Burnham, Sherburne Wesley, American astronomer: b. Thetford, Vt., 1838. He started in life as a stenographer, and became a clerk in the United States Circuit Court, northern district of Illinois. He took up astronomy as an amateur, and, in 1876, became connected with the Chicago Observatory, and later with the Lick Observatory, receiving also an appointment as professor of practical astronomy at the University of Chicago. He has made notable discoveries of double stars, having catalogued 1,274 new ones. In 1874 he was made a Fellow of the Royal Astronomical Society of England, receiving its gold medal in 1894 for his discovery and measurement of double stars.

Burnham Beeches, the fragment of an ancient forest in Buckinghamshire. It is situated some 25 miles northwest of London, and is famous for its enormous beech trees. Since 1883 the Burnham Beeches tract of 374 acres has been open to the public as a park by the Corporation of London.

Burning-bush, or **Waahoo**, a tall shrub (*Euonymus atropurpureus*) of the natural order *Celastraceæ* with oval-oblong leaves, and purple flowers occurring in fours. It is common throughout the middle west from New York to Wisconsin and Nebraska, and southward. It is sometimes cultivated for the ornamental effect of its long drooping peduncles of crimson fruit.

Burning-glass, a lens which readily brings the rays of light that fall upon it to a focus so as to cause them to kindle any combustible matter on which they are directed. The lenses commonly used as burning-glasses are convex on both sides. If a second lens, of a smaller focal distance, is placed between the first and its focus, so as to intercept the rays which pass through the first, the effect is greatly augmented. Glasses of this kind have been made with a diameter of two or three feet. Several accidents in modern times have shown that conflagrations may be caused by convex water-bottles, etc., which have the form of burning-glasses, if the rays of the sun are concentrated by them upon combustible substances lying within their reach. Burning mirrors or reflectors with a smoothly polished surface which reflects the rays of the sun and brings them to a focus may be used like burning-glasses. Spherical mirrors of this kind are the most common, but parabolic ones are the most suitable. The ancients were acquainted with such mirrors, and, as is well known, Archimedes, during the siege of Syracuse by Marcellus, is said to have set on fire the fleet of the latter by means of mirrors. Buffon in 1747, by means of a compound mirror formed of a combination of plane mirrors, set on fire, almost instantaneously, a piece of

beech wood covered with tar, at the distance of 66 feet; and with a stronger combination he afterward burned wood at the distance of 200 feet, melted tin at the distance of 150, lead at the distance of 130, and silver at the distance of 60 feet.

Bur'nisner, a blunt, smooth tool, used for smoothing and polishing a rough surface by pressure, and not by removing any part of the body. Other processes of polishing detach the little asperities. Agates, tempered steel, and dogs' teeth are used for burnishing. It is one of the most expeditious methods of polishing, and one which gives the highest lustre. The burnishers used by engravers are formed to burnish with one end and to erase blemishes with the other.

Burn'ley, England, a parliamentary county, and municipal borough in Lancashire, about 22 miles north of Manchester, situated on the small river Brun, near its confluence with the Calder. The town presents a modern appearance, and is, generally speaking, well built, mostly of stone. The town-hall is a large, handsome building, erected in 1887; there is also a commodious exchange, and a convenient market hall. Among the churches the chief place is due to St. Peter's, an ancient building modernized. The churches of St. James, St. Paul, and St. Andrew are all very modern structures; and there are numerous other places of worship. There are board and other schools; an ancient grammar school with modern scientific departments; mechanics' institute and technical school; public baths; and a Victoria Hospital. Burnley owns its gas, water, and electric works, public markets, and abattoirs, deriving considerable income from each. The manufactures and commerce of Burnley have rapidly increased in recent years. The staple manufacture is cotton goods, and there are large cotton-mills, worsted-mills, and several extensive foundries and machine-shops, with collieries, quarries, and other works in the vicinity. Burnley is situated on the Leeds and Liverpool Canal, has a good water supply, and has five railway stations. It seems to have been a Roman station, and various Roman remains have been dug up in and around it. Burnley was made a parliamentary borough with one member in 1867. Pop. (1901) 97,000.

Burnoose, *bër-noos'*, a large kind of mantle in use among the Bedouin Arabs and the Berbers of northern Africa, commonly made of white or undyed wool, but sometimes also of red, blue, green, or some other color, and having a hood which may be drawn over the head in case of rain. In Spain also a similar garment is worn which bears the similar name of *albornoz*, and the name has also been applied to different kinds of upper garments worn by women of other European countries.

Burnouf, Emil Louis, *ã-mël loo-ë bür-noof*, French Orientalist, cousin of Eugène Burnouf (q.v.): b. Valognes, Manche, 25 Aug. 1821. After a normal-school training, he became professor of ancient literature in the faculty of Nancy, and in 1867 director of the French School in Athens. Among his works are: 'Essay on the Veda' (1863); 'Sanskrit-French Dictionary'; 'History of Greek Literature'; 'Science of Religions'; 'The Athenian Legend'; 'The Mythology of the Japanese'; 'The City and the Acropolis of Athens'; and

'Contemporary Catholicism' (1879). He also edited the letters of his cousin, Eugène Burnouf.

Burnouf, Eugène, è-zhân, French Orientalist: b. Paris, 12 Aug. 1801; d. there, 28 May 1852. He commenced his studies at the Collège of Louis-le-Grand, became a pupil in the École des Chartes in 1822, passed as a lawyer in 1824, and soon after devoted himself to the study of Oriental languages. In 1826 he attracted the attention of men of learning throughout Europe by publishing, in conjunction with his friend, Lassen, an 'Essay on the Pali,' or the sacred language of the Buddhists in Ceylon and the Eastern Peninsula, and in 1827 by furnishing an explanatory text to the series of lithographic plates prepared by Geringer and Chabrelle, to illustrate the religion, manners, customs, etc., of the Hindu nations inhabiting the French possessions in India. This work was not completed till 1835. In 1832 he was admitted into the Academy of Inscriptions, and in the same year was appointed to the professorship of Sanskrit in the Collège de France, an office which he held till his death. His fame is chiefly due to his having, so to speak, restored to life an entire language, the Zend or old Persian language in which the Zoroastrian writings were composed. Anquetil-Duperron had obtained the text of the extant works of this sacred language of the Persians. It is the glory of Burnouf to have interpreted those works with the aid of the Sanskrit. To this part of his labors belong his 'Extrait d'un Commentaire et d'une Traduction nouvelle du Vendidad-Sadé' (1830); 'Observations sur la Grammaire de M. Bopp' (1833); 'Commentaire sur le Yaçna' (1833-5). Burnouf also distinguished himself by his labors on Buddhism. On this subject he published the text accompanied by a translation of the 'Bhāgavata Purāna' (1840-7); 'Introduction à l'Histoire du Bouddhisme Indien' (1st vol. 1844), etc. A fortnight before his death the Academy of Inscriptions elected him secretary for life.

Burns, Alexander, Canadian educator: b. Castletwellan, Ireland, 12 Aug. 1834; d. 22 May 1900. He went to Canada in 1847, and was graduated at Victoria College, Toronto, in 1861, joining the Methodist Church. From 1868 to 1878 he was president of Wesleyan Ladies' College, Hamilton, Ontario. He was tried for heresy by the Ontario Methodist Conference in 1882, but acquitted.

Burns, Anthony, American fugitive slave: b. Virginia, about 1830; d. Saint Catherine's, Ontario, 27 July 1862. Escaping from slavery he worked in Boston during the winter of 1853-4; but on 24 May 1854—the day after the repeal of the Missouri Compromise and the passing of the Kansas-Nebraska Bill had inflamed the North against the slave power—was arrested on warrant of Charles F. Suttle through his agent Brent. The next day he was taken before United States Commissioner Edward G. Loring for examination; but Wendell Phillips and Theodore Parker secured an adjournment for two days. Burns, meanwhile, was confined in the court-house under a strong guard, and on the evening of the 26th a great mass meeting in protest was held at Faneuil Hall. T. W. Higginson and others had planned to stampede the meeting into storming the court-house and rescuing Burns, and at the ap-

pointed time battered in a door and attempted the rescue themselves, relying upon assistance in their undertaking. The size of the meeting, however, prevented the signals from working well and the leaders from emerging, and after a scuffle in which a deputy was fatally stabbed and several assailants wounded, the latter retired. The next day Loring, an ardent upholder of the Fugitive Slave law, delivered Burns to his claimant on evidence entirely illegal and worthless even under that law. Escorted by a strong military guard Burns was taken to a government cutter, through streets draped in mourning and crowds ready to stone the soldiers. A riot at the wharf was only prevented by the action of Rev. Daniel Foster upon his saying "Let us pray!" The crowd uncovered and stood quiet while Burns was taken on board. Indictments were drawn against his would-be rescuers, but quashed for want of evidence. Burns afterward gained his liberty, studied theology at Oberlin College, and was eventually settled over a Baptist colored church in Saint Catherine's, Ontario, where he died. Consult: Stevens, 'Anthony Burns: a History' (1856); Adams, 'Richard Henry Dana: a Biography' (1891); Higginson, 'Cheerful Yesterdays' (1898).

Burns, John, English labor organizer and Socialist leader: b. London, October 1858. He was of humble birth and became a factory employee at the age of 10. He was an omnivorous reader and imbibed his socialistic views from a French fellow laborer. By working a year as engineer on the Niger River, he earned enough for a six months' tour of Europe. He constantly addressed audiences of workingmen, and was a persistent labor agitator. He was one of the leaders in the West End riot in London, February 1887, and was imprisoned the same year for maintaining the right of public meeting in Trafalgar Square. He has been thrice elected to the London county council and has sat in the House of Commons as member of Battersea since 1892. In 1905 he became President of the Local Government Board.

Burns, Robert, Scottish poet: b. near Ayr, Scotland, 25 January 1759; d., Dumfries, 21 July 1796. His father, William Burnes or Burness, a native of Kincardineshire, had been a gardener; but at the time of the poet's birth was a nurseryman on a small piece of land on the banks of the Doon in Ayrshire. He was a man of strong intelligence and deep piety, but unsuccessful in his struggle with poverty. His mother was Agnes Brown, a woman of ability, and, though of meagre book education, well-versed in folk-song and legend. Robert, the eldest of seven children, went to school for three years, 1765-68, under John Murdoch in the neighboring village of Alloway. Later he was in attendance for a few months each at Dalrymple parish school in 1772, at Ayr Academy in 1773, and at Kirkoswald about 1776; but the more important part of his education he received from his father and his own reading. In 1766 William Burness had borrowed money to rent the farm of Mount Oliphant; and the future poet by the time he was sixteen was doing a man's work, overstraining his immature physique in performing his share in the vain effort of the family to keep its head above water. The scene of the struggle was moved

ROBERT BURNS

BURNS

in 1777, to Lochlea, about ten miles distant, where in 1784 his father died. During the Lochlea period, Burns, ambitious to improve his position, went to the neighboring town of Irvine to learn flax-dressing. Nothing came of this move; but while resident there he formed that acquaintance with a dissipated sailor to which he himself ascribed the beginning of his licentious adventures. On his father's death, Robert and his brother Gilbert rented the farm of Mossiel, but this experiment was no more successful than those previously made. While here he contracted an intimacy with Jean Armour, which brought upon him the censure of the Kirk-session. Finally the poet, disheartened by successive bad harvests and irritated by the attempts of his father-in-law to cancel his irregular marriage with Jean and to hand him over to the law, determined to emigrate. For ten years he had been composing verses, some of which had brought him considerable local fame, and these he collected and published in order to raise money for the voyage; but the unexpected success of this volume (Kilmarnock 1786) roused his literary ambition, gave him fresh courage, and led him to change his plans. Instead of sailing for the West Indies, he went to Edinburgh in November 1786, and during that winter was the literary lion of the season. Here he met such celebrities as Dugald Stewart, the philosopher; Blair, the rhetorician; Henry Mackenzie, the author of 'The Man of Feeling'; Lord Glencairn; the Duchess of Gordon; and Creech, the publisher. The last-named undertook an enlarged edition of his poems (Edinburgh 1787); and while waiting for the profits of this volume, Burns made several tours through the country, traces of which are to be found in a number of occasional poems. Creech finally paid him enough to enable him to give substantial help to his brother in Mossiel, and to rent and stock the farm of Ellisland in Dumfriesshire. Hither in 1788 he brought Jean Armour, to whom he was now regularly married, his success and fame having reconciled her parents to the match; and for three years he tried farming. But failure still dogged him, and in 1791 he moved to Dumfries, where he lived on a position in the excise service which he had obtained while still at Ellisland through the influence of some of the powerful acquaintances he had made in Edinburgh. He had, however, lost heart; and after a few years of drudgery, varied with the drinking bouts to which he was constantly tempted both by habit and by the invitation of foolish admirers, he died at Dumfries in his 38th year.

Biographies of Burns have frequently been crowded with attempts to disentangle or to explain away the facts of his numerous amours. There is much controversy over the identity of the semi-mythical Mary Campbell, the "Highland Mary" of the songs; much curiosity over the precise degree of Platonism in his feeling for Mrs. McLehose, the "Clarinda" of his letters, and the inspirer of a number of lyrics; much difference of opinion as to whether and how long he was in love with his wife. Into these details we do not enter. It is clear enough that Burns was a man of exceptionally powerful passions, that the extreme and depressing hardships of his youth, and, indeed, of the greater part of his life, along with his natural tenden-

cies to conviviality, drove him to excesses or self-indulgence; and that while he strove often and painfully after better things, his striving was many times without avail. "The sport," he calls himself, "the miserable victim of rebellious pride, hypochondriac imagination, agonizing sensibility and bedlam passions." These phrases are true enough, though they do not imply the further explanation of his pitiful career that is found in the habits of his class and time, and the untoward nature of his environment.

Something of his education has already been indicated. His schooling left him with a good grammatical knowledge of English, and a reading knowledge of French. His father's care and his own eagerness gave him no slight knowledge of literature; and among other authors we know that he read, of older literature, the Bible, Shakespeare, Spenser, Jonson, Bunyan, Dryden, Locke, Molière, Wycherley; of his own century, Addison, Steele, and Pope; Ramsay, Fergusson, Thomson, and Beattie; Fielding, Smollett, Sterne, and Mackenzie; Shenstone, Gray, and Goldsmith; Hume, Robertson, and Adam Smith; and a number of philosophical and theological works. This list is by no means complete, but it is sufficient to correct the impression that Burns's was an "untutored Muse."

The literary influences apparent in the work of Burns are of two main classes: English and Scottish. So far as he fell under the former of these he was an inferior poet of the school of Pope, an ardent admirer and imitator of such minor master as Shenstone. In this field his critical judgment was never more than commonplace, and his imitations never first-rate. Almost all his greatest work was done in his native dialect; and here he is the heir, as well as the last great representative, of an ancient national tradition. Previous to the 17th century there existed a Scottish literature of considerable variety and distinction, produced in part under the patronage of the court. But the Reformation and the Union of the Crowns of England and Scotland resulted in the disuse of the vernacular for dignified and courtly writing, and it rapidly lost social prestige, until as a literary medium it survived only in the songs of the peasantry and in an occasional piece of satire. The 18th century, however, saw a revival of interest in purely Scottish letters, and the publication of such compilations as Watson's 'Choice Collection of Comic and Serious Scots Poems' (1706-9-11), and Allan Ramsay's 'Evergreen' (1724) and 'Tea-Table Miscellany' (1724-27) was the result of an impulse that showed itself also in renewed attempts to compose in dialect. Among the most important leaders in this movement were William Hamilton of Gilbertfield (who modernized the 15th century poem on Wallace), Allan Ramsay, and Robert Fergusson; and each of these had a share in inspiring Burns to work in that field in which he achieved his greatest triumphs. Their influence was both general and particular. They showed him by their own success what could be done in the native idiom; and they gave him models of which he was not slow to avail himself. Many of Burns's best known poems are all but imitations of productions, usually inferior, by Ramsay and Fergusson, and

BURNS

to them and their poetical ancestors he was indebted not only for suggestions as to theme and method of treatment, but also for his most characteristic verse-forms. This readiness on the part of Burns to accept from his predecessors all that they had to give, and to seek to maintain loyally a national tradition rather than to strive after mere novelty, has much to do with his success in carrying that tradition to its highest pitch, and in becoming, in a sense almost unique, the poet of his people.

The first kind of poetry which Burns thoroughly mastered was satire; and the most important of his successful efforts in this form, 'The Twa Herds, or The Holy Tulzie,' 'Holy Willie's Prayer,' The 'Address to the Unco Guid,' 'The Holy Fair,' and the 'Address to the Deil,' were all written within less than a year (1785-6). Whatever Burns's feelings may have been about what he suffered in his own person from the discipline of the Kirk, it is clear that the impulse that gave these poems their fire and their influence was something much larger than mere personal grudge. Against the narrow dogma and tyrannical conduct of the so-called "Auld Licht" party in the Scottish Church, there had sprung up the "New Lights," demanding some relaxation of Calvinistic bonds and preaching charity and tolerance. Though not a member of this or any ecclesiastical faction, Burns sympathized strongly with their protest; and the shafts of his satire were directed against both the doctrines of the orthodox party and their local leaders. For some time after the Reformation the Scottish people seem to have submitted willingly to the rigorous domination of the Presbyterian ministers; but, after the struggle against Rome and the persecutions of the Covenanting times had alike become matters of history, there began to appear a more critical attitude towards their spiritual leaders. The revolt against authority that spread throughout Europe in the latter part of the 18th century manifested itself in Scotland in a growing disposition to demand greater individual liberty in matters of conduct and belief. It was this disposition that Burns voiced in his satires, the local conditions determining the precise direction of his attack. The substantial justice of his cause, the sharpness of his wit, the vigor of his invective, and the imaginative fervor of his verse, all combined to bring the matter home to his countrymen; and he is here to be reckoned a great liberating force.

Several of the satires were published in the Kilmarnock volume, and along with them a variety of other kinds of poetry. In the words of his Preface, "he sings the sentiments and manners he felt and saw in himself and his rustic compeers around him." Some of these are descriptive of sides of humble Scots life with which he himself was in the closest contact. 'The Twa Dogs' gives a democratic peasant's view of the lives of lairds and farmers; and the sketch of the factor in this poem has been taken as a reminiscence of what his father had to endure from the arrogance of such an agent. 'The Cotter's Saturday Night' describes with affectionate reverence the order of his father's house; 'Puir Mailie,' 'The Auld Mare Maggie,' 'To a Mouse,' and others, reveal the kindness of the poet's heart in his relation to animals; 'Hallow'e'n' gives a vivid picture of rustic

mirth and manners, and preserves a mass of folk-lore. Of the additional poems that appeared in the Edinburgh editions the most notable was 'Tam o' Shanter,' Burns's best sustained piece of narrative, a poem that indicates that, had he worked this vein farther, he might have ranked with Chaucer as a teller of tales in verse.

A large quantity of Burns's poetry remained in MS. at the time of his death. Of this, much the most remarkable is 'The Jolly Beggars,' in the opinion of many his most brilliant production. This cantata carries to its highest point the far-descended literature of the rogue and the beggar, and its superb spirit and abandon show how heartily the poet could sympathize with the very dregs of society. It is to be noted that, alone among pieces that reach his highest level, it is chiefly in English. Burns wrote besides a large number of Epistles, Epigrams, Epitaphs, and other personal and occasional verse, the quality and interest of which vary much, but throughout which one constantly finds phrases and stanzas of superb quality. He came to write verse with great ease; but the result of the training he gave himself in artistic discrimination was to check mere fluency, and to lead him to discard much that was of inferior value in his improvisations. Thus the proportion of his work possessed of real poetic distinction is very high.

But the national importance of Burns, though increased by his influence upon the liberalizing movements of his time, and by his vital descriptions and characterizations of the peasant life of the Scotland of his time, is based chiefly on his songs. The period of Presbyterian despotism already referred to had forced the lyric Muse of Scotland into low company, and as a result Burns found Scottish song still pure and fine in melody, but hopelessly degraded in point of both poetry and decency. From youth he had been interested in collecting the sordid fragments he heard sung in cottage and tavern, or found printed in broadsides and chap-books; and the resuscitation of this all-but-lost national heritage came to be regarded by him in the light of a vocation. Two points are especially to be noted about his song-making: first, that almost all sprang from real emotional experiences; second, that almost all were composed to a previously existing melody. He had begun the composing of love-songs while still almost a boy, and he continued it to the end. During his visit to Edinburgh in 1786-7, he formed a connection with the editor of Johnson's 'Musical Museum,' and for this publication he undertook to supply material. Few of the traditional songs were such as could appear in a reputable volume, and Burns's task was to make them over into presentable form. Sometimes he retained a stanza or two, sometimes only a line or refrain, sometimes merely the name of the melody; the rest was his own. His method was to familiarize himself with the traditional air, to catch a suggestion from some stanza or phrase of the old song, to fix upon an idea or situation for the new poem; then, humming or whistling the melody about the fields or the farmyard, as imagination and emotion warmed within him, he worked out the new verses, coming into the house to write them down when the inspiration began to flag. Careful consideration of this process, for

BURNS — BURNSIDE

the reality of which we have his own authority as well as the evidence of the raw material and the finished product, will explain much of the precise quality and function of Burns as a songwriter. In George Thomson's collection of 'Scottish Airs' he had a share similar to that in Johnson's undertaking, his work for these two publications constituting the greater part of his poetical activity during the last eight or nine years of his life. It was characteristic that, in spite of his financial stringency during these years, he refused to accept any recompense, preferring to regard this as a patriotic service. And a patriotic service it was of no small magnitude. By birth and temperament he was singularly fitted for just such a task, and his fitness is proved not only by the impossibility of separating, by a mere examination of the finished songs, the new from the old, but by the unique extent to which his productions were accepted by his countrymen, and have passed into the life and feeling of his race.

Bibliography.—The early collected editions of the works of Burns are now superseded, and the material first published by Currie, Allan Cunningham, Hogg, and Motherwell, has been incorporated in more modern editions. In the 'Life and Work,' ed. by R. Chambers and rev. by W. Wallace (4 vols., Lond. and N. Y. 1896), the writings are incorporated in the life in chronological order, and Wallace has made many additions and corrections. 'The Centenary Burns,' ed. by W. E. Henley and T. F. Henderson (4 vols., Edin. and Bost. 1896-97, also cheaper, on small paper, 1901), contains a mass of bibliographical and textual matter, and is essential for a study of the text and sources. Other good editions are those of W. Scott Douglas (6 vols., Edin. 1877-79; and 3 vols., Edin. 1893) which have good notes; "Globe" edition, ed. Alex. Smith, containing poems, songs, and letters in one volume; of the poems and songs only, the third "Aldine," ed. by Sir Harris Nicholas, rev. by G. A. Aitken (3 vols., Lond. 1893); the "Cambridge" (Bost. 1897) containing the text, introductory essay, and some of the notes of the "Centenary" ed.; and that by A. Lang and W. A. Craigie (1 vol., N. Y. 1896). The main source for the life is the letters and poems. To the letters contained in the larger editions already named should be added the correspondence between 'Robert Burns and Mrs. F. A. Dunlop,' ed. by W. Wallace (Lond. 1898). The most authoritative life is that in the Chambers-Wallace edition; that in French by Aug. Angellier (2 vols., Paris 1893) is scholarly and sympathetic; that by J. G. Loekhart (rev. by W. S. Douglas, Lond. 1882) called forth Carlyle's famous review; that by J. C. Shairp (E. M. L. series, Lond. 1879) was the occasion of a notable essay by R. L. Stevenson; but is itself narrow and limited in sympathy; that by J. S. Blackie (Great Writers series, Lond. 1888) has a good bibliography by J. P. Anderson.

WILLIAM A. NELSON,

Professor of English, Harvard University.

Burns, William Wallace, American soldier: b. Coshocton, Ohio, 3 Sept. 1825; d. Beaufort, S. C., 19 April 1892. He was graduated from West Point in 1847. He served in the war with Mexico, and also in the Union army during the Civil War, becoming major-general of

volunteers. In 1865 he was brevetted brigadier-general and was for many years afterward in the Commissary Department at Washington.

Burns and Scalds, injuries produced by the application of excessive heat to the human body. They are generally dangerous in proportion to the extent of surface they cover, and a widespread scald may cause serious consequences on account of the nervous shock. Congestion of the brain, pneumonia, inflammation of the bowels, or lock-jaw may result from an extensive burn. Hence the treatment requires to be both local and constitutional. If there is shivering or exhaustion, hot brandy and water may be given with good effect, and if there is much pain, a sedative solution of opium. The local treatment consists in dredging the burn with fine flour and then wrapping it up in cotton-wool. An application of equal quantities of olive oil and lime water, called carron oil, is much recommended by some, the part being afterward covered with cotton. The main thing is to keep the air from the injured part, and therefore, when a blister forms, although it may be pricked, the loose skin should not be removed.

Burnside, Ambrose Everett, American soldier: b. Liberty, Ind., 23 May 1824; d. Bristol, R. I., 13 Sept. 1881. He served an apprenticeship to a tailor, but received a nomination to West Point, where he graduated in 1847. After serving some years in garrison duty he left the army as first lieutenant in 1852 and from 1853 until 1858 was engaged in the manufacture of firearms at Bristol, R. I., during this period, in 1856, inventing the Burnside breech-loading rifle. Upon the outbreak of the Civil War (q.v.) in 1861 he returned to the army as colonel of volunteers, serving from May to August of that year as Colonel of the Rhode Island volunteers, and as such taking part in the first battle of Bull Run (q.v.). On 6 August he was promoted brigadier-general of volunteers and from October 1861 to January 1862 supervised the organization of the "Coast Division" of the Army of the Potomac. From January to July 1862 he commanded the Department of North Carolina; in February captured Roanoke Island, occupied Newbern, N. C., and took Fort Macon, Beaufort. He was raised to the rank of Major-general of volunteers on 18 March 1862 and placed in command of the troops that subsequently constituted the Ninth Army Corps. In July 1862 and again after the second battle of Bull Run (q.v.) he was offered the command of the Army of Virginia which, after the battle of Bull Run, had been merged into the Army of the Potomac, but each time declined the offer and served with the Ninth Army Corps under McClellan. In this capacity he participated in the Maryland campaign (q.v.) against Lee, rendering important services in the battles of South Mountain and Antietam (qq.v.), in the latter action on 17 September commanding the left wing. On 10 November of that year he superseded Gen. McClellan in command of the Army of the Potomac. On 13 December he crossed the Rappahannock and attacked Gen. Lee near Fredericksburg, but was repulsed with a loss of over 10,000 men, and was soon after transferred to the department of Ohio. In No-

vember 1863 he successfully held Knoxville against a superior force, and in 1864 he led a corps, under Gen. Grant, through the battles of the Wilderness and Cold Harbor. Resigning in April 1865 he was elected governor of Rhode Island (1866-8), and United States senator in 1875 and 1881.

Burnside, Helen Marion, English artist and poet: b. Bromley Hall, 1844. She published a book of poems in 1864, which made her widely known. From 1880 to 1889 she was designer to the Royal School of Art Needlework. She has published 'The Lost Letter,' 'Tales for Children,' and many occasional contributions in prose and verse to leading magazines.

Burnt Ear, a disease in grain caused by a fungus (*Uredo carbo*), which covers the seed coat with a black dust, while leaving the interior apparently uninjured, but abortive.

Burnt Offering, one of the sacrifices enjoined on the Hebrew Church and nation. It is called, in their language, *olah*, from the root *alah*, to ascend, because, being wholly consumed, all but the refuse ashes was regarded as ascending in the smoke to God. In the New Testament it is called *holokautōma*, meaning a whole burnt offering, an offering wholly burnt. In the Vulgate it is called *holocaustum*, which has the same meaning. Stated burnt offerings were presented daily, every Sabbath, at the new moon, at the three great festivals, on the day of atonement, and at the feast of trumpets. Private ones might be presented at any time.

Burnt Sienna, an ochreous earth known as sienna earth (*terra di Sienna*) submitted to the action of fire, by which it is converted into a fine orange brown pigment used in both oil and water-color painting.

Burnt Umber, a pigment of reddish-brown color obtained by burning umber, a soft earthy mixture of the peroxides of iron and manganese, deriving its name from Umbria in Italy.

Burnt Wood Work. See PYROGRAPHY.

Burntisland, *būrnt-ī'land*, Scotland, a royal burgh and seaport of Fife, on the north shore of the estuary of the Forth, 7½ miles north by west of Edinburgh. It is a favorite summer residence and bathing-place as well as a busy port. It has four churches (Established, Free, United Presbyterian, and Episcopal), a town-hall, music-hall, mechanics' library, a large board school, etc. The harbor is capacious, of great depth, and of easy access. A dock with an area of five and a half acres was completed in 1876, and extensions have since been made. A second wet dock is being constructed with a depth of 28 feet on the sill, and provided with coal-shipping machinery of the most modern type. Vegetable oil and oil-cake are made, and there are railway repairing works and a distillery. Burntisland is a steamboat ferry station on the North British Railway, and is also connected with the Forth Bridge. It unites with Kinghorn, Dysart, and Kirkcaldy in sending a member to Parliament. Pop. about 5,000.

Burr, Aaron, American clergyman: b. Fairfield, Conn., 4 Jan. 1716; d. Princeton, N. J., 24 Sept. 1757. He graduated at Yale and was settled as pastor of the Presbyterian church

of Newark, N. J. In 1748 he became president of the College of New Jersey, now Princeton University, succeeding the first president, Dickinson, who held office only a few months. He married a daughter of Jonathan Edwards, and was the father of Aaron Burr (q.v.), third Vice-President of the United States. He published a Latin grammar, known as the 'Newark Grammar,' and 'The Supreme Divinity of Our Lord Jesus Christ.'

Burr, Aaron, American statesman: b. Newark, N. J. (son of the preceding), 6 Feb. 1756; d. Port Richmond, Staten Island, 14 Sept. 1836. Before he was three years old his parents died, leaving him a considerable estate. He entered the sophomore class of Princeton College in 1769, and graduated in 1772. At the outbreak of the Revolution Burr enlisted as a private, and joined the force before Boston. He volunteered for the expedition against Canada and took part in the attack upon Quebec. For this service he was raised to the rank of major. As aide-de-camp to Gen. Putnam, Burr was engaged in the defense of New York, and shortly after (1777) was promoted lieutenant-colonel with the command of his regiment, the colonel being a civilian. He was at Valley Forge, and distinguished himself at the battle of Monmouth, where he commanded a brigade in Lord Stirling's division. During the winter of 1778 he was stationed in Westchester County, N. Y., but early in the following spring he resigned his commission, partly on account of ill health, and partly through disappointment at not being more rapidly promoted. Burr belonged to the Lee and Gates faction; he always affected to despise the military talents of Gen. Washington; and it is not improbable that these circumstances interfered with his professional career. In 1782 he was admitted to the bar in Albany, and in July of the same year he married Mrs. Provost, the widow of a British officer who had died in the West Indies. In 1783 he began to practise in New York, and soon obtained a lucrative business. In politics his success was rapid and brilliant. In 1784 he was elected to the State legislature; he was appointed attorney-general of New York in 1789, and United States senator in 1791. While in the Senate, several influential members of Congress recommended him for the mission to France, but Washington, with marked emphasis, refused to appoint him. He left the Senate in 1797, and the following year was returned to the State legislature. Some aspersions upon his conduct while in that body, which were thrown out by John B. Church, led to a duel between Burr and that gentleman, in which, however, neither party was injured. Burr was very efficient in the presidential canvass of 1800. To his efforts may be attributed the success of the Republicans in New York, upon the action of which State the result in the Union depended. On account of the prominence he thus obtained, the friends of Jefferson brought him forward for the Vice-Presidency. An equal number of votes having been thrown for Jefferson and Burr in the Electoral College, the election of a president devolved upon the House of Representatives. Most of the federal members, taking advantage of the singular turn in affairs, supported Burr. The contest lasted several days. Upon the 36th ballot Jefferson was chosen Pres-

ident, and, in accordance with the provisions of the Constitution at that time, Burr became Vice-President. His conduct in permitting himself to be used by his political opponents in order to defeat the candidate of his party, whom he himself had supported, dissolved his connection with the Republicans and destroyed his political influence. The Federalists nominated him for governor of New York in 1804. Some of the leading men of that party refused to support him, and he was defeated. The contest was bitter, and led to a duel between Burr and Alexander Hamilton (q.v.), 11 July 1804, in which the latter was killed. Burr was compelled to give up his residence in New York. After his retirement from the Vice-Presidency in April 1805, he made a journey to the southwest. His conduct gave rise to the suspicion that he was organizing an expedition to invade Mexico, with the purpose of establishing an empire there which should embrace some of the southwestern States of the Union. He was arrested in Mississippi, and taken to Richmond, Va., for trial, upon an indictment for treason. After a protracted investigation before Chief Justice Marshall the prosecution was abandoned, and Burr was acquitted in September 1807. In 1808 he went to Europe, expecting to get means to carry out his Mexican design. He was disappointed; and after living abroad four years, part of the time in extreme poverty, he returned to America in 1812. He resumed his profession in New York, but never regained his former position at the bar. In 1833 he married Mme. Jumel, a wealthy widow, but they soon separated. Mr. Burr had but one child, the accomplished Theodosia Allston. (See BURR, THEODOSIA.) In person he was below the medium height, but his manners and presence were very attractive. He was an adroit, persevering, but not a great lawyer. He cannot be said to have been an orator, yet he was an effective and ready speaker. It has been usual to regard Burr as a brilliant, and even a great man, who was led astray by moral obliquity. In regard to the looseness of his principles, there can be no doubt; but there is a growing tendency to relieve his name of much of the odium that formerly attached to it. Consult Davis, 'Memoirs of Aaron Burr' (1836); Parton, 'Life of Aaron Burr' (1858); Tompkins, 'Burr Bibliography' (1892); Todd, 'The True Aaron Burr' (1902); McCaieb, 'The Aaron Burr Conspiracy' (1903).

Burr, Edward, American soldier: b. Booneville, Mo., 19 May 1859. He studied at Washington University 1874-8, and at the United States Military Academy 1878-82, and on graduation at the latter was assigned to the corps of engineers with the rank of second lieutenant. He was promoted first lieutenant in 1883, and captain in 1894; and as lieutenant-colonel of volunteers commanded the battalion of engineers in the campaign against Santiago de Cuba in June-July 1898. He is a member of the American Society of Civil Engineers.

Burr, Enoch Fitch, American mathematician and clergyman: b. Green's Farms, Fairfield County, Conn., 21 Oct. 1818. He graduated at Yale in 1839, and became pastor of the Congregational Church in Lyme, Conn., in 1850. Since 1868 he has been a lecturer at Amherst College. Among his works are: 'A Treatise on the Application of the Calculus to the The-

ory of Neptune' (1848); 'A Song of the Sea' (1873); 'Aleph, the Chaldean' (1891).

Burr, George Lincoln, American historian: b. Oramel, N. Y., 30 Jan. 1857. He graduated at Cornell in 1881 and entered its faculty in 1888, becoming professor of ancient and mediæval history there. He has written 'The Literature of Witchcraft,' and works on superstition and persecution. He was expert in history to the Venezuelan Boundary Commission (1896-7).

Burr, Theodosia (MRS. JOSEPH ALLSTON), daughter of Aaron Burr (1756-1836): b. New York, 1783; d. 1813. She was carefully educated and became very accomplished, showing particular linguistic talent. After the death of Mrs. Burr she presided over her father's household until her marriage in 1801 to Governor Allston of South Carolina. Her correspondence with her father after her removal to the South is of great interest and shows continued devotion to his interests. Her beauty, brilliant personality, and relationship to the famous statesman drew public attention to her, especially during her father's trial, and had the effect of enlisting the public sympathy on his behalf. In 1812 she sailed from Charleston in the Patriot for New York, but the vessel was never heard from and was believed to have been lost in the storm or sunk by pirates.

Burr, William Hubert, American educator: b. Waterloo, Conn., 14 July 1851. He graduated at Rensselaer Polytechnic Institute 1872; was employed by the Wrought Iron Bridge Company of New York, and later on the water supply and sewerage system of Newark, N. J. He was assistant professor, and later professor of rational and technical mechanics at Rensselaer Polytechnic Institute 1876-84; became assistant engineer of the Phoenix Bridge Company 1884, and subsequently its general manager; was professor of engineering in the Lawrence Scientific School of Harvard University 1892-3; consulting engineer to the New York city department of public works 1893-5, of parks and of docks 1895-7; and later of bridges. Since 1893 he has been professor of civil engineering at Columbia, and in 1904 became a member of the Isthmian Canal Commission. He is author of 'The Stresses in Bridge and Roof Trusses'; 'Arched Ribs and Suspension Bridges'; 'Elasticity of the Materials of Engineering'; 'The Theory of Masonry Arches,' etc.

Burrage, Henry Sweetzer, American clergyman: b. Fitchburg, Mass., 7 Jan. 1827. He was graduated from Brown University, 1861, and entering the 36th Massachusetts as a private, rose to the rank of captain, and brevet-major of volunteers. After the war he resumed his studies, graduated at Newton Theological Seminary, 1867, was at the University of Halle, Germany, 1868-9, and became a Baptist clergyman in 1869. He was pastor at Waterville, Maine, 1869-73; editor of *Zion's Advocate*, 1873-; recording secretary of the American Baptist Union, 1876-. He has edited: 'Brown University in the Civil War' (1868); 'Henry W. Longfellow's 75th Birthday' (1882); 'History of the 36th Regiment of Massachusetts Volunteers' (1884); and has written 'The Act of Baptism in the History of the Christian Church' (1879); 'History of the Anabaptists in Switzerland' (1882); 'Baptist Writers and

BURRARD INLET — BURROUGHS

their Hymns' (1888); 'History of the Baptists in New England' (1894). 'The First Mention of Pemaquid in History' (1894); 'The St. Croix Commission' (1895).

Burrard Inlet, an inlet of British Columbia, forming a fine harbor, and having Vancouver, the terminus of the Canadian Pacific Railway, on its southern shore.

Burrill, Thomas Jonathan, American naturalist: b. Pittsfield, Mass., 25 April 1839. He graduated at the Illinois State Normal University in 1865, and in 1867 was botanist of Powell's first Rocky Mountain Expedition. Since 1868 he has been a member of the faculty of the University of Illinois and has held the following offices in the University: Professor of botany and horticulture since 1868; dean of the College of Science, 1877-84; vice-president since 1879; acting president, 1880-90, 1891-94 and 1904; dean of the Graduate School since 1894. The degree of LL.D. was conferred upon him in 1893 by the Northwestern University. He is a member of several American and foreign scientific societies, and is well known from his writings under more than 100 titles mostly upon the parasitic diseases of plants, bacteriology, microscopy, fruit growing, forestry, landscape gardening, and modern education.

Burritt, Elihu, ē-lī'hū ("THE LEARNED BLACKSMITH"), American reformer: b. New Britain, Conn., 8 Dec. 1811; d. 7 March 1879. The son of a shoemaker, he was educated in the common schools of his native village, and at the age of 16 was apprenticed to a blacksmith. An early conceived project of reading the Scriptures in their original languages led him to philological studies in the intervals of labor, and by diligence and a remarkable facility he was soon able to understand works in several languages. He removed to Worcester to take advantage of the library of the Antiquarian Society there, and while still plying his trade became acquainted with the principal ancient and modern languages. In 1846 he went to England, where he formed the "League of Universal Brotherhood," whose object was "to employ all legitimate means for the abolition of war throughout the world." He was constantly engaged in writing and lecturing, and took a prominent part in all the European peace congresses. He returned to America in 1853. He was consular agent at Birmingham, 1865-8. The promotion of temperance, cheap ocean postage, and the abolition of American slavery were leading objects of his continued exertions. His principal publications are: 'Sparks from the Anvil' (1848); 'Thoughts and Things at Home and Abroad' (1854); 'Chips from Many Blocks,' etc.

Burrill College, a co-educational institution, in Spencer, Tenn.; organized in 1848 under the auspices of the Christian Church; reported at the end of 1905: Professors and instructors, 10; students, 214; volumes in the library, 3,854; grounds and buildings valued at \$20,000; income, \$4,000; number of graduates, 284.

Burro. See DONKEY.

Burrough, or Borough, Stephen, English navigator: b. Devonshire, 25 Sept. 1525. Being employed to search for a northeast passage to the Indies, he set out in 1556, and after doubling

the North Cape sailed along the north coast of Russia, touched at Nova Zembla and the Isle of Waigatz, and reached lat. 70° 30' N. The account of his voyage, contained in Hakluyt's collection, proves him to have been an active and intelligent sailor.

Burroughs, George, American clergyman: d. Salem, Mass., 19 Aug. 1692. He was graduated at Harvard College in 1670, was a preacher at Falmouth, now Portland, Me., in 1676, and at Salem in 1680. In consequence of some dispute with his people he returned to Portland in 1683, but, when that town was destroyed by the Indians in 1690, came back to Salem. Though a person of unblemished character, he became one of the victims of accusation by the confessing witches. It was testified that two of his wives had appeared to the witnesses, saying that he was the cause of their death, and threatening, if he denied it, to appear in court. He was also accused of performing feats of extraordinary strength by diabolical assistance, such as carrying a barrel of molasses, holding out a gun by a finger placed in the muzzle, and of having "tortured, afflicted, pined, consumed, wasted, and tormented" one Mary Wolcott. Although he asserted his innocence so as to draw tears from the spectators, and recited the Lord's Prayer, which it was supposed no witch could repeat without mistake, he was condemned and executed.

Burroughs, George Stockton, American educator: b. Waterloo, N. Y., 6 Jan. 1835; d. 1901. He graduated at Princeton College, 1873, and at its Theological Seminary, 1877. He removed to New England in 1880, and served in the ministry of the Presbyterian Church in Fairfield and New Britain, Conn. He was professor of biblical literature at Amherst College, 1886-92; president of Wabash College, Crawfordsville, Ind., 1892-9; and became professor of Old Testament language and literature in Oberlin Theological Seminary in 1899.

Burroughs, John, American essayist and naturalist: b. Roxbury, N. Y., 3 April 1837. He taught school for about eight years, was for a time a journalist, and then became a clerk in the Treasury Department and subsequently a national bank examiner. He settled on a farm in New York State and has since devoted himself to fruit-culture, nature-study, and literature. Many of his papers were written in his bark-covered study (to which he has given the name "Riverby") on the banks of the Hudson. The personal element is very marked in his writings, and the charm of his easy familiar style has done much to popularize the study of nature. His books on rural themes include: 'Wake Robin' (1871); 'Winter Sunshine' (1875); 'Birds and Poets' (1877); 'Locusts and Wild Honey' (1879); 'Pepacton; Notes of a Walker' (1881); 'Fresh Fields' (1884); 'Signs and Seasons' (1886); and 'Sharp Eyes' (1888); 'Indoor Papers.' He has also written 'Notes on Walt Whitman' (1867); 'Whitman: a Study' (1897); 'The Light of Day'; and 'Squirrels and Other Fur-Bearers.' In 1903 he accompanied President Roosevelt on a trip through the West, including a lengthy sojourn in the Yellowstone National Park in close communion with the wild life of that magnificent game preserve.

JOHN BURROUGHS.
AUTHOR AND NATURALIST.

BURROUGHS — BURT

Burroughs, Marie (LILLIE ARRINGTON), American actress: b. San Francisco, 1866. At the age of 18 she went to New York and made her debut as Gladys in 'The Rajah,' assuming the stage name of Marie Burroughs. She appeared as Mary Bleakern in 'The Middleman,' Vashti in 'Judah,' etc. In 1894 she was the star in 'The Profligate.' In 1899 she acted with Stuart Robson in 'The Meddler' and in 1900 filled the role of Guida Landresse in 'The Battle of the Strong.'

Burroughs, Stephen, American adventurer: b. Hanover, N. H., 1765; d. Three Rivers, Canada, 28 Jan. 1840. The son of a Congregational clergyman, his vicious jokes and propensity to trick people into misadventures made him early reputed the worst boy in town. At the age of 14 he ran away from home to join the army, which he later deserted. After studying under a clergyman in Connecticut, he entered Dartmouth College, where he continued his mischievous career. He left the college clandestinely before graduating, and was successively privateersman, ship's physician, and schoolmaster. At length he determined to go where he was unknown and preach. Under the name of Davis he had excellent success as pastor of a Congregational church in Pelham, Mass., until after nearly six months his character was revealed by persons who had formerly known him. Having entered into relations with a gang of counterfeiters, though still occasionally preaching, he was arrested in Springfield for passing counterfeit money, and convicted. He was imprisoned at Northampton, and for his numerous attempts to escape was loaded with chains. He sought to end his sufferings by firing the jail and was afterward removed to Castle Island in Boston Harbor, whence he effected his escape with seven other prisoners, but was retaken. When he was released he went to Canada, where for many years he was at the head of an association of counterfeiters. In the latter part of his life he thoroughly changed his conduct, joined the Roman Catholic Church, and passed his last years in receiving and educating at his residence the sons of wealthy Canadian gentlemen. He was beloved by his pupils, had an extensive library of choice books, and was noted for his happy faculty of communicating his great stores of knowledge. Few men have possessed equal capacity, and even during the worst part of his career his charitable deeds were hardly less remarkable than his iniquities. He described his early life in two autobiographical volumes, written with great naturalness and force.

Burrowing Owl, a small owl (*Speotyto cunicularia*) common on the open plains of both North and South America, where it makes its nest in burrows. It is mottled gray in color, has very long legs, scantily feathered, and stands erect upon them in a manner different from that of owls generally. It is gregarious, and is especially prevalent on the North American plains in the "towns" of the prairie dogs; and in South America it lives with the vizcachas, and cavies, and is thought to warn them by its excited notes whenever an enemy approaches. Among the many unowl-like traits of this curious little exile from the woods is its cry, which has no resemblance to the ordinary hoot of an owl, but more nearly resembles the chattering

of a cuckoo. This owl makes its home wherever it can in some abandoned burrow of a ground-squirrel or other animal, but, failing this, it digs a little cave-like hole of its own, which it furnishes with a bed of soft materials, whereon are laid about eight globular white eggs. The food of these owls consists almost entirely of insects and mice. Consult Coues, 'Birds of the Northwest' (Washington 1874); Selater and Hudson, 'Argentine Ornithology' (London 1888).

Burrowing Perch. See CULPER.

Burrows, William, American naval officer: b. near Philadelphia, Pa., 6 Oct. 1785; d. at sea, 5 Sept. 1813. He served in the war with Tripoli and commanded the sloop *Enterprise* in its successful action with the British brig *Boxer* off the coast of Maine. Both Burrows and the British commander were killed in the fight, and they were buried side by side at Portland. Congress struck a medal in honor of the victory and its hero.

Bursar, or **Bursary**, an endowment in one of the Scotch universities, corresponding to an exhibition in an English university, and intended for the support of a student during his ordinary course, and before he has taken a degree in the faculty in which he holds the bursary. Each of the four universities of Scotland has a greater or smaller number of bursaries. As yet the University of Aberdeen is better provided than any of the others with this class of endowments. Bursaries are in the gift sometimes of the *Senatus Academicus* of the university to which they belong, sometimes of the town-council of the city in which the university is situated, and sometimes of private individuals. With regard to the manner in which they are bestowed, some are obtained after competitive examination, and others are given by the patrons for special reasons. As the former method of bestowing them is found to be the more beneficial in its results, it is gradually becoming the prevailing one, as at Aberdeen it has always been. Bursaries which are in the gift of the *Senatus Academicus* are all bestowed in this way.

Burschenschaft, boor-shën-shäft, an association of students in Germany, formed in 1815, which had for its object the political regeneration of Germany.

Burs'lem, England, a market town and municipal borough in Staffordshire, within the parliamentary borough of Hanley, in "The Potteries." It is well built, chiefly of brick; has electric tramways, a fine town-hall, covered market, public baths, hospital, and the Wedgwood Institute, comprising a free library, a museum, and a school of art, erected in honor of Josiah Wedgwood, who was born at Burslem in 1730. The building is an excellent exemplification of the structural application of ceramics. Burslem has four Established churches, and places of worship for Independents, Baptists, Methodists, and Roman Catholics. It has extensive manufactures of china and earthenware, and carries on coal mining. Pop. (1901) 38,766.

Burt, Mary Elizabeth, American educator: b. Lake Geneva, Wis. She studied at Oberlin College and entered the teaching profession. For three years she was a member of the Chicago board of education. Later she undertook

editorial work and lecturing. She edited ('Little Nature Studies for Little People'); ('Seed Thoughts from Robert Browning,' etc.; and contributed frequently to periodical literature and is the author of: ('Browning's Women'; ('Literary Landmarks'); ('The World's Literature'); ('German Iliad (Siegfried)'); ('Stories from Plato and other Classic Writers'); and collaborated in writing ('The Literary Primer,' and 'The Boy General.'

Burt, Thomas, English labor leader: b. Northumberland, 12 Nov. 1837. He began work in the coal-mines at 10 years of age. In 1865 he began to take an interest in the labor movement and soon became prominent as a trades-unionist. He was president of the Trades Union Congress in 1891. Since 1874 he has had a seat in Parliament as a Liberal.

Burt, William A., American surveyor: b. Worcester, Mass., 13 June 1792; d. 18 Aug. 1858. After acting as a surveyor in New York State he removed to Michigan in 1824. Between 1840 and 1847 he surveyed a great part of northern Michigan. He introduced improved methods of surveying and invented the solar compass. He was judge of the Michigan circuit court and member of the legislature, and one of the projectors of the Sault Ste. Marie canal.

Burton, Ernest De Witt, American Biblical scholar: b. Granville, Ohio, 4 Feb. 1856. He graduated at Denison University in 1876 and at Rochester Theological Seminary in 1882, and went to Europe for further study in Leipsic and Berlin. From 1882-3 he taught in the Rochester Theological Seminary; and from 1883-92, in the Newton Theological Institution, first as associate professor and later as professor of New Testament Interpretation. In 1892 he was appointed head professor of New Testament Interpretation in the University of Chicago. Among his works are: ('Syntax of the Moods and Tenses in New Testament Greek'; ('Harmony of the Gospels for Historical Study' and 'Handbook of the Life of Christ' (in collaboration with W. A. Stevens); ('Records and Letters of the Apostolic Age'; ('Handbook of the Life of Paul'); ('Constructive Studies in the Life of Christ' (in collaboration with Shailer Mathews). In 1892 he became associate editor of the 'Biblical World,' and in 1897 of the 'American Journal of Theology.'

Burton, Sir Frederick William, Irish artist: b. Limerick, 1816; d. London, 15 March 1900. He received his education in Dublin. He was elected to the Royal Hibernian Academy in 1837, and in 1842 exhibited at the London Royal Academy. He is best known for his work as director of the National Gallery in London, to which post he was chosen in 1874, and which he held for 20 years.

Burton, John Hill, Scottish historian: b. Aberdeen, 22 Aug. 1809; d. 10 Aug. 1881. He was educated at the grammar school and Marischal College in that city. He studied law and was admitted to the bar in 1831. He never succeeded in gaining much practice, and soon turned his attention to literature, contributing to the 'Westminster,' the 'Edinburgh' and 'North British' reviews, as well as being a member of the staff of the *Scotsman*. With Sir John Bowring he edited Bentham's works, as well as an

illustrative ('Benthamiana,' with the aim of making more widely known the opinions of the great apostle of utilitarianism and radicalism. His first original work of importance, was the 'Life and Correspondence of David Hume' (1846), followed next year by the 'Lives' of Lord Lovat and Duncan Forbes of Culloden. In 1849 he published his 'Political and Social Economy'; in 1852 he compiled 'Narratives from Criminal Trials in Scotland.' He commenced in 1853 the publication of his chief work, the 'History of Scotland,' with two volumes covering the period from the Revolution of 1688 to the extinction of the last Jacobite rebellion in 1746. This was afterward completed by seven volumes commencing with Agricola's invasion and ending with the Revolution of 1688. A second edition of the complete history was published in eight volumes in 1873. A series of literary and historical sketches contributed to 'Blackwood's Magazine' formed the basis of two of his best-known books, 'The Scot Abroad' and 'The Bookhunter.' His last important historical work was the 'History of the Reign of Queen Anne' (1880). In 1854 Mr. Burton was appointed secretary to the Scottish Prison Board, and he continued his connection with this department as a commissioner of prisons until his death. The success of his 'History of Scotland' brought him the appointment of historiographer royal for Scotland, the degree of LL.D. from Edinburgh University, and that of D.C.L. from Oxford.

Burton, Lewis William, American clergyman: b. Cleveland, 9 Nov. 1852. He was educated at Kenyon College and the Philadelphia Divinity School; took orders in the Protestant Episcopal Church in 1878, and was successively in charge of parishes in Cleveland, Richmond, and Louisville. In 1896 he became bishop of Lexington, Ky.

Burton, Richard, American poet and journalist: b. Hartford, Conn., 14 March 1859. He graduated from Trinity College, Hartford, and took a degree at Johns Hopkins University. His published poems are 'Dumb in June' (1895), and 'Memorial Day' (1897).

Burton, Sir Richard Francis, English traveler, linguist, and author: b. Barham House, Herefordshire, 19 March 1821; d. Trieste, Austria, 20 Oct. 1890. He was educated at Oxford, with the intention of entering the Church; but in deference to his own urgent request, his father obtained a commission for him in the East India Company's service. He joined the army in 1842, served for some years in Sind, under Sir C. Napier, explored the Neilgherry Hills, published an important work on Sind, and acquired a complete knowledge of the Persian, Afghan, Hindustanee, and Arabic languages. Returning to England in 1851, he soon afterward set out to explore Arabia, disguised as an Afghan pilgrim, and published on his return a 'Personal Narrative of a Pilgrimage to El-Medinah and Mecca' (1855), as the result of this daring adventure. His next expedition was into the Somali country in East Africa, from whence he proceeded to the Crimea, where he was chief of the staff of Gen. Beatson, and organized the irregular cavalry. After peace was proclaimed, Burton set out in 1856 along with Capt. Speke to explore the lake region of Central Africa. The expedition was absent three years, and dur-

ing that time the great Lake Tanganyika was discovered by Burton. Subsequently he made a journey in the western states of North America, and published an account of the Mormon settlement at Utah, in his 'City of the Saints.' In 1861 he married, and he received the same year an appointment as consul at Fernando Po. While fulfilling his duties here he explored the Bight of Biafra, visited the Kamerun Mountains, and conducted a dangerous mission to the king of Dahomey. Afterward he was transferred to the consulate of Santos in Brazil, and here he explored his own province, visited the Argentine Republic, crossed the continent to Chile and Peru, returned home after exploring the Pacific coast, and published his 'Explorations of the Highlands of Brazil.' He was now (1871) made consul of Damascus, but was soon recalled, and in the following year, after a journey to Iceland, an account of which he wrote, he was appointed consul at Trieste. While occupying this position he led two expeditions into Midian (1876-8); and in company with Commander Cameron he conducted an expedition into the gold-producing country behind the Gold Coast. He remained English consul at Trieste until his death. In his latter years his services to geographical science were acknowledged by the gold medals of the French and English geographical societies, while in 1886 his services to his country were tardily recognized by the honor of knighthood. Besides the books of travel already mentioned, he was the author of many others, such as: 'Sind, or the Unhappy Valley' (1851); 'Goa and the Blue Mountains' (1851); 'Falconry in the Valley of the Indus' (1852); 'First Footsteps in East Africa' (1856); 'The Lake Region of Central Africa' (1860); 'Abeokuta, or an Exploration of the Kamerun Mountains' (1863); 'Narrative of a Mission to the King of Dahomey' (1864); 'The Nile Basin' (1864); 'Vikram and the Vampire' (1869); 'Zanzibar' (1872); 'Two Trips to Gorilla Land' (1875); 'Ultima Thule, or a Summer in Iceland' (1875); 'Etruscan Bologna' (1876); 'Sind Revisited' (1877); and 'The Gold Mines of Midian' (1878). In 1885-8, he published a remarkable literal translation of the 'Arabian Nights' entitled 'The Thousand Nights and a Night.' His manuscript translation with notes, from the Arabic of 'The Scented Garden,' of great value to scholars, was burned by his widow, who deemed it an immoral work. Consult lives by Hitchman (1887); Lady Burton (1893); Stisted (1897).

Burton, Robert, English clergyman and author: b. Lindley, Leicestershire, 1576; d. 1640. He was educated at Oxford, took orders, and became rector of Seagrave in Leicestershire. His learning, which was various and extensive, is copiously displayed in the 'Anatomy of Melancholy, by Democritus Junior', first published in 1621, and repeatedly reprinted. He was a man of integrity and benevolence, but subject to strange fits of hypochondriac melancholy which rendered his conduct flighty and inconsistent. He is reputed to have undertaken the composition of his 'Anatomy of Melancholy' with a view to the dissipation of his morbid feelings. Among those who have been most deeply indebted to Burton is Sterne, as may be seen in his 'Tristram Shandy.'

Burton, William Evans, English comedian and author: b. London, 24 Sept. 1804; d. New York, 10 Feb. 1860. He received a classical education, intending to adopt the ministry as a profession. In 1822 he took charge of a printing establishment and edited a magazine. His first appearance on the stage was at the Haymarket in 1832. He was very successful both in Great Britain and the United States; and built the National Theatre in Philadelphia, and owned another in New York. He compiled a 'Cyclopædia of Wit and Humor.'

Burton-upon-Trent, England, a municipal and county borough, in Staffordshire, on the north bank of the Trent, in a low, level situation. It is substantially built. Malting and iron-founding are carried on to a considerable extent, but it is chiefly celebrated for its excellent ale, of which vast quantities are made for both home consumption and exportation. There are about 20 breweries at work, giving employment in the various departments of the trade to about 10,000 men and boys. The largest brewing establishments are those of Messrs. Bass & Co., and Messrs. Allsopp, the former of which covers considerably more than 100 acres of ground. These two companies alone are said to pay to government £800,000 annually as duty on the ale brewed by them. Contrary to common usage, the brewers employ hard water obtained from wells instead of soft water. There are in all about 50 places of worship in the town, which also possesses a grammar school, girls' high school, numerous board and other elementary schools, four blocks of alms-houses, a dispensary and infirmary, a public library and reading-rooms, school of science and art, handsome public baths, etc. Pop. (1901) 50,400.

Burt'sell, Richard Lalor, American clergyman: b. New York, 14 April 1840. He studied in Rome and was ordained to the priesthood in 1862. After returning to the United States and having charge of parishes in New York he was appointed "defender of the marriage tie" being the first to fill this office, which in 1884 was instituted in the Catholic Church in the United States. Having become connected with the movement headed by Rev. Dr. McGlynn, he was retired from his parish to one of less prominence in 1890. In 1904 he was elevated to the dignity of Domestic Prelate by Pope Pius X. and is now (1905) rector of Saint Mary's Church, Kingston, N.Y.

Buru, boo-roo', or **Boeroe**, Malaysia, an island of the archipelago, in the residency of Amboyna, from which it lies about 40 miles to the west. Area, with the small island of Amblau, 3,360 square miles; population variously estimated at from 10,000 to 50,000. The marshy coast lands are notoriously unhealthy, but lofty mountains rise in the interior, one peak (Tomahoe) attaining an altitude of 10,320 feet. A dense natural forest covers most of the country, and only a very small portion has been brought under cultivation. The soil is rich, and vegetation everywhere luxuriant.

Burwash, Nathanael, Canadian educator: b. Argenteuil, near Saint Andrews, Quebec, 25 July 1839, of a loyalist family, who left Vermont during the American Revolution. He was educated at Victoria College, Cobourg, and Yale University, and entered the Methodist ministry in 1860. He was professor in Victoria Col-

BURY — BURYING-PLACES

lege, 1867-73; dean of faculty of theology in 1873, and has been president and chancellor of Victoria University, Toronto, from 1887. He was secretary of education for the Methodist Church in Canada, 1874-86, and has devoted much time toward bringing about university federation in the province of Ontario. He has published 'Memorials of Edward and Lydia Jackson' (1874); 'Wesley's Doctrinal Standards' (1881); 'Handbook on the Epistle to the Romans' (1887); 'Inductive Studies in Theology' (1896); 'Manual of Christian Theology' (1900); 'Life and Times of Egerton Ryerson' (1902).

Bury, bĕr'ī, John B., Irish scholar; b. 16 Oct. 1801. He was graduated from Trinity College, Dublin, of which he is a Fellow; in 1893 became professor of modern history in Dublin University, and professor of Greek there in 1898. He has written 'History of the Later Roman Empire from Arcadius to Irene' (1889); 'Student's History of the Roman Empire from Augustus to Marcus Aurelius' (1893); 'History of Greece to Death of Alexander the Great' (1902); and has edited Pindar's 'Isthmian Odes'; and 'Nemean Odes'; Freeman's 'History of Federal Government in Greece and Italy'; and Gibbon's 'Decline and Fall of the Roman Empire.'

Bury, Richard de, or Richard Aungerville, English clergyman and author; b. 1281; d. 1345. He was made bishop of Durham in 1333. His principal work, 'Philobiblon,' was intended to serve as a handbook to the library which he founded in connection with Durham College at Oxford (afterward suppressed). It gives an interesting account of how he collected his library, describes the state of learning in England and France, and closes with an explanation of the rules for the management of his library, which were founded on those adopted for the library of the Sorbonne.

Bury, bĕr'ī, England, a municipal and parliamentary borough, in Lancashire, eight miles north-northwest of Manchester. It is well situated on a rising ground between the Irwell and the Roche, and, being much improved in recent times, now presents the appearance of a clean and well-built town. It has a handsome town hall, an atheneum, a technical school and art gallery, a savings bank, the Bury Bank, Trevelyan Club, and Philips Hall, grammar school, public baths, railway station, etc. Among the churches, St. Mary's (the parish church) and St. Thomas' are perhaps the finest, being highly ornate Gothic buildings with tower and spire. There is also a handsome chapel belonging to the United Methodist Free Church, a fine Presbyterian church, and a Roman Catholic chapel. The staple manufacture is that of cotton, and there are also large woolen factories, bleaching and printing works, dyeworks, foundries, etc. The late Sir Robert Peel was born at Chamber Hall in the vicinity in 1788; and a bronze statue of him adorns the town. Bury was made a parliamentary borough, returning one member in 1832. Pop. about 60,000.

Bury St. Edmund's, England, a parliamentary and municipal borough in Suffolk, situated on the Lark, 26 miles from Ipswich. It contains four churches, two of them being fine old Gothic edifices. These are places of worship belonging to the Independents, Methodists,

Baptists, and others; and among other buildings a shire-hall, a guild-hall, a corn exchange, atheneum, with library, etc. Agricultural implements are manufactured, and there is a large trade in agricultural produce. Of many benevolent institutions the principal is a free grammar school founded by Edward VI. Bury St. Edmund's sends one member to Parliament. It is an ancient place, and derived its name from St. Edmund, a king of the East Angles, who was buried here. The barons in John's reign met here, and swore to obtain the ratification of Magna Charta. Bury St. Edmund's contains the remains of an abbey, once the most wealthy and magnificent in Great Britain. Pop. about 17,000.

Burying-beetles, coleopterous insects of the family *Silphidae*. The carrion or sexton beetles are useful in burying decaying bodies of birds, mice, etc., in which they lay their eggs. The larvæ are crustaceous, flattened, with the sides of the body often serrated, black and of a fetid odor. They undergo their transformations in an oval earthen cocoon. In *Necrophorus* the antennæ have 10 apparent joints, and the rounded club is four-jointed. The genus *Silpha*, of which *S. lapponica* is a common species, differs in the third joint of the antenna being no longer than the second but shorter than the first. In *Necrophilus* the third joint is as long as the first. *N. surinamensis* has a yellow thorax with a central irregular black spot. *Catops* and its allies live in fungi, carrion, and ants' nests, and are small, black, oval insects. There are between 800 and 900 species of the family, many of which are small and live in caves (see CAVE-DWELLING ANIMALS) or in nests of ants.

Burying-places, localities of sepulture of the dead. The custom of burying the dead in public places prevailed among the most ancient nations, including the Romans, who afterward, in the flourishing periods of the republic, burned their dead and kept the ashes in tombs, collected in urns. The ancient Germans buried their dead in groves consecrated by their priests. With the introduction of the Christian religion consecrated places were appropriated for the purpose of general burial; and it was regarded as ignominious not to be buried in consecrated earth. The deprivation of the rites of burial was therefore part of the punishment of excommunication. The Romans provided their grave-stones, upon which were inscribed the name of the deceased, and the wish, *Sit illi terra levis* ("May the earth rest lightly upon him"). This custom was preserved by the Christians. The Egyptians, Greeks, and Romans erected over the graves of men of rank, or persons otherwise remarkable, pyramids, mausoleums, or temples. After the introduction of Christianity little churches, called chapels, were erected over the dead. Early Christian martyrs were often buried in caverns, which by degrees were enlarged to spacious subterranean vaults. Subsequently others considered themselves happy if their bones were allowed to repose near the ashes of a martyr. As early as the 4th century the Christians built churches over the sepulchres of the holy martyrs; and in the belief that a place was sanctified by their ashes they anxiously sought out, on the erection of new churches in cities, or the transformation of heathen temples into

Christian churches, the remains (relics) of the martyrs, and buried them under the altar of the new church to communicate to it a character of greater sanctity. The Emperor Constantine, who died in 337, is supposed to have been the first person who ordered his tomb to be erected in a church. This was done in the Church of the Apostles at Constantinople, of which he was the founder, and therefore probably considered himself as peculiarly entitled to this privilege. He was soon imitated by the bishops, and later all those who had enriched the Church were distinguished by this honor. The Emperors Theodosius and Justinian, indeed, forbade the erection of sepulchres in churches, but in vain. Leo the Philosopher again permitted them to everybody. At present interment in churches is almost everywhere suppressed, or at least permitted only under certain restrictions. Even in Naples and Rome the general practice of erecting sepulchres in churches was forbidden in 1809, and the foundation of burial places without the city was provided for. The custom introduced by the communities of Moravian Brothers, who form their burial places into gardens, is now becoming general; and cemeteries, instead of exhibiting merely dull ranges of tombstones, are adorned with flower plots and ornamental shrubbery. The celebrated burying-place of Père la Chaise, near Paris, is one of the most beautiful and interesting spots in the world. See also CATACOMBS.

Busaco, boo-sä'kō, a hamlet in the province of Beira, on the north side of the river Mondego. It is memorable for the battle, 27 Sept. 1810, between Wellington and Masséna. Wellington, with about 40,000 men on a retreat before Masséna, with a force of 65,000, availed himself of the favorable position of the sierra or ridge here for checking the pursuit.

Busbecq, or **Busbequius**, **Ogier Ghislain de**, ô'ji-ér gēz-lān dē būs-bēk, Flemish diplomatist and author; b. Comines, 1522; d. 1592. After having studied in the most celebrated universities of Flanders, France, and Italy, he entered the service of Ferdinand, king of the Romans, who in 1555 sent him as ambassador to Constantinople. After seven years he returned home, and next was sent to accompany the Archduchess Elizabeth (who was to be married to Charles IX.) on her journey to France. Busbecq remained there as steward to Elizabeth, and when she left France, after the death of her husband, he remained as ambassador of Rudolph II. Two important works of his survive, 'Legationis Turcicæ Epistolæ Quatuor,' in which the policy, the power, and the weakness of the Porte are so profoundly and clearly explained that even at present information may be drawn from them; and 'Epistolæ ad Rudolphum II.' a very important work for the history of those times. His style is pure, elegant, and simple. During his stay in Turkey he collected Greek inscriptions and manuscripts.

Busby, büz'bi, **Richard**, English schoolmaster; b. Luton or Sutton, Lincolnshire, 22 Sept. 1606; d. 6 April 1695. He was educated at Westminster School and at Oxford, where he entered Christ Church in 1624, and graduated B.A. four years later, and M.A. in 1631. He became a tutor of his college, and at the age of 33 was appointed prebendary and rector of Cudworth, in Somersetshire. In 1638 he was provi-

sionally appointed headmaster of Westminster School, and two years later was confirmed in this appointment, which he held continuously till his death. He was strict in discipline and a successful teacher, and among his pupils were many of the greatest men of his time, Dryden, Locke, Atterbury, South, Henry, Hooper, and others. His published works were mainly school books, now long out of date. He was buried in Westminster Abbey.

Busby, a military headdress worn by Hussars, artillerymen, and engineers, consisting of a fur hat, with a bag of the same color as the facings of the regiment hanging from the top over the right side. The bag appears to be a relic of a Hungarian headdress, from which a long padded bag hung over, and was attached to the right shoulder as a defense against sword cuts.

Busch, **Moritz**, German publicist; b. Dresden, 13 Feb. 1821; d. 1899. He was educated at Leipzig, and in 1847 began his literary work by translating a number of the novels of Dickens and Thackeray. As a member of the Radical party he was disappointed by the failure of the revolutionary movement of 1848, and came to the United States in 1851, but returned to Germany in 1852. He also traveled in the Orient in behalf of the Austrian Lloyds. In 1856 he became editor of the *Grenzboten*, and in this paper defended the policy of Bismarck. In April 1870 he was appointed to a position in the Foreign Office, and accompanied Bismarck to France at the time of the Franco-Prussian war. In 1873 he gave up his official position to become the editor of the *Hannoverschen Kuriers*, but continued to be a confidant of Bismarck and strongly advocated the chancellor's policy in his articles for the press. After his visit to the United States he wrote 'Journeys from the Hudson to the Mississippi,' and 'The Mormons.' Other works of his are: 'American Humorists' (translations of selections from Mark Twain, Bret Harte, etc.); 'The History of the International'; 'The Humor of the German People'; 'Count Bismarck and His People During the War with France'; 'Our Chancellor' (a life of Bismarck); and 'Bismarck; Some Secret Pages of His History' (translated into English).

Busch, **Wilhelm**, German cartoonist; b. Wiedensahl, Hanover, 15 April 1832. He first studied engineering at the Polytechnic School at Hanover, but later studied art at the academies of Düsseldorf, Antwerp, and Munich. In 1859 he drew his first cartoons for the 'Fliegende Blätter.' His work is marked by keen satire and his later productions are far behind his earlier in form. He published a series of his sketches with explanatory text, including 'Saint Antonio of Padua'; 'The Pious Helena'; 'Father Filucius'; 'Max and Moritz'; and 'Hans Hucklebein.'

Büsching, **Anton Friedrich**, än-tōn frēd'riht bü'shing, German geographer; b. Stadthagen, Schaumburg-Lippe, 27 Sept. 1724; d. Berlin, 28 May 1793. He studied theology in Halle from 1744, and was for a time minister of a Protestant church in St. Petersburg. When acting as a traveling tutor he became convinced of the defects of existing geographical treatises, and resolved to write a new one, which he began on his return to Germany in 1752, by publishing

a short description of Schleswig and Holstein as a specimen. In 1754 he was made professor of philosophy in Göttingen. In 1766 he was made director of the united gymnasiums of Berlin and the suburb Kölln. Before his great 'Erdbeschreibung,' which he began to publish in 1754 in separate volumes, and which, though not entirely completed by the author, passed through eight editions during his life, neither the Germans nor any other nation had a thoroughly scientific geographical work. Another of his important writings is the 'Magazin für Historiographie und Geographie' (1767-93).

Busenbaum, Hermann, hēr'mān boo'zēn-bowm, German Jesuit: b. Notteln, 1600; d. Münster, 31 Jan. 1668. He taught moral philosophy at Cologne, and was rector of the Jesuit College at Münster. He is best known through his casuistical work, 'Medulla Theologiæ Moralis, Facili ac Perspicua Methodo Resolvens Casus Conscientiæ,' in which he treats of the principles of the Jesuit morals in a detailed and systematic manner. This book passed through 45 editions between 1645 and 1670, and has been reprinted in modern times. After Damieni's attempt to assassinate Louis XV. of France, the charge was made that it had taught the Jesuits' approval of murder and regicide; it was therefore publicly condemned by the order, and burned by the Parliament of Toulouse.

Busento, boo-sēn'tō, a river of southern Italy, joining the Crati at Cosenza. The Goths, it is said, dug Alaric a secret grave in the bed of this stream, which they temporarily diverted from its course.

Bush, George, American biblical scholar: b. Norwich, Vt., 12 June 1796; d. Rochester, N. Y., 19 Sept. 1859. He graduated at Dartmouth College in 1818, and studied theology at Princeton, N. J., from 1820 to 1822. In 1831 he became professor of Hebrew and Oriental literature in the University of the City of New York. Embracing the doctrines of Swedenborg in 1847, he became a minister of the New Church and editor of the 'New Church Repository.' Among his works are 'Life of Mohammed' (1832); a 'Hebrew Grammar' (1835); 'Bible Commentaries' (1840).

Bush-Brown, Henry Kirke, American sculptor: b. Ogdensburg, N. Y., 21 April 1857. He studied art in Paris and Italy, and has a studio in New York. His most important works are equestrian statues of Gens. Meade and Reynolds, at Gettysburg; the statue of Justinian, Appellate Court, New York; Indian Buffalo Hunt; Chicago World's Fair; statues for Hall of Records, New York.

Bush Creepers, the English name of the *Uncotillinae*, a subfamily of the *Sylviidae*. These birds have sharply conical bills and long, pointed wings. They are usually diminutive in size, active in habits, have a twittering note, and build their nests in thickets, solitary bushes, or trees. They are found in the warmer parts of both hemispheres, some of them, however, being migratory.

Bush-dog, a small wild dog (*Icticyon venaticus*), resembling a fox in appearance, found in Guiana and Brazil. It is distinguished by its one molar tooth in the upper jaw, has close hair, and a short, stubby tail. Compare Fox-dog.

Bush-hog. See RIVER-HOG.

Bush-quail, the Anglo-Indian name for the button-quail (q.v.).

Bushbuck, any of several African antelopes, frequenting thickets and bushy regions. The name applies especially to the diminutive antelopes of the genus *Cephalolophus*, which the Dutch of South Africa called "duykers" (q.v.). These include the smallest members of their race, some of them standing only 13 inches high at the shoulders. They haunt the rocky hillsides, leaping with extraordinary agility from stone to stone, and diving into the thickets at the first alarm. They feed upon berries, leaves, buds, and similar food, rather than upon grass, and their flesh has a delicate flavor. The name "bushbuck" is also given, especially in South Africa, to the larger antelopes of the genus *Tragelaphus*, more distinctively known as "harnessed" antelopes, because their hides, often richly colored, are conspicuously marked with whitish stripes, suggesting a harness thrown over the back. The largest of these handsome antelopes is the west African bongo (*T. euryceros*), of the forests of the Gaboon region, which stands nearly four feet high, and has horns 30 inches long. On the opposite side of the continent the nyala (*T. angasi*) frequents the fever-stricken swamps of the east African coast. Another well-known species of the swamps of southern and eastern Africa is Speke's antelope (*T. spekei*), native names for which are "nakong" and "sititunga." It differs from its fellows in having a uniform grayish-brown silky coat, without any "harness," but the young are faintly striped and spotted. This species is one of the best known of African antelopes, wherever rivers or swamps occur, and still survives in considerable numbers. That species most often called "bushbuck" is the "guib" (*T. scriptus*), still to be found in the jungles along the African rivers from Abyssinia to the Cape. It is remarkable for its inferior size, which is about that of a goat; and for the variability of its markings, which has led to much confusion in describing it. The variety most common in Cape Colony is uniformly dark brown, with no stripes whatever, and only a few spots on the haunches. This genus of antelopes is closely allied to that of the koodoos (q.v.), and resembles them in that the females are hornless, and usually differ in color from the males.

Bushel, a dry measure containing eight gallons or four pecks. The standard bushel in the United States (originally known as the Winchester bushel) contains 2150.42 cubic inches and holds 77.627 pounds of pure water at a temperature of 39.8° F., and 30 inches atmospheric pressure. The English standard, the imperial bushel, has a capacity of 2218.20 cubic inches and holds 80 pounds of pure water at 62° F. See WEIGHTS AND MEASURES.

Bushido, boo-shē'dō ("the way of the warrior"), the ethical code of the Samurai, the Japanese order of knighthood. It is in some ways like the code of the knights of the Middle Ages, demanding courage, honor, and loyalty to country and rulers; it also enjoins the duty of suicide by hari-kari (q.v.) to avoid loss of honor. Although the formal code was given up when feudalism was abolished in Japan, its ideals still have great influence on the people,

and many of the most prominent of the nation were educated according to its principles. It has given woman a remarkable position in Japan and even yet instills in the young loftier ideals. See SAMURAI.

Bushmaster, a large pit-viper (*Lachesis mutus*) of the rattlesnake family, numerous in northeastern South America, and called by the natives "surucucu." It is the largest and most venomous snake known, sometimes reaching a length of nine feet. Its ground color is pale yellow, darker on the back, and marked with a chain of jagged brown spots, and lighter on the belly. It has no rattle, but its tail terminates in a horny spur, which when the tail is vibrated, strikes against the ground, producing a rattling noise, which can be heard several feet. It is similar to the rattlesnake in its habits, dwells wholly upon the ground, and its poisonous apparatus is greatly developed, making it a very deadly serpent, and one much feared.

Bushman, or **Bosjesmans**, a dwarf African race inhabiting the Kalahari desert and some of the more northerly portions of Cape Colony. Their average height seems to be rather less than five feet, but the Bushmen of the Cape are more stunted than those living farther north. The skin is of a dirty yellowish color, and they have repulsive countenances, with a somewhat prominent forehead, thick lips, large ears, and small, deep-set, restless eyes. They are essentially a nomadic people, neither tilling the soil nor rearing domestic animals, but subsisting on the flesh of various wild animals, and on wild bulbs, roots, fruits, etc. They live in rocky caves or in rude nest-like structures in a bush.

Bushnell, Asa Smith, American politician: b. Rome, N. Y., 16 Sept. 1834; d. Columbus, O., 15 Jan. 1904. He began a business career, removed to Ohio in 1851 where he was a manufacturer of mowers and reapers. He served in the Civil War, commanding the 152d Ohio Volunteers. In 1895 he was elected governor of Ohio, and was re-elected in 1897.

Bushnell, Horace, American theologian: b. Litchfield, Conn., 14 April 1802; d. Hartford, 17 Feb. 1876. He graduated at Yale in 1827, engaged in journalistic and educational work, then studied law and theology at Yale, where for a time he was a tutor, and in 1833 he began his brilliant pastorate of the North Congregational Church in Hartford, from which he retired owing to failing health in 1853. His writings on theological subjects were as remarkable for the interest and discussion which they aroused among religious scholars and thinkers as for their originality and independence of thought and vigor of utterance. Both as writer and preacher he was a commanding figure, and his influence was far-reaching. His works include: 'Principles of National Greatness; Christian Nurture' (1847); 'God in Christ' (1849); 'Christian Theology' (1851); 'Sermons for the New Life' (1858); 'Nature and the Supernatural' (1858); 'Character of Jesus' (1861); 'The Vicarious Sacrifice' (1865); 'Women's Suffrage, the Reform Against Nature' (1869); 'Forgiveness and Law' (1874). See Mary B. Cheney, 'Life and Letters of Horace Bushnell' (1880); T. T. Munger, 'Horace Bushnell, Preacher and Theologian' (1899). The public services of Dr. Bushnell as a citizen were such as to make him long remembered for his civic pride and devotion to the interests of the city

where his lifework was performed. Bushnell Park, Hartford, named in his honor, is a monument to his initiative and persistent efforts, whereby mainly the city came into possession of one of its chief adornments.

Bushrangers, the name for desperadoes in Australia who, taking to the bush, supported themselves by levying contributions on the property of all and sundry within their reach. Considerable gangs of these lawless characters have sometimes collected, a body of 50 holding part of New South Wales in terror about 1830. A gang of four fell victims to justice in 1880, after having robbed a bank and committed other outrages. Since then little has been heard of outrages of this class.

Bushtit, a very small titmouse of the genus *Psaltriparus*, two species of which inhabit the western United States. One, the least bushtit (*P. minimus*), is found in summer from the Rocky Mountains to the Pacific coast, and is noted for its nest, which is formed of moss, down, lint of plants, and similar materials, and is shaped like an old-fashioned purse, 8 or 10 inches in length, suspended from the branch of a bush, and entered by a small hole near the top. The lining is of feathers and downy materials, and the eggs are 8 to 10 in number, and pure white. A southern variety of this is the lead-colored bushtit. A Mexican species (*P. melanotis*) is distinguished by black patches on each side of the head. The resemblance in the nesting habits of these birds to those of the European titmouse will be noted. See TITMOUSE.

Bushwhacker, a term applied during the Civil War to men living in the States where military operations were carried on, who professed to be neutrals and to be solely occupied in their ordinary vocations, but who seized opportunities to harass or attack individual soldiers or small bodies off their guard.

Busi'ris, a mythical Egyptian king mentioned by Apollodorus. Egypt had been for nine years subject to famine when Phrasius, a soothsayer of Cyprus, arrived to inform the king that the scarcity would not cease unless a foreigner were sacrificed each year to Zeus. Busi'ris made Phrasius the first victim, and established the custom of immolating a foreigner every year. Hercules was one year seized and bound to the altar, ready to be offered up, when he burst his chains and put Busi'ris to death.

Busk, George, English scientist: b. St. Petersburg, 1807; d. 1886. In the early part of his career he served as surgeon in the British navy, retiring in 1855. Later he devoted himself to the study of geology, paleontology, and kindred sciences, and became an authority in certain departments of zoology. He was a Fellow of the Royal Society and of the Geological Society of London.

Buskin (Latin *cothurnus*), a kind of high-soled shoe or half-boot, worn upon the stage by the ancient actors of tragedy, in order to give them a more heroic appearance. The Greek word *kothornos* denoted a sort of closed boot, fitting either foot, worn by women; the tragic boot being the *embates* or *embas*. The word is figuratively employed by the Latin authors for tragedy itself, or for a lofty and elevated style.

BUSSANG — BUSTARD QUAIL

Bussang, boo'sǎng, or **Boussa**, a town of central Africa in lat. 10° 14' N.; lon. 4° 11' E. It is walled, and being surrounded by rocks is a place of considerable strength. The houses are irregularly placed, and thus cover a space of ground disproportioned to the number of inhabitants. The soil of the country is fertile, producing corn, yams, cotton, rice, and timber trees in great abundance. Among the wild animals are elephants, hippopotami, lions, etc. It has obtained a melancholy notoriety from the place where Mungo Park met his death in 1805. Pop. estimated at 12,000 to 18,000.

Bus'sey, Benjamin, American merchant: b. Canton, Mass., 1 March 1757; d. Roxbury, 13 Jan. 1842. He was a soldier in the Revolutionary War, became a silversmith in Dedham, afterward a merchant in Boston, where he acquired a large property, from which he bequeathed about \$350,000 to Harvard College, one half for founding the Bussey Institute, a school of agriculture and horticulture, and one half for the support of the law and divinity schools of the college.

Bussi D'Amboise, Louis de Clermont D'Amboise, loo-ē dē klēr-mōñ dāñ-bwā bū-sē dāñ-bwā (STEUR DE): b. 1549; d. 19 Aug. 1579. He acquired an infamous notoriety by the prominent part he took in the massacre of St. Bartholomew. He afterward attached himself to the Duke of Anjou, and obtaining the command of the castle of Anjou, made himself universally odious by his pride and oppression. He had the meanness to pander to the low passions of the Duke, and undertook to seduce the wife of the Count of Montsoreau. The intrigue cost him his life. Montsoreau having come to the knowledge of it, obliged his wife to write Bussi, giving him a rendezvous at the castle of Constançières. Bussi arrived with a single confidant, and was immediately met by Montsoreau, who killed him.

Busson, Charles, shārl bū-sōñ, French painter: b. Montoire, Loir-et-Cher, 15 July 1822. He studied under Rémond and François and devoted himself to landscape painting. His style was not marked by the characteristics of the "open air school," but recalled the canvases of earlier masters in his chosen branch of art. Among his paintings are 'Les Ruines du Château de Lavardin' and 'La Chasse au Marais.'

Bussu (būs-soo) Palm, a plant (*Manicaria succifera*), common in the swamps of northern Brazil. Though it rarely exceeds 15 feet in height, it has huge leaves, said to be the largest undivided leaves produced by any palm, even reaching 30 feet in length by 4 or 5 feet in width. After splitting the midrib from end to end the leaves are laid obliquely upon rafters to form thatch for houses. This position makes the spaces between the veins act as gutters to carry off water. The spathes are used by the Indians for caps and bags and for cloth-making. The large, hard, three-seeded, olive-green fruits do not seem to be used commercially.

Bussy-Rabutin, bū-sē-ṛā-bū-tāñ, or Roger de Rabutin, COMTE DE BUSSY: b. Epiry, Nivernois, 1618; d. Autun, 1693. He entered the army at the age of 13, and made several campaigns. Turenne, in a letter to the king, describes him as the best officer in his army, as far as songs were concerned. His scandalous chronicle,

entitled 'Histoire Amoureuse des Gaules,' cost him the loss of his official appointment and a year's imprisonment in the Bastille. He was a correspondent of Madame de Sévigné, and is often mentioned in her letters. He had the vanity to suppose that he excelled her in her peculiar art, and his letters were afterward published in seven volumes.

Bust (French *buste*, Italian *busto*, of uncertain origin), in sculpture, the representation of that portion of the human figure which comprises the head and the upper part of the body. The bust did not become common among the Greeks until the time of Alexander, nor among the Romans till the time of the empire. Among the Greeks, the portrait busts of the learned formed an important branch of art. The artists in these works exhibited a singular power of expressing character, and in this way we possess what are probably faithful likenesses of Socrates, Plato, and other distinguished persons. The first Roman bust that can be depended upon as giving a correct likeness is that of Scipio Africanus the elder. The number of busts of the time of the Roman empire is very considerable, but those of the Roman poets and men of letters have not been preserved in so large numbers as those of the Greeks. A collection of drawings of antique busts was made by Fulvius Ursinus, and published with the title, 'Virum Illustrium Imagines' (Rome 1569; Antwerp 1606); subsequently a similar collection was published in the 'Iconographie Grecque' of Visconti (Paris 1811), which was followed by his 'Iconographie Romaine' in 1817.

Bustamante, boo-ṣṭā-māñ'tā, Anastasio, Mexican statesman and revolutionist: b. Tiquilpan, Michoacan, 27 July 1780; d. San Miguel Allende, 6 Feb. 1853. In 1808 he joined the Spanish army, and for a time fought against the party of the revolutionists, but in 1821 he acted with Iturbide. He was made vice-president and commander of the army, in the administration of Guerrero, 1829. He afterward revolted and led the Centralist party, and in 1830 became acting president of Mexico. In 1832 Santa Anna opposed him at the head of an army, and he was conquered and banished 1833. When the Centralist party returned to power he was recalled, and in 1837 was elected president of Mexico. In 1842 he was obliged to retire from the presidency, and was succeeded by Santa Anna. He served in the Mexican army in the war with the United States, retiring from military service in 1848.

Bustamante, Carlos Maria, cār'lōs mār-ē'a, Mexican historian: b. Oajaca, 4 Nov. 1774; d. 21 Sept. 1848. He studied law and in 1801 began its practice. In 1805 he became editor of the *Diario de Méjico*. He held a command under Morelos in 1812, and was captured at Vera Cruz. He was released, and became a member of Congress and held other public offices. His works treat of various periods of Mexican history, and are of special value, as he was an eye-witness of much that he describes. He published a history of the Mexican Revolution (1823-32), and histories of the times of Iturbide and of Santa Anna.

Bustard Quail, the name given by Anglo-Indians to the button-quail (q.v.).

BUSTARDS.

2. Great Bustard.

1. Little Bustard.

BUSTARDS — BUTE

Bustards, a family of game birds (*Otididæ*) of the Old World, which, however, are not gallinaceous, but are related in structure on the one hand to the cranes, and on the other to the plovers. They are inland birds, haunting dry, grassy, and sandy plains, and in the more settled districts resorting to stubble-fields and pastureland. They have strong legs and feet, as well as good wing-power, and spend more of their time on the ground than in flight. Most of them are birds of handsome plumage, the upper parts being mottled with brown and reddish tints, set off with white and black. Ornamental plumes are characteristic of the group, and often form crests, or ruffs, about the head, neck, and breast. Bustards are known in the Mediterranean regions, and throughout southern Asia to China and Japan. They also abound all over Africa, and one species (*Eupodotis australis*) inhabits Australia, where it is called "native turkey." Those of North Africa and western Asia are known as "houbaras," and form the favorite game-birds of that semi-desert region. Certain small species of India, favorites with sportsmen, are called "floricans." The typical, and best-known bustard, however, is *Otis tarda*, now extinct in Great Britain, but numerous throughout the Mediterranean countries. It has somewhat the size and form of an American turkey, and is the largest and one of the most valuable of European game-birds. A remarkable feature of this species is the fact that a great pouch, opening under the tongue, is developed in the throat of the male of some examples during the breeding season. This phenomenon is restricted to adult birds, and the pouch disappears at other times of the year. Its utility is unknown. A much smaller but otherwise similar species, the little bustard (*Otis tetrax*), is another favorite with European sportsmen. The term is sometimes erroneously applied to other large birds, such as the Magellanic goose of Argentina. Consult: Afalo, 'Sport in Europe' (London 1901); Seeböhm, 'Birds of Asia' (London 1901); Bryden, 'Nature and Sport in South Africa' (London 1897).

Busybody, **The**, a pen name under which Benjamin Franklin wrote a series of papers, modeled on 'The Spectator' of Addison; also a comedy by Mrs. Centlivre, 1709.

Bustades. See DIBUTADES.

Butcher, Samuel Henry, Irish classical scholar: b. Dublin, 16 April 1850. He was educated at Marlborough College, and Trinity College, Cambridge, and was a lecturer at University College, Oxford, 1876-82. In the last mentioned year he succeeded John Stuart Blackie as professor of Greek in the University of Edinburgh. He has published a 'Prose Translation of the Odyssey (with A. Lang q.v.)' (1879); 'Demosthenes' (1881); 'Some Aspects of the Greek Genius' (1891); 'Aristotle's Theory of Poetry and the Fine Arts, with a Critical Text and Translation of the Poetics' (1895).

Butcher. See ABATTOIR.

Butcher-bird, a shrike of the family *Laniidæ*, representatives of which range throughout the northern hemisphere. They are birds of moderate size, and gray and white in color, with black markings upon the head, wings, and tail, which are properly included among the insect-eating birds, but have developed certain falcon-

like traits. They are of powerful build, with hooked beaks, and strong claws, and in winter, when insect prey is not easily obtained, they are accustomed to strike down small birds, and to seize mice, shrews, etc. These they carry off in their claws to some thorn-tree, or to a fence with spikes, and impale them one by one upon the thorns, or other sharp points, in order to fix them firmly while they feed upon their flesh. It often happens, however, that their love of the chase exceeds their appetite, so that they will catch and store away several victims, whose frozen bodies remain hanging upon the thorns, like meat in a butcher's shop; the Germans have a popular belief that nine victims are thus stored at a time, and call the birds "nine-killers." These shrikes make rude nests in trees and lay four or five brownish spotted eggs. They feed their young upon insects, and these form the larger part of their own fare, especially grasshoppers. A typical species, common all over northern North America is the great northern shrike (*Lanius borealis*), which is rarely seen in the United States, except in winter. Another species, the loggerhead (*L. ludovicianus*), dwells in the southern States and is somewhat smaller in size. Consult: Ingersoll, 'Wild Life of Orchard and Field' (1902). See SHRIKE.

Bute, büt, John Patrick Crichton-Stuart, (3d MARQUIS OF): b. Mountstuart, 12 Sept. 1847; d. 9 Oct. 1900. He was educated at Harrow and Oxford. In 1872 he married a daughter of Lord Howard. He was mayor of Cardiff in 1891-2, and after the latter year was lord-lieutenant of Buteshire. From 1892 to 1898 he was lord rector of St. Andrew's University. He was the author of 'Early Days of Sir William Wallace'; 'The Burning of the Barns of Ayr'; and 'Altus of St. Columba.' He owned some 117,000 acres of landed property. In 1868 he joined the Roman Catholic Church and some years later published a translation of the Roman 'Breviary.'

Bute, John Stuart (3d EARL OF), British statesman: b. Edinburgh, 25 May 1713; d. 10 March 1792. His grandfather was created a peer in 1703, and the family was connected with the royal Stuart line. In 1737 he entered Parliament. In consequence of his opposition to the measures of the ministry was left out when a new Parliament was convened in 1741. Offended by this neglect, Bute retired to his estates, and lived there, wholly secluded, till the landing of the Pretender in Scotland in 1745 induced him to go to London, and offer his services to the government. He had attracted the notice of the Prince of Wales. He soon gained influence, and succeeded in making himself indispensable to the prince. At his death, in 1751, he was appointed, by the widowed princess, chamberlain to her son, and was intrusted by her with his education. Bute never lost sight of his pupil, and possessed so much more influence with the Princess of Wales than her son's particular tutors, the Earl of Harcourt and the Bishop of Norwich, that they resigned their offices. George II. died 25 Oct. 1760, and two days after Bute was appointed member of the privy council. In March 1761 the Parliament was dissolved, and Bute was made secretary of state. Pitt, who saw his influence in the new council annihilated, gave in his resignation the same year. This event made an unfavorable impression on the

nation; but Bute, possessing the unbounded confidence of his king, stood at the head of the state. After a severe contest in Parliament, he concluded a peace with France. The terms for England were perhaps not disproportionate to the successes obtained during the war; but Bute was obliged to bear the most bitter reproaches. He, however, succeeded in winning the popular favor, and everything seemed to promise the power of the minister a long continuance. The influence of Bute seemed unbounded, when it was made known, contrary to expectation, that he had resigned his office as prime minister, and was in future to live as a private man. In 1766 Bute declared in the House of Lords that he had wholly withdrawn from public business, and no longer saw the king; still it was not doubted that his great influence continued. On the death of the Princess of Wales, 1772, he seems first to have given up all participation in the affairs of government. He spent his last years on his estate. A costly botanical garden, a library of 30,000 volumes, excellent astronomical, philosophical, and mathematical instruments, afforded him occupation. His favorite study was botany, with which he was intimately acquainted. For the queen of England he wrote the 'Botanical Register,' which contained all the different kinds of plants in Great Britain (9 vols. 4to). This work is remarkable, both for its splendor, in which it excels all former botanical works, and for its rarity. Only 12 copies were printed, at an expense of more than \$50,000.

Bute, an island of Scotland, in the estuary of the Clyde, with an area of 30,000 acres, belonging principally to the Marquis of Bute. It is about 15 miles long, and the average breadth is $3\frac{1}{2}$ miles. Agriculture is in an advanced state, and there are about 20,000 acres under cultivation. The herring fishery is also a source of considerable profit. The only town is Rothesay, whose ancient castle is one of the interesting antiquities of the island. The climate of Bute is milder than that of almost any part of Scotland. The county of Bute comprises the islands of Bute, Arran, Great Cumbrae, Little Cumbrae, Inchmarnock, and Pladda, with a total area of 143,997 acres, but only a small part is under cultivation. Arran is about double the size of Bute, but the other islands belonging to the county are small. Pop. (1901) 18,800.

Bu'tea, a small genus of trees or woody vines of the natural order *Leguminosæ*, natives of China and India, noted for their racemes of large rich usually scarlet papilionaceous flowers, for which they are cultivated in warm countries and to a small extent in warm greenhouses. The best-known species (*B. frondosa*) is called the dhak or pulas tree in India, and is grown out of doors in California. It is a leafy tree, attains a height of 50 feet, and bears very showy orange-crimson flowers, which are used in the East under the name keesoo or teesoo for dyeing yellow or orange. Its fibrous roots and bark are used for caulking boats, making rope, etc. Its red, resinous gum, with which the twigs are frequently covered, is said to be very rich in tannin, and is found in the markets of India.

Butin, Ulysse Louis Auguste, ü-lës loo-ë õ-goost bü-tän, French painter: b. St. Quentin, 1838; d. Paris, 9 Dec. 1883. He was a pupil of Picot and Pils. His subjects are mostly

from the life of the French fishermen, and his work shows remarkable truthfulness to nature. Among his best paintings are 'The Departure'; 'Fishing'; and 'Burial of a Sailor at Viller-ville.'

Butler, Amos William, American ornithologist: b. Brookville, Ind., 1 Oct. 1860. He received his education at the University of Indiana and in 1895 was elected president of the Indiana Academy of Science. He has been general secretary of the American Association for the Advancement of Science from 1891 and has published 'The Birds of Indiana' and lesser works.

But'ler, Andrew Pickens, American politician: b. Edgefield District, S. C., 7 Nov. 1796; d. near Edgefield Court-house, 5 May 1857. He was admitted to the bar in 1819, and in 1824 was elected to the legislature as the representative of his native district. In 1831, a period marked by the apprehended collision of South Carolina with the Federal government, on the nullification issue, he was elected colonel of a regiment of cavalry. In 1833, still a member of the legislature, he was made a judge of the courts of general sessions and common pleas. Subsequently, when a change was made in the judiciary system, he was transferred to the supreme bench of the State, where he continued until 1846, when he was elected a senator in Congress. Soon after taking his seat in this body, he was appointed chairman of the Judiciary Committee. One of his earliest speeches was against making Col Benton lieutenant-general of the army. The Kansas question, the action of the naval retiring board, the abolition question, and all others affecting the peculiar interests of South Carolina, and the general welfare of the South, engaged him in frequent debate, in which he always took a conspicuous part. His last speech was in reply to Mr. Sumner, and in defense of South Carolina.

Butler, Benjamin Franklin, American lawyer: b. Kinderhook Landing, N. Y., 17 Dec. 1795; d. Paris, France, 8 Nov. 1858. He was a lineal descendant of Oliver Cromwell. He studied law under Martin Van Buren, whose partner he subsequently became. From 1821 to 1825 he was district attorney of Albany County. He was elected to the Assembly in 1828, and from 1834 to 1838 was United States attorney-general. He was also acting secretary of war during part of Jackson's administration. He organized the law department of the College of the City of New York and for many years was one of the foremost members of the New York bar.

Butler, Benjamin Franklin, American lawyer and soldier: b. Deerfield, N. H., 5 Nov. 1818; d. Washington, D. C., 11 Jan. 1893. He studied law, was admitted to the bar in 1841, and beginning practice at Lowell, Mass., became distinguished as a criminal lawyer and politician. He was a member of the State legislature in 1853, of the State Senate in 1859-60, and a delegate to the Democratic National Convention of 1860, which met at Charleston and adjourned to Baltimore. He supported the nomination of John C. Breckenridge, which rendered him so unpopular in the North that he was defeated for governor of Massachusetts in that year. Butler had risen to the rank of brigadier-general of militia; and at the outbreak of the Civil War, he marched with the 8th Massa-

BUTLER

chusetts Regiment, and, after a check at Big Bethel, was appointed to the command of Baltimore and of eastern Virginia, with his headquarters at Fort Monroe. In February 1862 he commanded the military forces sent from Boston to Ship Island, near the mouth of the Mississippi; and, after New Orleans had surrendered to the naval forces under Farragut, he held military possession of the city. Relieved of his command, he acted under Gen. Grant in his operations against Petersburg and Richmond in 1864. Returning to Massachusetts at the end of the war, he took an active part in politics as an extreme radical, advocated the impeachment of President Johnson, and in 1866-75 was a member of Congress. In 1877 and 1879 he was defeated as candidate for governor of Massachusetts, but in 1882 was elected by a large majority. In 1884 he ran for the presidency as the candidate of the Greenback and Anti-Monopolist parties, but was defeated, carrying no State. He published 'The Autobiography and Personal Reminiscences of Maj.-Gen. Benjamin F. Butler' (1892). Consult: Parton, 'Butler in New Orleans' (1863); Bland, 'Life of Benjamin F. Butler' (1879).

Butler, Charles, English Roman Catholic historian: b. London, 15 Aug. 1750; d. there, 2 June 1832. He was nephew of the Rev. Alban Butler (q.v.) He was called to the bar in 1791, and was the first Roman Catholic who was admitted, after the passing of the relief bill of that year. He wrote 'Horæ Biblicæ,' giving a history of the original text, early versions, and printed editions of the Old and New Testaments, and also of the 'Koran,' 'Zend-Avesta,' and the 'Edda.' This first appeared in 1797, and was followed by 'Horæ Juridicæ Subscivæ,' a connected series of notes respecting the geography, chronology, and literary history of the principal codes and original documents of the Grecian, Roman, feudal, and canon law. He continued and completed Hargrave's 'Coke Upon Littleton'; supervised the sixth edition of Fearn's 'Essay on Contingent Remainders'; wrote a history of the geographical and political revolutions of Germany, and a 'Historical and Literary Account of the Formularies, Confessions of Faith, or Symbolic Books of Roman Catholic, Greek, and Principal Protestant Churches.' During the last 25 years of his career he principally devoted his pen to the vindication of the Roman Catholic Church. He published numerous biographies of eminent Roman Catholic divines and authors; continued his uncle's 'Lives of the Saints,' and produced 'Historical Memoirs of the English, Irish, and Scottish Catholics.' When Southey's ultra-Protestant 'Book of the Church' appeared, it was replied to in Butler's 'Book of the Roman Catholic Church,' which gave rise to six answers on the Protestant side, two of which were responded to by Butler. His 'Reminiscences' appeared 1822-7. As a constitutional lawyer his reputation was very high.

Butler, Charles, American lawyer: b. Kinderhook Landing, N. Y., 15 Feb. 1802; d. New York, 13 Dec. 1897. He was admitted to the bar in 1824 and subsequently as agent of the New York Life Insurance and Trust Company did much to help forward the development of the western part of the State. He was one of the

founders of the Union Theological Seminary in 1835 and was for many years president of the council of New York University.

Butler, Clement Moore, American Episcopal clergyman: b. Troy, N. Y., 16 Oct. 1810; d. Philadelphia, Pa., 5 March 1890. He was a graduate from Trinity College, Hartford, in 1833, and from the General Theological Seminary in 1836. He was successively rector of churches in Boston and Washington, D. C., and of Grace Church in Rome, Italy, and from 1864 to 1884 professor of ecclesiastical history in the Episcopal Theological School in Philadelphia. He was the author of 'The Book of Common Prayer Interpreted by Its History' (1846); 'Old Truths and New Errors' (1850); 'Saint Paul in Rome' (1865); 'Inner Rome' (1866); 'Manual of Ecclesiastical History' (1868-72).

Butler, Lady Elizabeth Southerden Thompson: b. Lausanne, Switzerland, about 1844; married, 1877, Sir William Francis Butler (q.v.). She received her education in Italy, came to England in 1870, and first exhibited at the Royal Academy in 1873. Her 'Roll-Call' (1874) gained her a great reputation, and was purchased by Queen Victoria. Among her other pictures, which deal almost exclusively with military subjects, are: 'Missing' (1873); '28th Regiment at Quatre Bras' (1875); 'Balclava' (1876); 'Inkerman' (1877); 'Defense of Rorke's Drift' (1881); 'Scotland Forever' (1881); 'Floreat Etona' (1882); 'The Charge of the Scots Greys at Waterloo' (1882); 'Evicted' (1890); 'Camel Corps' (1891); 'Halt in a Forced March' (1892); 'Dawn of Waterloo' (1895); 'Steady the Drums and Fifes' (1897); 'Tent Pegging in India' (1902). She is a sister of Mrs. Alice Meynell, the writer (q.v.).

Butler, Howard Russell, American landscape artist: b. New York, 3 March 1856. He graduated from Yale in 1876 and the Columbia Law School in 1881, and studied art in New York and Paris. He organized the American Fine Arts Society and was its first president.

Butler, James (DUKE OF ORMOND), English statesman: b. London, 19 Oct. 1610; d. Kingston Hall, Dorsetshire, 21 July 1688. When Strafford became lord-lieutenant of Ireland, Butler was made commander of the army, but as it consisted of only 3,000 men, he could do little more than keep the enemy in check, and was obliged to agree to a cessation of hostilities; after which, having been created a marquis, he was appointed lord-lieutenant. On the ruin of the royal cause he retired to France. After the execution of Charles he returned to Ireland with a view of raising the people; but on the landing of Cromwell returned to France. While abroad he exerted himself to further the restoration of Charles; and when that event was brought about by Monk, returned with the king. Before the coronation he was created Duke, and assisted at that ceremony as lord high-steward of England. In 1662 he was again appointed lord-lieutenant of Ireland, which country he restored to comparative tranquillity, and was an active benefactor to it by encouraging various improvements, particularly the growth of flax and manufacture of linen. On the exile of Lord Clarendon, his attachment to that nobleman involved Butler in much of the odium attached to him, and although, on his recall from Ireland, noth-

ing, on the most rigorous inquiry, could be proved against him, he was removed by the machinations of Buckingham. For six years he was deprived of court favor, but at length was again appointed lord-lieutenant of Ireland, which place he held during the remainder of the reign of Charles, but soon after resigned, his principles not suiting the policy of James. He died at his seat in Dorsetshire, leaving behind him the character of a man who united the courtier and the man of honor and integrity better than any nobleman of the time.

Butler, John, American royalist leader in the American Revolution: b. Connecticut; d. Niagara, 1794. He became a leading resident of Tryon County, N. Y.; commanded the Indians in the Niagara campaign (1759) and in the Montreal expedition (1760). At the outbreak of the Revolution he sided with the Tories and became deputy superintendent of Indian affairs. In 1776 he organized a band of marauders, chiefly Indians, and fought the battle of Oriskany (1777); in July 1778, he commanded at the brutal Wyoming massacre. In 1780 he took part in Sir John Johnson's raid on the Mohawk settlements. At the end of the war he fled to Canada, and was appointed Indian agent.

Butler, Joseph, English prelate and theologian: b. Wantage, Berkshire, 18 May 1692; d. Bath, 16 June 1752. After some previous education at a grammar school he was sent to an academy at Tewkesbury, with a view to ordination as a minister among the Dissenters. While occupied by his studies he gave a proof of his talents by some acute and ingenious remarks on Dr. Samuel Clarke's 'Demonstration of the Being and Attributes of God,' in private letters addressed to the author. He likewise paid particular attention to the points of controversy between the members of the Established Church and the Dissenters, the result of which was a determination to be no longer a Nonconformist; he therefore removed to Oxford in 1714. Having taken orders, he was in 1718 appointed preacher at the Rolls Chapel, and the sermons which he preached while holding this office, especially the first three, 'On Human Nature,' occupy an important place in the history of ethical science. In 1736 he was appointed clerk of the closet to the queen. The same year he published his celebrated work, the 'Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature.' In 1738 Butler was promoted to the bishopric of Bristol on the recommendation of Queen Caroline; and in 1750 obtained his highest preferment—the bishopric of Durham. He was interred in Bristol Cathedral. His other published works include: 'Fifteen Sermons Preached at the Rolls Chapel' (1726); 'Six Sermons Preached Upon Public Occasions'; etc. The first collected edition of his works was published in 1804 at Edinburgh. An excellent edition of his famous 'Analogy' is that of Fitzgerald (1860). Mr. Gladstone brought out an edition of his works in two volumes (1896), and also published a volume of 'Subsidiary Studies on Butler.'

Butler, Josephine Grey, English philanthropist: b. Milfield, Gloucestershire, about 1828; d. 30 Dec. 1906. Married George Butler, afterward Canon Winchester, 1852. She was prominent in efforts for the higher education of women, and for moral reform, and published:

'Life of John Grey of Dilston'; 'Life of Catherine of Sierra'; 'Recollections of George Butler'; 'The Lady of Shunem'; 'Personal Reminiscences of a Great Crusade'; 'Prophets and Prophetesses'; 'Nature Races and the War'; 'Silent Victories'; 'The Hour Before the Dawn'; 'Government by Police'; 'The Constitution Violated'; 'Women's Work and Women's Culture'; 'Life of Oberlin'; 'A Voice in the Wilderness.'

Butler, Matthew Calbraith, American army officer: b. near Greenville, S. C., 8 March 1836. He studied law at Stonelands, near Edgefield Court-house, and was admitted to the bar in December 1857. He was elected to the legislature of South Carolina in 1860; entered the Confederate service as captain of cavalry in the Hampton Legion in June 1861, and became a major-general through the regular grades; lost his right leg at the battle of Brandy Station on 9 June 1863. He was elected to the legislature of South Carolina in 1866; was United States senator in 1877-95; commissioned a major-general of volunteers for the war with Spain, 28 May 1898; and was appointed one of the American commissioners to arrange and supervise the evacuation of Cuba.

Butler, Nicholas Murray, American educator: b. Elizabeth, N. J., 2 April 1862. He was graduated at Columbia University in 1882; took a special course in Berlin and Paris in 1884-5; and was then called to Columbia University, where he was an assistant in philosophy, 1885-6; tutor, 1886-9; and adjunct professor, 1889-90; and dean of the faculty of philosophy, 1890-2. He was a founder and the first president (1886-91) of the New York College for the Training of Teachers, now a part of Columbia University, and as member of the New Jersey State Board of Education (1887-95) introduced manual training into the public school system of that State. On 6 Jan. 1902 he was unanimously elected president of Columbia University to succeed Seth Low, then mayor-elect of New York. He has edited 'The Educational Review'; 'The Teachers' Professional Library'; 'The Great Educators Series'; 'The Columbia University Contributions to Philosophy and Education'; and the 'Monographs on Education in the United States,' which formed a part of the exhibit of the United States bureau of education at the Paris Exposition of 1900, and published a volume of miscellaneous essays, addresses, etc., entitled 'The Meaning of Education' (1898).

Butler, Samuel, English satirical poet: b. Strensham, Worcestershire, 12 Feb. 1612; d. London, 25 Sept. 1680. He passed some time in his youth at Cambridge, but never matriculated at the university. He was afterward clerk or steward to several country gentlemen, and latterly lived in London. He resided some time with Sir Samuel Luke, a commander under Cromwell. In this situation Butler acquired the materials for his 'Hudibras' by a study of those around him, and particularly of Sir Samuel himself, a caricature of whom constituted the celebrated knight Hudibras. The first edition of 'Hudibras' was published in 1663 and was brought under the notice of the court by the well-known Earl of Dorset. It immediately became highly popular with the prevailing party in Church and state, and served as a general

NICHOLAS MURRAY BUTLER,
PRESIDENT OF COLUMBIA UNIVERSITY.

BUTLER

source of quotation; the king himself perpetually answering his courtiers out of 'Hudibras.' Celebrated as it rendered its author, it did nothing toward extricating him from indigence. He was buried in St. Paul's Church, Covent Garden, at the expense of his friend, Mr. Longueville, of the Temple, and a monument was, 40 years after, erected to his memory, in Westminster Abbey, by Alderman Barber, the printer. 'Hudibras,' both in its style and matter, is one of the most original and witty works that were ever written. As a work intended to ridicule the Puritans its attraction was great but temporary, but as applicable to classes of character found in all ages, its satire will always be relished. Butler's 'Remains in Verse and Prose' appeared in 1759.

Butler, Samuel, English author and composer: b. Langar, 4 Dec. 1835; d. London, 19 June 1902. He was educated at Shrewsbury School and Cambridge University, and with Henry Festing Jones composed many gavottes, figures, etc., and the cantata of 'Narcissus.' He was also an artist of merit, and for several years exhibited at the Royal Academy. He is best known, however, as a brilliant, original writer in more than one field, and as a master of irony had few equals and still fewer superiors among his contemporaries, in this particular more nearly approaching Swift than anyone else. His published books include 'A First Year in Canterbury Settlement' (1863); 'Erewhon, or Over the Range,' his most remarkable work, with the exception of 'Erewhon Revisited'; 'Fair Haven,' an ironical defense of Christianity' (1873); 'Life and Habit' (1877); 'Evolution, Old and New' (1879); 'Unconscious Memory' (1880); 'Alps and Sanctuaries of Piedmont and the Canton Ticino' (1881); 'Luck or Cunning as the Means of Organic Modification' (1886); 'Ex Veto' (1888); 'Life of Dr. Samuel Butler of Shrewsbury and Bishop of Lichfield' (1896); 'The Authoress of the Odyssey' (1897); 'The Iliad of Homer, Rendered into English Prose' (1900); 'Erewhon Revisited' (1901).

Butler, William, American army officer: b. Prince William County, Va., 1759; d. Columbia, S. C., 15 Nov. 1821. He served in the Revolution in Pulaski's corps; afterward, under Pickens, Lee, and Greene; won fame as commander of the Mounted Rangers; and, after the war, became (1796) major-general of militia. He was a member of the Convention which adopted the Federal Constitution; helped frame the South Carolina constitution; was a member of Congress (1801-11); and commanded the South Carolina troops in 1812.

Butler, William Allen, American lawyer and man of letters: b. Albany, N. Y., 20 Feb. 1825; d. Yonkers, N. Y., 9 Sept. 1902. He was a son of Benjamin F. Butler (1795-1858, q.v.), and was graduated at the New York University in 1843 and began the practice of law. He wrote in 1857 'Nothing to Wear,' a satirical poem, which became famous almost immediately and was not only reprinted in England but translated into French and German. His other publications include a volume of his collective poems (1871); 'Mrs. Limber's Raffle' (1876); 'Oberammergau'; 'Domesticus' (1886).

Butler, Sir William Francis, British general: b. Tipperary County, Ireland, 31 Oct. 1838. He was educated at Dublin, and joined the army in 1858 as ensign in the 69th Regiment. In 1863 he became lieutenant, and in 1874 was promoted to the rank of major. He served on the Red River expedition of 1870-1, and about the same time was sent on a special mission to the Saskatchewan territories. He accompanied the Ashantee expedition in 1874, and in 1879 acted as staff officer in Natal. He also served in Egypt in 1882, and held important commands under Lord Wolseley in the Sudan campaign of 1884-5. From 1890 till 1893 he was in command at Alexandria, and in 1892 was raised to the rank of major-general. He has since had command of the 2d Infantry Brigade at Aldershot, of the southeastern district at Dover, 1896-8; in Cape Colony, 1898-9; and of the Western District since 1899, and concurrently at Aldershot, 1900-1. He has published 'The Great Lone Land: A Narrative of Travel and Adventure in the Northwest of America' (1872); 'The Wild North Land' (1872), the story of a winter journey across northern North America; 'Akim-Foo' (1875), a story of the Ashantee war; 'Far Out' (1880); 'Red Cloud, the Solitary Sioux' (1882); 'The Campaign of the Cataracts' (1887); 'Charles George Gordon' (1889); 'Sir Charles Napier' (1891); and 'Sir George Colley' (1899). He was made K.C.B. in 1886 and in 1900 was appointed Lieutenant-General.

Butler, William Morris, American physician: b. Maine, 1850. He was educated at Hamilton College and the New York College of Physicians and Surgeons; has been professionally connected with several homœopathic hospitals, and has been professor of nervous diseases at the Metropolitan Postgraduate School of Medicine, New York. He has published 'Home Care for the Insane.'

Butler, William Orlando, American general: b. Jessamine County, Ky., 1791; d. Carrollton, Ky., 6 Aug. 1880. He was about devoting himself to the legal profession when the War of 1812 broke out. Enlisting as a private soldier in Capt. Hart's company of Kentucky volunteers he gained distinction in the battles at Frenchtown and the river Raisin. Subsequently he took a conspicuous part in the battles of Pensacola and New Orleans, was brevetted major, 23 Dec. 1814, acted as aide-de-camp to Gen. Jackson from 17 June 1816 to 31 May 1817, when he tendered his resignation, resuming for the next 25 years the profession of the law. From 1839 to 1843 he served as a representative in Congress from that district, in the interests of the Democratic party. Nominated as a candidate for governor of Kentucky in 1844, he was defeated by the influence of Clay. Created major-general, 20 June 1846, he led with great spirit the daring charge at Monterey, and although wounded on that occasion, still remained for several months with the army. On 18 Feb. 1848, he succeeded Gen. Scott in command of the army in Mexico. The most important operation during his tenure of this office was the defeat of Padre Jarauta and his guerrilla forces by Gen. Lane. His military administration in Mexico was brought to a close on 29 May 1848, when he announced the ratification of the treaty of peace. After his return

to the United States he was nominated in 1848 by the Democratic party as candidate for the vice-presidency. He was the author of 'The Boatman's Horn and Other Poems.'

Butler, Zebulon, American military officer: b. Lyme, Conn., in 1731; d. Wilkesbarre, 28 July 1795. He served in the French and Indian war, and in the Revolutionary War also. He commanded the garrison at Wyoming Valley at the time of the massacre of 3 July 1778.

Butler, Pa., a borough and county-seat of Butler County, situated on the Conoquessing Creek, and on the Pennsylvania, the Pittsburg & W., the Buffalo, R. & P., and the Bessemer & L. E. R.R.'s. It is the centre of a region having oil and natural gas. The chief industry is glass manufacture, and there are also flouring mills, a large planing mill, and several oil-well supply manufactories. Pop. (1900) 10,853.

Butler University, a co-educational (non-sectarian) institution in Irvington, a suburb of Indianapolis, Ind.; organized in 1855 as Northwestern Christian University. In 1903 it had 25 professors and instructors, and 306 students.

Bu'to, an Egyptian goddess whom the Greeks identified with Leto or Latona. She was represented under the guise of a serpent, and the city of Buto, which took its name from her, is supposed to have occupied a site on an island in the modern Lake Burlos in the Delta of the Nile.

Buton, boo'tón, **Boeton**, or **Butung**, an East Indian island, southeast of Celebes, belonging to Holland. Its area is about 1,700 square miles. It is fertile and densely wooded, and is governed by a native chief, subject to the Dutch government. The population, mainly Malays, is about 100,000. The chief town is Buton at the south-western end of the island.

Bütschli, büt-shlê, **Otto**, German zoologist: b. Frankfort-on-the-Main, 1848. Since 1878 he has been professor of zoology in the University of Heidelberg. He was one of the first to establish knowledge of nucleus and cell division, and his writings upon protoplasm and bacteria have been widely read and discussed. He has published 'Protozoen'; 'Untersuchungen über mikroskopische Schäume und das Protoplasma' (1892); 'Untersuchungen über die Mikrostructur künstlicher und natürlicher Kieselsäuregallerten' (1900).

Butt, Clara, English contralto singer of note: b. Southwick, Sussex, 1 Feb. 1873. She was educated at the Royal College of Music, and made her début at Lyceum Theatre, London, on 5 Dec. 1892, in the opera 'Orfeo.' She has taken part in three Handel festivals, and ranks among the very first of contralto singers. She was married to Mr. Kennerly Rumford in June 1900.

Butt, Isaac, Irish politician: the first to make political use of the phrase "Home Rule"; was the son of a Protestant rector: b. County Donegal, 16 Sept. 1813; d. 5 May 1879. Educated at Raphoe and at Trinity College, Dublin, he gained a brilliant reputation for his accomplished scholarship. In 1852 he was elected to Parliament as a Liberal Conservative for Youghal, for which constituency he sat until 1865. He defended Smith O'Brien and others in the state trials of 1848, and, with equal fearless-

ness and self-devotion, all the Fenian prisoners between the years 1865 and 1869. In 1871 he was elected for the city of Limerick to lead the Home Rule party. He published 'History of Italy' (1860); and 'The Problem of Irish Education' (1875).

Butte, büt, Mont., a city and county-seat of Silverbow County, on the Great N., the Northern P., and the Union P. Railways. It is on the high plateau between the Rocky Mountains and the Bitter Root mountains, 5,800 feet above the sea level. The city is well-built, the more imposing buildings being the city hall, courthouse and jail, opera-house, the federal building, and a fine public high school, completed at a cost of \$125,000. The Montana State School of Mines is located here. The public school system is excellent, and there is a public library of more than 35,000 volumes.

Mining, Manufacturing, etc.—Butte is the largest mining town in the world, employing thousands of persons in this industry alone. Copper is the chief production, although there are valuable deposits of gold and silver. The Great Anaconda Copper mine is here, and many other valuable mining properties are within a radius of a few miles of the city. The copper production alone is about one-half that of the United States, and the total annual mineral output is estimated at more than \$40,000,000. Probably no city of equal size in the country is so exclusively given over to a single industry.

Butte is the trade and jobbing centre for southern and western Montana; has an extensive trolley system; gas and electric lights; national and other banks; and several daily and weekly newspapers.

Government, etc.—Butte is governed by a mayor, elected biennially, and a city council. It spends annually about \$200,000 for schools, and about \$50,000 each for the fire, police, and street-cleaning departments. Butte was settled as a gold-placer camp in 1863, laid out as a town in 1866, and grew rapidly after the successful opening up of quartz mining in 1875. It was incorporated by the Territorial Legislature in 1879, and reincorporated in 1888. In 1881 it was made the county-seat of Silverbow County. Pop. in 1870 about 300; (1880) 3,363; (1890) 10,723; (1900) 30,470; (1904, including suburbs) 60,000.

Butter, a product of milk, consisting largely of butter-fat and usually obtained by churning cream or milk, and working the product to remove water and other constituents.

Butter has been in use from early historic days. It is first mentioned in the Bible in Gen. xviii. 8. It was used as food and medicine, as an ointment, and for burning in lamps. The Greeks probably learned of it from the Scythians or Thracians, and the Romans from the Germans. It was made from the milk of sheep and goats, and later of cows, the method of making being to churn it in skin bags or pouches. Formerly butter was prepared by direct churning of the milk; this was both laborious and wasteful of butter-fat. To reduce labor and loss the system of setting the milk and skimming off the cream was evolved; since 1877 this method has given way to the use of centrifugal force for the separation of the cream and milk.

To-day the process of making is divided into the operations of creaming, churning, working,

BUTTER

and finishing. The fat exists in the form of small globules in the milk, in suspension. In the setting system the milk was placed in shallow pans about four inches high, or in deep ones of about 18 inches, and advantage was taken of the fact that the fat globules, being lighter than water and other constituents of the milk, would rise to the surface by the force of gravity. Large fat globules will rise more rapidly than small ones, and the size of the globules varies with different breeds of cattle. In the shallow-pan system the milk is set as soon as possible after it is drawn, and the cream is skimmed off in 24 or 36 hours. This system is wasteful in that the skim milk often contains 0.5 to 1.5 per cent of fat. The deep-setting system is less wasteful, the fat in the skim-milk being often reduced to 0.2 per cent. The new-drawn, warm milk is placed in cans surrounded or submerged in water at about 40° F., and the rapid reduction in temperature causes the globules to rise quickly. The cream is removed by dipping it off, or the skim-milk is drawn off from the bottom of the can. The fat left in the skim-milk consists of the small fat globules.

The introduction of the separator and use of centrifugal force has resulted in a more perfect and rapid separation. This force exceeds that of gravity a thousand-fold. The system of separation is continuous, a constant, uniform flow of milk being conducted into a bowl or drum revolving at from 5,000 to 9,000 or more revolutions per minute. The inlet tube is in the centre of the bowl and reaches almost to the bottom; here the constituents in the milk separate, the heavier serum gravitating to the circumference of the bowl, the fat—the lightest portion—remaining in the centre. These are forced upward by the incoming milk, and the separated milk escapes through a side tube, while the cream passes through a small outlet in the centre. This last outlet can be closed or opened in some machines, thus regulating the percentage of fat in the cream. The machines are of various sizes, from those worked by hand power and doing 200 to 500 pounds of milk per hour, to power machines of 2,000 pounds and over per hour capacity. Some make have appliances within the bowl to increase the efficiency. A good separator, well run, will not leave more than from 0.05 to 0.1 per cent of fat in the separated milk.

The cream may be churned at once if sweet cream butter is desired, or "ripened" or soured. The aim in ripening is to develop certain flavors in the butter, and a certain degree of acidity which aids in churning and influences the texture. In this latter case cream should be cooled as it leaves the separator; if it is to be churned next day the temperature of cooling should be 65° to 70° F. If the second day, 55° to 60° F.; and if four days or more, 40° F. It should then be held at such temperature that it will reach the desired degree of acidity by the time it is desired to churn. The degree of acidity may be determined by various tests. Ripening may be effected by adding to the cream a "starter" of sour cream, sour milk, buttermilk, or a commercial preparation of the desired organisms or bacteria. In any case only desirable organisms should be permitted in the ripening room, as undesirable ones rapidly affect flavor. In some cases it is considered advisable to pasteurize the milk or cream,

the milk being heated to kill all germs, then the sample may be inoculated with desirable ones. During ripening the cream is usually held constant at a temperature between 60° and 70° F. until ready to churn.

In churning, the fat globules receive such agitation that they unite into masses. This is usually done in a churn (q.v.) and at a temperature ranging from 50° to 65° F. It is wise to churn at as low a temperature as possible, the best results being obtained at such a degree that the particles of fat unite readily, and, when united, form firm granules of butter. Churning should stop when the particles are the size of wheat. The buttermilk may be drawn off and the butter washed; it is then worked, either by hand or by the butter-worker (q.v.), to remove buttermilk, water, etc., salted, and packed as required.

Scrupulous cleanliness and attention to detail, from the feeding of the cows to the placing of the product in the hands of the consumer, are imperative. See CREAMERIES; DAIRYING.

The composition of butter varies, but is approximately: Fat, 85 per cent; protein, 1 per cent; ash (salt), 3 per cent; water, 11 per cent. The percentage of fat should not fall below 80 per cent, nor the water rise above 15 per cent. The percentage of fat in butter of good quality often rises to 86 or 88 per cent. The water content is the most variable, running up to 25 per cent, and in some cases higher. The fats of butter are glycerides of fatty acids. About 15 per cent of the fats are volatile, and at least in some cases aid in giving flavor and odor. Oleine, palmitine, and myristine are the three leading fats present; the former, being fluid at ordinary temperatures and variable in amount, influences the hardness of the butter. The quality of butter is judged by its flavor, texture, color, amount of salt, and general appearance. Flavor counts about 45 per cent of the points, and varies with the market. Some markets require a mild, delicate butter; for the supply of such the cream is often pasteurized; others require a high flavor, almost verging on rancidity. Whatever is desired, that flavor should be pronounced, with an absence of rancidity or other flavors. Texture carries 25 per cent of the points and depends upon the granular condition of the fats. The more distinctly the granules show up when the butter is broken the better the texture. The right color depends upon the market requirements; usually a bright golden yellow, as naturally yielded when cows are on grass, is considered ideal. It should be uniform. To ensure this, it is sometimes necessary to use some butter-color: formerly the main one used was arnotto; now the coal-tar colors, aniline yellow, and butter yellow, are used, although turmeric, saffron, carrot-juice, or marigold leaves would do. The coloring matter is usually dissolved in some oil, and the preparations are of standard strengths. Some South American countries require the butter to be a deep orange or red color. A small quantity of salt is often added to improve the palatability; it has little influence on the keeping qualities. The amount varies with trade requirements. Unsalted or slightly salted butter is largely used in Europe and the United Kingdom. The finish and packing of the butter should be attractive and neat. The styles are numerous, but attempts are being made to stan-

BUTTER — BUTTER-WORKER

lardize. The American butter-tub is largely used here. It holds from 50 to 70 pounds. In Canada and Australia a box holding 56 pounds is used for the export trade. The Danes ship their butter in firkins containing 112 pounds. For local trade the standard rectangular pound print is $4\frac{5}{8} \times 2\frac{1}{2} \times 2\frac{3}{8}$ inches. These are wrapped in parchment paper and packed in specially made boxes.

Oleomargarine is the most common adulterant, and its detection, especially when present in only small amounts, is difficult. Cottonseed and other oils have been used. Glycogen has been added to increase the water-holding capacity of the butter, and in butters for South America glucose has been added as a preservative. The various preservatives, as borax, boracic acid, etc., sold under their own and other names, are now recognized as adulterants.

Renovated or process butter is generally low-grade butter which has been melted and put through a process to remove the disagreeable odors and taste; sometimes it is then mixed with soured separated or whole milk or cream, and granulated. If the primary article is not too inferior, the resulting product can be sold as good creamery butter; generally its keeping qualities are impaired. In some States and in the United Kingdom all butter so treated must be distinctly branded "Renovated."

During the year 1850 the amount of butter made on farms in the United States was 313,345,306 pounds. In 1899 that made on farms and in factories was 1,491,871,673 pounds. Over two thirds of the butter is made on the farms, but the factory system is increasing. The average value of that made on farms was 16.7 cents per pound, and that made in creameries and factories 20 cents. The cost of transporting the milk to factories is about 1.5 cents per pound of butter. Denmark is at present the leading butter-exporting country of the world, with a record in 1898 of 160,143,255 pounds, valued at \$34,575,634, the average price being the highest on the market.

The coefficient of digestibility of butter-fat is 98 per cent or over. It is well assimilated, and, like other fats, is a source of heat and energy. Its value as a food and methods of usage are well known. Butter containing 82.4 per cent butter-fat has a fuel value per pound of 3,475 calories, and in a number of dietary studies butter furnished 1.9 per cent of the total food, and 19.7 per cent of the total fat of the daily food. Further information is given in Prof. Atwater's reports on dietary studies. Fresh and salt butter are equally valuable. Clarified butter is used in cooking. It is ordinary butter freed from casein and water by heating.

S. FRASER,
Instructor in Farm Practice, Cornell University.

Butter, Artificial. See OLEOMARGARINE.

Butter and Eggs, a troublesome weed. See TOAD-FLAX.

Butter-bur (*Petasites vulgaris*), a composite plant, with large rhubarb-like leaves and purplish flowers, growing by the side of streams, allied to colt's-foot. The flowers appear before the leaves.

Butter-color, a preparation employed to color butter and its imitations. Annatto was formerly largely used for this purpose, but is now superseded by coal-tar colors and other coloring substances. Owing to the small quantities used in coloring butter they are quite harmless.

Butter-fishes. The two best known butter-fishes in American waters are denizens of the Atlantic. One (*Poronotus triacanthus*) is the butter-fish or dollar-fish of the coast of Massachusetts and New York, the harvest-fish of New Jersey, the dollar-fish of Maine, the sheephead of Cape Cod, the pumpkinseed of Connecticut, and the star-fish of Norfolk. It swims mostly in company with large jellyfish, whose streamers, while often protecting it from other depredators, are frequently the cause of its death from their stings. The body is ovate and flat, the dorsal and anal fins are each very pointed, and the tail is long and widely forked.

The harvest-fish (*Peprius paru*) is another "butter-fish" found from Cape Cod southward to Brazil, but it is most abundant about the mouth of Chesapeake Bay, where it is locally called "whiting." It has the habit of swimming beneath the Portuguese man-of-war. It is a delicious little pan-fish, about six inches long. On the Pacific coast there are three species, one of which (*P. simillina*) is the Californian "pompano," abundant during summer about Santa Cruz, where it is highly prized for its rich and delicate quality, and reaches 10 inches in length. Consult: Jordan and Evermann, 'American Food and Game Fishes' (1902).

Butter Making. See BUTTER.

Butter Rock, an obsolete name for certain alums.

Butter-tree, various tropical or subtropical trees of different genera and even families. Their seeds yield fixed oils which resemble butter and are similarly used or are employed for lighting. The leading group is perhaps the genus *Bassia* of the natural order *Sapotaceæ*. Of this genus the best-known species are *B. longifolia*, the Indian oil-tree, whose wood resembles teak, and is in use in the East; *B. butyracea*, the Indian butter-tree, whose light wood is of no commercial importance; and *B. latifolia*, the East Indian Mahowa, Mahwa, or Madhuca. Beside the oil obtained from each of these trees, *B. butyracea* yields an edible fruit, and the corollas of *B. latifolia* are either eaten raw or are used for making a liquor or for distilling their essential oil. *Butyrospermum Parkii*, formerly referred to the genus *Bassia*, is the butter-tree of central Africa. It yields the galam or shea butter, obtained by boiling the seeds, which is locally an important article of commerce. The oil is obtained by boiling the kernels of the sun or kiln-dried seeds in water. It possesses long-keeping qualities. Various species of the genus *Caryocar* (q.v.), natives of South America, are known as butter-trees.

Butter-worker, a machine designed to unite the small particles of butter, remove the buttermilk and water, and incorporate the salt,

giving the product a uniform appearance. Hand and power machines are made, the large power workers being also used for blending butters to make them uniform. The makes are variable and numerous; some being combined with a churn, the butter not being removed until it is finished. The former method of working by the hands injured the texture of the product and was too slow. With the present machinery the butter is untouched by hand, can be held at a temperature of 45° to 55° F. during working, and is handled expeditiously. They are a necessity in all creameries and dairies where butter is made in large quantities. See also BUTTER; CREAMERIES; DAIRYING.

Buttercup, the popular name of two or three species of the *Ranunculus* (q.v.).

But'nerfield, Daniel, American soldier: b. Utica, N. Y., 18 Oct. 1831; d. Cold Spring, N. Y., 17 July 1901. At the outbreak of the Civil War he was colonel of the 12th New York Militia. He served in the Peninsular campaign, and under Pope and McClellan in 1862. At Fredericksburg he commanded the 5th Corps, and at Chancellorsville and Gettysburg was chief of staff. He served as chief of staff to Hooker at Lookout Mountain, and Ringgold, and Pea Vine Creek, and commanded a division at Buzzard's Roost, Resaca, Dallas, New Hope Church, Kenesaw, Lost Mountain, and other battles. He was brevetted major-general in the regular army. He resigned in 1869, and became chief of the United States sub-treasury in New York. He was author of 'Camp and Outpost Duty' (1862). He is buried in the West Point military cemetery, an elaborate and costly marble tomb marking the spot.

Butterfield, William, English architect: b. 7 Sept. 1814; d. London, 25 Feb. 1900. He first attained distinction by the introduction of color into ecclesiastical buildings with the aid of bricks and mosaic. Among the notable structures designed by him are St. Augustine's College at Canterbury; Keble College, Oxford; All Saints' Church, Margaret Street, London; and the cathedral at Melbourne.

Butterfly, one of the day-flying or diurnal *Lepidoptera* (often called *Rhopalocera*). This group is at once distinguished from the moths by their knobbed antennæ, which are never hairy or pectinated. The body is small, but there is a greater equality in the size of the three regions than in the moths, the abdomen being much shorter and smaller, as a general rule, than in the lower families of *Lepidoptera*. The ocelli are usually wanting; the spiral tongue or maxillæ are long and well developed; and the large, broad wings are carried erect when in repose, and are not held together during flight by a bristle and socket as in most of the moths.

The larvæ or caterpillars vary greatly in shape and in their style of ornamentation, but they uniformly have, besides the thoracic legs, five pairs of abdominal legs. The pupa is called a "chrysalis" or "aurelian," from the bright golden hues which adorn those of many species. They disappear as the wet tissues beneath the pupa-skin harden, just before the fly appears. The pupa is usually angulated on the sides of the thorax and along the upper side of the abdomen. A few species, such as those of *Vanessa*,

hibernate, while several species, such as *V. antiopa*, are social as young larvæ. Butterflies also occasionally swarm while in the perfect state, such as species of *Colias*, *Cynthia*, and *Danais*, multitudes of which are sometimes seen passing overhead in long columns. They are truly tropical insects, since Wallace mentions that three times as many species (600) occur at a single point (Para, Brazil) as in all Germany, where scarcely 200 species live. There are about 13,000 species known; about 1,000 inhabit North America, and probably the number will be increased to 1,200, while about 130 species have been found in New England and its immediate border.

The butterflies are divided into six families, beginning with the more primitive and ending with the most specialized, they are: (1) *Hesperioidea*; (2) *Papilionida*; (3) *Pierida*; (4) *Lycanida*; (5) *Erycinida*; and (6) *Nymphalida*. In the last three families, which comprise the majority of butterflies, the first pair of legs are more or less modified, differing from the two hinder pairs, especially in the male *Nymphalida*, in the more or less aborted tarsi, or toe-joints. Butterflies are especially liable to local variation, and to seasonal and dimorphic changes; all these varieties, subspecies, and temperature-forms are becoming better known from year to year. Sharp anticipates that eventually the number of species of butterflies may amount to from 30,000 to 40,000 forms. South America is the metropolis of butterflies, as it is of other groups of *Lepidoptera*, being the richest in species of any other continent.

Certain *Nymphalida* (*Danais*, etc.) have glands at the end of the body secreting a repulsive fluid (see MIMICRY); in others there are remarkable differences between the sexes (*Ithomiides*); in certain butterflies some of the scales are battle-dore shaped, and secrete a special odor (*Androconia*). The species of *Ageronia*, a South American genus, make a clicking noise when flying. While caterpillars are plant-eaters, those of several *Lycanida* are known to be carnivorous, feeding on plant-lice and scale insects.

Bibliography.—Harris, 'A Treatise on Some of the Insects Injurious to Vegetation' (3d ed. 1862); Scudder, 'Butterflies, Their Structure, Changes, and Life-histories' (1881); 'Butterflies of the Eastern United States and Canada' (1887-9); French, 'The Butterflies of the Eastern United States' (1886); Edwards, 'Butterflies of North America' (1868-88); Strecker, 'Butterflies and Moths of North America Diurnes' (1878); Kirby, 'A Synonymic Catalogue of Diurnal Lepidoptera' (1871-7); Holland, 'The Butterfly Book' (1898); also the European works of Hæbner, Herrick-Schaeffer, Boisduval, Doubleday and Hewitson, Staudinger, Eimer, Aurivillius, Moore, Niceville, Romanoff, Oberthür, Godman and Salvin, 'Biologia Centrali Americana.'

Butterfly-fish, or **Coral-fish**. These beautiful fish, representing the large family *Chaetodontida* and its allies of the scaly-finned group (*Squamipinnes*) of marine fishes, obtain their English names from their oval form, brilliancy, and their quickness of movement, and the fact that their principal habitat is in and around the tropical coral-reefs. They are so compressed as to resemble the "pumpkin-seed" sunfishes of the ponds, and are aided in keeping their bal-

ance by a very high, arched dorsal fin, and an anal fin extended beyond the tail. Their colors are always gay, usually rich orange-yellow, as a ground tint, set off by broad, black bars and fin ornaments in great variety, besides blue and red touches. The type-genus *Chatodon* is represented by several species in the West Indies, and southward, some of which occasionally drift northward in the path of the Gulf Stream. More numerous in American waters is the "black-angel" (*Pomacanthus arcuatus*), common around Porto Rico and at Key West, where it is caught in traps, or sometimes speared. The "blue-angel" (*Holacanthus ciliaris*) represents a genus containing several West Indian species, of which the most important is the "rock beauty" (*H. tricolor*), often exceeding a foot long, and good food, as well as most beautiful. The name "angel-fish" is also given in Bermuda to several similar fishes of the genus *Anglichthys*, called in Spanish "isabellitas." All these fishes are carnivorous, and Jordan remarks that their excessive quickness of sense and motion enable them to maintain themselves in the struggle for existence in the close competition of the coral reefs, notwithstanding that they are made so conspicuous to their enemies by their bright colors. Consult: Jordan and Evermann, 'Food and Game Fishes of America' (1902).

Butterfly Orchid, a common book name for two varieties of orchids, namely: (1) *Habenaria chlorantha*; (2) *H. bifolia*.

Butterfly Plant, an orchid (*Oncidium papilio*) brought from Trinidad. It is so called because its large yellow and red blossoms, poised on slender footstalks and vibrating with every breath of wind that blows, resemble butterflies hovering on the wing. It is also applied to the Indian butterfly plant, *Phalanopsis amabilis*, of Lindley, not of Blume, which is another orchid. It is a very beautiful epiphyte.

Butterfly Shell, one of the separated plates of a large species of chiton (*Cryptochiton stelleri*), about six inches long. These separate white valves are cast ashore on the beaches of California, where they are gathered as curiosities.

Butterfly-weed, PLEURISY-ROOT, a handsome American perennial herb (*Asclepias tuberosa*) of the natural order *Asclepiadaceae*, common in dry ground almost throughout the United States and southern Canada. The large, irregular, yellowish-brown tubercular roots have a nauseous, bitter taste, and are reputed useful in lung and throat troubles, rheumatism, etc., but seem to be less popularly used than formerly. The hairy stems, which rise to a height of two or three feet, bear alternate oblong lanceolate leaves, and several umbels of short-peduncled, bright orange-yellow flowers followed by erect pubescent pods. Unlike other members of the genus, this plant has not a milky sap.

But'terick, Ebenezer, American pattern maker: b. Sterling, Mass. 1825; d. Brooklyn, N. Y., 31 March 1903. In early life he was a tailor's apprentice, and in 1859 set up in business for himself in Fitchburg, Mass., and shortly after began experiments in pattern-making, the result of which was the invention of the tissue paper dress-pattern. He removed to New York in 1864, and founded subsequently the Butterick Company, retiring from business in 1881.

But'terine, a substance prepared in imitation of butter, from animal or vegetable fats. The fat is first freed from all impurities, and by heat converted into oleine. The oleine is then transferred to a churn containing a small quantity of milk and churned into butterine. Lastly, it is colored in imitation of butter. Freshly prepared, it is sweet and palatable, and when spread on bread or cold toast is but slightly inferior to a fair quality of butter. The process has attained such perfection in the matter of manufacture in the United States that it takes an expert to distinguish it from genuine butter, and laws have been passed compelling tradesmen to label each package containing it so that no one may be deceived. See OLEOMARGARINE.

But'termere, a small but beautiful sheet of water in the famous Lake district of England, six miles southeast of Derwentwater.

Buttermilk, the fluid left behind after churning milk for butter. It possesses a specific gravity, somewhat higher than ordinary milk, owing to the removal of most of the fat, and varying between 1.032 and 1.035 per cent at 59° F. It may be fresh or sour, according to the method of churning. It should not contain more than 0.5 to 0.6 per cent of butter-fat. Its composition is variable, an average of 85 analyses being: Water, 90.1 per cent; fat, 1.1; protein, 4.0; milk sugar and lactic acid, 4.0; ash, 0.7 per cent. Its dry matter is practically all digestible, and it is a healthy and nutritious beverage, much relished by many people. Its fuel value per pound is 165 calories. It has about the same value as skim milk for pig-feeding, and is used in conjunction with corn meal or some other grain, excellent pork being produced. It is also used for calf-feeding, although failures are reported in the undertaking. In fattening poultry it is highly esteemed. See also BUTTER.

Butternut (WHITE WALNUT), a large spreading tree (*Juglans cinerea*) of the natural order *Juglandaceae*, native of America, where it ranges from New Brunswick to Georgia and westward to Dakota and Arkansas. It sometimes attains a height of 100 feet, but usually varies from 50 to 80. It has smooth, gray bark, large compound pubescent leaves, small flowers, followed by oblong, pointed, ribbed green nuts covered with viscid hairs. The ripe nuts when dried have very hard shells and are highly prized for dessert in regions where the trees grow; and the green nuts are used for making pickles. The bark of the stems has been used in dyeing and that of the root in medicine. The wood is used to some extent for cabinet work and interior finish of houses, but is less popular than black walnut. An inferior sugar can be made from the sap. The tree is not quite so attractive as the walnut and is less densely covered with foliage, but is less attacked by insects.

But'terwort, a genus of about 30 species of small succulent plants (*Pinguicula*) of the natural order *Lentibulariaceae*, widely distributed throughout the world in bogs and other wet ground. The species have rosettes or tufts of leaves, from among which single-flowered scapes arise to about a foot. The short, thick, sticky-haired leaves attract small insects which are covered by the in-rolling leaf-margins and digested. The leaves of certain species, especially

of the common butterwort (*P. vulgaris*) are used like rennet to coagulate milk, and thus form a favorite food in Lapland and the Alps. The milk (reindeer milk in Lapland) is poured upon the leaves, strained, allowed to stand 48 hours, or until creamy and somewhat acid, when it is ready for use as food or for impregnating other milk for the same purpose. This property is said by some authorities to account for the English name, but others attribute the name to the buttery feeling of the leaves. Several species are cultivated for their dainty flowers, and as curiosities on account of their carnivorous habits, but they are rather difficult to manage unless conditions are naturally right. They are less popular in America as greenhouse plants than in Europe. Several species are natives of the United States.

But'terworth, Hezekiah, American story writer and poet: b. Warren, R. I., 22 Dec. 1839; d. there, 5 Sept. 1905. He was editor of the *Youth's Companion*, 1871-4. He published many popular juvenile stories and travels, including (*Zig-Zag Journeys*) (1876-1890); (*Songs of History: Poems and Ballads upon Important Episodes in American History*) (1887); (*The Wampum Belt, or the Fairest Page of History*) (1896); (*A Knight of Liberty*); (*The Patriot Schoolmaster*); (*Poems for Christmas, Easter, and New Year*); (*The Boyhood of Lincoln*); (*Boys of Greenway Court*); (*In Old New England*); (*Traveler Tales of China*); (*Over the Andes*); (*Great Composers*); (*South America*); and many others.

Buttmann, but'man, Philip Karl, German philologist: b. Frankfurt-on-the-Main, 5 Dec. 1764; d. Berlin, 21 June 1829. He spent most of his life at Berlin, where he taught in the Joachimsthal University. His best-known works are his (*Greek Grammar*) (1792); (*Lexilogus for Homer and Hesiod*) (1818).

But'ton, Sir Thomas, English navigator in the early part of the 17th century, the successor of Hudson in exploring the northeastern coast of North America. He sailed in 1612 with two vessels, the *Resolution*, and the *Discovery*, passed through Hudson Strait, and was the first to reach land on the western coast of the bay. The point which he touched was in lat. 62°, and was named by him *Carey's Swan's Nest*. Being obliged to winter in this region, he selected a position near the mouth of a river, first named by him *Nelson's*, after the master of his ship. Every precaution was taken against cold and icebergs, yet the severity of the climate occasioned much suffering to his crew, and was fatal to a few of them. During the next summer he explored and named several places on the coast of Hudson Bay, and advancing to lat. 65°, became convinced of the possibility of the Northwest Passage.

Button, a small circular disk or knob of mother of pearl, horn, metal, or other material, with a shank or perforations through its centre for attachment to an object, and made to fit into a hole formed in another one for its reception, the two fastening the objects together. Its chief use is to unite portions of a dress together. The ancient method of fastening dresses was by means of pins, brooches, buckles and tie-strings. Buttons of brass are found on dresses of the 16th century. Gilt buttons were

first made in 1768, and those of papier-mâché in 1778. Buttons of vegetable ivory are now all but universally used for tweed coats and vests. The palm fruit which yields it is called corozo nut. It is not unlike true ivory but softer, and is easily turned and dyed. These buttons are often mottled with some stain to suit the common patterns of tweed stuffs. Mother of pearl buttons are formed of the beautiful substance of which the large flat shell of the pearl oyster consists, and this has long been a favorite material for buttons. Small cylinders are first cut out of the shells with a tubular saw. These are then split into disks, which are shaped by a steel tool, drilled with holes, and finally polished with rotten stone and soft soap, or by a more recent method with ground charcoal and turpentine. Shirt studs as well as flat and globular buttons with metal shanks are also made of this substance.

Among other animal substances used for buttons are ivory, bone, horn, and hoof. From this last so-called horn buttons were some years ago made in enormous numbers by pressing them in heated dies in which the design was cut. There are many kinds of composition buttons. Glass buttons are made in great variety. For pinched buttons small rods of colored glass are heated at the ends, and pressed into shape by means of a pair of rather long hand pliers, on the ends of which are a die and its counterpart, likewise kept hot. Other kinds are cut out of colored sheet glass, which is coated on the back with tin amalgam like a mirror. With other varieties, some beautiful glass buttons are made in Bohemia, either partly or wholly of aventurine glass; and of this gold-spangled material artistically inwrought with other colors, studs and solitaires still more remarkable for their beauty and minute patterns are made at Venice. Porcelain buttons were a few years ago nearly all of French manufacture, but are now made principally at Prague. The plastic clay is pressed into molds of plaster of Paris in the same way as small objects are usually produced in earthenware. Some are plain and others are painted or printed with patterns. More or less expensive buttons are made of ornamental stone, such as agate, jasper, and marble. Occasionally they are formed of amber, jade, or of still more costly materials, as pearls and gems. In recent years, improved methods and machines have been introduced for the shaping as well as for the polishing and finishing of bone, corozo, and wood buttons. In England, Birmingham is the seat of the button trade, which, however, is much more largely developed in France. Brass buttons were made in Philadelphia in 1750, and hard-wood buttons were made there soon after. The button factory in Waterbury, Conn., now the seat of the metal button manufacture, was established about 1800. Horn buttons were made in the United States as early as 1812, and the production of buttons covered by machinery was begun at Easthampton, Mass., by Samuel Williston in 1827. The making of composition buttons was begun at Newark, N. J., in 1862. Up to 1900 there had been 1,355 patents for buttons issued by the patent office of the United States. In 1850 there were in the United States 59 establishments for the manufacture of buttons, with an output whose value was placed at \$964,359. In 1900, according to the returns of the Twelfth Census, there were 238 establish-

ments, with a capital of \$4,212,568, and an output valued, including custom-work and repairing, at \$7,695,910. The value of imported buttons was stated in 1900 at only \$600,982, as against \$2,176,046 in 1891. For a valuable detailed account of the button industry in the United States, consult Bulletin 172 of the Twelfth Census.

Button-quail, a small quail-like bird of the genus *Turnix*, of which there are some 20 species in various parts of the Old World, some of which are termed bustard-quail, bush-quail, ortygan, and hemipode. They frequent wooded places, and afford good sport for the gunner. The females, as well as the males, are brightly colored. They are one of the smallest game birds known, inhabit woody places, and feed generally on berries and insects.

