHLER

Several species of *Anchusa*, which is also known as ankanet, are cultivated for ornament. They are hardy, have blue or purple blossoms in paniced racemes, which are used as cut flowers. The plants are easily raised from seed and thrive well in sunny places. The species of *Lycopsis*, to which some botanists restrict the name bugloss, are not cultivated in America, but in some parts of Europe certain ones, especially *L. arvensis*, are considered weeds. Several species of *Echium*, popularly known as viper's bugloss, are cultivated under glass in Europe and America, especially in California, where three species are grown out of doors. They are coarse herbs or shrubs which bear beautiful spikes of very numerous white, blue, red or violet flowers with prominent stamens. They are particularly useful where the soil is too poor for many other garden plants, because they produce more numerous and more highly colored blossoms upon such soils than upon rich soil. Indeed, upon rich soil they may fail to blossom altogether.

Bugong Moth, a species of owl-moth *Agrotis spina* of the family *Noctuidæ*. It occurs in millions in certain localities in Victoria, Australia. It hibernates as a moth, and in this stage was formerly an important article of food with the native tribes.

Bugonia Myth, also Bugonia lore, "Bugonia craze," and "Bugonia superstition." For more than 2,000 years a superstition has prevailed among the masses that besides the usual production of honey-bees in hives, they originated by spontaneous generations from the carcasses of dead animals, and chiefly from those of oxen. Thus, says Osten Sacken, arose in Greece the term Bugonia (from *Bovus* ox; and γουή progeny) as well as the Latin names Bugenæ melissæ or Taurigenæ apes, "oxen-born bees." Greeks, Carthaginians and Romans spoke of the Bugonia as an every-day occurrence. The poet Archelaus calls them the "factitious progeny of a decaying ox." This superstition has also prevailed in northern Africa and some parts of Asia; it continued to exist through the Middle Ages, and survived till the 16th and 17th centuries, being mentioned by Redi, Aldrovaldi (1602), while Melanchthon regarded it as a divine provision. The original cause of this delusion, which has been finally exploded by Osten-Sacken, lies in the fact that a fly which mimics the honey-bee in shape and its hairy clothing (*Eristalis tenax*, of the order *Diptera*), and which breeds in the carcasses of animals, has always been mistaken for the honey-bee. It is a true fly, with only one pair of wings and no sting, and is a little stouter and larger than a honey-bee. Its larva is the "rat-tailed maggot," that lives in open cess-pools, sewers, etc., and decaying carcasses on which the corrupt liquid forms during the secondary stage of putrescence. The Bugonia myth is, as shown by Osten-Sacken, the foundation of Samson's riddle; the supposed honey-bee issuing from the lion's carcass was evidently the *Eristalis* fly. This insect is now distributed over a greater part of the world, and is abundant in the United States. It was first detected at Cam-

bridge, Mass., in 1875 by Osten-Sacken himself. Consult Osten-Sacken on the Oxen-born Bees of the Ancient (Bugonia) and their relation to *Eristalis tenax*.

Bu'hach, a preparation for destroying insects made by grinding the flower-heads of certain species of chrysanthemums. See INSECT POWDER.

Buhl- (bool) work, a description of inlaid work, consisting at first of inserting a brass scroll or pattern in a ground of dark-colored tortoise-shell or wood; but at a later period the use of wood of a different color, instead of metal, was introduced by Reisner, and to his process the modern practice of buhl-work is chiefly confined. It consists in cutting out a pattern from two veneers of different colored woods, which are glued together with a piece of paper laid between them; the pieces are then separated by running a thin knife through the paper, the patterns are carefully taken out, and the figure removed from the one veneer is inserted into the cavity of the other, the dust of the wood being rubbed in to fill the interstices. A little glue is then rubbed in, and the work laid aside to dry, after which it is ready to be glued to the box or piece of furniture which it is wished to ornament. The cutting of the pattern is effected by the use of a very fine saw, of the kind known as a key-saw, which can readily be made to run around the sinuosities of the patterns. The suitable designs for this work are continuous figures like a running vine, or the honeysuckle, the saw completing these without the necessity of discontinuing the work to commence anew. Two pieces of buhl-work are thus produced; but three are frequently obtained by gluing together three pieces of wood, and cutting out in the same manner. It is not, however, found expedient to combine a greater number of pieces. The French term for buhl-work and all sorts of inlaid work, is *marqueterie*. The name buhl is derived from a French cabinet-maker, André Charles Boule or Boule, formerly miscalled Buhl, b. 1642, d. 1732. He raised cabinet-making to an art industry, and Reisner, above mentioned, was a German contemporary of Boule's.

Bühler, Johann Georg, yō'hān gā'örg bü'lér, German Orientalist: b. Berstel, Hanover, 19 July 1837; d. April 1896. He pursued his studies in Göttingen, Paris, and London, and in 1863 accepted the chair of Oriental languages in Elphinstone College, Bombay. Among his other labors while in India, he undertook tours into various provinces in search of ancient manuscripts, portions of his collections going to enrich the libraries of European universities. Returning from India in 1880, he became professor of Sanskrit and Indology in the University of Vienna. The breadth and accuracy of his knowledge in various departments of Oriental learning made him an ultimate authority. He collaborated in 1868 in the establishment of the Bombay Sanskrit Series, in 1867-84 in the production of a 'Digest of Hindu Law'; and in 1887 in the founding of the 'Wiener Zeitschrift für die Kunde des Morgenlandes.' His work upon the 'Grundriss der Indo-Arischen Philologie und Alterthums-kunde' was interrupted by his death from drowning in Lake Constance.

BUHR STONE—BUILDING

Buhrstone (ber), or **Burrstone**, a variety of quartz containing many small, empty cells, which give it a peculiar roughness of surface. They are used principally as mill-stones. The best kinds are creamy white, with a granular and somewhat cellular texture, and are obtained in the Tertiary formation of the Paris basin, and chiefly at La-Ferté-sous-Jouarre. They are cut into wedge-shaped parallelepipeds, called panes, which are bound together with iron hoops to form large mill-stones. Numerous substitutes for the French buhr stone have been found in the United States, the most important being furnished by the buhrstone rock of the bituminous coal measures of northwestern Pennsylvania and eastern Ohio; but they cannot compete in the great markets with the French rock.

Building. The remarkable physical development of the United States in the last 20 years, with its attendant increase of wealth, is most strongly evidenced in the number of buildings of every character constructed during that period throughout the country. As an incentive to artistic improvement, and an example of co-operated effort and grouping of buildings, the World's Fair at Chicago, re-echoed in varying forms at the expositions of Atlanta, Nashville, Buffalo, and St. Louis, though temporary in character, has exerted a strong influence. Many new schemes of magnitude have been projected along lines which will require years for their completion, but the start has been made intelligently and with a view to the final result. It is only necessary to cite the proposed buildings of the University of California, at San Francisco, and of Washington University, at St. Louis, to suggest the power of this influence. The business and residential sections of the larger cities—and it might almost be added the outlying suburban districts—have undergone in many instances a complete transformation. The improvement and expansion of the steel, cement, brick, and terra-cotta industries (q.v.) have done more to facilitate this transformation within the cities proper than any other causes. Fortunately the allied mechanical and decorative arts have kept pace with them, and in spite of the popular feeling that our cities are for the most part unsightly, they are more cosmopolitan, convenient, and interesting as to their buildings than ever before.

For the large majority of new buildings the systems of construction hitherto in vogue have been used without great change, and probably will continue to be so used. We must therefore look for signs of structural development, rather to the constructions commonly designated slow-burning, steel-skeleton, and fireproof.

In point of materials, and possibilities of decorative effect, the architect's palette has been extended to an incredible degree. Facilities of transportation make it possible to use granites, marbles, all kinds of stone, brick, and woods, ornamental bronze and iron, the most approved systems of plumbing, heating, lighting, and elevators, without approaching the domain of extravagance, and even without overstepping the limits of true economy. There has been a steady tendency toward more stable, permanent, and beautiful construction,—the outgrowth of public sentiment, which in its turn has been

stimulated by the results attained. It would have been quite impossible 20 years ago, even had individual fortunes at that time been large enough to create the demand, to build the palatial residences, churches, hotels, and office buildings which we now look upon as commonplace, for in many trades skilled artisans were not to be had, and the difficulties of securing proper materials were too great.

Steel structural building of the commercial type has advanced to such an extent, and involves such colossal operations, that vast corporations have been formed for this especial purpose. These corporations are affiliated with financial institutions seeking investments, with owners of real estate desiring to make improvements, and with large manufacturing concerns furnishing materials of construction, so that the necessary conditions for undertakings of importance are kept constantly related. The Fuller Construction Company, The Norcross Brothers Company, The Wells Brothers Company, and others of a similar nature, carry on a business chiefly made up of steel structural buildings aggregating many millions of dollars per annum, and widely scattered throughout the United States. These companies employ armies of men, covering every building trade and involving details of office management, methods of erection and finishing, transportation and storage of materials, and the harmonizing of the various and often conflicting elements entering into such undertakings, which are almost incredible, and can be appreciated only after the most minute investigation. It may be said in general that these constitute the great movements in building which distinguish the opening years of the 20th century.

Slow-burning Construction.—In buildings requiring special provisions against the spread of fire, and where the artistic effect is not of prime importance, a frequent mode of construction is that known as "slow-burning" or "mill" construction. This has been brought about in a great measure through the efforts of the mutual fire-insurance companies in New England. The system consists usually in building outside walls (generally of brick) of concentrated piers or buttresses, connected by a thin curtain wall; the girders, beams, and interior columns are made of large timbers, and the floors of plank of a suitable thickness. It is essential to avoid concealed hollow spaces, such as furring, where dirt would accumulate. The underlying theory of slow-burning construction is that whereas small timbers, such as the three-inch joists and studs, and the one-inch flooring of ordinary construction, readily burn through and are destroyed, large timbers, under the influence of severe heat, char but do not burn through readily, as the charred surface forms a non-conductor and protects the interior. If, however, for any reason they should burn to destruction, all connections are so made that the timbers can fall out of their places without disintegrating the masonry or columns on which they rest.

Beams are spaced every 8 or 10 feet between centres, and should not be painted for several years after completion of the building, in order to avoid dry-rot. The ends of timbers in masonry bear on iron plates with anchors, or rest in cast-iron boxes, with air spaces in the sides, which permit a circulation of air, and

STEEL SKELETON CONSTRUCTION.

BUILDING

reduce the risk of dry-rot. Floor planks are not less than three inches in thickness, and for spans of 12 feet usually four inches. The larger spans are less desirable than the smaller. These planks should not be over nine inches wide. They should be planed on both sides, and grooved on the edges, the grooves being filled with hard-wood splines.

Top floors are made of 1¼-inch boards of southern pine, maple, or other hard wood. It is desirable to lay top floors over a three-quarter-inch bed of mortar, or two thicknesses of heavy sheathing paper.

For rooms where there is unusual risk of fire, such as hot-air drying, it is well to protect the ceilings with plastering on metal lath, filling in solid so as to avoid any cavities. Wooden posts should be covered with asbestos paper and tin.

Roofs are best when flat, and are constructed in the same way as the floors. They should be covered with tin, gravel, or duck. Where the roof is pitched, it should be covered with shingles or slate, laid over a three-quarter-inch bed of mortar.

Superposed columns are connected by iron caps, bases, and pintles, arranged to give a proper bearing for the girders.

Partitions, if used, should be two-inch tongued-and-grooved plank set on end, and plastered both sides, on metal lath.

Doors and shutters are built of two or more thicknesses of inch boards, covered on all sides with asbestos paper and tin, lock jointed.

The underwriters' associations have formulated in detail the best practice in mill construction, and are willing to advise on all questionable points.

Steel-skeleton Construction.—The closing years of the 19th century witnessed a development in the structural use of steel for buildings which is wholly without precedent. While columns and floor beams of iron or steel had been in use for many years as interior supporting members, it was not until conditions demanded buildings of extraordinary heights that the metal framework was extended to the exterior as well as the interior structure. Exterior walls constructed entirely of masonry must be made too thick for economy of space and materials if the building which they enclose is more than six or seven stories high.

The first step was made by introducing iron columns in the masonry of the outside walls, with the sole purpose of supporting the adjacent floors, the masonry of the walls carrying itself on its own independent foundations. This system was found also to lack economy after the possible height of buildings had been increased a few stories. The culmination of the system was reached when the exterior frame was designed to carry not only the floors and their various loads, but also the exterior walls. Each story now has its enclosing wall independent of the story above and below it, so that, as is frequently the case, the outer facing or curtain wall of the high building is started at several levels at the same time at intervals of two or three stories.

There would seem to be no limit constructively to which this kind of building can be carried, provided the area of the building at the base is sufficiently large.

Vibration and deflection under the pressure of the wind must be provided against by

stiffening braces or ties in the floors or partitions, more particularly where the height of the structure is relatively great.

Where streets are narrow, the crowding together of a number of such buildings darkens the streets and often produces disagreeable and even dangerous currents of air. The trend of legislation in large cities is toward restriction of height, Boston having already fixed a limit of 125 feet from the sidewalk level to the top of the cornice line.

There are three elements which enter into the construction of the steel-skeleton building,—foundations, columns, and floors. Of these three elements the column is the most important: for while foundations may settle, deranging the floor levels and causing the building to lean out of plumb; and while floors may bend or break without serious danger to any parts of the structure other than themselves,—columns, if they fail, may entail the collapse of the entire structure. For this reason, in the best work, columns are made of the softer, less brittle grades of steel, while floor beams are permitted of "medium" steel, a harder and consequently more brittle grade.

Many sections of columns have been devised, each having its own particular advantages, but columns in which all the surfaces, except those between riveted plates, are accessible, are generally to be preferred. These columns usually consist of a single web or plate, with one or more flange plates connected to the web by riveted angles. Other sections have been devised, made of Z bars or of channels connected by lattice plates, and a very ingenious column is that known as the Gray column, made up of angles in pairs connected by ties. The choice of any one form depends upon the stability of its section, the ease of procuring the parts of which it is composed, and the facility of connections. It is sometimes necessary to use the box column, but it is not to be recommended by reason of the inaccessibility of the interior surfaces. Water and steam pipes are sometimes run inside the fireproofing of columns next to the steel, but this is to be avoided if possible.

Columns are usually made in two- or three-story lengths. The bearing parts are carefully ground normal to their axis, and the connections are made by riveted cover plates. The extraordinary weights which these columns are called upon to carry, demand on ordinary soils a very extended footing. If this were attempted by the old method of brick or stone piers, the foundations would have to be carried to such depths that the system would not be economical. The customary method is that known as the grillage-beam system, in which the column starts from an iron or steel shoe which bears upon steel beams extending on opposite sides of the shoe, and bearing in turn upon one or more layers of beams bolted together and completely imbedded in concrete; under all is a layer of concrete whose area depends upon the compressive resistance of the soil. In rare cases the foundation is of solid rock, and the area may then be reduced to a minimum.

A peculiar type of grillage foundations is required for columns on or near party lines, beyond which the foundations may not extend. A cantilever construction is then used, whereby the wall column foundation is

BUILDING

united by beams to the nearest interior column foundation, so that the two act together and in a measure counterbalance each other. Where foundations occupy an interior corner of a property, and must be maintained inside two intersecting party lines, it is often necessary to combine four grillages in the same fashion. Where the soil is of a very compressible nature, as is frequently the case in many parts of Chicago, the entire area of the building may have to be covered by a distributing foundation of concrete and beams, forming a pan upon which the building floats. This has been followed in some cases by settlements due to the leakage of the underlying soil, a result which might easily develop from the construction of other buildings in the immediate neighborhood. Where possible, it is preferable to penetrate through soft soils to a firm bed. In the lower part of Manhattan Island bed-rock has been reached by pneumatic caissons. These caissons are made of steel plates riveted together. The excavation is made under or in the caisson under air pressure sufficient to hold back any water-bearing material which may underlie the foundations of adjoining buildings. After the caisson has been sunk to its proper depth it is filled with concrete or such other masonry as has been designed to form the foundation. Hydraulic caissons have also been used for the same purpose. Where excavations adjoin high buildings on sandy soil, and are carried to a greater depth than the grillages, as in the case of the work on the subway in lower Broadway, New York, an artificial freezing process is sometimes resorted to. A network of tiny pipes is inserted into the sand foundation, winding in and out among each other, so as to reach every part of the foundation soil. A cold salt solution is sent through the pipes, causing the sand foundation to freeze solid. This is a very expensive process and not to be employed unless other means fail. See FOUNDATION.

The floors used in steel-skeleton construction may be of any of the ordinary fireproof types, but in designing the floors it is necessary to connect the columns by steel beams or girders, which act best for the stability of the building if arranged in continuous straight lines. The voids between the girders are spanned by beams, whose spacing is dependent upon the style of floor to be used, varying from 5 to 12 feet, the spaces between being filled by brick arches or porous terra-cotta tiles, or by concrete slabs. The amount of material in the beams must be exactly sufficient for the work—no more or less. This is essential, not only for economy, but also to reduce the dead loads on the joints, columns, and foundations. There are many varieties of each of these systems, nearly all requiring the use of steel ties, plates, or rods. For spans over 12 feet the monolithic concrete floor reinforced by steel bars or metal lath has been used, but there is a great tendency to deflection. The long-span systems are still in their infancy.

The girders of the exterior walls, commonly known as spandrel girders, are used at or near the level of each floor, and should be connected to the columns by knee or angle braces.

While the exterior walls of the building are carried in part on the spandrel girders, it is customary to rivet additional angles or channels on the outer face of the columns for the support of the outer four or more inches of the wall.

All projecting parts of the exterior, such as belt courses, cornices, and balconies, must be supported by special framings. The ornamental finish of cornices having any great projection is often secured to the frame by iron hangers.

All parts of steel framework, except those buried in concrete, such as grillage beams, should be painted with the greatest care, as their preservation depends almost entirely on the quality of paint used and the way in which it is applied. All surfaces should be first thoroughly cleaned of scale and rust. It has been found that concrete adheres to a clean steel surface, and is a sufficient protection. All remaining parts should be given a coat of oil at the shops; they should then be painted with a coat of red lead or graphite paint upon arrival at the building, followed by a second coat after they are assembled. Sometimes a third coat is given, but it is scarcely necessary if the two previous coats have been properly applied.

Fireproofing.—While the steel-skeleton building is economical from the constructive standpoint, its usefulness and safety are greatly impaired if it is left unprotected against the ravages of fire. Many systems of fireproofing have been devised, all of which, however, consist in enclosing the parts with a non-combustible substance,—usually a clay product, or concrete or plaster,—applied in blocks or molded forms, set in mortar. For the outside of exterior columns and girders it is considered sufficient to lay the outer facing of the wall, if of brick or terra-cotta, directly against the metal. Granite, by reason of its friability under the combined action of heat and water, should be kept sufficiently far away from the structural parts to allow of the insertion of a layer of concrete. For all other parts of the skeleton the usual protections consist of two inches of porous terra-cotta block, plaster block, or cinder concrete. Columns and beams are sometimes enveloped with a sheet of wire cloth or expanded metal, and plastered.

None of these systems may be considered absolutely perfect, since they have all shown serious signs of deterioration under the continued action of a fierce fire, but it is a conceded fact that concrete, as a fire-resisting material, is unequaled.

In connection with fireproofing it is essential that interior partitions be built of non-combustible materials. Those most frequently employed are of the same nature as the fireproofing just described. Porous terra-cotta blocks and plaster blocks, three or four inches in thickness, dependent upon the height of the story in which they occur, have certain advantages by reason of the rapidity with which they can be set up, and the ease with which they can be removed where alterations are desired. Partitions are often made of small T or angle irons, over which is spread expanded metal or wire cloth in one or two thicknesses, to which the plastering is directly applied. Double thickness partitions of this sort are more sound-proof than those first mentioned.

In many so-called fireproof buildings wood finishes are desired, which with the contents are a menace; but experience has shown that fire can usually be confined to the room in which it originates, and can be checked in a few minutes. Methods of fireproofing wood have been devised, and consist of injecting a fireproofing solution into the pores, either under pressure or

BUILDING

by capillarity. Its use is not frequent, however, being largely limited to war-ships.

Exterior Finishes.—The artistic effect of a building depends more upon its color than upon its form either in general lines or detail. This is due to the fact that a good color sense is commoner than an appreciation of line and form. So true is this that many excellent designs have been utterly ruined by execution in unpleasing materials, and many meretricious designs receive public commendation entirely due to their satisfactory color effect. The search for novel and beautiful, as well as durable effects, has led to a great multiplication and improvement of materials.

Of all exterior materials the granites easily hold first place for buildings requiring dignity and durability. The finer granites come from New England, and range from various tones of white, through the deepening grays, into the dark reds, greens, and blacks. Many of the granites present beautiful surfaces when polished, and in general combine well in color scheme with almost any other material. The southern granites, so called, are not truly granites in the geological sense. They lack warmth and brilliancy of color, and by reason of their softness stain easily in a harsh climate or smoky atmosphere.

Sandstones, such as those from Ohio, Maryland, Pennsylvania, and Massachusetts, are reliable materials, the particles being well cemented together. They vary in color from the whites to the browns, and have practically superseded the Connecticut brown-stone used extensively in the 'sixties and 'seventies, but whose loose stratification resulted in early deterioration upon exposure.

Of the limestones, that from Indiana has had great popularity by reason of its softness for cutting when fresh, the large sizes in which it is obtainable, and, in the buff varieties, its beautiful color. The stone hardens upon exposure to the air, but its color changes, improving for a year or two, to become almost black after a period of 7 to 10 years.

The white marbles of Vermont, New Hampshire, and Georgia are thoroughly reliable, but discolor without assuming the soft warm tones of the old marble structures of Greece and Italy.

Gneisses abound throughout the Eastern States, some of them approaching very closely in texture to the true granites.

For durability and permanency of color, combined with economy, no exterior facing can surpass natural red brick. The appreciation of red brick has fortunately developed beyond the point where the smooth Philadelphia pressed variety is considered the only brick desirable for the finest work, so that we now have reds toning into the browns and purples, and combined often with dark headers, from which it is possible to lay up a simple surface full of artistic interest. Outside the plain red, there is a wide variety of brick within certain limits; whites, buffs, browns, or grays are easily obtainable both in the plain colors and mottled, and made by either the wet or the dry process. Color, width, and style of mortar joints, if used knowingly, can be made to intensify or soften the natural color of the brick. American enameled brick holds its own with the English, and is invaluable for light-shafts and damp places.

Nearly all makes, however, craze or chip in time.

Architectural terra-cotta, as an exterior finish, easily claims first rank in point of development. Many steel structures are covered entirely with it, excepting perhaps parts near the ground, subject to abrasion. It can be made in almost any color by means of "slips" or "glazes," and it lends itself readily to decoration. The use of terra-cotta is of advantage to the architect, in that he can see the models for every part of the work as they are in process, and vary them to his satisfaction before they are finally cast. Economy in the use of terra-cotta comes chiefly from minimizing the number of molds; but this must be guarded against, for, if pushed to excess, monotony is likely to result.

Ornamental bronze, copper, and iron work, through improved processes of manipulation, have added greatly to the possible richness of exterior effect.

Outside enclosures of sheet metal, such as iron or aluminum, are rarely æsthetic. Corrugated sheet iron has been used extensively for freight sheds, wharf enclosures, and similar ordinary constructions, where no effort for good looks has been made. The enclosure of steel-skeleton buildings with metal is not to be counted upon where such buildings are tenanted, as it is too great a conductor of heat.

Rough-cast and plaster work are most admirable and sympathetic as exterior wall finishes, where the extremes of temperature from winter to summer are not too great. Even adobe structures are possible in the South and West, but their use is most limited. Rough-cast or pebble-dash is applied to both masonry walls and lath; it is more durable on masonry, as the expansion and shrinkage of lath tend to disintegrate the mortar. Rough-cast is combined frequently with timber work in imitation of the old English half-timber constructions, and is specially adapted to domestic buildings of the freer country sort.

Concrete walls, where of the right texture and color, such as that made from coquina in Florida, give a pleasing effect.

Roof coverings comprise tin, copper, slag, tiles, slate, and shingles, each having its own appropriateness. Copper is the only permanent one of those mentioned, and slag is the next best. Tiles and slate require constant repairs, and shingles rarely last more than 20 years. Shingles lend themselves admirably to staining, and are deservedly popular. Thatch is attempted where picturesqueness is demanded.

A roof interesting from the constructive standpoint is that commonly used on the steel-skeleton building. It is known as actinolite, and consists of a number of thicknesses of heavy felts bedded upon a smooth Portland-cement surface, and covered with a roofing cement on which are laid vitrified tiles with the joints thoroughly filled, practically forming a pavement.

Interior Finishes.—For ordinary buildings the interior finish of floors, walls, and ceilings must necessarily be simple, consisting of cement or wood for the floors, and plaster for the walls and ceilings, except that in the case of mill construction walls are usually made of hard red brick, pointed inside the same as outside, and

BUILDING AND LOAN ASSOCIATIONS

ceilings consist of the dressed undersurface of the floor planking white-washed, painted, or varnished.

Cement floors are the most permanent, particularly where they are subjected to moisture, although the hard pine and maple flooring commonly used is less tiresome to walk on and is sufficiently durable.

The so-called patent plasters have come largely into use by reason of their hardness and quick-setting quality. They are mixed by machine in fixed proportions, and are therefore more dependable in quality than the ordinary lime mortar. If applied to lath, the patent plasters require that the lath, if of wood, shall be wet before application, or, if of metal, that the metal be of heavy threads, as the finer wire cloth is sometimes eaten away by the ingredients of the plaster.

Tiles, whether of marble, ceramic, or glass, form excellent interior finishes, except that small tiles for floors are likely to loosen, and frequent joints in tiling become unsightly through discoloration. The glass tile known as "opalite" produces a finish similar to enameled brick, and has been shown in some cases to be more lasting. Interlocking rubber tiles are desirable in cases where there is risk of slipping, such as for elevator floors. They are also good deadeners of sound.

Beautiful effects of mosaic, both of marble and of glass, are easily obtainable—a great variety of color and design is largely in their favor. All of these applied finishes require a solid base, preferably of masonry or concrete.

The variety of woods for interior finish is almost without limit, and has been greatly increased by staining and by methods of finish.

In no department of interior ornamentation has greater progress been made than in plaster work—a system which can be pushed to almost any point of elaboration, and which lends itself perfectly to painted decoration. In fact, there are few materials that cannot be simulated in plaster if the decoration is clever.

The field of interior decoration was never wider, and the knowledge of the application of leathers, stamped, modeled, and woven fabrics, and the thousand and one other forms of wall applications, never better understood.

In marble for interior use America is not particularly fortunate. Granite and limestone produce satisfactory results, but most of the American marbles are cold and lacking in richness of texture. Among the best marbles are the Knoxville Gray, and a few of the whites. For the more beautiful effects recourse must be had to the imported marbles, such as Sienna, Numidian, Pavonazza, Alps Green, and others.

EDGAR V. SEELER,
Architect.

Building and Loan Associations, co-operative organizations, originally designed to aid their members in procuring homes, at the lowest cost, and on the easiest terms. Later developments gave them some of the functions of a bank for savings. The associations are a development, dating from about 1835, when a few experimental ones existed in the United States, the movement beginning in Pennsylvania. The original associations proving successful, plans were gradually improved, until by 1850 they became an established part of American institu-

tions. They have been operated under various titles, besides the above, as mutual loan associations, home assistance associations, co-operative savings and loan associations, and co-operative banks, the latter title being popular in New England.

The basic plan of these associations is the issuing of stock, which is paid for in monthly instalments, and the loaning of the money thus raised to shareholders, borrowers paying twice as much per month as lenders. It has been common to give the shares a maturing value of \$200 each, on which the holders pay \$1 per month as long as they are lenders or investors, and \$2 per month, as soon as they become borrowers on their stock. In addition to the \$2, the borrower is also liable to have to pay a premium to secure his loan, when there are more shareholders seeking loans than there is money to loan.

Under such an arrangement an association received an average of \$1.50 per month per share, and in the course of a little more than 11 years this was theoretically sufficient to bring the shares to par value. In practice, the shares would sometimes run out in 10 years, if premiums on loans ran high, and sometimes 12 or more years were required for shares to reach the \$200 value, if the association had passed through hard times. When the shares reached the \$200, or other maturing value, the lenders received their money back, and the borrowers had their loans canceled. Under the early plans, the maturing of the shares wound up the association. This was a hardship to many, and as a result the issuing of shares in annual series has become common. This enables outsiders to come in and take shares any time a new series is opened, or to purchase the most recent series, by paying the dues for the number of months such series has run.

The legislatures of the various States have made laws rendering easy the forming of these associations, because they have proven to be a good means of enabling wage workers to build and own their own homes. The parties interested manage their own affairs, and as the money is loaned out as fast as it comes in, there is seldom any loss by speculation. To illustrate how these associations assist a man of small means to build and pay for a home, let us follow the system from his point of view. Suppose he has a lot of land, for which he has paid \$400. He can subscribe for five shares of an association, of the par value of \$200 each, paying therefor \$5 per month. Every month, or every few months, there will be money to be loaned, and he attends the meetings, and when he thinks the premiums are low, he bids in a \$1,000 loan. If he has bid 10 cents premium on this, he must pay \$2.10 each month on his shares, from the time he receives the use of the money. As a matter of fact he does not handle the money, but having bid successfully, and the directors having passed upon his lot and proposed house as a safe loan, he sets a builder to work, and his house is put up, the association taking a mortgage on it for \$1,000, and the builder collecting his \$1,000 from the association. Every month he pays his \$10.50 into the association, just as if he were paying rent, and in 10 or 11 years the shares mature, and the home is paid for.

The plan appeals to the wage worker, because of the easy payments. It appeals to small lenders, because it affords them a sort of savings-

BUILDING LEASE—BUILDING MATERIALS

bank, and encourages systematic savings. Small tradesmen and merchants are almost as apt to become interested in such associations as are those who work for a weekly wage, and the economical methods by which a large amount of money is borrowed and loaned safely have attracted many to the associations as being a safe depository, and sure to pay 6 per cent dividends.

Originally, these associations were usually confined to a town or locality, no loans being made beyond the territory where most of the members lived and knew the value of the property. But within recent years both State and national associations have been organized, which do business anywhere within the limits of their larger territory.

The management of an association is usually lodged in a board of directors elected annually from the shareholders, and whose members serve without pay. They pass upon the loans, and having investments of their own to protect, closely guard the association treasury. The secretary is customarily the only salaried officer, and is often paid for doing the detail work by a system of small fees. Sometimes the fines levied on delinquents are his sole compensation.

Each association makes minor laws of its own, and many vary the plan as above given in numerous details; but the general principles here outlined are the same with all. In 1905 there were 5,265 of these associations, having a membership of 1,631,046, and total assets of \$600,342,586.

Building Lease, a lease of land for a long term of years, usually 99 years, at a rent called a ground-rent, the lessee covenanting to erect certain edifices thereon, and to maintain the same during the term. At the expiration of the lease the houses built become the absolute property of the landlord, unless otherwise provided in the contract. See **LEASE**.

Building Materials. The materials used for structural engineering and architectural purposes may be conveniently divided into two general classes—"Materials of Construction," such as the woods, stone, metals, cements, etc., and "Materials of Consumption," such as coal, water, oil, etc., which are consumed or transformed while being used.

In this article, the materials of construction will be briefly considered according to their physical and chemical properties, and their adaptability for various purposes, leaving the consideration of the materials of consumption to the sphere of chemistry and physics where they properly belong.

Apart from their chemical composition, the principal properties of building materials important to the engineer are the "density" or specific gravity of the substance; its "resistance" or capacity to withstand strains and stresses; the "hardness" or power to oppose penetration; its "toughness" or capacity to elongate under tension without rupturing; its "brittleness," which is the opposite of toughness; and, its behavior under conditions of varying temperature, or when worked in the many ways required by structural operations.

Timber or Wood.—The following general facts relative to the physical properties of wood have been determined by experiments: (1) Bleeding has not much effect on the strength

of wood, but increases its flexibility slightly, and it is probable that bleached timber will stand exposure to the weather fully as well as the unbled. (2) In general, moisture absorbed in the form of sap, or in the form of water after seasoning, reduces the strength of wood. Well-seasoned wood or that which contains not more than 12 per cent. of moisture is from 75 to 100 per cent. stronger than green timber. (3) In artificially-dried timber any remaining moisture exists in a uniform percentage throughout the mass, a condition which requires months, and sometimes years to attain in heavy air-dried timber. (4) The strength per square inch of section of large timbers is in every way equal to that of small timbers, provided they are equally sound and contain the same percentage of moisture. (5) In general, the strength of woods of uniform structure increases with their specific gravity, that is, the heaviest wood is generally the strongest. Oak, however, appears to be an exception to this rule. (6) Seasoned wood will increase in weight to the extent of 5 to 15 per cent. if exposed to the weather. This excess of weight can be easily reduced by keeping the timber in a warm dry place for a week or ten days.

The opposite table gives the physical properties of some of the woods suitable for structural, interior finishing, decorative and other similar purposes. The "elastic limit" given in the table is a relative quantity, as there is no definite "elastic limit" in woods similar to that in metals.

In selecting and preparing timber or wood for structural purposes, a careful consideration of the following facts in addition to those already stated is quite important: (1) That timber grown in moist soils is lighter, and decays more quickly than that grown in dry, sandy soil, and that, usually, the best timber is that grown in a dark soil intermixed with gravel, with the exception of the various kinds, such as poplar, cypress, willow and all others that naturally grow best in a wet soil. (2) That the wood of trees grown upon the plains, or in the centre of forests is less dense than that of those grown upon the edge of a forest or upon the side of a hill. (3) In temperate latitudes, as in the United States, standing timber should be selected in the latter part of July or the first part of August, when the sound and healthy trees are indicated by fresh green leaves, in contrast to the unsound and unhealthy trees, the leaves of which begin to turn yellow at that season of the year. Decaying branches, a scarcity of leaves, and the tendency of the bark to become rough and to separate from the wood, are positive indications that the physical properties of the wood are impaired.

The trees selected should be those that have most nearly attained their full maturity, a period which varies greatly with the different species. As a rule, the age and the rate of growth of a tree may be ascertained from the number and the width of the rings of annual increase which are exhibited in a cross-section of the wood. (4) Timber should be felled or cut either in midsummer or in mid-

BUILDING MATERIALS

winter. In midsummer, the most suitable time is in the month of July. A tree should be cut as near to the ground as possible, as the lower part of the trunk furnishes the best timber. (5) As soon as a tree is felled it should be "dressed" by having its bark stripped off, then raised from the ground and the sap-wood removed, and finally squared or reduced to the required dimensions. (6) In the inspection of timber the quality of the wood may be ascertained by observing that its color, as exhibited by a cross-section, is practically uniform in the heart. It may be a little deeper in color at the centre than near the white-colored sap-wood next to the bark, but the gradation should be uniform and free from sudden transitions of color, or white spots, which are infallible signs of decay; that it is free from "wind-shakes" or circular cracks which separate the concentric layers of wood from each other, and which constitute a very serious defect; that it is free from "splits," "checks," and "cracks," which extend very deeply toward the centre; and that it is free from large or decayed knots, which tend to materially affect its strength.

acter. Other serious defects are indicated by the presence of many knots, which, although the timber may be sound, stamps it as being of stunted growth, and is commonly known as "knotty timber," and a spirally winding grain characteristic of "twisted wood" which is unfit for long pieces. Dry-rot is indicated by yellow stains; elm and beech are very quickly affected by it if left with the bark on after felling.

The proper seasoning and preserving of timber is of the utmost importance in connection with its use as a material of construction. Freshly cut timber contains from 35 to 50 per cent. of moisture, which may be reduced to 17 or 25 per cent., by exposure to the air in seasoning one year, and to below 12 per cent., by artificial drying in a comparatively short time.

There are various processes of seasoning. Natural seasoning requires a period ranging from 2 to 8 years, according to the size and physical properties of the wood. Timber of large dimensions is not only improved in strength, but is rendered less liable to warp and crack when becoming seasoned, by being previously immersed in water for several

PHYSICAL PROPERTIES OF TIMBER OR WOOD.

(As determined by tests of seasoned timber, containing 12 per cent. or less of moisture.)

The stresses are given in pounds per square inch

Furthermore, the condition known as "brash-wood," is generally consequent to the decay of the tree on account of age, and is characterized by a reddish color of the wood which becomes porous, and breaks off short without splintering; while "belted" timber is that which has been killed, or which has died from some unavoidable cause, before being felled, and is of a highly objectionable char-

acter. When the seasoning is accomplished naturally by exposure to the air, the timber should be piled under a shed and kept dry, with a free circulation of air about it, but without being exposed to strong currents of the same. The bottom pieces should be placed upon skids raised about two feet from the ground, and a space of at least an inch should be allowed between the horizontal layers.