Buttonwood, a name often given to the North American plane (*Platanus occidentalis*). See PLANE.

Buttress, in architecture, a structure of masonry used to resist the thrust of an arch or vault. It takes the form of a great proportionate thickening of the walls at the point where the thrust affects the wall, the thickness sometimes increasing until the mass of masonry is set across the general direction of the wall. Thus in the developed Gothic style it nearly replaces the wall, because all the space between buttress and buttress is occupied by a great window. In the case of an archway in a single wall it often happens that the two sides or outer edges of the wall are carried up in such a way that they are spread wider toward the base and approach one another at the top, by means of certain offsets or steps, and these extensions of the wall are called buttresses, although they are mere widenings of the wall. In like manner some English Gothic church towers have curious diagonal spurs projecting on the four corners, in the form of short pieces of wall built on a prolongation of a diagonal of the square plan, and these are considered as buttresses, although they have very rarely any thrust to resist, because the tower is not often occupied by vaulted chambers, and because the meeting of the two walls would provide sufficient masonry for the practical purpose. It is a vice in that style that these considerations are lost sight of.

Historically, the real buttress begins to show itself in Romanesque work along the walls of the aisles, and is at first a slight projecting pilaster-like thickening of the wall, or a rounded projection like an engaged shaft of a column. These are called by special names, as buttress-pier, pilaster-strip, etc. They were very inadequate for their purpose (see ROMANESQUE) and their presence shows the uneasiness of the early builders in trying to dispense with the precautions taken by their masters, the Romans of the Empire, and their hesitation in building what alone would do the work. As the vaulting within became concentrated on certain points, when groined vaults superseded barrel-vaults for the aisles, the need of the buttress became more evident, and in some Romanesque churches they have been built up afterward, the walls being stayed up with great cost and trouble after they had begun to spread under the thrust of the vault. It is not until the ribbed vault came in and the Gothic style came into being that the buttress took its permanent shape of a piece

of wall, thin in comparison to its projection; that is to say, having much its greatest dimension in the direction of the thrust of the vault and therefore at right angles with the wall of the church. See FLYING BUTTRESS.

RUSSELL STURGIS.

Buttz, Henry Anson, American educator: b. Middle Smithfield, Pa., 18 April 1835. He was graduated at Princeton in 1858, and entered the Methodist ministry the same year. He has been president of Drew Theological Seminary since 1880, and has written much on polemics, exegetics and hermeneutics.

Butyric Acid, an acid obtained from butter; it also occurs in perspiration, in cod liver oil, and other fats, and in meat juice. When obtained, as it may be from butter and from sugar, it is in the form of a clear, oily, volatile fluid. It combines with bases, and forms crystalline salts, which possess no taste. Butyric acid is a colorless liquid, having a smell like that of rancid butter; its taste is acrid and biting, with a sweetish after-flavor. Formula, $C_4H_7Co.OH$.

Buxar, buks'är, or **Baxar**, a town of British India, in the district of Shahabad, presidency of Bengal, situated on the south bank of the Ganges, about 60 miles below Benares. It is celebrated for a victory which confirmed the British in the possession of Bengal and Bahar, 23 Oct. 1764. Pop. (1891) 15,506.

Buxton, Jedediah, English mathematical prodigy: b. Elmtun, Derbyshire, England, 20 March 1705; d. there 1772. Although the son of a school master and one of the most remarkable of mathematical calculators, he never advanced above the station of a farm laborer, owing to his incapacity to acquire any education outside of mental arithmetic.

Buxton, Sydney Charles. English publicist: b. Oehlen 1853. He was educated at Clifton College and Trinity College, Cambridge, and has sat in Parliament as member for Poplar since 1886. He was under-secretary for the colonies 1892-5, Postmaster-General in the Liberal Cabinet, 1905, and has published 'Handbook to Political Questions,' which has reached a ninth edition; 'Political Manual'; 'Finance and Politics: An Historical Study, 1873-85'; 'Handbook to Death Duties'; 'Mr. Gladstone as Chancellor of the Exchequer: a Study' (1901); 'Fishing and Shooting' (1901).

Buxton, Sir Thomas Fowell, English philanthropist: b. Earl's Colne, Essex, 1 April 1786; d. 19 Feb. 1845. He was educated at Trinity College, Dublin, and in 1811 joined the firm of the celebrated brewers, Truman, Hanbury & Company, and took an active share in carrying on the business. In 1816, on the occasion of the Spitalfields distress, he made his first public effort in a speech at the Mansion House, and afterward succeeded in organizing an extensive system of relief. He next proceeded, in concert with his sister-in-law, the celebrated Mrs. Elizabeth Fry (q.v.) to examine into the state of prisons; and as the result of his inquiries produced a work entitled 'An Inquiry Whether Crime and Misery are Produced or Prevented by Our Present System of Prison Discipline,' which attracted great attention, and led to the formation of the Prison

Discipline Society. In 1818 he was elected member of Parliament for Weymouth, and continued to sit for it in successive Parliaments till 1837. He distinguished himself by his enlightened zeal in the cause of humanity, and was long the right-hand man of Wilberforce, who, on retiring from public life selected Buxton as the person best qualified to carry out those of his benevolent schemes which remained uncompleted. In 1823 he moved, and with a slight modification, carried a resolution to the effect that slavery, being repugnant to the Christian religion and the British Constitution, ought to be abolished. Subsequently in 1831 he made such an impression on the house and country by an admirable speech that the government were glad to take the matter into their own hands and give full effect to emancipation. After his retirement from Parliament the slave trade occupied much of his thoughts, and he published a work entitled 'The Slave-trade and Its Remedy.' In 1840 he was created a baronet. See 'Memoirs of Sir T. F. Buxton, Bart' (1872).

Buxton, a town in Derbyshire, England, 37 miles northwest of Derby, and 25 south-southeast of Manchester. Buxton has long been famous for its calcareous springs, the waters being taken for indigestion, gout, rheumatism, and nervous and cutaneous diseases. The locality was known to the Romans, who had baths here. The season extends from May to October, some 15,000 persons visiting the springs annually. The town is 900 feet above sea-level and is situated in a deep valley. Much of the splendor of Buxton is due to the Dukes of Devonshire, one of whom, in 1780, at the cost of \$600,000, erected an immense three-storied pile of buildings, called the Crescent. Near Buxton is the Diamond Hill, famous for its crystals; and Poole's Hole, a gas-lit stalactite cavern 770 yards long. Mary, Queen of Scots, was at Buxton when in the custody of the Earl of Shrewsbury. Pop. (1901) 10,181.

Buxtorf, Johann, yō'hän büks'tōrf (THE ELDER), German Orientalist: b. Kamen, Westphalia, 25 Dec. 1564; d. Basel, 13 Sept. 1629. Being very learned in Hebrew and Chaldaic, in the acquirement of which he obtained the assistance of many learned Jews, he was engaged by the magistrates of Basel to become professor of those languages, which he taught with great success. His chief works are: 'Lexicon Chaldaicum Talmudicum et Rabbinicum'; 'Thesaurus Linguae Hebraeae'; 'Biblica Hebraica Rabbinica'; 'Synagoga Judaica hoc est Schola Judeorum'; 'Institutio Epistolaris Hebraica'; 'Concordantiae Bibliorum Hebraicorum.'

Buxtorf, Johann (THE YOUNGER), German Hebraist: b. Basel, 13 Aug. 1599; d. there, 16 Aug. 1664; son of the preceding. He succeeded his father in the chair of Hebrew at Basel, and occupied it for 34 years, until his death. The same chair was filled by his son and his nephew successively during 68 years longer, making a combined occupancy of this professional chair by the Buxtorf family for an unbroken period of 140 years. He completed and published two of his father's principal works, the most important publication of his own being the 'Lexicon Chaldaicum et Syriacum.'

Bux'us, the genus name of a number of shrubs or small trees. See **Box**.

Buys-Ballot, bois-bā-lō, **Christophorus Henricus Didericus**, Dutch meteorologist: b. Kloetinge, Zeeland, 10 Oct. 1817; d. Utrecht, 2 Feb. 1890. He studied at the University of Utrecht, where he became professor of mathematics in 1847, and professor of experimental physics in 1870. In 1854 he received the appointment of director of the Royal Meteorological Institute at Utrecht. He was one of the initiators of the new system, under which, by daily synoptical weather reports, and simultaneous observations by land and sea, materials are collected for forecasting changes. His own observations have resulted in the determination of a general law of storms, known as the Buys-Ballot law. The inventor of a system of weather signals, he was largely instrumental in bringing about an international uniformity in meteorological observations. His works include 'Changements Périodiques de la Température' (1847); and, in English, 'Suggestions on a Uniform System of Meteorological Observations' (1872-3).

Buyukdereh, bī-yook'dé-rā, a little town on the western side of the Bosphorus, situated in the midst of a large, deep-bosomed valley. It is the summer residence of the Christian embassies at Constantinople, and its gardens and palaces, not less than its natural beauty and coolness, make it a favorite promenade ground. A group of plane-trees, the most splendid on the Bosphorus, the Russian palace, distinguished by the regularity of its architecture, and the extensive gardens of Baron Hübsch, are particularly mentioned. The tradition that Godfrey of Bouillon encamped here with his army is not alluded to in the original records of the crusades.

Buzfuz, Sargeant, a character introduced by Dickens in the 'Pickwick Papers.' He is the barrister who becomes counsel for the plaintiff in Mrs. Bardell's breach of promise suit against Mr. Pickwick, and is remarkable for the ingenuity he displays in drawing incriminating inferences from ordinary and inconsequential occurrences.

Buzzard, a term given in America to two distinct groups of birds — buzzard-hawks of the genus *Buteo* and its allies, also familiar to Europeans, and the turkey-buzzard — a vulture. The buzzard-hawks are closely related to the eagles, from which they are distinguished by the smaller size in the majority of cases, the smaller and rounder head, and a slow and heavy manner of flight. They feed chiefly upon the smaller mammals and reptiles, seldom catching or disturbing poultry, although popularly accused of it and styled "hen-hawks." Important North American species of the genus *Buteo* are the red-tailed, red-shouldered, Swainson's, and broad-winged hawks, all of which are elsewhere described under their names. The most important of the genus *Archibuteo* is the rough-legged hawk (q.v.), and the handsomest one, the squirrel hawk (q.v.) of California. In the southern United States the name usually refers to the common black vulture (*Cathartes aura*). See **TURKEY BUZZARD**.

Buzzard's Bay, on the southeast coast of Massachusetts, is about 30 miles long, and has a mean breadth of 7 miles. It is sheltered from the ocean and separated from Vineyard

Sound by the Elizabeth Islands. Its chief harbors are those of New Bedford, Fairhaven, Wareham, and Mattapoisett.

Buzzing, the sounds produced by many insects, other than by mechanical means, that is, by friction. How the buzzing of bees, flies, etc., is produced has been a disputed question. Two distinct sounds may be distinguished—one, a deep noise, is due to the vibration of the wings, and is produced whenever a certain rapidity is attained; the other is an acute sound, and is said to be produced by the vibrations of the walls of the thorax, to which muscles are attached; this sound is specially evident in *Diptera* and *Hymenoptera*, because the integument is of the right consistence for vibration. In both of these, observers agree that the spiracles are not concerned in the matter. Laudois tells us that the wing-tone of the honey bee is A'; its voice, however, is an octave higher, and often goes to B" and C". The sounds produced by the wings are constant in each species, except where, as in *Bombus*, there are individuals of different sizes; in these the larger ones generally give a higher note. Thus, the comparatively small male of *B. terrestris* hums on A', while the large female hums an entire octave higher. Consult Sharp, 'Insects' (New York 1899); Packard, 'Textbook of Entomology' (New York 1898).

By-Law, a particular or private law, as the local or subordinate law of a city, town, private corporation or other organization. The power to make by-laws is usually conferred by express terms of the charter creating the corporation; though, when not expressly granted, it is given by implication, and it is incidental to the very existence of a corporation. The Constitution of the United States and acts of Congress made in conformity to it, the Constitution of the State in which a corporation is located, and all acts of the legislature constitutionally made, together with the common law as there accepted, are of superior force to any by-law; and any by-law, when contrary to either of them, is void, whether the charter authorizes the making of such by-law or not; because no legislature can grant power larger than it possesses.

Byblos, bib'lōs, an ancient maritime city of Phœnicia, now called Jebail, a little north of Beyrout. It was the chief seat of the worship of Adonis or Thammuz.

Byerly, William Elwood, American mathematician: b. Philadelphia, 13 Dec. 1849. He graduated at Harvard College in 1871; was assistant professor of mathematics at Cornell University from 1873-6 and at Harvard from 1876-81, when he became professor. Among his works are: 'Elements of Differential Calculus'; 'Elements of Integral Calculus'; 'Problems in Differential Calculus'; and a 'Treatise on Fourier's Series and Spherical, Cylindrical and Ellipsoidal Harmonics.'

By'ers, Samuel Hawkins Marshall, American historical writer: b. 23 July 1838. During the Civil War he served in the Union army, was taken prisoner, and while in prison at Columbia, S. C., wrote the famous song 'Sherman's March to the Sea.' He was consul at Zürich, Switzerland, from 1869 to 1884, and consul-general to Italy in 1885. Among his

works are: 'Iowa in War Times'; 'Switzerland and the Swiss'; 'Twenty Years in Europe'; and many poems.

Byford, William Heath, American physician: b. Eaton, Ohio, 20 March 1817; d. 1890. He graduated at the Ohio Medical College and a few years later became professor in the Evansville Medical College. He established a practice in Chicago; in 1857 became professor of obstetrics and diseases of women and children, in the Rush Medical College of that city, and in 1880, professor of gynecology in the same institution. For many years he was president and professor of clinical surgery in the Women's Hospital Medical College, and was twice president of the American Medical Association. Among his works are: 'Practice of Medicine and Surgery Applied to Diseases and Accidents Peculiar to Women'; 'Philosophy of Domestic Life'; and 'Theory and Practice of Obstetrics.'

By'ington, Ezra Hoyt, American author: b. Hinesburgh, Vt., 3 Sept. 1828; d. Newton, Mass., 16 May 1901. He was educated at the University of Vermont and Andover Theological Seminary; entered the Congregational ministry and filled several pastorates. Among his works are: 'The Puritan in England and New England'; 'The Puritan as Colonist and Reformer'; 'The Christ of Yesterday, To-day, and Forever'; and histories of a number of local churches.

Byles, Mather, American clergyman: b. Boston, 26 March 1706; d. there, 5 July 1788. He was ordained over the church in Hollis Street, in Boston, in the year 1733, and obtained a distinguished position among the contemporary clergy. He was learned after the manner of those times, and was more addicted to literary recreations, and had a keener relish of the later humanities, than was then common among the members of his profession. As a proof of his recognized excellence in polite letters, we may accept the fact that he was the correspondent of some of the chief poets and authors of England. He was himself a votary of the muses in a small way, and a volume of his miscellaneous poems was published in 1744. He gave an early expression, too, to the loyalty which distinguished his character through life, in a poem on the death of George I. and the succession of his son, in 1727, when he was but 21 years of age. He also tempered the bereavement which Gov. Belcher had suffered in the loss of his wife in 1734, by such consolation as an elegiac epistle could convey. It is not likely, however, that his name would have been preserved to this time had his reputation depended on the merits of his poetical effusions. The cheerful flow of his spirits and frank gaiety of his conversation seem to have been something out of the common way, and to have left an enduring mark on the memories of that generation. His piety was tinged with no asceticism, and the lively sallies of his sprightly imagination, always kept within the limits of decorum, were restrained by no fear of injuring his personal or clerical dignity. He was an ardent Royalist and in 1777 was sentenced to banishment, but was allowed to remain under guard in his own house. This severity was soon relaxed for a while, and afterward renewed. One of the stories told of him is, that wishing to have an errand done at a distance, he asked the

sentry to undertake it. The man objected on the ground that he could not leave the door unguarded; on which the doctor volunteered to be his substitute, and, accordingly was seen by some one in authority, in powdered wig and cocked hat, with a musket on his shoulder, walking up and down before his house, keeping guard over himself. His release from custody soon followed, on which occasion, alluding to these changes of treatment, he said that he had been "guarded, regarded, and disregarded."

Byllynge, Edward, English provincial governor: d. 1687. He became joint purchaser with John Fenwick of a large tract of land in what is now the State of New Jersey. Upon the occasion of a dispute between the two proprietors, nine tenths remained, by Penn's decision, with Byllynge and was long known as "the Byllynge Tenths." He was governor of the province of West Jersey in 1677.

Byng, bing, George Viscount Torrington, English admiral: b. Wrotham, Kent, 27 Jan. 1663; d. 17 Jan. 1733. He entered the navy at the age of 15. In 1688 he recommended himself to William of Orange, and for his gallant conduct at the sea-fight of Malaga was knighted by Queen Anne. In 1718 he commanded the English fleet sent to Sicily for the protection of the neutrality of Italy, and on 31 July utterly destroyed the Spanish fleet off Messina. He was created Viscount Torrington in 1721.

Byng, John, English admiral: b. 1704; d. 14 March 1757. He was the son of Viscount Torrington, and by his own merits, as well as the influence of his name, was raised to the rank of admiral. His attempts to relieve Fort St. Philip, in Minorca, when blockaded by a French fleet under La Galissonière, proved abortive, and his hesitation in engaging the enemy, when a bold attack might have perhaps gained him the victory, excited the clamor of the nation against him. The ministry, who wished to avert the public odium from their unsuccessful measures, beheld with seeming satisfaction the unpopularity of Byng, and when he was condemned by a court-martial they suffered him, though recommended to mercy, to be sacrificed to the general indignation, and he was shot at Portsmouth.

Bynkershoek, bin'kèrs-hook, Cornelius van, Dutch jurist: b. Middleburg, Zealand, 29 May 1673; d. 16 April 1743. He studied at the University of Franeker, and after practising as a barrister at The Hague, became professor of law at Leyden, and president of the supreme council of Holland. He was one of the most learned among modern civilians. His books are in Latin, and his treatise 'De Foro Legatorum Competente' was translated by Barbeyrac into French under the title of 'Du Juge Compétent des Ambassadeurs' (1728). His most important writings are the 'Observationes Juris Romani'; 'De Dominio Maris'; 'Quæstiones Juris Publici'; and a digest entitled 'Corpus Juris Hollandici et Zelandici.' A complete edition of his works was published at Geneva in 1761, and at Leyden in 1766.

Byn'ner, Edwin Lassetter, American novelist: b. Brooklyn, N. Y., 1842; d. Boston, 1893. He was librarian of the Boston Law Library, and author of short stories and of several novels, including 'Tritons' (1878);

'Agnes Surriage' (1886); 'Penelope's Suitors' (1887).

Byr, bür, Robert, pseudonym of KARL ROBERT EMMERICH BAYER (q.v.).

Byrd, bérđ, William, American lawyer and author: b. Westover, Va. 1674; d. there, 26 Aug. 1744. He received a liberal education in England, possessed one of the largest libraries in the colonies, and, having a large property, lived in a splendid style, unrivaled in Virginia. He was a member and at last president of the King's Council. To French Protestants fleeing to Virginia from persecution in France, he extended the most generous assistance. The towns of Richmond and Petersburg were laid out by him, and he was one of the commissioners for establishing the boundary line between Virginia and North Carolina. He was a member of the Royal Society, and as a patron of literature and art deserves remembrance. His own writings include the 'Westover Manuscripts,' embracing 'The History of the Dividing Line'; 'A Journey to the Land of Eden'; and 'A Progress to the Mines.' In 'The Virginia Magazine of History and Biography' (1902) appeared his letters, revealing much of interest concerning his personality and career.

Byrd, William, composer. See BIRD, WILLIAM.

Byrgius, bér'j'i-üs, Justus (properly JOBET BÜRGI), Swiss mathematician: b. Lichtensteig, Canton of St. Gall, Switzerland, 28 Feb. 1552; d. Cassel, Germany, 31 Jan. 1632. He was invited to Cassel by the landgrave of Hesse to superintend the observatory which he had there erected, and constructed a number of astronomical instruments, some curious clocks, and other machines. A discovery involving that of the logarithms, and another exhibiting an application of the pendulum to clocks, have been attributed to him. He is eulogized by Kepler for his talents, but censured for his indolence and undue reserve, which kept back his discoveries from the public.

Byrne, Thomas Sebastian, American clergyman: b. Hamilton, Ohio, 29 July 1842. In youth he was an expert machinist, but deciding to enter the priesthood of the Roman Catholic Church he went, after preparatory training, to the American College in Rome. In 1869 he was ordained in Cincinnati. He devoted himself to literature and teaching in Mt. St. Mary's Seminary; for a time had charge of the Cincinnati Cathedral and again became connected with the seminary, acting as rector until 1894. He wrote 'Man from a Catholic Point of View.'

By'rom, John, English poet and stenographer: b. near Manchester, 29 Feb. 1692; d. 26 Sept. 1763. He was educated at Merchant Taylor's School and Trinity College, Cambridge, and for some time studied medicine, but his chief means of livelihood for many years, till he inherited the family estates in 1740, was teaching shorthand on a system invented by himself. He was on friendly terms with many of the eminent men of his time. His earliest writings were a few papers to the 'Spectator'; his poems (collected in 1773) were chiefly humorous and satirical, and show remarkable facility in rhyming.

BYRON

Byron, George Gordon, sixth lord, English poet: b. London, 22 Jan. 1788; d. Missolonghi, Greece, 19 April 1824. He was the son of "Mad Jack Byron," a good-looking, profligate soldier, who married the divorced Marchioness of Carmarthen, and had by her a daughter Augusta, later Mrs. Leigh. Captain Byron became a widower in 1784, and, a little more than a year later, married a Scotch heiress, Catherine Gordon of Gight. Their only child, the poet, was born at No. 16 Holles street, Cavendish Square, and was lame from birth, his right foot being so contracted that he hobbled with difficulty. The influences surrounding the child were deplorable. John Byron, to escape his creditors, had to flee to France, where he died in 1791. Mrs. Byron, with a much reduced income, resided in Aberdeen and proved to be a most indiscreet mother, now fondly petting her child, now reviling him. She was actually guilty of reproaching him for his lameness. The boy himself was capable of great affection for his nurse and for a cousin, Mary Duff, and his schoolmates seem to have regarded him as warm-hearted. His education was not neglected during his early years, but tutors and schools could not make up for his lack of training at home. He learned, however, to love nature amid the Scotch hills.

In 1794 the grandson of the then Lord Byron died, and the six-year old boy became heir to the peerage, which he inherited in 1798. Then his mother obtained a pension and left Scotland, Byron being made a ward in chancery and Lord Carlisle being appointed his guardian, though his mother's lawyer, John Hanson, really looked after his welfare. A quack tortured his foot, and schoolmasters tried to make him studious, his main mental nutriment consisting, apparently, of the Bible and poetry. He wrote love verses to a young cousin, endured his mother's caprices, and was doubtless glad to be entered at Harrow in 1801, where, however, he was at first discontented and not liked. He could not make a scholar of himself, though, as Mr. Coleridge has shown, his classical attainments have been much underrated; but he was a good declaimer and through his pluck in fighting and in athletics, despite his deformity, he became a leader in the school. He was romantically devoted to his friends, and once offered to take half the thrashing a bully was giving to the boy who later was known as Sir Robert Peel. Impulsiveness characterized both his in-subordinate attitude toward the school authorities, and his love affair with his cousin and senior, Mary Anne Chaworth, who soon married and left him disconsolate. His affection for her seems never to have been entirely effaced. Altogether, his childhood and youth were well adapted to produce a wayward man.

In October 1805 he went into residence as a nobleman at Trinity College, Cambridge. He took full advantage of his privileges, ran into debt, though he had an allowance of £500 a year, gambled, consorted with pugilists, won fame as a swimmer, travelled about in style, and, last but not least, after stormy quarrels with his mother, successfully asserted his claim to be his own master. He formed some warm friendships with promising students, notably with John Cam Hobhouse, afterward Lord Brough-

ton (q. v.), he dabbled in literature and wrote verses, and he received his M. A. "by special privilege as a peer," in July 1808. Nearly two years previously he had printed 'Fugitive Pieces,' a volume of poetry, but had destroyed all save two or three copies because a clergyman friend had objected to one poem as too free. A small edition of what was practically the same book, 'Poems on Various Occasions,' appeared early in 1807. A few months later this was re-issued with considerable alterations as 'Hours of Idleness,' which was again altered in a second edition of March 1808, two months after the now famous slashing review from the pen of Brougham had appeared in the 'Edinburgh.'

Byron's youthful volume certainly gave little indication of the genius he was soon to display, but it called for no severe chastisement. Hence, the editor of the "Edinburgh," Jeffrey, got only what he deserved when Byron pilloried him in 'English Bards and Scotch Reviewers,' which appeared anonymously about the middle of March 1809, and was at once successful. It is still decidedly readable in parts and ranks with the best satires of its kind. It went through five editions in two years, the last being suppressed by its author, because he had become the friend of many of his victims.

Meanwhile, Byron had settled—if such a word may be used of his riotous occupation of his domain—at Newstead Abbey, and had repaired it on borrowed money. In March 1809 he took his seat in the House of Lords. Then he prepared himself for a tour of the Continent, which was begun with Hobhouse and three servants in July. That Byron was to any marked extent as dissipated and misanthropic as his own Harold does not seem likely.

The travellers sailed to Lisbon and saw something of Portugal, Spain, Malta, Albania, and Greece. At Athens Byron finished the first canto of 'Childe Harold' and celebrated the charms of his landlady's daughter, Theresa Macri, the 'Maid of Athens.' Then the friends visited Asia Minor and reached Constantinople shortly after Byron's famous swim from Sestos to Abydos (3 May 1810). About two months later Hobhouse returned to England and Byron to Athens, where, after a tour of the Morea, he spent the winter of 1810-11, apparently studying and writing and making excursions. He reached England, by way of Malta, about 20 July 1811.

Throughout his travels he had been in severe financial straits, which his mother had shared. Immediately on his return she was taken ill, and before he could reach her she died. He mourned for her in a passionate way, and the practically simultaneous deaths of three friends also afflicted him and gave him an excuse for writing melancholy verses. He had brought to England with him the first two cantos of 'Childe Harold' and his paraphrase of the 'Ars Poetica,' the 'Hints from Horace.' The latter, which he is said to have preferred, was immediately accepted by a publisher, but for some reason it did not appear during Byron's life. 'Childe Harold,' after some delay, was the means of uniting its author with his famous publisher, John Murray. It appeared in March 1812, after Byron had made a successful speech in the House of Lords. As all the world knows he awoke one morning and found himself fa-

mous as a poet; it is no wonder that he put a parliamentary career, in which he might have done great good, forever behind him.

It has been for some years fashionable to sneer at the first two cantos of 'Childe Harold;' but they are at least effective poetry, and their novel theme and romantic tone fitted them for the early readers who went wild over them. Melancholy and cynicism in a youth were more likely to attract than to shock men and women who were subjects of the Regent and contemporaries of Napoleon. Byron, who had previously made a fast friend of his would-be adversary, Thomas Moore (q. v.), became the social lion of the day. He was young and reckless, and unfortunately gave occasion for scandal through his relations with the notorious Lady Caroline Lamb (q. v.), and the equally frail Lady Caroline Lamb (q. v.), and the equally frail Lady Caroline Lamb (q. v.). People could also gossip about his handsome face, and his drinking, and his strange diet for the reduction of his disfiguring obesity. His pecuniary difficulties, too, and his folly in presenting the money from his copyrights to his connection Dallas doubtless caused tongues to wag. He enjoyed his vogue, but not to such an extent as to grow idle. After the failure of the anonymous 'Waltz,' he gave the world 'The Giaour' in May 1813, 'The Bride of Abydos,' in December of the same year, and 'The Corsair,' two months later. All were dashed off, all were very popular, all deepened the atmosphere of mystery about him. Scott's supremacy as a romantic poet passed to the newcomer, and although the lines on the Princess Charlotte caused some hard feeling and he threatened to quit poetry, Byron continued for two years to have his fling both as a poet and as a gay man of the world. 'Lara' appeared in August 1814; 'Hebrew Melodies' in January 1815; 'The Siege of Corinth' and 'Parisina' in January and February 1816. The sums paid by Murray for these poems — Byron, harassed by debt, at last began to be businesslike — show plainly how well he continued to hold his public. Except for such lyrics as 'She walks in beauty like the night,' the work of this period has failed to hold later generations. This is due no doubt to an unwholesome desire on the part of a puritanical race "to take it out" upon Byron's far from impeccable character and career, as well as to a natural change of taste toward greater polish and refinement, and to the effect of such a story as that he wrote the first sketch of 'The Bride of Abydos' in four nights after coming home from balls. That latter-day criticism has been altogether wrong in correcting the excessive praise given by Byron's contemporaries to this facile group of poems cannot be maintained; but it is well to remember that copious power is a good sign of genius, that Byron managed to put into 'The Giaour' not a little narrative vigor and into the whole group of Oriental tales much of the color and the spirit of the East, and that English literature would have been deprived of many beautiful lyric and descriptive passages if he had allowed society completely to turn him from writing verse.

Meanwhile Byron had seen much of Moore and Rogers and had met, after many years, his half-sister, Mrs. Leigh, the 'Augusta' of some of his best poems, and the being of all others to whom his heart went out most fondly. In after years his memory and hers were to be clouded

by a dark suspicion which, whether true or false, would probably never have soiled the ears of the world but for the jealousy of another woman — his wife. Whether the scandal which Mrs. Stowe (q. v.) spread and which Byron's own grandson, Lord Lovelace, unaccountably revived will ever be substantiated or laid completely to rest is a matter upon which the data for a decision are not forthcoming. In the interim generous minds and hearts will prefer to believe in the purity of the 'Epistle to Augusta.'

The story of Byron's courtship and marriage, while less mysterious than that of Milton, is not a clear one. In 1812 he seems to have been rejected by an heiress, Miss Anna Isabella Milbanke, four years his junior and a connection of his flame, Lady Lamb. The young woman appears to have been fond of mathematics and theology, to have written poems, to have been somewhat priggish and prudish, and very self-centred. Some correspondence was kept up between the pair and, as a marriage seemed likely to steady his habits and better his fortunes, Byron proposed again by letter in September 1814. This time he was accepted. Miss Milbanke was apparently proud of her catch and Byron of his. They were married on 2 Jan. 1815 and they seem to have got on well at first, though each later made reports to the contrary. The young wife soon inherited money and promised him a child; the poet behaved himself well on the surface, took an interest in the management of Drury Lane, saw something of Sir Walter Scott (always his defender), and helped Coleridge to publish 'Christabel.' But the pair were evidently incompatible, and after the birth of their only child, Augusta Ada, on 10 Dec. 1815, a separation was arranged for. Lady Byron believing that her husband was insane — a notion obviously stupid, but possibly charitable from her own point of view. The doctor, the lawyer, and the father-in-law she let loose upon Byron may have irritated him into conduct that did not allay her suspicions. It is all a tangle; perhaps the easiest way out is to censure Byron and resolutely refrain from admiring his wife.

The separation was followed by an astonishing public clamor against Byron, whose friends seem to have thought his life in danger. Sir Leslie Stephen has contended that the public indignation was not unnatural. Perhaps it was not, in the sense that it represented some of the worst elements of human nature. For a society that tolerated the Regent and his boon associates to fawn upon a man and then to condemn him unheard on the score of practically unspecified charges was simply to put an indelible blot upon Englishmen of the upper and middle classes — a blot the blackness of which may be somewhat gauged from the depth of the vindictiveness with which Byron's fame has been since attacked by many of his countrymen. It by no means follows, however, that Byron was at all justified in writing and publishing his numerous poems and passages relating to the separation — though literature would do ill without 'Fare Thee Well,' and would like to have had a chance to see his destroyed novel on the 'Marriage of Belphegor' — or that he can be excused for much of his conduct during the exile that began at the end of April 1816 and lasted for the rest of his spectacular life. One

can, however, pardon his constant desire to shock the British public; and, taking account of his temperament, one can understand his varying moods of conciliatory tenderness and defiant scorn toward his implacable wife.

Byron first visited Belgium, traveling luxuriously. Then he went, by the Rhine, to Geneva, where he met the Shelleys and Claire Clairmont, who had made up her mind in London to be his mistress. She bore him in January 1817 a daughter, Allegra, with whom he charged himself and whose death in 1822 grieved him deeply. The intercourse with the Shelleys at Geneva was more beneficial to Byron than to Shelley. 'The Prisoner of Chillon,' the most popular of his poems of the type, the third canto of 'Childe Harold' which, thanks to Shelley, showed the influence of Wordsworth, the stanzas 'To Augusta,' and other poems are memorials of the period and proofs that his experiences had ripened Byron's poetic powers. After the Shelleys returned to England, Byron, with Hobhouse, crossed into Italy.

He was in Milan in October 1816 and then went for the winter to Venice, where he practically remained for three years. His excesses in the Palazzo Macenigo are unfortunately but too well known; yet, although his health and his character suffered from them, to say nothing of his reputation, he did not a little studying, and his poetical genius continued active. The fourth canto of 'Childe Harold' and 'Manfred,' which date, in part at least, from 1817 and reveal the effects of a visit to Rome, show his genius almost at its zenith, and 'Beppo,' suggested by Frere's 'Whistlecraft,' precluded the greatest of his works—perhaps the greatest of modern English poems—the incomparable medley 'Don Juan,' the first canto of which was finished in September 1818. The first two cantos, between which he wrote 'Mazeppa,' were published, without indication of either author or publisher, in July 1819.

Meanwhile Byron had met the Countess Teresa Guiccioli, the young, beautiful, and accomplished daughter of Count Gamba of Ravenna. They became passionately attached to one another, and, aided by the customs of the country, were constantly together at Ravenna and other places, Venetian society finally giving them up when she resided under his roof. After some extraordinary business negotiations with the lady's elderly husband, it looked as if the temporarily weary lover might regain his freedom; but finally the affection of the Countess prevailed, and Byron, yielding to an influence higher and better than any he had known of late, established himself near her at Ravenna at the end of 1819. Here for a time, at her request, he gave up 'Don Juan,' and, after some translating from the Italian poets, began to write dramas.

His first play was 'Marino Faliero,' in writing which Byron departed from English models and made a diligent study of authorities. It was finished in the summer of 1820 and played unsuccessfully at Drury Lane the next spring. The year 1821 saw the writing of the more effective 'Sardanapalus,' 'The Two Foscari,' the powerful, though not stylistically adequate 'Cain: a Mystery,' 'Heaven and Earth,' another 'Mystery,' and the inception of 'Werner,' his best

acting play, taken largely from Harriet Lee's (q. v.) story 'Kruitznar.' That Byron had little dramatic genius is generally admitted; the literary power which he could not avoid putting into any composition is not, in the case of these experiments, sufficiently recognized.

While writing his dramas, Byron had more trouble with Count Guiccioli, who was finally separated from his wife, and he was led by the Gambas to take a deep interest in the Carbonari conspiracies. He had already in his poetry given evidence of liberal political sentiments; now he subscribed for the patriotic cause, headed a section of the conspirators, and, but for his birth and fame, would have got into trouble with the Austrian authorities. The Gambas and the Countess were exiled from Ravenna, and Byron, after some lingering, joined them at Pisa in November 1821. Here he saw much of Shelley, Medwin, Trelawny, and other Englishmen, and here, sometime in 1822, he wrote an ineffective drama, 'The Deformed Transformed.' The same year he made with Shelley and Leigh Hunt (q. v.) the unfortunate arrangements which induced the latter to come to Italy and begin the publication of the quarterly journal, 'The Liberal.' The details of this affair are too complicated to be entered upon without ample space. Shelley was imprudent, Byron rather brutal, Hunt exasperating. Shelley's death complicated matters still further, and 'The Liberal' expired after four numbers. Its most memorable item was Byron's masterly satire upon Southey, 'A Vision of Judgment,' written in 1821. This Murray had been chary of publishing after the trouble he had had with the orthodox on account of 'Cain'—an episode which had a good deal to do with Byron's willingness to establish a journal the chief expense of which he knew would fall on himself.

Meanwhile 'Don Juan' had been taken up once more, in a deeper vein, and the Gambas had been ordered to leave Tuscany. Byron, whose health and spirits were impaired, followed them to Genoa in the autumn of 1822. Here he wrote his satire 'The Age of Bronze,' upon the political reaction of the time, as well as his poor narrative poem 'The Island,' and the later cantos of 'Don Juan.' He was growing restless and feared that he was losing his powers; but, fortunately, for his fame at least, a new outlet for his energies was at hand. A Whig and Liberal committee was formed in London to aid the Greek revolutionists and at Trelawny's suggestion Byron was made a member. He proposed to go in person to the Levant, and by midsummer of 1823 he completed his elaborate preparations for the expedition. Sailing from Genoa, with rising spirits, he reached Cephalonia early in August. Here he remained four months writing excellent letters of advice and sensibly waiting for a clear opportunity for action, not, in all likelihood, for an offer of the Greek crown. At the end of December 1823 he accepted the invitation of Prince Alexander Mavrocordatos to co-operate in the organization of Western Greece and sailed for Missolonghi, where he was cordially welcomed. He appears to have shown great tact in harmonizing opposing factions and considerable practical genius as an organizer. He had no chance to do any fighting with the wild troops over

BYRON

whom he was placed as commander-in-chief, but he did hold out successfully against a mutiny, awing by his courage the Suliotes that broke into his tent while he was ill. He recovered somewhat, but exposure to fatigue and the constant rains told heavily upon him, and he took no care of himself. At last he was prostrated with ague and received only the crudest medical attention. After much delirium he passed into a long slumber, which ended in his death at six o'clock in the evening of 19 April 1824. The news was a shock to the world. His body was sent to England and was buried, not in Westminster Abbey, but at Hucknall Torkard, near Newstead Abbey. The Greeks would have liked, more appropriately, to bury him at Athens, and, fortunately, they did secure his heart for interment at Missolonghi. There is no incongruity, however, in thinking of him as reposing, after his stormy life, in company with his passionate mother and his long line of wild ancestors.

Byron's position in English literature is a much disputed matter. Foreigners, influenced by the spell cast by his genius upon the romantic writers of their own countries as well as by his devotion to freedom and by the fact that his work in translation does not offend by its slipshod features, almost unanimously—whether they be Frenchmen, or Germans, or Italians, or Spaniards, or Russians,—place him only below Shakespeare. The English-speaking world knows the work of Chaucer, Spenser, and Milton too well to admit such a high estimate of his genius; but it seems to have gone farther astray in depreciation than foreigners have in appreciation of his extraordinary gifts and achievements. With a few honorable exceptions like Matthew Arnold, English critics have magnified Byron's plain moral and artistic delinquencies and have minimized his powerful intelligence, his great range of work—he is one of the best of letter writers and the most brilliant of satirists, as well as the arch-romantic and revolutionary poet, and a notable descriptive and lyric one—his copious creative power, and his great "sincerity and strength." They have judged him as somewhat finicky connoisseurs of verse instead of as impartial appraisers of literature. They have underestimated the hold he has kept upon youth and the attraction which his later work, especially 'Don Juan,' so frequently exercises upon intelligent men of mature years. Whether he will ever receive his due from the more cultured of his countrymen is problematical; but there have been indications of late that a less banal attitude is being taken toward both him and his works. He may not be the greatest English poet of modern times, but he is certainly the most effective of all the enemies of cant.

Bibliography.—The bibliography of Byron is naturally immense. His memoirs, given to Moore, were burned, after many family complications, in 1824. Moore's 'Life, Letters, and Journals of Lord Byron' (1830) is the standard biography. It was included in Murray's edition of the collected 'Life and Works' (1832-5; 17 vols. 1837). The number of separate editions of the poems and of translations is enormous, all previous editions being superseded by Murray's edition of the works in 13 volumes (6 of

prose, edited by R. E. Prothero, 1898-1901; 7 of verse, edited by E. H. Coleridge, 1898-1904). The best 1-vol. edition of the poems is that by Coleridge (1905); the [American] Cambridge edition by P. E. More (1905) is also good. The large list of memoirs and books of biographical value may be represented here by Karl Elze's 'Lord Byron' (1870), J. C. Jeaffreson's 'The Real Lord Byron' (1883), and John Nichol's 'Byron' in the 'English Men of Letters' (1880). Reminiscences by Lady Blessington, Medwin, the Countess Guiccioli, E. J. Trelawny, Hobhouse, Leigh Hunt, and many others should also be consulted. Of critical essays, favorable and unfavorable, those by Matthew Arnold, Charles Kingsley, Macaulay, John Morley, J. A. Symonds, and Swinburne may be mentioned. The mass of continental criticism is very large and is steadily increasing.

WILLIAM P. TRENT,

Professor of English Literature, Columbia University.

Byron, Harriett, a character in Richardson's novel, 'Sir Charles Grandison.' She was attached to the hero and was the writer of the greater part of the letters comprising the novel.

Byron, Henry James, English dramatist and actor: b. Manchester, January 1834; d. London, 11 April 1884. He studied at first for the medical profession, and afterward for the bar, but his passion for the stage caused him to abandon them. He was the first editor of 'Fun,' and also started another paper entitled the 'Comic Times,' which soon ceased to appear. Many of his chief plays were produced at various theatres with which he was connected as manager, but they were not financially successful. He wrote an immense number of pieces, including a great many farces, burlesques, and extravaganzas, besides comedies or domestic dramas, such as 'Fra Diavolo' (1858); 'Cyril's Success,' probably his best work; 'Dearer than Life'; 'Blow for Blow'; 'Old Sailors' (1874); 'The Lady of Lyons'; 'Uncle Dick's Darling'; 'The Promoter's Box'; 'Partner's for Life'; and 'Our Boys' (1878), which had a run of four years and three months, the longest on record. He also wrote the novel 'Paid in Full' (3 vols., 1865).

Byron, John, English naval officer: b. Newstead, 8 Nov. 1723; d. 10 April 1786. At the age of 17 he sailed with Lord Anson on a voyage round the world, but was wrecked on the coast of the Pacific, north of the Straits of Magellan. Byron, with some of his unfortunate companions, was conducted by the Indians to Chile and remained there till 1744, when he embarked on board a ship of St. Malo and in 1745 returned to Europe. At a subsequent period he published a narrative of his adventures, which is extremely interesting. In 1758 he commanded three ships of the line and distinguished himself in the war against France. George III., who wished to explore the part of the Atlantic Ocean between the Cape of Good Hope and the southern part of America, gave Byron command of a frigate, with which he set sail in June 1764. After having circumnavigated the globe he returned at the end of two years to England, where he arrived in May 1766. Although Byron's voyage was not fruitful in discoveries, it still deserves an

BYRON BAY—BYZANTINE EMPIRE

honorable place in the history of voyages round the world, since he was the first of those renowned circumnavigators of the globe, including Wallis, Carteret, and Cook, whose enterprises were not merely mercantile, but were directed to scientific objects. In 1769 Commodore Byron was appointed to the government of Newfoundland, which he held till 1775. He was raised to the rank of vice-admiral of the white in 1779, and died in 1786. Such was his general ill fortune at sea, that he was called by the sailors "Foul-Weather Jack."

Byron Bay, a bay on the northeastern coast of Labrador, situated about lat. 55° N., and lon. 58° W., and north of Hamilton Inlet. The width of the bay is about 50 miles.

Byron Island, Micronesia, a small island of the Gilbert group, in the Pacific Ocean, about 12 miles in length, abounding in cocoanuts. It was discovered by Commodore Byron in 1765, and belongs to Great Britain.

Byssus, bis'sūs, a kind of fine flax, and the linen made from it, used in India and Egypt at a very early date. In the latter country it was used in embalming, and mummies are still found wrapped in it. As an article of dress it was worn only by the rich. Dives, in Christ's parable (Luke xvi. 19), was clothed in byssus, and it is mentioned among the riches of fallen Babylon (Rev. xviii. 12). Byssus was formerly erroneously considered as a fine kind of cotton. The fine stuff manufactured from the byssus is called more particularly "sindon." Foster derives the word byssus from the Coptic. Byssus was also used by the ancients, and is still used, to signify the hairlike or threadlike substance (also called the beard), with which different kinds of sea-mussels fasten themselves to rocks. *Pinna marina*, particularly, is distinguished by the length and silky fineness of its beard, from which very durable cloths, gloves, and stockings are still manufactured (mainly as curiosities) in Sicily and Calabria.

Byström, Johan Niklas, Swedish sculptor: b. Filipstad, Wernland, Sweden, 18 Dec. 1783; d. Rome, 11 March 1848. He studied art in Stockholm, and in 1810 went to Rome. In 1815 he returned, and winning the favor of the crown prince by his statue of the latter, received several important commissions. Several years before his death he again took up his residence in Rome. Among his more important works are: 'Drunken Bacchante'; 'Nymph Going into the Bath'; 'Reclining Juno'; 'Hygieia'; 'Dancing Girl'; a statue of Linnaeus and colossal statues of several of the kings of Sweden.

Bytneriaceæ, büt-nē-rī-ā'sē-ē (or more properly BÜTTNERIACEÆ), (after the botanist Büttner), a natural order of exogenous plants, with the following characteristics. Its members are trees or shrubs, with simple alternate leaves and opposite stipules; flowers disposed in clusters, which are axillar or opposite to the leaves; calyx and corolla with five divisions, but the latter sometimes wanting; stamens of the same number as the petals, or double or multiple, in general monadelphous; anthers always two-celled; carpels, from three to five in number, more or less completely united, each cell with two or three ascending ovules or a greater num-

ber; styles free, or more or less united; fruit generally a globular capsule dehiscent or indehiscent. This order is distinguished from the *Malvaceæ* by its two-celled anthers and by the fact that its seeds are generally furnished with a fleshy endosperm. The order is divided into six sub-orders, one of which takes its name from the genus *Bytneria*, which gives its name to the whole order. The chief genus of this sub-order is *Theobroma cacao*, from the seeds of which cocoa is prepared. The genus *Guazuma*, a native of Brazil, belonging to the same sub-order, is cultivated for the sake of its fruit, which is edible and filled with a sweet and pleasant mucilage. Another genus of this sub-order, *Abroma*, is valuable on account of its fibre, from which strong cordage is manufactured. The genus *Astropæa* is said to contain the most beautiful plants; all the species are remarkable for the mucilage they contain.

Byzantine Empire, called also the Roman empire of the East, the Eastern empire, and the Greek empire.

History.—On the death of Theodosius the Great, 395 A.D., the division of the great Roman empire into East and West became permanent. The eastern portion, with Constantinople, the ancient Byzantium, for its capital, was bequeathed to the elder son Arcadius, with whom the line of Byzantine emperors properly commences. During his minority Rufinus was his guardian and minister, between whom and Stilicho, the minister of the Western empire, a fierce rivalry existed. The Goths laid waste Greece. Eutropius, the successor, and Gainas, the murderer of Rufinus, were ruined by their own crimes. The latter lost his life in a civil war excited by him (400). Arcadius and his empire were now ruled by his proud and covetous wife Eudoxia, till her death (404). The Isaurians and the Huns wasted the provinces of Asia and the country along the Danube. Theodosius the Younger succeeded his father (408), under the guardianship of his sister Pulcheria. Naturally of an inferior mind, his education had made him entirely imbecile and unfit for self-command. Pulcheria, who bore the title of Augusta, administered the kingdom ably. Of the Western empire, which had been ceded to Valentinian, Theodosius seized upon West Illyria (423). The Greeks fought with success against the king of the Persians, Varanes. The kingdom of Armenia, thrown into confusion by internal dissensions, and claimed at the same time by the Romans and the Persians, became now a bone of contention between the two nations (440). Attila laid waste the dominions of Theodosius, and obliged him to pay tribute (447). After the death of her brother Pulcheria was acknowledged empress (450). She was the first female who attained this dignity, and giving her hand to the senator Marcian, raised him to the throne. His wisdom and valor averted the attacks of the Huns from the frontiers, but he did not support the Western empire in its wars against the Huns and the Vandals with sufficient energy, and afforded shelter to a part of the Germans and Sarmatians who were driven to the Roman frontiers by the incursions of the Huns. Pulcheria died before him in 453. Leo I. (457), a prince praised by contemporary authors, was chosen successor of Marcian. His expeditions

BYZANTINE EMPIRE

against the Vandals (467) were unsuccessful. His grandson Leo II. succeeded, but survived only a few months, when Zeno, the father of Leo, who had previously been appointed his colleague, became sole emperor (474). The government of this weak emperor, who was hated by his subjects, was disturbed by rebellions and internal disorders of the empire. The Goths depopulated the provinces till their king Theodoric turned his arms against Italy (489). Ariadne, widow of Zeno, raised the minister Anastasius, whom she married, to the throne (491). The nation, once excited to discontents and tumults, could not be entirely appeased by the alleviation of their burdens and by wise decrees. The forces of the empire, being thus weakened, could not offer an effectual resistance to the Persians and the Bulgarians along the Danube. To prevent their incursions into the peninsula of Constantinople, Anastasius built the long wall, as it is called. After the death of Anastasius the soldiers proclaimed Justin emperor (518). Notwithstanding his low birth he maintained possession of the throne. Religious persecutions, undertaken at the instigation of the clergy, and various crimes, into which he was seduced by his nephew Justinian, disgrace his reign. He was renowned as a legislator, and his reign was distinguished by the victories of his general Belisarius; but how unable he was to revive the strength of his empire was proved by its rapid decay after his death. Justin II., his successor (565), was an avaricious, cruel, weak prince, governed by his wife. The Longobardi (Lombards) tore from him part of Italy (568). His war with Persia, for the possession of Armenia (570), was unsuccessful; the Avari plundered the provinces on the Danube, and the violence of his grief at these misfortunes deprived him of reason. Tiberius, his minister, a man of merit, was declared Cæsar, and the general, Justinian, conducted the war against Persia with success. The Greeks now allied themselves, for the first time, with the Turks. Against his successor, Tiberius II. (578), the Empress Sophia and the general Justinian conspired in vain. From the Avari the emperor purchased peace; from the Persians it was extorted by his general, Mauricius or Maurice (582), who, after the death of Tiberius in the same year, was declared his successor. Mauricius, under other circumstances, would have made an excellent monarch, but, for the times, wanted prudence and resolution. He was indebted for the tranquillity of the eastern frontiers to the gratitude of King Chosroes II., whom, in 591, he restored to the throne, from which he had been deposed by his subjects. Nevertheless, the war against the Avari was unsuccessful, through the errors of Commen-tiolus. The army was discontented, and was irritated now by untimely severity and parsimony, and now by timid indulgence. They finally proclaimed Phocas, one of their officers, emperor. Mauricius was taken in his flight and put to death (602). The vices of Phocas and his incapacity for government produced the greatest disorder in the empire. Heraclius, son of the governor of Africa, took up arms, conquered Constantinople, and caused Phocas to be executed (610). He distinguished himself only in the short period of the Persian war. During the first 12 years of his reign the Avari,

and other nations of the Danube, plundered the European provinces, and the Persians conquered the coasts of Syria and Egypt. Having finally succeeded in pacifying the Avari, he marched against the Persians (622), and defeated them; but during this time the Avari, who had renewed the war, made an unsuccessful attack on Constantinople in 626. Taking advantage of an insurrection of the subjects of Chosroes, he penetrated into the centre of Persia. By the peace concluded with Siroes (628), he recovered the lost provinces and the holy cross. But the Arabians, who now became powerful under Mohammed and the caliphs, conquered Phœnicia, the countries on the Euphrates, Judea, Syria, and all Egypt (635-641). Among his descendants there was not one able prince. He was succeeded by his son Constantine III., probably in conjunction with his stepbrother Heracleonas (641). The former soon died, and the latter lost his crown in a rebellion, and was mutilated. After him Constans, son of Constantine, obtained the throne (642). His sanguinary spirit of persecution, and the murder of his brother Theodosius (650), made him odious to the nation. The Arabians, pursuing their conquests, took from him part of Africa, Cyprus, and Rhodes, and defeated him even at sea (653). Internal disturbances obliged him to make peace. After this he left Constantinople, and in 663 began an unsuccessful war against the Lombards in Italy. He died at Syracuse in 668. Constantine IV., Pogonatus, son of Constans, vanquished his Syracusan competitor Mezentius, and, in the beginning of his reign, shared the government with his brothers Tiberius and Heraclius. During the early part of his reign the Arabians inundated all Africa and Sicily, penetrated through Asia Minor into Thrace, and attacked Constantinople, for several successive years, by sea. Nevertheless, he made peace with them on favorable terms. But on the other hand, the Bulgarians obliged him to pay a tribute (680). Justinian II., his son, who succeeded him in 685, weakened the power of the Maronites, but fought without success against the Bulgarians and against the Arabians. Leontius dethroned this cruel prince, and after mutilating, banished him to the Tauric Chersonese (695). Leontius was dethroned by Apsimar, or Tiberius III. (698), who was dethroned by Trebelius, king of the Bulgarians, who restored Justinian (705); but Philippicus, Bardanes rebelled anew. With Justinian II. the race of Heraclius was extinguished. The only care of Philippicus was the spreading of Monothelism, while the Arabians wasted Asia Minor and Thrace. Philippicus reigned from 711 to 713, when he was deposed by Anastasius, who at the end of three years retired to a monastery, the army sent out against the Arabians having revolted against him, and proclaimed their leader, Theodosius, emperor. This prince, known as Theodosius III., after a reign of only 14 months, was compelled in his turn to yield the throne to Leo the Isaurian, general of the army of the East, who refused to recognize him, and marched against Constantinople (May 717). Leo repelled the Arabians from Constantinople, which they had attacked for almost two years, and suppressed the rebellion excited by Basilus and the former emperor Anastasius. From 726 the abolition of the worship of images absorbed his attention, and the Italian provinces were al-

BYZANTINE EMPIRE

lowed to become a prey to the Lombards, who thus put an end to the exarchate of Ravenna (728), while the Arabians plundered the eastern provinces. After his death (741), his son Constantine V. ascended the throne—a courageous, active, and noble prince. He vanquished his rebellious brother-in-law Artabases, wrested from the Arabians part of Syria and Armenia, and overcame at last the Bulgarians, against whom he had been long unsuccessful. He died (775), and was succeeded by his son Leo IV., who fought successfully against the Arabians, and this latter by his son Constantine VI. (780), whose imperious mother, Irene, his guardian and associate in the government, raised a powerful party by the restoration of the worship of images. He endeavored, in vain, to free himself from the dependence on her and her favorite, Stauratius, and died in 797, after having had his eyes put out. The war against the Arabians and Bulgarians was long continued; against the first it was unsuccessful. The design of the empress to marry Charlemagne excited the discontent of the patricians, who placed one of their own order, Nicephorus, upon the throne (802). Irene died in a monastery. Nicephorus became tributary to the Arabians, and fell in the war against the Bulgarians (811). Stauratius, his son, was deprived of the crown by Michael I., and he, in turn, by Leo V. (813). Leo was dethroned and put to death by Michael II. (820). During the reign of the latter the Arabians conquered Sicily, Lower Italy, Crete, and other countries. He prohibited the worship of images, as did also his son Theophilus (829-42). Theodora, widow of Theophilus and guardian of his son Michael III., put a stop to the dispute about images (842). During a cruel persecution of the Paulicians, considered to be an offshoot of the Manichæans, the Arabians devastated the Asiatic provinces. The dissolute and extravagant Michael confined his mother in a monastery. The government was administered in his name by Bardas, his uncle, and after the death of Bardas by Basil, by whom Michael was put to death (867). Basil I., who came to the throne in 867, was not altogether a contemptible monarch. He died 886. The reign of his learned son, Leo VI. (the Philosopher), was not very happy. He died 911. His son, Constantine VII., Porphyrogenitus (that is, "born in the purple"), a minor when he succeeded his father, was placed under the guardianship of his colleague, Alexander, and after Alexander's death, in 912, under that of his mother Zoe. Romanus Lacapenus, his general, obliged him, in 919, to share the throne with him and his children, Constantine VIII. and Stephanus. Constantine subsequently took sole possession of it again, and reigned mildly, but weakly. His son, Romanus II., succeeded him in 959, and fought successfully against the Arabians. To him succeeded, in 963, his general Nicephorus II. (Phocas), who was put to death by his own general, John Zimisces (969), who carried on a successful war against the Russians. Basil II., son of Romanus, succeeded this good prince in 976. He vanquished the Bulgarians and the Arabians. His brother, Constantine IX. (1025), was not equal to him. Romanus III. became emperor (1028) by marriage with Zoe, daughter of Constantine. This dissolute but able princess caused her husband to be executed, and successively raised to the throne

Michael IV. (1034), Michael V. (1041), and Constantine X. (1042). Russians and Arabians meanwhile devastated the empire. Her sister Theodora succeeded her on the throne (1054). Her successor, Michael VI. (1056), was dethroned by Isaac Comnenus in 1057, who became a monk (1059). His successor, Constantine XI., Ducas, fought successfully against the Uzes. Eudocia his wife, guardian of his sons, Michael, Andronicus, and Constantine, was intrusted with the administration (1067), married Romanus IV., and brought him the crown. He carried on an unsuccessful war against the Turks, who kept him for some time prisoner. Michael VII., son of Constantine, deprived him of the throne (1071). Michael was dethroned by Nicephorus III. (1078), and the latter by Alexius I., Comnenus (1081). Under his reign the Crusades commenced. His son, John II., came to the throne (1118), and fought with great success against the Turks and other barbarians. The reign of his son, Manuel I., who succeeded him (1143), was also not unfortunate. His son, Alexius II., succeeded (1180), and was dethroned by his guardian, Andronicus (1183), as was the latter by Isaac (1185). After a reign disturbed from without and within, Isaac was dethroned by his brother Alexius III. (1195). The Crusaders restored him and his son, Alexius IV.; but the seditious Constantinopolitans proclaimed Alexius V., Ducas Murzuphlus, emperor, who put Alexius IV. to death. At the same time Isaac II. died. During the last reigns the kings of Sicily had made many conquests on the coasts of the Adriatic. The Latins now forced their way to Constantinople (1204), conquered the city, and retained it, together with most of the European territories of the empire. Baldwin, Count of Flanders, was made emperor; Boniface, Marquis of Montferrat, obtained Thessalonica as a kingdom, and the Venetians acquired a large extent of territory. In Attalia, Rhodes, Philadelphia, Corinth, and Epirus, independent sovereigns arose. Theodore Lascaris seized on the Asiatic provinces, in 1206 made Nice (Nicaea) the capital of the empire, and was at first more powerful than Baldwin. In 1204 a descendant of the Comneni, named Alexius, established a principality at Trebizond, in which his great-grandson John took the title of emperor. Neither Baldwin nor his successors were able to secure the tottering throne. He himself died in captivity among the Bulgarians (1206). He was followed first by Henry, his brother, then by Peter, brother-in-law of Henry (1217), and then by Robert of Courtenay, son of Peter, who succeeded in 1219, but was not crowned till 1221. With the exception of Constantinople, all the remaining Byzantine territory, including Thessalonica, was conquered by John, emperor of Nice. Baldwin II., brother of Robert, succeeded and reigned under the guardianship of his colleague, John of Brienne, king of Jerusalem, till 1237, after which he was sole ruler till 1261. In that year Michael Palæologus, king of Nice, conquered Constantinople, and Baldwin died in the West, a private person. The sovereigns of Nice, up to this period were Theodore Lascaris (1206); John Ducas Vatatzes, a good monarch and successful warrior (1222); Theodore II., his son (1254); John Lascaris (1259), who was deprived of the crown by Michael Palæologus in December

1259, who himself received the crown 1 Jan. 1260. In 1261 Michael took Constantinople from the Latins. He labored to unite himself with the Latin Church, but his son, Andronicus II. (1282), renounced the connection. Internal disturbances and foreign wars, particularly with the Turks, threw the exhausted empire into confusion. Andronicus III., his grandson, obliged him to divide the throne, and at length wrested it entirely from him (1328). He waged war unsuccessfully against the Turks, and died in 1341. His son, John Palæologus, was obliged to share the throne with his guardian, John Cantacuzene, during the first years of his reign. The son of the latter, Matthew, was also made emperor. But John Cantacuzene resigned the crown, and Matthew was compelled to abdicate (1355), when John Palæologus, the son of Andronicus III., became sole emperor. Under his reign the Turks first obtained a firm footing in Europe, and conquered Gallipoli (1357). The family of Palæologus from this time were gradually deprived of their European territories, partly by revolt, partly by the Turks. The Sultan Amurath took Adrianople (1361). Bajazet conquered almost all the European provinces except Constantinople, and obliged John to pay him tribute. The latter was, some time after, driven out by his own son, Andronicus, who was succeeded by his second son, Manuel (1391). Bajazet besieged Constantinople, defeated an army of western warriors under Sigismund, king of Hungary, near Nicopolis (1396), and Manuel was obliged to place John, son of Andronicus, on the throne. Timur's invasion of the Turkish provinces saved Constantinople for this time (1402). Manuel then recovered his throne, and regained some of the lost provinces from the contending sons of Bajazet. To him succeeded his son John, Palæologus II. (1425), whom Amurath II. stripped of all his territories except Constantinople, and laid under tribute (1444). To the Emperor John succeeded his brother Constantine Palæologus. With the assistance of his general, Justinian, a Genoese, he withstood the superior forces of the enemy with fruitless courage, and fell in the defense of Constantinople, by the conquest of which (29 May 1453) Mohammed II. put an end to the Greek or Byzantine empire. In 1461 David Comnenus, emperor of Trebizond, submitted to him, and at a subsequent period was put to death. See Gibbon, 'Decline and Fall of the Roman Empire'; Pears, 'Fall of Constantinople' (1885); Bury, 'The Later Roman Empire' (1889); Oman, 'Byzantine Empire' (1892); Harrison, 'Byzantine History in the Early Middle Ages' (1900).

Byzantine Literature.—The Greek literature of the period of the Byzantine empire is almost entirely destitute of originality, and derives importance almost entirely from the mass of valuable historical material embodied in it. Among the historians proper the more notable are Procopius of Cæsarea; Agathias, who wrote an account of Justinian's reign; Nicephorus Gregoras; Anna Comæna, daughter of the Emperor Alexius I., author of a highly laudatory life of her father; Pachymerus; George Codinus; Constantine VII., Porphyrogenitus, from whom we have many works on history, law, politics, and science; John Cantacuzenus, emperor and historian; and at the very end of the

period, Michael Ducas. Poetry, in the proper sense of the word, can scarcely be said to have existed at all. Theodorus Prodrômus, who flourished in the later 12th century, is the chief of the versifiers, among his works being a long romance having Rhodanthe and Dosikles as its heroine and hero, some dramas, historical poems, epistles, etc. Georgius of Pisidia, in the early 7th century, wrote war poems; Nicetas Eugenianus, a contemporary of Prodrômus, wrote a work in imitation of the latter's romance; and among other writers of verse were Theodosius, of the latter half of the 10th century, Tzetzēs and Joannes Peditasimus, the latter two being better known as annotators of the Greek classical writers. Manuel Philes of Ephesus (about 1280–1330) has left many dramas; and we have hymns from Germanus, a patriarch of Constantinople; Theodorus Studites; Porphyrogenitus; Cosmas, an 8th-century writer; Joannes Damascenus (John of Damascus); and Theophanes Ho Graptos. Among writers of grammatical and similar works the most notable are Tzetzēs (about 1180), who annotated Homer, Hesiod, Æschylus, and especially Aristophanes; Eustathius, archbishop of Myra in Lycia in 1174, best known for his commentary on Homer; Manuel Moschopoulos, a 13th-century scholiast; Joannes Peditasimus, of the latter part of the 14th century, chiefly known for his scholia on Hesiod's poems; and Demetrius Triclinius, a scholiast contemporary with Peditasimus. Their work is less valuable in itself than as a link with the more reliable work of their predecessors, or as containing much that would, but for them, have been lost to us. Of the lexicographers Suidas, who lived during the 10th century, is much the most important; but the works of Photius in this department are also of value. Joannes Doxopater, of the later 11th century, wrote on rhetoric; and in the department of philosophy we find the names of Michael Bellus the younger (about 1018–1105), who also wrote historical and other works, and Joannes Italus. The theologians include Joannes Damascenus, already mentioned, author of *Sacra Parallela*, a collection of passages from the fathers; and Nicephorus Callistus, a 14th-century writer on ecclesiastical history.

Byzantine Art.—The style which prevailed in the Byzantine or Eastern Roman Empire, as long as it existed (395–1453) and which has prevailed since in Greece, in the Balkan Peninsula as far as allowed by the Turkish conquerors (as for instance, in convents), and in neighboring lands, such as Moldavia and the Russian lands north of it, and Armenia with other parts of Asia Minor. Byzantine architecture may be said to have assumed its distinctive features in the church of St. Sophia, built by Justinian in the 6th century, and still existing as the chief mosque in Constantinople. It is more especially the style associated with the Greek Church as distinguished from the Roman. The leading forms of the Byzantine style are the round arch, the circle, and in particular the dome. The last is the most conspicuous and characteristic object in Byzantine buildings, and the free and full employment of it was arrived at when by the use of pendentives the architects were enabled to place it on a square apartment instead of a circular or polygonal. In this style of building

incrustation, the masking or covering of brick surfaces with more precious materials, was largely in use. It depended much on color and surface ornament for its effect, and with this intent mosaics wrought on grounds of gold or of positive color are profusely introduced, while colored marbles and stones of various kinds are made much use of. The capitals are of peculiar and original design, the most characteristic being square and tapering downward, and they are very varied in their decorations. Byzantine architecture may be divided into an older and a newer (Neo-Byzantine) style. The most distinctive feature of the latter is that the dome is raised on a perpendicular circular or polygonal piece of masonry (technically the drum) containing windows for lighting the interior, while in the older style the light was admitted by openings in the dome itself. The Byzantine style had a great influence on the architecture of western Europe, especially in Italy, where Saint Mark's in Venice is a magnificent example, as also in Sicily.

Our knowledge of the earliest decorations other than mosaic is very slight. It is gathered from painted manuscripts, book bindings often of metal and ornamented with precious stones, a few enamels, and some glass ware, and a very few paintings on wood, forming parts of the iconostasis or choir screen of this or that church of the Greek form of Christianity. The mosaics are the most important decorations of the earlier art, so far as we have any knowledge of it, and these are more familiar to Europe as found in the churches of Ravenna than in any building farther East. The fact that Moslem rule requires the covering up as with whitewash of these representations when a church is taken over for a mosque, makes it probable that at some future time many fine early mosaics will be uncovered.

The characteristic of Byzantine art is rich decorative effects almost to the exclusion of accurate drawing or modeling of the human figure or faithful representation of nature in any form. Early or late, the attitudes of personages represented are formal and conventional, but the robes are splendid, the backgrounds are rich and the effect is that of a splendid colored pattern with but slight representative or expressional meaning. Sculpture has never risen to excellence; it is almost limited to decorative carvings, of book covers and sacred objects, reliefs in ivory and casting of small figures in bronze. The earlier statues of emperors and the like are chiefly remarkable for the lingering Roman traditions.

The art sometimes called Neo-Byzantine is of the 10th and following centuries, and has a surprising vigor and individuality. One of the typical churches is that of Saint Elias at Salonica. This has a plan like that of a northern Romanesque church, the three apses, east, north, and south, radiating from the sanctuary, which is covered by a cupola having a high, twelve-sided drum with vertical walls pierced with windows forming a continuous arcade, and a very low-pitched roof which covers the shallow, dome-shaped ceiling. That type of cupola is the one which has been used all through the provinces which are now included in European Russia, and in the lands on the Black Sea which still belong to Turkey, as well as in Greece

proper. Paintings often replace mosaics in these more recent churches.

Byzantium, bī-zān'shī-ūm, the name of the city of Constantinople before its name was changed by Constantine the Great. It was founded by a colony of Greeks from Megara, who, under a leader named Byzas, settled on what seemed a favorable spot at the entrance to the Thracian Bosphorus, in 658 B.C. The city which was built by the first colonists was named after their leader. Other colonists followed from different quarters, especially from Miletus, and Byzantium was already a flourishing town when it was taken and sacked by the Persians, in the reign of Darius, the son of Hystaspes. After the retreat of the Persians (479 B.C.) Byzantium soon recovered itself. During the Peloponnesian war it acknowledged for some time the supremacy of the Athenians, but afterward fell away. Alcibiades recovered it for Athens (409), but it was taken by Ly-sander in 405. At a later period the Byzantines received support from Athens in their resistance against Philip of Macedon. The barbarian Thracians, who occupied the neighboring territory, and the Celts (Galatians), in their migrations to the East, often appeared to threaten the safety of the town; but in spite of this, chiefly owing to its favorable position for commerce, it continued to prosper, and survived the decay of most of the other Greek cities; and even under the Romans it was left free to manage its own affairs, and was allowed to demand dues from all ships passing through the Bosphorus, only part of these being claimed by the Romans. At the end of the 2d century of the Christian era Byzantium, unfortunately for itself, sided with Pescennius Niger against Septimius Severus. By the latter it was besieged for three years, and when at last it was forced to surrender Severus ordered its walls to be razed to the ground, deprived the city of its privileges, and placed it under the jurisdiction of the Perinthians. For a time the prosperity of the city was annihilated, until a new and more brilliant era began for it under Constantine the Great. (See CONSTANTINE; CONSTANTINOPLE.) Its early form of government was that of an aristocracy, which passed into an oligarchy. In the year 390 B.C. it received from Thrasybulus a democratical constitution, closely resembling that of the Athenians. Byzantium was the great entrepôt for the grain trade between the countries bordering on the Black Sea and those bordering on the Ægean.

Bzovius, Abraham (Pol. *Bzowski*), Polish scholar and divine: b. Proszowice, near Miechow, 1567; d. Rome, 31 Jan. 1637. At the request of Pope Paul V., he spent several years of the latter part of his life in the Vatican, as librarian of the *Virginio dei Ursini*, and actively engaged in literary pursuits. He was a member of the order of the Dominicans, one of the most voluminous writers of his age, gained for himself a high reputation as professor of philosophy and theology at Milan and Bologna, and crowned the labors of his life by continuing the celebrated ecclesiastical annals of Cæsar Baronius, who had left them off at the year 1198, and completed only 12 volumes. Bzovius carried them to the year 1532, in 9 volumes.

C

C the third character of the English alphabet and of all the alphabets derived from the Latin. In its form it is a modification of the primitive Greek *gamma*. That primitive form was \angle , an angle with vertex pointing to the left; it is the reverse of the ancient Phœnician γ , which points to the right, and of the Old Hebrew *gimel*, γ . The Latin **C** (used also by the Greeks to some extent) is the ancient Greek \angle rounded, just as the later Greek *gamma* symbol, Γ , is the angular symbol erected. The Russian alphabet retains the Greek symbol Γ , but its place is fourth, because in that alphabet the sign for the denti-labial *V* holds the third place. The Greek *gamma* (\angle , Γ ,) seems to have always represented the same sonant guttural as the English *g* in "go." To express the corresponding mute guttural the Greeks attached the \angle to an upright line, \mid , making \mathbf{K} . In the Latin alphabet of the Romans, as represented in their earliest inscriptions, the **C** stood for the same sonant guttural as in the Greek, *g* hard; for example, *leccio*, later written *legio*; *macistratus*, later *magistratus*; yet at the same time the **C** represented also the surd guttural \mathbf{K} , as it still does in English except before the vowels *e* and *i* and the diphthongs *æ* and *æ* in words from the Latin. Thus the early Latin alphabet was without the symbol \mathbf{K} . There is in this use of the character **C** in ancient Roman epigraphy ground for the inference that the early Romans confounded the two gutturals *k* and *g* hard, as in some localities or in some classes of people the termination *ing* becomes *ink*, and "something" becomes "somethink." But at a later period the distinction between *g* hard and *k* was recognized, and then for the designation of the mute guttural the *kappa* (\mathbf{K}) of the Greek alphabet came into use in Latin writing. But the *k* was afterward rejected, and its only use in Latin was in writing the word *kalendæ* (abbreviated to *kal.* or *k.*) and as an abbreviation of *Carthago* (Carthage) and of the personal name *Cæso*. No doubt the persistence of *k* in *kalendæ* was due to the adherence of the Pontifices to the antique forms of the official calendars; and the \mathbf{K} standing for the forename *Cæso* was retained as a means of abbreviating that name and distinguishing it from the abbreviation of the name *Gaius*: **C.** Julius Cæsar is *Gaius*, but **K.** Fabius Ambustus is *Cæso*. But the *k* having been discarded from the Latin alphabet, its function was assigned to the symbol **C**, while for representation of the sonant guttural a modified form of **C** was adopted, namely, the **G** with the value of *g* in "go." The soft *g*, equal to *j*, was probably unknown to the Romans before the general debasement of the Latin language. After the symbol *k* had been discarded and been

superseded by **C**, the symbol **C**, with the power of *gamma*, was retained as an initial abbreviation of *Gaius*, name for a man, and of *Gaia* (with **C** reversed \mathcal{C}), name of a woman. **C** was also retained in the formula *Cn.* as an abbreviation of *Gnæus*. This use of the initial **C** as representing *g* hard (sonant guttural) recalls the primitive equivalence for the Romans of the two gutturals *k* and *g* hard; but the modern Latinists, unacquainted with such use of **C**, have usually pronounced *Gaius* "Kaius" and *Cnæus* "Knæus," instead of "Gæus" and "Gnæus." In the Anglo-Saxon, its alphabet having been derived from the Latin, the **C** had everywhere the value of \mathbf{K} , and the same is to be said of the *Gælic*; that fact gives presumptive proof that at the first contact of the *Gælic* and Germanic races with men of Latin speech the **C** in all situations was equivalent to *k* in Latin; and the German word *Kaiser* is proof that when the Germans first heard of *Julius* and the *Cæsars* who succeeded him the head of the Roman state was "Kaisar," not "Casar." The change in the pronunciation of **C** from *k* to *s*, as in French and English; to *ch* as in Italian, to *ts* as in German, appears to have come about long after the fall of the Roman empire.

Ca Ira, *sä ē-ra*, a popular song of the great French Revolution. The origin and date of this song are both uncertain, and there are various versions of the words claiming to be original. In all probability it dates from May or June 1790. French writers say that Benjamin Franklin, in speaking of the American Revolution, frequently used the expression "Ca ira" ("it will succeed"). The French republicans caught up the phrase, and "consecrated" it to their own revolution in a popular hymn. The air to which it was adapted was a popular *carillon*, a favorite one with Marie Antoinette. The refrain or chorus of one of the versions runs thus:—

"Ah ! ça ira, ça ira, ça ira,
En dépit d' l'aristocrat' et d' la pluie,
Ah ! ça ira, etc.
Nous nous mouillerons, mais ça finira,"

referring to the rain which fell during the taking of the Bastille.

Caaba, *kā'ba*, or *kā'a-ba*, or **Kaaba**, properly a quadrangular structure, applied particularly to a celebrated temple at Mecca. According to Mussulman tradition, the first Caaba was built by the angels on the model of the pavilion which surrounds the throne of the Most High; the second was built by Adam, with whom it was removed to the skies, where it still exists in a right line above the Caaba of Mecca; the third was built by Seth, but perished in the deluge; the fourth, which now exists, was built

by Abraham and Ishmael. The name is especially given to a small cubical oratory in the temple in the centre of a large space surrounded by galleries. This is the point toward which the prayers of all Mussulmans are directed. On one of its sides is inwrought the famous oval black stone, believed to be one of the precious stones of paradise, and to have been brought by the angel Gabriel to Abraham, when he was constructing the Caaba. At first, according to one version, of a dazzling whiteness, the Moslems say that it grieved and wept so long for the sins of the human race that it became gradually opaque, and at length absolutely black; or, in another version, that it has been blackened by the tears of pilgrims, shed for sin. It is an object of profound veneration to the pilgrims who resort to the sacred city. This inner Caaba is surrounded with a veil of black silk, and is opened but two or three times a year, and none but the faithful are permitted to approach it. The temple of the Caaba is older than the time of Mohammed, previous to whom it was the Arab pantheon, containing the nation's idols.

Caaing-whale; *kä-ing hwäl*, one of several species of porpoise-like cetaceans of the Killer family (*Orcida*), characterized by its globose head; properly *Globiocephalus melas*, of the North Atlantic Ocean. It is from 16 to 24 feet long, 10 feet in diameter at its thickest part, and weighs between 5,000 and 6,000 pounds. Its pectoral fins are about 5 feet long and 18 inches broad, and its dorsal fin is very low. With the exception of a white streak, which begins in the form of a heart under the throat and gradually narrows to the vent, the whole of the body is of a glossy black color, and hence the fish is frequently known as the blackfish (q.v.) or black dolphin. The teeth are arranged at considerable distances in the upper and under jaw in such a manner that those of the upper jaw fit into the spaces left in the lower jaw, and conversely. Their number is very variable. They are conical in shape, strong, rather long, and end in a point which is a little curved backward and inward. The caaing-whale is very abundant and very widely distributed. It is found in the whole of the Arctic Ocean, and also in the German, Atlantic, and Pacific oceans, and even in the Mediterranean Sea. It is remarkable for its gregarious habits, being often found in schools numbering several hundreds, which are led by an old and experienced male whom, it is said, they never abandon. On this account its pursuers always endeavor to force the leader on shore, and when this is accomplished all the rest follow him and are likewise stranded—hence the Scotch name "caaing," equivalent to "driving." In the stomachs of these animals are usually found the remains of cod-fishes and various species of cuttle-fish, as well as of herrings, ling, and other fishes. The caaing whale is pursued chiefly on account of its oil. See WHALE.

Caama, *kä'mä*. See HARTBEEST.

Cab, a carriage with two or four wheels, usually drawn by one horse, and plying for hire; a hackney-carriage. One well-known two-wheeled variety is the hansom, named after the inventor. Public cabriolets—hooded chaises carrying one person besides the driver—were introduced in London in 1823, and the name was soon after shortened to cab. See COACH; HACKNEY-CARRIAGE.

Cabal', an English ministry under Charles II. (1667-73), composed of Clifford, Ashley, Buckingham, Arlington, and Lauderdale, the initials of whose names form this word, whence perhaps its use as a designation. But the use of this word to signify a body of intriguers was not originally derived from this circumstance, as sometimes supposed, for the word cabale, derived from cabala (q.v.), was used in that sense in French before this time.

Cab'ala, or **Cabbala** (reception), is used by the Jews to denote sometimes the traditions of their ancestors regarding the interpretation of the Scriptures; sometimes, and most commonly, their mystical philosophy. The opinions of scholars respecting the origin of the Cabalistic philosophy are very various. The Jews derive the Cabala from the most ancient times of their nation, nay, even from Adam himself. But Cabalistic doctrines in reality seem to have had their origin about 200 years before Christ, and were derived from the mingling of Oriental ideas with those belonging to the Mosaic religion that was the result of the captivity. It was long before the Cabala reached its full development, however, the chief landmarks in its history being the writings of Philo Judæus and the appearance of the books called the *Sefer Jezirah*, 'Book of Creation,' and the *Sefer Zohar*, 'Book of Light.' The age of both is doubtful. The earliest probable date for the *Sefer Jezirah* is the beginning of our era. The earliest mention of the *Sefer Zohar* is in 1290, and the author is not supposed to have lived much before 1000. The Cabala is divided into the symbolical and the real. The symbolical portion treats principally of letters, to which it gives mystical significations. The real, which is opposed to the symbolical, and comprehends doctrines, is divided into the theoretical and the practical. The aim of the theoretical is to explain the Scriptures according to the secret traditions, and to form therefrom a philosophical system of metaphysics, physics, and pneumatology. The practical portion, on the other hand, pretends to teach the art of performing miracles, and that merely by an artificial application of the divine names and sentences in the Scriptures. After the revival of science many scholars studied the Cabala. The most famous modern Cabalists are Henry More and Christian Knorr, the latter of whom published a compilation of the Cabalistic writings in Latin (1677). See JUDAISM — THE CABALA.

Caballero, **Fernan**, *fēr-nān' kā-bā-lyā'rō*, pseudonym of CECILIA BÖHL VON FABER, Spanish novelist, daughter of a German settled in Spain and married to a Spanish lady: b. Morges, near Lausanne, Switzerland, 25 Dec. 1796; d. Seville, 7 April 1877. Brought up in Germany, she went to Cadiz with her father in 1813. Her first novel, 'La Gaviota,' appeared in 1849, and was followed by 'Elia,' 'Clemencia,' 'La Familia de Alvareda,' etc., as well as by many shorter stories. In 1859 she published a collection of folk-tales under the title, 'Cuentas y Poesias Populares Andaluces.' Some of her works have appeared in English translations, including 'La Gaviota' (translated as 'The Sea-Gull,' 1867); 'Elia: or Spain Fifty Years Ago' (1868); 'Air-Built Castles'; and 'The Bird of Truth' (1881). The chief charm of her writings lies in her descriptions of life and nature in Andalusia. She was three times left a widow; her last hus-

PILGRIMS AROUND THE KAABA.

band was a lawyer named De Arron. She forms the subject of one of the 'Six Life Studies' (1880) of M. B. Edwards.

Cabanel, Alexandre, ä-lëks-ändr kä-ba-nël, French artist: b. Montpellier, 28 Sept. 1823; d. Paris, 23 Jan. 1889. He studied with Picot, and after 1860 gave himself mainly to portrait painting. He was for many years a professor of the Académie des Beaux Arts and was especially popular with American patrons. Among his many portraits of Americans is that of Miss Catherine Wolfe, now in the Metropolitan Museum, New York, which contains also his 'Queen Vashti and King Ahasuerus,' and 'Birth of Venus.' See Stranahan, 'A History of French Painting' (1899).

Cabanis, Jean Louis, zhõn loo-e kä-ba-nës, German ornithologist: b. Berlin, 1816. He made an ornithological tour through North and South Carolina, 1839-41, and in 1849 became custodian of the ornithological department of the Berlin Zoological Museum. His investigations were largely instrumental in establishing a natural classification, and were published in Wiegmann's 'Archiv für Naturgeschichte' (1847), and in the 'Museum Heineum' (1850-63). Cabanis founded the 'Journal für Ornithologie' in 1853.

Cabanis, Pierre Jean Georges, pë-är zhõn zhõrzh, French physician and philosopher: b. Cosnac, department of Charente-Inférieure, 5 June 1757; d. Rueil, near Paris, 5 May 1808. In his 16th year he went to Warsaw as secretary of a Polish lord, where the proceedings of the stormy Diet of 1773 filled him with melancholy and contempt of mankind. He began at Paris a complete translation of the 'Iliad'; became acquainted with Madame Helvetius, and through her with Holbach, Franklin, and Jefferson, and became the friend of Condillac, Turgot, and Thomas. In his 'Serment d'un Médecin' he formally took leave of the belles-lettres. He professed the principles of the Revolution, and was intimately connected with Mirabeau, who made use of his ideas, and obtained from him the work on public education which Cabanis published himself in 1791, after the death of Mirabeau. He lived in still closer intimacy with Condorcet. At the time of his death he was a member of the Senate. His 'Rapports du Physique et du Moral de l'Homme' (1882), improved, is his most important work. It displays considerable power of analysis, and advocates the most extreme materialistic doctrines.

Cabat, Nicolas Louis, nik-õ-lä loo-e kä-ba, French artist: b. Paris, 1812; d. 1893. He studied with Flers and became prominent among painters of the landscape realistic school. Among his works are 'Pond at Ville d'Avray' (1834); 'A Spring in the Wood' (1864); and 'A Morning in the Park of Magnet' (1877).

Cabbage, a biennial plant, too well known to need description, and constituting one of the most valuable classes of vegetables. The *Brassica oleracea*, the original species from which the numerous varieties of cultivated cabbages are derived, although in a wild state very remote in appearance from the full, round head which our plants present, is scarcely more so than the kale, cauliflower, broccoli, etc., all of which belong to the same family. The principal

varieties are known to have existed at least as far back as the 16th century, but minor varieties are being constantly produced by selection and intercrossing. The parent stock is of highly vegetable character, as its habitat and habit alike show; and placed in more favorable conditions its growth becomes luxuriant. More normally it is carried back into the stem, and this may accordingly become swollen and turnip-like, in which case we have the kohlrabi, of which an extreme subterranean and almost turnip-like variety has also arisen, or may be, as in the Jersey cabbage, largely applied to the purpose of the growth of the stem, which may reach a height of 8 to 10 feet, and furnish not only walking-sticks, but even spars for small thatched roofs, etc. The vegetative surplus may, however, also be applied to the formation of buds, which accordingly develop with peculiar exuberance, giving us Brussels sprouts. The most evolved and final variety is the cauliflower, in which the vegetative surplus becomes poured into the flowering head, of which the flowering is more or less checked; the inflorescence becoming a dense corymb instead of an open panicle, and the majority of the flowers aborting, so as to become incapable of producing seed. Let a specially vegetative cabbage repeat the excessive development of its leaf parenchyma, and we have the wrinkled and blistered savoy. Again a specially vegetative cauliflower gives us an easily grown and hardy winter variety, broccoli, from which, and not from the ordinary cauliflower, a sprouting variety arises in turn.

The common cabbage is by far the most valuable to both man and beast. It is also the most productive; for it is believed that an acre of ground will yield a greater weight of green vegetable matter (and thus be more profitable to the farmer) in the shape of cabbage than in that of any other vegetable whatever. It is very abundantly produced by clay soils which are unfit for turnips, and the farmers who cultivate such soils will find it a vegetable worthy of much attention. The cabbage furnishes green fodder for cows and sheep, which is at least as good as turnips or carrots, fattening the animals equally fast, and rendering their milk, butter, etc., to the full as sweet; and is so far preferable, as it keeps later in the spring, and thus supplies green food when no other can be procured. It is eaten by men in three forms, all of which have their admirers, but which vary much in respect to their wholesomeness and digestibility. These forms are sliced raw, plain-boiled, and salted cabbage or sauerkraut (q.v.), the favorite dish of the German nation. Raw cabbage, sliced fine and eaten with vinegar, either cold, or hot enough merely to wilt the vegetable, is one of the lightest and most wholesome articles of vegetable food, and in this shape will supply a green summer vegetable through the whole of the winter. Its use cannot be too highly recommended. Boiled cabbage takes longer to digest and is more trying to a weak stomach.

Cultivation.—The cabbage being biennial, the main crop must be sown the autumn previous to that in which it is to be reaped. Field cabbages and the drum-head varieties that are used in gardens, being late in character, may be sown in July, or from the third week of that month to the second week of August. But

CABBAGE-BARK — CABEIRI

the smaller and early sorts used in gardens should not be sown before the first week of August, nor later than the second week of that month. If the plants are reared earlier, they are apt to run to seed the following spring; and if, on the other hand, they are reared later, they will not acquire strength enough to withstand the cold of winter before it comes upon them. For successive crops to be used in the shape of young summer cabbages, one or two sowings may be made from the beginning of March to the beginning of April. Autumn-sown plants may be planted out in rows permanently as soon as they are strong enough. Additional plantations from the same sowing may be made in spring, to be followed by others, made at intervals, up till July, from spring-sown plants. Thus a close succession of usable cabbage may be obtained the year round. In the northern parts of the United States cabbages for the early summer market are sown about September, kept under glass or frames during winter, and planted out in spring. For later markets the seed is sown in beds as early as possible in spring (about March), and transplanted later. Cabbages are sometimes preserved for winter by inverting them and burying them in the ground. Cabbage coleworts may be obtained from any good early variety of cabbage. They are simply cabbages which are not permitted to form hearts, but are used while the leaves are yet green and the hearts more or less open. Three sowings should be made for the rearing of these: the first about the middle of June, the second about the same time in July, and the third about the last week of the latter month, or the first week of August. These sowings will provide crops of green cabbages from October till March or April, if the winter is not destructive, after which they begin to run to seed.

Cabbage-bark. See ANDIRA.

Cabbage-bug. See CABBAGE-INSECTS.

Cabbage-butterfly, a name given to several species of butterfly, hence called *Brassicaria*, which deposit their eggs on cabbage-leaves; for example, *Pieris brassica*.

Cabbage-fly, a species of insect (*Anthomyia brassica*) of the same order (*Diptera*) as the house-fly, the larvæ of which prey upon the roots of cabbages. The *Anthomyia* deposit their eggs in the earth, and the different species receive different names according to the particular roots upon which the larvæ feed. Thus we have the potato-fly, the turnip-fly, etc.

Cabbage-insects, certain insects injurious to the cabbage, some of which also prey on the radish. The harlequin cabbage-bug (*Murgantia histrionica*) destroys in the southern States, by its punctures, cabbages, turnips, radishes, mustard, etc. It is a black-and-orange-colored bug. The newly hatched insect is pale green marked with black, but with successive molts takes on certain orange markings. The eggs hatch on the third or fourth day after laying, and the young bugs go through all their molts and are ready for reproduction in about two weeks. There are many generations in the course of the summer; and on the advent of winter the adult insects crawl under rubbish to hibernate. The earliest specimens in the spring

congregate upon mustard and early radishes, flying later to cabbages. The very young, as well as the old, combine to destroy the plant, which wilts as if poisoned. The insect is very difficult to kill, so that destruction of the over-wintering individual is the important point to be striven for. Diluted kerosene emulsion must be applied, not too strong to ruin cabbages. The caterpillar of the cabbage-moth (*Pieris brassica*) preys on cabbage and turnip leaves. Cabbages are more or less injured by the web-moth (*Plutella xylostella*), the zebra caterpillar (*Mamestra picta*), the cabbage aphid, the cabbage-weevil (*Otiorhynchus picipes*), etc. All these can best be destroyed by the use of pyrethrum, or dilute kerosene emulsion.

Cabbage-moth. See CABBAGE-INSECTS.

Cabbage-palm, a name given to various species of palm-tree, from the circumstance that the terminal bud, which is of great size, is edible and resembles cabbage, as the *Areca oleracea*, a native of the West Indies, the simple unbranched stem of which grows to a height of 150 or even 200 feet. It is crowned by a head of large pinnated leaves. The flowers are placed on a branching spadix and protected by a double spathe. The unopened bud of young leaves is much prized as a vegetable, but the removal of it completely destroys the tree, as it is unable to produce lateral buds. *Ptychosperma* (*Scaforthia*) *elegans* is the cabbage-palm of New South Wales. The name is also given to the *Euterpe montana* and the *Chamarcops palmetto*.

Cabbage-rose, a species of rose (*Rosa centifolia*) of many varieties, supposed to have been cultivated from ancient times, and eminently fitted, from its fragrance, for the manufacture of rose-water and attar. It has a large, rounded, and compact flower. It is called also Provence (or more correctly Provins) rose, from a town in the French department of Seine-et-Marne, where it is much cultivated.

Cabbage-tree, a name given to the cabbage-palm, and also to a tree of the genus *Andira* (q.v.).

Cab'ala. See CABALA.

Cabeiri, kã-b'ĩrĩ, or **Cabiri,** heroes or divinities, venerated by the ancients in Samothrace, Lemnos, and in different parts of the coasts of Greece, Phœnicia, and Asia Minor, as the authors of religion and the founders of the human race. The multiplicity of names applied to the same character, the interchange of the names of the divinities themselves with those of their priests, the oracular law which enjoined the preservation of ancient barbaric names, and thus led to a double nomenclature, sacred and profane, together with the profound secrecy of the rites, have involved the subject in great obscurity. Some have thought that the Eastern mythology and the Druidism of western Europe contain traces of the Cabeiri. Some say there were six, three male and three female, children of Vulcan and Cabira, daughter of Proteus. Others make two, sons of Jupiter or Bacchus. In Samothrace four were venerated. The mysteries celebrated there, in the obscurity of night, were the most famous.

Ca'bell, James Lawrence, American sanitarian: b. Nelson County, Va., 26 Aug. 1813; d. Overton, Va., 13 Aug. 1889. He was graduated at the University of Virginia in 1833, where he later filled the chair of anatomy. During the Civil War he had charge of military hospitals for the Confederate government. He devised measures to check the yellow fever epidemic at Memphis and was president of the National Board of Health from 1879 till his death.

Cabell, William, American statesman: b. Licking Hole, Va., 13 March 1730; d. Union Hill, Va., 23 March 1798. He was a member of the House of Burgesses of Virginia upon the outbreak of the Revolution; took an active part in the affairs of the new nation, and before the adoption of the Federal Constitution was presiding magistrate for the United States in Virginia.

Cabell, William Lewis, American soldier and lawyer: b. Danville, Va., 1 Jan. 1827. He graduated at West Point 1850, and served in the 7th Infantry 1858. In 1858 he was attached to Gen. Harney's staff in the Utah expedition. Between 1859-69 he was chiefly engaged in constructing forts in the country occupied by the Comanches, Kiowas, and other savage tribes. Resigning in 1861 he entered the Confederate service and rose to the rank of brigadier-general. While on a raid into Kansas in 1864 he was captured and held prisoner of war until 28 April 1865. Since 1872 he has practised law at Dallas, Texas, being four times mayor of the city. He was a United States marshal, 1885-9.

Cabello. See PORTO CABELLO.

Ca'ber, the undressed stem of a tree, 20 or more feet long, used for trial of strength in Scottish athletic games. It is held upright against the chest, by the smaller end, and tossed so as to strike the ground with the heavier end and turn over. The contestant making the farthest toss with the straightest fall is winner.

Cabes, kã'bēs, or **Gabes**, Africa, a town and port of the French protectorate of Tunis. It stands at the foot of the Jebel Hamarra, on the right bank of the Wad-er-rif, near the head of the Gulf of Cabes, and may be said to consist of several villages. It has some export trade in dates, henna, etc. The Gulf of Cabes (Syrtis Minor) has at its entrance the islands of Kerkenna and Jerba. Its chief seaport is Sfax. Pop. of Cabes, 13,000.

Cabet, Etienne, ã-tē-ën kã-bã, French communist: b. Dijon, 2 Jan. 1788; d. St. Louis, Mo., 9 Nov. 1856. He was brought up for the bar, and was appointed attorney-general of Corsica, from which office, however, he was soon dismissed. He was sent to the chamber of deputies in July 1831, and there made himself so obnoxious to the government by his violent speeches, and at the same time by his inflammatory pamphlets and a journal entitled 'La Populaire,' that he was indicted for treason, and rather than subject himself to the imprisonment to which he was sentenced, withdrew for five years to England. While there he published the 'Voyages en Icarie,' in which he elaborated his scheme of communism, which from 1842 to 1848 passed through five editions. On 2 Feb. 1848, a band of Icarians left France

for the Red River in Texas, where Cabet had secured a tract of 400,000 acres of land, the free use of which was open to the settlers, under condition that before their departure they should deposit all their funds in the hands of Cabet, who assumed the financial and general control of the expedition. But the expedition turned out badly, and lawsuits were instituted against Cabet; and on 30 Sept. 1849, after he had left France for Texas, he was found guilty by default of swindling his disciples, and sentenced to two years' imprisonment. Meanwhile, with his colony of Icarians much reduced in number, he took up his abode at Nauvoo, on the Mississippi, in May 1850, and soon after returned to Paris. There, after a protracted trial, his innocence was fully established, 26 July 1851, by the court of appeal, and the judgment against him cancelled. He returned to Nauvoo, where he continued to preside over his colony; but many disappointments and cares embittered his life and accelerated his death. In justice to Cabet it should be said that the highest moral tone prevailed in Nauvoo, and whatever may be the politico-economical objections to his system, the colony presented, as far as the conduct of the settlers was concerned, a model of purity and industry.

Cabeza de Vaca, Alvar Nuñez, ãl'bãr noon'yéth kã-bã'tha dã bã'ka, Spanish explorer: b. 1507 (?); d. about 1564. He was second in command in the ill-fated expedition of Pánfilo de Narvaez to Florida in 1528. After the loss of their commander, Cabeza de Vaca, with a few survivors, landed west of the mouth of the Mississippi, and after eight years of wandering and captivity among the Indians, reached a Spanish colony on the Pacific. He returned to Spain, and in 1540 was appointed Governor of La Plata. He explored Paraguay, but became unpopular with the colonists, and after a defeat by the Indians was arrested on the charge of one of his subordinates, returned to Spain (1544), found guilty, and banished to Africa. Eight years later he was pardoned and made judge of the Supreme Court at Seville. He has left an account of his travels and explorations in 'Shipwrecks of Alvar Nuñez' and 'Commentaries.'

Cabezón, a name applied to three or four distinct fishes.

1. *Larimus breviceps*, occurring in seas from the West Indies to Brazil, and belonging to the family of croakers, or *Sciænida*. It reaches a length of 10 inches.

2. *Scorpanichthys marmoratus*, a member of the *Cottida*, or sculpins. It is found from Puget Sound to San Diego, reaches a length of 30 inches, and is a common food-fish, but its flesh is coarse and tough.

3. The smooth cabezón (*Leptocottus armatus*), also a sculpin of the Pacific coast.

4. *Porichthys notatus*, a member of the *Batrachoidida*, found from Puget Sound to Lower California, which reaches a length of 15 inches and is sometimes called "singing-fish."

Cabillonum. See CHALON-SUR-SAÔNE.

Cabinda, kã-bën'dã, or **Kabinda**, Africa, Portuguese seaport and territory, north of the mouth of the Congo. The territory is bounded by the Atlantic on the west, the Congo Free State on the south, and French Congo on the

CABINET

north. The inhabitants are governed by numerous petty chiefs. The town, situated about 40 miles north of the Congo estuary, carries on a considerable trade and has shown marked growth since the introduction of a high tariff in the Congo State. Its people are noted for their ship-building and other handicrafts. Pop. 10,000.

Cabinet, a collective name popularly given to the leading officers of state in a number of constitutional governments, acting as a body of advisers to the head of the state, and in some as the chief executive council and controller of legislation as well. The uniform name, however, implies a uniformity of nature which does not exist. The status and functions of different cabinets are widely divergent. The earliest one, that of England, is of a type exactly opposite to the next oldest, that of the United States; and all others are based on one of these two forms. Those of other constitutional monarchies in Europe, that of Japan, and that of the republic of France, are of the English type; those of Switzerland and the Latin-American republics are of ours. The English cabinet is to all intents and purposes a committee of the legislative body, in which its members have seats, before which they expound and defend the legislative measures they prepare, and to which they are directly responsible. They confine business mainly to measures of their own drafting, dictate its order, and carry on all the executive work of the State besides; they are, in fact, "the government," in current phrase. They act as a body, each minister supporting the proposals agreed on by the majority, or else retiring, and all resigning in a body if their proposals are voted down. They have even gained the immense power of being able to dissolve their own head body, the Parliament, and ordering a new election to test the sense of the people; a result due to their being the agents of the new sovereign, the Parliament, as they were of the older one, the monarch. When the power of proroguing Parliament was taken from the monarch, it was naturally given, not to Parliament itself, but to its deputies. This system was called by Walter Bagehot "Cabinet Government" specifically, as opposed to presidential government of fixed tenure; and his classification has been universally accepted. The American group is not, properly speaking, a cabinet at all, in the sense of a unified body. It does not act as a unit, and has no responsibility as a unit. Cabinet here is merely a popular name for the group of heads of the chief departments, whom the President consults by individuals or collectively at will, or not at all. Their functions are advisory only, and the President is under no obligation to take their advice; they are responsible only to him, and can be dismissed by him at any time. They have nothing to do with legislation, and by law are prohibited from being members of the legislative body. Obviously, their position resembles much more that of the advisers of an autocrat than of an all-powerful entity like the English government; but the former are never styled a Cabinet. The resemblances of the types are mainly confined to two: the ministers who form the Cabinet are selected by the actual head of the state, whose assistants they are to be, whether he is prime minister or president; and

they are all of one political party. Even here, however, the difference between the systems is strongly marked. The premier in a "Cabinet government" has very little liberty of selection. His ministers must be able debaters first and able men of affairs next, and successful politicians besides. If they cannot defend their policy effectively on the floor in Parliament, the government may be turned out; and practical incapacity may render all defense of no avail. But men of such varied powers and success are never very plentiful, and the premier can do little more than allot offices among a small group whom he finds to his hand. On the contrary, the United States Cabinet official need not speak in public, and even if he is a practical failure the President can dismiss him or allow him to resign without affecting his own tenure of office. The President, therefore, may fill such a post with a totally unknown man, in reliance on his unproved ability, without serious risk, and some such appointments have been eminently successful. As to party, the premier's action is equally compulsory, since his majority would vote down a party opponent's measure at once; while the President, having no legislation to carry through, and secure his place, can exercise a somewhat wider independence, though personal feeling and party urgency usually keep the selections within the limits.

The British cabinet, a shortened name for "cabinet council"—that is, a council held in the king's cabinet, or private room—gained its name under Charles I., about 1630-40, when it was merely a committee of the privy council to expedite business; and all through that and the next century it was steadily drawing power to itself. But the kings did not give up their control over the power of appointing the great officers of state without a long and bitter struggle; and it was not till George III.'s insanity loosened his hand that it can be said to have won the final victory. Even then, and during the early 19th century, its unity had by no means become so rigid as now; during the latter there were many instances of members of the cabinet opposing the measures of the majority, and even of the premier, and still retaining their places in it. But by the 'thirties it had pretty much settled into its present constitution and rules. An important change was made in 1782, just after the American Revolution, when its honorary members were dropped, and the membership confined to "efficient" members,—officers of state so important that they cannot be excluded from it, or personalities so powerful that vanished offices are kept constructively alive to make place for them. There is no absolute limit to the number of members, but custom dictates not less than 11, and the necessity of coming to some agreement and transacting business prohibits its being much in excess of 15. The premier assigns the offices, and almost invariably takes for himself the control of finances or foreign relations—that is, first lord of the treasury or secretary of state for foreign affairs. There are also the four other chief secretaries of state—for war, for home affairs, for the colonies, and for India; the chancellor of the exchequer, the first lord of the admiralty, the lord privy seal, the lord president of the privy council, and the lord chancellor; the chief secretary for Ireland, the

CABINET ORGAN — CABLE

postmaster-general, the president of the board of trade, and the chancellor of the Duchy of Lancaster (one of the defunct posts used to give an able man a place in the cabinet). Other officers can be called in if desired. The prime minister presides, but has no added authority; if he is a strong man, however, no member would remain in the cabinet if steadily opposed to his general policy. All the cabinet's deliberations are secret; no minutes are taken, and it would be a gross breach of faith to reveal the struggles of opinion within it which result in an agreement on a line of policy.

The American Cabinet, or "President's Cabinet," has, of course, grown with the growth of the departments. There were but four Cabinet officers at the outset, the secretaries of state, of war, and of the treasury, with the attorney-general. Of these, following the English tradition, in which from necessity, foreign affairs had held the highest place, the secretaryship of state was regarded as the most important and honorable, and its incumbent was considered to be in the line of succession for the presidency, as for several administrations proved to be the case. John Quincy Adams was the last of these, and he appointed his chief rival, Henry Clay, secretary of state with the presidential succession in view. The same notion has lingered to our own day, and caused the secretary of state to be termed the "premier" of an administration; in itself an absurd and meaningless term, but with color given to it by the preference for this post among some of the ablest party leaders ambitious of the presidency. The next officer added was the secretary of the navy, whose office was created in 1798. In 1829 the postmaster-general was raised to the Cabinet, though the office had existed 35 years, in 1849 the secretaryship of the interior was created and made of Cabinet rank; in 1889 was added the secretary of agriculture, and in 1903 the secretary of commerce and labor. In accordance with Congressional action in 1886 the Cabinet officers rank in order of succession to the presidency, as follows: Secretary of state, secretary of war, secretary of the treasury, attorney-general, postmaster-general, secretary of the navy, secretary of the interior, secretary of agriculture, and secretary of commerce and labor. It will be noted that after the original four the others are named in order of the creation of their departments, not of their elevation to Cabinet rank. The term "cabinet" is sometimes used of the heads of our State departments advisory to the governor; but this is even less defensible than our national term, as the officers are elected by the people on the same ticket with the governor, and he has no power of appointment or dismissal. The municipal officers accessory to a mayor are sometimes so called; which has justification in the fact that some of them are appointed by him. See U. S.—CABINET OFFICERS, etc.

Cabinet Organ, a small portable reed organ or harmonium, designed for domestic use or for very small churches or schools.

Cabi'ri. See CABIERI.

Cable, George Washington, American novelist and miscellaneous writer: b. New Orleans, La., 12 Oct. 1844. His father died when

he was 14 years of age, and he had to leave school and seek employment as a clerk in order to support his mother and sisters. In 1863 he joined the Confederate army as soldier in a cavalry regiment, and served till the conclusion of the Civil War, when he returned to New Orleans and again took to commercial life. But in 1879, being by this time a practised writer, and having had considerable success with his literary ventures, he decided to devote himself entirely to authorship. In 1884 he took up his residence in Massachusetts, where he has originated a system of "home culture clubs." His first important book, 'Old Creole Days' (1879), appeared originally in 'Scribner's Magazine'; and since its publication he has written 'The Grandissimes' (1880); 'Madame Delphine' (1881); 'The Creoles of Louisiana' 1884), a history; 'Dr. Sevier' (1884); 'The Silent South' (1885), a plea for the negro; 'Bonaventure' (1888); 'The Negro Question' (1888); 'Strange True Stories of Louisiana' (1889); 'John March' (1894); 'Strong Hearts'; 'The Cavalier' (1901); 'Bylow Hill' (1902). For most readers the chief interest of Mr. Cable's novels lies in their excellent descriptions of Creole life, a subject which he may be said to have introduced into literature. His pictures of negro life are equally effective, and he handles dialect in a masterly manner.

Cable, Ransom R., American railroad manager: b. Athens, Ohio, 1834. He had almost no educational advantages, and early in life removed to Rock Island, Ill., where he was at first in the coal, flour, and lumber business, but later came to be wholly identified with Illinois railroads, and particularly the Chicago, R. I. & P. Ry. He was elected a director in 1877, and was successively vice-president, general manager, and in 1898, chairman of the board of directors.

Cable, a large rope or iron chain. The term cable is most frequently used in its nautical sense to describe the means by which a ship is connected with her anchor. The large ropes used for towing, or for making a vessel fast to a buoy or pier, are commonly known as hawsers. The term cable is also applied to the large suspensory ropes (usually of twisted or parallel wire) from which suspension bridges are hung, and to the endless ropes used to operate the kind of street cars commonly called cable cars or grip cars. Rope cables are made of hemp, manila, or other fibre, or of wire, twisted into a line of great compactness and strength. The circumference of hemp rope varies from about 3 to 26 inches. A certain number of yarns are laid up left-handed to form a strand; three strands laid up right-handed make a hawser; and three hawsers laid up left-handed make a cable. The strength of a hemp cable of 18 inches circumference is about 60 tons, and for other dimensions the strength is taken to vary according to the cube of the diameter. Wire rope has within recent years largely taken the place of hemp for tow-lines and hawsers on board ship. These usually consist of six strands, laid or spun around a hempen core, each strand consisting of six wires laid the contrary way around a smaller hempen core. The wires are galvanized or coated with a preservative composition. Wire ropes are usually housed on board ship

CABLES

by winding them round a special reel or drum. Hemp cables, moreover, have for long been almost wholly superseded by chain cables; the introduction of steam on board ship having brought in its train the powerful steam windlass wherewith to manipulate the heaviest chains and anchors required.

Chain cables are made in links, the length of each being generally about 6 diameters of the iron of which it is made, and the breadth about $3\frac{1}{2}$ diameters. There are two distinct kinds of chain cables—the stud-like chain, which has a tie or stud welded from side to side, and the short-link or unstudded chain. The cables for use in the mercantile service are made in 15-fathom lengths, but in government contracts chain cables are required to be made in $12\frac{1}{2}$ -fathom lengths, with one swivel in the middle of every alternate length, and one joining-shackle in each length. Besides the ordinary links and joining-shackles, there are end-links, splicing-tails, mooring-swivels, and bending-swivels. The sizes of chain cables are denoted by the thickness of rod iron selected for the links. The following table gives certain ascertained quantities concerning the cables in ordinary use:

Thickness of Iron	Weight of Stay-pin	Weight per Fathom	Breaking Strain
$\frac{1}{2}$ in.	$\frac{1}{2}$ oz.	$13\frac{1}{2}$ lbs.	6 tons
1 "	$3\frac{1}{2}$ "	54 "	24 "
$1\frac{1}{2}$ "	12 "	121 "	60 "
2 "	28 "	215 "	99 "
$2\frac{1}{4}$ "	40 "	272 "	126 "

Compared with the strength of hempen cable, a chain cable of one inch diameter of rod is equivalent to a hemp cable $10\frac{1}{2}$ inches in circumference; $1\frac{1}{4}$ inches, to $13\frac{1}{2}$ inches; $1\frac{1}{2}$ inches, to 16 inches; $1\frac{3}{4}$ inches, to 18 inches; and 2 inches, to 24 inches. In navigation a cable's length is a nautical measure of distance equaling 120 fathoms, or 720 feet, by which the distances of ships in a fleet are frequently estimated. This term is often misunderstood. In all marine charts a cable is deemed 607.56 feet, or one tenth of a sea mile. In rope-making the cable varies from 100 to 115 fathoms; cablet, 120 fathoms; hawser-laid, 130 fathoms, as determined by the British admiralty in 1830. According to Ure a cable's length is 100 to 140 fathoms in the merchant service. The wire rope used for submarine telegraphy is also called a cable. See CABLES, SUBMARINE.

Cables, Submarine, specially constructed ropes of wire, hemp, and gutta-percha, or other water-proofing and protecting materials, laid on ocean or river beds for the purpose of providing means of electrical communication across large bodies of water.

Until the discovery of gutta-percha such communication was impossible, as water is so good a conductor of electricity that the submersion of current-carrying wires was dependent upon complete insulation. In this gum, however, such a perfect insulator was found that submarine communication all over the world became merely a question of time, experience, and necessity. In 1843 Prof. S. F. B. Morse suggested electrical communication between the United States and Great Britain, but it was not until more than 20 years had passed

that practical telegraphy across the Atlantic Ocean was established.

Early Cables.—The first under-water cables were short ones laid across rivers; later the English Channel was electrically "bridged" in this manner. In 1852 Dover and Ostend were connected by a cable 75 miles long and containing six wires. In 1854 Sweden and Denmark, Italy and Corsica, and Corsica and Sardinia were linked. In the same year the New York, Newfoundland, and London Telegraph Company was incorporated, mainly through the efforts of Cyrus W. Field and Peter Cooper, of New York, for the purpose of laying a cable between Newfoundland and Ireland, a distance of about 2,000 miles. It received a charter from the Newfoundland legislature, with an exclusive right for 50 years to establish a telegraph between the American continent and Europe via Newfoundland. In 1856 Cape Ray and Cape Breton were united, as well as Prince Edward's Island and New Brunswick. The same year Mr. Field organized the Atlantic Telegraph Company. It was supported by both the United States and British governments, but the results of its efforts were discouraging for several years. In August 1857 an attempt was made to lay a cable by the American frigate Niagara and the British ship-of-war Agamemnon, but about 300 miles from the Irish coast the cable parted, owing to a strain caused by a sudden dip of the seabottom. In 1858 the same two ships, each with half the cable on board, steamed to a point in the Atlantic midway between Valentia, Ireland, and Heart's Content, Trinity Bay, Newfoundland, spliced the cable, and, steering in opposite directions, safely landed the ends at their destinations on 5 August. The cable was 2,500 miles in length, weighed about one ton per mile, and cost \$1,256,250. It was composed of seven copper wires encased in gutta-percha, which in turn was surrounded by a covering of hemp saturated with oil, pitch, and beeswax; the whole being protected by an outer sheath composed of 18 strands of seven iron wires each. Despite the success in laying, however, the cable was practically useless. The current was so weak that a message of 90 words from Queen Victoria to President Buchanan took 67 minutes to transmit, and after a few more messages the cable ceased to transmit signals. Two more cables were laid in this year to connect Great Britain with the Continent,—one to Holland and the other to Hanover; and 1859 saw, among other cable connections, the joining of England with Denmark and France, and of Malta with Sicily. In 1860 a cable was laid between France and Algiers, and in 1861 Malta was connected with Alexandria, and Batavia with Singapore. Failures were met with in attempts to lay cables through the Red Sea and from Falmouth to Gibraltar, and these, with the ill-success of the Atlantic cable, caused great disappointment to the promoters of the latter enterprise. Capital seemed to have made up its mind that a successful cable across the Atlantic was impossible. In 1865, however, another cable of 2,300 miles, and weighing 4,000 tons, was shipped on the Great Eastern, and was successfully paid out for 1,065 miles from Valentia, when it broke, and was abandoned after vain attempts to grapple the lost end. The following year the Great Eastern sailed with a lighter

CABLES

but stronger cable of 2,370 miles and laid it successfully. She then grappled the lost cable of the year before, recovering it from a depth of two miles, spliced it, and completed the task by landing the end at Heart's Content.

Advance in Cable-Laying.—With two cables now linking America and Great Britain, confidence was restored, and the manufacture and successful laying of submarine cables went on at a rapid rate. In 1869 a line was laid from Brest, France, to St. Pierre, Newfoundland (a distance of 3,100 miles), by a French company. In 1873 a cable joined the cities of Lisbon and Pernambuco, and in 1874 and 1875 two more cables were laid between Valentia and Heart's Content. The latter weighed less than 900 pounds per mile. Another line from Penzance, Cornwall, to St. Pierre, 2,920 miles, was laid in 1879, and one from England to Panama in 1882.

Meanwhile an incident had occurred which greatly influenced the expansion of submarine cable systems. In 1870 the British government purchased the entire land telegraph system of the British Isles, and the capital thus liberated, about \$50,000,000, was largely reinvested in submarine cable ventures. In 1872 a number of small competing companies with lines through the Mediterranean were consolidated into the Eastern Telegraph Company, and in the following year the Eastern Extension, Australasian, and China Telegraph Company was formed by the amalgamation of companies owning cables farther east. Since then the Eastern, Eastern Extension, and Associated Cable companies have become practically one immense organization.

In 1884 John W. Mackey and James Gordon Bennett organized a cable system across the Atlantic from Valentia to Torbay, N. S., in the interests of the Commercial Cable Company and the New York *Herald*. Consolidation of competing companies followed as a matter of course, and now there are practically, besides the French lines, but two competing cable companies in the north Atlantic field—the Anglo-American and the Commercial Cable companies. There are now 15 cables between North America and Europe, some of which run into New York harbor. The cables of 1858, 1865, and 1866 are "dead," and three others have but a brief tenure of life. Nine are "alive" and active.

Recently another great cable-laying boom has set in. France proposes to connect its colonies by a system under its own control. A German cable has been laid from Emden, Germany, to New York, via the Azores, which works in conjunction with the Commercial Cable Company. That company has recently laid its fourth cable connecting New York and London, via Canso, the Azores, and Waterville in Ireland.

Pacific Cables.—In the Pacific Ocean the Commercial Cable Company has constructed a cable 6,912 miles long, and costing \$12,000,000, laid from San Francisco, via Honolulu, the Midway Islands, and Guam, to Manila, in the Philippines, with an ultimate extension to Shanghai or Hong Kong. The first section, from San Francisco to Honolulu, 2,413 miles, was opened 1 Jan. 1903. This section is the most hazardous on the route, depres-

sions of 5,160 and 5,269 fathoms having been encountered, and the profile displaying mountains of immense elevation and valleys of corresponding depth. A level plain, with an average depth of 2,700 fathoms, extends throughout the second section, from Honolulu to the Midway Islands; the bottom being of soft mud and extremely favorable for cable-laying. Thence toward Guam an average of 3,200 fathoms is found, and favorable conditions are maintained throughout. The last section is similar in its profile to the first, though the depth averages less, being from 1,400 to 2,700 fathoms. The sea-bed is extremely irregular in outline, with many reefs and depressions.

The cable is built around a core formed of copper wire insulated by gutta-percha, around which layers of jute yarn are wound. This, in turn, is sheathed in small cables, each formed of several strands of steel wires. An outer covering of jute yarn, the whole saturated with a bituminous compound, binds together the conducting and protecting wires in one solid mass. The landing of the shore end of the cable at San Francisco was effected thus: A section of 6½ miles was cut from the main cable on board the cable-steamer *Silvertown*, and loaded on a tender, which steamed toward the shore. On approaching the line of breakers, which were heavy, the shore end was floated on balloon buoys placed every 10 fathoms, and a team of 12 horses dragged it ashore, where it was spliced to the permanent shore connection, and the tender returned to the *Silvertown*, on board which the shore section was respliced to the main cable. The cable-ship then started for Honolulu in the evening of 14 Dec. 1902.

The *Silvertown* was specially built for cable-laying purposes. On this trip she carried 2,413 nautical miles of cable, weighing 4,807 tons. She arrived off Honolulu on 25 December and landed the shore end by buoying the cable; but she employed no tender or horses. Two spider-sheaves were sent ashore, and fixed by sand anchors about 60 yards apart. A hauling-line was paid out from the ship, reeved through the sheaves, and brought on board again. One end of this line being attached to the cable, and the other to the picking-up gear, the engines were started and the cable was dragged toward the shore.

Another Pacific cable is being constructed jointly by the governments of Great Britain, Canada, and Australia across the Pacific from Vancouver to Fanning Island, Fiji Islands, Norfolk Island, and thence to New Zealand and Australia. It will be about 8,000 miles long, and the 3,600 mile stretch from Vancouver to Fanning Island will be the longest single section in the world. This new cable brings the Australasian colonies 10,000 miles nearer to Canada than they were before, and there is now completed a British telegraph girdle of the world which touches foreign territory only at Madeira and St. Vincent, in the Cape Verde Islands, both belonging to Britain's old ally, Portugal.

Mention has already been made of the consolidation of competing lines in the Mediterranean and the East into the Eastern Telegraph Company. To this huge organization belongs a marvelous network of submarine cables—practically all the cables from Land's End, in England, through the Mediterranean to Suez,

CABLES

on through the Red Sea to Aden, across the Indian Ocean to Bombay, thence linking into the system Madras, Singapore, Hong Kong, Manila, Australia, and New Zealand. In addition, practically all the cables which now surround Africa, and many of those which cross the ocean and follow the coast-line of South America are in its control. To such an organization the laying of 15,000 miles of cable from England to Australia, via the Cape of Good Hope, at a cost of over \$15,000,000, was comparatively easy. Yet this great line may be traced from Land's End in England to Adelaide in South Australia, a distance which a modern Atlantic liner would take six weeks to steam over. The length of cable is more than half way round the globe, and about eight times longer than the first Atlantic cable.

Cable Statistics.—In all there are now about 252,400 miles of submarine cables, enough to go about eight times around the globe. They have cost about \$200,000,000, but their market value is considerably higher, as deep-sea cables are solid and profitable investments. Of the total mileage, the Eastern and its associated companies control practically half, or, to be precise, 99,262 nautical miles of cables, with 161 stations and 11 cable steamers. All told there are 42 cable steamers in the world, including those owned by the cable-construction companies and governments, with gross tonnage of about 65,000 tons. There are about 1,700 submarine cables ranging from a quarter of a mile to 15,000 miles. Nearly all the short lines belong to governments, but although only about 420 cables belong to private companies, these include at present all the deep-sea cables and about 90 per cent of the total length of cables in the world.

The life of a deep-sea cable, aside from injuries by ships' anchors, rocks, sharks, sawfish, and swordfish has been variously estimated at from 30 to 40 years. Sharks occasionally bite cables and leave some of their teeth embedded, and sawfish and swordfish attack them, especially in tropical waters, but on the level plains of ooze two miles or more below the surface cables seem to be almost imperishable. In shallow water they are more exposed to damage. Deep-sea cables generally weigh from one to one and a half tons per mile, but the portions lying in shallow water are so heavily armored as to weigh from 10 to 30 tons per mile. Yet last year the ocean cables of the Commercial Company were severed by ships' anchors five times. In the Firth of Forth in Scotland no less than 13 ship's anchors were once found entangled in a length of four miles of cable.

Cable Tariffs and Codes.—In the early days the Atlantic Telegraph Company started with a minimum tariff of \$100 for 20 words, and \$5 for each additional word. Later this was reduced to \$25 for ten words. It was not till 1872 that a rate of \$1 a word was introduced. This word-rate system proved so popular that it was soon adopted universally, and since 1888 the cable rate across the Atlantic has been down to 25 cents a word. Rates now range from the 25-cent tariff across the Atlantic to about \$5 a word between England and Peru. The average for the whole world is roughly \$1 a word. This the Commercial Company proposes to charge from America to the Philippines, as compared with the present rate of \$2.35 by the circuitous

route across the Atlantic, through the Mediterranean, the Red Sea, across the Indian Ocean, and on to Manila via Hong Kong. Even from New York to far-away New Zealand the rate is now only about \$1.50 per word. The cost of cabling, however, is greatly influenced by "coding," a system by which business men use secret words for commercial messages, and which has developed to an extraordinary degree of perfection. One code word will frequently stand for 10 or 15 words, and there are instances where one word has been used to represent over 100 words. Practically all commercial cablegrams are coded, and nearly all departments of commercial and industrial life nowadays have their special codes.

Speed of Transmission.—The cost of deep-sea cables makes it vitally important to get as much work out of them as possible. In the first place the transmission time of messages has been greatly reduced. Formerly from many parts of the world it took 5 or 10 hours to deliver a cablegram where it now takes from 30 to 60 minutes, and across the Atlantic the companies, for stock-exchange purposes at any rate, send a cablegram and get a reply in two or three minutes. In the second place, where traffic is heavy, speed of transmission of the signals has been greatly increased. Across the Atlantic on three or four of the busy lines of the Eastern Company the art of cable telegraphy has been highly developed.

On the first Atlantic cables the speed was about seven words a minute in one direction only. The speed of recent Atlantic cables is as high as from 40 to 45 words a minute in both directions—that is, from 80 to 90 words a minute. Thus, compared with the early days, the speed and therefore the value of the best cables has been multiplied more than 10 times over by means of some of the most ingenious and delicate machinery in modern industry. On the first Atlantic cable it was found that, using land telegraph methods of signaling, the speed was only one or two words a minute. The first great forward step was to send exceedingly feeble currents and to use extremely sensitive receiving instruments. Lord Kelvin's mirror galvanometer supplied the instrument needed. By this means the speed of the early Atlantic cables was raised to seven or eight words a minute. Subsequently, when heavier cables were laid, the speed was increased to as much as 20 words a minute.

The Siphon Recorder.—In 1870 Lord Kelvin perfected his siphon recorder for working long cables, and it at once supplanted the mirror instrument, as it worked just as well with feeble currents, gave a written record of signals received, and enabled one man to do the work of two. An exceedingly light coil of fine wire (in shape and size like the long, narrow O which would be obtained by winding several hundred turns of fine silk thread around the palm of the open hand) is delicately suspended between the two poles of a powerful magnet. As the electric signals from the cable flow through the coil of wire, it swings round under the influence of the magnet, back or forward according as the current is positive or negative. The motions of the coil are transmitted by silken fibres to a little glass siphon about as thick as a needle and three or four inches long, suspended so as to swing with perfect freedom. One end

Cape Verde Islands, 10th February, 1900. This is the second section of the 15,000-mile cable line to Australia.

CABLES

of the siphon dips into a pot of ink, and the other end hangs close above a moving strip of paper. The signals are so feeble that if the end of the glass siphon rested on the paper it would not move at all, but by causing the siphon to vibrate continuously against the paper the free motion of the siphon is not interfered with, and the ink is splattered upon the paper so that the siphon traces a line of very fine dots and thus records the signals transmitted through the cable. This instrument, though crude at first, has gradually been perfected. It is now the most important part of modern cable apparatus.

The Duplex System.—The next improvement, undoubtedly the greatest ever made for increasing speed, was the invention of a successful system of "duplexing" cables by Dr. Alexander Muirhead and Herbert Taylor in 1875. This invention rendered it possible simultaneously to send messages both ways through a long ocean cable. In 1878 the Direct United States cable across the Atlantic was successfully duplexed, and a speed of 16 words a minute obtained each way at the same time. Duplexing cables has now become such a fine art, chiefly through the labors of Dr. Muirhead, that the capacity of cables, and therefore their commercial value, has been practically doubled. Since 1875 about 80,000 miles of ocean cables have been duplexed almost entirely on the Muirhead system.

The increasing traffic across the Atlantic and the pressure of competition led next to an increase in the size of the copper "core" which conducts the electric signals. The resistance of a wire delays the electric current and therefore the speed. By doubling the size of the copper core the resistance is halved and the speed greatly increased. The copper wires used for telegraphy on land weigh about 200 pounds per mile. In 1894 two cables were laid across the Atlantic, one for the Commercial Cable Company and the other for the Anglo-American Company. The copper core of the former weighed 500 pounds per mile, while the latter weighed no less than 650 pounds per mile, or as much as three ordinary land wires. The result was that the speed obtained with these two cables was as high as 40 to 50 words a minute, or, working duplex, from 80 to 90 words a minute. On previous Atlantic cables 25 to 28 words a minute was the maximum each way. Owing to the reduction of rates the benefit of this tenfold increase of speed since the early days has gone almost entirely to the general public.

Automatic Transmission.—The increase in speed brought up another difficulty. No human operator can send so fast. The key used for signaling through cables by hand is practically the same as the ordinary Morse key used for land telegraphy, except that two keys are used side by side, one to send positive signals and the other negative signals, the letters of the alphabet being indicated by various arrangements of the two kinds of signals. First-class cable operators can send as many as 30 words a minute for a few minutes, but a sustained speed of 20 words a minute, when working by the hour, is regarded as very good. To take full advantage of the speed of a modern Atlantic cable therefore, it is necessary to have some automatic method of transmitting. The advantages of automatic transmission are higher speed, greater

uniformity of signals, more legibility, and fewer mistakes.

The method adopted is simple and beautiful, — a modification of the Wheatstone system. The message is first punched as a series of holes in a paper tape. This perforated tape is then run through an automatic transmitter, and by means of a system of small levers the required signals are transmitted at any desired speed. The operator has a wooden stick in each hand with which he strikes one or other of the three keys of the small perforator directly in front of him. One key punches a right-hand hole, another key a left-hand hole, and the middle key makes a space. In this way the cablegram before him is transmitted at the rate of about 20 words a minute into a perforated tape. From the perforator the tape runs into an automatic transmitter, or "auto." There is a row of small central holes in the tape, and on each side is a row of larger holes. The latter represent the message. A small star wheel in the "auto" engages with the central line of holes and feeds the tape along at a uniform rate. A couple of small steel rods about the size of a knitting-needle, one for each of the two rows of message holes, continually vibrate against the paper. When either of them enters a perforation in the paper, a lever connected with it moves and makes an electric contact, sending a short, sharp signal into the cable.

Cable Relays.—Recently several still more wonderful inventions have been perfected. There is good reason to believe that it is now possible to work a typewriter in New York by playing on a typewriter keyboard in London, and *vice versa*.

The little tape perforator in the first machine of the series has three keys. These have to be struck on the average four times for each letter, and much practice is required to become skilful in using it. Several tape-perforators with ordinary typewriter keyboards have been invented. The success of a machine of this kind will mean that cable messages will be transmitted by simply playing on a typewriter keyboard, the striking of the keys perforating the transmitting tape, which then runs through the "auto," which sends signals through the cable to the other end, where they are written in ink by the siphon recorder. It is at this latter point that has lain the great difficulty that has baffled cable inventors for years. By the time that an electric signal has passed through a long section, say 1,000 miles, of ocean cable, it has become so feeble that it can be recorded only by the extremely delicate mechanism of the siphon recorder. It has not been possible, until recently, to retransmit automatically into another section. On land, relays are used. For instance, messages from New York to Chicago are automatically repeated at Buffalo or Meadville, and by automatic repeating every 600 or 800 miles it is an every-day occurrence to telegraph direct between New York and San Francisco. A relay capable of performing similar work for cables has been a dream of cable engineers and inventors for years, and in default of such an instrument "human relays" have been employed; that is, at the end of one section of a cable an operator takes the paper record of a cablegram as it comes from the siphon recorder and retransmits it.

CABOOL—CABOT

But the cable relay is now an accomplished fact. The only hope of constructing such an instrument was to utilize the siphon recorder. One difficulty has been that the movements of the siphon, as shown by the paper records, have till recently been most irregular. There has been what photographers would describe as "lack of definition" about the signals, rendering it hopeless to attempt to relay them automatically by machinery. The first thing to do was, therefore, to straighten and sharpen up the signals a bit, and a very able group of cable engineers, including H. A. C. Saunders, electrician-in-chief of the Eastern and its associate cable companies, his assistant, Walter Judd, with Dr. Muirhead, inventor of the cable duplex, and Messrs. Brown and Dearlove, succeeded in sharpening them. They secured very regular signals, usually described as "square signals." This result was obtained by means too technical to be described here, but the chief device used is known as an "inductive shunt." Having squared the signals, it was now possible, though by no means easy, to construct a cable relay. Two have recently been perfected. One is known as the Brown & Dearlove relay, the principal inventor of it being S. G. Brown. The other has been invented by Dr. Muirhead. In both a fine wire terminating in a platinum contact-point takes the place of the ink in the siphon of a recorder. The contact-point, instead of resting on the paper tape, rests on a rapidly moving metallic surface divided into two parts. In the Brown & Dearlove relay this contact-surface consists of a constantly revolving metallic drum or wheel. The siphon, with its wire and contact-point, "skates," as the inventor describes it, with the utmost freedom on the periphery of this wheel. The drum looks like a phonograph cylinder. As the siphon skates upon the right or left half of this drum it makes a positive or a negative electric contact and automatically transmits a corresponding signal with renewed energy into the next section of cable. In the Muirhead relay the moving metallic surface consists of a small plate vibrating rapidly. The result is the same. Able in this way to make definite electrical contacts through a long ocean cable, an operator can easily work, by means of these contacts, local apparatus moved by more powerful currents. In this way both Mr. Brown and Dr. Muirhead have devised perforators which reproduce at the receiving station perforated tape identical with that used for transmitting the message at the sending station. This tape is available for retransmission through an "auto," this plan having the advantage that the signals are retransmitted in as perfect form as the original signals; and, theoretically at any rate, the process may be repeated indefinitely, so that it would be possible to send a cable message automatically through a dozen stations from England to Australia. This will no doubt be done in time, but it is a very slow process getting such complicated and delicate inventions into commercial use. It is a question of time and growth. The Brown & Dearlove relay has been adopted by the Eastern Company, and has been in commercial use for some months at Mediterranean stations. Dr. Muirhead's relay has also proved very successful in several long-distance tests.

From this description of cable relays it will be seen that an operator, by playing on a typewriter keyboard in London, can now produce a perforated tape in New York. A machine invented by the writer of this article is so arranged that by simply turning a handle it works a typewriter automatically under the control of a perforated paper tape, something after the fashion of a mechanical piano, at a speed of 90 words a minute. In order that this machine may print messages from a perforated tape produced by the cable relays it is necessary that all the letters shall be of equal length, and the writer has devised a new cable alphabet that not only fulfills this condition, but is also about 12 per cent shorter than the cable alphabet at present in use.

Hence, it is now possible, at any rate theoretically, automatically to typewrite a cable message across the Atlantic in page form at a speed 12 per cent faster than the cables can at present be operated. More than this, by the same mechanism it is feasible to operate a linotype or typesetting machine automatically, so that the fantastic possibility presents itself of playing on a typewriter keyboard in London and setting type automatically in New York.

DONALD MURRAY.

Cabool. See **KABUL**.

Caboose, cā-boos', the cook-room or kitchen of a ship. In smaller vessels, the name is given not to a room but to an enclosed fireplace, hearth, or stove, for cooking on the main deck. The cook-room is also known as the "galley." The name *caboose* is also given to a railroad car on freight or construction trains, used for carrying brakemen, or workmen, tools, etc.

Cab'ot, George, American statesman: b. Salem, Mass., 3 Dec. 1751; d. Boston, 18 April 1823. He was educated at Harvard College. In 1791 he became United States senator for Massachusetts, and proved a steadfast friend of the Washington administration. He yielded essential aid to Hamilton in perfecting his financial system. In 1814 he was chosen a delegate to the memorable Hartford Convention, and was elected president of that assembly. See Lodge, 'Life and Letters of George Cabot' (1877).

Cabot, James Elliott, American biographer: b. Boston, Mass., 18 June 1821; d. 16 Jan. 1903. He was the friend and literary executor of Emerson and in 1887 published 'A Memoir of Ralph Waldo Emerson,' a work undertaken at the request of the Emerson family.

Cabot, John, or **Giovanni Cabota** (in the Venetian dialect, **ZUAN CABOTA**), an Italian navigator in English employ; the discoverer of the continent of North America. On 5 March 1496, he was given by Henry VII. of England letters patent authorizing him to take possession of any countries he might discover. Under this charter, in May 1497, he embarked in a single vessel, accompanied by his son Sebastian, and sailed west, as he said, 700 leagues, when, on 24 June 1497, he came upon land which he reported to have been a part of a continent, and which he assumed to be in the dominions of the Grand Cham. A letter of that year represents him as having sailed along the coast for 300 leagues; he landed, but saw no person, though he believed the country not uninhabited. He

planted on the soil the banners of England and of Venice. On his return he discerned two islands to the starboard, but for want of provisions, did not stop to examine them. He reached Bristol in August. His discovery attracted the favor of the English king, who on 3 Feb. 1498, granted him special authority to impress six English ships at no higher charges than were paid for ships taken for the king's service, to enlist companies of volunteers, "and them convey and lede to the londe and illes of late founde by the seid John." This license has been erroneously called a second charter; it was not so; the charter of 1496 was still valid and sufficient. This license is the last record that has been found of the career of John Cabot. He himself made no voyage under it, whether from illness or death, or other reason, can only be conjectured. Neither the time nor the place of his death, nor his age, is known. Neither is it known what country gave him birth. He was a Venetian only by denization. As he is found residing at Bristol the conjecture would arise that he was born an Englishman; but the license granted him in February 1498 calls him "Kabotto, Venician," a phrase which in our day, and still more in those days of stricter feudal rule, clearly implies that he was not a natural-born subject of the king of England. Had he been so, he would have been claimed as an Englishman. Consult: HARRISSE, 'Cabot, John, The Discoverer of North America, and Sebastian, His Son: a Chapter of the Maritime History of England under the Tudors (1496-1557)' (1895).

Cabot, Sebastian, English navigator: b. Bristol, about 1474; other authorities say 1477; d. London 1557. He was the son of John Cabot (q.v.). Sebastian was early instructed in the mathematical knowledge required by a seaman, and at the age of 17 had made several voyages. In 1496 John Cabot obtained from Henry VII. letters patent empowering him and his three sons, Lewis, Sebastian, and Sanctius, to discover unknown lands, and conquer and settle them. In consequence of this permission the king supplied one ship, and the merchants of London and Bristol a few smaller ones, and John and Sebastian sailed to the northwest. In June 1497 the coast of Newfoundland, or, as some think, of Labrador, was reached. The accounts of this voyage are attended with much obscurity; but a second patent was granted to John Cabot in 1498, and it seems that, in a subsequent voyage, the father and son sailed as far as Cape Florida, and were actually the first who saw the mainland of America. Little, however, is known of the proceedings of Sebastian Cabot for the ensuing 20 years; but it seems that, in the reign of Henry VIII., by the patronage of Sir Thomas Peart, vice-admiral of England, he procured another ship to make discoveries, and attempted a southern passage to the East Indies, in which he failed. This disappointment is supposed to have induced him to quit England and visit Spain, on the invitation of Ferdinand. The death of the king lost him his patron, and in a few years he returned to England, and was employed by Henry VIII. to find out the northwest passage. After this expedition he again entered the Spanish service, and in 1526 began a voyage which resulted in his reaching the river La Plata, where he discovered St. Salvador,

and erected a fort there. He returned to England toward the latter end of the reign of Henry VIII. At the beginning of the reign of Edward VI. he was introduced by the protector Somerset to the young king, who settled a pension on him as grand pilot of England. From this time he was consulted on all questions relating to trade and navigation; and in 1552, being governor of the company of merchant adventurers, he drew up instructions, and procured a license for an expedition to discover a passage to the East Indies by the north. He was also governor of the Russian company, and was very active in their affairs. He was the first who noticed the variations of the compass; and he published a large map of the world, as also a work under the title of 'Navigazione nelle parti Septentrionali, per Sebastiano Cabota' (1583). See NICHOLLS, 'Remarkable Life of Sebastian Cabot' (1869); WINSHIP, 'Cabot Bibliography' (1900).

Cabra, kă'bra, Spain a town in the province and 29 miles south-southeast of Cordova, in a valley almost environed by mountains. It has wide streets; a large irregular, but imposing looking square; two large and handsome parish churches; a richly endowed college, etc. Pop. (1902) 13,000.

Cabral, or **Cabrera**, Pedro Alvarez, pã'drô ä'l'ba-rêth ka-bräl', Portuguese navigator: b. about 1460; d. about 1526. In 1500 he received command of a fleet bound for the East Indies, and sailed from Lisbon, but having taken a course too far to the west he was carried by the South American current to the coast of Brazil, of which he took possession about 24 April 1500, in the name of Portugal. Continuing his voyage he lost several ships and men in a storm, but with the remainder he visited Mozambique, and at last reached India, where he made important commercial treaties with native princes, and then returned to Europe. Consult: FISKE, 'Discovery of America,' Vol. II. (1892); CAPISTRANO DE ABREU, 'Descobrimiento do Brasil' (1883).

Cabrera Bobadilla Cerda y Mendoza, Luis Gerónimo Fernandez de, loo-ês hä-rôn'ê-mô fêr-nân'dêth dâ ka-brã'ra bô-ba-dêl'ya thâr'da ê mên-dô'thã, Spanish colonial governor: b. Madrid, about 1500; d. near there, 1647. He was viceroy of Peru 1629-39, during which period the useful properties of cinchona bark were discovered and the third ascent of the Amazon made. The cruelty of the Spaniards caused a revolt among the Urn Indians near Lake Titicaca, which Cabrera had great difficulty in suppressing.

Cabrera, Ramon, rä'mon ka-brã'ra, Carlist general: b. Tortosa, Catalonia, 31 Aug. 1810; d. Wentworth, England, 24 May 1877. He was brought up for the clerical profession, for which, however, he was unfitted by his love of pleasure and dissipation. When civil war broke out between the partisans of Don Carlos and those of the queen Isabel II., the priests became the most zealous champions of Don Carlos, and their enthusiasm acted so powerfully upon the impetuous spirit of young Cabrera, that he joined in 1833 a small band of guerrillas. He fought with singular ferocity, which rose to fury, when, 16 Feb. 1836, upon the order of the queen and of Mina, Gen. Noguera put to death Cabrera's

aged mother and his three helpless sisters. Cabrera took vengeance upon all the Christinists who fell into his hands. His enemies treated him like a wild animal, and hunted him, after he had laid waste Aragon, Valencia, and Andalusia, from one place to another. After a temporary defeat at Torre Blanca he eventually took Morella. Hence in 1838 Don Carlos created him Count de Morella, and at the same time lieutenant-general, and in this capacity Cabrera continued to fight for the cause of the pretender, and for what he considered the cause of the priesthood and the Church, until 1840, when he was compelled to flee to Paris. By order of Louis Philippe he was arrested and consigned to the fortress of Ham, but was soon set free. In 1848 the French revolution filled Cabrera with the most sanguine expectations; which, however, were doomed to disappointment, as on his arrival in Catalonia he was but indifferently received, and on 27 Jan. 1849, he was severely wounded at Pasteral, although he succeeded in making good his escape to France. In August of the same year he took up his abode in London, where he married a rich English woman. When Alphonso XII. was proclaimed king of Spain in 1875 Cabrera advised the Carlists to submit to him.

Cabrera, kã-brã'ra, a small Spanish island, one of the Balearic Isles, about 10 miles from Majorca. It is about three miles in length and breadth and the coast is irregular. The chief industry of the island is fishing and the permanent population is very small. During the war in the Peninsula Spain used it as a place for receiving convicts.

Cabrilla, or **Hind**, one of the sea-basses (*Epinephelus maculosus*) found in the Atlantic from Charleston to Brazil. It attains a length of 18 inches and is highly esteemed as food. Another sea-bass (*Paralabrax maculatofasciatus*) living along the coast of lower California and highly regarded as a food-fish; is called the spotted cabrilla. See SEA-BASS.

Cabul, **Cabool**, or **Kabul**. See KABUL.

Cacao, kã-kã'õ, or **Cocoa**. The term "cocoa," a corruption of cacao, is almost universally used in English-speaking countries to designate the seeds of the small tropical tree known to botanists as *Theobroma cacao*, from which a great variety of preparations under the name of cocoa and chocolate for eating and drinking are made. The name "chocolate" is nearly the same in most European languages, and is taken from the Mexican name of the drink, "chocolatl" or "cacahuatl." The Spaniards found chocolate in common use among the Mexicans at the time of the invasion under Cortez, in 1519, and it was introduced into Spain immediately after. The Mexicans not only used chocolate as a staple article of food, but they used the seeds of the cacao tree as a medium of exchange.

The manner of preparing it for drinking was long kept a secret by the Spaniards, who sold it at a high price to the wealthy classes. The first notice of its use in England appears in the 'Public Advertiser' of 16 June 1657, which stated that "In Bishopsgate Street, in Queen's Head Alley, at a Frenchman's house, is an excellent West India drink, called chocolate, to be sold, where you may have it ready at any time; and

also unmade, at reasonable rates." In the time of Charles II., the price of chocolate was 6s. 8d. a pound—equivalent to \$6.00 or more in our currency. Had it not been for the monopoly Spain long possessed, which kept the price at a point where only the rich could afford to use it, cocoa would probably have come into as general use as tea and coffee did later.

Cocoa and chocolate were first made in this country in Dorchester, Mass., in 1765; and it is an interesting fact that the manufacture has been continued in the same place ever since and that it now represents one of the largest industries in the country.

The botanical characters of the genus to which the cacao tree belongs are given as follows:

Order Sterculiaceæ.—Tribe *Buettnericæ*; calyx, 5-partite, colored; petals, 5; limb cucullate, with a terminal, spatulate appendage; column, 10-fid; fertile lobes, bi-antheriferous; anthers, bilocular; style, 5-fid; fruit, baccate, 5-celled; cells pulpy, polysperous; embryo exalbuminous; cotyledons, fleshy, corrugate; trees, leaves entire; pedicels fascicled or solitary, lateral. (Grisebach's 'Flora of the British West Indies,' p. 91.)

The cacao tree can be cultivated in suitable situations within the 25th parallels of latitude. It flourishes best, however, within the 15th parallels, at elevations varying from near the sea-level up to about 2,000 feet in height.

An estimate of the world's production of crude cocoa in 1903 was 126,795,074 kilograms, or 279,532,420 pounds. The estimated consumption of crude cocoa in Europe and the United States in 1903 was 127,452,366 kilograms, or 280,981,486 pounds. The consumption in the United States in 1860 was only about three fifths of an ounce for each inhabitant. In 1903 the consumption was over 12 ounces for each inhabitant. In 1903 the countries from which the main supplies of crude cocoa were drawn took rank as follows: Ecuador, San Thomé, Brazil, Trinidad, Venezuela, San Domingo.

The countries consuming the largest amount of crude cocoa in 1903 took rank as follows: The United States, Germany, France, Great Britain, Holland, Spain. In 1893 the United States stood fifth in the list of consumers, and France had the first place.

The various kinds of cocoa may be placed in about the following order of merit: Finest Caracas (called Chaou) of Venezuela; the finest Maracaibo (of which very little, if any, is produced of late years); the finest Magdalena, of New Granada, of which the production is small and rarely exported; Soconusco, from the state of that name in Mexico; Java, from the island of that name; the finest Guayaquils from Ecuador. The cocoas from Trinidad, Surinam, Grenada, Para, Bahia and Africa, are classed as "good ordinaries."

In Ecuador, the country from which the largest supply of crude cocoa is drawn, the trees grow to a height of from 20 to 30 feet and the base of the trunk is from 8 to 10 inches in thickness. They are raised from fresh seeds which are planted in rows about five yards apart. They begin to bear in the sixth or seventh year and in the tenth year reach full maturity. The blossom is very small, pinkish white, and waxlike in appearance. It grows

directly out of the main trunk and branches. If it fructifies, the petals fall off, and from the stamens, in the course of from fifty to seventy days, an oblong pod is developed. This pod is of golden color, and contains some twenty to thirty-five grains of cacao, enveloped in a gummy liquid, which coagulates on exposure to air. The outer rind of this pod is dark or golden yellow in color and very hard, a sharp instrument being necessary to cut it open. Its size varies, according to the kind of cacao, from 8 to 15 inches long by from 2 to 6 inches thick. The outer rind is marked by longitudinal furrows, more or less pronounced, which indicate the interior arrangement of the seeds.

The average yield of the trees varies in the different countries in which they grow. In Ecuador the average is said to be from one to two pounds of dry cocoa to a tree. In Surinam the average is about two and one third pounds. The fully ripened pods are detached from the tree with a long pole armed with two prongs, or a knife at its extremity. The pods are left in a heap on the ground for about twenty-four hours; they are then cut open and the seeds are taken out and carried in baskets to the place where they undergo the operation of sweating or curing. There the acid juice which accompanies the seeds is first drained off, after which they are placed in a sweating box, in which they are enclosed and allowed to ferment for some time, great care being taken to keep the temperature from rising too high. The fermenting process is, in some cases, effected by throwing the seeds into holes or trenches in the ground, and covering them with earth or clay. The seeds in this process, which is called "claying," are occasionally stirred to keep the fermentation from proceeding too violently.

The cocoa is brought into the market in its crude state, as almond-shaped seeds which differ in color and somewhat in texture. They are first cleaned and then roasted, great care being taken to secure a uniform effect. By the roasting the shell becomes more readily detachable, and its complete removal is the next step. The crushing of the seeds into small fragments is easily accomplished; and this is followed by a thorough winnowing, by which the lighter shells are carried away by themselves, leaving the clean fragments of the roasted seeds ready for further manipulation.

The result of many analyses of the roasted seeds shows the following averages: Moisture, 6.51; fat, 49.24; theobromine, .43; starch, 10.43; cellulose, 3.1; other carbohydrates, glucosides, etc., 7.78; protein matters, 18.33; ash, 3.02.

The clean shells are used for the preparation of a wholesome and very low priced drink. The cracked cocoa or coarsely ground product of the roasted seeds is called "cocoa nibs" or cracked cocoa; the finely pulverized product of the roasted seeds from which a portion of the fat has been removed in order to make it more digestible and prevent it from caking, is called "breakfast cocoa" or "powdered cocoa." In the preparation of chocolate, the fragments are ground by a complicated mechanism until they attain the highest degree of fineness, and constitute a perfectly homogeneous mass or paste without removing any of the fat. The pure product of seeds prepared in this way, to which nothing is added and from which nothing is

taken away, is known as plain chocolate or bitter chocolate. Sweet chocolate is made by working into the mass a certain percentage of sugar. For flavoring, vanilla is generally used.

The fat or "cocoa butter," so called, constituting an average of about 50 per cent of the seeds, is, when pure and freshly extracted, of a pale, yellow color. Its consistency is about that of tallow. It is insoluble in water; completely soluble in sulphuric ether and the essential oil of turpentine. It is used very extensively in the manufacture of confections, and by pharmacists as the basis of pomades and ointments. Considered as a food and as a medicinal substance, it possesses the same fundamental property as other fat.

JAMES M. BUGBEE.

Ca'capon, or **Great Cacapon**, a river in West Virginia. It flows nearly northwest through Hampshire and Morgan counties, and enters the Potomac about five miles from Berkeley Springs. Its length is about 140 miles.

Caccianiga, Antonio, Italian writer: b. Treviso, 1823. He founded a satirical magazine called 'Lo Spirito Folletto' at Milan in 1848; being exiled after the revolution of 1848 was for six years a journalist in Paris. He has been mayor of Treviso subsequently, and is the author of 'Il proscrittato' (1853); 'Bozzetti morali ed economici' (1869); 'La Vita Campestre'; 'Villa Ortensia' (1876).

Caccini, kã-chẽ'nẽ, Giulio, Italian composer: b. Rome about 1546; d. Florence, 1618. He was styled the father of a new music, having been the first to write an opera for performance in a public theatre. His works include 'Daphne,' and 'Apollo's Battle with the Serpent.'

Caceres, Andres Avelino, Peruvian military officer and statesman: b. Ayacucho, in southern Peru, 11 Nov. 1838. While still young he was actively engaged in political strife, serving as an officer under Castilla and Prado, and when the latter was overthrown, was imprisoned for a year. He distinguished himself at the taking of Arequipa. In 1857 he became military attaché to the legation of the Peruvian government at Paris, and was stationed at that post until 1860. In the Chilean war (1870-83) he served in nearly all of the battles, being rapidly promoted from colonel to the rank of general, and, after the taking of Lima, was made second vice-president in the provisional government of Calderon (June 1883). The imprisonment of Calderon, the president, and the absence of the first vice-president made him acting president of Peru. In his refusal to acknowledge Iglesias, whom the Chileans had placed at the head of the government at Lima, as president, Caceres was supported by the interior provinces, and he at once planned to depose him. In his first attempt to take Lima, in August 1884, he was repulsed in a bloody street fight, but after raising a larger force he appeared before the city, 1 Dec. 1885, and peaceably persuaded Iglesias to submit the office of president to a general election. This resulted in the election of Caceres, and on 3 June 1886 he was inaugurated president of Peru. The country prospered greatly under his administration, gradually recovering from the ill effects of the war; a private company absorbed the state railroads and guano beds and took over a portion of the na-

tional debt. In 1890 he was defeated for the presidency by Bermudez, but was soon afterward, in 1891, appointed by him Peruvian minister to France and Spain. In 1894, upon the death of President Bermudez, the party of Caceres seized the reins of government, Caceres was proclaimed dictator, and the Congress forced to elect him president. The ex-dictator, Piérola, however, disputed his right to the office and besieged the city, on 18 March 1895, after a bloody conflict, taking it. A treaty of peace was signed between the two parties, in which Caceres was obliged to resign the presidency. He soon afterward fled and Piérola was elected president 10 July 1895.