BUILDING MATERIALS

Slats or piling strips should be placed between the layers at each end of the pile, and also at short intervals between the ends so as to prevent the timber from "winding." It is important that these strips should be placed directly one over the other and that they should not be less than one inch in thickness. Care should be taken to pile the heavy timbers upon the ground floor of the shelter, and the light stuff upon the upper portion, with a clearance of at least two and one-half feet between the piles. The timber should be re-piled from time to time, and all pieces showing any indications of decay should be removed, so as to prevent their affecting that which remains sound and healthy. The gradual method of seasoning is undoubtedly the most suitable for preserving the strength and durability of the timber; but, as already stated in the preceding paragraphs, it has been very definitely ascertained by tests that the results of artificial methods properly applied do not indicate that those qualities are materially affected by such processes, while other important advantages, such as the reduction in the time required for seasoning, and the uniformity of the percentage of moisture contained in the seasoned product, are unquestionably obtained. The hastening of seasoning by steaming the timber has been successfully accomplished, and the saturation of timber with a solution of corrosive sublimate, to secure it against dry-rot, and to protect it from the attacks of worms, has proved very satisfactory. Kiln-drying, however, is applicable only for boards and other pieces of small dimensions, and has a tendency to crack the wood and impair the strength in various ways, unless it is accomplished very slowly. Timber ought not to be seasoned by either charring, or smoking, and should not be painted unless it has been thoroughly seasoned, as such methods and applications effectually prevent the drying of the wood in the interior of the piece, so that fermentation sets in and decay soon takes place.

The principal processes of impregnation are the following: "Kyanizing," introduced by Kyan in 1832, consists of saturating the wood with a solution containing 1 pound of chloride of mercury to 4 gallons of water under a pressure of 15 pounds per square inch; "Burnettizing," introduced by Burnett in 1838, by which the wood is impregnated with a solution of 1 pound of chloride of zinc to 10 gallons of water, under an endwise pressure of 150 pounds to the square inch; the process introduced by Boucheri, by which the wood is impregnated with a solution of 1 pound of sulphate of copper to 12½ gallons of water, under a pressure of 15 pounds per square inch; "Creosoting," introduced by Bethel, by which the wood is impregnated with the oil of creosote mixed with bituminous matter under an endwise pressure of 150 to 400 pounds per square inch. The Kyanizing and the Boucheri processes are applied to standing timber, that is, while the tree is still growing, the head is cut off and the top of the stem is hollowed into the form of a bowl and filled with the solution which, being replenished from

time to time, soaks down into the tree, killing it as it goes down, but thoroughly saturating the wood and imparting to it a remarkable degree of durability. Timber may be creosoted by simply steeping it in the oil of creosote, but the "creosoting" and "burnettizing" of timber of large dimensions is accomplished with the aid of special apparatus that gives the requisite pressures. Creosoting is the most satisfactory method of preserving timber used as piles for wharves against the attacks of the "Teredo" or ship-worm, but it is not an infallible remedy.

The presence of vegetable albumen in timber appears to be the primary cause for its deterioration. The most necessary element in the healthy growing tree, it is the most pernicious of all in that which is dead. The sapwood contains a large proportion of it and other fermentable elements, the putrefactions of which cause dry-rot or sap-rot, and produce various forms of injurious fungi, therefore, in order to correct these evils, the most effective method to preserve timber is to expel or exhaust its fluids, solidify its albumen, and introduce an antiseptic liquid. This appears to be accomplished in the most satisfactory manner by the process introduced by Robbins in 1865, by which the liquids are dissipated and the albumen solidified by heating the wood in a chamber raised to a temperature of 212° Fahr., and then submitting it to the vapor of coal-tar, resin or bituminous oils, which being at a temperature of not less than 325° Fahr., readily takes the place of the vapor expelled by the lower temperature.

Stone.—To be suitable for building purposes, it is essential that a stone should possess the qualities of durability, permanency of color, strength and toughness, and should be susceptible of being inexpensively quarried, and easily worked. The greater number of such stones belongs to some one of the following classes of rocks: (1) The crystalline silicious; (2) the calcareous; and (3) the fragmentary rocks, including the sandstones and slates.

Of the crystalline silicious rocks, the best known and the most suitable are the granites and the syenites, which possess an average crushing strength ranging from 12,000 to 16,000 pounds per square inch. Some authorities credit them with an ultimate crushing strength ranging from 25,000 to 30,000 pounds per square inch, but the results of the latest tests are indicative of the smaller values, which are, however, all sufficient for any kind of building purposes. These stones, varying greatly in their physical composition and color are found in large quantities in all parts of the world. They are very proof against the action of frost, and are commonly quite permanent in color, which ranges in the modern varieties, from a sparkling whitish gray to dark gray, and from a delicate pink to a dark red. Until recently, on account of their great hardness, granite was only employed for massive masonry in which roughly dressed stones could be appropriately used, or where the magnitude of the structures permitted the great expense involved by dressing and pol-

BUILDING MATERIALS

ishing; but, the development of improved forms of stone-cutting and dressing machinery during the last few years permits of its being turned and carved into columns, pilasters, and other forms, and polished perfectly, at a comparatively small expense, so that it is being used more and more extensively, and is becoming one of the most popular of all building stones.

Although quarried in practically every eastern State embracing the Appalachian Mountain system, from Maine to North Carolina, and in the States of California, Montana, Wyoming, Colorado, Minnesota, Wisconsin and Missouri, the greatest supply of granite in the United States is furnished by Maine and Massachusetts. The Maine granites, principally derived from the Hurricane Island quarries, are mostly of the light gray variety, although a limited amount of the pink and red varieties are also quarried and are found to be commercially available. The Massachusetts granites are of a rich dark blue-gray color, and are extensively quarried in the vicinity of Quincy, while other fine granites of similar qualities are quarried at Concord, New Hampshire, and Westerly, Rhode Island.

While the United States is one of the largest producers of granite, it is also one of the largest importers of the stone. Red granites from the quarries at Peterhead, Scotland, and the gray granites from Aberdeen are quite largely imported into this country for monumental work. They take a very high polish, and are of great durability, especially the coarse red variety. This is also the case with the red and gray Canadian granites, which are extensively quarried in Quebec, New Brunswick, Nova Scotia, Ontario and near Victoria, in British Columbia. In the United States, besides granite and syenite, the other crystalline silicious rocks available to some extent for building purposes are porphyry, gneiss and trap. Porphyry, although a very handsome building stone, with large crystalline structure, and colors ranging through shades of white, gray, pink, red and black, is used only to a limited extent in rough construction on account of its great hardness, and the consequent difficulty of cutting and polishing it within a reasonable limit of expense. Gneiss is more extensively used; it resembles granite in composition, but unlike granite, it has a well-defined cleavage, which allows it to be split into thick slabs. Trap is a sombre-hued rock, which is very difficult to work, and is seldom used as a material of construction, except in the form of paving blocks, or as crushed stone for making concrete or road material.

Of the *calcareous rocks*, the most suitable for structural purposes are the limestones and the marbles. These consist of carbonate of lime, and differ in quality rather than in composition, the marble having a crystalline structure capable of taking a high polish. The oolitic limestones, possessing great strength, their resistance to compression ranging from 12,000 to 17,000 pounds per square inch, are of a very fine and even texture. The most widely known in the United States are those

quarried in Indiana and Kentucky, and commonly known as "Bedford Stone;" they are handsome in color and are very easily worked. The colors of limestones range through broken shades of pink, red, yellow, green and blue, imparted to the structure by various impurities. Dolomitic limestone, commonly known as dolomite, contains magnesia in addition to the carbonate of lime; is somewhat coarse in quality, and is quarried in nearly every State of the Union, to supply an apparently permanent local demand. The most favorably known of the foreign varieties is that obtained from the quarries of the Isle of Portland, England, and the French stones quarried near Caen, Normandy. The latter is a soft, fine grained stone of a light color very suitable for carved work, but entirely unfitted for exposed structures in cold climates, on account of its highly absorbent quality.

The marbles are much softer than the limestones, and have a crushing strength ranging from 7,000 to 8,000 pounds per square inch. They are the most showy and ornamental of all building stones, and have been very popular since the earliest times. A great many beautiful varieties are quarried in various parts of the United States, but about 60 per cent. of the total amount is quarried in the State of Vermont, the principal centres of the industry being at Dorset, West Rutland, Middlebury, Wallingford, Brandon and Pittsford. These marbles are of all varieties of texture, and range in color from pure white to dark green, and dark blue, the white stones often being veined and mottled with the darker colors. Very beautiful marbles are also quarried in Tennessee. They are particularly noticeable on account of their variegated colors, which include many shades of chocolate and red, and lemon yellow, olive and green, which form an endless variety of color combinations of striking effect. The distribution of these Appalachian marbles extends from Vermont to Georgia, and are extensively quarried in all of the States bordering that mountain system. On the other hand, although very fine marble deposits exist in many of the States in the Rocky Mountain region, they have not been worked to any great extent, up to the present time.

The most notable of the foreign marbles are those of Italy, the French Pyrenees and Belgium, although Germany, Austria, Spain, Portugal and Ireland, also furnish many varieties of fine texture and color. Among the most beautiful of these European productions are the "Brocatelle" marbles, having a light yellow body marked with veins and blotches of dull red, and the Languedoc, having a brilliant scarlet body color blotched with white, both of which are obtained from the Pyrenees; the "Black and Gold," a black limestone veined with yellow; the pure white stone of Carrara, and the "Giallo Antico," a yellow marble, all three of which are obtained from Italy; and the Saint Anne marble having a deep blue-black body color marked with white veins, and the pure black marble known as "Belgian Black," which are obtained from Belgium.

BUILDING MATERIALS

Of the fragmentary rocks, a great variety of sandstones are used for facing, lintels, and general structural purposes, while slate is used for roofing, and for floor tiles, flagging and mantels. Sandstones are composed of rounded and angular grains of sand, bound together by such cementing materials as silica, oxide of iron and carbonate of lime, into the form of solid rocks. The presence of silica gives a white colored stone of durable quality, but very difficult to work. Cementation by oxide of iron gives a reddish or brownish stone of medium durability, fairly easy to work. Carbonate of lime cement gives a gray-colored stone much softer than the other two varieties, and much easier to work, but much less durable. Sandstones vary in texture from those having a very fine grain to those composed of pebbles. The latter are divided into two classes—the “conglomerates” composed of rounded pebbles, and “breccias” composed of angular pebbles. Some sandstones have a clayey cement which makes them unfit for building purposes, while others, although they do not contain hardly any cement, and owe their tenacity to the pressure under which they were consolidated, make good building stone. As a general rule, sandstones are softer when first quarried, than after a period of seasoning by exposure to the air. They vary in color from light gray, buff, drab and blue, through shades of brown, pink and red. Their resistance to compression ranges from 9,000 pounds per square inch in the Ohio sandstone, to 12,000 pounds in the New Jersey stone; while the “Medina” stone and the blue-stone of New York have a crushing strength of 14,000 pounds per square inch. Other well-known and extensively quarried varieties are the “Berea” stone of Ohio, and the “Portland” stone of Massachusetts and Connecticut.

Slate consists of an indurated clay which may be easily split into sheets of various sizes and considerable thinness. The principal quarries in this country are located in Maine, Vermont, Pennsylvania and New York, while those of Ardennes in France, and of Wales in England, are the greatest producers in Europe.

The methods employed in quarrying building-stone vary with the character of the stone, but the ultimate object of all of them is to obtain large and well-shaped blocks free from incipient fractures. Therefore, explosives are used as little as possible for that purpose, and the work of dressing is very largely done by hand. A great deal of machinery, however, is employed for the purposes of sawing, planing and polishing, and for splitting slate.

The durability of a building stone is one of the most important factors in its value as a material of construction. Durability is the ability of a stone to withstand the deterioration induced by its exposure, to the action of changing weather and temperature conditions, to the chemical agencies in the moisture of the atmosphere, and to the disintegrating action of growing organisms. The normal strengths of the softest building stones are much greater than is necessary for structural purposes, but under the action of the natural

elements and agencies just stated, they disintegrate more or less rapidly according to their structure and the materials of which they are composed. Granites suffer disintegration chiefly from changes of temperature, and are affected but little by the expansion and contraction due to the absorption of water and its subsequent freezing in cold climates; and are almost entirely unaffected by the chemicals ordinarily held in the atmosphere, or carried by rain. Limestones suffer even less by expansion and contraction, but deteriorate much more quickly under the action of the chemicals in the air and rain; while the sandstones, on account of their porous structure, suffer chiefly from the effects of expansion and contraction and disintegrate so rapidly from the effects of frost that they are unsuitable for building purposes in countries with cold climates.

As the durability or “life in years” of a given variety of building stone would, therefore, vary greatly under different climatic conditions, it is obvious that the engineer and architect cannot be too careful in selecting the stones best suited to the climatic and other conditions of the localities in which his structure is to be built. In order to make the selection intelligently, it is necessary for him to know the special qualities of the various stones, according to their structural constituents, and the natural causes by which those constituents were formed into rocks. The porosity, or the capacity to absorb moisture, of the various classes of stone available for building purposes, varies from $\frac{1}{2}$ to 2 per cent. in the granites; 2 to 4 per cent. in the limestones, and 2 to 8 per cent. in the sandstones, and their hardness or resistance depends on the firmness with which the particles of which they consist are bound together. In the igneous or metamorphic rocks, the bond is the result of crystallization, and in the sedimentary rocks it is due to cementation by depositions of silica, etc., between the individual grains as already described. The resistance of a stone to frost action may be conveniently and accurately tested by soaking it in water and then freezing it; the process being repeated a number of times and the amount of disintegration noted.

Artificial Stones.—These are represented by a great variety of artificial compositions of which the basis is hydraulic cement. The best known varieties are the “Béton-Coignet,” a French production composed of Portland cement, silicious hydraulic cement and clean sharp sand. These constituents when mixed together with a small amount of cold water make a plastic compound which is hardened in molds to the consistency of a stone, very suitable for various building purposes; the “Ransome stone,” which consists of a mixture of sand and silicate of soda, moulded into blocks and slabs, are hardened under pressure in a hot solution of chloride of calcium; “Portland stone,” consisting of a mixture of Portland cement and sand, or sand and gravel, rammed while wet and plastic into molds to harden; “McMurrie stone,” consisting of the Portland stone mixture to which a certain

amount of alum and potash soap is added so as to deposit compounds of alumina in the pores of the stone and thus reduce its porosity; the "Sorel stone," another French product, made by adding a solution of chloride of magnesium to the oxide of magnesium; and various kinds of "sand bricks" made by mixing sand and lime into a moist paste, which after molding into blocks of various sizes, are hardened by heat in suitable furnaces. The Portland stone, under various trade names, is very extensively used in the United States; the Ransome stone in England, and the French products mostly in the country in which they were originated. All of them possess considerable merit for building purposes, except the Sorel stone, which is mainly used for making emery wheels.

Cement is applied in various ways for structural purposes other than simply as a bonding material. The several varieties of cements consisting of common lime, hydraulic lime, and those classified as "natural," "Portland" and puzzolanic cements, when combined with sand, and broken stone or gravel, or other hard material in fragments, afford several varieties of concrete which are extensively used for foundations in damp and soft or yielding soils; for breakwaters and for sea walls; for sidewalks, pavements and sustaining walls, and for subterranean and submarine masonry, under almost every combination of circumstances occurring in practice.

Combined with structural iron and steel, and now generally known as "re-inforced concrete," its sphere of application has been greatly extended, especially as a structural material for bridges, and in the construction of fireproof buildings. It has been demonstrated by actual test, that in these lines its general durability and fire-resisting qualities are not only superior to any other material, but that by its use the cost of large structures, such as office buildings, etc., may be reduced at least 20 per cent., as compared with the estimated cost of the steel and tile of ordinary fireproof construction.

The use of various kinds of brick and tile, and of iron, steel and other metals for building purposes, is too familiar to require a detailed account in this connection, especially as they are exhaustively treated under their special titles. It is important to note, however, that during the last decade, the tensile strength of structural iron and steel have been more than doubled by improved processes of manufacture, and they have almost entirely supplanted wood and stone in those portions of large structures which are subjected to the greatest strains, and also where economy of space is of vital importance.

For further detailed information relative to the production and strength of various kinds of building materials, and the specific purposes for which they are most suitable, see articles entitled ARCHITECTURE; BRICK; BUILDING; BUILDING STONE; CEMENT; CONCRETE; RE-INFORCED CONCRETE; IRON; LUMBER INDUSTRY IN THE UNITED STATES; STEEL, MANUFACTURE OF; TIMBER LANDS; WOOD; AND SPECIAL ARTICLES ON GRANITE; LIMESTONE; MARBLE; SANDSTONE;

MASONRY, STRENGTH OF MATERIALS, in this Encyclopædia.

WILLIAM MOREY, JR., C. E.,
Consulting Civil and Mechanical Engineer.

Buisson, Ferdinand Edouard, fār-dē-nōñ ā-door-ār bwē-sōñ, French educational administrator: b. Paris, 20 Dec. 1841. After completing his studies at Paris he went to Neuchâtel, Switzerland, where he taught from 1866 to 1870. His appointment by Jules Simon in 1871 as inspector of elementary schools aroused much agitation on account of his advocacy of the secularization of the schools. The opposition of the Church party led to his resignation. In 1873 he was sent to the exposition in Vienna, to represent French educational interests; in 1876 he came to Philadelphia on a similar mission, and in 1878 was in charge of the educational section of the Paris Exposition. In 1879 he was made director of elementary instruction and became prominent for the reforms introduced during his administration. After resigning from this post in 1896 he accepted the professorship of pedagogy in the *Faculté des Lettres*. His strong stand on the Dreyfus question attracted much attention. He is the author of an authoritative 'Dictionary of Pedagogy' (1882-4), and has also written 'Liberal Christianity'; 'Orthodoxy and the Gospel in the Reformed Church'; 'The Teaching of Sacred History in Primary Schools'; 'Duties of American Scholars'; 'Pedagogical Lectures and Talks'; and a life of Sebastian Castellion.

Bukowina, boo-kō-vē'nā ("beech land"), Austria-Hungary, a province in the extreme east of the empire, surrounded by Galicia, Russia, Moldavia, and Hungary. Area, 4,035 square miles. It is traversed by offsets of the Carpathians, culminating at 6,077 feet; gives rise to many rivers flowing toward the Black Sea; and abounds in wood, along with considerable mineral riches. Pop. (1900) 729,921.

Bul-tso ("borax lake"), Thibet, a lake situated 100 miles northwest of Lassa. It has an area of 24 square miles.

Bulacan, boo-lā-kan', Philippines, a town in Luzon, about 22 miles northwest of Manila, with which it is connected by railway. The town is composed mainly of native huts, although there are factories in which silk matting is made. Sugar-boiling is also an industry of importance. The place has strategic advantages, which caused it to become a theatre of military operations after the Spanish-American war. It was fully pacified in 1900, and made a military post by the United States authorities. Pop. about 14,000.

Bulama, boo-lā'ma, an island on the west coast of Africa, one of the Bissagos. It is 18 miles long and 9 broad, and is situated about two miles from the mouth of the Rio Grande. It is very fertile, but not easy of access. It is now occupied by the Portuguese. See BISSAGOS.

Bulan, boo-län, Philippines, a town of the province of Albay, situated in the southeastern part of the island of Luzon. Pop. about 11,000.

Bulau, boo'low, or **Tikus**, ti'koos, an animal of the mole family (*Talpidae*) and genus *Gymnura* (*G. rafflesii*), a native of Sumatra and Malacca, bearing a considerable resemblance to the opossum. The muzzle is much prolonged, the fur pierced by a number of long hairs or bristles, and the tail naked. It is possessed of glands which secrete a kind of musk.

Bulawayo, boo-lä-wä'yō, Rhodesia, the principal town and chief commercial centre of Matabeleland, South Africa, 490 miles north-east of Mafeking, 1,360 miles from Cape Town, with which it is connected by railroad. It has several hotels, good business blocks and residences, banks, and telephone service, and is rapidly growing in size and importance. A few years ago it was the chief town of the Matabele tribe, though only a collection of rude huts, in an enclosure of wattles, whose inhabitants were savages of the lowest type. The royal kraal is now replaced by the government house, which communicates by an avenue a mile and a half long with the town proper. Pop. (white) about 5,000.

Bulb, the name given to a leaf bud belonging to certain perennial herbaceous plants, and particularly to the monocotyledons. It is always underground, and is supported by a kind of solid and horizontal plate lying between it and the true root. To this flattened portion the fleshy scales of which the bulb is externally formed are fixed by their base. The interior contains the rudiments of the flower-stalks and leaves. The outermost scales are thin and dry like paper, but they become more fleshy and succulent in the interior. Sometimes the scales are of one piece, a single scale embracing the whole circumference of the bulb, as in the onion and the hyacinth. They are then named "coated" or "tunicated bulbs." At other times the scales are smaller and free at the sides, and cover one another only in the manner of tiles on a roof, as in the white lily. Lastly, the coats are sometimes so close as to be confounded together, so that the bulb seems as if formed of a solid and homogeneous substance. Such bulbs are called "solid," and they are exemplified in the common saffron. Bulbs again are either "simple," as in the tulip or squill, or they are "multiple," or formed of several small bulbs collected under the same envelope, as in garlic. Bulbs are reproduced every year, but differently in different species, the new bulbs sometimes being formed in the centre, sometimes at the side, sometimes above, sometimes below the old bulbs.

Bulbul, bül'bül, a small, brilliantly plumaged thrush-like bird of the family *Pycnonotidae*, species of which are found in Asia, Persia, India, and South Africa. The South African one (*Pycnonotus tricolor*) is remarkable for becoming intoxicated by syringa berries and similar fruits, at which time it is easily captured and caged. The common Indian bulbul (*P. hamorrhous*) is a familiar and favorite bird of European residents, and often builds its nest in their gardens and on the verandas. The pugnacity of the males is utilized by the

natives for their amusement, the birds being caught and trained to fight for small prizes. The name "bulbul" was applied to the little Persian nightingale (q.v.), and first introduced into English poetry by Lord Byron, after which its praises were much sung by the poets of the day.

Bulfinch, Charles, American architect: b. Boston, 8 Aug. 1763; d. there, 15 April 1844. He was graduated from Harvard in 1781, for several years traveled in Europe, studying architecture, which he adopted as a profession upon his return in 1786. In 1793 he built the first theatre in Boston. In the course of his career he designed more than 40 churches and public buildings in New England. Among them were: the State house, Suffolk county courthouse, Massachusetts General Hospital, and remodeled Faneuil Hall in Boston; the State prison and MacLean Asylum, at Charlestown; the county jail and University Hall in Cambridge; and the State house in Augusta, Me. From 1817 until its completion in 1830 he was the architect of the national capitol at Washington. Consult: Ellen Bulfinch, 'Life and Letters of Charles Bulfinch, Architect' (1896).

Bulfinch, Thomas, American author: b. Boston, Mass., 15 July 1796; d. there, 27 May 1867. He graduated at Harvard University in 1814. Although engaged in business he managed to devote considerable time to literature. Among his best-known works are 'The Age of Fable' (1855); 'The Age of Chivalry' (1858); 'Legends of Charlemagne' (1864); 'Oregon and Eldorado' (1866).

Bulgaria, bül-gär'ëa, or bool-gär'ëa, a principality in Europe, bounded north by the Danube and Rumania; east by the Black Sea; south by Turkey; and west by Serbia; capital, Sofia. It has an area of 38,080 square miles. Its surface is a gradually sloping plain, broken by occasional mountains, which give rise to many rapid tributaries to the Danube. There is little mining, although the mountains are rich in minerals. The soil is excellent and the slopes of the mountains are richly wooded. The inhabitants, though not skilled in agriculture, export a considerable quantity of grain, chiefly wheat. Fruit and vegetables are raised in abundance. Roses are largely cultivated for the production of the attar; 80,000 gallons of wine are made annually; silk worms are bred in some regions; and tobacco forms an important crop. Domestic industries are chiefly carpets, cloths, hosiery, and ribbons. The roads are very bad, and there is but a single line of railroad, about 500 miles, on the route between Vienna and Constantinople. All traffic is carried on by the rivers, and the export trade by the Black Sea. The government is Christian. There is a national militia, and military service is compulsory. The Bulgarians were originally a Tartar nation, which in the 4th century was settled on the Volga. The ruins of their former capital may still be seen in the neighborhood of Kazan. Their kingdom, which occupied a part of the Asiatic Sarmatia of the Greeks, was called Great Bulgaria, and is now comprehended in the Russian government of Orenburg. They afterward removed to the countries between the Bog and the Danube, and called their territories Second Bulgaria. The first Bulgarian kingdom south of the Danube was founded in the latter

half of the 7th century, but the Bulgarians who established it were comparatively few in number, and after their adoption of Christianity in the 9th century they became completely mixed up with the Slavonic inhabitants, though the whole became known as Bulgarians. The greatest ruler of this kingdom was Symeon (888-927), who subjugated the greater part of the peninsula, and raised the Archbishop of Bulgaria to a position independent of the Patriarch of Constantinople. Under the son of Symeon this empire fell to pieces. The western half broke off and formed a separate kingdom, with Ochrida in Macedonia for its capital; and the eastern portion was subdued by the Byzantine emperor, John Zimisceus, who reincorporated it with the empire. The western Bulgarian kingdom existed only till about 1018, when it also was subdued by Basil II., "the slayer of the Bulgarians." Toward the end of the 12th century, however, the Bulgarians revolted and managed to establish a third kingdom between the Balkan range and the Danube, which, sometimes weak and sometimes powerful, continued to exist till the advent of the Turks. The last ruler of this kingdom was conquered by Bajazet I. about 1390, and for nearly 500 years the Turks ruled supreme. In 1876, on account of the atrocities of the Turkish soldiers, an insurrection broke out. Russia took the part of Bulgaria against Turkey, and the war of 1877-8 followed. (See BATAK.) By the first article of the Treaty of Berlin, 13 July 1878, the principality of Bulgaria was constituted, made tributary to Turkey, and placed under the suzerainty of the Sultan. In 1879, Alexander of Battenberg, a German prince, was chosen sovereign of part of Bulgaria, the rest being made a separate province called East Rumelia, to prevent Bulgaria from becoming a strong state. In 1885 there was a revolution in East Rumelia, which annexed itself to Bulgaria. Servia intervened, and Alexander was forced to abdicate. Against Russia's will, Ferdinand of Saxe-Coburg accepted the vacant throne in 1887. The government is that of a hereditary prince as chief executive, with responsible ministers and Legislative Assembly (one for every 10,000), elected directly by the people for three years; it pays annual tribute to the Sultan. Pop. (1900) 3,733,189: about 74 per cent Bulgarians, 19 per cent Turks, the rest Spanish Jews, with a sprinkling of Greeks; 77 per cent are of the faith of the Orthodox Greek Church; only 2½ per cent Moslems.

Bulgarian Language and Literature. Bulgaria and the adjacent provinces of Macedonia are considered to have been the cradle of the old Slavic languages. The ancient Bulgarian language was the richest of them all, and was the scriptural language of the Greek-Slavic Church, and the great medium of ecclesiastical literature in the ancient Slavic lands. The Russian language is said to have been molded by missionaries of the Greek Church sent from Bulgaria about the 11th century, while the future empire was still in a state of semi-barbarism. The Russian tongue has preserved many inflections which the Bulgarian has lost. After the overthrow of the Bulgarian kingdom at the close of the 14th century, the grammatical structure and purity of the language became impaired by mixture with the Wallachian, Alba-

nian, Rumanian, Turco-Tartar, and perhaps Greek vernaculars; and the modern Bulgarian language has only the nominative and vocative of the seven Slavic cases, all the rest being supplied by prepositions. It has an article, which is put after the word it qualifies, like that of the Albanians and Wallachians. Among the ancient Bulgarian ecclesiastical literature must be mentioned the translations of the Bible by Cyril and Methodius, and the writings of John of Bulgary in the 10th century. Grammars of the Bulgarian language have been published by Neofyt in 1835, and by Christiaki in the following year. Venelin, a young Russian scholar, sent to Bulgaria by the Russian archæographical commission, published in 1837 a grammar and two volumes of a history of the Bulgarians, but died while he was engaged in preparing a third volume. A new grammar was given to the public by Bogojev in 1845, and finally in 1849, by the Rev. E. Riggs, an American missionary stationed at Smyrna, who also sent a Bulgarian translation of Gallaudet's 'Child's Book on the Soul' to New York. Dictionaries of the Bulgarian language have been compiled by Neofyt and Stojanowicz. A Bulgarian version of the New Testament was printed at Smyrna in 1840 for the British and Foreign Bible Society. The Bulgarian national songs are numerous, and are similar to those of the Servians. Czelakowsky's collection of Slavic songs contains a number of Bulgarian songs. Bogojev has published several historical poems. Among more recent writers may be mentioned the poet Christo Boteff, and the poet-novelist Ivan Vazoff, while a publication on the subject of education has appeared from the pen of Neofyt.

Bulgarin, Faddéi Venediktovich, fä-dä'é vā-nā-dik'tō-vich bool'gär-in, Russian author: b. Minsk, 1789; d. 13 Sept. 1859. He served in the Russian army, but, finding himself neglected, in 1810 joined Napoleon. In 1819 he returned to St. Petersburg, where his writings soon attracted notice by their intense satire and serenity. In 1825 he started the *Ssevernaja Pchelá* (*Northern Bee*), a daily paper, which for long was alone permitted to discuss political questions. A zealous supporter of reaction and of absolutism, he enjoyed, through relations with the secret police, an unlimited power. He was a witty and versatile writer, and published travels, histories, novels, and statistical works.

Bulgaris, bool-gä'rēs, Demetrius, Greek statesman: b. Hydra, 1803; d. Athens, 11 Jan. 1878. While a young man he held office in his native city and took a prominent part in the Grecian war for independence. In 1831, after the downfall of Cape d'Istria, he had charge of the administration of the Department of Marine; but on the accession of King Otho he retired from office. After the revolution of 1843 he was a member of the Senate, and from 1848 to 1849 was minister of finance in the Cabinet of Canaris. During the Crimean war he was at the head of the Cabinet and as minister of the interior put an end to internal disorder and conciliated the powers. In 1857 he resigned and entered the Senate as a leader of the opposition. At the outbreak of the revolution of 1862 he was made regent, and chose Canaris and Rufos as his colleagues, but was deposed by the former. In 1865, 1872, and 1874-5 he was again at the head of the Cabinet.

Bulga'rus, Italian jurist: b. Bologna in the 11th century; d. 1166. He was one of the famous group of writers known as the "Four Doctors" of Bologna, and his most noted work is a legal commentary, 'De Regulis Juris.'

Bulim'ia, a disease characterized by insatiable hunger. Persons suffering from this disorder are never satisfied. When the stomach is surfeited they throw off the food they have taken, half-digested, and with violent pain. It frequently occurs in the insane, in cases of paresis, etc., and usually appears as a concomitant of other diseases, as certain intermittent fevers, and diseases of the stomach and bowels, particularly such as are produced by the tapeworm.

Buli'mus, a genus of land-snails of the family *Helicida*, the species of which are mainly restricted to South America, especially Peru, Ecuador, and Bolivia. Some of the species are very large, as are also their eggs, those of *B. oblongus* being about the size of a sparrow's. There is an egg of another species in the British Museum which measures exactly one and three fourths inches in length.

Bulkeley, Morgan Gardner, American politician: b. East Haddam, Conn., 26 Dec. 1837. At the age of 15 he entered a mercantile house in Brooklyn, N. Y., and in a few years became a partner in it. When the Civil War broke out he went to the front as a private in the 13th New York regiment, and served during the McClellan-Peninsula campaign under Gen. Mansfield at Suffolk, Va. In 1872, he came to Hartford, organized and became president of the United States Bank in that city, and later was elected president of the Aetna Life Insurance Company, a position he still holds (1903). For 30 years he has been a prominent figure in local and state politics. He was four times elected mayor of Hartford, 1880-8, and in 1889 was elected governor. At the State election in November 1890 the first gubernatorial election under the new secret ballot law, the Democratic ticket received a considerable plurality over the Republican ticket; but a majority being necessary to elect, there was some doubt whether there had been a choice by the people for governor or treasurer. Accordingly the matter went before the General Assembly, which met in January 1891, and in which the Republicans had a majority of four on joint ballot, the Senate being Democratic. A long contest ensued between the two Houses, the Senate claiming the election of the recent Democratic candidates, and refusing to recognize in any manner Governor Bulkeley and the other hold-over Republican officials. The matter was finally settled on 5 Jan. 1892, when the State supreme court, in the *quo warranto* suit brought against Governor Bulkeley by the Democratic candidate for governor, found "Morgan G. Bulkeley to be governor, both *de facto* and *de jure*," and his right to hold over till both houses of the General Assembly should unite in declaring the election of his successor was affirmed. As the two houses could not agree the governor remained in office for another full term. In November 1892 the Democratic ticket swept the State. Governor Bulkeley has since, as chairman of the Connecticut highway and bridge commission, interested himself earnestly in trying to procure a fine stone bridge across the Connecticut at Hartford.

Bulkeley, Peter, American colonist and clergyman: b. Bedfordshire, England, 31 Jan. 1583; d. Concord, Mass., 9 March 1659. He was educated at Cambridge, and for 21 years was rector of a Bedfordshire parish. Being removed from this by Archbishop Laud, for non-conformity to certain ceremonies of the Church, he left England and became the first minister at Concord, in the colony of Massachusetts, of which famous town he was the chief founder. He was the author of some Latin poems, which are contained in Cotton Mather's 'History of New England'; also of some English verse, and of a theological treatise, 'The Gospel Covenant Opened,' published in London in 1646. He was as remarkable for his benevolence and kind dealings as for the strictness of his virtues.

Bulk'head, the name given to a variety of forms of partition. In its nautical sense a bulkhead is a wall or partition extending across the ship for the purpose of dividing the hold into compartments, for separating classes of merchandise, for strengthening the vessel, or more especially for confining water which may leak in, to the compartment in which the breach occurred. In large vessels longitudinal bulkheads are employed, as well as those running athwartships, and communications between the compartments are maintained by means of doors which can be instantly closed in case of accident and for the purpose of maintaining forced draught. One of the most important bulkheads in a ship is the one farthest forward, which is built with great strength, being designed to withstand the shock of ramming another vessel, an iceberg, etc., and confining the damage to a small portion of the vessel. It is hence known as the collision bulkhead. Another form of bulkhead is a strong framework used in the construction of tunnels, to prevent the irruption of water, quicksand, etc., into the workings. The term is also applied to the facing (generally of timber) that supports the seawall of a harbor, and somewhat illogically to the sloping flap doors often used to cover the entrance of a dwelling-house cellar.

Bull, Charles Stedman, American physician. He was graduated from Columbia College in 1864, and at the College of Physicians and Surgeons in 1868. He is surgeon to the New York Eye and Ear Infirmary, consulting ophthalmic surgeon to St. Luke's and Presbyterian hospitals, and St. Mary's Hospital for Children. He is professor of ophthalmology in Cornell University. He has written: 'Eye Defects Which May Cause Apparent Mental Dulness and Deficiency in Children' (1901); 'Tuberculosis of the Eye' (1900); both in the 'Transactions' of the New York Academy of Medicine; 'Vascular Tumors of the Orbit' (1900), and other articles on his specialty in the 'Transactions' of the American Ophthalmological Society, the 'Medical News' and 'Medical Record.'

Bull, George, English bishop: b. Wells, Somersetshire, 25 March 1634; d. 17 Feb. 1710. Having graduated with distinction at Oxford, he was ordained at the early age of 21, and soon became rector of St. George's, near Bristol. Here he made himself beloved by all, and kept his parish in peace during those troublesome times. In 1658 he became rector of Sud-

dington St. Mary's in Gloucester, and in 1662, of Suddington St. Peter's. In 1669 he published in the Latin tongue his most important work, called 'Harmonia Apostolica,' an attempt to reconcile the apparent contradictions between St. James and St. Paul on the doctrine of justification. This publication extended his fame to foreign countries, and his reputation procured him a stall in the cathedral of Gloucester. In 1705 he was promoted to the bishopric of St. David's. See edition of his works, with a life, etc., Clarendon Press, Oxford (1827).

Bull, George Joseph, Canadian ophthalmic surgeon: b. Hamilton, Ontario, 16 Feb. 1848. He was graduated at McGill University in 1869, studied in Paris, and began the practice of medicine in Montreal, devoting himself especially to diseases of the eye. He made his residence in Paris in 1886, and has won celebrity as an expert in ophthalmic subjects. He has written 'Ophthalmia and Optometry,' and many similar works.

Bull, John, English musician: b. Somersetshire, about 1563; d. Antwerp, 12 March 1628. He was appointed organist in the Queen's Chapel in 1591; first music lecturer at Gresham College in 1596; and organist to James I. in 1607. A Catholic, he fled beyond the seas in 1613, and at Brussels entered the archduke's service. In 1617 he became organist at Antwerp cathedral. Little of his music has been printed. The claim advanced for his authorship of 'God Save the King,' is unfounded.

Bull, John, the popular name of personification for the English nation. Its origin is obscure. Its first literary use appears to have been in Arbuthnot's famous 'History of John Bull,' written in ridicule of the Duke of Marlborough. The name is also used for an Englishman.

Bull, Ole Bornemann, ò-łę bôr'ne-män búl, Norwegian violinist: b. Bergen, 5 Feb. 1810; d. near there, 17 Aug. 1880. He secured great triumphs both throughout Europe and in America by his remarkable playing, which won for him a distinct and unique position in the musical world as a virtuoso of extraordinary talent and mastery of the violin. He conquered serious discouragements in preparing for his career, throughout which public interest and admiration were no less awakened by his manliness and grace of bearing than by his skill as a musician. At his début (Paris 1833) he was honored by the presence of Paganini, and that master was witness to the young aspirant's triumph. Bull afterward studied and turned to good account the method of Paganini. In business life he met with various successes and reverses. He lost all his money in a scheme to found a colony of his countrymen in Pennsylvania, and had to take to his violin to repair his broken fortunes. He afterward married in this country, settled at Cambridge, Mass., and retained a summer residence in Norway. Consult: 'Ole Bull: A Memoir' by Sara C. Bull (Boston 1883).

Bull, Papal, an authoritative letter issued by the Roman pontiff acting in his official capacity as head of the Church. A Papal Brief is also an official letter of the pontiff of a less formal and weighty character, and differs in

sundry particulars from the Bull, especially in its seal. The seal of the Bull, from which comes the name of the instrument is a *bull* or globular mass of lead on which is impressed the name of the reigning Pope, also those of Saints Peter and Paul, abbreviated, S. Pe, S. Pa. The material of the Bull is parchment, but of the Brief, white paper; and the seal of the Brief is of red wax, stamped with the Fisherman's Ring, which gives the impress of St. Peter in a boat fishing. There are other peculiarities in matter and manner distinguishing the Bull from the Brief, but it suffices to note the foregoing. Of Papal Bulls that have played a signal part in history ecclesiastical or civil especially worthy of mention are the Bull *Clericis laicos* (1296) of Boniface VIII. by which the French clergy were forbidden to pay taxes to King Philip the Fair unless these were approved by the Pope; the Bull *Exsurge Domine* of Leo X. against Martin Luther (1520); the Bull *In Coena Domini* against heretics and founders of heresy, dating from the 15th century, but re-enforced by Pius V. in 1571 and ordered to be publicly read in all parish churches yearly on Holy Thursday; the Bull *Unigenitus* (1713) against quietism and Jansenism; the Bull *Dominus ac Redemptor*, of Clement XIV., abolishing the Jesuit order (1773), and the Bull *Pastor aeternus* (1870), which defined papal infallibility.

Bull, a ludicrous speech in which the ideas combined are totally incongruous or contradictory. A good example is Artemus Ward's saying of Jefferson Davis that "It would have been money in Jefferson Davis's pocket if he had never been born."

Bull and Cow, the names given by English-speaking races from time immemorial to the male and female respectively of bovine cattle. The words are probably imitative, the root-idea of "bull" being a suggestion of its bellowing; while "cow"—which in early English, as yet in Scotch and some provincial dialects, is pronounced *coo*—is imitative of the lowing call to the calf. Since these animals have become domesticated, and most of the males been castrated, the term has come to mean more particularly an unutilized ox. On the other hand, the large size and robust qualities of the bull have led to a transference of the term to the males of various other animals having no zoological resemblance, or very little, to the cattle. Thus we speak of "bull and cow" elephants, moose, wapiti, seals, whales, and even alligators; while various animals, as the bull-snake take the name as expressive of some bull-like quality, as a habit of snorting, or because of horn-like appendages (for example, bullhead catfish).

Bull-baiting, the sport of setting dogs on a bull, which was tied to a stake and torn to death for the amusement of the spectators. In this case the dogs, which were set upon the bull singly, were trained to seize the bull by the muzzle, technically, "to pin" the bull; but they were very frequently tossed on the horns of the animal. Sometimes also the bull was allowed to run loose in the arena, and then several dogs were set upon him at once. Bull-baiting was a favorite sport in England till about the time of George IV.

BULL-DOG—BULL RUN

Bull-dog, a dog of moderate size, derived previous to the 13th century, from a cross between the old British mastiff and the large pug of extreme southeast Asia. Both its ancestors still exist as separate breeds. An average mature specimen will weigh 40 to 50 pounds. They are squat and muscular in build, with short legs, rather higher behind than in the front, especially if the front legs are very much bowed. Their chests and heads are abnormally broad for their size. The lower jaw overlaps the upper and is of extraordinary strength. The teeth are large, especially the two canines, and very strongly fixed in the jawbone, giving the dog a holding power beyond that of any other breed. The coat is close and short. The most variable feature is the color, which ranges from all black to all white among dogs bred for show purposes, but a brindle is more natural. For many centuries this dog was used for "baiting," or biting at, the bull, as a popular recreation; and up to more recent times men of brutal disposition used it for public dog-fights. It was through these exhibitions that the bull-dog got his bad name for temper, but now he is mainly kept as a watch-dog. In that capacity he is invaluable, and so gentle is his disposition that he is the safest canine companion for children. About the year 1900 a small variety of the bull-dog was evolved in the neighborhood of Brussels, but as it was first shown in Paris it has always been known as the "French" bull-dog. It is in the main a miniature of the English bull-dog. The most notable difference, other than that of size, being that the ears are shaped like those of a bat, and are carried erect, or "pricked," giving the animal a very alert, sharp look.

Bull-fight, a contest between men and bulls, conducted as a public spectacle. Once popular in Greece and Rome, this form of entertainment was introduced by the Moors into Spain, and universally adopted in the cities of the kingdom, where, as well as in Mexico and some other parts of the world, it is still much in favor. The bull-fight is held in an arena of greater or less magnificence, called in Spanish the *plaza de toros*. The bulls are turned out, one by one, with many forms of pomp and solemn ceremonial, into the open space, where they are assailed, first by horsemen, called *pica-dores*, who attack them with the lance; then, when one or more horses have been wounded, and one or more men have met with injury or perilous mishap—in which case a crowd of active footmen, called *chulos*, provided with crimson banners, take off the attention of the bull—the *banderilleros*, armed with sharp-barbed darts with fireworks and flags attached to them, worry the bull until he is covered with shafts, bleeding and scorched, his glossy hide black and crisp from the explosion of the fireworks. Then comes the last act of the tragedy, when the skilful *matador* enters the arena slowly and alone, clothed in plain black, and armed with a long, straight sword and a stick, called a *muleta*, with a piece of red silk fastened to it. With his sword he seldom fails to give the *coup de grace* to the tortured bull, sheathing the blade, with one sure thrust, up to the hilt in his body just at the juncture of the neck and spine. Mules drag out the slaughtered carcass, amid the sound of trumpets and acclamations

of the spectators; the dead or dying horses are removed; the arena is strewed with fresh sawdust; another bull is introduced; and so goes on the combat, until perhaps a score of bulls and a larger number of horses have been slaughtered to delight the spectators. The Spanish settlers of Mexico and South America introduced bull-fighting to the New World.

Bull-frog, a widely distributed, edible North American frog (*Rana catesbyana*) found in sluggish waters throughout the eastern half of the United States and Canada, and so called because of its loud, bass voice. It is from five to eight inches long, and of various shades of green, with the legs spotted. It lays its eggs in strings and the tadpole does not reach maturity until two years old. The same name is given by English-speaking people in various parts of the world to other large bellowing frogs, as the "bull-frog" of Siam and Malaya (*Callula pulchra*). See FROG.

Bull, Golden. See GOLDEN BULL.

Bull Run, First Battle of. The first great battle of the Civil War occurred Sunday, 21 July 1861, in the vicinity of Manassas, Va. The Union forces were commanded by Brig.-Gen. Irvin McDowell, the Confederates by Gen. Joseph E. Johnston, who had arrived from Winchester at noon of the 20th with nine regiments of his army, and assumed command. The battlefield was west of Bull Run, and near the crossing of that stream by the turnpike running nearly west from Alexandria to Warrenton. This road, a mile and a half west of the Stone Bridge by which it crossed Bull Run, unexpectedly to the Confederates, became the axis of the battle. Bull Run is a narrow, winding stream with rugged and mainly precipitous banks, but with numerous fords, flowing southeastwardly, being about 25 miles west of Alexandria, and from three to five miles east of Manassas.

McDowell marched from his camps in front of Arlington and Alexandria on the afternoon 16th July, with five divisions, commanded respectively, by Brig.-Gen. Daniel Tyler, four brigades; Col. David Hunter, two brigades; Col. S. P. Heintzelman, four brigades; Brig.-Gen. Theodore Runyon, two brigades; and Col. Dixon S. Miles, three brigades. The Fourth Division was left as a reserve in the region of Fairfax, guarding the lines of communication. The advance division, Tyler's, reached Centreville the morning of the 18th and sent a brigade to Blackburn's Ford in reconnaissance. After a sharp skirmish in which both sides lost about 60 men, it withdrew toward Centreville, to which point McDowell, hearing of the operations at Blackburn's Ford, directed the concentration of four divisions.

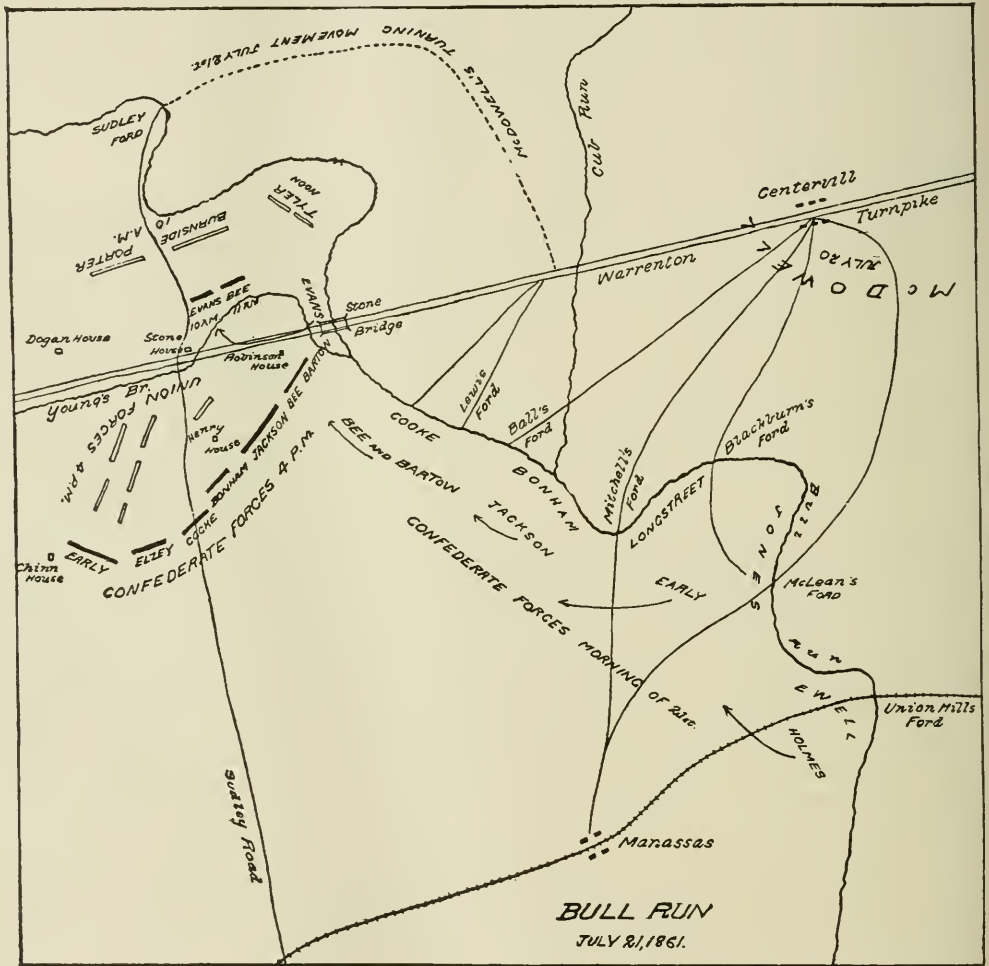

The Confederate "Army of the Potomac" had been concentrated at Manassas under Gen. Beauregard. In expectation of a Union advance it occupied the south bank of Bull Run for eight miles from Union Mills Ford, at the crossing of the railroad to Alexandria, to the Stone Bridge at the Warrenton turnpike, three brigades being thrown forward of that position, one of them to Fairfax Court House. These brigades fell back before the Union advance, skirmishing slightly. Ewell's brigade, the right of the line, was at Union Mills, with Holmes in support; Jones' brigade at McLean's Ford; Longstreet's at Blackburn's Ford; Bonham's be-

BULL RUN

tween Mitchell's and Ball's fords; Cocke's at Lewis' Ford; and Evans' demi-brigade at the Stone Bridge forming the Confederate left. Of Johnston's Army of the Shenandoah, Jackson's brigade was in support of Bonham, and Bee and Barton in support of Cocke.

From each of these fords fair roads led to Centreville. Gen. Beauregard had planned an attack upon Centreville which involved an advance of his whole force upon that point. This was officially approved by Gen. Johnston before daylight of the 21st, but at sunrise it was rendered impossible by McDowell's initiative. The

bridge, discovering the movement, withdrew 11 companies and formed them on a ridge half a mile north of the road as the head of Hunter's column entered the open fields which extended a mile north of the Warrenton road. Evans made stubborn resistance, and was soon supported by Bee's brigade, and Imboden's battery. While the position was hotly contested the Confederates were pressed back down the hill, across the valley of Young's branch, a tributary of Bull Run, to the plateau south of it upon which were the Robinson and Henry houses. Two of Tyler's brigades crossed above the Stone Bridge

plan was then changed to an attack on the Union left from Blackburn's Ford. This also was abandoned from the same cause.

McDowell, who had first intended to attack the enemy's right, after the affair at Blackburn's Ford, finding the ford at Sudley Spring two miles beyond the Confederate left, decided to attack from that direction. While Tyler feinted before the Stone Bridge, Hunter and Heintzelman, by a long detour, crossed at Sudley Spring and moved south toward the Warrenton turnpike in the enemy's rear. Evans, at the

and joined Hunter and Heintzelman in their advance. The fighting continued desperate until noon, and for new troops was, for both sides, most remarkable, but the Confederate line, though stubbornly contesting the ground, began to disintegrate, and the road to Manassas was crowded with retreating soldiers.

Gen. Johnston describes the Confederate situation at two o'clock as "critical"; Gen. Beauregard terms it a "pressing exigency," and speaks of the retirement of "our shattered battalions," and of the fighting line as having "lost its cohe-

BULL RUN

sion." Dr. Jones, Jackson's distinguished biographer, records that "the retreat became every moment more disordered," that Bee's quick eye "now told him that all was lost," and that "he could not reform his line."

At that hour a Union victory seemed assured. Johnston and Beauregard reached the position together. The troops on the line of Bull Run that had been held there by the demonstrations of two Union brigades designed to mask McDowell's turning movement, were ordered in haste to the new line which was at right angles to the first. Jackson soon arrived with five regiments and two batteries. Hampton's Legion joined him, and the Union advance was checked. Other arrivals strengthened the line. Kirby Smith's brigade of Johnston's army appeared about three o'clock, having just arrived on the field from Manassas, and pushed its three regiments toward the right of the Union line. Early's brigade of Beauregard's force, from the extreme right of his line, hastened beyond Smith's brigade, now commanded by Col. Elzey, and supported by Stuart's cavalry, appeared directly on the Union right flank. Two regiments from Bonham, and two from Coker, also arrived upon the Union right. These also were of Beauregard's army. This turned the check which that portion of the Union line had received, first into retreat, and then into a disorganized withdrawal, except that the rear guards maintained fair order till the columns were well off the field, the right retracing its long detour by Sudley Spring. At Cub Run, half-way to Centreville, the batteries of a pursuing column broke up the wagons and batteries on the bridge, compelling the abandonment of 13 guns. From this point the movement to the rear was still farther disorganized, to which condition the vehicles of many visitors, congressmen, correspondents and officials largely contributed. The attempt to rally the troops at Centreville failed, though Gen. Johnston reported that the "apparent firmness" of the Union reserves at that point checked the pursuit. The army, in great part disorganized, streamed on to Washington.

After the severe stress in which the Confederate leaders found themselves from 11 o'clock until about 3, the sudden change on the Union side, first from assaulting to cessation of fighting; next, to a general retreat, and, later, to widespread panic, was as much a surprise to the enemy as to the Union commanders. It was not until the second day after the battle that the Confederates ascertained the full extent of the Union stampede. Upon this point President Davis wrote Gen. Beauregard: "You will not fail to remember that, so far from knowing that the enemy was routed, a large part of our forces was moved by you in the night of the 21st to repel a supposed attack upon our right, and the next day's operations did not fully reveal what has since been reported of the enemy's panic."

McDowell's strength at Centreville appears to have been about 28,000 men and 49 guns. His report says he crossed Bull Run with 18,000 men. A very careful estimate made from official records in 1884, by Gen. James B. Fry, McDowell's adjutant-general at the battle, gives the number actually engaged as 17,676.

Gen. Beauregard reported his strength on the field when the battle opened at 27,833 and 49 guns; and after Johnston's delayed troops and Holmes' brigade had arrived in the afternoon as

31,972 and 57 guns. A very careful estimate by Gen. Thomas Jordan, his adjutant-general, fixed the number actually engaged at 18,053, thus showing the two sides to have been about equal on the firing line.

The Union loss as reported was: Killed, 460; wounded, 1,124; missing, 1,312; total, 2,896. Union guns captured or abandoned, 29.

The Confederate loss reported was: Killed, 387; wounded, 1,582; missing, 13; total, 1,982.

H. V. BOYNTON.

Bull Run, Second Battle of, 30 Aug. 1862. When McClellan on the peninsula had reached the vicinity of Richmond, Lee, to prevent McDowell's corps at Fredericksburg from re-inforcing McClellan, ordered Jackson in the Shenandoah to make a demonstration that should detain all available troops for the defense of Washington. Jackson advanced, and in a brilliant campaign drove Banks out of the valley, and forced him across the Potomac. By a masterly retreat, he regained the upper valley in spite of McDowell and Fremont, and soon after appeared on McClellan's flank at Mechanicsville and participated in the seven days' battles.

On 27 June the Union authorities united the three corps of McDowell, Fremont, and Banks into the Army of Virginia under the command of Maj.-Gen. John Pope. He had concentrated his forces between Sperryville and Warrenton, and began to operate with his cavalry against Lee's railroad lines about Gordonsville. His mission also was to prevent Lee from concentrating upon McClellan, when he should withdraw from the peninsula. Lee promptly sent Jackson's Division, followed by Ewell's and A. P. Hill's, to Gordonsville. On 7 August these moved from Gordonsville toward Pope's position at Culpeper, and 9 August encountered Banks at Cedar or Slaughter Mountain. Banks attacked, instead of holding his position as Pope's plan contemplated, and while at first brilliantly successful, he was at last defeated. Jackson, however, retreated on the 11th across the Rapidan.

On the 13th Lee ordered Longstreet, with his own and Hood's divisions, to Gordonsville. R. H. Anderson's division was ordered to follow. Upon their arrival Pope was largely outnumbered. Lee planned a move for the 18th against Pope's left, but this officer learned of the plan through the capture of Stuart's adjutant-general, re-crossed the Rappahannock, and took position behind it on the 20th. Lee next arranged to cross at Sulphur Springs, turn Pope's right, and move upon his communications. This failed. Pope, at the same time, had planned to cross the river and attack Lee's right and rear, but a sudden flood prevented the movement. Lee then sent Jackson's corps far beyond Pope's right by way of Salem and Thoroughfare Gap to cut Pope's railroad line at Manassas. Jackson succeeded, passing around Pope's right, capturing Bristoe Station and Manassas with its immense supplies on the night of 26 August. Pope moved to attack him at Manassas. On the night of the 27th and early on the 28th, Jackson's three divisions withdrew by different roads, and soon after noon of the 28th assembled on the battlefield of the first Bull Run.

On the night of the 25th Pope's headquarters were at Warrenton Junction. Reynolds' Division had joined him on the 23d. On the 25th the

BULL RUN

advance of Heintzelman's corps arrived from the Army of the Potomac, Hooker's and Kearny's divisions, and Fitz-John Porter, with the divisions of Sykes and Morell of his corps. These two corps with Reynolds' Division were the only re-inforcements that Pope received from the Army of the Potomac until after the battle of Manassas.

On the night of the 27th Pope, supposing Jackson at Manassas, ordered general concentration in that direction. Porter's failure to move promptly under this order constituted one

Jackson was just north of it on the first Bull Run field. The Union approach led Jackson to attack, thus revealing his position, which Pope had been vainly seeking. This was the battle of Gainesville, being a very bitter fight between Taliaferro's Division and two brigades of Ewell, and King of McDowell's advance.

After the close of the fight, in the absence of McDowell, his two divisions retreated, Rickett's to Bristoe Station, and King's to Manassas. At daylight of the 29th the Union forces were again put in motion to pursue Jackson. His line was

THEATRE OF SECOND BULL RUN CAMPAIGN

of the charges under which he was subsequently court-martialed and cashiered. Rickett's Division, the rear of McDowell's corps, upon the information from the cavalry that Longstreet's forces were entering Thoroughfare Gap, moved to the gap and held Longstreet back during the day, and into the evening of the 28th. In the afternoon of the 28th Pope, supposing Jackson east of Bull Run, ordered his army to Centerville, Heintzelman and Reno by the fords of Bull Run, McDowell, Sigel, and Reynolds by the Warrenton turnpike. The advance along the turnpike was begun without the knowledge that

mainly along an unfinished railroad, the left near Sudley Spring, and his right on high ground north of the Warrenton road overlooking Groveton. The Union forces attacked throughout the day, with brief intermissions. The contest was desperate, and Jackson's line, though hard pressed at various points, maintained its organization. Porter's failure to here attack the Confederate right was another of the charges under which he was tried. Subsequently, however, he was exonerated by the findings of an army board, and restored to his rank by act of Congress. McDowell arrived late, with King's Division.

BULL-SNAKE — BULLA

As it moved into action it encountered the head of Longstreet's column, which had achieved its junction with Jackson. In less than an hour, in a bloody contest, Hood's Division of Longstreet's force had ended the battle of Groveton. Such were the preliminaries of the Second Bull Run.

The battle of Manassas, the Second Bull Run, was fought 30 August, the day following the action at Groveton. The movement covered the ground of McDowell's and Johnston's battle of the year before. Jackson's line occupied the position from Sudley Spring to the heights overlooking Groveton. Lee, whose forces were now all up, formed Longstreet's line across the Warrenton turnpike on high ground about a mile west of Groveton. On this ridge he established a number of batteries under Stephen D. Lee and Walton. The line then turned east south of the turnpike, and extended toward the Sudley Spring road. The Confederate position south of the Warrenton road seemed not to be suspected by Pope. The fact that after the action of the afternoon before Jackson's troops had retired to their morning position Lee had withdrawn Longstreet's advance to form on better ground, misled Pope and caused him to insist that the enemy was retreating. At noon, after reconnaissances north of the road, he therefore ordered vigorous pursuit. Porter was to push west on the Warrenton pike followed by King's Division on his right and Reynolds' on his left. Ricketts' Division, followed by Heintzelman's corps, was to pursue on the Haymarket road. Sigel's and Reno's corps were the reserves.

About four o'clock Porter advanced with his own corps and King's Division pushed in on Jackson's line with great vigor, and assault followed assault, each made with great pertinacity. Lee seemed willing to let them continue in order to exhaust his opponents. At length Jackson sent for help, and Longstreet was ordered to his assistance. This officer had, however, posted his batteries so as to enfilade Jackson's front, and instead of sending troops, opened with a terrific flanking fire of artillery. The Union lines were repulsed with great loss. Nearly all of Pope's forces had been put in north of the turnpike and had been seriously repulsed. All Union support was now directed to defend the position against Longstreet's forces south of the Warrenton pike. The whole of Longstreet's line went forward toward the road with a rush. There were five divisions — Wilcox on the left, then Evans (Hood), Anderson, Kemper, and Jones. As soon as Jackson, north of the road, saw the advance of Longstreet he ordered his own line forward. The corps of Heintzelman and Reno resisted this attack, but were gradually forced back. The supreme struggle of the Union forces was to hold two elevated positions near the Henry and Chinn houses. The latter, known as Bald Hill, was carried by the Confederates, after persistent and sanguinary fighting. The Henry house hill was held against repeated assaults. The Union army was in retreat across Bull Run, and the possession of the hill was necessary to maintain an orderly retreat.

The Union troops remained in possession until eight o'clock, when the last of Pope's army moved unmolested toward the Stone Bridge, crossing Bull Run about midnight. The bridge was then destroyed and the Union army concentrated at Centreville. It was a Union defeat,

but not a rout. While there was much straggling, the main army had retreated in good order, and Lee did not pursue. In the management of the battle Lee had displayed his eminent generalship in a striking manner. Pope's chief error had been in persisting, before his attack was delivered, that the enemy was in retreat.

Pope was re-inforced at Centreville by the strong corps of Sumner and Franklin from the Army of the Potomac. Here also he found supplies. His army had fought for two days almost entirely without food or forage. Lee began pursuit the afternoon of the day after the battle, Jackson leading from Sudley Ford, and marching by a circuitous route toward Fairfax Court House, seven miles in rear of Centreville. Passing Chantilly, he turned toward the Warrenton turnpike and formed in front of Ox Hill, his right extending toward the pike. He was far in advance of Longstreet, and wholly without support. He was attacked by the two divisions of Reno under Stevens, and later by Kearny. Stevens and Kearny were killed, and Jackson was repulsed.

Longstreet came up at night, and at noon the next day (2 September) Pope's army was ordered by the authorities at Washington to withdraw within the defenses of the city. Pope's losses throughout the campaign from 16 August to 2 September were: Army of Virginia, killed and wounded 5,318, missing 2,787; Army of the Potomac, killed and wounded 3,613, missing 1,115; 9th Army Corps, killed and wounded 1,204, missing 319; Kanawha division, killed and wounded 64, missing 42; total killed and wounded 10,199; captured or missing 4,263. The Confederate losses are not fully reported, but the best estimates placed them at about 8,500. There are no official returns which enable a presentation of the exact strength of either army during the campaign up to 30 August, but the best estimate places the Union forces at about 65,000 to 70,000, and the Confederate at 54,000.

Bull-snake. See PINE SNAKE.

Bull-terrier. See TERRIER.

Bull-trout. (1) A salmon-like trout of North America. See SALMON-TROUT. (2) The Dolly Varden trout (q.v.)

Bulla, a genus of mollusks called, from the thinness of their shells, bubble-shells. The shell is oval, ventricose, convoluted externally, or only partially invested by the animal. The animal has a large cephalic disk bilobed behind; the lateral lobe is much developed. It occurs in

temperate and tropical seas from 25 to 30 fathoms. Over 50 recent species are known and 70 fossil, the latter from the Oölite onward.

Bullace, a small tree or shrub allied to the prunes. It is akin to the variety *Spinosa* (the sloe), but differs in having the peduncles and under side of the leaves pubescent and the branches slightly spinous, whereas the *Spinosa* has the peduncles glabrous, the leaves ultimately so also, and the branches decidedly spinous. It stands midway between the plum and the sloe. In England its fruit is used for making jam. The tree is seldom found in America.

Bullæ, miniature blisters, or blebs. They are larger than vesicles, with a large portion of cuticle detached from the skin and a watery transparent fluid between. The skin beneath is red and inflamed.

Bullant, Jean, zhõn bú-lân, French architect: b. probably in Ecouen about 1515; d. Paris, 10 Oct. 1578. He studied at Rome and after his return to France became supervisor of the royal buildings. He was connected with the erection of the Tuileries and built the pavilion named for him. He was also the architect of the Hôtel de Soissons for Catherine de Medici. In 1570 he succeeded Primaticcio at Fontainebleau.

Bullbat, a name in the Southern States for the nighthawk (q.v.), a bird which flies in the dusk like a bat, and makes a booming sound.

Bulle, búl-lé, **Konstantin**, German historian: b. Minden, 30 March 1844. He studied philosophy and history at Jena and Bonn, taught in the high school at Bonn and became director of the gymnasium there in 1879. In 1887-90 he was a member of the Reichstag. After some philosophical studies he devoted himself to historical work and wrote: 'History of Recent Times 1815-71'; 'History of the Years 1871-7' and 'History of the Second Empire and the Italian Kingdom.' The first two were combined and published as 'History of Recent Times' in 1886.

Bullen, búl'lén, **Frank Thomas**, English author and lecturer: b. Paddington, London, 5 April 1857. He received but scanty schooling, and after a few years' experience as errand boy, etc., went to sea as ordinary seaman in 1869, becoming chief mate after several years. He left the sea in 1883 and was junior clerk in the English meteorological office, 1883-99. His contributions to nautical literature have attracted widespread attention. The earliest of these, 'The Cruise of the Cachelot' (1898) being the most noted. His other books include: 'Idylls of the Sea'; 'The Log of a Sea Waif' (1899); 'The Men of the Merchant Service'; 'With Christ at Sea'; 'A Sack of Shakings' (1901); 'The Apostles of the Southeast'; 'Deep Sea Plunderings' (1901); 'A Whaleman's Wife' (1902).

Buller, búl'lér, **Sir Redvers Henry**, English general: b. Devonshire, 1839. He joined the 60th Rifles as ensign in 1858; in 1862 was promoted to the rank of lieutenant, and eight years later to that of captain. He was a major in 1874, lieutenant-colonel in 1878, colonel in 1879, and major-general in 1884. He served with his regiment in the Chinese campaign of 1860, and on the Red River expedition in 1870. During the Ashantee war he acted as quartermaster-

general and head of the intelligence department, and gained special mention for his behavior in several engagements. He also served with distinction during the Kaffir war of 1878, and the Victoria Cross was conferred on him in 1879 for his gallant conduct in saving the lives of two officers and a trooper of the Frontier Light Horse during the retreat at Inhlobane in the Zulu campaign. He was chief of the staff to Sir Evelyn Wood in the war against the Boers in 1881, and in Egypt in the following year, gaining special distinction for his services at Kassassin, Tel-el-Kebir, and elsewhere. In the Sudan campaign of 1884-5 he was chief of the staff to Lord Wolseley, and was in command at the battle of Abu-klea when Sir Herbert Stewart had been wounded. From 1887 till 1890 he held the post of quartermaster-general of the army, and from 1890 till 1897 he acted as adjutant-general to the forces. In 1886-7 he was under-secretary to the lord-lieutenant of Ireland, and in 1891 was promoted to the rank of lieutenant-general. He was created K.C.M.G. in 1882, K.C.B. in 1885, and G.C.B. in 1894. In 1899 he went to Natal as commander in the war with the Boer republics, and succeeded in relieving Ladysmith after it had been besieged 118 days. His various reverses prior to this event caused him to be superseded by Gen. Roberts, and on his return to England he was placed on the retired list in consequence of an unwise speech of his. The publication of official documents, still later, practically destroyed his reputation as a commander, it being shown by these he had advised Gen. White, the defender of Ladysmith, to give up the defense and surrender to the Boers.

Bullers of Buchan, a large oval cavity in the rocks on the east coast of Aberdeenshire, about six miles to the south of Peterhead, forming a sort of pot or caldron about 150 feet deep, open to the sky above and communicating with the sea below by a natural arch or horizontal passage, into which the waves often rush with a tremendous noise.

Bullet, the projectile used for small-arms, either spherical or of an elongated form. The elongated bullet is now in general use for rifles, and there has also been introduced some means of dilating the bullet at the moment of explosion, so that it is forced into the grooves of the rifle and exactly fits the barrel. In some cases there is merely a cavity left at the base of the bullet into which the gases formed on the explosion of the gunpowder are forced, so that these have the effect of dilating the bullet in the manner required. In other cases a plug is inserted in the cavity, which is driven forward by the explosion of the gunpowder, and has the same effect. Spherical bullets remained in use long after the invention of the rifle, though several kinds of elongated bullets were suggested by various inventors of the 17th and 18th centuries. In 1837 the French adopted an elongated bullet invented by Delvigne, but this was superseded by the Minié bullet about 1846. A similar form, but with a wooden plug instead of an iron cup to cause the expansion, was introduced into the English army with the Enfield rifles of 1855. Previous to this, in 1841, the Prussians had adopted the celebrated needle breech-loading rifle, with an egg-shaped bullet resting on a thick wad which alone took the

BULLET-TREE — BULLINGER

grooves of the rifle. In 1864 the three-grooved Enfield barrel was combined with the Snider breech-action in the rifles of the English army. The bullet supplied with this arm had a plug of baked clay and a hollow head, the lubrication being effected by bees'-wax placed in four cannelures running round its base. In 1866 the Chassepôt rifle was adopted by the French authorities, the bullet having shoulders serving the same end as the wad in the needle-gun bullet. The temporarily introduced Snider-Enfield rifles were replaced in 1874 by the much better Martini-Henry type, whose bullet, though longer and of smaller diameter, has the cylindrical form with domed end found in the French Chassepôt. The lubrication in this case was effected by a covering of wax-paper and a bees'-wax wad. The diminution in the diameter of the bullet was carried still further in the Enfield-Martini rifle of 1886, the bullets then supplied measuring only about two fifths of an inch in diameter; and in several subsequent types of rifle they are of still smaller diameter. This decrease in calibre has been accompanied by an increase in length in order to preserve the weight of the bullet, and it has also been found necessary to cover the lead of the bullet with a thin coating of some such metal as steel, copper, nickel, or German silver. These changes are all embodied in the bullets of the Lee-Metford magazine rifle, and the necessity for lubricators is thus done away with. The Lee-Metford bullet has a length of 3.05 inches, and the diameter of .312 inch. There is considerable variation in the weight of bullets. The old Brunswick bullets weighed 557, the Minié, 680 grains. The Enfield bullet had a weight of 535 grains; the Snider and Martini-Henry, 480; the Enfield-Martini, 384, while the Lee-Metford bullet weighs only 216 grains. The French Lebel magazine rifle has a bullet with a weight of 215 grains, and in a later French form, the Berthier, the weight is 205 grains. The Lebel bullet is flattened at the point in order to lessen the risk of explosion in the magazine. The German Mauser and Mannlicher magazine rifles have bullets of the same weight as the Lee-Metford. The slenderness of modern rifle bullets has necessitated the construction of rifles of very small bore, and this in turn has compelled the substitution of pellets of compressed powder for the older loose powder. In recent years a peculiar kind of bullet known as the Dum-Dum has been employed by English troops in warfare with uncivilized races, as the frontier tribes of India. In this the lead core is inserted from the top, not from the base, as in other bullets, and the lead being unprotected at the point, has to sustain the shock of the impact. The consequence is that it expands in the wound, and thus, even though it should pass right through a person's body, its effects are very severe, and likely to stop the onrush of the foe.

Bullet-tree, or Bully-tree (*Mimusops Balata* or *Sapota Mulleri*), a forest tree of Guiana and neighboring regions, order *Sapotacea*, yielding an excellent gum known as balata, having properties giving it in some respects an intermediate position between gutta-percha and india-rubber, and making it for certain industrial purposes more useful than either. The timber of the tree also is valuable.

Bullfinch, an European finch (*Pyrrhula europaea*), frequently kept as a cage bird, mainly because of its ability to learn to whistle tunes, the most capable birds, trained in Germany, acquiring as many as six. The training of "piping bullfinches" is a special art, and various domestic varieties are bred, some of which bring high prices. Its natural song is not remarkable. The bullfinch is a large bird of its kind, with a big inflated beak, and soft dense plumage. It is pearl-gray above and dull red on the under parts; the crown of the head, the beak, and the tail and wing quills are black, the latter crossed by a broad white bar. The colors of the female are duller than those of the male. Several similar species are known elsewhere, one (*P. casinii*) inhabiting Alaska. See **CAGE BIRDS**.