Caceres, kâ'thâ-rës, Spain, a town in Estremadura, capital of the province of the same name, 24 miles west by north of Truxillo. It consists of an old and a new town, the former crowning the top of a hill, and surrounded by a strong wall flanked with towers, and the latter built round it on the lower slopes. The houses are tolerably well built, but the streets are mostly narrow and steep. Among the objects worthy of notice are four churches, several old feudal mansions, and the bull-ring. Pop. (1902) about 16,000. The province of Caceres is the second largest of Spain, in the north of Estremadura, owned chiefly by large proprietors, and mostly devoted to cattle-raising; the north half is a good wine country. The area is over 8,000 square miles, and the population about 400,000.

Caceres Nueva. See NUEVA CÁCERES.

Cachalot. See SPERM WHALE.

Cachar, kâ-châr', a district of Assam, India, bounded east by Manipur and the Naga Hills, south by the Lushai Hills, west by Sylhet and the Jaintia Hills, and north by Nowgong district. It comprises a series of fertile valleys diversified by low hills and almost surrounded by mountain ranges. The Barak River flows through the district, its course here being about 130 miles. Lignite and petroleum have been found. Salt is manufactured in small quantities. The forests are of great extent, and constitute the chief natural wealth of the district. Rice and tea are extensively cultivated. Area, 2,472 square miles; pop. (1902) 467,300. The chief town is Silchar.

Cache, the name of (1) a river in Arkansas, flowing northwest about 150 miles into the White River, near Clarendon, Monroe County; (2) a peak of the Rocky Mountains in Idaho, height 10,451 feet; (3) a fertile valley in the Wasatch Mountains in Utah and Idaho. It is 60 miles long and from 10 to 20 miles wide, and has an altitude of 5,000 feet. It is watered by the Bear River, and has several villages, of which Logan is the largest.

Cache, kâsh, a hole in the ground for hiding and preserving provisions which it is inconvenient to carry; used by settlers or travelers in unpeopled parts of North America, and by Arctic explorers.

Cachet, *Lettres de*, lëtr dë kâ-shâ, a term formerly applied especially to letters proceeding from and signed by the kings of France, and countersigned by a secretary of state. They were at first made use of occasionally as a means of delaying the course of justice, and appear to have been rarely employed before

the 17th century as arbitrary warrant for the detention of private citizens, and for depriving them of their personal liberty. During the reign of Louis XIV. their use became frightfully common, and by means of them persons were imprisoned for long periods, or for life, on the most frivolous pretexts. Sometimes, however, such arrests were favors on the part of the king, as they withdrew the accused from the severer punishment to which they would have been liable upon trial before the courts. *Lettres de cachet* were abolished at the Revolution.

Cachexy, ka-këk'si, or **Cachexia**, ka-këk-si-ä, (Gr., "evil habit of body"), a morbid state of the bodily system, in which there is great weakness, with or without the local manifestation of some constitutional disease. It is not a disease of itself, but the result of diseases such as gout, cancer, lead-poisoning, tuberculosis, syphilis, intermittent fever, excessive use of alcohol, etc. Thus scrofulous cachexia means the condition of body due to scrofula, shown by slender form, narrow or deformed chest, pallor, diseased glands, large prominent joints, etc.

Cachexia Strumipriva. See THYROID GLAND, *Diseases of*.

Cachoeira, ka-shwâ'e-raq, Brazil, a town in the state and 62 miles northwest of Bahia. It stands on the Paraguassu, which divides it into two unequal parts and has often injured it by inundations, and is the entrepôt for the traffic of a large extent of surrounding country. The chief exports are coffee, cotton, and tobacco. Pop. 15,000.

Cacholong, a mineral of the quartz family, a variety of opal, often called pearl-opal. It is usually milk-white, sometimes grayish or yellowish white, opaque or slightly translucent at the edges. It often envelops common chalcidony, the two minerals being united by insensible shades. It also associates with flint and semi-opal.

Cachou, kâ-shoo', an aromatic sweetmeat in the form of a silvered pill, used for giving an agreeable odor to the breath.

Cachucha, kâ-choo'cha, an Andalusian dance, resembling the *bolero*, performed to a graceful air in 3-4 time and with a strongly marked accent.

Cacique, kâ-sëk', or **Cazique**, a title borne by, or a designation given to, the chiefs of Indian tribes in Central and South America, Cuba, Haiti, etc. The term was formed by the Spaniards from a native Haitian word.

Caçique, one of several South American icterine birds, forming the genus *Cassicus*, and closely related to the Baltimore oriole (q.v.). They are sometimes uniform black, sometimes black relieved by chestnut, yellow, green, or scarlet; the bill is frequently white instead of the usual black or brown. The caçiques are noted for their intricately woven, pouch-like nests, composed of thin bark and grasses, several of which, sometimes a yard in length, hang from the outer twigs of a single branch of some large tree, usually overhanging the water, as an extra precaution of safety against monkeys and snakes.

CACODYLE—CACTUS

Cac'odyle, or **Cac'odyl**, kāk'ō-dīl, -dīl (Gr., «having a bad smell»), in chemistry, a monad radical having the formula $As(CH_3)_2$, and of special interest to the chemist because it was the first radical known in which a metal or a metalloid is combined with an organic base. The compound $As_2(CH_3)_4$, which was discovered by Bunsen in 1837, and which can exist in the free state, is often called cacodyle, but it is more correctly known as dicacodyle since its molecule consists of two cacodyle radicals. Dicacodyle is obtained in the pure state by heating cacodyle chloride with zinc in an atmosphere of carbon dioxide, but a mixture of cacodyle oxide and dicacodyle (known formerly as Cadet's fuming liquid) may be obtained by distilling potassium acetate with an equal weight of arsenic trioxide. Mercuric oxide (HgO) converts both of the constituents of Cadet's liquid into cacodylic acid, $(CH_3)_2AsO(OH)$; and this, in turn, is converted into cacodyle chloride, $As(CH_3)_2Cl$, by the action of corrosive sublimate and fuming hydrochloric acid. Cacodyle oxide (known also as alkarsin) may be obtained in the pure state by distilling the chloride with an aqueous solution of caustic potash in an atmosphere of carbon dioxide. Dicacodyle is a colorless liquid, heavier than water, boiling at $338^\circ F.$, and characterized by an intensely disagreeable smell suggestive of garlic. Dicacodyle is known to the chemist as tetra-methyl di-arsenid.

Cacomistle, kāk-ō-mīs-ēl, a small Mexican animal (*Bassariscus astutus*), closely related to the raccoon, and similar in its haunts and habits. It is slender, about 10 inches long, with a sharp, fox-like face, large bright eyes surrounded with light patches, and erect ears. The long, soft fur is light brown above, darker along the back; the under parts are white, and the bushy tail has six broad white rings running around it.

Cacongo, kā-kōng'gō, or **Kakongo**, a former district of Guinea, Africa, extending along the South Atlantic Ocean, in lat. $5^\circ S.$, just north of the mouth of the Congo. The Cacongo River enters the sea in lat. $5^\circ 12' S.$ This territory was claimed by the Portuguese, and Cabinda is the northern part of it; the south and east to the Congo have been absorbed in the Congo Free State.

Cactaceæ. See CACTUS.

Cactus, the common name for all members of the family *Cactacea*, an order of calycifloral dicotyledons, found in luxuriance in the arid sections of the United States and South America. Both the Greeks and Latins were perfectly familiar with this curious monstrosity of nature, the word being *κάκτος* in Greek and *cacti* in Latin. Linnæus included all these species under the one generic term *cactus*, of which there were about 1,000 species. One of these is a native of Ceylon, with which the ancients were familiar. But the true home of the cactus is in America. Like the watermelon, it has the faculty of absorbing into itself a vast bulk of water, making its stem most succulent. The most common kind, met with in southern Mexico, is the *Opuntia coccinellifera*, which grows as a succession of small, oblong, thick leaves and is not very spiny.

The economic uses of the cacti are many, especially among primitive peoples. One or two species of the genus *Anhalonium* yield alkaloids which are used in medicine and which were known and used to produce intoxication by the Indians before the advent of the whites. The peculiar reticulations of the vascular or wood systems of many species render them very useful in the manufacture of art goods, otherwise known as curios in many sections. The various species are of most importance as articles of food for man and beast. In the semi-tropical and tropical regions of America a large group of the plants belonging to the genus *Cercus* and its allies furnish edible fruits known to the Spanish-American as *pitellas* (*pectia*). These grow for the most part on tall, branching, and columnar plants, similar to the familiar giant cactus (*Cercus giganteus*) of the Arizona desert. These fruits vary in size from three-fourths of an inch to two inches in diameter, depending upon the species. Along the Texas frontier forms grow which are known as Mexican strawberries to the English speaking peoples.

By far the greater part of the fruit produced by this family of plants comes from the flat-jointed prickly pears belonging to the genus *Opuntia*, the fruits of which are known in Spanish-America as *tunas*. Some of these are extensively cultivated throughout the highland region of Mexico and the Mediterranean region of Europe, Asia, and Africa especially. Prickly pears, although natives of the American continent and its continental islands, are now cultivated or have become naturalized throughout the tropical and subtropical regions of the world. The fruits are eaten raw, dried and in the form of preserves. Their juices are also expressed and fermented into a drink called *colonche*. It is less common now than formerly to find a distilled drink made from the tuna on account of the deleterious effects of tuna alcohol.

On account of their ability to absorb and retain large quantities of water, the cacti, especially the prickly pears, often become important to the stockmen in portions of our southwestern states. They remain green and succulent long after other fruits have dried up and become worthless. The rancher then resorts to this rough feed to save his stock. He may singe the horns off with a brush or, if his herds are large, he may singe them with a modified plumber's torch, or he may even chop the plants into small pieces and feed them in this way.

It is a common practice in southwestern Texas to feed prickly pear and cottonseed meal to stock during the winter. In the vicinity of San Antonio dairymen for a number of years have fed prickly pear to their dairy cows along with a liberal supply of grain and hay. Prickly pears furnish the succulence so essential in milk production and so difficult to obtain in a semi-arid region.

When driven to extremity travelers in the desert have been known to resort to these plants for water supply. The pulpy tissues, preferably of such forms as the barrel cactus (*Echinocactus*) are macerated to set the juices free. A rather unpalatable and somewhat purgative drink is thus obtained which relieves thirst to a measure.

The flowers and stems of the night-booming cereus (*Cercus grandiflorus*) have been used

in medicine, in the form of a fluid extract, as a cardiac stimulant. Its action resembles that of digitalis, but is less uniform.

Cactus Wren, a small wren (*Campylorhynchus brunnicapillus*) inhabiting the arid and desolate regions of the Mexican border. It is grayish brown above, darker on the head, nearly pure white beneath, with a spotted breast, and a white line over the eye. It makes a large flask-shaped nest of grasses and twigs, lined with feathers, and laid in the crotch of a cactus. This nest is entered by a covered way or neck several inches in length. It is a very sprightly bird with a clear, ringing song.

Ca'cus, in Roman legend, a huge giant, in some accounts a son of Vulcan, who lived in a cave on Mount Aventine. Having stolen and dragged into his cave some of the cattle which Hercules had carried away from Geryon in Spain, he was killed by that hero, who discovered his place of hiding by the lowing of the oxen within, in response to the lowing of the remainder of the flock as they were passing the entrance of the cave.

Cada Mosto, kã'dã mō'stō, or **Ca da Mosto**, Alois da, Italian navigator: b. Venice about 1432; d. 1464. In 1455 he departed from Lagos, sailed into the river Senegal, which had been discovered five years before, and after trading in slaves and gold he steered for Cape Verd, where he joined two other discovery ships, and visited, in company with them, the mouths of the Gambia, the riches of which had been greatly extolled. In 1456 Cada Mosto, in company with two other ships, made a second voyage to the Gambia. On the way thither they discovered the Cape Verde Islands. The description of his first voyage, 'Il Libro de la prima Navigazione per l'Oceano alle Terre de' Negri della Bassa Etiopia, di Luigi Cada Mosto' (Vicenza 1507, and Milan 1519), the oldest of the voyages of the moderns, is a masterpiece. The arrangement is admirable, the narrative interesting, the descriptions clear and accurate.

Cadamba, kã-dãm'ba, or **Kudumba**, the wood of several species of *Nauclca*, an Indian genus of *Cinchonaceæ*. *N. (Uncaria) gambir* is the source of gambier.

Cadastral Survey (F. *cadastre*, from It. *catastro*, from low Lat. *capitastrum*, "a register for a poll-tax"; Lat. *caput*, "the head"), a territorial survey in which objects are represented in their relative positions and magnitudes. A cadastral survey differs from a topographical one, in not magnifying the principal objects. It requires consequently to be made on a larger scale than the topographical survey, so as to admit of a proportionally accurate representation of towns, houses, roads, rivers, etc. The scale on which the map of the United Kingdom is being prepared $\frac{1}{25000}$ of the linear measure of the surface surveyed, is an example of the scale of a cadastral survey. This scale nearly corresponds with 25 inches to the mile. See SURVEYING.

Caddis-fly, the common name of any of the order *Trichoptera*, a group of aquatic insects, related to and by many supposed to be the ancestors of the moths and butterflies (*Lepidoptera*). They resemble the lower moths, but the wings are not scaled, except in a very

rudimentary way. They differ from moths in having no true "tongue" or well-developed maxilla adapted for sucking the nectar of flowers, but as in moths the mandibles are either absent or obsolete. About 150 species are thus far known to live in North America. The larvæ are called "caddis-worms," "case-worms," or "cad-bait." They are more or less cylindrical, with well-developed thoracic feet, and a pair of feet on the end of the abdomen, varying in length. The head is small, and like that of a tortricid larva, which the caddis-worm greatly resembles, not only in form, but in its habit of rolling up submerged leaves. They also construct cases of bits of sticks, sawdust, or grains of sand, which they drag over the bottom of quiet pools, retreating within when disturbed. They live on vegetable matter and on water-fleas (*Entomostraca*) and small aquatic larvæ. When about to pupate they close up the mouth of the case with a grating, or, as in the case of *Helicopsyche*, which is coiled like a snail-shell, by a dense silken lid with a single slit, and in some instances spin a slight, thin, silken cocoon, within which the pupa state is passed. The pupa is much like that of the smaller moths, except that the mandibles are present, and wings and limbs are free from the body. After leaving its case it makes its way over the surface of the water to the shore, sometimes going a long distance. The female deposits her eggs in a double gelatinous, greenish moss, which is attached to the surface of some aquatic plant. Consult: McLachlan, 'Monograph of the Trichoptera of the European Fauna'; Banks, 'A List, Synopsis, Catalogue, and Bibliography of the Neuropteroid Insects of Temperate North America'; 'Transactions of the American Entomological Society,' Vol. XIX; also a paper by Newham and Betten in 'Bulletin of the New York State Museum,' 47.

Caddoan (kã'dō-ãn) **Indians**, a family of North American Indians, comprising the Arikari tribe in North Dakota; the four Pawnee villages, Grand, Tapage, Republican, and Skidi, in the Indian Territory; and the Caddo, Kichai, Wichita, and other tribes, formerly in Louisiana, Texas, and Arkansas. The present number of these Indians is about 2,130, of which 416 are in North Dakota, the rest in the Indian Territory.

Cade, John (the Jack Cade of Shakespeare), Irish rebel: d. 11 July 1450. Early obliged to flee from Ireland, he took refuge in France. In 1450 he passed over to England at the moment of great popular dissatisfaction with the ministers of Henry VI. He at once pretended to be a relative of the Duke of York, assumed the name of Mortimer, raised the standard of rebellion in Kent, 8 May, and very soon found himself at the head of 20,000 men. He advanced to Blackheath, and interchanged notes with King Henry, to whom he made known the griefs of his companions. He defeated the royal troops which were sent against him, and entering London, 1 July, immediately caused the execution of two of the offensive ministers. At first he kept his army under rigorous discipline, but after a few days' residence in the capital their propensity to plunder could no longer be restrained, and they pillaged some of the finest houses. This aroused the citizens against them, and on the night of 5

1. Leaf-cactus (*Phyllocactus anguliger*). 2. *Stapelia* (simulating a cactus). 3. A *Cereus* (*Cereus dasycanthus*). 4. Globe-cactus (*Echinocactus horizontalis*). 5. Wart-cactus (*Mammillaria pectinata*). 6. Hairy *Opuntia* (*Opuntia filipendula*)—a, the blossom, enlarged. 7. Melon-cactus (*Melocactus communis*). 8. Giant Cactus (*Cereus giganteus*)—a, blossom, enlarged; b fruit, enlarged. 9. Mexican *Opuntia* (*Opuntia coccinellifera*)—a, the fruit ("prickly pear"), enlarged.

CACTUS.

Flower of the Hedgehog Cactus.

July Cade met with his first defeat. A promise of pardon now dispersed most of his followers, and finding his force no longer sufficient for resistance he took to flight, but was overtaken and killed.

Cade, Oil of, a thick oily liquid obtained in France, Spain, and northern Africa by the dry distillation of the wood of *Juniperus oxycedrus*, of the pine family (*Coniferae*). It has a not unpleasant tarry odor, and is largely employed in the treatment of skin diseases, especially certain forms of eczema.

Cadell, Francis, Scottish explorer in Australia: b. Cockenzie, Scotland, 1822; d. 1879. Becoming assured of the navigability of the Murray River in Australia he made an extended exploration of that stream in 1850. Subsequently forming a navigation company he reached by steamboat a point 300 miles from the river's mouth, and in 1858 explored the Murrumbidgee River, and in 1858 the Darling River as far as Mount Murchison. While in command of a vessel sailing from Amboyna he was murdered by his crew.

Cadenabbia, *kä-dē-nāb'bē-ä*, a health resort, beautifully situated among orange and citron groves, on the western shore of Lake Como, Italy. Its famous Villa Carlotta contains works by Canova and Thorwaldsen.

Cadence, the concluding notes of a musical composition or of any well-defined section of it. A cadence is perfect, full, or authentic when the last chord is the tonic preceded by the dominant; it is imperfect when the chord of the tonic precedes that of the dominant; it is plagal when the closing tonic chord is preceded by that of the subdominant; and it is interrupted, false, or deceptive when the bass rises a second, instead of falling a fifth.

Cadency, in heraldry, a system of marks intended to show the descent of a younger branch of a family from the main stock.

Caden'za, in music, a flourish of indefinite form introduced upon a bass note immediately preceding a close.

Cad'er Id'ris, a mountain in Merionethshire, Wales, the beginning of a chain running northeasterly. The ridge is nearly 10 miles long, and with its breadth of from one to three miles makes an elevation of great massiveness. Its greatest height is 2,925 feet.

Cadet-Gassicourt, Louis Claude, *loo-ē klöd kä-dä-gäs-ī-koor*, French scientist: b. 1731; d. 1799. He filled several important offices, such as apothecary to the Hôtel des Invalides, inspector of French hospitals in Germany, and chemical director to the Sèvres Porcelain Works. He published a variety of researches in pure and applied chemistry, but is best known by the fuming liquor still called by his name, and the subject of an elaborate research by Bunsen.

Cadet de Vaux, Antoine Alexis, *än-twän ä-läks-īs kä-dä-dē-vō*, French chemist: b. Paris, 1743; d. 1828. He was at first an apothecary, but for many years devoted himself to agriculture, writing on the effect which the destruction of mountain forests has in diminishing the copiousness of the springs in the valleys, the improvement of vineyards, the cultivation of foreign plants, and the providing of

substitutes for the usual articles of food in times of scarcity. He was one of the principal editors of the 'Journal d'Economie rurale et domestique,' and of the 'Cours complet d'Agriculture pratique.'

Cadet, *ka-dēt'*, a word having several significations.

1. A younger son of a family; that is, one junior to the eldest or heir by primogeniture.

2. In the former French military service, a gentleman who served in the ranks without pay, for the purpose of learning the art of war.

3. In the United States and Great Britain a pupil of a military or naval academy or training-ship, as of the United States Military Academy at West Point; the United States Naval Academy at Annapolis; the Royal Military Academy at Woolwich; or the Royal Military College at Sandhurst.

Cadet's Fuming Liquid. See CACODYLE.

Cadi, *kä'dē*, or **Kadi**, in Arabic, a judge or jurist. Among the Turks *cadi* signifies an inferior judge, in distinction from the *mollah*, or superior judge. They belong to the higher priesthood, as the Turks derive their law from their prophet.

Cadillac, Antoine de la Mothe, *än-twän dé lä môt ka-dē-yäk*, French military commander: b. Gascony, France, about 1660; d. France, 1720. He came of good family, and having entered the army was for some time captain in Acadia. In 1694 Frontenac placed him in command of Michilimackinac, where he remained until 1697. Cadillac then brought to the attention of Louis XIV. a well-considered scheme for a permanent settlement and trading post in the Northwest. On receiving the monarch's approval he founded Detroit in 1701, establishing 50 soldiers and 50 settlers at that point. From 1712 to 1717 he was governor of Louisiana, returning to France in the year last named. The town of Cadillac, Mich., was named in his honor. Consult: Burton, 'Cadillac's Village, a History of the Settlement, 1701-10' (1896); Parkman, 'A Half Century of Conflict' (1892).

Cadiz, *kä'dēth* or *kä-dīz* (anciently GADES), a seaport, and one of the handsomest cities in Spain, is situated at the extremity of a long tongue of land projecting from the Isla de Leon, off the southwestern coast of Andalusia. The narrowness of the land communication prevents its capture by a military force while the garrison is master of the sea. It is walled, with trenches and bastions on the land side; the houses are high, and the streets narrow. The chief buildings are the great hospital, the custom-house, the old and new cathedrals, two theatres, the bull-ring, capable of accommodating 12,000 spectators, and the light-house of St. Sebastian. From the harbor the town has a fine appearance. The Bay of Cadiz is a very fine one. It is a large basin enclosed by the mainland on one side, and the projecting tongue of land on the other. It is from 10 to 12 leagues in circumference, with good anchorage and protected by the neighboring hills. It has four forts, two of which form the defense of the grand arsenal, La Caracca, in which are 3 basins and 12 docks. Cadiz has long been the principal Spanish naval station. It was the centre of the Spanish-American trade, and the

CADIZ — CADMUS

commerce of the port was very extensive before the separation of the colonies. The preparation of salt from pits belonging to the government was formerly an important branch of industry, but is now of comparatively little consequence. The manufactures of Cadiz are of comparatively little importance, but in regard to the extent and value of its commerce it ranks as one of the first ports in Spain. Its imports consist of all kinds of foreign and colonial produce, coal, cotton, and woolen manufactures, etc.; its exports of wines, fruits, oils, and other products of Spain. The town of Santa Maria, opposite Cadiz, is the principal depot of the wines of Xeres. Notwithstanding the political agitations of recent years, the commerce of Cadiz has continued comparatively prosperous. Cadiz was founded by the Phœnicians about 1100 B.C., and subsequently belonged in succession to the Carthaginians and the Romans. It was taken by the Earl of Essex in 1596, and from its bay Villeneuve sailed previous to the battle of Trafalgar in 1805. In 1809 it became the seat of the central junta, and afterward of the Cortes. It sustained a long blockade from the French (1810-12), which was not raised till after the battle of Salamanca. In 1823 the French entered it after a short siege. An insurrection occurred in Cadiz in 1868, and the town was declared in a state of siege in December, but in the following January the siege was raised. Pop. (1897) 70,177.

Cadiz, Ohio, a village and county-seat of Harrison County, about 25 miles northwest of Wheeling, W. Va., and 120 miles east northeast of Columbus. Cadiz has commercial interests of some importance, and is the commercial center of a great wool-growing district. It is also noted as a banking centre. Cadiz was the home of Edwin M. Stanton (q.v.). Pop. (1900) 1,755.

Cadmea, the name given to the acropolis of Thebes, Bœotia, because it was said to have been founded by Cadmus. Only fragments of its walls remain.

Cadmia, a name used by early writers (1) for the mineral calamine (q.v.); and (2) for the sublimate of zinc oxide that often collects on the walls of furnaces used in the reduction of metallic ores, when those ores happen to contain zinc.

Cad'mium, a metallic element resembling zinc in its chemical properties, and discovered by Stromeyer in 1817, in a specimen of zinc carbonate. Cadmium often occurs in ores of zinc to a small extent, blende sometimes containing as much as 3 per cent of cadmium sulphide. The commercial supply of the element is obtained as a by-product in the smelting of zinc, chiefly in Belgium and Silesia. Cadmium sulphide also occurs native as the mineral greenockite (q.v.), otherwise known as "cadmium blende." In the distillation of zinc ores the cadmium, being more volatile, passes over first; and advantage is taken of this fact for the isolation of the metal in the arts. In Silesia, where the zinc ores often contain considerable quantities of cadmium, the first portion of the distillate is likely to contain as much as from 3 to 10 per cent of cadmium. This is mixed with coal or charcoal and redistilled at a low, red heat. Cadmium, mixed with a little zinc,

passes over; and by one more distillation the metal is obtained in a fairly pure form. To eliminate the last traces of zinc, the crude metal is dissolved in hydrochloric acid, and its sulphide is then dissolved in concentrated hydro-æ current of sulphuretted hydrogen. The sulphide is then dissolved in concentrated hydrochloric acid, and the subsequent addition of carbonate of soda precipitates the carbonate of cadmium, which is reduced to the oxide upon ignition. The pure oxide thus obtained may then be reduced to the metallic form by distillation with charcoal.

Metallic cadmium is lustrous and resembles tin in appearance, though it has a bluish tinge. It is stronger than tin, but, like that metal, it emits a peculiar crackling sound, or "cry," when bent. At ordinary temperatures it is quite ductile and malleable, and may be drawn into thin wire, rolled into thin sheets, or hammered into foil. At about 175° F. it becomes brittle, however, so that it can be pulverized in a mortar. Cadmium has the chemical symbol Cd. Its specific gravity is about 8.65. It melts at 600° F., and boils at about 1,500° F., yielding a yellow vapor. Its atomic weight is 112.4 if O=16, or 111.6 if H=1. Its specific heat is about 0.055, and its linear coefficient of expansion is about 0.0000185 per Fahrenheit degree. Metallic cadmium is used to a limited extent in the preparation of alloys, its general effect being to reduce the melting-point of the alloy to which it is added. The total production of the metal per annum is probably about two tons.

In its chemical relations, cadmium, like zinc, is a dyad. Metallic cadmium undergoes a slow, superficial oxidation upon exposure to the air; and when sufficiently heated in the presence of air it oxidizes rapidly and may even take fire. The resulting oxide, CdO, is brown in color and readily dissolves in acids, with the production of the corresponding cadmium salts. One of the best known of these salts is the iodide, CdI₂, which is used in photography and in medicine, and may be obtained by the action of hydriodic acid, HI, upon cadmium carbonate, or metallic cadmium. The bright yellow sulphide, CdS, is formed when the stream of sulphuretted hydrogen gas is passed through a slightly acid solution of a cadmium salt; and this fact is used in the detection and isolation of cadmium in qualitative analysis. The sulphide is used as a pigment, under the name of "cadmium yellow"; it is brilliant in color, and does not change upon exposure to air or light.

Cad'mus, in Greek mythology the son of Agenor and grandson of Poseidon. With his brothers he was sent by his father to seek for his sister, Europa, who had been carried away by Zeus, and he was not to return without her. After several adventures, the oracle at Delphi commanded him to desist from further search, to intrust himself to the guidance of a heifer, and where she should stop to build a city. He accordingly went to Bœotia, where he wished to sacrifice the cow to Athena. But his companions, attempting to bring water from the fountain of Ares for the purpose of the sacrifice, were slain by the dragon that guarded it. Cadmus killed the dragon, and, at the command of Athena, sowed its teeth in the earth; armed men immediately sprang up, whom he

called Sparti (the sowed), but who perished in a contest with each other, excepting five. With the remainder he built the city of Cadmea or Thebes (see THEBES). He became by his marriage with Harmonia the father of Antiope, Ino, Semele, Agave, and Polydorus. After ruling for a time the city which he had built, and the state which he had founded, he proceeded, at the command of Bacchus, with Harmonia to the Enchelæ, conquered their enemies, the Illyrians, became their king, and begat another son, Illyrius. Tradition states that Cadmus came to Bœotia from Phœnicia, 1550 B.C., conquered the inhabitants who opposed him, and, in conjunction with them, founded the above-mentioned city. To promote the improvement of his subjects he taught them the Phœnician alphabet, the employment of music at the festivals of the gods, besides the use of copper, etc. Another Cadmus, of Miletus, a son of Pandion, was regarded among the Greeks as the first who wrote in prose. He lived about 600 B.C.

Cadogan, George Henry (5TH EARL), English statesman: b. Durham, 12 May 1840. He was educated at Christ College, Oxford, and entered Parliament as member for Bath in 1873, becoming under-secretary for war in 1875, and under-secretary for the colonies, 1878-80. He was lord privy seal, 1886-95, and lord-lieutenant of Ireland, 1895-1902.

Cadol, Victor Édouard, vĕk-tōr ěd-oo-ărd ka-dōl, French dramatist: b. Paris 1831; d. 1898. He was long prominent as a journalist, being on the staff of 'Le Temps' and one of the founders of 'L'Esprit Français.' Among his very numerous works, many of which were written in collaboration, are 'Les ambitions of de M. Fauvel' (1867); 'Thérèse Gervais' (1893); 'L'archiduchesse' (1897). A corrected edition of his dramas appeared in 1897 entitled 'Théâtre inédit.'

Cadoolbergia Wood. See EBONY.

Cadore, kā-dō'rā, or **Pieve di Cadore**, a town of Italy, in the province and 22 miles north-northeast of the town of Belluno, on the Piave, derives its chief interest from being the birthplace of Titian.

Cadorna, Raffaele, răf-fă-ěl' kā-dōr-na, Italian general: b. Milan 1815; d. Turin 6 Feb. 1897. He served in the Crimean war, and in 1860 was made war minister in Tuscany's provisional government, and military commandant of Sicily in 1866. He suppressed the Bourbon insurrection in Palermo in the latter year, and in 1870 captured Rome and was its military governor for a time. In 1871 he entered the Italian Senate. He was the author of 'La liberazione di Roma nel 1870' (1889).

Cadoudal, Georges, zhōrzh kā-doo-dal, French Chouan chief: b. Brittany, 1 Jan. 1769; d. Paris, 25 June 1804. In the protracted and sanguinary contests between the Royalists and Republicans during the French Revolution, the Chouans and Vendéans were the most resolute supporters of the Royal cause; and the energy and ability of Cadoudal soon raised him to an influential place among the adherents of the house of Bourbon. At this time attempts were made by Napoleon to gain over Cadoudal to the cause of the republic, and a lieutenant-generalship in the army was offered as the price of his submission; but he firmly declined all these overtures. He afterward engaged, in con-

cert with Gen. Pichegru and others, in a conspiracy having for its object the overthrow of the consular government and the restoration of the monarchy; which being discovered, Cadoudal was arrested, and executed. See CHOUANS.

Caduceus, ka-dū'se-ūs, the staff considered as a symbol and attribute of the Greek god Hermes and the Roman god Mercury. It is generally represented as having two serpents twined around it in opposite directions, their heads confronting one another. It is probable that the staves carried by heralds and public criers gave rise to this fable, the fluttering ribbons or fillets tied to the end of the staff, or the green wreaths or boughs which were tied around it, giving the suggestion of the presence of living serpents. Several different fables were invented by late Greek writers to account for the serpents in a miraculous way. The fable tells that Apollo gave his staff to Mercury in consideration of his resigning to him the honor of inventing the lyre. As Mercury entered Arcadia with this wand in his hand he saw two serpents fighting together; he threw the staff between them, and they immediately wound themselves around it in friendly union. The caduceus is Mercury's peculiar mark of distinction. With this he conducted the shades to the lower world, and from it received the name of Caducifer; yet we find it on ancient coins in the hands of Bacchus, Hercules, Ceres, Venus, and Anubis. Among the moderns it serves principally as an emblem of commerce.

Cadwalader, kād-wōl'ă-dēr, **George**, American lawyer and soldier: b. Philadelphia, 1804; d. there, 3 Feb. 1879. He practised law till 1846; was made brigadier-general of volunteers; and won distinction at Chapultepec. He resumed his law practice till 1861; became major-general of State volunteers; was placed in command at Baltimore; accompanied Patterson's expedition to Winchester (1861); and, as one of a military board, directed the United States army operations.

Cadwalader, John, American soldier: b. Philadelphia, 10 Jan. 1742; d. Shrewsbury, Pa., 10 Feb. 1786. At the outbreak of the Revolution he was placed in command of a battalion and soon became brigadier-general. He fought at Trenton, Brandywine, Germantown, and Monmouth. In 1777 he organized the militia of eastern Maryland. In 1778 he challenged and wounded Thomas Conway for plotting against Washington. His daughter became, in 1800, the wife of Lord Erskine.

Cæcilian, sĕ-sil'ĭ-an, a member of a family of batrachians, the *Caciliida*, regarded as forming an order, called Apoda, or Gymnophiona. They are long, worm-like animals, lacking all traces of limbs, and having only a rudiment of a tail. There may be as many as 250 vertebræ. The hinder end is blunt and hardly to be distinguished from the head. The body is covered with a soft, moist skin, and the jaws are armed with rather feeble teeth. These animals are found in the tropical parts of America, Africa, and Asia, where they burrow like earthworms, which they resemble. They are often found in the nests of ants, which they devour. They also feed on worms. The breeding habits of these creatures are very interesting, but are not well understood. The eggs are laid either

in the water or near it. One species found in Ceylon lays a mass of eggs which are connected by a cord, thus resembling a string of beads. They are deposited in a burrow near the water, and are incubated by the mother until the escape of the young. About 30 species of these animals are known.

Cæcilius Statius, sē-cīl'ī-ūs stā'shī-ūs, Roman comic poet: b. Milan, about 200 B.C.; d. 168 B.C. His contemporaries ranked him with Plautus and Terence. He wrote over 30 comedies of which fragments remain.

Cæculus, sæk'ū-lūs, in mythology, a son of Vulcan, and a great robber, who lived in Italy, and built Præneste.

Cæcum, sē'kūm, a blind process or sac in the alimentary canal of various animals. In fishes the cæca are often numerous and long; and birds have generally two near the termination of the intestines. Mammals have commonly only one. In man the "blind-gut" is small and situated at the beginning of the colon. See INTESTINE.

Cædmon, käd'món, the first Anglo-Saxon poet: d. 680. According to Bede's 'Ecclesiastical History' Cædmon was a swine-herd to the monks of Whitby, and never gave evidence of any poetical talent until one night a vision appeared to him, and commanded him to sing. When he awoke, he found the words of a poem in praise of the Creator of the world impressed upon his memory. This manifestation of talent obtained for him admission into the monastery at Whitby, where he continued to compose devotional poems. An edition of his paraphrase of parts of the Scriptures was printed at Amsterdam in 1655, edited by Junius. Thorpe published an edition of it (London 1832) for the Society of Antiquaries. It has been assumed by some that Milton took some ideas of 'Paradise Lost' from the poems of Cædmon. It is certain that they were very popular among the English and the Saxon part of the Scottish nation, and furnished plentiful materials to the makers of mysteries and miracle plays. In the Bodleian Library at Oxford is a manuscript the contents of which are ascribed to Cædmon, but the best authorities do not consider it to be his. Consult: Ten Brink, 'Early English Literature'; Morley, 'English Writers,' Vol. II. (1888).

Cælius Aurelianus, sē'lī-ūs ô-rē-lī-ā'nūs, Latin physician, generally supposed to have been a native of Numidia, and to have flourished in the 2d century of the Christian era. He was a member of the sect of the Methodici, and the author of a medical work still extant. In this work, 'De Morbis Chronicis et De Morbis Acutis,' Cælius divides diseases into two great classes, the acute and the chronic.

Cælius Mons, sē'lī-ūs mōns, one of the seven hills on which Rome was built. It is said to have received its name from Cælius Vibenna, an Etruscan, to whom it was assigned. The palace of Tullus Hostilius was on this mount. It is at present covered with ruins.

Caen, kæn, France, a town in the department Calvados, and the ancient capital of Normandy, 125 miles northwest of Paris, and about nine miles from the mouth of the Orne, which is here navigable and crossed by several bridges. There is a dock connected with the sea by both river and canal. Caen is the centre of

an important domestic trade, the market of a rich agricultural district, and carries on extensive manufactures. The streets are broad, regular, and clean, the houses well-built of white freestone, and it possesses various ancient and remarkable edifices. The public promenades and recreation grounds are beautiful, and there are various extensive squares and "places." The church of La Trinité, a fine edifice in the Norman-Romanesque style, restored in modern times, was formerly the church of the Abbaye-aux-dames, founded in 1066 by Matilda, wife of William the Conqueror. The church of St. Stephen was founded at the same time by William the Conqueror, as the church of the Abbaye-aux-hommes, and though considerably modified since it is a noble and impressive edifice. It has two fine western towers 295 feet high. The Abbaye-aux-hommes, built by the Conqueror, who was buried in it, is now used as a college, having been rebuilt in the 18th century. One of the finest churches in Caen is that of St. Pierre, whose tower (235 feet), terminated by a spire, is exceedingly elegant. Among other public buildings are the Hôtel de Ville, the prefecture, and the palace of justice. Caen possesses a university faculty or college, a public library with some 100,000 volumes, a gallery of paintings with valuable works of old masters, a natural history museum, an antiquarian museum, etc. The hospital of the Abbaye-aux-dames is one of the best regulated in France. The hospital of the Bon-Sauveur is another admirable institution. The city was formerly fortified, and there are remains of a castle begun by William the Conqueror and finished by Henry I., but since much altered and now used as barracks. Caen first rose into importance in the time of William the Conqueror. In 1346 it was taken by Edward III., at which time it was said to be larger than any city in England except London. Henry VI. of England founded a university here in 1431, Caen having been in the possession of the English from 1417 to 1450. It suffered much in the religious wars between the Protestants and Roman Catholics of France. Admiral de Coligny captured it for the Protestants in 1562. Caen carries on ship-building, and its manufactures embrace linen, woolen, and cotton goods, lace, ropes, metal goods, and various other articles. It carries on a considerable trade in timber and other articles, including agricultural produce exported to England, to which also is still exported the Caen building stone famous for many centuries. Malherbe, Laplace, Elie de Beaumont, and Auber were born in this city or in its vicinity, and are commemorated by statues. Pop. (1901) 44,524.

Caen-stone, a cream-colored oolitic limestone from Caen in Normandy, identical with the Bath oolite of England. It is easily carved and has long been highly esteemed as a building stone. Westminster Abbey, Canterbury Cathedral, and other English churches are built of it.

Cænopus, sē'nō-pūs, a genus of fossil rhinoceroses of the Oligocene Epoch in North America. This animal was hornless, smaller and less heavily proportioned than any living species, the Sumatran rhinoceros coming nearest to it in this respect.

Cænotherium, sē-nō-thē'rī-ūm, an extinct primitive ruminant, characteristic of the Oligocene formations of Europe. It was no larger

than the modern chevrotain of Java and had many archaic characters, the four-toed feet, short skull, and complete series of 44 teeth being the most remarkable. See RUMINANTS, FOSSIL.

Caernarvon, kâr-nâr'vôn. See CARNARVON.

Cærula'rius, Michael, Greek ecclesiastic, the Patriarch of Constantinople, 1043-9. By dispensing with the Latin ritual in many churches of Bulgaria and protesting against the use of unleavened bread by the Latins in the Eucharist, he completed the division between the Latin and the Greek communions. He was formally excommunicated by Pope Leo IX.

Cæsalpinieæ, sës-äl-pîn'î-ë, a subdivision of the natural order of plants *Leguminosæ*, containing several genera. The botanical characteristics of the sub-order are: calyx in five divisions, joined together at different points, or often cleft to the base, with prefloration imbricated or valvular; petals equal or fewer in number; stamens often not symmetrical to the other parts of the flower, or very irregular, sometimes very numerous, sometimes partly abortive, rarely regular; very often free, or lightly joined together at the base only; ovaries raised on a free support, or joined in part to the calyx and becoming legumes, which sometimes contain only one single or double ovule, and of which the pericarp may have a fleshy consistence; seeds without perisperm; embryo often straight; stalk arborescent or fruticose, sometimes creeping; leaves simple, or more frequently compound; in the latter case frequently bipinnate. The typical genus is *Casalpinia*, to which belong the Brazil-wood, Sapan-wood, Nicaragua-wood, etc.

Cæsalpinus, Andreas, äü'drâ-as sës-al-pî'nûs, or **Andrea Cesalpino**, Italian physiologist: b. Arezzo, Italy, 1519; d. 23 Feb. 1603. He is first mentioned in public life as a professor of botany in the University of Pisa. He was subsequently made chief physician to Clement VII., and lived during the remainder of his life at Rome. He published works upon botany, mineralogy, medicine, and the highest questions of philosophy. In his first publication, entitled 'Speculum Artis Medicæ Hypocraticum,' his knowledge of the system of the circulation of the blood is stated in the clearest manner. The following passage is taken from the second chapter of its first book: "For in animals we see that the nutriment is carried through the veins to the heart as to a laboratory, and its last perfection being there attained, it is driven by the spirit which is begotten in the heart through the arteries and distributed to the whole body." The system accepted since the time of Harvey could hardly be more definitely or accurately stated. His philosophical speculations are contained mainly in his 'Questiones Peripateticæ.' The philosophy of Cæsalpinus was scholastic Aristotelianism, with a leaning toward some of the methods and doctrines of the later transcendental or absolute systems. He reduces the world to the simplicity of two only substances, God and matter, and he makes all finite intelligences, all human, angelic, and demoniac souls, to belong to the latter element. Two things are remarkable about his system: (1) the boldness of speculation, unparalleled in his age, with which he seeks a purely scientific view of the universe; and (2) its entirely materialistic character. But

more important than either his anticipation of Harvey's discovery, or his speculative opinions, were his botanical labors. He was styled by Linnæus the first orthodox or systematic botanist, and his work on plants was a hand-book to Linnæus in all his classifications. Botany in the time of Cæsalpinus was the popular witchcraft: as a science, it consisted in a mass of erudition about the imaginary but marvelous virtues of plants. Cæsalpinus sought successfully to transfer it from the realm of magic to that of science. He proposed the basis of classification upon which the whole system of Linnæus rests, namely, the distinction of plants in their parts of fructification. He lived quietly to an old age at Rome, submitting all his speculations to the supremacy of the Church, and presenting in his life an example of every virtue.

Cæsar, the name of a patrician family of the Julian gens, tracing its origin to Julius, the son of Æneas. The first member of the family who occurs in history with the surname of Cæsar was Sextus Julius Cæsar, prætor, 208 B.C. Cæsar was the family name of the first five Roman emperors. With Nero the imperial family became extinct (68 A.D.), and Cæsar became merely a title of dignity. The emperor, who bore the title of Augustus, appointed his successor, with the title of Cæsar. On medals and monuments we find the title Cæsar preceding the name of the emperor, as "Imp. Cæsar Nerva Trajanus Augustus," and following that of the designated successor, as "Marc. Aurel. Antonin. Cæsar." In the lower Greek empire, a new dignity of Sebastocrator was conferred, and that of Cæsar became the third rank in the state. From Cæsar are derived the German "kaiser" and the Russian "czar."

Cæsar, Gaius Julius, the greatest representative of the genius of Rome, a man of consummate ability alike as a general, a constructive statesman, and a writer. He was born, according to all the ancient authorities, 12 July 100 B.C., but Mommsen, in his 'History of Rome,' has made it probable that the year should be given as 102. Of purest patrician ancestry, and with a family tradition intimately associated with the rule of the senatorial oligarchy, he was yet, from early youth, a champion of the popular party. His aunt Julie had married Marius, and when, upon the latter's death in 86, Cinna became the leader of the Populares, Cæsar entered into intimate relations with him and in 83 married his daughter Cornelia. But the following year Sulla returned from the East and overwhelmed the foes of the senate. A reign of terror for the Marian party followed. With characteristic boldness, Cæsar refused to divorce his wife at the order of the dictator, and lost, in consequence, his property, his position as priest of Jupiter, and almost his life. The famous story that Sulla pardoned him with the remark that "he would one day be the ruin of the aristocracy, for in him there was many a Marius," though vouched for by both Suetonius and Plutarch, seems strikingly inconsistent with Sulla's usual remorseless logic. Partly to avoid further trouble, and partly to gain that military experience which was at Rome deemed a prerequisite to an official career, he now went to Asia, and, as a staff officer, served with distinguished bravery at the siege of Mytilene, and afterward against the pirates in Cilicia, but re-

turned home upon receiving news of Sulla's death in 78. As pleading in the courts was the natural avenue to popular favor, we presently find him acting as prosecutor in two cases involving extortion in provincial administration. But the culprits, Dolabella and Antonius, belonged to the senatorial order, and his eloquence, though it won applause, failed to move juries composed of senators. He determined to perfect himself in oratory by studying under the most famous teacher of the age, Apollonius Molo of Rhodes. On the way thither he fell into the hands of pirates near Miletus, and was held for a ransom of 50 talents (over \$55,000). During a stay of almost 40 days he won the admiration of his captors by his coolness and wit, and laughingly promised to crucify them all as soon as he should obtain his freedom, a threat which he promptly carried out to the letter. He studied under Molo only a short time, however, for the renewal of hostilities by Mithridates against the Roman province of Asia brought him into the field with some hastily levied troops, and, after brief but effective service, he returned to Rome in the winter of 74-73. He had been elected pontifex in his absence, and now took part, with the utmost energy, in the attempts that were being made to overthrow the Sullan constitution. This was accomplished in the year 70, though in a totally unexpected manner, by the legislation of Pompey and Crassus, both of whom had, previous to that time, been supporters of senatorial prerogative. Meanwhile Cæsar, by his unflinching courtesy and good will, and a lavish generosity that soon plunged him deep into debt, had been winning all hearts. In 69 he was elected quaestor, and was assigned to the province of Further Spain. But before his departure he lost his aunt Julia and his wife Cornelia. At the former's funeral he caused busts of Marius to be carried in the procession, to the great delight of the populace, and in the two memorial addresses which he delivered in the forum he eulogized the aims and leaders of the people's party. In Spain he must have noted with appreciation the work of the great Marian general, Sertorius, the first man who tried to Romanize the provincials. Upon his return, in 67, he entered into friendly relations with Pompey, and supported the Gabinian and Manilian laws, by which the latter was to receive the supreme command against the pirates and Mithridates, with powers unprecedented in the history of the republic. In 65 he was ædile, and met the demands of his office with unheard-of magnificence in buildings and games. In particular, he stirred the people to frantic enthusiasm by secretly erecting in the capitol new trophies of Marius, to replace those which Sulla had destroyed. In 63 he was chosen pontifex maximus, an office of great prestige and prominence in a state in which religion and politics had always been closely associated. That he had knowledge of the Catilinarian conspiracy of this year is by no means unlikely. But he took no part in it, and the aristocracy was unable to persuade Cicero to include him in the list of the conspirators. In 62 he was prætor, and in the following year went as governor to Further Spain, where for the first time he commanded an army and became conscious of his military genius. Toward the end of 61 Pompey returned to Rome, a victor over the entire East,

but was coldly received by the distrustful senate, which refused to ratify his acts in Asia and to make the assignments of lands promised to his veterans. Cæsar, returning from Spain, seized his opportunity, and about the time of his election to the consulship, reconciled Pompey and Crassus, whose enormous wealth made him indispensable, and formed with them the so-called First Triumvirate. The alliance was strengthened by the marriage of Pompey with Cæsar's daughter Julia. During his consulship in 59 Cæsar carried, among other measures, a popular agrarian bill, the ratification of Pompey's acts, and a stringent law against extortion in the provinces, while he won to his support the whole equestrian order, to which the collectors of the public revenues belonged, by modifying the terms of their last contract with the state. His popularity enabled him to secure the assignment to himself for five years (subsequently increased to 10) of the provinces of Cisalpine Gaul, Illyricum, and Transalpine Gaul, together with four legions. The following eight years (58-51) witnessed those brilliant campaigns which ended in the complete subjugation of Gaul, and its acceptance of the laws, language, and civilization of Rome. The first three years of war brought all Gaul to his feet, but the love of liberty was still too strong in this brave people, and dangerous revolts broke out year after year. In 55 he crossed the Rhine on the famous bridge, and later made his first expedition to Britain, which he invaded again the following year. Finally, in the winter of 53-52, Vercingetorix, Gaul's greatest hero, and a born leader of men, organized a general uprising of all the tribes. The flame of insurrection swept over the whole country. The campaign culminated in the siege of Alesia (Aise in Burgundy), an almost impregnable fortress into which the Gallic chieftain had thrown himself with 80,000 men. Cæsar invested the place with less than 60,000, and was presently himself invested by an enormous army of relief, estimated at over 240,000 men. But he completely routed this vast host, and Vercingetorix, worn out by hunger, surrendered. By the end of the following year Cæsar was at last able to address himself to the peaceful organization of the new territory.

At Rome, however, a crisis was imminent. The ties between Cæsar and Pompey were being rapidly dissolved. The death, in 54, of Julia, Pompey's wife and Cæsar's daughter, was followed in 53 by the defeat and death of Crassus in the Parthian war. Pompey became more and more jealous of his rival's military glory, and the senate, resolved to crush Cæsar at any cost, and itself unable even to keep order in the streets of Rome, made friendly overtures to Pompey, and in 52 made him sole consul, with practically the powers of a dictator. Cæsar's term of office would expire on 1 March 49. It was essential to his safety that he should retain his provinces and his army until after he should be elected consul for 48. But the aristocracy was plainly determined that there should be an interval during which he would be a mere private citizen, defenseless against the attacks of his enemies. It is certain that Cæsar acted with great moderation, even sending to Italy two of his legions which the senate declared were needed for the war in the East, but which, as he had foreseen, were instead placed in camp

at Capua. At length, in January 49, the decisive step was taken. The senate ordered Cæsar to lay down his command on pain of being proclaimed a public enemy. The tribunes of the people, Antony and Quintus Cassius, who had in vain interposed their veto, fled to him for protection in their inviolable office, Cæsar with a single legion crossed the Rubicon, the frontier stream of Italy, and war was begun.

In the ensuing five years, all that remained for him of life, the amazing energy and resourcefulness of this extraordinary man are most impressively displayed. In three months, without striking a blow, he was master of Italy, and Pompey, with a small force, barely escaped from Brundisium across the Adriatic. Cæsar had no ships on which to follow him, and, besides, the veteran Pompeian forces in Spain must be crushed before they could join their commander. Accordingly, after first securing, through his lieutenants, Sicily and Sardinia, he crossed the Pyrenees into Spain, and, in a brief campaign of 40 days, perhaps the most brilliant in all his career, extricated himself from apparently certain destruction, and forced the surrender of the entire opposing army. All Spain now declared for him. On his way back he received the submission of Massilia (Marseilles), which had been besieged by Decimus Brutus and Trebonius. Eleven days were spent in Rome in administrative work, and early in January 48 he crossed the Adriatic and proceeded to invest Pompey, near Dyrrachium, now Durazzo. But his force was quite insufficient, and, to deprive his foe of the advantage of the sea, he retreated into Thessaly, whither Pompey followed him, and the decisive battle was fought on the plain of Pharsalus, 9 Aug. 48. Pompey had 47,000 infantry and 7,000 cavalry; Cæsar only 22,000 infantry and 1,000 cavalry. But the latter's army was composed of veterans, and numbers did not avail. Pompey fled to Egypt, where he was brutally murdered. Cæsar, who had followed him with all speed, was nearly trapped in Alexandria by the forces of the young king Ptolemy, but ultimately, upon the arrival of reinforcements, defeated them, and set Cleopatra upon the throne. He then passed through Syria and Asia Minor, putting affairs on a permanent basis, and incidentally defeating Pharnaces, a son of the great Mithridates. The victory was announced in the famous despatch, "*Veni, vidi, vici*" ("I came, I saw, I conquered"). Upon his return he announced his intention of pardoning all who had fought against him. In December he left Rome for Africa, where the campaign against the Pompeians, commanded by Scipio and Cato, ended in a sweeping victory at Thapsus, 6 April 46. Cato, unable to defend Utica, committed suicide. Cæsar returned to Rome in June, and, after celebrating his victories over the Gauls, Egyptians, Pharnaces, and Juba, king of Numidia, who had fought against him at Thapsus, by four magnificent triumphs, flung himself into the work of legislation. Among his reforms was the placing of the calendar, for the first time, upon a scientific basis. But these labors were interrupted by a dangerous revolt in Spain, headed by Pompey's sons, and the campaign against them, ending in the hard-fought battle of Munda, 17 March, and the final settlement of affairs in Spain, necessitated his absence from Rome from the end of 46 to September 45. The

senate welcomed him upon his return with the most servile flattery. He was already tribune for life; he was now made, for life, dictator and *praefectus morum*, a new term for the censorship, his head was stamped on the coinage, the month of Quintilis was renamed Julius, and he was given divine honors. With absolute power thus lodged in his hands, he set about the permanent reconstruction of the government and the social fabric. He made the senate a much larger and more representative body; increased the number of magistrates, reduced by one half the recipients of the donation of grain, passed several laws in the interest of the debtor class and of Italian agriculture, prohibited farming by slave labor exclusively, inaugurated a far-reaching plan to colonize in the provinces the unemployed population of Rome and Italy, and laid a legal foundation for the principle of limited local self-government of all Roman communities, wherever they might be. He had in mind, but did not live to carry out, the codification of the laws, the building of public libraries, the draining of the Pontine marshes, the making of a canal through the Isthmus of Corinth, and the taking of a general census which should form a just basis for the imposition of taxes throughout the empire.

But he had risen too high to escape hatred. The plot to assassinate him probably originated in the personal spite of Gaius Cassius, but many of the conspirators, in particular Marcus Brutus, were foolish enough to believe that by the death of the dictator the republic could be restored. On 15 March 44 B.C., at a meeting of the senate held in the hall attached to Pompey's theatre, he fell at the feet of his great rival's statue, pierced by 23 wounds.

In studying Cæsar's life, one is especially struck by three points: his sane perception of the concrete fact, his indomitable energy, and his many-sidedness. More clearly than any other man of that time, he saw that the senatorial oligarchy had been proven wholly incompetent to govern a great empire, and that the problem could be solved only by the concentration of all power in the hands of a single man. Augustus cautiously veiled the change to monarchy; Julius bluntly called things by their real names and paid the penalty with his life. He was an able orator, but of his speeches, warmly praised by Cicero and Quintilian, none has come down to us. A treatise on grammar and one on astronomy have also perished. But his enduring fame as a writer rests upon the seven books of 'Commentaries on the Gallic War' (the eighth book is by Aulus Hirtius) and the three books of 'Commentaries on the Civil War.' The former, essentially a political document, published in 51 B.C., is unsurpassed in its succinct simplicity and strength.

Bibliography.—The principal ancient authorities are the biographies of Plutarch and Suetonius, Cicero's 'Letters,' Sallust's 'Catiline,' Cæsar's own 'Commentaries,' and the Roman histories of Velleius Paterculus, Appian, and Dion Cassius. Mommsen's account in his 'History of Rome' is brilliant but over-enthusiastic. The following books may be recommended: Fowler, 'Julius Cæsar and the Foundation of the Roman Imperial System' (New York 1899); Dodge, 'Cæsar' (Boston 1892); Froude, 'Cæsar' (New York 1884); Napoleon III. 'Histoire de Jules Cæsar' (English translator

New York 1865); continued by Stoffel, 'Histoire de Jules César; la guerre civile' (Paris 1887); Holmes, 'Cæsar's Conquest of Gaul' (London 1899).

NELSON G. MCCREA,

Professor of Latin Literature, Columbia University.

Cæsarea, ses-ā-rē'a, the ancient name of many cities: (1) CÆSAREA PHILIPPI, or PANEAS, named after Philip, tetrarch of Galilee, son of Herod the Great, who founded it in 3-2 B.C., near the source of the Jordan. It is mentioned twice in the Gospels. On its site is the small modern village of Banias. (2) CÆSAREA PALESTINÆ or STRATONIS, on the shores of the Mediterranean, about 55 miles northwest from Jerusalem. It was built with great magnificence by Herod the Great, and became the metropolis of Palestine, and the seat of the Roman proconsul, as well as a busy seaport. It was the place where Herod Agrippa was smitten by the angel (Acts xii: 20-23), where Cornelius the centurian resided (x.), and St. Paul was imprisoned two years (xxiii.-xxv.). It was a place of some importance during the Crusades, but is now a scene of ruin and of utter desolation. Eusebius was bishop of Cæsarea. (3) The ancient capital of Cappadocia in Asia Minor, originally called Mazaca, and now Kaisarieh. It is situated in the southeast of the vilayet of Angora, at the foot of the Erjish Dagh, about 160 miles to the southeast of the town of Angora. It was once supposed to contain 400,000 inhabitants. It has now about 70,000 inhabitants, and its position makes it a place of considerable trade. The manufacture of carpets, though of quite recent introduction, is of some importance. Foreign goods are received by way of the railway from Angora to Constantinople. The name Cæsarea dates from the time of Tiberius, and under Valerian the city was captured by Sapor, when a large number of its inhabitants were slain.

Cæsarean Operation, a surgical operation, which consists in delivering a child by means of an incision made through the walls of the abdomen and womb. There are three cases in which this may be necessary: first, when the child is alive and the mother dead, either in labor or in the last two months of pregnancy; second, when the child is dead, but cannot be delivered in the usual way on account of the deformity of the mother or the disproportionate size of the child; and third, when both mother and child are living, but delivery cannot take place from the same causes as in the second case. In many instances both mother and child have survived this critical operation; and cases are known in which it has been successfully performed by the mother herself. The etymology of the name is doubtless from the Latin verb *cadere*, to cut; though a popular myth attributes it to Julius Cæsar, who, according to Pliny, was brought into the world in this manner. The operation appears to have been known from ancient times. See SURGERY.

Cæsa'riön, the son of Julius Cæsar and Cleopatra, put to death by order of Augustus.

Cæsa'rius, Saint, of Arles, French prelate of the 6th century, consecrated Bishop of Arles in 502. Before the general adoption by monastic orders of the Rule of Saint Benedict his *Regula Duæ* formed a standard of discipline much esteemed by the founders of orders.

Cæsarius of Nazian'zus, Christian scholar of the 4th century. From Alexandria, where his education was received, he went to Constantinople and rose to distinction as a mathematician and physicist. In the Latin editions of Saint Gregory are four dialogues ascribed to him, and he is also credited with a work styled 'Contra Gentes.'

Cæsar's Commentaries. This great work contains the narrative of Cæsar's military operations in Gaul, Germany, and Britain. It was given to the world in the year 51 B.C. Every victory won by Cæsar had only served to increase the alarm and hostility of his enemies at Rome, and doubt and suspicion were beginning to spread among the plebeians, on whom he chiefly relied for help in carrying out his designs. When public opinion was evidently taking the side of the Gauls and Germans the time had come for Cæsar to act on public opinion. Hence the 'Commentaries,' a hasty compilation made from notes jotted down in his tent or during a journey. As to its truthfulness we cannot decide absolutely, the Gauls not having written *their* commentaries. But if Cæsar sinned in this respect, it was probably by omission, not by commission. Things the Romans might not like he does not mention: the sole aim of the book is to gain their suffrages. There is no allusion to the enormous fortune Cæsar acquired by plunder. On the other hand, he speaks of his cruelties—for instance, the killing in cold blood of 20,000 or 100,000 prisoners—with a calmness that to us is horrible, but which the Romans would deem natural and proper.

Cæsars, The Era of, also known as the Spanish Era, a period of time reckoned from 1 Jan. 38 B.C., being the year following the conquest of Spain by Augustus. It was much used in Africa, Spain, and the south of France; but by a synod held in 1180 its use was abolished in all the churches dependent on Barcelona. Pedro IV. of Aragon abolished the use of it in his dominions in 1350. John of Castile did the same in 1383. It was used in Portugal till 1415, if not till 1422. The months and days of this era are identical with the Julian calendar, and to turn the time into that of our era, subtract 38 from the year; but if before the Christian era, subtract 39.

Cæsium, sē'zī-ŭm, a metallic element discovered in 1860 by Bunsen and Kirchhoff, in the form of the chloride, in a mineral spring at Dürkheim, Bavaria. The metal is widely disseminated, but is seldom found in any considerable quantity. It never occurs in the metallic state, but usually as the chloride or oxide, and commonly associated with the rare element rubidium. Its most important source is the mineral pollucite (q.v.), or pollux, which is found on the island of Elba and in the vicinity of Hebron, Me., and which contains as much as 36 per cent of cæsium oxide, with no rubidium. Cæsium forms stable salts, and strongly resembles potassium in its chemical properties. It may be separated from this metal, however, by taking advantage of the fact that cæsium platinochloride is much less soluble in water than the corresponding potassium compound. Metallic cæsium cannot be obtained by reducing the oxide with carbon, but is best prepared by the electrolysis of a fused mixture of the cyan-

ides of cæsium and barium, using aluminum electrodes. It is a silvery white metal, quite soft and ductile, and oxidizing rapidly upon exposure to the air. It also decomposes water with the production of sufficient heat to ignite the liberated hydrogen. Cæsium has a specific gravity of 1.88, and melts at about 80° F. Its chemical symbol is Cs, and its atomic weight is 133 (O=16). Its oxalate and nitrate are used to a limited extent in medicine. The spectrum of cæsium is characterized by two blue lines, from which circumstance the element takes its name (*cæsius*, bluish-gray). It is readily recognized by the spectroscope, and was the first element discovered by that instrument.

Cæstus. See CESTUS.

Cæsura, sɛ-zū'ra (Lat., literally a cutting), in verse, the separation of the last syllable of any word from those which precede it, and the carrying it forward into another foot. The term originally belongs to classical verse, in which the cæsura renders the syllable on which it falls long (if not otherwise so), and is accompanied by a slight pause, hence called the cæsural pause, as in the following line:

Ille latus niveum molli fultus hyacintho.

See RHYTHM, VERSE.

Caf, káf, or **Kaf**, a fabled mountain of the Mohammedans which encircles the whole earth. It is the home of giants and fairies, and rests upon the sacred stone Sakhral, one grain of which gives miraculous powers to its possessor. This stone is of an emerald color, and its reflected light is the cause of the tints of the sky.

Café, ká-fá, a coffee-house, enlarged by American usage to include restaurants of all descriptions.

Caffarelli, François Marie Auguste, frän-swä mä-rē ô-güst káf-fa-rél'lē, French general: b. Falga, Haute-Garonne, 7 Oct. 1766; d. 23 Jan. 1849. At the beginning of the revolution he was employed in the Sardinian army, but joined the army of the republic as a simple dragoon. In 1804 he was charged with the mission to Rome to induce the Pope to come to Paris to perform the ceremony of Napoleon's coronation, and on his return was made governor of the Tuileries. He was wounded at Austerlitz, accompanied Prince Eugene in Italy, and took part in the war in Spain. In 1814 he was chosen by Napoleon to conduct the empress and their son from Paris to Vienna. He retired from public life after the battle of Waterloo.

Caffarelli, Gaetano Majorano, gä-ä-tä'nō mä-yō-rä'nō, Italian vocalist: b. Province of Bari, Italy, 16 April 1703; d. Naples, 30 April 1783. As a boy he was considered the finest soprano of his time, his only possible rival in later years being the famous Farinelli.

Caffarelli du Falga, Louis Marie Joseph, loo-ē mä-rē zhō-zéf káf-fa-rél-lē dü fäl-gä, French general: b. Falga, 13 Feb. 1756; d. Syria, 27 April 1799. He protested against the right of the national assembly to dethrone the king, and was dismissed from the army and imprisoned. Being released and reinstated, he distinguished himself in the army of the Rhine, under Jourdan. He accompanied the expedition of Napoleon to Egypt.

Caffeine, kăff'ē-in, an alkaloid occurring in the coffee bean, and having the formula C₈H₁₀N₄O₂. It is believed to be identical with the alkaloid theine, which occurs in tea, and also with guaranine (the alkaloid of guarana); and it is present in small amounts in cocoa. It may be prepared by adding basic acetate of lead to a strong decoction of coffee or tea until the tannin that is present has all been precipitated, removing excess of lead by a stream of sulphuretted hydrogen, and then evaporating the filtrate until the caffeine crystallizes out. When prepared in this manner caffeine consists of a mass of silky needles which contain more or less water. It is but slightly soluble in water, alcohol, or ether. It has a bitter taste, and although it acts as a weak base its salts are decomposed by water. See also COFFEE.

Caffery, Donelson, American lawyer: b. Saint Mary Parish, La., 10 Sept. 1835; d. 30 Dec. 1906. He was educated at Saint Mary's College, Md., studied law and was admitted to the bar. He served in the Confederate army, 1861-5, was State senator in 1892, and United States senator, 1893-1901. From 1896 his political affiliations were with the Gold Democrats.

Caffi, Ippolito, ip-pō-lē'tō kăff'ē, Italian artist: b. Bulluno, 1814; d. near Lissa, 20 July 1866. He studied in Venice and excelled in matters of perspective and effects of light. Among his chief works are 'Isthmus of Suez'; and 'Carnival Scene on the Piazzetta, Venice' (1855). He was killed on the Italian battleship *Re d'Italia* in a naval battle off Lissa, being present on that occasion with the design of painting a picture of the engagement. He also painted the 'Panorama of Rome.'

Caffyn, Kathleen Mannington (HUNT) ('Iota'), English novelist: b. Waterloo House, County Tipperary, Ireland. She was trained as a hospital nurse, was married to Mannington Caffyn, a surgeon and author, and after his death began novel writing under the pseudonym of 'Iota.' Her first book, 'A Yellow Aster' (1894), attracted much attention. It is a "problem novel" and has been followed by 'Children of Circumstances' (1895); 'A Comedy in Spasms'; 'A Quaker Grandmother' (1896); 'Poor Max' (1898); 'Anne Mauleverer' (1899); 'The Minx' (1900); 'The Happiness of Jill' (1901).

Caftan, kăf'tän, the national garment of the Turks, in the form of a loose gown, generally white, with pale-yellow flowers. It is made of woolen or silk stuff, and sometimes lined with costly fur.

Cagayan, kä-gä-yän', an island of the Philippine group; the largest of six small islets, known as the Cagayan-Sulu group. It is five miles wide and eight miles long. Pop. (1900) 3,500. There are mountains attaining a height of 1,100 feet. The chief products are tobacco and sugar. There are pearl and shell fisheries. Cagayan was sold by Spain to the United States, with Cibitu, in 1900, upon payment of \$100,000, having been inadvertently excluded from the terms of the treaty of peace.

Cage-birds, birds kept in cages for the benefit or enjoyment afforded by their powers of song, beauty of plumage, ability to talk, or companionship. They have been so kept by

CAGLIARI—CAGLIOSTRO

human beings ever since prehistoric times. The first essential for the maintenance of birds in captivity is a cage as large as possible, and as nearly like the bird's original habitat as circumstances permit. Cleanliness is a prime necessity, and the bird should be given a constant fresh supply of water for bathing and drinking purposes, and as much fresh air and light as possible, always, however, avoiding draughts and the sun's direct rays. The food and necessary attention bestowed on the bird vary according to the species.

Birds are captured by means of birdlime or a falling net, but many are taken from their nests when young, and so tamed, or are bred solely for market purposes. An important trade throughout Europe is the rearing of cage-birds, especially German canaries. The best-known songster, and probably the most popular cage-bird, is the common canary (q.v.), originally a native of the Canary Islands. It is typical of captive birds generally, in the marked change produced by captivity and selective breeding, in coloring and size, from that in its original wild state. Other widely known and popular cage-birds are the nightingale, goldfinch, cardinal, mocking-bird, bullfinch, the Indian bulbul, several European thrushes, and others, all of which are fine singers. Among the birds kept because of their beauty are the parrakeets, love-birds, cockatoos, macaws, the whydah-bird, the painted finches, and others. Those imitating human speech are not so plentiful, consisting chiefly of the parrot, of which there are several species, and the starlings, especially the English species, and the Indian mina-bird (qq.v.). Owing to the change of climate, and especially the cold, nine tenths of the African parrots transported to Europe or North America die before learning to speak. It is advisable, therefore, to purchase such birds in the spring, thus giving them a chance to become gradually acclimated.

In the case of all cage-birds most particular attention should be paid to their food, and over-feeding must be especially guarded against. Frequently ailments can be greatly benefited by a fresh supply of food given in smaller quantities. Insectivorous birds are most troublesome to care for in regard to food, as their diet is less easily obtained. In case of inability to procure the accustomed food, finely chopped meat should be substituted, and a reasonable quantity of spiders is always beneficial. The universal and most acceptable food to nearly all birds, however, is canary-seed, with which hemp, rape, or oats may frequently be mixed to advantage. Seed-eating birds should be given such fresh vegetable matter as soft green leaves, chickweed, or lettuce, at regular intervals. Sugar in small quantities is also beneficial, but acid fruits of all kinds should be avoided. A prime necessity in the rearing of cage-birds is something on which the bird may sharpen its bill. This is most easily supplied in the form of sandpaper, or, better, cuttle-fish bone, which is essential to the health of breeding birds. A bird's nails are apt to grow so long as to become troublesome to it, but in clipping them care should be taken to use a sharp pair of scissors, avoiding a possible injury to the foot by twisting. In case of illness due to over-feeding, a drop of castor oil may prove beneficial, especially if it is accompanied by a change of surroundings, quiet, and a simpler diet for a time.

Consult: Bechstein, 'Cage and Chamber Birds'; and Greene, 'Notes on Cage Birds.'

Cagliari, Paolo, pã'ō-lā, käl-yä'rē. See VERONESE, PAOLO.

Cagliari, käl-yä'rē, Sardinia, the capital of the island situated on a hill slope near the south coast. It consists of four parts: (1) the Castle or old town; (2) the Marina; (3) Estempache; (4) the Villa Nuova or new town. It is fortified, and is the residence of the viceroy and of an archbishop, and the seat of a university founded in 1596, and revived and remodeled in 1765. Cagliari has some manufactures, and is the chief emporium of the Sardinian trade. There are dockyards and a spacious and safe harbor. The "Castle" contains some important buildings, including palaces of the nobility. The cathedral, partly faced with marble, was completed in 1312, but afterward modernized. There are some interesting remains of Roman times, including an amphitheatre and ancient dwelling-houses. Cagliari was the residence of the kings of Sardinia from 1798 to 1814. It is connected by railway with the most important Sardinian towns. Pop. (1902) 55,300.

Cagliostro, Allesandro, ä'l-lēs-än'drō käl-yōs'trō (COUNT OF) (real name *Giuseppe Balsamo*), Italian charlatan: b. Palermo, 8 June 1743; d. St. Leon, Italy, 26 Aug. 1795. He entered the order of the Brothers of Mercy, where he found an opportunity to cultivate his talents for medical science, by which he afterward distinguished himself. But as he showed at the same time a great love of dissipation, he was compelled to separate from the order. He returned to Palermo, where, among other tricks, he deceived some credulous persons by his pretended skill in magic and the finding of hidden treasures. He also showed himself adroit in counterfeiting handwriting, and attempted to get possession of a contested estate by means of a forged document, but was discovered and was obliged to flee. He now determined to go to Rome, and in his journey through Calabria became acquainted with Lorenza Feliciani, daughter of a belt-maker, who appeared to him intended by fortune to assist his designs. He formed an intimacy with her, and they began their travels, in which he assumed the character of a man of rank, first appearing under the name of the Marquis Pellegrini, and finally under that of the Count Cagliostro. He traveled through many countries of Europe, stopped in the capital cities, and by his chemical mixtures, his tricks, and by the amours of his companion, gained considerable sums. He knew how to cheat with great ingenuity, and was always fortunate enough to preserve himself by an early flight, if men's eyes began to be opened, or waking justice threatened him with imprisonment. The discovery of the philosopher's stone, the preparation of a precious elixir vitæ, etc., were the pretenses by means of which he extracted considerable sums from credulous people. Many had recourse to his assistance, not indeed to be initiated into the mysteries of magic, but to purchase at a high rate different kinds of medicine, one of which was the water of beauty. This profitable business employed him many years; but his trade in medicine began to grow less lucrative, and he determined to seek his fortune as the founder of a new and secret sect. In pursuance of this plan he passed

himself off during his second residence in London for a freemason, and played the part of a magician and worker of miracles, in which character he drew upon himself the eyes of all the enthusiasts in Europe. The Countess Cagliostro, on her part, did not remain idle. She was the first and most perfect scholar of her husband, and ably played the part of a priestess to this new order. His plan for reviving an old Egyptian order, the founders of which he declared to be Enoch and Elias, contained a mass of absurdities, but his pretensions to supernatural power, the mystery with which his doctrines were enveloped, his pretended ability to work miracles, his healing the sick without pay, with the greatest appearance of generosity, and the belief that, as the Great Kophta (this name he had taken as the restorer of Egyptian masonry), he could reveal the secrets of futurity, gained him many friends and supporters. Cagliostro again traveled through Europe, and attracted great attention in Mittau, Strasburg, Lyons, and Paris. While in this last city (1785) he has the misfortune to be implicated in the scandalous affair of the necklace, and was banished the country as a confidant of Cardinal Rohan. He now returned to London, and sent many epistles to his followers, wherein he bitterly complained of the injury he had received in France, and painted the French court in the blackest colors. From London, where he could not long remain, he went to Basel and other cities in that quarter. But at length, listening to the repeated entreaties of his wife and other friends, he returned (1789) to Rome. Here he busied himself about freemasonry; but being discovered and committed to the Castle of St. Angelo, he was condemned by a decree of the Pope to imprisonment for life as a freemason, an arch heretic, and a very dangerous foe to religion.

Cagnacci, kǎn-yǎ'chē. See CANLASSI.

Cagnola, Luigi, loo-ě'jē kǎn-yō'la, MARCHESE, an Italian architect: b. Milan, 9 June 1762; d. Inveriga, 14 Aug. 1833. He was a member of the State Council, and was much engaged in political affairs. His most celebrated works are the Arco della Pace, "Arch of Peace," commenced in 1807 and finished in 1837; the Porta di Marengo, subsequently called Porta di Ticino (both built by order of Napoleon), at Milan; the Campanile, at Urganò, completed in 1829, and the Mausoleum for the Metternich family.

Cagnoli, kǎn-yō'lē, Antonio, Italian astronomer: b. Zante, Ionian Islands, 1743; d. Verona, Italy, 1816. He was attached in his youth to the Venetian embassy at Paris, where, after the year 1776, he showed more love for astronomy than for diplomacy. Having settled in Verona in 1786 he constructed an observatory in his own house, by his observations in which he enriched the science of astronomy with many discoveries. After the destruction of his observatory by the French (1798), who, however, compensated him for his loss, his instruments were transferred to the observatory of Brera in Milan, and he was appointed professor of astronomy in the military school at Modena. His best works are 'Notizie Astronomiche adate all' Uso comune' (1802); 'Trigonometria Piana e Sferica' (second edition, Bologna, 1804).

Cagots, ka-gō', a race or caste of men, living in the south of France in the region of the Pyrenees, regarded as pariahs or social outcasts. In former ages they were shut out from society as lepers, cursed as heretics, and abhorred as cannibals; their feet were bored with an iron, and they were forced to wear a piece of red cloth in the shape of a duck's foot on their clothes by way of distinction. The only trade they were allowed to follow was that of sawyers or carpenters. They had to enter the church by a special door, and had a special corner set apart for them with a holy-water vessel for themselves. Opinions are divided with regard to the origin of the Cagots, of whom there are now comparatively few. They have been considered by some to be remains of the Saracens conquered by Charles Martel. The most plausible conjecture is that which derives them from the Visigoths who established themselves in the south of France and in Spain in the 5th century. The origin of the name has been the subject of equal controversy. Among numerous derivations, is that from *canis* and *gothus*, "dogs of Goths." Others derive the name from a word simply meaning leper, and believe that the Cagots were originally lepers, who as such were expelled from the society of and intercourse with their fellowmen. Until the French Revolution the Cagots were not considered as citizens. Some remains of them, or of corresponding outcasts, are to be found under various names in different parts of France. Similar remains are also found among the mountains of North Spain. Consult Michel, 'Histoire des Races Maudites de la France et de l'Espagne.'

Cahan, kǎ'hān, Abraham, Russo-American journalist and novelist: b. Vilna, Russia, 7 July 1860. He came to the United States in 1882 and has edited several Yiddish periodicals in New York. He has written 'Yekl, a Tale of the New York Ghetto'; 'Raphael Narizokh,' in Yiddish; 'The Chasm'; 'The Imported Bridegroom and Other Stories'; 'The White Terror and the Red' (1904).

Cahawba, ka-hō'ba, a river of Alabama, rises in Jefferson County, and after passing through a rich coal region, joins the Alabama at Cahawba, in Dallas County. It is navigable by small boats for 100 miles.

Cahens'lyism, a popular name given to a movement in the United States in 1891, among Roman Catholics speaking other languages than English, to have bishops or priests of their respective nationalities appointed over them. It took its name from Herr Cahensly, a layman, secretary of St. Raphael's Society for the protection of German Catholic immigrants to this country, on the supposition that he was the chief inspirer of the movement. On a visit to the United States in 1893 Herr Cahensly denied his connection with the scheme. It was vigorously opposed by most of the English-speaking prelates of the Roman Catholic Church in this country. It received no official sanction by the Vatican authorities, and, after considerable agitation in the Catholic and secular press, died out. As a matter of fact, owing to the large immigration of Roman Catholics speaking foreign tongues, priests of their respective nationalities are often appointed to administer to their spiritual needs. This is

especially notable in the instance of the Italians. To meet this necessity in the archdiocese of New York, the study of Italian is now made compulsory in its diocesan seminary for all candidates for the priesthood.

Cahors, *ka-ōr*, France, (ancient *CADURCUM*), capital of the department of Lot, and on the river of that name, 60 miles north of Toulouse. It is nearly surrounded by the river, and communicates with the opposite shore by three bridges, one of which is ancient. Before the conquest of Gaul by Cæsar it was the capital of the Cadurci, and under the Romans, who gave it the name of *Divona*, it was adorned with a temple, theatre, baths, an immense aqueduct, and forum. Several Roman roads can still be traced in its vicinity. Among the principal edifices are the cathedral, an irregular structure, supposed to be partly Roman; an episcopal palace, now converted into the prefecture; three old churches; barracks; a theatre; and a lyceum or college. Cahors had formerly a university, which was united with that of Toulouse in 1751. It was founded in 1322 by Pope John XXII, a native of the town. The celebrated jurist Cujas was a professor, and Fénelon a student in it. To the latter an obelisk has been erected. The manufactures are insignificant; but a considerable trade is carried on in the red wine of the district, and in brandy. Coal is worked in the vicinity. Clément Marot, the poet, was born here. Cahors was given up to the English by the Treaty of Brétigny in 1360. It revolted, and returned to France in 1428. Pop. (1902) about 15,000.

Caiaphas, *ka'ya-fas*, the high-priest of the Jews at the time when the crucifixion took place. Previously, when the resurrection of Lazarus had spread dismay among the Jewish functionaries, it was Caiaphas who suggested the expediency of putting the Saviour to death, and when he was arrested in Gethsemane he was carried first to Annas, and then to Caiaphas, from whom he was transferred to the hands of the civil authority. Caiaphas was deposed, 35 A.D., and Jonathan, son of Annas, appointed in his stead.

Caibarien, *kī-bā-re-ān'*, Cuba, a town of the province of Santa Clara, situated on the northern seacoast; it has sponge fisheries and some trade. Pop. about 8,000.

Caicos, *kī'kōs*, **Cayos**, or **The Keys** (from the Spanish *cayo*, a rock, shoal, or islet), one of the island groups comprehended under the general name of the Bahamas, belonging to Great Britain, consisting of six islands besides some uninhabited rocks; between lat. 21° and 22° N. and lon. 71° and 73° W. The largest, called the Great Key, is about 30 miles long. They are wooded and tolerably fertile, and at one time produced cotton, but at present the inhabitants are few in number, and mostly engaged in fishing and the preparation of salt. In 1873 the Turks Islands and the Caicos were united into a commissionership under the governor of Jamaica. Pop. 1,784.

Cailletet, **Louis Paul**, *loo-ē pōl ka-yē-tā*, French chemist: b. Châtillon-sur-Seine, 1832. He studied at the School of Mines in Chatillon and subsequently gave especial attention to original research. He was able to liquefy both oxygen and nitrogen in 1877 and was at once elected

corresponding member of the Académie des Sciences, becoming a full member in 1884. He was made an officer of the Legion of Honor in 1889.

Cailliaud, **Frédéric**, *frā-dē-rīk ka-yō*, French traveler: b. Nantes, France, 9 June 1787; d. there, 1 May 1869. In examining the mineral resources of Egypt, he rediscovered the ancient emerald mines of Jebel Zobara, near the Red Sea; and his report of a journey to Siwah, led to its annexation by Egypt in 1820. In 1821-2 he accompanied Ibrahim Pasha's expedition to the White Nile, and his 'Journey to Meroe' (1826-7), contained the first reliable information of that district. He also published 'Voyage à Oasis de Thebes' (1821). In 1827 he settled as conservator of the Natural History Museum at Nantes, where he died.

Caillie, **René**, *rē-nā ka-yā*, French traveler: b. Mauzé, Poitou, France, 19 Sept. 1799; d. Paris, 8 May 1838. He became an African traveler early in his career, obtaining his living by trading with the Moors, who taught him Arabic. On his travels he dressed in Arabic style and passed as an Egyptian. Having gone to Senegal he learned that the Geographical Society of Paris had offered a premium of 10,000 francs to the first traveler who should reach Timbuctoo. On 13 June 1827 he reached for the first time the shores of the Niger, which he crossed. He then traveled about 200 miles eastwardly over territories never visited before, arriving at Timé 3 August. Here he was detained by illness until 9 Jan. 1828, when he struck on a new road previously unknown to geographers, and reached Jenne on 11 March. Here he embarked for Timbuctoo, where he arrived about 11 April, after one month's sail on the Niger. After a short stay of a fortnight, and after a tedious and painful return passage through the desert, he reached Fez, 12 August, and from there returned to France. On his arrival at Toulon he was received with the utmost enthusiasm. He was the first European who ever returned from Timbuctoo, and who had achieved success, while expeditions supported by government had resulted in failure. A special prize of 10,000 francs was awarded to him by the Geographical Society, with the annual prize of 1,000 francs for the most important discovery. The order of the Legion of Honor was conferred upon him by the king, and he became, at the same time, the recipient of a salary in connection with an office, to which he was appointed in the Senegal service. Furthermore, a pension from the fund set apart for eminent literary and scientific men was decreed to him by the minister of the interior, and his 'Journal d'un voyage à Timbuktou et Jenné, dans l'Afrique centrale, etc.' with geographical data added by Jomard, was published at the expense of government, and appeared at the beginning of 1830 in three volumes.

Caiman. See **CAYMAN**.

Cain, the eldest son of Adam and Eve; the first murderer, who slew his brother Abel. For the biblical account of Cain and his descendants see Gen iv.-vii. Modern biblical scholars assume that Genesis iv. is a composite of stories relating to several Cains. The posterity of Cain became extinct at the flood. Cain founded the first city, and his descendants were the first

inventors and promoters of the useful and agreeable arts. Josephus relates that he became the leader of a band of robbers, committed all sorts of licentiousness, corrupted the simplicity of primitive manners by his luxury, established the right of property by setting up landmarks, and was the inventor of weights and measures. A Gnostic sect of the second century were called "Cainites." See RELIGIOUS SECTS.

Cain, Auguste Nicolas, ô-güst nik-ô-lä ka-än, French sculptor: b. Paris, 4 Nov. 1822; d. there, 7 Aug. 1894. He was in early life a carpenter, but subsequently studied under Guionnet and Rude, and devoted his attention chiefly to groups of animals. He received the bronze medal in the Great Exhibition of 1851, another medal in 1864, and a third at the Universal Exposition in 1867. Among noted works by him are 'Eagle Defending its Quarry' (1852); 'Combat Between Two Tigers' (1878); 'Rhinceros Attacked by Tigers.'

Cain, Richard Harvey, American clergyman: b. Greenbrier County, Va., 12 April 1825; d. Washington, D. C., 18 Jan. 1887. He entered the ministry at an early age; was elected to the South Carolina constitutional convention in 1867, and to the State Senate in 1868; and was a member of Congress 1876-1880. He was made bishop in the African Methodist Episcopal Church and placed in charge of the churches in Louisiana and Texas, and later was transferred to the first Episcopal district of that church. While in Texas he organized Paul Quinn College in Waco.

Cain, William, American civil engineer: b. Hillsboro, N. C., 14 May 1847. He was graduated from the North Carolina Military Institute and has since been professor of mathematics and civil engineering in the University of North Carolina. He has published 'Theory of Voussoir, Solid and Braced Arches' (1874); 'Maximum Stresses in Framed Bridges' (1878); 'Solid and Braced Elastic Arches' (1879); 'Symbolic Algebra' (1884); 'Practical Designing of Retaining Walls' (1888).

Caine, Thomas Henry Hall, English novelist and dramatist: b. Runcorn, Cheshire, 14 May 1853. He received his education in the Isle of Man and at Liverpool, and qualified as an architect, but abandoned architecture in order to become a journalist. He lived in London with Dante Gabriel Rossetti from 1881 till the latter's death in 1882, and in that year appeared his 'Recollections of Rossetti.' He had previously published 'Richard III. and Macbeth' (1877), a critical work, and 'Sonnets of Three Centuries' (1882). In 1883 appeared his 'Cobwebs of Criticism,' a review of the contemporary critiques of Wordsworth, Shelley, Byron, Keats, and other poets; and in 1887 he contributed to the Great Writers series a 'Life of Coleridge.' His first novel was 'The Shadow of a Crime' (1885), followed by 'A Son of Hagar'; but 'The Deemster' (1887) (dramatized as 'Ben-na-Chree'), first brought him fame. His subsequent novels include 'The Bondman' (1890); 'The Scapegoat' (1891); 'The Prophet' (1892); 'The Manxman' (1894); 'The Christian' (1897); 'The Eternal City' (1901); 'The Prodigal Son' (1904). Of 'The Christian' nearly 100,000 copies were sold in England, and as many more in the United States, within the first year after publication.

On both continents it provoked great discussion, the verdict in England being generally unfavorable to the motive of the book, while in the United States it was generally favorable. It was immediately translated into most of the languages of Europe, and provoked the same divided opinion everywhere. He has traveled in Morocco, Iceland, Russia, and North America, and acted in Canada as representative of the Society of Authors in negotiations concerning Canadian copyright. His most successful novels deal with Manx life, in the description of which he reveals intimate knowledge of his subject and considerable literary power.

Caique, kä'ëk, a light boat or skiff much used in the Levant, and particularly in the Bosphorus.

Caird, kârd, Edward, Scottish philosopher: b. Greenock, 22 March 1835. He was educated in his native town and at the universities of Glasgow and Oxford: was a Fellow and tutor of Merton College, and was professor of moral philosophy at Glasgow from 1866 till 1893, the year of his appointment as master of Balliol College, Oxford, in which post he succeeded Prof. Jowett. He is author of 'Account of the Philosophy of Kant' (1878); 'Social Philosophy and Religion of Comte' (1885); 'Hegel' in Blackwood's Series of Philosophical Classics (1883); 'Critical Philosophy of Immanuel Kant' (1889); 'Essays on Literature and Philosophy' (1892); and 'The Evolution of Religion' (1893). He is a brother of John Caird (q.v.).

Caird, John, Scottish clergyman: b. Greenock, 15 Dec. 1820; d. London, 30 July 1898. He was educated at the Grammar School of Greenock, and at Glasgow University, where he took a high place both in arts and divinity. Having entered the ministry of the Church of Scotland, in 1845 he became minister of Newton-upon-Ayr, and two years later was transferred to Lady Yester's parish church, Edinburgh. Between that date and 1862, when he became professor of divinity in Glasgow University, he was minister of Errol, Perthshire (1849-57), and of Park Church, Glasgow (1857-62). In 1873 he was elected principal of his university, a position which he held till his resignation in 1898. He died before his resignation had taken effect. He published sermons (his sermon 'Religion in Common Life,' preached before the queen, had an immense circulation, and was described by Dean Stanley as the greatest sermon of the century); 'Introduction to the Philosophy of Religion' (1880); and 'Spinoza' (1888) in Blackwood's Philosophical Classics. In 1899 appeared 'The Fundamental Ideas of Christianity,' under the editorship of his brother, being the Gifford Lectures delivered in 1891-2 and 1895-6, accompanied by a memoir of the author.

Cairn, kârn (Gaelic *carn*), a name given to heaps of stones, common in Great Britain, particularly in Scotland and Wales, generally of a conical form. Some are evidently sepulchral, containing urns, stone chests, bones, etc. Others were erected to commemorate some remarkable event, and others appear to have been intended for religious rites. See TUMULUS.

Cairnes, kârnz, John Elliot, British political economist: b. Castle Bellingham, County Louth, 26 Dec. 1823; d. London, 8 July 1875.

After an education at Kingstown and Chester he was for a time employed in his father's brewery at Grogheda, but ultimately went to Trinity College, Dublin. He was graduated in 1854, and two years afterward was appointed Whately professor of political economy at Dublin. His first series of lectures was published in 1857, under the title 'The Character and Logical Method of Political Economy.' In 1859 he was elected professor of political economy and jurisprudence in Queen's College, Galway, and seven years later was appointed to the corresponding chair in University College, London; but in 1872 the state of his health compelled him to give up active teaching. He had been called to the Irish bar in 1857, but he hardly ever practised. During the later years of his life he suffered much from the effects of an accident to his knee, which befell him while hunting in 1860, and for some time before his death was completely crippled. In 1862 he issued a work in defense of the northern States of America, entitled 'The Slave Power,' which had a very large circulation. The most important of his other works are 'Essays on Political Economy, Theoretical and Applied' (1873); and 'Some Leading Principles of Political Economy newly Expounded' (1874). He takes rank as one of the leading economists of the 19th century.

Cairnes, William Elliott, English army officer: d. London, 19 April 1902. He obtained a lieutenant's commission in 1884, and became a captain in 1890. He published 'The Absent-Minded War'; 'The Army from Within'; 'The Coming Waterloo'; and 'Lord Roberts as a Soldier in Peace and War.'

Cairngorm, *kārn-gōrm'* (that is, "blue cairn"), a mountain of Scotland belonging to the Grampian Hills, on the border of Banffshire and Inverness-shire, three miles north of Ben Macdhui in Aberdeenshire. Its summit is 4,084 feet above the level of the sea, and its sides are clothed with pine forests. The group of mountains to which it belongs is known as the Cairngorm Mountains. It is particularly celebrated for the regular, brownish yellow crystals of quartz found on it and known as cairngorms. These are also found in many other places, and are much used for seals, brooches, etc. Specimens weighing a good many pounds are sometimes found.

Cairns, kārnz, Hugh MacCalmont (EARL), Irish lawyer and parliamentary debater: b. County Down, Ireland, 1819; d. Bournemouth, England, 2 April 1885. He was called to the bar at the Middle Temple in 1844, was returned to Parliament for Belfast in 1852, and quickly made his mark in the House by his fluency and readiness in debate. He became Queen's Counsel in 1856, in 1858 solicitor-general, and in 1866 attorney-general under Lord Derby. Later in the same year he was a judge of appeal, and in 1867 was created Baron Cairns. Under Disraeli's premiership he became Lord Chancellor in 1868, and again in 1874, and was created Viscount Garmoyle and Earl Cairns in 1878. For some years he led the Conservatives in the House of Lords with equal dexterity and vigor, and is ranked among the finest parliamentary orators of recent years.

Cairns, John, English theologian: b. Berwickshire, 23 Aug. 1818; d. Edinburgh, 14 March 1892. He was ordained at Berwick in 1845, where he remained till 1876, becoming also in 1867 professor of theology in the United Presbyterian Church, and principal in 1879. He was an eminent preacher and the author of the article 'Kant' in the 'Encyclopædia Britannica' (8th ed.); contributed to the new edition of Herzog's 'Real-encyklopädie'; and published the 'Life of John Brown, D.D.' (1860); and 'Unbelief in the 18th Century' (1881). See Cairns, 'Principal Cairns' (1903).

Cairo, *kī'rō* (Arabic, *El Kāhira*, "The Victorious," or *Masr el Kāhira*), Egypt, capital of the country and largest town of Africa, situated on the right bank of the Nile, about seven miles above the point where it divides to form the two main branches of its delta. The town is built between the river-bank and the northwestern end of the hills known as Jebel Mokattam, on whose most advanced spur stands the citadel in a commanding position well above the rest of the city. During the last 40 years the town has lost much of its Oriental character, but the Arab quarters still present a maze of very narrow streets lined by curious buildings in endless variety of style. The houses are mostly built of yellow limestone, with flat roofs; and many of them have small gardens behind. In the more modern parts of the city the streets are broader, and many of them are lined by trees and lighted by gas. The European quarter, known as Ismailiyeh, forms the western part of modern Cairo, and its centre is the octagonal Ezbekiyeh Garden (20½ acres), with plants from many regions and with an artificial pond. Here, too, are many cafés, concert-halls, and other similar buildings. Among the more notable buildings of the European quarter are the consulates, the opera-house, open in winter, the Italian summer theatre, English and German churches, the ministerial offices, and the barracks. The chief business street of Cairo, known as Muski, runs east-southeastward from the neighborhood of the Ezbekiyeh, and the Boulevard Mehemet Ali extends from about the same place southeastward to the citadel. Cairo has more than 500 mosques, but many of them are wholly or partly in ruins. The finest of all is the Sultan Hasan Mosque, a truly noble building with a lofty minaret. Others worthy of mention are: that built in the 9th century by Ahmed ibn Tulūn in imitation of the one at Mecca; the Hakim Mosque, dating from the beginning of the 11th century; the Hosen Mosque of the son of Ali, Mohammed's son-in-law; the Sitti-Zeynab Mosque, named after a grandchild of the prophet; the Azhar Mosque, famous for its schools of theology, which are attended by Mohammedans from all parts of the world; and the Alabaster Mosque of the citadel, with the tomb of Mehemet Ali, the finest of the modern mosques. The tombs in the burying-grounds outside the city, many of them in the form of mosques, also deserve mention, especially those known as the tombs of the caliphs. The most important gate of the city is the Bab-en-Nasr, through which large numbers of pilgrims pass every year on their way to Mecca. The mosques contain valuable libraries, but the chief library of the city is the viceregal one, founded in 1870, and now con-

TOMBS OF THE MAMELUKES, CAIRO.

CAIRO — CAISSON DISEASE

taining about 60,000 volumes, largely in manuscript. The trade of Cairo is large and the bazaars and markets are numerous, there being special bazaars for gold and silver smiths, tapestry merchants, saddlers, armourers, shoemakers, etc. Beside the numerous Mohammedan places of worship Cairo contains English, French, German, Coptic, and other churches and Jewish synagogues, and there are European schools and hospitals. The Egyptian Institute, founded at Alexandria in 1859, is now located in Cairo.

The suburb of Bulak, in the northwest of the town, opposite the island of Bulak, forms the port of Cairo, and its narrow streets present a busy scene of Oriental life. The island of Bulak and the left bank of the Nile are reached by a great iron bridge, and there is also a railway and general traffic bridge below the island. To the southwest of the modern town and also on the Nile bank stands the suburb of Old Cairo or Masr el-Atika. On the left bank of the river, almost directly opposite Old Cairo, is the suburb of Gizeh. It has government buildings, a zoological garden, etc., but its chief attraction is the great Egyptological Museum formerly in Bulak, but removed here in 1889. From Gizeh a road and a tramway lead southwestward to the famous group of pyramids called the pyramids of Gizeh. On the island of Roda, between Gizeh and Old Cairo, the celebrated Nilometer still stands. Cairo enjoys a very mild climate, and is in consequence visited in winter by many Europeans suffering from chest and lung ailments. Many of these stay at Helwan, a small place about 14 miles south-southeast of the town. Cairo is in railway communication with Alexandria, Damietta, Suez, etc., and with Upper Egypt, and the Fresh-water Canal connects it with Ismailia and Suez. In 1896 electric tramways were introduced in the most important streets. Cairo is the residence of the Khedive, the seat of a Coptic and a Greek Orthodox patriarch, and it contains all the highest public offices of the country. El-Fostat, "The Tent," now Old Cairo, was founded by Amru, lieutenant of Caliph Omar, in 640 A.D. In 969, when the Fatimite dynasty gained possession of the country, the new city to the north was founded. Saladin surrounded it with walls of stone and built the citadel. He also constructed a wooden aqueduct from the Nile to the citadel, a work afterward replaced by the still existing aqueduct of stone. Cairo was taken by the French in 1798, and was occupied by the British in 1882, after the battle of Tel-el-Kebir. Pop. (1897) 570,062, including Fellahin, Copts, Turks, Arabs, and other Orientals, beside about 25,000 foreigners from the chief European countries, especially Italy, Greece, France, Austria, England, and Germany.

Cairo, Ill., city, port of entry and county-seat of Alexander County, situated at the junction of the Mississippi and other rivers, 150 miles southeast of Saint Louis on the Illinois Central, Cleveland, C., C. & St. L. and other railroads. The city was first settled in 1838 by William Bird and was incorporated as a city in 1857. Cairo is governed by a mayor and a council of 14 members elected for two years, who select the other administrative officers. It has a large transit trade in agriculture and lumber,

and affords a good market for the produce and trade of the Mississippi Valley. The industries include a sewing-machine factory, box factories, handle factory, flour mills, wagon works, foundries, etc. The city has five banks with a combined capital of \$400,000 and a surplus of \$350,000. A United States custom house is located in Cairo and it has a free public library, court-house, United States Marine Hospital and Saint Mary's Infirmary. The Federal Government during the Civil War used the town as a depot for military supplies. For many years, until levees were built, the city suffered from frequent floods which greatly impeded its progress, but it is now growing in wealth and population, has many fine churches and an excellent system of education. Pop. (1904) 16,235.

E. E. ELLIS,

Editor Cairo Daily Telegram.

Caisson, a water-tight chest or casing, used in the construction of bridges, quays, etc., large enough to contain an entire pier, which is built in it, the caisson being sunk to the bed of the river. (See FOUNDATION.) The pneumatic caisson has an air-chamber in which men may work at the bottom of the water, air being forced in to keep the water out, and the air-space being entered by what is called an air-lock. This form of caisson is used where the water is too deep to permit of the construction of a coffer-dam. The name is also applied to an air-tight structure which is sunk below a vessel by the admission of water, and raises the vessel when the water is pumped out; and to the boat-shaped gate used to close the entrance to a dry dock. (See DOCK.) In military language, the ammunition carriage attached to a battery of artillery. In architecture caisson signifies a panel left in a vaulted ceiling, or more rarely in a flat ceiling or a wall. They are sometimes square or of other forms, but the most common arrangement is a series of sunken octagons with much smaller sunken squares set diagonally between. The caisson was decorated with mouldings and ornaments of stucco painted and gilded.

Caisson Disease, or **Compressed Air Disease**, a disorder occurring among workers in compressed air, as in bridge-caissons. After working in an atmosphere of compressed air the return to normal pressure is brought about gradually in an anteroom, which is called an "air-lock." If this transfer takes place rapidly the symptoms may appear quite suddenly. The usual factors are high pressure, poor ventilation, and prolonged exposure. Old people, those addicted to alcohol, and those with organic disease are most susceptible. Slight transient symptoms, such as ringing of the ears and giddiness, are not uncommon; more severe symptoms are rare. When the disease is well marked we may have rupture of the ear-drum, nose-bleed, spitting of blood, pain in the stomach, vomiting, various neuralgic pains, paralysis—especially of the legs and bladder, incoherent speech, prostration, and loss of consciousness. The disease lasts from a few hours to several days, but the paralysis may persist for months. The fatal cases show congestion of the internal organs, especially the brain. Death may be sudden or occur in three or four days. When the symptoms come on suddenly the patient should be at once returned to the compressed air and given oxygen to breathe.

CAITES — CAJAMARCA

Caités, or **Caetés**, *kä-e-tā'*, an extinct tribe of Brazilian Indians which, up to the close of the 16th century, inhabited a large portion of the eastern coast region north of the Sao Francisco. Of the Tupi race, they were more warlike than other branches of that family, and, while they exhibited traits that indicated at least a crude sort of civilization, such as life in fixed villages and the practice of agriculture, they were the most cannibalistic of all the Brazilian tribes. In 1554 they murdered the bishop of Bahia and his companions, who were shipwrecked on that coast, and their ravages upon the settlements of the colonists aroused an enmity that finally resulted in their complete extinction.

Caithness, *kāth'nēs*, Scotland, most northern county of the mainland; area, 686 square miles. The surface is generally level or undulating, and there are few hills of any height, except on the Sutherland border. Much of the surface is deep moss or peaty moor, but there is a fair proportion of fertile land in the eastern part. About one quarter of the whole surface is under crops and rotation grasses, or in permanent pasture. Of corn crops oats is by far the most important. Only a very small portion of the county is wooded. The coast is prevailingly bold and rocky, the chief headlands being Dunnet Head on the north coast, Duncansby Head at the northeast corner, Noss Head and the Ord on the east coast. The largest bays are Dunnet Bay on the north and Sinclair's Bay on the east, but Thurso Bay and Wick Bay are also noteworthy. There are many lakes, some of them very attractive. The largest is Loch Watten, near the centre of the county. Of the rivers only the Thurso, the Forss, and the Wick need be mentioned. Caithness is poor in metallic minerals, but excellent flagstones have been quarried for many years and form one of the chief exports of the county. Many of the inhabitants are engaged in fishing, and Wick is one of the chief centres of the Scottish herring-fishery. The manufactures are mainly subsidiary to its other industries. Wick, the county town, is a royal burgh, and Thurso is the only other town. The antiquities of Caithness are numerous, and include old castles, so-called Picts' houses, monoliths, etc. The county returns one member to Parliament, and Wick joins with Kirkwall, Tain, and other places in sending another representative. Pop. (1901) 33,850.

Caius, *kā'yūs*. See **GAIUS**.

Caius Cestius, *kā'yūs ses'ti-us*, Pyramid of, a sepulchral monument, a pyramid of the time of Augustus, standing at Rome. Built of brick and stone and incrustured with white marble, it is more than 114 feet in height, while each side of the base measures 90 feet. This contains a small burial chamber, which is painted with arabesque.

Caius, *kēz*, **John**, English physician, the founder of Caius College, Cambridge University; b. Norwich 6 Oct. 1510; d. Cambridge 29 July 1573. His name was Kaye or Key, which he Latinized into Caius. He took his degrees at Gonville Hall, Cambridge, and was chosen Fellow of his college. While at Cambridge he distinguished himself by various translations from the classics. He spent some time in travel-

ing on the Continent, studied medicine at Padua, under Montanus and Vesalius, and took his doctor's degree at Bologna (1541). In 1542 he lectured at Padua on the Greek text of Aristotle, and in the following year made a tour through Italy, visiting the principal libraries, in order to compare the manuscripts of Galen and Celsus. He returned to his native country in 1544, and practised, first at Cambridge, then at Shrewsbury, and afterward at Norwich. He was appointed by Henry VIII. lecturer on anatomy to the company of surgeons, London. In 1547 he became Fellow of the college of physicians, and was appointed court physician to the young king Edward VI., which appointment he retained under Queens Mary and Elizabeth. In the reign of the latter, an exciting controversy arose between the surgeons and physicians of London, as to the right of the former to administer internal remedies for the sciatica. Caius argued the negative so ably on behalf of the physicians that the decision was against the right of the surgeons to continue the practice of administering medicines. He was elected president of the college of physicians for seven years in succession. There is extant a book of the college annals from 1555 to 1572 written by him in Latin, the earliest account we have of the transactions of that college. He was dismissed from the royal service in 1568 on suspicion of favoring the Catholic party. He obtained permission to endow and raise Gonville Hall into a college, which still bears his name (Gonville and Caius College), and accepted the mastership thereof. The last days of his life were passed in the seclusion of his college. His works are numerous, on various subjects; many of them have been reprinted in modern times.

Caius (*kēz*) College. See **GONVILLE AND CAIUS COLLEGE**.

Caix, *kā-ēks*, **Napoleone**, Italian philologist; b. Bozzolo, near Mantua, 1845. His education was obtained at Cremona and Pisa, and in 1869 he was called to the chair of ancient languages in the Lyceum of Parma, becoming professor of Romanic languages and comparative philology in the Institute of Higher Studies in Florence in 1873. He has been a prolific writer and among his many works are 'Saggio sulla storia della lingua e dei dialetti d'Italia' (1872); 'Sulla lingua del Contrasto' (1876); 'Le origini della lingua Poetica Italiana' (1880).

Cajabamba, *kā-ḥa-bām-bā'*, Ecuador, capital of the province of Chimborazo, 102 miles south of Quito, on the arid plateau of Topi, at an elevation of 9,480 feet. The former town of Riobamba, founded on this site in 1533, was in 1797 overwhelmed by an earthquake in which 30,000 lives were lost. Pop. 16,000.

Cajamarca, *kā-ḥa-mār-cā'*, or **Caxamarca**, Peru, the name of a department and city in the valley of the upper Marañon, or Amazon. The department lies in a very mountainous region. Pop. 213,391. The city stands on the eastern declivity of the Andes in a rich silver mining district, 75 miles from Trujillo. It contains several handsome churches, and flourishing manufactories of woollens and cutlery. The inhabitants are considered the best workmen in silver and iron in Peru. An extensive trade

CAJEPUT — CALABAR BEAN

between the inland provinces and Lambeyeque and Truxillo is carried on through this town. Woolen fabrics form the chief exports, and European manufactures, sugar, brandy, wine, iron, steel, and other articles are imported in return. In the vicinity are the baths of the Incas, and a volcanic lake, into which, according to tradition, were cast the throne and regalia of the Peruvian monarchs, the last of whom, Atahualpa, perished here by the hands of Pizarro. Pop. 12,000.

Cajeput, kǎj'ĕ-püt, or **Cajuput Oil**, the volatile oil obtained from the leaves of the cajeput-tree (*Melaleuca cajuputi* or *minor*), belonging to the order *Myrtaceae*. This tree has lanceolate, aromatic leaves and spikes of odorless flowers, and is common in many islands of the Malay Archipelago. Booro, one of the Moluccas, yields the bulk of the oil exported. It is mostly sent to Singapore, whence it is re-exported to other countries. The oil is of a pale-green color, very liquid, lighter than water, of a strong smell, resembling camphor, and of a strong pungent taste. It is often adulterated with other essential oils. The color of the oil depends on the presence of a little copper, which must be removed before the oil is fit for use in medicine, in which it has many applications, being used as a carminative, an antispasmodic, a rubefacient, and a sudorific. *Kayuputi*, the native name of the tree, means "white wood," and refers to the color of the bark.

Cajetan, kǎj'ĕ-tan, or **Cajetan**, **Tommaso de Vio**, Italian cardinal: b. Gaeta, 25 July 1470; d. Rome, 9 Aug. 1534. He entered the order of Dominican friars, graduated as a doctor, and was elected general of his order in 1508. When Pope Julius II. was summoned to appear before the council of cardinals assembled at Pisa and afterward at Milan, in the interest of King Louis XII. of France, Cajetan undertook his defense, asserting that to the Pope alone belonged the power of convening a council. He was appointed cardinal in 1517 by Leo X., and sent as a legate in Germany to bring the emperor Maximilian and the king of Denmark into the league formed against the Turks. His efforts to make Luther recant his doctrines proved in vain. In 1519 he was present, as Roman legate, at the assembly of the electors of the empire, and sided with the partisans of Don Carlos of Spain, who was elected emperor under the name of Charles V. Then he returned to Rome, but was soon ordered by Adrian VI. to Hungary, which was invaded by the Turks. In 1524 he was recalled to Rome by Clement VII. On the capture of Rome in 1527, being taken prisoner by the imperial troops, under the command of the constable of Bourbon, he had to pay 5,000 crowns as a ransom for his liberty. See Schilbach, 'De Vita ac Scriptis de Vio Cajetani' (1881).

Cajigal de la Vega, **Francisco Antonio**, frān-thēs'kō ān-tō'nē-ō kǎ-hē-gāl dā la vā'ga, Spanish colonial governor: b. Santander, 5 Feb. 1695; d. there, 30 April 1777. He held the post of governor of Santiago, Cuba, 1738-47, and in 1742 during the course of the war between Spain and England, repelled an attack by Admiral Vernon. He was governor-general of Cuba 1747-60, and while in office established an arsenal and a navy yard at Havana. During a part

of 1760 and the year following he was viceroy of Mexico.

Cajori, cǎ-jō'rĕ, **Florian**, Swiss-American mathematician: b. Saint Aignan, Switzerland, 28 Feb. 1859. He came to the United States in 1875 and studied at the University of Wisconsin. He has been professor of mathematics in Colorado College from 1898, besides holding similar positions prior to that date. He has published 'The Teaching and History of Mathematics in the United States' (1890); 'A History of Mathematics' (1894); 'A History of Elementary Mathematics' (1896); 'A History of Physics' (1899).

Cakchiquel, kāk-chĕ-kāl', a tribe of Mayan stock occupying northern and central Guatemala. They are probably an off-shoot of the Quichés, as they resemble that tribe closely in customs and language. They were conquered by Alvarado in 1524, and at that time had a well-developed civilization, as is shown by their architectural ruins and their system of hieroglyphic writings.

Cake-urchin, **Sand-cake**, or **Sand-dollar**, a flat, round sea-urchin (*Echinarachnius parma*) which lives buried in the sand in the shallow portions of the North Atlantic, from low-water mark to 40 fathoms. It is occasionally thrown ashore on beaches. The body is protected by limestone plates, and the "ambulacra" or delicate suckers, are arranged in a rosette on the upper side of the animal, the mouth being on the under side. See also SEA-URCHIN.

Cal'aba-oil, an excellent illuminating oil obtained from calabanuts, the seeds of *Calophyllum calaba*, a tree of the order *Guttifera* that flourishes in Brazil and the West Indies, and yields useful timber.

Calabar, kǎ-lā-bār', or kal-ā-bār', Africa, the former name of a district on the west coast, extending eastward from the Niger delta, and now included in the Niger Territories. The name is now applied to two towns and two rivers in that region. Old Calabar is a port in southern Nigeria, situated on the east bank of the estuary of the Cross River at the point where it receives the waters of the Old Calabar River. It contains, among other buildings, a Presbyterian Mission Institute for natives, a large prison, good hospitals, and marine workshops. Its climate, like that of all coast settlements in this part of the continent, is very unhealthy. The rainfall is very great, tornadoes are frequent, and the temperature is very high. The value of its exports, consisting chiefly of palm-oil, palm kernels, and rubber, exceeds \$1,000,000, and its imports are valued at rather more. New Calabar is situated farther west on one of the mouths of the Niger known by the same name. Its trade is less than that of Old Calabar, but is nevertheless of considerable value.

Calabar Bean, or **Ordeal Bean**, the brown or reddish-brown kidney-shaped seed of *Physostigma venenosum*, a climbing, woody, west African vine of the pea family (*Leguminosæ*). The flowers are purple, resembling the sweet-pea, and each pod contains two or three seeds, which are about one inch long with a blackish groove along the convex edge; and in the interior an air-cavity which enables the heavy seeds to float on water. This bean is very poisonous,

CALABASH GOURD — CALADIUM

and has been much used in paste or in infusion in the trial by ordeal of west African medicine-men. If the person accused of witchcraft or crime vomited the mixture, he was declared innocent; if he did not vomit, death ensued. At one time 70 children in Liverpool ate some of the beans; one who ate four seeds did not vomit and died; all the rest vomited and recovered. In poisoning with this bean vomiting should be encouraged, the stomach washed out, and atropine, the antidote, administered.

Cal'abash Gourd, Bottle Gourd, White Pumpkin, *Lagenaria vulgaris*, the only cultivated or common wild species of its genus which belongs to the natural order *Cucurbitaceae*, distinguished from the species of the closely related genus *Cucurbita* by having white instead of yellow flowers; separated instead of united anthers, and seeds with distended edges. It is a climbing annual vine, 30 to 40 feet long, with a musky odor and sticky feeling. It is a native of tropical Asia and Africa, and is grown in warm countries for its very variable smooth, hard-shelled fruit, which, while young and soft, is used by some races as food; but much more generally the ripe fruits are used for making utensils such as dippers, cups, and pitchers. Some of the largest fruits are used in India and other Eastern countries in raft-construction and for buoys. These fruits range in size from a few inches to five feet or even more, and from their resemblance to various objects are called Hercules' club, dipper, bottle, snake, sugar trough, etc. The plant is often cultivated in the southern United States, but is less frequently seen in the north, where the season is usually too short for the fruits to fully mature. A sunny exposure in warm, quick soil, and cultivation similar to that given squashes and melons will suit the plant well.

Calabash Nutmeg, a tree (*Monodora muristica*) of the order *Anonaceae*, introduced into Jamaica probably from west Africa. The fruit resembles small calabashes; hence the name. It is called also American nutmeg, or Jamaica nutmeg.

Calabash-tree, a tree (*Crescentia cujete*) of the west Indies and the continent of America, of the order *Bignoniaceae*, about the height and dimensions of an apple-tree, with crooked, horizontal branches, wedge-shaped leaves, pale-white flowers on the trunk and branches, and a roundish fruit, from two inches to a foot in diameter. The greenish-yellow skin of the fruit encloses a thin, hard, and almost woody shell, which is used for the same purposes as water-cans, goblets, cups, etc. So hard and close-grained are these shells that when they contain fluid they may even be put several times on the fire as kettles, without any injury. When intended for ornamental vessels, they are sometimes highly polished, and have figures engraven upon them, which are variously tinged with indigo and other colors. The calabash contains a pale-yellow juicy pulp of an unpleasant taste, which is esteemed a valuable remedy in several disorders, both external and internal.

Calabazar, *kä-lä-bä-thär'*, Cuba, a city of the province of Santa Clara, situated 20 miles north of the city of Santa Clara. It has a fine municipal building. Pop. 1,575.

Calabozo, *kä-lä-bö-thö'*, Venezuela, a town in the state of Miranda (Guzman Blanco), 120 miles south-southwest of Caracas, on the left bank of the river Guarico, in the midst of the Llanos. It was founded in 1730, is tolerably well built, and has rather a pleasing appearance. Its church, though not very handsome, is commodious. The principal wealth of the inhabitants consists of cattle. The neighboring ponds abound in electrical eels. Pop. 6,000.

Calabrese (*käl-a-brä'zè*) **II,** Italian painter whose real name was **MATTEO PRETI** (q.v.): b. Calabria, 1613; d. Malta, 1699. He was chiefly celebrated for his frescoes. He worked for a considerable time in Malta, being employed in executing pictures on the walls of the cathedral.

Calab'ria, Italy, division of the kingdom, comprising the southwest peninsula or toe of Italy, from about 40° N. lat. to the Strait of Messina; area estimated at 6,663 square miles. It was formerly divided into three provinces — Calabria Citra, the most northerly; Calabria Ultra I., the most southerly; and Calabria Ultra II., between the two former; but these have been renamed respectively Cosenza, Reggio, and Catanzaro. The central region is occupied by the great Apennine ridge, wild and bleak, to which, however, whole colonies with their cattle migrate in the summer. The flats near the coast are marshy and unhealthy, and inhabited by herds of buffaloes; but the valleys at the foot of the mountains are well watered and produce most luxuriant vegetation. The vine, the orange and lemon trees, the fig, the olive, and all the fruits of southern climes, grow there to perfection. The climate was reckoned salubrious in ancient times; but in some places the accumulation of stagnant water produces disease in the hot season. Corn, rice, saffron, anise, licorice, madder, flax, hemp, olives, almonds, cotton, and sugar-cane are raised in abundance. Sheep, horned cattle, and horses are numerous. Near Reggio a kind of mussel is found, called *Pinna marina*, from whose silky byssus or beard a beautiful fabric is manufactured, remarkable for its extreme lightness and warmth. Coral is also obtained. The quarries and pits afford alabaster, marble, gypsum, alum, chalk, rock-salt, lapis lazuli, and the fine copper renowned in ancient times.

Calabria corresponds with the ancient **Bruttium** and part of **Lucania**, while the ancient Calabria corresponds to the heel of Italy. It early received numerous Greek colonies, and formed part of **Magna Græcia**. In 268 B.C. it was conquered by the Romans. The Saracens had occupied the greater part of it when it was conquered by the Normans in the 11th century. Since then it has constantly followed the fate of the kingdom of the Two Sicilies, with which it was united to the kingdom of Italy in 1860. It was visited by continuous earthquakes from 1783-87. The greater part of the inhabitants are poor. Formerly the country was much infested by brigands and brigandage is not yet entirely extinct. The language of the people is a corruption of the Italian. Pop. (1900) 1,366,982.

Caladium, *ka-lä'di-üm*, a genus of succulent perennial herbs of the natural order *Aroideae*. There are about a dozen species, natives of tropical America. Several are largely

planted for ornament, for which their long petioled, often brilliantly marked, large, arrow-shaped leaves specially commend them. They give a rich subtropical effect in outdoor or greenhouse planting, and, being of rather easy culture, are very popular. The perennial rhizome is planted in rich, moist soil in the greenhouse, and transplanted in the garden after danger of frost has passed. Plenty of water is essential. In autumn the rootstock is dug before frost touches it, and stored in a cool, dry cellar.

Calah, kā'lā, an ancient city mentioned in Genesis x, 12 as one of those built by Asur. It is the city called Kalchu in the Assyrian inscriptions, which say that it was founded by Shalmaneser I. about 1250 B.C. It was rebuilt by Asurnazirpal about 880 B.C., who erected a wall on the northern side and a large palace. His successors also built palaces in the city. It is now known as Nimrud, where a number of important ruins and inscriptions have been found, among them the so-called "black obelisk" which tells of the tribute paid by Jehu, king of Israel, to Shalmaneser II.

Calahorra, kā-la-ōr'ra, Spain, a town of Old Castile, near the south side of the Ebro, in the province of Logroño, and 40 miles east-southeast of the city of Logroño. It is a bishop's see, and contains three parish churches and three convents. In 78 B.C. this town, then called Calagurris, siding with Sertorius, was besieged by Afranius, one of Pompey's generals, and the inhabitants reduced to such extremity that they fed on their wives and children; whence the Romans were wont to call any grievous famine *fames Calagurritana*. Quintilian was born here. Pop. 8,821.

Calais, ka-lā, France, a seaport town, and fortified place of the first class, in the department of Pas-de-Calais, 20 miles northeast from Boulogne, on the Strait of Dover, and about 23½ miles southeast of the port of Dover. It is situated at the junction of several canals, and by railway is directly connected with Paris, from which it is distant 185 miles. The town consists of two portions, almost entirely separated by basins or water areas connected with the harbor accommodation. These are Calais proper or the old town farther to the north, and St. Pierre or the new town lying to the south, and incorporated with the other portion only in 1885. The whole is enclosed by a new line of circumvallation, and is also defended by a citadel and detached forts and batteries. On the land side the country is flat and marshy, and can be laid under water to strengthen the defenses. The streets are broad and well paved, the houses substantially built of brick, and the hotels in general excellent. The chief square is the Place d'Armes, where the Hôtel de Ville, built in 1740 (restored in 1867), is situated. The principal church, Notre Dame, contains a fine altar-piece in Genoa marble. Other noteworthy objects are the Hôtel de Guise, originally founded by Edward III. of England; the column erected to commemorate the landing of Louis XVIII. in 1814; theatre; barracks; and the Hôtel Dessin. Calais is the seat of a commercial court and chamber of commerce, and has a college, a commercial school, school of design, school of hydrography, etc.

The harbor is accessible at all states of the tide, and is entered between two long piers. The works include a dry or graving dock 426 feet long at bottom, and having a depth of water on the sill of 28 feet 8 inches (at spring tides). There is also a wet-dock 27 acres in extent, with a depth of 25 feet. Calais is one of the principal ports for the debarkation of travelers from England (who are landed at the new railway station), there being day and night communication with Dover by steamboat. The number of travelers arriving and departing by sea is considerably over 200,000 per annum. There is a submarine cable to England from this port. The manufactures of the town are important. The silk and cotton tulle or bobbinet trade employs about 15,000 artisans. Various other industries are also carried on, such as flax-spinning, engineering, net-making, brewing, etc. Vessels are built here, and fitted out for the cod, mackerel, and herring fisheries. A considerable trade is carried on in grain, wool, wine, sugar, timber, coal, etc., and not less than 55,000,000 of eggs are annually exported to England. Calais is a town of considerable antiquity. In 1347 it was taken by Edward III. of England, after a siege of 11 months. The famous incident of the six burghesses having their lives saved at the intercession of Queen Philippa belongs to this siege. In 1558 it was retaken by the Duke of Guise, being then the last relic of the French dominions of the Plantagenets, which at one time comprehended the half of France. Pop. (1901) 59,793.

Calais, käl'is, Me., city, port of entry, and county-seat of Washington County, situated on the St. Croix River, opposite St. Stephen, N. B., and on the St. Croix & P. and the Canadian P. R.R.'s, 120 miles east of Bangor. It is the extreme northeast seaport of the United States and is connected by steamship lines with Boston, Portland, and St. John, N. B. It has a large lumber trade and numerous foundries, machine shops, shipyards, and other extensive mechanical industries; a national bank, several newspapers, high and grammar schools, electric lights, a public library, and an assessed property valuation of \$2,500,000. Pop. (1900) 7,665.

Calais, Pas de. See PAS-DE-CALAIS.

Cal'aite. See TURQUOISE.

Calaman'co, a woolen stuff made in the Netherlands, the warp of which is sometimes mixed with silk or goats' hair. It has a fine gloss, and is checkered in the warp, so that the checks are seen on one side only. It was fashionable in Addison's time.

Cal'amander Wood, a hard wood of Ceylon, obtained from a species of ebony-tree. See EBONY.

Cal'amary. See CEPHALOPODA, SQUID.

Calamatta, Luigi, Italian engraver: b. Civita Vecchia, Italy, 12 July 1802; d. Milan, 13 March 1869. He was educated in Rome, but was much in Paris, and is sometimes spoken of as French. He founded a school of engravers in Brussels under government direction, and in his latest years was professor of drawing in the Academy of Milan. He is well known by his engraving of the head of Napoleon.

Calamba, ka-lām'ba, Philippines, a town of the province of Laguna, situated in the southern part of the island of Luzon, about 30 miles

CALAMBAC—CALANCHA

southeast of Manila. It is connected with several important towns by highways, and has a telegraph station. Pop (1898) 11,480.

Calambac, aloes-wood, the product of a tree (*agila*) growing in China and some of the Indian islands. It is of a very light, spongy texture, and contains a soft, fragrant resin, which is chewed by the natives.

Calambuco, ká-lam-boo'kō, a very durable tree, found in the island of Luzon, Philippines. It is indestructible by ants, and is used for ship-building, making farming implements, etc.

Calame, Alexandre, ä-lëks-ändr ka-län, Swiss landscape artist: b. Vevey, Switzerland, 28 May 1810; d. Mentone, France, 17 March 1864. His life was passed mainly in Geneva, where a monument was erected to him in 1880. He was ranked among the best landscape painters of his day and he excelled the most, if not all, of his contemporaries in portraying Alpine scenery. Among works by him are: 'Bernese Oberland'; 'Wetterhorn'; 'Lake of Lucerne'; 'Shreckhorn'; 'Lake of the Four Cantons.'

Calamianes, ká-la-më-än's, a cluster of islands in the Philippine Archipelago, Busuanga, Calamian, and Linacapan are the most important; Busuanga is 36 miles long and 17 miles broad. They lie between lat. 11° 25' and 12° 20' N. and about lon. 120° E. The islands are mountainous and well timbered. They produce rice, cacao and great quantities of wax and honey. The climate is unhealthful. Pop. 14,291.

Calamine, a native basic silicate of zinc, having the formula $(\text{ZnOH})_2\text{SiO}_3$. The mineral, now known as smithsonite, was formerly included here, but James Smithson, in 1803, showed that the two species are distinct. Calamine occurs in hemimorphic, rhombohedral crystals, usually white, with a vitreous lustre, a hardness of from 4.5 to 5, and a specific gravity of between 3.4 and 3.5. It also occurs in massive forms, sometimes mammillary in shape, and often cellular. In the United States calamine is found in New Jersey, Pennsylvania, Virginia, Missouri, Utah, and Montana. In localities where it occurs pure and in quantity, it constitutes a valuable ore of zinc.

Calamint, any plant of the genus *Calamintha*, belonging to the natural order *Labiata*. The plants are herbs or shrubs with usually entire leaves, and dense whorls of purple-white or yellow flowers, with a two-lipped corolla and didynamous stamens not projecting from the corolla. Five species are British. They all contain a volatile oil, and a pectoral medicine is obtained from them. In the United States several species are also found.

Calamis, Greek sculptor, statuary and embosser of Athens, a contemporary of Phidias, who flourished between 467 and 429 B.C. Pliny bestows the highest praises upon his horses. Among his most celebrated works were a statue in metal of Apollo Alexicacos, in Athens, in 429 B.C., and which has erroneously been supposed to be the Apollo Heredere: a colossal statue of Apollo in bronze, 30 cubits in height, which was taken to Rome by Lucullus; and a Jupiter Ammon consecrated by Pindar at Thebes.

Calamite, a genus of fossil plants very characteristic of the coal measures. They occur in the Devonian rocks, and in other formations

up to the Jurassic, in which one species is found. Their classification is not finally determined, but they are generally regarded as closely related to the *Equisetacea* or horsetails. The stalks are striated lengthwise, and interrupted with rings marking a regular articulation.

Calamity Jane. See BURKE, JANE.

Calamus, a remarkable genus of palms, the plants of which belong to the eastern countries, and are very different from most other palms, having slender, many-jointed, reed-like stems, often stretching to a length of several hundred feet. Some have the stems erect, others climb and trail among other trees on which they support themselves, hanging on by the hooked prickles that terminate their leaves. Some have leaves at intervals along the stem, others only at the extremity. The stems are hard, smooth, and siliceous on the surface, and from their toughness and pliancy they are much used in the countries where they grow for matting, strong ropes, plaited work, etc. Bridges over streams are frequently made of ropes formed by twisting up their stems, and the native vessels of the Eastern seas often carry cables of the same kind.

Calamus, a popular name for the sweet flag (*Acorus calamus*), of the natural order *Aroidæ*. This plant is found in wet land from Nova Scotia to Florida, and westward to Kansas and Minnesota. The pungent bitterish acid root-stocks have been used in medicine, especially among the colored people of the southern United States. It is sometimes cultivated as an ornamental plant in wet places, and is attractive for its erect, sword-shaped leaves, which in one variety are striped with yellow.

Calamy, Edmund, Puritan clergyman: b. London, England, February 1600; d. there, 29 Oct. 1666. He studied at Pembroke Hall, Cambridge (1616-19), where he attached himself to the Calvinistic party, and in 1639 was chosen minister of St. Mary's, Aldermanbury, London. He entered warmly into the controversies of the time, and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of 'Smectymnuus,' a work intended as a reply to Bishop Hall's 'Divine Right of Episcopacy,' and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not republican in his political opinions. He disapproved, therefore, of the execution of Charles, and of Cromwell's protectorate, and did not hesitate to avow his attachment to the Royalist cause. He was ejected for nonconformity in 1662.

Calamy, Edmund, English clergyman, grandson of the preceding: b. London, 5 April 1671; d. there, 3 June 1732. He was pastor of a congregation in Westminster and published an abridgement of Baxter's 'History of His Life and Times,' with a continuation; 'Inspiration of the Scriptures'; 'Life of Increase Mather'; 'Historical Account of My Own Life'; and also carried on through the press controversies with Bishop Hoadly and others.

Calancha, Antonio de la, Peruvian chronicler: b. Chuquisaca, 1584; d. Lima, 1 March 1654. He belonged to the Augustinian order,

CALANUS — CALATRAVA

and was rector of the College of San Ildefonso in Lima. He wrote 'Crónica moralizada del Orden de S. Agustín en Peru,' first printed at Barcelona in 1638 in folio, which is an important source for early Peruvian history. It was continued in a second volume, never completed, however, by Fray Diego de Cordova (Lima 1653). The first volume was translated into French as 'Histoire de l'Eglise du Perou aux Antipodes' (Toulouse 1653), and Brulius' 'Historia Peruana' (Antwerp 1651) is called a translation. The Spanish bibliographer Antonio credits Calancha with another work. 'De immaculate Virginis Mariæ conceptionis certitudine' (Lima 1629), but had not seen a copy. Brunet merely quotes Antonio on this point.

Calanus, Indian philosopher, much esteemed by Alexander the Great. At the age of 73, 323 B.C., being seized with illness at Persopolis, he caused a funeral pile to be erected, which he ascended with a composed countenance, and expired in the flames, saying, that having lost his health and seen Alexander, life had no more charms for him.

Calas, Jean, zhōn kā-lā, or kā-lā, French judicial martyr: b. Languedoc, 1698; d. Toulouse, 9 March 1762. Brought up in the Protestant religion, he had established himself as a merchant in Toulouse. He had four sons and two daughters whom he educated himself, and was held in general esteem, when he was suddenly accused of the crime of murdering one of his sons. In 1761 his eldest son, Marc Antoine, a young man of irregular habits and a gloomy disposition, was found strangled in his father's house. It was reported that the unfortunate youth had been put to death by his father because he wished to become a Catholic. Jean Calas and his whole family were arrested, and a prosecution instituted against him, in support of which numerous witnesses came forward. The parliament of Toulouse condemned him, by eight voices against five, to be tortured and then broken on the wheel; and on 9 March 1762, the sentence was executed. He suffered the torture with firmness, and protested his innocence to the last. The youngest son was banished forever, but the mother and servant were acquitted. The family of the unhappy man retired to Geneva. Voltaire, then at Ferney, became acquainted with them, and for three years exerted himself to defend the memory of Calas, and to direct attention to the defects of the criminal law. The widow and children of Calas also solicited a revision of the trial. Fifty judges once more examined the circumstances, and declared Calas altogether innocent, 9 March 1765. The king by his liberality sought to recompense the family for their undeserved losses, and people of the first rank emulated each other in endeavoring to relieve them. See Coquerel, 'Jean Calas et sa Famille' (1858).

Calasiao, kā-lā-se-ā'ō, Philippines, a town of the province of Pangasinan, situated in the western part of the island of Luzon, a few miles from the coast of the Gulf of Lingayen. Pop. (1898) 13,750.

Calatafimi, kā-lā-tā-fē'mē, Sicily, town in the western part of the island, in the district of Trapani, and 21 miles east-southeast of the city of Trapani. It is situated in a mountainous district, near the river Gaggera, is badly built, and has a ruinous castle on the summit of a neigh-

boring hill, now used as a prison. The environs are well cultivated and extremely fertile. In 1860 a battle took place here between Garibaldi's forces and Landi's Neapolitan troops, in which the latter were defeated. Pop. 10,964.

Calatagirone, kāl-ta-je-rō'nā, or **Caltagirone** (ancient CALATA HIERONIS), Sicily, town in the province of, and 34 miles southwest of Catania. It stands on two hills, and consists generally of spacious, clean, and well-built streets. There is a fine promenade and market-place, beside which stands the old castle. It is the see of a bishop, and has several churches and a college. Its inhabitants are said to be the best workmen in the island. It has a considerable commerce, and is celebrated for the manufacture of terra-cotta ware. It was fortified by the Saracens, and wrested from them by the Genoese. Roger Guiscard gave it important privileges. Pop. about 34,000.

Calatayud, kā-lā-ta-yood', Spain, the second city of Aragon, 45 miles southwest of Saragossa. It stands on the Jalon, near its confluence with the Jiloca, at the foot of two rocky heights crowned with the ruins of Moorish forts. The upper or Moorish town is a very wretched place; but the modern town below is well built, and contains many remarkable edifices, among which the most conspicuous are the Church of Santa Maria, once a mosque, and surmounted by an octagonal tower; and that of St. Sepolcro, a Doric structure containing many curious relics. Red wines are produced in the neighborhood, and about 10 miles from the town there are sulphurous baths. The poet Martial was born at Bilbilis, a former town on the site of the present Bambola, two miles east of Calatayud. Pop. 11,055.

Calatrava, kā-lā-trā'va, **Order of**, a Spanish order of chivalry, originated during the Moorish wars. Calatrava la Vieja, taken from the Moors in the 12th century by the king of Castile, was committed to the Templars, who guarded it till 1158. At this time, a powerful army advancing to besiege it, they despaired of being able to defend it, and restored it to the king, who offered it in absolute property to whoever would defend it. Two monks of the abbey of Citeaux (Cistercians), in France, presented themselves and were accepted. They preached a crusade, and offered a pardon of sins, and being supplied with money and arms, were able to repel the invaders. Thereupon, having received the investiture of the town and other donations, they instituted the same year (1158) an order into which all the nobility of Castile and Navarre were emulous to enter. In 1164 the chevaliers of this order, by sanction of Pope Alexander III., separated themselves from the monks, and the order became purely military. They still followed the rule of the Cistercians, until Paul III. dispensed them from the vow of chastity. The almost uniform success of the Knights of Calatrava against the Moors gave rise to rashness, and in 1197 they were defeated and nearly exterminated, the survivors transferring the seat to the castle of Salvatierra. In 1523 the grandmastership was transferred to the crown by a papal bull, the knights being permitted to marry once by way of compensation for their loss of independence. Since 1808 the body has been continued as an order of merit.

CALATRAVA LA VIEGA — CALCINATION

Calatrava la Viega, *kā-la-trā'va la vē-ā'ha*, a ruined city of Spain, situated on the Guadiana, about 12 miles northeast of Ciudad Real. Its defense against the Moors, undertaken by Raymond, abbot of Fitero, and Diego Velasquez in 1158, after it had been abandoned by the Templars, is famous on account of its having originated the Order of Calatrava (q.v.) in 1158.

Calaveras, *kāl-a-vā'ras*, a river of California, rises among the hills at the foot of the Sierra Nevada, in Calaveras County, and after a westerly and southwesterly course joins the San Joaquin River, a few miles below Stockton.

Calaveras Grove, the most northern of the California groves of big trees, containing about 100 of these trees. The tallest one standing is known as the "Keystone State," and is 325 feet in height and 45 feet in girth; the "Mother of the Forest" is another tree of notable size, being 315 feet high and 61 feet in circumference. The grove is a State reservation.

Calaverite, a native gold telluride, $AuTe_2$. It was originally described by Gentz as a very rare massive gold (and silver) telluride from Boulder County, Col. It is now the commonest of the gold ores of Cripple Creek and occurs there in beautiful triclinic crystals. It is often confused with "sylvanite" by the miners. It has a brilliant metallic lustre, pale bronze-yellow color, a hardness of 3, and a specific gravity of about 9.

Calc-tufa, a variety of calcite essentially travertine. It is formed in small streams by the deposit of calcium carbonate in a cellular form. It often contains fossil twigs, moss, leaves, seeds, etc.

Calcaire, *Grossier*, *kāl-cār grō-sē-ā*, a chief type of the Eocene Tertiary series of the Paris and London basins. Its limestone strata furnish building material for the city of Paris. The fossils of the Calcaire Grossier are remarkable for number, and for the variety of forms, rising up to the mammalia.

Calcar, or **Kalkar**, *Jan Stephanus van, yān stē-fān'ūs vān kāl'kār*, Dutch painter: b. Calcar in Cleves, 1499; d. Naples, 1546. He studied so thoroughly the works of Titian, that their pictures cannot always be distinguished. The 'Mater Dolorosa,' in the Boisseree collection in Stuttgart, a perfect work of art, is by him. Another small picture of his, the 'Infant Christ with the Shepherds,' was a favorite with Rubens. In this piece the light is represented as proceeding from the child. He designed almost all the portraits in Vasari's Lives, and the figures for the anatomical work of Vesalius.

Calca'reous, a term applied to substances partaking of the nature of lime, or containing quantities of lime. Thus, we speak of calcareous waters, calcareous rocks, calcareous soils. Calcareous spar is calcite (q.v.). See also **CALC-TUFA**.

Calcasieu, *kāl'ka-shū*, a river of Louisiana, rising in the western part of the State. It flows through the parish of the same name, and after a southerly course of about 200 miles enters the Gulf of Mexico through Lake Calcasieu.

Calcasieu Lake, situated in Calcasieu Parish, about five miles from the Gulf of Mexico, is little more than an expansion of the river of the same name. Length, about 18 miles; greatest breadth, five or six miles.

Calceola'ria (Latin, *calceolus*, a little shoe, alluding to the form of the corolla), a genus of plants of the natural order *Scrophulariaceae*, natives of South America, especially of Chile and Peru. They are characterized by having a corolla with a very short tube, with two lips, concave or shaped like a hood, the upper one very small, the under one greatly inflated. They are common as greenhouse or outdoor plants. These are upward of 60 species, of which about 20 are cultivated in the gardens of Europe, and their varieties are very numerous. The flowers of the indigenous species are white, yellow, and purple. They are greatly excelled in beauty by the cultivated varieties, which acquire numerous tints in these colors, and have besides on the lower part of the corolla, the part which bears the strictest resemblance to a shoe, large spots, or innumerable small points of a different color, which have a very graceful effect. They grow best in a rich, open, sandy garden mold, and are propagated by seeds or cuttings, the herbaceous kinds mostly by the former method.

Calchaqui, *kal-chā'kē*, a South American tribe formerly living in the northwestern part of Argentina. They were conquered by the Incas in the 15th century, and the ruins of their buildings and tombs indicate quite an advanced stage of civilization. They were visited by the Jesuit missionaries, but strongly opposed the inroads of the Spaniards. The tribe is now extinct and all record of their language is lost.

Calchas, *kāl'kās*, a legendary priest and prophet of the Greeks at the time of the Trojan war, who foretold that Troy would not be subdued by them till the 10th year of the siege. He himself accompanied the Greek army to Troy. During the siege, the Greeks were attacked by a plague, and Calchas declared that it was the effect of Apollo's anger, because they had deprived his priest of his daughter Chryseis, whom Agamemnon had selected as his mistress. He counseled the Greeks to appease Apollo by restoring the damsel; and it was by his advice that they afterward built the wooden horse. There are various legends relating to his death.

Calcliferous, a geologic term applied to the sandy limestones found in Pennsylvania, extending across New Jersey and New York to Canada, and known as the Beekmantown beds. An equivalent formation is found in the magnesium limestones of Iowa and Missouri.

Cal'cimine, a mixture of zinc-white, glue, water, and pigments, used to finish the plaster walls of buildings. See **WHITEWASH**.

Calcination, a term now used as practically equivalent to roasting or oxidation. It is derived from the Latin word *calx*, meaning quicklime, and received its present signification by extension from its original meaning of obtaining lime from limestone by the application of great heat. By calcination many substances are reduced to a friable condition, and freed from constituents capable of passing off in the form of gas or vapor. Thus various salts may be deprived of water of crystallization, and rendered amorphous in this way; the hydrated carbonate of magnesium is reduced to the pure oxide, known as calcined magnesite; limestone is converted into quicklime, etc. Calcination is usually the first process in the extraction of metals from their ores. The oxides of metals

CALCEOLARIA (FISHERMAN'S BASKET).

1. Calcite Crystals, Bigrigg Mine, England.
2. Calcite "Bird's Nest," Reichelsdorf, Hesse, Germany.

CALCITE — CALCIUM

produced by this process were formerly known as calxes, but this term is now disused. It depends on circumstances which oxide is obtained, if the metal, like lead, can form more than one. The weight of the total calx is equal of course to that of the metal and the oxygen with which it has combined, but the calx itself is specifically lighter than the metal. Platinum, gold, silver, and some other metals, are not affected in this way, and on this account they are called the noble metals. See COMBUSTION.

Cal'cite, -sīt, a native carbonate of calcium, crystallizing in the rhombohedral system, and exhibiting hundreds of distinct crystals of general forms or "habits." The mineral also occurs massive, fibrous, granular, lamellar, compact, earthy, stalactitic, nodular. Its typical crystals exhibit a very perfect cleavage, commonly splitting up, from a blow, into many small rhombohedrons. Pure crystals have a specific gravity of about 2.72, and a hardness of about 3, though the latter varies somewhat with the face of the crystal. Calcite may be transparent, translucent, or opaque, and in color may vary from white, or colorless, to black, also brown, violet, blue, green, yellow, and red. It exhibits the phenomenon of double refraction powerfully, and transparent crystals of it (called "Iceland spar" because first obtained from Iceland) are used in the manufacture of polarizing prisms. (See LIGHT.) Limestone, marble, and chalk are commonly classed as massive or cryptocrystalline varieties of calcite. Oolite (q.v.) is a granular limestone composed of innumerable minute rounded concretions. Pisolite is a similar variety in which the spheres are as large as peas. The stalactites and stalagmites of many caves (q.v.) are calcite. Mexican onyx, travertine, and calc-tufa (q.v.) are a few of the many other varieties of calcite. Varieties containing other metallic carbonates are known as baricalcite, strontianocalcite, ferocalcite, etc. Calcite effervesces briskly even in cold acid. It occurs abundantly all over the world; especially choice specimens come from Germany, England, Mexico; Rossie, N. Y.; Joplin, Mo., and Lake Superior.

Calcite Group, in mineralogy, an important series of rhombohedral carbonates including calcite, dolomite, ankerite, magnesite, mesitite, siderite, rhodochrosite, smithsonite, and sphærocobaltite.

Cal'cium, a metallic element first obtained in the free state by Sir Humphry Davy in 1808. Its compounds are exceedingly abundant and are widely distributed. Calcium carbonate, CaCO_3 , is familiar in the various forms of marble, chalk, limestone, and calcite. The sulphate, CaSO_4 , is also very common, and is perhaps best known in the form of gypsum, which contains two molecules of water, and therefore has the formula, $\text{CaSO}_4 + 2\text{H}_2\text{O}$. Calcium phosphate also occurs in nature in considerable quantities, both in the form of fossilized bones and as apatite (q.v.), and its various modifications.

Metallic calcium may be obtained by the electrolysis of the fused chloride (which melts at a red heat), or by decomposing the iodide with metallic sodium. It has a light yellow color, has a hardness about equal to that of gold, and (according to most authorities) is very malleable and ductile. Its chemical symbol is Ca, its specific gravity is about 1.58, and its

atomic weight is 40.0 if $\text{O} = 16$, or 39.7 if $\text{H} = 1$. Perfectly dry air does not affect it at ordinary temperatures, but in moist air it becomes rapidly coated with the hydrate, $\text{Ca}(\text{OH})_2$. When strongly heated in air it burns with a yellow flame, taking up oxygen to form the oxide, CaO . It decomposes water rapidly, passing into the form of the hydrate, with evolution of hydrogen. It melts at a red heat, has a specific heat of about 0.169, and has an electrical resistance only about one twelfth of that of mercury.

In its chemical relations calcium is a dyad. It combines with almost every known acid, and yields a vast number of compounds, many of which are of great industrial value. Of these the best known are the carbonate, oxide, hydrate, chloride, sulphate, fluoride, carbide, and bisulphide, and the indefinite mixture of the chloride and hypochlorite known as bleaching-powder (q.v.).

The carbonate occurs native in large quantities, as already noted. It is also commonly present in ground water as obtained from wells and springs. It is almost insoluble in pure water, but dissolves to a considerable extent when the water contains free carbon dioxide in solution. It is this compound that gives to water what is known as "temporary hardness." Upon boiling, the free carbon dioxide held in solution is expelled, and the lime carbonate is therefore precipitated also, so that the water loses that part of its hardness which is due to the presence of the carbonate. This effect is well illustrated, in regions where the soil is rich in limestone, by the crust of lime carbonate that is deposited upon the interior of household kettles that are used for heating water. Calcium carbonate also gives rise, in steam boilers, to troublesome deposits that keep the water out of contact with the metal plates, which often become overheated and seriously impaired in consequence. To prevent this action chemists often recommend the addition to the water in the boiler of a certain amount of ammonium chloride (sal ammoniac). This compound combines with the lime carbonate to form calcium chloride, which is exceedingly soluble, and ammonium carbonate, which is volatile, and therefore passes away with the steam. Beautiful as this process is in theory, it cannot be recommended for adoption in practice, because if the sal ammoniac is present in any excess it induces rapid corrosion of boiler-plates. For a further discussion of boiler-scale, see SCALE.

When calcium carbonate (more familiarly known as carbonate of lime) is strongly heated in a current of air, it loses its carbon dioxide and becomes converted into a substance known to the chemist as calcium oxide CaO , and in the arts as quicklime, burnt lime, or simply lime. Pure calcium oxide (or lime) is a white, amorphous substance, extremely infusible, glowing with a dazzling white light when strongly heated, possessing caustic properties, and acting as a powerful chemical base. When treated with about one third of its own weight of water, lime passes into the form of the hydrate or hydroxide, $\text{Ca}(\text{OH})_2$, with the evolution of much heat. The process of converting it into the hydrate by the addition of water is called slaking, and the resulting hydrate is known in the arts as slaked lime. Mortar is composed of a mixture of slaked lime and sand, the silica (or sand) slowly combining with the lime to form a silicate after the

CALCIUM CARBIDE — CALCULATING-MACHINES

mortar has been applied. Slaked lime, or calcium hydrate, is somewhat soluble in water, its solution being known as lime water.

Calcium chloride is formed when calcium carbonate is dissolved in hydrochloric acid. It is exceedingly soluble, but upon evaporation of its solution it separates in white, needle-like crystals having the formula $\text{CaCl}_2 + 6\text{H}_2\text{O}$. When these are heated to about 400°F . they lose two thirds of their water of crystallization and become converted into $\text{CaCl}_2 + 2\text{H}_2\text{O}$, in which form the chloride is commonly used. Thus prepared, calcium chloride is a white, porous solid, which absorbs moisture with great avidity, and hence is exceedingly valuable to the chemist and physicist for drying air and other gaseous bodies. It forms crystalline compounds with ethyl and methyl alcohols, which are again resolved, by the addition of water, into calcium chloride and the free alcohol. On account of this property it has been used for the preparation of these alcohols in the pure state.

Calcium sulphate occurs native in the anhydrous form, as the mineral anhydrite; and, combined with two molecules of water, it also occurs abundantly as gypsum. It is soluble in 400 parts of water, and, like the carbonate, it occurs quite generally in the waters of wells and springs. Like the carbonate, too, it makes the water in which it occurs hard; but the hardness due to the presence of the sulphate cannot be removed by boiling, and it is therefore said to be "permanent." Calcium sulphate produces deposits in steam boilers that are far more troublesome and injurious than those due to the carbonate, since the sulphate is deposited in a hard, compact, stony form, and can be removed only with difficulty. See SCALE.

When gypsum is moderately heated it loses its water of crystallization and becomes converted into a substance that is commercially known as plaster of Paris, from the fact that the gypsum from which it is prepared (and which is also called plaster of Paris, though rarely), occurs abundantly in the Tertiary formations of the Paris basin. Plaster of Paris, when moistened by the addition of the proper quantity of water, takes up two molecules of water again, and rapidly sets into a hard, solid mass which expands somewhat at the instant of solidification. It is greatly used in making casts and molds. These are harder and better when the plaster is wetted with a solution of alum than they are when pure water is used for this purpose. If equal weights of the anhydrous sulphates of calcium and of potassium are wetted with about four parts of water, the mixture sets like plaster of Paris, with the formation of a double sulphate of calcium and potassium, having the formula, $\text{CaSO}_4 \cdot \text{K}_2\text{SO}_4 \cdot \text{H}_2\text{O}$. The casts so obtained exhibit polished surfaces, superior to those obtained with the pure plaster.

Calcium fluoride, CaF_2 , occurs native as fluor spar, or fluorite, and is used to some extent as a flux in metallurgical operations, to which circumstance it owes its name (Latin *fluor*, a flux). It is also used in the manufacture of vases and other ornamental articles and as a source of hydrofluoric acid, which is set free when the fluoride is treated with warm sulphuric acid.

Calcium carbide, CaC_2 , has long been known, and was prepared by Wöhler in 1862 by melting an alloy of zinc and calcium in the presence of

carbon. Its commercial importance, however, dates from the discovery made by Mr. T. L. Willson in 1892, that it can be formed by the direct combination of lime and carbon at the temperature of the electric furnace. Large quantities of it are now made by this process at Niagara Falls, at Spray, N. C., and elsewhere. Calcium carbide in its commercial form is a dark-gray substance, often almost black. It is hard, infusible, and incombustible, with a specific gravity of about 2.24. Its value in the arts depends upon the remarkable fact that when it is thrown into water a double decomposition occurs, by which acetylene gas is formed, in accordance with the equation $\text{CaC}_2 + 2\text{H}_2\text{O} = \text{C}_2\text{H}_2 + \text{Ca}(\text{OH})_2$. See ACETYLENE; CARBIDE.