Bullheads, or "horned-pouts," are small, dark-colored catfish, abundant everywhere east of the plains, and, by introduction, in California and Oregon. They are mud-loving fishes, remaining on the bottom and feeling for food with the barbels, one on each side of the mouth and two under the chin. The "common bullhead" (*Ameiurus nebulosus*) varies in length, at full age, from 18 to 24 inches, and occasionally weighs 5 pounds. It is brownish-black in color, with a fine, scaleless, rubber-like skin, a big head, and a long upper jaw. It is a gluttonous biter, gorging the bait, so that the hook must often be cut out of its interior. A smaller species, the black bullhead (*A. melas*) may be distinguished by the smaller anal fin and its nearly white rays. The southern "flat-headed cat" (*A. platyccephalus*) has an eel-like form and a greenish brown hue, and is almost entirely herbivorous. Several of the large "catfish" (q.v.) of the western lakes belong to this genus.

Bulliard, Pierre, pē-ār bül-yär, French botanist: b. Aubepierre en Barrois, about 1742; d. Paris 1793. He was educated at the College of Langres, where he showed a decided taste for natural history, proceeded to Paris to pursue his medical studies, and employed his leisure in collecting the materials of a 'Flora Parisiensis,' which he afterward published in six volumes, with colored plates. Among his other works are a 'Herbier de la France,' and a 'Dictionnaire élémentaire de Botanique,' which has been repeatedly printed.

Bullinger, Heinrich, hīn'rih bül'ling-ēr, Swiss reformer: b. Bremgarten, 18 Aug. 1504; d. Zürich, 17 Sept. 1575. He studied first at Emmerich, in the duchy of Cleves, and afterward at Cologne. His intention was to become a Carthusian monk, but after perusing the writings of Melancthon and other reformers he changed his views, formed a close connection with Zuinglius, became one of the most strenuous supporters of his views, and ultimately succeeded him in his charge of Zürich. He was one of the authors of the first Helvetic Confession, drew up in concert with Calvin the formulary of 1549, by which the differences between the churches of Zürich and Geneva on the subject of the Lord's Supper were happily terminated, and kept up a close correspondence with the lately published by the Parker Society, con-principal English reformers. The Zürich Letters, tains part of this correspondence, and among others, letters addressed to him by Lady Jane Grey. The most important of his many writ-

ings is a 'History of the Reformation.' See lives by Hess (1828-9); Vestalozzi (1858); also Heinrich, 'Bullinger und seine Gattin' (1875); Zimmermann, 'Die Züricher Kirche und ihre Antistes' (1877).

Bullion, bū-yón, uncoined gold or silver, in bars, plate, or other masses. United States standard bullion contains 900 parts of pure gold or pure silver, and 100 parts of copper alloy. The coining value of an ounce of pure gold is \$20.67183, and the coining value of an ounce of standard gold is \$18.60465. The coining value in standard silver dollars of an ounce of pure silver is \$1.2929, and the coining value of an ounce of standard silver is \$1.1636. The word bullion was of frequent use in the proceedings respecting the Bank of England from 1797, when the order of council was issued that the bank should discontinue the redemption of its notes by the payment of specie to 1823, when specie payments were resumed; for, by a previous law, the bank was authorized to pay its notes in uncoined silver or gold, according to its weight and fineness. The investigations of the bullion committees, and the various speculations on the subject of bullion, related to the supply of gold and silver, whether coined or not, as the basis of the circulating medium. The discovery of the mines in America did not at first add materially to the stock of bullion in Europe. The total addition for the first 54 years was about \$85,000,000; not quite so great an amount of value (in gold at least) as Russia has obtained from the Ural mines in less than half the time. The average annual supply from all the American sources during the 54 years from 1546 to the end of the 16th century, was rather more than \$10,000,000. During the 17th century the annual average was about \$16,250,000; in the next half century it was \$27,500,000; and in the years 1750 to 1803 it was \$38,000,000.

Bul'lock, Alexander Hamilton, American politician: b. Royalston, Mass., 1816; d. 1882. He was educated at Amherst College and the Harvard Law School and was admitted to the bar in 1841. After practising law in Worcester, Mass., he was elected to the Massachusetts House of Representatives in 1845 and re-elected in 1861, when he became speaker. In 1849 he became a member of the State Senate. He held many judicial offices, was mayor of Worcester in 1859, and from 1866-8 was governor of his State.

Bullock, Charles, English clergyman, editor and author: b. 24 Feb. 1829. He entered the Anglican ministry in 1855, was curate of Ripley, Yorkshire, 1857-9; of Luton, Bedfordshire, 1859-60; rector of St. Nicholas', Worcester, 1860-74. He has edited 'The Fireside Magazine,' 'Home Words,' and other periodicals, and among his published works are 'The Way Home'; 'The Royal Year'; 'England's Royal Home'; 'Shakespeare's Debt to the Bible'; 'Popular Recreation'; 'The Poet of Home Life'; 'Biography of Frances Ridley Havergal'; 'Crowned to Serve.'

Bullock, Charles Jesse, American economist: b. Boston, 21 May 1869. He graduated at the Boston University in 1889, devoted himself to special studies, and was appointed to the chair of economics in Williams College. He is the author of 'The Finances of the United

States, 1775-89' (1895); 'Introduction to the Study of Economics' (1900); 'Essays on the Monetary History of the United States' (1900); and has edited 'Currencies of the British Plantations in North America.'

Bullock, Rufus Brown, American politician: b. Bethlehem, N. Y., 28 March 1834; d. 27 April 1907. He was educated at Albion Academy and early in life went to Georgia in connection with a business enterprise. During the Civil War he was connected with the quartermaster's department in the Confederate army. In 1867 he became a member of the State Constitutional Convention of Georgia and in the following year was elected governor. His championship of the negro members expelled from the legislature brought him such violent opposition that he resigned from office. He was actively engaged in the promotion of the railroad and industrial interests of his own State and was government director of the Union P. R.R.

Bullock, Shan F., Irish novelist: b. Crom, Fermanagh, Ireland, 17 May 1865. He has written a number of popular works. Among them are: 'The Awkward Squads' (1893); 'By Thrasna River' (1895); 'Ring o' Rushes' (1896); 'The Charmer' (1897); 'The Barrys' (1899); and 'Irish Pastorals' (1901). His work is remarkably individual and his studies of life in the north of Ireland are faithful reflections of Irish life and character.

Bullock, William A., American inventor: b. Greenville, Greene County, N. Y., 1813; d. Philadelphia, 14 April 1867. He learned the trade of machinist, and having started a periodical, 'The Banner of the Union,' he invented a printing-press in connection with that enterprise. He removed to New York and devoted himself to the construction and gradual development of a "planetary press," finally producing the Web perfecting press that delivers 30,000 papers per hour, printed, cut and folded. While handling one of his presses he met with an injury that proved fatal.

Bulls and Bears, a popular phrase used in connection with the stock market. The term "bulls" is applied to the operators attempting to force up prices, and the term "bears" to those seeking to lower them.

Bull's Horn Coraline (so named because the shape of the cells is like a bull's horn), a zoophyte of the family *Cellariadae*. It is the *Eucratia loricata*. It is branched subalternate, and has the cells conical, with a raised orifice, beneath which is a spinous process.

Bulnes, Manuel, mā-noo-el' bool-nās, Chilean soldier and statesman: b. Concepcion, 25 Dec. 1799; d. Santiago, 18 Oct. 1866. He served in most of the battles of the Chilean revolution. In 1838 he commanded the Chilean army of 5,000 men against Santa Cruz, in Peru, and was finally instrumental in driving Santa Cruz from the country and breaking up the Peru-Bolivian confederation. In 1841 he was elected president of Chile and served for four years. He was afterward senator and councillor of state.

Bulow, Bernhard, bērn'härt bū'lō, Count von, German statesman: b. Klein-Flottbeck, Holstein, in the spring of 1849. He came of a

distinguished family, and was, on the mother's side, of Danish ancestry. He was educated at Lausanne, Leipsic and Berlin, studied law and served in the Franco-German war, where he rose to the grade of lieutenant. After filling the posts of secretary of legation at Rome, St. Petersburg, and Vienna, he became chargé d'affaires at Athens during the Russo-Turkish war, and later was secretary of the Berlin Congress. In 1888 he was appointed minister to Rumania, and in 1893 ambassador to Italy. He was called home to become minister of foreign affairs. His skilful treatment of the Samoan difficulty won him popular favor in his own country. During the Chinese complications in 1900 he fully supported the emperor's foreign policy. When Prince Hohenlohe resigned, 16 Oct. 1900, Von Bülow was called to succeed him as chancellor of the empire.

Bülow, Bertha von, bār'ta fōn, German story writer: b. Warmbrunn, Silesia, 30 Sept. 1850. Among her stories which enjoy great popularity are 'Merry Tales' (1891); and 'Once in May and Other Stories' (1892). She has also written some good comedies, namely, 'Theory and Practice' (1890), and 'Two Peaceful Ones' (1892).

Bülow, Friedrich Wilhelm, frēd-rīh vīl'helm (COUNT VON DENNEWITZ), Prussian general: b. Falkenberg, 16 Feb. 1755; d. Königsberg, 25 Feb. 1816. In his 14th year he entered the Prussian army. In the war of 1806 he was a lieutenant-colonel at the siege of Thorn, and distinguished himself in various battles. In 1808 he was made major-general and general of brigade. When the war against France broke out in 1813 he fought the first successful battle at Möckern, 5 April; 2 May took Halle, and protected Berlin from the danger which threatened it, by his victory at Luckau 4 June. He saved Berlin a second time by the memorable victory of Grosbeeren, 23 August, and relieved the same city a third time by the great victory at Dennewitz. For this service the king made him one of the few grand knights of the Iron Cross, and after the end of the campaign bestowed on him the title Count Bülow of Dennewitz, and made the same hereditary in his family. At the storming of Leipsic, 19 October, he took an important part. At the opening of the campaign of 1815 he received the chief command of the fourth division of the army, with which he contributed so essentially to the victory of Waterloo, that the king gave him the command of the 15th regiment of the line, which was to bear in future the name of the Regiment of Bülow von Dennewitz.

Bülow, Hans Guido von, hänts gwē'dō fōn, German pianist and composer: b. Dresden, 8 Jan. 1830; d. Cairo, Egypt, 12 Feb. 1894. He studied the piano under Liszt, and made his first public appearance in 1852. In 1855 he became leading professor in the Conservatory at Berlin; in 1858 was appointed court pianist; and in 1867 he became musical director to the king of Bavaria. His compositions include overture and music to 'Julius Cæsar,' 'The Minstrel's Curse,' and 'Nirvana'; songs, choruses, and pianoforte pieces. He was considered one of the first of pianists and orchestral conductors. In 1875-6 he gave a series of concerts in the principal cities of the United States. His Letters appeared 1895-7.

Bülow, Heinrich (hīn'rīh) von, German military writer: b. Falkenberg, in Altmark, about 1757; d. Riga, Russia, 1807. He studied in the military academy at Berlin, and afterward entered the Prussian service. But he soon retired, and occupied himself with the study of Polybius, Tacitus, and J. J. Rousseau, and then served for a short period in the Netherlands. He afterward undertook to establish a theatre, but immediately abandoned his project, and visited the United States, whence he returned poor in purse but rich in experience, and became an author. His first work was on the 'Art of War,' in which he displayed uncommon talents. He wrote a book on 'Money,' translated the 'Travels of Mungo Park,' and published in 1801, his 'History of the Campaign of 1800.' In 1804 he wrote 'Lehrsätze des neuern Krieges' (Theory of Modern Warfare) and several other military works, among which is his 'Tactics of the Moderns as They Should Be.' In the former he points out the distinction between strategy and tactics, and makes the triangle the basis of all military operations. This principle of his was opposed by Jomini, and other French writers. His history of the war of 1805 occasioned his imprisonment in Prussia, at the request of the Russian and Austrian courts. He died in the prison of Riga. He was a follower of Swedenborg.

Bülow, Karl Eduard von, kār'l ēd-wārd fōn, German author: b. Berg vor Eilenburg, Saxony, 17 Nov. 1803; d. Ötztshausen, 16 Sept. 1853. His literary fame rests mainly on his 'Book of Tales,' after ancient Italian, Spanish, French, English, Latin, and German originals (4 vols. 1834-6), which was followed by a supplementary volume. Of his own original compositions, the 'Springtide Wandering Among the Hartz Mountains' is one of the best. He wrote also the very interesting story of 'The Youth of a Poor Man of Toggenburg,' founded on the autobiography of Ulrich Bräker, a Swiss weaver. He published the original later.

Bülow, Margarete von, mar-ga-rā'ta fōn, German novelist: b. Berlin 1860; d. near there, 2 Jan. 1885. She wrote four volumes of stories, namely, 'Stories' (1885); 'Jonas Briccius' (1886); 'Chronicle of the Riffelshausen Folks' (1887); 'New Stories' (1890). She delineated character with great precision, and displayed true insight into the human heart. She lost her life in an attempt to rescue a boy from drowning.

Buloz, François, frān-swā bī-lō, French publicist: b. Bubbens, Savoy, 20 Sept. 1803; d. Paris, 12 Jan. 1877. In 1831 he became editor of the 'Revue des Deux Mondes,' the celebrated French fortnightly literary magazine. From 1835-45 he also edited the 'Revue de Paris.' For 10 years (1838-48) he was director of the Comédie Française.

Bulrampur, bool-rūm-poor', a town of India, in the Fyzabad division of Oudh, the residence of the Maharaja of Bulrampur. It has a trade in rice, etc., besides manufactures of cotton and other articles. Pop. (1891) 14,849.

Bulrush, a popular name for tall, reed-like plants which grow in marshy places, and which for the most part belong to the genus *Scirpus*. The common bulrush is frequent in clear waters and about the borders of rivers throughout Europe, as well as in North America and New

south Wales. The roots are thick and stout, creeping under water in the deep mud; the stems are of a dark-green color, and four or five feet or more in height, and are naked, smooth, round, tough, pliant, and spongy within. Their base is covered with several sheathing scales, partly ending in leafy points. They are useful for packing and thatching, and especially for plaiting into the bottom of chairs.

Bulthaupt, Heinrich Alfred, hīn'rih āl-frēb boolt'haupt, German poet and dramatist: b. Bremen, 26 Oct. 1849. On quitting the university he was for a while a private tutor; then traveled in the East, Greece, and in Italy. He was a lawyer in his native town for some years, and in 1879 became custodian of the city library. Of his dramatic compositions the list is very long, comprising tragedies, 'Saul'; 'A Corsican Tragedy'; plays dealing with the questions of the time, 'The Workman'; comedies, comic operas, etc. He has also written 'Dramaturgy of the Theatre'; 'Dramaturgie der Klassiker,' a work of exceeding value; and 'Dramaturgie des Schauspiels'; also 'Dramaturgy of the Opera' (2 vols.).

Buluwayo. See BULAWAYO.

Bulwer, John, English physician. He flourished in the 17th century and appears to be entitled to the honor of having first pointed out a method of instructing the deaf and dumb. His works include 'Philocophus, or the Deafe and Dumbe Man's Friend' (1648); 'Chironomia, or the Art of Manual Rhetoric'; 'Chirologia, or the Natural Language of the Hand,' and 'Anthropometamorphosis.'

Bulwer, William Henry Lytton Earle (BARON DALLING AND BULWER), English author and diplomatist, brother of Sir Edward Bulwer-Lytton (q.v.): b. London, 13 Feb. 1801; d. Naples, 23 May 1872. He was minister to Madrid in 1843; in 1849 had a diplomatic mission to Washington, and was one of the negotiators of the Bulwer-Clayton Treaty (q.v.); was ambassador to Turkey in 1858-65. He was created Baron Dalling and Bulwer in 1871. His works include 'An Autumn in Greece' (1826); 'France, Social, Literary, and Political' (1834-6) 'Life of Byron' (1835); 'Historical Characters' (1868-70); 'Life of Palmerston' (1870-4).

Bulwer-Clayton Treaty, a treaty negotiated at Washington, D. C., in April 1850, by John M. Clayton, secretary of state under President Taylor, and Sir Henry Bulwer, British minister to the United States. It provided that neither the United States nor Great Britain should attempt to control a proposed canal across Nicaragua. The treaty provided further for the neutrality of the canal and it guaranteed encouragement to all lines of interoceanic communication. The terms of the treaty were afterward much disputed. In 1882 the United States government intimated to Great Britain that the canal having become impracticable because of reasons for which Great Britain alone was responsible, the United States considered the treaty as no longer binding, but Great Britain continued to hold it as in force. On 3 March 1890, Congress passed a bill providing for the construction of a canal on the Nicaragua route, which also authorized the President to open negotiations with Great Britain for the abroga-

tion of the Bulwer-Clayton Treaty, and under the last clause a convention between the two countries, abrogating the portions of the treaty that were deemed to be against the interests of the United States was signed in Washington, 5 Feb. 1900. See TREATIES.

Bulwer-Lytton, Edward George Earle (first LORD LYTTON), English politician and novelist: b. London 25 May 1803; d. Torquay, Devonshire 18 Jan. 1873. The Bulwers, long settled at Heydon Hall, Norfolk, claimed descent from the Normans and Vikings, perhaps as a ready explanation of their bold and turbulent spirit. The novelist's father, William Earle Bulwer, was colonel of the 106th regiment or Norfolk rangers. His mother, Elizabeth Barbara, was the only daughter of Richard Warburton Lytton of Knebworth in Hertfordshire, the family seat since the time of Henry VII. From her and her father, who was a learned scholar, Bulwer claimed to have derived his love for letters. As a boy he lived much among his grandfather's books and read through three circulating libraries. He wrote volumes of Byronic verse, some of which was published at the age of seventeen. Prepared for the university at various private schools, he entered Trinity College, Cambridge, at Easter in 1822; but soon migrated to Trinity Hall, where it was not necessary to attend lectures. At Cambridge he was a conspicuous member of the Union; he won the Chancellor's medal in 1825, and sketched two novels. At this time he also read enormously in history and began the practice of keeping those huge commonplace books which afterwards became useful in preparing his historical novels. Before receiving his bachelor's degree in 1826, he published more Byronic verse, fell desperately in love, made a tour of Scotland and the English lakes, and passed a season in Paris, where he was received into the most brilliant salons. Returning to London "a finished dandy," he married on 29 Aug., 1827, Rosina Doyle Wheeler, a beautiful Irish girl of some accomplishments. The marriage led to an estrangement from his mother and the young man was consequently thrown upon his own resources. He settled with his wife at Woodcot House in Berkshire, where he attempted to live in style from what he could earn with his pen. The marriage proving uncomfortable, a legal separation was obtained in 1836 after years of a life apart. On the death of his mother in 1843 he inherited Knebworth and assumed the surname of Lytton.

To pass by Bulwer's numerous contributions to annuals and periodicals, he published in 1827, 'Falkland,' a sentimental novel in imitation of Rousseau's 'Nouvelle Héloïse.' After a quick passage through the sentimental stage, he came out with 'Pelham' in 1828, a brilliant novel founded upon what he had seen of high life in London and Paris. It was likewise Bulwer's first excursion into politics and crime. Late in the same year followed 'The Disowned,' a curious novel which the author called "metaphysical" inasmuch as the characters are intended to stand for "certain dispositions influential upon conduct." After 'Devereux' (1829), an experiment in historical romance, Bulwer took up the criminal novel, publishing 'Paul Clifford' (1830) and 'Eugene Aram'

(1832), which are among his most characteristic books. By this time a popular novelist, he displayed during the coming years extraordinary versatility. With 'The Pilgrims of the Rhine' (1834) he began a series of fantastic tales which he called ideal and poetic, announcing that they should be judged "by the rules rather of poetry than prose." The chapter entitled "The Life of Dreams" elaborates a clever system of dreaming, evidently made use of in our day by Du Maurier in 'Peter Ibbetson' and by Kipling in 'The Brushwood Boy.' Occult philosophy was cleverly employed in 'Zanoni' (1842) and speculation about the future age of electricity in 'The Coming Race' (1871). A series of ghost stories culminated in 'The Haunted and the Haunters' (1861) hardly surpassed in its kind. Historical romance, resumed in 'The Last Days of Pompeii' (1834), was continued in 'Rienzi' (1835), 'The Last of the Barons' (1843), 'Harold' (1848), and the incomplete 'Pausanias' (posthumous, 1876). The best of these novels stand for an attempt to get near to the facts of history. In the midst of this work was planned a comprehensive history of 'Athens, its Rise and Fall,' of which two volumes appeared in 1837. Another idealization of the criminal in 'Lucretia' (1847) provoked considerable criticism, to which he replied with 'A Word to the Public' (1846). To test his popularity, Bulwer now published anonymously in *Blackwood's Magazine* three experiments in 18th century humor. The series comprises 'The Caxtons' (1849), 'My Novel' (1853), and 'What Will He Do With It' (1858). Though a little too obviously in the manner of Sterne, the novels are among Bulwer's best work. They were, curiously enough, as well received by the public as if they had borne the author's name. Somewhat like them is 'Kenelm Chillingly' (1873), interesting besides for its infusion of autobiography.

Throughout his career, Bulwer never ceased to cultivate his muse. From the Byronic influence that marked his poems down to 1830, he worked into satire, addressing himself "to the humors rather than to the passions of men." The 'Siamese Twins' (1831) a poem of four books in the metre of 'Hudibras' appeared in a volume of miscellaneous poems, of which the longest is one on Milton. 'The New Timon; A Poetical Romance of London' (1846), a satire on men then prominent in politics and literature, is memorable for the reference to Tennyson as "Schoolmiss Alfred," and for Tennyson's caustic stanzas in a reply contributed to *Punch*, 28 Feb. 1846. Among Bulwer's other collections of verse are 'Poems and Ballads,' translated from Schiller (1844); an epic in two volumes on 'King Arthur' (1848-9); 'The Lost Tales of Miletus' (1866); and a translation of the 'Odes and Epodes of Horace' (1869). If Bulwer did not gain much fame as a poet, he exactly hit popular taste in three plays—'The Lady of Lyons' (1838), 'Riche-lieu' (1838) and 'Money' (1840)—which still keep the stage.

Bulwer's rôle in letters has obscured for later times the part he played in politics. From 1831 to 1841 he sat in parliament as a liberal member for St. Ives, Huntingdonshire, and then for Lincoln. After making his maiden speech in support of the Reform Bill, he de-

voted his energies largely in favor of copyright on original works, cheap postage on newspapers, and the laws affecting dramatic literature and the stage. His early speeches on these subjects are still worth reading. In 1834, he issued a spirited pamphlet on the 'Present Crisis,' which went through 20 editions and influenced greatly the election that brought Lord Melbourne back to power. The new premier offered him a lordship in the admiralty but the post was declined. In 1841, Bulwer lost his seat owing to his willingness to accept a slight tax on corn. Ten years later he advocated protection to this extent in 'Letters to John Bull, Esq.'; and in 1852 he returned to parliament as a conservative member for Hertfordshire. His numerous speeches of this period relate to the excise duties, the Crimean War, China, and the East India Company. On the formation of the Derby Ministry in 1848, he became secretary to the colonies. While holding this office he organized the new colony of British Columbia. He spoke in support of Disraeli's reform bill of 1859 but against the measures introduced by Lord Russell and Gladstone in 1860 and 1866. As a reward for his services, he was elevated to the peerage in 1866, as Baron Lytton of Knebworth. Before this he received the degree LL.D. from both of the great English Universities. In 1854 he was installed honorary president of the associated societies of Edinburgh University, and he was twice elected lord rector of the University of Glasgow. To the last he kept up his literary work. 'The Parisians' was running in *Blackwood's Magazine* when the end came at Torquay on 18 Jan. 1873.

As a novelist Bulwer was subjected to fierce assaults from the critics throughout his career. Thackeray, for example, in a review of 'Ernest Maltravers' ridiculed and scorned his bad art, affected style, "his eternal whine * * * about the good and the beautiful" and "the dulness of his moral sense." Still there is the other side. In various prefaces to his novels and especially in two papers contributed to the *Monthly Chronicle* for 1838, Bulwer carefully elaborated his views on the art of fiction, drawing clear distinctions between the novel and the drama as he understood and practiced them. He never aimed at the dramatic novel wherein each incident and conversation must contribute to the working out of a logical plot. "It is often desirable," he said with reference to the novel, "to go back instead of forward,—to wind, to vary, to shift the interest from person to person" that the reader may not become fatigued. In that aim he succeeded. However much his novels may fail in technical details, they have never failed to find an audience.

Bibliography.—Unfortunately there is no adequate life of Bulwer or critical edition of his novels, indicating the many important changes he made in the text from time to time. Uncritical editions of the novels are numerous. To his 'Speeches' (two vols., Edinburgh 1874), his son, the Earl of Lytton, prefixed a memoir dealing with his political career. The period of his life from 1803 to 1832 is covered by a most interesting autobiography, half fact and half fiction, and several supplementary chapters by his son, published together under the title 'Life, Letters, and Literary Remains' (2 vols.,

London 1883). After the death of Lady Lytton, her executrix, Louisa Devey, published in vindication of her memory 'Letters of the Late Edward Bulwer, Lord Lytton to his Wife' (New York 1886). WILBUR L. CROSS, Professor of English, Yale University.

Bulwer-Lytton, Edward Robert. See LYTTON, EDWARD ROBERT BULWER.

Bum-boat (perhaps originally "boom-boat," from the boom rigged out from the side of a man-of-war at anchor, to which boats may make fast), employed by hucksters to visit ships lying at anchor, with supplies of provisions, trinkets, clothing, etc., for sale to the sailors.

Bumblebee, a wild bee of some species of the genus *Bombus*, of which upward of 50 species inhabit North America. Few occur in the southern hemisphere or tropical regions, and none in Africa south of the Sahara or in Australia, while they are the only bees inhabiting Arctic and Alpine regions. The bumble, or humble, bee is recognized by its large, thick, hairy body and long bass hum. The colonies of bumblebees are not numerous compared with those of wasps, or the stingless or the honey bee. A populous colony in England and America may number from 300 to 400 individuals. The proportion of sexes and castes of *Bombus muscorum* in England were found by Smith to be, in a colony of 120, 25 females, 36 males, and 59 workers. The roundish oval cells differ in size and have no exact arrangement. Besides the cells containing the young, the old discarded ones are made to serve as honey tubs or pollen tubs, and there are also the cells of the guest or Psithyrus bees (q.v.). In good weather and when flowers are plentiful the bees collect and store honey in abundance, and when the empty pupa-cells are full they form special cells made entirely of wax and these are filled with honey, and left open for the benefit of the community (Sharp). Hofer states that special tubs for the storing of pollen are sometimes constructed. Putnam says that the larvæ make their own cells of silk, which are finally strengthened with wax by the old bees. Bumblebees have been seen working in warm moonlight nights. About two centuries ago Godart stated that a trumpeter bee is kept in some nests to rouse the colony to work by three or four o'clock in the morning, and this has been recently confirmed by Hofer, who observed the fact in his laboratory. If the trumpeter was removed its place was filled the next morning.

There is a great deal of variation in our bumblebees, and, besides the local and climatic varieties, polymorphism is apparently marked, as Packard has (in *Bombus fervidus*) detected two sets of males and females, the large and the small; but whether there are two sizes of workers has not yet been ascertained.

The queen bees lay their eggs in masses of bee-bread attached to the top or sides of the old cells, in little enclosures formed by thin partitions set up by the bee after the eggs have been deposited. Thus placed, says Packard, in a mass of food, the young larvæ, on hatching, begin, by eating the food, gradually to construct their cells in the manner described by Putnam, who gives the following account of the economy of the bumblebee colony:

The queen awakens in early spring from her winter's sleep beneath the leaves or moss, or in deserted nests, and selects a nesting-place, generally in an abandoned nest of a field-mouse, or beneath a stump or sod, and immediately collects a small amount of pollen mixed with honey, and in this deposits from seven to fourteen eggs, gradually adding to the pollen mass until the first brood is hatched. She does not wait, however, for one brood to be hatched before laying the eggs of another; but, as soon as food enough has been collected, she lays the eggs for the second.

As soon as the larvæ are capable of motion, and commence feeding, they eat the pollen by which they are surrounded, and gradually separating, push their way in various directions. Eating as they move, and increasing in size quite rapidly, they soon make large cavities in the pollen mass. When they have attained their full size, they spin a silken wall about them, which is strengthened by the old bees covering it with a thin layer of wax, which soon becomes hard and tough, thus forming a cell. The larvæ now gradually attain the pupa stage, and remain inactive until their full development. They then cut their way out, and are ready to assume their duties as workers, small females, males, or queens.

It is apparent that the irregular disposition of the cells is due to their being constructed so peculiarly by the larvæ. After the first brood, composed of workers, has come forth, the queen bee devotes her time principally to her duties at home, the workers supplying the colony with honey and pollen. As the queen continues prolific, more workers are added, and the nest is rapidly enlarged. About the middle of summer eggs are deposited which produce both small females and males. All eggs laid after the last of July produce the large females or queens; and, the males being still in the nest, it is presumed that the queens are impregnated at this time, as, on the approach of cold weather, all except the queens, of which there are several in each nest, die.

Consult Putnam, 'Notes on the Habits of Some Species of Humblebees'; and Packard, 'The Humblebees of New England and Their Parasites' (Proceedings Essex Institute, IV.); Sharp, 'Insects,' Part II.

Bum'lefoot, a corn or abscess on the feet of domestic fowls, thought to arise from roosting on narrow perches or walking on sharp pebbles. The disease is sometimes incurable, but in other cases yields to the daily application of lunar caustic.

Bumblepuppy, a coined word used to describe the attempts of unskilful persons to play whist; opposed to scientific whist and "the rigor of the game."

Bummalo'ti, a fish (*Harporodon nchereus*), related to the salmon, but marine, which is caught in large quantities on the western coast of India, dried, salted, and exported all over the East. A trade-name is "Bombay duck."

Bump'ing Posts, constructions at the ends of railroad tracks in shifting yards, intended to prevent cars from running off the track. They are usually strong wooden frames with buffers placed at such a height as to receive the blow of the platform or coupler of the car. Banks of earth or cinders are sometimes utilized

for this purpose and portable metal posts known as shipblocks are frequently employed as bumping posts.

Bumpo, Natty. See LEATHERSTOCKING.

Bump'us, Herman Carey, American educator: b. Buckfield, Maine, 5 May 1862. He was graduated from Brown University in 1884, was professor of biology at Olivet College, Mich., 1886-9; professor of zoology in Clark University, Worcester, Mass., 1890-1; and professor of comparative anatomy in Brown University from 1892. In 1898 he was appointed director of the biological laboratory of the United States Fish Commission at Wood's Hole, Mass. He is the author of 'A Laboratory Course in Invertebrate Zoology' (1893).

Bunce, Francis Marvin, American naval officer: b. Hartford, Conn., 25 Dec. 1836; d. there, 19 Oct. 1901. He entered the naval service in 1851, and was graduated from the naval academy in 1857. In 1862 as executive officer of the Penobscot he took part in the engagement with the rebel batteries at Yorktown, Va. Assigned to temporary duty with the army, he had charge of the disembarkation of the heavy artillery and mortars for use in the investment of Yorktown by Gen. McCellan, April 1862. He commanded a successful expedition up Little River, between North and South Carolina, destroying several schooners and large quantities of cotton, turpentine, and resin, together with extensive salt works. With the monitor *Patapsco* in 1863 he took part in all the actions in which she was engaged during the siege of Charleston, and was wounded by the premature explosion of a cartridge. Later he was chief of scouts on the staff of Admiral Dahlgren. On 5 Sept. 1865 he was placed in command of the monitor *Monadnock*, and took that vessel from Philadelphia to San Francisco, the first extended sea voyage ever made by a monitor. On 1 March 1895 he was selected to command the North Atlantic squadron, with the rank of active rear-admiral. On 1 May 1897 he went to the Brooklyn navy yard and there superintended the conversion of many fast ships and yachts for war service. It is said that the government's policy of furnishing the navy with abundant ammunition for target practice and giving prizes for the best shots, a policy which produced such admirable results in the Spanish-American war, was due to the efforts of Admiral Bunce. He was commissioned rear-admiral 6 Feb. 1898, and retired from active service 25 Dec. 1898.

Bunce, Oliver Bell, American author: b. New York, 8 Feb. 1828; d. there, 15 May 1890. After spending several years as clerk in a stationery store, and bookseller and publisher on his own account, he became manager of the publishing house of James G. Gregory, which he conducted very successfully for many years. It was at his instigation that the fine edition of Cooper's works, with steel and wood engravings by F. O. C. Darley, was planned and published. For a short time he was a reader for Harper & Bros., but in 1869 he formed a connection with D. Appleton & Company, that ended only with his death. He edited 'Appleton's Journal,' and largely planned and carried through for the firm some of their most famous illustrated publications, such as 'Picturesque America,' 'Picturesque Europe,' 'Picturesque

Palestine.' In addition to office business his literary aptitudes and ambitions kept him at work in spite of chronic invalidism. He wrote among other works, 'Romance of the Revolution' (1852); 'A Bachelor's Story' (1859); 'Life Before Him' (1860); 'Bachelor Bluff, His Opinions, etc.' (1881); 'Don't: A Manual of Mistakes and Improprieties' (1883), of which over 100,000 copies have been sold; 'My House: An Ideal' (1884), a graphic study of a country home; and 'The Adventures of Timias Terry-stone: a Novel' (1885). As a very young man he wrote three plays which were accepted and produced on the stage with success: 'Fate, or the Prophecy,' a tragedy; 'Love in '76,' a comedy; 'Marco Bozzaris,' an heroic tragedy. The second of these was played by Laura Keane, the other two by James W. Wallack.

Bun'co, a familiar term applied to the practices of a certain class of swindlers. The trickster trades upon the credulity of an apparently well-to-do stranger in the city, under pretense of some connection with the latter's friends or native place, or by similar expedients. After confidence is secured, counterfeit money is imposed upon him, he is induced to cash "bogus" checks, etc., or even becomes the victim of more direct robbery.

Buncombe, swollen political oratory not directed to the point in hand or the audience present, but to the achievement of a charlatanic reputation outside. "Twisting the tail of the British lion," and other like feats of windy chauvinism, are specimens of buncombe; the object of the speaker being, not primarily to impress the hearers, but to make the general populace admire his swaggering patriotism. The reputed origin of the story is an anecdote of a member of the North Carolina legislature, from Buncombe County in that State, who told the thin remnants of a house he had nearly emptied by his dull and pointless remarks, that they might go, too, as he was only "speaking for Buncombe." Wheeler, 'History of North Carolina.'

Bundelcund, būn-dēl-kūnd', or **Bandal-khand, būn-dēl-kānd',** India, a tract, consisting partly of certain British districts connected with the Northwest Provinces, and partly of a number of small native states subordinate to the central India agency. Its surface is considerably diversified, and there are several ranges of hills, some of which reach the height of 2,000 feet. It has soil of every variety, which yields almost every grain and plant of India. Its waters are carried by different streams to the Jamna, and so to the Ganges. The total area is 20,559 square miles, of which the British districts occupy 10,332. Population of the latter (1901) about 1,400,000.

Bundesrath, boon'dēz-rāt, the German federal council which represents the individual states of the empire, as the Reichstag represents the German nation. It consists (1900) of 58 members, and its functions are mainly those of a confirming body, although it has the privilege of rejecting measures passed by the Reichstag.

Bundi, boon'de, India, a principality in Rajputana, under British protection; area, 2,300 square miles. Although small, Boondee is important as the medium of communication be-

tween the north and south. Pop. 295,675. Bundi, the capital, is picturesquely situated, and its antiquity, numerous temples, and magnificent fountains give it a very interesting appearance. Pop. 22,544.

Bun'galow, an East Indian term for a kind of country house with a thatched or tiled roof. Bungalows are generally of one story, though sometimes of two, and have verandas running round them to afford shelter from the sun. Public bungalows for travelers (daks) are maintained by government on the main highways.

Bun'gay, England, a market town in Suffolk, on the right bank of the Waveney, 30 miles northeast of Ipswich. It is well built; the streets, spacious and well paved, diverging from a moderate-sized area in the centre of the town, forming a market-place, in which is a handsome cross. It has two fine churches. The principal trade is in corn, coal, flour, lime, and malt, in which a considerable amount of business is done. There is also an extensive printing-office and stereotype foundry. Adjoining the town is a very spacious common. Pop. about 4,000.

Bunge, boon'gè, **Alexander**, Russian botanist: b. Kiev, 24 Sept. 1803; d. 1890. He was educated at Dorpat, and after taking the degree of M.D. in 1825 he traveled in Siberia and the eastern part of the Altai Mountains, and then joined the mission of the Academy of St. Petersburg to Peking, where he remained eight months and procured an extensive herbarium. In 1833, by invitation of the Academy of St. Petersburg, he made a second Asiatic journey, and in 1836 settled as professor of botany at Dorpat. His principal publications are catalogues of the plants which he collected in China and near the Altai Mountains.

Bunge, **Frederic George**, Russian jurist: b. Kiev (brother of the preceding), 1 March 1802; d. 1897. He was educated at Dorpat, and for many years was professor of law there. His writings, principally upon the history of law and rights in the countries around the Baltic Sea, are numerous and valuable.