Calcium sulphite, CaSO_3 , is formed and precipitated as a white powder when a solution of a calcium salt is added to a solution of an alkaline sulphite. The sulphite so formed requires 800 parts of pure water to effect its solution. It is far more soluble in sulphurous acid, however, and it is believed that the sulphurous acid acts upon it to produce a new but comparatively unstable compound, $\text{CaSO}_3 \cdot \text{SO}_2$, to which hypothetical substance the name calcium bisulphite, or bisulphite of lime, has been given. Upon exposure to air the bisulphite solution gradually deposits crystals of the monosulphite, having the composition, $\text{CaSO}_3 \cdot 2\text{H}_2\text{O}$. On the commercial scale the bisulphite solution is prepared by passing sulphur dioxide gas (SO_2) through "milk of lime" (that is, water containing slaked lime in suspension). The monosulphite of lime is first formed, and by the continued action of the sulphur dioxide this passes into solution in the form of the bisulphite. The usefulness of bisulphite of lime in the arts depends upon its power of dissolving the gums and resins by which the fibres of wood are cemented together. Thus, in the sulphite process of manufacturing wood pulp, chips of wood are submerged in a solution of the bisulphite and heated for some hours in closed digesters, by the action of steam. By this means the chips are disintegrated, the gummy connective materials being entirely dissolved away, and the wood being thereby reduced to a mass of separate fibres, which after simple washing and bleaching, are ready for use in the manufacture of paper.

Calcium Carbide. See ACETYLENE; CALCIUM; CARBIDE.

Calcium Light, a brilliant light produced by directing the flame of an oxy-hydrogen blow-pipe against a block of compressed quicklime. It had long been known that lime emits a light of extraordinary brilliance and whiteness when strongly heated in this manner, but the first practical application of the principle was made by Capt. Thomas Drummond in 1825, in connection with the trigonometrical survey of Ireland. The calcium light is now constantly employed in the production of theatrical effects, and for the projection of photographic pictures upon a screen. It is also called Drummond light, lime-light, and oxy-hydrogen light.

Calculating-machines. The simplest form of calculating mechanism in common use is the slide-rule, which consists usually of three strips, bearing graduations, the centre strip sliding between the others. The scales being graduated to logarithms, and one function of a number being on a stationary strip, and another function

CALCULATING-MACHINES

on the sliding strip, movements of the strip afford a sight reading of a variety of calculations. A mechanism identical in principle with the slide-rule is the calculating-circle, in which graduated rings are substituted for the strips or slides.

The counter used in street cars to register fares, the cyclometer, odometer, and cash-register are all simple forms of calculating machines, based on the principle common to nearly all these machines, namely, the use of a disk or wheel bearing figures from 0 to 9 inclusive. A very simple form is shown in the illustration. When the disk at the right has completed one revolution it advances the centre disk one step; and so on successively at each revolution of the right-hand disk until after 10 revolutions the centre disk has likewise completed a full revolution, when it in turn advances the left-hand disk one step and thus registers 100. The train of disks may be extended to register any number desired. Apertures in the casing of the train enable the figures to be read.

During recent years the keyboard type of calculating machine has come into extended use in banks, business houses, and other concerns where numerous and tedious calculations have to be made. There are a number of these machines, but that of Dorr E. Felt of Chicago is

Wheels of a form of counter, illustrating the principle common to nearly all calculating machines.

perhaps the best known. This was introduced in 1889, and has been improved several times, the different styles being known as the comptograph and comptometer. The comptograph is the more complete machine of the two, and prints the record of its work as performed. The comptometer is very similar, but does not print its record, and hence cannot be used for listing. Either machine performs any of the four arithmetical operations of adding, subtracting, multiplying, and dividing, besides extracting the square root. In the comptograph the totals are recorded in front of the operator, and, if, by accident, wrong keys have been struck, they can be instantly released by touching a release key, after which the correct keys can be struck.

The keys resemble those of a typewriter. They are arranged in columns, the first column on the right representing units (1, 2, 3, etc.), the next column tens (10, 20, 30, etc.), the next hundreds, and so on. Two figures (a large and a small one) appear on the top of each key. In addition and multiplication the keys are struck with reference to the large figures, while in subtraction, division, and square root, the small figures (which are red) guide the operator. Addition is performed by touching the large figure keys of the proper numbers to be added, and standing in their proper columns, all the columns being added at one time, the carrying being done automatically by the machine, with

no attention from the operator. In multiplication the operator begins at the right of the row of keys indicated by the first figure of the multiplier, and strikes each successive row in the same row toward the left as many times as indicated by the corresponding figure in the multiplicand, and then proceeds with each of the other figures of the multiplier as with the first, beginning always in the column of keys in which the figure of the multiplier stands. To multiply such a sum as 198 by 377, it is only necessary to strike three keys, but these must be selected according to their positions in the columns.

In dividing, the number to be divided is first struck on the keys, precisely as in addition, and then the divisor is struck with respect to the smaller figures on the keys, the operator striking the proper keys continually (never more than nine times) until the figures in the complementary place agree with the number of strokes on the keys, and the answer then shows on the register.

In 1900 Felt patented a machine to compute in pounds, shillings, and pence, and this is now being introduced in Great Britain. James Mallmann, of Sheboygan, Wis., has recently produced a machine of the keyboard type that has attracted some attention. So has D. J. T. Hiett, of St. Louis. Somewhat less pretentious among new machines is the arithmachine of Henry Goldman, of Chicago, and the machine of James B. Moore, of New York, operating with registering tape and slides.

Among foreign machines that have attracted comment are the Thomas machine, used in France; the Tate, an improved Thomas, employed in Great Britain; the Odhner, used in Poland; and Babbage's differential machine, which cost \$100,000, and calculates logarithms besides performing operations in trigonometry.

The Hollerith electric tabulating mechanism used by the United States Census Bureau is prominent among the remarkable calculating machines that have been developed in America. Three separate machines constitute the outfit. The first one punches holes in cards, in any one or more of 240 places; the second tabulates the cards, while the third sorts them. Machine No. 1 has a keyboard of 240 keys, this being the number of answers called for in the census blanks of the bureau. The operator takes a return blank, representing the report of some individual, and, as he reads it, strikes the appropriate keys, which results in the punching of a card, that becomes a mechanical counterpart of the original return. As the average number of questions answered on each return is but 15, the work is not so tedious as might be inferred from the statement as to 240 questions.

When the cards of a State have been punched, they are brought to the tabulating machine, which is the real calculator. This machine reads the holes of the cards that are fed into it, and makes an electrical record of each hole, according to its position, adding up the totals for each hole, and showing them on dials. When the cards are all fed through, the total of each of the 240 replies is enumerated. The third machine is a sorting box, which serves to secure answers to cross-questions. For instance, if it is desired to know how many white persons are among the total number convicted of crime, the sorting box will locate all cards having the holes corresponding to these two statements, and give the

CALCULUS

total. In this way a great variety of statistics are made available which it would be too expensive to gather or compute in any other way. For other information on this subject, see CASH REGISTER.

C. H. COCHRANE.

Calculus. As used in medicine the term calculus (*Lat. calculus*, a pebble or small stone) is applied to certain concretions occurring in the cavities or tissues of the body, usually as the result of the deposition of solids from some natural secretion. Calculi may be of many different sorts, and vary greatly in consistency, some being merely crumbly masses that can be crushed between the fingers, while others are extremely hard. Calculi occurring in the lachrymal or tear passages are called dacryoliths, while salivary calculi are formed in the salivary glands or their ducts, and amygdoliths in the tonsils. So-called rhinoliths are concretions which sometimes develop in the nasal cavities, usually as the result of the presence of some foreign body. The tartar on the teeth is sometimes spoken of as dental calculus. Pneumoliths occur in the lung, and broncholiths in the bronchi; pancreatic calculi are found in the pancreas. The breast and prostrate gland also occasionally harbor calcareous concretions, which in the former case are called lacteal calculi. The deposits of chalk about the joints in gouty persons are sometimes referred to as arthritic calculi. Intestinal calculi or enteroliths may give rise to serious disturbances, and if they happen to occur in the vermiform appendix often simulate date or other fruit stones in appearance. Before appendicitis was well understood their true nature often passed unrecognized and when they were discovered in cases of the disease the malady was mistakenly attributed to the swallowing of such foreign bodies. The two most important types of calculi, however, are the biliary calculi or gall-stones, and urinary calculi.

Gall-stones are very common and fortunately usually do not give rise to symptoms. It is estimated that in Europe 10 per cent of the entire population have gall-stones, while in this country their frequency is held to be about 7 per cent. As their formation is probably encouraged by sedentary life and conditions favoring stagnation of the bile such as tight lacing, lack of exercise, and constipation, they are three times commoner in women than in men. They rarely give symptoms in younger persons, and about half of the patients are over 40 years of age. Pregnancy is said to be of importance in favoring their formation. Biliary calculi may be extremely small or may attain considerable size, stones as large as an English walnut not being at all uncommon. They also vary greatly in number and the smaller ones may be present in hundreds. They are composed principally of cholesterin (q.v.), with varying but much smaller amounts of bile pigment, lime and magnesium salts, fatty acids, and bile acids. It is now generally assumed that an inflammatory or catarrhal condition of the mucous membrane of the gall-bladder (q.v.), usually induced by microorganisms, furnishes the starting point of gall-stone formation. As already stated gall-stones may remain in the gall-bladder for years without causing symptoms, or their presence may be accompanied by inflammatory changes in the organ, or they may enter the gall-ducts and

give rise to disturbances of various sorts, of which pain, local tenderness, persistent or remittent jaundice, clay-colored stools, and chills and fever are conspicuous features. While a rational and hygienic mode of life will do much to prevent the formation of gall-stones, if they are present and give rise to symptoms that are at all severe surgical intervention is usually necessary to effect a cure.

Urinary calculi may be found either in the kidney, ureter, or bladder, and are accordingly called renal, ureteral, or vesical calculi. Kidney stones of small size often pass into the ureter and during their journey downward to the bladder give rise to seizures of renal colic which in the agony and general prostration they cause are very similar to those of biliary colic. The pain is felt lower down in the abdomen and also in the back; frequently also radiating along the inner surface of the thigh. Aside from the attacks of colic renal stones may cause pain in the back, chills, fever, and bloody or turbid urine containing pus. "Coral calculi" are large stones which gradually fill the pelvis of the kidney, and in the conformation reproduce with great fidelity the irregularities and recesses of this cavity. Very small concretions pass into the bladder without difficulty and are evacuated in the urine as "gravel." Stone in the bladder is rare in women and in the male sex is seen oftenest in infancy and after the fiftieth year. The symptoms include pain increased by jolting or bodily motion, frequent urination, pain at the end of urination—and sometimes sudden stoppage of the stream owing to the fact that the stone rolls into the neck of the bladder shutting off the flow—and usually bloody and turbid urine. Stone is especially common in old persons on account of the cystitis (q.v.) often present. Urinary calculi may be composed of various materials, of which uric acid and urates, calcium oxalate ("mulberry calculus"), calcium phosphate and ammonio-magnesium phosphate are the commonest, singly or in combination. Rarer forms are made up of calcium carbonate, cystin, or xanthin. The cut section usually shows a laminated structure and a nucleus or starting point, which may be a blood clot, a shred of tissue, a bit of mucous, a small renal calculus, a mass of urates or a foreign body. Any conditions encouraging excessive deposition of the urinary constituents predispose to urinary calculi. Among such causes are lack of exercise, digestive disorders, defect oxidation, excesses in eating or drinking, catarrhal conditions of the urinary tract, etc. The tendency to stone formation is particularly pronounced in those having what is called the gouty or lithemic diathesis. The diagnosis of renal calculi is facilitated by the use of the x-ray, while for the detection of bladder stones a special form of steel sound termed a "stone searcher" is introduced into the bladder. The cystoscope is also of great service in this field. Individuals predisposed to stone should keep the urine abundant by the free use of water—preferably distilled—and milk, should take much open air exercise, and avoid the consumption of large amounts of meat, fats, sugar, or alcohol. Green vegetables, salads, bread, poultry, fish, eggs, and fruit should form the main articles of diet. Despite the claims of nostrum vendors, when a stone is once formed there is little chance of its being dissolved by any plan of internal medica-

CALCULUS, THE INFINITESIMAL

tion. If the condition causes decided symptoms surgical removal of the offending body is indicated. See LITHOTOMY; LITHOTRITY.

KARL M. VOGEL, M. D.,
New York City.

Calculus, The Infinitesimal.—The Infinitesimal, or Differential and Integral, Calculus is not so much a branch of mathematics as a method or instrument of mathematical investigation, of indefinite applicability. The masters now seldom try to treat it in less than a thousand large pages; here we may hope no more than to expose its basic principles, to illustrate its characteristic processes, and to exhibit some of its nearer-lying applications, with their results. Even so little will require utmost condensation and self-explaining abbreviations.

We might define the Calculus as the Theory and Application of Limits, so central and dominant is this latter concept. We must, then, clear the ground for its full presentment.

Successive addition of the unit 1, continued without end, gives rise to the *Assemblage* of positive integers, in which all additions, multiplications, and involutions are possible. This assemblage is *ordered*: i.e. of two different elements, a and b , either $a < b$ or $a > b$; and if $a < b$ and $b < c$, then $a < c$. To make all subtractions (inverses of addition) possible, we annex the symmetric assemblage of *negative* integers, any negative integer, as a' (or $-a$), being *defined* by the equation $a + a' = 0$, this 0 itself being defined by $a - a = 0$. To make all divisions (inverses of multiplication) possible, we annex the assemblage of *Fractions*, quotients of integers by integers. This total assemblage of integers and their quotients, both + and -, we may call the *domain* or assemblage of *rational real* numbers, wherein all direct operations (of addition and multiplication) and also the inverses (subtraction and division) are possible.

The operation of involution is direct, a special case of multiplication, but is not commutative like addition and multiplication: thus $a + b = b + a$, $ab = ba$, but in general $ab \neq ba$. Hence the direct operation ab , yielding c , has two inverses: Given b and c , to find a , and given a and c , to find b . The former gives rise to roots or surds, the latter to logarithms. But neither of these can in general be found in the universe of rationals; to make such inversions always possible, we must still further enlarge the domain of number by annexing *Irrationals*. These demand exact definition.

Divide the assemblage of rationals into two classes, A and B , any member a of the first being $<$ any member b of the second. Three possibilities present themselves:

1. A may contain and be closed by a number $\alpha >$ any other a but $<$ any b .

2. B may contain and be closed by a number $\beta <$ any other b but $>$ any a .

3. Neither A may contain a largest a , nor B a smallest b . Thus we may form (1) A of 2 and all rationals < 2 ; or (2) B of 2 and all rationals > 2 ,—in either case 2 is a *border* (frontière) number; or (3) A of all negatives and all positive rationals whose squares are < 2 and B of all positive rationals whose squares are > 2 . Here there is *no border* number among rationals. But a border does exist, defined as $>$ any a but $<$ any b . We name it *second root* of 2 and denote it by

$\sqrt{2}$ or $2^{\frac{1}{2}}$. All such common borders are called *Irrationals*. The assemblage of irrationals is determined by all possible such partitions of rationals (A, B). The assemblage of all rationals and all such irrationals is the assemblage of *Reals*. It remains and is possible to extend the operations of arithmetic to all reals. In particular, the assemblage of rationals is *dense*; i.e. between every two there is an infinity of others; in the same sense the assemblage of reals also has density. Again, always on dividing all reals into A and B , each member of $A <$ each member of B , there will be a border γ , the greatest in A or the least in B , all less numbers being in A , all greater in B . Hence, and in this sense, the assemblage of reals is named *continuous*.

In this continuum, admitting no further introductions, suppose a magnitude to assume successively an infinity of values: $v_1, v_2, \dots, v_n, \dots, v_{n+k}, \dots$; it is then called a *variable*, V , and its values in order form a *sequence*, S . It often happens that V will approach some *constant* L , so that by enlarging n we may make and keep the modulus or absolute worth (i.e., regardless of sign) of the difference $V - L <$ any *preassigned positive magnitude*, ϵ , for all following values of V ; in symbols, $|V_{n+k} - L| < \epsilon$ for every positive k . Then L is called the *Limit* of V : $L = \text{Lim. } V$. Plainly, V cannot have two limits as thus defined. It is easily seen that V will have a limit when and only when $|V_{n+k} - V_n| < \epsilon_n$. If V changes always in the same sense, by increase or decrease, it has a limit when and only when $|V| <$ always than some fixed number u . When V increases (positively or negatively) beyond any assignable n , it is often said to have ∞ as limit.

A perfect *geometric illustration* is found in the sequences I and C of inscribed and circumscribed regular polygons of the circle. Here every C is $>$ every I ; also $C_n - I_n < \epsilon$; also $C_{n+k} - C_n < \epsilon$, $I_{n+k} - I_n < \epsilon$, $C_n - A < \epsilon$, $A - I_n < \epsilon$ (A being the circle-area); hence A is the common *limit* both of C_n and of I_n , for n increasing without limit ($n \neq \infty$).

Algebraically, if $c_1, c_3, c_5, \dots, c_{2n+1}, \dots$ be the sequence (O) of odd convergents, and $c_2, c_4, \dots, c_{2n}, \dots$ the sequence (E) of even convergents in an interminate continued fraction as $\frac{1}{1 + \frac{1}{1 + \frac{1}{1 + \frac{1}{6 + \frac{1}{1 + \frac{1}{\dots}}}}}}$, then every $C_{2n+1} > C_{2n}$, also $C_{2n+1} - C_{2(n+k)+1} < \epsilon$, $C_{2n} - C_{2(n+k)} < \epsilon$; and $C_{2n+1} - (\sqrt{13} - 3) < \epsilon$, $(\sqrt{13} - 3) - C_{2n} < \epsilon$. The odd convergents from above and the even convergents from below close down endlessly upon their *common limit*, $\sqrt{13} - 3$,—as quadrants of an hyperbola and its conjugate close down upon their common asymptote.

The difference $|V - L|$ is a *variable small at will* and is called *Infinitesimal* (σ); its *limit* is 0. The quotient of two σ 's will generally be a variable; if it has a finite limit L , the σ 's are named *of the same order*; if the limit of the quotient is 0 (or ∞), then the numerator (or denominator) is of *higher order*. If any σ be chosen as standard, it is called *principal infinitesimal*; any other whose p th root is of the same order as the principal σ is itself said to be of p th order.

Easy theorems are now proved as to the limits of the sum, difference, product, quotient of variables. In general: If $R(u, v, w, \dots)$ be a rational function of simultaneous variables,

$1, v, w, \dots$, and if u, v, w, \dots have limits l, m, n, \dots ,—then $R(u, v, w, \dots)$ has a limit $R(l, m, n, \dots)$.—always provided that this latter does not involve a division by 0, which has no sense.

If two V 's differ at most by a σ , and one has a limit, the other has the same limit. Herewith there becomes possible a Calculus of the Limits of Variables instead of the Variables themselves. These limits are often far the more important, as we shall soon see.

A variable V (or sequence v_1, v_2, \dots) is bounded above when we may assign a value M that it cannot exceed; then there is a certain smallest number, its upper limit, which it cannot exceed. Similarly, it is bounded below when we may assign an m below which it cannot sink; then there is a certain greatest number, its lower limit, under which it cannot descend. If V may assume either of these limits as one of its values, then that limit is attainable and is a Maximum or a Minimum; otherwise it is unattainable. If V be a proper fraction, its limits, 0 and 1, are not attainable. When V may assume every value between its attainable limits, a and b , it is said to vary continuously in the interval $[a, b]$. But if a , or b , or both, be unattainable, we shall write $[a+\sigma, b]$ or $[a, b-\sigma]$, or $[a+\sigma, b-\sigma]$.

When to values of one magnitude correspond values of another, the magnitudes are called Functions of each other (Leibnitz). The one to which arbitrary values may be supposed given is called the argument or independent variable; the other, whose corresponding values may be reckoned or observed (or which at least exist), is called the function. Such are a number and its logarithm or sine; the radius of a sphere and its surface or volume; the elasticity of a medium and the velocity of an undulation through it; etc. . . . The general functional connection of x and y is expressed by $F(x, y) = 0$. If this F be an entire polynomial in x and also in y , then F is algebraic, otherwise transcendental. If F be solved as to y , thus $y=f(x)$, then y is an explicit function of x ; otherwise, an implicit function. If $f(x)$ be the quotient of two entire polynomials in x , then $f(x)$ is a rational function of x ; otherwise, irrational. If to any one value of x there corresponds only one value of y , then y is a one-valued or unique function of x ; if x be also a unique function of y , then there exists between x and y a one-to-one correspondence.

If $y=f(x)$ and $x=\phi(y)$ express the same correspondence between x and y , then f and ϕ denote inverse functions. A function may reduce to a constant; as $x^n=1$, for every finite x when $n=0$.

As x ranges in $[a, b]$, $f(x)$ will also range. Similarly $f(x)$ may have an upper limit M and a lower limit m ; then $f(x)$ is bounded in $[a, b]$, $[m, M]$ is its interval and $M-m$ its oscillation. If either m or M be absent (or ∞), this oscillation is ∞ . If we cut $[a, b]$ into n sub-intervals (a_k, b_k) ($k=1, \dots, n$), then plainly the upper limit of $f(x)$ will be M in at least one $[a_k, b_k]$ and $> M$ in none; the oscillation will not be $> M-m$ in any $[a_k, b_k]$.

If as x approaches c , no matter how, $f(x)$ approaches $f(c)$ as its limit, then $f(x)$ is continuous at c (i.e. for $x=c$). Or, if $f(x)$ be bounded in $[c-\sigma, c+\sigma]$ and if the limit of its oscillation be 0 for σ vanishing, then $f(x)$ is continuous at c . That is, we must be able to

make and keep the oscillation of $f(x)$ small at will by making and keeping the fluctuation in x small at will.

It may be that limit $f(c+\sigma)=f(c)$ only for $+\sigma$, then $f(x)$ is named continuous right of c ; or that $\text{Lim. } f(c+\sigma)=f(c)$ only for $-\sigma$, then $f(x)$ is named continuous left of c . Only when $f(x)$ is continuous both right and left of c [$f(c)$ being the same], is $f(x)$ continuous at c .

If $f(x)$ be continuous at all points (values of x) right of a and left of b , it is named continuous in $[a, b]$.

The infinitesimal $[c-\sigma, c+\sigma]$ is called the (immediate) vicinity (or neighborhood) of c .

A change in the value of a v is conveniently denoted by Δv , read difference- v or Delta- v ; hence Δx and Δy will denote corresponding (simultaneous) differences or changes in x and y .

If now $y=f(x)$ be continuous in $[a, b]$, we may cut this latter up into finite sub-intervals, Δx , each so small that the oscillation of y in each shall be $< \epsilon$. Hence Heine calls y uniformly (equally, gleichmässig) continuous in $[a, b]$. This corresponds to uniform convergence, as of a power-series, $y = \sum_{n=0}^{\infty} C_n x^n$, as

opposed to non-uniform or infinitely slow convergence (Seidel, 1850). Finer discriminations must here be omitted.

Continuity is the supreme functional property with which the Calculus is concerned. Sine and cosine are everywhere continuous, but $\tan x$ is discontinuous for $x=(2n\pm 1)\pi/2$, where $\tan x$ drops from $+\infty$ to $-\infty$. Similarly $\frac{1}{x-a}$ at $x=a$, an extremely important discontinuity.

So $y = \left(e^{\frac{1}{x}} - 1 \right) / \left(e^{\frac{1}{x}} + 1 \right)$ is discontinuous at $x=0$, leaping from -1 to 1 , the discontinuity is 2. It is generally assumed that Continuity holds throughout the Processes of Nature.

Again, $y = \sin \frac{1}{x}$ is not defined for $x=0$, but whatever value be assigned it there, it remains discontinuous, since $\sin \frac{1}{x}$ vibrates infinitely

fast between $+1$ and -1 for $x \doteq 0$.—Again, $f(c \pm \sigma)$ may approach a limit for σ vanishing, yet not approach $f(c)$. Thus, let $f(x) = x^2 + \frac{x^2}{1+x^2} + \dots$, a decreasing geometrical series, ratio $(1+x^2)^{-1}$, hence $\text{Lim. } f(x) = 1+x^2$. Then as $x \doteq 0$, $f(x) \doteq 1$, $\text{Lim. } f(0 \pm \sigma) = 1$; but for $x=0$, $f(x) = f(0) = 0$.—There are many immediate consequences of continuity, which we have no space to discuss here, such as: A function continuous in $[a, b]$ attains its upper and lower limits (its maximum and minimum); it also assumes at least once every value between $f(a)$ and $f(b)$,—a property, however, not peculiar to continuous functions (Darboux).

The notion of function is at once extended to several variables, $u=f(x, y, \dots)$, one- or many-valued, algebraic or transcendental, etc., as before. Here each variable, as x , has its range or interval $[a, a']$; so y its $[b, b']$, etc. All possible sets of values (x, y, \dots) form an assemblage or the Domain (D) of variation. Any set (or point) for which any variable has an extreme or border value, as a or a' , b or b' , is a border

CALCULUS, THE INFINITESIMAL

point; the assemblage of all such is the *border* or *contour* of D . A simple geometric depiction of D in rectangular coordinates for only two variables, x and y , would be a rectangle with sides $x=a, x=a', y=b, y=b'$; of three variables, x, y, z , it would be a cuboid bounded by the planes $x=a, x=a', y=b, y=b', z=c, z=c'$; etc. The point (x, y) or (x, y, z) may be anywhere *in* or *on* the rectangle or cuboid. Such a D may be thought cut up into *elements*, infinitesimal rectangles or cuboids. Suppose any point (a_1, b_1, \dots) within an element. If now $f(x, y, \dots)$ approaches $f(a_1, b_1, \dots)$ as limit, as point (x, y, \dots) approaches point (a_1, b_1, \dots) , *no matter how*, then $f(x, y, \dots)$ is called *continuous* at (a_1, b_1, \dots) . This amounts to saying that the *oscillation* of f shrinks towards zero as the element contracts, *no matter how*, about the point; that is, infinitesimal function-changes correspond to any and all infinitesimal argument-changes in the immediate vicinity of the point.

Any $f(x, y, \dots)$ is called *continuous* within D when continuous at every point in D , *border included*; but *on* this border, as x, y, \dots approach a_1, b_1, \dots the point must not get without D . An f is continuous in the (immediate) *vicinity* of a point, when continuous within an infinitesimal D including that point. In general, theorems holding for functions of one variable may be extended, with proper modifications, to functions of several variables.

Derivatives.—In the study of functional dependence, the main subject of scientific inquiry, it is of first importance to know how corresponding changes in the magnitudes are related. To discover this, we form the quotient of corresponding differences, $\frac{Jy}{Jx}$, called

Difference-Quotient (DQ). In general, it is very complex, but breaks up into two parts, one *independent* of Jx , the other *vanishing* with Jx . The first is the important part and is named *Derivative* (D) or *Differential Coefficient* (DC). More formally, if $y=f(x)$ be a unique continuous function of x in $[a, b]$, and x be any point therein, and if $\frac{Jy}{Jx} = \frac{f(x \pm Jx) - f(x)}{\pm Jx}$

approaches a limit as Jx approaches 0 *no matter how*, then that limit is called *Derivative* (D) of $f(x)$, as to x , at the point x . If $f(x)$ has a D at every point of $[a, b]$, the assemblage of them forms a new function, the *Derivative* of $f(x)$ for $[a, b]$, which we may write $f'(x)$ with Lagrange, or $Df(x)$ with Cauchy. Hence $\frac{Jf(x)}{Jx} = f'(x) + \sigma$.

Geometric Interpretation.—The Differential Calculus originated in the Problem of *Tangents*. Let P be any point of a curve referred to rectangular axes X, Y , and let P be between Q and Q' . Draw secants PQ, PQ' , sloped θ and θ' to X , and ϕ to each other; draw ordinates through P, Q, Q' ; through P and Q' draw parallels to X , meeting ordinates through Q and P at D and D' . Then $PD = Jx, D'Q' = Jx', DQ = Jy, PD' = J'y$.

Also $\frac{Jy}{Jx} = \tan \theta, \frac{J'y}{Jx'} = \tan \theta', \tan(\theta' - \theta) = \tan \phi$. If now by approaching Q and Q' to P we can *make* and *keep* ϕ , and therefore $\tan \phi$, small at will, then the secants settle

down into a common position called *tangent* to the curve at P (sloped τ to X) and the common limit of $\frac{Jy}{Jx}$ and $\frac{J'y}{J'x}$ is $\tan \tau$; or $f'(x) = \tan \tau$. But if P were an *angular point*, then PQ and PQ' would *not* tend together, $\frac{Jy}{Jx}$ would tend to one limit, the *progressive* differential coefficient, and $\frac{J'y}{J'x}$ to another limit, the *regressive* differential coefficient; only when these two *coalesce* is there a *Derivative* proper.

Thus in $y = x \left(e^{\frac{1}{x}} - 1 \right) / \left(e^{\frac{1}{x} + 1} \right)$,

at the Origin, $\text{Lim. } \frac{Jy}{Jx} = \left(e^{\frac{1}{x}} - 1 \right) / \left(e^{\frac{1}{x} + 1} \right)$,

the *progressive* $DC = 1$, the *regressive* $DC = -1$, the two limiting positions of the secants are perpendicular.

How thickly may such *salients* be strewn along a curve? To have a D , *i.e.* to be *differentially*, plainly the function must be continuous; it was long thought that this *necessary* condition was *sufficient*, that the continuous function possessed in general a D , save at certain special points. It was *Riemann* who first suggested (at least as early as 1861) the astonishing possibility that such an

$f(x)$ as $\sum_{n=1}^{\infty} \frac{\sin(n^2x)}{n^2}$, though everywhere con-

tinuous, was nowhere differentiable; but as he left no proof, it was generally thought he meant that it was possible to find such salients in every infinitesimal $[x, x + Jx]$, which was easy to show; but *Weierstrass* thought he meant strictly that the D did not exist for any value of x . In any case *Weierstrass* himself produced (July 18, 1872) an example of such

a function, $y = \sum_{n=0}^{\infty} b^n \cos(a^n n \pi)$,—where a is an

odd integer, b a positive < 1 , and $ab > 1 + \frac{3}{8}\pi$,—which, though everywhere continuous, has nowhere a D , since the *progressive* and *regressive* Difference-Quotients are everywhere opposite in sign and increase oppositely toward ∞ as they pass over into *Differential Coefficients* (*Math. Werke von K. Weierstrass, II, p. 71-4*). *Geometrically*, in the graph of the differentiable function, the polygon formed by n consecutive chords tends towards the curve for $n = \infty$, PQ and PQ' tend to coalesce as Q and Q' both approach P , the triangle PQQ' becomes flatter and flatter (we may suppose the arc QPQ' steadily enlarged under a microscope to its original length as Q and Q' close down on P), the curve we may say is *elementally straight* at P . But with *Weierstrass's* function the polygon remains always reentrant, a zigzag, and consecutive chords, PQ and PQ' , tend to *separate* at a straight angle. Such discontinuities may yet present themselves to the future student of nature.

If $y = x^2, Jy = 2x Jx + \overline{Jx}^2, \frac{Jy}{Jx} = 2x + Jx$,

whence $Dx^2 = \frac{dy}{dx} = y_x = 2x$. Here y is the area of a square whose side is x , and $2x$ is the border of the square perpendicular to which the square expands, the D is the *front of variation*.

CALCULUS, THE INFINITESIMAL

Similarly, if $y = \pi x^2$, $D_x y = 2\pi x$, the circumference, the front of variation perpendicular to which x varies. If $y = x^3$, $D_x y = 3x^2$ = the front of variation perpendicular to which x varies. If $y = \frac{4}{3}\pi x^3$, $D_x y = 4\pi x^2$ = the sphere-surface, the front of variation perpendicular to x . For $y = x^4$, $D_x y = 4x^3$ = again the whole front of variation, though here our powers of envisagement fail us. Thus we are conducted to the Derivation of *Assemblages*, for which the reader must be referred to this latter subject.

Kinematic Illustration.—Let s = length of path of a moving point P , described in time t ; Δs and Δt = corresponding changes in s and t ; then $\frac{\Delta s}{\Delta t} = \bar{v}$ = average speed during Δt ;

Lim. $\frac{\Delta s}{\Delta t} = D_t s$ = instantaneous speed at t = speed at the instant t (i.e. end of t and beginning of Δt). There is no motion at the instant of time, nor at the point of path, but only during the time and space immediately about the point and instant. *Instantaneous speed* is a technical term for *limit of average speed* in the immediate vicinity of the point and instant. This instantaneous speed generally varies with t , and its D as to t is named *acceleration* and is written $\frac{dv}{dt}$. The product of this

acceleration by the mass of the moving P yields the all-important motion of *force*. The D of this acceleration might be called *second acceleration*, but the notion has not yet proved useful in *Mechanics* (q.v.).

The notation for D may be this or that. Newton used the dot, thus \dot{y} , to denote derivative as to t , as still do the British; Lagrange, the accent, $F'(x)$, still common; Cauchy, the operator D , with or without subscripted argument x ; others subscripts, as y_x, y_1 , etc.; most common, most expressive, but possibly misleading is the Leibnitzian $\frac{dy}{dx}$, not a fraction (thus far at least), not the quotient of dy divided by dx , but the limit of the fraction

$\frac{\Delta y}{\Delta x}$ for Δx vanishing, no matter how. Sometimes we write $\frac{d}{dx}$ for D_x , thus: $y_x \equiv D_x y \equiv$

$$\frac{d}{dx} y \equiv \frac{dy}{dx}, \text{ etc.}$$

Lagrange (*Théorie des Fonctions*,¹ I) attains the notion of *Derived Functions* (or *Ds*) by substituting $x + \xi$ for x in $F(x) = a_0 + a_1 x + a_2 x^2 + \dots + a_n x^n$, whence $F(x + \xi) = F(x) + F'(x) \cdot \xi + \frac{F''(x)}{2!} \cdot \xi^2 + \dots + \frac{F^{(n)}(x)}{n!} \cdot \xi^n$, where each F turns

out to be formed from the preceding in the same way; they are the *Derived Functions* of F . A near-lying Generalization considers

$$f(x) = \sum_{n=0}^{\infty} a_n (x-a)^n, \text{ supposed absolutely convergent for all values of } |x-a| < +R, \text{ i.e. for } x \text{ within } [a-R, a+R]. \text{ Then in the same [] all the } \infty \text{ series}$$

$$\sum_{n=m}^{\infty} \frac{|n|}{|n-m|} a_n (x-a)^{n-m} \quad (m = 1, 2, 3, \dots)$$

will also converge absolutely. Denote them in turn by $f'(x), f''(x), \dots$. Choose ξ so that

$$|x-a| + |\xi| < R; \text{ then the series } \sum_{m=0}^{\infty} \frac{f^{(m)}(x)}{|m|} \cdot \xi^m$$

will also converge absolutely in the same [] and will equal $f(x + \xi)$. These Sums $f'(x), f''(x), \dots$ are called 1st and 2d, ... *Derived Functions* of $f(x)$, which may be called its own *oth Derived Function*. If instead of the inconvenient Lagrangian accents we put Cauchy's D 's with proper exponents, we perceive that these latter, denoting order of differentiation, obey the same laws as ordinary exponents:

$$D^{m+n} = D^m \cdot D^n = D^n \cdot D^m, \text{ etc.}$$

It is usual, though not quite satisfactory, to denote the value of any derived function at any point ($x=a$) by writing a for x , thus: $f^{(n)}(a)$. At this stage the D -notation is not so convenient. These special values are seen to be $f^{(n)}(a) = |n \cdot a_n$. On finding hence the a 's and substituting in the definition of $f(x)$

$$\text{we get } f(x) = f(a) + \sum_{n=1}^{\infty} \frac{f^{(n)}(a)}{|n|} (x-a)^n = \sum_{n=0}^{\infty} \frac{f^{(n)}(a)}{|n|} (x-a)^n.$$

Such is the ordinary *Taylor's Series*, or *Maclaurin's* (more justly *Stirling's*) in case $a=0$.

Lagrange supposed (amazingly, Picard) any arbitrary $f(x)$ expansible in positive integral powers of $(x-a)$, except for special values of a . However, presupposed only uniqueness and continuity in a definite interval, there may be n value of a in the interval for which such expansion is possible. Thus, $f(x) = (-x)^p$ for

$x < 0$ and $= x^p$ for $x \geq 0$ cannot be developed in positive integral powers of x for x positive and p not integral. Hence this Lagrangian notion of derived function, while in general agreeing with the notion of D as limit of difference-quotient, is not yet so universal.

The notion of *Differential*, though unnecessary at this stage, is commonly introduced thus: From $\frac{\Delta y}{\Delta x} \equiv \frac{df(x)}{\Delta x} = f'(x) + \sigma$, $\Delta y \equiv \Delta f(x) =$

$f'(x) \Delta x + \sigma \Delta x$. This first part of $\Delta f(x)$, namely, $f'(x) \Delta x$, proportional to Δx and of the same order of infinitesimality, may be defined as the *Differential of $f(x)$* and may be denoted by $df(x)$, which is thus a *finite variable* for $\Delta x \leq 0$.

For $f(x) = x$, we have $dx = \Delta x$, which is therefore *differential of x* . Hence $\frac{dy}{dx} \equiv \frac{df(x)}{dx} = f'(x)$, i.e. the D of $f(x)$ as to x = the quotient of the differentials of $f(x)$ and x (Leibnitz). Here $\frac{dy}{dx}$

is strictly a *fraction* whose terms are by no means "ghosts of departed quantities" (Berkeley). *Geometrically*, dy is the Δy (or DQ) prolonged up to the tangent at P , = change of the ordinate of the tangent when abscissa changes

by dx ; Lim. $\frac{\Delta y}{\Delta x} = 1$. This notion of differential, though useful in geometry, mechanics, and elsewhere, rather embarrasses theoretical development of the subject. Hence the terms *Differentiation* (= Derivation), to *differentiate*, and hence the names *Differential Calculus*, *Differential Coefficient*.

CALCULUS, THE INFINITESIMAL

On these bases the structure of the DIFFERENTIAL CALCULUS may now be safely erected. Primary formulæ, easily established, are as follows (D meaning always *Derivative as to* x , u, v , etc., being *simultaneous* functions of x):

$$D(u+v-w) = Du + Dv - Dw;$$

$$D(uv) = Du \cdot v + u \cdot Dv = uv \left(\frac{Du}{u} + \frac{Dv}{v} \right);$$

$$D\left(\frac{u}{v}\right) \equiv \left(\frac{u}{v}\right)' = \frac{u' \cdot v - u \cdot v'}{v^2};$$

$$(u \pm c)' = u'; \quad (cu)' = c \cdot u'.$$

Very important is *Mediate Derivation*, when y is function of a function of x , as $y = \phi(u)$, $u = f(x)$, hence $y = \phi\{f(x)\} = F(x)$. If then ϕ and f have definite D 's, $\phi'(u)$ and $f'(x)$, we have

$$\frac{Jy}{Jx} = \frac{Jy}{Ju} \cdot \frac{Ju}{Jx}, \text{ hence } y_x = y_u \cdot u_x = \phi'(u) \cdot f'(x).$$

But y_x may exist even when the supposition fails, and this rule with it.

In particular, if $y = f(x)$ and inversely $x = \phi(y)$, and if either variable has a $D \neq 0$, so has the other. For if $f'(x) \equiv \text{Lim. } \frac{Jy}{Jx} \neq 0$,

$$\text{then } \frac{Dx}{Dy} = 1 / \frac{Jy}{Jx}; \text{ hence } \text{Lim. } \frac{Jx}{Dy} = \frac{1}{f'(x)}, \text{ or } \phi'(y)$$

$= \frac{1}{f'(x)}$, i.e., in general, the D 's of x as to y and of y as to x are *reciprocals of each other*: $y_x \cdot x_y = 1$.

If $y' \equiv f'(x)$ be $+$, then x and y increase (or decrease) together, $f(x)$ is called *increasing* at x . But if y' be $-$, then x and y change oppositely, $f(x)$ is *decreasing* at x .

Hence if $f'(c) \neq 0$, $f(x)$ must be $> f(c)$ on one side of the point c , and $< f(c)$ on the other. Hence *Rolle's Theorem*: If $f(x)$ vanishes at a and b and has a D at every point within $[a, b]$, then this D , $f'(x)$, vanishes at some point within $[a, b]$.

Now, $f(x) \equiv (b-a)\{\phi(x) - \phi(a)\} - (x-a)\{\phi(b) - \phi(a)\}$ is such an $f(x)$, made to order, ϕ being differentiable within $[a, b]$. Hence $f'(x) \equiv (b-a)\phi'(x) - \{\phi(b) - \phi(a)\}$ must be $= 0$ for some \bar{x} in $[a, b]$. Hence $\phi(b) - \phi(a) = (b-a)\phi'(\bar{x})$. Commonly we write a for x and $x+h$ for b ; then $\bar{x} = x + \theta h$, where θ is in $[0, 1]$. So that $\phi(x+h) - \phi(x) = h\phi'(x + \theta h)$, the extremely important formula for *finite increments*. Hence we see at once that if the D is everywhere 0 within an interval, the function is constant in that interval; and hence that two functions whose D 's are equal in an interval can themselves differ only by a constant in that interval — a Theorem at the base of the Integral Calculus.

Passing now to D 's, we first attempt $y = e^x$. Hence

$$y + Jy = e^x + Dx = e^x \cdot e^{Jx} = e^x \{1 + Jx + (Jx)^2\}.$$

Hence

$$\frac{Dy}{Jx} = e^x \left(\frac{e^{Jx} - 1}{Jx} \right) = e^x \left[1 + \frac{Jx}{2} + \frac{Jx^2}{3} + \dots \right].$$

This [] is term by term, except the first, less than e^{Jx} , whose limit is 1; hence Lim. []

is 1; hence $\text{Lim. } \frac{Dy}{Jx} = e^x$, or $De^x = e^x$. The exponential e^x is unchanged by Derivation as to its

exponent. Hence $De^u = e^u \cdot u_x$. Hence, if

$$y = \log x, \quad e^y = x, \quad e^y \cdot y_x = 1, \quad y_x = e^{-y} = \frac{1}{x}; \text{ or}$$

$$D \log x = \frac{1}{x}. \text{ Hence } D \log u = \frac{u_x}{u}. \text{ Hence, if}$$

$$y = x^m, \quad \log y = m \log x; \quad Dy = D x^m = m x^{m-1}.$$

For $y = \sin x$,

$$2 Jy = \sin(x + Jx) - \sin x \\ = 2 \cos(x + Jx) \sin Jx;$$

$$\frac{Dy}{Jx} = \cos(x + Jx) \frac{\sin Jx}{Jx}; \text{ hence}$$

$$y_x = D \sin x = \cos x = \sin\left(x + \frac{\pi}{2}\right); \text{ hence}$$

$$D \sin u = \cos u \cdot u_x. \text{ Hence } D \cos x = -\sin x \\ = \cos\left(x + \frac{\pi}{2}\right). \text{ Hence derivation of sine and}$$

cosine as to the angle merely adds $\frac{\pi}{2}$ to the angle.

Also, $D \tan x = 1 + \overline{\tan x^2} = \overline{\sec x^2}$. If $y = \sin^{-1}x$, $\sin y = x$, $y_x \cdot \cos y = 1$, $y_x = \frac{1}{\sqrt{1-x^2}}$; hence

$$D \sin^{-1}u = \frac{u_x}{\sqrt{1-u^2}}. \text{ Similarly for } \cos^{-1}. \text{ If}$$

$$y = \tan^{-1}x, \text{ similarly } D \tan^{-1}x = \frac{1}{1+x^2}. \text{ Spe-$$

$$\text{cially, } D \sin^{-1} \frac{x}{a} = \frac{1}{\sqrt{a^2-x^2}}, \quad D \tan^{-1} \frac{x}{a} = \frac{a}{a^2+x^2}.$$

Similarly we treat the hyperbolic sine and cosine and tangent ($hsx, hcx, ht x$), and their inverses $hs^{-1}x, hc^{-1}x, ht^{-1}x$, with the important results: $Dhsx = hcx$, $Dhc x = hsx$, $Dht x = 1 - ht^2x$,

$$Dhs^{-1}x = \frac{1}{\sqrt{x^2+1}}, \quad Dhc^{-1}x = \frac{1}{\sqrt{x^2-1}},$$

$$Dht^{-1}x = \frac{1}{1-x^2},$$

with easy generalization for u and $\frac{x}{a}$ — formulæ

especially important in Integration. By Derivation the anti-transcendentals are thus reduced to algebraic forms, while the exponentials and goniometrics return into themselves; hence the inverse of Derivation, whatever it may be, applied to algebraic forms, may give rise to transcendentals. So much for ordinary algebraic and simply periodic functions.

The *Infinite Series* cannot always be differentiated by differentiating term by term, but only under certain conditions of *equable*

convergence. If each term $f_n(x)$ of $f(x) = \sum_{n=0}^{\infty} f_n(x)$

be unique and continuous and if \sum converge, for every x in $[a, a+d]$, and if $L f(x) = f(a)$,

for such a series the Theorem holds: If each term has a finite progressive DC , $f_n'(a)$, and if

the series of DC 's, $\sum_{n=0}^{\infty} \frac{f_n'(a+Jx) - f_n'(a)}{Jx}$, con-

verges equably for every $Jx > 0$ and $< d$, then

$\sum_{n=0}^{\infty} f_n'(a)$ also converges and

$$= L \sum_{n=0}^{\infty} \frac{f_n(a+Jx) - f_n(a)}{Jx}, \text{ for } Jx \neq 0.$$

CALCULUS, THE INFINITESIMAL

In general, this narrower Theorem will answer: If, for every x in $[a, a+d]$, each $f_n(x)$ is unique, continuous, and has a D (and for $x=a$ at least a progressive DC), and if both $\sum_{n=0}^{\infty} f_n(x)$ and $\sum_{n=0}^{\infty} f'_n(x)$ converge, the latter equably, then $L_j f(x) = f(a)$, and $f(x)$ has a progressive DC at a , which is $\sum_{n=0}^{\infty} f'_n(a)$; i.e.

we form the D of the infinite series by summing (to ∞) the D 's of the terms (for details see *Real Variable, Theory of Functions of the*

For D of $f(z)$ as to z , where $z=x+iy$, see *Complex Variable, Theory of Functions of*.*

A D of a first D is called a *second D*, written variously $j''(x)$, Dx^2 , $\frac{d^2}{dx^2}$, and so on for the 3d, 4th, ... n th D 's. We see at once,

$$D^n x^m = \frac{|m|}{|m-n|} x^{m-n}, \quad D^n \frac{\sin x}{\cos x} = \frac{\sin(x + n\frac{\pi}{2})}{\cos(x + n\frac{\pi}{2})},$$

$$D^n \frac{a}{(x+b)^m} = (-1)^n \frac{a|m+n-1}{|m-1|(x+b)^{m+n}}.$$

A rational fraction must first be decomposed into *such* fractions. The exponential e^x repeats itself steadily, $D^n e^{ax} = a^n e^{ax}$; hence $\phi(D)e^{ax} = e^{ax}$, ϕ being algebraic and rational. The log x is at once reduced to a fraction by $D \log x = \frac{1}{x}$. For a product uv we have *Leibnitz's Theorem*:

$$D^n(uv) = u_n v + nu_{n-1} v_1 + \frac{n(n-1)}{1 \cdot 2} u_{n-2} v_2 + \dots,$$

*The simultaneous variation of x and y is vividly depicted by the graph of $f(x, y) = 0$. But we may image it otherwise, thus: Let P and Q depict the variables x and y , one moving on X , the other on Y , and let the elastic rod PQ connect them. As P moves uniformly along X , Q will slide up and down along Y , obeying $f = 0$. The assemblage of x -values is strewn evenly along X , the assemblage of y -values is not strewn evenly along Y , but is stretched, compressed, folded, crumpled in countless ways. The study of y_x becomes the study of the *intimate texture* of this Y -axis bearing the assemblage of y -values.

If now $z = x + iy$, $w = u + iv$ be complex variables, and $w = f(z)$, then w is indeed compounded of x and y , not however in just any combination, as $x^2 + y^2$, $x + 2iy$, but only in the one combination, $x + iy$. The domain of z is the XY -plane, of w the UV -plane, as which two we may take the floor and a wall or the ceiling. Not having a 4th dimension at command, we cannot envisage $w = f(z)$ as a surface, as we did $y = f(x)$ as a curve. We must again think of two points P and Q , in XY and UV , connected by an elastic rod, PQ ; as P moves about in XY , Q moves about in UV , obeying $w = f(z)$. We may think of the texture of XY as uniform, then the texture of UV will not be uniform, but stretched, compressed, folded, and crumpled in countless ways. The study of w_z now becomes the study of this intimate texture of UV . As in $y = f(x)$ the derivative y_x is the part of the $\frac{dy}{dx}$ that is entirely independent of Jx , so w_z must be independent of Jz : as y_x is the same whether $Jx = +0$ or -0 , so in general w_z is the same no matter how $Jz \neq 0$, along whatever path of value. Geometrically this signifies that if p, p' be two intersecting paths of z , and q, q' the corresponding intersecting paths of w , then p and p' , q and q' , intersect under the same angle. Hence the angles of the curvilinear triangle (q, q', q'') = the angles of the corresponding curvilinear triangle (p, p', p'') ; hence the two corresponding infinitesimal rectilinear triangles of the chords (or tangents) will be similar, the ratio of similitude being w_z , which of course varies from point to point: the one plane is a map of the other and the textures are similar in the smallest parts. Such is the geometric interpretation of the Derivative of Functions of a Complex Variable (q. v.). It would seem that such interpretations might be indefinitely extended.

precisely as in the Binomial Theorem, the subscripts denoting the D 's. For a quotient

$y = \frac{u}{v}$, we write $u = vy$, $u_1 = v_1 y + v y_1$, $u_2 = v_2 y + 2v_1 y_1 + v y_2$, ... , $u_n = v_n y + n v_{n-1} y_1 + \dots + v y_n$. From these $(n+1)$ simultaneous equations we form the *eliminant* of the n unknowns, $y, y_1, y_2, \dots, y_{n-1}$; this eliminant is linear in y_n and yields

$$y_n = \frac{(-1)^n n!}{v^{n+1}} \begin{vmatrix} u & v & 0 & 0 & \dots \\ u_1 & v_1 & v & 0 & \dots \\ \frac{u_2}{2} & \frac{v_2}{2} & v_1 & v & \dots \\ \dots & \dots & \dots & \dots & \dots \\ \frac{u_n}{n} & \dots & \dots & v_1 & v \end{vmatrix}$$

Applications.—1. Let P be any ordinary point of a curve, S the foot of the ordinate y , T and N the feet (on X) of tangent and normal at P . Since $y_x = \tan \tau$, $SN = y \cdot y_x$, $ST = y \cdot x y_x$, and we easily express PN , PT , etc. Also, if $\phi =$ angle of intersection of $y = f(x)$ and $Y = F(x)$,

then $\tan \phi = \frac{y_x - Y_x}{1 + y_x Y_x}$. If the curves touch, the numerator = 0; if they are perpendicular, the denominator = 0.

2. *Envelopes.*—Let $F(x, y; p) = 0$ (1) be a system of curves distinguished by varying values of the parameter p . For any special value of p , $F(x, y; p) = 0$ will be one curve and

$$F(x, y; p + \Delta p) = 0 \quad (2)$$

a neighboring curve. Where do they meet? What relation connects x and y of the intersection, I , of any such pair? We must combine (1) and (2) and eliminate p . If in the result we pass to the limit for $\Delta p \neq 0$, we shall find the *locus of the intersection of consecutive* (or the *Envelope*) of the system. For (2) we may put (1)-(2), or still better

$$\frac{F(x, y; p + \Delta p) - F(x, y; p)}{\Delta p} = 0. \quad (3)$$

It will be equivalent to invert the procedure, to pass to the limit and then eliminate p . So we get

$$F_p(x, y; p) = 0, \quad (4)$$

between which and (1) we now eliminate p . This eliminant connects x and y for every intersection of two consecutive of the system, every *instantaneous pivot* about which the curve starts to turn into a neighboring position. *But this is not all.* It connects the x and y of all other points where meet two curves (branches) corresponding to the same p , as may thus be seen. Assign any pair of values to x and y , i.e., take any point in the plane, and ask what members of $F = 0$ pass through it, i.e. what are the corresponding values of p ? There are n such, if F be of n th degree in p . When will two of these p -roots be equal? Only when the p -discriminant of $F = 0$ vanishes; i.e., when the eliminant of p between $F = 0$ and $F_p = 0$ vanishes, as we know from *Algebra*: Hence this eliminant connects x and y for all points where meet two curves corresponding to the same or equal p 's. This will include all *cusps* and *nodes* as well as *instantaneous pivots*; hence the p -eliminant = 0 will be the equation of all *cusp-loci* and *node-loci* as well as of *envelope* proper.

Illustration.—Find the envelope of a straight line AB on which the intercept between X and Y is a constant c . The equation of AB is

$$\frac{x}{a} + \frac{y}{\sqrt{c^2 - a^2}} - 1 = 0 = F(x, y; a).$$

Another $A'B'$ of the system is

$$\frac{x}{a'} + \frac{y}{\sqrt{c^2 - a'^2}} - 1 = 0 \quad (a' = a + \Delta a),$$

and another $A''B''$ is

$$\frac{x}{a''} + \frac{y}{\sqrt{c^2 - a''^2}} - 1 = 0 \quad (a'' = a - \Delta a).$$

The Intersections I' and I'' of these two with AB are definite. As A' and A'' close down upon and coalesce in A , I' and I'' , always definite, close down upon and coalesce in their common limit I , the *instantaneous pivot* about which AB starts to turn. Differentiating and eliminating a we find the 4-cusped Hypocycloid, $x^2 + y^2 = ci$, as the envelope, or path of the *instantaneous pivot I*.

Hence Plücker's double conception of a curve as *path* of a point gliding along a straight line that turns about the point, and *envelope* of a straight line that turns about a point that glides on the straight line. The relation connecting the corresponding magnitudes, arc-length s (of the path) and angle α (through which the straight line turns), is the *intrinsic equation* of the curve. The $DQ, \frac{J\alpha}{J\tau}$, is named *average curvature* of $J\alpha$; its limit $\frac{d\alpha}{ds}$ is named *instantaneous curvature* (κ) at P . Plainly $d\alpha = J\tau$; hence

$$\kappa = \frac{d\tau}{ds} = \frac{d\tau}{d \tan \tau} \cdot \frac{d \tan \tau}{dx} \cdot \frac{dx}{ds} = \frac{y''}{(1 + y'^2)^{\frac{3}{2}}}$$

(N.B. The *Differential Triangle* PDQ formed by Jx, Jy, Js , yields at once

$$s^2 = x^2 + y^2, \quad \frac{dx}{ds} = \frac{x}{\sqrt{1 + y'^2}}, \quad \frac{dy}{ds} = \frac{y'}{\sqrt{1 + y'^2}})$$

In the circle κ is the constant $\frac{1}{r}$, hence the curvature of the circle is the *reciprocal of the radius*. For any point of any curve the reciprocal of this curvature is called the *radius of curvature*, ρ ; hence this ρ at any point is the *radius of a circle of equal curvature*, hence called *circle of curvature*.

To illustrate.—Draw PT and PV , tangent and normal to the curve; about K' and K'' on PV , with radii $\rho' > \rho$ and $\rho'' < \rho$, through P draw two circles, one less, the other greater than the circle of curvature. Let ρ' and ρ'' approach and coalesce in ρ ; then K' and K'' approach and coalesce in K , the *center of curvature*, and the \odot about K is the *osculatory circle*.

Otherwise, through P , and Q' and Q'' on opposite sides of P , draw a circle. Let mid-normals to PQ', PQ'' meet PV at S', S'' , and each other at S''' ; as Q' and Q'' approach and coalesce in P, S', S'', S''' all approach and coalesce in their common limit, S (or K). Hence the *osculatory circle* = circle through *three consecutive points* of a curve, and *center of curvature* = *intersection of two consecutive normals*.

The coordinates (u and v) of K are given by $u = x - \frac{y''}{y'}(1 + y'^2), v = y + \frac{1}{y'}(1 + y'^2)$. Eliminating x and y between these equations and the equation of the curve, we get the equation connecting u and v for every K , i.e. the *equation of the Evolute*, or *locus of the centers of curvature* of the original curve (the *Involute*).

Since $v_u \cdot y_x + 1 = 0$, the tangents at corresponding P and K are perpendicular, the *normal to the involute is tangent to the evolute*. Also, it is easy to prove that the arc-length in *Evolute* can differ only by a constant from the *radius of curvature* (ρ) in *Involute*. Hence a point of a cord held tight while being unwound from the *evolute* must trace an *involute*; hence the former name. To any involute there is only one evolute, but to any evolute there are infinitely many (so-called parallel) involutes,—an excellent illustration of a one-valued determination with many-valued inverse, and also of the definiteness of differentiation as compared with the indefiniteness of its inverse, Integration (see below). Some curves reproduce themselves in their evolutes, notably Cycloid and Logarithmic Spiral, which latter inspired the engraving and epitaph on the tomb of Jacob Bernoulli (1654–1705): *Eadem mutata resurgo*. The general theory of the Contact of curves, Asymptotes, etc., beautifully exemplifies this Calculus, but cannot be treated here (see *Curves, Higher Plane*).

Indeterminates.—If for $x = a$ both terms of a fraction $y = \frac{\phi(x)}{\psi(x)}$ vanish, then y loses definiteness, taking the unmeaning form, $y' = \frac{\phi'(a)}{\psi'(a)} = \frac{0}{0}$. (Cf. *Algebra*.)

The fundamental example is $y = \frac{x^m - a^m}{x - a}$, for $x = a$. However, we may still seek $\text{Lim. } \frac{\phi(x)}{\psi(x)}$ for $x = a \neq 0$, though it would be arbitrary to assume this limit as the *value* of $\frac{\phi(a)}{\psi(a)}$ (Darboux). If $x - a$ be removable from both terms, we may cancel it for $x \neq a$, and then seek the limit for $x = a$. Thus $\frac{x^3 - a^3}{x - a} \equiv x^2 + ax + a^2$ for $x \neq a$; this last = $3a^2$ for $x = a$; hence $\text{Lim. } \frac{x^3 - a^3}{x - a} = 3a^2$, but not $\frac{x^3 - a^3}{x - a} = 3a^2$

for $x = a$, unless arbitrarily. Now $\text{Lim. } \frac{\phi(x)}{\psi(x)} = \text{Lim. } \frac{\phi'(a)}{\psi'(a)}$ for $\phi(a) = 0 = \psi(a)$ (L'Hospital).

Hence the ordinary rule: Take the limit of the quotient of the I 's of the terms at the critical value. Or, expand the terms in the neighborhood of a , simplify, cancel the vanishing common factor, and evaluate for $x = a$. Similarly, with proper modification, we treat $\frac{\infty}{\infty}$; and $\infty - \infty$, reduced to $\frac{0}{0}$. Indeterminate exponentials like $1^\infty, 0^\infty$, etc., are first reduced to $\frac{0}{0}$ by passing to Logarithms.

Maxima, Minima, are already defined, and

accordingly at such points the D must change sign; hence must pass through 0, if *continuous*. This passage is from + to - for a maximum, from - to + for a minimum. Hence the ordinary rule: To maximize or minimize $f(x)$, put $f'(x)=0$; the x -roots will yield maximal or minimal values of $f(x)$ according as they make $f''(x)$ negative or positive. For $f''(x)=0$, treat 3d and 4th D 's precisely as the 1st and 2d D 's. The same rules result from expanding $f(x)$, as by Taylor's Theorem. Special cases (as of D discontinuous) call for special treatment, often geometrical or mechanical preferably.

The geometric depiction of a function of two independent variables, $z=f(x, y)$ or $F(x, y, z)=0$, is of course a *surface* (S): at any point (x, y) in the plane erect the corresponding value of z ; the ends of these z 's form S . We may pass on S from P to P' in ∞ of ways; e.g., parallel to ZX ; then x and z would change, but not y . Hence there would be simultaneous Δx and Δz , but $\Delta y=0$. Then $L\frac{\Delta z}{\Delta x}$ is written $\frac{\partial z}{\partial x}$ (Jacobi), and is read *partial D of z as to x*. Similarly, for a path of P parallel to YZ , there are simultaneous Δy and Δz , but $\Delta x=0$; $L\frac{\Delta z}{\Delta y}=\frac{\partial z}{\partial y}$ = *partial D of z as to y*.

For $u=f(x, y, z)$ intuition fails, but we think each P in $[x, y, z]$ as *weighted* with the proper u instead of erecting this u perpendicular to $[x, y, z]$. As P moves, the weight u changes. For motion parallel to X both Δy and Δz are 0 and $L\frac{\Delta u}{\Delta x}=\frac{\partial u}{\partial x}$, etc. Of course, the foregoing presumes that z and u actually admit of the Derivations in question.

Differentials, Partial and Total.—By Definition, $d_x u = \frac{\partial u}{\partial x} \cdot \Delta x$ = *partial Differential of u as to x*, etc. $du = \frac{\partial u}{\partial x} \cdot \Delta x + \dots = \frac{\partial u}{\partial x} \cdot dx + \dots =$ *total Differential of u*. $\Delta u = \frac{\partial u}{\partial x} \cdot \Delta x + \dots + \epsilon \Delta x + \dots =$ *total Difference*— u .

Geometrically, on $z=f(x, y)$, the path of x -change is parallel to ZX , hence $\frac{\partial z}{\partial x} = \tan \tau$, as before. Similarly $\frac{\partial z}{\partial y} = \tan \nu$. The plane through the tangents to these paths (at P) is in general the plane tangent at $P(x, y, z)$ to S . Clearly its equation is $w-z=(u-x)\frac{\partial z}{\partial x} + (v-y)\frac{\partial z}{\partial y}$ (u, v, w , the current coördinates for the plane). This equation assumes the symmetric form $(u-x)F_x + (v-y)F_y + (w-z)F_z = 0$, since $\frac{\partial z}{\partial x} = -\frac{F_x}{F_z}$, etc. Hence the equations of the normal are $\frac{u-x}{F_x} = \frac{v-y}{F_y} = \frac{w-z}{F_z}$.

As to *existence*, the tangent plane is conditioned like the tangent line. Through $P(x, y, z)$ and two neighbor points, Q and R (as $x+\Delta x, y, z+\Delta z$, and $x, y+\Delta y, z+\Delta yz$), pass a secant plane Π . Let R and O descend any wise upon P . If the tiltings of Π approach 0, if Π settles down toward the same fixed position, no matter

how Δx and Δy approach 0, *i.e.* independently of $\frac{\Delta y}{\Delta x}$ and y_x , then the limiting position of Π is the tangent plane at P . But at the vertex P of a cone ($x^2+y^2=m^2z^2$), Π rolls forever round the cone as Q and R circle round P . Here, at $(0, 0, 0)$, $\frac{\partial z}{\partial x} = \frac{x}{m^2z}$ and $\frac{\partial z}{\partial y} = \frac{y}{m^2z}$ lose all meaning, as do tangent plane and normal.

In general there is no such notion as Total Derivative of $z=f(x, y)$, x and y independent; but if both be functions of an arbitrary t , we have the *Total D of z as to this t*:

$$\frac{dz}{dt} = \frac{df}{dt} = \frac{\partial f}{\partial x} \cdot \frac{dx}{dt} + \frac{\partial f}{\partial y} \cdot \frac{dy}{dt},$$

an extension of mediate derivation. Of course, the possibility and definiteness of the operations are implied. Hence again

$$dz \equiv df = \frac{\partial f}{\partial x} \cdot dx + \frac{\partial f}{\partial y} \cdot dy,$$

or the *Total Differential* = the sum of the *Partial Differentials*. For $t=x$, $\frac{dz}{dx} = f_x + f_y \cdot y_x$, or $dz = f_x \cdot dx + f_y \cdot dy$, a fundamental theorem holding when at (x, y) the DQ

$$\frac{f(x+\Delta x, y+\Delta y) - f(x, y+\Delta y)}{\Delta x}$$

is an *equably continuous function* of y and Δx .

Higher D's are *pure* when the same *Independent Variable* is retained, *mixed* when it is changed. So $\frac{\partial^2 z}{\partial x^2}$, $\frac{\partial^2 z}{\partial y^2}$ are *pure*, but $\frac{\partial^2 z}{\partial x \partial y}$ is *mixed*. In mixed D 's the question arises: Is the *order of Derivation indifferent*? The answer is, Yes, $\frac{\partial^2 z}{\partial x \partial y} = \frac{\partial^2 z}{\partial y \partial x}$, but only under conditions. For a power-series the case is clear, but the general investigation is subtle, and the result is involved and tedious. The theorem holds: When, for x in $[a-h, a+h]$ and y in $[b-k, b+k]$, $f(x, y)$ is uniquely defined, and the $\frac{1}{2}(n-1)(n+2)$ DC 's

$$\frac{\partial^n f}{\partial x^m \partial y^r} \left(r=0, 1, \dots, m \right) \left(1 \leq m \leq n-1 \right)$$

exist and are finite, and all the mixed ones are continuous as to both x and y , then everywhere in the same rectangle ($2h, 2k$) all the other mixed DC 's below the n th order exist, and the order of derivation is indifferent. Also, if, besides, everywhere in the rectangle the $(n-1)$ mixed DC 's of n th order, $\frac{\partial^n f(x, y)}{\partial x^{n-1} \partial y}$, $\frac{\partial^n f(x, y)}{\partial x \partial y^{n-1}}$, exist finite, and at $[a, b]$ are continuous as to both x and y , then all other mixed DC 's exist at $[a, b]$, the order of derivation being indifferent. Space is wanting for the proofs.

The Taylorian Series or *Law of the Mean* may now be extended, under proper conditions, to develop $f(x, y)$ near (x, y) , thus:

$$\begin{aligned} f(x+h, y+k) &= f(x, y) + \left\{ h \frac{\partial f}{\partial x} + k \frac{\partial f}{\partial y} \right\} \\ &+ \frac{1}{2} \left\{ h^2 \frac{\partial^2 f}{\partial x^2} + 2hk \frac{\partial^2 f}{\partial x \partial y} + k^2 \frac{\partial^2 f}{\partial y^2} \right\} \dots \\ &+ \frac{1}{n!} \sum_{p=0}^n \frac{h^{n-p} k^p \partial^n f(x+\theta h, y+\theta y)}{\partial x^{n-p} \partial y^p} \end{aligned}$$

Synbolically,

$$f(x+h, y+k) = \Sigma e^{h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y}} f(x, y).$$

The last term is the remainder R_n , which must converge upon 0, for $n \rightarrow \infty$, to be neglected. A sufficient condition therefore is that the partial D 's of f remain finite near (x, y) for $n \rightarrow \infty$. This is not a necessary condition, however, to find which is not easy nor attempted here.

Geometrically, take the tangent plane at P as XY , the normal as Z . Develop $z=f(x, y)$ near $P(0, 0, 0)$ so that $\Delta x=h=x$, $\Delta y=k=y$, $\Delta z=z$. We have

$$z = f(x, y) = \left\{ x \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} \right\} f(0, 0) + \frac{1}{2} \left\{ x^2 \frac{\partial^2}{\partial x^2} + 2xy \frac{\partial^2}{\partial x \partial y} + y^2 \frac{\partial^2}{\partial y^2} \right\} f(0, 0) + \{x^3, y^3\}.$$

Since x, y, z are all infinitesimal and $\frac{\partial f}{\partial x} = 0 = \frac{\partial f}{\partial y}$ at $(0, 0, 0)$, z is infinitesimal of 2d order. Call the 2d D 's in order A, B, C and put $x=r \cos \vartheta$, $y=r \sin \vartheta$, where ϑ is the angle with ZN of a normal plane, making a normal section, through Z . Hence $\frac{z^2}{r^2} = A \cos^2 \vartheta + 2B \cos \vartheta \sin \vartheta + C \sin^2 \vartheta$

+ $\{r\}$, hence $\text{Lim. } \frac{z^2}{r^2} = A \cos^2 \vartheta + 2B \cos \vartheta \sin \vartheta + C \sin^2 \vartheta$, which is easily seen to be the curvature, $\kappa = \frac{1}{\rho}$, of this normal section. For a perpendicular normal section, $\vartheta' = \vartheta + \pi/2$,

$$\kappa' = \frac{1}{\rho'} = A \sin^2 \vartheta - 2B \sin \vartheta \cos \vartheta + C \cos^2 \vartheta;$$

hence $\frac{1}{\rho} + \frac{1}{\rho'} = A+B$, a constant for all pairs of perpendicular normal sections (Euler), important in Physics and formerly taken as measure of the curvature at $P(0, 0, 0)$. Consider the surface $z = Ax^2 + 2Bxy + Cy^2$. It is a Paraboloid (Pd); it fits on S only at $P(0, 0, 0)$, elsewhere departs from S . The sections of S and Pd are not the same for $c \neq 0$, but close down on each other for $c \rightarrow 0$. The Pd -section is an ellipse, an hyperbola, or a parabola, according as $B^2 - AC < 0, > 0, = 0$. Suppose it enlarged under the microscope to a constant size as $c \rightarrow 0$; then the S -section steadily closes down on it as limit.

Hence Pd and S agree elementally at $P(0, 0, 0)$; also they agree in curvature (of their own normal sections), hence Pd is called the osculating paraboloid of S at $(0, 0, 0)$. All these parallel sections, for changing c , are similar, hence $Ax^2 + 2Bxy + Cy^2 = 1$ is taken as type and called Indicatrix (Dupin). This indicatrix is an ellipse for $B^2 - AC < 0$, the S is cup-shaped or synclastic; it is an hyperbola for $B^2 - AC > 0$, the S is saddle-shaped (anticlastic), like a mountain-pass. The indicatrix has two Axes, tangents to sections of greatest and least curvature both of Pd and S at P (any point of S) which are mutually perpendicular and named principal sections. Now let P start to move on S facing along either (say the least) axis or principal section. This axis starts to turn about P . Let P continue to move on S facing always along the turning axis. The tangent to its path will give the direction of this axis at every point of its path, which path

is called a Line of Curvature (LC). Plainly through every point of S there pass in general two and only two LC 's (Monge), each the envelope on S of a system of principal tangents to S . These LC 's cut up S into elementary curvilinear rectangles and yield an excellent system of coordinates (u, v) . If the indicatrix be a circle, then all its axes are principal, through the point P there pass an ∞ of LC 's, every normal section is principal, the point P is an umbilic or cyclic point. If the indicatrix be a parabola, then S is edged or ridged (cylindric) at P .

The notion of surface-curvature is generated and defined quite like that of line-curvature. Draw the normal N to S at every point of the border B of ΔS , forming a ruled surface, R . Draw parallel to each N a radius of a unit-sphere, forming a cone C cutting out $\Delta S'$, on the sphere-surface, which subtends a (so-called) solid angle $\Delta \alpha$ at the center. This we also define as the solid angle of the N 's, and further define the average curvature of ΔS as the ratio $\frac{\Delta \alpha}{\Delta S}$. (Think of a cord passed round the gorge of R and then tightened, compressing R into C without changing the solid angle.) If the unit solid angle or stereradian (Halsted) be subtended by r^2 , the whole solid angle about center $= 4\pi$; then the metric numbers of $\Delta \alpha$ and $\Delta S'$ are equal, hence the curvature of $\Delta S = \frac{\Delta S'}{\Delta S}$, and $\text{Lim. } \frac{\Delta S'}{\Delta S} = S'_g = \alpha_g = \text{instantaneous curvature at } P \text{ (in } \Delta S) = K$.

If R, R' be the principal radii of curvature at any P on S , then $K = \frac{1}{RR'}$; moreover, this

K is not affected by bending S in any way without stretching or tearing—a beautiful Gaussian theorem of profound philosophic import. In this sense, an S that may be flattened out into a plane (a Developable) has 0-curvature; for such, RR' must become ∞ ; hence either $R = \infty$ or $R' = \infty$. But $RR' = (1 + p^2 + q^2) / (rt - s^2)$, where $p = z_x, q = z_y, r = z_{xx}, s = z_{xy}, t = z_{yy}$ (Euler). Hence $rt - s^2 = 0$ is the equation of Developables. For Applicables and further illustrations, see SURFACES, THEORY OF.

The difficulty in dealing with Implicit Functions (defined by unsolved equations) lies in the Existence-theorems, which can only be stated. I. Let $F(x, y) = 0$ at (x_0, y_0) , and have 1st partial D 's finite and continuous about (x_0, y_0) , and $F_y \neq 0$ at (x_0, y_0) : then there is a $y = \phi(x)$ that becomes y_0 for $x = x_0$, and satisfies identically $F(x, y) = 0$ in the vicinity, and is unique, and has a $D, y_x = \phi'(x) = -F_x/F_y$. II. Quite similarly for $F(x, y, z) = 0, z = \phi(x, y)$, the last statement being: has two partial D 's.

$$z_x = -\frac{F_x}{F_z}, z_y = -\frac{F_y}{F_z}; \text{ and so on for } n \text{ variables.}$$

Most generally (III) let F_1, \dots, F_n be n functions of m variables x, y, \dots , and n variables u, v, \dots , all the F 's vanishing at $(x_0, y_0, \dots, u_0, v_0, \dots)$, all admitting partial D 's in that vicinity, and $J(F_1, \dots, F_n; u, v, \dots) \neq 0$ (p. 13), at $(x_0, y_0, \dots, u_0, v_0, \dots)$: then there is a system of functions of m independents x, y, \dots that become u_0, v_0, \dots at (x_0, y_0, \dots) , that satisfy identically all the F 's in that vicinity, and that have partial D 's.

Hence we have as ordinary rule for finding y_x from $F(x, y) = 0$: Differentiate F as to x

CALCULUS, THE INFINITESIMAL

regarding y as a function of x , as in mediate derivation, and solve the result as to y_x .

To find now *maximum* or *minimum* y in $F(x, y) = 0$, we have $y_x = 0$, $\therefore F_x = 0$; also, therefore, $F_{xx} + F_{yy} \cdot y_{xx} = 0$. If $F_{yy} \neq 0$, there is *maximum* for F_{xx} and F_{yy} like-signed, *minimum* for F_{xx} and F_{yy} unlike-signed, and no determination for $F_{xx} = 0$.*

Often we seek (so-called) *relative maximum* and *minimum* of $z = f(x, y)$ when $F(x, y) = 0$. The former equation is a surface S , the latter an intersecting surface determining a path over S .—we seek the peak and valley points in this path. Differentiating we find as the prime condition, $f_x \cdot F_y - f_y \cdot F_x = 0 = J(f, F; x, y)$, from which and $F = 0$ we find the x and y that maximize or minimize f .

More generally we seek *maximum* or *minimum* of a function of $(m+n)$ variables, $f(x, y, \dots, u, v, \dots)$, under n conditions $F_1(x, y, \dots, u, v, \dots) = 0, \dots, F_n(x, y, \dots, u, v, \dots) = 0$. Theoretically we might eliminate n variables u, v, \dots leaving the other m independent; better to let them remain considered as functions of the m independents, x, y, \dots . Hence, on putting each partial $D = 0$, we get m equations which, with the n $F_i = 0, \dots, F_n = 0$, form $(m+n)$ equations for finding $(m+n)$ unknowns $x, y, \dots, u, v, w, \dots$. To discriminate between maximum and minimum by the sign of d^2f will now be tedious, but often geometrically or mechanically unnecessary.

Swifter and simpler is Lagrange's 'Method of Multipliers.' We form a new function, $\phi(x, y, \dots, u, v, \dots) = f(x, y, \dots, u, v, \dots) - \sum \lambda F_i(x, y, \dots, u, v, \dots)$. Only so long as each $F_i = 0$ will $\phi = f$ identically for all values (under consideration) of the variables. We now determine these λ 's so as to make vanish simultaneously all the partial D 's of ϕ as to x, y, \dots, u, v, \dots . The n conditions are rolled off from the u, v, \dots upon the n λ 's. We may proceed similarly in dealing with *Envelopes*, where $(n+1)$ parameters are connected by n conditions.

Transformation of Variables is often necessary, like transformation of Coördinates. The formulæ, simple at first, soon become highly complicated and we are led into the *Theory of Substitutions, Invariants, Reciprocants* and the like, which cannot be treated here.

Integration.—As the Differential Calculus is the doctrine of Limits of Quotients of Simultaneous Infinitesimal Differences, so the INTEGRAL CALCULUS is the doctrine of Limits of the Sums of Infinitesimal Products that increase in number while decreasing in size, both indefinitely. The type is the quadrature of an area (A) bounded by X , a curve $y = f(x)$, and two end-ordinates, $x = a$ and $x = b$. Cut it into n strips, ΔA , standing each on a Δx ; their sum is A ; plainly $\sum \Delta x > \Delta A > y \Delta x$, Y being the greatest, y the least, ordinate standing on its own particular base Δx . Since $\sum \Delta x = b - a$, if $y = f(x)$ be continuous, finite, one-valued throughout $[a, b]$, each $Y - y$ is an ϵ , hence $\sum (Y - y) \Delta x < \epsilon \sum \Delta x$, or $< (b - a)\epsilon$; hence $\text{Lim. } \sum (Y - y) \Delta x = 0$. Hence A is the common limit of every $\sum y \Delta x$, written $\int_a^b y dx$, named

Definite Integral (DI) of $f(x)$ (the *Integrand*) as to x , between the *extremes* (end-values) a and b . The total sign of Integration is $\int \dots dx$ or \int_x^b , being an extended S , meaning

Limit of Sum.

Plainly, exchanging extremes (a and b) merely reverses the integral by reversing Δx , $\int_b^a = -\int_a^b$. Also $\int_a^b = \int_a^c + \int_c^b$, $f(x)$ being supposed integrable throughout, from a to b , and to c . Also $\int c \phi x dx = c \int \phi(x) dx$. Also

$\int_a^b f(x) dx = \int_{a \pm c}^{b \pm c} f(x \pm c) d(x \pm c)$,—a mere change

of origin. Also $\int [\phi(x) \pm \psi(x)] dx = \int \phi(x) dx \pm$

$\int \psi(x) dx$. We easily prove the almost obvious

Theorem of the Mean: If $f(x) = \phi(x) \cdot \psi(x)$, each factor integrable, and $\psi(x)$ always of same sign, in $[a, b]$, then $\int_a^b \phi(x) \psi(x) dx =$

$\phi(\bar{x}) \int_a^b \psi(x) dx$, $\bar{x} \equiv a + \theta(b - a)$. Hence $I_b =$

$f(b), I_a = -f(a)$, where the D is again the

front of variation of the Integral I or Area A .

Hence we readily reckon many integrals as:

$\int_a^b x^n dx = \frac{b^{n+1} - a^{n+1}}{n+1} = \left\{ \frac{x^{n+1}}{n+1} \right\}_a^b$, n a pos. int.;

$\int \cos x dx = \left\{ \sin x \right\}_a^b$, $\int_a^b \sin x dx = \left\{ -\cos x \right\}_a^b$;

$\int_a^b \sqrt{r^2 - x^2} dx = \frac{r}{2} \left\{ x \sqrt{r^2 - x^2} + r^2 \sin^{-1} \frac{x}{r} \right\}_a^b$,

this seen at once from the figure (circle-quadrant), as also

$\int_a^b \sqrt{r^2 + x^2} dx = \frac{r}{2} \left\{ x \sqrt{r^2 + x^2} + r^2 \text{hs}^{-1} \frac{x}{r} \right\}_a^b$,

seen from $y^2 - x^2 = r^2$. We perceive that the $f(x)$ is always the D of the so-called *Indefinite Integral*, the expression to be evaluated at b and a . This is easily proved variously to be always the case. Thus, if $f(x) = \phi'(x)$ for x in $[a, b]$, then $\{I - \phi(b)\}'_b = f(b) - \phi'(b) = 0$, for every value of b in the range of Integrability. Hence $I - \phi(b) = C$. For $b = a$, C is found to be $= -\phi(a)$; hence

$$I \equiv \int_a^b \phi'(x) dx = \phi(b) - \phi(a).$$

Hence, to calculate the integral of any integrand from a to b , find the function of which the integrand is the D , and take the difference of its values at b and a . The D of the integral is the integrand, so far as form goes, but the value depends on the extremes. Since b may be any x in the range of integrability, it is common to write it x , using x in double sense, not necessarily confusing. So long as a is unassigned, C is undetermined; hence it is common to omit a and write

$\int^x f(x) dx = \phi(x) + C$, where under \int we may put z or any other symbol for x . The integral

* From foregoing sections it is seen that, to max- resp. minimize z a function of independent x and y , we must have, as first condition, $z_x = 0 = z_y$; and similarly for any number of independents. The secondary conditions are too complicate for discussion here.

CALCULUS, THE INFINITESIMAL

depends for its *form* solely on f ; for its *value*, on a and b also.

Hence *integration* and *derivation* or *differen-
tiation* are *inverse operations* and $\int = D^{-1}$,
 $D = \int^{-1}$. The direct D yields a definite result,

the inverse \int yields a result definite only as to *form*, up to an *additive constant*, C . (Cf. Evolute and Involute, above). Derivation simplifies, reducing even transcendents to algebraics; Integration complicates, lifting algebraics and even rationals up into transcendents (as $\sqrt{a^2-x^2}$ and $\frac{1}{x}$). Derivation is deductive and can create no new forms. Integration is inductive and creates an ∞ of new forms, all defined as integrals.

Operating directly on $y=f(x)$ by a series of differentiations as to x , say $\psi(D)$, we get some function of x , as X , or $\psi(D)y=X$. If we know X and ψ , we may seek that $y \equiv f(x)$ that will yield X on being subjected to the train of operations $\psi(D)$; *i.e.* we seek to *invert* at once the totality of operations $\psi(D)$,

so that $y = \frac{X}{\psi(D)} = \psi^{-1}(D)X$. This inversion is solving the *Differential Equation* $\psi(D)y=X$, and is perhaps the most profound of mathematical operations, of immense and even unconquerable difficulty, overcome as yet only in special cases. Thus $x^2 \frac{d^2y}{dx^2} - 3x \frac{dy}{dx} + 4y = 2x^2$, where $\psi(D) \equiv x^2 D^2 - 3x D + 4$, yields, as result of the inverse $\psi^{-1}(D)$ or $\frac{1}{\psi(D)}$,

$$y = x^2(A + B \log x + \log x^2),$$

where A and B are arbitrary constants. Other forms of $\psi(D)$, quite as simple, yield far higher transcendents.

Inverting a table of elementary D 's we get a table of *elementary Integrals*. The art is to *reduce* other forms, if possible, to these elementary forms; when impossible, we must introduce transcendents *defined by integrals*.

Change of Variable is the most fruitful method of Reduction. By mediate derivation, $D_x \phi(u) = \phi'(u) \cdot u_x$; also $D_u \phi(u) = \phi'(u)$; hence $\int \phi'(u) du = \phi(u) = \int \phi'(u) \cdot u_x \cdot dx$. In this

2d \int , all is supposed expressed through x .

Hence, to pass from an *old* to a *new* variable of integration, multiply by the D of the *old* as to the *new*, or divide by the D of the *new* as to the *old*; *i.e.* under the \int sign,

$$du = u_x \cdot dx, \quad dx = \frac{du}{u_x}.$$

Of course, the extremes must be properly adjusted.

Integration by parts is also a powerful reductive process. From $(uv)_x = u_x v + uv_x$ we have

$$uv = \int u_x v dx + \int uv_x dx, \text{ or } \int uv_x dx = uv - \int u_x v dx.$$

This latter \int may be simpler, or may return into the first, or other advantages may accrue.

Thus $\int \cos x \cdot \cos x \cdot dx = \sin x \cdot \cos x + \int \overline{\sin x^2} \cdot dx$

$$= \sin x \cdot \cos x + x - \int \overline{\cos x^2} dx; \text{ whence}$$

$2 \int \overline{\cos x^2} \cdot dx = x + \sin x \cdot \cos x$. Similarly for any integral power of sine or cosine except $(\sin x)^{-1}$, $(\cos x)^{-1}$, which are reduced by passing to the half-angle, $\frac{x}{2}$.

What is the range of such reductions? *What functions can we thus integrate in terms of known functions?* Few enough. Of *Algebraics*,

I. *Rational functions*, $\frac{\phi(x)}{\psi(x)}$, by decomposition into part-fractions.

II. *Rational functions* of x and $\left(\frac{ax+b}{cx+d}\right)^{\alpha/\beta}$, $\left(\frac{ax+b}{cx+d}\right)^{\alpha'/\beta'}$, ... Put $\frac{ax+b}{cx+d} = u^m$, m being L.C.M. of β, β', \dots . Herewith the \int becomes rational in u .

III. *Rational functions* of x and

$$\sqrt{ax^2 + 2bx + c}.$$

If we think of $y^2 = ax^2 + 2bx + c$ as a conic, and $y - \beta = u(x - \alpha)$ as a secant through a point (α, β) of the conic, then we may express both x and y rationally through u , which reduces this case to I; (α, β) may be taken variously. Generally we bring y^2 to the form of sum or difference of two squares by putting $x = z + h$.

IV. *Rational functions* of x and y , these being coordinates of a *unicursal* $F(x, y) = 0$. We shall then have $x = \phi(u)$, $y = \psi(u)$, where ϕ and ψ are rational, whereby these Abelian Integrals reduce to I.

The binomial $x^n(a + bx^n)^p$ can be reduced to II, and hence integrated, not generally, but in these important cases, by putting $u = x^n$.

1. p integral; if $\frac{m+1}{n} = \frac{r}{s}$ (r and s integers),

put $\sqrt[s]{u} = z$.

2. $\frac{m+1}{n}$ integral; if $p = \frac{r}{s}$ (r and s integers),

put $\sqrt[s]{a + bu} = z$.

3. $\frac{m+1}{n} + p$ integral; if $p = \frac{r}{s}$ (r and s integers), put $a + bu = uz^s$.

If $f(x)$ be rational in x , $\sqrt{ax+b}$, $\sqrt{cx+d}$, put $ax+b = v^2$, which reduces it to 3.

Of *Transcendents*.—I. *Rational functions* of $\sin x$ and $\cos x$. Put $u = \tan \frac{x}{2}$, a very important substitution.

2. *Rational functions* of ea^x . Put $u = ca^x$.

3. *Rational Integral functions* of x , ea^x , cb^x , ... $\sin mx$, $\sin nx$, ... $\cos mx$, $\cos nx$, ... Express the sines and cosines through imaginary exponentials. In the result express the imaginaries through sines and cosines. Here

CALCULUS, THE INFINITESIMAL

are included rational functions of the hyper-sine and -cosine.

4. Rational Integral functions of x and $\log x$, or x and $\sin^{-1}x$. Put $x = e^u$, or $x = \sin u$.

If $f(x) = R(x, \sqrt{T})$, T of 3d or 4th degree in x , we cannot rationalize but must introduce Higher Transcendents. Let

$$u = \int_x^\infty \frac{dx}{\sqrt{T}} = \int_x^\infty \frac{dx}{\sqrt{4(x-e_1)(x-e_2)(x-e_3)}}.$$

Here x and u are functions of each other and it seems natural to take u as function, x as argument; but in $I = \int \frac{dx}{\sqrt{1-x^2}} = \sin^{-1}x$, $x =$

$\sin I$ is a much simpler (periodic) function of I than I is of x ; hence we may suspect that x above is a simpler (periodic?) function of u than u of x . Hence Abel thought the theory might be simplified by inverting the dependence before him assumed—one of the greatest divinations in mathematical history. We write

$$x = \wp(u) \text{ (Weierstrass), } u = \int_{\wp(u)}^\infty \frac{dx}{\sqrt{T}} = \wp^{-1}(x).$$

Hence $u_\wp = -\frac{1}{\sqrt{T[\wp(u)]}}$, and so on. Now just

as sine and cosine have one period 2π , so \wp has two periods, 2ω and $2\omega'$, it is an *Elliptic or Doubly periodic function*. The Theory of such Functions, one of the most august creations of the last century, is conspicuous in Analysis. Of Hyper-elliptic Integrals there is no space to speak.

The integral of an Infinite Series may be found by integrating term by term *only when* the series converges uniformly within an interval comprising the extremes of the integration.

It is seen that the integrable forms are absolutely many, relatively few, the integration generally giving rise to a *new function*.

Thus far we have raised no question as to *Integrability*, the Integrand being supposed unique, continuous, finite, and therefore integrable, in $[a, b]$. But when, if ever, may we let one or more of these conditions fall? As to continuity, Riemann has discussed profoundly, *In what cases is a function integrable, and in what not?* and still further precision has been attained by Du Bois Reymond and Weierstrass.* It is of particular interest to know whether $\Sigma y \Delta x$ will vary finitely with varying modes of divisions of $[a, b]$. Riemann calls the sub-intervals $\delta_1, \delta_2, \dots, \delta_n$; the greatest fluctuation of function-value in each δ_k he calls D_k ; then must $\Sigma \delta_k D_k$ be *infinitesimal*. Thence follows that when, as each δ_k sinks indefinitely toward 0, the sum of sub-intervals, in which D is $> \sigma$, itself is infinitesimal, then the Sum Σ has a definite limit, the same however $[a, b]$ be subdivided. Hence the integral

$$I = L \lim_{\delta_k \rightarrow 0} \sum_{k=0}^{n=\infty} f(x_k) \delta_k = \int_a^b f(x) dx \text{ exists when } f(x)$$

is finite and unique in $[a, b]$, and when for every infinitesimal positive ϵ there is also a positive δ such that $|\Sigma - I| < \epsilon$ when each $\delta_k < \delta$.

Plainly such is the case (1) for $f(x)$ *continuous throughout* $[a, b]$; but also (2) when $f(x)$ is finitely discontinuous at a finite number of

points in $[a, b]$, and when $f(x)$ has an ∞ of maxima and minima, or is quite undetermined (though finite) at a finite number of

points in $[a, b]$, as $\sin \frac{1}{(x-1)(x-2)}$ at 1 and 2;

(3) even when $f(x)$ is *discontinuous* or *finitely indeterminate* at an ∞ of points and has an ∞ of maxima and minima in the vicinity of an ∞ of points, provided only all these points of finite function-fluctuation form *not* a *linear* but only a *discrete mass of points* (Punktmenge)—the function is then said to be only *point-wise* (punktirt) *discontinuous* (Hankel).—A *discrete mass* or manifold of points is an ∞ of points in a finite interval $[a-h, a+h]$, so distributed in subintervals that the *sum* of these subintervals may be made small at will by enlarging at will the number of subintervals. Otherwise, the mass is *linear*. Functions *linearly discontinuous* are *not* integrable. (For Cantor's more comprehensive theory of Derived Masses ('Math. Ann.,' XVII, 358f), see *Assemblages*.)

Du Bois Reymond has shown ('Jour. f. d. r. u. d. a. Math.,' 79, 21f) that the *product* of two such integrable functions is itself integrable.

Thus far the integrand has been *finite*. But the $DI \int_0^1 \frac{dx}{\sqrt{1-x^2}} = \pi/2$, *although* the inte-

grand $= \infty$ at 1. In general, if $f(x)$ be ∞ , or discontinuous, or oscillatory at $x=c$ in $[a, b]$, then

$\int_a^b f(x) dx$ loses meaning; but if the sum

$$\int_a^{c-\alpha} f(x) dx + \int_{c+\beta}^b f(x) dx \text{ nears a definite limit}$$

no matter how α and β approach 0 indefinitely, then this limit is named *value of* $\int_a^b f(x) dx$.

Such is the case only when $\int_{c-\alpha}^{c-\alpha'} f(x) dx$ and

$$\int_{c+\beta}^{c+\beta'} f(x) dx \text{ converge each toward } 0, \text{ as } \alpha, \alpha',$$

β, β' , all close down on 0, $\alpha' < \alpha, \beta' < \beta$; *i.e.* the immediate neighborhood of c must contribute infinitesimally to the integral. Similarly for any number of points not forming a

linear mass.

So, too, we may let either *extreme*, as b , increase towards ∞ , if only the total contribution of the infinitely remote region be infinitesimal, *i.e.* if $\int_b^{b'} f(x) dx < \sigma$ for b however large,

b' being *first* taken sufficiently large.

Double Integrals. $\iint f(x, y) dx dy$.—Think of a

finite region R in XY , at each point of which is erected a perpendicular z , all forming a cylindrical volume (V) bounded by XY , the surface

$z=f(x, y)$, and the cylindrical surface standing on the border (B) of R . To find V we may cut up R into elements (ΔR), as by parallels to X and Y , and V into elementary cylinders (ΔV) on these elementary bases. Plainly

$$V = L \Sigma f(x, y) \Delta R = \iint f(x, y) dR. \text{ Here we assign}$$

no extremes to R , the integration stretches over all of R , so that B corresponds to the extremes of simple integration. It is and

* For yet greater refinement and generalization, see *Lebesgue*. Annali di Matematica, 1902, 259f.

CALCULUS, THE INFINITESIMAL

must be indifferent in what order the elements $\mathcal{J}k$ are taken; hence we may sum first along a strip parallel to X , and then sum all such strips along Y . This double summing is expressed by a *Double Integral (II)* thus:

$$L \Sigma [\Sigma f(x, y) \mathcal{J}x] \mathcal{J}y = \int_a^{\alpha} \int_b^{\beta} f(x, y) dx dy.$$

Here for any value of x the values of y are determined by the equation of B . Hence b and β are functions of x ; but a and α depend on the extreme parallels to Y tangent to B , hence are absolute constants.

It is geometrically clear that *II* is perfectly *definite*, but we must ask in default of Geometry, when does Σ approach the *same limit* independently of the function-value chosen for each $\mathcal{J}R$ and of the way in which each $\mathcal{J}R \rightarrow 0$, as their number $\rightarrow \infty$? Answer: When $\Sigma D_k \cdot \mathcal{J}k \rightarrow 0$ as each $\mathcal{J}R \rightarrow 0$, D_k being the greatest fluctuation in function-value in $\mathcal{J}R_k$. When is this the case? Answer: (1) When $f(x, y)$ is continuous throughout R ; (2) when f at single points or on single lines (at ∞^1 points) becomes finitely discontinuous or indeterminate or oscillatory; (3) when f becomes thus finitely discontinuous or indeterminate or oscillatory along an ∞ of lines (at ∞^2 points), *if only* the sum of the elements ($\mathcal{J}R$'s), where $D > \sigma$, is itself $< \varepsilon$ (infinitesimal); *i.e.* when the linear masses do *not* form an areal (or planar) mass, *i.e.* when their initial elements form not a linear but only a discrete mass.

May $f(x, y)$ attain ∞ and *II* retain sense? Answer: If f attains a definite ∞ , but only at definite points, or along a curve and of order < 1 , then the *II* remains definite and finite; also the order of integration remains indifferent. Here the contribution, to the *II*, $\rightarrow 0$ as the element of area (in XY) shrinks toward 0 along the curve; *i.e.* the volume V shoots up to ∞ only along an infinitely sharp edge.

So, too, the *region R* may stretch out any way towards ∞ , if f shrinks faster than R spreads; *e.g.*, R may spread over all the plane, if in all remote regions f becomes 0 of higher than 2d order. Minuter discussion must be foregone.

Extremely important is the *change of variables* in *II*. In simple integration $du = u_x dx$ under the \int , whereby we pass from x to u as variable of integration. In passing from x, y to u, v , under the $\int \int$, $du dv = M dx dy$, but what is M ? It is $\frac{\partial u}{\partial x} \cdot \frac{\partial v}{\partial y} - \frac{\partial u}{\partial y} \cdot \frac{\partial v}{\partial x} = \begin{vmatrix} u_x & v_x \\ u_y & v_y \end{vmatrix} = \frac{\partial(u, v)}{\partial(x, y)} = J(u, v; x, y)$. This remarkable expression, introduced by Jacobi and named by him *Functional Determinant*, is called *Jacobian* (Salmon). As already exemplified, it plays the rôle of *derivative of the system*

$\{u, v\}$ as to (x, y) . In fact, $\frac{\partial(u, v)}{\partial(x, y)} \cdot \frac{\partial(x, y)}{\partial(u, v)} = 1$ just as $\frac{du}{dx} \cdot \frac{dx}{du} = 1$. Also $\frac{\partial(u, v)}{\partial(x, y)} = \frac{\partial(u, v)}{\partial(w, z)} \cdot \frac{\partial(w, z)}{\partial(x, y)}$,

as $y_x = y_u \cdot u_x$. Again, if $\frac{du}{dx} = 0$, then $u = c$; so,

if $\frac{\partial(u, v)}{\partial(x, y)} = 0$, then $F(u, v) = c$, and so on.

From *DI* we readily pass to the *triple I*, $\int_a^{\alpha'} \int_b^{\beta'} \int_c^{\gamma'} f(x, y, z) dx dy dz$, and hence to *multiple I*'s in general. The higher Jacobian maintains its rôle: $du dv dw = J dx dy dz$, $J = \frac{\partial(u, v, w)}{\partial(x, y, z)} = \begin{vmatrix} u_x & u_y & u_z \\ v_x & v_y & v_z \\ w_x & w_y & w_z \end{vmatrix}$; and so on in general.

Thus, to pass from rectangular to polar coördinates, $x = \rho \cos \theta$, $y = \rho \sin \theta$; $J(x, y; \rho, \theta) = \rho$; under $\int \int$, $dx dy = \rho d\rho d\theta$ —this latter is in fact the elementary curvilinear rectangle.—To pass from rectangular to spherical coördinates, $x = \rho \cos \theta \sin \phi$, $y = \rho \sin \theta \sin \phi$, $z = \rho \cos \phi$, whence $J(x, y, z; \rho, \theta, \phi) = \rho^2 \sin \phi$, and $\rho^2 \sin \phi d\rho d\theta d\phi$ is in fact the rectangular curvilinear volumetric element under $\int \int \int$. Analogy readily extends these forms to n -fold spaces. Thus the Jacobian appears geometrically as a real *derivative*, the limit of the ratio of two simultaneous changes.

The single $\int_a^b f(x) dx = F(b) - F(a)$, where $f = F'$ expresses the sum-value of f , integrated along the length $b-a$, through the *end-values* of some F at b and a ; can the double $\int \int f(x, y) dx dy$

integrated over the region R also be expressed through the *end-values* of some $F(x, y)$ along the contour of R ? This query is much harder to answer, but is answered similarly: If $f(x, y)$ is integrable in R , then in general $\int \int f(x, y) dx dy$

is for every included value of y a continuous function of x , $F(x, y)$, and for every included value of x an integrable function of y . Then the *DI* $\int \int f(x, y) dx dy = \int F(x, y) \sin \nu ds$, where

s is the contour of R and ν = slope of the normal (drawn inwards at any point of s) to the $+Y$ -axis. This latter is a curvilinear \int ,

geometrically depicted as a wall built up (*resp.* down) along the contour s of R .—

Similarly a $\int \int \int$ of f extended throughout a volume (or three-wayed spread) may be expressed through the end-values of a certain F integrated over the entire surface (S) of the volume, whereby a space-integral is turned into a surface-integral; and conversely:

$$\int \int \int \left(\frac{\partial \phi}{\partial x} + \frac{\partial \psi}{\partial y} + \frac{\partial \chi}{\partial z} \right) dx dy dz =$$

$$\int \int \left(\phi \frac{\partial n}{\partial x} + \psi \frac{\partial n}{\partial y} + \chi \frac{\partial n}{\partial z} \right) dS,$$

where $\mathcal{J}n$ along the normal to S corresponds to $\mathcal{J}x$ on X , etc. These conversions (of Green and Riemann) are equally important to pure and to applied mathematics.

The nearest-lying geometric problem of integration is *Quadrature*, already discussed. *Rectification* is finding a straight-length = an arc-length. This latter must be *defined* as the

CALCULUS, THE INFINITESIMAL

common limit of the length of inscribed and circumscribed polygons of which each side $\doteq 0$.

$$\text{Since } s_t = \sqrt{(x_t)^2 + (y_t)^2}, \quad s = \int \sqrt{(x_t)^2 + (y_t)^2} dt.$$

If now $x = \phi(t)$, $y = \psi(t)$, be continuous functions of t , with finite limits of value, then this integration is possible, the curve is *rectifiable*. Such is *not* the case in Weierstrass's curve; there the oscillations (maxima and minima) are infinitely many in every neighborhood however small, nor is the variation finite in any such neighborhood—the arc is infinite between any two points.

Volume is given by triple Integration, $\iiint dx dy dz$, extremes defined by the bounding surface. Often the area of a section perpendicular (or possibly oblique) to an axis, as X , is a function of x , $xS = f(x)$; then $V = \int xS dx$.

In the important case of *Revolutes* (of an area bounded by X , the curve, and two y -ordinates), $xS = \pi y^2$, $V = \pi \int y^2 dx$.

Quadrature of a curved surface is sometimes called *Complanation*.

Here again the area must be defined as the common limit of the surface area of polyhedra inscribed and circumscribed, no matter how. The surface element dS or $(\mathcal{J}S)$ about P may be viewed as projected into the element $dx dy$ in XY and as having a limiting ratio ι with the corresponding element $\mathcal{J}\Pi$ in the plane tangent at P . The slope of this plane to $XY = \gamma = \text{slope of normal to } Z$;

$$\text{hence } \text{Lim. } \frac{\mathcal{J}S}{\mathcal{J}x \mathcal{J}y} = \text{Lim. } \frac{\mathcal{J}S}{\mathcal{J}\Pi} \cdot \frac{\mathcal{J}\Pi}{\mathcal{J}x \mathcal{J}y} = \int \frac{\mathcal{J}\Pi}{\mathcal{J}x \mathcal{J}y} = \sec \gamma = \{F_x^2 + F_y^2 + F_z^2\}^{1/2} / F_z;$$

hence $S = \iint \{ \dots \} / F_z dx dy$, the region of integration in XY being the projection thereon of S , under obvious conditions. Often the surface is given *parametrically*, i.e., x , y , and z as functions of the independents, u and v . Then we write off the rectangular array $\left\| \begin{matrix} x_u & y_u & z_u \\ x_v & y_v & z_v \end{matrix} \right\|$,

and form therefrom the three Jacobians, by deleting the columns in order, commonly written A, B, C . Hence, by easy substitution for F_x, F_y, F_z , $S = \iint \sqrt{A^2 + B^2 + C^2} du dv$.
To every point (x, y, z) of S there is coordinated a point (uv) of a plane.

For *Revolutes*, $S = 2\pi \int y ds$.

Differentiatio de Curva in Curvam.—We have found the D of an \int as to either extreme, but the integrand may contain a *parameter*, thus $\int f(x; p) dx$. The \int , being then a function of f , is also a function of p and may be differentiated as to p , giving rise to *Parametric Derivation*. Thus, $I = \int_a^b c p x dx = \left\{ \frac{1}{p} c p x \right\}_a^b$; hence

$$I_p = \left\{ \frac{p x - 1}{p^2} c p x \right\}_a^b. \quad \text{If now we differentiate}$$

* Also $S = \iint \sqrt{EG - F^2} du dv$, $E = x_u^2 + y_u^2 + z_u^2$, $G = x_v^2 + y_v^2 + z_v^2$, $F = x_u \cdot x_v + y_u \cdot y_v + z_u \cdot z_v$ (Lagrange).

the integrand first, and then integrate, we obtain the same result. Hence the order $\text{Integr.}_x \text{Der.}_p$ is equivalent to $\text{Der.}_p \text{Integr.}_x$. This holds generally, if for a definite interval

$$[p, p + \Delta p], \text{ and for } [a, b], \frac{\partial f(x, p)}{\partial p} \text{ is in general (with possible exception of only discrete masses of points) a continuous function of both } x \text{ and } p; \text{ then } \frac{\partial}{\partial p} \int_a^b f(x, p) dx = \int_a^b \frac{\partial f(x, p)}{\partial p} dx.$$

$$\text{If } \frac{\partial}{\partial p} \int_a^b f(x, p) dx = f(b, p) \frac{db}{dp} - f(a, p) \frac{da}{dp} + \int_a^b \frac{\partial f(x, p)}{\partial p} dx.$$

If the \int_a^b be an integrable function of p , $F(p)$, in $[\alpha, \beta]$, integrating as to p we get $\int_a^b \left\{ \int_a^b f(x, p) dx \right\} dp = \int_a^b F(p) dp$, and the order of integration is indifferent while f is a continuous function of both x and p .

Thus the \int_a^b may be treated as function of any parameter in f , when the extremes are constant, as $0, 1, \pm \infty$, and this gives rise to an important set of concepts and to the *Theory of Definite Integrals*. Thus, for $0 < a < 1$, $\int_0^{\infty} \frac{x^{a-1}}{x+1} dx = \frac{\pi}{\sin a\pi}$, and is a function of a . Among such the *Eulerians* are conspicuous, especially that of 2d species (Legendre), $\int_0^{\infty} x^{a-1} e^{-x} dx$, denoted by $\Gamma(a)$, or better by the Gaussian $\Pi(a-1)$, through which countless others are expressible. This Γ - or Π -function has remarkable properties:

1. $\Gamma(a+1) = a\Gamma(a)$, or $\Pi(a) = a\Pi(a-1)$,—the factorial property, $[n] = n!$. But the factorial loses its meaning for n not a positive integer, while Γ and Π retain theirs: thus, $\Gamma(\frac{1}{2}) = \sqrt{\pi}$, $\Gamma(\frac{3}{2}) = \frac{1}{2}\sqrt{\pi}$.

2. $\Gamma(a)\Gamma(1-a) = \frac{\pi}{\sin a\pi}$, Euler's beautiful discovery. Hereby arguments complementary to 1 are set in mutual relation, as $\sin(\pi - a) = \sin a$, $\tan a \cdot \tan(\frac{\pi}{2} - a) = 1$, so that from $\Gamma(\frac{3}{2})$ we may reckon $\Gamma(\frac{5}{2})$. Hence we need reckon $\Gamma(a)$ only for a in $[0, \frac{1}{2}]$, as sin a only for a in $[0, \pi/2]$.

$\Gamma(a)$ and particularly $\log \Gamma(a)$ may now be differentiated with highly interesting results, as $\frac{d^2 \log \Gamma(a)}{da^2} = \sum_{n=0}^{\infty} \frac{1}{(a+n)^2}$. This \mathcal{L} is uniformly convergent for $a > 0$; hence we may integrate term-wise from ι to a and get $\frac{d \log \Gamma(a)}{da} = (a-1) \sum_{n=0}^{\infty} \frac{1}{(1+n)(a+n)} + C$, where C is the Eulerian or Mascheronian Constant $= \frac{\Gamma(1)'}{\Gamma(1)} = \Gamma(1)' = .5772156649 \dots$ calculated by Euler to 15 and by Legendre to 19 decimals.

Hence, by a 2d Integration,

$$\log \Gamma(a) = \sum_{m=1}^{\infty} \log \frac{m(m+1)^{a-1}}{a+m-1},$$

$$\Gamma(a) = \prod_{m=1}^{m=\infty} \frac{\binom{m+1}{m} a^{-1}}{a+m-1} = \frac{m(m+1)a^{-1}}{a(1+a)\left(1+\frac{a}{2}\right)\dots\left(1+\frac{a}{m-1}\right)} = \frac{(m+1)^a}{a(1+a)\left(1+\frac{a}{2}\right)\dots\left(1+\frac{a}{m-1}\right)}, (m \neq \infty).$$

Such is Gauss's *Definition of $\Gamma(a)$* for every finite a for which no factor in the denominator vanishes. Herewith we are brought to the expression of functions not through infinite series but through infinite *products*, as already exemplified in Wallis's formula:

$$\frac{\pi}{2} = \frac{2}{1} \cdot \frac{2}{3} \cdot \frac{4}{5} \cdot \frac{4}{5} \cdot \frac{6}{7} \cdot \frac{6}{7} \dots$$

This subject, of infinite range, cannot be pursued here—"hills peep o'er hills, and Alps on Alps arise." The fundamental theorems were rigorously proved first by Weierstrass (*Jour. f. d. r. u. d. a. Math.*, LI). It may be

added that the 1st Eulerian, $\int_0^{\infty} \frac{x^{a-1}}{(1+x)^{a+b}} dx$, is denoted by $B(a, b)$ (Binet) and is connected with the 2d by $B(a, b)\Gamma(a+b) = \Gamma(a) \cdot \Gamma(b)$, and being expressible thus simply through Γ has not so much independent significance.

The central notion of the *Integral Calculus*, the LIMIT of a SUM, is more obvious than that of the *Differential Calculus*, the LIMIT of a QUOTIENT. The foundations of the one are also seen to be much broader than those of the other, so that the former is *not merely* the inverse of the latter. The twain seize upon the two great aspects of History, the Dynamical and the Statical, Process and Result. While the Integral Calculus borrows its speed and directness from the Differential Calculus, its own reaction upon this latter is instant and powerful. Thus, from integration by parts we have

$$\int \phi'(y) dy = y\phi'(y) - \int \phi''(y)y dy; - \int \phi''(y)y dy = -\frac{1}{2}y^2\phi'(y) + \frac{1}{2}\int \phi'''(y)y^2 dy; \text{ and so on.}$$

Evaluating between the extremes 0 and h we get Bernoulli's Series (with Remainder); $\phi(h) = \phi(0) + h\phi'(h) - \frac{h^2}{2}\phi''(h) + \frac{h^3}{3}\phi'''(h) - \dots$

$\pm \frac{1}{n} \int_0^h 1^n \phi^{(n+1)}(y) dy$. To avoid the alternation in sign we take $\int \phi(a-u) du$ and proceed as before: then on putting $a = x_0 + h$,

$$\phi(x_0 + h) = \phi(x_0) + h\phi'(x_0) + \frac{h^2}{2}\phi''(x_0) + \dots + \frac{1}{n!} \int_0^h u^n \phi^{n+1}(x+h-u) du, \quad 0 < h < R.$$

Such is the swiftest, directest, nearest-lying deduction of the fundamental *Taylor's Series*, by which the value of ϕ at $(x_0 + h)$ is built up out of the value of ϕ and its D 's at x_0 . The R_n is here yielded as a definite integral, from which form the other forms, as Lagrange's,

Cauchy's, Schlömilch's, come at once on applying the Maximum-Minimum Theorem. This development holds under the two necessary and sufficient conditions (Pringsheim):

1. That $\phi(x)$ possess everywhere in $[x_0, x_0 + R]$ definite finite differential coefficients of every finite order;

2. That $\text{Lim.} \frac{1}{n!} \phi^{(n)}(x_0 + h) \cdot k^n$ converge uniformly on 0 (for $n = \infty$) for all pairs (h, k) for which $0 \leq h \leq h+k < R$.

The Infinitesimal Analysis or Method of Limits is very highly developed and is applicable to almost every subject of exact thought, often asserting itself in the most surprising fashion, as in the *Theories of Numbers* and of *Knots*, to which it might seem wholly alien, suddenly unlocking and laying wide open secret passages utterly unsuspected. In particular the Integral Calculus shows itself amazingly and unendingly fertile in the generation of new notions. As other and still other fields are exposed to investigative thought, the Calculus will receive more and more applications, and there seems to be no limit to the subtlety and refinement of its processes, to the keenness and penetration that may be given to this two-edged sword of the spirit, the strongest, sharpest, and most flexible ever fashioned or wielded by the mind of man.

Historical Sketch.—Passing by anticipations, especially of Integration, that reach back at least to Archimedes (287–212 B.C.), we come to Barrow's (*Lectiones opticae et geometricae*) (1669–70), on which *Newton* collaborated, how much no one knows. Barrow used the Differential Triangle even in 1664 (*indefinitum parvum, . . . ob indefinitam curvæ parvitudinem*), calling Δy a and Δx e (as Fermat used A and E , 1638). *Newton* was busied with Series at Cambridge, 1665–6 (eo tempore pestis ingruens coegit me hinc fugere—in his famous letter, filling thirty pages in the *Opuscula*, to Oldenburg, Secretary of the Royal Society, 24th October, 1676). His MS. (*De analysi per æquationes numero terminorum infinitas*) (partially published first in Wallis's Works, vol. II, 1693) was shown to Barrow, Collins, Lord Brouncker in 1669, wherein he used 0 for a magnitude ultimately vanishing, as had James Gregory already in his (*Geometriae pars universalis*) (1667, Venice). He treated Rectification, Cubature, and Mass-Center determinations as reducible to Quadrature and to be solved by introducing the notion of (*Momentum*)=instantaneous change, thus going beyond Barrow. *Newton's* (*Methodus Fluxionum et Serierum infinitarum*) was ready for the press before 1672, but not printed till 1736. In it he proposes, (1) to find the velocity at any instant from the space traversed up to each instant, (2) to find the latter (space) from the former (velocity)—the two problems of Derivation and Integration conceived kinematically. The equirescent magnitude x , as a space, is called *fluens* (*Cavalieri fluens*, 1639, Napier *fluxus*, 1614, Clavius *fluere*, 1574); the velocity he writes \dot{x} and calls *fluxio*—our Derivative (as to the time t). *Momentum* varies as fluxion, is written $\dot{x}o$, and corresponds to our Differential x (*incrementa indefinita parva*). This treatise seems to have been revised after 1673, hence

does not clearly attest Newton's knowledge in 1671. Leibnitz wrote, 26 Oct., 1675 (following Cavalieri), *Omnia w*, etc.; but 29 Oct., 1675, *Utile erit scribi ∫ pro omni. ut ∫ l pro omni. l id est summa ipsorum l*; again, the same day, *nampe ut ∫ augebit, ita d minuet dimensiones.*

∫ autem significat summam, d differentiam.

There and then was born the "Algorithm of the Differential" and Integral "Calculus." Under date of 11 Nov., 1673, Leibnitz wrote $\int ydy = \frac{y^2}{2}$, but the 3 was originally 5. His "Characteristic Triangle", equivalent to Differential Triangle, he took not from Barrow but from Pascal. All attempts to show any real dependence of Leibnitz on Newton have failed. The germs of the new Method were abroad in the air.

Bibliography.—Leibnitz and his school, especially the Bernoullis, poured forth memoirs abundantly. Leibnitz' first, (Nova Methodus pro maximis et minimis, itemque tangentibus, etc.,) appeared in the Leipzig *Acta Eruditorum*, 1684. Newton gave his method of prime and ultimate ratios in geometric form in his 'Philosophiæ Naturalis Principia Mathematica', 1687. Johann Bernoulli's (Lectiones Mathematicæ) was the first text-book of the Integral Calculus, composed at Paris 1691-2, published 1742; Taylor, (Methodus incrementorum directa et inversa) (1715); D'Alembert, (Mémoire sur le calcul intégral) (1739); Maclaurin, (A Treatise on Fluxions) (1742); Euler, (Introductio in Analysin Infinitorum) (1748)—resuming and expanding all knowledge on the subject, "one of the most contentful, beautiful, and fruitful works that ever left the press,"—(Institutiones Calculi Integralis) (1768-70); Cramer, (Introduction à l'analyse des lignes courbes algébriques) (1750); Lacroix, (Traité du calcul dif. et du cal. int.) (1797); Lagrange, (Théorie des fonctions analytiques) (1797); Cauchy, (Cours d'analyse) (1821), (Leçons sur le calcul différentiel) (1829); Duhamel, (Cours d'analyse) (1840), 3d ed., by Bertrand (1874-5); De Morgan, (Diff. and Int. Calculus) (1842); Todhunter, (Diff. and Int. Calculus) (1852); Price, (Infinitesimal Calculus) (1854); Gerhardt, (Die Entdeckung der höheren Analysis) (1855); Bertrand, (Traité du Cal. Diff. et du Cal. Int.) (1864-70); Hermite, (Cours d'Analyse) (1873); Williamson, (Dif. and Int. Calculus) (1872-74); Meyer, (Theorie der bestimmten Integrale)—nach Lejeune-Dirichlet (1875); Lipschitz, (Lehrbuch der Analysis) (1877-80); Houël, (Cours de Calcul Infinitésimal) (1878-9); Dini, (Analisi Infinitesimale) (1877-8), (Fondamenti per la teoria delle funzioni di variabili reali) (1878); Harnack, (Die Elemente der Dif. und Int. rechnung) (1881); Stolz, (Allgemeine Arithmetik) (1885-6), (Grundzüge der Differential- und Integralrechnung) (1893-6-9); Tannery, (Introduction à la théorie des fonctions d'une variable) (1886); Laurent, (Traité d'Analyse) (1885-92); Picard, (Traité d'analyse) (1891-1903); Genocchi-Peano, (Calcolo differenziale e principii di calcolo integrale) (1884, German translation 1898-9); Cantor, (Geschichte der Mathematik) (1880-1900/1);

Jordan, (Cours d'Analyse) (1893-4-6); Serret, (Cours de Calcul dif. et int.) (1868, Harnack's German transl., 2d ed., by Bohlmann and Zermelo, 1899-1904-5); de la Vallée Poussin, (Cours d'Analyse Infinitésimale) (1903); Goursat, (Cours d'Analyse mathématique) (1902-4); Humbert, (Cours d'Analyse) (1903-4); Borel, (Leçons sur les fonctions de Variables réelles) (1905); Kiepert-Stegemann, (Grundriss der Differential- u. Integralrechnung) (1905). American works are omitted as familiar.

WILLIAM BENJAMIN SMITH,
Professor of Mathematics, The Tulane University
of Louisiana.

Calculus of Variations, The. The *Calculus of Variations* is a natural outgrowth of the *Infinitesimal Calculus* (q.v.)—in particular of the *Integral Calculus* (q.v.) and of *Differential Equations* (q.v.). In the Integral Calculus, properly speaking, only integrals of the type $\int f(x, \alpha_1, \alpha_2, \dots) dx$ are considered, where

$f(x, \alpha_1, \alpha_2, \dots)$ is a function of the variable of integration x and of several parameters $\alpha_1, \alpha_2, \dots$ which are independent of x . In solving differential equations of the type $dy/dx = f(x, y)$ we are in one sense dealing with a new type of integral, $\int f(x, y) dx$. Such integrals, in which y is to be replaced by a certain function of x , are called *line integrals* (q.v.).

The integrals considered in the Calculus of Variations are essentially of this kind, but we shall see that the more interesting problems are those in which still another element is introduced. The integral

$$(1) \quad I = \int_{x_0}^{x_1} f(x, y, y') dx,$$

where $y' = dy/dx$, can be evaluated whenever y is known as a function of x . For if $y = \phi(x)$ be the known value of y in terms of x , and if $\phi(x)$ and $\phi'(x) = d\phi(x)/dx$ be substituted for y and y' respectively under the integral sign, the integrand becomes a function of x alone, and the integral itself has a definite numerical value, at least under certain very general restrictions which need not be stated here. Thus to every function of x which can be substituted for y there corresponds a definite number—the value of I calculated as above for that function. The relation $y = \phi(x)$ defines a curve C in the plane of x and y . We shall denote the value of I which corresponds to the function $\phi(x)$ by the symbol I_c .

The central problem of the Calculus of Variations is the determination of a curve $K [y = \psi(x)]$, for which the value of I, I_K , is less than [greater than] the value of I for any other curve $C [y = \phi(x)]$, which satisfies the conditions of the particular example.

In most of the simpler examples it is specified or implied by the conditions of the problem that the curves C considered shall all pass through each of two given fixed points $P_0(x_0, y_0)$ and $P_1(x_1, y_1)$, whose abscissæ are respectively x_0 and x_1 , the limits of integration of the integral I . Hence only those functions of x , $\phi(x)$, are to be considered for which $\phi(x_0) = y_0$ and $\phi(x_1) = y_1$.

In order to clarify the general problem, let

us consider the example

$$L = \int_{x_0}^{x_1} \sqrt{1+y'^2} dx.$$

This is a familiar integral; it is the formula for the length of any curve $y = \phi(x)$ between any two of its points. With respect to this integral the statement of the simplest problem of the Calculus of Variations is as follows: Given two fixed points $P_0(x_0, y_0)$ and $P_1(x_1, y_1)$ in the xy plane; to determine that curve $y = \phi(x)$ joining P_0 and P_1 for which the value of the integral L (i.e., the length of the arc P_0P_1) is at a minimum. Accepting the Euclidean postulate that the shortest distance between two points is measured along the straight line joining them, it is evident *a priori* that the solution of this example is the straight line P_0P_1 , or

$$y = y_0 + (x - x_0)(y_1 - y_0)/(x_1 - x_0).$$

It is at least plausible that any conditions which we may discover must, in this particular example, be satisfied by this function.

It is easy to see how this simple problem may be generalized. For we might inquire what is the shortest path between a fixed point and a fixed curve, or between two fixed curves. Again, obstacles may be placed in the plane, and the shortest path then sought. This latter idea leads to an important application of the general theory: the determination of the shortest path between any two fixed points of a given surface, the surface being thought of as an obstacle placed in the plane. The most general problem of the kind mentioned above may be thought of as the determination of a certain shortest path.

An entirely distinct generalization of the preceding problem is that in which the integrand involves derivatives of higher order than the first, i.e., of the type: $\int f(x, y, y', y'', \dots, y^{(n)}) dx$.

Another is that in which the integral involves several dependent variables:

$\int f(x, y, z, \dots, y', z', \dots) dx$. Finally, the integral considered may involve two (or more) independent variables and require two integrations:

$\iint f(x, y, z, p, q) dx dy$, where p and q denote $\partial z/\partial x$ and $\partial z/\partial y$, respectively, and where the function to be determined is a function of x and y which is to be substituted for z . Further generalizations are evident and would tend only to confuse if stated here. We shall return briefly to these generalized problems, but we shall state theorems principally for the simple integral I in one dependent and one independent variable. Many of these theorems can be generalized without essential difficulty to the other cases which have been mentioned.

Returning to the integral (1), let us consider the history of the problem very briefly. Although a previous problem had been considered by Newton in 1687 ('Phil. nat. prin. Math.,' II, Sec. 7, Prop. 34), the first problem which gave rise to any general theory and encouraged investigation was the so-called problem of the brachistochrone—or curve of quickest descent—which we shall discuss as a particular example. This problem was stated by Johann Bernoulli in 1698, solved by him in the following year, by his brother Jacob in 1701 in an

important memoir dealing with more general problems, and by Euler in 1744 in an important treatise ('Methodus inveniendi lineas curvas . . .'). It has remained of interest down to the present day, probably the last paper concerning it being that by Bolza, ('Bull. Amer. Math. Soc.,' 1904, No. 1,) in which a final solution is given. In the paper mentioned Euler first gave the first necessary condition (known as "Euler's condition," or less properly as "Lagrange's condition") in its general form, and developed the theory in several directions, solving incidentally many problems from the formal standpoint. Following Euler, Lagrange introduced many simplifications and generalizations in a series of important papers (cf. his 'Works,') and his books ('Théorie des fonctions' and 'Calcul des fonctions'). In particular the Method of Multipliers for the treatment of problems of relative extrema, which we shall discuss briefly, is due to Lagrange. The other prominent names in the early history are Legendre, for whom the second condition is named; Gauss, who first studied double integrals with variable limits; Jacobi, who discovered the condition which bears his name; and Du Bois-Reymond, who initiated the very modern critical development of the theory. We shall restrict ourselves to a reference to Todhunter, ('A History of . . . the Calculus of Variations . . .') (Cambridge, 1861); and Pascal, ('Calcolo delle variazioni' (Milan, 1897, German translation by Schepp, 1899); and Kneser, ('Variationsrechnung' and ('Ency. der Math. Wiss., II A 8, 1900'); and Bolza, ('Lectures on the Calculus of Variations' (Chicago, 1905). In these books exact and complete references to the literature of the subject and notes concerning its history up to the dates of publication may be found. It should be noted that only the latter of these books contains references to the important developments published since 1900.

Precise Statement of the Problem.—It is evident upon examination that the naive conception of the problem does not permit of exact mathematical treatment. For definiteness, let us suppose that the function $f(x, y, y')$ in (1) is an analytic function of its three arguments inside of a certain three-dimensional region R , which may be finite or infinite, but which expressly does not include any points at infinity. Let us also restrict ourselves to curves of the type $y = \phi(x)$, where $\phi(x)$, together with its first derivative $\phi'(x)$, is a continuous, single-valued function of x in the interval $x_0 \leq x \leq x_1$, and where $\phi(x_0)$ and $\phi(x_1)$ are equal, respectively, to the ordinates y_0 and y_1 of the fixed points P_0 and P_1 . We shall call these "curves of the class B." If there is a single one of these curves $y = \phi(x)$, or K , for which I_K is less than [greater than] I_C for any other curve C [$y = \phi(x)$] of the class B, that curve K is said to render the given integral I an absolute minimum [maximum]. It is evident that this will rarely occur, as is also the case in extrema of functions of a single variable. If we no,

(2) $\phi(x) = \psi'(x) + \eta(x)$, . . . $\eta(x) = \phi(x) - \psi'(x)$, and if there exists a positive number δ such that I_K is less than [greater than] I_C whenever the condition

(3) $|\eta(x)| < \delta, \quad |\eta'(x)| < \delta, \quad x_0 \leq x \leq x_1,$

then K is said to render the integral I a weak

CALCULUS OF VARIATIONS

minimum [maximum] among the curves of the class B. If instead of (3) we merely require the condition

$$(4) \quad |\eta(x)| < \delta, \quad x_0 < x \leq x_1,$$

the curve K is said to render a *strong minimum* [maximum]. If in addition to (3) [or (4)] we also require that

$$(5) \quad \eta(x_i) = 0, \\ x_0 + (i-2) \cdot \delta \leq x_i \leq x_0 + (i-1) \cdot \delta \leq x_1, \\ i = 2, 3, \dots (n+1),$$

where $n \cdot \delta = x_1 - x_0$, the curve K is said to render I a *limited weak* [strong] *minimum* [maximum].

Geometrically these conditions mean that the curves compared to K must lie, in the case of a strong extremum (*i.e.*, maximum or minimum), close to the curve K ; in the case of the weak extremum, they must lie close to K and vary only a little from K in direction; in the case of a limited extremum, they must cut K at least once in every vertical strip of width δ .

It is easy to show that if K is to render I an extremum (of any sort), $\psi(x)$ must satisfy the equation

$$(6) \quad \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) - \frac{\partial f}{\partial y} = 0,$$

or

$$\frac{\partial^2 f}{\partial y'^2} y'' + \frac{\partial^2 f}{\partial y \partial y'} y' + \frac{\partial^2 f}{\partial x \partial y'} - \frac{\partial f}{\partial y} = 0,$$

which is known as *Euler's* (or less properly as *Lagrange's*) *equation*. For we have

$$(7) \quad I_c = \int_{x_0}^{x_1} \{ \lambda(x) + \eta(x), \psi(x) + \eta'(x) \} dx,$$

which must be a minimum [maximum] for $\eta(x) = 0$. Replacing $\eta(x)$ by $\epsilon \cdot \lambda(x)$, where $\lambda(x)$ is a certain function and ϵ is a variable parameter, I_c will evidently be a function of the parameter ϵ alone:

$$(8) \quad I_c = F(\epsilon) = \int_{x_0}^{x_1} \{ \lambda(x), \psi + \epsilon \cdot \lambda, \psi' + \epsilon \cdot \lambda' \} dx.$$

It is easy to show that the ordinary rule applies and that we can have an extremum only if

$$(9) \quad dI_c/d\epsilon = F'(\epsilon) = \int_{x_0}^{x_1} \{ \lambda y(x), \psi + \epsilon \cdot \lambda, \psi' + \epsilon \cdot \lambda' \} \lambda \\ + \lambda y'(x), \psi + \epsilon \lambda, \psi' + \epsilon \lambda' \cdot \lambda' \} dx = 0,$$

$$\text{when } \epsilon = 0, \text{ or } F'(0) = \int_{x_0}^{x_1} \{ \lambda y \cdot \lambda + \lambda y' \cdot \lambda' \} dx = 0,$$

where $\lambda y = \partial f / \partial y$, etc. Integrating the second term by parts, we get

$$(10) \quad F'(0) = 0 = \left[\lambda(x) \lambda y'(x), \psi, \psi' \right]_{x_0}^{x_1} \\ + \int_{x_0}^{x_1} \lambda(x) \left\{ \lambda y(x), \psi, \psi' \right\} - \frac{d}{dx} \lambda y'(x), \psi, \psi' \} dx,$$

or since $\lambda(x)$ evidently vanishes for $x = x_0$ and for $x = x_1$,

$$(11) \quad \int_{x_0}^{x_1} \lambda(x) \left\{ \lambda y(x), \psi, \psi' \right\} - \frac{d}{dx} \lambda y'(x), \psi, \psi' \} dx = 0.$$

But $\lambda(x)$ was itself any permissible function of x , and it is easy to show that the integral of such a product, of which one factor is arbitrary, can vanish only if the other factor vanishes. This gives precisely the equation (6). Certain further considerations are necessary to show

that this proof, which implicitly assumes the existence of the second derivative of $\psi(x)$, does not involve any restrictions. (Cf. Bolza, 'Lectures,' chap. i).

Assuming the further details without proof, it becomes evident that any curve K , $y = \psi(x)$, which is to render I a minimum (of any sort) must satisfy the differential equation (6). Since f and its derivatives are known functions, (6) is an ordinary differential equation of the second order, linear in $d^2 y / dx^2 (= y'')$. The coefficient of y'' is $d^2 f / dy'^2 (= f_{y'y'})$. If this coefficient $f_{y'y'}$ does not vanish, one and only one solution of (6) passes through a given point in a given direction. The general solution of (6) contains two arbitrary constants:

$$(12) \quad y = f(x, \alpha, \beta).$$

Any one of these solutions, *i.e.*, any solution whatever of (6) is called an *extremal*. Hence the required curve K , if it exists, must be an extremal, and it is necessary to search for it only among the extremals. But K was to connect P_0 and P_1 . Usually, however, there is only one of the extremals (12) which passes through two given points, for the equations,

$$(13) \quad y_0 = f(x_0, \alpha, \beta), \quad y_1 = f(x_1, \alpha, \beta),$$

usually determine α and β , and hence also determine a single extremal joining P_0 and P_1 . If this is actually the case, either that extremal is the required solution K , or else there is no solution of the problem.

A large number of special cases lead to differential equations which can be solved directly.

For example, if $I = \int_{x_0}^{x_1} \sqrt{1 + y'^2} dx$, we shall have

$f(x, y, y') = \sqrt{1 + y'^2}$, whence $f_x = f_y = f_{xy} = f_{yy'} = 0$, $f_{y'y'} = y' / (1 + y'^2)^{3/2}$, and the equation (6) takes the form $y'' = 0$. The only solutions of this differential equation are the straight lines $y = ax + b$. It follows that if there is any curve of the class B in the plane along which the distance between two given fixed points is at a minimum, that curve is the straight line joining the two points. This result is independent of the Euclidean postulate, and depends only upon the definition of length by means of the preceding integral.

The problem of the brachistocrone, mentioned above, is to find the curve along which a particle with initial velocity v_0 will descend most quickly from a given initial point P_0 to another given point P_1 . It is easy to show that the time of descent is given by the formula

$$t = \int_{x_0}^{x_1} \frac{\sqrt{1 + y'^2}}{\sqrt{v_0^2 - 2g(x - x_0)}} dx,$$

hence Euler's equation (6) is

$$\frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = \frac{d}{dx} \left(\frac{y'}{\sqrt{1 + y'^2} \sqrt{v_0^2 - 2g(x - x_0)}} \right) = 0,$$

which gives at once $y'^2 = c^2(1 + y'^2)(v_0^2 + 2g(x_0 - x))$. It is easy to solve this equation in parameter form, and we find:

$$x - A = -\frac{A + B}{2} (1 - \cos \omega),$$

$$y - C = -\frac{A + B}{2} (\omega - \sin \omega),$$

where

$$A = \frac{v_0}{2g} + x_0, \\ B = \frac{c^2 - v_0^2}{2g} - x_0.$$

These extremals are cycloids on horizontal bases, the radius of the generating circle being $(A+B)/2$, and one cusp being at the point (A, C) . Further investigation is necessary to decide just when a given pair of points can be connected by such a cycloid (cf. Bolza, 'Lectures,' p. 236). If such a cycloid can be drawn, we can infer that it is the solution if there is any solution. If no such cycloid can be drawn, we can infer that there is no solution in the region R .

The problem of finding the geodetic lines on a given surface is that of minimizing the integral,

$$I = \int_{x_0}^x (E + 2Fy' + Gy'^2)^{\frac{1}{2}} dx,$$

where $z = \phi(x, y)$ is the surface and where $E = 1 + z_x^2$, $F = z_x z_y$, $G = 1 + z_y^2$. Euler's equation therefore coincides with the usual equation for the geodetic lines:

$$\frac{d}{dx} \left(\frac{Gy' + F}{\sqrt{E + 2Fy' + Gy'^2}} \right) = \frac{E_y + 2F_y y' + G_y y'^2}{2\sqrt{E + 2Fy' + Gy'^2}},$$

and the geodetic lines are the extremals of this problem, i.e., no line not a geodetic can be a shortest line on a surface.

Though the proof of the necessity of Euler's condition was satisfactory, even in a cruder form, to the originators of the subject, a desire to formulate sufficient conditions arose. Thus Legendre showed that a *second necessary condition* for a minimum [maximum] is that the condition

$$f_{y'y'}(x, \psi(x), \psi'(x)) > 0 \text{ [} < 0 \text{]} \text{ for } x_0 \leq x \leq x_1$$

be satisfied along the supposed solution $y = \psi(x)$ between the end points. We shall prove this, and we shall see that the same condition is actually a sufficient condition for a weak limited minimum if the sign = be removed.

Jacobi then showed, by means of the second variation of the given integral, that a *third necessary condition* for a minimum [maximum] is that the quantity

$$J(x, x_0) = \eta_1(x)\eta_2(x_0) - \eta_2(x)\eta_1(x_0)$$

should not vanish for any value of x in the interval $x_0 < x < x_1$, where $J(x, x_0)$ is a solution of the equation

$$f_{y'y'}\eta'' + \frac{df_{y'y'}}{dx}\eta' + \left(\frac{df_{yy'}}{dx} - f_{yy} \right)\eta = 0,$$

which vanishes for $x = x_0$. The proof, which is omitted, can be found in Bolza, 'Lectures,' chap. ii. A beautiful geometrical interpretation of this condition exists: if we consider the one parameter family of extremals through (x_0, y_0) , and call their envelope E , the extremal which joins x_0 to any point beyond its point of tangency with E cannot possibly render the integral a minimum [maximum] between those two points, i.e., the envelope of the extremals through (x_0, y_0) bounds all the points which can possibly be reached by a minimizing extremal from x_0 .

It was long believed that Jacobi's condition, together with the previous two, was a sufficient condition. That such is not the case was first

pointed out by Weierstrass, who also showed that *Jacobi's condition*, while not sufficient for a minimum in general, is sufficient for a weak minimum (if the point (x_1, y_1) lies inside the envelope of the extremals through (x_0, y_0) . (Cf. Bolza, 'Lectures,' chap. iii.)

That the preceding conditions are not sufficient is most readily seen by giving an actual example in which the extremals, though all the above conditions are satisfied, do not minimize the integral. Such is the example (see Bolza 'Lectures,' p. 73),

$$f(x, y, y') = y'^2(y' + 1)^2.$$

Here the extremals are straight lines, but it is easy to join two points for which all the preceding conditions are satisfied by a simple broken line for which the value of the integral is less than that along the straight line extremal. Of course, the comparison line used varies considerably from the straight line extremal in direction, though not in position.

Weierstrass, in 1879, gave a fourth necessary condition. He defines a new function,

$$E(x, y, y', p) = f(x, y, y') - f(x, y, p) - (y' - p)f_p(x, y, p).$$

Then *Weierstrass's (fourth) necessary condition* for a minimum [maximum] is

$$E(x, y, y', p) \geq 0 \text{ [} \leq 0 \text{]} \text{ } x_0 \leq x \leq x_1,$$

where x, y, p are the values of $x, y, dy/dx$ along the extremal between the end points, and where y' is any finite number whatever. (Cf. Bolza, 'Lectures,' chap. iii.) Since we have

$$\text{Limit}_{y'=p} \left[\frac{E(x, y, y', p)}{(y' - p)^2} \right] = \frac{\partial^2 f}{\partial y'^2} \Big|_{y'=p},$$

it follows that it is also necessary that $f_{y'y'} \geq 0$, which is precisely the *second (Legendre's) necessary condition* mentioned above. It is easy to show that if (a) the end points can be joined by an extremal K , (b) a one parameter family of extremals $[y = \psi(x, \alpha)]$ can be found, one of which is K itself, and one and only one of which passes through each point of the plane near K , so that $y' = p(x, y)$ can be found, i.e., a function which gives the slope of the extremal of the family at any point (x, y) near K , then the integral

$$J = \int_{x_0}^{x_1} [f(x, y, p) + (y' - p)f_p(x, y, p)] dx$$

is independent of the path of integration inside the field just constructed near K , and we have

$$I_c - I_k = \int_{x_0}^{x_1} E(x, y, y', p) dx \Big]_{\text{along } C},$$

where C is any curve of the class B in the field about K , since $I_k = J_k = J_c$. It follows that the condition

$$E(x, y, y', p) \geq 0, \quad x_0 \leq x \leq x_1,$$

for all x and y near K and for the function $p(x, y)$ just mentioned and for any finite value of y' whatever, is a *sufficient condition* for a strong minimum, if the sign of equality holds only for $p = y'$. (Cf. Osgood, 'Annals of Mathematics,' II, 3; Bolza, 'Lectures,' chap. iii.)

It is possible to show (cf. Hedrick, 'Bull. A. M. S.,' IX, 1) that for a *limited minimum* the conditions remain the same except that *Jacobi's condition* may be omitted. The conditions in the various cases may be summarized in the following scheme:

CALCULUS OF VARIATIONS

		Limited Variations.		Unlimited Variations.	
		Weak.	Strong.	Weak.	Strong.
Necessary.	Euler's, Legendre's necessary.	Euler's, Legendre's necessary, Weierstrass's necessary.	Euler's, Legendre's necessary, Jacobi's necessary.	Euler's, Legendre's necessary, Jacobi's necessary, Weierstrass's necessary.	Euler's, Legendre's necessary, Jacobi's necessary, Weierstrass's necessary.
	Euler's, Legendre's sufficient.	Euler's, Legendre's sufficient, Weierstrass's sufficient.	Euler's, Legendre's sufficient, Jacobi's necessary.	Euler's, Legendre's sufficient, Jacobi's necessary, Weierstrass's sufficient.	Euler's, Legendre's sufficient, Jacobi's necessary, Weierstrass's sufficient.

It is seen on glancing at the table that from the simple conditions (Euler's and Legendre's) for limited weak variation we proceed to any other case by adding Weierstrass's conditions in the case of a strong minimum, and Jacobi's in case of an unlimited minimum, only. The above table represents *substantially* the present known conditions.

In special problems the irksomeness of these conditions can sometimes be circumvented. For instance, given a problem in which $\frac{\partial^2 f}{\partial y'^2} > 0$ for all values of x, y, y' , then the necessary and sufficient condition for a limited strong minimum is the possibility of finding a solution of Euler's equation joining the two given end points. Such is the case in the geodetic problem and also in the integral which leads to Hamilton's principle; and in each of these cases, fortunately, a limited strong minimum is all that is desired. Similar simplification occurs in every case when $\frac{\partial^2 f}{\partial y'^2} > 0$ for all x, y, y' . For then Legendre's and Weierstrass's conditions are always satisfied, and may be abstracted from the above table. For this reason Hilbert has called a problem in which $\frac{\partial^2 f}{\partial y'^2} > 0$ for all x, y, y' contained in a singly connected region R , in which the given end points lie, a "regular" problem of the Calculus of Variations.

Considering the example $\int_{x_0}^{x_1} \sqrt{1+y'^2} dx$, we see that $f_{y'y'} > 0$ for all finite values of x, y , and y' whatever. Since

$$E(x, y, y', p) = \frac{(y' - p)^2}{2} - f_{y'y'}(x, y, \xi), \quad y' \geq \xi \geq p,$$

it follows that such an example surely satisfies Weierstrass's sufficient condition, provided that a field exist in the manner specified above. But in this case, since the extremals are all straight lines in the plane, it is obvious that all other conditions are satisfied. Hence the straight line joining any two points actually minimizes the given integral, *i.e.*, the straight line is the "shortest" line between any two of its points if the preceding integral be the definition of length.

In the problem of the brachistochrone, mentioned above, it is shown that the extremals found (cycloids) actually render the integral of the problem a minimum provided no cusp lies between the end points (cf. Bolza, 'Lectures,' chap. iv., pp. 126, 136, 146).

Returning to the integral which defines length, it is evident that some other integral might as well have been selected as the definition of length, if we are not to assume an intuitive knowledge of it. The variety of choice is limited only by the selection of those properties which we desire to have hold. This leads very naturally to The Inverse Problem of the Calculus of Variations: Given a set of curves which form a two-parameter family. What is the condition that they be the extremals of a problem of the Calculus of Variations? What are the conditions that they actually render the integral thus discovered a minimum? Let $y = \bar{F}(x, a, b)$ be the given family. Then (cf. Bolza, 'Lectures,' p. 31) the integrand of any integral for which these are extremals must satisfy the equation

$$\frac{\partial f}{\partial y} - \frac{\partial^2 f}{\partial y' \partial x} - \frac{\partial^2 f}{\partial y' \partial y'} y' = G(x, y, y') \cdot \frac{\partial^2 f}{\partial y' \partial y'},$$

where $y'' = G(x, y, y')$ is the differential equation of the given family. This equation for $f(x, y, y')$ always has an infinite number of solutions, of which only those are actually solutions of the given inverse problem which satisfy the relation $f_{y'y'} > 0$, and these are solutions in any region free from envelopes of one-parameter families of the given extremals. Some interesting conclusions for particular forms are to be found in a paper by Stromquist, ('Transactions of American Mathematical Society' (1905).

Another interesting class of problems are the so-called isoperimetric problems. These are problems in which a further restriction is placed upon the solution by requiring that it shall give a second (given) integral a given value. Such is, for example, the problem of finding the curve of maximum area with a given perimeter. The problem is treated by means of the so-called method of multipliers, which is too long for presentation here. (See Bolza, 'Lectures,' chap. vi.)

This article is too short to give any account of the details of the work for double integrals. Suffice it to say that the known methods follow closely those given above for simple integrals. In the other possible problems mentioned above the same holds true. An interesting application of these other problems occurs in the well-known *Problem of Dirichlet*, which is fundamental in mathematical work. Another is the important problem of *Minimum Surfaces*. Another is the well-known theory of mechanics based upon *Hamilton's Principle* or one of the analogous mechanical principles. The modern methods have made these theories more rigorous.

Bibliography.—The following is a list of the more important works and articles published in America concerning the Calculus of Variations: Carll, ('Calculus of Variations') (New York, 1885); Osgood, ('Annals of Mathematics') (II, 3, and Trans. A. M. S., II); Whittemore, ('Annals of Mathematics') (II, 3); Hancock, ('Various papers in Annals of Mathematics and Calculus of Variations') (Cincinnati, 1894); Bliss, ('Thesis' (Chicago, 1901); and various papers, ('Annals of Mathematics') and ('Transactions American Mathematical Society'); Hedrick, ('Bulletin American Mathematical Society,' IX (1901-5); Bolza, various papers, ('Bulletin American Mathematical Society,' ('Transactions American Mathematical Society,' etc. (1901-5); Brochures published in the Chicago Decennial Publications,

CALCUTTA

including the Lectures on the Calculus of Variations mentioned above (Chicago, 1904).

The foreign literature is well collected for reference in the foot-notes to Bolza's ('Lectures,') and in the following books and articles: Todhunter, ('History of the Calculus of Variations') (Cambridge, 1861); Moigno-Lindeloff, ('Calcul des Variations') (Paris, 1861); Pascal, ('Calcolo delle variazioni') (Milan, 1897, German Trans., Leipzig, 1899); Kneser, ('Variationsrechnung') (Braunschweig, 1900); Kneser, ('Ency. der Math. Wiss., II, A 8') (Leipzig, 1904); Zermelo u. Hahn, ('Ency. der Math. Wiss., II, A 8a') (Leipzig, 1904).

The literature is altogether extremely extensive, covering, as it does, a period of over two hundred years. It is evident that the more important papers for present use are those of recent date.

An important phase of the subject which has necessarily been overlooked is the general proof by Hilbert (1900) that at least an *improper* minimum always exists. (See Bolza, ('Lectures,' chap. vii.)

EARLE RAYMOND HEDRICK,

Professor of Mathematics, University of Missouri.

Calcut'ta ("the ghaut or landing-place of Kālī" from a famous shrine of this goddess), India, the capital of British India, and of the presidency and province of Bengal, is situated on the left bank of the Hooghly (Hūghli), a branch of the Ganges, about 80 miles from the Bay of Bengal. The Hooghly is navigable up to the city for vessels of 4,000 tons or drawing 26 feet; the navigation, however, on account of sand-banks which are continually changing their size and position, is dangerous. The river opposite the city varies in breadth from rather more than a quarter to three quarters of a mile. The city may be said to occupy an area extending along the river for about five miles from north to south, and stretching eastward to a distance of nearly two miles in the south, narrowing in the north to about half a mile. The eastern boundary is nominally formed by what is known as the Circular Road, the Lower Circular Road forming part of the southern boundary. Another eastern boundary on the north is the Circular Canal, which runs for some distance parallel to the Circular Road. The southwestern portion of the area thus spoken of is formed by the Maidan, a great park stretching along the river bank for about one and three quarter miles, with a breadth in the south of one and a half miles. This grassy and tree-studded area is one of the ornaments of Calcutta; it is intersected by fine drives, and is partly occupied by public gardens, a cricket ground, race-course, etc., and partly by Fort William, which rises from the river bank. It was built in 1757-73, being begun by Clive after the battle of Plassey, and is said to have cost about \$10,000,000. Along the river bank there is a promenade, and drive known as the Strand Road, which has for the most part been reclaimed from the river by successive embankments. Along the east side of the Maidan runs Chauringhi Road, which is lined with magnificent residences, and forms the front of European fashionable residential quarter. Along the north side of the Maidan runs a road or street known as the Esplanade, on the north side of which are Government House and other public buildings. The European commer-

cial quarter lies north of the Esplanade, between it and another street called Canning Street, having the river on the west. The centre of this area is occupied by Dalhousie Square (enclosing a large tank or reservoir), and here there are a number of public buildings, including the post-office, telegraph office, custom house, Bengal secretariat, etc. The European retail trade quarter occupies a small area to the east of the above area. Everywhere outside of the European quarters Calcutta is interspersed with *bastis*, or native hamlets of mud huts, which form great outlying suburbs. "The growth of the European quarters, and the municipal clearings demanded by improved sanitation, are pushing these mud hamlets outward in all directions, but especially toward the east. . . . They have given rise to the reproach that Calcutta, while a city of palaces in front, is one of pigstyes in the rear." First among the public buildings is the Government House, the viceregal residence, situated, as already mentioned, on the Esplanade. It was built in 1799-1804, and with its grounds occupies six acres. Four wings extend toward the four points of the compass from a central mass which is crowned with a dome and approached from the north by a splendid flight of steps. Besides accommodating the viceroy and his staff it contains the council chamber in which the supreme legislature holds its sittings. The high court, the town hall, the bank of Bengal, the currency office, post-office, etc., are among the other public buildings in this locality, while further to the north stands the mint, near the bank of the Hooghly. The chief of the Anglican churches in Calcutta is the cathedral of St. Paul's, at the southeastern corner of the Maidan, a building in the "Indo-Gothic" style, with a tower and spire 201 feet high, consecrated in 1847. St. John's Church, or the old cathedral, is another important church, in the graveyard surrounding which is the tomb of Job Charnock, founder of Calcutta. The chief Presbyterian church is St. Andrew's or the Scotch Kirk, a handsome Grecian building with a spire. The Roman Catholics have a cathedral and several other churches; and there are also places of worship for Greeks, Parsees, and Hebrews. Hindu temples are numerous, but uninteresting; among the Mohammedan mosques the only one of note is that which was built and endowed by Prince Ghulam Mohammed, son of Tippoo Sultan. The religions, educational, and benevolent institutions are numerous. Various missionary and other religious bodies, British, European, and American, are well represented. There are four government colleges—the Presidency College, the Sanskrit College, the Mohammedan College, and the Bethune Girls' School. There are five colleges mainly supported by missionary efforts; besides several others, some of them under native management. Other educational institutions include Calcutta Medical College, a government school of art, Campbell Vernacular Medical School, and a school of engineering at Howrah, on the western side of the river. Besides these there is the Calcutta University, an examining and degree-conferring institution. Among the hospitals are the Medical College Hospital, the General Hospital, the Mayo Hospital (for natives), and the Eden Hospital for women and children. The Martinière (so named from its founder, Gen. Martin, a Frenchman in the Company's ser-

vice) is an important institution for the board and education of indigent Christian children. Elementary and other schools are increasing in numbers. In this connection we may mention the Asiatic Society, founded by Sir W. Jones in 1784, for the study of the languages, literature, antiquities, etc., of Asia; and the Botanic Garden, which occupies a large area on the right bank of the river. Calcutta possesses a number of public monuments, most of them in or about the Maidan. Several governors-general are thus commemorated, as also Sir David Ochterlony and Sir James Outram, "the Bayard of the East," of whom there is an admirable equestrian statue by Foley. The city is lighted partly by gas, partly by electricity. There is an extensive system of tramways. The sanitation of Calcutta, though vastly improved in recent years, is still defective, more especially in the suburban districts, where the *bastis* or native huts are so common. One difficulty in the way is the site of the city itself, which is practically a dead level. An act which came into force in 1889 brought a large additional area under the municipal authorities, and since then much has been done in the way of drainage, opening up of arterial streets, alignment of roads, etc. The water supply has also been greatly increased, and filtered water from the Hooghly (there is a pumping station at Palta, 16 miles above Calcutta) is now available at the daily rate of 36 gallons per head in the city, and over 15 in the suburbs, besides a supply of unfiltered water for washing and other purposes. The mortality over the entire municipality in 1893 was 29.5 per 1,000, a great improvement on former times. The death-rate is far higher among the natives than among the Europeans, and in the native quarters cholera is said to be seldom entirely absent. The healthiest months are July and August, which form part of the season of rains; the unhealthiest are November, December, and January. The mean temperature is about 79°, the average rainfall a little over 66 inches. The port of Calcutta extends for about 10 miles along the river, and is under the management of a body of commissioners. Opposite the city it is crossed by a great pontoon bridge, which gives communication with Howrah for vehicles and foot passengers, and can be opened at one point to let vessels pass up or down. It cost \$1,100,000. Besides the accommodation for shipping furnished by the river, there are also several docks. The trade is very large, Calcutta being the commercial centre of India. There is a very extensive inland trade by the Ganges and its connections, as also by railways (the chief of which start from Howrah), while almost the whole foreign trade of this part of India is monopolized by Calcutta. In 1897-8 the gross tonnage of the shipping inward and outward was over 5,000,000 tons; while the total of exports and imports was 71,994,608 tons of rupees, the exports being largely in excess of imports. The chief exports are opium, jute, and jute goods, tea, grain and pulse, oil-seeds, raw cotton, indigo, hides and skins, silk and silk goods, etc. The most important import is cotton goods. The jute manufacture is extensively carried on, also that of cottons.

The first factory in Bengal of the East India Company, which was incorporated by royal charter in the year 1600, was established at Hooghly, 28 miles farther up the river, in 1644. Job Charnock, the company's agent, was driven out of

this settlement in 1686, and the English then occupied part of the present site of Calcutta, which in 1689-90 became the headquarters of the commercial establishments of the company in Bengal. In 1700 the company acquired from Prince Azim, son of the Emperor Aurengzebe, the three villages of Sutánati, Kalikata (Calcutta), and Govindpore, for an annual rent of 1,195 rupees, and these formed the nucleus of the present city. The original Fort William, named after William III., was built in 1696, on a site considerably to the north of the present fort. Calcutta was taken and plundered by Suraj-ud-Dowlah in 1756, and retaken by Lord Clive in 1757. To the capture by Suraj-ud-Dowlah belongs the episode of the "Black Hole" (q.v.) of Calcutta. When the British recovered possession, much of the town was in ruins and had to be rebuilt, so that it may be said to date only from 1757. Clive built the new Fort William on the site of Govindpore, between 1757 and 1773. In 1773 Calcutta became the seat of British government for the whole of India. Since then the history of Calcutta has been a record of progress and prosperity. Pop. (1901) 1,121,664.

Caldera, Polidoro. See CARAVAGGIO.

Calderon, Francisco Garcia, Peruvian statesman: b. Arequipa, 1834; d. Lima, Peru, 21 Sept. 1905. At the age of 21 he was a professor of jurisprudence, a member of the Peruvian Congress 1867, and minister of the treasury 1868. After the occupation of Lima by the Chilean army, during the war between Chile, Peru, and Bolivia, 1879-81, he was made president of a provisional government formed under the protection of the Chilean authorities, February 1881. He pledged himself to conduct his government upon principles not opposed to the fundamental conditions demanded by Chile for the final arrangement of peace, but failing to do this, he was arrested, 6 Nov. 1881, by order of Gen. Patrick Lynch, rear-admiral and general-in-chief of the Chileans, and sent as a prisoner to Valparaiso. Upon his return to Lima in 1886 he was elected president of the senate. His principal work is a 'Dictionary of Peruvian Legislation.'

Calderon, Manuel Alvarez, mā'noo-él ál'bā rēth, Peruvian lawyer and diplomatist: b. Lima, Peru, 2 June 1852. He was graduated from the University of San Marcos, Lima. He is a member of the Illustrious College of Lawyers at Lima, has been professor of the science of finance at this university, and from 14 July 1900 has been minister plenipotentiary from Peru to the United States.

Calderon, kál'dér-ōn, Philip Hermogenes, English painter, of Spanish parentage: b. Poitiers, 3 May 1833; d. London, 30 April 1898. He was the son of Juan Calderon, at one time professor of Spanish literature in King's College, London. Coming to England about 1845, he became shortly afterward the pupil of a civil engineer; but his artistic ability was so pronounced that his father allowed him to devote himself to the study of art at the British Museum and the National Gallery. In 1853 he went to study under Picot at the Ecole des Beaux Arts in Paris. He first exhibited at the

Academy in 1853, his picture being named 'By the Waters of Babylon.' Among the many pictures he subsequently produced are: 'Broken Vows' (1857); 'Far Away' (1858); 'The Gaoler's Daughter' (1858); 'Never More' (1860); 'Liberating Prisoners on the Young Heir's Birthday' (1861); 'After the Battle' (1862), one of his most successful works; 'The English Embassy in Paris on the Day of the Massacre of St. Bartholomew' (1863); 'Her Most High, Noble, and Puissant Grace' (1865), the last two being probably his finest works; 'Whither?' (1867—his diploma picture); 'Sighing His Soul out in His Lady's Face' (1869); 'Spring Driving Away Winter' (1870); 'On Her Way to the Throne' (1871), a sequel to his masterpiece of 1865; 'Victory' (1873); 'Half-hours with the Best Authors'; 'La Gloire de Dijon' (1878); 'Home They Brought Her Warrior Dead'; 'Aphrodite'; 'The Answer' (1897); and 'Ruth' (1897). Elected A.R.A. in 1864, he became, three years later, a full academician. He gained in 1867 the first French gold medal awarded to an English artist.

Calderon, Serafin Estebanez, sër-ä-fën' ës-tä-bä'nëth käl-dä-rön', Spanish writer: b. Malaga, Spain, 27 Dec. 1801; d. Madrid, 7 Feb. 1867. He was professor of poetry and rhetoric at Granada, 1822-30, but resigned and went to Madrid. There he collected a library of old Spanish literature, especially of ballads, whether manuscript or in print: the collection is in the National Library at Madrid. He wrote a volume of poems, 'Poesias del Solitario' (1833); a novel, 'Christians and Moriscos' (1838), and a very valuable study of 'The Literature of the Moriscos.' He also wrote 'The Conquest and the Loss of Portugal,' and a charming volume of 'Andalusian Scenes.'

Calderon de la Barca, käl'dër ön dü la bär'ka, Frances Erskine (INGLIS), Scottish-American writer: b. Scotland about 1810. Her father, Mr. Inglis, was a grandson of Col. Gardiner who fell at Preston-Pans. She resided in her youth for several years in Normandy, and then emigrated with her mother to the United States, where they established a school at Boston, in which the daughter officiated as teacher for six years. In 1838 she married the Spanish minister at Washington, Don Calderon de la Barca, and afterward accompanied her husband to Mexico. In 1843 she published 'Life in Mexico,' which gained for her considerable literary reputation.

Calderon de la Barca, Pedro, pä'drō käl-dä-rön' dā la bär'ka, Spanish dramatist: b. Madrid, 17 Jan. 1600; d. 25 May 1681. He received his early education in the Jesuits' college of his native city, and studied at Salamanca, where he devoted himself chiefly to history, philosophy, and jurisprudence. His poetical genius early discovered itself. Before his 14th year he had written his third play, 'El Carro del Cielo.' His talent for this species of poetry, which has brought his name down to posterity, and perhaps his powers of invention in the preparation of entertainments for festivals, soon gained him friends and patrons. When he left Salamanca in 1625, to seek employment at the court of Madrid, many noblemen interested themselves in bringing forward the young poet. But having an inclination

for the military profession, he entered the service in 1625, and bore arms with distinction for 10 years in Milan and the Netherlands. From these countries, it has been observed, he usually drew his heroes of comedy. In 1630 he was recalled by Philip IV., who gave him the direction of the court entertainments, and, in particular, the preparation of plays for the court theatre. The next year he was made knight of the order of Santiago, and he served in 1640 in the campaign in Catalonia. The unexpected termination of the war restored him again to his peaceful occupation. The king now conferred on him a monthly pension of 30 *escudos de oro*; but he still employed his talents with unintermitted industry in composing for the theatre and the Church. The king spared no cost in the representation of his theatrical pieces. Ten years after, in 1651, he procured permission from the order of Santiago to enter the clerical profession, and in 1653 obtained a chaplain's office in the archiepiscopal church at Toledo, without quitting, however, his former occupation. But as this situation removed him too far from court, he received, in 1663, another at the king's court chapel (being still allowed to hold the former); and at the same time a pension was assigned him from the Sicilian revenue. His fame greatly increased his income, as he was solicited by the principal cities of Spain to compose their *autos sacramentales*, for which he was liberally paid. He bestowed particular pains on the composition of these pieces, and in fact, eclipsed all that the Spanish literature, so rich in this department of fancy, had hitherto produced. These subjects were particularly suited to his religious turn of mind; and he set a peculiar value on his performances of this kind, so as even to disparage his other works, which deserve no mean reputation. Religion is the ruling idea, the central point, of his poems. Whatever subject he handles he exhibits true poetical genius. Even allowing that he is inferior in richness of invention to Lope de Vega, he certainly excels him in fineness of execution, elevation of feeling, and aptness of expression. If we find in him much that is foreign to our modes of thinking and feeling, to our accustomed views and manner of expression, we shall have occasion much oftener to admire his unrivaled genius. The Spanish nation esteem Calderon among the greatest poetical geniuses. Among his dramatic works are many pieces of intrigue, full of complicated plots and rich in interesting incidents. There are, besides, heroic comedies and historical plays, some of which merit the name of tragedies. To this class belongs the 'Constant Prince,' which deserves an honorable place among romantic tragedies of the first rank. Besides these, Calderon has left 95 *autos sacramentales*, 200 *loas* (preludes), and 100 *saynetes* (farces). He wrote his last play in the 80th year of his age. The smaller poems of Calderon, his songs, sonnets, ballads, etc., notwithstanding the applause which they received from his contemporaries, are now forgotten; but his plays have maintained their place on the stage, even more than those of Lope de Vega. The number of his collected plays amounts to 128. He wrote, however, many more, some of which were never published. The most complete edition of his works is that published by D. Juan de Vera Tassis y Villarroel (Madrid 1685, 9

CALDERON Y BELTRAN — CALDWELL

vols.). 'The Constant Prince' shows, perhaps, in the highest degree, Calderon's tragic powers. It turns on one of the most perplexing of all subjects, that is, the idea of destiny, managed in a truly poetical way, in a tragedy terminating happily. The great fertility of Calderon's invention has heaped up an abundance of materials from which foreign theatres might be much enriched. It is to be regretted that his works have not been chronologically arranged. We might then have traced the growth of mysticism in his mind, and seen it striking root more deeply as he advanced in life. At the age of 62 he was admitted into the fraternity of San Pedro. Before his death he was elected their *capellan mayor*. He left them all his property, for which they erected a splendid monument to his memory. Among his imitators, Tirso de Molina is worthy of mention, as the author of the 'Inflexible Stranger,' which has been often imitated. He also found imitators among his rivals in other countries. Corneille and Molière are believed to have built some of their renowned productions upon the foundations he had provided. See Schmidt, 'Die Schauspiele Calderons' (1857); Trench, 'Essay on the Life and Genius of Calderon' (1880); Menendez y Pelayo, 'Calderon y su teatro' (1881); Günther, 'Calderon und seine Werke' (1888).

Calderon y Beltran, ē bēl-trān', **Fernando**, Mexican dramatist and poet: b. Guadajara, 20 July 1809; d. Ojocaliente, 18 Jan. 1845. Throughout Spanish America his plays, such as 'The Journey,' 'Anne Boleyn,' and 'The Return of the Crusader,' have been extremely popular, and as a lyricist he is much admired by the Mexican public.

Calderwood, kōl'dēr-wūd, **David**, Scottish clergyman and ecclesiastical historian: b. Dalkeith, 1575; d. Jedbury, 29 Oct. 1650. In 1604 he was settled as a minister of Crailing, in Roxburghshire, where he distinguished himself by his opposition to episcopal authority. In 1617 he was banished from the realm for his contumacy, and went to Holland, where, in 1623, he published his famous work entitled 'Altare Damascenum.' Some time afterward he returned to Scotland, and became minister of the church of Pencaitland, near Edinburgh. He then engaged in writing the history of the Church of Scotland, in continuation of that of Knox, a work which was published from his manuscript in 1842-9 in eight volumes.

Calderwood, **Henry**, Scottish philosopher: b. Peebles, 10 May 1830; d. Edinburgh, 19 Nov. 1897. He received his early education at the Edinburgh Institution and High School. He afterward attended the university of that city, and while a student published his 'Philosophy of the Infinite' (1854), an attempt to controvert the views of Sir William Hamilton. He became minister of Greyfriars United Presbyterian Church, Glasgow, in 1856, and in 1868 was elected professor of moral philosophy in Edinburgh University, a chair which he occupied for the rest of his life. His chief works are his 'Handbook of Moral Philosophy' (1872); 'Relations of Mind and Brain' (1881); and 'Evolution and Man's Place in Nature' (1893).

Caldicott, kōl'dī kōt, **Alfred James**, English musician and composer: b. Worcester, England, 1842; d. 24 Oct. 1897. After studying at

Leipsic under Richter and Moscheles he was organist of Saint Stephen's Church in his native town for a time, becoming professor in the Royal College of Music in 1882. Among his works, beside many songs, glees, etc., are the cantatas 'The Widow of Nain' (1881); and 'A Rhine Legend' (1883); and the operettas, 'A Moss Rose Pent' (1883); and 'Old Knockles' (1884).

Caldwell, **Alexander**, American banker: b. Drake's Ferry, Huntington County, Pa., 1 March 1830. He attended public and private schools until 16 years of age. In 1847 he enlisted as a soldier in the Mexican war, entering the company of his father, who was killed at one of the gates of the city of Mexico. In 1848 he returned to Columbia, Pa., where he entered a bank, and later took up business. In 1861 he removed to Kansas, where he engaged in the transportation of military supplies to the various posts on the plains, and became largely interested in railroad and bridge building. He was elected to the United States Senate as a Republican, took his seat 4 March 1871, and served until 24 March 1873, when he resigned.

Caldwell, kōld'wēl, **Charles**, American physician: b. Caswell County, N. C., 14 May 1772; d. Louisville, Ky., 9 July 1853. He studied medicine at Philadelphia, and in 1795 translated from the Latin, Blumenbach's 'Elements of Physiology.' He published also a 'Life of General Greene' (1819), a work on mesmerism, and other volumes. In 1819 he became professor of the institutes of medicine in Transylvania University, Lexington, Ky. He subsequently founded a medical school in Louisville.

Caldwell, **Charles Henry Bromedge**, American naval officer: b. Hingham, Mass., 11 June 1828; d. Boston, 30 Nov. 1877. He did a notable service in an expedition against a tribe of cannibals inhabiting one of the Fiji Islands, defeating them in a pitched battle and destroying their town. In the Civil War he commanded the Itasca, taking part in the bombardment of forts Jackson and St. Philip and the Chalmette batteries, and in the capture of New Orleans. He was promoted commodore in 1874.

Caldwell, **Howard Walter**, American historian: b. Bryan, Ohio, 26 Aug. 1858. He was graduated from the University of Nebraska in 1880 and is professor of American history and jurisprudence there. He has written 'History of the United States, 1815-1861' (1896); 'Studies in History' (1897); 'A Survey of American History' (1898); 'Some Great American Legislators' (1899); 'Life of Henry Clay' (1899); 'Expansion of the United States' (1900).

Caldwell, **James**, American clergyman: b. Charlotte County, Va., April 1734; d. 24 Nov. 1781. After graduating at the College of New Jersey, now Princeton University, he became Presbyterian pastor at Elizabethtown. During the growing antagonism between the colonies and Great Britain, he warmly took the side of the former, and when hostilities began, became chaplain to the New Jersey brigade, and took an active share in its campaigns, fighting "with the sword in one hand and the Bible in the other." Irritated at the unexpected and obstinate resistance made by the Jersey troops and

yeomanry, the English began to burn the houses and pillage the property of the villagers at Connecticut Farms. In one of the houses was the family of Mr. Caldwell, whose wife had retired to a back room with her two youngest children — one an infant in her arms — where she was engaged in prayer, when a musket was discharged through the window. Two balls struck her in the breast, and she fell dead upon the floor. On 23 June Gen. Knyphausen made a second incursion with about 5,000 troops. On this occasion he passed over the same route to Springfield, where a battle was fought. Among the most active in the fight was the chaplain Caldwell. There is a tradition, well authenticated, that in the hottest period of the action the wadding of a portion of the Jersey infantry gave out, which fact being communicated to Caldwell, he rode to the Presbyterian Church, and hastily collecting the psalm and hymn books which were in the building, he distributed them to the soldiers with the exhortation, "Now put Watts into them, boys!" The British were finally compelled to retrace their steps, which they did with all possible rapidity. He was shot and killed by an American sentinel in the course of a dispute over a package the latter desired to examine. Sixty-four years after Caldwell's death a monument was raised to his memory in Elizabeth.

Caldwell, Merritt, American educator: b. Helron, Me., 29 Nov. 1806; d. Portland, Me., 6 June 1848. He was graduated from Bowdoin College in 1828 and was subsequently professor of mathematics and English literature in Dickinson College, Pa. He published 'Mannual of Elocution' (1846); 'Philosophy of Christian Perfection' (1847); 'Christianity Tested by Eminent Men'; 'The Doctrine of the English Verb.'

Caldwell, Samuel Lunt, American Baptist clergyman: b. Newburyport, Mass., 13 Nov. 1820; d. Providence, R. I., 26 Sept. 1889. After studying at the Newton (Mass.) Theological Institution he entered the ministry and was successively pastor at Bangor, Me., 1846-58; and of the First Baptist Church in Providence 1858-73; professor of Church history in the Newton Theological Institution 1873-8; and president of Vassar College 1878-85.

Caldwell, William, Scottish-American educator: b. Edinburgh, Scotland, 10 Nov. 1803. He was graduated from the university of his native city and was assistant professor of logic and metaphysics in that institution 1887-8. In 1891 he was called to the Sage School of Philosophy, Cornell University, N. Y.; in 1892 to the University of Chicago, and since 1894 has been professor of moral and social philosophy in the Northwestern University at Evanston, Ill. He has published 'Schopenhauer's System in Its Philosophical Significance.'

Ca'leb, son of Jephunneh, a descendant of the tribe of Judah, or according to some authorities a foreigner of Kenezite origin incorporated with that tribe, according to Ussher born 1550 B.C. was sent with Joshua and 10 others to examine the land of Canaan. When Joshua had conquered the country, Caleb reminded the Jews of the promise which had been made by God, that they should enjoy this country. He obtained the city of Hebron for his share of the

spoils, besieged and captured it, and drove out three giants, or Anakim. He then marched against Kirjath-sepher, and offered his daughter Achsah to the first who should enter it. Othniel, his nephew, was the successful aspirant for the fair Jewess.

Caleb Williams, a novel by William Godwin (1794), a curious, rambling, half sensational and half psychological story. It met with immediate popularity, and furnished the suggestion of the well-known play 'The Iron Chest.'

Caledo'nia, the name by which the northern portion of Scotland first became known to the Romans. The year 80 of the Christian era is the period when Scotland first becomes known to history. The invasion of Cæsar did not immediately lead to the permanent occupation of southern Britain. It was only in the year 43 that the annexation of this portion of the island to the Roman empire began. It was completed superficially about 78, and two years were occupied in reconciling the natives to the Roman yoke. Agricola then moved northward, invading Scotland by the eastern route, and occupying the country up to the line of the Friths of Clyde and Forth. Agricola ran defensive works across this line, and hearing, in the third year of his occupation, rumors of an organized invasion in preparation by the Caledonians, a name applied to the dwellers north of the boundary, he resolved to anticipate them, and again advanced northward. The Roman army marched in three divisions. The weakest, consisting of the ninth legion, was attacked by the barbarians, who fought their way to the Roman camp. Agricola came to the rescue, and the Romans were victorious. The Roman army now advanced to Mons Grampius, where they found the enemy, 30,000 strong, under a chief named Galgacus. Agricola had to stretch his line as far as he deemed prudent to prevent being outflanked. The auxiliaries and Romanized Britons were in the centre and front, the legions in the rear. The Caledonians are described as riding furiously about in chariots between the two camps. Each chief (Roman and Caledonian) made a set speech to his followers; that of Galgacus was peculiarly eloquent. The Caledonians were armed with small shields, arrows, and large pointless swords. Their chariots routed the Roman cavalry, but afterward became embarrassed in the broken ground; and when the Roman auxiliaries charged the masses of the enemy with the gladius, they gave way before a method of fighting to which they were unaccustomed. Some further manœuvres occurred, but the victory of the Romans was complete. It does not appear, however, to have been productive of great effects, as next morning the enemy had entirely disappeared. Such is the account given by Tacitus of the only one of the numerous battles between the Romans and the Caledonians, of which we have a detailed description. The site of the battle remains undetermined, and the origin of the name Caledonian remains in equal obscurity. Various derivations are given of the word, but whether it was a native term, and to what exact people it applied, cannot with certainty be determined. The name Caledonian is first used by Pliny, who, as well as Tacitus, is supposed to have derived it from Agricola. The name is applied by Ptolemy to one of the numerous

CALEDONIAN CANAL — CALENDAR

populations of North Britain. The use of the name by Tacitus gave it immediate popularity with the Romans, and to the same source its subsequent popularity in Britain is to be traced. Its historical importance is therefore exclusively limited to this first mention of it. See Dr. Smith, 'Dictionary of Greek and Roman Geography,' and Burton, 'History of Scotland.'

Caledonian Canal, in Scotland, counties of Inverness and Argyle, connects the North with the Irish Sea, extending from Murray Frith through Lochs Ness, Oich, and Lochy, in the great glen of Caledonia, to Loch Eil. The total length is $60\frac{1}{2}$ miles, of which the lochs compose $37\frac{1}{2}$. The canal was begun in 1803, and opened for navigation about the close of 1823.

Calef, Robert, American merchant of Boston: b. about 1648; d. Roxbury, Mass., 13 April 1719. His fourth son, also named Robert, died in 1722 or 1723, aged about 41. One or the other of these men was the author of a remarkable book on the witchcraft delusion in New England. The best authorities, notably James Savage and Wm. F. Poole, ascribe it to the younger, who was about 23 when it appeared. The book was entitled 'More Wonders of the Invisible World' (Lond. 1700), the title being suggested by Cotton Mather's 'Wonders of the Invisible World.' The substance of it had been circulated in manuscript several years previous to its publication and its malicious attacks on Cotton and Increase Mather caused a bitter and life-long quarrel between the former and the author. The book abounds in malicious innuendos, directly charges the Mathers with inciting and being in full sympathy with the Salem tragedies, and accuses the Boston ministers, in their advice of 15 June 1692, of endorsing the Salem methods. When the book was printed and came back to Boston it was denounced and hated because it was an untruthful and atrocious libel on the public sentiment of Boston, and on the conduct of its ministers. It is said that Increase Mather publicly burned it in the Harvard College yard. The animus of the book has been greatly misunderstood, and the popular idea that Calef was a stalwart agent in putting an end to Salem witchcraft is both a myth and a delusion. Its historical value and the author's character have been greatly overrated. His personal history is a blank which the most assiduous investigation has never been able to fill, or even to supply with the most common details. It is not known where or when he was born, when he died, or where he was buried, although he lived in Boston and his will is on file in the Suffolk records. His book has now become very rare and copies bring high prices in the book auctions. It was reprinted at Salem in 1796, 1823, and 1861, and at Boston in 1828 and 1865.

W. N. CARLTON,
Trinity College, Hartford.

Calendar, a system of dividing time into years, months, weeks, and days for use in civil life, or a register of these or similar divisions. Among the old Romans, for want of such a register, it was the custom of the Pontifex Maximus, on the first day of the month, which began with the new moon, to proclaim (*calare*) the month, with the festivals occurring in it. Hence, *calendæ* (the first of the month) and

calendar. The periodical occurrence of certain natural phenomena gave rise to the first division of time. The apparent daily revolution of the sun about the earth occasioned the division into days. The time at which a day begins and ends has been differently fixed, the reckoning being from sunrise to sunrise, from sunset to sunset, from noon to noon, or from midnight to midnight. The changes of the moon, which were observed to recur every 29 or 30 days, suggested the division into months, but the month now used, though nearly equal to a lunation, is really an arbitrary unit; and, as a still longer measure of time was found necessary for many purposes, it was supplied by the apparent yearly revolution of the sun round the earth, producing the changing seasons. The time of this revolution is now known to be 365 days, 5 hours, 48 minutes, and 46 seconds, but as it has at various times been reckoned differently, this has given rise to corresponding changes in the calendar. This unit of time is called a solar year. The division into weeks, which has been almost universally adopted, is not founded on any natural phenomenon, and, as it originated in the East, has been attributed to the divine command to Moses in regard to the observation of the seventh day as a day of rest. By other authorities it has been ascribed to the number of the principal planets, a theory supported by the names given to the days. It was not used by the Greeks, nor by the Romans, till the time of Theodosius. The great influence of the sun's course upon the seasons naturally attracted the attention of men at all periods to this phenomenon; accordingly all nations in any degree civilized have adopted the year as the longest unit of time. The year of the ancient Egyptians was based on the changes of the seasons alone, without reference to the lunar month, and contained 365 days, which were divided into 12 months of 30 days each, with five supplementary days at the end of each year. The Jewish year consisted of lunar months, of which they reckoned 12 in the year, intercalating a 13th when necessary to maintain the correspondence of the particular months with the regular recurrence of the seasons. The Greeks in the earliest period also reckoned by lunar and intercalary months. They divided the month into three decades, a system also adopted long afterward at the time of the French Revolution. It possesses the advantage of making the smaller division an exact measure of the larger, and under it the number of a day in the 10-day period readily suggests its number in the month. The Greeks in the time of Solon had a year of 12 months alternately of 29 and 30 days, the total number of days being 354, and the year being very nearly equal to a lunar one. Soon afterward a month of 30 days began to be intercalated every other year in order to reconcile their year with that founded on the sun's movement, but as the error was still very large the intercalary month was afterward omitted once in four times. The Jewish and also the Greek year thus both varied in duration according as the intercalary month was introduced or omitted. This, with the uncertainty as to the exact duration of the year, was a constant source of confusion.

Various plans for the reformation of the calendar were proposed from time to time; but all proved insufficient till Meton and Euctemon finally succeeded in bringing it to a much

CALENDAR

greater degree of accuracy by fixing on the period of 19 years, in which time the new moons return upon the same days of the year as before (as 19 solar years are very nearly equal to 235 lunations). (See CYCLE.) This mode of computation, first adopted by the Greeks about 432 B.C., was so much approved of that it was engraven with golden letters on a tablet at Athens. Hence the number showing what year of the moon's cycle any given year is called the golden number. This period of 19 years was found, however, to be about six hours too long. This defect Calippus, about 102 years later, endeavored to remedy, but still failed to make the beginning of the seasons return on the same fixed day of the year.

The Romans first divided the year into 10 months, but they early adopted the Greek method of lunar and intercalary months, making the lunar year consist of 354, and afterward of 355 days, leaving 10 or 11 days and a fraction to be supplied by the intercalary division. This arrangement, which was placed under the charge of the pontiffs, continued until the time of Cæsar. The first day of the month was called the calends. In March, May, July, and October, the 15th, in other months the 13th, was called the ides. The ninth day before the ides (reckoning inclusive) was called the nones. The other days of the months they reckoned forward to the next calends, nones, or ides, whether in the same or the succeeding month, always including both days in the reckoning. Thus the 3d of March, according to the Roman reckoning, would be the fifth day before the nones, which in that month fall on the 7th. The 8th of January, in which month the nones happen on the 5th, and the ides on the 13th, was called the 6th before the ides of January. Finally, to express any of the days after the ides, they reckon in a similar manner from the calends of the following month. From the inaccuracy of the Roman method of reckoning it appears that in Cicero's time the calendar brought the vernal equinox almost two months later than it ought to be. To check this irregularity Julius Cæsar invited the Greek astronomer Sosigenes to Rome, who, with the assistance of Marcus Fabius, invented that mode of reckoning which, after him who introduced it into use, has been called the Julian calendar. The chief improvement consisted in restoring the equinox to its proper place in March. For this purpose two months were inserted between November and December, so that the year 707 (46 B.C.), called from this circumstance the year of confusion, contained 14 months. In the number of days the Greek computation was adopted, which made it $365\frac{1}{4}$. The number and names of the months were kept unaltered with the exception of Quintilis, which was henceforth called, in honor of the author of the improvement, Julius. To dispose of the quarter of a day it was determined to intercalate a day every fourth year between the 23rd and 24th of February. This was called an intercalary day, and the year in which it took place was called an intercalary year, or, as we term it, a leap year.

This calendar continued in use among the Romans until the fall of the empire, and throughout Christendom till 1582. The festivals of the Christian Church were determined by it. With regard to Easter, however, it was necessary to

have reference to the course of the moon. The Jews celebrated Easter (that is, the Passover) on the 14th of the month Nisan (or March); the Christians in the same month, but always on a Sunday. Now, as the Easter of the Christians sometimes coincided with the Passover of the Jews, and it was thought unchristian to celebrate so important a festival at the same time as the Jews did, it was resolved at the council of Nice, 325 A.D., that from that time Easter should be solemnized on the Sunday following the first full moon after the vernal equinox, which was then supposed to take place on 21 March. As the course of the moon was thus made the foundation for determining the time of Easter, the lunar Cycle of Meton was taken for this purpose; according to which the year contains $365\frac{1}{4}$ days, and the new moons, after a period of 19 years, return on the same day as before. The inaccuracy of this combination of the Julian year and the lunar cycle must have soon discovered itself on a comparison with the true time of the commencement of the equinoxes, since the received length of $365\frac{1}{4}$ days exceeds the true by about 11 minutes; so that for every such Julian year the equinox receded 11 minutes, or a day in about 130 years. In consequence of this, in the 16th century, the vernal equinox had changed its place in the calendar from the 21st to the 10th; that is, it really took place on the 10th instead of the 21st, on which it was placed in the calendar. Luigi Lilio Ghiraldi, frequently called Aloysius Lilius, a physician of Verona, projected a plan for amending the calendar, which, after his death, was presented by his brother to Pope Gregory XIII. To carry it into execution, the Pope assembled a number of prelates and learned men. In 1577 the proposed change was adopted by all the Catholic princes; and in 1582 Gregory issued a brief abolishing the Julian calendar in all Catholic countries, and introducing in its stead the one now in use, under the name of the Gregorian or reformed calendar, or the new style, as the other was now called the old style. The amendment ordered was this: 10 days were to be dropped after 4 Oct. 1582, and the 15th was reckoned immediately after the 4th. Every 100th year, which by the old style was a leap year, was now to be a common year, the fourth century divisible by 4 excepted; that is, 1600 was to remain a leap year, but 1700, 1800, 1900 of the common length, and 2000 a leap year again. In this calendar the length of the solar year is taken to be 365 days, 5 hours, 49 minutes, and 12 seconds, the difference between which and the true length is immaterial. In Spain, Portugal, and the greater part of Italy, the amendment was introduced according to the Pope's instructions. In France the 10 days were dropped in December, the 10th being called the 20th. In Catholic Switzerland, Germany, and the Netherlands the change was introduced in the following year, in Poland in 1586, in Hungary 1587. Protestant Germany, Holland, and Denmark accepted it in 1700, and Switzerland in 1701. In the German empire a difference still remained for a considerable time as to the period for observing Easter. In England the Gregorian calendar was adopted in 1752, in accordance with an act of Parliament passed the previous year, the day after 2d September becoming the 14th. Sweden followed in 1753.

CALENDAR — CALHOUN

The change adopted in the English calendar in 1752 embraced another point. There had been previous to this time various periods fixed for the commencement of the year in various countries of Europe. In France, from the time of Charles IX., the year was reckoned to begin from 1 January; this was also the popular reckoning in England, but the legal and ecclesiastical year began on 25 March. The 1st of January was now adopted as the beginning of the legal year, and it was customary for some time to give two dates for the period intervening between 1 January and 25 March, that of the old and that of the new year, as January 1752-3. Russia alone retains the old style, which now differs 13 days from the new; but has it in contemplation to adopt the Gregorian calendar at an early date.

In France, during the Revolutionary epoch, a new calendar was introduced by a decree of the National Convention, 24 Nov. 1793. The new reckoning was to begin with 22 Sept. 1792, the day on which the first decree of the new republic had been promulgated. The year was made to consist of 12 months of 30 days each, and, to complete the full number, five *fête* days (in leap year six) were added at the end of the year. Instead of weeks, each month was divided into three parts, called decades, consisting of 10 days each; the other divisions being also accommodated to the decimal system. The names of the months were so chosen as to indicate, by their etymology, the time of year to which they belonged. They were as follows:

AUTUMN (September 22 to December 22):

Vendémiaire (vintage month), October
Brumaire (foggy month), November
Frimaire (sleet month), December

WINTER (December 22 to March 22):

Nivôse (snowy month), January
Pluviôse (rainy month), February
Ventôse (windy month), March

SPRING (March 22 to June 22):

Germinal (bud month), April
Floréal (flower month), May
Prairial (meadow month), June

SUMMER (June 22 to September 22):

Messidor (harvest month), July
Thermidor (hot month), August
Fructidor (fruit month), September

The 10 days of each decade were called:

1 Primod.	4 Quartidi	7 Septidi
2 Duodi	5 Quintidi	8 Octidi
3 Tridi	6 Sextidi	9 Nonidi
	10 Decadi, the Sabbath	

This calendar was abolished at the command of Napoleon, by a decree of the senate, 9 Sept. 1805, and the common or Gregorian calendar was re-established on 1 January of the following year. See also **CHRONOLOGY**; **CYCLE**; **EPOCH**.

Calendar, French Revolutionary. See **CALENDAR**.

Calgary, Canada, city in the Province of Alberta, situated at the confluence of the Bow and Elbow rivers; on the Western Division of the Canadian Pacific Railway; 640 miles west of Winnipeg, 420 miles east of Vancouver, and 2,260 miles northwest of Montreal. It is the junction place for Edmonton and northern points, for Macleod and southern points, and for Donald, B. C., and western points.

Industries and Business Interests.—It is probably the chief distributing point of the two new Provinces, and there are 63 eastern manufacturers established locally with large

houses or agencies. It is the centre of the trade of a great ranching country and the chief source of supply for the mining districts in the mountains beyond. Lumber is largely made from logs floated down the Bow River. Amongst the chief industries are one soap factory valued at \$50,000, two flour mills and elevators valued at \$200,000, one abattoir valued at \$200,000, two sash and door factories, a saw-mill, a brewery and an artificial gas company. There is also a company recently established for boring for natural gas, and the Alberta Portland Cement Company has just started operations with a capital to be expended on plant of about \$500,000. Calgary has also a considerable and growing live-stock trade and is the seat of eight bank branches.

Public Works, Buildings, etc.—The value of the buildings erected in 1904 was \$1,250,000, and in 1905, \$1,300,000; there are 25 miles of plank side-walks, 11 miles of sewer lines, 17½ miles of water mains and three miles of concrete; the value of the water-works plant is \$250,000, and there are in the city two electric light plants—one owned by the municipality at a cost of \$65,000 and the other by the Calgary Water-Power Company at a cost of \$90,000. There are five churches and three large public school buildings which cost \$175,000. The Western Canada College is located here. There are also three hospitals, a sanitarium, an opera house, railway shops, municipal buildings and four parks.

Irrigation Interests in the Vicinity.—Some 14 miles east of Calgary is a great tract of fertile but hitherto arid country upon which the Canadian Pacific Railway is spending millions for irrigation purposes. Its works consist of a great ditch through clay, embankments piled by steam shovels and a narrow gauge railway, cuts in which hundreds of men and horses are sometimes supplementing the work of the steam shovel, and sometimes preparing ground for it. About two miles from Calgary is the intake, a set of sluice gates, prepared for lifting by steam winches, and for admitting the water of the Bow River into a big ditch or canal. The river flows on a ridge which must be cut through, in order that the ditch may convey water northward and eastward. This meandering cutting, some 16 miles long, constitutes the main canal, and is very heavy. It terminates in a reservoir planned to cover about 800 acres, some 9 miles eastward of Calgary. Thence secondary canals having a total length of 250 miles in the western irrigation district will convey the water through 500 miles of distributing ditches.

Population.—Incorporated in 1804, its growth in population has, of late years, been very great. In 1904 it was stated to have 6,500 people; official estimate (1906) place its population at 15,000. J. CASTELL HOPKINS, *Editor of 'The Canadian Annual Review of Public Affairs.'*

Calhoun, käl-hoon', **John Caldwell,** American statesman; b. Ableville District, S. C., 18 March 1782; d. Washington, D. C., 31 March 1850. He was graduated with distinction at Yale College in 1804, and was admitted to the South Carolina bar in 1807. After serving for two sessions in the legislature of his native

CALICO-PRINTING

State. he was elected to Congress in 1811. From that time until his death, a period of nearly 40 years, he was seldom absent from Washington, being nearly the whole time in the public service, either in Congress or in the Cabinet. When he first entered Congress the disputes with England were fast approaching actual hostilities, and he immediately took part with that portion of the dominant party whose object was to drive the still reluctant Administration into a declaration of war. They succeeded, and, as a member of the Committee on Foreign Relations, he reported a bill for declaring war, which was passed in June 1812. When Monroe formed his administration in 1817, Calhoun became secretary of war, a post which he filled with great ability for seven years, reducing the affairs of the department from a state of great confusion to simplicity and order.

In 1824 he was chosen Vice-President of the United States under John Q. Adams, and again in 1828 under Gen. Jackson.

In 1828, a protective tariff was enacted which bore very heavily on the agriculturists of the South and hence was known throughout that section as "The Tariff of Abominations." Mr. Calhoun prepared a paper declaring that the "United States is not a union of the people, but a league or compact between sovereign states, any of which has the right to judge when the compact is broken and to pronounce any law to be null and void which violates its conditions." This paper was issued by the legislature of South Carolina and was known as the "The South Carolina Exposition." This view of the United States Constitution as a compact between the States had been many years before strongly expressed in the Virginia and Kentucky resolutions, the former being drawn up by James Madison, often styled the "Father of the Constitution," and the latter by Thomas Jefferson. The Kentucky resolutions had suggested nullification as a remedy. Alexander Hamilton in "The Federalist" frequently spoke of the United States as a "Confederate Republic" and a "Confederacy" and called the Constitution a "compact." Washington frequently referred to the Constitution as a "compact," and spoke of the Union as a "Confederated Republic." At the time of the Louisiana Purchase Hon. Timothy Pickering of Massachusetts advocated the right and advisability of secession and Hon. Josiah Quincy of the same State in 1811 expressed similar views. Hence John C. Calhoun propounded no new or strange doctrine, but one which had found advocates before, and in the North as well as in the South.

In 1828, the friendly relations between Mr. Calhoun and President Jackson were broken off, when the latter ascertained that Calhoun had sought to have him called to account for his acts in the Seminole War. This breach was still further enlarged when Calhoun refused to co-operate with President Jackson in the effort to reinstate Mrs. Eaton in Washington society.

When Mr. Calhoun found that the repeal of the tariff of 1828 could not be secured through President Jackson, he resigned the Vice-Presidency and entered the Senate from South Carolina. On 26 July 1831 he published a paper favoring free trade and declaring that the

"great conservative principle of Union is nullification." The tariff question was settled by a compromise in 1832.

Mr. Calhoun feared that the slavery quarrel would some day disrupt the Union and therefore endeavored to check all discussion of this issue. He opposed Jackson's removal of the funds from the National Bank and also assailed the "spoils system." He supported Van Buren's "sub-treasury system," favored his re-election and secured for him the electoral vote of South Carolina. He defended Tyler for vetoing the recharter of the United States Bank and as Secretary of State under that President was largely instrumental in bringing about the annexation of Texas. He regretted the division of the Union into sections, but, recognizing a fact which already existed, he advocated a dual executive, one from the North, the other from the South, each having the power to veto an act approved by the other; thus preventing the passage of any law offensive to either section. His motive in this was the preservation of the Union, which he dearly loved.

He died 31 March 1850, having spent the last few months of his life in writing his "Disquisition on Government" and his "Discussion on the Constitution and Government of the United States" which has been pronounced the most remarkable discussion of the rights of minorities ever written.

Mr. Calhoun was of attractive personality and of irreproachable character, to which Daniel Webster testified in his grand eulogy on the great South Carolinian.

His 'Collected Works' appeared 1853-4, and his correspondence, edited by Jameson, in 1900. See lives by Jenkins (1851); Von Holst (1882); Benton, 'Thirty Years' View' (1854).

J. T. DERRY,

Author History of Georgia.

Calico-printing, the art of producing on calico or cotton cloth variegated patterns by the process of printing; the object, as a rule, being to have the colors composing the designs as fast as possible to washing and other influences. It is similar to the art of dyeing, but differs from it in so far that the coloring matters are fixed on certain parts of the fabric only, to form a pattern. Linen, wool, and silk fabrics are printed in a similar manner, but less extensively. The origin of the art of printing is probably coeval with that of dyeing (q.v.). India is generally regarded as the birthplace of calico-printing, and the word calico is derived from the name of the Indian town Calicut, where it was at one time extensively manufactured and printed. Calico-printing, as an Egyptian art, was first described by Pliny in the 1st century. Indian printed chintz calicoes were introduced into Europe by the Dutch East India Company, and the first attempts at imitating them in Europe are said to have been made in Holland, but at what exact date is uncertain. The art, however, soon spread to Germany and England, where it is said to have been introduced about 1676, two of the earliest works being situated at Richmond, on the Thames, and at Bromley Hall, Essex. In 1738 calico print-works were established in Scotland in the neighborhood of Glasgow, and in 1764 at Bamber Bridge, near Preston, in Lancashire. At the present time the chief seats of the calico-

CALICO-PRINTING

printing trade in Great Britain are still in the neighborhood of Glasgow and Manchester. The chief European seat of calico-printing is Mülhausen, in Germany, and it is practised in various towns in France, Austria, Russia, Switzerland, Holland, and the United States.

Calico-printing is of a highly complex character, and enlists not only the co-operation of the arts of designing, engraving, bleaching, and dyeing, but also an important element of success, the science of chemistry.

The first operation to which the gray calico is submitted, as it comes from the loom, is that of singeing. This consists in burning off the loose downy fibres from the surface by passing the pieces rapidly, in an open and stretched condition, over red-hot plates or a row of smokeless Bunsen gas flames. The object of singeing is to obtain a smooth printing surface on the calico, thus ensuring the production of clear, sharp impressions during the printing process. The next operation is that of bleaching, which consists in boiling the fabric with weak alkaline solutions, followed by a treatment with cold dilute solutions of bleaching-powder and acid, interspersed with frequent washings with water. By these means the natural impurities of the cotton are removed, and the calico ultimately presents a snow-white appearance. A number of pieces are now stitched together, wrapped on a wooden roller, and passed through a so-called shearing machine, in which, by means of a spiral cutter similar to that in a lawn-mower, any projecting knots, loose fibres, or down are finally removed. In this condition the calico is ready for the printer.

The printing of the patterns upon the cloth may be carried out in various ways, the earliest method being by means of wooden blocks, on which the figures of the patterns stood out in relief. Where several colors were employed in one pattern, a block for each color was necessary. In a set of blocks for one pattern, each block, although at first having the same design drawn upon it, was cut in such a manner that it ultimately transferred only a single color, which appeared in different parts of the pattern. When all the blocks had been applied, the various colors printed completed the original design. To ensure accurate juxtaposition of the colors, each block was furnished with brass points at the corners, in order to guide the workman. The printer first furnished the face of the block with the requisite color by pressing it several times on a piece of woolen cloth suitably stretched and supported on a so-called color-sieve, and which had been previously brushed over with color by a boy attendant. The printer then applied the block to the surface of the calico, which was stretched on a long table covered with felt, striking the back of the block with his hand or with a small mallet. The operation of block printing was slow and tedious and though many improvements have been introduced, and it can even be effected by mechanical power, as in the so-called Perrotine machine, it is now only employed to a very limited extent for certain special kinds of work. Another mode of printing, introduced about 1760, is by means of engraved copper-plates, but its employment is also similarly restricted.

The modern method of printing, which dates from 1785, is effected by means of engraved

copper cylinders, and this method has now practically superseded all others.

The method of engraving employed varies according to the kind of pattern to be put on the roller. In the case of very large patterns the figures are engraved by hand on the cylinders themselves with the use of the ordinary tools of the copper-plate engraver. For smaller designs, however, which are often repeated, it is usual in the first instance to engrave the pattern by hand on a very small cylinder of soft steel in intaglio, just as it will ultimately appear on the copper. This steel cylinder, which is called a die, is then tempered to a high degree of hardness, and by means of machinery is pressed against another cylinder of soft steel, on which the pattern is thus made to appear in relief. This last cylinder, called the mill, is then hardened, and, being pressed against the copper cylinder, the figures are indented and the roller is ready for use. In the first instance the original pattern of the designer has always to be reduced or enlarged, so as to repeat an exact number of times over the roller to be engraved. In order to reduce the amount of skilled labor one repeat only of the pattern is engraved on the die; the mill, which is of larger diameter, has two, three, or four repeats; while the number of repeats on the circumference of the copper cylinder is still greater. A third method of engraving, which has now largely superseded the foregoing, is that of etching, in conjunction with the pantograph system of transferring the design to the copper roller. The roller, being coated uniformly with a bituminous varnish, has the pattern traced on the varnish in the pantograph machine by a set of diamond points, and it is then submitted for a very brief period to the action of nitric acid. In the parts where the pattern has been traced the varnish is removed, there the copper is speedily attacked by the acid, and the pattern is thus etched upon it. After removing the varnish the roller is ready for printing.

The cylinder printing machine consists of a large central iron drum, around which are arranged one or more engraved copper rollers, according to the number of colors to be printed simultaneously. Each roller is provided with the means of making several adjustments, in order to determine the exact position of the color which it prints. The central drum is wrapped with cloth, and it is further provided with an endless blanket and back-cloth, so as to present a yielding surface to the printing rollers. The cloth to be printed passes from a roll behind the machine, round the central drum, in a tightly stretched condition, while the several printing rollers press forcibly against it. Each roller, as it revolves, is fed with color from a small trough below, the superfluous color being scraped off the plain surface of the roller by means of a sharp-edged steel blade, or "doctor," thus leaving the color only in the engraved portions. As the rollers thus charged with color press against the cloth, the latter absorbs or withdraws the color from the engraving, and the pattern is thus transferred to the calico. By this machine as much work can be performed in three minutes as could be done by block-printing in six hours. After the cloth has received the impression from the rollers it passes over a series of steam-heated flat iron chests, or cylinders, and is thus dried.

CALICO-PRINTING

In close connection with the printing-machine department is the so-called color-house or color-shop, where the solutions of coloring matters are suitably thickened and made ready for the printer. The color-house is provided with numerous steam-heated copper pans, so arranged on supports that they can be readily turned over for emptying or cleaning. The color mixtures are stirred with wooden blades by hand, or by mechanical agitators, and carefully strained through cloth before use. The thickening of the color solutions with starch, flour, gum, dextrine, albumen, etc., is necessary to prevent the spreading of the color by capillary attraction beyond the printed parts, and thus ensure sharp and neat impressions. Near the color-house is a chemical laboratory, and a drug-room containing the store of coloring matters, dyewood, extracts, thickenings, chemicals, etc.

The various classes or styles of calico-prints are usually arranged either according to the chief dyestuffs employed or their mode of application. Each of these primary styles may be further separated into subdivisions, of which the most important are the discharge and resist styles, which refer to the manner in which the pattern is produced. The following include the chief styles of calico-prints at present in vogue:

Madder Style.—This is so named because the chief dyestuff formerly employed in it was madder. This dyestuff belongs to the class of so-called mordant-colors. Such dyestuffs are worthless if employed alone by the calico-printer, and only furnish useful colors if applied in conjunction with certain metallic salts or mordants, of which the chief ones here employed are the acetates of aluminum and iron. At first the pattern is printed on the white calico with these or similar mordants alone, and only after they have been suitably fixed is the madder or other similar coloring matter applied in the dye-bath, where for the first time the desired colored pattern appears. The aluminum mordant yields red and pink, iron yields purple or black, a mixture of iron and aluminum yields chocolate, etc. The fixing of the mordant after printing and drying is effected by passing the printed calico through the so-called ageing-machine, a large chamber suitably heated and charged with moisture, where the acetic acid of the printed mordants is driven off, leaving the aluminum salt in an insoluble form on the calico. A more complete fixing of the mordant is subsequently effected by passing the fabric through solutions containing silicate or arseniate of soda, and a final washing completes its preparation for dyeing. The dyeing operation consists in boiling the fabric in a solution or decoction of the requisite dyestuff. After dyeing, the stained unprinted portions are cleaned and purified, while the printed colors are rendered more brilliant by washing, soaping, coloring, etc. Variety of effect is produced by printing the same fabric two or three times (print, cover, pad) with various designs before proceeding to the ageing, etc. If in the first instance a portion of the pattern is printed with lime-juice (citric acid), it resists or prevents the fixing of the mordants applied over it in the second and third printings, and the part remains undyed and appears as a so-called resist white. In a similar manner stannous chloride, mixed with aluminum acetate before printing, resists the fixing

of iron mordants printed over the aluminum mordant, and a resist red pattern under a purple cover is obtained, presuming madder to be the dyestuff employed. Alizarin now replaces the madder formerly used, and similar variegated effects are obtained if other mordant dyestuffs are employed, for example, cochineal, quercitron bark, etc. Formerly a preparation of madder, termed garancine, was largely employed, and gave rise to the garancine style, in which the colors were fuller and darker, the prevailing hues being browns, chocolates, drabs, etc. Since the range of colors yielded in the madder style is limited, additional colors, as green, blue, or yellow, may be printed in by block after dyeing, etc., and are fixed by steaming. If the whole fabric is evenly impregnated with mordant by means of a "padding-machine" and dried, and then a pattern is printed over the mordant with lime-juice, the mordant is removed or discharged in the printed parts, and remains white in the subsequent dyeing. Such a print would be termed a padded style with discharge white.

Steam Style.—Many coloring matters, differing from each other widely in character, are fixed by the operation of steaming instead of by dyeing, so that this style is somewhat varied in character. Ordinary steam-colors consist of a thickened mixture of dyewood extract and mordant, with the addition of assistant metallic salts and acids. The mixture is printed upon the white calico, which, after drying, is exposed from a half to one hour in closed chambers to the action of steam. This steaming operation effects the combination of the coloring matter and mordant, and the color is thus developed and at the same time fixed upon the calico. Black is produced with logwood extract and chromium acetate, scarlet is produced with cochineal extract and stannous chloride. The prints are washed and dried after steaming, the colors being usually bright, but not very fast. Steam-colors, fast to light and soap, are obtained in a similar manner by printing mixtures of alizarin and allied coloring matters with mordants, and then steaming. These are used in the so-called madder extract or steam alizarin style, in which red, pink, purple, etc., appear. In the pigment style use is made of pigments, or insoluble colored mineral powders, as ultramarine-blue, chrome yellow, Guignet's green, etc. These are mixed with a solution of egg or blood albumen, printed, and steamed. The albumen coagulates on steaming, and thus adheres firmly to the cloth, at the same time enclosing the pigments within the coagulum. Such colors are fast to light and soap, and may therefore be printed simultaneously with the steam alizarin colors for the production of variegated fast prints. Another class of colors are the so-called basic colors, as magenta, aniline blue, etc. Their solutions may also be thickened with albumen, printed, and steamed, to give fast steam-colors. It is more usual, however, to print a mixture of the thickened color solution and tannic acid, and to pass the steamed print through a boiling solution of tartar emetic. By this means an insoluble color-lake (tannate of antimony and color-base) is fixed on the calico, which is fast to soaping, but not to light. Basic colors applied in this manner are now usually printed along with the steam alizarin colors, instead of pigments, thickened with albumen, and

CALICO-PRINTING

variegated fast prints are thus obtained. Loose pigment colors are basic colors thickened with starch or gum tragacanth only, and then steamed. Such prints do not even stand washing with cold water.

Turkey-red Style.—In this style use is made of the fact that turkey red is at once bleached by the action of chlorine. Plain dyed turkey-red calico is printed with tartaric acid, dried, and passed through a solution of bleaching-powder. In the printed parts chlorine gas is evolved, the red is destroyed, and a white discharge pattern is produced. A blue pattern results if Prussian blue is added to the printing mixture; yellow is obtained if a lead salt is added, and the fabric is afterward passed through bichromate of potash solution, whereby yellow chromate of lead is produced; green results from a mixture of the blue and yellow; black is printed direct. These and other discharge colors may also be obtained by other methods.

Indigo Style.—Of the numerous indigo styles in use it is only possible to refer to one or two of the most important. Indigo blue patterns on a white ground are obtained by printing a thickened mixture of finely-ground indigo and caustic soda on white calico, previously impregnated with glucose. A subsequent steaming reduces the indigo to indigo white, and causes it to penetrate the fibre, while a final washing oxidizes, regenerates, and fixes the color. A resist white pattern on a blue ground is obtained by first printing upon white calico a resist paste composed of gum or flour, China clay, sulphate of copper, etc. When the printed calico is dyed in the indigo vat the paste resists the entrance of the color, partly in a mechanical and partly in a chemical manner, hence the blue is only fixed in those parts which are unprotected by the paste, after the removal of which by washing, the white pattern appears. Various resist colors, as yellow, green, etc., are obtained by the addition of different chemicals to the paste and altering the after-processes. A discharge white pattern on a blue ground is obtained by printing on plain indigo-blue-dyed calico a solution of bichromate of potash thickened with gum, and then passing the fabric through a solution containing sulphuric and oxalic acids. During this passage there is liberated, in the printed parts only, chromic acid, which at once oxidizes and destroys the blue, producing the desired white pattern. Colored discharge patterns are produced similarly by employing albumen thickening instead of gum thickening, and adding to the printing mixture such pigments as are not affected by acids, for example, vermilion, chrome yellow, Guignet's green, etc.

Bronze Style.—Manganese brown or bronze is decolorized by reducing agents; hence white discharge patterns on a bronze ground are obtained by printing plain manganese-brown-dyed calico with a mixture of stannous chloride and oxalic acid, and then steaming. Colored discharge patterns are obtained if coloring matters are added to the printing mixture which are not affected by reducing-agents, or which even require stannous chloride as a mordant to develop the color, as Prussian blue, chrome yellow, Persian-berry yellow, Brazil-wood pink, safranine, acridine orange, etc.

Aniline Black Style.—Aniline black being a product of the oxidation of aniline, patterns in

this color on a white ground are obtained by printing a thickened solution of aniline hydrochloride containing the oxidizing agent, sodium chlorate, and a salt of copper or vanadium. When the printed fabric is slightly steamed or exposed to a moist, warm atmosphere, the impression, which is at first devoid of color, gradually becomes dark green, and this by a final treatment with an alkaline solution, soap, etc., changes at once to a rich black. The color is extremely fast to light, alkalis, acids, etc., and it is largely employed by the printer, both alone and in conjunction with dyed or steam colors. The development of the black during the ageing or oxidizing process occurs only in the presence of a mineral acid, hence resist whites are obtained by first printing the design on the white calico with thickened solutions of substances of an alkaline or reducing character, or salts of organic acids, as acetate of soda, and then printing or padding over all with the aniline black mixture, ageing, steaming, etc. Where the design is printed the alkalinity entirely prevents the development of the black. Pigment colors thickened with albumen, also certain benzidine colors, containing an admixture of chalk, acetate of soda, etc., are largely employed in this manner. These resist colors may also be printed immediately after the application of the aniline black mixture, before the development of the color by ageing.

Azo Color Style.—The so-called insoluble azo colors result from the interaction of an azo compound and a phenol. Two methods of printing based upon this principle are employed. One method is to print the design with a thickened solution of β -naphthol on the white calico, and then pass the fabric through a very cold solution of the azo compound (developing-bath), when the design at once appears in a color corresponding to the azo compound employed. Another method is to print the design with a thickened solution of the azo compound upon calico which has been previously impregnated with a solution of sodium-naphthol and dried; in this case the color of the design is developed in the moment of impression. The necessary azo compounds are obtained by the action of nitrous acid, on salts of amido substances for example, paranitraniline, naphthylamine nitrotoluidine, dianisidine, etc., each of which yields a distinct color, bright red, claret red, orange, blue, etc. The naphthol-prepared cloth and also the azo compounds are somewhat unstable, so that this style is not successfully printed without considerable care. The insoluble azo colors, also the direct or benzidine colors, are capable of furnishing discharge patterns, since, in common with the azo colors generally, they are readily decomposed and destroyed by reducing-agents. It suffices to print calico dyed with these colors, as benzopurpurine, chrysophenine, benzoazurine, Mikado brown, etc., with a mixture containing stannous acetate, zinc powder, or other similar reducing-agent, and then steam the printed fabric, to obtain white discharge patterns. If there be added to the printing mixture such mordants and coloring matters as are not affected by reducing-agents, for example, safranine, auramine, etc., a variety of colored discharges are obtained, exactly as in the bronze style. Many of the benzidine colors may also

be printed direct on white calico to furnish color designs, but such prints are not particularly fast to washing.

Calicut, India, a seaport in the presidency of Madras, on the Malabar coast, six miles north of Bèypur, in the midst of extensive palm groves. It is an important place, with various public offices and institutions, including court-house, customs-house, lunatic asylum, Anglican, Lutheran, and Roman Catholic missions, municipal and other schools, barracks, lighthouse, etc. The town dates from the 13th century, and was the first port in India visited by Europeans. It was from the name of this place that the word calico was derived. Vasco da Gama visited it in 1498, and in 1510 Albuquerque wrecked the town. In 1766 Calicut was taken by Hyder Ali, and in 1790 it fell into the hands of the British. Cardamoms, teak, sandal-wood, pepper, and wax are the principal exports. Pop. (1901) 75,510.

California, principal Pacific coast State of United States (No. 31 in order of admission), bounded north by Oregon, south by Mexico (Lower California), east by Nevada and Arizona, west by Pacific Ocean. Extreme length about 800 miles, coast line 1,097 miles, greatest width about 270 miles. Area (No. 2 in United States) 158,360 square miles (2,380 water). Pop. (1900) (No. 21 in United States) 1,485,053 or 9.5 to square mile (No. 37 in density). Whites, 1,402,727.

Topography and Climate.—Its peculiar shape, determined no more by political than by natural delimitations, gives California a character unique among the States, climatically and economically. It has a climate all its own, and its boundaries include all that climate in North America. It is longest of the States; and, in proportion to its length, narrowest. It corresponds with an area which upon the Atlantic seaboard should run as far inland as does South Carolina, and as long coastwise as from Charleston to Boston. This in itself gives large range of climate by latitudes; but its topography and its colimitations greatly increase this range. Its peculiar projection or "leaning out" upon the Pacific; its enormous coast line (somewhat less than one fifth total coastline of the United States); and particularly its "exposure" to the west and south upon this great equalizer; its contact on the east with the "Great American Desert"; its huge mountain systems; and its orographic protection against the north, are all vital factors in determining its atmospheric temperament. While the Atlantic seaboard is made humid by the warm Gulf Stream, and is open to the north (its mountains being scattered, low, and well inland), California is screened from the Arctic air-currents by a vast Alpine range, almost unbroken in its whole length and with its lowest passes 50 per cent higher than the highest peak east of Colorado. The State has 120 peaks exceeding 8,000 feet; 41 exceeding 10,000 feet; and 11 exceeding 13,000 feet. From its northern boundary down to Point Conception, California is washed by the cold Kuro Sivo, or Japan current, swinging back from the Arctic; and the exposure is largely westerly. From this point southward, the exposure is more southerly, the Japan current is deflected far offshore, and the coast is sheltered by a long line of islands. Tempered on one side by an equable

ocean, on the other by 1,000 miles of arid lands, the climate of California is still further differentiated by its mountain systems. Roughly speaking, it is all "under wall." Two huge cordilleras, inosculating at the north and south, form an almost complete circumvallation of the great agricultural region; while to the south, though the ranges are much broken down, there is something like a repetition of this pattern, on a much smaller scale; the whole forming something like an inverted figure 8. In their major loop, these ranges enclose one great central valley, practically level, of 18,000 square miles,—or about the aggregate area of Massachusetts, New Jersey, and Delaware,—screening it from the Arctic, and filtering the winds from sea and desert. This great rampart is broken down only at the Golden Gate, through which, in a mile-wide passage, the drainage of this enormous watershed reaches the sea. In their imperfect minor loop, there is a broken congeries of valleys aggregating an almost equal area, sheltered from the desert, but as a rule partially open toward the sea. To the east of the main wall lies a large but almost uninhabited area, strictly desert, and part of the great interior wastes. The inclination of the State to the west, and its consequent southern exposure, is indicated by the fact that despite its narrowness the extremes are three fourths as far apart in longitude as in latitude. The corner of San Bernardino County is nearly 500 miles more easterly than False Cape; while from Oregon to the Mexican line the north and south distance is about 655 miles.

The Coast Range, altitude 2,000 to 8,000 feet, rather closely follows the coast line from Oregon to Point Conception; south of which topographic hinge it so breaks down as to be relatively unimportant. The Sierra Nevada, proximately following the east line of the State, at an average distance of 50 to 100 miles therefrom, is "the largest and most interesting chain of mountains in the United States" (J. D. Whitney). Really part of the gigantic spine which extends from Lower California to Alaska, this range in California is 600 miles long and 75 to 100 miles wide—its base covering four times the area of Massachusetts. The snow-line averages about 30 miles wide. Its surpassing peak (Mt. Whitney, highest in the United States) is 14,522 feet (Langley). Its passes average 11,000 feet, the lowest being 9,000 feet, and the most used (Kearsarge) 12,000 feet. The western slope is gradual, averaging about 100 feet to the mile; its eastern slope 10 times as rapid, being by far the steepest general gradient in North America. At many points the fall is 10,000 feet in 10 miles; and from the highest peak in the United States one looks down nearly 15,000 feet into Death Valley, some 200 feet below sea-level. This vast granitic range is the most remarkable register of glacial action on the continent. Decapitated by "perhaps a vertical mile" (Muir) it is still the most Alpine cordillera in North America. It holds 1,500 glacial lakes—the lake line being at about 8,000 feet. Of small residual glaciers, Muir has counted 65 between 36° 30' and 39°. Its yosemites (including the famous one so-called, the Hetch-Hetchy, and minor ones) are famous among geologists as well as travelers—well-like valleys gouged deep in the granite by glaciers, and of scenery nowhere surpassed. The highest

CALIFORNIA

water-fall in the world (the Pioneer, 3,270 feet) is in this region. Upon the huge moraines left by that continental incubus of ice grow the noblest coniferous forests in the world—greatest in variety of species, in density of merchantable lumber and in size, age, and beauty of trees. These forests cover 44,700 square miles (a larger area than the entire States of New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, Delaware, and Maryland together). California is fifth in area of forests and second in stand of lumber (200,000,000,000 feet, exceeded only by Oregon with 225,000,000,000. Cut, 1900, 864,000 M.). Seven national forest reserves in the State cover 8,511,794 acres. The Big Tree (*Sequoia Gigantea*) is the largest and oldest of growing things on earth; averaging 275 feet high and 20 feet diameter. The largest reach over 325 feet high and 38 feet diameter, with an age of 5,000 years. Muir "never saw a Big Tree that had died a natural death." The other Sequoia (*Semprevirens*), or California redwood, covers an area of about 2,000 square miles. It is second only to the Big Tree in size, reaching 18 feet diameter; and like it is found nowhere else. It belongs to the Coast Range, as the Big Tree to the Sierra. It is almost exclusively used in California for sheathing. The immunity of a city like San Francisco from great fires, though windy, hill-built, and of "frame," is largely due to the non-inflammability of this redwood lumber. The sugar pine, the noblest pine yet discovered, reaches 245 feet high and 18 feet diameter; the yellow pine 220 feet high and 8 feet diameter; the Douglas spruce, king of spruces, 200 feet high, 6 feet diameter; the Libocedrus, or incense cedar, 150 feet high and 7 feet diameter; the white silver fir 200 feet high, 6 feet diameter; the "magnificent" silver fir 250 feet high and 5 feet diameter. The nut pine, or piñon, is a small and shabby tree, but of great economic importance in feeding the Indians: in a good year its crop of excellent nuts is enormous. These are often fed to horses instead of barley. There are many varieties of oaks (which reach great size): also maples, yews, birches, alders, sycamores, cottonwoods, aspens, madroños, etc. A California palm (*Washingtonia*) is native in mountain cañons along the southerly desert, and is now largely used for street ornamentation. Specimens planted by the Franciscans have reached a height of 80 feet. The flora of the State includes about 2,500 species, and is of great interest. In the great central valley in February or March one can travel 400 miles, treading flowers at every step; and as much is true in other parts of the State.

No other State contains a moiety of the vast number of exotic trees now in California. Fruit, ornamental, and shade trees from every country in the world have been acclimated here. Nearly 9,000,000 tropical fruit trees were bearing in 1900. Millions of "pepper-trees" (*Molle*) from Peru are used on streets, etc.; and of Australian eucalyptus, (introd. 1858), there are now over 10,000,000, including about 100 varieties for fuel and ornament. Setting 2,000,000 acres to orchard and other trees within a generation has partially balanced the deforestation by lumbermen.

The most striking meteorological feature of California is perhaps the ordering of its seasons,

of which it has practically but two, the wet and dry. The winter, or "rainy season," is approximately from late October to late April, with 15 to 25 rainy days, an annual precipitation ranging from 23.53 inches for San Francisco (and far greater in the extreme north) to 14.56 inches for Los Angeles, and 10 for San Diego. For six months after 1 May, rain is practically unknown, except showers in the high mountain regions. In the high Sierra the winter precipitation takes form of snow, with an annual fall of 30 to 50 feet, thus supplying the natural reservoirs which feed the streams, upon irrigation from which agriculture largely depends. But in Oregon, which bounds California on the north, we have the familiar eastern seasons; and again in Arizona and Nevada, abutting upon the east, winter snow and summer rains characterize the meteorology. Thus, climatically, California differs altogether from all its neighbors, and has well been called an "Island on Land." Within its own limits, also, it has extraordinary range of climates, as it were in strata, following the topographic contours. Thus in the vicinity of Los Angeles it is possible at times to take a sleigh-ride within 12 miles of the city on one side (and looking down upon blossoming orange groves not five miles distant), and by an hour's ride to bathe in the Pacific, which has here a winter temperature of 60°. Within a short journey from almost any given point one may find almost any variety of climate, from below sea-level to nearly 15,000 feet above it; from the extreme but arid and non-prostrating heat of the desert to eternal snow; from palms and perennial roses to the primeval coniferous forests, or to the desolation of alkaline Saharas. Although all California shares the seasonal peculiarity of "California climate," the northern and southern parts of the State—roughly dividing at Point Conception and the Tehachepi Range—are very unlike meteorologically. The upper portion is relatively humid, with more than twice the average rainfall, with far larger streams and vastly richer forestation. At Crescent City, on the far north coast, precipitation often reaches 80 inches per year. The trend of the coast is here northerly, and the region shares something of the extraordinary humidity of Oregon. The smallest precipitation is in the desert southeast corner, averaging only three inches annually at Yuma. The seven counties habitually termed "Southern California"—though the geographic southern half of the State would include 13 counties—have an average rainfall of but about 15 inches. This precipitation is insufficient to insure crops, except cereals (which are not irrigated but depend on the rains). This broad difference between the two sections in rainfall has been chief factor in an extraordinary difference of development within the last 15 years. Compelled by aridity to resort to irrigation; compelled by the magnitude of this task to associative effort, the southern communities have suddenly developed a generic type of agriculture and of life quite unlike anything else in the Union. The paragraph on population shows something of the disproportionate settling-up of the southern end of the State—an entire reversal of the balance which obtained for nearly 40 years, during which the population was overwhelmingly about the Bay, and San Francisco

CALIFORNIA

was practically California, socially, politically, and financially.

About San Francisco there is a steady and brisk wind movement, flowing in through the narrow gap of the Golden Gate. In Southern California, while there is daily ebb and flow of air-currents (in the morning from off the sea, and at night down from the mountains), a real wind is very rare. Hurricanes and cyclones are absolutely unknown in the State. Despite the great heat of the deserts, and high mercury sometimes recorded in the valleys, the dryness of the atmosphere renders it harmless, and sun-stroke is unknown. Seasonal diseases, typhoids, malarias, and pernicious fevers, summer diseases of children, gastric or hepatic diseases, are rare. Mean summer temperature San Francisco 60°; winter mean 51°; greatest daily range temperature Los Angeles 29°, as against 69° for Boston. The modern migration to California has been largely attracted by this unique and hospitable climate, free from the dangerous heats of summer and the bitter winter cold of the regions east of the Rocky Mountains. In the inhabited portions of this State, extreme cold is unknown; while owing to rapid radiation, the summer nights are always so cool as to call for blankets.

The fauna of California is peculiarly interesting, and includes considerably over 100 species of mammals, though the larger game varieties have in a half century been nearly exterminated. At the American occupation, elk were seen in droves of thousands. Great numbers were killed from the deck of steamers plying to Sacramento. Occupation of the State by Indians immemorably, and by Spaniards for nearly a century, had not appreciably diminished the wild animals; but the same wanton spirit which in a score of years exterminated tens of millions of the American bison on the great plains has in California made the great mammals nearly extinct. The grizzly bear, once in great abundance in all parts of the State, is now very scarce; the black, cinnamon, and brown bear are more common. Sea lions of a ton weight are still numerous along the coast, and their populous rookeries a few hundred feet from the cliff House in San Francisco are an object of interest to travelers. The California lion, mountain lion, or puma, is still not infrequent, and wildcats abound in the mountains. The coyote is common, and of utility in decimating the hordes of rabbits; though an ill-judged bounty on coyote scalps has of late years much reduced the numbers of this small wolf. The beaver, once in vast numbers here, is now confined to the remotest mountain streams; and the valuable sea otter is almost extinct. Black-tailed and mule deer are still reasonably frequent; but the antelope, which once roamed the northern and southern valleys in great bands, have hardly a representative left. The same is true of the mountain sheep (*Ovis Ammon*), once common in all the higher ranges. Spermophiles, or ground squirrels, and five species of gopher, are numerous and a great pest to the farmer. Jack rabbits and "cotton-tails" are abundant in all parts of the State, despite community "drives" in which sometimes tens of thousands are killed in a day. The birds of California number above 350 species. The largest winged creature in North America is the California condor. Quail of two species are in vast abundance throughout the State.

While the Pacific coast of North and South America in general is peculiarly liable to seismic disturbances, California had never experienced an earthquake of the first magnitude, nor anything approaching that of Charleston, S. C., in 1886; nor that of New Madrid, Mo., until those of April 1906, when San Francisco was devastated and a large portion of the city subsequently burned, with a property loss of over \$200,000,000 and numerous lives and the surrounding cities and towns suffered severely. The severest shocks previous to this were in 1812, when 30 people were killed by the fall of a church tower in Capistrano; and that of 1872, when about a score perished in Owen's Valley.

River Systems.—As in most arid States, the drainage of California is simple. For some 300 miles on its southeastern edge the State is bounded by the Colorado River, which rises in the Rocky Mountains in Colorado and flows 1,360 miles to the Gulf of California. It has no tributaries whatever from California, all east-bound streams from the Sierra Nevada being lost in the desert. On the western coast, though a few rivers reach the sea (like the Klamath, Mad, Eel, and Salinas) they are relatively unimportant and incidental. The real drainage system of the State has outlet through San Francisco Bay and the Golden Gate, by the two chief inland rivers which join about 60 miles northeast of San Francisco. Both rise in the Sierra Nevada, the Sacramento (370 miles long) to the north, the San Joaquin (350 miles long) to the south. Their main course averages along nearly the median line north and south, through nearly two thirds the length of the State. They have no tributaries worthy of the name from the great westerly mountain wall, the Coast Range; their waters being fed almost exclusively from the vast Alpine chain which is in effect, though not politically, the eastern boundary of California down to latitude 35° 30". Their important feeders from the Sierra are the Feather, Yuba, Cosumnes, American, Mokelumne, Kern, Kings, etc. All these are fine mountain torrents, beloved of sportsmen, and flowing through magnificent scenery, but not of rank as waterways. The most important is the Feather, which has a large drainage area. Several streams in Southern California, like the Los Angeles, San Gabriel, and Santa Ana, reach the sea, but all are practically exhausted by irrigation uses, except during winter flood-water. The many streams from the abrupt eastern slopes of the Sierra Nevada all disappear in alkaline "sinks,"—like Pyramid Lake, Owen's Lake, Mono Lake, and Death Valley,—and never even in flood reach the ocean by their great natural conduit, the Colorado River. The lakes of California are not important as to navigation. Tulare Lake, receiving the drainage of the Kern, Kaweah, and Kings rivers, is 700 square miles in area, but only 40 feet deep. In very high water its overflow reaches the San Joaquin; but ordinarily its income of waters is cared for by evaporation. Lake Tahoe in the extreme north, at an elevation of 6,200 feet, is 20 miles long and 1,500 feet deep, and famous for the purity of its waters, the beauty of its scenery, and its trout. It is the largest of the glacial lakes, of which there are a great number in the Sierra, mostly at altitudes exceeding the highest mountain summits east of Colorado. The lower-lying

CALIFORNIA

lakes of the State are mostly without outlet, and of various degrees of brackishness, culminating in the "sink" of the Amargosa River nearly 200 feet below sea-level on the eastern side of the range; where evaporation has left vast alkaline deposits, now of great commercial value.

Geology.—The main axis of the Sierra Nevada is of granite throughout. To the north there are some metamorphic peaks, and many summits are capped with volcanic materials. Mt. Shasta in the far north is an extinct volcano (14,470 feet). So also is Lassen's Peak (10,577 feet). This granite core is flanked by a very heavy mass of slaty metamorphic rocks,—mostly argillaceous, chloritic, and talcose slates,—constituting the great auriferous belt of the Sierra. The Coast Range is made up almost entirely of cretaceous and tertiary marines, chiefly sandstones and bituminous shales. It is in this belt that the great recent development of petroleum has been made.

Besides the vast reaches of alluvial soils in the lower valleys, which were first attacked for agriculture, an enormous area of disintegrated granite gravels along the foothills and first acclivities has been found the most productive soil in the State, particularly with reference to valuable crops. These great gravel beds, which seem to the farmer from the black "bot-toms" of Ohio the most unpromising of soils, are in reality rich in all the elements of plant food. The vast majority of the valuable orchards, particularly of Southern California, are planted upon this granitic detritus; and without exception the finest oranges and other citrus fruits come from this soil. The relative aridity of California, long supposed to be a curse, is now known to be a two-fold blessing. Exhaustive analyses, comparative with every portion of the Union, show these gravels to average much richer in chemical constituents than soils leached out by excessive rainfall. Furthermore, the fact that precipitation is not invariably sufficient to insure crops has compelled irrigation, which does insure them; so that farmers in the arid lands have much greater crop-certainty than those of regions with most abundant rainfall.

Agriculture.—In no item of its history has California been more unlike other States than in development and sequences of agriculture. The first (and for 60 years commercially chief) industry was cattle—derived from herds introduced from Mexico by Viceroy Galvez, 1769, and chief wealth of the Mission establishments and Spanish colonists. It was a generation after the American occupation before agriculture was seriously undertaken; and for another term of years it was chiefly a gigantic seasonal "gamble with the weather" in dry-farming of cereals. The characteristic features of agriculture up to about 1870 were enormous holdings,—reckoned at least by tens of thousands of acres,—with the single crop (almost exclusively wheat and barley) and purchase of every other article of necessity or luxury. On areas of hundreds of square miles apiece there were an individual or corporate owner, a single crop, a few hundred hirelings at the height of the season, and their temporary quarters. A few of these enormous ranchos still survive; and Miller and Lux still farm about 1,000,000

acres, with 20,000 acres in a single field. But within a generation the typical character of agriculture in California has radically changed. The greatest recorded drouth (1864) which not only destroyed grain but hundreds of thousands of cattle (60,000 head being sold that year in Santa Barbara at 37½c. per head), exclusion of the Chinese, who had been the chief reliance for labor on the great ranchos, the fall in wheat, and other factors, led to the breaking up of these gigantic domains. A slight idea of the change may be had from the census fact that in 1850 the average size of all California farms was 4,456.6 acres; and in 1900, 397.4 acres. Along with this great dry-farm gambling—for such it was—sheep became a leading industry in the State, particularly in Southern California.

Within about 15 years—that is, since 1885,—the general character of California farming has changed to small holdings, occupied not by tenants but by American owners, with families, with diversified crops, and obliged to purchase only the luxuries of life; with intensive methods and certainty (by irrigation) of crops. California has now more than one fourth of all the irrigators in the United States. The average size of irrigated farms is in Southern California 21¼ acres; in rest of State about 82 acres. The typical California farm under the modern régime is perhaps 10 acres; irrigated either by its own pumping plant or from a community ditch, and yielding an annual income of not less than \$200 per acre.

Perhaps the greatest single factor in bringing about this structural change was the orange. In 1862 there were 25,000 orange trees in the State, all seedlings, and deriving from Mexico, where the fruit was introduced by the Spaniards nearly three and a half centuries earlier. In 1873 two seedless orange trees from Brazil were sent from the Department of Agriculture in Washington to Riverside, California. From these two parent trees has sprung the modern orange industry of California—and practically of the United States; as Florida, the only other orange State in the Union, yielded in 1900 273,000 boxes of oranges to California's 5,882,000. Millions of trees from their buds are now bearing or growing in this State, and the hereditary fruit, seedless and delicious, leads the American market. This crop, highly remunerative, and practically continuous (shipments being made every month in the year) has been for these reasons, and æsthetic ones, a large attraction to high-class immigration, and an important factor in shaping agricultural methods. For development of the industry, see statistics below.

In deciduous fruits, total production, shipments fresh, canning and drying, California has within a generation come to lead the Union; as it leads in all tropical fruits.

California is first successful grower of sugar beets, and has by far the largest factories. In 1900 it had 37.4 per cent of acreage and 44.9 per cent of beet sugar product of the entire Union. The sensational achievements of Luther Burbank in hybridizing fruits—for instance, the creation of a large plum without any pit whatever—are already world-famous. Almost as remarkable results have been reached in floriculture. Seeds and bulbs are raised on

CALIFORNIA.

2. Mt. Tamalpais, near San Francisco.

CALIFORNIA

a great scale; carnations, calla lilies, and other flowers being grown outdoors by the 10-acre field.

Total area of California farms is now over 45,000 square miles; considerably exceeding entire area of States of Massachusetts, New Hampshire, Vermont, Connecticut, Rhode Island, and Maryland. The State is eleventh in the Union in per capita value of farm products (\$88) and fifth in value products per farm (\$1,816 as compared with Ohio, \$929).

California has (1900) 72,542 farms; total value of farm property, \$796,527,955; total value farm products 1899, \$131,690,606. Total acreage in farms, 28,828,951 acres, of which 11,958,837 acres are improved. The area farmed has increased 34.5 per cent since 1890. In 1850 there were 872 farms; in 1860, 18,716. The development of farming is briefly indicated as follows:

Year	Farms	Acres	Val. farm Property	Value Products
1900. . . .	72,542	28,828,951	\$796,527,955	\$131,690,606
1890. . . .	52,894	21,427,293	772,065,570	87,033,290
1880. . . .	35,934	16,593,742	305,999,443	59,721,425
1870. . . .	23,724	11,427,105	147,617,176	39,884,820

The largest number of farms is in Los Angeles County (6,577); three other counties have over 3,000 farms each; Santa Clara, 3,995; Sonoma, 3,676; and Fresno, 3,290. Of all farms, 70,935 are farmed by whites; 658 by Indians; 777 by Chinese; 135 by negroes; 37 by Japanese.

Dairy cows have increased more than seventy-fold since 1850, now numbering 307,245. Of other neat cattle there are 1,137,379; horses, 421,293; mules, 87,000; sheep, 1,724,968; swine, 598,336. Total value animal products 1899, \$36,324,894 — including milk, butter, and cheese, \$12,128,471; animals sold and slaughtered, \$15,754,985; poultry and eggs, \$6,356,746; wool, \$1,707,088. Sheep and wool have decreased steadily since 1879, with the great increase in value of lands for farming. The principal crops in 1899 were: Wheat, \$20,179,044; hay and forage, \$19,436,398; orchard fruits, \$14,526,786; tropical fruits, \$7,219,082; grapes and small fruits, \$6,534,236; barley, \$10,645,723; corn, oats, and rye, \$2,652,777; hops (nearly one fourth of total United States output), \$925,319; sugar beets (nearly half total United States output, \$1,550,346; potatoes and sweet potatoes, \$2,773,140; dry beans (one fourth total output of United States), \$1,022,586; other vegetables, \$2,929,465. The total value of farm crops in 1899 was \$95,365,712.

From 1850 to 1900 the population has increased sixteen-fold; number of farms over eighty-fold. California is one of the few States that in the last 30 years has added more to its agricultural than to its other population.

Irrigation and Horticulture.—Development of the new and characteristic agricultural era in California is outlined by these statistics (1900):

	No. Irrigators	Acres Irrigated	Value Irrigated Crop
United States	102,810	7,263,273	\$84,433,438
California	25,611	1,445,872	32,975,361

Of the 72,542 farms in the State, 25,675 or 35.4 per cent are irrigated, an increase of 44 per cent in 10 years; the number of irrigators

has increased in the same term 87 per cent. Total cost of construction of all irrigating systems, \$19,181,610; so the irrigated crop of 1899 alone paid nearly \$14,000,000 in excess of total cost of works. Los Angeles County leads by far in number of irrigators (4,066); only Fresno (2,459) having one half as many. In number of acres Fresno County is far in the lead, with 283,737 acres; Kern next with 112,533, and Merced, 111,330.

Of the total 1,445,872 acres irrigated, 1,293,608 are irrigated from streams; the balance from wells, 6,894 farms being irrigated from wells. More than half of all the flowing artesian wells in the United States are in California; and besides these a large number of farms are served by power pumps from phreatic wells. There are 1,913 main canals and ditches, aggregating 5,106 miles. In many places tunnels driven into the foothills supply streams for irrigation.

Of deciduous orchard trees there are in the State 28,138,471; including (in that order) plums and prunes, peaches, apricots, apples, pears, and cherries. The value of their product is \$14,526,786. In 1900 the number of plum and prune trees is greater than total number of all deciduous orchard trees in 1890. The number of apricot trees has more than doubled in the decade.

Total number of semi-tropical fruit trees has increased from 1,809,161 in 1890 to 8,996,459 in 1900. Of the latter number, 62.8 per cent are orange trees; 17 per cent olives; 16.6 per cent lemons; 2.1 per cent figs. Other trees included are guavas, kaki, limes, pineapples, pomelos, etc. The counties of San Bernardino, Los Angeles, Riverside, and Orange contain more than four fifths of the orange trees. The number for the State is nearly five times as great as in 1890. Orange and lemon shipments, 1890, 2,400 carloads; 1900, 18,000 carloads. San Diego and Los Angeles counties contain more than half the lemon trees of the State, the number being more than 18 times as great as in 1890. There are 5,648,714 orange; 1,493,113 lemon; 1,530,164 olive trees in the State.

Strawberries, blackberries, raspberries, and other small fruits produced in 1899, \$911,411. Fifty-two of the 57 counties raise grapes. California is the principal wine-producer of the Union, yielding more than one half the total product. The yield for 1899 was 5,492,216 gallons of wine and 3,403,368 centals of raisin grapes. California is the only raisin State; its annual product is about 40,000 tons.

Mining.—So early as 1690, Loyola Casallo mentions seeing placer gold in California; large nuggets were described (by Antonio Alcedo, 1786) in the 18th century. Not later than 1841, gold was found on San Francisquito Creek, Ventura County, about 45 miles from Los Angeles, and was "washed" there by Mexicans on a modest scale. On 19 Jan. 1848, James W. Marshall, an American from New Jersey, employed by the Swiss pioneer, John Sutter, in building a saw-mill near Coloma, on the north fork of the American, picked up yellow metallic flakes in the mill-race; the news spread in spite of efforts to suppress it, and in a few months the gold rush was on. Up to 1848 the whole United States had produced less than \$12,000,000 in gold since the discovery of Amer-

CALIFORNIA

ica; in five years following California alone yielded over \$258,000,000. The annual gold product of the State, from the discovery to 1859 inclusive, was in million dollars, 5, 10, 45, 75, 85, 65, 65½, 65, 57, 50, and 50. Not until 1865 did annual gold output of California fall below \$30,000,000. Up to 1 Jan. 1900, the gold product of California was \$1,409,849,068. Since that time the annual output has been between \$15,000,000 and \$16,000,000. No other State or country in the world has approximated this aggregate yield, though in the last few years Colorado has led California in annual production of gold. This first bonanza in United States history had a profound economic, sociologic, and political effect. "Sound money" was as yet unknown in this country; silver and gold together in the whole Union up to 1848 had not reached \$25,000,000 in total output; and the instability of the currency prior to the California gold discovery is familiar to students. The California gold-find not only precipitated such a shifting of population as had not before been dreamed of on this continent; it not only brought about the admission to the Union of a State distant 2,000 miles from any other State,—California was the first State in the geographic western half of the United States, and sixth west of the Mississippi River,—it furnished the finances for the great civil cleavage nominally most concerned with slavery, and gave the free States a majority in the United States Senate. It is probably not fanciful to hold that this "irrepressible conflict" could not so soon have opened had the nation been so short of bullion and of credit as it was prior to the gold discovery of 1848. Furthermore, in 1859, almost exclusively with California capital, labor, enterprise, and machinery, the great silver bonanzas of Nevada (just across the Sierra) began the remarkable record of 21 years, in which they produced over \$306,000,000 in bullion.

The first mining in California by Americans was crude, as it had been in Mexican days—"washing out" the auriferous gravels in the "gold pan." The first step in advance was the "rocker," employing two men, and foreshadowing a certain associative effort. Next came the "Long Tom," which made also for stability, since it could not be carried. Then came the sluice-box, a small wooden flume with wooden riffles on the bottom, behind which the gold sank and was saved, while the lighter sand and gravel were swept on by the swift current. In 1852, E. E. Matteson, a Connecticut Yankee, invented hydraulic mining, the greatest advance ever made in the placers. Water under high pressure, served through a nozzle called the "monitor," thrown 200 or 300 feet with such nozzle force that a crowbar could not be thrust into the jet, ate away whole hillsides almost as hot water disintegrates sugar; the detritus passing through long, riffled sluice-boxes. While this invention was the most essential yet made in mining, it was long disastrous to ultimate development of the State, agriculturally. In 1880 it was proved by engineers' measurements that on the Yuba River alone more than 100,000,000 cubic yards of gravel had been washed by hydraulics into the bed of the stream, raising it 70 feet; and burying 15,000 acres of farm lands under the débris. After a long and bitter fight, the "anti-Slickens" campaign ended

in 1884 in favor of the agricultural interests, and hydraulic mining in California has never since been on a large scale.

"Quartz mining"—that is, deep mining on the original veins from whose waste the placers derive—began in 1851, but did not take chief rank for many years. Now it is the principal form of gold mining in this State; and as it requires large capital, experience, and time, gold mining no longer attracts the multitude, though the State annually produces three times as much gold as set all the East in a fever half a century ago. California is the only ante-bellum State in the Union which has never had "soft money" or a depreciation of currency. The largest mint in the world is located in San Francisco.

In the 'sixties, extensive experiments were made by Thomas Scott of the Pennsylvania Railroad to develop petroleum in California, even shipping around the Horn barrels for the expected product. For various reasons, chiefly administrative, the experiment failed. The enormous seepages in many parts of the Coast Range tempted further prospecting, and finally producing wells began to be struck in the Puente, in Ventura County, and in Los Angeles city. In 1893 there were about 100 wells in California, producing in the year 400,000 barrels. By 1897 the annual product had increased to 1,903,411 barrels; and by 1900 to 4,324,484 barrels. In the latter year there were 1,590 producing wells and 470 drilling. Since then the increase has been rapid. During 1901, 1,116 wells were completed, and 526 drilling, besides 259 dry holes; and the product was 8,786,330 barrels. Total production in California up to and including 1901, 27,850,205 barrels; output for 1902, about 12,000,000 barrels. The oil fields embrace 17 counties, in a line over 600 miles long; chief producers, Kern, Los Angeles, and Ventura counties. Wells are from 700 to 2,000 feet deep. In the Summerland district most of the production is from wells put down in the ocean from piers. Extensive pipe lines now under construction will deliver at tide water the oil from Kern River and other districts.

California is the first State in the Union in total production of gold, and second in present annual output; second in present output of copper; eighth or ninth in output of silver; first in borax and soda; fourth in petroleum; fifth in salt; first in asphaltum, quicksilver (with two fifths of the total production of the world), and soda.

Total value of mineral products for California in 1901 was \$34,355,981, in 46 items. Principal products, with yield and value:

Gold.....		\$16,989,044
Copper.....	34,931,785 lbs.	5,501,782
Petroleum.....	7,710,315 bbls.	2,961,102
Quicksilver.....	26,720 flasks	1,285,014
Silver.....		1,229,356
Borax.....	22,221 tons	982,380

Other interesting items are asphalt and bituminous rock, \$378,573; lime, \$334,688; mineral waters, \$559,057; salt, 126,000 tons, \$366,376; soda, \$400,000. There is also considerable production of turquoise, tourmaline, antimony, asbestos, fuller's earth, graphite, manganese, magnesite, platinum, etc.; 54 of the 57 counties produce minerals.

Manufactures.—Between its first census (1850) and that of 1900, California gained 1,500 per cent in population and 2,196 per cent in aver-

SOUTHERN CALIFORNIA PALMS.

CALIFORNIA ROSE GARDEN.

CALIFORNIA

age number of wage-earners engaged in manufacturing. Although chiefly an agricultural and mining State, it had in 1900 140,330 persons engaged in manufacturing. In the last decade there has been great increase in number of establishments, capital, wage-earners, and value of products. This has been due to discovery and development of a cheap fuel, namely, petroleum. Though length of transcontinental haul (2,000 to 3,000 miles) from the great factory centres acted as a "high protective tariff," and many raw materials were abundant here, imported fuel-coal at \$8 to \$10 per ton was a heavy handicap to manufacturing. Within a decade, petroleum has become, from practically nothing, the third mineral product of California, reaching over 12,000,000 barrels in 1902. This is equivalent to coal at about \$3 per ton, and has enormously stimulated manufacturing. Twenty-five years ago, Prof. J. D. Whitney, dean of American geologists, was doubtful of any future for petroleum in California, and stated that certainly this State would never have flowing wells. There are now many "gushers" in California, and the petroleum industry is one of the most important. The locomotives of California railroads chiefly burn crude petroleum. Steam roadbeds and country highways are "sprinkled" with petroleum for thousands of miles. An overwhelming majority of manufacturers in the State now use it for fuel; and as local development of oil is only in its infancy, increase of manufacturing may be expected to take even longer strides. In the decade the per cent increase has been 58.8 in number of manufacturing establishments; 39.9 in capital; 41.9 in value of products; and in part of the State these figures have been nearly doubled. The leading manufactures are: Refining sugar and molasses, \$15,909,998; slaughtering and meat-packing, \$15,717,712; lumber and timber products, \$13,764,647; flouring and grist-mill products, \$13,100,944; canning fruits and vegetables, \$13,081,829; foundry and machine shop products, \$12,047,149; wines and liquors, \$9,261,600; car construction, \$7,553,626; tanning and finishing leather, \$7,405,981; printing and publishing, \$6,858,192; explosives, \$4,283,818.

Manufacturing statistics, 1900: Number of establishments, 12,582; capital, \$205,395,025; average number of wage-earners, 91,047; value of products, \$302,874,761. In per capita value of manufactured products California is twelfth State, with \$203.95 per capita; United States average, \$170.90 per capita. It is also twelfth in number of manufacturing establishments, and first in wages. It is eleventh in dairy products; fifth in capital in lumber; first in canning fruits and vegetables; first in all dried fruits; sixth in canning fish; eighth in number of establishments, and twelfth in value of product, in piano-making; third in ship-building; fifteenth in flour. The canning of fruits and vegetables has reached its highest development in California; and in output this State easily leads the Union,—being about three times in excess of the 6 New England States, 10 Southern States, 6 Western States, and Washington and Oregon, all together. Its product, 1900, was \$13,081,829. More than one half all canned peaches; more than two thirds all canned pears; nearly one half all canned cherries; nearly four fifths all canned plums; more than one half all canned beans; more than one half all dried

fruits, produced by the whole United States are from California. The increase in all items of manufacturing has been by far largest in the city of Los Angeles, where, for instance, the per cent gain in a decade has been in number of establishments, 88.7; number of wage-earners, 107.7; value of products, 115.3. The 1900 census specifies 181 manufacturing industries in California. Another new, but highly important industrial advance is long-distance transmission of electric power from mountain streams. In this California has for years led the world. When a 33,000-volt, 82-mile line from San Bernardino Mountains to Los Angeles was installed (1900), it far exceeded any other line in the world in length and voltage. Then 40,000 volts were brought 140 miles from Yuba River to Oakland—with cable crossing Carquinez Straits by suspension span of 4,400 feet, 300 feet in air. The longest power transmission in the world is (1903) from Colgate to San Francisco, 211¾ miles. Plants are now building to transmit 28,000 horse-power from Kern River, 116 miles, to Los Angeles; and 120,000 horse-power from San Joaquin River, 180 miles to San Francisco; and 218 miles to Los Angeles. One electric company expended \$250,000 per month throughout 1902, in electric development in and around Los Angeles; and is expending even larger sums in 1903. Two other companies in northern part of State are developing 169,000 horse-power for long-distance transmission.

Within the decade, ship-building has had great impetus, and California is now third State in the Union in this industry. The Oregon, Olympia, Ohio, and other United States war vessels were built in San Francisco.

Commerce, Navigation, etc.—The position of California (commanding, from the best seaport in 5,000 miles of Pacific coast, the shortest routes to the Orient); its great coast-line,—two thirds of total United States frontage upon the Pacific,—and its relation as outlet for an enormous inland territory, give great importance to its commerce. San Francisco, though ninth city of the Union in population, is third in commerce. Its exports for 1902 were \$47,601,422; imports, \$36,078,270. Operations in the Philippines, and development of the Oriental trade are bringing about for California the realization of Seward's prophecy that "the Pacific is to be the chief theatre of the world's activities." The bay of San Francisco, with a shore-line of 300 miles, open to the ocean only by the mile-wide Golden Gate, and receiving through the two great central rivers the drainage of the vast interior valley, is reckoned next to Sydney among the world's best harbors. San Diego at the extreme south has a well-sheltered natural harbor, entrance to which is now being improved by the government. At San Pedro an enormous breakwater is being constructed by the government, which will enclose an excellent artificial harbor. At the roadstead of Santa Monica, a wharf 4,700 feet long serves rapidly growing commerce. There are several minor ports scattered along the coast. California has seven lines of oceanic steamers—plying to China, the Philippines, Sandwich Islands, Alaska, Mexico, Panama, and Chile, and coastwise. There are six lines of river steamers, five concerned with San Francisco and its river system. The Sacramento is navigable to the capital city of that name,

CALIFORNIA

90 miles from San Francisco; the San Joaquin to Stockton, about an equal distance. The Colorado, on the desert east boundary of the State, is sixth or seventh among the great rivers of North America; and though a sandy, shifting, and impetuous stream is navigable for small steamers for over 300 miles above its mouth in the California Gulf (in Mexico). In 1902 exports by sea from San Francisco included treasure, \$14,851,789; flour and wheat, \$14,458,321. During the same year exports from San Francisco to China were \$15,819,922; to Japan, \$6,858,942.

Fisheries.—San Francisco is now leading whaling port in the world; and despite great decay of this once noted industry there are still about 25 vessels engaged. Product (1902) 10,976 barrels oil; 110,662 pounds whalebone; 15,566 pounds ivory. In 1855 there were engaged in whale fisheries in the Pacific 650 vessels, manned by 15,000 men. In fish canning, California is sixth State in the Union. This is principally salmon pack. Fisheries for local markets employ many hundred people, but statistics are not available. In marine and fresh-water fishes the State is probably richest in the Union. Salmon, sturgeon, rock-fish, smelt, halibut, soles, tom-cod, mackerel, Spanish mackerel, and a great variety of other sea fish are abundant. The barracouda (*Sphyræna argentea*), pompano (*Trachynotus*), sand-dab, red-snapper, and "small fry" are characteristic and famous food fishes; while soles and flounders, differing from those of the Atlantic seaboard, are a noted delicacy. These marine fish are in market the whole year. The leaping tuna of Southern California disputes with the Florida tarpon place as gamiest of sea fish. At Catalina Island there are great annual tournaments for capture of this fish with light rod, reel, and 21-strand line. Tuna of 251 pounds, and black sea-bass, or Jew fish, of 380 pounds, are the record with this frail tackle. The coast is extraordinarily rich in shell-fish. Crabs of extraordinary size, but very delicate; shrimps, crawfish closely resembling the eastern lobster, but without mandibles, are very abundant. The native oyster is small, but flavorful, and eastern oysters transplanted to the coast propagate well and are of excellent flavor. Mussels, clams, razor-shells, cockles, and other edible mollusks are abundant and good. The Rocky Mountain trout is indigenous here, and grows to large size. Within the last 25 years all the eastern varieties of trout have been successfully introduced into this State. Taken altogether, California exceeds any other State in variety, size, and abundance of trout. Black bass, shad, cat-fish, and carp have also been colonized here on a large scale. Game fishes in the streams, as well as game birds and animals, are carefully protected by "close seasons."

Railroads and Street Railways.—Mileage of railroads in the State (1900) 5,500; chiefly pertaining to the two great transcontinental lines, the Southern P., and the Atchison, T. & S. F. R.R.'s. So rapid is the development of electric lines, urban and suburban, that statistics are constantly changing. San Francisco and vicinity have about 400 miles (mostly cable roads in the city and electric outside). In Los Angeles there are (1903) 170 miles electric roads, with 500 miles of suburban lines in active construction. In 1870, railroad mileage of California

was 525; and there were no urban lines whatever. San Francisco invented in 1873 the first successful urban rapid transit in the world, and its cable system is still probably without rival. A new transcontinental railroad is now building from Salt Lake City to Los Angeles, about 800 miles.

State Finances.—Total assessed valuation, 1902, \$1,290,750,465; in 1890, \$584,578,036. State tax, .382c. Bonded debt nominally, \$2,500,000; but the State owns the bonds. Total county indebtedness, \$3,175,942.

Banks.—In 1900 there were 37 national banks, capital \$10,975,000, total resources \$62,135,611; 178 commercial banks, capital \$26,981,972, total resources \$146,495,782; 53 savings banks, capital \$7,655,705, total resources \$173,872,499; 19 private banks, capital \$890,142, total resources \$2,798,391; grand total, 287 banks; capital, \$46,502,820; total resources, \$385,302,285. In 1902 there were 321 banks, and their net gain in deposits over 1901 was \$55,405,951.

California far exceeds any other State of the Union in average amount deposited in banks to each depositor, with \$764.52 per capita, against the United States average of \$408.30. One in every seven of entire population is a depositor. In clearing-house business, San Francisco stands about sixth city in the Union. Its clearances, 1901, were \$1,134,499,932. Clearances, Los Angeles, 1901, \$145,170,809.

Education.—California leads the Union in enrollment of college students, having 1 to every 419 of total population, and surpasses New England in pro rata of pupils in secondary schools. There are (1900) 5 State Normal Schools, 120 high schools, 7,119 kindergarten, primary, and grammar schools; with grand total of 7,706 teachers, 372,352 scholars; \$19,135,722 value of school property. Annual expenditures for secondary public schools is over \$6,000,000. California is the only State in the Union with two great free universities. The State University at Berkeley ranks second among American universities in number of undergraduates and in total number of students, being exceeded only by Harvard. Total enrollment, 2,470 (1,026 women). It is fourteenth in size among the universities of the world. Resources, \$7,260,000; supported by State tax of 2 cents on every \$100 valuation. Mrs. Phœbe A. Hearst, widow of United States Senator Hearst, has contributed great sums to the university, and has secured in a competition open to all the world (won by M. Bénard of Paris), a complete architectural plan whose buildings will cost at least \$10,000,000. Leland Stanford Jr. University was founded 1891 by Gov. and United States Senator Leland Stanford and wife. The widow has recently turned over to the university the complete endowment they designed, amounting to nearly \$30,000,000. A harmonious architectural plan, of symmetry and beauty unrivaled at present by any university in the world, has already been carried far enough to accommodate the 1,200 students (of whom one third are women) and has cost several millions. University affairs in California are in the hands of noted educators from the East; standards are high, and friendly rivalry has done much to promote educational affairs throughout the State; while the two universities have together about five times the enrollment that the one

A DRY SALT SEA IN THE COLORADO DESERT, CAL.

The Indian laborers have washed the salt and stacked it into cones ready for the mill.

had 12 years ago. David Starr Jordan is president of Stanford, and Benjamin Ide Wheeler of the State University. The accrediting system has been developed to high efficiency. Co-education in both universities is not an experiment, but acknowledged success. There is a large number of colleges, private schools, seminaries, academies, and other educational institutions, besides those under State supervision; also medical, law, and other schools. Educationally, California ranks very high in the Union. A large number of distinguished teachers have been attracted by climatic and other considerations. It pays its teachers in public schools the highest average salaries in the Union (\$943, as compared with \$620 for Ohio).

Public libraries are very numerous, and are to be found even in the smallest cities. With its free public library of 80,000 volumes, San Francisco has four other libraries aggregating 200,000 volumes—besides the great Sutro library of 500,000 titles, not yet available to the public. Los Angeles has a library of about 70,000 volumes. In circulation, California libraries are much more active than those of the East. Average number of books distributed per capita: Chicago, .96; Philadelphia, 1.40; Boston, 2.13; Los Angeles, 3.45. Circulation per volume: Boston, 1.76; Los Angeles, 7.40.

Of philanthropic and temperance organizations; of literary, social, fraternal, and other societies, California has an extraordinary number; due to the cosmopolitan character and average education of its immigrants. Women's clubs, the Young Men's Christian Association, the Women's Christian Temperance Union, and other federated bodies are here much stronger than in most States. In proportion to population California has twice as many newspapers as New England. In San Francisco alone are 242 periodicals in 13 languages. The first kindergarten in America was established in San Francisco.

Churches.—No recent statistics available. In 1890 there were 1,505 church buildings, seating capacity, 422,609; value church property, \$12,000,000; number of communicants, 280,619. Of these, 156,846 were Roman Catholics*, about 37,000 Methodists; 19,000 Presbyterians; 11,000 to 12,000 each Baptists and Congregationalists. With increase of 22.9 per cent in population in the decade, these totals have been greatly changed; but probably not the order—nor extensively, the proportions. In 1900 Los Angeles city had one church to every 662 of population, as compared to New York with one church to every 6,424 of population.

Charitable and Penal Institutions.—California has two State prisons, two industrial reform schools, five asylums for insane, one for deaf, dumb, and blind, and a great number of public and private hospitals, asylums, orphanages, etc.

State Government.—State officers elected for four years, except assemblymen for two; no bar to re-election; governor's salary, \$6,000; two thirds vote in each house passes bill over governor's veto. If he does not act on any bill within 10 days, it becomes law, unless adjournment of legislature prevents return of bill, in

which case it becomes operative if within 10 days after such adjournment, the governor approves it. Legislature limited to 40 members in Senate, 80 in House; meets biennially, in January of odd-numbered years. Sessions not limited, but pay allowed members only for 60 days—\$8 per day, with traveling expenses and mileage 10 cents per mile. No bill can be introduced after 50th day of session. State constitution is notable for numerous restrictions on legislative action; provision for three fourths' majority verdict of juries in civil cases; and prohibition of Chinese suffrage and of employment of Chinese on State works or by corporations.

United States Representatives.—Two senators, eight congressmen (prior to apportionment of 1901, seven congressmen). Electoral vote, nine.

Population.—The settlement of California, steadily progressive for 55 years, has been marked by two of the most remarkable shiftings of population anywhere recorded. Everything considered, the "Gold Rush" of 1848-9 has no parallel. In first 12 months after the discovery of a small flake of gold at Sutter's Mill, 42,000 Americans from the far eastern States made their way across the unbroken plains with wagons. This great migration continued uninterruptedly for years. Its demands brought about the first large development of steam navigation; and the finest clipper ships that had ever been built were constructed for the California trade. In 1845 the white population of California was about 5,000; 4,000 of whom were Spanish Californians, 360 Americans, 300 English, Scotch, and Irish, and the remainder "scattering." By 1850 this number had increased to 92,597; by 1860 to 379,994. That is, in 12 years over 370,000 persons reached California by an overland journey of 2,000 miles; or by a voyage of 19,000 miles around the Horn in sailing ships; or by the 5,000-mile voyage by way of Panama, with its difficult passage of the isthmus. For the first decade this precipitate migration was overwhelmingly of men; and this preponderance of males, with dearth of families and of women, colored in almost every social, political, and economic aspect the early fortunes of the State. The scarcity of home life, and profligate abundance of money, brought about an era of luxury in private and public expenditures on such a scale as was then hardly dreamed of in the eastern States. San Francisco had less than 150,000 people when it began to build the largest hotel in the world—covering two and a half acres and costing \$7,000,000. The State had a population of less than half a million during the Civil War, but it contributed more than one third as much to the expenses of the United States Sanitary Commission as all the rest of the "loyal States" together, with their population of 18,500,000. Its cash contribution to this cause was over \$1,200,000. Everything was in this proportion. Enormous subscriptions were sent to relieve great catastrophes of fire, pestilence, or war, in all parts of the world. Huge gifts were made to education and other public utilities, on a scale never yet surpassed and at that time elsewhere unheard of. For a generation San Francisco was a proverb the world over of princely living and princely giving. This large population of young men, vigorous,

* Roman Catholic figures include entire family; other denominations only communicants.

CALIFORNIA

adventurous, mostly unattached, far from home and the conventions, and under excitation of sudden wealth, shaped and established such an epoch, social and financial, as no other American State has ever comparably known.

It was only after the first decline in the "diggings"—after the pursuit of gold became less a fortuitous scramble for surface nuggets, and mining had come to demand skill, patience, and business methods—that attention began to be paid to the soil. Though for 80 years, already the Franciscan missionaries had proved, in little oases about their missions, the wonderful fertility of California, the aridity of climate and the "look" of the land, so unlike in color and texture to soils recognized as fertile at home, led the adventurers to believe for years that California was worthless except for mining and stock-raising. It was only when the real fecundity of the soil began to be understood that character of population underwent essential change. Immigration in the first decade was almost purely of male fortune-hunters, with no thought of permanent residence. They came to get rich and go home. But when the slow comprehension dawned that in agricultural possibilities the State was inconceivably richer than in mineral resources, and that here was not only the most hospitable of climates, but the most generous land for home-building, an entirely different type of migration began—the migration of families. This stream, small at first, has continued steadily since about 1870. In 1886 the completion of a competing railroad into southern California—to which its first transcontinental line had brought but slow increase of population or development—precipitated another migration numerically greater than the Gold Rush, almost as rapid, far longer continued, and of entirely different category. It was characteristically of well-to-do and educated families, without the heroic qualities of the pioneers, but of much higher average in the civic and financial scale. They came not to tame a wilderness, but to enjoy such a land as travelers seek along the Mediterranean. They came by Pullman cars instead of "prairie schooner"; instead of felling forests they planted groves of tropical fruits; instead of building frontier cabins, they erected a class of homes such as probably cannot be found among an equal population. It is only by reference to the peculiar character of this migration that the development and progress of California in all social, educational, and material lines during the last 15 years seems at all credible.

In 1880 the population was 864,694; in 1890, 1,208,130; in 1900, 1,485,053; the latter figure being more than 16 times as large as the population of 1850. The recent great increase in population, however, has been disproportionately in the seven southern counties of the State. Much more than half of the State gain for 20 years has been in eight counties, including in the northern half of the State only the city and county of San Francisco. Since 1880, Los Angeles has outstripped in population 99 other American cities then numerically larger. In 1900 it was thirty-sixth city in the Union in population, and only 13 cities in the Union had gained as many people in the decade. There are 57 counties, with 116 incorporated cities and towns; 19 places exceeding 5,000 population;

10 exceeding 10,000; and 4 exceeding 25,000. Of the total population of 1,485,053, whites are 1,402,727; colored, 11,045; Chinese, 45,753; Japanese, 10,151; Indians, 15,377. The total males are 820,531; females, 664,522. While in most of the far eastern States the excess of females to males is increasing, in California the growth is toward a balance; the number of women to every 100,000 men having risen from 72,657 in 1890, to 80,987 in 1900. Of the total population, 1,117,813 are native born, and 367,240 foreign.

The 15,377 Indians in California, comprising at least 14 different linguistic stocks, live principally on three reservations in the north; 1 at Yuma, and 32 mission reservations, all on the edge of the desert in the south. They are mostly self-supporting, peaceful, and fairly industrious farmers, with government day-schools everywhere among them; besides which, 2,934 Indian children are in public schools. Their chief art is basket-making, in which some tribes lead the world for beauty and value of product. The record price for a basket is \$2,000; but prices average from \$5 to \$50. The government is now encouraging this industry by teaching it in Indian schools.

Chief Cities.—San Francisco, largest city west of Saint Louis (about 2,000 miles by rail) and largest on entire Pacific coast of North and South America; has population (1900), 342,782, a gain of 43,785 in the decade. It is ninth city in the Union in population and twentieth in increase in the decade. The population was 2,000 in February 1849; 5,000 in July; 20,000 in December of same year. In 1850 it was about 25,000 (United States census figures destroyed by fire). In 1860 it was 56,802; in 1870, 149,473; in 1880, 233,959. Los Angeles was, in 1880, 135th city in the Union in population; in 1890, 57th; in 1900, 36th, having gained in the last decade 52,089, which makes it 14th city in gross increase. In 1850 it had 1,610 inhabitants; in 1860, 4,385; in 1870, 5,728; in 1880, 11,183; in 1890, 50,395; in 1900, 102,479. In 1902 it was fifth city in Union in number of new buildings erected, and eighth in value of new buildings; first in expenditure per capita for new buildings. It has the largest proportionate telephone service in the world, with 1 telephone to every 8 persons; San Francisco coming next with 1 to every 12 persons; then Detroit with 1 to every 24,—as compared with Boston 1 to every 31, New York 1 to every 41, Chicago 1 to every 44. Oakland, across the bay from San Francisco, has grown from 48,682 in 1890 to 66,960 in 1900; Sacramento, State capital, has 29,282 population. Other cities are San José, 21,500; San Diego, 17,700; Stockton, 17,506; Alameda, 16,464; Berkeley (seat of State university, and Asylum for Deaf, Dumb, and Blind), 13,214; Fresno, 12,470; Pasadena, 9,117; Riverside, 7,973; Vallejo, 7,965; Eureka, 7,327; Santa Rosa, 6,673; Santa Barbara, 6,587; San Bernardino, 6,150; Santa Cruz, 5,659; Pomona, 5,526. No other place exceeded 5,000 in 1900.

History.—The name California, for which so many preposterous derivations have been urged, is taken from a Spanish romance, called 'Sergas de Esplandian' ('Exploits of Esplandian') by Ordoñez de Montalvo (translator of Amadis de Gaul), printed about 1510, and often mentioned in old sources. It was a mythi-

CORONADO BEACH, CALIFORNIA.

CALIFORNIA

cal island "on the right hand of the Indies, very near the Terrestrial Paradise," peopled with Amazons and Griffins. The name was first applied to the peninsula (discovered by Jimenez 1533) and is first recorded thus in Preciado's diary of Ulloa's coastwise voyage in 1539. In time it came to be used indefinitely for the whole Pacific coast from the peninsula practically to Nootka; and later "the Californias," differentiated into Baja (or Lower) California and Alta (Upper) California, the former including about what is now the Mexican Peninsular Territory. The first European to touch the present State was Alarcon, who went up the Colorado River some hundreds of miles in 1540. The first seaboard exploration was by Cabrillo 1542; and the next important coast explorations were by Sir Francis Drake 1579, and Vizcaino 1602. The first colonization of Upper California was by the Franciscan missionaries under Junipero Serra, with a small escort of Spanish troops. These pioneer missionaries had by 1800 founded 18 missions, whose total population, mostly Indian neophytes, was 13,000. Three other missions were established by 1823. The mission period lasted about 65 years; converted over 80,000 Indians; erected in the wilderness at least \$1,000,000 worth of buildings, and had developed stock-raising and wheat on a scale which astonished Humboldt. In 1834 the Mexican government "disestablished" the missions and confiscated their property. The Indians were scattered, and perished in great numbers. The buildings were plundered and left to decay. At present the Landmarks Club (incorporated) is preserving the mission edifices. The State passed from Spanish rule to that of the Mexican republic, 1821; was seized, practically without resistance, by the United States in 1845, and ceded by Mexico at close of Mexican war; admitted to the Union, 9 Sept. 1850. The American discovery of gold caused an unprecedented transcontinental migration (see *Population*). Aside from the great impetus given steam and clipper ships, the migration had other unique features—like the Merchant's Express, which employed 5,000 men, 2,000 wagons, and 20,000 yoke of oxen in freighting across the continent; and the Pony Express, which carried mail (letters only) at \$5 per half ounce, 1,950 miles horseback from Independence, Mo., to San Francisco, in 10 days; and the Butterfield stages, 8 times a month between St. Louis and San Francisco, via Texas and New Mexico; quickest time, 21 days from New York to San Francisco. Extraordinary records were made in this overland traffic. Robert H. Haslam, ("Pony Bob") made one continuous ride of 380 miles; and William F. Cody ("Buffalo Bill") one of 384, without stopping except for meals and to change horses—both as riders of the Pony Express. Quickest time made by this route (1,950 miles), 7 days, 17 hours. The growth of this overland traffic led California capitalists, heavily subsidized by government, to build a transcontinental railroad. Ground was broken at Sacramento for the Central P. R.R., 8 Jan. 1863. The road was completed by driving of a spike of pure California gold by Gov. Stanford in presence of distinguished company at Promontory, Utah, 10 May 1869. In 1877 the Southern P. R.R. from Texas tidewater to San Francisco was completed. In 1885 the

Atchison, T. & S. F. R.R. reached Los Angeles from St. Louis; and within the last two years has been extended to San Francisco. The latter and the Southern P. R.R. are the longest railroad systems in the world, each with a mileage much over 7,000. The modern development of California dates from competition of these two lines during the decade beginning 1886.

The swift creation of an American commonwealth by the sudden horde of adventurous pioneers upon whom that duty at once devolved, is perhaps the most remarkable monument to the genius of the American people for self-government. Ninety thousand wanderers, homeless, wifeless, and chaotic in the wilderness, fevered by enormous and sudden gains, without cities or laws or communication with the outside world, within a year installed soberly and firmly all essential machineries of an American State. The desperadoes who flocked in from all parts of the world—including a large contingent of Australian convicts—were firmly suppressed, though not at once. Between 1849 and 1856 there were in San Francisco alone 1,000 homicides and 7 executions. In 1856 the second vigilance committee, composed of the best citizens, judicially, after full and formal trial, publicly hanged half a dozen worst desperadoes, and banished scores of others on pain of death. Since that time life and property have been quite as safe in California as in the eastern States. Chinese exclusion, though finally a national measure, was brought about by California, which then contained a majority of all Chinese in this country. In 1879 California voted exclusion by 154,638 to 883. The number of Chinese in the State has decreased from 75,132 in 1880 and 72,472 in 1890 to 45,753 in 1900. The bitterness aroused by the exclusion struggle has passed, and Chinese are well treated.

California entered the Union as a free State, thus giving balance of power to the North. In State elections since the war it has been peculiarly independent, having gone Democratic in 1867, 1875, 1882, 1886 (Democratic governor and Republican lieutenant-governor, who became governor by his superior's death) and 1894; Republican in 1871, 1879, 1890, 1898, and 1902.

Next to the gold excitement (see *Mining and Population*) the most sensational era in California history was the great bonanza silver period from 1859 to 1880. The mines were in Nevada, but were owned in San Francisco, and an era of stock-gambling theretofore unheard of in history, and probably not yet surpassed, sprang from their sensational yield. Stocks on the San Francisco board rose \$1,000,000 a day for many months, and sales in one year were \$120,000,000. Everybody gambled in stock, from bankers to scrub-women. In 1875, with less than 200,000 population, San Francisco had 100 millionaires. The "Consolidated Virginia" mines paid \$1,000,000 per month dividends for nearly two years. One lode was valued at nearly \$400,000,000; \$250,000,000 was spent in "developing" a small group of hills. The decadence of these great bonanzas, following the subsidence of gold mining to sober methods, at last turned more general attention to agriculture, the real wealth of the State (see *Agriculture*). In 1880 California was first in the Union only in gold, sheep, and quicksilver; all other industries being far down the list. It is

CALIFORNIA

now second in gold; ninth in sheep; first in diversity of crops; first in wines, total fruits, canned fruits, dried fruits, barley; first in number of irrigated farms; first in average wages in manufacturing establishments; first in borax, asphalt, quicksilver, platinum; second in copper; third in wheat; second in beet sugar; second in hops; first in oranges, lemons, olives, and all semi-tropic fruits, honey, prunes, walnuts, almonds, beans, grapes, pears, peaches, cherries, apricots, etc.; first in electric power transmission; third in ship-building; fourth in petroleum; fifth in total value products per farm; eleventh in value farm products per capita; twelfth in total value manufactured products.

The highest California gold product in any one year was \$85,000,000. The total agricultural products for 1899 were \$131,000,000; and total value of manufactured products (1900) \$302,000,000.

A South Sea bubble as wild as the Comstock silver stock-craze was the great "Land Boom" of southern California, 1886-7; a period of land-gambling never quite equaled in any other part of America. An area as large as New England was involved, with varying intensity; but the chief focus of excitement was in Los Angeles, San Bernardino, and San Diego counties. Scores of thousands of city lots were staked out far from towns, hundreds of miles of cement sidewalks and curbs were laid; scores of big hotels and other buildings erected as baits, and great quantities of lands (purchased at from \$10 to \$30 per acre) were sold in town lots at \$1,000 to \$10,000 per acre. In Los Angeles County alone, with a population then not over 50,000, real estate transfers recorded in 1887 were over \$100,000,000. Excursion auction sales of new "towns" sometimes realized \$250,000 in a day; and \$100 was often paid for place in the line waiting for a sale to open. The collapse of this gigantic bubble, early in 1888, was as extraordinary in its freedom from disaster as it had been in its inflation. Not a bank failed, nor a business house of respectable standing; and while desert town lots reverted to acreage and acreage values, all really desirable real estate, rural and urban, has constantly advanced in value every year—thanks to the uninterrupted continuance of large and wealthy immigration. Building of homes and setting out of orchards continue on an extraordinary scale. During 1902, besides other buildings, more than 4,000 new residences were erected in the city of Los Angeles. "Local option" is in force; and nearly all towns of southern California are "prohibition."

CHARLES FLETCHER LUMMIS.

Editor of 'Out West Magazine.'

California, Gulf of, or Sea of Cortez, an arm of the Pacific Ocean, separating lower California from the Mexican mainland. It is 700 miles in length and varies in width from 40 to 100 miles. There is but little navigation carried on there. On the western coast are pearl fisheries. The gulf was discovered by Cortez, and for some time was called after him. The river Colorado empties into the northern extremity.

California, Lower or Old, a territory of the Republic of Mexico, forming a peninsula in the Pacific Ocean, united on the north to the continent, from which it is separated on the east, throughout its entire length, by the Gulf of California. It is about 750 miles in length, and in different places 30, 60, 90, and 150 miles wide. The coast forms many capes, bays, and havens, and is fringed by numerous islands. A chain of mountains extends throughout, of which the greatest height is from 4,500 to 4,900 feet above the sea, the latter being the height attained by its culminating point, Cerro de la Giganta. The chain is almost destitute of vegetation, having only here and there a few stunted trees or shrubs. It has a single volcano, and possesses distinct traces of volcanic origin. The foot of the range is covered with cactuses of remarkable size. Some of the hollows, where the soil is formed of decomposed lava, are tolerably fertile. On the plains the soil is often of the richest quality, and when the advantage of irrigation can be obtained, raises the most abundant crops; but this advantage often fails, owing to the great deficiency of water. Rain seldom

THE CAMPUS OF THE UNIVERSITY OF CALIFORNIA.

falls in summer, and the streams are very insignificant. The climate varies much according to locality. On the coast of the Pacific the temperature ranges in summer from 58° to 71°; the sky is peculiarly clear and perfectly cloudless, except toward sunset, the tints of which are remarkable for variety and beauty. At a distance from the coast, where the sea breeze is not enjoyed, the summer heat is excessive. The principal vegetable products are maize, manioc, wheat, grapes, oranges, lemons, pineapples, and many other varieties of the finest fruits. In the valleys horses, sheep, and cattle are raised successfully. The fish on the coast are very abundant, and a pearl-fishery was long very successfully carried on. Gold mining is also carried on with considerable success. La Paz, in the south, is the capital; Ensenada, in the north, is a rising port. California was explored by order of Cortez in 1532-3. The region was visited by Drake as early as 1579. In 1697 the Jesuits formed establishments in the territory, built villages and missions, and in some measure civilized the natives. On their expulsion in 1767, the missions were carried on by the Dominicans. Pop. (1895) 42,245, of whom probably about half are Indians.

California, University of, a university which is a part of the State educational system in California, but supported as well by the income from endowments and by national aid.

In 1869 the College of California, which had been incorporated in 1855 and which had carried on collegiate instruction since 1860, closed its work of instruction and transferred its property, on terms which were mutually agreed upon, to the University of California.

The university was instituted by a law which received the approval of the governor, 23 March 1868. Instruction was begun in Oakland in the autumn of 1869. The commencement exercises of 1873 were held at Berkeley, 16 July, when the university was formally transferred to its permanent home. Instruction began at Berkeley in the autumn of 1873. The new constitution of 1879 made the existing organization of the university perpetual.

The professional schools were contemplated in the original plan, but not organized till later. The governing body, the board of regents, consists of the governor and lieutenant-governor of the State, the speaker of the Assembly, the State superintendent of public instruction, the presidents of the State Agricultural Society and the Mechanics' Institute of San Francisco, and the president of the university (all regents *ex officio*), and 16 others appointed by the governor for a 16-year term with the advice and consent of the Senate. The university is divided into the following departments: (1) The four colleges of general culture, including letters (degree of bachelor of arts), social sciences (bachelor of letters), natural sciences (bachelor of science), and commerce (bachelor of science); (2) the five colleges of applied science, agriculture, mining, mechanics, chemistry, and civil engineering (leading to the degree of bachelor of science); (3) the Mark Hopkins Institute of Art; (4) the Hastings College of the Law; (5) the college of medicine; (6) the post-graduate medical department; (7) the college of dentistry; (8) the California College of

Pharmacy. The nine colleges first mentioned are situated at Berkeley; the others are in San Francisco; the Lick Observatory on Mount Hamilton was established as a part of the university in 1888.

In 1896 Mrs. Phoebe Apperson Hearst informed the regents that she proposed to erect a building, but wished first a worthy general plan for the Berkeley campus, and that she would bear the expense of an international competition to obtain such a plan. In 1898 an international jury assembled at Antwerp and voted upon more than one hundred plans submitted, awarding prizes to eleven competitors, who were invited to visit the university and to prepare revised plans for a second competition. In September, 1899, the jury met again in San Francisco and gave the first prize (\$10,000) to M. Emile Bénard of Paris. After a long stay in Berkeley and many conferences with the university authorities, M. Bénard undertook a revision of his drawings to fit the plans to the actual necessities of the site and the prospective needs of the university. In December, 1900, he submitted a design which the regents adopted as the permanent plan. To Mr. John Galen Howard has been entrusted the development of the plan, as supervising architect. In realization of the Hearst plan, three buildings are (1905) approaching completion; the Hearst Memorial Mining Building, given by Mrs. Hearst for the College of Mining of the university and as a memorial to the late Senator George Hearst; California Hall, for which an appropriation of \$250,000 was made by the California legislature, and the president's house. A fourth building has been erected—the beautiful Greek Theatre, an open-air auditorium, seating 8,000, patterned after the classic theatres of Greece and the Greek colonies, and given to the university by Mr. William Randolph Hearst. The fifth of the new buildings will be the library, for which generous provision was made by Mr. Charles F. Doe of San Francisco, who bequeathed \$700,000 for this purpose.

At Berkeley there are 175 officers of instruction distributed among 36 departments, 2,700 students, a library of 130,000 volumes, an art gallery, museums and laboratories, also the agricultural experiment grounds and stations, which are invaluable adjuncts of the farming, orchard, and vineyard interests of the State. In San Francisco there are 150 officers of instruction, besides demonstrators and other assistants, and 600 students. Tuition in the colleges at Berkeley, during regular sessions, is free to residents of California; non-residents pay a fee of \$10 each half year. In the professional colleges, in San Francisco, except that of law, tuition fees are charged. The instruction in all the colleges is open to all qualified persons, without distinction of sex. The constitution of the State provides for the perpetuation of the university with all its departments.

In 1904 there were 4,175 students in all the departments, of whom about 40 per cent were women; it is also to be noted that a comparatively large proportion of students are in the general or academic courses, as distinguished from the technical and professional courses.

JAMES SUTTON,
Recorder of the Faculties.

Calig'ula, Gaius Cæsar Augustus Germanicus, Roman emperor, a son of Germanicus and Agrippina: b. 31 Aug. 12 A.D., in the camp at Antium, and brought up among the legions; d. 24 Jan. 41 A.D. He received from the soldiers the surname of Caligula, on account of his wearing the *caligæ*, the boots commonly used by the soldiers. He understood so well how to insinuate himself into the good graces of Tiberius that he not only escaped the cruel fate of his parents, and brothers, and sisters, but was even loaded with honors. Whether, as some writers inform us, he removed Tiberius out of the way by slow poison is uncertain. When the latter was about to die he appointed, according to Suetonius, Caligula and the son of Drusus, Tiberius Nero, heirs of the empire. But Caligula, universally beloved for the sake of his father Germanicus, was able without difficulty to obtain sole possession of the throne. Rome received him joyfully, and the distant provinces echoed his welcome. His first actions were just and noble. He interred, in the most honorable manner, the remains of his mother and of his brother Nero, set free all state prisoners, recalled the banished, and forbade all prosecutions for treason. He conferred on the magistrates free and independent power. Although the will of Tiberius had been declared by the senate to be null and void, he fulfilled every article of it, with the exception only of that above-mentioned. When he was chosen consul he took his uncle, Claudius, as his colleague. Thus he distinguished the first eight months of his reign by many magnanimous actions, when he fell sick. After his recovery, by a most unexpected alteration, which has given good grounds to suspect his sanity, he suddenly showed himself the most cruel and unnatural of tyrants. The most exquisite tortures served him for enjoyments. During his meals he caused criminals, and even innocent persons, to be stretched on the rack and beheaded: the most respectable persons were daily executed. In the madness of his arrogance he even considered himself a god, and caused the honors to be paid to him which were paid to Apollo, to Mars, and even to Jupiter. He also showed himself in public with the attributes of Venus and of other goddesses. He built a temple to his own divinity. At one time he wished that the whole Roman people had but one head, that he might be able to cut it off at one blow. He frequently repeated the words of an old poet, *Oderint dum metuant* — "let them hate so long as they fear." He squandered the public money with almost incredible prodigality. One of his greatest follies was the building of a bridge between Baïæ and Puteoli (Puzzuoli), in order that he might be able to boast of marching over the sea on dry land. He had it covered with earth, and houses built on it, and then rode over it in triumph. He gave a banquet in the middle of the bridge, and to celebrate this great achievement ordered numbers of the spectators whom he had invited, to be thrown into the sea. On his return, he entered Rome in triumph, because, as he said, he had conquered nature herself. After this, he made preparations for an expedition against the Germans, passed with more than 200,000 men over the Rhine, but returned after he had traveled a few miles, and that without having seen an enemy. Such was his terror,

that, when he came to the river, and found the bridge obstructed by the crowd upon it, he caused himself to be passed over the heads of the soldiers. He then went to Gaul, which he plundered with unexampled rapacity. Not content with the considerable booty thus obtained, he sold all the property of both his sisters, Agrippina and Livilla, whom he banished. He also sold the furniture of the old court, the clothes of Marcus Antoninus, of Augustus, Agrippina, etc. Before he left Gaul, he declared his intention of going to Britain. He collected his army on the coast, embarked in a magnificent galley, but returned when he had hardly left the land, drew up his forces, ordered the signal for battle to be sounded, and commanded the soldiers to fill their pockets and helmets with shells, while he cried out, "This booty, ravished from the sea, is fit for my palace and the capitol!" When he returned to Rome, he was desirous of a triumph on account of his achievements, but contented himself with an ovation. Discontented with the senate, he resolved to destroy the greater part of the members, and the most distinguished men of Rome. This is proved by two books which were found after his death, wherein the names of the proscribed were noted down, and of which one was entitled *Gladius* (Sword), and the other *Pugillus* (Dagger). He became reconciled to the senate again when he found it worthy of him. Caligula's morals were, from his youth upward, corrupt. After he had married and repudiated several wives, Cæsonia retained a permanent hold on his affections. A number of conspirators, at the head of whom were Chærea and Cornelius Sabinus, both tribunes of the prætorian cohorts, murdered him in the 29th year of his age, and the fourth of his tyrannical reign, which thus lasted from 37 to 41 A.D.

Ca'liph (successor, successor and representative) is the name assumed by the successors of Mohammed in the government of the faithful and in the high-priesthood. Caliphate is therefore the name given by historians to the empire of these princes which the Arabs founded in Asia, and impelled by religious enthusiasm, enlarged, within a few centuries, to a dominion superior in extent to the Roman empire. The title is still borne by the Sultan of Turkey. Mohammed, in the character of the prophet of God, made himself the spiritual and temporal ruler of his people. In the following account the dates both of the Hegira and the Christian year are often given. The difference in the mode of computing the Mohammedan year has caused considerable divergencies among authorities in regard to the exact dates of the particular events of Mohammedan history.

After the death of the Prophet the election of a successor occasioned considerable excitement, Mohammed having left no son and nominated no successor. Abdallah Ebn Abu Koa-fas, called Abubekr, that is, father of the virgin (because his daughter Ayesha was the only one of the wives of Mohammed whom he had married as a virgin), obtained the victory over Ali, the cousin and son-in-law of Mohammed, and became the first caliph, 632 A.D. (year of the Hegira 11). Victorious over enemies at home, by the aid of his general Khaled, "the Sword of God," he proceeded, as the Koran directs, to spread the doctrines of Mohammed by arras

among the neighboring nations. With the watchword conversion or tribute, a numerous army, consisting entirely of volunteers inspired with zeal for the holy war, penetrated into Syria and Mesopotamia, but before much could be done, Abubekr died after he had filled the place of the Prophet two years and four months.

Omar, another father-in-law of the Prophet, now became second caliph, and under him the war was continued. The Moslems having once acquired a strong footing in Syria by the treacherous surrender of Bosra, they undertook, under Khaled, the siege of Damascus, and having repulsed two large armies, sent by the Emperor Heraclius to the relief of the city, they obtained possession of it by a capitulation (635 A. D.), the terms of which were perfidiously broken, Khaled pursuing and slaughtering the retreating Christians. By him and other generals, though not without a brave resistance on the part of the Greeks, the subjugation of Syria was completed (638 A. D., of the Hegira 17). Jerusalem having been compelled to surrender (636 A. D., Heg. 15), Omar proceeded thither in person to fix the terms of capitulation, which subsequently served as a model in settling the relations of the Moslems to the subject Christians. These terms were carefully observed by the conscientious caliph. The new Persian empire of the Sassanidæ was also overthrown, and Mesopotamia and other extensive regions overrun. Equally successful was the Mohammedan general, Amru, in Egypt, which was subjected to the caliphate in two years (641). Omar was the first who bore the appellation of Emir al Moumenin ("Prince of the Faithful")—a title inherited by all succeeding caliphs. Many of these conquests were over Christian populations who readily changed their creed and adapted themselves to the new rule.

After the murder of Omar by a revengeful slave (644 A. D., Heg. 23), a council, appointed by him on his death-bed, chose Osman, or Othman, son-in-law of the Prophet, passing over Ali. Under him the empire of the Arabs continued to expand. From Egypt the tide of conquest advanced westward along the northern coast of Africa, as far as Ceuta. Cyprus too (647 A. D.), and Rhodes (654 A. D.) were conquered; but the former was lost again two years after. An agitation against Othman now arose, partly owing to the fact that he favored and aggrandized his own family connections in every way, and intrusted the provinces, not to the most capable, but to his favorites. To many also the claims of Ali to the caliphate were deemed superior to those of Othman. The dissatisfaction thus excited occasioned a general insurrection in the year 656 (Heg. 34), which terminated in Othman's death.

Ali, the son-in-law of the Prophet by Fatima, became the fourth caliph, by the choice of the people of Medina, and is regarded as the first legitimate possessor of the dignity by a numerous sect of Mohammedans, which gives him and his son, Hassan, almost equal honor with the Prophet. This belief prevails among the Persians, and others who belong to the Shiite sect as opposed to the Sunnites or orthodox. Instead of being able to continue the conquests of his predecessors, Ali always had to contend with domestic enemies. Among these was Ayesha, the widow of the Prophet, called the

mother of the faithful; also Tellah, Zobeir, and especially the powerful Moawiyah, governor of Syria, who all laid claim to the government. These were able to create suspicion, and spread the report that Ali had instigated the murder of Othman. In vain did he endeavor to repress the machinations of his enemies by intrusting the government of the provinces to his friends. Nowhere were the new governors received. The discontented collected an army, and made themselves masters of Bassora. Ali defeated it, and Tellah and Zobeir fell; but he could not prevent Moawiyah and his friend Amru from extending their party and maintaining themselves in Syria, Egypt, and even in a part of Arabia. Three men of the sect of the Kharejites proposed to restore concord among the faithful, by slaying each one of the three heads of the parties, Ali, Moawiyah, and Amru; but Ali only fell (661 A. D., Heg. 40). He was a man of a cultivated mind, and was the author of a collection of sentences or moral maxims, etc. His son, the mild, peaceful Hassan, had no desire to defend the caliphate against the indefatigable Moawiyah; a treaty was concluded between the two, by which Hassan solemnly abdicated the government (661). Some years later he perished by poison, said to have been administered by one of his wives at the instigation of Moawiyah.

Moawiyah I. transferred the seat of the caliphate from the city of the Prophet, Medina, where it had hitherto always been, to Damascus, in the province of which he had formerly been governor (673 A. D., Heg. 54). With him began the series of the caliphs called Ommiades (or Ommayyads), which name this family bore from Moawiyah's progenitor, Ommiyah. Not long after his accession he was obliged to quell an insurrection of the Kharejites by a campaign, and a rebellion at Bassora by severe punishments. He then seriously meditated the entire subversion of the Byzantine empire (q.v.). Rhodes was attacked, and the famous colossus was broken in pieces. His son Jezid marched through Asia Minor, meeting but little resistance; then crossed the Hellespont and laid siege to Constantinople, but was obliged to raise it (669 A. D., Heg. 49). Other generals were more successful against the Turks in Khorasan, and the regions extending to the borders of India.

The next caliph, Jezid (or Yazid), was not altogether a worthy successor of his father, the politic Moawiyah (680 A. D., Heg. 60). At first he was not acknowledged by the two holy cities, Mecca and Medina, which, as long as the caliphs had resided in the latter city, had enjoyed a principal voice in their election, but which had not been consulted when Moawiyah, according to the custom of the caliphs, appointed his successor in his lifetime. The discontented espoused the cause, either of Houssain, the famous son of Ali, or of Abdallah, Zobeir's son, both of whom had laid claim to the caliphate. A rebellion of the inhabitants of Irak, in favor of Houssain, led by Moslim, Houssain's cousin, was suppressed by the prudence and decision of Obeidallah, governor of Cufa; and Houssain, who had accepted the invitation of the conspirators, was killed (680 A. D., Heg. 61), to the great grief and rage of all those who took part with Ali's family—a feeling still cherished by the Shiites. Abdallah

Ebn Zobeir was recognized as caliph in Medina, where Jezid was detested for his voluptuousness and scepticism. On this account Medina was invested, stormed, and sacked; and Mecca, in which Abdallah took shelter, was besieged, but during the siege Jezid died.

After Jezid's death (683 A.D., Heg. 64) his son, Moawiyah II., a weak but pious youth, became caliph, but after a reign of 40 days he died when he was meditating abdication. By this time Abdallah Ebn Zobeir had caused himself to be proclaimed as Prince of the True Believers, and he had a powerful following. For a period anarchy prevailed. Irak, Hejaz, Yemen, and Egypt acknowledged Abdallah Ebn Zobeir as caliph. In Syria, Dehac, regent to Abdallah, was at first chosen caliph; but the people of Damascus appointed Merwan I., of the race of the Ommiades, caliph, who made himself master of all Syria and Egypt. Khorasan separated from the caliphate, and submitted to a prince of its own choosing—the noble Salem. In the following year (684 A.D., Heg. 65) Soliman Ebn Sarad excited a great rebellion of the discontented in Syria and Arabia, and pronounced both caliphs deposed, but was defeated by the experienced soldier Obeidallah. Merwan (who died in 685) had been compelled to promise on oath to leave the caliphate to Khaled, the son of Jezid, yet he nominated his son Abdalmelek as his successor. Under him (685 A.D., Heg. 65) Mokthar, a new rebel against both caliphs, was subdued by one of them, Abdallah (686 A.D., Heg. 67); but this only made Abdallah more formidable to Abdalmelek, who, in order to be able to direct all his forces against him, concluded a peace with the Greek emperor, Justinian II., in which, reversing the order of the Koran, he conceded to the Christians a yearly tribute of 50,000 pieces of gold. He then marched against Abdallah, defeated him twice, and took Mecca by assault. In this last conflict Abdallah fell. Thus Abdalmelek united under his dominion all the Mussulmans; but the resistance of governors and wars with the Greeks kept him constantly occupied. He was the first caliph that caused money to be coined. He died 705 A.D. (Heg. 86). Under Walid I., his son, the Arabs conquered in the east Charasm and Turkestan (707 A.D., Heg. 88); in the north Galatia (710 A.D.); and in the west Spain (711 A.D.). (See SPAIN.) He died in 716 (Heg. 97). His brother and successor Soliman besieged Constantinople, but his fleet was destroyed by Greek fire, and his army suffered severely from famine. He died while on his way to take part in the siege in 717 (Heg. 99).

Omar II., his successor by Soliman's last will, was equally unsuccessful in the conduct of the war. Having incurred the displeasure of the Ommiades by his indulgence toward the sect of Ali, he was poisoned by them (721 A.D., Heg. 102). Jezid II., his successor also by the disposition of Soliman, died of grief for the loss of a female favorite, of whose death he was the author (723 A.D., Heg. 104). His successor was Hisham, who reigned till 743. He had to suppress several revolts, the chief being that of Zaid (739-40). About this time the Abbassides, descendants of Abbas, son of Abdalmoteleb, uncle of the Prophet, began to be formidable. Under Hisham an end was put to the progress of the Saracens in the west by the

energy of Charles Martel, who annihilated their armies at Tours in 732, and at Narbonne in 736. Walid II. was murdered after a reign of one year (744 A.D., Heg. 124).

After the still briefer reigns of Jezid III. and of his brother Ibrahim, Merwan II. followed, with the surname (respectable among the Arabs) of the Ass (Al Hemar). Ibrahim, the Abbasside leader, being imprisoned and put to death by this prince, his brother, Abul Abbas, took up the cause of the Abbassides and assumed the title of caliph. In the resulting war Merwan was twice defeated, and fell (750 A.D., Heg. 133). With him terminates the series of caliphs of the race of Ommiyah. The furious Abdallah, uncle of Ibrahim and Abul Abbas, treacherously destroyed almost all the Ommiades by a horrible massacre at a meeting to which they had been inveigled. One of the family, Abderrahman, grandson of Hisham, having taken refuge in Spain, escaped the massacre and founded the independent caliphate of Cordova. See SPAIN.

Abul Abbas, first of the Abbasside caliphs, died young in 754 A.D. (Heg. 136). His brother, Abu Giafar, called Al Mansur ("the Victorious"), was obliged to contend with a rival in his uncle, Abdallah, whom he, however, overcame. He acquired his surname by his victories in Armenia, Cilicia, and Cappadocia. Spain was lost by him, however, as well as Africa. In the year 764 he founded the city of Bagdad on the Tigris, and transferred thither the seat of the caliphate (768 A.D., Heg. 149). He died on a pilgrimage to Mecca, leaving immense treasures (775 A.D., Heg. 158). Mohammed Mahdi, his son and successor, a man of a noble character, had to contend with the turbulent inhabitants of Khorasan under the pretended prophet, Hakem, and died 785 A.D.; and Musa or Hadi, his grandson, met with the same opposition from the Ali party under Houssain. Hadi's mother was a strong-minded, ambitious woman, who wished to rule her son, and with him the state, and this led him to try to poison her. She, however, caused him to be smothered before he could effect his purpose.

Hadi was followed, not by his son, but by his brother Harun (786 A.D.), who was denominated Al Rashid ("The Upright") on account of his justice, and is famous for promoting the arts and sciences. He concluded a truce (an actual peace could never be made with Christians) with the Greek empress, Irene (788 A.D.), who consented to pay him tribute. Yahya, a member of the house of Ali, disputed with him the possession of the throne, but subsequently submitted. Harun, however, tarnished his reputation by the murder of Yahya, and still more by the murder of his sister, and her favorite the Barmecide Giafar, and by the expulsion and persecution of the whole family of the Barmecides, whose services to the state and himself had been of very great value. Harun divided the empire among his three sons. Al Amin, as sole caliph, was to reign over Irak, Arabia, Syria, Egypt, and the rest of Africa: under him Al Mamun was to govern Persia; Turkestan, Khorasan, and the whole East; and Motassem was to rule Asia Minor, Armenia, and all the countries on the Black Sea. The younger brothers were to succeed Amin in the caliphate. At Thus, in Khorasan, through which Harun was passing, in order to quell a rebellion that had

CALIPH

broken out in Samarcand, he was arrested by death, of which he had been forewarned by extraordinary dreams (809 A.D., Heg. 190).

Al Amin the faithful (his proper name was Mohammed) was undeserving of this name. Untrue to his obligations as a ruler, and addicted to all kinds of sensuality, he left the discharge of his duties to his vizier Fadel. The vizier, from hatred of Mamun, persuaded the caliph to appoint his son his successor, and deprive Motassem of his portion of territory. A war arose between the brothers. Mamun's general, Thaher, defeated the armies of the caliph, took Bagdad, and caused Amin to be put to death (813 A.D., Heg. 194).

Mamun was recognized as caliph. Nobler in his inclinations than Amin, he cherished the arts and sciences; but, like his brother, he left the government and armies to his ministers. His measures to secure the caliphate to the Alides in order to please Riza, his favorite, excited the powerful Abbassides to an insurrection. They declared Mamun to have forfeited the throne, and proclaimed Ibrahim caliph, but submitted again, after the death of Riza, when the caliph had changed his sentiments. The vast empire of the Arabs, embracing numberless provinces in two quarters of the globe, could hardly be held under his sceptre. There is but one step, and that an easy one, under a weak sovereign, from a viceroyalty to a kingdom. The wisdom of the former Abbassides could only retard this evil; the faults of the latter precipitated it. Even under Harun Al Raschid the Agladides had founded an independent empire in Tunis (800 A.D., Heg. 181), as had likewise the Edrisides in Fez. Thaher, having been appointed governor of Khorasan, made himself independent. From him the Thaherides derived their origin. Mamun sent Thomas, a Greek exile, with an army against the Greek emperor, Michael II. the Stammerer. Thomas depopulated Asia Minor, and laid siege to Constantinople; but a storm destroyed his fleet (823 A.D., Heg. 207). A second attack on the imperial city was repelled by the aid of the Bulgarians. Thomas was taken prisoner, and executed. Toward the many religious sects into which the Mussulmans were then divided Mamun acted with toleration. He died 833 A.D. (Heg. 218). During his government (about 830 A.D., Heg. 215), the African Arabs conquered Sicily and Sardinia, where they maintained themselves about 200 years, till the latter island was torn from them by the Pisans in 1016-17, and the former island by the Normans between 1061 and 1090.

Motassem, at first named Billah (by the grace of God), Harun's third son, built a new city, Samara, 56 miles from Bagdad, and transferred thither his residence. In his wars against the Greeks and rebellious Persians he first used Turkish soldiers. From grief at the death of his private physician, Motassem became insane, and died 842 A.D. (Heg. 227).

Vathek Billah, his son, member of the Motazelite sect, exerted himself to promote the advancement of science; but he was an enervated voluptuary, and died of nervous weakness (846 A.D., Heg. 232). A contest for the succession, between his brother Motawackel and his son Mothadi, was decided by the already powerful and arrogant Turkish bodyguard in favor of the former, the more unworthy competitor.

Under Motawackel it became more and more customary to carry on all wars by means of Turkish mercenaries. Thus the Arabs were rendered unwarlike and effeminate, as must necessarily be the case in a hot climate with those who do not live in constant activity. Motawackel manifested a blind hatred of the Alides, not sparing even the memory of the deceased. He moreover evinced a malignant spirit, and a proneness to sensuality and cruelty. His own son, Montasser, trained to early indulgence in both these vices, and often barbarously treated by him, conspired against him with the Turkish bodyguards, and effected his murder (861 A.D., Heg. 247).

The Turks, who now arrogated the right of electing the caliphs, called the murderer to the throne of the faithful, and compelled his brothers, who were innocent of the atrocious act, and whose revenge they feared, to renounce the succession which had been designed for them by Motawackel. Montasser died soon after of a fever, caused by the goadings of remorse (862 A.D., Heg. 248). The Turks then elected Mostain Billah, a grandson of the caliph Motassem. Two of the Alides became competitors with him for the caliphate. One of them, at Cufa, was defeated and put to death; but the other founded an independent empire in Tabristan, which subsisted half a century. The discord of the Turkish soldiers completed the dismemberment of the empire. One party raised to the throne Motaz, second son of Motawackel, and compelled Mostain to abdicate. Motaz Billah soon found means to get rid of him as well as of his own brother Muwiad. He then meditated the removal of the Turkish soldiers; but before he found courage to execute his projects they rebelled on account of their pay being in arrear, and forced him to resign the government. He soon after died (869 A.D., Heg. 255). They conferred the caliphate on Mohadi Billah, son of the caliph Vathek, but deposed this excellent prince 11 months after, because he attempted to improve their military discipline.

Under Motawackel's third son, the sensual Motamed Billah, whom they next called to the caliphate, Muaffek his brother succeeded, by his prudence and courage, in overcoming the dangerous preponderance of these Turks. Motamed transferred the seat of the caliphate from Samara back to Bagdad in the year 873 (Heg. 259), where it afterward continued. In the same year, owing to a revolution in the independent government of Khorasan, the dynasty of the Thaherides gave place to that of the Sofarides, who eventually extended their dominion over Tabristan and Segestan. The governor of Egypt and Syria, Achmet Ben Tulun, also made himself independent (877 A.D., Heg. 263), from whom are descended the Tulunides. The brave Muaffek annihilated, indeed, the empire of the Zinghians, in Cufa and Bassora, 10 years after its formation (881 A.D., Heg. 268); but he was unable to save the caliphate from the ruin to which it was continually hastening.