Bungert, **August**, ow'goost boon'gärt, German composer: b. Mülheim, Prussia, 14 March 1846. He studied under Kufferath at Mülheim, at Cologne, and Paris. He held a position as musical director at Kreuznach, then went to Berlin, where he continued his studies under Kiel, and later moved to Genoa. His compositions include an opera cycle, 'The Homeric World,' consisting of two main parts, 'The Iliad,' and 'The Odyssey'; 'Tasso'; 'The Students of Salamanca,' a comic opera; 'On the Wartburg'; and a number of songs. The songs are considered his most successful productions.

Bu'nias, a small genus of plants of the natural order *Crucifera*, mostly natives of south-eastern Europe and adjacent Asia. Some of the species, especially *B. orientalis*, called hill-mustard, have been cultivated for forage, and have become weeds where they have escaped from cultivation. Since they are not very leafy and are not relished by stock, they have not become popular.

Bunion, a small, hard, painful tumor, formed in any part of the foot, but especially in the metatarsal joints. It consists in a swelling of the bones themselves, which fact distin-

guishes bunions from corns. It appears to be caused by the pressure of a boot or shoe which is too tight, especially when the feet are a little deformed. The best means to relieve the pain is to remove the causes of the tumor as soon as possible, to give rest to the foot, and to apply lotions and emollient poultices.

Bunker Hill, Mass., an eminence, 110 feet high, in the Charlestown district of Boston, connected by a ridge with another elevation, 75 feet high, named Breed's Hill. These heights are memorable as being the scene of a battle, 17 June 1775, commonly known as the battle of Bunker Hill. The city of Boston was occupied by the British under Gen. Gage, who had resolved to begin offensive operations against the rebels. This design becoming known in the American camp, it was determined to seize and fortify the heights of Charlestown on the night of 16 June. The execution of this perilous mission was confided to Cols. Prescott and Pepperell at the head of a brigade of 1,000 men; and at dawn of day a strong redoubt was already completed on Breed's Hill. About 1,500 Americans advanced successively to the relief of Prescott, and Gen. Warren entered the redoubt as a volunteer, refusing the command which was tendered to him. At about two thirty o'clock, two columns of the British advanced to a simultaneous assault; they were received with a terrific fire, and were twice repulsed in disorder. When the Americans had exhausted all their ammunition, Prescott gave the order for retreat. They received a destructive volley as they left the redoubt, and Warren fell, shot through the head with a bullet. The retreat was harassed by a raking fire from the British ships and batteries, but there was no pursuit beyond Charlestown Neck. The British loss was 226 officers and men killed, and 828 wounded; that of the Americans 145 killed or missing, and 304 wounded. Although a defeat, the moral result of this action was great. The Americans had seen superior numbers of the disciplined soldiers of England retreat before their fire, and had given the proof that they were able to defend their liberties. On Breed's Hill, and near the spot where Warren fell, stands the Bunker Hill Monument, the corner-stone of which was laid by the Marquis de Lafayette, 17 June 1825. This monument was inaugurated 17 June 1843. It consists of a plain granite shaft, 220 feet high, 31 feet square at the base, and 15 at the top. The monument affords a magnificent panoramic view of the surrounding country.

Bunner, **Henry Cuyler**, American author: b. Oswego, N. Y., 3 Aug. 1855; d. Nutley, N. J., 11 May 1896. He became a journalist in 1873, and was editor of 'Puck' from shortly after its start till his death. He was author of 'A Woman of Honor' (1883); 'Airs from Arcady and Elsewhere' (1884); 'The Midge' (1886); 'The Story of a New York House' (1887); 'Zadoc Pine and Other Stories' (1891); 'Short Sixes' (1891); 'The Runaway Browns' (1892); 'Jersey Street and Jersey Lane' (1896).

Bun'ning, **Herbert**, English composer: b. London, 2 May 1863. He graduated from Brasenose College, Oxford, and was for a time lieutenant in the 4th Hussars, but resigned his commission to study music in France and Italy. He remained abroad four years (1886-90), and after his return to England was musical director

in the Lyric Theatre, 1892-3, and in the Prince of Wales Theatre, 1895-6. Among his musical compositions are 'Shepherd's Call'; 'Village Suite'; and 'La Princesse Osra,' an opera produced at the Royal Opera, Covent Garden, in July 1902.

Bun'odont, a term applied to animals in which the crowns of the molar teeth are composed of a number of low rounded cones or cusps. The pig is one of the best examples among living animals; the teeth of monkeys and other omnivorous or frugivorous animals, including man, are also of this type. It is probable that the molars of many if not all modern mammals have been evolved from bunodont teeth, for the ancestors of many races of the modern hoofed animals, carnivora, and some other groups, show a series of stages in the evolution of the teeth leading from the omnivorous bunodont type into the specialized grinding or cutting teeth (selenodont) of the modern animals. See **TEETH**.

Bun'sen, Christian Karl Josias (**CHEVALIER**), German statesman and philosopher: b. Korbach, Waldeck, 25 Aug. 1791; d. Bonn, 28 Nov. 1860. He studied philology under Heyne at Göttingen, and subsequently went to Holland and Denmark, to acquire a critical knowledge of the Danish and Dutch languages. In 1815 he made the acquaintance at Berlin of the celebrated Niebuhr, and in 1816 proceeded to Paris, where he studied Persian and Arabic under Sylvestre de Sacy. The same year he visited Rome, where he married, and renewed his intimacy with Niebuhr, then Prussian ambassador at the papal court. Niebuhr procured him the appointment of secretary to the Prussian legation, and in 1823 Bunsen assumed Niebuhr's duties, being later, and in 1827, formally accredited as resident Prussian minister. In this capacity he continued till 1838, and conducted several important negotiations with the papal see, the result of one of which was the brief of Leo XII. relative to mixed marriages. His next mission was to Berne, as ambassador to the Swiss Federation. During his residence at Rome Bunsen had industriously pursued his philosophical and historical studies, including more especially that of the Platonic philosophy, and investigations into the religious and ecclesiastical history of mankind. The liturgies of the Church received his special attention, and a service of his own framing, introduced by him into the chapel of the Prussian embassy at Rome, was printed by order of the king of Prussia, who wrote a preface to it. This work was published without the author's name at Hamburg in 1846, under the title of 'Allgemeines Evang. Gesang-und Gebetbuch' ('General Hymn and Prayer Book of the Evangelical Lutheran Church'), and may be regarded as a new edition of the 'Versuch Eines Allgemeinen Evang. Gesang-und Gebetbuchs,' published at Hamburg in 1833.

In 1841 Bunsen was summoned to Berlin from Switzerland to proceed to England in charge of a mission for the establishment, in conjunction with that country, of a bishopric at Jerusalem. Shortly afterward he was nominated Prussian ambassador to England. In 1844 he was consulted on the subject of granting a constitution to Prussia, and is said to have drawn

up and submitted to government the form of one which bore a very close resemblance to that of Great Britain. In the Schleswig-Holstein affair he strenuously supported the claims of Prussia and the German Confederation in opposition to those of Denmark. From the opposite views taken by him to those of his government in relation to the Russian war he was recalled from London in 1854, and, abandoning politics, retired to Heidelberg to devote himself exclusively to literary pursuits. The results of these have established his reputation as one of the most profound and original critics in the department of biblical and ecclesiastical history. Among these are 'Die Verfassung der Kirche der Zukunft' ('The Constitution of the Church of the Future') (1845); 'Ägyptens Stelle in der Weltgeschichte' ('Egypt's Place in the World's History') (1845); 'Hippolytus und Seine Zeit' ('Hippolytus and His Time') (1851); and lastly, his greatest work, 'Bibelwerk für die Gemeinde' ('Bible Commentary for the Community'), the first part of which was published in 1858, and was intended to be completed in 1862. It had occupied his attention for nearly 30 years, and, as he informs us, was regarded as the grand centre-point to which all his literary and intellectual energies were to be devoted. Death interposed to prevent him completing his undertaking. Ill health caused him to spend the winters of 1858-9 and 1859-60 at Cannes, in the south of France, returning thence in the spring of 1860 to Bonn (whither he had recently transferred his abode from Heidelberg), where he died. Three volumes of his 'Bibelwerk' had been published at his death (the first, second, and fifth), and this great work was completed in his spirit and by the aid of his manuscripts under the editorship of Holtzmann and Kamphausen, in nine volumes (1858-70).

Bunsen, Robert Wilhelm Eberard, German chemist: b. Göttingen, 31 March 1811; d. 16 Aug. 1899. He studied at Göttingen University, and at Paris, Berlin, and Vienna; was appointed professor at the Polytechnic Institute of Cassel 1836; extraordinary professor at the University of Marburg 1838, and ordinary professor there 1841; professor at Breslau 1851; and finally professor of experimental chemistry at Heidelberg 1852. Among his many discoveries and inventions are the production of magnesium in quantities, magnesium light, spectrum analysis, and the electric pile and the burner which bear his name (see below). Among his works are 'Chemische Analyse durch Spektralbeobachtungen' (with Kirchoff, 1861; new ed. 1895); 'Gasometrische Methoden' (1857; English by Roscoe); and 'Anleitung zur Analyse der Aschen und Mineralwasser' (1874). He retired from active teaching in 1889.

Bunsen Battery, a modification of the Grove battery, plates or bars of gas coke being used instead of platinum. The electromotive force is slightly less than that of the Grove battery.

Bunsen Burner, a form of gas-burner especially adapted for heating, consisting of a tube in which, by means of holes in the side, the gas becomes mixed with air before consumption, so that it gives a non-illuminating, smokeless flame. Burners of this nature are part of the indispensable outfit of a chemical laboratory.

Bunt, sometimes called **Smut Ball**, **Pepper Brand**, and **Brand Bladders**, the most formidable disease, perhaps, to which wheat is subject, but one which may in most instances be greatly modified, and which seldom in the present day does material injury, except where there is careless cultivation. Like many other of the diseases to which the cereal plants are subject, it arises from the attack of a parasitic fungus (*Uredo caries*). It is generated in the ovary of wheat and a few other *Gramineæ*, and very rarely on the stem. It is formed at an early stage of growth, before the ear is free from the sheath; and indeed the plants which are affected by the parasite may be readily recognized by their unusual luxuriance, being generally several inches higher than plants not affected, larger in bulk, and often producing a greater number of stems from the same root. The bunted grains are shorter and blunter than the sound, of a dark-green when young, but when old of a pale brown, or sometimes nearly black. The contents of the ovary are reduced to a uniform black powder or paste, which has an offensive smell like that of decayed fish. Various substances have been used by cultivators to prevent the growth of bunt, such as salt, quicklime, arsenic, corrosive sublimate, etc. Careful washing and a selection of good seed will alone prevent much mischief, but it is advisable to take some more stringent measures with a view to destroy the vitality of the bunt spores. For this purpose Dombasle's method is the most successful. It consists in thoroughly wetting the grain with a solution of sulphate of soda (Glauber's salts), then drying the wheat with quicklime, which combines with the water to make sulphate of lime (gypsum), which acts as a manure, while the caustic soda destroys the vegetative powers of the bunt spores.

Bunter Sandstone, one of the three great divisions of Triassic formation. It is the lowest, that is, the oldest, of the series. It corresponds to the *grès bigarré* (variegated freestone or grit) of the French. In the Hartz it is more than 1,000 feet thick; in Cheshire and Lancashire, England, about 600. The footprints formerly known as those of chirotherium, now known to be labyrinthodont, are found in the bunter; the plants are chiefly ferns, cycads, and conifers.

Bunting, Jabez, English clergyman: b. Monyash, Derbyshire, 1778; d. London, 16 June 1858. His parents were members of the Wesleyan Church and removed to Manchester when he was a child. While at school he attracted the attention of Dr. Percival, who employed him as his amanuensis, and at his death made him one of his executors. He early joined the Church; became a traveling preacher in 1799; joined the Conference after the death of Mr. Wesley, and was appointed to the Oldham circuit. After traveling four years he was sent to London, where he gained great popularity as a pulpit and platform orator. After remaining two years in London he was removed to Manchester, where he distinguished himself as an advocate of ecclesiastical order and discipline in a controversy with some disaffected Methodists. In this controversy he gave such evidence of a knowledge of the polity of Wesleyan Methodism as secured for him the favor of the entire body to which he belonged. He was four times presi-

dent of the Methodist Conference; 17 years missionary secretary; and three years as editor. In 1835 he was chosen president of the theological school, and was looked upon as the acknowledged leader of the Methodists, superintending the interests of the body at home and abroad, while, at the same time, his influence was felt in other evangelical denominations, and also in the political world, statesmen frequently resorting to him for advice. Yet he derived only the ordinary emoluments of a Methodist minister — a yearly salary of £150, with house-rent and taxes. During all the distractions connected with the secessions that have taken place in the Wesleyan body, Dr. Bunting remained a firm, unwavering adherent and advocate of the doctrines and discipline of the Church as they came from the hands of John Wesley, and to his influence and indefatigable zeal are largely to be ascribed the permanency and prosperity of the Wesleyan connection.

Bunting, one of a group of cone-billed birds, forming the genus *Emberiza*, represented in Europe by several large, brown-streaked, or yellowish finches, of which the corn-bunting, reed-bunting, and ciril-bunting (qq.v.) are well known in Great Britain. The corn-bunting, which is considerably larger than a house sparrow, is brown in color with darker streaks on the upper parts or whitish brown with dark brown spots and lines on the under parts, and has a slightly forked tail. The reed-bunting has a black head and throat and the nape and sides of the neck are white. The head of the ciril-bunting is olive-green, with bright yellow patches on the cheek and over the eyes. The term is used in the United States for two or three similar birds, such as the dick-cissel, and snow-bunting (qq.v.). All the buntings are good singers, and the term is applied by dealers in cage birds not only to the true European buntings, but to many other seed-eaters, such as the ortolan and our indigo-bird.

Bunting, a thin woolen stuff, of which flags are usually made; hence, flags, collectively.

Bun'ya-bun'ya, the native Australian name of the *Araucaria bidwillii*, a fine Queensland tree with cones larger than a man's head, containing seeds that are eagerly eaten by the natives.

Bunyan, John, English preacher and author: b. Elstow, near Bedford, Bedfordshire, England, 1628; d. Swan Hill, London, 31 Aug. 1688. The Bunyan's were an old family in Bedfordshire but Bunyan's immediate ancestors for several generations had been obscure, and Bunyan's own father, Thomas Bunyan, was a tinker. Of his mother, Margaret Bentley, little is known. In spite of their lowliness, however, these parents trained Bunyan with some care and sent him to the Bedford schools. Then he took up the trade of tinker, at which, until he became an established preacher, he worked industriously. In the latter part of 1645 and the early months of the following year he fought in the Civil War, but on which side is uncertain. Froude maintains that he was in the Royalist army, whereas Macaulay and Brown, to whom the weight of authority must be given, state that the evidence goes to show that Bunyan was with the Parliamentarians. In 1646, he returned to his trade in Elstow, and at about

BUNTINGS, CANARIES, ETC.

1. Lapland Longspur Bunting.
2. Chaffinch.
3. Wild Canary.

4. Meadow Bunting.
5. Cardinal.
6. Rose-breasted Grosbeak (Male).

7. Reed Bunting (Male and Female).

BUNYAN

the age of twenty married a wife, whose goodness of character is the accepted proof that Bunyan was better than he represented himself.

Of far more importance in giving character to Bunyan's career was his spiritual life. Besides being brought up religiously and at a time of peculiarly strong belief in the literal truth of hell and heaven, of damnation and atonement, of devils and evil spirits, Bunyan's boyhood and early manhood were not only a continual struggle between the inclinations of an active, pleasure-loving youth and the terror lest he be doomed to eternal perdition, but also a spiritual anguish heightened by one of the most imaginative of minds of which there is record. "He was," says William James ('The Varieties of Religious Experience'), "a typical case of the psychopathic temperament, sensitive of conscience to a diseased degree, beset by doubts, fears, and insistent ideas, and a victim of verbal automatisms, both motor and sensory. These were usually texts of Scripture which, sometimes damnatory and sometimes favorable, would come in a half-hallucinatory form as if they were voices, and fasten on his mind and buffet it between them like a shuttlecock." Though in most ways a wholly respectable character, he speaks of himself, in his autobiography, ('Grace Abounding,') as a most blasphemous youth, in return for which he was warned and tormented by visions to which he gave little heed. When the visions left him he tells us that he became worse, nor were some narrow escapes from death sufficient to make him repent. His marriage had a good effect on him; he went to church regularly and was reverent, though, he says, in a formal way. He still liked his sports and was in the habit of playing cat on the village green Sunday afternoons. The effect of a peculiarly vivid vision of a warning voice from heaven while he was in the act of striking the cat, was to make him despair of ever being redeemed from his wicked courses. Yet he began to mend his ways, first giving up his profanity, then his love of bellingering, and lastly his dancing, though it took him "nearly a full year before he could quite leave that." He became esteemed as a godly man, but he feared that he had no depth of repentance. Overhearing some poor old women talking of the new birth and of the ways of resisting the devil, he became convinced that he "wanted the true tokens of a truly godly man." Though he meditated much on their sayings, though he gave up all his evil companions, and once or twice had visions of the way to salvation, two questions obtruded themselves, "Whether he was elected?" and "How if the day of grace should now be past and gone?" After much questioning, distress of mind, and manifold temptations that Satan put in his way, he gained some comfort from the Scriptures. The preaching and talk of Gifford, the Bedford minister, made him feel worse and worse; he seemed to himself to be utterly base and corrupt. Temporary comfort came in the Song of Solomon, but about "a month after, a very great storm came down upon me, which handled me twenty times worst than all I had met with before." Satan was continually with him; he feared that he had blasphemed against the Holy Ghost. This temptation lasted about

a year, but partly from texts in the Bible, and partly from the ministrations of Gifford and Luther's 'Comment on the Galatians,' he received some comfort. Even so, he was subject to another temptation, which endured a year, "to sell and part with the most blessed Christ." He feared that he had committed the unpardonable sin, and he was so torn between despair and hope that, after another conflict of three-quarters of a year, he fell into sickness. Even then he was tempted, but his mind and body grew whole together, and from this time on, about 1655, he seems to have felt himself redeemed.

In 1653 Bunyan joined the Bedford church, and two years later, "after I had been about five or six years awakened," he began preaching at the suggestion of "some of the most able of the saints." He was at first appalled by the gravity of his mission, but finding that he gave comfort to many he grew more confident. The secret of his success lay in the fact that "I preached what I felt, what I smartingly did feel; even that under which my poor soul did groan and tremble to astonishment." So great was the sincerity and success of his mission that he raised for himself much opposition among the Anglican divines, and was much slandered. Almost simultaneously, he began his very prolific career as author with a book of controversy directed against the Quakers, ('Some Gospel Truths Opened') (1656).

On 12 Nov. 1660, shortly after the return of Charles II., Bunyan was arrested for preaching. Refusing to flee or to agree not to preach, he was lodged in the Bedford county jail. Failing to get his case heard, he remained here for twelve years, except for a few weeks of liberty in 1666. During his unjust imprisonment, Bunyan had some access to the outside world, frequently visiting his church and once going as far as London. In the sense that he had much leisure to write, his confinement was of advantage to him. He composed and had published many books of which the most famous was 'Grace Abounding to the Chief of Sinners' (1666). On his release, in 1672, from jail, in accordance with the Declaration of Indulgence of Charles II., he became minister of the Bedford church. In 1675-76, Bunyan was again imprisoned, this time for six months in the small jail on Bedford bridge. The fact is important because it is probable that there he wrote, among other books, at least two-thirds of the first part of 'Pilgrim's Progress.' This part was first published in 1678, and a second edition with some additions, as the character of Mr. Worldly Wiseman, appeared the same year. The third came out early in 1679 and since then editions have been numberless. The second part appeared in January 1685. In the interval between the two were published the other books for which Bunyan is best known next to 'Pilgrim's Progress' and 'Grace Abounding'—'The Life and Death of Mr. Badman' (1680) and 'The Holy War' (1682). Aside from the imprisonment of 1685 and some persecution Bunyan's last years were quiet. His influence from his preaching and his writing was very widely diffused, and he was, in these respects, second to scarcely any man in England. He met his death in doing a characteristic act of

charity: having successfully reconciled a father and son at Reading, he was, while continuing his journey to London, overtaken by a rain storm and died from the effects of the exposure, in his sixtieth year.

Bunyan ranks among the most popular of English authors: his 'Pilgrim's Progress' is said to be read more widely than any other book in the language, except the Bible. It has been translated into over 70 foreign tongues. The reasons for its extraordinary vogue lie in the simplicity of the style, the fervor of the imagination, the universality of its spiritual appeal; no book is more widely intelligible or freer from sectarian dogmas. In all his books he appears as an unsurpassed master of a simple, direct, vernacular style.

Bibliography.— Editions of Bunyan's four more important works are numerous, and there are several of his collected works. Altogether he wrote about 60 books. Among the many lives that of the Rev. John Brown, 'John Bunyan, His Life, Times, and Work' (1885), is the most complete and authoritative. Froude's life in the 'English Men of Letters' (1880) and that by Canon Venables in the 'Great Writers Series' are also good; to the latter a full bibliography is added. Consult also Dowden, 'Puritan and Anglican Studies' (1901) and James *op. cit.* (1902).

WILLIAM T. BREWSTER,

Professor of English, Columbia University.

Bunzlau, boontz'low, the name of several European towns:

1. A town of Prussia, in the province of Silesia, near the Bober, 25 miles west of Liegnitz. It was formerly surrounded by fortifications, but handsome promenades now cover most of the area once occupied by them. In the market-place is an iron obelisk to the Russian general, Kutusov, who died here in 1819. Earthenware, glass, iron, etc., are manufactured. Pop. (1895) 13,870.

2. JUNG BUNZLAU, a town of Bohemia, 31 miles northeast of Prague, the capital of the circle of Bunzlau. It stands on the left bank of the Iser, is well built, and has an old castle, an old and a new town-house, and other interesting buildings. Its inhabitants are chiefly engaged in manufacturing cottons, woolens, starch, sugar, spirits, beer, etc. Pop. (1890) 11,518.

3. ALT BUNZLAU, a small town of Bohemia, situated on the Elbe.

Buol-Schauenstein, bwäl-show'en-stīn, **Karl Ferdinand** (COUNT), Austrian statesman: b. 17 May 1797; d. Vienna, 28 Oct. 1865. He was minister in succession at Carlsruhe, Stuttgart, Turin, and St. Petersburg. He was second Austrian plenipotentiary at the Dresden Conference (1850), after which he was minister at London until the death of Schwarzenberg recalled him to Vienna to hold the portfolio of foreign affairs. He presided at the Vienna Conference in 1855, and represented Austria at the Congress of Paris.

Buonaparte, bwō-nā-pār'tē. See BONA-PARTE.

Buonarotti, bwō-nār-rōt'tē, **Filippo**: b. Pisa, 11 Nov. 1761; d. Paris, 15 Sept. 1837. He received an excellent education under the auspices of the Grand Duke Leopold, but forfeiting the friendship of that prince on account of his sym-

pathies with the French revolutionists, he resorted to Corsica, where he commenced a journal of so inflammatory a character that he became involved in difficulties with the government. After having spent some time in Sardinia, where he was invited to draw up a liberal constitution for the people, he went to Paris to urge the desire of the people of the Corsican island of St. Pierre for annexation to France. French citizenship was conferred upon him; he was employed in important missions in Corsica and Oneglia, and became an ardent partisan of the Terrorists. Having been detained for some time in prison after the fall of Robespierre, he founded the Pantheon Association, and when this was dissolved by the government he joined the conspiracy of Babeuf and was sentenced to transportation, but was finally permitted to retire to Geneva, and afterward went to Brussels, where in 1828, he published his 'Conspiration de Babeuf.' Returning to Paris after the revolution of 1830, he spent the rest of his life in poverty and obscurity.

Buonarroti, Michael Angelo. See MICHEL-ANGELO.

Buononcini, Giovanni Battista, jō-vān'nē bāt-tēs'tā bwō-nōn-chē'nē, Italian composer: b. Modena, 1672. In 1697 he went to Vienna and soon after to Berlin, where his opera 'Polifemo' had great success. After living a while at Rome, he went, in 1720, to London, and became there one of the most powerful rivals of Handel. Everything in England at that time was made to bear upon party politics, and Buononcini became the favorite of the Whigs, while Handel was supported by the Tories. But upon a trial of skill, in an opera of their joint composition, the talent and taste of Buononcini proved an unequal match for the genius of his rival.

Buontalenti, Bernardo, bér-nār'do bwōn-tā-lén'tē (DELLE GIRANDOLE), Italian painter, sculptor, and architect: b. Florence, 1536; d. 6 June 1608. When 11 years of age an inundation of the Arno broke into the quarter of Florence where his family resided, and carried off every member of it except himself. Cosmo de Medici, on learning the disaster, received him into his palace, and improved the taste which he had displayed for drawing by placing him in the schools of Salviati, Bronzino, and Vasari. He displayed great versatility of mind, and excelled not only in the kindred arts of painting, sculpture, and architecture, but distinguished himself as a mathematician, a military engineer, and an inventor of machines.

Buoy, boo'y, any floating body employed to point out the particular situation of anything under water, as of a ship's anchor, a shoal, etc. They are of various shapes and constructions. The can buoy is of a conical form and is used for pointing out shoals, sand-banks, etc. Channel buoys are usually painted red on the starboard hand coming in from sea, and black on the port hand. They are also numbered in order from seaward, with even numbers on the starboard and odd numbers on the port hand. The cask buoy is in the form of a cask; the larger are employed for mooring, and are called mooring buoys. Spar buoys are wooden poles weighted at the thick end, by which they are moored. They are used in inland waters and in situations where, by reason of ice, iron buoys

BUPALUS—BURA

would be damaged in winter. Whistling buoys are provided with apparatus, operated by the waves, which compresses air and discharges it through a whistle. A bell buoy is a large fixed buoy to which is attached a bell which is sounded by the heaving of the sea, serving as a signal in foggy weather. The life or safety buoy is intended to keep a person afloat till he can be taken from the water. Its most usual form is a ring of cork covered with painted canvas and having becketts at its circumference. Life buoys are sometimes equipped with a port-fire or signal light which is kindled by pulling a lanyard at the moment of heaving overboard. Gas buoys are charged with compressed gas and provided with a suitable burner. The gas being lighted, and burning continuously, such buoys serve as a guide at night. Electric buoys are illuminated by connection with power on shore by means of a cable.

Bupalus, bū'pa-lūs, Greek sculptor; fl. at Chios about 500 B.C. He and his brother Athenis are best known for their satirical conflict with the poet Hipponax. Augustus adorned many of the Roman temples with works of the two brothers, who used the pure white marble of Paros. Pausanias represents Bupalus as being an elegant architect as well as a sculptor.

Buphaga, bū-fa-ga, a genus of birds of the starling family (*Sturnida*), whose species are found in various parts of Africa, where they are of great use from their habit of feeding on the parasites infesting cattle. They are popularly known as beef-eaters or ox-peckers, and are distinguished from the true starlings by a stouter beak, bare nostrils, more curved claws, and some other characters. The South African ox-pecker (*B. africana*) inhabits Natal, while farther north the genus is represented by a red-billed species (*B. erythrorhyncha*). A third species is found still farther north and also in the Transvaal.

Buphagus, in ancient mythology, a son of Japetus and Thornax, who was killed by Diana for an attempt upon her chastity. A river of Arcadia was named after him. Buphagus was also one of the surnames of Hercules, which was given to him on account of his gluttony.

Buphonia, bū-fō'nyā (Gr. *Βουφόνος* ox-killer), an ancient Athenian festival in honor of Zeus, celebrated every year on the 14th of Scirophorion, on the Acropolis. Barley and wheat were placed on the altar, and the ox destined for the sacrifice was permitted to go and eat the grain, when a priest armed with an axe sprang forward and slew the ox, and then secreted himself. The other priests, as if not knowing the author of the deed, made inquiry, and, failing to ascertain anything, for lack of a better victim arraigned the axe, found it guilty, and condemned it. The Buphonia were also called Diipolia.

Bupthalmum, in botany, a genus of the *Syngenesia Polygamia Superflua*; natural order, *Compositæ Oppositifoliæ*; *Corymbifera*, *Jussieu*. Essential character: stigma of the hermaphrodite floscules undivided; seeds have the sides, especially in the ray, edged; receptacle chaffy. There are 12 species, of which *B. frutescens*, shrubby ox-eye, rises with several woody stems from the root, and grows to the height of 8 or 10 feet, furnished with leaves very unequal in

size, some of which are narrow and long, others broad and obtuse. The foot-stalks of the larger leaves have, on their upper side, near their base, two sharp teeth standing upward, and a little higher there are generally two or three more growing on the edge of the leaves. The flowers are produced at the ends of the branches, single; these are of a pale yellow color, and have scaly calyxes. It grows naturally in America. *B. arborescens*, tree ox-eye, seldom grows higher than three feet, sending out many stalks from the root, which are succulent; it has spear-shaped leaves, placed opposite; the flowers are produced upon foot-stalks, which are two inches long; the flowers are larger than those of the *B. frutescens*, and of a bright yellow color. They appear in July, August, and September. Some of the *Bupthalmum* plants are shrubs, but most of them are herbs. The flowers are commonly terminating, and mostly of a yellow color. See OX-EYE.

Buprasium, a town of ancient Greece, in Elis, often mentioned by Homer as one of the chief cities of the Epians. It had ceased to exist in the time of Strabo, but the name was still attached to a district situated on the left bank of the Larissus, and on the road leading from Dyme to Elis. The region is now identified with the plain of Bakouma.

Buprestidæ, bu-prēs'tī-dē, a family of coleopterous insects (beetles), many of which are remarkable for the splendor of their appearance. This family is included in the pentamerous section of *Coleoptera*, which was formed by Latreille, and so named because the members of it have five joints in the tarsi. The characters of the *Buprestidæ* are: body ovate, elongated, somewhat broad and obtuse in front, but pointed behind; eyes oval, with the antennæ inserted between them; jaws powerful. They walk slowly, but fly with great rapidity, especially in warm weather. They are very fond of sunning themselves on bushes or the branches of trees. When one attempts to seize them, sometimes even when one approaches them, they allow themselves to fall suddenly to the earth, or fly rapidly away. There are several hundred species belonging to this family, most of which are found within the tropics, and the tropical species are those which are chiefly distinguished by the brilliancy of their colors. The prevailing color appears to be green, but species are often found of a blue, red, golden, or other color. The *B. gigas* of Linnaeus, which is about two inches in length, and one of the largest of the family, has bright golden elytra, or wing-cases, which are often used as ornaments by the inhabitants of South America, of which continent it is a native.

Bura, in ancient mythology, a daughter of Jupiter, or, according to some authorities, the offspring of Ion and Helice, from whom Bura, or Buris, once a flourishing city of ancient Greece, on the Bay of Corinth, received its name.

Bura, in ancient Greece, one of the 12 original Achaean cities, which stood formerly close to the sea, on the Bay of Corinth, but, having been destroyed, with the neighboring town of Helice, by a terrible earthquake, the surviving inhabitants rebuilt it afterward about 40 stadia from the coast, and near the small river

Buraicus. Bura was situated on a hill, and contained temples of Ceres, Venus, Bacchus, and Lucina, the statues of which were sculptured by Euclidas of Athens. On the banks of the river Buraicus was a cave consecrated to Hercules, and an oracle usually consulted by the throwing of dice. The ruins of Bura are close to the road from Megastelia to Vostitza, and the cave of Hercules Buraicus is visited by tourists.

Bur-marigold, a large genus of annual and perennial herbs (*Bidens*) of the natural order *Composita*, mostly natives of North America, but widely distributed in other countries, chiefly as weeds, but some as garden plants. The best known ornamental species is *B. grandiflora*, a native of South America; and the most common North American species is *B. frondosa*, which is popularly and variously known as devil's bootjack, stick-tight, beggar-tick, Spanish-needle, etc., and is especially troublesome in wool and on clothing, to which the seeds stick like burs.

Burbank, Luther, American plant breeder: b. Lancaster, Worcester county, Mass., 7 March 1849; of English-Scotch ancestry; educated in common schools and local academy; worked as a boy in a plow factory, showing some inventive capacity, but soon began market-gardening and seed-raising in a small way, and developed the Burbank potato in 1873; removed to Santa Rosa, Cal., 1 Oct. 1875, where he has since resided and carried on his work. His many and important "new creations" of fruits, flowers and vegetables have made him the best-known plant-breeder in America, and probably in the world. The characteristics which are the special factors in the success of his work are, the large extent of his experiments, his keenness of preception of slight variations in plant-qualities, and the rapidity with which he develops new qualities, this rapidity being due to a combination of multiple hybridizing, selection, and grafting of seedling plants on mature stocks, so that immediate results as to flowers and fruits are got from seedling stems. But the final and most important factor in Burbank's success is the inherent personal genius of the man, whose innate sympathy with Nature, aided by the practical education in plant biology derived from thirty years of constant study and experiment, enable him to perceive correlations and outcomes of plant growth which seem to have been visible to no other man. As the history of Burbank's life is the history of his work, the remainder of this biographical sketch may advantageously be devoted to a brief consideration of the character and method of creation of some of his principal new plant varieties.

Burbank has originated and introduced a remarkable series of plums and prunes. No less than twenty varieties are included in his list of offerings, and some of them, notably the Gold, Wickson, Apple, October Purple, Chalco, American and Climax plums and the Splendor and Sugar prunes are among the best known and most successful kinds now grown. In addition he is now perfecting a stoneless plum, and has created the interesting plum-cot by hybridizing the Japanese plum and the apricot. The plum-cot, however, has not yet become a fixed variety and may never be, as it tends to revert to the plum. The stoneless and seedless plum is being produced by selection from the descendants of

the crossing of a single fruit in a small wild plum with only part of a stone with the French prune; the percentage of stoneless fruits is gradually increasing with succeeding generations. The sugar prune, which promises to supplant the French prune in California, is a selected product of a second or third generation variety of the *Petite d'Algen*, a very variable French prune. The Bartlett plum, cross of the bitter Chinese *simoni* and the Delaware, a Burbank hybrid, has the exact fragrance and flavor of the Bartlett pear. The Climax is a cross of the *simoni* and the Japanese *triflora*. The Chinese *simoni* produces almost no pollen, but few grains of it ever having been obtained, but these few grains have enabled Burbank to revolutionize the whole plum shipping industry. Most of Burbank's plums and prunes are the result of multiple crossings, in which the Japanese Satsuma has played an important part. Hundreds of thousands of seedlings have been grown and carefully worked over in the twenty years' experimenting with plums, and single trees have been made to carry as many as 600 varying seedling grafts.

Burbank has originated and introduced the Van Deman, Santa Rosa, Alpha, Pineapple, "No. 80," the flowering Dazzle, and other quinces; the Opulent peach, cross-bred from the Muir and Wager; the Winterstein apple, a seedling variety of the Gravenstein; and has made interesting, although not profitable, crosses of the peach and nectarine, peach and almond, and plum and almond.

Next in extent, probably, to his work with plums is his long and successful experimentation with berries. This work has extended through twenty-five years of constant attention, has involved the use of forty different species of *Rubus*, and has resulted in the origination and introduction of a score of new commercial varieties mostly obtained through various hybridizations of dewberries, blackberries, and raspberries. Among these may especially be mentioned the Primus, a hybrid of the Western dewberry (*R. ursinus*) and the Siberian raspberry (*R. crataegifolius*), fixed in the first generation, which ripens its main crop before most of the standard, well-known varieties of raspberries and blackberries commence to bloom; the Iceberg, a cross-bred white blackberry derived from a hybridization of the Crystal White (pistillate parent) with the Lawton (staminate parent), and with beautiful snow-white berries so nearly transparent that the small seeds may be seen in them; the Japanese Golden Mayberry, a cross of the Japanese *R. palmatus* (with small, tasteless, dingy yellow worthless berries) and the Cuthbert, the hybrid growing into tree-like bushes six to eight feet high and bearing great, sweet, golden, semi-translucent berries which ripen before strawberries; and Paradox, an oval, light-red berry obtained in the fourth generation from a cross of Crystal White Blackberry and Shaffer's Colossal Raspberry. While most of the plants from this cross are partly or wholly barren, this particular outcome is an unusually prolific fruit producer. An interesting feature of Mr. Burbank's brief account, in his "New Creations" catalogue of 1894, of the berry experimentation, is a reproduction of a photograph showing "a sample pile of brush twelve feet wide, fourteen feet high and twenty-two feet long, containing 65,000 two and three-year-

old seedling berry bushes (40,000 Blackberry X Raspberry hybrids and 25,000 Shaffer X Gregg hybrids) all dug up with their crop of ripening berries." The photograph is introduced to give the reader some idea of the work necessary to produce a satisfactory new race of berries. "Of the 40,000 Blackberry-Raspberry hybrids of this kind 'Paradox' is the only one now in existence. From the other 25,000 hybrids two dozen bushes were reserved for further trial."