Motamed died soon after him (892 A.D., Heg. 279), and was succeeded by Muaffek's son, Mothadad Billah. He contended unsuccessfully with a new sect that had arisen in Irak—the Carmathians (899 A.D., Heg. 286)—against whom his son, Moktaphi Billah (902 A.D., Heg. 289), was more fortunate. He was still more successful in a war against the Tulunides, as he

CALIPH

again reduced Egypt and Syria in 905 (Heg. 292). Under his brother, Moktadar Billah, who succeeded him at the age of 13 years (909 A.D., Heg. 296), rebellions and bloody quarrels about the sovereignty disturbed the government of the empire. He was several times deposed and reinstated, and finally murdered (931 A.D., Heg. 319). During his reign Abu Mohammed Obeidallah rose in Africa, who, pretending to be descended from Fatima, daughter of the Prophet (therefore from Ali), overthrew the dynasty of the Aglades in Tunis, and founded that of the Fatimites (910 A.D., Heg. 298). Not satisfied with reigning independent of the caliph, this party, as descendants of the Prophet, asserted themselves to be the only lawful caliphs.

Shortly afterward the dynasty of the Bouides, in Persia, rose to authority and power (925 A.D., Heg. 315). Khorasan was still independent. The only change was that the Samanides had taken the place of the Soffarides. In a part of Arabia the heretic Carmathians ruled; in Mesopotamia, the Hamadamites. In Egypt, which had just been recovered, Akschid, from a governor, was called to be a sovereign. From him descended the Akschidites. Kahr Billah, Mothadad's third son, merited his fate, on account of his malice and cruelty. The Turkish soldiers having recovered their power drove him from the throne into exile (934 A.D., Heg. 322), in which he perished five years afterward. Rhadi Billah, his brother, bore the dignity of an emir al omra ("captain of the captains"), with which the exercise of absolute power, in the name of the caliph, was united; and thus the caliph was more and more thrown into the back-ground. The first who was invested with this dignity was Raik; but it was soon torn from him by the Turk Jakan, by force of arms, in the year 939 (Heg. 327). Jakan extended the power of the office to such a degree as to leave the caliph nothing, but the name of his temporal sway, and even assumed the right of determining the succession to the throne. Raik was indemnified by receiving Cufa, Bassora, and Irak Arabi as an independent government.

The next caliph, Motaki Billah, Moktader's son, made an effort to regain his independence by the murder of Jakun; but he was soon compelled by the Turkish soldiers to appoint Tozun, another of their countrymen, emir, who made this office hereditary. He formally devised it to a certain Schirzad, but it soon came into the possession of the Persian royal house of the Bouides, whose aid the succeeding caliph, Mostaki Billah, solicited against the tyranny of Schirzad. The first Bouide emir, Moezddulat, left it as an inheritance to his posterity. Not the caliph but the emir now reigned in Bagdad, though over only a small territory. In every remote province there were independent princes.

To continue the catalogue of the names of those who were henceforward caliphs would be superfluous, for these Mussulman popes had not by any means the power of the Christian. It would be too tedious to trace the branches into which the history of the caliphate is now divided; but we must briefly show the great changes which the different states and their dynasties have undergone, and which gave rise to the dominion of the Ottoman Porte.

During the minority of the Akschidite Ali, the Fatimite Morz Ledinillah, at that time caliph in Tunis, subjugated Egypt in 969 (Heg. 358),

and founded Cairo, which he made the seat of his caliphate. There were, consequently, at this time three caliphs,— at Bagdad, Cairo, and Cordova,— each of which declared the others heretics. But the Fatimites as well as the Abbassides fell under the power of their viziers, and, like them, the Omniades in Cordova were deprived of all power by the division of Spain into many small sovereignties, till they were entirely subverted by the Morabethun.

Ilkan, king of Turkestan, having conquered Khorasan, and overthrown the Samanides, was expelled again by Mahmud, prince of Gazna, who founded there the dominion of the Gaznevites, in 998 (Heg. 388), who were soon, however, overthrown in turn by the Seljuk Turks under Togrul Beg, in 1030 (Heg. 421). This leader conquered also Charasm, Georgia, and the Persian Irak. Called to the assistance of the Caliph Kajem Bemeillah, at Bagdad, against the tyranny of the Bouide emirs, he proceeded to Bagdad, and became emir himself in 1055 (Heg. 448), by which means the dominion of the Turks was firmly established over all the Mussulmans. To his nephew, Alp Arslan (who defeated and took prisoner the Greek emperor Romanus Diogenes), he left this dignity, with so great power that these Turkish emirs al omra were frequently called the sultans of Bagdad. Turkish princes, who aspired to be sovereigns in the other provinces, were at first satisfied with the title of atabek (father, teacher), such as the atabeks of Irak and Syria, of Azerbaijan, Farsistan (Persia), and Laristan. It was the atabeks of Syria and Irak with whom the Crusaders had principally to contend. The first was called Omededdin Zenghi; by the Franks, Sanguin. They were afterward termed sultans. The Caliph of Bagdad was recognized by all as the spiritual sovereign of all Mussulmans: his temporal authority did not extend beyond the walls of Bagdad. Nouredin, Zenghi's son, being requested by the Fatimite caliph Adhed to protect Bagdad against his vizier, sent to Cairo, in succession, Shirkuh and Salaheddin or Saladin; but the latter overthrew the Fatimites (as schismatic anti-popes), and usurped the authority of Sultan of Egypt in 1170 (Heg. 556), with which he united Syria, after Nouredin's death. This is the great Salaheddin (Saladin), the formidable enemy of the Christians, the conqueror of Jerusalem. The dynasty which commenced with him was called, from his father, Ayoub, the Ayoubites. They reigned over Egypt till expelled by the Mamelukes in 1250. The Seljuk sultans of Irak were overthrown in 1194 (Heg. 590) by the Charasmians; and as those of Khorasan were extinct, there remained of the Seljuk dominions nothing but the empire of Iconium or Roum, in Asia Minor, from which the present Turkish empire derives its origin. See OTTOMAN EMPIRE.

The Charasmian sultans extended their conquests far into Asia, until their territories were invaded by the Tartars under Genghis Khan, in 1220 (Heg. 617). They were finally totally destroyed by his son Octai. Bagdad, also, the remains of the possessions of the caliphs, became the easy prey of a Mongol horde under Holagu, in 1258 (Heg. 636), by the treachery of the vizier Al Kami, and a slave, Amram, under the 56th caliph Motazem. The nephew of the cruelly murdered Motazem fled to Egypt, where he continued to be called caliph under the protection

of the Mamelukes, and bequeathed the Mohammedan popedom to his posterity. When the Turks conquered Egypt, in 1517, the last of these nominal caliphs was carried to Constantinople and died, after returning to Egypt in 1538. The Turkish sultans subsequently assumed the title of caliph, and have retained it to the present day, with the claim of spiritual supremacy over all Mussulmans, though this claim is little regarded out of his own dominions, and strongly disputed by the Persians.

Calip'pus, a Greek astronomer, who was the first to discover the inaccuracy of the golden number or period invented by Meton, and attempted to remedy it by the invention of a new cycle of 76 years, being only six hours less than the quadruple of Meton's period. It commenced 331 B.C., and being adopted particularly by astronomers in giving the date of their observations, is frequently mentioned by Ptolemy. Though more perfect than Meton's period, it was shown to be inaccurate by Hippocrates, who substituted for it a cycle of 345 years.

Calisa'ya Bark, the yellowish bark of *Cinchona Calisaya* (q.v.).

Calisthen'ics, or **Callisthenics**, the art of promoting gracefulness, strength, and health by means of the lighter forms of gymnastic exercise. See GYMNASTICS.

Cal'iver, an early form of hand-gun, musket, or arquebuse, lighter and shorter than the original musket, fired without a rest and much more rapidly. It seems to have gone out of fashion about 1630.

Calixtines, ka-lik's'tinz, or **Utraquists**, a sect of the Hussites in Bohemia, who differed from the Roman Catholics principally in giving the cup in the Lord's Supper to laymen, from which circumstance they got their name, derived from the Latin *calix*, "a cup." For their tenets see HUSS, JOHN.

Calix'tus, the name of several popes. 1. The first was a Roman bishop from 217 to 224, when he suffered martyrdom. 2. **GUILDON**, son of Count William of Burgundy, archbishop of Vienne, and papal legate in France, was elected in 1119, in the monastery of Clugny, successor of the expelled Pope, Gelasius II., who had been driven from Italy by the Emperor Henry V., and had died in this monastery. In the same year he held councils at Toulouse and at Rheims, the latter of which was intended to settle the protracted dispute respecting the right of investiture. As the Emperor Henry V. would not confirm an agreement which he had already made on this subject, Calixtus repeated anew the excommunication which he had already pronounced against him when legate in 1112. He excommunicated also the anti-pope, Gregory VIII., and renewed former decrees respecting simony, lay investiture, and the marriage of priests. Successful in his contest with the emperor on the subject of investiture by means of his alliance with the rebels in Germany, in particular with the Saxons, he made his entrance into Italy in 1120, and with great pomp into Rome itself; took Gregory VIII. prisoner in 1121, and banished him to a monastery. He availed himself of the troubles of the emperor to force him, in 1122, to agree to the Concordat of Worms. After an energetic pontificate he died in 1124. 3. **CALIXTUS III.**, chosen in 1168

in Rome as anti-pope to Paschal III., and confirmed by the Emperor Frederick I. in 1178, was obliged to submit to Pope Alexander III. As he was not counted among the legal popes, a subsequent Pope was called Calixtus III. This was a Spanish nobleman, Alfonso Borgia, counselor of Alfonso, king of Aragon and the Sicilies. He was made Pope in 1455. He was at this time far advanced in life, but equaled in policy and energy the most enterprising rulers of the Church. He appointed an ecclesiastical commission to reconsider the case against Jeanne d'Arc, and its decision was that she died a martyr to her faith, her king, and her country. In order to appease the displeasure of the princes and nations occasioned by the proceedings of the councils of Constance and Basel, he instigated them to a crusade against the Turks. His intention was counteracted in Germany by the discontent of the states of the empire with the Concordat of Vienna, and in France by the appeals of the universities of Paris and Toulouse against the tithe for the Turkish war. King Alfonso, moreover, was indignant at the refusal of the Pope to acknowledge his natural son Ferdinand as king of Naples.

Calixtus (properly **CALLISEN**) **Georg**, gä-örg, German clergyman, the most able and enlightened theologian of the Lutheran Church in the 17th century: b. Medelbye, Schleswig, 14 Dec. 1586; d. 19 March 1656. In 1609 he visited the universities of the south of Germany; in 1612 those of Holland, Britain, and France, where his intercourse with the different religious parties and the greatest scholars of his time developed that independence and liberality of opinion for which he was distinguished. In 1614 he was made professor of theology at Helmstedt, and he held this post till his death. His treatises on the authority of the Holy Scriptures, transubstantiation, celibacy, supremacy of the Pope, and the Lord's Supper belong, even according to the judgment of learned Roman Catholics, to the most profound and acute writings against Roman Catholicism. But his genius and the depths of his exegetic and historical knowledge exposed him to the persecutions of the zealots of his time. His assertion that the points of difference between Calvinists and Lutherans were of less importance than the doctrines in which they were agreed, and that the doctrine of the Trinity was less distinctly expressed in the Old Testament than in the New, and his recommendation of good works, drew upon him the reproach of heresy. He made Christian morality a distinct branch of science, and, by reviving the study of the Christian fathers and of the history of the Church, prepared the way for Spener, Thomasius, and Semler.

Calking, kôk'ing, the process of driving tarred oakum into the seams between the planks of ships, in order to render the joints watertight. A wisp of the oakum is drawn out and rolled together between the hands, and, being laid over the seam, is driven by a wedge-shaped instrument called a calking iron. The work is afterward gone over with a more powerful instrument of the same kind, which is held by one man and struck with a beetle held by another. When all the oakum is forced in that is practicable, the seams are payed over with melted pitch, and where they are to be covered

CALKINS — CALLED BACK

with copper, a thread of spunyarn is laid in to make them flush with the planks.

Calkins, kô-kîns, Franklin Welles, American writer: b. Iowa County, Wisconsin, 5 June 1855. He has traveled extensively in the Rocky Mountains, 1870-86; and is the author of 'Frontier Sketches' (1893); 'Indian Tales' (1893); 'Hunting Stores' (1893); 'The Congar Tamer' (1899).

Calkins, Gary Nathan, American scientist: b. Valparaiso, Ind., 18 Jan. 1869. He was graduated at the Massachusetts Institute of Technology in 1890; had charge of scientific expeditions to Alaska in 1896 and 1897; and in 1900 was instructor in Zoology at Columbia University.

Call, Wilkinson, American senator: b. Russellville, Ky., 9 Jan. 1834. He went to Florida as a boy, adopted the legal profession; served as adjutant-general in the Confederate army, and was presidential elector for the State-at-large in 1872 and 1876, and the same year was a delegate to the Democratic National Convention. He was chosen senator by the Florida legislature under the provisional government established by President Johnson, but was denied admission. In 1879 he was elected senator and took his seat on 18 March. He was re-elected in 1885 and 1891, serving until 3 March 1897.

Calla, a genus of plants of the natural order *Araceæ*, consisting of herbaceous marsh plants with creeping or floating stems, cordate leaves, and spadices of small flowers enveloped in large leafy spathe. The flowers are succeeded by red berries. *C. palustris* occurs in cold bogs, from New Jersey to Nova Scotia, and west to Michigan in America, and in the north of Europe. It has a creeping root-stock extremely acrid in taste, but which, when deprived of its acridity by maceration and boiling, is made by the Laplanders into bread. The Trumpet Lily, or Lily of the Nile (*Richardia athiopica*), is sometimes referred to this genus.

Callahan, James Morton, American publicist: b. Bedford, Ind., 4 Nov. 1864. He was graduated at the University of Indiana in 1894, lecturer on American diplomatic history at Johns Hopkins University 1898-1902, and since 1902 professor of history and political science, West Virginia University. He has written 'Neutrality of the American Lakes' (1898); 'Cuba and International Relations' (1899); 'American Relations in the Pacific and the Far East' (1901); 'The American Expansion Policy.'

Callao, käl yã'ô or käl lä'ô, Peru, the port of Lima, and the starting point of the Callao, L. & Oroya R.R. It is situated in lat. 12° 4' S., lon. 77° 8' W. The railway connects the seaboard with a point near the head of navigation on the Amazon River, and the line of the intercontinental railway, according to surveys tentatively approved in 1902, will pass through Oroya. Thus Callao, as a crossroads port, is favorably situated for sharing in the future commercial development of South America, though it has not a very good harbor. After the defeat of the combined forces of Peru and Bolivia by Chile in 1880, Callao was bombarded by a Chilean fleet. (See CHILE.) In 1867 it had a similar experience at the hands of Spain. For early history see PERU. On 28 Oct. 1746, a

great wave destroyed the town, the frigate San Firmin was carried far inland, 19 vessels were stranded, and 4,600 people killed (see LIMA). The famous castle of Callao, planned by the French mathematician Godin, was the last point on the Pacific coast to be surrendered by the Spaniards. Pop. (including province, of which area is 14 square miles) 48,118.

Callaway, Morgan, American educator: b. Cuthbert, Ga., 3 Nov. 1862. He was educated at Emory College, Ga., and at Johns Hopkins University, and has been professor of English in the University of Texas from 1890. He has published 'The Absolute Participle in Anglo-Saxon' (1889); 'The Appositive Participle in Anglo-Saxon' (1901).

Callaway, Samuel Roger, American railroad president: b. Toronto, Canada, 24 Dec. 1850; d. New York, 1 June 1904. At the age of 14 he entered the employ of the Grand T. Ry., and later was in the service of the Canadian Express Company, and Great W. Ry. His rapid progress thereafter may be summarized as follows: in 1875 he became superintendent of the Detroit & M. R.R.; in 1880, manager of the Chicago & G. T.; in 1884, vice-president of the Union P. and allied lines of nearly 6,000 miles; president of the Toledo, St. L. & K. C. R.R., 1887-95; president of the Lake Shore & M. S., 1897-8; president of the New York C. & H. R. R.R., 1898-1901. He was regarded as one of the ablest railway managers in the United States. From 1901 he was president of the American Locomotive Company.

Callcott, kôl'kôt, Sir Augustus Wall, English painter: b. Kensington, 20 Feb. 1779; d. there, 25 Nov. 1844. He studied portrait-painting under Hoppner, but soon discovered that his genius lay in another department of art, and was so successful in his delineation of landscape, that in 1807 he was elected an associate of the Royal Academy. In 1837 he was knighted, and in 1843 was appointed keeper of the royal collections of pictures. He suffered much from ill health for many years before his death. Callcott excelled in the delineation of coast scenes, and like Turner, has been called the "Modern Claude."

Callcott, John Wall, English composer, brother of Augustus Wall (q.v.): b. Kensington, 20 Nov. 1766; d. near Bristol, 15 May 1821. He at first intended to become a surgeon, but abandoned the intention, and devoted himself to music. In 1785 he competed for the prizes of the Catch Club, and gained three out of four gold medals. In the following decade the same club awarded him 20 medals. In 1790, when Haydn arrived in England, he studied under him, and the same year obtained from Oxford the degree of musical doctor. In 1805 he published his 'Musical Grammar'; and in 1806 was preparing to deliver lectures on music at the Royal Institution when his mind gave way. He never completely recovered, although his insanity left him on one occasion for three years. He ranks among the most eminent of English composers.

Called Back, a sensational tale by "Hugh Conway" (FREDERICK JOHN FARGUS), published in 1883. Extremely sensational in character, and with little literary merit, the graphic force of this story, the rapidity of its movement, its di-

rectness, and its skilful suspension of interest, gave it for a season so extraordinary a vogue that it outsold every other work of fiction of its year.

Calleja del Rey, käl-yā'ha dēl rā, **Felix Maria**, Spanish general: b. Medina del Campo, 1750; d. Cadiz, 1820. He distinguished himself in Mexico by quelling the insurrection instigated in 1810 by Hidalgo, who was on the point of seizing the city of Mexico, when Calleja was charged by the viceroys Venegas to oppose his progress. After encounters, in which both parties strove to surpass each other in a display of cruelty and brutality, Calleja succeeded in defeating Hidalgo's army, and on 2 Jan. 1812, he took possession of the principal fortress Zitaquaro, and massacred the inhabitants. Hidalgo, who fell near Guadalajara, was succeeded by the priest, Morelos, who defended Cuautla Amilpas against the attack of Calleja with great bravery until 2 May 1812, when famine forced him to surrender. Calleja again signalized his victory by acts of barbarism, and was rewarded for his zeal, 4 March 1813, by the appointment of viceroys, in which capacity he continued to alienate the feelings of the Mexicans by his relentless rigor. The priest, Morelos, fell into his hands and was shot, 22 Dec. 1815. Subsequently he promulgated an amnesty, but as he was unable to restore peace to the distracted country, he was recalled. On his return to Spain he was created Conde de Calderon, and in January 1820, while preparing to sail from Cadiz against the revolutionists of Paraguay, his troops having mutinied, he was captured and remained prisoner in the fortress of the Isla de Leon until the insurrection was quelled by Ferdinand VII., when he died, soon after having recovered his liberty.

Cal'ender, James Thomas, American publicist: b. England; d. 1803. He was exiled for his pamphlet 'The Political Progress of Great Britain.' He wrote: 'Sketches of the History of America'; 'The Prospect Before Us.'

Callender, John, American historian: b. Boston, Mass., 1706; d. Newport, R. I., 26 Jan. 1748. He collected many valuable papers relating to the Baptists in America; and published 'A Centennial Discourse on the Civil and Religious Affairs of the Colony of Rhode Island' (1739), which was the only history of that State for more than a century. The State Historical Society reprinted it, with notes by Rev. Romeo Elton (1838), and a memoir of the author.

Cal'lernish, Scotland, a village and district in the island of Lewis, on Loch Roag, 16 miles west of Stornoway, famous for its circles of standing-stones. The main circle is 40 feet in diameter, formed of 12 unhewn blocks of gneiss from 10 to 13 feet high, with a larger block in the centre. From this circle rows of stones project to the east, west, and south. There are upward of 40 blocks altogether.

Callet, Antoine François, äñ twän frän swä kä-lō, French historical painter: b. Paris, 1741; d. 1823. He obtained his earliest prize in 1764 for a painting entitled 'Biton and Cleobis' and became a member of the Academy in 1780. He painted portraits of Louis XVI., Louis XVIII. and the Comte d'Artois, and several other works now in the Louvre.

Callet, Jean François, zhōñ frän-swä, French mathematician: b. Versailles, 1744; d. 1798. He completed his studies at Paris in 1768, and in 1779 gained the prize which the Academy of Arts at Geneva had proposed for escapements in watches. In 1788 he was appointed professor of hydrography at Vannes, and shortly after obtained the same appointment at Dunkirk. He was afterward professor of the geographical engineers at the Dépôt de la Guerre, Paris. He is best known by his 'Tables of Logarithms.'

Callichthys, käl-ik'thīs, a genus of fishes belonging to the abdominal malacopterygians, and family *Siluridae* or sheat-fishes. They are natives of hot climates, and are said to make their way over land in search of water during dry seasons.

Callic'rates, Greek architect of the 5th century B.C. He was a contemporary of Ictinus and with him erected the Parthenon at Athens.

Callicrat'idas, a Spartan, succeeded Ly-sander in the command of the Lacedæmonian fleet against the Athenians, in 406 B.C. He defeated Conon at Mitylene, and was afterward himself defeated by the Athenians at Arginusæ, where he was drowned.

Calligo'num, a genus of shrubs belonging to the *Polygonacæ*. They are leafless plants, with small flowers, branches jointed, dichotomous, and the fruit a large, four-cornered nut. The root of *C. Pallasia*, a leafless shrub found in the sandy steppes of Siberia, furnishes from its roots, when pounded and boiled, a gummy, nutritious substance like tragacanth, on which the Calmucks feed in times of scarcity, at the same time chewing the acid branches and fruit to allay their thirst.

Callimachus, Greek poet and grammarian: b. Cyrene, about 310 B.C.; d. about 240. He opened in Alexandria a school of grammar, that is, of the belles-lettres and liberal sciences, and could boast of several scholars of distinguished attainments, such as Eratosthenes, Apollonius Rhodius, Aristophanes of Byzantium, and others. Ptolemy Philadelphus presented him with a place in the museum, and gave him a salary, as he did other men of learning. After the death of Philadelphus, he stood in equal favor with Ptolemy Euergetes. Under these circumstances he wrote most of his works, the number of which was very considerable. With the exception of some fragments, we have of these only 64 epigrams and 6 hymns. His poem on the hair of Berenice has been preserved in the Latin adaptation of Catullus ('De coma Berenices'). Callimachus' poems bear the stamp of their age, which sought to supply the want of natural genius by a great ostentation of learning. Instead of noble simple grandeur, they exhibit an overcharged style, a false pathos, and a straining after the singular, the antiquated, the learned. His elegies are mentioned by the ancients with great praise, and served Propertius as models. The best edition of the hymns and epigrams is that of Meineke (Berlin 1861).

Callim'achus, Greek artist, supposed to have lived about the end of the 5th century. His work is celebrated by some of the ancient writers, and he is said to have been the inventor of the Corinthian capital.

Callinger, käl-lin-jär', or **Kalinjar**, India, a hill fort in the northwest provinces, division of Allahabad, and district of Banda, 90 miles southwest of the town of Allahabad. The summit of the hill on which it stands is about 1,200 feet above the plains below. At the southeastern base of the hill is a decaying village, which was formerly a place of considerable importance and the capital of a rajahship. The whole summit of the hill, comprehending a plain five miles in circuit, is encompassed by an immense rampart of Mohammedan construction. It was surrendered to the British in 1812. There are a number of interesting caves, tombs, temples, and statues here.

Calli'nus of Ephesus, the earliest Greek elegiac poet, flourished probably about 700 B.C. Only one elegy and a few fragments are extant; these have been edited by several scholars, among them Bergk, in the 'Poetæ Lyrici Græci.'

Callion'yms, a genus of fishes (the drag-onets) belonging to the family *Gobiida*. They are distinguished by having the eyes very near together, teeth on the jawbone but none on the roof of the mouth, six gill-rays, and the first dorsal fin long, usually much elevated and, in many species, brightly colored.

Calliope, käl lî'ō pē. 1. In Greek mythology, one of the Muses (q.v.). She presided over eloquence and epic poetry. She is said to have been the mother of Orpheus by Apollo. She was represented with an epic poem in one hand and a trumpet in the other, and generally crowned with laurel.

2. An asteroid (No. 22). It was discovered by Hind, on 16 Nov. 1852.

3. A musical instrument, consisting of a series of steam whistles, pitched to produce the notes of the scale, and grouped together and operated by a keyboard.

Calli'ope Humming-bird. See HUMMING-BIRD.

Cal'lisen, Henry, Danish physician and surgeon: b. Pentz, Holstein, 1740; d. Copenhagen, 5 Feb. 1824. He educated himself by his own exertions, and was made, in 1771, chief surgeon in the Danish fleet, and in 1773 professor of surgery at the University of Copenhagen. He wrote in 1777 his 'Institut. Chirurgiæ Hodiernæ,' which was received with applause by all Europe.

Callisthenes, Greek historian: b. Olynthus, about 365 B.C.; d. 328. He was a nephew and pupil of Aristotle, and was appointed to attend Alexander the Great in his expedition against Persia. His republican sentiments rendered him unfit for a courtier, but his unpardonable crime was his opposition to the assumption of divine honors by the conqueror. On a charge of treason, he was put to death, by what method historians are not agreed. Of several historical works written by him only fragments remain.

Callisthenics. See GYMNASTICS.

Callis'to, in Greek mythology, a nymph of Artemis, daughter of Lycaon, king of Arcadia. According to the most prevalent story of this maiden, Zeus loved her, and her son Arcas was hid in the woods, and preserved, while she was changed by the jealousy of Hera into a

bear. Zeus placed her, with her son, among the stars, as the constellation of the Great Bear.

Callistratus, käl-lis'tra-tūs, Athenian orator: b. about 400 B.C.; d. 361. His eloquence is said to have fired the imagination of the youthful Demosthenes. For his Spartan sympathies he was condemned to death by the Athenians, and on his return from exile in Macedonia was actually executed.

Callot, Jacques, French engraver: b. Nancy, 1592; d. there 1635. He overcame many obstacles to his study of art, twice running away from his parents. He went to Italy, learned drawing in Rome, soon gave himself up entirely to his love for engraving, and became famous for his etchings. In the space of 20 years he designed and executed about 1,600 pieces, most of them, except sacred subjects, representations of battles, sieges, dances, festive processions, etc. The 'Misères et Malheurs de la Guerre,' in 18 pieces, may be mentioned as a remarkable series. He executed works of this kind for Cosmo II. of Florence, Louis XIII. of France, and the Duke of Lorraine. His 'Fair' and his 'Beggars' are called his best pieces. He was the first who used in his etchings the hard varnish—the *vernice grosso dei lignaiuoli* of the Italians. He was distinguished for his piety, magnanimity, and regularity of life.

Cal'low, William, English water color artist: b. Greenwich, 28 July 1812. He studied in Paris and was for seven years professor of water color painting to the family of Louis Philippe. He has received many medals and is the senior member of the Royal Society of Painters in Water Colors. He still continues to exhibit and is the author of 'Illustrated Book of Versailles'; 'Work Illustrative of Deep Sea Fishing,' etc.

Calluna. See HEATH.

Callus, an abnormal hard growth, either carneous or osseous. The new growth of bony substance between the extremities of fractured bones, by which they are united, is an instance of the latter. External friction or pressure produces the former, as in the hands of laborers and the feet of persons who wear ill-fitting shoes. See CORN.

Calmar, käl'mär. See KALMAR.

Calmet, Augustin, ô-güst-ăn käl-mă, French exegetical and historical author: b. Mesnil-la-Horgne, near Toul, France, 26 Feb. 1672; d. Paris, 25 Oct. 1757. He entered the order of St. Benedict in 1688, and became the head of several abbeys in succession. In 1698 he became teacher of philosophy and theology in the abbey of Moyon-Moutier. He was an industrious compiler of voluminous works. Among them are: 'Commentary on the Old and New Testaments' (Paris 1707-16); 'Historical and Critical Dictionary of the Bible'; and 'Ecclesiastical and Civil History of Lorraine.'

Calmon, Marc Antoine, märk än-twăn käl-môn, French political economist: b. Tannies, Dordogne, 3 March 1815; d. Paris, 13 Oct. 1890. He entered the National Assembly as life member in 1875, but will be longest remembered for his writings on political economy, which include 'Les impôts avant 1789' (1865); 'William Pitt, étude financière et parlementaire'

(1865); 'Histoire parlementaire des finances de la Restauration' (1868-70); 'Etude des finances de l'Angleterre depuis la réforme de Robert Peel, jusqu'en 1869' (1870).

Calmon du Pin e Almeida, Miguel, Brazilian statesman: b. Santa Amara, Bahia, 22 Dec. 1796; d. Rio de Janeiro, 5 Oct. 1865. He entered the Constituent Assembly in 1822, was senator in 1840, prime minister in 1840 and again in 1843 and resided in Europe as special envoy 1844-7. He was created viscount in 1849 and Marquis of Abrantes in 1854.

Calms, Region of, tracts in the Atlantic and Pacific oceans, on the confines of the trade-winds, where calms of long duration prevail. This region is not the same all the year through, but follows the course of the sun, and lies farther north or farther south according to the hemisphere in which the sun happens to be. About the winter solstice its average northern limit is in lat. 5° N., and in the months about the summer solstice its average northern limit is about 12° N. lat. The southern limit lies nearly always to the north of the equator, varying between lat. 1° and 3° N.; but it is sometimes, though rarely, so far south as lat. 1° or 2° S. During the months following the winter solstice its average breadth is four degrees, while in the months following the summer solstice it is about six degrees. The calms prevail especially on the northern margin of this region, but even there there is an occasional light breeze, but not sufficient to fill the sails. The climate of this region is extremely unpleasant, for the atmosphere is moist and foggy, and the sky generally overcast and gloomy. Almost every day there occurs a violent storm of thunder and lightning, accompanied by sudden blasts of wind, and by rain which falls in regular streams for hours together. On this account the region is dangerous to navigators. To increase these dangers there is between lat. 4° and 10° N., and lon. 18° and 23° W., a tract of considerable extent, which seamen call the "rainy sea," and which, with only rare intervals of calm, is visited by almost constant storms of thunder and lightning, and violent falls of rain, from which it is very difficult for a sailing vessel to make its escape.

Cal'mucks. See KALMUCKS.

Calomarde, or Calomarda, Francisco Tadeo, frän-thës'kō tā-dā'ō kā-lō-mār'da (COUNT OF ALMEIDA), Spanish statesman: b. Villel, Aragon, 1775; d. Toulouse, France, 1842. He studied law, entered political life and sustained the national cause in resistance to Napoleon. In 1814 on the return of Ferdinand VII., Calomarde was made chief secretary of the department of Indian affairs. Here he was convicted of bribery and banished to Toledo and afterward to Pamplona. In 1823 he received the appointment of secretary to the regency, and subsequently an important office in the royal household, and he was appointed minister of justice. He organized the corps of royalist volunteers, recalled the Jesuits, reopened the convents, and closed the universities. In 1832, when Ferdinand's death was supposed to have taken place, Calomarde was the first to bend his knee before Don Carlos. The king recovered physically, but lingered in a semi-idiotic condition: of this Calomarde took advantage, by extorting from him his signature to the act

of 31 Dec. 1832, in which Ferdinand abdicated in favor of Don Carlos. When Ferdinand revealed this fraudulent proceeding, Calomarde was banished to Aragon, and later avoided imprisonment by escaping to France in disguise. Here he passed the rest of his days in obscurity.

Cal'omel, the sub-chloride, or "mild" chloride of mercury, HgCl (or Hg₂Cl₂); known to chemists as "mercurous chloride," to distinguish it from corrosive sublimate, HgCl₂, which is known as "mercuric chloride." (For its preparation see MERCURY.) In the use of calomel as a medicine, particular attention should be given to its liability to generate corrosive sublimate by decomposition. This effect may be produced by bitter almonds or cherry-laurel water, or any other substance containing hydrocyanic acid, being administered simultaneously with it. Nitro-muriatic acid produces the same effects, as also, to some degree, the chlorides of potassium, sodium, and ammonium. It is rendered ineffectual by the alkalis and alkaline earths. Calomel is regarded as the most valuable of the mercurial preparations, though some medical innovators reject it. It is employed as a purgative, operating chiefly upon the liver by stimulating its secretory functions. Being slow in its action, and liable to salivate if too long retained, it is usually administered with some saline cathartic. It is also given as a remedy for worms, and as an alterative in derangement of the liver.

Calomel occurs native in Spain, Bohemia, Servia, Mexico, and elsewhere, in the form of tetragonal crystals white in color (or nearly so) with a hardness of from 1 to 2, and a specific gravity of 6.48.

Calonne, Charles Alexandre de, shärl ä-lëks-ändr də kä-lön, French statesman: b. Douai, 20 Jan. 1734; d. Paris, 30 Oct. 1802. He succeeded Necker in 1783 as comptroller-general of the finances, and found not a single crown in the treasury. In this office he continued till 1787. During this period he maintained the public credit by a punctuality till then unknown in the payments of the royal treasury, though he found it drained to the lowest ebb. He labored with unwearied assiduity to restore the equipoise between the annual income and expenditure, and to provide a supply for the emergencies of the state, without increasing the burdens of the people. For this purpose he advised the king to revive the ancient usage of convening the national assemblies of the "notables," to whom he proposed the bold project of suppressing the pecuniary privileges and exemptions of the nobility, clergy, and magistracy. This measure alarmed those powerful bodies, and Calonne found it necessary to retire to England, where he wrote two defenses of himself—his 'Petition to the King,' and 'Reply to Necker.' On the breaking out of the Revolution he supported the Royalist party with much zeal, both by his pen and his journeys to various countries of Europe on their account.

Calophyllum, a genus of trees belonging to the natural order *Guttifera*, and natives of warm climates. They have large shining leaves, with numerous transverse parallel veins. Some of the species yield excellent timber. *C. inophyllum* affords a medical resin, the tacamahac of the East Indies. The seeds yield an oil which is

CALORESCENCE—CALORIMETER

used for burning, for making ointment, etc. *C. calaba* is a West Indian species whose oil is used for illuminating purposes.

Calores'cence, the phenomenon of the transmutation of heat rays into light rays; a peculiar transmutation of the invisible calorific rays, observable beyond the red rays of the spectrum of solar and electric light, into visible luminous rays, by passing them through a solution of iodine in bisulphide of carbon, which intercepts the luminous rays and transmits the calorific. The latter, when brought to a focus, produce a heat strong enough to ignite combustible substances, and to heat up metals to incandescence; the less refrangible calorific rays being converted into rays of higher refrangibility, whereby they become luminous.

Caloric (Latin, *calor*, "heat"), a name formerly given to a hypothetical, imponderable fluid, whose existence was postulated in order to explain the observed phenomena of heat. It is known that no such fluid exists, and the word is now practically obsolete, except as an adjective in such expressions as "caloric effect," "caloric engine," etc., where it stands for the words "thermal," or "heat," though sometimes in a special sense. (For a statement of the principles of the old caloric theory, consult Preston, 'Theory of Heat,' p. 34.) See also HEAT; THERMODYNAMICS.

Caloric Engine, a name originally given by Ericsson to a form of hot-air engine invented by him, in order to distinguish it from other engines whose operation depends upon the same general principles; but now commonly applied to every form of hot-air engine in which the source of the motive power is a furnace external to the working cylinder, but associated with it. In these engines air is admitted to the working cylinder, where it is heated by contact with the hot cylinder wall. Its pressure at once rises, and it is then allowed to expand, pushing a piston before it. A new supply of air is next admitted, and the process is repeated indefinitely. Hot-air engines are useful for pumping and other small work, especially because they do not need a skilled engineer. They have also been thoroughly tried upon a large scale, but without lasting success. Doubtless the inventors who have striven to overcome the immense practical difficulties that appear to be inherent in the hot-air engine have been stimulated by the knowledge that in the steam-engine an enormous quantity of heat is required merely to evaporate the water that is used, before a single pound of pressure can be exerted upon the piston of the engine. The heat so expended appears to be largely wasted, and hence it might be hoped that some form of air-engine can be devised that will avoid this apparent source of loss, and be correspondingly more efficient. (See THERMODYNAMICS.) It does not appear that this hope is likely to be fulfilled by the hot-air engine; and the gas-engine (q.v.) must be regarded as a far more promising subject for the exercise of inventive genius, and a far more formidable rival of the steam-engine. (For more detailed accounts of the hot-air engines now in use, consult Hutton, 'Heat and Heat Engines,' and Carpenter, 'Text-Book of Experimental Engineering.') The latter volume contains useful directions for testing such engines. For the general theory of the hot-air engine, see

Wood, 'Thermodynamics,' and Rankine, 'The Steam-Engine and Other Prime Movers.'

Cal'orie, or **Cal'ory**, the unit of heat; the amount of heat necessary to raise the temperature of a kilogram of water one degree Centigrade, or from 0° to 1° C. It is used as a standard of heat by physicists as the term "foot-pound" is employed as the unit of energy. It is also known as the "greater calorie," to distinguish it from the "small calorie," in which the unit of mass is the gram instead of the kilogram. See CALORIMETRY.

Calorimeter, Respiration. The respiration calorimeter is an instrument which has proved of great value for studying the fundamental laws of nutrition, as well as more practical problems. It takes its name from the fact that it is used to measure and study the products of respiration and to measure energy in the form of heat. The apparatus was devised (1896-1903) by Professors W. O. Atwater and E. B. Rosa, under the auspices of the United States Department of Agriculture, co-operating with the Storrs (Connecticut) Experiment Station and the Wesleyan University, some of the features being suggested by the respiration apparatus elaborated a number of years ago by Pettenkofer of Munich.

The apparatus includes a copper walled chamber about seven feet long, four feet wide, and six and one-half feet high, in which the man who served as subject of the experiment lives one or more days and nights, usually at least four. An opening in the front of the apparatus, sealed during an experiment, serves as both door and window. A smaller opening in the side, called the food aperture, having tightly-fitting caps on both ends, is used for passing food, drink, excreta, and other materials into and out of the chamber. There is a telephone by which the subject may communicate with those outside. The chamber is furnished with a folding chair, table and bed. Air is kept in circulation through the chamber at the rate of not far from two and one-half cubic feet a minute. Thus, while the dimensions of the chamber are rather small, the subject finds nothing particularly disagreeable or uncomfortable in his sojourn within it, save for the restricted space and the monotony of the prescribed daily routine.

The circulation of air is effected by a special pump, which measures the volume of the ventilating current and at regular intervals draws measured samples of the outgoing air for analysis. At the same time samples of the incoming air are also taken for analysis. From these determinations the amounts of respiratory products—carbon dioxide and water—given off by the subject may be computed.

The diet during an experiment is uniform from day to day. All food and drink, and all solid and liquid excreta are carefully weighed, sampled and analyzed. By comparing the chemical elements and compounds received by the body in food, drink and inhaled air with those given off in the solid, liquid and gaseous excretions, it is possible to strike a balance between the total income and total outgo of matter in the body and to determine whether it has increased or diminished its store of material. In this way a gain or loss of even a small

CALORIMETER

fraction of an ounce of body fat or protein during a period of one or several days can be detected and measured.

At the same time it is desirable to study the metabolism of energy. This is done likewise by determining the balance of income and outgo. The measurements made in these investigations are in terms of heat, since other forms of energy may be transformed into it. To this end it is necessary to know how much energy is taken into the body in food and drink, how much is given off unused in the solid and liquid excreta, and how much is transformed in the body and given off in the forms of heat and external muscular work.

burned outside the body, that is by their heats of combustion, as learned by burning samples of them with oxygen in an apparatus called the bomb calorimeter.

As regards the outgo of energy it must be remembered that heat is constantly given off within the chamber of the man's body, whether he is at work or at rest. When he is at rest, *i. e.*, doing no external muscular work, there is nevertheless a great deal of muscular work going on within his body. Even when he is asleep the organs of respiration, circulation and digestion are active. The energy of the internal work is transformed into heat in the body and leaves the body as heat. In rest ex-

So far as we know the only energy received by the body is the potential energy of the food, and the only forms in which it leaves the body are (1) partly in the potential energy of the unoxidized residues of food and body material which are eliminated in the solid and liquid excreta, but (2) chiefly in the kinetic energy resulting from the oxidation of material in the body, and leaving the body, so far as is known, only as heat and external muscular work.

The potential energy of the food and excretory products is measured by the amount of heat generated when these substances are

periments, practically all the kinetic energy leaves the body as heat. In work experiments part is put forth as muscular power applied to the pedals of a bicycle-dynamo, which transforms this external muscular energy into heat and as an ergometer, measures its amount. The problem is to measure the whole heat including that which left the body as heat and that which resulted from the transformation of the muscular work. The method consists in collecting this heat, for measurement, and at the same time providing that there shall be no gain or loss in the amount.

CALORIMETRY

The chamber of the calorimeter is enclosed by double metal walls, which are surrounded on all sides by walls of wood with air spaces between, so that the temperature within the chamber is not greatly affected by changes in the temperature of the room outside. Very delicate thermo-electric elements arranged in series and connected with a galvanometer, show changes in the temperature of the metal walls; and devices for heating and cooling the walls are arranged so that their temperature may be kept as near that of the interior of the chamber as desired and the very small amounts of heat that may pass through them into or out of the calorimeter may be made to counterbalance each other. The temperature of the ventilating air current is also regulated so that neither more nor less heat is taken in than is brought out. Accordingly there is no gain or loss of heat either through the walls of the chamber or by the ventilating air current.

The heat produced within the chamber is that from the energy of the material oxidized in the man's body. The only way this heat can escape is by the proper agencies for carrying it out and measuring it, two in number. A small portion of the heat generated within the chamber is carried out by water vapor in the ventilating air current. The excess of vapor in the air leaving the chamber over that in the air entering it represents the amount given off as vapor from the body of the subject, and has required heat to vaporize it. The amount of this heat is computed by factor from the amount of water vapor and the temperature at which it leaves the chamber.

The larger part of the heat generated within the chamber is absorbed and carried out of it by a current of cold water, flowing through a copper pipe around the interior. The cooling surface of the pipe is increased by thin disks of copper fastened at close intervals along the coil. The water enters the chamber at a low temperature, passes through the copper coil, absorbs heat from the chamber and passes out at a higher temperature. The quantity of water and the difference between the temperatures at which it enters and leaves the coil are carefully determined and show how much heat was thus brought out of the chamber. Adding the heat brought out by the water vapor in the ventilating air current to this heat we have the whole heat produced.

By regulating the temperature and rate of flow of the water current, the heat is absorbed and carried out of the chamber as fast as generated, at the same time keeping the temperature within the chamber at a point agreeable to the subject and almost absolutely constant. So delicate are the measurements of temperature of the air within the chamber, and of the metal walls, that the observer sitting outside the apparatus and noting the changes every two or four minutes, immediately detects a rise or fall of even one one-hundredth of a degree. The accuracy of the respiration calorimeter is shown by the fact that in check experiments in which large quantities of alcohol were burned in a lamp in the chamber 99.8 per cent of the theoretical amount of carbon-dioxid, 100.1 per cent of the theoretical water, and 99.9 per cent of the energy were measured. In the average of 32 experiments with man, covering 107 days,

the energy measured was 99.9 per cent of the theoretical amount, and the value for carbon and hydrogen was equally satisfactory. Fig. A. shows the general plan of the apparatus and accessories.

The data for the metabolism of matter and of energy, obtained as heretofore explained, taken in connection with what is known of the physiological processes that go on in the body, give more accurate information than can be otherwise obtained regarding the ways in which food is used in the body, the quantities of different food ingredients that are needed to supply the demands of the body, the different conditions of rest and work, and the comparative nutritive value of different food materials. A respiration calorimeter, like that described, has been built, under government auspices, at Bonn, Germany, and a form adapted for experiments with steers has just been completed at the Pennsylvania Experiment Station, in cooperation with the United States Department of Agriculture.

C. F. LANGWORTHY,
U. S. Agricultural Dept., Washington, D. C.

Calorimetry, ("heat measurement"), the art of measuring the quantity of heat that a body absorbs or emits when it passes from one temperature to another, or when it undergoes some definite change of state. In order to execute such measurements it is first necessary to adopt some convenient and accurate unit, in terms of which the quantities of heat that are to be measured can be expressed. Several such units have been proposed, but none has yet met with universal favor among physicists. One of the simplest that has been suggested (at least so far as the principles involved are concerned) is the quantity of heat that is required to melt a kilogram or a pound of ice. Evidently it will require precisely 10 times as much heat to melt 10 pounds of ice as to melt one pound, and hence, if the quantity of heat required to melt one pound of ice is taken as the unit of heat, the measurement of any given quantity of heat becomes reduced to the simple operation of observing how many pounds of ice the proposed quantity of heat can melt. The earliest form of heat-measuring device (or "calorimeter") based upon this idea is that invented by Dr. Joseph Black about the year 1760. It consists simply of a block of clear ice, in which a cavity is made, the cavity being closed by a slab of ice laid upon the main block. To make the use of this device plain, let us suppose that it is desired to determine the quantity of heat that is given out by a certain fragment of platinum in cooling from 100° F. to the freezing-point. The chamber in the block of ice is first carefully wiped dry, and the platinum, heated accurately to 100°, is quickly introduced, and the covering lid of ice is laid in place. The platinum gives up its heat to the ice about it, with the result that a certain weight of the ice is melted, and a corresponding weight of water collects within the chamber. When it is certain that the platinum has attained the temperature of the ice, the slab covering the excavation in the main block is lifted off, and the water that has collected about the platinum is removed and weighed. The quantity of heat given out by the platinum is then known at once, if the

CALORIMETRY

accepted unit of heat is the quantity required to melt one pound of ice. Lavoisier and Laplace improved Black's calorimeter in certain respects, while retaining its main features. Their instrument consists essentially of three distinct concentric chambers. The object upon which the experiment is to be performed is placed in the inner chamber, and the ice whose melting is to serve as a measure of the heat given out is placed, in the form of broken lumps, in the intermediate chamber, surrounding the object to be investigated. In the outer chamber, which encloses the other two as completely as possible, broken ice is also introduced, to prevent the conduction of heat into the apparatus from the outside. The quantity of ice melted is determined by observing the amount of water that is formed in the middle chamber, this being drawn off by a conveniently situated tube and tap. This apparatus has been described as an improvement upon that of Black; but the only way in which it can be said to be an improvement is in the respect that it does not call for large blocks of pure, clear ice. In other particulars it is somewhat inferior to the simpler apparatus of Black. The quantity of water that is produced, for example, cannot be determined with the same degree of accuracy in Lavoisier and Laplace's instrument. The ice calorimeter of Bunsen was a far greater advance. This ingenious apparatus consists of an inner chamber, for the reception of the object to be studied, and an outer enveloping one, which is entirely filled with a mixture of ice and water, and from which a graduated capillary tube is led away. The whole instrument is surrounded by broken ice, as in Lavoisier and Laplace's form, in order to protect the interior parts from the effect of external thermal influences. When the apparatus is in perfect working order, the mixture of ice and water in the intermediate chamber should be neither melting nor freezing, but should be in exact equilibrium in this respect. Upon the introduction of the object to be studied into the central chamber, the ice in the intermediate chamber begins to melt, just as in the types of calorimeter already considered; but the essential peculiarity of Bunsen's instrument consists in deducing the quantity of ice that is melted by observing the change of volume of the contents of the intermediate chamber, as shown by the motion of the water in the graduated capillary tube that leads away from that chamber; advantage being taken, for this purpose, of the known fact that ice diminishes in volume upon melting, so that when the exact diminution in the volume of the contents of the intermediate chamber is known, we can calculate with a considerable degree of precision the quantity of ice that has been melted. Bunsen's calorimeter is an admirable instrument, capable of giving results of great accuracy when intelligently handled.

Another unit of heat that suggests itself quite naturally is the quantity of heat given out by a pound of steam when it condenses into a pound of water at the same temperature. A calorimeter based upon this idea was also used by Bunsen, but the steam calorimeter was brought to its present excellent form largely through the labors of Dr. J. Joly. In his type of the instrument the object to be studied is suspended from one arm of a delicate balance. After being accurately counterpoised, the object

is bathed in an atmosphere of steam, with the result that it absorbs a certain amount of heat as its temperature rises to that of the steam. But the heat thus absorbed by the body under examination can be obtained only from the steam itself; and, since saturated steam cannot part with heat in this way without condensing, it follows that there is deposited upon the body a weight of condensed moisture that corresponds precisely to the quantity of heat that has been absorbed. The amount of this moisture is determined by careful weighing; and it is evident that the quantity of heat absorbed by the experimental body in passing from its original temperature to the temperature of the steam is then immediately known, if we take, as the unit of heat, the quantity of heat that is given out by a pound of steam in condensing into a pound of water at the same temperature. In practice, numerous corrections are of course necessary, as with all other instruments of precision. It may be added that although the ice and the steam calorimeters are primarily intended to determine the heat emitted or absorbed by a body in passing from any given temperature to some one particular temperature that is always the same (that is, the freezing-point in the one case and the boiling-point in the other), yet it is always possible to determine the quantity of heat emitted or absorbed by the body between any two temperatures, by performing two experiments in succession, the body having these respective temperatures as its initial temperatures in the respective experiments. It is plain that the quantity of heat emitted or absorbed between the proposed initial and terminal temperatures can then be obtained by simply subtracting one of these results from the other.

Another and more familiar unit of heat is the quantity of heat required to warm a given weight of water by one degree on a given thermometric scale. (See CALORIC.) Thus in general engineering practice in the United States and in England, it is customary to define a heat unit as the quantity of heat that is required in order to raise the temperature of a pound of water one degree on the Fahrenheit scale. This definition is good enough for rough purposes, because it conveniently happens that there is no great difference between the quantity of heat required to warm a pound of water from 32° to 33° and the quantity required (for example) to warm it from 99° to 100° . This, however, we can only regard as a fortunate accident; and for accurate scientific purposes we must recognize that the equality is only approximate, and we must adopt some particular temperature range as a part of our definition. Thus it is common to define the British heat unit, when great accuracy is desired, as the quantity of heat required to raise the temperature of a pound of water from 59° to 60° ; although some authorities, apparently without sufficient reason, make the temperature range from 32° to 33° , and others have chosen other positions on the temperature scale for the defining degree. It is unfortunate that no general agreement has yet been reached on this point. In accurate scientific work the unit of heat is usually taken as the quantity of heat required to warm a kilogram of water from 15° C. to 16° C., or (which is practically the same thing) from 14.5° to 15.5° C. It would appear that several very good reasons could be assigned for selecting 40° C.

CALOTROPIS—CALOVIUS

as the standard temperature to be used in defining the heat unit. For example, the specific heat of water has its minimum value not far from that point; or, in other words, any small uncertainty in the actual realization of the temperature contained in the definition would have little or no effect if that temperature were 40° C. Again, 40° C. is the temperature at or near which the differences between the various thermometric scales that are in practical use reach their maximum; and this means that at or near this temperature a slight error in the standardization of the thermometer that is used would have the least effect upon the verification of the heat unit. Moreover, 40° C. (104° F.) is a temperature that is likely to be always greater than the general temperature of the laboratory in which work is being carried out; and it is well known to be easier to realize a temperature that is higher than that of the surrounding air, than it is to realize one that is lower. From every point of view, therefore, 40° C. (or thereabouts) would appear to be the best temperature to assume in establishing the definition of the heat unit; a unit of heat being then defined as the quantity of heat required to raise the temperature of a kilogram of water from (say) 39° C. to 40° C. Yet, cogent as these reasons would appear, no authority has yet suggested this particular temperature as the standard.

In measuring the quantity of heat emitted by a body by observing the change of temperature produced in a given mass of water when the water absorbs the heat so emitted, a great variety of forms of apparatus may be used. In some cases the heated body may be plunged into the water directly, the water being kept well stirred, and its temperature taken at the beginning and end of the experiment. In other cases, and especially when the body under examination cannot be allowed to come in contact with the water, it is necessary to adopt some more elaborate method, such as enclosing the experimental body in a water-tight envelope of some kind, and afterward making due allowance for the heat capacity of the envelope. In cases, for example, in which the heat generated by the combustion of fuel is to be measured, the fuel must be enclosed in an air-tight crucible, to which oxygen is admitted by one tube, and from which the products of combustion are drawn off by another. The crucible is surrounded by a mass of water that is disposed in such a way as to intercept and absorb as much of the heat that is produced as possible. A direct observation of the temperature of the water in the calorimeter is made before and after the combustion, and the change of temperature so obtained gives a first approximation to the amount of heat that has been liberated. This result has to be corrected, however, for the thermal capacity of each part of the calorimeter that has been warmed during the experiment, and for that of the gases admitted and drawn off, and also for any loss of heat that may have occurred through radiation. The precise details of the corrections will vary, however, with the design of the calorimeter, and with the mode of conducting the experiments.

For a discussion of the relations of the different units of heat that have been mentioned above, and for an account of the experiments that have been made for determining the differences in the heat capacities of water at

different temperatures, see HEAT. A very good account of the subject of calorimetry in general will be found in Preston's 'Theory of Heat,' which also contains valuable references to original papers. The various forms of calorimeter that are used in practical engineering are explained and illustrated in Carpenter's 'Text-Book of Experimental Engineering.'

Calotropis, a genus of asclepiads forming shrubs or small trees, natives of the tropics of Asia and Africa. There are three species, and their flowers have a somewhat bell-shaped corolla, expanding into five divisions. *C. gigantea*, the largest of the genus, forms a branching shrub or small tree about 15 feet high, with a short trunk four or five inches in diameter. Its flowers are of a pretty rose-purple color. Cloth and paper have been made from the silky down of the seeds. The bark of the roots of several of the species furnishes the substance called mudar, which is used in India as a diaphoretic. The juice has been found very efficacious in the cure of elephantiasis, in syphilis, and anasarca. From the bark of the plant is made a substance called mudarine. The bark of the young branches also yields a valuable fibre. The leaves warmed and moistened with oil are applied as a dry fomentation in pains of the stomach; they are a valuable rubefacient. The root, reduced to powder, is given in India to horses. An intoxicating liquor, called bar, is made from the mudar by the hillmen about Mahabuleshwar, in the western Ghats.

Calot'tists (French, *Calottistes*, ka-lō-tēs't'), or the RÉGIMENT DE LA CALOTTE, a society which sprang up at Paris in the last years of the reign of Louis XIV., and took their name from the word *calotte*, a flat cap formerly worn by the priests, which was the symbol of the society. All were admitted whose odd behavior or character, foolish opinions, etc., had exposed them to public criticism. Every one who made himself particularly ridiculous received letters-patent, authorizing him to wear the calotte. They had a singular coat of arms, on which was the sceptre of Momus, with bells, apes, rattles, etc. On their principal standard were the words, *Favet Momus, luna influit*. On the death of Torsac, the colonel of the Calottists, the *éloge* (a spirited satire on the academical style), which the Calottists pronounced on this occasion, was suppressed. Aimon, colonel of the guards, hastened to Marshal Villars with their complaints, and concluded with the words, "My lord, since the death of Alexander and Cæsar, the Calottists have not had any protector besides you," and the order was retracted. They became, however, too bold, attacked the ministers and even the king himself; and the regiment was in consequence dissolved. After the restoration the epithet *Régime de la Calotte*, was applied to the clerical influence in politics.

Cal'otype, a photographic process invented by Talbot. Paper saturated with iodide of silver is exposed to the action of light, the latent image being subsequently developed and fixed by hyposulphite of soda.

Calo'vius (Latinized form of original German name, KALAU), Abraham, German polemic: b. Mohrungen, Prussia, 16 April 1612; d. 25 Feb. 1686. He was the chief representative of controversial Lutheran orthodoxy in the 17th century, and waged war

incessantly on Arminian, Socinian, Reformed, and Roman Catholic doctrines, and with the greatest bitterness against Calixtus. He was six times married, the last time in his 72d year. His chief writings are: 'System of Theological Locations'; 'History of Syncretism'.

Caloy'ers, (καλός, "beautiful," "good"; and γέρων, "an old man"), Greek monks belonging with a few exceptions to the order of St. Basil, who led a very austere life, eating no meat and observing the fasts of the Greek Church very rigidly. They do not even eat bread unless they have earned it. During their seven weeks of Lent they pass the greatest part of the night in weeping and lamentations for their own sins and for those of others. The caloyers of the Greek Church occupy a position of much greater importance than the members of the religious fraternities of the Church of Rome, inasmuch as all the higher Church dignitaries — bishops, archbishops, and patriarchs are chosen from their number. They are, indeed, the only individuals in the Greek Church who are instructed in theology, and even among them the amount of theological learning is very limited. They are commonly educated at the monasteries on Mount Athos, and on the Isle of Patmos, but besides these there are many monasteries dispersed over the archipelago and the Morea, and a few elsewhere belonging to this class of monks. Their most celebrated monastery in Asia is at Mount Sinai. They do not all agree as to their mode of life. Some of them are cenobites; that is, they live in common. Others are anchorites, living alone, or with only one or two companions; and others again are recluses, who live in grottoes or caverns in the greatest retirement, and are supported by alms supplied to them by the monasteries. There are also convents of female caloyers. The Turks sometimes call their dervishes by this name.

Calpe, kāl'pē, the ancient name of the rock of Gibraltar (q.v.), at the southern extremity of Spain, the northern of the two hills called by the ancients the "Pillars of Hercules." Across the straits of Gibraltar, on the African coast, was Abyla, the southern pillar.

Calpee. See KALPI.

Calprenède, Gautier de Costes de la, French romance writer: b. Toulou, Gascony, 1610; d. Paris, 1663. He was an officer of the guards and royal chamberlain, and one of the authors who in the 17th century brought into fashion a new kind of voluminous and long-spun romances of chivalry. He wrote: 'Cassandra'; 'Cleopatra'; and 'Pharamond,' besides some tragedies. His romances were highly celebrated, and are the best of their kind.

Calpur'nia, the fourth wife of Julius Cæsar, married to him 59 B.C. She was a daughter of L. Calpurnius Piso Cæsonius, who was consul 58 B.C. Shakespeare introduces her into his tragedy, 'Julius Cæsar.'

Calpurnius, Titus, surnamed **Siculus**, Latin poet: b. about 30 A.D.; d. about 80. Seven eclogues composed by him are extant, but nothing whatever is known with certainty about his life, and even his name is doubtful. The poems attributed to him are evidently modeled on Vergil's more famous eclogues. They are

smooth, flowing, and melodious, but lacking in simplicity and naturalness. See NEMESIANUS.

Caltanissetta, kāl-tā-nē-sēt'ta, Sicily, capital of the province of the same name, on the right bank of the Salso, 62 miles southeast of Palermo. It is fortified, and has a citadel and cathedral, broad streets, and well-built houses. In the vicinity, at Terra Pilata, are springs of petroleum and of hydrogen gas, a mud-volcano, and important sulphur mines, producing annually about 5,500 tons. Caltanissetta owes its origin to the Saracens, by whom it was called *Kalat al Nisa* ("the lady's castle"). Pop. (1901) 44,600. The province of the same name has an area of 1,445 square miles. Pop. 330,972.

Caltha, the genus of ranunculaceous plants to which the marsh-marigold (*C. palustris*) belongs. See COWSLIP.

Cal'throp, Samuel Robert, American Unitarian clergyman: b. Swineshead Abbey, Lincolnshire, England, 7 Oct. 1829. He was educated at Cambridge University and came to the United States in 1853. He entered the Unitarian ministry in 1860 and has been pastor of a church in Syracuse, N. Y., for several years. He has published 'Essay on Religion and Science'; 'The Rights of the Body'; 'The Primitive Gospel and Its Life of Jesus.'

Calton Hill, a hill in the city of Edinburgh at the eastern end of Princes Street. It is rocky, and has a broad, grassy summit, which commands a view of the Forth and the surrounding country. On the hill are monuments in memory of Dugald Stewart and Lord Nelson, and one in commemoration of the victory at Waterloo.

Caltonica, Sicily, a town in the province of Girgenti, situated 15 miles northwest of the town of Girgenti. The sulphur works in the neighborhood produce annually upward of 1,000 tons of sulphur. Salt is also manufactured in the district. Pop. 7,000.

Caltrop, a kind of thistle growing in southern Europe. It is armed with prickles, which, if trodden on by men or animals, are capable of wounding. Hence in the military art the name of caltrop is given to an instrument with four iron points disposed in a triangular form, three of them being turned to the ground, and the other pointing upward. They are used to impede the progress of cavalry.

Calumba, or Colombo, the root of the *Cocculus palmatus*, a herbaceous plant, belonging to the natural order *Menispermaceæ*, which grows in Ceylon in the neighborhood of Colombo, whence it is said to derive its name. It is imported in the form of round slices or cut pieces, the interior of which is of a greenish-yellow color, while its thick and furrowed skin is greenish-brown; its odor is slightly aromatic, but somewhat nauseous; its taste extremely bitter. Calumba is often administered as a tonic, and is considered an excellent stomachic. It is regarded as of great value in chronic diarrhœa and dysentery; but it is necessary that all symptoms of inflammation should have disappeared before it can be used. It is usually given as a decoction, less commonly in the form of pills or powders. The root of a gentian, the *Frasera Walteri*, is sometimes substituted for the true calumba, and is

CALUMET — CALVERLEY

hence frequently called the false calumba. It is not very bitter, and is almost without smell; it has no very marked effects.

Calumet, Mich., a township in Houghton County, at the terminus of the Mineral Range R.R., 42 miles north of L'Anse. It is the seat of the famous Calumet and Hecla copper mine, the richest in the world, producing nearly 50,000 tons a year. It is the trade and supply centre of the Superior mining district, and has a national bank, several weekly newspapers, manufactories, and an assessed property valuation of over \$26,000,000. Pop. (1900) 25,991.

Calumet, the pipe of peace, a tobacco-pipe used by the North American Indians. On ceremonial occasions, as when Indian chiefs and warriors meet in peace, or at the close of a war with those of another nation, in their talks and treaties with the whites, or even when a single person of distinction comes among them, the calumet is handed round with ceremonies peculiar to each tribe, and each member of the company draws a few whiffs. To accept the calumet is to agree to the terms proposed; to refuse it is to reject them. Some symbols of amity are found among all nations; the white flag or flag of truce of the moderns, and the olive branch of the ancients are similar in character to the Indian calumet. There is also, it appears, a calumet used in the ceremonial declaration of war, and differently made from that of peace. Tobacco is smoked in the calumet, and the leaves of various other kinds of plants. The bowl of this pipe is made of different kinds of soft stone, especially a kind of red soapstone, and the stem of a reed, or of some light kind of wood which is easily perforated. This stem is adorned in various ways; sometimes it is marked with the figures of animals and hieroglyphical delineations, and almost universally has beautiful feathers attached to it, disposed according to the taste of the individual, or of the tribe to which he belongs.

Calumpit, Philippines, a town of the province of Bulacan, situated in the southwestern part of the island of Luzon on the Pampanga River. It is about 27 miles northwest of Manila, with which it is connected by rail. Pop. about 15,000.

Calvados, käl-vä-dös, France, a department in Normandy, bounded on the north by the English Channel, east by the department Eure, south by Orne and La Manche, and west by La Manche. Area, 2,145 square miles. It comprises the ancient Auge, Bessin, and part of Lieuvin. The region is undulating and picturesque, and possesses rich pastures. The principal rivers are the Touques, Dives, Orne, and Vire, which are navigable for small vessels. Agriculture is in a more advanced state than in many other parts of France. Dairies are numerous and well managed, and large herds of cattle are brought in from the departments of Finisterre, Côtes-du-Nord, etc., to be fattened on the pastures for the markets of Paris, Rouen, and Caen. Horses of the Norman breed are extensively reared and held in high estimation. The principal manufactures are linen and lace. The latter, near Caen and Bayeux, employs about 50,000 hands. About 25,000,000 of oysters, procured in the roads of

Cancale, are annually laid down in beds at the mouth of the Sculles. The department is divided into six arrondissements, containing 37 cantons. Chief town, Caen. Pop. (1901) 407,639.

Calvados, a dangerous ridge of rocks on the northern coast of Normandy in lat. 49° 22' N., and extending to the west of Orne for the space of 10 or 12 miles. It is so called from a vessel belonging to the Spanish Armada which was wrecked on it, and gives its name to the department.

Calvaert, käl'värt, **Dionys** (called in Italy **DIONISIO FLAMMINGO**), Flemish painter: b. Antwerp, 1555; d. Bologna, Italy, 17 March 1619. He went very young to Italy as a landscape painter, where, in order to learn how to draw figures, he entered the school of Fontana and Sabbatini, in Bologna, with the latter of whom he visited Rome. After having passed some time in copying the paintings of Raphael, he opened a school at Bologna, from which proceeded 137 masters, and among these Albano, Guido, and Domenichino. The Bolognese regarded him as one of the restorers of their school, particularly in respect to coloring. Calvaert understood perspective, anatomy, and architecture; but the attitudes of his figures are sometimes mean and exaggerated. His best paintings are to be seen at Bologna.

Calvary, the English name for the eminence which was the scene of the crucifixion of Jesus Christ. It lay beyond but near Jerusalem, and by some is identified with the old House of Stoning, or place of public execution, according to the law of Moses, on the top of the remarkable knoll outside the Damascus gate, on the north side of Jerusalem. It was from this cliff that the criminal used to be flung before being stoned (according to the Talmud), and on it his body was afterward crucified; for the spot commands a view all over the city, and from the slopes round it the whole population might easily witness the execution.

Calvé, käl'vä, **Emma**, French opera singer: b. Madrid, Spain, 1864. Her real name is Emma de Roquer. She was born of a French mother and Spanish father, and was educated in a convent school in the south of France. She made her début at Brussels in Gounod's 'Faust.' She has made successful tours of the United States in leading roles, her first appearance in New York being on 29 Nov. 1893.

Calverley, käl'ver lī, **Charles**, American sculptor: b. Albany, N. Y., 1 Nov. 1833. He has won distinction with groups and figures and portrait busts of Greeley, Cooper, Howe, etc. He was elected to the National Academy of Design in 1875.

Calverley, **Charles Stuart**, English poet, son of the Rev. Henry Blayds: b. Martley, Worcestershire, 22 Dec. 1831; d. London, 17 Feb. 1884. In 1852 his father dropped the name of Blayds and resumed that of Calverley, formerly borne by his family. He was educated at Christ's College, Cambridge, and during his college career showed great skill in Latin and Greek composition, and in 1856 was second in the classical tripos. As a writer of humorous English verse he also made himself famous

He afterward studied for the bar, and was called in 1865, but his promising legal career was cut short by a serious accident which befell him on the ice in the winter of 1866-7. The effects of this misfortune clouded the whole of the remainder of his life. As a parodist and writer of light verses Calverley is perhaps unequalled, but his published volumes are not numerous. The earliest of them appeared in 1862 under the title of 'Verses and Translations'; and the others are 'Translations into English and Latin' (1866); 'Theocritus Translated into English Verse' (1869); and 'Fly Leaves' (1872). A 'Memoir and Literary Remains' were published in 1885 by Sendall.

Calvert, George. See BALTIMORE FAMILY.

Calvert, George Henry, American writer; b. Baltimore, Md., 2 Jan. 1803; d. Newport, R. I., 24 May 1889. He was a great-grandson of Lord Baltimore. After graduating at Harvard in 1823, he studied in Germany; then returning to Baltimore, became editor of the 'American' and a contributor to various periodicals. His published books include 'Poems' (1847); 'Joan of Arc' (1860); 'Goethe, his Life and Works' (1872); 'Brief Essays and Brevities' (1874), and 'Wordsworth: a Biographic Esthetic Study' (1875); 'Three Score and Other Poems' (1883).

Calvert, Leonard. See BALTIMORE FAMILY.

Calvi, Lazzaro and Pantaleone, lätz-ä'rō and pän-tä-lä-ō'nē käl'vē, Genoese painters, sons of Agostino Calvi: the former b. 1502; d. 1606; the latter died 1595. They painted in concert many pictures in Genoa, Monaco, and Naples. In particular, the façade of the Palazzo Doria (now Spinola), a spirited composition crowded with figures, is highly extolled. Lazzaro was the more inventive genius of the two, his brother generally working out the details of their joint productions.

Calvin (Modified from the French form Cauvin or Caulvin), **John.** Swiss reformer of the 16th century. B. Noyon, Picardie, 10 July, 1509; d. Geneva, Switzerland, 27 May, 1564. Though born in humble condition, his father, by virtue of certain official relations that he sustained to the ecclesiastical court and diocese of Noyon was able by personal influence to further the interests of his family. Calvin's mother was distinguished alike by personal beauty and piety. Even as a lad Calvin was deficient in physical vigor, but gave early tokens of more than ordinary intellectual powers, a circumstance that attracted to him the regards of a noble family at Noyon who received him under their care and gave to him the same opportunities of schooling as were enjoyed by their own children (1523). It was his father's original intention to fit him for the priesthood and in pursuance of that object he was sent to the Collège de la Marche at Paris; then to the Collège Montaigu where he was trained in logic by a learned Spaniard who afterward directed the education of Ignatius Loyola while a student at the same school. He easily stood in the front rank of his fellow-students but was little disposed to affiliate with them and from a certain unsocial severity of bearing acquired among them the nickname of the "Accusative Case."

He was already 18 and had done some preaching when from motives of ambition his father changed his plans with reference to him and determined to have him prepared for the profession of the law, putting him for that purpose under instruction at Orléans (1528) and Bourges (1530), where he applied himself to his studies with the same assiduity evinced at Paris, and attained immediate distinction though at the expense of impaired health. Without confining himself strictly to the curriculum of the school he devoted himself at the same time to the study of Greek under the German Professor Wolmar, whose Protestant views strengthened the bias toward the new faith already existing in his pupil's mind, for his attention had previously been drawn to the careful study of the Scriptures by his kinsman Olivetan, the first Protestant translator of the Bible into French. When Calvin was 22 his father died, whereupon the young man gave up his law studies and returned to Paris and theology, issuing soon after his first publication, an annotated edition of Seneca's "De Clementia."

Up to this point it is safe to presume that his interests and ambitions were purely those of a humanist, and whatever thought he may have had in regard to the need of reform in the matters of church doctrine and discipline, he doubtless felt with Erasmus and Reuchlin that all the reforms that might be required would come about as the result of completer knowledge.

It was not long after this that he experienced what he calls his "sudden conversion." He writes: "After my heart had long been prepared by the most earnest self-examination, on a sudden the full knowledge of the truth, like a bright light, disclosed to me the abyss of errors in which I was weltering, the sin and shame with which I was defiled." His experience is near of kin to that of Luther, and we are set thinking also of the "great light" that shone upon Saul as he was nearing Damascus. Yet with all the profound disclosure thus made to him, he still felt no special call to the work of preaching the reformed doctrine, and sought only for the undisturbed retirement that would permit him farther prosecution of his studies.

His friend Nicholas Cop had been elected to the rectorship of the University of Paris and at his request Calvin prepared for him an inaugural address which was substantially a defence of the reformed doctrine (1533). To the Sorbonnists this was intolerable, and Calvin was obliged to escape to Basel, where in 1536, at the age of 26, he published his "Institutes." This remarkable work was intended to be a vindication of the Protestant doctrine, and its dedication to the reigning King, Francis I, sought to create royal sympathy for the cause and for its persecuted adherents. It has been claimed that no other work, written at so early an age, has produced such a marked influence upon the opinions and practices both of contemporaries and posterity. Although the book as then composed was but the germ of what it was subsequently developed into, yet the line initially laid down in it Calvin never swerved from. By his Catholic opponents his work was styled the "Koran of the heretics."

CALVIN

From Basel he made a secret visit to his old home in Picardie, returning by way of Geneva, where he arrived on the 5th of August, 1536. Here it had been his intention to remain but a single night. The situation, political and religious, which he there confronted, however, vetoed his plans and really determined his entire subsequent career. That situation briefly outlined is as follows: The Duke of Savoy, unable to secure the submission of Geneva, had by the aid of Pope Leo X forced upon the city the reluctant acceptance of John, the Bastard of Savoy, as bishop, it being stipulated that the civil administration of the city should be vested in the Duke. The Genevese revolted under the lead of Berthelier and Bonnivard, but were defeated, Berthelier was executed and Bonnivard became the 'Prisoner of Chillon' (1530-1536). Defeat did not however extinguish the spirit of revolt. Of the two parties into which the Genevese were divided the Confederates ("Eidgenossen," a word from which perhaps comes the word Huguenot) looked for relief to the Swiss and the Mamelukes favored supporting the Duke. The Confederates prevailed, the Duke was worsted and all power both military and civil passed into the hands of the people. This was in 1533.

To this civil overturning succeeded an ecclesiastical revolution. Protestant tendencies had established themselves in Bern, and from there had extended themselves to Geneva. The struggle in the latter place was a severe one, but Protestantism gained ground till under the leadership of Farel and with the assistance of Bern an ecclesiastical reconstruction was effected, the Bishop driven out, Protestantism established, and Geneva left independent. This meant not only a new form of doctrine and mode of worship, but a reformed system of morals, and thereby a strain put upon the large profligate element of the population that soon worked a reaction strenuously encouraged by the Savoyards and the Catholic priests. The entire city was in this way wrought into a condition of tumultuous faction, and it was just in the midst of this warring of civil, moral and ecclesiastical elements that Calvin arrived at Geneva as already stated, and took lodgings for the night with the distinct intention of going on to Basel the next day. Farel who was in charge of the Protestant movement accidentally learned of Calvin's presence in the city, got into communication with him, and in an interview graphically described by Calvin in the preface to his "Commentary on the Psalms" (a work especially rich in autobiographical references), entreated him to remain and help work out the problem of Protestantism in Geneva, denouncing upon him the curse of God if he refused. Calvin was awe-stricken by what seemed to him the prophetic deliverance of Farel and yielded to his Elijah-like expostulation, so that the dictum is well justified that "Farel gave Geneva to the reformation and Calvin to Geneva."

He prefaced his work in Geneva by introducing and setting in operation a system of stringent regulations relative to doctrine, discipline and daily conduct. Amusements like dancing and card-playing were punishable offences, not because in his judgment inherently wrong, but because so abused that the only safe course was to prohibit them altogether. The stringency of

this policy excited a revolt led by the Libertines, so styled, and participated in even by many of the same "Eidgenossen" that had helped wrest Geneva from the grasp of the Duke. The opposition culminated in an act of Council expelling Calvin and Farel from the city (1538), the latter going to Neufchâtel, and Calvin to Strasburg, where, with a sense of relief, he thought to find himself free to gratify his tastes and resume his studies. Here again, however, as at Geneva, he was stirred by an intimidating call and applied himself to the work of ministering to the French refugees there gathered. It was during his stay in Strasburg that he married a lady of admirable character, with whom he lived in relations of tender attachment till her death nine years later, their only child, a son, dying in early infancy.

In Geneva, in the meantime, matters had been going from bad to worse, till by the united voice of government and people Calvin was recalled. Crime and vice had become rampant. Catholics were scheming for the restoration of the old faith. Cardinal Sordelet had addressed to the people a flattering and cajoling letter calculated to win them back to the Catholic Church. To that letter Calvin while still in Strasburg had published a reply both sagacious and masterly. Bern was suspected of having ambitious political designs on the city. The local government was too weak to maintain itself amid such a storm of conflicting elements and so after three years the people turned again helplessly to the man they had exiled. He fought against the overtures tendered him but was overborne by their earnestness and unanimity and came back to Geneva to make there his life-long home (1541).

Calvin entered at once upon his office of administrative head of the city considered in both its ecclesiastical and civic character. Though combining the two in his own person he was no Erastian, and Church and State stood to him as theoretically distinct, and yet contributing, each, to the interests of the other, the Church infusing its spirit into the State and the State in turn furnishing authoritative support to the Church. Civil authority which had previously been widely distributed he made more oligarchic and vested it primarily in what was known as the Little Council of twenty-five. The code devised for the city bears everywhere the marks of Calvin's authorship. For this his legal training especially qualified him. Larger and smaller matters alike came under his purview. Like the English Alfred the Genevese legislator braced his system of enactments by a liberal infusion of the Mosaic letter and spirit. Ecclesiastical discipline was delegated to the Consistory composed at first of 18 members, 6 clerical and 12 lay, with Calvin as its president. The city was divided into districts or parishes and a system of vigilance so thoroughly organized that every family was at least once a year visited by responsible parties for purposes of censure, counsel or relief.

Although introducing his administration with a measure of moderation its animus soon evinced itself in a way that made evident to the lawless and vicious classes what it was they had to contend with, and a wide-reaching opposition began immediately to organize itself. This opposition included the Libertines and the "Patriots," which latter class bitterly opposed

the close aristocratic lines with which the previous popular government had been replaced, and regarded with jealousy the foreigners that in great numbers were coming to make their home at Geneva. The enmity toward him and his administration was still farther fomented by the irrational and merciless severity shown in the punishment of small offences, such as the beheading of a child for striking its mother, the committal of heretics to the flames, the eliciting of testimony by torture. His rule was one of terror and he was both feared and hated. Mobs attempted to intimidate him. Dogs in the street were named after him. To antagonize Calvin was a crime, as Castellio found to his cost, and to speak disrespectfully of predestination, as did Bolsec, a felony. But cases like these two are quite eclipsed by the instance of Servetus.

Servetus was a Spaniard, a scholar of independent thought, who convinced himself of the groundlessness of papal claims, but without cordially accepting the theology of Protestantism. In 1531 he published a book entitled "The Errors of the Trinity." Irritated by Calvin's treatment of him and his speculations he retorted upon him and the reformed doctrine flatly and acrimoniously. Though out of sympathy with the Roman Catholic Church Servetus continued for twenty years in outward conformity with its doctrine and discipline and then wrote another volume under the title "The Restoration of Christianity." This was issued by him during his residence at Vienne and resulted in his arrest at the instance of the Archbishop. A copy of the work came under Calvin's eye, who declared that if Servetus were to come to Geneva he should not get away alive if his authority was sufficient to prevent it. Having escaped from Vienne Servetus did come to Geneva, where his presence soon reached the knowledge of Calvin, who ordered his arrest. Thirty-eight heretical propositions were alleged against him, among others the rejection of the Trinity and speculations leaning toward pantheism: and, although he conducted his defence with vigor and with a degree of acuteness, he was condemned and, to the disgrace of the Protestant cause, was burned a little way out from Geneva on the 27th of October 1553. It is claimed in behalf of Calvin that he tried to mitigate the severity of the penalty. However that may be, he was set on pursuing Servetus to the death, and it is on record that he wrote as follows to Farel two months before the execution,— "I hope the sentence will be capital but desire the atrocity of the punishment to be mitigated." It has to be remembered however that all of this was in keeping with the barbarism of the age and that so gracious-spirited a man as Melancthon gave to it his assent.

During the entire course of his conflict with heresy and the Libertines, Calvin was actively engaged in preaching and lecturing. He had crowds of hearers from all parts of Europe. Protestant refugees were in attendance upon his lectures and discourses and went back carrying with them the impression made upon them by his doctrines and personality. Thus was he able to stamp himself ineffaceably upon the religious thought of his own and aftertimes, and to cause Geneva to sustain to the Latin nations in particular a relation similar to that subsisting between Wittenberg and the Germanic. The

weight and permanence of the influence he exerted was due partly to his own idiosyncrasies. Both his mode of thinking and his policy of action were measurably determined by his natural temperament and his physical debility. He was composed principally of will and brain, with too little of the tenderer sensibilities to sweeten the action of the one or to rectify the aberrations of the other. Naturally enough then he made the doctrine of God's sovereignty the key-stone of his system, and could conceive of heresy as being none other than the unpardonable sin. The same combination of volitional and intellectual genius made him also a born organizer enabling him to compact and mature the reform tendencies of the times into a corporate whole where before everything had been incipient and sporadic.

Calvinism is Augustinianism in its developed and protestant form, the two theologians coinciding in their views of predestination, sin, and grace, though differing in the matter of justification and other less important matters. The keynote of Calvinism is not predestination, as is sometimes claimed, but divine sovereignty, out of which, understood as Augustine and Calvin understood it, predestination issues as a necessary corollary. Predestination so derived carries with it perforce the notion that those who are elected to be saved are so elected by the arbitrary action of the divine will;—"He hath mercy on whom he will have mercy, and whom he will he hardeneth." The motive therefore leading to God's exercise of grace in specific cases has its inexplicable grounds in the mind of God, and is nowise referable to any condition existent in the sinner. 'Infralapsarianism,' 'Permissive Decree,' etc., are merely philosophical attempts to relieve divine arbitrariness from the charge of immorality.

For a detailed history of the life of Calvin see Merle d'Aubigné's 'History of the Reformation in Europe in the Time of Calvin.' For a briefer outline of the same consult G. P. Fisher, 'The Reformation.' See also under 'Calvin' and 'Calvinism' in Schaff-Herzog Encyclopædia of Religious Knowledge. A very complete Bibliography is given in Schaff's 'Creeds of Christendom.'

CHARLES H. PARKHURST,

Madison Square Presbyterian Church, N. Y.

Calvin, Samuel, Scottish-American scientist: b. Wigtonshire, Scotland, 2 Feb. 1840. He came to the United States when a youth and served in the Civil War. He studied geology as a life pursuit, and since 1874 has been professor of geology at the University of Iowa, and State geologist of Iowa since 1892.

Calvinism. See CALVIN, JOHN.

Calvinistic Methodists, a section of the Methodists in Great Britain, distinguished by their Calvinistic sentiments from the ordinary Wesleyans, who are Arminian. Wesley and Whitefield, the colleagues in the great evangelistic movement in the 18th century, differed with regard to the doctrines of grace, Wesley being Arminian, and Whitefield Calvinistic. Whitefield may be regarded as the founder of Calvinistic Methodism. Other names, and especially that of Howell Harries, of Trevecca, should be mentioned in connection with it. In its distinctive form it dates from 1725, but did

not completely sever its connection with the English Church till 1810. In government it is now Presbyterian. Its great seat is Wales. The Calvinistic Methodists exist in three divisions: the Whitefield Connection, 1741; Countess of Huntingdon's Connection (Huntingdonians), 1748; Welsh Methodists, 1750.

Calvo, käl'vō, **Carlos**, Argentine jurist and author: b. Buenos Ayres, 26 Feb. 1824; d. Paris, 4 May 1893. On 25 June 1860 he was accredited to the courts of Paris and London as minister plenipotentiary, and resigned after having fulfilled his special mission. In 1885 he became Argentine minister at Berlin. In 1869 he was elected a corresponding member of the Paris Academy of Moral and Political Sciences, and later received the decoration of an officer of the Legion of Honor. He wrote numerous works, mostly in French, the most important of which are: 'Complete Collection of Treaties, Conventions, and Other Diplomatic Acts of All the Latin-American States' (11 vols., 1862-9); 'Historical Annals of the Revolution in Latin America' (15 vols. 1864, and later dates); 'International Law in Theory and Practice' (2 vols. 1870-2; 3d ed. 5 vols. 1881-8), a work considered by jurists as one of the most remarkable on its subject; 'Study on Emigration and Colonization' (1875); 'Dictionary of Public and Private International Law' (2 vols. 1885); 'Manual of Public and Private International Law' (3d ed. 1892).

Cal'vus, **Gai'us Licin'ius Ma'cer**, Roman orator and poet, a son of the annalist and orator of the same name: b. 82 B.C.; d. about 47. He left 21 orations, but few fragments survive. One of these, against Vatinius, whose counsel Cicero was, produced so powerful an effect that the accused interrupted the orator and exclaimed, "Judges, am I to be condemned because my accuser is eloquent?" His poems were ranked with those of Catullus.

Calx, properly lime or calk (hence "calcareous earth"); but the term is more generally applied to the residuum of a metal or mineral which has been subjected to violent heat, burning, or calcination, solution by acids, or detonation by nitre, and which is or may be reduced to a fine powder.

Calycanthus, käl-i-kän'thus, a genus of plants of the natural order *Calycanthaceæ*. About a dozen species of American and Japanese fragrant shrubs often grown for ornament. *C. floridus*, and *C. glaucus* are found in the Alleghany Mountains from Pennsylvania southward; *C. occidentalis*, in California. They are popularly known as sweet-scented shrub and Carolina or American allspice. The leaves are green and rather large, and the flowers usually some shade of chocolate or purple. Both are sweet-scented. In the northern United States the species are scarcely hardy, though some thrive in the vicinity of New York city upon well-drained, rather rich soil in somewhat sheltered situations.

Calycifloræ, a subclass of exogenous or dicotyledonous plants, characterized by having both calyx and corolla, petals separate and stamens attached to the calyx.

Cal'ydon, an ancient city of Ætolia, celebrated in the stories of King Cæneus, the Calydonian boar, and Dejanira and Hercules.

Calydon, Forest of, a large forest mentioned in the Arthurian legends; it is supposed to have been in the northern part of England, or it may have been the wooded portion of the midland counties, which include also the "Sherwood" of Robin Hood.

Calydo'nian Boar, in Greek mythology, a boar sent to lay waste the fields of Cæneus, king of Calydon, the ancient capital of Ætolia, when he omitted a sacrifice to Artemis. The goddess sent the boar when Cæneus was absent on the Argonautic expedition. No one dared to face the monster, until Meleager, the son of Cæneus, with a band of heroes, pursued and slew him. The Curetes laid claim to the head and hide, but were driven off by Meleager. Later accounts make Meleager summon to the hunt heroes from all parts of Greece, among them the maiden Atalanta, who gave the monster the first wound.

Calymene, a genus belonging to the fossil order of the trilobites, characteristic of the Upper Silurian formations of Europe. In this genus the head is almost semicircular, and deeply divided by longitudinal furrows. The eyes are situated on the lateral lobes. The rings of the thorax and abdomen are difficult to distinguish from each other. The thoracic segments are from 10 to 14 in number. The abdominal rings are distinct and never attached to each other. The genus includes about 20 species, of which the *Calymene Blumenbachii* may be taken as the type. The members of this genus have the power of rolling themselves up like a ball.

Calypso, in Greek mythology, a daughter of Atlas (some say of Nereus and Doris, or of Oceanus and Thetis). She inhabited the woody island Ogygia, situated deep in the ocean, and lived remote from all intercourse with gods and men.

Calyptra, the hood of the theca or capsule of mosses. The same name is given to any hoodlike body connected with the organs of fructification in flowering plants.

Calyptræa, a genus of gasteropod mollusks belonging to the family of the *Calyptræidæ*, resembling limpets in certain characteristics, but differing from them in structure. This genus consists of small marine shellfish, conical in form, but sometimes very flat; they are fragile, and are distinguished by a conical shell or testaceous process attached to the bottom of the cavity of the shell. The branchiæ of this mollusk are composed of long and thin hairlike filaments. It is sometimes found as a fossil.

Calyx, in botany, the exterior covering of a flower; that is, the outermost floral envelope, consisting of a circle or whorl of leaves external to the corolla, which it encloses and supports. The parts or leaves which belong to it are called sepals; they may be united by their margins, or distinct, and are usually of a green color and of less delicate texture than the corolla. In many flowers, however (especially monocotyledons), there is little or no difference in character between calyx and corolla, in which case the whole gets the name of perianth.

Cam, Auguste Nicolas, ô-güst nîk-ô-lâ kân, French sculptor: b. Paris, 1822. He was a pupil of Rude; his first works represent small animals, but he later chose the large beasts and birds of prey for his subjects. Among his best-known works are 'Linnets Defending Their Nest Against Rats'; 'Tiger in Conflict with a Crocodile'; and 'Eagle and Vulture Wrangling over the Carcass of a Bear.'

Cam, kân, or Caô, kân, Diogo, Portuguese explorer of the 15th century, who followed up the course of Prince Henry of Portugal, and in 1484 discovered the mouth of the Congo, near whose bank an inscribed stone erected by him as a memorial was found in 1887. He afterward examined the coast as far as lat. 22° S.

Cam, kâm, an English river formed by the junction of two streams, one of which (the Granta) rises in Essex and flows northwest, while the other (the Rhee) rises in the north of Hertfordshire, and flows northeast. The united stream flows sluggishly northward through Cambridgeshire, and falls into the Ouse some four miles south of Ely after a course of about 40 miles. The university town of Cambridge is situated on its banks a few miles below the confluence of the head-streams. It is navigable to Cambridge.

Cam, in machinery, a simple contrivance for converting a uniform rotary motion into a varied rectilinear motion, usually a projecting part of a wheel or other revolving piece so placed as to give an alternating or varying motion to another piece that comes in contact with it and is free to move only in a certain direction.

Cam and Isis, a familiar couplet by which the sister universities of Cambridge and Oxford are often mentioned. The allusion is to the rivers on which they are situated.

"May you, my Cam and Isis, preach it long;
The right divine of kings to govern wrong."
POPE, "The Dunciad."

"The drooping Muses, (Sir Industry,
Brought to another Castale,
Where Isis many a famous nursling breeds
Or where old Cam soft passes o'er the lea,
In pensive mood."
THOMSON, "Castle of Indolence."

Camaieu, ka-mī'ū, or Camayeu, a painting wherein there is only one color, and where the lights and shades are of gold, wrought on a golden or azure ground. When the ground is yellow the French call it *cirage*; when gray, *grisaille*. This kind of work is chiefly used to represent bas-reliefs. The Greeks called pieces of this sort *μονοχρόματα*. The word is also applied to a painting in two or three different colors, which, however, do not represent the natural colors of the objects depicted.

Camajuani, kâ-ma-hwá'nê, Cuba, an inland city in the province of Santa Clara. It has rail connection with the capital and other northern cities. Pop. about 5,000.

Camal'dolites, Camaldulians, or Camaldunians, a religious order established in 1012, by St. Romuald, a Benedictine of Ravenna, in the valley of Camaldoli, near Arezzo, in the Apennines, and confirmed afterward by Pope Alexander II. They were originally hermits living in separate cells, but as their wealth increased the greater part of them associated in

convents. They existed in Italy, France, Germany, and Poland. In the 18th century there were five independent fraternities of them, which are here mentioned in the order of their foundation: (1) at Camaldoli; (2) at Murano in the Venetian territory; (3) on Monte Corona, near Perugia; (4) at Turin; (5) the French fraternity, the first establishment of which was that of Notre Dame de la Consolation. They all had in common white garments, and the austere rules of the Benedictines. The hermits wore beards, and had still more severe rules than the monks in regard to fasting, silence, and penances. Their life was devoted to contemplation rather than to active work. A small branch of the order, consisting of nuns, was founded in 1086. There is in the vicinity of Naples a mountain which takes its name from a convent of the Camaldoli situated on its top, from which the traveler enjoys a prospect of remarkable grandeur and beauty. It is one of the most charming of all the beautiful views around Naples; yet the spot is not much visited by travelers.

Camalig, kâ-ma-lêg', Philippines, a town in the southeast part of the island of Luzon, situated within a few miles of the city of Albay. Pop. 14,868.

Cámara y Livermore, Manuel de la, mā'-noo-ël dā lā kâ'ma-rā ē liv'er-mōr, Spanish naval officer: b. in Malaga in 1836, his father being a Spaniard of the middle class, his mother an English woman. In 1903 he was in command of the *Escuadron de instruccion*, or training ships for cadets. During the Spanish-American war his name was associated with plans for the relief of the provincial capitals of the Spanish West and East Indies. First, in May 1898, it was suggested that a squadron, commanded by him as vice-admiral, might be sent from Spain for the relief of Havana. Second, a month later, he actually started to go to Manila, where Capt.-Gen. Augustin was shut in by Admiral Dewey and the insurgents. On 16 and 17 June the Cadiz reserve squadron under Admiral Cámara left port and sailed eastward through the Mediterranean. His fleet included troopships convoyed by the Pelayo and the best of the men-of-war, except those with Cervera in the West Indies. The United States consul at Port Said protested against permitting the Spanish fleet to refill its bunkers with coal there; nevertheless Cámara received orders to proceed through the Suez Canal. At this juncture an official bulletin of the navy department at Washington announced that Commodore Watson would "take under his command an armored squadron with cruisers and proceed at once to the Spanish coast." That was on 27 June. As though to emphasize the threat, came Cervera's defeat on 3 July. On 6 July Cámara's squadron was recalled to protect the Spanish coast; and so Watson's fleet, which had scarcely begun to exist, had yet completely fulfilled its destiny. Admiral Cámara's advancement to the grade he held in 1898 was very honorably won by service in Mexico, South America, Cuba (during the Ten Years' war), and the Philippines.

Camarasaurus, kâm-a-ra-sôr'us, a genus of amphibious dinosaurs (see DINOSAURIA), resembling the brontosaurus (q.v.), but of more massive proportions, with heavier fore limbs and shorter tail. An incomplete skeleton found in

the Jurassic strata near Cañon City, Col., was the first of these gigantic animals discovered in America. It was deposited in the American Museum of Natural History, New York. The length of this animal was estimated by Prof. Cope at 75 feet; its name was suggested by the hollow-chambered vertebrae of the back and neck. The *atlantosaurus*, of which the femur is over six feet long and two feet across at the head, was probably the same animal.

Camargue, La, *la ka-märg'*, France, an island in the department of Bouches-du-Rhône, formed at the mouth of the river by its two principal branches. It has an area of about 300 square miles. It is protected from the inundations of the river by dykes, and is mostly an unhealthy tract of pools and marshes, only a small portion of its being cultivated. Horses and cattle are raised on the island.

Camarilla, a word first used in Spain, but now in other countries also, to express the influence of certain persons in obstructing the operation of the official organs of government. When Ferdinand VII., in 1814, returned to Spain, he was surrounded by flatterers, who prevailed upon him to violate his promise of giving the people a constitution. They were called *camarilla* either from the room where they remained in waiting, or in allusion to the Council of Castille (*Camara de Castilla*). Until the revolution of 1820 the *camarilla* consisted mostly of men without talent, but passionately opposed to everything new; but when the king recovered his power in 1823 they became more influential and have since repeatedly interfered with the ministers. The thing itself is old enough; priests, favorites, and women have often formed *camarillas* in monarchies and other governments.

Camarina, *kä-ma-rē'na*, Sicily, an ancient town on the southern coast of the island, founded by a colony from Syracuse, about 600 B.C. Its first overthrow, which occurred 553 B.C., was the result of a revolt from the parent city. On its reduction it was razed to the ground, but was afterward rebuilt. It was in an exposed position in the Roman and Carthaginian wars, and was several times taken, retaken, and destroyed. Scarcely any vestiges of the ancient town remain.

Cam'arines, North and South, Philippines, two provinces in the southeastern part of the island of Luzon. The name is also applied more vaguely to the whole of the southeastern peninsula of the island. The Camarines provinces are bounded north by the province of Tayabas; south by the province of Albay, which forms the southern extremity of the peninsula; east by the Pacific Ocean; and west by the great Bay of Ragay. The formation of the peninsula is volcanic; the Caravallós range of mountains extends its whole length, from north to south, and seven of its peaks are active volcanoes. One of them, which is continually emitting smoke and flame, is well known to mariners coming from the east, and forms a kind of natural lighthouse. The most important product is rice. The soil of the two provinces possesses the same remarkable fertility which accompanies all the volcanic formations throughout the archipelago. Tobacco, sugar, coffee, cocoa, and indigo, are largely produced for ex-

portation; but the chief occupation of the inhabitants of the Camarines is the culture of the pineapple, and the manufacture of pina cloth (q.v.). The women of the Camarines are esteemed the most skilful embroiderers in Luzon of the delicate pina. The skill of the women of these provinces is also singularly displayed in the working of gold and silver filigree. All the artificers in precious metals are women; and some articles of jewelry, especially their neck chains, are very beautiful. The agriculture of the Camarines indicates in some respects a degree of progress beyond that of the other provinces of the island. The ox, and occasionally the horse, are used in plowing, instead of the slow, unwieldy buffalo, so generally preferred by the native East Indian farmer. The Camarinians have also discarded the primitive plow, formed from a single piece of crooked timber, with a point hardened by fire; and have substituted in its place a more modern style of implement. The provinces have well-constructed roads; and many of the rivers are traversed by substantial stone bridges. The Naga River, which drains the lakes Bato, Baaó, Buhi, and Iryga, and empties into the Bay of San Miguel, is navigable about 40 miles for vessels drawing not more than 13 feet of water. The industrial development of these provinces has been accompanied by a notable increase in population; and this being composed, with but small exception, of the brown race of the Philippines, which has yielded so readily to the influences of Christian civilization. The Camarines have not had their progress retarded, like other provinces of Luzon, by the troublesome presence of the wild negro race.

Camass-rat, *ka-mäs-rät*, a pocket-rat of the northwestern United States, similar to the gopher (q.v.). Its chief food is the camass (*Camasia esculenta*).

Cambacérés, Jean Jacques Régis, *zhöñ zhäk rä-zhē kän-ba-sä-räs*, Duke of Parma, French statesman: b. Montpellier, 18 Oct. 1753; d. Paris, 8 March 1824. His zeal and talents soon obtained him distinction, and the office of a counselor at the *cour des comptes* at Montpellier. At the beginning of the Revolution he received several public offices, became in September 1792 a member of the Convention, and labored in the committees, particularly in the committee of legislation. On 12 Dec. 1792 he was commissioned to inquire of Louis XVI. whom he desired for his counsel, and it was on his motion that the counsel was allowed to communicate freely with the king. In January 1793 he declared Louis guilty, but disputed the right of the Convention to judge him, and voted for his provisory arrest, and in case of a hostile invasion, death. On 24 January he was chosen secretary of the Convention. As a member of the Committee of Public Safety he reported, in the session of 26 March, the treason of Dumouriez. In August and October 1793 he presented his first plan for a civil code, in which his democratical notions were displayed. He was a member of the Council of the Five Hundred, where he presented a new plan for a code civil. This *Projet de Code Civil*, 1796, became subsequently the foundation of the Code Napoléon. On 20 May 1797 he left his seat in the council. A year afterward he appeared among the electors of Paris;

and after the revolution of the 30th Prairial, VII. (19 June 1799), was made minister of justice. On the 18th of Brumaire he was chosen second consul, and in that office made the administration of justice the chief object of his attention. After Napoleon had ascended the throne, Cambacérés was appointed arch-chancellor of the empire, and after obtaining many high distinctions, became in 1808 Duke of Parma. During the campaign against the allied powers in 1813, Cambacérés was made president of the council of regency. At the approach of the allies in 1814 he followed the government to Blois, and from that place sent his consent to the abdication of the emperor. When Napoleon returned in 1815 Cambacérés was again made arch-chancellor and minister of justice, and subsequently president of the Chamber of Peers. After the second fall of Napoleon he was banished, as a regicide, but in 1818 was permitted to return.

Cambaluc, kām-ba-look', the name by which the city we now know as Peking became known to Europe during the Middle Ages. It was the form given by Marco Polo (q.v.) to the Tartar word, *Khambalu*.

Cambay, kām-bā', British India, a seaport of Hindustan, Bombay presidency, the chief town of a native state of the same name, at the head of the Gulf of Cambay, 82 miles north-northwest of Surat. It was once a place of importance, but owing to the silting-up of the harbor, has greatly declined. The tides rush in with violence, and rising from 30 to 40 feet, enable the largest vessels to approach the shore; but again, at ebb, leave them dry. Among the buildings are several mosques and Hindu temples, and many religious structures of the Jains. The natives are expert jewelers and goldsmiths, and agate, carnelian, and onyx ornaments are exported. The trade is chiefly in cotton, ivory, and grain; the latter product being shipped to Bombay. Pop. 31,390. The state has an area of 350 square miles, and a population of 89,722.

Cambert, Robert, rō-bār kām-bār, French musician: b. Paris, about 1628; d. London, 1677. He founded the Royal Academy of Music, now the Paris Grand Opera. He was the first French opera composer, his works including 'La Pastorale' (1659), the first French opera; 'Pomone' (1671); 'Ariadne'; and 'Adonis.' For 22 years he was associated with the Abbe Perrin in the conduct of French opera, and going to England subsequently became "Master of the Music" to Charles II.

Cam'berwell, England, a parliamentary and municipal borough of London, on the south of the Thames, in Surrey, between Lambeth and Deptford. Its three divisions, North Camberwell, Peckham, and Dulwich, each return one member to Parliament. Pop. (1901) 259,258. See LONDON.

Camberwell Beauty, the common English name of the *Panessa antiopa*, a large and beautiful butterfly found in Great Britain, but much more common on the continent of Europe and in North America, where it is called Mourning Cloak (q.v.). It measures three inches or more between the extremities of its extended wings, which are of a dark-brown color, with a broad light-yellow border, and a row of blue spots

near the edge. The caterpillar feeds on the leaves of the birch, willow, and poplar. When fully grown the caterpillar is black, with bright-red spots along the back, and small spines over the whole body.

Cambiaso, kām-bē-ä'sō, **Luca** (called LUCHETTO DA GENOVA), Italian painter: b. Moneglia, 1527; d. Madrid, 1585. His best works are the 'Martyrdom of St. George'; and the 'Rape of the Sabines.' Late in life, at the invitation of Philip II., he visited Madrid, and executed a fine composition, representing the 'Assemblage of the Blessed,' on the ceiling of the Escorial.

Cambier, kām-bē-ā, **Ernest**, Belgian explorer: b. Ath, 1844. He entered the army, serving as adjutant on the general's staff, and in 1877 went as geographer on the first expedition of the International African Association, under the leadership of Crespel. The latter died in Zanzibar in 1878, and Cambier became leader. Accompanied by Wauters and Dutrieux, he started for the interior from Bagamoyo, and after a difficult journey reached Unyamwezi; after the death of Wauters and Dutrieux's return to Europe, he went on to Karema on Lake Tanganyika. Here, in September 1879, he established the first post and scientific station of the association, and remained there till 1882. He published 'Rapports sur les Marches de la première Expédition de l'Association internationale.'

Cam'bium, in botany, the layer of delicate thin-walled cells separating the wood from the bast in a great many stems and in a cross section appearing as a ring. The growth of the stem takes place by the deposition on the outside of the wood, of new wood-layers formed from the cambium, and on the inside of the bast, of new layers of bast formed from the outer cells of the cambium layer. In conifers and dicotyledonous woody perennials the primary bundles are arranged in a circle, and their cambium layers are thus made to form a more or less continuous ring of cambium in the stem. By the deposition of new layers of wood and bast regularly taking place, especially in spring, at the inner and outer surfaces of this cambium-ring, the stem is caused to increase in thickness.

Cambles, a gluttonous king of Lydia, who is said to have eaten his own wife, and afterward killed himself for the act.

Cambo'dia, or **Camboja**, Indo-China, nominally a state under a French protectorate, but practically a French dependency, situated on the lower course of the Mekong, 220 miles from northeast to southwest, and 150 miles broad, comprising an area of 40,530 square miles. It is bounded on the southeast and south by French Cochinchina; on the southwest by the Gulf of Siam; on the north by Siam; on the east, toward Anam, where the frontier traversing imperfectly explored territories is vague, by the territories of independent Mois tribes. The coast, 156 miles long, indented about the middle by the Bay of Kompong-Som, offers but one port, Kampot. Among the numerous islands along the coast are Kong, Rong, Hon-Nan-Trung, etc., most of them inhabited. The principal river, the Mekong (in Cambodian, Tonlé-Tom, "Great River"), flows through Cambodia

CAMBODIA — CAMBRAI

from north to south, as far as Chen-Tel-Pho, and thence southwest till, at the town of Pnom-Penh, it divides into two arms, the Han-Giang, or Bassac, and the Tien-Giang, or Anterior River, both flowing south. Above Pnom-Penh is a north-northwest outlet for the surcharge of the Tonlé-Tom, the Tonlé-Sap ("Sweet Water River"), expanding into the Great Lake, 100 miles by 25 miles in area, with a depth of 65 feet at its maximum magnitude. The greater part of the country is low and well watered and heavily timbered. The climate presents a dry and a wet season (June to November) and is fairly healthy. The soil is very fertile, producing large quantities of rice, besides maize, sugarcane, cotton, betel, tobacco, indigo, coffee, etc. Timber is abundant. Gold and precious stones are found, besides iron, tin, and limestone. Cattle are exceedingly numerous. Among wild animals are the elephant, wild buffalo, deer, and tiger. The Cambodians were formerly a highly cultured and civilized race. Various architectural remains, witnessing to former greatness, are found throughout the country. The present population is very mixed. The religion is Buddhism. In early times Cambodia was a powerful state to which even the kings of Siam paid tribute, but it gradually fell into decay, until about the close of the 18th century the Siamese annexed part of Cambodia to their own land, and reduced the rest of the country to a state of dependency. France, on 11 Aug. 1863, concluded a treaty with the king of Cambodia, Nerodom, placing Cambodia under a French protectorate. This treaty was superseded by that of 17 June 1884, under which the king of Cambodia accepted all the reforms, administrative, judiciary, financial, and commercial, which the government of France might institute. The chief imports are salt, sugar, wine, and various manufactured goods, such as textiles, and arms; the exports include salt-fish, spices, cotton, tobacco, and rice. The capital is Pnom-Penh. Pop. 1,500,000.

Cambodia, or **Mekong**, a large river of southeastern Asia, which rises in Tibet, passes through Yunnan, a province of China, Laos, Anam, Cambodia, and French Cochinchina, and falls into the Chinese Sea by several mouths, after a course of about 2,600 miles. Its navigation is much interrupted by sand-banks, rapids, etc., at various points of its middle and upper course. The Tonle-Sap ("Great Lake"), on the frontiers of Cambodia and Siam, is connected with the Mekong.

Cambon, Jules Martin, zhül mär-tän kähn bôn, French diplomatist: b. Paris, 5 April, 1845. He studied for the law and fought in the Franco-Prussian war, reaching the grade of captain. Entering the civil service, he became prefect of Constantine in 1878, prefect of the Department du Nord in 1882, prefect of the Rhone in 1887, governor-general of Algeria in 1891, and ambassador to the United States in 1897. He represented Spain in drawing up the Spanish-American protocol in 1898.

Cambon, Pierre Joseph, pē ār zhō-zěf, French statesman: b. Montpellier, 17 June 1754; d. Brussels, 15 Feb. 1820. Engaged in commercial pursuits, he became interested in the Revolution, and on hearing of the flight of Louis XVI. he caused the republican government to be proclaimed in his native town. He was sent to

the legislative assembly, and while supporting the cause of democracy, gave particular attention to financial matters. Most of the great measures which enabled the government to get through the revolutionary period were suggested or controlled by him; and to him the honor is due of having laid the foundation of the modern financial system of France. He promoted the confiscation of the estates of the *émigrés* in 1792, and made, after 10 August, a report in which he argued that Louis XVI., having held a secret correspondence with the enemies of France, was guilty of high treason. He presided over the last sittings of the legislative assembly, and afterward took his seat as a member of the Convention. Here he opposed with equal energy the partisans of monarchy and of terrorism. When Louis XVI. was arraigned before the Convention, he voted for his immediate death, and against the appeal to the people. He opposed the creation of the revolutionary tribunal, and insisted upon trial by jury. At the opening of the Convention, he had been appointed member of the Committee on Finances; 7 April 1793 he entered the Committee of Public Safety. On 2 June, when the Girondists were threatened by the infuriated mob calling for their proscription, he boldly took his place among them, hoping to be able, through his name of the Committee on Public Safety, to save them from violence and arrest. The next year he made another report on the administration of finances, which is considered a masterpiece of financial ability, and gives a full sketch of the plan which was afterward adopted for the regular registration of public debt. In the conflict which brought on the revolution of the 9th Thermidor, Cambon took part against Robespierre and his adherents; but though he had been instrumental in their defeat, he was charged with having been their accomplice, and a warrant was issued against him. He succeeded in baffling the search for him, and on the amnesty proclaimed by the Convention on its adjournment, he retired to an estate in the vicinity of Montpellier, where he devoted himself to agriculture. In 1815 he was elected a member of the Chamber of Deputies. On the second return of the Bourbons, he was exiled as a regicide.

Cambon, Pierre Paul, pē ār pōl, French diplomatist: b. Paris, 20 Jan. 1843. He was graduated at the Ecole Polytechnique in 1863, and, after serving as secretary to Jules Ferry, became secretary of prefecture for the Alpes-Maritimes, prefect of the Aube, and French resident-general in Tunis. He was appointed ambassador to Spain in 1886, was transferred to Constantinople in 1890, and to London in 1898.

Cam'borne, England, a market town of Cornwall, 11 miles northwest of Falmouth, situated on the slope of a gently rising hill. There is a granite church in the Perpendicular style, restored in 1862, and several other places of worship. It also contains a market-hall, a mining-school, a working-man's institute, and a museum of mineralogy. Near it are tin and copper mines. Pop. (1901) 14,726.

Cambrai, kähn-brā, or **Cambrai**, France (Flemish, *KAMBRYK*), a fortified city on the Scheldt, in the department Nord, 45 miles-south of Lille. From this place the linen cloth known by the name of cambric got its name. Cambrai

CAMBRIA — CAMBRIAN SYSTEM

is the seat of an archbishop. The Revolution stripped it of all its principal ornaments. The beautiful cathedral and the tomb of its archbishop, the celebrated Fénelon, were razed to the ground. There is a new monument to the memory of Fénelon in the present cathedral, a modern building of indifferent architecture. There is a large and handsome modern Hôtel de Ville, and an ancient belfry tower. Cambrai is the seat of a diocesan seminary, communal college, etc. It has a public library with 40,000 volumes and 1,400 MSS. Cambric and other linen goods, cotton, lace thread, leather goods, sugar, soap, beer, etc., are manufactured; and there is a trade in grain, oil-seed, hemp, etc. Cambrai is the Camaracum of the Romans. In 1508 the league against Venice was concluded at Cambrai between the Emperor Maximilian, Louis XII, the Pope, and Ferdinand of Aragon; in 1529 the peace with Charles V. Louis XIV. took Cambrai from the Spaniards in 1677, and it was finally confirmed to France by the Treaty of Nijmegen in 1678. Pop. 25,250.

Cam'bria, the Latin name of Wales, derived from Cymri, the name of the branch of the Celts to which the Welsh belong, and the name which they always give to themselves.

Cambrian Period, the name proposed by American geologists for the first or earliest time period of the Paleozoic era; in it were deposited the rocks of the Cambrian series. In Cambrian time animal life on the earth was already highly differentiated. All the great types of vertebrates were present then and definitely characterized. The principal types, so far as the fossil evidence goes, were Brachiopods and Trilobites, but many others existed, such as mollusks, marine worms, siliceous sponges, graptolites, and jellyfish, and by the end of the period starfish and crinoids. It is probable that plants, such as seaweeds, existed, but the evidence is very obscure. The climate during the Cambrian period was probably warm, even up to the Arctic Circle, but not torrid. This evenness of temperature may have been due to a much larger part of the earth's surface being covered by water than in later time, or to a difference in the composition of the atmosphere, more carbon dioxide being present.

At the beginning of Cambrian time the North American continent had already begun to take shape. A great land mass, which may have had lofty mountain ranges, extended from Labrador westward and northward, probably reaching as far south as St. Louis, and as far west as the Pacific coast. Its northern boundary is unknown, but probably was north of the Arctic Circle. To the south long narrow strips of land and narrow sounds occupied parts of Newfoundland, Nova Scotia, New Brunswick, and New England. A large Appalachian island, its west shore marked by what is now the Blue Ridge, extended from Vermont to Alabama; its eastern boundary is unknown, but was east of the present Atlantic coast-line. This Appalachian island was separated from the continental land mass to the west by a narrow sound. Southwest of the continent another long but narrow land mass, now the Sierra Nevada, extended from Puget Sound to Mexico, and another large island reached from the Kootenai district of British Columbia southward to Colorado. There were besides smaller islands in

Missouri and Texas. During Cambrian time the continental land mass slowly sank, and by the end of the Cambrian a great interior sea covered the whole Mississippi valley.

Cambrian System (from "Cambria," an ancient name for Wales), a term first used by Murchison and Sedgwick in describing the great series of slates and grits on the boundary between England and Wales, about 1835. Murchison, however, included the rocks in his Lower Silurian system, and the Cambrian was not generally recognized as a separate system until over 20 years later. The Cambrian system is fairly well defined at its base, since the rocks are deposited upon the upturned, eroded edges of Algonkian and Silurian strata, indicating a great time break. The top of the Cambrian grades into the Silurian. In North America the rocks of the Cambrian system are divided into three series, as follows: (1) the Lower Cambrian, or Georgian, containing *Olenellus* fossils; (2) the Middle Cambrian, or Acadian, with *Paradoxides* fauna; and (3) the Upper Cambrian, or Potsdam, with *Olenus* fauna. The Cambrian rocks were laid down along the shores of the great Algonkian continent that extended from Labrador to the Pacific Ocean, and as far south as St. Louis, in the narrow sounds that covered parts of Newfoundland, Nova Scotia, New Brunswick, and New England, and around the shores of the Appalachian and the Sierra Nevada uplifts. The rocks indicate generally a period of tranquil change, the ocean slowly advancing over the sinking continent and islands, just as one may see it to-day along great stretches of coast. The rocks are chiefly shallow water formations, including conglomerates, sandstones, and shales, though limestones, indicating deep water, are found in western Vermont, Nevada, and British Columbia. In a few places, as at South Mountain, Pa., there are rocks representing lava and volcanic ash interstratified with detrital sediments.

The Cambrian rocks undoubtedly cover a great area in North America, but are, over long stretches of country, buried beneath later sediments. The total thickness so far as known is not over 12,000 feet as a maximum, unless part of the underlying Algonkian be included. The Rhode Island Cambrian is 1,000 feet thick, the New Brunswick 2,500 feet, the Arizona 5,000 feet. The rocks are classified by Wolcott into these geographic provinces: (1) the Atlantic or eastern border, including the Nova Scotia basin, and the basin extending from southeast Newfoundland, across New Brunswick and Maine, into Massachusetts; (2) the Appalachian or eastern border province; (3) the Rocky Mountain or western border province; (4) the interior or continental province, including the region of the central and upper Mississippi and Missouri valleys, the Adirondacks of New York and Canada, and the deposits found in Dakota, Wyoming, Arizona, and Texas.

In Europe the Cambrian rocks are developed more fully than in North America; thus the conglomerate sandstones, shales, slates, and quartzites of the Welsh Cambrian are fully 20,000 feet thick. They are rocks indicating shallow-water conditions, and show three divisions. They extend from Wales, along Sweden, Norway, and Lapland into Russia, having in Sweden a thickness of 2,000 feet. To the east the Cambrian

formations thin out, and in central Russia die out altogether, the Ordovician resting directly on the Archæan. There are considerable areas of Cambrian in Germany, Bohemia, France, Portugal, and Spain; also in northeast China, in the Salt Range in India, in Australia, and in Argentina. See CAMBRIAN PERIOD.

(Report of the British Association) (Sedgwick 1835); Dana's 'Manual of Geology'; Geikie's 'Text-Book of Geology'; 'Bulletin 81 of the United States Geological Survey.'

Cambric, kām-brīk, a fine, thin kind of linen cloth manufactured originally, it is said, at Cambrai (q.v.) in French Flanders, whence the name. Cambric is manufactured in the north of Ireland, in England, Switzerland, and France, and is now chiefly used for handkerchiefs. The name is also applied to a cotton fabric which is in reality a kind of muslin.

Cambridge, kām brīdj, **Ada**, the pseudonym of Mrs. **George Frederick Cross**, English novelist: b. Saint Germans, Norfolk, England, 21 Nov. 1844. She was married in 1870 to Rev. G. F. Cross and went with him to Victoria in that year, since 1893 living near Melbourne. She is the author of 'My Guardian' (1877); 'In Two Years' Time' (1879); 'A Mere Chance' (1882); 'A Marked Man' (1891); 'The Three Miss Kings' (1891); 'Not All in Vain' (1892); 'A Little Minx' (1893); 'A Marriage Ceremony' (1894); 'Fidelis' (1895); 'A Humble Enterprise' (1896); 'At Midnight' (1897); 'Materfamilias' (1898); 'Path and Goal' (1900); 'The Devastators' (1901); 'Thirty Years in Australia' (1903); 'Sisters' (1904); etc. She has also written several notable poems.

Cambridge, **Adolphus Frederick** (1ST DUKE OF): b. London, 25 Feb. 1774; d. 8 July 1850. He was the youngest son of George III., and the uncle of Queen Victoria. He entered the British army as ensign when 16 years of age, and completed his education at the German university of Göttingen. He leaned at first to the side of the opposition on the question of the French war, but afterward sided with the government. He took part in the campaign in the Netherlands (1793), and fell into the hands of the French at the battle of Hondschoote, but was soon afterward exchanged. In 1801-3 he was employed in Hanover, vainly endeavoring to preserve it from occupation by foreign powers. In 1816 he was again sent to Hanover by the British prince regent, in the capacity of governor-general, and in 1831 was appointed viceroy of Hanover. In 1837, on the separation of Hanover from the British crown, he returned to England again. From that period until his death he was best known to the public as the president of charitable societies, and the chairman at the anniversary dinners of public associations.

Cambridge, **George William Frederick Charles** (2D DUKE OF), English general, son of the preceding: b. Hanover, 26 March 1810; d. 17 March 1904. He became colonel in the army in 1837, and major-general in 1845. In 1850 he succeeded his father as Duke of Cambridge, in 1854 was advanced to lieutenant-general, and in 1856 to that of general. He commanded the two brigades of Highlanders which formed the first division of the army sent to the Crimea. He led these troops into action at the battle of Alma, and at Inkerman had a horse shot under him. Di-

rected by his physician to withdraw for a time from camp life, he retired first to Pera, and soon after to England. On the resignation of Viscount Hardinge in 1856, he was appointed commander-in-chief of the British army. He retired in 1895.

Cambridge, England, an inland county bounded on the north by the county of Lincoln; on the west by Northampton, Huntingdon, and Bedford; on the south by Hertfordshire and Essex; and on the east by Suffolk and Norfolk. A great part of northern half of the county belongs to the fen district and is very flat, farther south it is undulating, and in the south-east some heights occur. The principal rivers are the Cam or Granta, and the Ouse, with the Nen in the north. An important portion of the county, including the Isle of Ely, belongs to the great artificially drained tract known as the Bedford Level (q.v.). About nine tenths of the total acreage of the county is now productive, and a greater proportion of land is under corn crops than in any other county in the kingdom. Potatoes, turnips, and mangold are the chief green crops. The southern portion of the county abounds in dairy farms, celebrated for the production of excellent butter and cheese. The part of the county extending from Gogmagog Hills to Newmarket is chiefly appropriated to sheep-walks. The chief mineral productions are the phosphatic nodules known as coprolites, lime, and clay for brick and tiles; and peat is cut for fuel. For parliamentary purposes the ancient county is divided into three divisions—Wisbech, Chesterton, and Newmarket, and embraces also the parliamentary borough of Cambridge, each returning one member to parliament. Administratively the ancient county embraces the two counties of Cambridge and the Isle of Ely. There are two municipal boroughs, Cambridge and Wisbech. The educational institutions include a day training college for schoolmasters, and the new Homerton undenominational training college for women at Cambridge, and a theological college founded in 1876 at Ely; there are also more than 225 elementary schools in the county. See also CAMBRIDGE, UNIVERSITY OF.

Cambridge, England, capital of the county of Cambridge, is situated on the Cam, about 56 miles n.e. by rail from London. It is a municipal and parliamentary borough, the seat of a celebrated university (see CAMBRIDGE, UNIVERSITY OF), and has a large agricultural market.

Geology.—The geological formation of Cambridge and the surrounding district consists chiefly of clay. The following strata are to be found,—Chalk Marl, Cambridge Greensand, Gault, Kinneridge Clay, Oxford Clay, Ampthill Clay, Cherryhinton Chalk, and some recent alluvium which borders the rivers and tributaries, consisting of peat, sandy loam, etc. The town is made up of three main thoroughfares, two running north and south and the other east and west, connected by a number of short streets.

Public Buildings, Libraries, etc.—The city possesses a Guildhall, including municipal buildings, law courts, and public free library. There is also a spacious corn exchange, attended weekly by buyers from all parts of the United Kingdom, and a cattle market. Addenbrooke's Hospital is a noted institution, connected as it

CAMBRIDGE

is with the Cambridge University Medical School. Cambridge was one of the first towns to establish a public free library, which now comprises a central library and three branches with a collection of upwards of 50,000 volumes.

Churches.—In its early history Cambridge was fortunate in the number of its churches, two of which are worthy of mention. The church of Saint Benedict's is the oldest, being of pre-conquest date. It possesses a tower in Saxon architecture. That of the Holy Sepulchre or "Round Church" is one of four round churches in England and was probably in existence about the year 1130. The largest parish church is that of Saint Mary the Great (the University church), built in the perpendicular style. Other churches of interest are The Abbey (Early English, 13th century), Saint Edward (rebuilt in the 14th century with the exception of the tower which is a work of the 12th century), Saint Michael (13th century), Trinity (about 1274), Saint Mary the Less (1340), Saint Botolph (14th century) and Saint Peter, which has examples of 12th century architecture. The history of nonconformity in Cambridge dates from the year 1457, and it is now well represented by its churches. The Roman Catholics have a fine church built in the early decorated style. It was commenced in 1887, through a donation from Yolande Marie Louise Lyne-Stephens. Of theologians Cambridge was the birthplace of Jeremy Taylor; it was at Cambridge the Rev. Charles Simeon founded the evangelical school of the Church of England, and at the same period Robert Hall, the great Baptist preacher, attracted large congregations. Johnny Stittle, the hedger, occupied a unique position at the end of the 18th and beginning of the 19th century, drawing a large congregation from both town and University. Thomas Hobson was famous as a carrier. He is said to have been the first to let out horses for hire, and the originator of the proverb "Hobson's Choice." His fame must have extended far beyond the limits of the University, as in 1617 a quarto tract appeared under the title of 'Hobson's Horse Load of Letters, or Precedents for Epistles of Business.'

Education.—Cambridge has 20 public elementary schools, including higher grade schools, among which we may note the Perse grammar schools, founded by Dr. Stephen Perse in 1615. The Wesleyans are represented in education by the Leys school, the Roman Catholics by Saint Edmund's House, the Presbyterians by Westminster College, and more recently the Congregationalists have removed from Cheshunt, Herts, to Cambridge, preliminary to the erection of a new college. Homerton College has about 150 female students in training for educational duties.

Railroads.—The railway companies which have connections at Cambridge are the Great Eastern, the Great Northern, the Midland, and the London North Western.

Public Works.—The re drainage of the whole borough was carried out a few years ago, and sewage works were constructed at a total cost of about £170,000. Two other recent undertakings were the building of a new police station at a cost of about £20,000, and the purchasing and setting out of land for a new cemetery, covering 25 acres, at a cost of about £16,000.

Recreation Grounds.—Cambridge is fortunate

in its number of common lands and recreation grounds, numbering in all and having a total area of 300 acres. Of the recreation grounds Parker's Piece is a noted cricket and football ground, where all the University matches were played, until they purchased their own grounds.

Government.—The corporation of Cambridge, under the "Municipal Reform Act," consists of a mayor, 10 aldermen and 30 councillors. The University also returns its quota of two aldermen and six councillors. The town returns one member to Parliament.

History.—There is every proof that in its early days Cambridge was an important trading centre. Its situation on the Cam made it easily accessible from the surrounding district for miles around, and provender, fuel, and merchandise was conveyed by water to all parts of East Anglia. It was the seat of Stourbridge Fair, one of the largest fairs in Europe. That the Romans occupied the town is evident from the fact that numerous Roman remains have been found at various periods. Miles of ancient earthworks, said to be of British origin, surround Cambridge, and in the town itself there is a large mound called "Castle Hill," probably of Saxon origin and raised as a defence against the incursions of the Danes. In the years 870 and 1010 the town was destroyed by the Danes. William the Conqueror built a castle here in 1068. The year 1110 is alleged to be the date of the origin of the university, at which time we read that learned monks visited Cambridge to teach their philosophy and other primitive sciences. Richard II. held a Parliament at Cambridge in 1388. The town was frequently visited by the plague ("Black Death"), and in 1630 the mortality was terrible. At the time of the Civil War Oliver Cromwell (formerly a student of Sidney Sussex College) represented Cambridge in Parliament, and the town supplied a large number of men for the Parliamentary army. William Dowsing did considerable damage both to the colleges and to the parish churches in 1643. Queen Victoria and her consort visited Cambridge in 1845 and again in 1847, and as chancellor of the university, the influence for good, exercised by the Prince Consort, was predominant. The King and Queen visited Cambridge on 1 March 1904 to open the new university museums. The second meeting of the British association was held at Cambridge in 1833, and subsequent meetings were held in 1845, 1862, and 1904. Apart from the University, Cambridge would lose much of its importance. The colleges with their various styles of architecture, surrounded by gardens and "college walks," are a constant source of delight. The river Cam winds its course through the college grounds for a distance of about three quarters of a mile. Nine bridges connect the colleges and grounds where nature and art combine. Below the town, the river is the scene of the well-known college boatraces which occasion the visit of thousands of people from far and near.

Area and population.—The town covers an area of 3,278 acres. Much house property has been destroyed to make room for the continuous additions to colleges and university buildings, with the result that residents have migrated to adjacent districts. Pop. (1901) 38,379.

J. PINK,

Chief Librarian of the Public Library.

W. A. FENTON,

Senior Assistant of the Public Library.

Cambridge, Mass., city and one of the county-seats of Middlesex County, situated on the Charles River and the Fitchburg railroad; opposite to and connected with Boston by nine bridges. It was founded in 1630-31, under the name of "Newe-Towne," or "Newtown," and did not receive its present name until several years later. In 1636 the General Court appropriated \$2,000 to locate a school in Old Cambridge, which later became Harvard College, now Harvard University. In 1631 Cambridge was 35 miles long and only one mile wide, including the townships now incorporated as Billerica, Bedford, Lexington, Arlington, Brighton, and Newton, all these having been gradually separated from it. The city was formerly divided into villages called Old Cambridge, Cambridgeport, East Cambridge, and North Cambridge, names which are still used to designate certain districts. It has grown into a populous manufacturing centre, where glass, furniture, organs, steam-engines, etc., are made, the value of which amounts annually to over \$55,000,000. Here also is located the massive stone courthouse of Middlesex County. The first printing office in the United States was located in Cambridge, and the 'Bay Psalm-Book,' published by Stephen Day and printed in 1640, was the first book from this press. Cambridge has now extensive printing establishments, including the Riverside Press; the Athenæum Press, and the University Press. For historical and literary associations, Cambridge is one of the most famous cities in the United States. The venerable Washington elm, under which Washington took command of the American army, 3 July 1775, stands at the corner of Mason and Garden streets. "Craigie House," built by Col. John Vassall in 1759, was Washington's headquarters in 1775-6, and afterward became the home of the poet Henry W. Longfellow until his death. On Elm Avenue is "Elmwood," the birthplace and home of James Russell Lowell, who lived here 1819-91. A part of this place has been bought by public subscription, to be preserved as a public park. This city has been the home of such distinguished men as Oliver Wendell Holmes, William Henry Channing, Margaret Fuller Ossoli, Col. Thomas Wentworth Higginson, Louis Agassiz, John Fiske, and Charles Eliot Norton. The fine city hall and land for a park was the gift of a former citizen, Frederick H. Rindge, who also presented the city with a public library, an institution now called the Rindge Manual Training School, and other benefactions which amounted to more than \$1,000,000. The beautiful Mount Auburn cemetery is partly in Cambridge and partly in Watertown. Among important buildings are those of Harvard University; Radcliffe College; Cambridge Hospital; Manual Training School; the Latin and High Schools; Public Library; and Middlesex County Court-house. In recent

years much has been accomplished toward developing a system of parks which will eventually include nearly the entire river front. Pop. (1900) 91,886. Consult: Paige, 'History of Cambridge' (1877); Powell, 'Historic Towns of New England' (1898). See HARVARD UNIVERSITY.

Cambridge, Ill., the county-seat of Henry County, a village on the Rock Island and Peoria R.R., about 28 miles southeast of Rock Island. Surrounded by a productive agricultural district, it has a thriving domestic and export trade in farm produce, grain and cattle, etc. Pop. (1904) 2,000.

Cambridge, Md., a city and county-seat of Dorchester County, about 58 miles southeast of Baltimore on the Choptank River, and on the Seaford & Cambridge R.R. Cambridge was settled in 1684 and was incorporated as a city in 1900. It is governed by a mayor who is elected every two years by the city council, which consists of five members, the mayor and four aldermen. The aldermen are chosen by the different wards in the city. Cambridge has important manufactures of underwear and lumber and as the centre of a fertile agricultural district has an active trade in farm produce and live stock. The oyster canning industry is also carried on to a considerable extent. Pop. (1903) 6,100.

Cambridge, N. Y., a village in Washington County, situated on the Delaware and Hudson R.R., about 28 miles northeast of Albany. The Cambridge Valley Agricultural and Stockbreeders' Association is located in the valley. Pop. (1903) 2,000.

Cambridge, Ohio, city and county-seat of Guernsey County, on the Baltimore & O. and the Pennsylvania R.R.'s, 55 miles north of Marietta. It is situated in a coal and iron region which has also deposits of pottery clay; and the industries are chiefly mining and manufactures connected with these resources. There is also natural gas used for heating. The city owns and operates its waterworks. The city has five banks, court-house, children's home, and Carnegie Library. It was settled in 1804 and was incorporated as a city in 1887. Pop. (1900) 8,241.

Cambridge Manuscript, the *Codex Cantabrigiensis* or *Bezae*, the most famous of the uncial MSS. in the University Library, Cambridge, England, consisting of a copy of the four Gospels and the Acts of the Apostles. It was presented in 1581 to the University of Cambridge by Theodore Beza (q.v.) the celebrated Calvinistic divine. The *Codex Bezae* and the *Codex Laudianus* at Oxford, differ widely in text from all those of other codices. Scrivener, the editor and other critics look upon these divergences as interpolations of which the *Codex Bezae* is said to contain no less than six hundred. Scrivener, nevertheless, believes that the *Codex Bezae* which originated probably in the south of France in the 6th century, is derived from an original of not later than the 3d century. Bornemann on the other hand contends that the *Codex Bezae* contains the original text and that other versions are mutilated. Scrivener's criticism is interesting. "While the general course of the history and the spirit of the work remain the same as in our com-

monly received text, we perpetually encounter long passages in Codex Bezae which resemble that text only as a loose and explanatory paraphrase recalls the original form from which it sprung. Save that there is no difference in the language in this instance, it is hardly an exaggeration of the facts to assert that Codex D (that is Codex Bezae) reproduces the *textus receptus* of the Acts much in the same way that one of the best Chaldean Targums does the Hebrew of the Old Testament, so wide are the variations in the diction, so constant and inveterate the practice of expanding the narrative by means of interpolations." See BIBLE—Codex Bezae D.

Cambridge Platform, a system of church order and polity agreed on by a synod of New England churches, held at Cambridge, Mass., in 1648. It was a resolution rather than a decree, the platform itself denying the synod's authority to pronounce the latter. Its chief positions were: The one true and immutable form of church government has been prescribed in God's word. Christ is the supreme head of his Church, which, since his advent, consists of distinct, equal, and self-governing bodies under him, not too large to meet conveniently in one place nor too small to carry on church work effectively. They are therefore monarchies as to him, democracies in themselves, and aristocracies as to each other; but obligated to mutual communion of care, counsel, monition, worship, succor, and transfer of members. Synods are useful, but not permanent, nor with authority for censure or discipline; but when their decisions accord with God's word they should be submitted to. Christ has deputed extraordinary but temporary power to his apostles, ordinary and permanent power to the churches. Officers are advantageous, but not indispensable, and each church may appoint and remove its own, but should consult its neighbor churches when feasible. These officers consist of bishops, pastors or elders (synonymous in function), and deacons who can act officially only in temporal matters. Ordination is the solemn installation of a church head into his place, following his election. The relation of civil magistrates to church affairs is also expounded.

Cambridge Platonists, the name given to a school of theological and philosophical thinkers of the English Church who were connected with Cambridge University, and who exercised an important influence during the latter half of the 17th century. The most important members of this school were Benjamin Whichcote, John Smith, Ralph Cudworth, Henry More, Nathaniel Culverwel, John Worthington, and George Rust. Joseph Glanvil and John Norris were both Oxford men and much younger than the Cambridge thinkers, though representing the same general intellectual tendency. Sir Thomas Browne, author of 'Religio Medici' and 'Christian Morals,' is also a representative of the Platonic type of thought, but his work as an author belongs to a somewhat earlier period.

In theology, the influence of these men was in favor of toleration and liberality of view. They maintain that dogmatic uniformity is unattainable, and that the welfare of both church and state demands toleration and latitude of religious opinion. Hence they were frequently

termed latitudinarians (q.v.). This position was the result of a faith in reason and a conviction that free inquiry and discussion could not be prejudicial to theological truth, and that rigid uniformity of doctrine is neither possible nor desirable. At the same time they distinguish between dogma and true religion. The former is external and necessarily changes from time to time. Religion is the spiritual life springing up in the soul, the union with the divine, which manifests itself through the moral life. The spiritual life is no mere subjective fancy, but is the true reality, more real and abiding than the world of sense and matter.

In philosophy, the Cambridge Platonists were idealists, emphasizing the reality of the ideal essences of things and the higher truth and reality that these possess, both in the intellectual and moral sphere, as opposed to what is material and sensuous. Cudworth, who was the most learned and, in many respects, the most important representative of the school, names his two chief works, 'The True Intellectual System of the Universe,' and 'The Eternal and Immutable Principles of Morality.' From these titles the general standpoint of the whole movement appears. Cudworth was acquainted with the writings of Descartes, and corresponded with him on philosophical subjects, but the real inspiration of the school came from Plato and Neo-Platonists like Plotinus, Proclus, Hierocles, all of whom are abundantly quoted in uncritical fashion. Negatively, too, their thought and activity were influenced greatly by Hobbes (q.v.), who stands for materialism and for relativity and a naturalistic system of ethics. Indeed the work of Cudworth and Henry More, the two most prominent writers of the school, may be said to be explicit attempts to refute Hobbes. Cudworth's work is the more ponderous and learned, abounding in quotations drawn from many sources. In More we find a more mystical tendency, with perhaps deeper speculative insight.

Bibliography.—J. Tulloch, 'Rational Theology and Christian Philosophy in England in the Seventeenth Century' (Vol. II., 2d edition, 1874); H. Hallam, 'Introduction to the Literature of Europe'; H. Sidgwick, 'An Outline History of Ethics'; Erdmann, 'History of Philosophy.' In addition, many of the writings of representatives of the school are accessible in English form.

J. E. CREIGHTON,

Professor of Philosophy, Cornell University.

Cambridge, University of. Situated at Cambridge, England. Its origin is very obscure, and of its early history, before the 12th century, there are only very scanty records. It is clear that a university existed long before the foundation of the oldest college, and that it was powerful enough to claim and to obtain from the town very important privileges, such as immunity from taxation, the right to test weights and measures, and to prescribe what amusements should be allowed or forbidden. From the bitter feeling aroused by the possession of these and other privileges frequent serious outbreaks of hostilities arose between the town and the university, resulting in the wanton destruction of valuable records, which has left little or no material for a connected history. It is probable

CAMBRIDGE, UNIVERSITY OF

that the university owed its origin to the schools in connection with the Priory of St. Frideswyde and the conventual church at Ely. The earliest recognition of Cambridge as a university is contained in a writ of the second year of Henry III., 1217, ordering all clerks who had been excommunicated for their adherence to Louis, son of the King of France, to depart the realm. The number of students was increased in the same reign by a migration of students from Paris in 1229, and further by a like migration from Oxford in 1240. In the early part of the 13th century students lived where they pleased, but in time they inaugurated a system of hostels or lodging houses, in which a number had to live under the supervision of a superior; and out of this system of hostels sprang the collegiate system. The oldest of the colleges, Peterhouse, was founded in 1284 by Hugh de Balsham, Bishop of Ely; it was followed by Clare College, founded in 1326 by Lady Elizabeth, granddaughter of Edward I.; Pembroke Hall, in 1347, by Marie de St. Paul; Gonville Hall, afterwards Gonville and Caius College, in 1348, by Edmund Gonville; Trinity Hall, in 1350, by William Bateman, Bishop of Norwich; Corpus Christi College, in 1352, by the joint efforts of two Cambridge communities, the Guild of Corpus Christi, and the Guild of the Blessed Virgin; King's College, in 1441, by King Henry VI.; Queen's College, in 1448, by Margaret of Anjou, though it was not till 1475 that it received its code of statutes from Elizabeth Woodville, the consort of Edward IV.; St. Catherine's Hall, in 1452, by Robert Wodelarke, Provost of King's College; Jesus College, in 1497, by John Alcock, Bishop of Ely; Christ's College, in 1505, by the Lady Margaret, Countess of Richmond, mother of Henry VII.; St. John's College, in 1511, also by Lady Margaret; Magdalene College, in 1542, by Sir Thomas Audley; Trinity College, formed by the union of the earlier foundations of Michaelhouse, 1324, and of King's Hall, 1337, and founded in 1546 by Henry VIII.; Emmanuel College, in 1584, by Sir Walter Mildmay, a college dear to all Americans as that in which John Harvard, founder of Harvard College, was educated; Sidney Sussex College, in 1596, by the Lady Frances Sidney, Countess of Sussex; Downing College, in 1800, by Sir George Downing; Selwyn College Public Hostel, founded in 1882 in memory of George Augustus Selwyn, late Bishop of Lichfield, formerly Bishop of New Zealand. Each of these colleges is a separate corporation governed by its own statutes and practically independent of the university, though the connection between the two is necessarily very close, as every member of the university is a member of some one of the colleges, as a non-collegiate student. The head of a college is styled the Master, except in the case of King's College, where he is styled the Provost, and of Queen's College, which is ruled by the President. Other college officers are the Tutor, who stands in *loco parentis* to the undergraduates, and the Dean, who is responsible for the services in the College Chapel, and for college discipline.

A code of statutes was given to the university by Queen Elizabeth, and this code remained in force till 1858, when a new code was framed by a Royal Commission; this latter code was again revised in 1882, when they took their

present form. In 1874 all religious tests were finally abolished except for Degrees in Divinity; and in 1894 the university surrendered the last of its privileges over the town which it had retained since the 13th century, and then only put an end to the bitter feeling which had existed for centuries between the town and the university, and which had led to frequent outbreaks of hostilities between the two bodies.

The university was incorporated in the reign of Elizabeth, by the name of "The Chancellor, Masters and Scholars of the University of Cambridge." The executive authority of the university rests in theory with the Chancellor, who is elected for life; but as he is non-resident, it is practically in the hands of the Vice-Chancellor, who is elected annually from among the heads of colleges. The ultimate decision of all questions touching academic policy rests with the Senate, a body composed of all those members of the university who have proceeded to the M.A. or some higher degree, and whose names are on the Register of Members of the Senate. All legislative proposals so far as they are consistent with the statutes, which can only be altered by act of Parliament, are framed by the Vice-Chancellor in conjunction with the Council of the Senate, a body elected by the resident members of the Senate and consisting of the Chancellor, the Vice-Chancellor, four Heads of Colleges, four professors, and eight other members of the Senate. These proposals, having received the sanction of the Council, are offered to the Senate in the form of Graces or resolutions, and must pass the Senate before they can take effect. Of the other officers of the university the most important are the two Proctors, whose duty it is to attend to the discipline of all persons *in statu pupillari* and to read the Graces in the Senate House; the Registrar, who keeps the archives of the university; the Public Orator, who is the voice of the university on all important occasions, who writes letters in the name of the university, and who presents all honorary degrees in a Latin speech; the Librarian, who has charge of the University Library. A General Board of Studies supervises the system of teaching as a whole, and each department of study is controlled by a professor and a syndicate or board. The teaching of the undergraduates is undertaken partly by the university and partly by the colleges. It takes mainly the form of lectures, delivered either by the university professors or readers, and open to all members of the university; or by college lectures to members of particular colleges or groups of colleges.

The academical year is divided into three terms: the Michaelmas Term, lasting from 1 Oct. to 14 Dec.; the Lent Term from 8 Jan. to within a few days of Easter; the Easter Term from three weeks after Easter to 24 June. The undergraduates reside either in rooms belonging to the several colleges or in rooms in the town licensed for the purpose. They dine together in the College Hall, but all other meals are taken in their own rooms. Academical dress, a gown and square college cap, must be worn in the College Hall and Chapel. Before proceeding to any examination for a degree they must have resided for the greater part of each of nine terms; and must have passed the previous examination, commonly called the "Little Go," a

CAMBRIDGE, UNIVERSITY OF

somewhat elementary examination in Classics, Mathematics, and Divinity. Exemption from this examination can be obtained by passing various non-university examinations. The student can then, if he wishes to proceed to an "Honors" degree, devote the rest of his time to his special subject, and having kept his terms, is qualified to become a Candidate for Honor in a tripos, as honor examinations are called. If he wishes merely to obtain a pass degree he must first pass the general examination of somewhat similar nature to the previous, but more advanced, and can then proceed to one of the special examinations, as they are called. These examinations are in the same subjects as the tripos examinations, but the questions set are of a much less advanced nature. A student who passes a tripos is called an honorman; one who passes in a special examination is called a Passman (commonly "Pollman," from *οι πολλοι*). The names of successful candidates are arranged in three classes, called in the case of the mathematical tripos, Wranglers, Senior Optimes, and Junior Optimes; in the case of the examinations merely first, second, and third class. To the rule that every student before proceeding to a degree must have "kept" residence at least nine terms, there are some important exceptions. Graduates of other universities, British and foreign, who can produce evidence of special qualifications, can qualify for the B.A. degree by passing a tripos examination, or by submitting for approval a dissertation on some subject connected with the special branch of study. Students from various educational institutions for adults both at home and in the colonies, which are said to be "affiliated" to the University, are allowed practically the same privileges. Further, diplomas in Sanitary Science, Tropical Medicine, Agriculture, Geography, Mining Engineering, and Forestry are granted, after examination, to persons who are not members of the university. Having obtained the B.A. degree the student can then, after the lapse of three years, proceed to the M.A. degree, and thereby, for the first time, he obtains a voice in the government of the university. He can exercise a vote in the Senate, and can "non-placet" or oppose the Graces offered to the Senate by the Council. Of the degrees above that of B.A., the M.A. is the only one that is conferred without further examination or exercise. The degree of Doctor in the various faculties can only be obtained by examination or by a dissertation. Degrees other than these already mentioned which are conferred by the university, are the degrees of Doctor in Divinity, Law, Medicine, Music, Letters, and Science; Master in Law and Surgery, Bachelor of Divinity, Law, Music, Medicine, and Surgery. The university has power to confer honorary degrees, without residence or examination, on distinguished persons, noblemen, bishops, deans, and heads of colleges. Before 1850 the only avenue to an honor's degree was by way of the mathematical tripos, or by the mathematical and classical tripos combined. The last half century has witnessed a remarkable development. New triposes have been established in Moral Sciences, Theology, Natural Sciences, Law, History, Economics, Mediæval and Modern Languages, Oriental Languages, and Mechanical Sciences; while new professorships

have been founded in Archæology, Fine Arts, Latin, Anglo-Saxon, Experimental Physics, Mechanism and Applied Science, Surgery, Agriculture, Sanscrit, and Chinese. This last was founded by Sir Thomas Wade, who was the first professor and who bequeathed to the university the first Chinese library outside China. The number of students attending the school of medicine number about 400. Provision is also made for the teaching of Hindustani, Tamil, Burmese, Persian, Russian, etc.

Of the university buildings the most important is the University Library, containing over 700,000 volumes, and over 8,000 manuscripts, including the famous Codex Bezae. This library is entitled by the Copyright Act to a copy of every book published in the United Kingdom, and a large sum is expended every year in the purchase of foreign books and periodicals. The Fitzwilliam Museum contains a valuable collection of paintings, ancient marbles, and coins. The Observatory stands about a mile from Cambridge, and is splendidly equipped with instruments large and small. The Museums and Laboratories of Science cover a large space of ground in the centre of the university and include laboratories, lecture rooms, and workshops for all departments of science and medicine. These museums have been erected at great cost during the last few years, and were formally opened by King Edward in 1905. The Engineering Laboratory, probably one of the best equipped of its kind in existence, provides adequate instruction for the profession of engineer. The Cavendish Laboratory of Experimental Physics was the gift of the seventh Duke of Devonshire, late Chancellor of the University. The Sedgwick Museum of Geology was built as a memorial to the late Adam Sedgwick, Professor of Geology. Other museums are those of Classical Archæology, Botany, Mineralogy, etc. The Botanic Garden occupies over 20 acres, and contains an extensive range of plant houses, a large arboretum, etc.

Two colleges, Girton and Newnham, have been established just outside Cambridge for the education of women. The students at these colleges are admitted to university and college lectures and to the various examinations for honors. The names of those who pass are placed in the published lists, and certificates are granted to them. Many of them have obtained the highest honors, but the university confers no degrees upon them.

Two movements of the last half century have served to bring the university "into closer connection with education generally throughout the country." By the Local Examinations, established in 1858, the standard of instruction in so-called Middle Schools has been raised to and maintained at a high standard of excellence; and the movement has spread beyond all expectations. In 1878 the number of candidates offering themselves for examination was 6,396; in 1906 it was 16,257. Examinations are held at centres all over the Kingdom as well as in the Colonies. The other movement, known as the University Extension Movement, has had an equally remarkable success. It originated in a course of lectures delivered in one or two of the large towns in the north of England in 1867. During 1886 lectures were delivered at about 50 centres, and were attended by 8,000

students. In 1906 the number of centres was nearly 90 and the number of students 13,900. The scheme is "an attempt to solve the problem of how much of what the universities do for their non-students can be done by university lectures for persons unable to go to a university." The method of teaching "has four characteristic features—the lecture, the class, the weekly paper work, and the examination."

The members of the university whose names are on the Board in 1906 numbered 13,819, of whom 7,192 were members of the Senate, and 3,207 undergraduates. The annual income of the university is about £64,000; that of the colleges about £310,000. The university sends two Members to Parliament elected by the Senate. The polling is continued for two or more days and the university is exempt from the provisions of the School Act.

Bibliography.—Cooper, 'Annals of Cambridge'; Mullinger, 'History of the University of Cambridge'; 'Statutes and Ordinances of the University'; 'Student's Handbook to the University and Colleges of Cambridge'; 'Quarterly Review' (April 1906).

Cambridgeshire, England, an inland agricultural county situated in the western part of England; greatest length about 50 miles; breadth 30 miles; area 820 square miles. Arable land, meadow, and pasture constitute about three-fourths of the county, the rest being fens. The surface is marshy, flat, and thinly wooded, except in the southern portion, which is somewhat elevated and on the chalk formation. The northern section forms part of the Bedford Level. The principal water-courses are the Lark River, the Nene, which borders the county on the north, and the Ouse, which crosses the middle of the county from west to east, with its tributary, the Cam. All of these are navigable for some distance. For parliamentary purposes the county is divided into three sections (northern, or Wisbech, western, or Chesterton, and eastern, or Newmarket) and embraces also, the parliamentary borough of Cambridge, each of which returns one member. Cambridge University also returns two members. There are a day training college for schoolmasters and the New Homerton training college for women at Cambridge, a theological college at Ely, and about 230 elementary schools (see CAMBRIDGE). In the higher sections beans and wheat are produced; the black spongy soil of the fens, when drained and burned, in dry years, produces large crops of wheat, oats, barley, potatoes, cole-seed, hemp, hay, and flax; fine butter and cream-cheese are produced on the meadows of the Cam; and the Isle of Ely, a part of the fen-tract and within the Bedford Level, is noted for its garden vegetables. Cattle and sheep are reared on the thin chalky soils, and horses, cattle, sheep, and pigeons on the fens. The manufactures are mostly confined to articles used in the agricultural industry; there are paper and parchment mills and coarse earthenware and needles are manufactured. Cambridgeshire was anciently the seat of a powerful tribe, the Icenii. Prop. 190,687.

Cambronne, Pierre Jacques Étienne, pē-ār zhāk ā-tē-ën kân-brōn (COUNT OF), French general: b. Saint-Sebastian, near Nantes, 26 Dec. 1770; d. 5 March 1842. He served on the

national guard in the Vendée in 1792; distinguished himself by the capture of a Russian battery at Zurich in 1799; and took part in the campaigns of 1806-13. He went to Elba with Napoleon, and returned with him in 1815. Napoleon made him general and gave him the rank of count. At the battle of Waterloo he commanded a division of the Old Guard, and is credited with having made the famous reply to the demand for surrender, *La garde meurt et ne se rend pas* ("The guard dies, but never surrenders"). It is now certain, however, that he did not say this, but gave himself up as a prisoner to Gen. Halkett, and was taken to England. At the time of the restoration of the Bourbons he was on the list of proscriptions, but was exonerated by two court-martials, and in 1820 appointed commandant of Lille by Louis XVIII.

Cambuscan', a prince of Cambaluc (Peking), whose name is a corruption of Genghis Khan, while the description applies apparently to his grandson, Kublai Khan. This was Milton's form of the Cambyskan of Chaucer's fragment of a metrical romance, 'The Squieres Tale.' Spenser continues and finishes the tale in his 'Faerie Queene' (IV., ii. and iii.); and John Lane, a friend of Milton's father, also wrote a continuation. Some of the romantic elements in it are widespread in Oriental story, occurring in the 'Arabian Nights,' the 'Panchatantra,' and elsewhere.

Cambyses (kām-bi'sēz) I., Persian king. His historical character is involved in great doubt, but he is commonly identified as the son and successor of Teispes, and father of Cyrus the Great (q.v.).

Cambyses II., king of the Medes and Persians: d. 522 B.C. He was the son of Cyrus the Great, and grandson of Cambyses I., and became, after the death of his father, king of the Medes and Persians, 529 B.C. In the fifth year of his reign he invaded Egypt, killed King Psammetichus, plundered Memphis, and conquered the whole kingdom within six months. He now wished to send a fleet against Carthage, to conquer Ethiopia, and to obtain possession of the temple of Jupiter Ammon. The first of these expeditions, however, did not take place, because the fleet, which was manned with Phœnicians, refused obedience to him. The army which was sent against the Ammonites perished in the desert; and the troops, at whose head he himself had set out against the Ethiopians, were compelled by hunger to retreat. From this time he gave himself up to the greatest cruelties. On his entrance into Memphis, seeing the Egyptians engaged in the celebration of a feast in honor of their god Apis, whom they had found, he believed that they were rejoicing at his misfortunes. He caused the holy bull to be brought before him, slew him with his own sword, and caused the priest to be scourged with rods. To drown his remorse he indulged in wine. No relation was held sacred by him when intoxicated. He caused his brother Smerdis, a dream concerning whom had disturbed him, to be murdered. His sister and wife Atossa, who lamented the death of Smerdis, he killed with a blow of his foot. These and other acts, almost indicating insanity, had irritated his subjects. A magian

CAMDEN

availed himself of this discontent, and obtained possession of the throne under the name of Smerdis, whose death had been concealed. Cambyses had resolved to go to Susa, in order to punish him, when, according to the account of Herodotus, as he was mounting his horse, he received a wound in the hip from his sword, in consequence of which, he soon died, at Ecbatana, Syria, leaving no children. Somewhat different accounts are given by Ctesias and others.

Cam'den, Charles Pratt (1ST EARL OF), English statesman: b. 1713; d. London, 18 April 1794. After studying at Eton and King's College, Cambridge, he entered as a student at Lincoln's Inn, and in due time was called to the bar. In 1754 he was chosen member of Parliament for the borough of Downton. After acquiring great reputation as an advocate, he was, in 1757, appointed attorney-general, having the same year been elected recorder of the city of Bath. While he held the office of chief justice of the common pleas Wilkes was arrested on a general warrant as the author of the 'North Briton.' He was committed to the tower as a state prisoner; and being brought, in obedience to a writ of habeas corpus, before the court of common pleas, Chief Justice Pratt discharged him from his confinement on 6 May 1763. The behavior of the judge on this occasion, and in the consequent judicial proceedings between the printers of the 'North Briton' and the messengers of the House of Commons, and other agents of the ministry, was so acceptable to the metropolis that the city of London presented him with the freedom of the corporation, in a gold box, and requested to have his picture. In July 1765 he was raised to the peerage, by the title of Baron Camden; and about a year after made lord chancellor. In this capacity he presided at the decision of a suit against the messengers who arrested Mr. Wilkes, when he made a speech, in which he stated that "it was the unanimous opinion of the court, that general warrants, except in cases of high treason, were illegal, oppressive, and unwarrantable." On his opposing the taxation of the American colonies, he was deprived of the seals in 1770. He came into office again as president of the council, under the administration of the Marquis of Rockingham, in March 1782; on whose death, he resigned the following year. He soon after, however, resumed his place under Mr. Pitt, and, in 1786 was made Earl Camden. His popularity was very great in the American colonies, as is shown by the many counties, towns, and villages named in his honor.

Camden, William, English antiquary and historian: b. London, 2 May 1551; d. Chiselmhurst, Kent, 9 Nov. 1623. He received part of his education at Christ's Hospital and St. Paul's School, after which he studied at Oxford, and in 1575 was appointed second master of Westminster School. He devoted himself faithfully to the duties of his situation, employing all his leisure in his favorite study of British antiquities. At this time he began to make collections for his great work, the 'Britannia.' In 1582 he traveled through the eastern and northern parts of England, to survey the country. The result of his researches appeared in 1586, when the first edition of his 'Britannia' was published

in Latin. This work, though at first necessarily imperfect, procured the author high reputation at home and abroad. In 1589 and 1590 he went into Wales and the west of England, and obtained materials for the improvement of his book, of which the fourth edition (1594) was enlarged to a quarto volume. In 1593 he became head master of Westminster, for the use of which seminary he drew up a Greek grammar (1597). The same year he obtained the office of Clarendieux king-at-arms, which left him at leisure to cultivate his favorite branches of knowledge. In 1600 appeared the fifth edition of the 'Britannia,' and in 1605 was published 'Remains of a Greater Work Concerning Britain'; and in 1607 a 'Narrative of the Conspiracy Called the Gunpowder Plot,' written in Latin, by the king's command. The same year Camden published the last edition of the 'Britannia' printed during his life, from which was made the English translation of Philemon Holland. After this he undertook to write the history of the reign of Queen Elizabeth, the principal literary labor of his future years. The first part of this work appeared in 1615, entitled 'Annales Rerum Anglicarum et Hibernicarum regnante Elizabetha, ad annum salutis' (1589). The second part was finished in 1617, but not printed till after the death of the author. In 1622 Camden founded a professorship of history at Oxford, which he endowed with the valuable manor of Bexley in Kent. He died at Chiselmhurst in Kent, where he had spent the latter part of his life, and was buried in Westminster Abbey. His Chiselmhurst home was the residence of Napoleon III. 1871-3. Besides the works already mentioned, Camden published a collection of early English historians, printed at Frankfurt in 1603, folio. Hume, in his 'History of England,' ranks Camden's 'History of Queen Elizabeth' among the best historical productions which had been composed by any Englishman. Of the 'Britannia,' which has for three centuries been considered as a standard work, it is unnecessary to say more than that, as subsequently enlarged in Richard Gough's English edition of 1806, so as to extend to four volumes in folio, it constitutes a valuable treasury of British topography and antiquities. The Camden Society, which was established in London in 1838, and has issued a number of valuable works, was named in honor of William Camden. Its publications began in 1847, the first series including 104 volumes. The second series up to 1900 included 63 volumes.

Camden, N. J., city, port of entry, and county-seat of Camden County; on the Delaware River, opposite Philadelphia, with which it is connected by several ferries. The city is situated on a level plain and the streets cross one another at right angles. It is noted for its immense market gardens and manufactures, and is the site of several large ship-building concerns. Area five square miles.

Business Interests.—According to the Federal census of 1900 Camden had 817 manufacturing establishments, employing \$16,430,611 capital and 9,677 persons; paying \$4,540,032 for wages and \$11,499,151 for materials; and having an aggregate output valued at \$20,451,874. The most important industries were carpentry, foundry and machine-shop products, ship-building, worsted goods, oil cloth, boots and

shoes, masonry, and textile fabrics. There were three national banks in 1902 with a combined capital of \$560,000 and surplus of \$315,000, five trust companies, and several private banking houses. The assessed valuation in 1900 exceeded \$16,000,000, and the tax rate was \$22 per \$1,000.

Public Interests.—In 1899 the city had 120 miles of streets, of which 55 miles were paved, 46 miles of sewers, 110 miles of water mains; and oil, gas, and electric street lighting and waterworks plants, the latter owned by the city. The notable buildings are the city hall, county buildings, and the hospitals and churches. At the close of the school year 1903 there were 21 public school buildings, 11,941 pupils, 241 teachers, and a public and a private high school.

History.—The city was settled in 1681 by William Cooper and was incorporated as a city under an act passed 14 Feb. 1828. Pop. (1830) 1,987; (1840) 3,371; (1890) 58,313; (1900) 75,935.

UPTON JEFFERYS,
Editor Post Telegram.

Camden, Battle of, a battle fought near Camden, 16 Aug. 1780, between the American troops under Gates and the British under Lord Rawdon. Shortly after the British captured Charleston in May, all South Carolina was in their hands except for the guerrilla warfare of Marion, Sumter, and others. Washington had already sent Kalb (q.v.) with 1,400 Maryland and Delaware regulars, among the best troops in the army, to save it, but the new disaster called for fresh efforts and a first-rate new commander of the Southern Department to succeed Lincoln. Washington wished to send Greene; but a popular clamor for Gates, mistakenly credited with the victory over Burgoyne, led Congress to give him the post. He took command at Hillsborough, N. C., where Kalb was vainly waiting for Gen. Caswell and the North Carolina militia to come up from South Carolina. Gates, therefore, determined to march south and join Caswell, and thus reinforced, seize Camden and the Wateree, near which was their camp—the strategic centre of the State, and the converging point of the chief northern roads. It was held by Lord Rawdon with a comparatively small force. A fortnight's starving march of 150 miles, in the course of which he picked up a company of Virginia regulars and the North Carolina men, brought him in front of Rawdon, strongly posted across the road 15 miles northeast of Camden. He might either attack with superior forces or hold Rawdon with a part while he sent the rest around his flank to seize Camden in the rear; but he did neither, and, after waiting two days without apparent object, moved west to Clermont, or Rugely's Mill, a strong position, 13 miles north of Camden. Here he was joined by 700 Virginia militia, but sent off 400 of his splendid Maryland regulars to help Sumter cut the British communications far to the southeast, and Cornwallis joined Rawdon, giving the British 2,000 trained men. Gates had no intelligence department, and supposed he still had only Rawdon's small force before him; and about 10 P.M. of 15 August started down the road to surprise Rawdon, Cornwallis at the same hour starting north to surprise him. The vanguards met about 3 A.M. a few miles above Camden, and the American's were routed; but some British prisoners informed Gates that Cornwallis

was in front with 3,000 men. Gates had 3,052, most of his nominal force being on paper or helpless with dysentery; and over half of them were militia who had never been under fire and did not even understand using a bayonet. Kalb, the brave but judicious officer, wished to fall back on Rugely's Mill; but the other officers thought it too late to retreat, and Gates deployed his men, with as bad judgment as the decision to fight at all. The road ran through a level field flanked by swamps, so that everything depended on the firmness of the front rank; but he massed all the regulars on one wing and all the militia on the other. Kalb held the right opposite Rawdon, with the Delaware regiment and the 2d Maryland brigade in front, the 1st Maryland in reserve; the left wing had the Virginia militia in front and the North Carolina troops in the rear, opposed to Col. James Webster, with the Tarleton's cavalry in reserve. Gates' tactics were as ill-judged as his arrangement; he ordered the first charge made by the Virginia men, who did not even know how to march in order. They became tangled, and, while trying to reform, Webster's onrush broke them in wild panic; they threw down their loaded guns with bayonets set, without firing a shot, and ran to the rear. One regiment of North Carolina men fired several volleys, but all the rest fled like their neighbors, and the one exception soon shared their flight. Meantime, the 2d Maryland twice drove back Rawdon, then broke his ranks with a bayonet charge, and held the field. But Webster and Tarleton, following the routed mob, had flanked the 1st Maryland and after an obstinate fight crowded it off the field; and, taking the 2d Maryland in the rear, compelled it, too, to retire, after a fierce resistance. Kalb fought to the last, and was mortally wounded and captured, with eleven wounds. The stubborn fight of the regulars is shown by the fact that the Delaware troops were nearly annihilated, and the Maryland regiments lost nearly half their number. There were about 1,000 killed and wounded, and as many prisoners taken, with seven cannon and 2,000 muskets. The British lost 324. For the time the American cause in the South was at an end. Gates escaped to Hillsborough, but was shortly supplanted by Greene, who wrought a wonderful transformation in a few months.

Camden Society. See CAMDEN, WILLIAM.

Camden Town, England, a district of London in the parish of St. Pancras, and county of Middlesex. It takes its name from the Earl of Camden who acquired property here by marriage. The houses which are in general of recent erection, are regular and substantial buildings. It lies northeast of Regent's Park and north of the Euston station of the London & N.W. R.R.

Camel, a large ruminant of the genus *Camelus*, family *Camelidae* (q.v.), two species of which have been domesticated since prehistoric times, and used as riding-animals and beasts of burden in the desert regions of the Old World. They differ from other ruminating animals in the presence of incisor teeth in the upper jaw, and canine teeth in both jaws; other differences are found in the feet, which have two elongated toes tipped with small hoofs, the feet resting upon fleshy pads beneath and uniting the toes. Although much search has been made, no wild species of camel can be found except one small

two-humped variety, discovered by Prejevalski, which inhabits central Asia, northward to Siberia, in respect to which it is not certain that it represents an original wild species, or whether, on the contrary, it is not a degenerate race long ago escaped from domestication.

The Arabian camel (*Camelus dromedarius*) has one hump on the shoulders; the Bactrian camel (*C. bactrianus*) two. These are composed of muscle, flesh, and fat, which in times of famine is re-absorbed to a large extent. After it has been exhausted, a rest of three or four months, with abundance of food, is necessary to restore it. The former is the more common species, and is used from Mongolia and northwest India throughout south-central Asia, Asia Minor, Arabia, and northern and eastern Africa, and to a small extent in Spain and elsewhere. At the time of the rush of gold-seekers to California about 1850, efforts were made to naturalize them in the arid regions of the southwestern United States, as a means of carrying supplies to the army posts there, but they proved unsuccessful. The camels were allowed to run loose, and those that survived the mountain lions, Indians, and sportsmen, are still found in small numbers throughout Arizona and Sonora.

The original home of the single-humped camel is uncertain, but as it is better adapted to a sandy region than is the Bactrian species, it is thought to have originated in the Sahara or Arabian desert. Its peculiar adaptability to life in sandy regions is noticeable in many ways. The callous cushions (pads) on its feet are repeated upon the chest and the joints of the legs, upon which it rests when rising, kneeling, or lying down, and protect these parts from abrasion by the sharp sand. Its wedge-shaped, cutting teeth are well fitted for cropping the short, shrubby plants of the desert. Its long eye-lashes protect it from the glaring sun and from the drifting sand; and the ability to close the oblique nostrils at will prevents the entrance of dust. The most remarkable provision for life in arid regions, however, is found in the structure of the stomach, the interior of which has no villi on its surface. Both the compartments of the paunch contain a number of pouches or cells in their walls, each of which may be closed and separated from the remainder of the paunch. These are filled and closed when the camel drinks, and by these means it can store more water than is requisite for its immediate use, and so save up a store which may gradually be drawn upon during long journeys over waterless districts. The camel's senses of sight and smell are very acute, and it is capable of discerning water at a great distance. By reason of these qualities it has been a most important factor in the colonizing of the countries that lie south and east of the Mediterranean, Black, and Caspian seas, and such oases or fertile areas as are separated by desert wastes.

The Bactrian camel is of smaller size and heavier build, and, by its harder and more cloven feet, and longer and finer hair, is better adapted to a rocky and cooler region. Its habitat is central Asia. Like the southern species it has wonderful endurance, withstanding the terrific summer heat of Persia and the Tibetan plains, and the Arctic cold of the passes of Hindu-Kush and Mongolia. They have been successfully employed as army transports by the English in northwestern India; and for many years,

through all weathers, trains of these camels, sometimes of many thousands, were the only means by which tea and other merchandise was transported between China and Russia.

There are many breeds of camel, exhibiting great diversity. Some are those bred only for the saddle, others as baggage-carriers or draft animals. Properly, a "dromedary" is any camel of either species of a saddle-breed, distinguished for its speed and ease of gait. As a beast of burden the camel has great powers of endurance. The Arabian species carries twice the load of a mule, while it is not unusual for the Bactrian species to carry half a ton weight upon its back; by reason of which it is sometimes poetically termed the "ship of the desert." Caravans frequently contain as many as 1,000 camels, which move along at a steady and uniform pace of about two and a half miles an hour. When bred especially for the purpose they have been known to carry a traveler 100 miles a day. They move with a pacing motion, lifting the feet on the same side successively. Their money value is about the same as that of horses of similar grade and purpose.

Camel, a water-tight box or caisson used to raise a sunken vessel, or to float a vessel over a shoal or bar. It is sunk by the admission of water, and is attached to the vessel, after which the water is pumped out, and the camel, rising by its buoyancy, lifts the load.

Camel-bird, a book-name of the ostrich (q.v.).

Camel-cricket. See MANTIS.

Cam'elford, England, a village, formerly a parliamentary borough of Cornwall, on the Camel, 28 miles northwest of Plymouth. The streets are spacious and well paved, but the houses are in general very indifferent. It has a town-hall, erected by the Duke of Bedford. Four miles to the northwest of Camelford are the ruins of King Arthur's castle of Tintagel, and about two miles to the north are the celebrated slate quarries of Delabole. The inhabitants are chiefly engaged in agriculture. It was disfranchised by the Reform Act of 1832. Previous to that period it sent two members to the House of Commons, and had done so from the time of Edward VI.

Camelidæ, the camel family, a highly interesting branch of the ruminants, including the Old World camels and New World llamas and guanacos, as the existing remainder of a divergent group formerly closely connected both in structure and in geographical distribution. It forms a distinct section of the *Ruminantia* named *Tylopoda*, in reference to the character of the feet, in which only the third and fourth toes are developed (no traces of any others being present), and these are embedded in a cutaneous pad, forming a broad elastic sole to the foot. The two metapodial or "cannon" bones of each of the long limbs are united for the greater part of their length, though separated for a considerable distance at the lower end. Their distal, articular surfaces, instead of being pulley-like, with deep ridges and grooves, as in other recent split-hoofed animals (*Artiodactyla*), are simple, rounded, and smooth. The toes terminate in small nails, and the weight of the animal rests upon the padded sole of the foot, instead of on hoofs, in adaptation to the soft

CAMELIDÆ—CAMELLIA

sandy soil of the deserts, in which this race of animals seem to have lived ever since its origin. The dentition of the prolonged jaws has certain peculiarities. The full number of incisors are present in youth, but in the upper jaw these disappear, except the outermost, which persist through life. Canines are present in both jaws, those in the lower jaw being nearly erect and pointed, whereas the incisors in that jaw are procumbent. The molars are of the selenodont type, and one or more of the anterior premolars are usually detached from the series and of a simple pointed form. The neck is very long and flexuous, and its vertebræ have certain peculiarities. The shoulders are high, and the hind quarters inclined to droop. The hinder part of the body, indeed, is much contracted, and the thigh bone is long, and vertically placed, so that the knee-joint is lower in position, and the thigh bone altogether more detached from the abdomen than in most quadrupeds. The tail is well developed and the skin is clothed with long shaggy hair, capable of being woven. The nostrils are high, and may be closed against the admission of dust; and the lips are prolonged and flexible. There are no horns or antlers in either sex. The interior anatomy is peculiar, principally in the character of the digestive organs, described in the article CAMEL. The family includes the camels, of the genus *Camelus*, with two species, which are confined at present to the Old World (see CAMEL) and the genus *Llama*—with two species that are restricted to the New World. See ALPACA; GUANACO; LLAMA.

Camelidæ, Fossil. The evolution of the camel (q.v.) through the Tertiary and Quaternary periods is nearly as completely known as that of the horse, and is hardly less instructive. The camels now inhabit central Asia and northern Africa, the llamas, South America. No fossil camels or llamas are found in these countries in deposits much older than the Quaternary. But in the Tertiary strata of North America have been found a series of animals which appear to be the direct ancestors of this family, and connect them with the primitive hoofed animals of the earliest Eocene. The earliest member of this series, ancestral probably to the camels among other ruminants, is *Trigonolestes* of the Lower Eocene, smaller than a cotton-tail rabbit, with the complete series of incisor, premolar, and molar teeth, the molars of the primitive bunodont type (see BUNODONT) and four complete toes, the side toes very slender (one toe of the primitive five had already been lost), and the metapodials all separate. In the Upper Eocene stage, *Protylopus*, as large as a jack-rabbit, the molars have become selenodont (q.v.), as in modern camels, but with shorter crowns, and the side toes are represented only by splints. In the Oligocene stage, *Poëbrotherium*, as large as a gazelle, the molars have longer crowns, the splints are reduced to small nodules of bone, and the metapodials, though still separate, are closely appressed. In the Miocene stage (*Procamelus*, etc.) the metapodials are sometimes separate, sometimes united; the incisors and premolars are generally reduced in size, and the anterior ones often lost; and the form of the teeth and skull comes closer to the modern type. The Pliocene camels (*Plianchenia*, etc.) are still closer to the

modern type, all with united metapodials and reduced incisors and premolars, and at this epoch they spread to South America and the Old World, the gradual rising of the continents having made land connections between them about this time. During the Pleistocene epoch the camels all became extinct in their original home, although they still survive in the alien continents to which they had wandered.

The most remarkable peculiarity of the camels is the adaptation of the stomach, which enables the animal to go a long time without water (see CAMEL); palæontology gives no direct evidence of the evolution of this character. But the cushioned foot, equally an adaptation to desert life, is not indicated (by the form of the toe bones) in any ancestral camel previous to the Miocene, from which time it became gradually more marked. We may suppose, therefore, that the earlier ancestors of the camel were antelope- or deer-like in their habitat, and were gradually adapted to desert life.

Besides the main line of descent there were, especially in the Miocene, side branches now extinct, one of which (*Alticamelus*) was singularly giraffe-like in proportions, although not related to the giraffes, which were evolved in the Old World at the same epoch.

It is a general law in the evolution of any race of animals that at each succeeding stage in its development the progressive characters appear at an earlier period in the lifetime of the individual. The young individuals of one stage resemble the adults of the preceding stage, while the old individuals take on some of the characters of that next succeeding. This is well illustrated in the camels, especially of the Miocene epoch; in young individuals the metapodials are always separate, as they are in all adult camels of the Oligocene, and they are usually not completely consolidated until a comparatively advanced age. In modern camels and llamas they are consolidated before birth. The anterior incisors and premolars usually drop out in old individuals of Miocene camels; in the later stages they are minute stumps or scales which disappear early in life.

W. D. MATTHEW.

American Museum of Natural History.

Camelina Sativa, căm-e-lî'na sa-tî'va ("gold of pleasure"), a cruciferous annual, belonging to the order *Brassicacæ*, frequently found in cultivated fields, especially among flax, where it has long been cultivated for its seeds, which contain much oil.

Camellia, ka-měl'ya, a genus of plants belonging to the natural order *Ternstramiacæ*, an order which includes the tea-plant and several species of beautiful flowering shrubs, all natives of China. The name *Camellia* was given to this genus by Linnæus in honor of Kamel or Camellus, a Moravian Jesuit. The *Camellia japonica*, as it grows in the woods and gardens of Japan and China, is a lofty tree of beautiful proportions, and clothed with a deep green shining foliage, with large, elegant flowers, either single or double, and of a red or pure white color. There are numerous varieties of this species in China, the greater part of which have found their way to Europe and America, while other new varieties have been produced. The double-white, double-striped, and double-waratoh, the last so called from the central petals

CAMELIDAE.

1. Guanaco.

2. Dromedary.

3. Two-Humped Camel.

CAMELIDAE.

1 Alpaca.

2. Vicuna.

resembling those of the waratah plant of Australia, are considered the finest varieties, and both grow and flower well. The peony-flowered and fringed are also much admired. The oil-bearing camellia (*C. oleifera*) is cultivated for its seeds, from which an oil is expressed that is very generally used by the Chinese in their cookery. It thrives best in a red sandy soil, and attains a height of six to eight feet, producing a profusion of white blossoms and seeds. Besides these species the *C. reticulata* and *C. sasanqua* are cultivated.

The single red camellia is propagated by cuttings, layers, and seeds. It forms suitable stocks, on which the others are either inarched or budded and engrafted. The cuttings to be selected are the ripened shoots of the preceding summer; these are taken off in August, being cut smoothly at a joint or bud; two or three of the lower leaves are taken off, and the cuttings then planted firmly in the soil with a dibble. Inarching or engrafting is performed early in spring, when the plants begin to grow. A few seeds are sometimes obtained from the single red and semi-double camellias, and from the single waratah. These require two years to come up, but make the best stocks of any.

Camelopard. See GIRAFFE.

Camelopardalis, one of the northern circumpolar constellations added by Hevelius in 1690. It is a large, irregularly shaped constellation, something like the animal, and is more than 40° in length, with its head close to the North Pole. It borders upon Ursa Minor, Draco, Ursa Major, Lynx, Auriga, Perseus, Cassiopeia, and Cepheus. It contains no stars brighter than the fourth magnitude, and was put in to fill up a part of the sky otherwise uncovered by constellations. Being introduced later than Bayer's time, it has no letters except α , β , and γ , which Baily introduced into the "B. A. C." in 1845. While these have not been universally accepted by astronomers, they will probably be adopted in a general revision of the northern constellations.

Cam'elot, in the Arthurian legends, the city where King Arthur's palace with the Round Table was located. Tennyson, in 'The Coming of Arthur,' describes the city and the royal court, and mentions it in others of the 'Idylls of the King' and in 'The Lady of Shalott.' It is also referred to by Shakespeare in 'King Lear.' The site of Camelot has been much in dispute; Shakespeare supposed it to be in Somersetshire; Tennyson and Capell located it at or near Winchester; and Caxton placed it in Wales.

Camel's Hump, one of the peaks of the Green Mountains, in Vermont, 17 miles west of Montpelier. Its height is about 4,100 feet.

Cam'el's-thorn, a genus of plants belonging to the natural order *Leguminosae*, and the suborder *Papilionacea*. They are herbaceous or half-shrubby plants, with simple leaves, minute stipules, axillary peduncles terminating in spines, and red flowers arranged in racemes. Only three species of this genus are known, the *Alhagi camelorum*, *A. nivalensis* and *A. mauro-rum*. They grow in the deserts of Egypt and the East, and their common name is derived from the fact that they afford a food much relished by camels. The first two species (if not

the third) yield a gummy, saccharine exudation like manna.

Cam'eo, in the proper sense, a gem engraved in relief, opposed to intaglio, in which the figure is sunk in the surface. The ancients generally used the onyx for this purpose. The gems were carved according to the layers of the stone, so that the ground should be of a different color from the figure in relief; and it is to gems cut in this way that the word is now generally applied. One of the most famous cameos is an onyx representing 'The Apotheosis of Augustus,' 1 foot high and 10 inches wide. Cameos are often cut in shells having layers of different colors. See GEMS.

Camera Lucida ("light chamber"), an optical instrument employed to facilitate the sketching of objects from nature. It acts by total reflection, and may have various forms, of which that proposed by Wollaston, and represented in the accompanying figures, is one of the commonest. The essential part is a totally reflecting prism with four angles, one of which is 90° , the opposite one 135° , and the other two each $67^\circ 30'$.

Fig. 1.

One of the two faces which contain the right angle is turned toward the object to be sketched. Rays falling in a straight line on this face as xr , are totally reflected from the face cd to the next face da , whence they are again totally reflected to the fourth face, from which they emerge in a straight line. An eye (pp) placed so as to receive the emergent rays will see an image of the object in a direction at right angles to that in which the object lies. In practice the eye is held over the corner a of the prism in such a position that one half of the pupil receives these reflected rays, while the other half receives light in a parallel direction outside the prism. The observer thus sees the reflected image projected on a real background, which consists of a sheet of paper for sketching. He is thus enabled to pass a pencil over the outlines of the image—pencil, image, and paper being simultaneously visible. It is very desirable that the image should lie in the plane of the paper, not only because the pencil-point and the image will then be seen with the same focusing of the eye, but also because parallax is thus obviated, so that when the observer shifts his eye the pencil-point is not displaced on the image. As the paper, for convenience of drawing, must be at a distance of about a foot, a concave lens, with a focal length of something less than a foot, is placed close in front of the prism in drawing distant objects. By raising or lowering the prism in its stand (Fig. 2), the image of the object to be sketched may be made to coincide with the plane of the paper. The prism is mounted in such a way that it can be rotated about either a horizontal or a vertical axis; and its top is usually covered with a movable plate of blackened metal, having a semi-circular notch at one edge for the observer to look through.

Another form of the camera lucida, that of Amici, an Italian optician, is sometimes preferred to that of Wollaston, inasmuch as it al-

CAMERA OBSCURA — CAMERARIUS

allows the observer to change the position of his eye considerably without ceasing to see the image of the object he is tracing.

FIG. 2

The prism in this case is triangular in shape, and one of the angles is a right angle. In using it, the right angle is turned upward, so that one of the perpendicular faces is turned toward the object in an oblique direction, while the edge of the other perpendicular face meets a transparent glass plate at right angles. The rays from the object falling upon the face of the prism which is turned toward it are, after being more or less refracted, thrown upon the base of the prism, from which they are totally reflected in the direction of the other perpendicular face. In emerging from the prism at this face they are again refracted and thrown upon the transparent glass plate. By this, again, the rays are partially reflected, being thrown upward in the direction of the eye of the observer, who, looking through the plate, sees an image of the object on a sheet of paper beneath, the outlines of which can be traced by a pencil as before.

Camera Obscura ("dark chamber"), an optical instrument employed for exhibiting the images of external objects in their forms and colors, so that they may be traced and a picture formed. From certain scattered observations in the writings of Friar Roger Bacon, in the 13th century, it would appear that he was acquainted with the principle upon which the camera obscura is constructed, but the first complete description of the instrument is found in the 'Magia Naturalis' of Giambattista della Porta, published in 1569, and Porta is commonly credited with its invention.

In its simplest form the camera obscura consists of a darkened chamber, into which no light is permitted to enter excepting by a small hole in the window-shutter. A picture of the objects opposite the hole will then be seen on the wall, or a white screen placed so as to receive the light coming through the opening. The images thus obtained become sharper as the size of the hole is diminished; but this diminution involves loss of light, so that it is impossible by this method to obtain an image at once bright and sharp. This difficulty can be overcome by employing a lens. If the objects in the external landscape are all at distances many times greater than the focal length of the lens, their images will all be formed at sensibly the same distance from the lens,

and may be received upon a screen placed at this distance. The images are inverted, and are of the same size whether the lens is in position or not, so long as the screen remains fixed; but they are far sharper and more distinct when the lens is used. As exhibited at seaside resorts and other places of amusement, the camera obscura consists of a small building or of a tent surrounded by opaque curtains, and having at its top a revolving lantern, containing a lens with its axis horizontal, and a mirror placed behind it at a slope of 45°, to reflect the transmitted light downward on a sheet of white paper lying on the top of a table. Images of external objects are thus depicted on the paper, and their outlines can be traced with a pencil if desired. It is still better to combine lens and mirror in one by the arrangement represented in section in the figure. Rays from external objects are first refracted at a convex surface, then totally reflected at the back of the lens (or prism), which is plane, and finally emerge through the bottom, which is concave, but has a larger radius of curvature than the first surface. The two refractions produce the effect of a converging meniscus. The camera obscura, which was formerly chiefly employed for purposes of amusement, has now become well-known from its application to photography.

The instrument employed by photographers (and called simply a "camera") varies in general design according to the use to which it is to be put. It consists essentially, however, of a light-tight box, the length of which can be adjusted by means of a bellows. A lens or object-glass is secured to the front end of the box, and the bellows is drawn out until the lens throws a distinct image of the object upon a ground-glass screen at the back of the camera. The object-glass is usually compound, consisting of two single lenses, an arrangement which is very commonly adopted in optical instruments, and which has the advantage of giving the same effective focal length as a single lens of smaller radius of curvature, while it permits the employment of a larger aperture, and consequently gives more light. When the image upon the ground-glass screen has been rendered as sharp as possible, the screen is withdrawn and replaced by a sensitized plate, which is affected chemically by the light rays so as to retain a permanent impress of the image. The impression thus produced upon the sensitized plate is not visible at first, but is brought out, or "developed," by subsequent treatment with chemicals. See PHOTOGRAPHY.

Camera, Photographic, a camera obscura so constructed that sensitized plates or films may be placed at the back and receive the image. There are many styles of camera in use, those of the tripod variety being used for portraits, and landscapes where a long exposure is required, and the hand camera used by tourists on account of its convenient shape and size. See CAMERA OBSCURA; PHOTOGRAPHY.

Camerarius, Joachim, yō'āh-īm kā-mā-rā'rē-ōos, German scholar: b. Bamberg, 12 April 1500; d. Leipsic, 17 April 1574. He contributed to the progress of knowledge, in the 16th century, by his own works as well as by editions of Greek and Latin authors with com-

CAMERARIUS — CAMERON

mentaries, and by a better organization of the universities at Leipzig and Tübingen, and of the gymnasium at Nuremberg. He also took an important part in the political and religious affairs of his time. He was a friend of Melancthon, and was held in great esteem by the emperors Charles V., Ferdinand I., and Maximilian II. In 1555 he was deputy of the University of Leipzig to the Diet of Augsburg. His proper name was Liebhard, but he changed it to Camerarius, because his ancestors had been chamberlains (late Latin *camerarii*) at the court of the bishops of Bamberg. His son Joachim (1554-98) became known as a botanist.

Camerarius, Rudolph Jakob, roo'dölf yä-köb, German botanist: b. Württemberg, 12 Feb. 1665; d. Tübingen, 11 Sept. 1721. To him is ascribed the discovery of the sexual relation in plants. He was in charge of the botanic gardens at Tübingen and was also a medical professor.

Camerino, kä-mā-rē'nō (ancient CAMERINUM), Italy, a town in the province of Macerata, 41 miles southwest of Ancona. It is the seat of an archbishopric, and contains some good public buildings, among which are the archiepiscopal palace and the cathedral. There is a university, founded in 1727. Silk is grown and manufactured here. Pop. (1901) 12,542.

Camerlen'go (It. *camerlingo*, "a chamberlain"), one of the highest officers of the Vatican court. A cardinal Camerlengo, during a vacancy in the holy see, takes charge of all the temporalities, and presides over the apostolic chamber or palace.

Cam'eron, Archibald, American clergyman: b. Scotland, about 1770; d. 1836. After studying at Transylvania Seminary, Lexington, Ky., he was ordained in 1796, and in the same year assumed charge of churches at Big Spring, Akron, and Fox Run. Until 1828 he performed itinerant services, and then became minister of the churches at Mulberry and Shelbyville. The Presbyterian Church in Kentucky owes much to his pioneer labors. His published works include: 'The Faithful Steward' (1806); 'An Appeal to the Scriptures' (1811); 'A Defense of the Doctrines of Grace' (1816); and 'A Reply to Some Arminian Questions on Divine Predestination' (1822).

Cameron, Arnold Guyot, American educator: b. Princeton, N. J., 4 March 1864. He was graduated at Princeton University in 1886, and during the next two years studied abroad. In 1888-91 he was professor of French and German languages and their literatures in Miami University; in 1891-7, assistant professor of French in the Sheffield Scientific School of Yale University; and in 1897 accepted the chair of French at the John C. Green School of Science of Princeton University. He is editor of the text-books: 'Daudet'; 'Mérimée'; 'Loti'; 'Coppée and Maupassant'; and 'The Goncourts.'

Cameron Sir Charles, Scotch journalist and politician: b. Dublin, 1841. He was educated at Madras College, St. Andrews, Trinity College, Dublin, and at medical schools in Paris, Berlin, and Vienna. He edited the *North British Daily Mail* from 1864 to 1874, and from the latter year till 1885 was member of Parliament

for Glasgow. From 1885 to 1895 he sat for the College division, Glasgow, and for the Bridge-ton division 1897-1900. The adoption of six-penny telegrams was the result of a resolution which he introduced in the House, and he was likewise instrumental in the conferring of municipal franchise upon women in Scotland. His publications include many pamphlets on political, social, and medical subjects.

Cameron, Str Charles Alexander, Irish physician: b. Dublin, 16 July 1830. He was elected public analyst for the city of Dublin in 1862. He was the only one who succeeded in applying the Adulteration of Food Act of 1860. In 1867 he was elected professor of hygiene or political medicine in the Royal College of Surgeons, in Ireland. His lectures on hygiene, open to ladies, were largely attended. He was knighted in 1886, in recognition of his services to public health. He has written: 'Chemistry of Agriculture' (1857); 'Lectures on Public Health' (1868); 'History of the Royal College of Surgeons, Ireland, etc.' (1886); 'Elementary Chemistry and Geology' (1896); etc.

Cameron, Charles Duncan, English soldier: d. 1870. He served in the Kaffir war (1846-7), in the Crimean war, and later at Kars. In 1862 he became British consul in Abyssinia, and having undertaken to deliver a letter from Queen Victoria to King Theodore, was imprisoned by the king for two years on the charge of interfering in the politics of that country. He was released only to be shortly imprisoned again, together with Rassan, agent of the British government, and others, their final release being effected by the advance of English troops upon Theodore's territory. An account of these matters by Cameron was published in the 'Parliamentary Printed Papers' (1868-9).

Cameron, Donald Andreas, English civil servant: b. 1856. He filled the post of consul at Suakin, 1885-8, and at Bengazi, 1888-9. He was judge of the native court of appeals at Cairo 1889-97 and then, returning to the consular service, became consul at Port Said for the Suez Canal. He has published 'Arabic-English Vocabulary' (1892); 'Egypt in the 19th Century' (1898).

Cameron, Emily Lovett, English novelist: b. Walthamstow; married to H. Lovett Cameron, about 1876. Her novels deal mostly with personal complications, and include: 'Juliet's Garden' (1877); 'Deceivers Ever' (1878); 'Vera Nevill' (1880); 'In a Grass Country' (1885); 'The Cost of a Lie' (1886); 'The Dead Past' (1886); 'Pure Gold' (1887); 'A North Country Maid'; 'Jack's Secret'; 'A Sister's Sin'; 'A Bad Lot'; 'A Soul Astray'; 'The Craze of Christina'; 'Bitter Fruit'; 'An Ill Wind.'

Cameron, George Frederick, Canadian poet: b. New Glasgow, Nova Scotia, 1854; d. 1885. He was educated at Queens' University, Kingston, Ontario; resided for a time in the United States; returned to Canada, and edited the *Kingston News*. As a lyrical poet he has received high praise from leading critics, and was accorded an eminent position by some of the great contemporary English poets. See Stedman, 'Victorian Anthology' (1895).

Cameron, Henry Clay, American educator: b. Shepherdstown, Va., 1 Sept. 1827;

CAMERON

d. 26 Oct. 1906. He was graduated at Princeton College in 1847, and at the Princeton Theological Seminary in 1855; and was connected with the department of Greek at Princeton from 1852 to 1906. He was twice chosen to the Presbyterian General Assembly, and wrote 'Princeton Roll of Honor'; 'History of the American Whig Society'; 'Old Princeton: Its Battle, Its Cannon, etc.'

Cameron, Hugh, Scottish artist: b. Edinburgh, 1835. He is a well-known and popular painter of portraits and figure pieces, and among his works are: 'Maternal Care'; 'Age and Infancy'; 'Haymakers Resting'; 'A Lonely Life'; 'The Rivals'; 'The Timid Bather.'

Cameron, James Donald, American capitalist and politician: b. Middletown, Pa., 14 May 1833. He is the oldest son of Simon Cameron (q.v.), and was graduated from Princeton College in 1852. He devoted himself to business pursuits and in 1861 was made vice-president and two years later president of the Northern Central R.R. He remained in this office till 1874. In 1876 President Grant appointed him secretary of war, and in 1877 he succeeded his father as United States senator from Pennsylvania. He was re-elected in 1885 and 1890.

Cameron, John, Scottish scholar: b. Glasgow, 1579; d. 1625. In 1600 he went to the Continent, where his ability and erudition secured for him several appointments at Bergerac, Sedan, Saumur, and other seats of learning. Returning to Great Britain in 1620, he was two years later appointed principal of the university of Glasgow; but in less than a year returned to Saumur, and thence to Montauban, where he received a divinity professorship. Here, as at Glasgow, his doctrine of passive obedience made him many enemies, by one of whom he was stabbed in the street, and he died from the effects of the wound in 1625. Sir Thomas Urquhart styles him a "walking library," and Milton, "an ingenious writer in high esteem." He was considered one of the best scholars of his day; in biblical criticism he was inclined to be perverse; where there was a difficulty he usually chose the opposite view to that held by other divines, especially Beza. His theological opinions were of a somewhat lax character, his eight works, in Latin and French (10 vols., 1616-42), being said to be the foundation of Moses Amyraut's doctrine of universal grace (1634). His followers are sometimes called Cameronites.

Cameron, Richard, Scottish Covenanter: b. Falkland, Fifeshire, 1648; d. Ayrsmoss 22 July 1680. He was at first a schoolmaster, and for a time was tutor in the family of Sir Walter Scott of Harden. Being converted by the field-preachers, he became an enthusiastic votary of the Covenant. On the 20th of June 1680, in company with about 20 other persons, well armed, he entered the village of Sanquhar, and proclaimed at the cross that he and those who adhered to him renounced their allegiance to the king on account of his having abused his government, and also declared a war against him and all who adhered to him, at the same time avowing their resolution to resist the succession of his brother the Duke of York. The privy council immediately put a reward of 5,000 merks upon Cameron's head, and 3,000 upon

those of Cargill and Douglas, his associates; and parties were sent out to waylay them. The little band kept together in arms for a month in the mountainous country between Nithsdale and Ayrshire. But on the 22d of July, when they were lying in Ayrsmoss, near Auchinleck in Ayrshire, Bruce of Earlshall approached them with a party of horse and foot much superior in numbers. A brief skirmish took place, in which the insurgents were allowed even by their enemies to have behaved with great bravery; but nothing could avail against superior numbers. Cameron being among the slain, his head and hands were cut off and carried to Edinburgh, along with the prisoners. The name of Cameron was applied to the small but zealous sect of Presbyterians which he had led in life, and was also used in a wider and looser sense. The 26th Regiment, which was raised at the Revolution out of the west-country people who flocked to Edinburgh, was styled on that account the Cameronian Regiment. It is now known as the Cameronians or Scottish Rifles. Consult Herkless, 'Richard Cameron' (1896). See CAMERONIANS.

Cameron, Sir Roderick William, Canadian capitalist: b. Williamstown, Ontario, 25 July 1825; d. 24 Oct. 1900. He entered mercantile life in New York as a youth and acquired a large fortune as an exporter and importer. He was knighted in 1883. He was well known as a turfman and yacht owner, and was prominent in Canadian-American diplomacy.

Cameron, Simon, American statesman: b. Maytown, Lancaster County, Pa., 8 March 1799; d. there, 26 June 1889. He learned printing and in 1820 he was editor of a paper in Doylestown, Pa., and in 1822 held a similar post in Harrisburg. He then interested himself in banking and the building of railroads, and for a time served as adjutant-general of Pennsylvania. From 1845 to 1849 he was United States senator from Pennsylvania, elected by the Democratic party. He became a member of the Republican party on its formation, and in 1856 was again elected United States senator. He was unsuccessfully supported for the offices of both President and Vice-President in the National Convention of 1860, and in 1861 was appointed secretary of war by President Lincoln. He advocated the arming of fugitive slaves and other extreme measures. In January 1862 he resigned from the Cabinet, and was appointed minister to Russia. He succeeded in gaining the support of the Russian government for the Union. In November of the same year he resigned, and lived in retirement till 1866, when he was again elected to the United States Senate. In 1872 he became chairman of the Committee on Foreign Affairs. In 1877 he retired from the Senate in favor of his son, James Donald Cameron. His influence over the Republican party was strong, and his power in the politics of his State practically absolute. He was a vigorous opponent of civil service reform during the administration of President Hayes.

Cameron, Verney Lovett, English traveler in Africa: b. Weymouth, 1 July 1844; d. Leighton Buzzard, 26 March 1894. He entered the British navy in 1857, and in 1872 was chosen by the Royal Geographical Society of London to conduct an expedition for the relief

of Dr. Livingstone. He was only in time to meet the remains of Livingstone at Unyan-yembe, but pushed onward to Ujiji on Lake Tanganyika, and partly circumnavigated this great sheet of water, establishing the fact that its outlet was the Lukuga. Not being able to follow the Lualaba River downward, he continued his journey westward to Benguela, and was thus the first to cross tropical Africa from east to west. Returning to England in 1876, he was raised to the rank of a commander. In 1878 he made a journey through Asia Minor and Persia in order to satisfy himself as to the feasibility of a railroad connecting India with the Mediterranean, and in 1882 with Sir Richard Burton explored the country behind the Gold Coast. He published accounts of his journeys in his 'Across Africa' (1877); 'Our Future Highway to India' (1880); and 'To the Gold Coast for Gold' (1883, with Sir R. F. Burton). He died from an accident in the hunting field.

Cameron Highlanders, the old 79th Regiment in the British army, raised in 1793 by Allan Cameron of Erroch. It wears the Highland dress and now forms the first battalion of the King's Own Cameron Highlanders. There is not as yet a second battalion linked with it.

Camero'nian Regiment, a British regiment raised in 1689 among the Camerונים of the west of Scotland to support William III., and long famous as the 26th Regiment. It forms now the first battalion of the Camerונים (Scottish Rifles), the second battalion being the old 90th Regiment.

Camero'nians, a sect of Scotch Presbyterian dissenters, named after Richard Cameron. James I. had enforced on his Scottish subjects a liturgy which the people abhorred, and this led, in 1638, to the formation of the covenant, "in behalf of the true religion and the freedom of the kingdom." The organization of the Scottish presbytery was still further completed in the adoption of the Presbyterian form of Church government, a Calvinistic confession of faith, and the two catechisms, which documents are the standards of the Scottish kirk to this day. Throughout the revolution of 1688 the Camerונים maintained inflexible hostility to the royal usurpation of religious freedom. They supported the Prince of Orange on his assuming the crown of England, but were displeased and disappointed by the form in which the Presbyterian Church was restored. In 1709 they exerted all their influence against the union of Scotland and England. The presbytery of this denomination was not organized until 1 Aug. 1743, when an act of toleration was procured in their favor. They still have a distinctive existence in Great Britain and America, under the name of Reformed Presbyterians.

Cameroons, kã-më-roon', or **Kamerun**, a German colonial possession in West Africa extending inland from the Bight of Biafra to the northeast and north as far as Lake Chad, and having an area of 191,130 square miles. It is separated from the British territory on the northwest by a line running north-east from the Rio del Rey to a point on the river Benue east of Yola, and from there north-northeast to the south shore of Lake Chad. From French Congo on the south it is marked off by a line running east from the mouth of the Campo River to the river Sanga, and from

there the eastern boundary proceeds first north-west to lat. 4° N., lon. 15° E., then along that meridian to about lat. 8° 30' N., when it proceeds northwest to the parallel of 10°, which forms the boundary eastward to the Shari River. This river itself to its mouth in Lake Chad serves as the northeastern boundary. The territory receives its name from the Cameroon River, which enters the Bight of Biafra by an estuary nearly 20 miles wide. The swamps along the banks of the river render this district unhealthy for Europeans. Northwest of the river lies the volcanic group called the Cameroon Mountains, which rise to a height of 13,760 feet. The lower slopes of these mountains are more healthy, and are covered with ebony, redwood, and palm-trees. More important than the Cameroon River is the much longer Sannaga or Mbam, entering the Bight of Biafra a little south of the former, and navigable for 40 miles inland to Idia. Among cultivated plants are the banana, oil-palm, cocoanut, groundnut, manioc, yam, sweet-potato, and colocasia; of more recent introduction are cacao, coffee, tobacco, etc. Among the minerals are gold and iron. There is a considerable trade in cotton, ivory, and oil. The inhabitants are almost entirely of the Bantu stock, widely diffused throughout the more southerly portion of the continent, and many of them have almost regular European features. The coast of the Cameroon territory was annexed by Germany in 1884, and the interior has since been acquired, the whole being now a German colony under a governor. The seat of government is at Cameroons, a group of native villages on the estuary of the Cameroon River, but the greater part of the territory is only nominally under German rule. Pop. 4,500,000.

Camilla, in Roman fable, a virgin, said to have been a daughter of Metabus, a Volscian king, and to have aided Turnus against Æneas (Vergil, 'Æneid,' vii.).

Camille, ka-mël ("La Dame Aux Camélias"), a novel by Alexandre Dumas the younger, published in 1848, the celebrated play founded upon it appearing in 1852 at the Vaudeville Theatre in Paris. The popularity of both the novel and the play is owing, perhaps, to the fact that the incidents of the story admit of many interpretations of the character of the heroine.

Camillus, Marcus Furius, Roman patrician: d. 365 B.C. He is famous as the deliverer of the city of Rome from the Gauls. In 396 B.C. he was made dictator during the Veientine war, and captured the town of Veii after it had defied the Roman power for more than 10 years. In 394 B.C. Camillus besieged the Falerii, and by an act of generosity induced them to surrender. Three years later the envy and jealousy of enemies caused him to exile himself for a time, and he was living in retirement when the Gauls, under Brennus, invaded and captured Rome, with the exception of the capital. Camillus was now appointed dictator a second time, and was successful in repelling the invaders. After he had been four times appointed dictator, a new invasion of the Gauls called him, at the age of 80, once more to that position, and he defeated and dispersed the barbarians. There is a certain amount of myth in the story of his life.

Caminatzin, *kā-mē-ŋa-tsēn'*, or **Cacumazin**, Mexican king: d. 30 June 1520. He was nephew of King Montezuma, and reigned over Tezcuco, the principal city of Anahuac. The best citizens of the state, the nobles and priests, saw with indignation the humiliation of their king and kingdom under Cortez and the Spaniards. Caminatzin, with more courage and enterprise than his uncle, proposed to his subjects a declaration of war against the foreigners. The proposal was received with enthusiasm, and Caminatzin called upon the Spaniards to leave the country immediately or to expect to be treated as enemies. Cortez was preparing to march his army against Tezcuco, when the representations of Montezuma concerning the defenses of the town and the daring of the population, induced him to change his plan, and to resort to treason instead of force. At his instigation Montezuma invited his nephew to Mexico to become reconciled with the Spaniards. The answer of Caminatzin was that he could enter Mexico only to destroy the tyrants of his country. Montezuma then despatched secret agents to Tezcuco to get possession of the young prince by whatever means. His first officers and nearest friends were corrupted, and he was delivered by them to Cortez and imprisoned. He was released after the expulsion of the Spaniards, and perished during the evacuation of Mexico by the Spaniards.

Camisards, *kām'z-zārdz*, Protestants in France (in the Cévennes), who, in the beginning of the 18th century, in consequence of the persecution to which they were exposed after the revocation of the Edict of Nantes in 1685, rose against the royal deputies. The name is usually thought to be derived from "camise," a provincial form of the French word "chemise," signifying a shirt, and it is said to have been applied to them either because their ordinary outer garment was a kind of shirt or blouse, or because on certain occasions they wore their shirts above their other garments. The first occasion on which they broke out into open revolt against the royal deputies was on the night of 24 July 1702, when 50 of them attacked the house of the Abbé du Chayla, one who had signaled himself by his cruelty during the persecutions. They set free the prisoners whom they found confined in the dungeons, and put the abbé himself to death. This was the signal for a general rising of the mountaineers. The government sent troops to punish the authors of these acts. A certain Jean Cavalier, a peasant, whom a fortune-teller had pointed out as the deliverer of Israel, placed himself at the head of the Camisards. His unlimited authority with his adherents, his talents, and courage, enabled him to oppose the measures of experienced generals with so much success that negotiation was substituted for force. The Marshal Villars in 1704 made a treaty with Cavalier, by virtue of which Cavalier himself was received into the royal service as a colonel. This treaty, however, did not satisfy his associates, because it did not concede to them liberty of conscience, and on that account Cavalier was reproached as a traitor who had sacrificed the cause of his coreligionists to his own interest. At the court, too, he was received with coldness, so that in a short time he was glad to go into voluntary exile. He went to England, where Queen Anne gave him a favorable reception. Voltaire, who became acquainted with him in

London, speaks of him in high terms. At the time of his death Cavalier was general and governor of Jersey. The name *camisards blancs* (white camisards), or *cadets de la croix* (cadets of the cross), was given to a band of Roman Catholics formed to put down the Calvinistic camisards, who were called *camisards noirs*, or black camisards.

Cam'let, or **Camblet** (in French, *camelot*), a name applied in England to a fabric made of long wool, hand-spun, sometimes mixed with cotton or linen yarn. Various derivations of the word are given. Some consider it to be of the same root with camel, because it was originally made of camel's hair; others derive it from the Arabic *chamal*, signifying fine, because according to them it was originally made of the fine hair of the Angora goat.

Cammerhoff, *kām'mēr-hōf*, **John Christophe Frederic**, Moravian bishop in America: b. near Magdeburg, Germany, 28 July 1721; d. Bethlehem, Pa., 28 April 1751. He was educated at Jena, and at the age of 25 was consecrated a bishop in London and came to America as Bishop Spangenburg's assistant. He preached in Pennsylvania and New York, but his greatest successes were made among the Indians. The Iroquois adopted him into the Turtle tribe of the Oneida nation, and gave him the name of Gallichwio, or "A Good Message." In 1750 he undertook amid great hardships a tour to Onondaga. It occupied three months, embraced a distance of 1,600 miles and was filled with hair-breadth escapes. He was too weak to endure such enterprises, and died the following year. The Iroquois mourned him as a brother and said of him "He was an honest, upright man, in whose heart no guile was found." Thirty years later Zeisberger heard his name mentioned among them with deep respect and veneration. The memory of his devotion and irrepressible missionary zeal has ever been held in honor by the people of his faith.

Camões, or **Camoens**, *Luis de*, *loo-ēs dā kā-mōñ'ēsh*, Portuguese poet: b. Lisbon probably 1524, or 1525; d. there, 1579. His father, Simon Vaz de Camoes, was a ship-captain, who perished by shipwreck on the coast of Goa about 1552. Camoes studied at Coimbra. At that time writers were esteemed in proportion as they imitated the ancients. Camoes was inspired by the history of his country, and by the manners of his age. His lyric poems, like the works of Dante, Petrarch, Ariosto, and Tasso, belong to the literature formed under the influence of Christianity. After the completion of his studies he returned to Lisbon, where he fell deeply in love with a lady of the palace, Catharina d'Atayada. Violent passions are often joined with great talents—Camoens had both. He was exiled to Santarem on account of disputes in which his love for Catharina involved him. From despair he became a soldier, and served in the fleet which the Portuguese sent against Morocco. He composed poetry in the midst of battles, and as danger kindled his genius, so genius animated his courage. An arrow deprived him of his right eye before Ceuta. He hoped that his wounds would receive a recompense, though his talents were not appreciated; but envy opposed his claims. Full of indignation at seeing himself neglected, he embarked in 1553 for India. His

powerful imagination was excited by the heroic deeds of his countrymen in this quarter, and although he had much reason to complain of them, he could not resist the desire of celebrating their glory in an epic. But this vivacity of mind, essential to the poet, is not easily united with the moderation which a dependent condition demands. Camoes was displeased with the abuses of the government in India, and wrote a satire, which caused his banishment to Macao. Soon after he was removed to the Moluccas, but after three years of captivity a new viceroy recalled the decree of banishment against him, and appointed him administrator of the effects of deceased persons at Macao. His chief poem, the 'Lusiad,' was composed partly during the period of his captivity, and partly while he held the office of administrator. Camoes was at last recalled from his banishment. At the mouth of the river Mekon, in Cochinchina, he was shipwrecked, and saved himself by swimming—holding in one hand above the water the manuscript of his poem, the only treasure which he rescued from the waves. In Goa he encountered new persecutions; was confined in prison for alleged embezzlement of funds intrusted to him during his tenure of office at Macao, and not allowed, until his friends became responsible for him, to embark and return to Lisbon in 1569. King Sebastian, yet hardly past the age of childhood, took an interest in Camoes. He accepted the dedication of his epic (which appeared in two editions, varying both in the text and the orthography, in 1572), and being on the point of embarking on his expedition against the Moors in Africa, felt more sensibly than others the genius of the poet, who, like him, loved dangers if they led to glory. But Sebastian was killed in a battle before Alcazar in 1578, and with him the royal family became extinct, and Portugal lost her independence. Every source of assistance, as well as every hope of Camoes, was destroyed by this event. So great was his poverty that at night a slave, whom he had brought with him from India, begged in the streets in order to support the life of his master. In this misery he yet wrote lyric poems, some of which contain the most moving complaints. This hero of Portuguese literature, the ornament of his country and Europe, died in a hospital, neglected. In 1596 a splendid monument was erected to his memory. Vasco da Gama's expedition to India is the subject of his great poem. The parts of it which are best known are the episode of Ines de Castro, and the appearance of Adamastor who, by means of his power over the storms, aims to stop Gama's voyage when he is about to double the Cape. In conformity to the taste of the time, Camoes united in this poem a narrative of the Portuguese history with the splendor of poetic description, and Christianity with mythological fables. He pleased himself with tracing the descent of the Portuguese from the Romans, of whom Mars and Venus are considered the progenitors and protectors. Since fable ascribes to Bacchus the first conquest of India, it was natural to represent him as jealous of the undertaking of the Portuguese. If the imitation of the works of classical antiquity has been of any disadvantage to the 'Lusiad,' the injury consists, perhaps, in a diminution of the originality which one expects in a work in which India and

Africa are described by an eye-witness. The general interest of the poem consists principally in the patriotic feeling which pervades it. The national glory of the Portuguese appears here in every form which invention can lend to it, and therefore the countrymen of Camoes must naturally admire this poem more than foreigners. Some critics pronounce the 'Lusiad' a more powerful and pure historical painting than Tasso's 'Jerusalem Delivered.' A valuable edition of the 'Lusiad' (*Os Lusíadas*, etc.) was published by Joze Maria de Souza-Botelho (Paris 1817). It has been translated into English by Fanshaw, Mickle and Duff; by J. J. Aubertin (with Portuguese text), and by Sir R. F. Burton (with 'Life of Camoes, Commentary,' etc.; 6 vols.). The works of Camoes, besides the 'Lusiad' consist of sonnets, songs, odes, elegies, eulogues, *redondillas*, epigrams, satires, letters, and three dramas 'Amphitryon,' after Plautus, 'King Seleucus,' and the 'Love of Philodemos.' Consult: Adamson, 'Memoirs of the Life and Writings of Luis De Camões' (1820); Braga, 'Historia de Camões' (1873-5); Castello Branco 'Luis de Camões' (1880); Storck, 'Luis de Camoens Leben' (1890).

Cam'omile, or Chamomile (*Anthemis*), a plant belonging to the natural order *Compositæ*. It is perennial, and has slender, trailing, hairy, and branched stems. The leaves are doubly pinnate, with linear pointed pinnæ. The flower is white, with a yellow centre. Both leaves and flowers of this plant have a strong though not unpleasant smell, and a very bitter nauseous taste; but the flowers are more bitter and aromatic than the leaves. The principal use for which camomile flowers are applied is to excite vomiting and promote the operation of emetics. They have likewise been substituted for Peruvian bark in the case of intermittent fevers or agues, but not with much success. Both the leaves and flowers are employed in fomentations and poultices. They are also administered in substance as a powder or electuary, in infusion as tea, in decoction or extract, or in the form of an essential oil obtained by distillation. Camomile flowers are sometimes used by brewers as a substitute for hops. Distilled with water, an essential oil in small quantities is obtained of a greenish color and strong pungent taste. So fragrant is the camomile plant that the places where it grows wild may easily be discovered by the somewhat strawberry-like perfume emitted when it is trodden on. This quality has sometimes induced the cultivation of camomile for a green-walk in gardens. Camomile in the United States is an importation from Europe, the commonest wild varieties being May-weed (*Anthemis cotula*), and corn camomile (*A. arvensis*). The garden camomile is *A. nobilis*.

Camomile enjoys a wide, popular reputation as a diaphoretic and diuretic. The flowers are usually made into an infusion or tea and this is drunk while hot. A poultice is also made of the flowers and applied to painful swellings, such as rheumatic joints, or ear-ache, boils, etc. There is a large amount of fixed and volatile oil in camomile to which its useful physiological and physical properties are due. Volatile oils act as vaso dilators and antispasmodics, diuretics and diaphoretics, the fixed oils permitting of long-continued heat.

Camonica, *kā-mō-nē'ka*, or **Valle Camonica**, a valley in north Italy, formed by two branches of the Rætian Alps, watered by the Oglio, and stretching about 50 miles from north-northeast to south-southwest as far as Lake Iseo. It is a principal thoroughfare between Italy and the Tyrol.

Camorra, *kā-mōr'ra*, an association in Naples, the members of which (*Camorristi*) carried on extortion as a regular business, and were to be found at markets, fairs, and all public gatherings in the exercise of their employment. They might even be hired to commit murder. The association extended its ramifications over the whole of Naples. It had central stations in all the large provincial towns, and 12 in the city of Naples, and it had a regular staff of recruiting officers. Under the former régime it did not aim at concealment; but under the present more powerful government efforts are being made to suppress it. These efforts have not yet been crowned with complete success; but it is not denied that the power of the association has been greatly diminished. The members no longer dare to carry on their business openly. The army, which was formerly infested with them, and is said still to contain a considerable number, is gradually being freed from them, and in every way they are being brought under the power of the law.

Camp, *kān*, **Maxime du**. See **DU CAMP**, **MAXIME**.

Camp, **Walter**, American writer on athletics: b. New Britain, Conn., 7 April 1859. He was graduated at Yale (1880) and soon attained prominence with such writings as 'Book of College Sports,' 'American Football,' etc. He has edited various weekly papers devoted to sports, and is well known as an authority upon college athletics and football.

Camp, in military use, the place and aggregate body of tents or huts for soldiers in the field. In modern times a difference is often made between camp and bivouac, the former signifying the quarters of an army sheltered in tents; the latter the situation of one which dispenses with them, and remains either entirely in the open air, or, when time allows it, in huts built of branches, etc. Camps, in a general sense, are of very ancient origin, since almost all nations in their infancy lived as nomads, dwelling in tents, as is the case with many tribes in Asia and Africa at the present day, for example the Arabs. Among the Greeks, the Lacedæmonians seem to have been the first who devoted attention to the art of forming military camps. The form which they adopted was the circular, that being the form which was best calculated to enable the general, who had his tent in the centre, to have a view of the whole camp, and to despatch assistance in the shortest possible time to any part of the camp that might be attacked. The Romans probably first carried the art of encampment to a high degree of perfection, on account of their many wars in distant and thinly settled regions, where their large armies found no cities to quarter in. Cæsar and several other Roman authors give us much information on their way of constructing a camp, and in Polybius we have a detailed description of the consular camp as it was made in his time. This form of camp, with some modifications, continued to be the usual one

during the whole period of the Roman domination, and down to the time of the invention of gunpowder. The site was chosen by the general himself, or by one of the military tribunes; a spot from which a view of the whole camp could be obtained. This spot was marked by a white pole as the point from which the rest of the camp was measured out, and the place where the general's tent (*prætorium*) was to be erected. The form of the camp was a square, and it was divided into two parts by a street from 50 to 100 feet wide, called the *principia* or *via principalis*, which ran across it. One of these divisions occupied about one third of the whole space, the other, the remaining two thirds; and it was in the former of these that the *prætorium* was situated, with an open area around it extending 100 feet on all sides. On the right of the *prætorium* was the *forum* or market-place, and on the left the *quæstorium*, where were the camp-stores under the superintendence of the *quæstor*. Beyond these again on each side there were select bodies of horse and foot taken from the extraordinaries, and behind this whole line of the encampment, and separated from it by a street 100 feet broad, was the place reserved for the main body of the extraordinaries, and for foreigners and occasional auxiliary troops. Immediately in front of the line of the encampment first described the tents of the military tribunes and of the *præfecti*, or officers of the allies, were erected, the former before the *forum* and *quæstorium*, the latter before the select bodies of horse and foot. These tents lined the *principia* on the side of the *prætorium*. On the other side of the *principia* the main body of the army was quartered, the allies being stationed on the right and left, the two Roman legions which belonged to every consular army in the middle. The whole was surrounded with a ditch (*fossa*) and a rampart (*vallum*) at the distance of 200 feet from the tents. On every side of the camp there was a gate. That behind the *prætorium* was called *porta prætoriana*, the one on the opposite side *porta decumana*. The other two were at the ends of the *principia*, and were called respectively *porta principalis dextra* and *sinistra*. The camp was improved in strength and convenience according to the time that it was occupied, and in some cases, from the want of fortresses, it was made the basis of their military operations.

Since the invention of gunpowder, intrenched camps, such as that just described, have been of very little service, as they afford no protection against projectiles shot from long ranges. What are usually known as intrenched camps at the present day are much more elaborate affairs and cover a much greater area. They may consist of intrenched areas permanently connected with and under the protection of fortified places; thus they are sometimes attached to certain large cities on the chief roads, partly in order to defend them against the first attack of the enemy, and to prevent his possessing himself easily of the important resources which they afford; partly to give to retreating armies rallying-points for support to numerous soldiers. Camps which, though intrenched, are to be occupied merely for the period of a campaign, or which serve as a refuge for a few days only to a subordinate army, are termed "lines" or "temporary posi-

CAMP ALLEGHANY — CAMPAGNA

tions.⁹ An example of the former was exhibited by the extensive lines of Torres Vedras. From the perfection of modern artillery strong detached forts form the chief defensive feature of intrenched camps of the present day. For temporary encampments in the field a position is selected such as is not only well supplied with wood, forage, water, and the other necessities of a camp, but also one that may be easily defended. Rifle-trenches, gun-pits, etc., may be constructed, sentinels being posted to guard against surprise. It has recently become common to form camps in time of peace for the sake of disciplining the soldiers to a camp life, and exercising them in the evolutions connected with camps. These are camps of instruction, of which examples are seen in the United States, where the organizations of the National Guard in the different States are accustomed to annual encampments for these purposes; also in the camp for British troops at Aldershot, and temporary camps throughout Great Britain for the training of the militia and volunteers, and in the like customs and establishments of other countries. The military camp of the United States army is arranged according to directions given in the 'Army Regulations' published by the War Department.

Camp Alleghany, W. Va., a Confederate camp where an engagement took place 13 Dec. 1861. After the affair at Camp Bartow, 3 Oct. 1861, the Union troops had remained at Cheat Mountain Summit. Gen. R. H. Milroy, who was in command 12 Dec. 1861, determined to attack Camp Alleghany, the summit of Alleghany Mountain, to which the Confederates had fallen back from Camp Bartow, and which was held by Col. Edward Johnson, with 1,400 men and eight guns, partially entrenched. With 1,800 men Milroy marched to Camp Bartow, 12 December, and made his dispositions. One column of 900 men, under Col. James A. Jones, was to ascend the mountain, until near its summit, when, leaving the road, it was to move to the left and attack Johnson's right and rear, while another column of 900 men, under Col. G. C. Moody, was to move down the Greenbank road and by a circuitous route, concealed by heavy forests, assail Johnson's left. The attacks were to be simultaneous at 4 A.M. of the 13th. Jones started at midnight, gained his assigned position on time, and waited for Moody, but his presence being discovered, he was quickly engaged and for a time met with success, driving the Confederates before him, but Johnson rallying his troops on that flank and fighting desperately, Jones was repulsed after a two-hours' contest, leaving his dead and many wounded on the field. While Jones was being driven from Johnson's right Moody was slowly approaching his left. He had been delayed by the difficulties of his route, and it was after 8 o'clock when he became engaged, and was met by such a severe fire of artillery and musketry that he could make no progress, but continued a desultory skirmish until afternoon, when he fell back, and the whole force, reuniting at Camp Bartow, marched back to Cheat Summit. The action was the most severely contested one of the West Virginia campaign of 1861. The Union loss was 20 killed, 107 wounded, and 10 missing; the Confederate loss 20 killed, 08 wounded, and 28 missing. Consult 'Official Records,' Vol. V.

E. A. CARMAN.

Camp Bartow, bär'tō, or **Greenbrier River**, W. Va., a place where an engagement in the Civil War was fought, 3 Oct. 1861. On 2 October the Confederates held Camp Bartow, where the road from Beverly to Staunton crosses the Greenbrier River, with about 2,500 men and eight guns, under command of Gen. H. R. Jackson. Gen. J. J. Reynolds, commanding the Union troops at Cheat Mountain Summit, 12 miles west, concluded to feel Jackson's position and, if possible, force it. He marched at midnight of the 2d with about 5,000 men and 13 guns, drove in a picket post west of the Greenbrier on the morning of the 3d, and coming to within 600 or 700 yards of Jackson's intrenched position beyond the stream, opened on it with his artillery, the Confederates promptly replying. Several guns were disabled on either side, and Reynolds then, under cover of a demonstration on Jackson's left, moved with six regiments to turn his right. The regiment to make the demonstration on the left crossed the stream, but was quickly driven back, and when the six regiments were about to cross the stream on Jackson's right they were met by such a severe fire of artillery and musketry that Reynolds deemed further effort inadvisable and withdrew with a loss of 43 killed and wounded. The Confederate loss was 39 killed and wounded. Consult 'Official Records,' Vol. V.

E. A. CARMAN.

Camp Diseases, disorders common in camp life and more or less incidental to the conditions of active military service, which are often such as to increase the virulence of ordinary diseases. Improper food, exposure to wet and to extremes of temperature, hard muscular labor, unhygienic surroundings, and immoral or intemperate habits, contribute to the general conditions in which disease flourishes. Some of the troublesome infectious diseases of military life are: Asiatic cholera, bubonic plague, cerebro-spinal meningitis, diarrhoea, dysentery, influenza, malaria, measles, mumps, typhoid fever, and tuberculosis. Alcoholism and venereal diseases depend on personal habits; bronchitis, frost-bite, pneumonia, rheumatism, snow-blindness, and sunstroke come from exposure. Scurvy was formerly common, but it is now not often met with. From forced marches or severe exertion the soldier often suffers from heart-trouble.

Camp-meetings, gatherings for religious purposes, held usually in thinly populated districts, and continued for several days at a time, with the view of securing prolonged and uninterrupted spiritual exercises. Assemblies of a like kind have been more or less usual at various periods in the history of the Christian Church; but it was in connection with Methodism in the United States that such meetings became especially prominent. The introduction of the protracted camp-meetings into England in 1709 by Lorenzo Dow led to the separation of the Primitive Methodists from the Wesleys. See CHAUTAUQUA.

Campa. See ANTI.

Campagna, Girolamo, jē-rō'lā-mō kām-pān'yā (called DE VERGNA), Italian sculptor: b. Verona, 1552; d. about 1623. He was a pupil and assistant of Cataneo, many of whose works he completed. Among his own works are the bronze group for the high altar of San Giorgio;

CAMPAGNA DI ROMA — CAMPANA

a Madonna and child in San Salvatore; and the altar in the Santi Giovanni e Paolo (all at Venice).

Campagna di Roma, kām-pān'yā dē rō mā, a territory in Italy which comprehends the greater part of old Latium, from 30 to 40 miles wide and 100 long. By it is usually understood the desert plain which begins near Ronciglione or Viterbo, and including the Pontine Marshes, extends to Terracina. In the middle of this region lies Rome, on its seven hills, and on the Tiber. The lakes of the Campagna are evidently craters of extinct volcanoes. Thus the Lake Regillus above Frascati, lies at the bottom of an inverted cone of hard, black lava, rising in wild and naked masses from 40 to 60 feet high. The craters containing the lakes of Albano and Nemi have a very regular conical form. The Lake of Albano is also remarkable for its aqueduct, or *emissarium*, one of the most ancient and excellent works of the Romans, which discharges the waters of the lake through the mountains. It answers its original purpose even at the present day. There are, also, many sulphur springs here, particularly between Rome and Tivoli, where the water issues almost boiling from the earth, and forms the Lake of Solfatara, which contains floating islands, consisting of a calcareous deposit, that collects round substances thrown into the water. The vapors which rise from the ground all over the Campagna, and especially in the neighborhood of this lake, render the whole district unhealthy. The soil of the Campagna is in general dry, but very fertile in the lower parts. In the middle of the summer, when fevers render a residence in the Campagna very dangerous, all the inhabitants who can do so take refuge in the neighboring towns or in Rome itself; or they may retire with their cattle to the mountains. Besides huts, innumerable ruins of temples, circuses and monuments are scattered over the Campagna, particularly near the Via Appia; and long rows of aqueducts, some in ruins, some in a state of preservation, are overgrown with ivy and other plants. In the winter flocks of sheep pasture in these solitudes; during the summer they are driven up the Apennines. Herds of half-wild cattle remain during the whole year in the Campagna. The herdsmen are mounted, and armed with long lances, with which they manage the cattle very skilfully. Scarcely a ninth part of the Campagna is cultivated, the rest is used for pasturage. In the times of the ancient Romans, this dreary solitude exhibited a smiling picture of abundance and fertility. Yet even in those times the climate was far from being a healthy one. Strabo, Livy, Cicero, Horace, and others agree in describing the districts in the neighborhood of Rome, Ardea, and other towns which stood in what is now the Campagna di Roma, as extremely unwholesome, especially at certain seasons of the year; and it was only through the greatest exertions on the part of the ancient cultivators, and the numerous aids to cultivation that stood at their command, that this tract, now so desolate, was then made so productive. Several of the Popes, particularly Pius VI., have attempted to lessen the insalubrity of the air by the draining of the Pontine Marshes which form the southern portion of the tract. In recent years the Italian government has

taken up the problem, and has accomplished much in the way of reclamation, increasing the healthfulness of this historic region.

Campagnola, kām-pān-yō'la, **Domenico**, Italian painter and engraver: flourished about 1520. He was probably born at Padua, where he was a rival of Titian in painting the frescoes in the Scuola del Carmine and in the Scuola del Santa. He is considered one of the best painters of the Venetian school, and his work as an engraver is less important. Of 14 engravings which are known to belong to him, 10 are dated 1517, and one, 'The Descent of the Holy Ghost,' bears the date 1518.

Campaign', in military language, the season during which armies keep the field. Formerly, when war was not carried on with so much impetuosity as at present, campaigns lasted only during the warmer months; and toward winter the troops went into winter quarters, when the officers of the opposing armies often met very amicably at balls and other entertainments; but of late armies have kept the field through the winter till a decisive victory has been gained. Thus the Germans in the war of 1870 with France prosecuted the siege of Paris all through the winter, while at the same time other armies were operating in different parts of France.

Campan, **Jeanne Louise Henriette**, zhān loo-ēz ōn-rē-ēt kām-pān (GENEST): b. Paris, 6 Oct. 1752; d. Mantes, 16 March 1822. She became reader to the daughters of Louis XV.; gained the favor of the wife of the dauphin, afterward Queen Marie Antoinette, who gave her in marriage to the son of her private secretary, M. Campan, and appointed her the first lady of the bed-chamber. Madame Campan gave her patroness many proofs of fidelity and attachment and wished to follow her into the temple after the 10th of August 1792, which, however, Péthion did not allow. After the fall of Robespierre, Madame Campan established a boarding school for the education of young ladies at St. Germain, which soon acquired a wide reputation. On this account Napoleon appointed her the principal of an institution founded by him for the daughters of the officers of the Legion of Honor, at Ecouen, which she organized and superintended for seven years. After the restoration Louis XVIII. abolished this institution, and Madame Campan lost her situation. Her only son died in 1821, in consequence of ill treatment inflicted because he was a relation of Marshal Ney. She published: 'Memoirs Respecting the Private Life of the Queen Marie Antoinette, with Recollections of the Times of Louis XIV., XV., and XVI.' (1823); 'Journal Anecdotique' (1824); 'Correspondance inédite avec la Reine Hortense' (1835); 'De l'éducation.'

Campana, **Pedro**, pā'drō kām-pā'ñā (in the Netherlands known as PETER DE KEMPENEER), Flemish painter of Spanish descent: b. Brussels, 1490; d. there, 1580. In 1530 he went to Italy for study of the Italian masters; he later lived in Seville, Cordova, and other cities of Andalusia, and in 1562 returned to Brussels. In style he combined to some extent the characteristics of the school of Raphael and the Flemish painters. His best known work is in the cathedral at Seville, the 'Descent from the Cross'; other

paintings of his are in the same city and he also painted the altar-piece of the Church of Santa Anna in Triana, a suburb of Seville.

Campanella, Tommaso, tōm-mā'sō kām-pā-nē'l'a, Italian philosopher: b. Stilo, Calabria. 5 Sept. 1568; d. Paris, 1639. He displayed great quickness of parts when quite young, and at the age of 15 entered into the order of the Dominicans. He studied theology and other branches of knowledge with assiduity, but was principally attracted by philosophy. The opinions of Aristotle, then generally taught in the schools, appeared to him unsatisfactory; and in 1591 he published at Naples a work entitled 'Philosophia Sensibus Demonstrata,' intended to show the futility of the prevailing doctrines. This book procured him some admirers, and more enemies. He then went to Rome, and afterward to Florence, where he was well received by the Grand-duke Ferdinand. In 1598 he returned to Naples, and revisited shortly after Calabria, where, in the following year, he was arrested on a charge of conspiracy against the Spanish government, to which Naples was then subject. A scheme was imputed to him of having engaged the Turks to assist him in making himself master of Calabria. On this improbable and apparently unfounded accusation he was imprisoned, and after being repeatedly tortured, condemned to perpetual confinement. In this situation he wrote many learned works, afterward published. At length, in 1626, Pope Urban VIII. procured his removal to Rome, and in 1629 gave him his liberty, and bestowed on him a pension. Dreading some further persecution from the Spaniards, he withdrew in 1634 to France, where he was honorably received by Louis XIII. and Richelieu, and much esteemed by the learned men of that country. He died at the monastery of his order. Among his numerous works may be mentioned: 'Atheismus Triumphatus' (1631); 'Monarchia Messiae' (1633); 'Defense of Roman Catholicism and the Papal Supremacy'; 'Discorsi della Libertà' (1633); 'Prodromus Philosophiæ Instaurandæ' (1617); 'De Sensu Rerum et Magia' (1620); 'De Monarchia Hispanica Discursus' (1640). A 'Life of Campanella,' by Baldacchini, was published at Naples (1840-3).

Campanero. See BELL-BIRD.

Campani-Alimenis, Matteo, māt-tā'ō kām-pā'nē ā-lē-mā'nīs, Italian mechanician: fl. 17th century. In optics, his greatest achievement was the manufacture of the object-glasses through which Cassini discovered two satellites of Saturn. He wrote 'Horologium solo nature motu' (1678), a work on the construction of clocks.

Campa'nia, the ancient name of a province of Italy, in the late kingdom of Naples, which, partly on account of its natural curiosities, including Vesuvius, the Phlegrean fields, the Lake of Avernus, and partly for its remarkable fertility, was a favorite resort of the distinguished Romans, who built there magnificent country houses. Cumæ, Puteoli, Naples, Herculaneum, Pompeii, Baie, Stabie, Salernum, and Capua, the principal cities of Campania, are names rich in classical associations. The Appian and Latin ways led into the interior of this charming province. Even now Campania, or the province of Caserta, is the most beautiful and fruitful part of Italy, and no traveler can wish for a more

delightful country than the fields of Campania, filled in the month of April with barley four feet high, and adorned with lofty poplars, which are connected by luxuriant vines, forming a canopy over the fields. "There," says Goethe, "it is worth while to till the ground."

Cam'panile, a detached tower containing bells. Campaniles are most common in Italy. Several of them have deviated considerably from the perpendicular, in consequence of their great height and narrowness of base. The campanile of Pisa, called *Torre Pendente* (or Leaning Tower), is one of the most remarkable. Its architects were Bonano of Pisa, and Willhelm of Innsbruck, and it was begun in 1174. The tower consists of eight stories, each of which is surrounded by columns, and it inclines nearly 13 feet from the perpendicular. Another celebrated campanile is that which was begun at Florence in 1334, after the designs of Giotto, and finished by Taddeo Gaddi. Its height approaches 300 feet, and it is adorned with 54 bas-reliefs, and 16 statues, representing biblical, pagan, and allegorical subjects. Giotto intended to surmount this tower with a spire nearly 100 feet high, but his intention was never carried out. The Torre degli Asinelli and the Torre Garisenda at Bologna are also remarkable specimens of the campanile. The campanile of St. Mark's Church, Venice, is probably the best known to Americans. Begun as far back as 888 by Pietro Tribuno, it did not assume the form which tourists are familiar with until 1590. For centuries its majestic height dominated the city. Its pinnacle was about 325 feet from the ground.

In 1417 a marble top was put on the old tower. One hundred years later it was crowned with the figure of an angel nearly 16 feet high. Simple in design, the campanile stood out in sharp contrast with the famous belfry of Florence.

The Loggetta at the foot of the campanile was built by the famous Jacopo Sansovino, and was the rendezvous for the nobles of the town. Sansovino adorned it with reliefs and with bronze statues of Minerva, Apollo, Mercury, and Peace. The bronze doors of the vestibule have long been regarded as masterpieces that deserve to rank by the side of the work of the great Italian sculptors. Like many another Italian structure, the Loggetta lost much of its old-time significance. From a meeting-place for the nobles it degenerated into a waiting room for the commanders of the guards during the sessions of the great council. Latterly it was used for auctions and lottery drawings.

The tower was peculiar in that it had no staircase. It was ascended by a winding inclined plane, having 38 bends and ending in a few steps. The tower was always open; but visitors were not allowed to enter alone. For that reason a single traveler was compelled to engage a bystander to accompany him.

From time immemorial a watchman was stationed in the lantern. In the days of the grand maritime Venetian republic it was from the tower that the watchman caught the first glimpse of home-coming war vessels. In modern times the watchman no longer scanned the horizon for vessels, but kept a lookout upon the city for fires.

The campanile served other purposes as well. It was also used for the purpose which its name signifies. According to some authorities, four

bells were hung in the olden days in the tower, to be sounded for different purposes. *La marangola* was sounded at dawn to call the laboring classes; *la sestanzana* opened the official bureaus; *la trotterar* called the councils to duty; and the bell *del malfizio* tolled out the requiem for those who were to be put to death. A fifth bell was later brought from Candia, and tolled only on Ascension Day. In 1518 there hung halfway up the tower a wooden cage, in which prisoners were kept until they starved to death. Scientifically, the tower was of interest by reason of the fact that from it Galileo made many observations. On the morning of 14 July 1902, the campanile collapsed and fell with a great crash into the square. The church of St. Mark and the palace of the Doges were not hurt, but the campanile in falling carried away the Sansovino Loggetta and the library of the Royal Palace. Steps were taken at once to rebuild, and the corner-stone of the new edifice was laid on 24 April 1903. A study of the data provided by the examination of the remains of the fallen tower showed that the bricks had been used for various purposes at a previous stage, in arches, fortifications, tops of walls, etc. The most important fact was that they were not Venetian, but Roman bricks. Moreover, when they were manufactured, they were not manipulated like modern bricks, but formed from slices of clay, as they were found without the natural layers being disturbed. This process resulted in each individual brick being able to support a weight quite four times as great as the modern brick. The bricks examined are of the first century. One bore the impression of a horseshoe, proving the debated point that horseshoes were then in use.

Campanini, kām-pa-nē'nē, **Italo**, Italian singer: b. Parma, 29 June 1846; d. 23 Nov. 1896. His father was a blacksmith. At 14 the boy enlisted in Garibaldi's army and served in two campaigns, after which he worked at his father's trade until the age of 18. Meanwhile, having shown that he possessed an excellent voice, he had taken singing lessons, and after spending a year at the Conservatory in Parma, he appeared in that city as the notary in 'La Sonnambula,' but suffered failure and ridicule. He still continued to sing in public, and in 1869 began to study under Lamperti, a celebrated teacher of Milan. In that city, at La Scala, he sang in 'Faust,' and immediately was acclaimed a great tenor. He appeared in London in 1872, and in the following year made his first visit to the United States, appearing with Nilsson at the Academy of Music, New York, in 'Lucrezia Borgia.' Afterward, in this country and Europe, he sang with great success, and was regarded as the foremost tenor of his time. The partial failure of his voice, mainly through an affection of the throat, caused some interruption of his career, but scarcely diminished his popularity until near the close of his life.

Campan'ula, Bell Flower, or Bellwort, a genus of mostly annual, biennial, and perennial herbs of the natural order *Campanulacæ*. The species, of which there are about 300, are almost all natives of the cooler parts of the northern temperate zone, and among them are some of the most widely grown garden plants which are popular on account of their bell-shaped blue, violet, or white flowers, and the ease with which

they can be cultivated. They do best in a rich, well-drained garden soil, and are readily propagated, the annual and biennial kinds from seeds, and the perennial either from seeds or by division or cuttings. All are hardy. A few species were formerly used in medicine, but are now considered inert. For a list of species and for details of cultivation consult Bailey and Miller, 'Cyclopædia of American Horticulture.'

Campanula'ceæ, a natural order of herbaceous and shrubby plants, generally abounding in a bitter, white juice. Their leaves are alternate and entire, rarely opposite. Their flowers form spikes, thyrsi, or heads. They have a monosepalous calyx, with four, five, or eight persistent divisions, and a regular or irregular monopetalous bell-shaped corolla, having its limb divided into as many lobes as there are divisions in the calyx. The stamens are five in number, the anthers free, or brought together in the form of a tube. The ovary is inferior or semi-inferior, with two or more cells, each containing numerous seeds. The style is simple, terminated by a lobed stigma, sometimes surrounded by hairs. The fruit is a capsule crowned by the limb of the calyx, with two or more cells opening either by means of holes which are formed near the upper part, or by incomplete valves. The seeds are very small and very numerous. These plants are chiefly natives of the temperate and colder climates of the northern hemisphere.

Campanula'rians, or **Sertula'rians**, hydroids of the order *Campanularia*. They are always colonial and possess hydrothecæ, and in most cases give rise to a medusa, with auditory organs on the flaps. The ectoderm is protected by a horny or chitinous sheath (perisarc) enveloping the zooids. The hydroids retract, when disturbed, into small cells (hydrothecæ), arranged in opposite rows on the stalk as in *Sertularia*, or singly at the ends of the stalks, as in *Campanularia*, while the sheaths (gonothecæ) protecting the medusa-buds are distinguished by their much larger size and cup-shaped form. The Sertularians abound on seaweeds, and may be recognized from their resemblance to mosses. The medusæ of these and many other hydroids can be collected by a towing-net, and emptied into a jar, where they can be detected by the naked eye after a little practice. It is possible that the extinct palæozoic group, *Graaptolites*, belong near the Campanularians, as they have a similar perisarc composed of cells (hydrothecæ). Consult: A. Agassiz, 'North American Acalophe' (Illustrated Catalogue of the Museum of Comparative Zoology at Harvard College, No. 2, Cambridge 1865); E. C. and A. Agassiz, 'Seaside Studies in Natural History' (Boston 1871); Nutting, 'American Hydroids' ('Special Bulletin of the U. S. National Museum': Washington 1900), contains a full bibliography.

Campardon, **Emile**, ā-mēl kām-pār-dōn. French writer: b. Paris, 1834. He was educated at the Ecole des Chartes, and then had charge of the archives there. In this position he had opportunity to examine the documents relating to the 18th century and the period of the French Revolution. He has written: 'History of the Revolutionary Tribunal of Paris' (1861); 'Marie Antoinette at the Conciergerie' (1862):

CAMPBELL

'Madame Pompadour and the Court of Louis XV.' (1867); ('Unpublished Documents of J. B. Poquelin Molière'; 'Voltaire, Unpublished Documents'; 'The Royal Academy of Music in the 18th Century'; and 'Memoirs of Frederic II., King of Prussia' (with E. Boutaric).

Campbell, kām'bēl, Alexander, American clergyman: b. near Ballymena, County Antrim, Ireland, 12 Sept. 1788; d. Bethany, W. Va., 4 March 1866. He emigrated to the United States in 1807. He was originally a Presbyterian, but withdrew from that Church in 1812, and received baptism by immersion the same year. In connection with his father, Thomas Campbell, he formed several congregations, which united with a Baptist association, but protested against all human creeds as a bond of union, accepting the Bible alone as the rule of faith and practice. He met with much opposition in the assertion of this principle, and in 1827 was excluded from the fellowship of the Baptist churches. Certain vaguely defined expressions in his writings have been interpreted as implying a belief in baptismal regeneration, a doctrine which the Disciples repudiate. By his discussions on public platforms, and his serial publications, the 'Christian Baptist,' and the 'Millennial Harbinger,' as well as by his assiduity in preaching tours and in training young men for the ministry, Campbell gradually formed a large party of followers, who began about 1827 to form themselves into a sect under the designation of "The Disciples of Christ" (q.v.), but who are most commonly known as Campbellites. In 1841 Campbell founded Bethany College in West Virginia (q.v.). His writings were numerous, and among them are 'The Christian System'; and 'Remission of Sin.' Consult: Richardson, 'Mémorial of Alexander Campbell' (1868).

Campbell, Alexander, American politician: b. Concord, Pa., 4 Oct. 1814; d. La Salle, Ill., 9 Aug. 1898. He received a common-school education and entered the iron business, removing to Illinois and attaining prominence in local politics. He was mayor of La Salle, Ill., in 1852, a member of the Illinois legislature in 1858 and a member of Congress in 1875. He was widely known as the "father of the Green-back party."

Campbell, Sir Alexander, Canadian statesman: b. Yorkshire, England, 9 March 1822; d. Toronto, 24 May 1892. He began the practice of law in 1843, and in 1856 became queen's counsel. In 1858 he entered the legislative council, and in 1862 was elected speaker. In 1864-7 he was commissioner of Crown Lands. He was a member of the Quebec Conference in 1864, received an appointment to the Dominion senate (1867), where he was the government leader; became a member of the Queen's Privy Council in 1897, and was postmaster-general in Sir John Macdonald's first federal cabinet. In 1873 he became minister of the interior. With the other cabinet officers, he resigned in the same year, because of the Pacific Railroad scandal. On the return of Macdonald to power, he was minister of militia and defense and again postmaster-general. In 1881 he was minister of justice, and in 1887 lieutenant-governor of Ontario. In politics he was a Conservative, and represented Canada in the imperial federation conference held at London in 1887.

Campbell, Allan, American civil engineer: b. Albany, N. Y., 1815; d. New York, 18 March 1894. He laid out the route of the New York and Harlem R.R.; built a railroad from Callao to Lima, Peru (1855); was appointed engineer of the harbor defenses of New York in the early part of the Civil War; was chief engineer in the construction of the Union P. R.R. He superintended the Harlem R.R. improvement, and became commissioner of public works in New York (1876).

Campbell, Archibald (8th EARL and 1st MARQUIS OF ARGYLE): b. 1508; d. 1661. He was a zealous partisan of the Covenanters. Charles I. created him a marquis in 1641, notwithstanding the opposition he had shown to his favorite object of effecting a conformity between the churches of Scotland and England. It was by his persuasion that Charles II. visited Scotland, and was crowned at Scone in 1651. At the Restoration he was confined in the Tower for five months, and was then sent to Scotland, where he was tried for high treason in connection with the death of Charles I., and beheaded.

Campbell, Archibald (9th EARL OF ARGYLE): d. 30 June 1685. He was the son of the 8th Earl of Argyle, and served the king with great bravery at the battle of Dunbar, and was excluded from the general pardon by Cromwell in 1654, for his exertions in favor of the royal cause. He was afterward made a privy-councilor and one of the lords of the treasury. For refusal to take contradictory oaths, he was tried for treason, and condemned to death, but escaped to Holland, whence he returned with several other disaffected persons, and landed in the Highlands, with a view of aiding the insurrection of the Duke of Monmouth. The plan, however, failed; and he was taken by some country people, who conveyed him to Edinburgh, where he was beheaded.

Campbell, Bartley, American dramatist: b. Allegheny City, Pa., 12 Aug. 1843; d. Middletown, N. Y., 30 July 1888. He engaged in journalism early in his career and established the *Evening Mail* in Pittsburg (1868) and the 'Southern Magazine' in New Orleans (1869). His first drama that met with success in New York was 'My Partner,' appearing in 1879. 'Fairfax, or Life in the Sunny South,' and 'The Galley Slave,' were on the metropolitan boards during the same season. Included in his plays are: 'Matrimony'; 'The White Slave'; 'Siberia'; and 'Paquita.' Several of his plays were brought out in England.

Campbell, Beatrice Stella Tanner (MRS. PATRICK CAMPBELL), English actress: b. London, 1867; married in 1884 Patrick Campbell, killed in 1900 in the Boer war. Her first appearance on the professional stage was made in 1888 at the Alexandra Theatre in Liverpool. She has been particularly successful in such plays as 'The Second Mrs. Tanqueray,' 'John-a-Dreams,' and 'The Notorious Mrs. Ebb-smith.' She has also appeared in such Shakespearean roles as Juliet, Ophelia, and Lady Macbeth. She has frequently visited the United States, playing in most of the leading cities.

Campbell, Charles, American historian: b. Petersburg, Va., 1 May 1807; d. Staunton, Va., 11 July 1876. His life was mainly spent in teaching in his native city. Among his publica-

CAMPBELL

tions are: 'The Bland Papers' (1840-3); 'An Introduction to the History of the Colony and Ancient Dominion of Virginia' (1849); 'Genealogy of the Spotswood Family' (1868). He belonged to the Historical Society of Virginia; was a contributor of the 'Historical Register' and the 'Southern Literary Messenger'; and editor of the 'Orderly Book' of Gen. Andrew Lewis in 1776 (1860).

Campbell, Sir Colin (LORD CLYDE), general: b. Glasgow, 20 Oct. 1792; d. 14 Aug. 1863. His father was a carpenter, named Macliver, but the son assumed the name of Campbell. Entering the army in 1808, and serving in the Peninsular war (1809-14), he was severely wounded at the siege of San Sebastian and the passage of the Bidassoa. He took part in the expedition to the United States (1814), and then passed nearly 30 years in garrison duty at Gibraltar, Barbados, Demerara, and various places in England, in 1837 becoming lieutenant-colonel of the 98th foot. He served in India previous to the Crimean war, on the outbreak of which, in 1854, he was appointed to the command of the Highland brigade. The victory of the Alma was mainly his; and his, too, the splendid repulse of the Russians by the "thin red line" in the battle of Balaklava. When, on 11 July 1857, the news reached England of the Sepoy mutiny, Lord Palmerston offered him the command of the forces in India. He effected the final relief of Lucknow, and on 20 Dec. 1858, having five months earlier been created Baron Clyde, announced to the viceroy that the rebellion was ended. Returning next year to England, he was made a field-marshal, and received an annuity of £2,000.

Campbell, Colin, Scottish clergyman: b. Campbelltown, Argyshire, 1848. He was educated at the universities of Edinburgh and Heidelberg, entered the ministry of the Established Kirk of Scotland, and has been minister of the parish of Dundee from 1882. He preached nearly every year from 1883 to 1900 before Queen Victoria at Balmoral Castle and Craithie Parish Church, and has published 'The First Three Gospels in Greek'; 'Critical Studies in St. Luke's Gospel' (1891).

Campbell, Lady Colin, English writer. She is a daughter of Edmond Blood of County Clare, Ireland, and was married to Lord Colin Campbell, youngest son of the 8th Duke of Argyll. She became a widow in 1895. Besides many contributions to journalism, she has published 'Darell Blake'; 'A Book of the Running Brook'; 'A Miracle in Rabbits.'

Campbell, Douglas, American lawyer and writer, son of W. W. Campbell (q.v.): b. Cooperstown, N. Y., 13 July 1840; d. Schenectady, N. Y., 7 March 1903. He practised law in New York (1865-90), but devoted his latest years to historical research. He was the author of 'The Puritan in Holland, England, and America' (1892), which has been widely read.

Campbell, Douglas Houghton, American educator: b. Detroit, Mich., 16 Dec. 1850. He was graduated at the University of Michigan in 1882, and then studied in Europe for four years. Returning he was professor of botany in the University of Indiana till 1891, when he was called to the similar chair in Stanford University. He is author of 'Elements of Structural and Systematic Botany'; 'Structure and

Development of Mosses and Ferns'; and 'Lectures on Evolution of Plants.'

Campbell, George, Scottish clergyman: b. Aberdeen, 25 Dec. 1719; d. 6 April 1796. He was educated at Marischal College, and afterwards articulated to a writer of the signet at Edinburgh. In 1741 he relinquished the law and studied divinity. In 1759 he was appointed principal of Marischal College. In 1763 he published his celebrated 'Dissertation on Miracles,' in answer to Hume's essay. In 1771 he was chosen professor of divinity, and in 1776 gave to the world his 'Philosophy of Rhetoric,' which established his reputation as a grammarian and critic.

Campbell, Sir George, English statesman: b. 1824; d. London, 18 Feb. 1892. He was educated at Haileyburg for the East Indian service and held several important posts under the Indian government, serving several terms in Parliament also. He published: 'Modern India' (1852); 'India as It May Be'; 'Handy Book of the Eastern Question' (1876); 'White and Black in the United States'; 'The British Empire' (1889).

Campbell, Harry, English physician: b. Margaretting, Essex, England. He studied medicine at Saint Bartholomew's Hospital College and was appointed to the staff of North-west London Hospital, 1886, and that of Welbeck Street Hospital, 1896. He has published: 'The Physiology of Eyesight' (1885); 'The Causation of Disease' (1889); 'Flushing and Morbid Blushing' (1890); 'Differences in the Nervous Organization of Man and Woman' (1891); 'Headache and Other Morbid Cephalic Sensations' (1894); 'Respiratory Exercises in the Treatment of Disease' (1898).

Campbell, Helen Stuart, American author. b. Lockport, N. Y., 4 July 1839. She was educated at Mrs. Cook's Seminary, Bloomfield, N. J., 1850-8, and very early began contributing to periodicals. From 1881 to 1884 she edited 'Our Continent' (Philadelphia). Her especial interest has been in social and domestic questions, such as the condition of the poor, household management, etc., and her writings for the most part consists of essays and stories illustrating these topics. Chief among them are: 'The Ainslee Series' (1864-7); 'Six Sinners' (1878); 'Unto the Third and Fourth Generation' (1880); 'Under Green Apple Boughs' (1881); 'The Easiest Way in Housekeeping and Cooking' (1881); 'The Problem of the Poor' (1882); 'Mrs. Herndon's Income: a Novel' (1885); 'Prisoners of Poverty' (1887); 'Prisoners of Poverty Abroad' (1889); 'Roger Berkeley's Probation' (1891); 'Anne Bradstreet and Her Time' (1892); 'Women Wage-Earners' (1893); 'In Foreign Kitchens' (1894); 'Some Passages in the Practice of Dr. Martha Scarborough' (1893); 'Ballantyne: a Novel' (1901).

Campbell, Henry Donald, American scientist: b. Lexington, Va., 29 July 1862. He was graduated at Washington and Lee University in 1882; later studied at Berlin and Heidelberg, and in 1887 became professor of geology and biology at Washington and Lee University.

Campbell, James Edwin, American politician: b. Middletown, Ohio, 7 July 1843. After an academic education he was admitted to the

CAMPBELL

bar. During the Civil War he served for a time in the navy and was with the Mississippi and Red River flotillas. He was a Democratic member of Congress, 1883-9; governor of Ohio, 1890-2. He was defeated for re-election by William McKinley, afterward President of the United States. In 1895 he was again a candidate, but was defeated by A. S. Bushnell. His home is at Hamilton, Ohio, where he has a successful law practice.

Campbell, James M., Scottish-American clergyman: b. Scotland, 5 May 1840. He received his education at the universities of Edinburgh and Glasgow and in 1874 came to the United States. He has lectured much on religious themes and has published: 'Unto the Uttermost' (1889); 'The Indwelling Christ' (1895); 'After Pentecost, What?' (1897); 'The Teachings of the Books' (1899); 'Clerical Types' (1900); 'Bible Questions' (1900).

Campbell, James Valentine, American jurist: b. Buffalo, N. Y., 25 Feb. 1823; d. Detroit, Mich., 26 March 1890. When three years old he accompanied his parents to Detroit. He graduated at St. Paul's College, L. I., in 1841; was admitted to the Detroit bar, 1844; practised with success until 1857. He was then elected a judge of the supreme court of Michigan, re-elected at every succeeding election, and was chosen chief justice for nine terms in succession. From 1859 he lectured for 20 years in the law department of the University of Michigan. Much of his leisure was devoted to literary and historical studies, especially the history of Michigan and the northwest territory. Until 1854 he was a Whig, but thereafter acted chiefly with the Republicans. He wrote 'Outlines of the Political History of Michigan' (1876).

Campbell, John, American editor: b. Scotland, 1653; d. 4 March 1728. He was one of a family or kin of Boston booksellers and public officials whose relationships are not determinable, but which included John, in the middle of the 17th century, Duncan, postmaster of Boston from 1694 on, and John (above), who was appointed postmaster—probably succeeding Duncan—in the latter part of 1702. There seems to have been a Thomas also about this time. The later John as postmaster was the news centre of the New England provinces; and in 1703 was writing "news letters" of European news to Gov. Winthrop of Connecticut, and perhaps other governors, made up of information received from arriving travelers, etc., with inferences as to New England policy. In 1704 he concluded to make these public and for sale; and on 24 April issued the first newspaper in America, the *Boston News Letter* (q.v.), which he edited till 1722. In 1719 he was deprived of the postmastership. He was justice of the peace for Suffolk County for some years.

Campbell, John (2d DUKE OF ARGYLE and DUKE OF GREENWICH), British general and statesman: b. Scotland, 1678; d. 1743. In 1706 he served under the Duke of Marlborough, and was a brigadier-general at the battle of Ramillies. He was a promoter of the union, for which he incurred considerable odium in his own country. He commanded at the battles of Oudenarde and Malplaquet, and assisted at the sieges of Lisle and Ghent. For these ser-

vices he was made a Knight of the Garter in 1710, and the year following was sent as ambassador to Charles III. of Spain. He was also appointed commander-in-chief of the English forces there. In 1712 he had the military command in Scotland, of which post he was soon after deprived for opposing the court measures; but on the accession of George I. he was restored, and received additional honors. In 1715 he engaged the Earl of Mar's army at Dunblane, and forced the Pretender to quit the kingdom. In 1718 he was created an English peer with the title of Duke of Greenwich. He filled successively several high offices, of which he was deprived for his opposition to Sir Robert Walpole, but on the removal of that minister he was replaced. In Westminster Abbey, where he was buried, is a noble monument to his memory.

Campbell, John, British historian: b. Edinburgh, 8 March 1708; d. 28 Dec. 1775. His writings before 1742 were published anonymously. From 1755 to the close of his life he was agent of the British government for the province of Georgia. Among his works are: 'A Concise History of Spanish America' (1741); 'Lives of the English Admirals' (1744); 'A Survey of the Present State of Europe' (1750); and 'Trade of Great Britain to America' (1772).

Campbell, John (BARON), lord high chancellor of England: b. Springfield, near Cupar, county of Fife, Scotland, 15 Sept. 1779; d. 23 June 1861. He was educated at the grammar school of Cupar, and at 12 entered the University of St. Andrews (1791) for the purpose of studying for the Church. After remaining, however, for some years at college, he resolved to abandon the clerical profession, and determined to try his fortune in London. In 1798 he quitted his native country for the metropolis, where he became reporter and theatrical critic on the *Morning Chronicle*. In November 1800 he entered as a student of Lincoln's Inn, and in 1806 was called to the bar. He traveled the Oxford circuit, and obtained considerable practice. In 1830 he was elected member of Parliament for Stafford, and in 1832 was appointed solicitor-general. In 1834, on the retirement of Sir William Horne, he became attorney-general, and the same year was elected one of the members of Parliament for the city of Edinburgh, serving till 1841, when he was created chancellor of Ireland, and raised to the peerage as Baron Campbell of St. Andrews. He had scarcely, however, assumed his official duties in Ireland when he quitted office with the Melbourne ministry; and having now more leisure worked on his 'Lives of the Chancellors,' the first series of which was published early in 1846. On the accession of Lord John Russell to power in that year Lord Campbell accepted the chancellorship of the Duchy of Lancaster, but still continued his literary labors, completing, in seven volumes, his 'Lives of the Chancellors,' and adding two other supplemental volumes, entitled 'Lives of the Chief Justices of England.' In 1850, on the retirement of Lord Denman, he was appointed chief justice; in 1859, on Lord Palmerston's resumption of the premiership, Lord Campbell reached the highest legal dignity in the British empire, being raised to the woolsack as lord high chancellor.

CAMPBELL

Campbell, John, Canadian Presbyterian clergyman: b. Edinburgh, Scotland, 18 June 1840. He was educated in the University of Toronto, and New College, Edinburgh, and in 1868 became pastor of the Charles Street Church in Toronto. In 1873 he was appointed professor of Church history and apologetics in the Presbyterian College, Montreal. Twenty years later he was convicted of heresy by the Montreal Presbytery, but the decision was reversed by the synod. He has published 'The Hittites: Their Inscriptions and Their History' (1890).

Campbell, John Archibald, American lawyer: b. Washington, Ga., 24 June 1811; d. Baltimore, 12 March 1889. He was graduated from the Georgia University in 1826 and was admitted to the bar in 1829 before coming of age, by virtue of a special act of the legislature. Removing to Alabama he soon became prominent in his profession, and in 1853 was appointed associate justice of the supreme court of the United States, resigning in 1861. He was subsequently appointed Confederate secretary of war, and was one of the commissioners named by President Davis to meet President Lincoln and Secretary Seward at the conference in Fortress Monroe in February 1865. He was imprisoned for some months after the close of the Civil War and on his release resumed his legal practice.

Campbell, John Douglas Sutherland. See ARGYLE, CAMPBELLS OF.

Campbell, John Francis, Scotch folklore writer: b. 29 Dec. 1822; d. Cannes, France, 17 Feb. 1885. His first success was 'Popular Tales of the West Highlands' (1860-2), an accurate and discriminating compilation; to which succeeded 'Frost and Fire' (1865).

Campbell, John Lorne, American Baptist clergyman: b. Dominionville, Ontario, 14 Jan. 1845. He was graduated from Woodstock College, Ontario, and from the Baptist Theological Seminary of the same institution, and subsequently from Toronto University. He was ordained to the Baptist ministry in 1868. Since 1889 he has been pastor of the Lexington Avenue Baptist Church in New York. He has published 'Heavenly Recognition and Other Sermons' (1895); 'Sanctification' (1901).

Campbell, John McLeod, Scotch theologian: b. Kilninver, Argyle, 4 May 1800; d. 27 Feb. 1872. Sent to Glasgow University at 11, he was licensed to preach by the presbytery of Lorne in 1821. His views on salvation and the atonement brought upon him a charge of heresy, which led to his deposition in 1831. For years he labored in the Highlands and preached without remuneration. When his health broke down he advised his people to attach themselves to the church of Norman Macleod. He spent the remainder of his life in retirement. In 1868 his university gave him the degree of D.D., and in 1871 a testimonial and address was presented to him by men of nearly every religious denomination in Scotland. He wrote: 'Christ the Bread of Life' (1851); 'The Nature of the Atonement' (1856); and 'Thoughts on Revelation' (1862).

Campbell, John Pendleton, American scientist: b. Cumberland, Md., 20 Nov. 1863. He studied at Johns Hopkins University, and in 1888 became professor of biology at the University of Georgia.

Campbell, John Preston, American lawyer and author: b. Boston, Mass., 8 April 1849. He practised law at Abilene, Kansas, but since 1897 has lived in Washington, D. C. Among his numerous writings are: 'Merl of Medevon and Other Prose Writings' (1888); 'My Mate Immortal'; and 'Queen Sylvia and Other Poems' (1886).

Campbell, John TenBrook, American scientist: b. Montezuma, Ind., 21 May 1833. A carpenter in early life, he enlisted as a private at the outbreak of the Civil War, and rose to the rank of captain. He studied engineering and physical science, and has perfected many surveying implements. He has written 'National Finances,' and pamphlets on mathematical science and astro-physics.

Campbell, Lewis, British classical scholar: b. Edinburgh, 3 Sept. 1830. He received his early education at Edinburgh Academy, and afterward attended the University of Glasgow, and Trinity and Balliol colleges, Oxford, taking the degree of B.A. (with first-class honors in classics) in 1853, and that of M.A. in 1856. Ordained in 1857, he became vicar of Milford, Hants, in the following year, a post which he held till his appointment, in 1863, as professor of Greek in St. Andrew's University. He retired from this chair in 1892, becoming emeritus professor. The 1894-5 series of Gifford Lectures at St. Andrews was delivered by him. As a writer he is known mainly by his editions and translations of ancient Greek authors, the chief of which are: Plato's 'Theætetus' (1861); Plato's 'Sophistes and Politicus' (1867); 'Sophocles—The Plays and Fragments' (1879); 'Sophocles in English Verse' (1873-83); 'Æschylus in English Verse' (1890); and Plato's 'Republic' (with the late Benjamin Jowett 1894). 'The Christian Ideal,' published in 1877, is a volume of sermons; and his other works include a 'Guide to Greek Tragedy' (1891); 'Life of James Clerk Maxwell' (with W. Garnett 1882); 'Life of Benjamin Jowett' (with E. Abbott 1897); 'Religion in Greek Literature' (1898), the substance of his Gifford Lectures; and the articles, 'Plato' and 'Sophocles' in the ninth edition of the 'Encyclopædia Britannica.'

Campbell, Loomis J., American philologist: b. Oneonta, N. Y., 1831; d. there, 6 Nov. 1896. He was author of a 'United States History,' also of the popular 'Franklin Series' of school books; and edited a 'Young Folks' Book of Poetry' and a 'Hand-Book of Synonyms.'

Campbell, Mrs. Patrick. See CAMPBELL, BEATRICE.

Campbell, Reginald John, English Congregational clergyman: b. London, 1867. After receiving a collegiate training at University College, Nottingham, and Christ Church College, Oxford, he entered the Congregational ministry in 1895. He is pastor of the Union Church, Brighton, and is widely known as a preacher. He has published 'The Making of an Apostle'; 'The Restored Innocent' (1898); 'A Faith for To-day' (1900).

Campbell, Thomas, British poet: b. Glasgow, 27 July 1777; d. Boulogne, France, 15 June 1844. He was educated at the University of Glasgow, where he distinguished himself by the excellence of his poetical translations from

the Greek. After leaving the university he resided for a short time in Edinburgh; and all at once attained the zenith of his fame by publishing, in 1799, 'The Pleasures of Hope.' It produced an extraordinary sensation, and soon became a familiar book throughout the kingdom. This was due not more to the graces of its style than to the noble purity of its thoughts. After the publication of this he went to Germany, where he met Klopstock at Hamburg, and visited the scene of the battle celebrated in 'Hohenlinden,' one of the most famous of his poems. The appearance of the English fleet caused him to leave Altona, where he had resided for some time. During this tour several of his best lyrics were written or suggested, among them 'The Exile of Erin,' 'Ye Mariners of England,' and 'The Battle of the Baltic.' In 1803 a new edition of 'The Pleasures of Hope,' with other poems, appeared, and in that year he was married. Settling in London, he devoted himself to literary work, and in 1805 obtained a pension of £200, through the influence of Fox, of whose politics he was an admirer. After this he appears for a time to have given his attention less to poetry than prose, but in 1809 he again made his appearance as a poet, and published 'Gertrude of Wyoming,' which some eminent critics have considered superior to 'The Pleasures of Hope,' though the public appear to have judged differently. In 1814 he visited Paris, and in the following year he received a legacy of over £4,000. In 1819, by his 'Specimens of the British Poets,' accompanied with critical essays, he proved himself the possessor of great critical acumen and an admirable prose style. In 1820 he became editor of the 'New Monthly Magazine,' a position which he held till 1830. In 1824 he published 'Theodoric,' which, though not devoid of fine passages, scarcely sustained his reputation. For some years he took an active interest in the emancipation of Greece and Poland, and in the foundation of the London University, of which he considered himself the originator. He was lord rector of the University of Glasgow from 1826 to 1829. In 1828 his wife died, and thenceforth his vigor, both bodily and mental, began to decline; and though he afterward published 'Letters from the South' (1837), describing a visit which he had paid to Algiers, a 'Life of Mrs. Siddons' (1834-42), and a 'Life of Petrarch,' and either wrote or edited the 'Life and Times of Frederick the Great,' he failed to equal his more youthful efforts. In 1831-2 he was editor of the 'Metropolitan Magazine,' and in 1832 he founded the Polish Association. Among his works not mentioned above are: 'The Advent,' a hymn; 'Love and Madness'; 'Lord Ullin's Daughter'; 'The Wounded Hussar'; 'Gilderoy'; 'The Soldier's Dream'; 'Judith'; 'The Name Unknown'; 'The Turkish Lady'; 'Lochiel's Warning'; 'The Rainbow'; 'The Last Man'; 'Navarino'; 'Pilgrim of Glencoe'; 'Moonlight'; etc. See Beattie, 'Life and Letters of Thomas Campbell'; and Redding, 'Literary Reminiscences of Campbell.'

Campbell, Thomas W., American clergyman: b. Three Rivers, Quebec, Canada, 24 Sept. 1851. He was graduated at Victoria University in 1879, and became a Methodist missionary. Joining the Reformed Episcopal Church, he was elected a bishop in 1891, and presiding bishop

in 1894, and resigned to enter the Presbyterian Church in 1898. Since October 1899 he has been pastor of the Noble Street Church, Brooklyn, N. Y.

Campbell, William, American soldier: b. Augusta County, Va., 1745; d. Rocky Mills, Va., 22 Aug. 1781. He was of Scottish descent. Commissioned a captain in the first regular troops raised in Virginia in 1775, and later becoming a colonel of militia, he distinguished himself greatly in the battles of King's Mountain and Guilford Court-House. His military career was short but brilliant, and on all occasions marked by conspicuous bravery. Lafayette gave him the command of a brigade of riflemen and light infantry. Washington, Gates, and Greene, the Virginia legislature, and the Continental Congress expressed their high sense of his merits and services. He was taken fatally ill a few weeks before the siege of Yorktown. He married a sister of Patrick Henry.

Campbell, William (LORD), English royal governor of South Carolina: b. (?); d. 5 Sept. 1778. He was the youngest son of John, fourth Duke of Argyle. He received a captaincy in the British navy, 20 Aug. 1762; was a member of Parliament in 1764, and governor of Nova Scotia, 1766-73. In 1774 he was appointed governor of South Carolina, entered upon his duties in June 1775, was courteously received by the people, for whom he professed great friendship. The hollowness of his promises was soon proved, however, and finding his residence in Charleston unsafe, he fled on board a British man-of-war, where he was soon joined by his wife, who was a Miss Sarah Izard, sister of the patriot, Ralph Izard, who belonged to the wealthiest family in the province. In 1776 Campbell served as a volunteer on board Sir Peter Parker's flagship, Bristol, in the attack on Fort Sullivan, 28 June, and was severely wounded early in the action, while in command of the lower deck. He ultimately died from the effects of the wounds received at this time. Though not of a very firm character, he was possessed of a vigorous courage which frequently displayed itself.

Campbell, William W., American lawyer and historian: b. Cherry Valley, N. Y., 1806; d. there, 7 Sept. 1881. He settled in New York and was a judge of the State supreme court. He wrote 'Annals of Tryon County' (re-issued as 'Border Warfare'); 'Life and Writings of De Witt Clinton'; 'Sketches of Robin Hood and Capt. Kidd'; etc.

Campbell, William Wallace, American astronomer: b. Hancock County, Ohio, 11 April 1862. He was graduated from the University of Michigan in 1886, was professor of mathematics at the University of Colorado, 1886-8; and instructor in astronomy in the University of Michigan 1888-91. Since 1891 he has been astronomer at the Lick Observatory, California, and director there from 1 Jan. 1901. He is a member of several American and foreign learned societies, and besides many professional papers has published 'The Elements of Practical Astronomy' (1899).

Campbell, William Wilfred, Canadian poet: b. Berlin, Ontario, Canada, 1 June 1861. He was educated at Toronto University, and the Episcopal Theological School, Cambridge, Mass.,

and was for some years in the Episcopal ministry in Canada, retiring from it in 1891 in order to devote himself entirely to literary pursuits. He has published 'Lake Lyrics' (1889); 'The Dread Voyage' (1893); 'Mordred, a Tragedy'; and 'Hildebrand' (1895), the two latter being dramas in blank verse; 'Beyond the Hills of Dream' (1899); and numerous separate poems, among them 'England' (1897). He is cited, in the 'Victorian Anthology,' among the notable poets of Canada.

Campbell. See ARGYLE, CAMPBELLS OF.

Campbell-Ban'nerman, Sir Henry, English statesman: b. 7 Sept. 1836. He was the son of Sir James Campbell, but added the surname Bannerman, under the will of a maternal uncle. He was educated at Glasgow University and Trinity College, Cambridge. In 1868 he was elected member of Parliament for Stirling Borough. From 1871-4, and from 1880-2, he was financial secretary of the war office; 1882-4, secretary of admiralty; 1884-5, chief secretary for Ireland; 1886 and 1892-5, secretary for war. In February 1899 he became leader of the Liberal party, and on 4 Dec. 1905 succeeded Sir Arthur Balfour as Premier.

Campbell Island, a lonely island to the south of New Zealand, in lat. 52° 34' S., and lon. 169° 12' E. Though it rises to a height of 1,498 feet, and is only 85 square miles in area, it is yet valuable on account of its harbors. It is also scientifically interesting, being volcanic, and displaying a rich and rare flora. It served as an observatory during the transit of Venus in 1874.

Camp'bellites, followers of Rev. John McLeod Campbell, who was deposed from the Church of Scotland in 1831 for teaching the universality of the Atonement. He established a church at Glasgow in 1833. The name is also applied to members of the church founded in the United States by Alexander Campbell. See DISCIPLES OF CHRIST.

Campbell's Station, Tenn., the scene of an engagement between Federal and Confederate forces, 4 Nov. 1863. Gen. Braxton Bragg, who was besieging Chattanooga, detached Longstreet's corps of 10,000 men and 35 guns, with Wheeler's cavalry force of 5,000 men, to capture Burnside or drive him out of East Tennessee. Longstreet reached the south bank of the Tennessee, near Loudon, on the 13th, and that night and next day laid bridges at Huff's Ferry, two miles below Loudon, and began crossing his infantry. Burnside, who was holding the north bank of the river from Kingston to Lenoirs, concluded to leave one brigade at Kingston and retire the rest of his command to Knoxville, about 30 miles, where he had prepared to make a stand behind defensive works. He skirmished sharply with Longstreet's advance on the 14th, and gradually falling back on the 15th, at night concentrated Hartranft's and Ferrero's divisions of the 9th Corps, and White's of the 23d, at Lenoirs. He had about 5,000 men. Longstreet followed, attacked during the night, and was repulsed. Before daybreak of the 16th Hartranft, with his division and some cavalry, was put on the march to secure Campbell's Station, the intersection of roads coming from the south. After destroying many wagons and contents, taking the teams to

assist his artillery over the bad roads, axle-deep in mud. Burnside followed with the other two divisions, artillery and trains, closely pursued by Longstreet, with Hood's division, commanded by Gen. Micah Jenkins, with whose advance his rearguard had several sharp encounters. McLaws' division of Longstreet's corps took a more direct road to the left, the two roads intersecting about a mile southward of Campbell's Station, 15 miles south of Knoxville. Hartranft reached the coveted point in advance of McLaws and, turning west on the Kingston road, deployed his division in such manner as to confront McLaws, and at the same time cover the Lenoir road, along which the trains were moving in advance of the infantry. He had scarcely made his dispositions when McLaws appeared and attacked, but Hartranft held on until Burnside, with the trains and the remainder of the troops, had passed and the troops taken position, when he fell back and formed on the left of White's division, in position half a mile beyond the junction of the two roads. Ferrero's division on White's right, and the artillery on commanding ground sweeping the road and the open country in front. The jaded train continued on the road to Knoxville. McLaws advanced and drew up in the plain, but the forbidding aspect of Burnside's artillery, which opened viciously on him, forbade direct attack with infantry, whereupon he opened with artillery, and Longstreet ordered attacks upon both flanks of Burnside's line, which were made and nicely parried or repulsed; but, largely superior in numbers, Longstreet was able to move around both flanks, especially on Burnside's left, which obliged him to fall back to a ridge nearly a mile in the rear. This he did in a handsome manner, though under a heavy and constant fire, and closely pressed on all sides. It was four o'clock when Hood's division made an attack on Burnside's left, which was repulsed. McLaws attacked his right and was thrown back, and Longstreet then prepared for a general advance of his entire line; but before his preparations were completed it was coming dark, and his train secure and well on the way to Knoxville. Burnside, after dark, resumed his march. His advance reached Knoxville about daybreak next morning, 17 November, Longstreet warily following during the day, and the siege of Knoxville began. In this action at Campbell's Station and the skirmishes preceding it at Huff's Ferry, Lenoirs, and on the march, the Union loss was 303 killed and wounded, and 135 missing. The Confederate loss is not definitely known. Hood's division, the most seriously engaged, lost 174 killed and wounded; the loss of McLaws was much less. Consult: 'Official Records,' Vol. XXXV.; the Century Company's 'Battles and Leaders of the Civil War,' Vol. III.; Woodward's 'Burnside and the 9th Army Corps.'

E. A. CARMAN.

Campe, Joachim Heinrich, yō'äh-īm hīn rīh kām'pē, German author: b. Deensen, Brunswick, Germany, 29 June 1746; d. 22 Oct. 1818. He studied for the Church, acted for some time as a teacher in various positions, and in 1786 was chosen by the government of Brunswick to superintend and reform the schools of that duchy. He became likewise the head of a school-book publishing house at Brunswick, and his own works, which were issued

from it, contributed greatly to extend its reputation. These consist principally of educational works and books for youth, the most successful being 'Robinson the Younger,' an adaptation of Defoe's 'Robinson Crusoe.' This attained an immense popularity, being translated into almost all the languages of Europe. He also wrote a 'History of the Discovery of America.'

Campe'che, or **Campeachy**, Mexico, a seaport town in the state and on the bay of the same name, on the west coast of the peninsula of Yucatan, about 100 miles southwest of Merida, with which it is connected by railroad. It contains a citadel, a university with a museum, a hospital, and a handsome theatre. Campeche is an important mart for logwood or Campeachy wood, of which great quantities are exported. Other important exports are wax, cigars, and henequen or sisal-hemp. Owing to the shallowness of the roadstead large vessels have to anchor five or six miles off. There is a lighthouse on the coast at this port. Pop. 16,631. The state of Campeachy has an area of 18,091 square miles. Pop. 84,000. The Bay of Campeachy, part of the Gulf of Mexico, lies on the southwest of the peninsula of Yucatan, and on the north of the province of Tabasco.

Campeggio, **käm-pěj'ō**, or **Campeggi**, **Lorenzo**, Italian ecclesiastic: b. Bologna, 1472; d. Rome, 19 July 1539. He succeeded his father as professor of law in the University of Padua in 1511, and gained a high reputation. When holding this office he married, and became the father of several children, but having lost his wife, took orders. Pope Julius II. made him bishop of Feltri, and Leo X., after giving him a cardinal's hat, employed him on several important missions, the execution of which gave him some prominence in connection with the Reformation. One of his missions was to Germany, for the purpose of regaining Luther; and another to England, to attempt to levy a tithe for defraying the expense of a war against the Turks. He failed signally in both, but ingratiated himself with Henry VIII., and was made bishop of Salisbury. Under Clement VII. he was sent as legate to the Diet of Nuremberg, where he vainly endeavored to unite the princes in opposition to Luther; and to the Diet of Augsburg. He again visited England, with extensive powers to decide in the question of divorce between Henry VIII. and Queen Catherine; but his temporizing measures lost him the confidence of all parties, as well as his bishopric of Salisbury. Notwithstanding his repeated failures, he remained high in favor at the papal court; and at his death was archbishop of Bologna.

Campen. See KAMPEN.

Campen, Jacob de. See KAMPEN, JACOB DE.

Campen, Jan van. See KAMPEN, JAN VAN.

Camper, Peter, **pā'tēr kām'pēr**, Dutch anatomist: b. Leyden, 11 May 1722; d. The Hague, 7 April 1789. He distinguished himself in anatomy, surgery, obstetrics, and medical jurisprudence, and also as a writer on æsthetics. From 1750 to 1755 he was professor of medicine at Francker, and from the latter year to 1763 at Amsterdam. Henceforth till his resignation in 1773 he held a professorship at Groningen. His 'Dissertation on the Natural Varieties,' etc., is the first work in which was thrown

much light on the varieties of the human species, which the author distinguishes by the shape of the skull. His 'Treatise on the Natural Difference of Features in Persons of Various Countries and Ages,' and one on 'Beauty as Exhibited in Ancient Paintings and Engravings,' followed by a method of delineating various sorts of heads with accuracy, is intended to prove that the rules laid down by the most celebrated limners and painters are very defective. His general doctrine is, that the difference in form and cast of countenance proceeds from the facial angle.

Cam'perdown (Dutch, *Camperduin*), Holland, a stretch of sandy hills or downs in the province of North Holland, between the North Sea and the small village of Camp, off which the British, under Admiral Duncan, gained a hard-won victory over the Dutch, under De Winter, 11 Oct. 1797. For this victory Admiral Duncan was raised to the peerage as Viscount Duncan of Camperdown. His son became Earl of Camperdown, and this title still belongs to a descendant.

Campero, Narciso, **nār-thēsō kām-pā'rō**, Bolivian statesman and soldier: b. Tojo (now in Argentina), 1815. He studied and traveled in Europe, and on his return entered the Bolivian army, and rose to the rank of brigadier-general. He was minister of war in 1872. After the overthrow of Hilarion Daza in 1880 he was chosen president of Bolivia. He commanded the combined forces of Peru and Bolivia in Tacna campaign, but was defeated at Tacna, 26 May 1880. Internally, his administration was quiet.

Camphausen, Wilhelm, **vil'hēlm kām'p'how-zēn**, German painter: b. Düsseldorf, 8 Feb. 1818; d. Düsseldorf, 16 June 1885. He was from 1859 professor in the art academy there. He was specially famous for battle-pieces—scenes from Cromwell's battles, the Thirty Years' war, the wars of 1866 and 1870—and painted many notable portraits of soldiers and equestrian figures.

Cam'phene, or **Camphine'**, (1) a general name for those terpenes which are solid at ordinary temperatures (see TERPENE); (2) a purified form of turpentine, obtained by distilling that substance over quicklime in order to remove the resins that the crude product contains, and widely used as an illuminating oil before petroleum was available.

Cam'phol, a substance now better known as borneol (q.v.).

Cam'phor, a white, translucent, crystalline substance occurring in the wood and bark of the laurel-tree (*Camphora officinarum*, *Cinnamomum camphora*, or *Laurus camphora*), from which it is obtained by distillation with steam and subsequent sublimation. It has the chemical formula $C_{10}H_{16}O$, melts at 350° F., boils at 500° F., and sublimes to an appreciable extent at practically all temperatures. It has a strong, pleasant, characteristic odor, and a peculiar, cooling, aromatic taste. Its specific gravity is about 0.992, and it dissolves to a slight extent in water, and freely in alcohol or ether. Small shavings of it exhibit lively motions when thrown upon a water-surface that is absolutely free from oily matter. (See SURFACE TENSION.) It is familiar about the household, on account of its use for protecting furs and woollens from

the attacks of moths and other insects. It is also employed in the manufacture of celluloid and various explosives. The chemistry of camphor is very complicated, and numerous substances are known that resemble it closely, and yet differ from it in certain particulars. See **BORNEOL**.

Camphoric Acid, a substance crystallizing in colorless, needle-like, monoclinic crystals, and obtained by boiling camphor with concentrated nitric acid. It has the formula $C_{10}H_{16}O_4$, and a specific gravity of 1.19, and melts at about 370° F. It is almost insoluble in cold water, but is soluble in hot water, alcohol, and ether.

Camphuysen, Dirk Rafelsk, *dürk räf'ä ëlz kãmp'hoi zën*, Dutch painter, theologian, and poet: b. Gorkum, 1586; d. Dokkum, 9 July 1627. He lost his parents at an early age, and was left to the care of an elder brother; who, thinking that he observed in Rafelsk an inclination for painting, placed him as a pupil in the studio of the artist Govitz. He soon distinguished himself by his landscapes, which were generally of small size, but animated with huts, cattle, and human figures, and executed with a skill and delicacy to which no former Dutch painter had attained. His paintings are now very rare, for he abandoned his art to devote himself to theology, which was the reigning passion of the age. He embraced the doctrines of Arminius, and shared in the persecutions under which Arminianism then suffered. He was expelled from the curacy of Vleuten which he had previously obtained, became a fugitive from village to village, a prey to suffering and privation, and often regretted the canvas and brush which had erewhile opened to him so pleasant a career. He found now in writing short poems his only relief and consolation. These are generally upon religious subjects, and are characterized by a remarkable depth of feeling.

Campi, *kãm'pë*, a family of Italian artists who founded what is known in painting as the school of Cremona. Of the four of this name, Giulio, Antonio, Vincenzo, and Bernardino, the first and the last are the best known. Giulio (1502-72), the eldest and the teacher of the others, was a pupil of Giulio Romano, and acquired from the study of Titian and Pordenone a skill in coloring which gave the school its high place. Bernardino (1525-90), was the greatest of the school. He took Romano, Titian, and Correggio in succession as his models, but without losing his own individuality as an artist.

Campion, Edmund, English theologian: b. London, 25 Jan. 1540; d. 1 Dec. 1581. He was educated at Christ's Hospital and St. John's College, Oxford, and distinguished himself greatly, becoming B.A. in 1561 and M.A. in 1564. Though at first a Roman Catholic he adopted nominally the Reformed faith and took deacon's orders in the Church of England. When Queen Elizabeth visited Oxford in 1566 he was selected to make the oration before her, as formerly while at school he had been chosen to deliver an oration before Queen Mary on her accession. He went from college to Ireland, and while there wrote the history of that country and connected himself with the Roman Catholic Church. His enthusiasm leading him to seek to make proselytes to his new faith, he was seized and imprisoned; but after a short time effected his escape to the Low Countries, and soon after

joined the English college of Jesuits at Douay, passed his novitiate as a member of that society, and became distinguished for his piety and learning. At Rome in 1573 he was admitted a member of the Order of Jesuits, after which he resided for a time at Vienna, where he composed a tragedy, which was received with much applause and acted before the emperor; and at Prague, where he taught rhetoric and philosophy for six years. Sent by Gregory XIII. on a mission to England in 1581, he challenged the universities and clergy to dispute with him. His efforts were followed by so large a number of conversions as to disquiet the ministry of Elizabeth; and he was arrested and thrown into the Tower upon a charge of having excited the people to rebellion, and of holding treasonable correspondence with foreign powers. Being tried, he was found guilty, condemned to death for high treason, and executed at Tyburn. The insults of the populace attended him to the Tower, where torture was fruitlessly applied to extort from him a confession of treason or a recognition of the supremacy of the English Church, and after his death a fragment of his body was sent to each of the principal towns for exposure. Beside his history of Ireland, he wrote 'Decem Rationes' ('Ten Reasons'), and compiled a 'Universal Chronology,' and collections of his letters and several essays were published after his death. His biography has been written by Richard Simpson (London 1867).

Campion, Thomas, English poet: b. about 1575; d. London, 1 March 1619. He was a physician by profession. He wrote a volume of 'Poems' (1595), being Latin elegies and epigrams. He published (1610-12) four 'Books of Airs,' containing songs written by himself to airs of his own composition: the first book contains 'Divine and Moral Songs'; the second, 'Light Conceits of Lovers'; the third and fourth are not distinguished by any separate sub-title. In his songs the verse and the music are most happily wedded.

Campli, Italy, a town in Naples, in the province of Teramo, and five miles north of the town of Teramo. It has a cathedral, three churches, an abbey, several convents, a hospital, and a *mont-de-piété*. Pop. 7,236.

Campo Basso, Niccolo, (CONTE DA), Italian soldier: fl. in the latter half of the 15th century. He had first supported the house of Anjou in the kingdom of Naples, but afterward transferred his services to their opponent, Charles the Bold, Duke of Burgundy. By pandering to the prejudices and caprices of that headstrong prince he acquired great influence over his mind, and in the end availed himself of the confidence placed in him by the Duke to sell him to his enemies. While the Duke was engaged in the siege of Nancy, in 1477, on the approach of a superior force under Ferrand, Duke of Lorraine, to relieve the place, Campo Basso deserted to the enemy immediately before battle. The Burgundians were in consequence defeated, and the Duke himself slain. The treacherous Italian was supposed to be the murderer, as the bodies of some of his men were observed near the spot where the unfortunate prince was found killed and stripped the day after the battle.

Campo-Formio, Italy, a town 66 miles northeast of Venice, famous for the treaty of peace between Austria and France which was signed in its neighborhood, 17 Oct. 1797. Its chief provisions were that Austria should cede the Belgian provinces and Lombardy to France, receiving in compensation the Venetian states.

Campo Santo ("holy field"), the name given to a burying-ground in Italy, best known as the appellation of the more remarkable, such as are surrounded with arcades and richly adorned. The most famous Campo Santo is that of Pisa, which dates from the 12th century, and has on its walls frescoes of the 14th century of great interest in the history of art. Among more modern Italian cemeteries, that of Genoa is distinguished for its magnificence.

Campo Santo of Dissenters, Bunhill Fields burying-ground, in London; so named by Southey, and with good reason. Among those who lie buried there are John Bunyan; George Fox, the founder of the Quakers; Dr. Thomas Goodwin, who attended Cromwell on his death-bed; Dr. John Owen, who preached the first sermon before Parliament after Charles I. was executed; Susannah Wesley, the mother of John Wesley; Dr. Isaac Watts; William Blake, the painter and poet; Daniel De Foe, and Horne Tooke. On a remnant of land in the neighborhood the Friends have built a coffee tavern and memorial hall.

Campoamor y Campoosorio, Ramon de, rā mōn dā kām-pō-a-mōr' ē kām-pō-ō-sō-rē-ō, Spanish poet: b. Navia, 24 Sept. 1817; d. 11 Feb. 1901. He studied medicine at Madrid for a time, but gave it up for literary work. He also entered political life, was governor of Alicante and Valencia and became state counselor under King Alfonso XII. in 1874. In politics he was a Conservative, and his views are expressed in 'Polémicas con la Democracia.' His chief work was in poetry, and he is considered one of the greatest Spanish poets of the 19th century; his attitude of thought is distinctively modern, and the interest of his best writings centres in modern life and problems. His best-known and most characteristic poems are the 'Doloras' (1856), a collection of short pieces which he himself defines as "dramas taken direct from life"; 'Los Pequeños Poemas' (1887), dealing with the "little things" of life; and the 'Humoradas' (1890), a collection of epigrams. He has written also two long narrative poems, 'Colon' (1853) in 16 cantos, and 'El Drama Universal,' and shorter narrative poems which are much more successful, among which are: 'Los Buenos y los Sabios'; 'El Amor y el Río Piedra'; 'El Trén Express'; 'La Nina y el Nido'; 'Los Grandes Problemas.' His latest poems are 'Licenciado Torralba' (1892); and 'Nuevos Poemas' (1892). He also wrote dramas, which did not prove successful on the stage. These include 'Días Irae' (1873); 'El Honor' (1874); and 'Cuerdos y Locos' (1887). Among his prose writings are 'La Filosofía de las Leyes' (1846); 'El Personalismo' (1850); 'Lo absoluto' (1862), giving most fully his philosophical system; 'El Idealismo' (1883); and 'La Poética' (1883), summarizing his theory of poetry.

Campobel'lo, New Brunswick, an island, eight miles long, in Passamaquoddy Bay, Char-

lotte County. It is noted as a summer resort. Though copper and lead ores exist, the inhabitants are chiefly engaged in the herring, mackerel, and cod fisheries.

Campodea, a wingless insect of the order *Thysanura*. Owing to its very primitive features it has been regarded by Brauer and by Packard as being the form nearest related to the probable ancestor of all insects. It is a little white insect living under stones. The body is long and narrow, each thoracic segment equal in size, the antennæ long and narrow, while the body ends in two very large, slender, many-jointed appendages. It is very agile in its movements and might be mistaken for a young centipede (*Lithobius*). Though allied to the bristle-tail (*Lepisma*) it is still more primitive. The mouth-parts have undergone some degeneration, being partly withdrawn within the head. It has a pair of short vestigial legs on the first abdominal segment. This and other features suggest its origin from some form with several pairs of abdominal appendages, similar to *Scolopendrella*. It is a cosmopolitan, and this, as well as its structure, suggests that it is an ancient form which has persisted to the present time.

Campos, Arsenio Martinez, ār-sā'nē-o mār-tē'nēth kām'pōs, Spanish military officer: b. Segovia, Spain, 14 Dec. 1834; d. 3 Sept. 1900. He was graduated at the Military Staff School in Madrid and appointed a lieutenant in the army in 1858; served on the staff of Gen. O'Donnell and became chief of the battalion in the Morocco campaign of 1859; was on duty in Cuba with the rank of colonel in 1864-70; took part in suppressing the Carlist insurrection and was promoted brigadier-general in 1870; opposed the republic after the abdication of King Amadeus, and was imprisoned as a conspirator. Under a plea for permission to be allowed to serve as a private, he was released and given command of a division in the 3d Army Corps in 1874. In the next two years he was constantly fighting the Carlists, distinguishing himself at Las Muncas and Galdames and causing the noted siege of Bilbao to be raised. With Gen. Jovellar, he called Alphonso XII. to the throne; was made commander-in-chief of the Catalonia district, and crushed Don Carlos at Pena de la Plata in 1876. For these services he was promoted captain-general. In 1877 he was appointed commander-in-chief in Cuba, and brought the revolution to a close chiefly by means of concessions which, as minister of war and premier in 1879, he endeavored unavailingly to carry out. He was minister of war in 1881 and 1883, commander of the Army of the North of Spain in 1884-5, president of the Spanish senate in 1885; and captain-general of New Castile in 1888. In April 1895 he was appointed governor-general and commander-in-chief in Cuba, and in January 1896 he was recalled to Spain. He found the insurrection more formidable than he had anticipated, and his failure to pursue a vigorous war policy caused much dissatisfaction in Spain. On his arrival in Madrid he repeated his belief that the trouble in Cuba could only be ended by granting reforms.

Cam'pra, An'dra, French composer: b. Aix, Provence, 4 Dec. 1660; d. Versailles, 29 July 1774. He ranks among the most distin-

guished composers of operas, his themes being classical love stories, notably 'The Triumph of Love'; 'The Amours of Mars and Venus'; 'Hippodamia'; etc.

Cam'pus Mar'tius (known also as *Campus*, merely) was a large place in the suburbs of ancient Rome, consisting of the level ground between the Quirinal, Capitoline, and Pincian hills, and the river Tiber. From the earliest times it seems to have been sacred to the god Mars, from which circumstance it received its name. It was originally set apart for military exercises and contests, as also for the meetings of the comitia by tribes and by centuries. In the later period of the republic, and during the empire, it was a suburban pleasure-ground for the Romans, and was laid out with gardens, shady walks, baths, etc.

Cam'pus Scelera'tus, a name given to a spot within the walls of Rome, and close by the Porta Capēña, where those of the vestal virgins who had transgressed their vows were entombed alive, from which circumstance it took its name.

Camuccini, Vincenzo, yin-chēnt-zo kāmoo-chē'nē, Italian historical painter; b. Rome, about 1775; d. 1844. He followed the pseudo-classical style, and his pictures are of large size. Among his best-known works are 'Death of Cæsar'; 'Death of Virginia'; 'The Incredulity of Thomas'; 'Horatius Cocles'; and 'Death of Mary Magdalene.' He also excelled in portraits.

Camus, Armand Gaston, ār-mān gās-tōn, French revolutionist; b. Paris, 2 April 1740; d. 2 Nov. 1804. A zealous and ascetic Jansenist, and a master of ecclesiastical law, he was elected advocate-general of the French clergy, and in 1789 member of the States-General by the people of Paris. He now appeared as the resolute foe of the ancient régime, gained possession of and published the so-called 'Red Book,' with its details of expenditures so disadvantageous to the court and its ministers. He was absent in Belgium during the king's trial, but sent his vote for death. He was made member, and afterward president, of the Council of Five Hundred, but resigned in May 1797, and devoted his time to literature.

Cam'wood, Barwood, or Ringwood, a red dye-wood (*Baphia nitida*) obtained in Brazil and also in Africa. It once was common in the neighborhood of Sierra Leone, and was also found in Tonquin and other parts of Asia.

This wood is of a very fine color, and is principally used in turnery for making knife-handles and other similar articles. The dye, mordanted with alum and tartar, obtained from it is brilliant, but not permanent.

Ca'na of Galilee, a town in Palestine, at no great distance from Capernaum, remarkable chiefly as having been the scene of our Lord's first miracle. It was there he turned water into wine (John ii. 1). It was also the city of Nathanael, and the place where Jesus was applied to by the nobleman from Capernaum on behalf of his dying son, and with a word effected the cure. A long-established tradition has identified it with a village bearing the name of Kefr Kenna, which lies about four miles northeast from Nazareth; but this has been disputed.

Canaan, kā'nān, the ancient name of the country west of the Jordan, called also Chanaan, and the Land of Canaan, after one of the sons of Ham. The Greeks applied the term Cana to the entire region between the Jordan and the Mediterranean up to Sidon, afterward termed by them Phœnicia, a name which by degrees came to be confined to the north coast district, or Phœnicia proper. Canaan is generally considered equivalent to the Land of Israel or Palestine. The term is so used in the Pentateuch, and in the early history of the Hebrews it was synonymous with the "Land of Promise." In certain passages in the Prophets the word seems to be restricted in meaning to the maritime plain of Palestine.

Ca'naanites, the general name for the heathen peoples (Jebusites, Hittites, Amorites, etc.) whom the Israelites found dwelling in Canaan (q.v.), west of the Jordan, and whom latterly they utterly subdued, though the subjugation was not quite complete till Solomon's time. They are believed to have been, in part at least, of kindred race with the Israelites; and some authorities find traces of their descendants among the present inhabitants of Palestine. The name Canaanites was also applied in a more restricted sense to one of these peoples.

Canace, kān'ā-sē (1) In Greek mythology, a daughter of Æolus and Enarete, who was punished by death because of her unlawful passion for her brother; she is mentioned in Gower's 'Confessio Amantis,' and in Chaucer's 'Man of Law's Tale.' (2) In Chaucer's 'Squire's Tale' the daughter of King Cambuscan.

DOMINION OF CANADA;

HISTORY AND MODERN DEVELOPMENT.

1. Canada, Dominion of. Outline History and Political Development (1534 to 1907). When the Dominion of Canada came into existence in 1867 the word "Canada" received a wholly new signification. Its origin is doubtful but it was applied loosely in the early time to the regions occupied by France on the Saint Lawrence, called by the French themselves New France. When in 1763 France surrendered her North American territory to England the term "Canada" was commonly used for the new British dominions. In 1774 these dominions, including part of the Canadian Northwest and what is now the northern tier of western American States, were officially called the "Province of Quebec." Canada does not appear technically until 1791, when the name was used in a constitution given to Upper and Lower Canada, practically the Quebec and Ontario of the present time. Later these Provinces were known as Canada East and Canada West. Not until 1867 did Nova Scotia and New Brunswick become a part of Canada. In considering the history of Canada as we now understand the word, it is important to remember that it includes a separate record of detached provinces, Nova Scotia, New Brunswick, Lower Canada, Upper Canada, etc., until 1867.

In the succeeding articles the epochs in Canadian development are treated in detail. It is sufficient here to outline the chief phases of Canada's history. The first of these, the age of discovery in the 16th and early 17th centuries, has received much attention, but there is still great obscurity as to the range of French effort on the Saint Lawrence. Jacques Cartier (q.v.) and Champlain (q.v.) are the most honored names in this pioneer work. Though few details are known, an extensive fur trade and fishing industry existed in the Saint Lawrence region long before the end of the 16th century. Early in the 17th century French trading companies were fighting for the monopoly of this trade.

The second epoch is that of French colonization and exploration until the final struggle with Britain for the country. When the first pioneer efforts were over France undertook the serious work of colonization, with Quebec as her centre of influence. Her aim was to transplant French social life to North America. Huge grants of land were given to seigniors who were to play the parts of lords in Canada, with vassals looking to them for light and leading and paying rent for the land which they occupied. The system was wholly uncongenial to the new world, but it survived during the whole period of French supremacy and is a picturesque and interesting if not a successful feature of French colonization. See CANADA — SEIGNIORIAL TENURE.

The first permanent settlement apart from

trading posts occupied only in the summer was at Port Royal, now Annapolis, in Nova Scotia. Here the French planned really to till the soil and develop the country. From the first the colony had a terrible struggle for life. In 1614 the English from Virginia destroyed it and after it was restored to France in 1632, the adjacent American colonies were always planning to drive out the French. After a chequered history they at last succeeded in 1710, during the reign of Anne, in taking final possession of the Colony, and it became Annapolis. The quiet village of the present day was thus the object of strife between two nations for well nigh one hundred years.

Samuel de Champlain was one of the pioneers at Port Royal, but in 1608 he turned to the Saint Lawrence and made the beginnings of Quebec (q.v.), long the centre of political and commercial life in Canada. By instinct Champlain was an explorer. Like others of that and a later time he hoped that the Saint Lawrence would in some way lead to a water route to China. To Lake Huron and Lake Ontario Champlain penetrated, but the obstacles were enormous. The Iroquois Indians were hostile to the French from the first, and it is hardly strange that with their menace added to the natural difficulties Champlain could do but little to lift the veil from the North American interior.

Nor was he left free from European rivals. The English followed the French to the Saint Lawrence. Quebec they attacked and captured in 1629, and over it the English flag floated for three years. When in 1632 France recovered the place the fortunes of Canada were committed to a great commercial company. This Company of "One Hundred Associates" was to be lord of the land and to have in its hands the work both of trade and of settlement. In France it had the powerful support of Cardinal Richelieu, but when at Quebec in 1635 Champlain died, New France lost its ablest leader, and the Company the most effective exponent of its interests. In the end it failed. Both in India and in America in the 17th century the French commercial companies failed where their English and Dutch rivals succeeded.

After 1635 Canada was the scene of varied activity. It was an age of religious zeal in Europe, and the Jesuit and other missionaries planned to convert and control the savage native tribes of the country. In what is now Northern New York, in Ontario, and in Quebec the missionaries did heroic work. Since the French missionaries were the friends of the Huron tribe, the relentless Iroquois bent on destroying the Hurons, pursued the French too. By 1649 the Huron settlements and the French missions were alike destroyed, and the French were driven back for a time to their base, at Quebec. They had founded Montreal in 1640.

3. Sir Charles Tupper.

but it was long only a fortified outpost to check the Iroquois.

But missions represent only one, if the dominant, phase of French interest. The great interior exercised all the fascination of the unknown upon the chivalrous minds of the French explorers. La Salle, Marquette, Joliet (qq.v.) are only the best known of the leaders who penetrated to the interior before 1700. On Lake Huron, Lake Michigan, Lake Superior, on the Mississippi, even in the Far West of Canada and the United States the survival of French names to this day bears witness to the activity of these explorers. It was a French Canadian, La Vérendrye (q.v.), who first crossed the continent so far as to view the Rocky Mountains, but this was not until 1743.

Between missions and discovery the slow and laborious work of colonization was in danger of being forgotten, but there grew up gradually on both sides of the Saint Lawrence and near the mouths of its tributaries, colonies of French farmers. The river was their highway. For protection from the Indians they lived as close together as possible and so they divided the land into long narrow strips with the houses stretching in a line on the river front. To the present day it is the most conspicuous feature of the French Canadian farms. Colonization was slow work. Adventurous Frenchmen preferred the wild life of the forest, and it was so difficult to attract settlers that in 1700 there were hardly more than 6,000 Europeans in the whole of New France. They enjoyed no semblance of political liberty. Between an aggressive church and a governor with the ideals of Louis XIV., the subjection of the French *habitant* is in striking contrast with the liberty of New England. Towards the end of the 17th century New France was committed to a very able Governor, Frontenac (q.v.). He had a definite programme. He would curb the Church, which aimed to exclude settlement from the interior so that the missionaries might be alone with and continue to control the Indian tribes; he would hold back the English, build a chain of forts from the Saint Lawrence by the Great Lakes and the Ohio to the mouth of the Mississippi to shut them out from the West, and finally drive them into the sea. It was a great plan, but it required resources beyond anything that France could command. In Europe she was fighting William III. of England and his allies, and needed all the strength she could muster. So Frontenac died in 1698 with his plans unrealized, but he had done a definite work. The mission stage was ended in New France. Entrenched on the Saint Lawrence and soon on the Mississippi France was ready to engage in the supreme struggle to make the interior French and to build up a great transatlantic empire for the glory of the French nation.

The next epoch in Canada's history covers the prolonged struggle resulting in the British Conquest. Probably impossible of realization in any case, the plan of a French empire in America was ended by Louis XIV.'s misfortunes in Europe. With a great alliance against him, he was obliged to make the Peace of Utrecht (q.v.) in 1713. In this he surrendered his claims to Hudson Bay, to Newfoundland and to Nova Scotia. This was the beginning of the end. Though in Cape Breton France built a great fortress, Louis-

bourg, so as to command the Saint Lawrence, and though she still held the country tributary to Quebec, the odds against her were too great. Walpole managed to keep Great Britain at peace until 1744, but when war then broke out France and England engaged in a final struggle for North America. The Treaty of Aix-La-Chapelle (q.v.), in 1748, did not really bring peace. Both sides were preparing steadily for renewed conflict. On the Ohio, on the Atlantic Coast, on the Great Lakes, on the Saint Lawrence, a deadly conflict went on after 1755, and when on a September day in 1759 Wolfe (q.v.) defeated Montcalm (q.v.) before Quebec, the issue was at last decided. By the Treaty of Paris (q.v.) in 1763, France surrendered her dominion of New France to Great Britain.