Leaving Burbank's other fruit and berry creations unreferred to, we may refer to his curious cross-bred walnut results, the most astonishing of which is a hybrid between *Juglans californica* (staminate parent) and *J. nigra* (pistillate parent), which grows with an amazing vigor and rapidity, the trees increasing in size at least twice as fast as the combined growth of both parents, and the clean-cut, glossy, bright-green leaves, from two to three feet long, having a sweet odor like that of apples. This hybrid produces no nuts, but curiously enough the result of the reverse hybridization (*i. e.*, pollen from *nigra* on pistils of *californica*) produces in abundance large nuts of a quality superior to that possessed by either parent.

Of new vegetables Burbank has introduced, besides the Burbank and several other new potatoes, new tomatoes, squashes, asparagus, etc. Perhaps the most interesting of his experiments in this field is his attempt, apparently destined to be successful, to produce a spineless and spicule-less cactus (the spicules are the minute spines, much more dangerous and harder to get rid of than the conspicuous long, thorn-like spines), edible, for stock, and indeed for man. This work is chiefly one of pure selection, for the cross-bred forms seem to tend strongly to revert to the ancestral spiny condition.

Among the many new flower varieties originated by Burbank may be mentioned the Peach-blow, Burbank, Coquito, and Santa Rosa roses, the Splendor, Fragrance (a fragrant form) and Dwarf Snowflake callas, the enormous Shasta and Alaska daisies, the Ostrich plume, Waverly, Snowdrift and Double clematises, the Hybrid Wax myrtle, the extraordinary Nicotiana, a hybrid between a large, flowering Nicotiana and a petunia, several hybrid Nicotianas, a dozen new gladioli, an ampelopsis, several amaryllids, various dahlias, the Fire poppy (a brilliant flame colored variety obtained from a cross of two white forms) striped and carnelian poppies, a blue Shirley (obtained by selection from the Crimson field poppy of Europe), the Silver Line poppy (obtained by selection from an individual of *Papaver umbrosum* showing a streak of silver inside), with silver interior and crimson exterior, and a crimson California poppy (*Escholtzia*) obtained by selection from the familiar golden form. Perhaps his most extensive experimenting with flowers has been done in the hybridizing of lilies, a field in which many plant breeders have found great difficulties. Using over half a hundred varieties as basis of his work, Burbank has produced a great variety of new forms. "Can my thoughts be imagined," he says, in his "New Creations" of 1893, "after so many years of patient care and labor [he had been working over sixteen years], as, walking among them [his new lilies] on a dewy morning, I look upon these new forms of beauty, on which other eyes have never gazed? Here a plant six feet high, with

yellow flowers, beside it one only six inches high with dark red flowers, and further on one of pale straw, or snowy white, or with curious dots and shadings: some deliciously fragrant, others faintly so; some with upright, others with nodding flowers: some with dark green, woolly leaves in whorls, or with polished light green, lance-like, scattered leaves."

So far no special reference has been made to the more strictly scientific aspects of Burbank's work. Burbank has been primarily intent on the production of new and improved fruits, flowers, vegetables and trees for the immediate benefit of mankind. But where biological experimentation is being carried on so extensively it is obvious that there must be a large accumulation of data of much scientific value in its relation to the great problems of heredity, variation, and species-forming. Burbank's experimental gardens may be looked on from the point of view of the biologist and evolutionist as a great laboratory in which, at present, masses of valuable data are, for lack of time and means, being let go unrecorded. The Carnegie Institution has therefore made a grant of \$100,000 to Burbank, payable \$10,000 annually, beginning with 1905, to enable him to note, collect and collate the scientific data which his extensive experimentation is constantly affording. Of Burbank's own particular scientific beliefs touching the "grand problems" of heredity we have space to record but two: first, he is a thorough believer in the inheritance of acquired characters, a condition disbelieved in by the Weismann school of evolutionists; second, he believes in the constant mutability of species, and the strong individuality of each plant organism, holding that the apparent fixity of characteristics is a phenomenon wholly dependent, for its degree of reality, on the length of time this characteristic has been ontogenetically repeated in the phylogeny of the race.

For other accounts of Burbank and his work, see articles in the illustrated magazines of 1903 and 1904, and "New Creations in Plant Life," by W. S. Harwood. Burbank has written but little himself, namely, only a few essays to be read at horticultural and other meetings, the article on Plant-breeding in this Encyclopedia, Vol. III, and his short series of catalogues, 1893-1901, called "New Creations."

VERNON L. KELLOGG,
Professor of Entomology, Leland Stanford Jr.
University.

Bur'bot, a fresh-water fish (*Lota lota*) of the cod family, inhabiting northern Europe and America. It is numerous in the inland waters of the northern States and Canada, where it displays the nocturnal voracity of its race. It ordinarily weighs about five pounds, but has little market value. It is more often called cusk, ling, or loche among us, than burbot, which is the British designation.

Burbridge, Stephen Gano, American soldier: b. Scott County, Ky., 19 Aug. 1831; d. 1894. He organized the famous 26th Kentucky Regiment, which he led for the Union at Shiloh, where he was promoted to the rank of brigadier-general of volunteers. He was engaged in the Vicksburg expedition under Gen. Grant; led the charge at Arkansas Post and at Port Gibson, being the first to enter each of these places; was retired with the brevet of major-general in 1865.

Burchard, Samuel Dickinson, American clergyman: b. Steuben, N. Y., 6 Sept. 1812; d. Saratoga, N. Y., 25 Sept. 1891. He was for many years a Presbyterian pastor in New York. During the presidential campaign of 1884 a company of clergymen, about 600 in number, called on James G. Blaine, the Republican candidate, at the Fifth Avenue Hotel, New York. Dr. Burchard made an address, in which he affirmed that the antecedents of the Democracy were "rum, Romanism, and rebellion," and this denunciatory speech on the very eve of the election created intense excitement throughout the United States and alienated from Blaine many Democratic votes upon which he had reckoned. It is generally conceded that Burchard was thus largely instrumental in electing Grover Cleveland.

Bur'chell, William John, English explorer: b. Fulham, about 1782; d. 1863. He was in the service of the East India Company on the island of St. Helena, 1805-10, and then went to South Africa. Here he spent several years in exploring and making a large natural-history collection. In 1825 he made a tour in South America. On all his expeditions he was generally entirely alone. A large part of his collections are now in the British Museum.

Burchiello, Domenico, dō-mā-nē'kō boor-kē-ē'lō, Italian poet: fl. 15th century, at Florence, where he was probably born. He was the son of a barber named Giovanni, and was called originally only Domenico. He assumed the name of Burchiello afterward for reasons that cannot be assigned. His fame began about 1425. He was first registered as a barber in 1432. Some writers have reproached him for shameful vices, and represented him as a low buffoon who did everything for money. Others have defended him. His shop was so famous that learned and unlearned, high and low, assembled there every day, and Cosmo the Great caused a picture of it to be painted on one of the arches of his gallery. It appears here divided into two portions; in one Burchiello is acting the part of a barber; in the other that of a musician and poet. The portrait of Burchiello himself is painted over his shop. It is extremely difficult to decide upon the absolute value of his satires, as the local and personal allusions in them are obscure. They were composed for his contemporaries, with a studied obscurity and extravagance of expression. His style is, nevertheless, pure and elegant. His burlesque sonnets are enigmas, of which we have no intelligible explanation, notwithstanding what Doni has done. The narrative and descriptive parts are very easy to be understood; but the wit they contain is, for the most part, so coarse, that the satire fails of producing its effect. They are, on the whole, lively, but licentious. The best editions of his sonnets are those of Florence, 1568, and of London, 1757.

Burckhardt, boor'k'hart, Johann, yō'hän, Karl, German astronomer: b. Leipsic, 30 April 1773; d. 22 June 1825. He acquired a fondness for astronomy from the study of the works of Lalande, and made himself master, at the same time, of nearly all the European languages. He wrote a Latin treatise 'On the Combinatory Analytic Method' (Leipsic 1794). He then studied practical astronomy with Baron von Zach at the latter's observatory on the See-

berg, near Gotha, and assisted his patron, from 1795-7, in observing the right ascension of the stars. Von Zach recommended him to Lalande, at Paris, who received him at his house 15 Dec. 1797. Here he distinguished himself by the calculation of the orbits of comets; participated in all the labors of Lalande and those of his nephew Lefrançois Lalande; took an active part in the observatory of the école Militaire; and translated the first two volumes of Laplace's 'Mécanique Céleste' into German (Berlin 1800-2). Being appointed adjunct astronomer by the board of longitude, he received letters of naturalization as a French citizen 20 Dec. 1799. His important treatise on the comet of 1770, which had not been visible for nearly 30 years, although, according to the calculations of its orbit, it should have returned every five or six, was rewarded with a gold medal by the Institute in 1800. This treatise, which proposed some improvements in Dr. Olbers' mode of calculation, is contained in the 'Memoires de l'Institut' for 1806. During this year he was made a member of the department of physical and mathematical sciences in the Academy; in 1818 was made a member of the board of longitude; and, after Lalande's death, astronomer in the observatory of the école Militaire. In 1814 and 1816 he published in French, at Paris, 'Tables to Assist in Astronomical Calculations.' He also wrote some treatises in Von Zach's 'Geographical Ephemerides.' His labors in the board of longitude were particularly valuable.

Burckhardt, Johann Ludwig, yō'hän lood'vīg boor'k'härt, Swiss explorer: b. Lausanne, 24 Nov. 1784; d. Cairo, 17 Oct. 1817. He studied at Leipsic, Göttingen, and London, giving special attention to Arabic. In 1809 he started on an expedition to Africa for the African Association at London; assuming the disguise of an Oriental at Malta he went to Aleppo and remained there over a year and a half studying Arabic and the history of Mohammedanism. Then he visited Damascus and traveled through Palestine to Cairo, arriving there in September 1812; here he joined a caravan going through the Nubian Desert by a route never before traveled by Europeans, and reached the Red Sea in July 1814. He then crossed over to Asia Minor and went to Mecca, where he became a Moslem and joined a body of pilgrims going to Mount Ararat. In 1815 he returned to Cairo and from there traveled through the region of Mount Sinai, climbing the mountain. Shortly after his return from this trip he died of the fever just as he was about to start on another expedition. He was the author of 'Travels in Nubia' (1819); 'Travels in Syria and the Holy Land' (1822); 'Travels in Arabia' (1829); 'Notes on the Bedouins and Wahabys' (1830); 'Arabic Proverbs' (1830).

Bur'dekin, a river of the northeast of Queensland, with a course of about 350 miles. With its affluents it waters a large extent of country, but it is useless for navigation.

Burden, Henry, American inventor: b. Dumblane, Scotland, 20 April 1791; d. Troy, N. Y., 19 Jan. 1871. He was brought up on a farm, and at an early age showed his inventive genius by making a variety of labor-saving machinery, including a threshing-machine. He came to the United States in 1819 and engaged in the manufacture of agricultural implements.

BURDEN OF PROOF — BURDICK

He invented an improved plow; the first cultivator made in this country; machines for making horse-shoes and hook-headed spikes used on railroads; a self-acting machine for rolling iron into bars; and a new machine for making horse-shoes, which received a rod of iron and turned out completed shoes at the rate of 60 a minute.

Burden of Proof, in legal procedure, the obligation to establish by evidence certain disputed facts. As a general rule this burden lies on the party asserting the affirmative of the issue to be tried or question in dispute, or on the party who would fail if no evidence were adduced on either side. Burden of proof is to be distinguished from *prima facie* evidence or a *prima facie* case. Generally, when the latter is shown, the duty imposed upon the party having the burden will be satisfied; but it is not necessarily so. In criminal cases, on the two-fold ground that a prosecutor must prove every fact necessary to substantiate his charge against a prisoner, and that the law will presume innocence in the absence of convincing evidence to the contrary, the burden of proof, unless shifted by legislative interference, will, in criminal proceedings, be on the prosecuting party, though in order to convict he must necessarily have recourse to negative evidence. The burden of proof throughout is on the government. This subject is treated by all writers on Evidence, as Taylor, Roscoe, and Powell in England; Dickson in Scotland; and Greenleaf in the United States. Consult also Bentham's 'Rationale of Judicial Evidence.'

Burdett', Sir Francis, English politician: b. 25 Jan. 1770; d. 23 Jan. 1844. He was educated at Westminster, and after two years at Oxford made a Continental tour. In 1796 he obtained a seat in Parliament through the patronage of the Duke of Newcastle; but he soon abandoned the Tory party and made himself conspicuous by his advocacy of liberal measures. In 1802 he stood for Middlesex, but though at first elected he finally lost his seat in 1806, after much costly litigation. He was more successful in 1807 at Westminster, where his election at the head of the poll was hailed as a great popular triumph. In 1810 he published a letter in Cobbett's 'Political Register,' denying the right of the House of Commons to imprison for libel, as they had recently done in the case of John Gale Jones. This letter, having been brought under the notice of the House, was declared a gross breach of its privileges, and a warrant was issued by the speaker for the committal of Sir Francis to the Tower. He denied the legality of the warrant, and declared his determination to surrender only to force. The public mind was strongly agitated; but prorogation of Parliament relieved him from his imprisonment in the Tower, and he became perhaps the most popular man in the kingdom. In attaining this popularity he was greatly aided by the graces of his appearance and the talents which he undoubtedly possessed. Ultimately, however, his fervor cooled, and he owed his last seat in Parliament to the Conservatives of Wiltshire.

Burdett, Sir Henry, English publicist and statistician: b. 1847. He served in an administrative capacity in the Queen's Hospital, Birmingham, and the Seaman's Hospital, Green-

wich, and was secretary of a department of the London Stock Exchange. He was founder and editor of 'The Hospital.' His works are numerous, and cover a wide range. Among them are 'Official Intelligence of British, American, and Foreign Securities' (17 vols.); 'The National Debt'; 'National Debts of the World'; 'Local Taxation in England and Wales'; 'Colonial Loans, Finance, and Development'; 'Seventeen Years of Securities'; 'The Admiralty and the Country'; 'Hospitals and Asylums of the World'; 'Hospitals and Charities, a Year-book of Philanthropy'; 'Hospitals and the State'; 'Architects, Hospitals, and Asylums'; 'A Practical Scheme for Old Age Pensions'; 'The Nursing Profession'; 'Housing of the Poor'; and 'Official Nursing Directory.'

Burdett-Coutts, Right Hon. Angela Georgina (Baroness), English philanthropist: b. 21 April 1814; d. London 30 Dec. 1906. In 1837 she inherited much of the property of her grandfather, Thomas Coutts, the banker, on the death of his widow, the Duchess of St. Albans (formerly the actress, Miss Mellon). Besides spending large sums of money in building and endowing churches and schools, she endowed the three colonial bishoprics of Cape Town, Adelaide, and British Columbia. She founded an establishment in South Australia for the improvement of the aborigines, and established a fishery school at the Irish village of Baltimore (1887). To the city of London she presented, besides several handsome fountains, the Columbia Market, Bethnal Green (1870), for the supply of fish in a poor district. She also built Columbia Square, consisting of model dwellings at low rents, for about 300 families. The home established by her at Shepherd's Bush has rendered great assistance to many unfortunate women, and the People's Palace owes much to her generosity. In 1871 she was created a peeress in her own right as Baroness Burdett-Coutts. In 1877 she organized the Turkish Compassionate Fund, to relieve the sufferings of the peasants in Turkey, and in recognition of her services the Sultan conferred upon her the Order of the Medjidie. In 1881 she was married to William Ashmead-Bartlett, who in 1882 obtained the royal license to assume her name.

Burdette', Robert Jones, American humorist: b. Greensboro, Pa., 30 July 1844. He served in the Union army during the Civil War. He is famous for humorous newspaper skits, of rare variety, charm, and unrepentitious freshness; begun in the Burlington (Iowa) *Hawkeye*, of which he became associate editor in 1874. Among his works are: 'The Rise and Fall of the Moustache,' a lecture (1877); 'Hawkeyes,' collected articles (1880); 'Life of William Penn' (1882); 'Sons of Asaph'; 'Chimes from a Jester's Bells'; etc. He was licensed as a Baptist clergyman in 1887.

Burdick, Francis Marion, American jurist: b. De Ruyter, N. Y., 1 Aug. 1845. He was graduated at Hamilton College in 1860, and at its law school in 1872. He practised law in Utica, N. Y., from 1872 to 1883, and was later professor of law at Hamilton College, and at Cornell. Since 1891 he has been professor of law at Columbia. He has written 'Law of Sales'; 'Law of Partnership'; and other legal textbooks.

Burdock, a small genus (*Arctium*) of coarse perennial or biennial herbs of the natural order *Compositae*, natives of temperate Asia and Europe, but widely distributed as weeds throughout the world. Common burdock (*A. lappa*), which often attains a height of four feet, is sometimes planted in flower-borders for its foliage, which makes a good screen; and in Japan, where it has been improved by cultivation, for its enlarged parsnip-like roots, which are eaten as a boiled vegetable. Formerly the roots were used in medicine, but they seem to be generally classed with many other domestic remedies of doubtful value. The plant is best known as a weed in waste land, but usually on good soil. Its globular burs become attached to the wool of sheep and to clothing. Their presence injures the price of wool.

Burdwan, būrd-wān, or **Bardwan**, bārd-wān', India, a town and capital of a division of the same name in the lower provinces of Bengal, on the left bank of the Damoda, 68 miles northwest of Calcutta, with which it is connected by railway. There is a titular rajah of Burdwan, who resides here in a spacious palace, with gardens, etc.; and there are also a large collection of temples and a shrine of Pirba-haram. Pop. 34,477. The division has an area of 13,956 square miles, and a population of about 8,250,000, and is divided into the districts of Burdwan, Bankura, Birbhum, Hugli, Midnapur, and Howrah. The chief crops are sugar, indigo, tobacco, cotton, and the usual cereals. Mulberry-trees are cultivated, and coal is raised.

Bureau, bū-rō, or bū-rō', the chamber or official apartments of an officer of government, and the body of subordinate officials who labor under the direction of a chief. The term "bureau system," or "bureaucracy," is applied to those systems of government in which the business of administration is carried on in departments, each under the control of a chief; and is opposed to those in which the officers of government have a co-ordinate authority. Sometimes a mixture of the two systems is found. Thus the business of the executive branch of government may be carried on by bureaus, while the administration of justice is in the hands of co-ordinate judges. In the United States, bureau is the universal word for a chest of drawers.

Burette, bū-ret', a graduated glass tube occasionally used for dividing a given portion of any liquid into small quantities of a definite amount.

Burg, Adriaan (ä'drē-än) van der, Dutch painter: b. Dordrecht, 1693; d. 1733. He studied under Arnold Houbraken, distinguished himself by his portraits, and acquired a reputation which would soon have procured him an independence. But intemperate habits rendered his talents of no avail, and hurried him to a premature grave. His freedom of touch and fine coloring are his distinguishing excellences. His best-known pieces are two large pictures at Dordrecht, one of which gives on a single canvas portraits of the managers of the orphan hospital, and the other portraits of the officers of the Mint.

Burg, Johann (yō'hän) Tobias, Austrian astronomer: b. Vienna, 1766; d. 1834. He attracted the notice of Van Swieten, who was then at the head of the commission appointed to reform the scholastic estab-

lishments of Austria, and through his patronage obtained the means of prosecuting the study of mathematics, and more especially of astronomy, for which he showed a decided inclination. In 1791 he became professor of physics at Klagenfurt, and in 1792 was appointed colleague of Trisnecker at the Observatory of Vienna. In 1798, the French Institute having proposed a prize for the determination, by at least 500 observations, of the mean place of the apogee and ascending node of the moon, Burg sent in a memoir in which the determination was made by a most accurate and ingenious method, not from 500 but 3,232 observations. The tables contained in it were afterward published by the Institute, and constitute the chief foundation of his fame. In 1813 he became almost entirely deaf and retired from public life to Wiesenau, Carinthia.

Burg, Prussia, a town in the province of Saxony, 12 miles northeast of Magdeburg, on the Ihle, where it joins a canal uniting the Havel with the Elbe. It has four churches, a hospital, a gymnasium, and a well-endowed institution for the bringing up of orphan children, and is the seat of civil and judicial administration for the circle. Its manufactures are extensive, especially of woollens, for which it was a centre as early as the 12th century. Cloths for army purposes are largely made. There are also spinning mills, dye works, machine works, tanneries, oil works, etc. Pop. (1895) 19,397.

Bur'gage Tenure, in England, a tenure in socage, whereby burgesses, citizens, or townsmen hold their lands or tenements of the king or other lord for a certain yearly rent. In Scotland that tenure by which the property in royal burghs is held under the Crown, proprietors being liable to the (nominal) service of watching and warding, or, as it is commonly termed, "service of burgh, used and wont."

Burgas, boor-gäs', or **Bourgas**, Turkey, a seaport of the province of eastern Rumelia, situated on the Black Sea. The bay on which it stands is of sufficient depth for large vessels, and the exports are grain, iron, butter, wine, and also woollen goods for Constantinople. The principal source of the prosperity of the town is the manufacture of pottery, pipe-bowls, cups, etc., for which a superior clay is found in the neighborhood. Pop. about 12,000.

Burgdorf, boorg'dôrf, Switzerland, a town in the canton of Bern, situated on the Emmen. It is the entrepôt for the linen goods and cheeses of the Emmenthal. The castle which stands here was formerly a place of great strength. Pestalozzi resided from 1798 to 1804 in the château of Burgdorf, and converted it into an educational institution. In the vicinity are the baths of Sommerhaus. Pop. 8,400.

Bur'geo Islands, Newfoundland, a group of islands on the southern coast, much visited by summer tourists and artists from the eastern States and Canada. The population is chiefly engaged in fishing. Burgeo, the principal town, has a population of less than 1,000.

Bür'ger, Gottfried August, göt'frēd ow'-goost, German poet: b. 1 Jan. 1748, at Wolmerswende, near Halberstadt; d. Göttingen, 8 June 1794. He showed an early predilection for solitary and gloomy places and the making of verses, for which he had no other model than

hymn-books. He learned Latin with difficulty. In 1764 he studied theology at the University of Halle, and in 1768 he went to Göttingen, in order to exchange theology for law, but soon formed connections here equally disadvantageous to his studies and his morals, so that his grandfather, who had hitherto maintained him, withdrew his support. The friendship of several distinguished young men at the university was now of great service to him. He studied the ancient classics and the best works in French, Italian, Spanish, and English, particularly Shakespeare, and the old English and Scottish ballads. Percy's 'Reliques' was his constant companion. His poems soon attracted attention. In 1772 he obtained the office of baillie in Alten-Gleichen, but throughout his life he was involved in pecuniary difficulties. In 1774 he married the daughter of a neighboring baillie, named Leonhart, but his marriage was unfortunate. He conceived a violent passion for the sister of his wife, and married her, in 1784, soon after his first wife's death. She also, his celebrated "Molly," died in the first year of their marriage. At the same time he was obliged, by intrigues, to resign his place. He was made professor extraordinary in Göttingen, but received no salary, and this favorite poet of the nation was obliged to gain his living by poorly rewarded translations for booksellers. A third marriage in 1790, with a young lady of Swabia, who had publicly offered him her hand in a poem, completed his misfortunes; he procured a divorce from her two years afterward. The government of Hanover afforded him some assistance shortly before his death. His songs, odes, elegies, ballads, narrative poems, and epigrams hold a very high place in German literature, Schlegel especially commending his work, though Schiller criticised him very severely. The first collection of his poems appeared in Göttingen in 1778. His complete works were first published by Reinhard at Göttingen in four volumes in 1796-8, and this edition has been repeatedly published since. Other editions of his works and letters have also been published, and his life has been written by Döring, Pröhle ('G. A. Bürger: Sein Leben und Seine Dichtungen,' Leipsic, 1865), and others.

Burger, Ludwig, lood'vīg boor'gēr, German painter and illustrator: b. Braacow, 19 Sept. 1825. He studied at the Berlin Art Academy, at the same time working at book-illustrating, he was also a pupil of Couture in Paris. Among his best drawings are the illustrations for the works of La Fontaine and a collection of 20 plates known as 'Die Kanone.' Since 1869 he has done considerable work in interior decoration, particularly at the Berlin city hall.

Burgers, boor'gērs, Thomas Francis, Transvaal statesman: b. Cape Colony, 1834; d. 1881. He was educated for the ministry at Utrecht and was pastor of the Dutch Reformed Church of Hanover, Cape Colony. Some of the rationalistic views he expressed led to his trial for heresy, but he was acquitted. He was elected president of the Transvaal republic in 1872 and held the office until 1877, when the republic was annexed by Great Britain.

Burges, bër'jēs, Tristram, American statesman and orator: b. Rochester, Mass., 26 Feb. 1770; d. Providence, R. I., 13 Oct. 1853. When 15 years old he attended a school in the vicinity

for six weeks, and again the next year for six weeks more. This was all the instruction he received from others until he reached the age of 21. In September 1793, he entered Rhode Island College, now Brown University, graduated three years later with the first honors of his class, and was admitted to the bar in 1799. He became a leader of the Federal party, and in 1811 was elected to a seat in the State legislature. In 1815 he was made chief justice of Rhode Island, and afterward became professor of oratory and belles-lettres in Brown University. In 1825 he was elected to Congress, and almost immediately achieved a national reputation by his speech on the judiciary. He continued in Congress until 1835. Many of his most brilliant efforts were in defense of the American tariff system, and his logic and sarcasm won for him an unrivaled reputation as a debater. See Bowen, 'Memoirs of Tristram Burges.'

Bur'gess, Alexander, American Protestant Episcopal bishop: b. Providence, R. I., 31 Oct. 1819; d. St. Albans, Vt., 8 Oct. 1901. He was a younger brother of George Burgess, first bishop of Maine. He was graduated from Brown University in 1838, and from the General Theological Seminary in 1841. He was successively rector at East Haddam, Conn., 1842-3; St. Mark's, Augusta, Me., 1843-54; St. Luke's, Portland, Me., 1854-67; St. John's, Brooklyn, N. Y., 1867-9; and Christ Church, Springfield, Mass., 1869-78. In 1878 he was consecrated first bishop of the diocese of Quincy, Ill. He wrote a popular religious text-book, 'Questions for Bible-Classes and Sunday-schools' (1855), and a 'Memoir of the Life of George Burgess, First Bishop of Maine' (1869).

Bur'gess, Edward, American naval architect: b. West Sandwich, Mass., 30 June 1848; d. Boston, 12 July 1891. He was educated at Harvard, where he graduated in 1871, and became secretary of the Boston Society of Natural History. He was instructor of entomology at Harvard from 1879 to 1883. He then became a designer of sailing-yachts. In 1884 he designed the Puritan, the winner of the America's cup in 1885; and a year later the Mayflower, the winner in 1886. He was also the designer of the Volunteer, which won the cup in 1887.

Burgess, Frank Gellert, American humorous writer and illustrator: b. Boston, 30 Jan. 1866. He was graduated from the Massachusetts Institute of Technology in 1887; was a draughtsman with the Southern P. Ry. 1887-90, and instructor in topographical drawing in the University of California, 1891-4. In 1895-7 he came prominently before the reading public as a publisher and writer of eccentric and humorous literature, such as his journal called 'The Lark,' and poem, 'The Purple Cow' (1897). In 1898 he removed to London, but returned to America in 1900. He edited 'Petit Journal des Refusés' (1897), and has written 'The Lark Almanac' (1898); 'Vivette' (1898); 'The Non-sense Almanac' (1898); 'The Lively City o' Ligg' (1898); 'Goops and How to be Them' (1900); 'A Joyous Journey Round the Year' (1901); 'Romance of the Commonplace' (1902); 'A Gage of Youth' (1901).

Burgess, George, bishop of Maine: b. Providence, R. I., 31 Oct. 1809; d. Haiti, 23 April 1866. After graduating at Brown Uni-

versity, and holding a tutorship in that college, he traveled in Europe, and studied for two years in the universities of Göttingen, Bonn, and Berlin. He was rector of Christ Church in Hartford from 1834 to 1847, when he was consecrated first bishop of the diocese of Maine, and became, at the same time, rector of Christ Church in Gardiner. Both offices he filled with great ability. He published two academic poems, a metrical version of a portion of the Psalms, 'Pages from the Ecclesiastical History of New England' (1847); 'The Last Enemy Conquering and Conquered' (1850), and various sermons.

Burgess, James, Scottish archæologist: b. Kirkmahoe, Dumfriesshire, 14 Aug. 1832. He went to India in 1855, and there entered upon educational work in Calcutta and Bombay. In 1886 he was made director-general of the archæological surveys of India, retiring under age limit in 1889. From 1872 to 1884 he published the 'Indian Antiquary.' His works include: 'The Temples of Shatrunjaya' (1869); 'The Rock Temples of Elephanta' (1871); 'Scenery and Architecture in Gujarat and Rajputana' (1873); and other books; also many writings in the 'Epigraphia Indica,' 'Archæological Reports' (1874-87), etc.

Burgess, John William, American educator: b. Cornersville, Tenn., 26 Aug. 1844. He was educated at Cumberland University, Lebanon, Tenn., and at Amherst College, Mass., graduating there in 1867; studied law, and began to practise in 1869. During this year he was appointed professor of English literature and political economy at Knox College, Galesburg, Ill. Two years later he studied in Göttingen, Leipsic, and Berlin. On his return, he became professor of history and political science at Amherst, in 1870 professor of history, political science, and international law in Columbia College, and in 1880 professor of constitutional and international history and law. In 1906 he became Roosevelt Professor of American history and institutions at Berlin University. He has published 'Political Science and Comparative Constitutional Law' (1890); 'The Middle Period of United States History' (1897); 'The Civil War and the Constitution' (1901); 'Reconstruction and the Constitution' (1902); etc.

Burgess, Neil, American actor: b. Boston, 1846. Not long after entering the theatrical profession, he undertook in a stage emergency to fill the place of an actress, and his success in the humorous female role assumed led to his entering that line permanently. He acted in 'Josiah Allen's Wife' and in 'Widow Bedott.' The latter was very popular, as was also 'Vim,' produced in 1883. 'The Country Fair,' a play which he brought out in 1889, ran for more than two years. Mr. Burgess has lately undertaken vaudeville acting.

Burgess, a word used in somewhat varying senses, but generally meaning a freeholder, or a person invested with all the privileges of a citizen in a borough or corporate town. Those entered on the burgess roll of English boroughs are householders who have resided and paid rates for 12 months prior to July in any year. In the United States the uses of the word have undergone some specific changes, and in States having boroughs as political divisions,

as Connecticut, New Jersey, and Pennsylvania, it carries an implication of magisterial authority. See **BOROUGH**; **BURGH**.

Burgh, *bérg*, the same as borough. The spelling borough is the common one in England and the United States, while burgh is that which chiefly prevails in Scotland, as Scarborough, Edinburgh. A burgh of barony, in Scotland, is a certain tract of land created in a barony by the feudal superior, and placed under the authority of magistrates. A royal burgh in Scotland is a corporate body created by a charter from the Crown. There is a convention of royal burghs. In the United States the termination -borough was for generations added to the names of places, as in England; but, under a decision of the United States Board on Geographic Names, the form is now -boro, as Brattleboro.

Burgher, *bérg'er*, the name applied to a former subdivision of the Scottish Secession Church. The Secession, which originated through the withdrawal of Ebenezer Erskine and some other ministers from the Scottish establishment in 1732, split in two in 1747, part having felt free to take, while others refused, what they deemed an ensnaring burgess oath. They reunited in 1820 under the name of the Associate Synod, and, joining with the "Relief" in 1847, formed the United Presbyterian Church.

Burgin, George B., English novelist and journalist: b. Croydon, Surrey, England, 15 Jan. 1856. He became private secretary to Baker Pasha and accompanied him to Asia Minor as secretary of the Reform Commission in Armenia. In 1885 he returned to England and was for a time sub-editor of 'The Idler.' Among his works are: 'The Dance at the Four Corners'; 'Tuxter's Little Maid'; 'The Judge of the Four Corners'; 'Tomalyn's Quest'; 'Fortune's Footballs'; 'The Cattle Man'; 'The Hermits of Gray's Inn'; 'The Bread of Tears'; 'The Tiger's Claw'; 'A Son of Mammon'; 'A Wilful Woman'; 'The Shutters of Silence.'

Burgkmair, Hans, *hänts boork'mër*, German painter and engraver: b. Augsburg, 1473; d. about 1531. He is supposed to have been a pupil of Albert Dürer. Several of his frescoes and paintings in oil upon wood are still preserved in his native town; but though possessed of considerable merit, they have contributed far less to his fame than his woodcuts, in which he at least equaled Dürer, and has scarcely been surpassed by Holbein. Among his most famous works are the 'Triumph of the Emperor Maximilian I.,' embracing 135 cuts, with a text written by that emperor; and a series, 'The Wise King,' including 237 cuts, in which the deeds of the same ruler are represented.

Burglary, at common law, the breaking and entering the house of another in the nighttime, with intent to commit a felony therein, whether the felony be actually committed or not. Burglary at common law, and in its first degree in the statutes of the various States, must, in general, be committed in a mansion-house actually occupied as a dwelling, but if it be left by the owner *animo revertendi*, though no person resides in it in his absence, it is still his mansion. But at common law burglary may be committed in a church. In New York (Penal Code

§ 496), and in some other States in which the New York statute has been adopted, burglary at common law, or in the first degree, must be committed in the night, but in New York and in some other States burglary in the second and third degrees may be committed in the daytime, and it is burglary in the third degree in New York feloniously to enter a building, whether inhabited or not, either in the daytime or night. Before the offense is complete there must be both a breaking and an entry or an exit. An actual breaking takes place when the burglar breaks or removes any part of the house, or the fastenings provided for it, with violence. Constructive breakings occur when the burglar gains an entry by fraud, conspiracy, or threats. The least entry, with the whole or any part of the body, hand or foot, or with any instrument or weapon, introduced for the purpose of committing a felony, will be sufficient to constitute the offense. Burglary is a felony in all of the States, and in North Carolina it may be punished with death or imprisonment. In New York it is punishable as follows: Burglary in the first degree, imprisonment for not less than 10 years; second degree, not exceeding 10 years; third degree, not exceeding 5 years.

Bürglen, a village of Switzerland, in the canton of Uri, about a mile from Altorf, is the traditional birthplace of William Tell. The supposed site of the patriot's house is now occupied by a chapel, erected in 1522, upon the walls of which are represented certain well-known scenes from his history.

Bur'gomaster, the title of the chief magistrate of a city or a large town in Germany and the Netherlands, practically equivalent to mayor.

Burgomaster, a sailor's name for certain large domineering gulls of the genus *Larus*.

Burgos, Francisco Javier de, fran-thēs'kō há'vēr dē boor'gōs, Spanish statesman and poet: b. Motril, Granada, 1778; d. 1845. In his dramatic compositions he sought to restore the classical Spanish comedy. Among them are: 'The Three Equals'; 'The Masked Ball'; and 'The Optimist and the Pessimist.' He wrote a celebrated 'Ode to Reason.'

Burgos, a city of northern Spain, the capital of the province of Burgos, and formerly of Old Castile, and once the residence of its kings. It stands on the declivity of a hill, on the right bank of the Arlanzon. The streets are narrow and dark, the finest in every respect being that called the Huerto del Rey. Places of promenade are numerous; the one most frequented, and justly forming the boast of the town, being the Espolon. The most remarkable structure is the cathedral, one of the finest buildings of the kind in Europe. It was begun in 1221, but was not finished for several centuries. It is built of white marble in the form of a Latin cross, and is about 300 feet long by 200 broad, and its size is such that service can be performed in eight chapels at once without confusion. Its interior, as well as its exterior, is of great magnificence, is adorned with fine carvings and paintings, and contains numerous monuments, in particular the tombs of Don Fernando and the Cid, both natives of Burgos, and celebrated throughout Spain for their heroic achievements in the wars with the Moors. There are several other fine churches,

but the rest of the public buildings are not deserving of notice. The wool of Old Castile passes principally through Burgos, and it has some woolen manufactures. Burgos is the see of an archbishop, and at one time contained a university. Pop. (1900) 31,413. The province of Burgos is bounded on the north by Santander, east by Alava, Logroño, and Soria; south by Segovia, and west by Palencia and Valladolid. The area is 5,650 square miles. Pop. (1897) 340,001.

Burgoyne, bér-goin', John, English general and dramatist: b. 24 Feb. 1723; d. London, 4 Aug. 1792. He was the son of Capt. John Burgoyne, and grandson of Sir John Burgoyne of Bedfordshire, although reputed to be a natural son of Lord Bingley. Educated at Westminster, he entered the army at an early age, and while a subaltern eloped with Lady Charlotte Stanley, daughter of the Earl of Derby. By this alliance his military advancement was secured. After an election to Parliament in 1761, he served with distinction in Portugal, and was sent to America in 1775. He joined Gen. Gage at Boston, with large reinforcements, and witnessed the battle of Bunker Hill, of which he has left an animated description. After proceeding to Canada as governor, he returned to England, but in 1777 was despatched to take command of that expedition from Canada against the United States, the failure of which so largely contributed to the establishment of American freedom. Indeed, few battles have led in their ultimate influence to results so great as did the surrender of Burgoyne with 5,791 fighting men, well provided with artillery, at Saratoga, to the army of Gen. Gates. On his return home, he was received by the king with marked disfavor. Burgoyne did not possess the genius of a great general, and was in many respects utterly inadequate to the tasks imposed upon him, yet no one can read his work written in his own defense, 'State of the Expedition from Canada' (London 1780), without acknowledging his courage, and detecting qualities, which, in a less exalted station, might have been of much service to his country. Disgusted with his treatment by the government, he retired to private life, and devoted his leisure to the production of dramas, some of which, as 'The Maid of the Oaks,' 'The Lord of the Manor,' etc., were highly popular in their day. His best play, 'The Heiress,' has been successful not only in its original tongue, but also in several foreign versions. He was made commander-in-chief in Ireland in 1782, and in 1787 was one of the managers of the impeachment of Warren Hastings, whose trial lasted through several years after Burgoyne's death. See SARATOGA, BATTLES OF.

Burgoyne, Sir John Fox, English officer of engineers: b. 24 July 1782; d. 7 Oct. 1871. He was the son of Gen. John Burgoyne; was educated at Eton and at the Royal Military Academy at Woolwich; entered the Royal Engineers in 1798; served at Malta in 1800, in Sicily with Gen. Stewart in 1806, in Egypt in 1807, and in the Peninsula with Sir John Moore and Wellington from 1809 to 1814. He shared in the celebrated retreat on Corunna, and was present at all the sieges, generally as first or second in command of the engineers, and at most of the battles of the Peninsular war,

in which he was twice wounded. During the War of 1812, he assisted as lieutenant-colonel and chief engineer in the attack on New Orleans. In 1826 he accompanied the army of Gen. Clinton to Portugal in the same capacity. He was appointed chairman of the Board of Public Works in Ireland in 1830 and in 1845 became inspector-general of fortifications in England. He was made a lieutenant-general in 1851, and on the outbreak of the Crimean war was sent to Turkey to provide for the defense of Constantinople. After returning to England he was again sent out to Sebastopol, where he was chief of the engineering department till recalled in 1855. He received the order of the Medjidie from the Sultan of Turkey, was made a general in 1855, the following year was created a baronet, in 1868 a field-marshal, and for some years, up to his death, held the appointment of constable of the Tower of London. In 1859 a work was published in London under the title of 'Military Opinions of Gen. Sir J. F. Burgoyne,' in which many of his official writings were collected.

Burgrass. See **SANDBUR.**

Bur'grave, a count who in the Middle Ages had command of a castle or burg. Burgraves were appointed to their office by the emperor or by the bishops; and belonged to the nobility by virtue of their office. Their powers differed in different places, but as a rule they were entrusted with keeping the public peace, the oversight of trade and the market, and the command of the troops and the police in their districts. As the free cities grew in power they were separated from the jurisdiction of the burgrave. The office lost its significance in the course of the 13th century, but the title is retained by some princely families to the present time, as, for instance, by the kings of Prussia who have the title of Burgrave of Nuremberg.

Bur'gundy, Louis (DUKE OF), Dauphin of France: b. Versailles, 6 Aug. 1682; d. 18 Feb. 1712. He was grandson of Louis XIV. and father of Louis XV. A boy of ungovernable passions and temper, great haughtiness of bearing, and sensuality of life, he is said to have been much corrected in character and conduct by the influence of his preceptor, the saintly Fénelon. At the age of about 15 he married Princess Adelaïde of Savoy; was made generalissimo of the army in 1701; and on the death of his father became heir-apparent to the throne. He was called the Grand Dauphin, and from his relationship to two of the greatest sovereigns of France his figure gains a historical importance out of all proportion to that of his own personality and career.

Bur'gundy, a region of western Europe, so called from the Burgundians, a Teutonic people originally from the country between the Oder and the Vistula. They migrated to the region of the Upper Rhine, and in the beginning of the 5th century they passed over into Gaul, and after a long struggle obtained possession of the southeastern part of this country. Here they founded a kingdom, which had as its seat of government sometimes Lyons and sometimes Geneva; but having become engaged in a war with the Franks, they were at last wholly subdued in 534. More than one kingdom of Burgundy, so called, subsequently arose, as well

as the important county of Burgundy (Upper Burgundy, Franche-Comté); but the most important state of this name was the duchy of Burgundy (Lower Burgundy), consisting principally of the French province Bourgogne (Burgundy, properly so called). The long line of ancient Dukes of Burgundy became extinct in 1361 with the death of Duke Philip, and Burgundy was immediately united by King John of France with the French crown. The dignity of Duke of Burgundy was restored in 1363 by his grant of the dukedom to his youngest and favorite son, Philip the Bold (q.v.). In 1368 he married Margaret, the widow of the last Duke Philip of the old line, only daughter and heiress of Louis III., Count of Flanders, and thereby greatly augmented his possessions, which now included Flanders, Mechlin, Antwerp, and Franche-Comté. In 1402 he was made regent of France, an appointment which gained him the hatred of the king's brother Louis, Duke of Orleans, and led to the struggle between the Orleanist and the Burgundian factions. In 1404 Philip died, and was succeeded by his son, John the Fearless, who was stabbed by the companions of the dauphin in 1419. His son and successor, Philip the Good (q.v.) gained great accessions of territory, including Hainault, Holland, Zealand, Namur, and in 1431 Brabant and Limburg, which reverted to him from a younger branch of his family. In 1441 he also obtained the duchy of Luxemburg. On his marriage with his third wife, Isabella, daughter of King John of Portugal, he founded the order of the Golden Fleece. His son, Charles the Bold (q.v.), who succeeded him in 1467, became the inveterate enemy of Louis XI. of France, and one of the most powerful princes in Europe. He acquired Gueldres in 1475, but perished in the fatal battle of Nancy in 1477, leaving behind him a daughter, Maria, the sole heiress of his states. She married Maximilian of Austria, who thus obtained the Netherlands and Upper Burgundy. The king of France received the dukedom of Burgundy, which he assumed as a male fief. Henceforth the territories that had belonged to Charles shared the fortunes either of France or of the empire. In the empire what was called the circle of Burgundy for a time embraced Franche-Comté and the Netherlands. In the Peace of Madrid, in 1526, Francis I. was obliged to agree to the cession of the duchy of Burgundy to Charles V. of Germany, but the cession was never carried out, and in the Peace of Cambray, in 1529, Charles renounced his claim to it. Franche-Comté was conquered by Louis XIV., and retained by him at the Peace of Nimeguen in 1678. After this time the name Burgundy is best known as designating one of the provinces or governments of France.

Burgundy (called also Burgundy Proper, or Lower Burgundy), formerly a province in the east of France, lying on the west of Franche-Comté, and on the south of Champagne. It now forms the four departments of Yonne, Côte-d'Or, Saône-et-Loire, and Ain. It is one of the most productive regions in France. The principal product is wine. See **BURGUNDY WINES.**

Burgundy Pitch, the resinous exudation of the stem of the spruce fir (*Abies excelsa* or *Pinus abies*), melted and strained. It is ob-

BURGUNDY WINES—BURITI PALM

tained from Switzerland, but is seldom genuine. It is hard and brittle, opaque, of a dull reddish-brown color, empyreumatic odor, and aromatic taste. It gives off no water when heated, is not bitter, and is free from vesicles. It consists chiefly of resin and a little volatile oil, whence its odor. The resin resembles that of turpentine. Pitch plaster acts externally as a slight stimulant to the skin. Burgundy pitch enters also into the composition of the iron plaster. It takes its name from Burgundy in France, where it was first prepared.

Burgundy Wines, famous French wines, deriving their name from the ancient province of Burgundy. They have a reputation superior to their present popularity. They are nevertheless wines of delicious flavor and bouquet. It has been supposed that they would not well bear a sea-voyage, but it is now settled that when transported to America and back, their quality is greatly improved. The most renowned red wines of Burgundy are Romané-Conti, Clos-Vougeôt, Chambertin, and Richebourg. Chambertin was the favorite wine of Louis XVI. and Napoleon. Chablis, a white wine, has many admirers, but is inferior to the best growths of the Garonne and the Rhone.

Burhānpur, boor-ḥan-poor', a town of the Nimar district, Central Provinces, British India, formerly the capital of Khandesh, is situated on the Tapti River, about 300 miles northeast of Bombay. It is situated on high ground, and is well planned and built. It has a mosque and other buildings worthy of note, and was once famous for its manufactures of gold and silver brocade, muslin, and silks, which still exist to some extent, though the town has long been declining.

Burhel. See **BAHRAL**.

Buri, boo-rē, the grandfather of Odin, in Norwegian mythology. According to the legends 12 streams flowed from the spring Hvergelmir in Niflheim (the region of shadows), and later in their course were frozen, thus surrounding the region of elemental fire (Muspelheim) with blocks of ice. From this ice came the giant Ymir and the cow Audhumla; from the cow's udder came four streams of milk with which the giant was fed. Audhumla was nourished by licking the salt ice-blocks, and as she licked them a man's hair appeared on the first day; a man's head on the second day and the whole man on the third day; this was Buri. He was of giant size and strength; he had a son Bor through whom he was the grandfather of Odin, Vili, and Ve.

Bur'ial, the ordinary method of disposing of the dead, a practice which varies among different peoples. Among savage races, and even among some civilized peoples of the East, exposure to wild animals or birds of prey is not uncommon. The careful embalming of the dead by the ancient Egyptians may be regarded as a special form of burial. But by far the most common forms of disposing of the dead have been burning and interring. Among the Greeks and Romans both forms were practised, though among the latter burning became common only in the later times of the republic. In this form of burial the corpse, after being borne in procession through the streets, was

placed upon a pyre built of wood, and profusely sprinkled with oils and perfumes. Fire was set to the wood, and after the process of cremation was complete the bones and ashes were carefully gathered together by the relatives and placed in an urn. With the introduction of the Christian religion, consecrated places were appropriated for the purpose of general burial, and the Roman custom of providing the sepulchre with a stone and inscription was continued by the Christians. The practice of cremation now declined and finally disappeared, but has recently to some extent been revived. See **BURYING-PLACES**; **CREMATION**; **FUNERAL RITES**; **MOUND BUILDERS**; **MUMMY**; etc.

Buriats, boo-rē-äts', a Mongol people, forming a branch of the Kalmucks, and who submitted to the Russians in 1644. They inhabit the southern part of the government of Irkutsk and Transbaikalia, and number more than 200,000. They support themselves by their flocks, by hunting, and the mechanical arts, particularly the forging of iron. Their dress consists partly of leather. Their religion is partly Lamaism and partly Shamanism; and their idols are sometimes painted on cloth, and sometimes made of wood, metal, felt, and sheepskin.

Buridan, Jean, zhōn bū-rē-dān, French scholastic philosopher: b. Béthune, Artois, about 1300; d. after 1358. He studied at Paris, where he attached himself as a disciple of Occam to the party of the Nominalists, and at a later time became himself a teacher. In the end he was forced by his opponents to flee from Paris, when he betook himself to Vienna, where he is said to have been influential in bringing about the establishment of the university. Here also he wrote some logical and ethical treatises, in which he appears as a zealous adherent of the Aristotelian philosophy. Buridan was a supporter of the doctrine of Determinism (q.v.), and he is now chiefly known through having his name attached to an illustration that he is said to have used in support of his views, and known as "Buridan's Ass." He is said to have supposed the case of a hungry ass placed at an equal distance from two equally attractive bundles of hay, and to have asserted that in the supposed case the ass must inevitably perish from hunger, there being nothing to determine him to prefer the one bundle to the other. This illustration, however, is not found in any of his works, and from its nature it would appear more likely to have been used by the assailants of the doctrine of Determinism. He wrote 'Compendium Logicae' (1489), and other works.

Bu'rin, or **Graver**, the principal instrument used in copper engraving, is made of tempered steel, and is of prismatic form, the graving end being ground off obliquely to a sharp point. The distinctive style of a master is frequently described by such expressions as a soft burin, a graphic burin, a brilliant burin, etc.

Buriti (bu-rī-tē') **Palm**, a lofty, fan-leaved palm (*Mauritia vinifera*), common in swamps in northern Brazil. It bears abundant crops of scaly nuts about two inches long, from the reddish oily pulp of which a confection is made by boiling with sugar. The nuts also yield an oil which is emulsified to make a popular drink. After the tree is felled numerous cup-like holes are made in the prostrate trunk.

These become filled with a reddish fluid, which is used as a beverage. Its taste resembles some sweet wines.

Burke, Edmund, political philosopher and orator: b. Dublin 12 Jan. (probably) 1729; d. Beaconsfield, England, 9 July 1797. He was the son of a solicitor in good practice. His mother was a Roman Catholic, but he and his two brothers adopted the religion of their Protestant father. Always, however, he was tolerant of Catholicism. At the age of 14 he entered Trinity College, Dublin, where he took his bachelor's degree in 1748. In this period, as his letters show, he had fits of enthusiasm over various studies—a *furor mathematicus*, succeeded by a *furor logicus*, a *furor historicus*, and a *furor poeticus*. The 17 years between 1748 and 1765, when his career was finally determined by his election to Parliament, he spent in different employments. Going to London with the intention of taking up law, he succumbed to the attractions of literature and philosophy. He travelled in England and on the Continent, frequented debating clubs and theatres, and did more or less hack work for publishers. He printed nothing, however, with which his name is connected till the two books of 1756: 'A Vindication of Natural Society' and 'A Philosophical Inquiry into the Origin of Our Ideas on the Sublime and Beautiful.' In the first he attempted to refute Bolingbroke's arguments against revealed religion by showing that they might be urged with equal force against the organization of society. In the second he took up a subject much discussed at the time; and though his speculations have been superseded, he has the credit of stimulating Lessing to the production of 'Laokoon.' Burke also wrote or helped to write an 'Account of the European Settlements in America' (1757), and an 'Abridgment of the History of England' (1758). In 1759 he began to edit the *Annual Register*, with which he was connected for 30 years. In 1761 he went to Ireland, attached in some indefinite way to William Gerard Hamilton—"Single-speech" Hamilton—who was secretary to the lord-lieutenant. After two years in Dublin he returned to England; there he joined the famous Literary Club, with which are associated the names of Johnson, Goldsmith, Sir Joshua Reynolds, and Garrick.

In recognition of his abilities and of the knowledge of politics which he had shown in the *Annual Register*, he was offered the post of private secretary to Lord Rockingham when the latter became prime minister in 1765. In the same year he was elected member of Parliament from Wendover. Within a week or two he made a strong impression with two speeches for the repeal of the Stamp Act. Upon the fall of the Rockingham ministry, Burke, who might have had a place with the new administration, remained with his friends. Turning to their account his literary powers, he began his series of great political tracts. In 1769 he put forth 'Observations on the Present State of the Nation,' a reply to a pamphlet by George Grenville. In this controversy Burke showed himself a master of the details of revenue and finance. At this time he took part in some transactions which afforded his enemies a handle against him. Though he had been living almost from hand to mouth till he entered

Parliament, he bought in 1768 an estate worth upwards of \$100,000. The underlying facts have never been determined with complete satisfaction. This much, however is clear: Burke lived on terms of intimacy with his brother Richard and a distant kinsman, William Burke. Richard and William, together with Lord Verney, a political patron of Edmund, speculated in stock of the East India Company, and later Richard was engaged in questionable dealings in West Indian lands. That these ventures were shared by Burke has been charged but never proved. On the other hand it can be shown that most of the money for the purchase of his estate he borrowed from Lord Rockingham. After getting the place, he had to borrow right and left to maintain it. Probably his faults were neither dishonesty in speculation nor venality in Parliament, but undue ambition to live as he thought became his position, carelessness and improvidence, and an adherence to eighteenth century standards of propriety, which in such matters were lower than ours.

Whatever his shortcomings in managing his private affairs, his services to the public were very great. He was on the side of the people in the long contest over John Wilkes. Since his sentiments on this subject were in general those of the 'Letters' of Junius, he was suspected of being Junius. This accusation he denied; and his 'Thoughts on the Cause of the Present Discontents' (1770) showed so many differences on minor points that—were no other evidence available—it must be concluded that Burke was not Junius. In the 'Thoughts' Burke argued that the king and a small knot of advisers were building up power for themselves; that powers of government are held in trust for the people; and that popular impatience must therefore be indulged. But, true to his conservative instincts, he would not accept the radical reforms commonly proposed—universal suffrage and the disfranchisement of "rotten boroughs." He would have changes more gradual. During the years immediately following 1770 Burke devoted his energies to keeping the Rockingham Whigs united against the efforts of the king to win them over. Without Burke, says John Morley, "the Rockingham connection would undoubtedly have fallen to ruin, and with it the most upright, consistent, and disinterested body of men then in public life."

From his political activity Burke withdrew for a time in 1773 for a trip to France. There he observed two things which he strongly dreaded: atheism and an eager questioning of the "allowed opinions which contribute so much to the public tranquillity." This atheism and speculation, he perceived—and he was one of the few who were so clear-sighted—were working toward revolution. His fear of these tendencies he expressed in Parliament not long after his return.

By this time Burke had won a substantial reputation throughout the United Kingdom. Indeed, as early as 1766 at least one Irish municipality had voted him the freedom of the city; and in succeeding years English mercantile organizations passed resolutions commending his labors in behalf of commerce. Finally in 1774, when troubles with America were thickening, Bristol, the trading centre of the west of England, a city which had everything to lose

and nothing to gain from a war with the colonies, elected him to Parliament. At the conclusion of the poll his colleagues had promised obedience to the instructions of his constituents. Burke, however, declared his independence: "Your representative owes you, not his industry only but his judgment; and he betrays you instead of serving you if he sacrifices it to your opinion." To this declaration he adhered when in 1778 a bill was proposed relaxing restrictions upon Irish commerce. The English merchants, including those of Bristol, protested; but Burke replied, "England and Ireland may flourish together. The world is large enough for us both. Let it be our care not to make ourselves too little for it." ("Two Letters to Gentlemen in Bristol.") For this liberality Burke was never forgiven, and in the election of 1780 he was forced to seek a new constituency.

It was during his six years as member for Bristol that, in the contest over America, he rose to his full height as a statesman. He was almost alone among the speech-makers of that time in always going below the superficial considerations of the moment to the fundamental fact that in the long run restraint and violence defeat themselves. In addition to many minor speeches scattered through the 'Parliamentary History' he made three great contributions to the subject: 'Speech on American Taxation,' 19 April 1774; 'Speech on Conciliation,' 22 March 1775; and 'Letter to the Sheriffs of Bristol,' 3 April 1777. In the first he argued that the tea duty was of no use to England for revenue; that it served only to irritate the Americans; and that by winning the loyalty of the colonists England would get more than she could ever take by force. In the second speech Burke maintained that England must conciliate, and that the only way was by yielding. In the 'Letter' he reviewed the struggle and in the light of events justified his own position. Of the three pieces that on 'Conciliation' is the best. Not even when dealing with India does Burke excel in grasp of details, in lucid presentation of a large mass of facts, and in ripened political wisdom. Then, too, he saw what so many failed to observe, that the real cause of the contest lay deeper than the casual orders of a governor or the retaliation of a mob; and that America, in resisting the encroachments of royal prerogative, was fighting a battle for the liberties of Englishmen at home.

Though Burke could not win over Parliament to his views on America, he had better success with his 'Speech on the Plan for Economical Reform' (1780). People were staggering under the debt from the American war and agitating for a general reform of Parliament. Burke opposed such radical changes; he proposed to abolish some offices, consolidate others, and reduce salaries. One of the offices which he reformed, that of paymaster of the forces, he himself occupied in 1782. At that time the North ministry yielded to the Whigs, who were temporarily united under Lord Rockingham, Charles James Fox, and Lord Shelburne. Burke, owing in part to infirmities of his temper and the suspicions against him, got only this third-rate position, instead of a place in the cabinet. The Whigs were scarcely in their seats when Lord Rockingham died and Lord Shelburne became head of the administration. At

once Fox and Burke refused to work with him, and by joining their old enemy Lord North, in what is known as the Coalition, they broke up the Whig party. Burke is accused of deserting his principles for purely personal motives. His conduct is hard to defend; for he attacked Shelburne with asperity, and under the Coalition resumed for a few months the office of paymaster.

Against this dubious course we may set his strenuous advocacy of reform in India. That country was victim of the corrupt and cruel system of the East India Company. Burke was familiar with the subject, for he had been a member of select committees on Indian affairs and had drawn two important reports. He is also supposed to have framed the East India bill commonly known as Fox's. At any rate he defended it (1 Dec. 1783) in one of his best speeches. The bill, however, was defeated, and the Coalition, which supported it, driven from office. Early in 1785 Burke renewed the attack in his 'Speech on the Nabob of Arcot's Debts'—a preliminary to the proceedings against Warren Hastings. In 1786 Burke drew the articles against Hastings. The trial dragged on till 1795; and though the verdict at last was for acquittal, Burke had none the less succeeded in reforming the government of India; for he had trumpeted the wrongs of that "emptied and emboweled" land till public sentiment would no longer tolerate them.

Before the trial of Hastings had closed, the French Revolution had broken out. Burke looked upon it, not as the emancipation of oppressed masses, but as an effort of atheists and political theorists to uproot the settled order. Since his views were hostile to those of the more radical Whigs, he began to draw away from the men with whom he had been allied against the encroachments of the crown in England and America. In 1790 he widened the breach still further by aggressive proclamation of his opinions in 'Reflections on the Revolution in France.' The book had for that day an enormous sale and divided Great Britain into two parties: one composed of Burke and an uncongenial company of Tories; the other of liberals, many of whom had been Burke's life-long associates. Burke himself violently quarreled with his old friend Fox. The seeming contradiction between his early position and his later is accounted for in part by the fact that he grew more conservative with age, in part by his desire to preserve the balance between monarch and subject. In England the crown had been the aggressor; in France, he thought, the people. Moreover, he had always insisted that liberty is "inseparable from order"; and in France he saw nothing but disorder. As the Revolution progressed, Burke became more and more wrought up, so that in each of his succeeding utterances—'Letter to a Member of the National Assembly' (1791), 'Appeal from the New to the Old Whigs' (1791), 'Thoughts on French Affairs' (1791), 'Remarks on the Policy of the Allies' (1793), 'Observations on the Conduct of the Minority' (1793), and 'Letters on a Regicidal Peace' (1796)—the reasoning grew feebler, the scolding shriller.

During the same period, when Burke was dealing with a subject on which he was more thoroughly informed, Ireland, he showed his old qualities of statesmanship. He had always been

BURKE

a champion of his down-trodden native land. When Ireland caught the contagion of the French Revolution, and when the war between England and France made Ireland still more restless, Burke urged for Ireland the same policy of conciliation that he had urged for America. In letter and pamphlet he unceasingly advocated relieving the Catholics of their political disabilities.

In 1794 he retired from Parliament. He was to have received a peerage with the title Lord Beaconsfield; but since the death of his son left him without direct male heir, he accepted instead a pension. This was the occasion of a fresh attack upon him by his enemies. He replied effectively in the 'Letter to a Noble Lord' (1796).

His zeal in behalf of the wretched and the oppressed was not a mere vague sentiment; it was a motive in his daily conduct. When the poet Crabbe was obscure and penniless Burke took him into the family, found a printer for his verses, and finally obtained for him a living in the Church. At the time of the Revolution Burke also kept open house for French refugees and established a school for their children. Burke's principles of statesmanship, when briefly set down, seem very bald and simple. The basis of his system is explained in a sentence from one of his letters: "The principles of politics are those of morality enlarged." The first of the moral laws upon which he rested great weight was justice; the second, generosity. Knowing that perfect justice could never be obtained, that human institutions are at best compromises, he was not a theorist, he did not fall into the fallacy that the machinery of government may be constructed as if men were uniform, passive units. These phases of his bent for the practical are in the last analysis a trust in experience. A man who clings so tenaciously to experience is likely to be an uncompromising conservative; and Burke was for his generation and all generations since, the "great pleader for conservatism." As an orator he frequently produced no immediate effect. His gestures were clumsy, and when he spoke in public his voice was somewhat harsh, he dropped into a strong Irish brogue, and at times a hurried articulation. But, above all, he overestimated the capacity of his hearers. Not content with a concise presentation of leading points, he insisted on applying profound philosophic principles. Yet some of his speeches, notably at the trial of Warren Hastings, produced a profound effect. This effect was largely due to the vigor of his style as a writer. He was virile, vivid in description, and unsurpassed in lucid and logical arrangement of material.

In the winter of 1756-1757 he married Jane Nugent, daughter of a physician. Her capacity for management lifted many burdens from his shoulders. His only child, a son, Richard, died in 1794.

Among his important writings or speeches not already mentioned are 'Address to the King' (1777), 'Letter to Sir Hercules Langrishe' (1792), 'Thoughts and Details on Scarcity' (1795).

Bibliography.—There are in the market three or four editions of Burke's writings and speeches, substantially complete. The best short life is in the 'Dictionary of National Biography.'

John Morley's *Life of Burke* (1879) in the English 'Men of Letters' is excellent; also his 'Burke, a Historical Study' (1867). Of the earlier lives James Prior's (2d. ed. 1826) is the best. Of course Burke bulks large in the standard histories and memoirs of England in the 18th century.

HAMMOND LAMONT,
Editor New York Nation; Editor 'Burke's Speech on Conciliation with America.'

Burke, Jane, better known as CALAMITY JANE; American army scout and mail carrier: b. Princeton, Mo., 1852; d. Deadwood, S. D., 1 Aug. 1903. She was reared on the plains and early became an Indian scout, and was an aide to Gen. Custer and Gen. Miles in numerous campaigns. For several years she was the government mail carrier between Deadwood, S. D., and Custer, Mont.

Burke, John, Irish genealogist: b. near Parsonstown, Ireland, 1786; d. Aix-la-Chapelle, 27 March 1848. His life was devoted to genealogical research. In 1826 he began to publish a 'Genealogical and Heraldic Dictionary of the Peerage and Baronetage of the British Empire' and subsequent works by him were: 'A Genealogical and Heraldic History of the Commoners of Great Britain and Ireland' (1833-8), which in subsequent editions appeared as 'A Dictionary of the Landed Gentry.'

Burke, Sir John Bernard, English herald and genealogist; son of John Burke (q.v.): b. London, 1815; d. Dublin, 13 Dec. 1892. He was educated at Caen in Normandy, was trained as a lawyer and called to the bar in 1839. Besides editing the successive issues of the 'Peerage' founded by his father (49th ed. 1887), he published other works on the 'Landed Gentry' (1846); 'Extinct Peerages' (1846); 'Anecdotes of the Aristocracy' (1849); 'Family Romance' (1853); 'The Vicissitudes of Great Families' (1859); 'The Rise of Great Families' (1873); 'The Book of Precedence' (1881); and 'Reminiscences' (1882).

Burke, Maurice Francis, American clergyman: b. Ireland, 5 May 1845. He came to the United States in childhood and was educated in Chicago and Notre Dame, Ind., and in the American College, Rome, where he was ordained to the Roman Catholic priesthood in 1875. Returning to the United States, he took charge of a parish in Joliet, Ill. In 1887 he was consecrated bishop of Cheyenne, Wyo., and in 1893 was transferred to the see of St. Joseph, Mo. Bishop Burke is known as a fine linguist.

Burke, Robert O'Hara, Australian explorer: b. county Galway, Ireland, 1820; d. Australia, 28 June 1861. After serving in the Austrian army he went to Australia, and after seven years' service as inspector of police was appointed commander of an expedition to cross the continent of Australia from south to north. He and his associate, Wills, reached the tidal waters of the Flinders River, but both perished of starvation on the return journey. They were among the very first white men to cross the Australian continent from south to north.

Burke, Thomas Martin Aloisius, American clergyman: b. Ireland, 10 Jan. 1840. He came in childhood to Utica, N. Y., and was educated in Toronto and Baltimore and was ordained to the Roman Catholic priesthood in

1864. He was appointed to labor in Albany and became successively vicar-general and administrator. In 1894 he was consecrated bishop of Albany.

Burke, Thomas Nicholas, Irish clergyman and orator: b. Galway, 1830; d. 1883. He was educated in Italy, where he entered the Order of St. Dominic. Going to England, he preached in that country and later in Ireland, gaining a high reputation as an orator and becoming familiarly known as "Father Tom." In 1872 he made a visit to the United States and lectured in reply to Froude, his addresses appearing in print under the title of 'English Misrule in Ireland.'

Burke and Hare, two miscreants, of whom William Burke, a native of Ireland, was detected, tried, and executed at Edinburgh, in 1829, for the murder of numerous individuals, his accomplice, Hare, escaping the hangman by turning king's evidence. At this time the "resurrectionists" were busy at their nefarious trade, but the vigilance with which the burying-grounds throughout the country were watched rendered a supply of subjects for anatomical schools almost impracticable, and the demand for dead bodies consequently became great. This led Burke and Hare to murder, by suffocation, many poor waifs who were decoyed into Hare's lodging-house, and whose bodies they sold to Dr. Robert Knox, proprietor of an anatomical theatre in Edinburgh. The case of Burke and Hare brought home to the public mind more clearly than ever how necessary it is that schools of anatomy should receive a regular supply of subjects for dissection, and in 1832 an act was passed for supplying the anatomical schools throughout the kingdom from the unclaimed dead in the hospitals.

Bürkel, Heinrich, hîn'rîh bür'kêl, German painter: b. Pirmasens, 30 March 1813; d. Munich, 10 June 1869. He was educated at Munich and in Italy; he is chiefly a genre painter; his scenes from the Bavarian and Tyrolean Alps were among the first of their kind, and his village and tavern scenes rank among the best in modern art. Among his paintings are 'Scenes in an Inn' and 'Winter Scenes in the Tyrol.'

Bur'kitt, Francis Crawford, English Biblical scholar: b. London, 3 Sept. 1864. He was graduated at Trinity College, Cambridge. He has published 'Early Christianity Outside the Roman Empire' (1899); 'Fragments of Aquila' (1897); 'The Rules of Tyconius' (1894); 'Two Lectures on the Gospels' (1900); etc.

Burleigh, bër'li, George Shepard, American writer, brother of William H. Burleigh (q.v.): b. Plainfield, Conn., 26 March 1821; a. Providence, R. I., July 21, 1903. He has published 'The Maniac and Other Poems'; 'Signal Fires on the Trail of the Pathfinder.'

Burleigh, William Cecil (LORD), English statesman: b. Bourn, Lincolnshire, 13 Sept. 1520; d. London, 4 Aug. 1598. He was secretary of state under Edward VI. and Elizabeth, and prime minister of England for 40 years. In 1588 Parliament was assembled, and, by his advice, a plan of religious reform was laid before it. In this he had a considerable share; and he also took the leading part in the establishment of the Thirty-nine Articles of faith, which form the basis of the reformed religion

of the State. To him is also due the regulation of the coinage, which had been altered since Henry VIII.'s time. He was created Baron Burleigh in 1571, and, in 1588, concluded an advantageous treaty with the Netherlands. His policy was both cautious and comprehensive and he was entirely unaffected by personal prejudices in his management of public affairs. Consult: Nares, 'Memoirs of Lord Burghley' (1828-31); Charlton, 'Life' (1847); Ilume, 'Great Lord Burleigh' (1898).

Burleigh, William Henry, American poet: b. Woodstock, Conn., 2 Feb. 1812; d. Brooklyn, N. Y., 18 March 1871. Bred on a farm, at 16 he became apprentice to a clothier, then to a village printer, and continued to labor in various places as journeyman printer, and finally as editor. In the latter capacity he had charge of the 'Literary Journal' at Schenectady, the 'Christian Witness', at Pittsburg, and the 'Washington Banner', in which papers, and in others, he published many short poems. A collection of them was published in 1840.

Burlesque, the comic effect arising from a ludicrous mixture of things high and low. High thoughts, for instance, are clothed in low expressions, or noble subjects described in a familiar manner, or *vice versa*.

Burlingame, Anson, American diplomatist: b. New Berlin, N. Y., 14 Nov. 1822; d. St. Petersburg, Russia, 23 Feb. 1870. After graduating from the Harvard Law School in 1847 he practiced law in Boston, and entering politics was active as a Free Soil advocate in 1848, and in 1854 was sent to Congress as a representative of the American Party. His vigorous denunciation of the assault upon Senator Sumner by Preston Brooks brought him a challenge from the latter, which was accepted, but Brooks declined to travel to the rendezvous in Canada. In 1861 he was sent as minister to Austria but was not received by the Austrian government on account of his advocacy of Hungarian independence. He was minister to China 1861-67, and in the last-named year was appointed ambassador from China to the United States and various European governments. On 4 July 1868 he concluded the noted 'Burlingame Treaty' which gave reciprocal privileges to China and the United States. After concluding treaties between China and Denmark, Sweden, Holland and Prussia, he died while arranging a treaty between China and Russia.

Burlingame, Edward Livermore, an American editor, son of Anson Burlingame (q.v.): b. Boston, 30 May 1848. He studied at Harvard and acted as private secretary to his father, who was United States minister. Since 1879 he has been associated with the publishing house of Charles Scribner's Sons, and in 1886 became editor of 'Scribner's Magazine.'

Burlington, England. See BRIDLINGTON.

Bur'lington, Iowa, a city and county-seat of Des Moines County, on the west bank of the Mississippi River at the intersection of the Chicago, Burlington, and Quincy, and several other lines of railroad. Its industries include the manufacture of machinery, furniture, agricultural tools, flour, linseed oil, soap, and many other articles, and extensive railroad shops are situated here. The city contains among its

BURLINGTON — BURMA

important buildings an opera house, court-house, city hall, hospitals, public library, schools of various kinds, and Burlington Institute College. Crapo Park, containing 100 acres, is in the southern part of the city. Burlington is governed by a mayor, elected biennially and a city council, and was named for Burlington, Vt. Its earliest buildings were built in 1833 and from 1837 to 1840 it was the State capital. Pop. (1900) 23,201.

Burlington, N. J., a city and port of entry in Burlington County, on the Delaware River and the Pennsylvania R.R.; 18 miles northeast of Philadelphia. It is a manufacturing trade centre for surrounding towns, and contains St. Mary's Church, endowed by Queen Anne; St. Mary's Hall, the oldest Church school for girls in the country; the State Masonic Home; Burlington College, and many fine old residences; and has manufactories of shoes, stoves, iron pipe, terra-cotta, and canned goods. The city was settled in 1677, by Friends, under the name of New Beverly. The name was subsequently changed to Bridlington, in honor of the Yorkshire town of that name on the North Sea, commonly called Burlington, and the spelling was presently made to accord with the pronunciation. The city was for many years the seat of government of West Jersey; and was the residence of the last colonial governor, William Franklin. It was bombarded by the British in 1776. Pop. (1900) 7,394.

Burlington, Vt., a city, port of entry and county-seat of Chittenden County, on Lake Champlain and the Central V. and Rutland R.R.'s; 40 miles northwest of Montpelier. It has a very large lake commerce and manufactories of lumber, cotton, and woolen goods, and iron. The environment is agricultural. The city is the seat of the State University of Vermont and of the State Agricultural and Medical colleges; Bishop Hopkins Hall; the Roman Catholic Cathedral; the Fletcher, Billings, and Burlington Law libraries; a county court-house; United States government building, and a Young Men's Christian Association Hall. Burlington is noted for its benevolent and educational institutions, which include the Mary Fletcher Hospital, Home for Aged Women, Home for Friendless Women, Home for Destitute Children, Adams Mission House, Louisa Howard Mission, Providence Orphan Asylum, Cancer Relief Association, Lake View Retreat, several sanitariums, the Vermont Episcopal Institute, St. Joseph's and St. Mary's academies (Roman Catholic), and high and graded schools. The city was settled in 1773; was a garrisoned post during the War of 1812; and was incorporated in 1805. Its material development has been largely due to its great lumbering industries. The famous Col. Ethan Allen is buried beneath a handsome monument in Greenmount Cemetery. Pop. (1900) 18,640.

Burlington Limestone, a limestone of sub-Carboniferous age, named for its occurrence near Burlington, Iowa. It is also found in other parts of the Mississippi valley. This limestone is of light color and fine-crystalline, resembling lithographic stone. It has important industrial value.

Bur'ma, the largest province of British India. It is on the east side of the Bay of Bengal, and at one time formed the greater portion of a

native kingdom or empire, which is said to have extended from lat. 9° to 26° N., and from lon. 92° to 104° E., its greatest length being about 1,000 miles, and its breadth 600; its area being then about 270,000 English square miles. But in 1826 the provinces or divisions of Arracan and Tenasserim were wrested from it by the British, and in 1852 Pegu and the province of Martaban shared the same fate. This portion was then known as British Burma, and continued to be so till in 1886 the rest of the kingdom was annexed by Great Britain, when the two portions came to be designated Upper and Lower Burma respectively. They now form together one province under a lieutenant-governor and legislative council. The area of Lower Burma is 87,957 square miles. It is to a large extent mountainous in character, the only extensive level being in Pegu, where the valleys of the Irrawadi and Sittaung form an alluvial tract of about 10,000 square miles. The rainfall varies from less than 60 inches in some places to 190 or more in others. About half the soil is believed to be cultivatable, but a comparatively small portion is as yet under cultivation, though agriculture is extending year by year. Since the occupation of the country by the British it has rapidly increased in prosperity, and the revenue is generally greater than the expenditure. The imports and exports together exceed \$50,000,000, the bulk of the trade being with Great Britain. The capital and principal port is Rangoon. Other towns are Moulmein, Akyab, and Bassein. Upper Burma has an area of 83,473 square miles, and is on the whole similar in character to Lower Burma, but less productive, and has generally a smaller rainfall. It is rich in minerals, including gold, silver, precious stones, marble, iron, lead, tin, antimony, arsenic, sulphur, and petroleum. Only a few of these are worked. The chief precious stones are the ruby and the sapphire; amber and jade are also found. All precious stones used to be sent to the royal treasury and strangers were prohibited from approaching the places where they were found. These districts are still the subject of special regulation under the British rule. The whole country is intersected by numerous streams, which, following the direction of the chief mountain chains, flow generally south to the Indian Ocean. The chief of these are the Irrawadi, the Salween, and the Chindwin, which joins the Irrawadi, the combined stream being of great volume. The Irrawadi is of great value as a highway of communication and traffic, being navigable beyond Bhamo, near the Chinese frontier. In their upper courses the rivers flow through narrow valleys; in their lower courses they traverse low-lying districts, and in the rainy season often overflow their banks. Among the wild animals of the country are the elephant, rhinoceros, tiger, leopard, deer of various kinds, and the wild hog. The rivers abound with fish. Of domestic animals we may mention the ox, buffalo, horse, elephant, and cat. In the southern districts, owing to the numerous rivers, the soil is most productive. Here grow rice, sugar cane, tobacco, cotton, indigo, and all the tropical fruits. Tea is cultivated in many of the more elevated parts. The forests produce timber of many sorts, including teak. A great part of the trade of the country is carried on by means of the Irrawadi River. From Bhamo

BURMA

goods are conveyed to China, and this branch of trade is believed to be capable of great development. Rice is the great crop (occupying about 80 per cent of the cultivated area), and this grain forms the chief export, others being teak, cotton, and silk stuffs, petroleum, saltpetre, paper, and lacquer ware. Railways have been introduced, and the number of miles open is now about 1,000. From Rangoon two lines proceed north, one along the left bank of the Irrawadi to Prome and Meaday, the other through the Sittaung valley to Mandalay, and from that on the other side of the Irrawadi to Bhamo and Mogaung.

The Burmese have many skilful weavers, smiths, sculptors, workers in gold and silver, joiners, etc. Among industrial establishments are rice-mills, saw-mills, a few works for iron goods, ship-building yards, cutch works, etc. Other industries include boat-building, weaving, pottery, lacquerwork, and brasswork. The weaving of cotton and silk goods is carried on by the women everywhere. The pottery of the country is strong and durable, if not especially artistic; and the gold and silver work finds numerous purchasers outside the country. Wood-carving is extensively practised for the adornment of houses, boats, etc. The native vessels plying on the Irrawadi and other rivers are often of 100 to 150 tons burden, while thousands of small craft are engaged in trade or fishing. Large numbers of good cigars are made by women, and are partly used in the country, partly exported. The buildings among the Burmese are very slight, as the government used to require them to be chiefly of wood or bamboo, and prohibited the use of stone or brick except for pagodas, and other important structures.

People.—The Burmese are divided into several tribes, and belong to the common Indo-Chinese stock. Among the tribes other than the Burmese proper are the Karens, Kakhyens, Shams, etc. The Burmese proper are of a brown color, with lank, black hair, and vigorous, well-proportioned frames. No Burmese can have more than one wife; but he may have as many mistresses as he will. The latter live in the same house with the wife, and are her servants. The Burmese women enjoy a good deal of freedom; are not shut up as in some parts of the East, and can even engage in a lawsuit in their own name. The chief amusement of the Burmese is their theatre, where declamation, dancing, and music are given by turns. The new year (which begins in April) is celebrated with what is known as the "water feast," when young men and women throw water on each other and the passers-by. The Burmese usually write on palm leaves with an iron style or on black tablets with a pencil; the rich have libraries, with books, the leaves of some of which are thin pieces of ivory, with gilt edges. Their *materia medica* is chiefly confined to herbs, spices, and mercury; with vaccination they have long been acquainted. The language is monosyllabic, like Chinese, and written with an alphabet (derived from India), the characters of which are more or less circular. Among the common people the principal part of the male dress consists of a double piece of cloth about five yards long, loosely wrapped about the body. Over this a frock is worn, with sleeves open in

front, and reaching below the knees. The lower classes of women wear only a single garment, resembling a sheet, wrapped round the body and fastened under the arms. Men of rank wear a long robe of flowered velvet or satin, with open sleeves and collar, a mantle or scarf being thrown over this. On the head is worn a high velvet or silk cap, plain or embroidered, according to rank. The men wear earrings, often of large size. Women of the higher classes generally wear a shift which reaches only to the pit of the stomach, where it is drawn tight and fastened by strings. This is covered by a loose jacket, with tight sleeves. A piece of silk or cloth encircles the waist and descends to the feet. When a woman wishes to be particularly fine she stains her nails and palms a red color, and tinges her teeth and the edges of her eyelids with black. Both sexes wear the hair long; the men tying it in a knot on the crown of the head, the women on the back. Sandals are often worn, but neither boots, shoes, nor stockings; every man, woman, and child, however, carries an umbrella. The chewing of betel and smoking of tobacco are universal. The Kakhyens or Singfo are a courageous people inhabiting the upper basin of the Irrawadi above Bhamo. They practise a sort of nature worship, and are active as traders, though at present rather lawless. Their villages are ruled by hereditary chiefs. The Chinese from Yunnan have of late years settled in considerable numbers as traders and agriculturists in the Kakhyen country; and in Lower Burma they are now a highly important element in the population as traders and otherwise. In the hilly districts of Tenasserim and Pegu we find the Karens, a somewhat secluded people, less intelligent and more ignorant than the Burmese, and not so purely Mongolian in physical character. The Talaings or Mons of the Irrawadi delta resemble the Burmese, but speak a distinct language. The Shans are a numerous people closely allied to the Siamese, and inhabiting eastern and northeastern Burma, together with portions of the neighboring countries.

The native government was an absolute monarchy, the king having unlimited power over life and property. The seat of government, after oscillating between Ava and Amarapura, was latterly fixed in Mandalay, a new town founded in 1857, and situated in a dusty plain a little over two miles from the left bank of the Irrawadi, and about 28 miles northwest from Amarapura. The king was assisted in governing by a council of state known as the *Hloot-daw*, to which belonged at once the functions of a legislature, a cabinet, and a supreme court of justice. It was composed of officials of 14 grades, the president being the king himself, some other member of the royal family, or the prime minister. The king had power to punish at his pleasure anyone, including even the great officers of state. The public revenue was derived from taxes levied in a very irregular and capricious manner, and as the officials received no fixed salary corruption and oppression were extremely prevalent. The criminal laws were barbarously severe. Capital punishment was commonly inflicted by decapitation, but crucifixion and disemboweling were also practised. Torture might be applied to principals or witnesses; and trial by ordeal was not unknown. The

standing army was small. Levies were made, in case of war, by way of conscription; and a specified number of houses was required to furnish a soldier or pay a fine. The religion of the country is that of Buddha, which is said to exist here in great purity. The tutelary divinities worshipped in various Buddhist countries are unknown, and the vows of poverty and chastity taken by the monks are said to be less frequently broken here than elsewhere. The Burmese possess a complete system of education, so far as male children are concerned. All boys are required to reside in a religious house for three years, and there they act as servants to the priests, who instruct them in reading, writing, and arithmetic, as well as the doctrines of their religion. The census of 1901 returned a population of 9,184,121, of whom 88.6 per cent were Buddhists, the density per square mile being 55, against 184 for India. Upward of 90 per cent of the population dwell in rural areas, and no tendency toward gravitation to the towns is observed. Although population has been steadily increasing in Burma the fact that an enormous tract of country not previously enumerated was now included in the census operations renders any comparison with the figures of 1891 misleading. Within Burma proper, however, an increase of over 19 per cent is found to have occurred, and a birth-rate of over 38 per mile compares not unfavorably with average European standards. Notwithstanding the fact that the social position of women is so assured in Burma and that there is no suspicion of the existence of female infanticide, women number only 962 in 1,000, against 1,006 and 1,022 in Bengal and Madras. But the explanation probably lies in the preponderance of the male element among the numerous immigrants into the province. Marriage in Burma is a purely secular ceremony, and elementary education is far more widely dispersed than in India, one individual in five being able to read and write.

History.—The Burmese empire is of little note in ancient or general history. Buddhism and civilization are said to have been introduced from India. The last native dynasty was founded by a Burmese called Alompra, a man of obscure birth, who defeated the Peguans, and in 1753 obtained possession of Ava. Having made himself master of Burma, he invaded Siam; but, during this invasion he died suddenly in 1760. Alompra ruled well and wisely, and Namdogee, his eldest son and successor, who died in 1764, inheriting his father's spirit, introduced various reforms and useful measures. Shembuan (Tshen-bo-yen), the emperor's brother, became regent as guardian for his nephew Momiin; but he usurped the throne himself and conquered Siam. In 1771, however, Siam recovered its independence, while the principal part of the Burmese forces were engaged in a war with China. In this war they were victorious, and compelled the Chinese whom they took prisoners to intermarry with Burmese females, and to remain in their territory. In 1776 Shembuan left his empire, much enlarged, to his son, Chenguza. This prince lived in the unrestrained indulgence of every appetite till in 1782 he was dethroned and put to death. In consequence of the revolution, Mentaragyi, the fourth son of Alompra,

ascended the throne. He ordered his nephew, Momiin, who was a state prisoner, to be drowned, and in 1783 subdued the kingdom of Arracan. He then engaged in a war with Siam, which continued till 1793, when peace was made on certain conditions. About this period, it happened that some robbers fled from the Burmese empire, and took refuge in the territory of the East India Company. The Burmese demanded that they should be delivered up, and on their demands not being immediately complied with, marched with a strong force into the offending country. At the same time they carried on a friendly negotiation with the government in Calcutta, which resulted in the surrender of the criminals, and the conclusion of a treaty of amity and commerce between the two governments, negotiated by Capt. Symes. The last victory of the Burmese was in 1822 over the province of Assam. The party driven from Assam, together with the Burmese rebels, fled to the British territories, whence they intended to invade Burma. The British government disarmed the insurgents, but refused to deliver them up or to drive them from the island of Shapuri, which they had occupied. At length the Burmese sovereign demanded of the government at Calcutta the cession of northern Bengal as being a part of Ava, and in January 1824 his forces marched into Cacliar, which was under British protection. Lord Amherst, as governor-general of the British East Indies, now declared war against Burma, and Gen. Archibald Campbell prosecuted it so successfully that after the victory at Promé (1-3 Dec. 1825), he obliged the monarch to conclude a peace at Palanagh in 1825. As the treaty was not ratified on the part of the Burmese emperor by the time specified (18 Jan. 1826), Campbell renewed the war and stormed the fortress of Munnun. On 24 February the peace was ratified, and the war concluded with the cession of Arracan, Mergui, Tavoy, etc. In 1852 a second war broke out at the conclusion of which Rangoon and the whole of Pegu fell into the hands of the British. About 1860 the new city Mandalay supplanted Amarapura as the capital. In 1867 British steamers were permitted by treaty to navigate Burmese rivers, and not long after traffic was carried on up the Irrawadi as far as Bhamo. In 1885 the outrageous proceedings of King Theebaw provoked another war, and a British force proceeded from Rangoon up the Irrawadi River, took Mandalay, and sent King Theebaw a prisoner to Rangoon. On 1 Jan. 1886, Theebaw's dominions were annexed to the British empire by proclamation of the viceroy of India (the Earl of Dufferin). After the annexation there was a considerable amount of scattered fighting with dacoits and others, but the country is now comparatively quiet, is being opened up to commerce, and is rapidly advancing in prosperity. In 1897 Burma was constituted a province, and placed under a lieutenant-governor instead of a chief-commissioner.

Bibliography.—Spearman, 'British-Burma Gazetteer' (1880); Mason, 'Burma: Its People and Productions' (1882-3); Phayre, 'History of Burma' (1883); Geary, 'Burma After the Conquest' (1886); Meaton, 'The Loyal Karen of Burma' (1886); Yoc, 'The Burman, His Life and Notions' (2d ed. 1896); Bird, 'Wanderings in Burma' (1897); Hart, 'Pic-

turesque Burma, Past and Present' (1897); Ferrar, 'Burma' (1898); Harmer, 'The Story of Burma' (1901).

Burmeister, Hermann, hĕr'măn boor'mīs-tĕr, German scientific writer: b. Stralsund, 15 Jan. 1807; d. Buenos Ayres, Argentina, 2 May 1892. He distinguished himself as a geologist and zoologist in his native country, and settled permanently in Argentina, where he continued his investigations. 'Manual of Entomology'; 'History of Creation' (1843); and 'The Fossils of Horses Found Among the South American Pampas' (1875), are among his books.

Burmeister, Richard, German-American musical composer: b. Hamburg, Germany, 7 Dec. 1860. He received an academical education in Hamburg; studied with Franz Liszt, and in Rome, Budapest, and Weimar; made concert tours in Europe in 1883-5 and in the winter of 1893; was at the head of the piano department of Peabody Institute, Baltimore, Md., 1885-97; and settled in New York in the latter year. He made concert tours all over the United States and was director of the Scharwenka Conservatory, New York, in 1897-9. He has composed 'The Sisters' (a dramatic tone poem), numerous songs, and piano, violin, and orchestra pieces; and arranged Liszt's 'Concerto Pathétique,' originally for two pianos, for the piano and orchestra.

Burnaby, Frederick Gustavus, English soldier and traveler: b. Bedford, England, 3 March 1842; d. 17 Jan. 1885. He was educated at Bedford and Harrow, and entered the Royal Horse Guards in his 18th year as cornet. In 1861 he became lieutenant, in 1866 captain, major in 1879, lieutenant-colonel in 1880, and finally, in 1881, was appointed colonel, a rank which he held till his death. In 1875 he made his famous ride to Khiva—a journey that presented great difficulties. During the ride, which he undertook partly because he had learned that the Russian government kept Europeans out of central Asia, he suffered severely from the intense cold prevailing at the time when he crossed the steppes. In 1876 he rode through Asiatic Turkey and Persia. Of both these journeys he published narratives, namely, 'Ride to Khiva' (1876, 11th ed. 1877, new ed. 1884), and 'On Horseback Through Asia Minor' (1877). While serving as lieutenant-colonel of the Royal Horse Guards in the Egyptian campaign, he was killed at the battle of Abu-Klea.

Burnand, Sir Francis Cowley, English author: b. 29 Nov. 1837. He was educated at Eton and Trinity College, Cambridge, and at first studied with a view to entering the Church of England, but when in 1858 he became a Roman Catholic he devoted himself to legal studies, and was called to the bar in 1862. By that year he had already achieved some success as a writer, and in consequence he seldom practised. After about a year's connection with 'Fun' he joined the staff of 'Punch' in 1863, becoming editor in 1880. He resigned this position 14 Feb. 1906. His book, 'Happy Thoughts,' republished from 'Punch,' went through several editions, and was followed by 'More Happy Thoughts' (1871); 'Happy Thought Hall' (1872); 'Quito at Home' (1890). Other successful productions of his

are the extravaganzas, 'New Light on Darkest Africa,' and 'Ride to Khiva' (making fun out of H. M. Stanley and Col. Burnaby respectively), the parody on Ouida's novel, 'Strathmore,' which he published under the title of 'Strapmore,' and 'The Modern Sandford and Merton.' Numerous plays have come from his pen, mostly of the nature of burlesques and light comedies, such as the plays 'Black-eyed Susan' (a burlesque of Douglas Jerrold's drama), and 'The Colonel.' In 1879 he issued a history of the Amateur Dramatic Club, which he had founded at Cambridge University. He collaborated with Sir A. Sullivan in the light operas 'The Chieftain,' produced in 1894, and 'Contrabandista.'

Burnap, George Washington, American Unitarian clergyman: b. Merrimack, N. H., 1802; d. 1859. He was graduated at Harvard College in 1824, and in 1827 he was ordained pastor of the First Independent Church in Baltimore, where he remained until his death. He was a voluminous writer, his publications being chiefly of a theological and controversial character. They include a doctrinal work on the 'Controversy Between Unitarians and Other Denominations of Christians' (1835); 'Lectures to Young Men'; 'Lectures on the Sphere and Duties of Woman'; 'Lectures on the History of Christianity'; 'Expository Lectures on the Principal Texts of the Bible Which Relate to the Doctrine of the Trinity'; and various other works of theology, as well as numerous occasional addresses.

Burne-Jones, Sir Edward, English painter: b. Birmingham, 28 Aug. 1833; d. London, 17 June, 1898. In 1852 he went to Exeter College, Oxford, where he was a fellow student of William Morris, and afterward became acquainted with A. C. Swinburne (who dedicated his 'Poems and Ballads' to him). His first intention was to enter the Church of England, and it was not till he had reached his 22d year that he seriously devoted himself to art studies; but, going to London in 1855, he came under the influence of D. G. Rossetti and the Pre-Raphaelite movement, and soon attained considerable success in various departments of artistic work. In 1859 he set out on a journey through Italy in order to see the productions of the early Italian painters and sculptors, and on his return to England he gave in his stained-glass designs and his pictures splendid promise of his subsequent triumphs. In 1865 he began a series of illustrations to Morris' 'Earthly Paradise,' and he also executed some 70 designs for the 'Story of Cupid and Psyche,' besides pictures dealing with the same subject. He was elected a member of the Old Society of Painters in Water Colors in 1864, but withdrew from it in 1870, and from this year till 1877 scarcely ever exhibited in London. In the Grosvenor Gallery exhibition of the latter year, however, his works formed the chief attraction. He received the Cross of the Legion of Honor in 1880, was elected in 1885 Associate of the Royal Academy, a position which he resigned in 1893 (having only exhibited one picture at the Academy, 'The Depths of the Sea'), and he was created a baronet in 1894. His most important pictures are 'Day, Night'; 'Spring, Summer, Autumn, Winter' (1867-8); 'The Wine of Circe' (1869); 'Chant d'Amour' (1873); 'Be-

guiling of Merlin' (1877), an illustration of Tennyson's 'Merlin and Vivien'; 'Six Days of Creation' (1877); 'The Golden Stairs' (1880); 'The Wheel of Fortune' (1883); 'Wood Nymph'; 'King Cophetua' (1884); 'Laus Veneris'; 'The Depths of the Sea' (1886); and 'The Briar Rose' series (1890). He holds a specially high place as a designer for stained-glass windows, and in many other departments of decorative art. His leading characteristics as a painter are his fertile imagination and fine poetic feeling, qualities which no painter of the century has possessed in anything like the same degree. The Old-World dreaminess of his work is finely aided by his wonderful power as a colorist. In common with his friends, Morris and Rossetti, he exercised a most potent influence on Victorian art. See Bell, 'Edward Burne-Jones' (1902).

Burnes, Sir Alexander, Scottish soldier and traveler: b. Montrose, 1805; d. Cabul, 2 Nov. 1841. Having obtained a cadetship, he joined the Bombay native infantry in 1821. Here his proficiency in Hindustani and Persian procured him two regimental appointments as interpreter, and contributed greatly to his future promotion. In 1830 he was appointed to proceed to Lahore, ostensibly for the purpose of delivering a present of horses from the king of England to Runjeet Singh, but really for the purpose of acquainting himself with the lower Indus, with the view of opening it up to commercial enterprise. On returning from this mission, which he successfully accomplished, he proposed a mission into central Asia, and having obtained the sanction of the government, set out in January 1832, descended the Sutlej to Lahore, and proceeded thereafter to Peshawur, Cabul, and Bokhara. He afterward traveled with a caravan across the desert of Merv, visited the shah of Persia in his capital of Teheran, traveled southward to the Persian Gulf, and reached Bombay after a year's absence. He published an account of this journey in 1834, under the title of 'Travels into Bokhara.' He was afterward sent to England as the bearer of his own despatches, received the special thanks of the court of directors, and was presented with the gold medal of the Royal and the silver medal of the French Geographical Society. He returned to India in 1835, and in the following year was sent on a commercial mission to Cabul. While there he discovered that Russia was intriguing to detach the emir, Dost Mohammed, from the British alliance, and on finding the emir disposed to be friendly to Great Britain, he urged Lord Auckland to come to terms with him. His advice was, however, rejected, and a force was dispatched in 1839 to reinstate Shah Sujah on the throne. Burnes accompanied the force as second political officer, and received the honor of knighthood. On the breaking out of an insurrection in Cabul, he was murdered with his brother and several other Europeans.

Burnet, Gilbert, British prelate and historian: b. Edinburgh, 18 Sept. 1643; d. London, 15 March 1715. Having graduated at Marischal College, Aberdeen, he zealously devoted himself to the study of law and divinity. In 1661 he qualified as a probationer in the Church, and traveled into Holland in 1664. On his return he was made Fellow of the Royal Society in London, and ordained to the living of Sal-

toun, Haddingtonshire, in 1665. In 1669 he was made a professor of divinity at Glasgow, where he published his 'Modest and Free Conference Between a Conformist and a Nonconformist,' and wrote his 'Memoirs of the Dukes of Hamilton' (1676); and was offered a Scottish bishopric, which he refused. His 'Vindication of the Authority, Constitution, and Laws of the Church and State of Scotland,' in which he maintains the cause of Episcopacy, was much approved of at court, and several bishoprics were successively offered him and refused. In 1673 he was made chaplain in ordinary to the king, and was in high credit both with Charles and the Duke of York. Removing to London he received the appointment of chaplain to the Rolls Chapel in 1675, and shortly afterward the lectureship at St. Clement's. The nation being alarmed on account of the progress of Catholicism, Burnet undertook a 'History of the Reformation in England.' He gave a first volume to the public in 1679, when the affair of the popish plot was in agitation. It procured for the author the unprecedented honor of thanks from both houses of Parliament. The second appeared in 1681; the third, which was supplementary, in 1714. The high character of Burnet as a divine caused him to be sent for by the witty and profligate Earl of Rochester, when, exhausted by a course of libertinism, he was sinking into the grave. The result of his conferences with the dying nobleman he gave to the world in his celebrated 'Account of the Life and Death of the Earl of Rochester.' About this time he wrote a letter to the king censuring his public misgovernment and private vices. His connection with the opposition party was now very intimate, and he attended Lord William Russell on the scaffold, when executed for his share in the Rye House plot. He published during this period several works in favor of liberty and Protestantism, and wrote the lives of Bishop Bedell and Sir Matthew Hale (1682); and in 1683 made his translation of More's 'Utopia.' On the accession of James he made a tour in France and Italy, and in 1687 he published an account of his travels in a series of letters to Robert Boyle. When at Utrecht he was invited to The Hague by the Prince and Princess of Orange, and had a great share in the councils relative to Britain. James caused a prosecution for high treason to be commenced against him in Scotland, and demanded his person from the states, who refused to deliver him up. In the revolution he took an active part, accompanying the Prince of Orange to England as chaplain, and was rewarded for his services by the bishopric of Salisbury. On taking his seat in the House of Lords, he displayed his usual moderation in regard to the non-juring clergy and dissenters. As a prelate, Bishop Burnet distinguished himself by fervor, assiduity, tolerance, and charity. In 1699 he published his 'Exposition of the Thirty-nine Articles.' The scheme for the augmentation of poor livings out of the first-fruits and tithes due to the Crown, known as Queen Anne's Bounty, originated with Burnet. He left behind him in manuscript his well-known 'History of His Own Times' (1723-34), upon which the best judgment today is that nothing could be more admirable than his general candor, his accuracy as to facts, the fullness of his information, and the

BURNE-JONES.
The Prioress's Tale.

BURNET — BURNETT

justice of his judgments both of those whom he vehemently opposed and of those whom he greatly admired. The value of the work, says a recent authority, "as a candid narrative and an invaluable work of reference, has continually risen as investigations into original materials have proceeded."

Burnet, Jacob, American jurist: b. Newark, N. J., 22 Feb. 1770; d. Cincinnati, Ohio, 10 May 1853. Admitted to the bar in 1796, he removed to Cincinnati, then a village with about 500 inhabitants, and was a member of the territorial government from 1799 till the establishment of a State government in 1803. In 1821 he was appointed judge of the supreme court of Ohio, and was elected United States senator in 1828. Burnet was elected a member of the French Academy of Sciences upon the recommendation of Lafayette, and published in 1847 a volume of 'Notes on the Northwestern Territory.' He was prominent in civic enterprises in Cincinnati for over half a century, assisting to establish the Lancastrian Academy; helping to found the Cincinnati College, whose first president he was; besides being president of the Ohio Medical College, and the Cincinnati Colonization Society.

Burnet, John, Scottish engraver, painter and art-critic: b. Fisher-row, near Edinburgh, 20 March 1784; d. 1868. He learned etching and engraving, and with Sir William Allan and Sir David Wilkie, was a student in drawing and painting at the Trustees' Academy, Edinburgh. In 1806 he went to London, where he engraved Wilkie's 'Jew's Harp'; 'Blind Fiddler'; 'Rent Day'; 'Rabbit on the Wall'; 'Chelsea Pensioners Reading the Gazette of the Battle of Waterloo' (his largest and most elaborate work); 'Letter of Introduction'; 'Death of Tippoo Saib'; and 'Village School.' He also engraved plates from several recent painters, from the Rembrandts in the National Gallery, and from several of his own paintings. He published 'Practical Treatise on Painting' (1827); 'Rembrandt and His Works' (1849); 'Life and Works of J. W. M. Turner,' with Cunningham (1852).

Burnet, Thomas, English divine and philosopher: b. Croft, Yorkshire, about 1635; d. London, 27 Sept. 1715. He was educated under Dr. Ralph Cudworth at Cambridge, and afterward traveled as tutor to several young noblemen. In 1681 he made himself known by his 'Telluris Theoria Sacra,' which he subsequently translated into English. In 1685 he became master of the Charter-house, and after the revolution of 1688 was appointed chaplain in ordinary and clerk of the closet to King William. In 1692 he published 'Archæologia Philosophica, sive Doctrina antiqua de Rerum Originibus,' but the freedom of opinion displayed in this work led to the removal of the author from the clerkship of the royal closet. Two posthumous works of this author appeared in 1727—the treatises 'De Fide et Officiis Christianorum'; 'De Statu Mortuorum et Resurgentium.' All the works of Burnet exhibit him as an ingenious speculator, rather than as a patient and sober inquirer concerning the moral and natural phenomena of which he treats. His great work, the 'Theory of the Earth,' is one of the many systems of cosmogony in which Christian philosophers have attempted to reconcile the Mo-

saic account of the creation, paradise, and the deluge, with the traditions of the ancients and the principles of modern science. His speculations are recommended by sublimity of description and eloquence of style. In his 'Archæologia Philosophica' he has combated the literal interpretation of the history of the fall of man; and to expose its improbability he has introduced an imaginary dialogue between Eve and the serpent, which, as coming from the pen of a divine, is singular enough. It is only to be found in the first edition of the work.

Burnet, William, American colonial governor: b. The Hague, Holland, 1688; d. 1729. He was a son of Gilbert Burnet (q.v.) and was appointed governor of New York and New Jersey in 1720. Two years later he founded at Oswego the earliest English trading post on the Great Lakes as the first step in his able Indian policy in New York which accomplished very much for the interests of the mother country and the colonies. In 1728 he was transferred to the governorship of Massachusetts and New Hampshire and was speedily involved in disputes with the Assembly of the former colony over the question of salary.

Burnet, the popular name of two genera of plants, both of which belong to the natural order *Rosacea*. (1) Garden Burnet (*Poterium sanguisorba*), a perennial plant which grows to the height of about two feet; leaves smooth, alternate, imparipinnate, composed of serrate leaflets; flowers arranged in rounded heads of a purplish color, with the female flowers above and the male flowers below. It is found wild in sunny places among rocks and in open fields, from New York to Maryland. It is cultivated in kitchen gardens for its aromatic leaves, which are used to season salads. It is also an excellent food for cattle. (2) Canadian Burnet (*P. canadense*) is also a perennial plant; calyx in four divisions; stamens, four. Its stem is straight, from three to six feet in height; leaflets ovate, smooth. This plant grows chiefly in bogs and wet places from Newfoundland to Georgia, and west to Michigan.

Burnet Moth, the name for the genus of hawkmoths, called *Anthrocera*, or, by some *Zygæna*. *Anthrocera filipendulæ* is the six-spot burnet moth. The six spots, which are on the superior wings, are red, while the rest of the wings are green. Its caterpillar, which feeds on the plantain, trefoil, dandelion, etc., is yellow, spotted with black. *A. loti* is the five-spot burnet moth. It is less common. The caterpillar feeds on honeysuckle, bird's foot, trefoil, etc.

Burnett', Frances Eliza Hodgson, Anglo-American novelist: b. Manchester, England, 24 Nov. 1849. In 1865 she went to Tennessee with her parents, and there married in 1873 Dr. S. M. Burnett. Divorced from him in 1898 she married in 1900 Stephen Townsend, an English writer. Her first conspicuous literary success was 'That Lass o' Lowrie's,' a story of collier life in her native county, which appeared originally in 'Scribner's Magazine,' and in book form in 1877. Her other works, which usually appeared first in serial form, include 'Theo, a Love Story' (1877); 'Kathleen Mavourneen' (1879); 'Haworth's, a Novel' (1879); 'Louisi-ana' (1880); 'A Fair Barbarian' (1881); 'Es-

meralda,' a play (1881); 'Through One Administration' (1883); 'Little Lord Fauntleroy,' a story of child-life, which has had very great success both as novel and as drama (1886); 'Sara Crewe' (1888); 'Little Saint Elizabeth' (1889); 'Two Little Pilgrims' Progress' (1895); 'A Lady of Quality' (1896); 'His Grace of Ormonde' (1897); 'The Captain's Youngest' (1898); 'In Connection with the De Willoughby Claim' (1899); 'The Making of a Marchioness' (1901); 'The Little Unfair Princess' (1903). Mrs. Burnett's work shows great versatility in the creation of character, and has but little of the sensational element.

Bur'nett, James (LORD MONBODDO), Scottish judge: b. at the family seat of Monboddo, in Kincardineshire, 1714; d. Edinburgh, 26 May 1799. After studying at Aberdeen and Edinburgh he went to the University of Groningen, whence he returned in 1737, and commenced practice as an advocate at the Scottish bar. In 1767 he was raised to the bench on the decease of his relative, Lord Milton. He distinguished himself by his writings as a metaphysician, having published a work on the 'Origin and Progress of Language' (1773-92), and 'Ancient Metaphysics' (1779-99, six volumes). Lord Monboddo was an enthusiastic admirer of ancient literature, and especially of the works of Plato and other Grecian philosophers. His works contain many interesting observations, but also exhibit some strange and paradoxical opinions. Thus he seriously advocates the existence of satyrs and mermaids, and has advanced some whimsical speculations relative to the affinity between the human race and the monkey tribe, which exposed him to a good deal of ridicule on the first publication of his theories. Both his official and his private character were extremely respectable; and he was, notwithstanding some eccentricities, a man of learning and ability.

Burnett, Peter Hardeman, American pioneer and writer: b. Tennessee, 1807; d. 1895. In early life he removed to Missouri and thence to Oregon, where he assisted in establishing a territorial government and sat for two terms in the legislature. He was one of the first of the gold hunters in California in 1848, and actively advocated organization of civil government without delaying for action of Congress. When the new constitution was adopted he was elected governor, resigning in 1851. He was judge of the supreme court, 1857-8, and president of the Pacific Bank of San Francisco, 1863-80. He published 'The Path Which Led a Protestant Lawyer to the Catholic Church' (1860); 'The American Theory of Government Considered with Reference to the Present Crisis' (1861); 'Recollections of an Old Pioneer' (1878); 'Reasons Why We Should Believe in God, Love God, and Obey God' (1884).

Burnett Prizes, two prizes established by John Burnett, merchant of Aberdeen, on his death in 1784. He left a fund from which were to be given every 40 years two theological prizes (not less than \$6,000 and \$2,000) for the best two essays in favor of the evidence that there is an all-powerful, wise, and good Being, and this independent of all revelation. The first competition was in 1815, when Dr. Brown, prin-

cipal of Aberdeen University, gained the first prize, and Dr. John Bird Sumner, afterward archbishop of Canterbury, the second. In 1855 the first prize was adjudged to the Rev. R. A. Thompson, Lincolnshire, and the second prize to the Rev. Dr. John Tulloch, afterward principal of St. Mary's College, St. Andrews. The destination of the fund was applied by Parliament in 1883 to the establishment of a lectureship on natural theology in the University of Aberdeen.

Burney, Charles, English composer and writer on music: b. Shrewsbury, 12 April 1726; d. Chelsea, London, 12 April 1814. He studied music under the organist of Chester Cathedral there, and at Shrewsbury, under the direction of his half-brother, an organist, and afterward in London between 1744 and 1747, under Dr. Arne. In 1751 he obtained the place of organist at Saint Margaret's Church, Lynn Regis, in Norfolk. Here he commenced his 'General History of Music.' In 1760 he returned to London, where his compositions and the musical skill of his eldest daughter, then eight years of age, excited admiration. In 1769 he took the degree of doctor of music at Oxford. In 1770 he visited France and Italy, and two years afterward, the Netherlands and Germany, for the sake of his great work. He published accounts of both tours. After his second return he became a Fellow of the Royal Society. In 1776 appeared the first volume of his 'General History of Music from the Earliest Ages to the Present Period' (4to), the second in 1782, and the third and fourth in 1789. He was the author of several other valuable works, among which are the 'Memoir of Handel,' and a 'Life of Metastasio.' He died in the office of organist at Chelsea Hospital, and in receipt of a pension of \$1,500. He wrote most of the musical articles in Rees' Cyclopaedia. His second daughter, Frances or Fanny (Madame d'Arblay, q.v.), well known as an authoress, published a memoir of her father.

Burney, Charles, English classical scholar and critic, son of Charles Burney (1726-1814, q.v.): b. Lynn, Norfolk, 4 Dec. 1757; d. 28 Dec. 1817. He received his education at the Charter-house School, at Caius College, Cambridge, and King's College, Aberdeen, where he took the degree of M.A. He carried on a private school, distinguished himself as a writer in the 'Monthly Review' and the 'London Magazine,' to which he contributed many articles on classical literature; subsequently entered into holy orders, and obtained some preferment in the Church. His valuable collection of books, many of them enriched with manuscript notes, was purchased by Parliament for the British Museum.

Burney, Frances. See D'ARBLAY, MADAME.

Burnham, Clara Louise (ROOT), American novelist: b. Newton, Mass., 25 May 1854. She is the daughter of George F. Root (q.v.), and has lived in Chicago since childhood. Her novels include 'No Gentleman' (1881); 'A Sane Lunatic' (1882); 'Dearly Bought' (1884); 'Next Door' (1886); 'Young Maids and Old' (1888); 'The Mistress of Beech Knoll' (1890); 'Miss Bagg's Secretary' (1892); 'Dr. Latimer' (1893); 'Sweet Clover, a Romance of the White City' (1894); 'The Wise Woman' (1895); 'Miss Archer Archer'

(1897); 'A Great Love' (1898); 'A West Point Woing' (1899); 'A Right Princess' (1902). She has also written libretti for her father's cantatas.

Burnham, Daniel Hudson, American architect: b. Henderson, N. Y., 4 Sept. 1846. He studied architecture in Chicago and designed notable structures there, including the Rookery, Calumet Club, the Temple, Masonic Temple, and the great Northern Hotel, as well as Ellicott Square, Buffalo, and large buildings in other cities. He was director of works at the Chicago World's Fair.