The fourth epoch in Canadian history covers British rule from 1763 to the Confederation of the Provinces in 1867. After the conquest in 1763, Canada was for a time governed by the British without creating a special constitution for the country, and not until 1774 did the Quebec Act (q.v.) provide for a permanent system. The Quebec Act played a great part in both American and Canadian history. It set up a despotic system of government, and it aimed to bring the whole western country under this despotic régime at Quebec. While introducing British criminal law in the country, it re-established the French civil law. The seigniors retained their feudal rights, the Church was given legal power to collect the tithe.

In the English colonies the Quebec Act caused discontent. They did not desire despotism as a neighbor, they did not wish to be checked in the west, they disliked the legal establishment of Roman Catholicism; and when the colonies revolted the Quebec Act was one of their grievances. They resolved to attempt the overthrow of British rule in Canada and allied, as they hoped, with the conquered French rising against their new masters they planned to make the revolt continental in character. But in 1775 the American army under Benedict Arnold failed to take Quebec; and the French showed fight on behalf of Great Britain. Soon the plan to drive the British from Canada was abandoned and the country remained firm in its British allegiance.

Probably with Arnold's failure the die was cast finally; it is certainly true that the intervening 130 years have never seen any serious prospect of the union of Canada with the United States. When the Loyalists, driven from the United States, found a home in Canada they treasured bitter memories of the revolutionary struggle and rendered the prospect of union even more remote. But once settled in Canada these refugees from the United States demanded the self-government which they had enjoyed at home, and at last in 1791 the British Parliament established Lower Canada and Upper Canada each with a legislature of its own and with some, though not a complete, measure of self-government. In 1812 the United States and Great Britain drifted into war, and the second failure at that time to overthrow British rule in Canada confirmed the results of the defeat of Arnold. Beyond domestic conflicts, more than once resulting in bloodshed, Canada has known no external warfare since 1812-14.

In 1837 there was armed rebellion in the two

Canadas. In Upper Canada the inhabitants claimed the complete control of their own affairs that the Colonial Office in London persistently refused, and to vindicate this demand a few took up arms. In Lower Canada there was a war of races. The French majority demanded that they should dominate in the councils of the country. The English minority, allied usually with the Governor, resisted this claim, and at length some of the French also appealed to arms. Each revolt failed completely, but the risings threw into a clear light the causes of discontent in Canada and in time a remedy was furnished.

Lord Durham, an English radical Whig, sent out to rule Canada with despotic authority and to restore order, in a very able report, published in 1839, urged that the English Province and the French Province should be united under one legislature. This was done. In 1841 Canada received a new constitution, and, joined together for the first time, the people of the two provinces could demand respect and consideration. With more than a million people Canada could no longer be treated as the child of the Colonial Office. After a few doubtful years under the new constitution, the Earl of Elgin, one of the Governor-Generals sent out from England, definitely, amidst some riotous events in 1849, recognized the supreme authority of the Canadian Parliament in regard to Canadian affairs. Since that time political warfare in Canada has been between Canadian parties and not between Canada and the Colonial Office.

But the union of the two provinces contained nothing of finality. Lord Durham had hoped that the English would dominate the French. Instead the French asserted themselves and since each province equaled the other in the number of its representatives, the work of government under the party system proved extremely difficult. A better political temper was growing up throughout British North America. Once free to control their own affairs the provinces saw the advantages of union. Their insight was quickened when in 1866 an advantageous Reciprocity Treaty with the United States came to an end, and in self-preservation it became necessary to increase the commercial and political strength of the provinces. With surprising rapidity negotiations were successfully concluded between 1864 and 1866, and in 1867 the Dominion of Canada came into existence.

The events connected with Confederation furnish a distinct epoch in Canadian history. In the next and concluding epoch the various provinces have been welded together until a real national life has appeared. The development of Federal Government in Canada presents some interesting contrasts with the Federal system in the United States. Sir John Macdonald (q.v.) aimed to make the Federal power strong, the Provincial power relatively weak, and, since his was the master mind that directed Confederation, the Canadian constitution reflected his views. The powers of the provinces are strictly defined, the undefined residue remaining with the Federal Government. Carrying out his views Macdonald frequently tried to curb the provinces, and answering him there was a cry for provincial rights. In spite of Macdonald's desires, development in Canada has been rather in the direction of strengthening the authority

of the provinces, but it is still true that a province in Canada falls far short of a State of the Union in political authority. The Federal Government can disallow Provincial legislation; it can dismiss a Provincial Lieutenant-Governor and has done so more than once. But as a result of nearly forty years' experience a fairly stable balance between the two jurisdictions has now been reached. During this time a real unity has grown up in Canada, and it makes Canadians, as it long since made Americans, one in sentiment from ocean to ocean.

Bibliography.—A good, though in some respects defective, bibliography of Canadian history will be found in 'Literature of American History, American Library Association Annotated Guide,' edited by J. N. Larned (1902). Only a short list of the best general histories and of those dealing with special periods need be noted here. Francis Parkman devoted his life to the history of New France and his collected works (12 vols., numerous editions) form the standard history of French rule in Canada. Kingsford's 'History of Canada' (10 vols., 1888-98) covers the whole subject down to 1841. J. C. Dent's 'Story of the Upper Canadian Rebellion' (2 vols., 1885), and his 'Last Forty Years; Canada Since the Union of 1841' (2 vols., 1881), may be used to supplement Kingsford's work to bring the history down to the present time. Roberts' 'History of Canada' (1904) is the best short history. McMullen's (2 vols., 1896) is fuller.

Turning to special periods Biggar's 'Early Trading Companies of New France' (1891), with extensive bibliographies, is the best account of early discovery. Read in connection with Parkman's 'Pioneers of France in the New World,' it gives an adequate account of the early period. For the later period of French supremacy by far the most interesting mass of material is contained in 'The Jesuit Relations and Allied Documents' (73 vols., 1896-1901). Parkman's work is the best connected narrative account of the period. The story of the British conquest of Canada is well told in Bradley's 'Fight with France for North America' (1901), while Doughty and Parmelee's 'Siege of Quebec' (6 vols., 1901), is a unique and exhaustive account of that aspect of the struggle. For a brilliant narrative of the Conquest and its preceding struggles Parkman's account in his 'Half Century of Conflict' (2 vols.), and his 'Montcalm and Wolfe' remains unequalled.

The works of Kingsford and Dent above cited are not rivalled by any special monographs on Canadian history for the period between 1763 and 1840. For recent times Pope's 'Memoirs of Sir John A. Macdonald' (2 vols., 1894), and Willison's 'Sir Wilfrid Laurier and the Liberal Party' (2 vols., 1903), cover the ground adequately. Sir John Bourinot's 'Canada Under British Rule' (1900), is an admirable short sketch, while his 'Constitutional History of Canada' (1901), is the best manual dealing with the subject. 'The Review of Historical Publications Relating to Canada,' edited by the present writer and Mr. H. H. Langton, is an annual bibliography, with extensive critical reviews of the literature of each year relating to Canada (Toronto, The University Library).

GEORGE M. WRONG,

Professor of History, University of Toronto.

2. Canada—The Era of Early Discovery.—

The early history of Canada from 1497 to 1632 may for the sake of convenience be divided into four periods: (1) The period of the early explorations along the Atlantic seaboard, 1497-1533; (2) the discovery and occupation by the French of the gulf and river St. Lawrence, 1534-43; (3) the rise of the fur-trade, 1544-1612; and (4) the first permanent colonization, 1613-32.

The Explorations along the Atlantic Seaboard, 1497-1533.—The first European to set foot on British North America after the departure of the Northmen in the 11th century was John Cabot (q.v.) of Bristol. Though born in Genoa, Cabot had removed in 1461 to Venice and by his naturalization in 1476 as a citizen of that republic had been able to trade to the Venetian factories throughout the Levant. When on a voyage to Alexandria for spices he made up his mind to push on to Mecca, then the great mart for the transfer of eastern and western goods. He wished to learn the situation of the region where the spices grew. On questioning on this subject those in charge of the spice-caravans at Mecca, they told him that they received them from other caravans coming from further eastward to whom they had in turn been handed over by others coming from still more remote regions. It seemed clear to Cabot that the spices must grow on the very eastern confines of Asia. In that case would it not be more practical to bring them direct to Europe by sea across the western ocean? With this idea in mind Cabot removed with his family from Venice to London. In England he learned that in the summer of 1480 an attempt had been made by two ships from Bristol to find the island of Brazil to the west of Ireland. Under Cabot's direction fresh efforts were made to find both this island and that of the Seven Cities which should but form stepping-stones on the new route to Asia by the west. All was to no purpose. No islands or land of any sort could be discovered. Suddenly, however, in the summer of 1493 news reached England that another Genoese, Christopher Columbus, had sailed out into the western ocean with three Spanish ships and had succeeded in reaching the Indies. Cabot and his friends were roused to fresh efforts. During Henry VII.'s visit to Bristol in the winter of 1495-6 Cabot proceeded to set before him the advantages to accrue to England could intercourse be opened between that country and Asia. London would become in a short time a greater emporium for spices than was then Alexandria itself. As a result of this interview letters patent were issued on 5 March 1496, giving Cabot and his sons permission to sail to Asia under the English flag. Armed with these powers Cabot fitted out at Bristol a small vessel called the *Mathew*. Her crew consisted of but 18 men. Owing to various delays they were not able to set sail until Tuesday, 2 May 1497. Rounding Ireland, they first of all headed north and then west. After many weeks of varied winds, land was at length sighted at 5 o'clock on Saturday morning, 24 June. On the 53d day after leaving Bristol they had reached the most easterly point of Cape Breton Island. The royal banner was unfurled and as the ship's

boat rounded her keel on the beach, perhaps of Mira Bay, John Cabot stepped ashore and in solemn form took possession of the land in the name of King Henry VII. No inhabitants were seen, but the sailors found snares set for game and a needle for making nets. It was, therefore, judged that the country was inhabited. As the climate was agreeable and the soil fertile, they were of opinion that they had reached that portion of the coast of Asia where grew the spices Cabot had seen at Mecca. The modern Cape Breton was named "Cape Discovery" and Scatari Island which lies opposite, "Saint John's Island," as the day was the feast of Saint John the Baptist. Sailing north along Cape Breton Island they gave to Cape Ray the name of "Cape Saint George," and called Saint Pierre, Miquelon and Langley islands the "Trinity group." Since their provisions were none too plentiful should the return voyage prove a long one, they spent no time in further exploration and early in July set sail for home from Cape Race which they named "England's Cape." Favored by the westerly winds of the North Atlantic, they made good progress and on Sunday, 6 August, the *Mathew* dropped anchor once more in Bristol harbor. Cabot hurried to Court and on the following Thursday, 10 August, was given a reward of £10 for his successful discovery. According to Cabot's report he had found some 700 leagues to the west of Ireland the country of the Great Khan. Although silk and brazil-wood grew at the spot where he landed, it was his intention on the next voyage to proceed on down that coast till he reached Cipango, for in his opinion this was the region whence came the spices and precious stones he had seen at Mecca. Henry VII. was delighted and granted Cabot a yearly pension of £20. On 3 Feb. 1498 new letters patent were issued authorizing Cabot to prepare a fresh fleet of six vessels. In order to secure skilled seamen and probably also to hear news of what Columbus had done, Cabot about this time made a trip to Lisbon and Seville. In Lisbon he came across a certain João Fernandes, called "Labrador" because he owned land on the island of Terceira. When Cabot informed this man of his discovery, Fernandes in turn told him how he himself had also visited a region to the west of Iceland and north of the point in Asia reached by Cabot. The latter's curiosity was roused. Here was perhaps a shorter way of returning to Asia than by crossing again the dreaded western ocean. On Cabot's return to Bristol with Fernandes, a brief consultation with the merchants of that town who had long traded to Iceland convinced everyone that this was the best route to take. By the beginning of May the two vessels manned by 300 men were in readiness. Since it was known that Cabot was taking the route via Iceland, "in his company sayled also out of Bristowe three or foure small ships fraught with sleight and grosse merchandizes, as course cloth, caps, laces, points, and other trifles." Early in June they reached the east coast of Greenland a little north of Cape Farewell. As Fernandes had already told them of this region they named it the "Labrador's Land." On coasting north along this desolate shore, they found the ice to grow steadily thicker and heavier and the

CANADA — THE ERA OF EARLY DISCOVERY

cold to become more and more intense. It was also noticed that the coast trended continually eastward. Finally on 11 June in lat. $67^{\circ} 30'$, the crews mutinied and refused to proceed further in that direction. Cabot was thereupon obliged to turn his ships about and to head back to the south. On reaching Cape Farewell, they sailed west and explored the southern and also the western coast of Greenland. On meeting with ice again on the west coast they once more headed west until they arrived off the coast of the present Labrador, near the modern Table Hill in $57^{\circ} 40'$. Since they had not penetrated to the bottom of Davis Strait they naturally supposed it was merely a gulf and that this coast was one with the Labrador's Land in the north. Following on down this coast, which in their opinion was that of Asia, they at length reached Cape Race and the region explored in the previous summer. Proceeding on toward the south they coasted the shores of Nova Scotia and New England until they reached the bay of New York. They were now much struck by the distance westward they had come. The east coast of Greenland lies in 43° while the longitude of Sandy Hook is 74° , which is only three quarters of a degree less than that of Cuba. Cabot could well say, therefore, that he had now "sayled in this tracte so farre towarde the weste, that he had the Ilande of Cuba on his left hande in maner in the same degree of longitude." They continued to coast the shores of New Jersey, Delaware, and Maryland as far as the 38° parallel of latitude, at which point the low state of their provisions and the absence of any traces of eastern civilization induced them to come about and head back to Bristol, where they arrived late in the autumn of 1498. The results of this voyage proved such a disappointment that no fresh expedition was despatched until 1501. Meanwhile João Fernandes returned to Portugal. On the island of Terceira, where he had his home, a Portuguese nobleman named Gaspar Corte-Real (q.v.) possessed considerable estates. This nobleman, who was much interested in the discoveries that were then taking place, seems to have put himself in communication with Fernandes. The result was that early in the spring of 1500 Corte-Real applied for and received letters patent empowering him to undertake an expedition to the northwest. Setting sail from Lisbon early in that summer he reached the east coast of Greenland on 8 June. They proceeded to follow it northward until 29 June, when the ice-floes and icebergs in Denmark strait forced them to head back toward the south. Rounding Cape Farewell they explored the southern and western coasts of Greenland, whence as the season was well advanced they once more returned to Lisbon. In the hope of discovering a region of a less wild and desolate nature, Gaspar Corte-Real fitted out a fresh expedition in the spring of 1501. They left Lisbon on 15 May and were nearing Cape Farewell when they came upon a large pack of field-ice, which forced them to alter their course to the northwest. At the end of several weeks they came in sight of the coast of our present Labrador in 58° . Following this mainland toward the south they came upon a band of Nasquapee Indians, who still inhabit

Labrador. Thinking they would make good slaves they seized 50 of these natives and stowed them under the hatches. Continuing on down that coast they reached Conception bay in Newfoundland early in September. It was then decided that the two vessels with the Indians on board should sail from here direct to Portugal while Gaspar Corte-Real himself should proceed on down that coast in order to discover its connection with the islands discovered near the equator by Columbus. The two caravels reached Lisbon in safety in the second week in October. Though the account of the discovery of this mainland and the appearance of its inhabitants excited considerable interest, more importance was attached to Gaspar Corte-Real's exploration of the region to the south. The autumn passed, however, without anything being seen of him or his vessel. In that summer an English expedition had been dispatched to the same coast by João Fernandes, now a naturalized Englishman, and several other English merchants, but on their return in the autumn with three Indians they reported that they had seen nothing of Gaspar Corte-Real. In January 1502 his rights were transferred to his brother Miguel, who left Lisbon on 10 May with three vessels to search for his lost brother. They reached Newfoundland toward the end of June and on the 24th of that month named the modern Saint John's, "the river Saint John," in commemoration of the feast of Saint John the Baptist. To facilitate the search each ship was ordered to visit a certain portion of the coast and to return to Saint John's by 20 August. Two of the vessels returned at the date fixed but the vessel of Miguel himself was never heard of more. An English expedition also visited the same coast in that year and on 20 September King Henry VII. granted a pension of £10 each to two naturalized Portuguese "in consideracion of the true service which they have doon unto us to our singler pleasure as Capitaignes into the newe founde lande." No trace had been seen by them, however, of either of the missing Corte-Reals. In the hope of finding some trace of them, King Manoel dispatched two vessels to that coast in the summer of 1503, but neither these vessels nor those which were sent out in that year by the merchants of Bristol saw any trace of them. They were thereupon given up for lost. The rich cod-fishing on this coast had now become so well known that in 1504 the French and Bretons began to resort thither. Two years later a tax was laid on the cod from these parts taken to Portugal. The French rapidly increased in numbers and in 1512 when the first Spanish expedition to this coast was fitted out the latter got their pilots in Brittany. By 1519 the French fleet numbered 100 sail and included vessels from Dieppe all the way down to Bayonne. In 1520 Alvares Fagundes of Vianna in Portugal explored the region between Saint Pierre and Miquelon and the coast of Nova Scotia. On his return he received a grant of these regions from the king of Portugal. It is possible that a colony was sent thither in 1525. In this same year the Emperor Charles V. dispatched Estevan Gomez (q.v.), who had sailed with Magellan, to discover in the north a strait similar to the strait of Magellan in the south. Gomez

explored the Bay of Fundy and then followed the coast southwards as far as the West Indies. On his return to La Corunna with a ship-load of Indians he was understood to say he had spices. The excitement was great for it was believed he had reached the Moluccas. Ultimately the mistake, which was due to the similarity of the words for slaves and spices in Spanish, was explained and afforded the emperor and his court much amusement. In 1527 two English vessels, the *Samson* and the *Mary-of-Gilford*, the latter being a three-masted barque of 250 tons' burden, were sent out to find a northwest passage. On meeting with icebergs at the mouth of Davis Strait they headed south. On 1 July in 52° a storm separated them and the *Samson* was never heard of more. The *Mary-of-Gilford* on reaching Saint John's on 3 August found "eleven saile of Normans and one Brittain and two Portugall Barkes and all a fishing." Finding no news here of the *Samson*, she continued her course to the south "oftentimes putting her men on land to search the state of those unknown regions." On one of these occasions the Italian pilot, who may possibly have been Giovanni Verrazano, who had explored this coast for Francis I. in 1524, was killed by the Indians. In the middle of November the *Mary-of-Gilford* reached the West Indies. Being refused permission to enter San Domingo, she set sail again for England. In the course of her voyage she had met more than 50 French, Portuguese, and Spanish fishing-vessels, which shows the proportions to which the cod-fishing on the Banks had then attained. Each year in fact the numbers increased.

The Discovery and Occupation by the French of the Gulf and River of Saint Lawrence, 1534-43.—Though during the course of the first three decades of the 16th century various English, Portuguese, French, and Spanish expeditions had explored the seaboard of eastern North America none of them had penetrated into the interior. The first to do this were the French in 1534. The French fishermen who resorted every summer to that portion of this main coast which was rich in cod had noticed that a bay, called by them the "Bay of Castles" from the formation of the land thereabout, extended so far inland that not one had ever been able to reach the head of it. It was just possible, therefore, that this might be the entrance to a strait similar to that found by Magellan in the south. On this being reported to the authorities at home an expedition was dispatched from Saint Malo in the spring of 1534 under the pilot Jacques Cartier with orders to explore this opening. Cartier reached Bonne Espérance harbor inside the Strait of Belle Isle (then called the "Bay of Castles") on Wednesday, 10 June. Having discovered on examining the coast beyond this point with the long-boats, that it was completely barren and rocky, sail was made on Monday, 15 June, from Bonne Espérance harbor in order to explore the land seen to the south. Following this south shore of the Strait of Belle Isle they were led steadily down the west coast of what we now call the island of Newfoundland. Off St. George's Bay to the north of Cape Ray they had stormy weather for a week, which forced them to beat up and down. On resuming their

course southward they fell in with the Bird Rocks which lie 55 miles north-northwest of Cape Breton Island. The island to the south of these they named "Brion Island" after the Admiral of France. From the currents observed here Cartier surmised that the opening beside Cape Breton Island was a strait and that one could sail from Brion Island directly into the Atlantic. "Should this prove to be the case," added Cartier, "it would mean a great saving both in time and distance should anything of importance be discovered on this voyage." As is well known, this opening, Cabot Strait, is now used quite as much as the Strait of Belle Isle. Leaving Brion Island on Saturday, 27 June, they crossed over to the Magdalen Islands, of which they coasted the northwestern corner until the following Monday, 29 June, when on the wind veering to the south they had to set sail toward the west. They were under the impression that these islands formed the main shore on the south side of the gulf, and when on Tuesday morning, 30 June, they reached Cascumpeque Bay in Prince Edward Island, they believed that this latter formed part of the same main shore with the Magdalens. The western end of Northumberland Strait, which separates Prince Edward Island from the mainland, was mistaken for a bay and called "Saint Leonore's Bay" in memory of a Breton bishop whose festival is celebrated on 1 July. Coasting northward along the New Brunswick shore they believed on reaching Chaleur Bay that they had at last found a passage into the South Sea. On Thursday, 9 July, they discovered that it was merely a deep bay; "whereat," says Cartier, "we were much put out." On account of the heat experienced there they christened it "the Bay of Heat." Pursuing their course northward they entered Gaspé Bay, where they were detained for ten days by bad weather. On Friday, 24 July, the day before they set sail, they set up a cross 30 feet high as a landmark and also seized the two sons of an Indian chief who had come down to the sea with his tribe to fish. Rounding the peninsula of Gaspé, they were heading straight for the mouth of the Saint Lawrence, when one of the mirages so common in those parts led them to believe that this passage between Gaspé and Anticosti was merely a land-locked bay. They consequently crossed over and followed the south shore of Anticosti as far as the eastern extremity of that island. Continuing on along the north shore of Anticosti they at length caught sight of the Quebec coast opposite and saw that they were entering a passage which they called "Saint Peter's Strait." At this point a consultation was held at which it was decided that since there was a great probability of this passage being the one they were in search of, it would be advisable as the season was late to postpone their exploration of it until the following year. They consequently headed east along the north shore of the gulf and were finally brought back to the Strait of Belle Isle or the "Bay of Castles," whence they had set out. The fishermen's statement had been fully confirmed. This narrow opening had turned out to be a great gulf with probably a second entrance into the Atlantic near Brion Island. There was also a prospect that the

opening they had just discovered in the north-west corner of this gulf would yet lead them into the South Sea. Setting sail from Belle Isle on Saturday, 15 August, they reached Saint Malo in safety on Saturday, 5 September. As they were in great hopes that the opening in the northwest corner of this large inland gulf would eventually lead them to the South Sea, a fresh expedition consisting of three vessels was sent out under Cartier in the spring of 1535 in order to explore it. Passing through the Strait of Belle Isle and along the north shore of the gulf they anchored on Monday, 9 August, in a small bay on the Quebec shore, opposite Anticosti. As the following day was the feast of Saint Lawrence, this bay was christened "Saint Lawrence's Bay." The name afterward spread by mistake to the whole gulf and was finally extended to the river. The two savages who had passed the winter with Cartier in France, now informed him that the land on the south side of this Saint Peter's Strait was an island and that further west he would come to the mouth of a very large river. Where that river rose they did not know. With this information to help him Cartier proceeded through the passage north of Anticosti and passing on up the gulf entered the river Saint Lawrence or as the savages called it the "River of Hochelaga." On arriving at the mouth of the Saguenay his Indian guides informed him that this river took its name from a kingdom lying toward the northwest which was "rich and wealthy in precious stones." Pleased with this information Cartier pushed on up the "River of Hochelaga" until he reached a large island which he named the "Island of Orleans" after Francis I.'s third son, Charles, Duke of Orleans. On the banks of a small stream which here enters the Saint Lawrence stood the home of the two Indians who had passed the winter in France. For this and other reasons Cartier laid up his two largest vessels in this stream and with his third vessel and two long-boats pushed on westward to visit another Indian village called Hochelaga. The shallow water at the head of Lake Saint Peter, which he named the "Lake of Angoulême" after Charles, Duke of Orleans, checked the further progress of the sailing vessel which had to be left behind here. Pushing on in their long-boats they reached the Huron-Iroquois village of Hochelaga on the island of Montreal at the foot of the Lachine rapids on Saturday, 2 October. On the following morning a visit was paid to this village and an ascent was also made of a mountain near at hand which Cartier named "Mount Royal." From this point they had a magnificent view of the surrounding country. They specially noticed the rapids, which checked further progress westward and heard from the savages that there were more such "falls of water" beyond. Just above the rapids another river entered the main stream. According to the savages this was the best route to the kingdom of Saguenay, whose inhabitants were clothed like the French and had great stores of gold and other precious metals.

Cartier made his way back to his vessels on the Saint Charles and in the course of the winter, during which part of his crew was carried off by scurvy, sought to obtain as much information as possible about this northern Mex-

ico called by the savages the "kingdom of Saguenay." That King Francis might have as much information as possible on this subject Cartier, on the day he had a large cross erected to mark the French possession of this region, ordered his men to seize the chief of this village and eleven others whom he placed on board his vessels as prisoners. Leaving the Saint Charles with only two of his vessels on Saturday, 6 May, he passed down the south shore of the Saint Lawrence and through the passage to the south of Anticosti Island, which on his first voyage he had mistaken for a bay. From Chaleur Bay he steered for Brion Island and discovered after leaving it that the coast to the south was not the main shore but a group of islands. Heading still to the east he reached Cape Breton Island and found his conjecture as to the existence of a strait here to be correct. After touching at the islands of Saint Pierre and Miquelon he left one of his long-boats in a small harbor 10 miles north of Cape Race and then on Monday, 9 June, set sail for home. They reached St. Malo in safety on Sunday, 16 July.

Owing to the wars in which France was then engaged, nothing further was done until the winter of 1540-41, when an expedition was organized to proceed to the conquest of this rich kingdom of Saguenay. While Cartier was to act as pilot, the command of the land forces was given to a Picard nobleman named Roberval, who had distinguished himself in the recent wars. Through a delay about the artillery, the latter was not able to be ready in time, so Cartier set sail from Saint Malo alone with five vessels on Monday, 23 May. They had a bad passage out and having waited some time in Newfoundland for Roberval did not reach the island of Orleans until the end of August. Cartier took up his quarters this time at the river of Cap-Rouge, nine miles above Quebec. A week later he sent back two of his vessels to France "with letters unto the king, and to advertise him what had been done and found: and how Monsieur de Roberval was not yet come, and that he feared that by occasion of contrary winds and tempests he was driven backe againe into France." Five days later Cartier set off in two long-boats to re-examine the rapids of Hochelaga and find out what arrangements should be made for passing them in the spring with the troops. He was informed by the Indians living alongside the rapids that after passing this one there were several others of the same sort before the Saguenay could be reached. With this information to help him Cartier returned to Cap-Rouge, where he spent the winter. Neither in that autumn nor in the spring of 1542 was anything heard of Roberval. The latter did not set sail from France until the middle of April 1542 and was unable to reach Newfoundland until the first week in June. When at anchor there in the harbor of Saint John's he was much surprised one morning to see Cartier arrive. According to Cartier's account "hee could not with his small company withstand the Savages, which went about dayly to annoy him." On being commanded, however, by Roberval to return "he and his company, mooved as it seemeth with ambition, because they would have all the glory of the discoverie of those partes themselves, stole privily away the next night and departed home for Brittany." Roberval was

thus obliged toward the end of June to make his way up the Saint Lawrence alone. He took up his quarters in the buildings at Cap-Rouge which Cartier had vacated. On 14 September he sent back to France two ships "to carie neues unto the king and to come backe againe the yeere next ensuing furnished with victuals and other things." During the course of the winter 50 of his people were carried off by scurvy, so that when he set off early in June 1543 to conquer the kingdom of Saguenay he had only 8 boats and 40 men. The remainder who only numbered 30 were left in charge of the fort. How far up the Saint Lawrence Roberval penetrated we do not know; for no further account of his movements has come down to us. It seems probable, however, that after penetrating a short distance up the Ottawa and finding no trace of gold he returned to Cap-Rouge where he found Cartier, who had been sent out to bring him home. In the course of the autumn the rest of the men returned. On the failure of this expedition becoming generally known a new proverb was coined. When any object in appearance of value was found to be worthless, it was called a "Canadian diamond."

The Rise of the Fur Trade, 1544-1612.—During the 10 years in which the French had been busy exploring the gulf and river Saint Lawrence and seeking to reach the mysterious kingdom of Saguenay, the number of vessels of various nationalities engaged in the fishing trade along the Atlantic seaboard had been steadily increasing. On his arrival at Saint John's, Newfoundland, on 8 June 1542, Roberval had found "seventene shippes of fishers," which were six more than Rut had met there in August 1527. Out of this annual fishing trade, which was carried on along the coast from Belle Isle as far south as Cape Cod, gradually grew the fur trade. The fishermen, when riding at anchor in a bay or inlet, found that the savages of the neighborhood were always ready to part with their furs for a mere trifle. Since these furs sold in Europe for a high price, the practice grew up among the fishermen of bringing out each year a supply of trinkets on purpose to barter for furs. The returns were so good that in process of time some vessels made a specialty of the fur trade. Thus in 1569 we hear of a French vessel from Havre that "had a trade with the people of divers sortes of fine fures." In 1581 some Saint Malo merchants sent a small barque of 30 tons into the upper Saint Lawrence, and so successful did the voyage prove that in the following year they despatched a ship of 80 tons. In 1583, in which year the merchants of Saint Malo sent three vessels to the Saint Lawrence, Stephen Bellinger of Rouen "brought home a kynde of muske called castor; divers beastes skynnes, as bevers, otters, martenes, lucernes, scales, buffs, dere skynnes, all dressed and painted on the inner-side with divers excellent colours." In the following year the merchants of Saint Malo brought back with them two savages in order that they should learn French and afterward facilitate more extended trading relations. The result was that in 1585 they sent 10 ships into the Saint Lawrence. In January 1588 two of Cartier's descendants obtained a monopoly of this fur trade, but so great was the outcry raised by the other excluded merchants that in May the monopoly was revoked. The trade continued to remain open like the

fishing trade until 1599. In addition to cod, some of the vessels fished for furs, and toward the close of the century there was a great development of the walrus-fishing. In the spring of 1591 the Bonaventure of Saint Malo made her way to the Magdalen Islands in the Gulf of Saint Lawrence, where she "slewe and killed to the number of fiteene hundred morses or Sea-oxen," as the walruses were then called. With the 40 tons of train-oil into which these were boiled down she reached the mouth of the English Channel in safety, but was there captured by an English vessel from Bristol. Relying on the information thus obtained, a vessel was sent thither from Falmouth in 1593, and though she "tooke certaine Sea-oxen," it was "nothing such numbers as they might have had, if they had come in due season," for they arrived late in the summer. In the spring of 1594 the Grace of Bristol set sail to Anticosti, "being informed that the Whales which are deadly wounded in the grand Bay (the Gulf of Saint Lawrence), and yet escape the fisher for a time, are wont usually to shoot themselves on shore there." Finding no whales she made her way back to the bay of Placentia in Newfoundland, where she met "fishermen of Saint John de Luz and of Sibiburo [Ciboure] and of Biskay to the number of threescore and odde sayles." After fishing there for some time she made her way to Ferryland on the east coast, where lay "two and twentie sayles of Englishmen." In that port she "made up her fishing voyage" and set sail for home. In the summer of 1597 the Hopewell of London, of 120 tons, was driven away from the Magdalens by two ships of Saint Malo and two others of Ciboure, which united their forces against her. Meeting with a similar hostile welcome from five French ships in a harbor of Cape Breton Island, she repaired to the port of Sainte Marie in Newfoundland, where she found a vessel from La Rochelle and another from Belle-Isle-en-Terre at the mouth of the Loire. Since this latter hailed from a Catholic part of France it was decided to capture her. "We first," says the account, "sent our boat aboard the Rocheller to certifie him that we were his friends and to request him not to hinder our fight with the enemy. This message being sent, we made all the haste we could unto the ship of Belle Isle, which first began with us with three great shot, one whereof hit our maintoppsaile, but both the other missed us. And we also sent one unto them; then being approached nere unto them ten or twelve of us went in a shallop to enter them. And when we boarded them in our boat, they betooke themselves to their close fights, playing chiefly upon us with shot and pikes out at two ports, between which we entred very dangerously, escaping meere dangers both by shot and pike. Some of our men were wounded, but no great harme was done." With this prize the Hopewell returned to England. In the following year an unsuccessful attempt was made to establish a colony on Sable Island. The Marquis de la Roche (q.v.) had obtained his first letters patent authorizing him to occupy land in the region of Newfoundland in 1577, and in 1578 he had set sail thither with two vessels. The "pinnacle" however, had been obliged to return through "fowell weather," and, though the larger vessel, after being "well beaten by four English ships which this French ship had thought to have robbed," had "taken her course

for Newfoundland," we do not know what was done there. It is probable, however, that La Roche merely selected a spot for settlement, since it was not until 1584 that the colonists were embarked. Unfortunately "his greatest ship of 300 tons was caste away over against Brouage" on the west coast of France, and so the expedition came to naught. From 1589 to 1596 La Roche was kept a prisoner by the Duc de Mercœur, but on his release he made a fresh attempt to establish a colony. In the summer of 1598 he landed on Sable Island 60 "sturdy male and female beggars," taken from the prisons of Normandy. On returning thither from the mainland he was blown all the way back to France. No fresh attempt was made to continue his colony, and when the remnant was succored by a fishing vessel in 1603, only 11 persons were still alive. On this failure of La Roche's colony, no sign was left that France claimed the region of the Saint Lawrence as her own. To remedy this state of affairs a monopoly of the fur trade for 10 years was granted in the spring of 1599 to a fur trader of Honfleur, who yearly sent out four vessels to the Saint Lawrence. The condition was that he should people the country each year with 50 colonists. In fulfillment of this agreement, on the conclusion of his annual barter with the Montagnais at Tadoussac in the summer of 1599, he left behind 16 men huddled together for warmth in a small log hut at the mouth of the Saguenay. On the return of the vessels in the following summer, no fresh colonists were landed and only five of the former batch were found alive. These had only saved themselves from perishing by taking refuge among the neighboring Indians. In the meantime the remaining traders, who were well aware that the few colonists taken out were only to throw dust in the eyes of the government, loudly complained against their exclusion from the fur trade. To quiet matters, a commission was appointed in the winter of 1602-3, which recommended the admission of certain Rouen and Saint Malo traders on condition they should bear their share of the cost of colonization. Before, however, more colonists were sent out it was deemed advisable to explore the country in detail in order that the best site available might be chosen for the settlement. This survey was carried out in the summer of 1603 by Samuel de Champlain, an officer of the navy, and Dupont-Gravé, one of the fur traders. The result was that in the spring of 1604 a fresh monopoly for 10 years was given to a company formed by the Sieur de Monts (q.v.) on condition that 60 colonists a year should be taken out. The first settlement was formed in the summer of 1604 on the island of Sainte Croix, in the Bay of Fundy. "The Fort hee [De Monts] seated at the end of the Iland, opposite to the place where he had lodged his Canon, which was wisely considered to the end to command the river up and down. And out of the same Fort was the Switzers lodging, great and large, and other small lodgings, representing as it were a suburb. Some had honsed themselves on the firme lande neere the brook. But within the Fort was Monsieur de Monts his lodging made with very faire and artificiall Carpentrie worke, with the Banner of France upon the same. At another part was the store-house wherein consisted the safety and life of everie one, likewise made with faire Carpentrie worke and covered with reedes

Right over against the said store-house were the lodgings and houses of these Gentlemen, Monsieur D'Orville, Monsieur Champlain, Monsieur Champdoré and other men of reckoning. Opposite to Monsieur de Monts, his said lodging, there was a galerie covered for to exercise themselves either in play or for the workmen in time of raine. And betweene the said Fort and the Platforme, where lay the Canon, all was full of gardens whereunto everie one exercised himselfe willingly." The winter of 1604-5 proved so severe on the exposed island of Sainte Croix, the soil of which turned out to be extremely sandy, that in the following summer the settlement was transported across the Bay of Fundy to the harbor of Port Royal (now Annapolis Basin), where the buildings were put together in the form of a large square. The winter of 1605-6 again proved a hard one, however, and, owing to the late arrival of the company's vessel, not only were all the furs taken by interlopers, but the colonists themselves finally embarked in two small boats in order to find a fishing vessel willing to take them back to France. They fortunately met their own vessel, in which they returned to Port Royal. In the spring of 1607, however, the company's monopoly, which had legally seven years more to run, was suddenly repealed through the intrigues of the Hatters' Corporation of Paris. Nothing remained but to send out a vessel to bring home the colonists at Port Royal, which was done.

On Champlain's recommendation De Monts now turned his attention to the Saint Lawrence. In order that he might retrieve a part, at least, of his losses King Henry IV. allowed him a monopoly of the fur trade there for one year. In the summer of 1608, accordingly, Champlain repaired to that part of the river called Quebec, or "the Narrows," where he constructed a trading-post. It was hoped that this would not only give them an advantage over the other competitors in the years of open trade, but would also hold the warlike nation of the Iroquois in check and allow the Algonquins, who came down every summer with furs from the upper Ottawa, to go backward and forward on the Saint Lawrence in all security. When Henry IV. heard of the construction of De Mont's post at Quebec he renewed his monopoly for another year. Taking advantage of this, Champlain, in the summer of 1609, accompanied the Montagnais and the Algonquins on the warpath against the Iroquois. In order to see the palefaces of which they had heard so much, and also to have their share of the victory over the Iroquois, the Hurons, who dwell beyond the Algonquins on the shores of Georgian Bay, came down to Quebec, for the first time, in the summer of 1609. This combined expedition surprised a combined force of 200 Iroquois on Lake Champlain. At the sight of the French and the report of their fire-arms the enemy broke and fled. The Hurons were delighted, and promised to come down henceforward every summer to the annual barter. In this same year (1609) the Sieur de Poutrincourt (see *POUTRINCOURT*, *JEAN DE BIENCOURT*) established himself with his family in the buildings formerly occupied by De Monts' colony at Port Royal. He continued to reside here until his home was burned by the English in 1613. Although during the winter of 1609-10 De Monts sought to have his monopoly renewed, or at any rate the trade reserved to him, in the

region explored by Champlain in his expedition against the Iroquois, all was to no purpose. In the summer of 1610 the fur trade was thrown open to the merchant marine of France to the same extent as the cod, whale, and walrus fishing. The result was that so many traders resorted to the Saint Lawrence in that summer that there was a plethora of goods and many ships found it impossible to get rid of even a portion of their cargoes. There was a similar inroad in the summer of 1611. The results of this competition were soon apparent among the savages. Not only did they ask more for their furs, but they also began to have a poor opinion of the palefaces, whom they saw even strip blood-stained furs off the corpses of dead Indians. De Monts also felt it to be unjust that he should be put to the expense of keeping up the post at Quebec when no advantages were accorded him in return. During the summer of 1612 Champlain was kept in France by a fall from a horse, and he improved the opportunity by seeking to bring about a better order of things in the Saint Lawrence. Through his efforts the system of open trade was brought to an end in the autumn of 1612.

The First Permanent Colonization, 1613-32.

—In order that the licentiousness of a few merchants should not spoil the trade in the upper Saint Lawrence and ruin the prospects of exploring, with the help of these Indians, the regions farther to the west, Champlain induced the king's uncle, the Comte de Soissons, to apply in the autumn of 1612 for a monopoly of the fur trade above Quebec. This was granted on condition that, during the 12 years it lasted, six families a year should be taken out by the company. Although Soissons died a few weeks later, the monopoly was transferred, at Champlain's request, to Soisson's nephew, the young Prince de Condé. As no time was left to form the company before the trading season opened, Condé merely issued licenses to seven merchants to barter above Quebec. They were each to place four men at Champlain's disposal in case he had need of them. On account, however, of the licentiousness of some of the traders in the previous summer when Champlain was absent, neither the Algonquins nor the Hurons put in an appearance in 1613 at the rapids. At this Champlain set off up the Ottawa with a few attendants, and by his exertions induced over 80 canoes to come down to the barter. In the same summer of 1613 an English vessel from Virginia destroyed De Poutrincourt's home at Port Royal, and also captured a French vessel sent out by the Jesuits to form a colony at Mount Desert, on the New England coast. In the summer of 1614 Champlain completed the formation of the new company for trade in the Saint Lawrence. On the failure of the La Rochelle merchants to appear, the whole of the shares were divided among the traders of Rouen and Saint Malo. On reaching the annual barter at the Lachine Rapid in the spring of 1615, Champlain found that his absence in the previous summer had made the Indians doubt his friendship. In order to regain their confidence, and also explore the regions farther to the west, he set out with the Hurons on their return. He was thus able during the winter of 1615-16 to learn much of the geography of the present western Ontario as well as the region about Lake Ontario, to the southern shore of which he

accompanied a war expedition against the Iroquois. So grateful were the Hurons for the help thus accorded them that they accompanied Champlain in great numbers on his return to the Saint Lawrence in the spring of 1616. For this reason, also, the barter of 1617 and 1618 were extremely well attended. Notwithstanding this increase of trade, the company unfortunately did nothing toward establishing a local source of supply, and paid almost no attention to colonization. Only one family was brought out, and it was treated in an extremely unjust manner. Not only were none of its members allowed to engage in the fur trade, but while paying very high prices for all the stores bought from the company they were obliged to sell their own produce at the very low prices current in France. When Champlain, as the representative of the viceroy, sought to secure the fulfilment of these conditions as to colonists, defense and local sources of supply, he simply made himself disliked. In the spring of 1619 they even refused him a passage to Quebec. At the king's express command he returned there in 1620, only to find the factory so tumble-down that the rain came in on every side. When this was notified to the admiral of France, who had succeeded Condé as viceroy, he at once revoked the monopoly of the company and gave the trade to two Huguenot merchants, William and Emery de Caën. The old company, however, appealed to the king. Pending his decision both parties sent out vessels in the summer of 1621 and each left servants of its own to winter at the factory. In the course of the winter of 1621-2 the two companies amalgamated with a fresh monopoly which was to run until the year 1635. Unfortunately this united company neglected colonization and local sources of supply as much as its predecessor. The result was that in the spring of 1623 when the vessels arrived late they found that for some months all the inmates of the factory had been living on roots and berries. The same state of affairs re-occurred a few years later. Champlain, who was still governor, did his best to keep this united company up to its engagements, but whenever he returned to France everything was allowed to go to ruin. Although on his departure in the autumn of 1624 he left the new factory almost completed, he found on his return two years later that not a single nail had been driven in since he went away. "It could have been finished," said Champlain, "in a fortnight, had they been willing to work, but that is just what they will not do." As little attention was paid to cultivating a local source of supply, and when, in the summer of 1627, the principal supply-ship failed to appear, the outlook for the winter was far from bright. To make matters worse, war broke out between England and France in the spring of 1628 and several English ships were sent into the Saint Lawrence. Although Champlain bravely refused to surrender the factory, the fleet sent out to Quebec by a new company which Richelieu had formed was captured below Tadousac. At the same time a Scottish colony was founded at De Poutrincourt's old quarters at Port Royal. In the winter of 1628-9 these Scottish and English merchants formed themselves into one company and sent out two fleets in the spring of 1629. While one brought fresh stores to Port Royal, the other entered the

CANADA — UNDER FRENCH RULE

Saint Lawrence and summoned the factory at Quebec to surrender. As no help of any sort had come since 1627 and all the inmates had been living for some time on roots and berries, Champlain was obliged to comply. On 22 July 1629 the English flag was run up on the flag-staff. The new company formed by Richelieu, called the Company of New France, also sent out a fleet, however, which not only succeeded the small French post at Cape Sable, below Port Royal, but also succeeded in dislodging Lord Ochiltree, who had formed a settlement on Cape Breton Island. He and his people were taken prisoners, and out of the material of their buildings a new French fort was constructed in one of the neighboring harbors. Here a garrison of 40 men was left. In the autumn of 1629 the French applied for the restitution of Quebec, since it had been surrendered after the conclusion of peace on 29 April. King Charles I. acquiesced, but the negotiations dragged on until the spring of 1632. In the meanwhile both companies sent out provisions to their posts; the Company of New France to Cape Sable and Cape Breton Island, and the English and Scottish company to Port Royal and Quebec. Finally, on the conclusion of the Treaty of Saint Germain-en-Laye on 20 March 1632, the post at Port Royal was made over to the Company of New France, while the old United Company was allowed to enjoy the trade at Quebec for one year in order to recuperate itself for its heavy losses. In the summer of 1633 its servants retired and the whole of New France passed into the hands of the Company of New France, which held it until the year 1664. See also EXPLORATION IN AMERICA.

H. P. BIGGAR,
Author of 'The Early Trading Companies of New France.'

3. Canada—Under French Rule (1632-1755). When the Treaty of St. Germain-en-Laye (1632) restored to France (See FRANCE—History), her possessions in North America, Acadia and Canada were still savage wastes. Prior to this date Port Royal and Quebec had hardly advanced beyond the status of convenient landing points, while Tadoussac and Three Rivers were mere rendezvous for barter. In theory the profits of the fur-trade were enormous, but disaster or disappointment seemed to follow each venture with dismal regularity. At the same time the attempt to establish permanent colonies had been attended by only a moderate degree of success. Louis Hébert and a few other settlers had maintained themselves at Quebec for twenty-one years before the surrender of that place to the English, but their privations were constant and severe. Those who supported themselves by agriculture were less than a score and the total population barely passed one hundred. As for the missionary efforts which constituted a third form of French activity in Canada, neither Jesuits nor Récollets had gained more than a handful of converts and a certain amount of friction between the two orders already existed. One hopeful sign was indeed visible; for in 1627 the Company of New France took form with Richelieu (q.v.) and other prominent people at its head, but this organization (better known as the Company of the Hundred Associates) was just beginning to show signs of vitality when Quebec fell (1629)

into the hands of Kirke (see KIRKE, SIR DAVID). The general state of the situation can be described in a single phrase. Though individuals had displayed great enterprise and splendid heroism, the French as a nation had not impressed themselves deeply upon the western hemisphere.

Between the Treaty of St. Germain-en-Laye and Wolfe's decisive victory over Montcalm (1759) (see COLONIAL WARS IN AMERICA), lies a period of one hundred and twenty-seven years which is marked by all the features of genuine colonization. It cannot be said that in wealth and population New France kept pace with the English colonies from Massachusetts to Georgia: but while the economic basis of the French was less solid their geographical range was wider and their institutions were equally distinctive. For a century and a quarter France continued to be an active competitor for the control of this continent and maintained a strong foothold upon it. Moreover the Canadian French, the *habitants*, developed feelings of local pride and patriotism which, though they did not beget political restlessness, are not less noticeable to the historian than are the pride and patriotism of the English in America. From 1632 to 1759 New France was a colony peopled by vigorous and resourceful inhabitants. Unfortunately it possessed a defective system of administration, but its annals are adorned by noble deeds and its life represents a characteristic form of civilization.

Of the two regions which France regained in 1632, Canada was destined to be the more important and to be held upon the firmer tenure. Acadia with its long frontier of seaboard lay open to easy attack from the side of New England and after 1621, when James I. gave Sir William Alexander the charter of Nova Scotia, (see NOVA SCOTIA—History) its population contained a Scottish element. At the moment when Port Royal fell to the English for the second time (1628) the ablest and most loyal Frenchman in Acadia was Charles de la Tour, but on the formal restoration of the colony four years later Isaac de Razilly, a relative of Richelieu, was appointed royal lieutenant. During his lifetime the French in Acadia proved able to hold their own against New England and even to destroy posts which the English had established on the coast of Maine. De Razilly's death, however, precipitated an acute quarrel between de la Tour and the able, unscrupulous Charnisay who had come to the colony with de Razilly in 1632. The prosecution of the feud between these rivals led, among other things, to a famous siege of Fort Saint John by Charnisay and a spirited but fruitless defense of the stronghold by Mme. de la Tour in her husband's absence. The long and bitter broil ended peacefully enough in the marriage of de la Tour and Mme. Charnisay after the death of Charnisay and Mme. de la Tour, but meanwhile the prosperity of Acadia had been seriously hampered by a domestic feud which unsettled the whole administrative system and raised the issue of Catholic versus Huguenot. In 1654 Acadia was seized by the English for the third time and held till 1667 when France regained it by the Treaty of Breda (see BREDÁ, TREATY OF). During the greater part of the next twenty years peace between the two nations prevailed along the Atlantic coast, broken by occasional

CANADA — UNDER FRENCH RULE

bickerings at points near a frontier which was always in dispute: but with the renewal of hostilities in the reign of William III. Acadia suffered severely and had not repaired her losses when the war of the Spanish Succession (see SUCCESSION WARS) broke out. This time the contest for supremacy reached a final settlement in one part at least of the New World. Nicholson's occupation of Port Royal (which he rechristened Annapolis, 1709) together with Marlborough's victories in Europe combined to secure Acadia to England by the Peace of Utrecht (1713). (See UTRECHT, PEACE OF). But even then the triumph of the English was not complete, for the island of Cape Breton still remained in the hands of France and the guns of Louisburg, guarding the entry to the Gulf of St. Lawrence, declared more plainly than words that the Atlantic seaboard would not be surrendered to England without a further struggle. In marked contrast to their precarious hold upon Acadia, the French built up along the shores of the Saint Lawrence a colony which, whatever its shortcomings, did not change hands with every generation. Canada was far from invulnerable, as the capture of Quebec by Kirke had already proved and as its siege by Phips (see PHIPS, SIR WILLIAM), was to prove once more in 1690; but long stretches of wilderness separated it from the English settlements, while the navigation of the river presented grave dangers to a hostile fleet. The fate of Sir Hovenden Walker, whose powerful fleet was shattered among the shoals of the Egg Islands (1710), shows that sea power could not be brought to bear against Canada so readily as against Acadia, and the fierce raids of Frontenac illustrate with equal force the ability of the French to defend themselves by land. French rule in Canada lasted long enough and was sufficiently secure to furnish a great object lesson in colonial method.

Apart from military history and the pathos which belongs to the loss of an empire, the life of New France is more interesting in the 17th than in the 18th century. The two generations that elapse between the return of Champlain (q.v.) and the death of Frontenac (q.v.) (1633-1698) are marked by a series of striking exploits and the establishment of fixed institutions. Energy and enthusiasm abound; the explorer and the missionary are lavishing their lives on causes which mean infinitely more to them than any form of personal ambition; the colonist is becoming a native, a *habitant*, whose concerns are increasingly associated with America; problems of Church and State are arising to vex the souls of governors and quicken the zeal of prelates. On every side there are signs of that fresh vigor which derives its impulse from the novelty and charm of the wilderness. In dealing with the progress of Canada during the middle and latter part of the 17th century, it is necessary to distinguish between the regions which were claimed by right of discovery and those which were effectively occupied by settlement. Before Frontenac's death lands had been cleared and rendered fit for cultivation at a good many points between Tadousac, where the Saguenay enters the Saint Lawrence, and Montreal. Above Lake Saint Louis there were forts at important strategic points like Kingston (then Fort Frontenac) and Detroit, but for agricultural purposes the colonial zone stopped at the

Lake of Two Mountains, an expansion of the Ottawa. Beyond the island of Montreal lay the *pays d'en haut*, a vast territory which was repeatedly traversed by the pioneers, whether adventurers, traders, or missionaries, but which remained almost destitute of settlers. From the Saint Lawrence the French were led inevitably to the Great Lakes and thence by an easy passage to the Mississippi. Thus their explorations belong no less to the history of Illinois, Michigan and Wisconsin than to that of Canada. In the Laurentian valley the river was another Nile with a further element added, since besides being the great local thoroughfare it was a highway that opened the route to the Mother Country. If, unlike the Nile, its waters could not be made to produce a rice crop they abounded in the fish which were so necessary to the food of a Catholic community. The form of land allotment sprang from the one cardinal condition of life on the banks of a central stream. Each peasant had his strip of water frontage, however narrow, and was able at a moment's notice to embark in his own bateau or canoe. The only towns of Canada were Quebec, Three Rivers and Montreal, all situated on the Saint Lawrence, and no permanent settlements were made in any part of the country unless within easy reach of it or its tributaries. The north shore, owing to its rugged character, was less suited to farming than the south, and in the valley of the Richelieu, the outlet of Lake Champlain, many of the best seigneuries sprang up. The settlement of the Richelieu valley was also intended to provide a bulwark against the Iroquois. (See SIX NATIONS, THE.)

Closely connected with the distinction which has just been made between the Laurentian valley and the back or upper country (*pays d'en haut*) is the contrast between peasant and woodsman. According to the system of land tenure that prevailed in Canada under the Old Régime rural society was divided between the *seigneurs* or landlords and the *censitaires* or tenants. In Canada, as in France, gentility and the possession of an estate went together, but there is this important difference between the feudalism of the mother country and the colony, that whereas in France the peasants bore appreciable burdens during the 17th century, in Canada no *censitaire* could be seriously crippled by the taxes or services to which he was bound. Feudalism, an institution of the 9th century could not be transplanted without change to the New World in the age of Louis XIV. The French of Normandy and Brittany made admirable colonists, when once they had been induced to embark; but some prospect of improved conditions must be held out before emigrants would come forward. Moreover in a country of virgin forest it was impossible that peasants should be taxed as their kindred were in a land of ancient cultivation. In view of these considerations the *habitants* received their farms on very reasonable terms. How moderate were the demands of the *seigneur* may be seen from a single instance. A deed of 19 June 1694, concedes a lot of land three arpents in front by forty in depth (about a hundred acres) "in consideration of twenty sous and one good live capon for each arpent of front and one sou of *cens*, payable at the principal manor-house of the seigneurie on St. Martin's day in each year so long as the grantee shall occupy the land." The *habitant*

had in a certain sense the character of a woodsman, for a large part of his time was devoted to hewing down the forest, but he was not a woodsman in the fullest sense of the word. Besides the stationary peasant who cultivated his stump fields in the valley of the St. Lawrence, the population of New France embraced many restless and adventurous spirits who roved the woods, traded in beaver skins whenever they could elude the monopoly, intermarried with the Indians, and evaded the restraints of civilization without punishment from civil or ecclesiastical law. The *coureur de bois*, ("wood-runner") to give this type of colonist his generic name, was one of the most remarkable adventurers that this continent has ever seen. Though his vices were an object of scandal to the missionaries and his lawless habits an inconvenience to the government, he possessed the virtues of fearlessness and initiative to an exceptional degree. The comrades of Magellan and Drake were no more daring or resourceful than the *coureurs de bois* who pressed on from the valley of the Saint Lawrence into the wilds of the *pays d'en haut* and found amid the dangers of forest or prairie the fullest excitements of a nomadic life. Their names, for the most part, have perished; but legends like that of the *Chasse-galerie* bear witness to the hold they preserve upon the memory of French Canada.

In passing from these general statements regarding country and inhabitants, it is hard to say whether a place of greater prominence should be given to the government or to the Church. One should be careful not to represent the French Canadians of the 17th century as slaves—a tendency too current among English writers at the present day. The feudalism of New France was feudalism in its most mitigated form and the *habitant* winning a home for himself by courageous toil seems anything but a serf by instinct. Nevertheless French Canada was overshadowed by two institutions which visibly embodied authority as authority was not visibly embodied in New England or New York. Whether or not paternalism was the bane of Canada is an open question to be answered by the historical student in accordance with his own scheme of philosophy. The broad fact is that the Crown and the Clergy divided between them an extremely large part of the world in which the *habitant* lived. From 1632 to 1663 the affairs of Canada were controlled, under the Crown, by the Company of the Hundred Associates. Had this corporation been better managed, or rather had it been actuated by a larger spirit, it might have gained for itself a distinguished reputation and eventually handed over to the King a flourishing possession; but looking only to the greatest immediate return it wasted a fine opportunity and does not merit comparison with either the East India Company (see EAST INDIA COMPANIES) or the Hudson's Bay Company (q.v.). After 1663 executive power in Canada was deputed by the King to the Governor and the Intendant, with whom were associated the Bishop and a board of councillors varying in number from five to twelve. The Governor, who was always a noble, held the highest office in the colony though he did not possess so much real power as the Intendant. He commanded the forces, was the channel of diplomatic intercourse with the English and the Indians, occupied the central place in

colonial society and was authorized to follow his own judgment regarding matters of emergency. With finance, however, he had little or nothing to do, and from the whole field of civil administration he was excluded by the presence at his side of the Intendant. This official belonged ordinarily to the middle class and had been trained to law or business. The Crown seems to have acted on the maxim, "Divide and Rule." Both Governor and Intendant were required to send home detailed reports which always included a large amount of criticism and gossip. The Intendant passed judgment on the acts of the Governor and the Governor was not slow to express his opinion concerning the administration of the Intendant. Neither received untrammelled authority, for an autocratic king like Louis XIV. insisted upon reserving the use of his prerogative. The government of New France was less rigid and cumbersome than that of the Spanish possessions under Philip II., but the principle of absolutism carried out at such a distance from the court could not fail to impair the efficiency of administration.

The position of the Church in New France cannot be properly described unless a reference is made to the dominating influence which controlled Europe during the age of colonization. Seventeen years before Cartier's first voyage to the Saint Lawrence (1534) Luther had denounced the sale of indulgences at Wittenberg. In the interval between Cartier's first voyage and his last (1541) the "Institutes" of Calvin (see CALVIN, JOHN) was becoming the foundation of a church and the Company of Jesus (see JESUITS) was arising to stem the tide of heresy. Despite the wars of religion and the national exhaustion which they produced, religion was still the reigning issue in France when Champlain sailed westward to continue the work of Cartier. This may be seen chiefly in two ways; from the missionary zeal of the religious orders and from the anxiety of French Catholics that New France be kept untainted by Huguenot misbelief. With De Monts and Poutrincourt, Calvinism made its appearance at Port Royal and a little later it maintained itself for a while at Quebec under the protection of William and Emery de Caen, who did not carry out their promise to exclude heretics from the colony. But during the sway of Richelieu, the Huguenot cause perishes even more completely in Canada than in France, and a way is left clear for the unchecked ascendancy of Rome. No one can read the religious literature of New France without recognizing the sincerity of motive which brought Jesuits, Récollets, Sulpicians, Ursulines, to Quebec and Montreal. The savage races of America had excited the imagination of all Europe, and in France the desire was particularly strong to rescue these heathen from the doom of the unbaptized. The greatest nobles in the realm subscribed funds for the mission and acted as sponsors at the baptism of Micmac or Algonquin converts. First in importance among the religious orders of New France come the Jesuits, whose missionary tradition had been established more than half a century earlier by St. Francis Xavier. Entering Acadia and Canada with a record of brilliant success to give them confidence, they prosecuted their labors among all the nations from the Iroquois to the Illinois and from the Ottawas to the Natchez. Their most heroic deeds of self-sacrifice are

CANADA — UNDER FRENCH RULE

bound up with their mission to the Hurons (ending in 1649, when the power of the Hurons was destroyed by the Iroquois), and with their mission to the Iroquois covering the third quarter of the 17th century. It was always the aim of the Jesuits to turn the Indians from the nomadic life to the arts of civilization. In this attempt they were but partially successful. Although certain tribes of the Algonquin family yielded themselves willingly to the guidance of the missionaries, the total number of converts was far smaller in New France than in Paraguay. During the first generation after the restoration of Canada to France the Jesuits published in Paris an annual account of the labors undertaken by members of their order among the American Indians. These "Relations" (see *JESUIT RELATIONS AND ALLIED DOCUMENTS, THE*), are the best single source of information about the habits of the aborigines and also rank high in the list of our authorities for the history of Canada. Next to the Jesuits in order of prominence stand the Sulpicians, whose efforts centred chiefly in Montreal and the neighboring district. The founding of Ville-Marie de Montreal exemplifies in its purest form the mood of devotion that prompted Frenchmen to leave the civilization of Europe for a life of privation among the barbarous heathen of Canada. Here the colonizing impulse proceeded solely from a desire to spread the faith. With Olier and Dauversière, who founded the Society of Notre-Dame de Montreal, there was no thought of gaining wealth through the fur trade. The charter of the society expressly states that its members detach themselves from all regard to temporal interest and take for their one purpose the conversion of the natives. From 1642 to the close of the century Montreal was an outpost of civilization and Christianity, exposed to frightful dangers, as the exploit of Dollard (1660) and the Lachine Massacre (1689) testify, but defended by men who cared more for religion than for life. In the relations of the Church with the *habitants* friction seldom arose. There is reason to believe that the Jesuits incurred some unpopularity because they did not favor the appointment of *curés* in the outlying districts, but for the most part the attitude of the peasants towards the clergy was one of complete deference. Until 1665 when the Carignan Regiment came to Canada, the social order presented many features of a theocracy. Religion was supported by the state and derived a stronger support still from the energy of the religious. The prevalent mood was pietistic and public opinion sanctioned the ecclesiastical punishments which were called forth even by minor offenses against morals. Apart from church festivals the routine of daily life at Quebec or Montreal made little provision for relaxation or entertainment. Taverns were under the ban, dancing parties were unknown, and the general demeanor of sobriety would have met favor in the eyes of a New England Puritan. The coming of the Carignan Regiment broke in on this religious Arcadia and proved an entering wedge for frivolity, but in the early days the temper of New France was deeply religious, if not ascetic. One other aspect of ecclesiastical affairs deserves emphatic notice. While the clergy had to do with a docile population and were animated by pure enthusiasm in their work among the Indians, the religious life of the

colony was not free from friction. The Récollets, and after them the Sulpicians, felt that their interests were threatened by the enmity of the Jesuits. The Jesuits in turn prevented the Abbé de Queylus, an able Sulpician, from being made Bishop of Quebec, casting their influence in favor of Laval (see LAVAL-MONTMORENCY, FRANCIS XAVIER DE), who became the first titular bishop in New France. Laval, once appointed, quarreled with successive governors on different grounds—with Argenson (1661) on the question of precedence, and with Avaugour (1662) on the question of selling brandy to the Indians. The difficulty over precedence brought in the whole issue of Church and state; the quarrel over the brandy question was less lofty but more practical. The position of the Church was that brandy should not be sold to the savages under any circumstances. The general, though not the invariable, position of the government was that if the French did not sell brandy to the Indians the latter would buy rum from the Dutch and English. The Church as a whole and the *habitants* as a whole lived on excellent terms; but there was much friction between the religious orders, the *coureurs de bois* were a thorn in the side of the clergy, and a governor of secular tastes, like Frontenac, might keep up a running feud with the hierarchy for years.

The mention of Frontenac's name recalls a striking personality, for of all the governors who were sent out to New France during the long reign of Louis XIV. he must be called the ablest and most forcible. That his policy towards the Church was judicious or free from prejudice cannot be maintained, nor can it be forgotten that his memory is defaced by the stain of fearful massacres. But he was bold, resolute and thoroughly devoted to the interests of Canada. Throughout both periods of his rule (1672-1682; 1689-1698) he was master of the situation as none of his predecessors had been, and during the seven years of his absence from the colony the failures of La Barre and Denonville served to set off his virtues in the strongest light. The main political problems with which he had to deal were the enmity of the Iroquois, the aggressive policy of the English as suggested by Governor Dongan, and the extension of French influence from the Great Lakes into the valley of the Mississippi. Speaking broadly the Iroquois were the chief menace of Canada in the last part of the 17th century as the English were its chief menace in the first part of the 18th. The most celebrated of the Jesuit martyrs, Jogues and Brébeuf, met death at their hands; the most brilliant deed of courage which the annals of New France contain was Dollard's fight against them at the Long Saut; it was in their face that Madeleine de Verchères shut the door of her father's fort. Whether left to themselves or set on by the English they had every disposition to molest the French. The spirit of conciliation they mistook for weakness and, as Frontenac saw, the only way to impress them was by a show of strength. In 1696 he ravaged their country more thoroughly than De Tracy had done thirty years earlier, burned their palisades, destroyed their corn and convinced them that he had a power which they must respect. The next year their envoys came to Quebec speaking the language of humility. Frontenac's attack upon the

English dates from the beginning of his second term of office. Returning to the colony in 1689 he found that French prestige had vanished almost wholly during his absence. To impress the Indians and terrorize the English he equipped those raiding parties which carried the torch and the tomahawk to Schenectady, Salmon Falls and Casco Bay. As a *tour de force* of endurance, this winter campaign of the French was a remarkable feat, but the atrocities which accompanied it cannot fail to awaken the deepest abhorrence. Parkman finds extenuation for Frontenac in the standards of his age. "He was no whit more ruthless than his times and his surroundings, and some of his contemporaries find fault with him for not allowing more Indian captives to be tortured. Many surpassed him in cruelty, none equalled him in capacity and vigor." Everything considered, this must be called a mitigated sentence, and apart from all considerations of humanity it may be doubted whether Frontenac's policy of carnage was a sound one. Its momentary success in impressing the Indians was not an equivalent for the spirit of vengeance which it awakened among the English. From 1690 forward, New France and New England have their rancorous enmities which continue to exist quite irrespective of peace or war between the mother countries. Phips may be turned back from Quebec but the memory of massacre endures until French power in Canada has been destroyed. A much brighter feature of Frontenac's régime is the progress made by French exploration in the Far West. While the famous journey of Marquette (q.v.) and Joliet (q.v.) down the upper waters of the Mississippi (1673) may be more fitly connected with the names of Courcelle (q.v.), Frontenac's predecessor, and of Talon (q.v.), the good Intendant, the picturesque exploits of La Salle (q.v.) and Tonty (q.v.) fall within the period of Frontenac. It was by favor of Frontenac that the fort at Cataracoui, (now Kingston) was placed in La Salle's hands, thus enabling him to establish a fixed base at the east end of Lake Ontario for his operations on the Great Lakes and beyond. As far as the Huron country the French had been on familiar ground ever since the days of Champlain, but their chief triumphs in opening up the *Hinterland* were won under Frontenac.

The 18th century opened for New France with bright prospects which were destined never to be realized. The war that closed at the Peace of Ryswick (1697) had just demonstrated the defensive strength of Canada, and though D'Iberville's (see IBERVILLE, SIEUR D') conquests in Hudson's Bay were restored to England, France did not lose Acadia. Frontenac's chastisement of the Iroquois had brought relief from an ancient scourge and Callières' diplomacy concluded the peace which had been made possible by a decided blow. The War of the Spanish Succession closed less favorably. The success of Vaudreuil's raids was a poor equivalent for Marlborough's victories or even for Nicholson's capture of Port Royal. France lost Acadia and was thrown back for her hope of an Atlantic dominion upon the single fortress of Louisburg (q.v.). The Peace of Utrecht (1713) may be called the beginning of the end.

The history of Louisburg is a tale of great effort, enormous expense and complete disappointment. France lavished upon this harbor

in Cape Breton as much money as it would have cost to erect a fortress of the first class in Europe. Until 1745 its strength remained untested, but the French themselves thought it impregnable and the English looked upon it with dread. The political effect of Louisburg was two-fold. Its near neighborhood to Acadia prevented the French of that province from becoming loyal to British rule, and in New England it was regarded as a permanent menace to peace. When the War of the Austrian Succession offered an excuse, Massachusetts was ready for the attack. Governor Shirley (see SHIRLEY, WILLIAM) devised the plan, which was daringly executed by a colonial fleet under William Pepperell (q.v.) in co-operation with four British men of war. The capture of Louisburg by a militia force was the greatest humiliation which France had suffered in America and its restoration by the Peace of Aix-la-Chapelle (1748) (see AIX-LA-CHAPELLE, TREATIES OF PEACE CONCLUDED AT), came to New England as the sorest affront which it had ever received at the hands of the home government.

At the Peace of Utrecht New France contained a population of rather more than 25,000. In 1763 when Canada was ceded to England the number of inhabitants had advanced to about 60,000. It is obvious that this rate of increase was trivial in comparison with the progress of the English colonies during the same period, and when we remember the unusual fecundity of the French Canadians, some special reason needs to be assigned for the slow development of the colony. The cause of this striking phenomenon will be found in the fact that immigration was not spontaneous, as in the case of the English colonies, but controlled by government. Partly owing to the institutions which prevailed in France during the 17th and 18th centuries, and partly owing to gross mismanagement of colonial affairs by the court of Versailles, New France was handicapped in the long race with its southern rivals. This fact must be brought out because it is often erroneously stated that the Frenchman has never made a good colonist. The biography of Canada from Champlain to Montcalm gives the direct negative to such an idea. Maladministration, the lack of local self-government, and excess of loyalty to inherited institutions account for the defeat of the French in America rather than the want of promptness, courage, industry and resource. It must be remembered, moreover, that the English colonies took root in a soil which was better fitted to stimulate rapid growth. The long calm which followed the Peace of Utrecht (1713-1742) was often broken by signs of acute restlessness. As early as 1725 the Marquis de Beauharnois, who had become Governor in succession to Vaudreuil, was busy with schemes for keeping the English within the limits they already occupied. This meant that their expansion northwards should be checked in the vicinity of Lake George and their expansion westward by the range of the Alleghanies. Far from losing their love of exploration, the French pushed farther and farther westward with each decade. Michilimackinac was to Verendrye what Cataracoui had been to La Salle, and just at the moment when Maria Theresa was preparing to recover Silesia from Frederick the Great, one of Verendrye's sons caught a first glimpse of the Rocky Mountains. In America the hostili-

ties which accompanied the War of the Austrian Succession centred at Louisburg and accordingly this conflict affected Canada less than the two preceding wars had done. But every man of colonial origin, English and French alike, saw that the Peace of Aix-la-Chapelle was merely an armistice. Unsettled boundaries suggested endless friction, especially in Acadia and the Ohio Valley. The line which was run by Céloron de Bienville at the instance of France aimed at excluding the English from the Ohio and according to patriotic opinion in such colonies as New York, Pennsylvania and Virginia, amounted to a *casus belli*. Before the development of the western trade the English and French had been separated by a wide zone of wilderness. The expansion of both races brought them face to face at the junction of the Alleghany and the Monongahela. Should the stronghold built in this angle be called Fort Duquesne or Pittsburg? Here was an issue on which lingered the future of a continent. It was the misfortune of the French both at home and in Canada that their administrative system suffered from the worst evils of a corrupt absolutism. At Versailles the folly and extravagance of Louis XV., at Quebec the unblushing thefts of the Intendant Bigot, were but a poor preparation for war. And so the small but valiant race of the Canadian French bore the burden of vices not their own when they entered upon the last act of an irrepressible conflict. 4. **Canada—Great Britain's Fight with France for North America—1753-1763.** For several years previous to the formal declaration of war between England and France, in 1756 (see CANADA—UNDER FRENCH RULE), the stirring events in the Ohio Valley and in distant Acadia foreshadowed a great crisis, during which territorial disputes, aggressions, and political intrigues would be lost sight of for the moment, and the question paramount would be, the supremacy of France or of England in North America. The policy of France, as dictated from Versailles, had not been broad enough to successfully promote colonization, in the sense of expansion, or even to maintain permanent occupancy, although this was much desired. And the honest designs of her colonial administrator, La Galissonnière, to increase the dominion of his royal master, at an opportune moment, met with no responsive aid. The mother country was wedded to schemes of aggrandizement at home, and was inclined to leave her colony to work out its own future. Besides, the French then, as now, were rather a stay-at-home people. New France was consequently weak in population, and not in a position to retain her empire in the North, and, moreover, her influence was being undermined by official corruption. Great Britain, on the other hand, had the real advantage of superior numbers in the New World, although she had no definite colonial policy, and was already smarting from the effects of an earlier administration, due rather to ignorance than to knavery. The disputes touching possessions in Acadia were of long standing. By the twelfth article of the Treaty of Utrecht (see UTRICHT,

PEACE OF), Nova Scotia, within its ancient boundaries, had been ceded to the Crown of England. A controversy soon arose over the interpretation of a certain clause. Great Britain claimed that her possessions under the Treaty of Utrecht were of the same extent as those acquired by France under the Treaty of Breda; but France protested that the territory she then received was quite distinct from the ancient boundaries, which confined Nova Scotia to a portion of the southern peninsula. At the conclusion of the Treaty of Aix-la-Chapelle (see AIX-LA-CHAPELLE, TREATIES OF PEACE CONCLUDED AT), when Louisburg (q.v.) was restored to the French, the boundary questions were referred to commissioners, each Court agreeing that, until a decision was reached, no fort or settlement should be attempted upon the debatable ground. But the shrewd La Galissonnière, disregarding the stipulation, if he was ever officially acquainted with it, commenced the construction of forts, and favored settlement upon the lands claimed by England. The importance of Nova Scotia in the future development of Canada was apparent to each nation, both from a strategic and commercial point of view, but neither power could furnish from its colonial resources an army of sufficient strength to support its ambition. The policy of Great Britain toward Nova Scotia was most short-sighted. Instead of encouraging the emigration of a desirable class, intended to grow up with the Acadians and form a united and loyal people, she allowed the French, for nearly 40 years, to regard the country in the light of an exclusive settlement. It is true that they were good subjects; but they were French at heart, and it remained to be proved whether, under extraordinary pressure, their sympathies would incline to France or not. The possibility of such a contingency was for years practically ignored, but when it was seriously considered the methods adopted were ill-advised. The lands of the French were divided and sub-divided, until new grants were necessary; but Great Britain decreed that new lands could be acquired only by Protestants. The question of religion, therefore, became a condition of tenure. Shirley (see SHIRLEY, WILLIAM), the energetic governor of Massachusetts, who was largely responsible for the government of Nova Scotia, was firmly convinced that until French influence was exterminated British interests could not flourish; and so he endeavored to effect the conversion of the inhabitants, suggesting that rewards be given to those who renounced their faith. The king favored an assurance that the people should enjoy the exercise of their religion, but Shirley, in a proclamation, omitted the passage as dangerous. The home government then consented to a scheme for promoting the loyalty of the province by the importation of foreign Protestants, to mingle with the Acadians—a fusion possible under the British flag, but doubtful at such a critical moment, when the military organization was insufficient to protect the frontier, or to inspire confidence in the stability of British institutions. Government agents in Geneva, and elsewhere, were active in advertising in the papers for settlers, and bargaining with poor artisans. But the scheme fell through; though at last 3,000 good settlers were landed at Chiboucto Bay in 1749, from which at length sprang

CANADA — GREAT BRITAIN'S FIGHT WITH FRANCE

the important naval post of Halifax (q.v.). In the meantime, however, a great struggle was impending, which led to the deportation of 8,000 Acadians (see CANADA — THE ACADIAN REFUGEES), whose subsequent misery and suffering contribute the darkest page to the history of Nova Scotia. A new oath of allegiance was demanded by Governor Cornwallis, which from time to time was deferred. While, on the other hand, the fiery zealot, Le Loutre (see LE LOU-TRE, LOUIS JOSEPH), backed by the Indians, exercised every effort to retain influence over the people. Le Loutre detested the English, and was generally successful in persuading the unhappy people that an oath of allegiance to a Protestant monarch was very much like being disloyal to their faith, the penalties for which did not cease with their natural existence. But, although the dark deeds which were being enacted in 1753, concerning Nova Scotia, had a distinct bearing upon the approaching conflict, they were of secondary importance to the great mass of the British colonists, when compared with the prize which both French and English coveted—the possession of the Ohio Valley. The details of the contest in this section cannot be given here. See BRADDOCK, EDWARD; COLONIAL WARS IN AMERICA; FORT NECESSITY; PITTSBURGH, *History*; WASHINGTON, GEORGE. The effect of Braddock's defeat was felt in the expeditions of Shirley against Oswego (q.v.), and in that of Johnson against Crown Point (see CROWN POINT, FORTRESS OF). A body of provincials had been raised, and placed under the command of Johnson for the reduction of Crown Point. But Dieskau intercepted, and almost captured, a detachment of this expedition. Reinforcements arrived at a critical moment, and the tables were turned by the capture of Dieskau. This circumstance was made a great deal of, but, nevertheless, Crown Point was unmolested, and still in the hands of the French. War and bloodshed had desolated the homes of the colonists and destroyed their commerce, and over all of them hung the dread of the tomahawk and the scalping knife of the Indian. Panic-stricken, they could devise no means of defense, and surrender seemed preferable to fight. In Acadia, while the two nations were still at peace, the determination of the British had driven into exile the unhappy Acadians. But their own position there was by no means to be envied. British prestige was indeed at a low ebb in America, when the struggle between the colonists was superseded by a contest between the two powers, which commenced officially when King George II. signed the declaration of war against France in May 1756.

The situation in New France was indeed acute. Agriculture had been neglected, grain was scarce, horses were slaughtered for food, famine was imminent. But it should be borne in mind that this deplorable state of affairs was not the inevitable outcome of the struggles through which the country had passed, but a condition actually created for profit, toiled for and plotted for by Bigot, in order that he might appear as the real savior of the distressed colony. The advice of the Intendant to his somewhat weak-kneed, and certainly dishonest, henchman, Vergor, to "cut and slip, and make hay while the sun shone, in order that he might have the means to build a château

in France," was but an indication of the course he intended to follow himself, though on a grander and more colossal scale. New France was to be pillaged. The people must be subdued, and bodily suffering would prove effective where less persuasive methods might fail. New life was given to the colony for a moment when the Marquis de Montcalm (q.v.) arrived in Canada in the spring of 1756, with 1,200 troops and ample supplies. No better general could have been chosen than Montcalm. In fact, men of his mold were just what New France needed most at this time. He was an excellent soldier and had already won renown. He was loyal to his sovereign, at a time when loyalty was not profitable; he was brave and courteous, and he dearly loved France. Vaudreuil (see VAUDREUIL-CAVAGNAL, MARQUIS DE), the governor, was a Canadian, and attached to the land of his birth, but he despised every form of interference from France. Hence there was constant friction. Bigot, the representative of the king, loved his master and the colony only in proportion to the measure in which they contributed to his needs; and his needs were of abnormal proportions. The conduct of Montcalm throughout the war, until the supreme hour when he yielded up his life in defense of the colony, forms a striking and pleasing contrast to the actions of his two colleagues. He was also fortunate in the chief officers under him.

England was far less happy than France in the choice of the commander-in-chief of her forces. Lord Loudon, who was placed at the head of the 900 regulars sent out to the colonies, was no match for the brilliant Montcalm. Arriving in Albany two months after he was expected by his chief officers, Abercromby and Webb, Loudon was confronted with a condition of affairs similar to that with which Montcalm had to contend—jealousy between colonials and regulars. The War Office had decreed that a colonial officer could not rank above a senior captain of regulars, and consequently well-seasoned officers, experienced in the methods of the enemy, were liable to orders from a man who had never been under fire, and had no knowledge whatever of colonial affairs. The British general seemed unable to decide upon any plan of action, and much valuable time was wasted. In the meanwhile, disaster had overtaken the British at Oswego. By clever tactics Montcalm had surprised the fort, and had 30 guns directed against it before the commander was aware of the danger which threatened him. There was little effective resistance, and capitulation necessarily followed; 1,600 men were made prisoners, and in a few days the fort was razed. The year was passing away without any important move on the part of the British. Loudon desired a change of scene, and induced the home government to agree to an expedition against Louisburg. Large reinforcements were sent out, and in the month of June 1757 he had nearly 12,000 men arrayed against that stronghold. Still unable to decide upon a plan of attack, he wasted a month in exercising the troops, or, as Lord Charles Howe said, "In keeping the courage of His Majesty's soldiers at bay, and in expending the nation's wealth in making sham fights and planting cabbages, when they ought to have been fighting the enemies of the king in reality." On 4 August a movement

CANADA — GREAT BRITAIN'S FIGHT WITH FRANCE

was set on foot, but intelligence was conveyed to the commander that the French expected reinforcements and were eager for the fray. Thereupon, the noble lord abandoned the enterprise and returned to New York, having covered himself with ridicule, and greatly amused the French.

In the spring of 1757, the region of Lake Champlain was the scene of unusual activity. The Indians from the distant shores of Lake Superior, and from the forests beyond Lake Erie, were rallying around the French standard; and by midsummer a restless band, eager for the fray and only restrained with difficulty, gathered at Fort Carillon as part of the expedition against the British strongholds of Fort Edward and Fort William Henry. Montcalm's army consisted of about 6,000 of the best troops, with the addition of the Indians. The British force was divided between the two forts. Webb was at Fort Edward in command of 3,500 men, and Munro had 2,000 men in Fort William Henry, and 500 entrenched upon a rising ground in the rear of the fort. Montcalm's first move, on approaching, was to occupy the route communicating with the forts, which, at the same time, cut off the British troops upon the rising ground. This was accomplished by de Lévis with 3,000 men. Montcalm strengthened his position and soon had 40 guns bearing upon the fort. From the first it was clear that the British position was untenable. Munro was twice offered terms of capitulation, but he stubbornly refused. At length he was forced to surrender, and the garrison marched out of the fort. Then followed a frightful scene which has unjustly tarnished the memory of Montcalm. The Indians, disappointed of the plunder to which they looked forward at the sack of the fort, fell upon the prisoners with fury, and horribly massacred nearly 100 before any means could be taken to prevent them. Montcalm and Lévis did their best to arrest the fury of the savage hordes, and saved many lives; but the mischief was done, and dire vengeance was threatened. Notwithstanding the dismal failure of Loudon, Pitt was still determined to reduce Louisburg, which was to be made the chief objective in the campaign of 1758. Loudon had been recalled, and the command was entrusted to Amherst, who had already done good service in Germany. The chief officers under him were Lawrence and Wolfe. The force consisted of about 12,000 men. On the second of June part of the fleet anchored in Gabarus Bay, a few miles from Louisburg, Boscawen being the admiral in command. The expedition was a joint one, both naval and military. Wolfe was the most conspicuous figure of all present. His brigade made the real attack from the boats, while Whitmore's and Lawrence's supported him by feints in other places. The landward siege was well pressed home, and Louisburg, the gateway of New France, soon fell, and being shortly after razed to the ground, literally became a thing of the past.

Success had attended British arms in other quarters. Bradstreet at the head of 3,000 men had captured Fort Frontenac, which the unwisdom of Vaudreuil had left inadequately supported, although it was a most important post commanding Lake Ontario and serving as a base for the Ohio forts. De Noyan, the gover-

nor, had demanded reinforcements, but, in the place of troops, Vaudreuil had dispatched a one-armed man to his assistance, and, as resistance was futile, capitulation followed. Fort Duquesne had also become a British post, and now bore the name of Fort Pitt. Forbes, in the face of great difficulties, had endured the perils and suffering of a winter's march; and, when at last his bravery and determination had triumphed over every obstacle, and the fort was in sight, he found that it had been evacuated. While Loudon was "planting cabbages," a harmless occupation, Abercomby was making a worse mess of affairs at Ticonderoga (q.v.). The French had been expecting an attack at this vital point, which commanded the route by way of Lake Champlain, and threatened Montreal. A large body of men had been ordered there in the spring by Montcalm; but the withdrawal of so many troops under Loudon, had convinced Vaudreuil that it would be an opportune moment to create a diversion on the Mohawk. Montcalm was opposed to this enterprise; consequently Vaudreuil insisted, and 1,600 men were detached for the purpose. By the middle of June Montcalm had only 3,000 men at Ticonderoga, the battalions of La Sarre, Languedoc, Béarn, Berri, Guienne, and Royal Roussillon, with two good engineers. The place was by no means strongly fortified, but works were hastily thrown up in advantageous positions. In the meantime the formidable army under Abercomby, consisting of regulars and provincials, in all 15,000 men, was encamped about half a mile from the fort. But the real head of the army, Lord Howe, the best soldier in America, as Wolfe had said, had been killed in a preliminary skirmish, and the commander was powerless to act. Something had to be done, however, and Abercomby moved his whole force against Carillon. Montcalm's army had been increased by 500 men under de Lévis; and after a seven hours' blundering assault, Abercomby was completely outgeneralled, and lost no less than 2,000 men. This victory covered Montcalm with glory, and he is frequently referred to as "the hero of Carillon." But although he had won glory for French arms, the victory was a blow to the jealous Vaudreuil, and signaled the farther accentuation of discord which produced serious results in future operations.

In 1759 Pitt was at last in a position to put his greater scheme into practice. The tide of war was almost on the turn, and he seized opportunity beforehand. The Seven Years' war (q.v.) was being waged in many parts of the world; in fact, in a purely military sense, there were several different wars going on at the same time. But there was one great connective force which made them one, and that was the British navy. France and England were now in the very middle of their great imperial war, which began after the fall of the Stuarts in 1688, and was continued as one single age-long and world-wide struggle for the over-sea dominion of the world, down to Trafalgar and Waterloo. The Seven Years' war was the most distinctively imperial phase of the whole of this vast conflict; the heart of it lay in the fight for American dominion; and the central episode of this fight itself is to be found in the expedition against Quebec, which culminated in the renowned battle of the Plains of Abraham. The

four real conquerors of New France are Pitt, Anson, Saunders, and Wolfe. The names of Pitt and Wolfe have always been on every tongue; but the equally important ones of Anson and of Saunders have been unduly forgotten. Pitt, of course, was the originator; and in himself, the most important of the four. But as the whole fortunes of the war were really determined by the British command of the sea, it is absolutely necessary to understand the naval side of the campaign, not only for its own sake, but also to fully appreciate the work of the army. In the ever-memorable year of 1759, it was entirely due to the navy that England remained safe at home, and it was more than half due to the navy that she emerged as a conqueror abroad. France had prepared a gigantic scheme of invasion. One fleet was to sail for Ireland, where the troops were to be met on landing by a general rising in their favor. The Jacobites were to be stirred into insurrection by another French fleet destined for Scotland; whilst their third fleet, larger than both the others united, was to convoy innumerable troop-boats across the Channel, as they made a dash for the south of England. To guard against this national danger the navy then developed the first regular system of blockade ever known. Boscawen blockaded Toulon, Hawke blockaded Brest, Rodney cruised off Havre, and Admiral Smith kept the reserve fleet always ready in the Downs. Meanwhile, however, Pitt was preparing a counterstroke; not at France herself—where she would be stronger than England in a campaign fought out on her own home base—but at her over-sea possessions in Canada, from which she was separated by those 3,000 miles of hostile waters, which the British command of the sea had practically made a British possession. Thus Montcalm had to await attack in utter isolation, on the far side of an immense stretch of territorial waters, across which Wolfe advanced in perfect safety to meet him. And it must be remembered that Saunders' squadron was not only a strong one, for it comprised a full quarter of the whole navy, but that it was playing an integral part in a universal scheme of strategy—for all seas are strategically one—whilst Wolfe's little army was only a landing-party on a large scale. There were twice as many seamen as landmen engaged in the taking of Quebec. Saunders had over 18,000 sailors, more than two thirds of whom belonged to the navy, while Wolfe had less than 9,000 soldiers. The total British force, therefore, amounted to 27,000 men. Saunders and Wolfe received their secret instructions from the King in February, and immediately after sailed for Nova Scotia. The final rendezvous was Louisburg, where over 8,000 men were assembled in May. On 1 June the fleet began its dangerous voyage, with no less than 200 vessels of all sorts and sizes. It was navigated in perfect safety to the Island of Orleans, where it arrived on 27 June, and was not injured by a tremendous gale a day or two later, nor by the costly display of fireworks, in the shape of fire ships, destined to work its destruction. The picket boats met the attack well up stream, and, "taking hell in tow," as a bluejacket forcibly expressed it, put all the enemy's vessels ashore, where they burnt themselves out. Wolfe established three camps.

The principal one was at Montmorency, just beyond the falls. The second was on the Island of Orleans, completely out of range, and thus very convenient for a hospital and stores. The third was at Point Levis, which Vaudreuil foolishly refused to occupy, in spite of Montcalm's sensible advice, and which was consequently left open for Wolfe to build his batteries on. These batteries literally pounded the town to pieces; as a manuscript note on a plan of the siege in the French War Office, truly remarks, "*ce ne fut pas un siège, mais un bombardement.*" Among other projectiles of all kinds, 36,000 solid cannon balls were fired from this coign of vantage. Montcalm's position was still immensely strong, in spite of the loss of the Levis Heights. The Upper Town of Quebec is built upon the extremity of a long promontory which is bounded on the south by steep cliffs, 200 or 300 feet sheer up above the Saint Lawrence, and on the north by lower, but still easily defensible, cliffs overlooking the valley of the Saint Charles. The town was held by 2,000 men under de Ramesay. It had a double tier of batteries, one on the top of the cliffs, the other along the water front below them. The only open ground in the vicinity was round the mouth of the Saint Charles. But this was well entrenched, and the trenches were carried on continuously for seven miles along the Beauport shore to the Montmorency, opposite Wolfe's camp.

Wolfe's first attempt to break through was made some distance up the Montmorency, where he tried to force his way across the fords and so attack the entrenchments in the rear. But he was repulsed with loss, in a bush-fight in which his regulars were at a great disadvantage. His second attempt was a more serious one. On 31 July he tried to carry the Montmorency Heights by storm, a mile on the Quebec side of the Falls. But as his troops had to be collected from several quarters, in full view of the French, Montcalm easily anticipated him at the right spot, before he could deliver the assault. Besides, the faulty British plan could not be carried out even according to Wolfe's intentions, because the grenadiers, 1,000 strong, suddenly broke into a wild charge before being properly formed up, and lost nearly half their numbers in a fruitless effort to scale the heights. Then a terrific thunderstorm burst on the scene of carnage, making the heights more slippery than ever, and so he had no choice but to call off his men at once. After this repulse Wolfe fell seriously ill, and towards the end of August he gave his brigadiers, Monckton, Townshend and Murray, a memorandum of three other plans for assaulting the trenches, and asked them "to consult together for the public utility." Their council of war resulted in a complete rejection of all his suggestions; because, as they well remarked, the storming of such works from open ground would certainly be both difficult and dangerous. Moreover, even if the works themselves were carried, there would still remain the fortified line of the Saint Charles, as well as the heights of the promontory beyond, to keep him out of Quebec, until the lateness of the season would compel him to raise the siege. Their own plan was to take all the available men up the Saint Lawrence, and land at any suitable point between Cap Rouge, which was nine miles, and

Pointe aux Trembles, which was 22 miles, above Quebec. Wolfe informed Pitt, in a dispatch written on 2 September, that he had acquiesced in this plan, and intended to put it into operation at once.

The Montmorency camp was cleverly evacuated, without the loss of a man, by a general naval and military demonstration against the entrenchments, which made the French feel sure that another attempt to storm the position there was about to take place. From 7 to 10 September the rain suspended all operations; and on 10 September Wolfe made his final reconnaissance. He was already well posted on the lie of the land in every direction, and the idea of attacking above Quebec was thoroughly familiar to his mind long before it was mentioned by his brigadiers. On 19 May he had said to his uncle, that he "reckoned on a smart action at the passage of the Saint Charles unless we can steal a detachment up the river and land it three, four, five miles, or more above Quebec." This plan was better than the brigadiers', as it contemplated seizing the ground much closer to Quebec than the nearest objective point they proposed trying. At the final reconnaissance he chose the Foulon, where a path led up to the Plains of Abraham, within two miles of the walls. If he could get up there without any serious check, he saw that he could forestall Montcalm by forming a line less than three quarters of a mile from the city, where the promontory was narrow enough to be commanded by his small army, and where the mixed regulars and irregulars of New France would be forced to meet his homogeneous British red-coats on a flat and open ground. The French were on the alert everywhere along the north shore, from the Falls up to Pointe aux Trembles, a distance of 29 miles — except just at the Foulon itself. They could not tell what Wolfe was about, nor where the bulk of his men were, behind the impenetrable screen of the ubiquitous British fleet. They were naturally very apprehensive of another desperate attack on their trenches; they were well prepared against an assault upon the town, which was so strongly fortified by nature; while the constant movement of the fleet, and occasional landings from it, in the vicinity of Pointe aux Trembles, 22 miles up, made them think that any new plan would probably take the form of an advance in force by land from somewhere thereabouts. One man, indeed, besides Wolfe, was thinking of the Foulon, and that man was Montcalm. On 5 September he had sent the regiment of Guienne to the Heights of Abraham, but Vaudreuil withdrew it on 7 September, and left no defense there, except the puny Samos battery near Sillery Point, and 100 militiamen at the top of the Foulon, under the treacherous Vergor. Even on 12 September, the very eve of the battle, Montcalm had again ordered the same regiment back, this time to the Foulon itself. However, Vaudreuil had again countermanded the order, saying, "We'll see about it to-morrow." But Wolfe himself was up there on that morning! [For some account of the battle of the Plains of Abraham, see COLONIAL WARS IN AMERICA; MONTCALM; QUEBEC; WOLFE.]

The winter at Quebec, after its capture, was a terribly trying one for the little British garrison; and so many men died of scurvy that, in

the following April, when de Lévis marched out of Montreal with 7,260 men, expecting several thousand more to join him on the way, Murray could only muster 3,886 effectives. There was a second battle of the Plains, in which Lévis defeated Murray, who in less than two hours lost over one third of his men. A second investment followed, and Lévis was in the act of advancing to storm the walls, when the vanguard of the British fleet suddenly entered the harbor. The French had now no choice of action. They hurriedly abandoned their camp, and retreated, in all haste, on Montreal, both by land and water. Then, step by step, the final British advance converged on the doomed colony. Murray came up steadily from Quebec, in close touch with Lord Colville's squadron, which the French had absolutely no means of resisting. Haviland advanced from the south by way of Lake Champlain; while Amherst, with the main army, came down the Saint Lawrence from the Lakes. When the united British army, 17,000 strong, actually landed on the Island of Montreal, the few remaining Canadians deserted Lévis in a body, and he found himself left with only some 2,000 of the faithful French regulars. The capitulation of New France occurred two days later, on 8 Sept. 1760. The French troops were deported. The Canadians had already dispersed. The American militia went back to their homes. The fleet sailed away to their stations. The British regulars took up their winter quarters. And the New Régime began. The Seven Years' War was one of the most pregnant events in history; and its results have continued to exert a vast determining influence on the fortunes of every world power, down to the present day. In Europe it foretold the ultimate decline of France and Austria, and the ultimate rise of Prussia to the leadership of Germany. But its significance for the English-speaking people lies mainly in the fact that it was the most truly imperial war they ever waged; and its most dramatic episode — the battle of the Plains of Abraham — will serve to mark forever three vital stages in three great epochs of modern times — the passing of Greater France, the coming of age of Greater Britain, and the birth of the United States.

ARTHUR G. DOUGHTY,

Dominion Archivist, Author of 'The Battle of the Plains,' etc.

5. Canada — Under British Rule to Confederation (1760-1864). At the moment when Vaudreuil (see VAUDREUIL-CAVAGNAL, PIERRE) capitulated to Amherst (September 1760) (see MONTREAL — History) there were no English in Canada save the troops and a few civilians who had come with them. But, outwardly at least, this act of surrender placed the French Canadians and the English colonists in America on the same basis as subjects of the British crown. One sovereignty was thus established over a vast area where dwelt two races whose origin, sentiments, faith and institutions marked them off from each other in the sharpest contrast. A century later the face of the situation was profoundly changed. The American Revolution had created a second sovereignty in this region at a time when the population of Canada was almost wholly French, and yet by 1860 the Canadian English had come to outnumber the Canadian French. The maintenance of the bond with

Great Britain, the rise of the United States and the influx of English settlers are the broad conditions which have affected the progress of Canada since the cession.

Three years elapsed between Vaudreuil's surrender and the Treaty of Paris, which confirmed Great Britain in the possession of her American conquests. During this interval the country remained under military rule, and though Gen. Murray's relations with the subject population were marked by sympathy and tact, it was impossible that a sense of permanence should be inspired by such a document as the Act of Capitulation. The text of the treaty, in its turn, left many essential points unsettled, especially in the domain of law, and not until 1774, when the Quebec Act was passed, did French Canada receive from the British crown and Parliament a charter upon which it could rely. The first 14 years of British rule were, however, a time of great importance in that the experience gained during this period suggested legislation which continues in force at the present day. The mass of the French population, *seigneurs* and *habitants* alike, accepted the change of masters in a spirit of resignation. Their courageous support of Montcalm and Lévis is proved by a large variety of evidence. They seem to have shown as much daring as the French regulars, together with a superior knowledge of the country and a better grasp of the tactics which were suited to American warfare. That the deportation of the Acadians had stimulated their resistance to the British is more than probable, but in any case loyalty and patriotism would have led them to make a brave defence. Once beaten, they accepted the situation frankly and were not encouraged to rebel by that restlessness of the Indian tribes which took form in the conspiracy of Pontiac (1763-4) (see PONTIAC). The contrast between their docility and the growing disaffection of New England and Virginia did not fail to leave an impression on the official mind both in Quebec and London. The result was that when difficulties arose between them and their English fellow-subjects the government was not disposed to espouse the cause of the latter. Apart from the retention of their property, the guarantee of their religious institutions was the question which came nearest to the hearts of the French Canadians. By Article 27 of Vaudreuil's Capitulation it was agreed that "the free exercise of the Catholic, Apostolic and Roman religion shall subsist entire, in such manner that all classes and peoples of the towns and rural districts, places, and distant posts may continue to assemble in churches, and to frequent the sacraments as heretofore, without being molested in any manner, directly or indirectly." This clause of the capitulation was confirmed at the Treaty of Paris (see PARIS, TREATIES OF) with the condition "as far as the laws of Great Britain permit," but any restriction which might seem to be placed upon religious toleration by the foregoing phrase was nominal rather than real. The communities of nuns were not disturbed even at first, and after a few years of deprivation large estates were restored to the Sulpicians. The Jesuits also would probably have received a confirmation of title but for the special circumstances attending their suppression in France shortly before the Treaty of Paris and their general suppression in 1773. As

it was, the scrupulous care with which governors like Murray and Carleton (see CARLETON, SIR GUY) carried out the policy of toleration reassured the hierarchy and made it a firm supporter of British rule.

Had there been no other factors in the political life of the country than the government and the French Canadians, the first years of the new order would have been peaceful enough. It is true that the commission of Governor Murray (1763) was marked by ill-advised expressions. For example, the members of such an assembly as might hereafter be convened by the governor and council "shall, before their sitting, take the oaths mentioned in the act entitled 'An Act for the further security of his Majesty's person and government, and the succession of the Crown in the heirs of the late Princess Sophia, being Protestants,'" etc. In other words, every French Canadian who aspired to sit in the assembly of the colony must subscribe a declaration against transubstantiation, the adoration of the Virgin and the sacrifice of the mass. Such language (borrowed from the laws of England) would have seemed offensive had political life become active in the colony, but as no assembly was convened till 1791 it remained shorn of practical significance. Real difficulty sprang less from the disaffection of the "new subjects" than from the presence in Canada of certain "old subjects," that is to say, of the English who had come to Quebec and Montreal at the close of the war. Here was a fresh element in the population, small but active and bitterly opposed to the recognition of French institutions. Prior to the outbreak of the Revolution an influential proportion of the English living in Canada were natives of the American colonies who had moved to the northern part of the British dominions with the design of enriching themselves through the fur-trade. Their antagonism to the French was prompted partly by race and religion but also by dislike of French law and contempt for the conservatism of French character. Their plea was that since the fate of war had given Canada to the English the country should be made in the fullest sense a British possession. These "old subjects," but just arrived in the colony, would have uprooted French law, discouraged the use of the French language, destroyed or fettered the hierarchy, and incidentally have made themselves a dominant class. At no time before the passage of the Quebec Act could they have formed more than a fiftieth part of the population, but, owing to the strength with which they raised the cry of the ruling race, they enjoyed a position of great prominence. Unfortunately for the success of their programme, they incurred the dislike of the local authorities by an extreme radicalism of utterance and demeanor. Carleton, in particular, discountenanced them and held them to be infected with the mutinous views which were becoming so increasingly prevalent in the English colonies.

Sir Guy Carleton, afterwards Lord Dorchester, is the most striking figure in Canadian history from the Conquest to the days of responsible government. The close friend and confidant of Wolfe, he began his career as a soldier. Circumstances made him an administrator and he ended by reaching the full stature of a statesman. Those who approve the policy

embodied in the Quebec Act will, of course, rank him higher than he will be ranked by those who deny the wisdom of that far-reaching measure, but regarding the quality of his mind, the firmness of his temper, and the justice of his intentions, opinion is undivided. After serving with distinction in the campaigns of 1759 and 1760 he returned to Canada as administrator of the government in 1766. In 1769 he became governor-in-chief; and from this date until his final surrender of office in 1796 he remained among all Englishmen the leading authority on Canadian affairs. The Quebec Act was the fruit of information and advice which he supplied; it was he who repelled Montgomery's invasion, and the Constitutional Act of 1791 which gave the colony its first training in self-government was largely his work. During a formative period of 30 years his policy of generosity towards the defeated race was the policy of the British government. Murray, whose language reflects personal resentment, says of the "old subjects": "I report them to be in general the most immoral collection of men I ever knew." Carleton, though less severe in his strictures, formed a highly unfavorable opinion of them and expressed his preference for the French Canadians with perfect freedom. According to his forecast, which in this respect has not been altogether justified, the valley of the Saint Lawrence was unlikely to be inhabited by any large number of Englishmen. Most of the English who were then resident in Montreal and Quebec had come in the train of the troops and would probably return with them. The traders had not been successful and would soon disappear. To quote his own words, it remained that "barring a catastrophe too shocking to think of, this country must to the end of time be peopled by the Canadian race." The Canadians, he continues, "are not a migration of Britons, who brought with them the laws of England, but a populous and long-established colony." Thus believing that the French could never be supplanted he concluded that their customs, ecclesiastical and legal, should be retained. A detailed statement regarding the Quebec Act will be found elsewhere (see CANADA — THE QUEBEC ACT). Here it need only be said that its territorial provisions were extremely distasteful to the English colonies and that its concessions to the French Canadians have supplied a solid groundwork for their loyalty to the British Crown. Whether Sir Etienne Taché was correct when he said, "The last gun that will be fired for British supremacy in America will be fired by a French Canadian," must be termed matter of conjecture; but the sentiment which prompted him to speak so fervently was gratitude for the Quebec Act. This measure provided an unobjectionable oath of allegiance, sanctioned the Roman Catholic religion in so far as it did not conflict with the king's supremacy, and ordained that "in all matters of controversy relating to property and civil rights, resort shall be had to the laws of Canada as the rule for the decision of the same." Hence English criminal law and French civil law were established side by side in the regions covered by the act. When Upper Canada was constituted in 1791 it received the common law of England unmodified and unlimited, but French civil law still survives in the Province of Quebec.

At the same moment when Great Britain was

endeavoring to meet the wishes of her French subjects, the question of Canada was becoming an additional source of friction between the mother country and her older colonies in America. Not only did the English colonies disapprove a policy which heaped such favors upon the French, but some of them resented the king's disposition of the recently acquired territory to the west of the Alleghenies. In the royal proclamation of 1763 nothing was said concerning the government of this valuable region, an omission which disappointed Virginia and other colonies ambitious of expansion. Worse still, the Quebec Act handed over the western country to Canada, shutting out the older colonies and rendering an immense area subject to the operation of French civil law. At any time such action would have provoked remonstrance; in 1774 it quickened the resentment which had been gathering force ever since the passage of the Stamp Act. How prominent Canada was in the eyes of the Continental Congress may be inferred from the decision, speedily formed, to gain control of it by force. The sequel was a severe blow to the Revolutionary cause. Montgomery (see MONTGOMERY, RICHARD), advancing by Lake Champlain and the Richelieu, occupied Montreal and nearly succeeded in capturing Carleton, who was the head and front of the defense. Simultaneously Benedict Arnold (q.v.) made his way through the woods of Maine to the valley of the Chaudière and despite dreadful privations appeared before the walls of Quebec. On the arrival of Montgomery from Montreal a siege was commenced, but the sufferings of the troops proved so intolerable that it was decided to carry the town by assault. On 31 Dec. 1775, the two generals made a desperate attempt to force a passage through the streets of the Lower Town. During the fight which ensued Montgomery was killed and after a sharp encounter Carleton drove out the invaders with heavy loss. The war in Canada dragged on during the greater part of 1776 but before the close of that year the Americans had been repulsed at all points and the issue, so far as it affected Quebec was decided. On the British side the hero of this campaign is undoubtedly Carleton, who maintained his position against heavy odds; but considered historically the attitude of the French Canadians is no less interesting. The clergy and the *seigneurs* used their influence actively on behalf of the British; the *habitants* remained neutral. It seems clear, however, that without the aid which he received from Canadian volunteers, Carleton would have been beaten, and it is also manifest that the French peasantry did not respond with any heartiness to the appeals of the Continental Congress.

While Montgomery's invasion is an exciting and critical episode, the Revolution affected Canada still more profoundly by causing the emigration of the United Empire Loyalists (see LOYALISTS). Into the nature of their differences with the American patriots it is not necessary to go, beyond stating that each party represented a definite point of view and was separated from its opponents by the wide gulf of contrasted ideals. The Loyalists represent the conservative element in the Thirteen Colonies and undoubtedly embraced within their ranks a large proportion of distinguished, educated men. Including those who left their homes while the war was in progress

and those who came northwards after its close, we may place the total number of Loyalist emigrants in British North America at nearly 40,000. More than half of these newcomers settled in the neighborhood of the Bay of Fundy, particularly in the region which now forms the province of New Brunswick, but at least 10,000 of them made their way to Canada. It is at this period that important settlements are first established upon the northern shore of Lake Ontario, where a population exclusively English possessed itself of lands which the French had explored but never colonized. The population of Canada was further modified between 1783 and 1800 by the opening up of the Eastern Townships, a district situated on the northern border of New Hampshire and Vermont, with a short frontier on the northeastern corner of New York. Here the original settlements were made in part by Loyalists but more largely by emigrants from New England who moved north in quest of cheap land. At the close of the Revolution, then, the race question in Canada begins to assume a very different aspect from that which it had worn before the passage of the Quebec Act. Then the English population constituted a mere handful. Now, through the steady influx of immigrants from the United States fresh portions of the country are developed and a nucleus is formed round which later accessions of English-speaking colonists will range themselves. As the bulk of the new population professed the deepest affection for Great Britain, a separatist movement was not to be thought of, but it was equally certain that disagreement would arise within Canada over the issue of legal and ecclesiastical institutions. As early as 1785 the Loyalists resident on and near Lake Ontario sent a petition to England praying that they might enjoy "the blessings of British laws and British government and of exemption from French tenure of property." Carleton, now Lord Dorchester, was eminently suited to effect an arrangement between the Loyalists and the French Canadians, towards both of whom he was drawn by feelings of strong sympathy. After establishing in 1788 special regulations for the administration of districts inhabited by Loyalists, he assisted in the preparation of the Constitutional Act (1791), a measure which was designed to do away with the grievances of the Loyalists without creating a sense of grievance among the French. Under the Constitutional Act, which in the British Parliament received support from Pitt and Burke, a division was made between Upper and Lower Canada. For each of these provinces the act created a legislative council and an assembly, but no independent power with respect to tariff legislation was granted. Clergymen of whatever denomination were declared ineligible to sit either in the council or the assembly, but freedom of worship was guaranteed to the Catholics in perpetuity and the Protestant clergy received as an endowment one seventh of all waste lands belonging to the crown. Some idea of the relative importance of the two provinces at this date may be gathered from the fact that in Lower Canada the legislative council was to consist of not less than 15 members, while in Upper Canada the minimum number was placed at seven. A still greater disproportion existed between the number of members in the assembly — a minimum of 50 in Lower Canada as op-

posed to a minimum of 16 in the other province. Although grave troubles afterwards arose under the operation of the Constitutional Act, the measure seems to have encountered little opposition in Canada save from the English minority in Quebec, whose leaders looked forward with discontent to the prospect of political inferiority. No tests excluded Roman Catholics from the council or the assembly, and after the elections of 1792 the latter body in Lower Canada contained 34 French as against 16 English members.

Within six months from the day when the first Canadian legislature met, Great Britain joined Austria and Prussia in their war against revolutionary France. While British North America was not drawn into the vortex of England's contest with the Convention, the Directory and the Napoleonic Empire, it felt the influence of that long struggle in more ways than one. Besides Canada's part in the war of 1812, which was a by-product of the larger strife, one must mention the attempt of French republicans to make trouble for England in Lower Canada, and a certain neglect of Canadian issues by the home government which may be ascribed to the pressure of more critical questions in Europe. At about the same time when Genet was endeavoring to raise the United States against Great Britain, agents of the National Convention sought to provoke a disturbance among the *habitants* of Quebec. The execution of McLane and the imprisonment of Fréchette for life are the chief incidents in this abortive undertaking. Of much more consequence was the failure of the colonial office to watch the working of the Constitutional Act in Lower Canada. The council, whose members were appointed by the governor, speedily became a stronghold of English interests. The assembly, whose members were chosen by popular vote, assumed no less speedily a French complexion. As the council considered itself to represent the dominant power and was quite free from the control of the assembly, it tended to assume a tone which was extremely offensive to the French majority in the other house. The Constitutional Act gave representation but did not recognize the principle of ministerial responsibility to the popular branch of the legislature. In an age of mounting democracy, this type of government was open to fierce attack, especially when the question was complicated by racial prejudice. Between 1791 and 1812 the most maladroit governor of Lower Canada was Sir James Craig, who for three years (1808-10) carried on open strife with the assembly and finally had recourse to a *coup d'état*. In his assault upon the 'Canadien,' a nationalist newspaper, he unwarrantably arrested Bedard as the publisher of treasonable articles, dismissed Panet, the speaker of the assembly, from the militia, and eventually imprisoned six of the leading members of the assembly. Craig's action was due to a sincere belief that the French Canadians were disloyal because they criticized the council, but the effect of his measures was most unfortunate, since the Colonial Office could not fail to be identified with them in the public mind. The political life of Upper Canada during the same period was unmarked by any notable dissensions. Through no fault of her own, and simply by virtue of being a British possession, Canada was drawn

into the war of 1812 (see UNITED STATES — THE WAR OF 1812). Among the causes of the war, the only one which concerned her directly was the ill-founded contention that English officials were trying to stir up an Indian attack upon the American colonists in the West. From the outbreak of hostilities till the conclusion of peace Canadians of both provinces conducted the defence of their country in a truly patriotic spirit. The Loyalists were stimulated by the memory of their expatriation and fought enthusiastically for the British cause under Brock and Sheaffe. The French Canadians guided by Bishop Plessis (see PLESSIS, JOSEPH OCTAVE) of Quebec, himself the descendant of a New England captive, displayed an attachment to England which had not been so clearly apparent at the time of Montgomery's invasion. De Salaberry's victory at Chateauguay showed that the French peasants had not lost their ancestral courage or their knowledge of the methods to be pursued in guerilla warfare. At Queens-town Heights (see QUEENSTOWN) and Lundy's Lane (see LUNDY'S LANE, BATTLE OF) the Loyalists acquitted themselves well in the open field. The war of 1812 contributed much to the formation of a patriotic sentiment which was independent of provincial bounds.

The political unrest which affected most civilized countries in the generation following the Battle of Waterloo, appeared in Canada under an acute form and was not quieted until after the Rebellion of 1837. The Upper Province, free from the problem of a mixed nationality, had hitherto been undisturbed by violent disputes, but as time went on the Constitutional Act was found unsatisfactory—or rather, the act gave no redress of the grievances which grew up under the existing system of administration. In Lower Canada the claims of the assembly found an eloquent champion in Louis Joseph Papineau (q.v.), the most prominent French Canadian of his generation. It should be clearly pointed out that the grounds of discord were different in the two provinces, but the development of agitation went on simultaneously and the two movements, each proceeding from its own set of conditions reacted strongly on each other. English radicals and French radicals were brought into close sympathy as agitators by their common opposition to the established order. In both cases there were minorities whose privileges depended upon the maintenance of the constitution and the bitterness of the struggle for responsible government was intensified by the presence of these vested interests. In Upper Canada the contest between officialism and reform did not centre round the first principles of politics so much as it did round the exercise of power by certain individuals. The main strife was one of old settlers against new, with several minor issues coming in to complicate the situation and render it disagreeable. A few leading families of Loyalist stock constituted a local oligarchy from which were drawn the chief officials of the colony. As the members of this ruling class belonged almost wholly to the Anglican Church, and used their influence freely to benefit the Anglican clergy, they provoked the opposition of the dissenters who formed a majority of the more recent immigrants. The political solidarity of Anglicanism and the "Family Compact" led both to be denounced by the champions of responsible gov-

ernment—Robert Gourlay, William Lyon Mackenzie, Dr. Rolph and Egerton Ryerson. The clergy reserves were represented as a symbol of government by privilege and Roman Catholics united with Protestant dissenters to demand the application of their proceeds toward the support of schools. It will be seen that these sources of discontent were hardly of a fundamental character, but the population of Upper Canada was not one to bear political grievances lightly. In Lower Canada the situation was more intricate and more serious. When the excitement caused by the War of 1812 had died away, the relations between council and assembly resumed their former rancor, while the assembly and the executive became involved in a protracted dispute over the power of the purse. By the financial provisions of the constitution certain revenues were at the disposition of the crown and the assembly had control of certain other revenues which originally were much smaller. Through the development of the colony, the assembly's share of the revenue kept growing larger in proportion to that of the crown, and at the same time the radicals discovered that they could place the government in a very awkward position by refusing their assent to appropriations. The advantage which the assembly possessed through its power to keep up a perpetual dispute over fiscal matters was used with much tactical cleverness, though perhaps with less genuine patriotism than might have been desired. The fight against privilege (and there can be no doubt that the council had excessive privileges) was accompanied by a revival of racial feeling among the French Canadians. With Papineau for their leader the nationalist majority in the assembly used language which showed that their brightest ideal was not summed up in subjection to British sway. Gradually the English element was eliminated from the ranks of the reformers, and though a few politicians of English and Irish name supported Papineau during the disturbances of 1837 his sole hope of success lay in the support of the French. Under such a system of government as was provided by the Constitutional Act, the role of the governor assumed a degree of importance which it does not possess at present in any self-governing colony of the British Empire. Had abler men than Sir Francis Bond Head and Lord Gosford represented the crown in Upper and Lower Canada during the acrimonious debates of 1836, there might have been no breach of the peace. As it was, risings took place in both provinces, the radicals of Upper Canada being encouraged by some initial successes which the party of Papineau had gained in the autumn of 1837. The Rebellion cannot be dignified by the name of a war since the engagements were accompanied by slight fatalities and the issue was never in doubt. The French Canadian peasants who took the field were defeated at Saint Charles and Saint Eustache, and in Upper Canada the appeal to force collapsed after a farcical skirmish at Montgomery's Tavern, near Toronto. In 1838 fresh disturbances occurred at a few places in Lower Canada, only to be repressed with a promptness which showed the futility of further resistance. Apart from the domestic bitterness occasioned by these outbreaks, they were the cause of a diplomatic crisis, in that the activity of Mackenzie's American sympathizers led to strained

relations between Great Britain and the United States. The burning of the *Caroline* (q.v.) and the fight at Pelee Island (q.v.) were international episodes of the first importance.

The best fruit of the Rebellion was Lord Durham's Report and the transformation of British colonial methods which followed it. In 1838 the Earl of Durham (see DURHAM, J. G. L., EARL OF) was sent to Canada as governor-general and given a commission to investigate the state of the country. The blue-book in which he described the causes of the Rebellion and suggested remedies for obvious evils is held, by common consent, to rank first among the documents of the Colonial Office. Whether the text was written by Durham or Charles Buller, or by both in conjunction with Gibbon Wakefield, the report as it stands is a classic in political literature. The two essential recommendations which it makes are that responsible government be freely conceded and that the provinces of Upper and Lower Canada be reunited with a view to allaying the racial discord which had raged so fiercely in Quebec under the Constitutional Act. The Union Act of 1840 was the immediate sequel of Lord Durham's proposals and a first step towards the political consolidation of British North America. The salient feature of this constitution may be defined as the transfer of political power to an assembly which was chosen on a very democratic basis, though not by universal suffrage. The legislative council, with members appointed by the crown, was retained but real authority centered in the popular branch of the legislature. To the assembly each province contributed 42 members and it was provided that a general election should be held every four years, subject to the chance of a dissolution by the governor-general during the interval. The Union Act had imperfections and inconveniences which finally furnished a strong argument in favor of confederation, but under it (1840-67) Canada gained a political training which was invaluable and escaped from the worst of the anomalies that had provoked the Rebellion. At first the act seemed to favor the English, inasmuch as French ceased to be an official language; but in 1848 it was restored to its former position of parity. With the establishment of democratic principles the party system reached a maturity which before had been unknown in Canada. Lafontaine (see LAFONTAINE, SIR LOUIS H.), Baldwin (see BALDWIN, ROBERT), McNab (see McNAB, SIR ALAN N.), Macdonald (see MACDONALD, SIR JOHN A.), Brown (see BROWN, GEORGE), Cartier (see CARTIER, SIR GEORGE E.), and many other accomplished politicians found free scope for their talents in the ranks of Reformers or Conservatives. Much of the legislation which marks this period (for example, the abolition of seigniorial tenure in 1854) was designed to adjust the life of Canada to modern conditions, even at the cost of parting with a picturesque institution or discarding an ancient view of the relations which should subsist between church and state. The Reformers, however, had no exclusive possession of the liberal spirit, for it was a Conservative administration which abolished the clergy reserves. Education in both provinces began to receive an amount of attention which had not been paid to it hitherto. Judged also by economic results the progress of

Canada under the Union Act was extremely satisfactory.

As the confederation movement is considered separately (see CANADA — THE CONFEDERATION), it will be unnecessary to discuss here the causes which suggested to Canadians a larger political conception than is represented by the Union Act. But in conclusion some reference should be made to the progress of Canada as affected by its relations with England on the one hand and with the United States on the other. From 1840 onwards the country enjoyed self-government in all matters of a local or domestic character, but it remained a colony and never considered itself to be a co-ordinate part of the British Empire. In the second quarter of the 19th century the fixed belief of English ministers was that colonies are a kind of fruit which drops off the parent tree when it has become ripe. The rebellion of 1837 coming when liberal principles were triumphant in the mother country prompted the adoption of a generous colonial policy which has never been abandoned, but its effect upon the rise of imperial sentiment was only indirect. Yet notwithstanding the absence of a full partnership between Canada and England, the loyalty of the colony was signally illustrated during the first century of British rule. Despite friction between races, the pressure of foreign invasion and the existence of political privilege in both provinces, the attachment of an overwhelming majority of the population to British institutions and the British connection remained firm even throughout the decade that preceded the rebellion. The division which the American Revolution created between the United States and British North America, could not fail to affect the fortunes of Canada in the most vital manner. Apart from the importance of the Loyalist immigration, the rise of a new and powerful state on the southern frontier brought into being conditions which thenceforth could never be ignored. As early as 1775 a small but active minority would have preferred membership in the band of revolted colonies, and ever since there have been individual advocates of annexation. But this propaganda has never spread widely or gone beyond the theoretical stage. In addition to the war of 1812 and the irritation caused by the filibustering raids of 1838, the question of boundaries was for long periods together unpleasantly prominent. The Webster-Ashburton Treaty of 1842, though it was received with great dissatisfaction in New Brunswick and Quebec, did good rather than harm by settling an irritating dispute. The Reciprocity Treaty of 1854, which was largely due to the efforts of Lord Elgin, brought the two countries into more direct contact than ever before, promoted friendly intercourse, and was a source of prosperity to Canada during the 13 years of its existence (1854-67). Its repeal by the United States was in large measure due to a resentment which had arisen from Great Britain's attitude during the American Civil War. The fact remains that in its birth year the Dominion of Canada was excluded, by action not its own, from reciprocity in natural products with United States. See CANADA — UNDER FRENCH RULE; CANADA — THE CLERGY RESERVES; CANADA — SEIGNORIAL TENURE.

CHARLES W. COLBY,
Professor of History, McGill University.

6. Canada—The Maritime Provinces to Confederation. The early history of the three eastern sea-board provinces of Canada is an important incident in the long dramatic struggle between France and England for world-empire. (See CANADA.) Their place on the map linked their destinies with those of New France on the one hand, and of New England on the other. The tale of their settlement and organization into communities is part of a greater story, the overflow of European peoples into the New World. They have been profoundly affected by great events outside their borders, European wars, and political changes on this continent; and if they have not as yet reacted on the history of the world, as a nation they are young; their history is yet to make.

Nova Scotia.—In 1604, Sieur de Monts, a Huguenot gentleman adventurer and trusted soldier of Henry IV., made a voyage to the great Atlantic peninsula, which is now called Nova Scotia (q.v.). He was to found a colony in return for his broad patent to trade in furs. After exploring the rugged eastern and southern coast-line, he discovered the beautiful Annapolis Basin, and wintered, suffering terribly, on the island of Saint Croix. The next year, after searching as far south as Cape Cod for a suitable place, he turned back to the Annapolis Basin, and planted his colony on its shores, naming the cluster of huts Port Royal. The colony did not flourish, and, in 1613, it was destroyed by a force under Argall from the newly founded colony of Virginia.

The French name for the country was Acadie, a musical native word, often mistaken for Arcady. It means "abounding in," as in Shubenacadie, and covered an ill-defined tract of wilderness, comprising what is now Nova Scotia, New Brunswick (q.v.), and part of Maine. In 1621, this territory was granted by James I. to Sir William Alexander (q.v.), a Scottish gentleman, to be colonized on a plan distinctly mediæval. Alexander was to parcel out his province in "baronies," six miles long by three deep, to gentlemen, who were to "plant" them with settlers. Each baronet was to have almost regal powers within his own domain, even striking his own coinage, and "repleding" criminals from the King's courts of law to his own. The colony was to be a new Scotland, even by a legal fiction, part of the county of Edinburgh. One small settlement was actually made on the Annapolis Basin in 1629, but it came to nothing, and the whole province was handed back to France in 1632, by the treaty of Saint Germain-en-Laye. Still, to this day, the Baronets of Nova Scotia form a distinct order in the British aristocracy, and the provincial flag bears the azure saltire of Sir William Alexander and the ruddy lion of Scotland ramping in gold.

For 22 years, the French had undisputed possession, and succeeded in planting a colony on the feudal pattern, as far removed as possible in principle from republican New England. The government was military and paternal; the land was held by seigniors and tilled by a docile tenantry. The *habitants* were chiefly unlettered peasants from the country about Rochelle. In Acadie, they found broad marsh lands beside tidal waters, resembling the country they had left. Here they settled, built long dykes of logs and earth on the river banks, and peacefully cultivated the rich fields the salt tides fertilized.

Population grew slowly. In 1671, there were 378 persons in the colony; in 1683, 600, chiefly about Port Royal. An interesting census of Acadie was made in 1686 by de Meulles, intendant of New France, who visited the scattered settlements and numbered the families, acres of cleared ground, boys, girls, fusils, horned cattle, swine and sheep in each. The population had grown to 915, including 30 soldiers at Port Royal. Although thickest about the seat of government, the Acadians had spread along the coasts and as far as Beaubassin at the head of the Bay of Fundy. They were a race of husbandmen, growing wheat, pease and rye; and raising cattle, sheep, swine and poultry; they also built small boats for the shore fisheries. An observer relates that when the manure-heaps beside their barns grew unmanageable, they moved the barns. Few women came with the first settlers, who married with the Indians, and always lived on friendly terms with them. Priests of the Sulpicians and Missions-Etrangères were their trusted guides both before and after the English conquest. See CANADA — ACADIAN REFUGEES.

Throughout this period, the chief interest lies in the shifting fortunes of one family. Claude de St. Etienne, Sieur de la Tour, a ruined Huguenot gentleman of Champagne came out early in the 17th century, with his son, Charles Amador, a boy of fourteen, to better himself in the new colony. After Argall's raid, the two lived for years like Indians among the Indians. Their stronghold was Fort Saint Louis at Cape Sable, on the inlet now known as Port Latour. In 1627, Charles petitioned Louis XIII. to be made commander of the coasts of Acadie, and his father took the petition to the French Court. On his return voyage the next year, he was captured by Kirk's fleet and taken prisoner to England. Here he became a friend of Sir William Alexander, married a maid of honor to Queen Henrietta Maria and was made a Baronet of Nova Scotia, as well as his son, with large grants of land to support their titles. With two men-of-war, he came back to Cape Sable, where Charles held the one solitary post for France in Acadie. By persuasion, and at last, by force, he strove to win his son over. Failing in both, he begged permission to live in Acadie, rather than return to England in shame, or to France and lose his head. This Charles granted, and Claude with his bride, his effects, two valets and two *femmes de chambre* disembarked. In 1635 Denys the historian found them living there in comfort.

Louis XIII. rewarded Charles' loyalty by making him his lieutenant-general in Acadie. In 1632, Isaac de Razilly took possession of the province in the name of France; his chief officers were La Tour the younger and D'Aulnay Charnizay. On the death of de Razilly in 1636, the territory was divided between the two; La Tour established himself in baronial state at the mouth of the Saint John, with his Huguenot bride, while D'Aulnay made Port Royal, across the bay, his headquarters. D'Aulnay intrigued against his rival at the court of France and procured his recall to answer charges of fraud upon de Biencourt, his former commander. La Tour refused to go to France, and tried to enlist the Puritans of Boston on his side. Failing them, he obtained help from Rochelle; the "proud city of the waters" sent him supplies, munitions of

war and 140 soldiers in the *Clement*. When the *Clement* arrived in the spring of 1643, she found Fort Saint John closely beset by D'Aulnay and 500 men. Being closely pressed, La Tour and his devoted wife slipped through the blockade by night, reached Boston safely, returned with reinforcements and drove D'Aulnay back to Port Royal. But D'Aulnay's hate was not easily tired. He went to France to raise another force against his enemy. At the same time, Madame La Tour went to Rochelle, to gather aid for her husband. D'Aulnay heard of her presence there and tried to have her arrested, but she escaped to England. On her return voyage, she almost fell into his hands a second time, but at last she reached Saint John again in safety. In April 1645 D'Aulnay besieged her here, while La Tour was in Boston. After a gallant defense, the fort was taken by treachery. D'Aulnay, to his everlasting shame, broke the terms of surrender, hanged the garrison and forced Madame La Tour to witness the death-struggles of her faithful soldiers, with a rope about her neck. Three weeks later, the heroine died of a broken heart. La Tour became a wanderer on the face of the earth, exploring and border-fighting in New France, while his rival ruled his province unchecked and built it up with a strong hand until he was drowned in the Annapolis River in 1650. La Tour hastened to France, confuted the old charges against him and obtained his former possessions in Acadie. Returning he married the widow of D'Aulnay and seemed about to enjoy a period of prosperity, when the province was once more taken by a Cromwellian fleet, in 1654. Undismayed by the sudden change of fortune, La Tour sailed for England and secured a joint grant of the territory with two English colonels, Crowne and Temple, to whom he soon sold out his interests. At the Restoration, he was made a baronet of Nova Scotia, and closed his chequered and adventurous career in 1672.

In 1667 Acadie was again restored to France by the treaty of Breda. The story of the French administration is not a pleasant one. It is a tale of incompetence, corruption, pettiness, and is told at length in the pages of Parkman. The priests accuse the officials, the officials accuse the priests. The luckless colony was raided time and again by pirates, and by expeditions from New England to avenge the Haverhill and Deerfield massacres. Canada could only be reached by long and dangerous traverse of the wilderness, but Acadie was only a few days' sail from Boston.

French rule came to an end during Marlborough's wars. In September 1710 a force from Boston, chiefly of provincial troops, under Col. Francis Nicholson, took Port Royal after a brief but gallant defense by Subercase. Port Royal at once became Annapolis Royal, in honor of the reigning sovereign, but it was not until 1713, by the Treaty of Utrecht (q.v.), and surely against the will of Louis XIV., that Acadie became finally a part of the British Empire.

From 1710 to 1749 a small British garrison at Annapolis Royal held the province tenaciously for England. The fort, though well placed, and a Vauban plan, was ruinous; the earthen walls were always crumbling into breaches; the gun-carriages would not bear the guns; the barracks were roofless; for years the men were without bedding, stockings, great-

coats or medicines. Supply-ships from England came once a year and brought provisions for nine months instead of twelve. The hostile population would not take New England money for their corn and cattle; the home authorities would not honor the governor's drafts; the Boston merchants refused credit. During Walpole's long peace England seemed to forget the lonely garrison, while the French priests were agents of the French government, undermining English authority. From 1720 on, Louisbourg, the new French city on the island of Cape Breton, was yearly growing in power, millions of livres were spent on its defences, for France was bound to win back her lost province. All the time, convinced of its importance to the empire, one discouraged English governor after another held doggedly to his post.

The government was military, not civil, for the Acadians being Roman Catholics were, by the laws of England, incapable of voting; but at least one official regretted that they could not be given representation. They were governed by their deputies, the "ancientest" and most reputable men of each parish, chosen every year on or about 11 October. These were responsible for the good behavior of their districts and for the execution of orders transmitted by the governor-in-council. Philipps, colonel of the 20th regiment, was governor for almost this entire period. He visited the province twice, but resided mainly in London, while lieutenant-governors, chiefly regimental officers, Armstrong, Cosby, Mascarene, administered the colony. The governor was supreme; but to assist him, he had a small council, whose functions were advisory and executive. These officials did their best to advance British interests, giving the litigious Acadians justice in their endless disputes, and making wise suggestions for the improvement of the colony, which must have been doomed to gather dust in the Duke of Newcastle's closet of unopened despatches.

On the outbreak of the war of the Spanish Succession (see SUCCESSION WARS) the men of Massachusetts rose and by splendid audacity struck down the stronghold of French power, Louisbourg; but that glorious adventure belongs to the annals of New England rather than of Nova Scotia. In the summer of 1744, gallant old Mascarene sustained two hot sieges in his ramshackle fort of Annapolis Royal; the first force was led by young Belleisle and other Acadians; the second, by Du Vivier, a descendant of Charles de la Tour. In 1746, Ramezay encamped against him, awaiting D'Anville's armada, but did not fight. The same winter, he surprised Noble's force at Grand Pré, and killed, wounded, or took prisoner nearly 200 men.

When the war ended by the treaty of Aix-la-Chapelle in 1748, Cape Breton was restored to France, and Louisbourg, the Dunkirk of America, resumed its old attitude of menace to the very life of the English colonies. Then at last, sluggish England moved to save the key to her possessions over-sea. Nova Scotia was to have an effective garrison to counter-check Louisbourg. In June 1749 a fleet of 13 transports, bearing some 3,000 colonists, and escorted by the sloop-of-war *Sphinx*, reached the great three-fold harbor of Chebucto, long known for its excellence to French and English mariners. The leader of the expedition was Col. Edward Cornwallis, twin brother of the gay Archbishop

CANADA — THE MARITIME PROVINCES TO CONFEDERATION

of Canterbury, and uncle of the Lord Cornwallis, who surrendered at Yorktown. He had seen service at Fontenoy and Preston Pans, and although his military reputation was afterwards clouded by his share in the Rochefort and Minorca fiascos, he did his work as a city-builder well. The new military post, Halifax (q.v.), was quickly laid out, the land cleared, the population organized into a militia and a rough line of stockade and block-house run round the streets of tents and log-huts. In spite of the character of the settlers, trade-fallen soldiers and sailors, and the plague that carried them off in hundreds; in spite of Indian massacres, opposition from local smugglers, extortions of Boston merchants, discouragements from the home government, Cornwallis made Halifax a place on the map of the world. The founding of Halifax brought about the second capture of Louisbourg, leaving the way free for Quebec (q.v.) and the downfall of French power in America. Emigrants from Old and New England flocked to the new city. In 1750 and again in 1752, some hundreds of settlers came from the Palatinate. After a brief stay in Halifax, they were transferred to the island-studded bay of the La Hève, the old headquarters of de Razilly, where they have grown into a race of hardy fishermen, whose town, Lunenburg, is the Gloucester of Canada.

In 1752, Cornwallis returned to England crippled by rheumatism, but his successors, Hopson and Lawrence, built strongly on the foundation he had laid. Their great problem was the growth of French power in the fortress of Louisbourg and in the Acadian population. Under English rule, the *habitants* were far happier than under their old masters. The nominal government at Annapolis Royal had been powerless for good or evil. Its authority did not extend beyond a cannon-shot from the walls of Fort Anne. It was precisely under English rule that the Acadians increased and multiplied and, beginning to press upon the means of subsistence, spread outward, round the Bay of Fundy to the marsh-lands on the further shore. Their law-suits were nearly always over disputed lands, or boundaries. In 1755, they numbered about 10,000 persons. England and France were then mustering all their forces for the coming struggle known to history as the Seven Years War. No one could foretell that it would be final or which country would win. England seemed to be at the lowest ebb of fortune and spirit. Brown's lugubrious *Estimate* predicted her immediate downfall. France seemed strong in the New World; she had hemmed the disunited English colonies in with a chain of posts from the mouth of the Mississippi to Louisbourg. She had never ceased to regret the loss of Acadie or to plan for its recovery. The province was the pivot of the whole situation in the east. In these circumstances, the presence of the alien French population in it constituted a grave danger. The claim has been set up that they were neutrals; they had this idea themselves; but this strange notion was simply due to the impotence of the British government. They were no more neutrals than the people of Alsace and Lorraine were after their transfer to Germany in 1871. They were British subjects by conquest, by treaty, by the formal taking of an oath of allegiance and by the common law of nations, but they refused to consider themselves as such.

They might be French subjects again by another war, or the return of the Pretender. Whether they left the province or remained in it was not a matter of indifference. If they stayed, they afforded a shield to hostile operations; if they were free to go, they would strengthen and feed the garrison of Louisbourg. In this dilemma, the old proposal of Shirley's was renewed, their deportation. In the autumn of 1755, after Braddock's defeat gave the signal for war, this was done. The idea originated in New England and was carried out by New England men, acting under the orders of Gov. Lawrence. At Grand Pré, Pisiquid, Chignecto, and Annapolis Royal, the men were called together and made prisoners, and placed on board the transports; their families followed them. The embarkation consumed long weeks. Finally the ships sailed and distributed the unhappy people among the Atlantic colonies. In all, some 7,000 persons were in this way removed from the province. Opinions differ as to the measure. The French theory is the natural brutality of the English; one writer finds his reason for it in the greed of Lawrence to seize on the belongings of the poor peasantry. The general English view is that it was a war measure, cruel as all war is, but imperative for self-preservation; and this theory has the support of Parkman.

With the deportation of the Acadians came peace with the Indians. In 1761, Argimoosh, "the great witch," and his braves buried the hatchet in Halifax and washed the war paint from their bodies. Now for the first time, settlers were safe outside the pickets of the city; and the country began to fill up. Emigrants from Connecticut occupied the waste lands of the Acadians. Highlanders from Caithness and the Western Isles settled about Pictou harbor. Presbyterians from the north of Ireland found homes in Colchester. Before and after the Revolutionary War, thousands of devoted Loyalists came to the province, some to remain, some to pass on. Shelburne, a city of these exiles, numbering 10,000 at one time, passed away like a gipsy encampment. The long wars of peace began with countless inroads upon the wilderness. In a century the Acadians had scarcely cleared 300 acres. Now farms and settlements were eating into the forest, and hamlets were springing up beside the empty harbors. Before the end of the century, the great industries of shipbuilding and the fishery were in their vigorous infancy. The American Revolution left few marks on the history of the province: efforts were made to bring the colony into revolt with the rest; one daring man planned the capture of Halifax, and some sympathizers with the rebels were tried for treason. There was even something like a tea riot in Halifax; but the conservative forces held the province firm. Halifax prospered, as it always did in war-times, through supplying the army and navy, and the sale of the many prizes brought to port. With the return of peace, the tide of prosperity promptly ebbed. In three great wars since its founding, Halifax was a nest of privateers, which brought large returns to their owners.

Colonial government was at first military. All power was vested in one man, the governor, or his lieutenant-governor, who was usually a soldier. To advise him, he had a council, and his instructions contemplated a legislative as-

sembly. As the Acadians were incapable of representative institutions, they were governed through their deputies. Members of the old council were sworn into the new one by Cornwallis, when Halifax became the seat of government. His large instructions empowered him to summon assemblies and make laws; but the first Assembly was not elected until 1758. From this time, the chief power passed from the governor to the council, a small coterie of Halifax officials and merchants, appointed for life, who sat in secret session and were not responsible to the people. The powers of the Assembly were curiously limited, and friction between the two bodies was constant. Governor succeeded governor, almost always an army officer with high Tory views of prerogative and military conceptions of his office. He was gently guided through his unfamiliar civic part by permanent officials in the council like Richard Bulkeley, who came out as aide to Cornwallis and died provincial secretary in 1800. The tone of society as well as government was conservative, not to say reactionary. This state of things lasted until well into the fourth decade of the 19th century. With its large military and naval population, and the merchants who lived by supplying them, Halifax was in many respects an English garrison town in America. In the first session of the House of Assembly, the Church of England was established by law; the first college was modeled on Oxford, and its statutes required subscription to the Thirty-nine Articles both at matriculation and on taking a degree.

The agitation for reform began outside, for the country was pitted against the city. Jotham Blanchard, editor of the 'Colonial Patriot,' was perhaps the first critic of the existing order. The Rev. T. McCulloch, the Scottish "Seceder" missionary, who founded Pictou Academy and became the first president of Dalhousie College (q.v.), was another early reformer. But the man who brought reform to pass was Joseph Howe (q.v.), Nova Scotia's darling son, perhaps the most interesting personality in Canadian history. He was born at Halifax in 1806 of Loyalist stock. His father was king's printer, and, after some scanty schooling, he was apprenticed to his father's trade. In 1835 he was editor and owner of the 'Nova Scotian' newspaper. On New Year's day it contained a letter signed "The People," accusing the Halifax magistrates, in plain terms, of pocketing public money. Their indignation was extreme and they began a libel suit against the daring editor. If truth is libel, Howe had no case; and no lawyer would undertake it. Howe conducted his own defense, and by a brilliant address to the jury secured a triumphant acquittal. From that hour he was the idol of the people, whose cause he had espoused. On the other hand, several hot upholders of the existing order challenged him; he fought one duel, and, having proved his courage, wisely declined further argument by pistol. Howe was a good example of the popular tribune, emotional, eloquent, social, with the faults of such a nature, but possessing tact withal and the statesman's insight into great problems far beyond the ken of provincial politicians. On such questions as the union of the remaining British American colonies, communication between them, the federation of the empire, Howe was far in advance of his time, and his ideas were formative.

Henceforth, his career was in politics, rather than in journalism. Elected member for Halifax in 1836, he at once attacked existing abuses in a series of resolutions, which served chiefly as a programme of reform. Soon afterward he began an important correspondence with Lord John Russell, the colonial secretary, on the difficulties of local government. As a result, the latter instructed Sir Colin Campbell, the governor, to introduce certain of the changes suggested by Howe. This Sir Colin refused to do, and Howe began an agitation which led to his recall. He was succeeded by Lord Falkland, whose remedy for the trouble was coalition in the council. Four of the old council were dismissed, and four Liberals, Howe among them, took their place. But the two interests were irreconcilable: Howe and his friends soon resigned, and began to lay before the people the evils of the irresponsible system. In the election of 1847 Howe and his party swept the country. The new Assembly passed a vote of want of confidence in the council, which thereupon resigned in disgust. A cabinet was formed of the triumphant liberals and the principle of responsible government was established.

The situation of the colonies remaining to Britain on this continent, in the first half of the 19th century was not cheering. Upper Canada was largely uncleared forest, with struggling towns and widening clearings; Lower Canada was alien in speech and religion; both passed through the throes of rebellion. The great West was supposed to be uninhabitable. The Provinces by the sea were poor, thinly settled, each with its own government and its own tariff wall against the rest. The 20th century dawns on a united and prosperous country stretching from the Atlantic to the Pacific. For years Howe pointed out the value of union, for the object lesson of the Great Republic was hard to mistake. But here, as in the case of the Thirteen Colonies, before and after they achieved their independence, each province had its own pride, interests, and jealousies. Besides these, the geographical barriers to union seemed insurmountable; but the locomotive engine changed the face of affairs and provided the solution of the problem. The universal fever for building railways reached the Provinces. The first railway in Nova Scotia united Windsor, Halifax, and Truro; the first in New Brunswick, Saint John and Shediac. A bolder idea was to join the provinces, inland and seaboard, by an inter-colonial railway. If united for commerce, why should not the colonies be united for government?

It cannot be said that anywhere in the Maritime Provinces was there a popular movement in favor of union. It was the thought of a few strong, far-seeing men, with powers of persuasion, like Macdonald in the West and Howe in the East. Nova Scotia has the honor of leadership in bringing about the Charlottetown conference. When the question came up in 1867, Howe was in opposition, and Tupper carried the resolution through the House. By a curious irony of fate, Howe was now led to combat the very measures he had fought for so long. He took advantage of his opponent's failure to submit such an important measure to the verdict of a popular election and he roused the people into fury against confederation. They were bought and sold, he told them, "for 80 cents a head, the

CANADA — THE MARITIME PROVINCES TO CONFEDERATION

price of a sheepskin." In the next election, the great issue was repeal of the union, Howe carried the country, and Tupper was the only Conservative returned. Howe tried every legal means to detach his province from the union, but the British Government refused to reconsider the measure it had just sanctioned, and Howe would not appeal to Washington, or have recourse to arms. He sought "better terms" for his province from the Dominion Government, and entered the Macdonald ministry to assist in working out the problems of the new experiment in government. Though not a consistent, Howe was a great man; with all his faults, he loved Nova Scotia well, and Nova Scotia will long cherish his memory.

New Brunswick.—The waterway of the Saint John as a great Indian road, attracted the attention of the French fur traders early in the 17th century. La Tour fixed his headquarters at its mouth. It is still the main artery of the Province. There were also French settlements on the rivers and harbors, such as the Miramichi, the Restigouche, Baie Verte. Petite Rochelle was partly fortified; the town at Beaubair's Point had 200 houses and a chapel. These settlements were not permanent. There was a small colony from Massachusetts at Manguerville on the Saint John in 1760; but the history of New Brunswick as a political unity begins with the close of the American Revolutionary War.

In some respects, the struggle of the Thirteen Colonies for independence was a civil war: for all the colonists were not of the same mind. Some of the best regiments on the King's side were raised in America. For instance, Fanning, the second governor of Prince Edward Island, at one time Judge of the Supreme Court of North Carolina, raised and commanded "The King's American Regiment." When the British cause was lost, such forces were disbanded, and the citizen soldiers, impoverished by eight years of war, could not or would not live under the new government. Many of the official class, the Episcopal clergy and their humble followers were also on the losing side. For the defeated, there was no mercy; the fierce republicans would not let them live in the country. After the surrender at Yorktown (q.v.) thousands of these unfortunates flocked to New York and other seaports. No provision was made for them in the terms of peace; but public sympathy was aroused on their behalf, the British Parliament took generous measures for their relief, Sir Guy Carleton stood their friend. Ships were provided to carry them away, large grants of land were made to them in the loyal colonies, with tools, supplies and provisions for one, two, or three years. Some went to England, but the great majority found homes in the northern wildernesses. There some thirty thousand exiles, many of the educated and cultured classes, found refuge. In American history these are the Tories, traitors to their country; in Canadian history, they are the United Empire Loyalists, the makers of the new Dominion. More than any other class of emigrants, they formed present Canadian sentiment and institutions.

The great emigration took place in 1783. On 18 May a fleet of 19 transports, with some 3,000 Loyalists on board, reached the mouth of the Saint John. Here a great stream of 450 miles pours through a narrow breach in the rocks into a small harbor, where the flood-tide rises 26 feet.

and ebb leaves the great ships aground. All round are desolate hills masking the fertile region beyond. This unpromising site the Loyalists chose for their city. They were men of the 8th, 98th, 194th Regiments, the New Jersey Volunteers, and the Queen's Rangers. The grantees' lists show good substantial English names. The "fall fleet" brought 1,200 more, and Parrtown, so called in honor of Gov. Parr, of Nova Scotia, began its career with a population of 5,000. Politically, it was situated in Sunbury County, Nova Scotia. Soon the Loyalists showed active discontent at Gov. Parr's delay in making out their grants, and in giving them representation in the House of Assembly, and, in spite of his opposition, they succeeded in persuading the British government to erect their county into a separate province with a royal governor, council and House of Assembly of their own. This was done in 1784, and the province of New Brunswick was created by royal charter, with Col. Thomas Carleton, brother of the famous Sir Guy Carleton (q.v.) for governor. His commission and instructions were practically the same as those given to Cornwallis in 1749. This council of 12 members exercised both executive and legislative functions. The first House of Assembly, of 26 members, was elected, not without riot, in 1785, and met for the first time in the following January. In this year, Parrtown was incorporated as Saint John (q.v.): it was the first city in British America to receive a charter. It is modelled on the charter of New York, and gives the Mayor the office of garbling spices and the right to appoint the bearer of the great beam. No emigrant or other person could sell goods without first obtaining the freedom of the city. From the founding of the province until 1832, no changes were made in the constitution. As in Nova Scotia, the prevailing ideas were high Tory; and popular rights received little attention.

New Brunswick's chief wealth is her great forests; and her two chief industries, lumbering and ship-building, soon sprang up: but agriculture languished. Population followed the waterways, the natural timber roads from the interior. Down to the time of the Crimean War, the timber trade was fostered by British legislation. The province grew, but not steadily; periods of prosperity were followed by periods of depression. Many emigrants brought out by the timber-ships simply passed through to the United States. The Reciprocity Treaty of 1852 was a boon to the Maritime Provinces: its abrogation injured trade.

During the War of 1812, the provinces were harried by privateers; but they were not invaded, like Upper Canada, because New England was opposed to the war. In the provincial sea-ports privateering also thrived. Dalhousie College was founded with customs money taken at Castine by an expedition from Halifax. After 1815, settlers from the United States began to occupy disputed territory between New Brunswick and Maine. The boundary between the two, left vague by the treaty of 1783 almost led to war. The northwest line was to run due north from the source of the Saint Croix River to the height of land between the Saint Lawrence and the Atlantic. Instead of one chain of high lands, there are two chains: between them lay the disputed territory, comprising some

CANADA — THE MARITIME PROVINCES TO CONFEDERATION

12,000 square miles. Under the Jay treaty of 1794, a commission was appointed to determine the line. The Americans wished to extend the due-north line to the Métis River in Quebec: the British wished to make Mars Hill the limit, and they could not agree. Another attempt at settlement was made by the Treaty of Ghent. The King of the Netherlands was appointed arbitrator, but his award was not accepted. In 1839, the difficulty became acute. Some lumber-thieves cut timber on the debatable land: the Governor of Maine sent a sheriff and posse to drive them out, and New Brunswick lumbermen resisted the officers of the law. The squabble roused intense feeling on both sides. The governor of Maine called for 10,000 troops to guard the State's rights. The governor of New Brunswick, Sir John Harvey, sent two line regiments with artillery and volunteers to the scene of action. Nova Scotia voted all her militia and £100,000 to aid the sister colony; the Canadas also proffered help. Gen. Winfield Scott took command of the American forces. He and Sir John Harvey had fought against each other in the War of 1812. They agreed to a joint occupation of the disputed territory; and the war-cloud blew by. In 1842, Mr. Baring for England, and Webster for the United States, negotiated a treaty that at last delimited the frontier. Of the disputed territory, Maine got 7,000 and New Brunswick 5,000 square miles. Mr. Baring was made Lord Ashburton for his success, and the treaty is known by his title.

One peculiarity of the colonial status was the appointment of colonial officials by the home government. New Brunswick's case is typical. The Governor, the Attorney General, the Provincial Secretary, the Judiciary, the Customs and Crown land officials were all appointed from England and paid out of the revenues arising from the customs and Crown lands. In 1825, the Legislature was given control of the customs, when it soon discovered that nearly all the revenue went out in salaries. Not until 1848 did the province both receive the revenues and fix the salaries of this department. In 1837, the province took over the revenue arising from the Crown lands on condition of paying the Governor, the Judiciary and the other government officials. The last department to come under provincial control was the Post Office.

As in other colonies, the irresponsible Council became an abuse, and many were the contests between it and the Assembly. In 1832, a second Council was established with executive, but not legislative functions. This was done by the home government in its desire for uniformity in the colonial governments; but the parliamentary principle of majority rule with an executive council or cabinet to carry out the will of the majority were slow in being understood. It was six years later before the executive included a member of the elected Assembly. Slowly the province worked out the problem of self-government. In 1839, when Sir John Harvey read to his Legislature, Lord John Russell's despatch on tenure of office, and unlike the Governor of Nova Scotia was in accord with its proposals, the Assembly, after full debate, actually refused the boon of responsible government. In 1848, however, the modern system was in essential particulars recognized by formal resolution. Charles Fisher, and L. A. Wilmot, afterwards Judge and Lieutenant-Governor, were the lead-

ing Reformers, and two of the royal Governors, Sir Howard Douglas and Sir John Harvey, were in complete sympathy with the popular movement.

New Brunswick was represented at the Charlottetown Conference, where the preliminaries of Confederation were discussed. At the Quebec Conference, the leading men of the opposition as well as of the party in power were delegates. The Seventy-two Resolutions then agreed upon were to be submitted to the various Legislatures for their approval. Before the New Brunswick Assembly could vote on them, it was dissolved; and in the new House, a large majority were pledged to oppose them. This led Nova Scotia to withhold the Resolutions, as no vital union could be effected with the upper provinces that left out New Brunswick. However, when the House opened in 1866, the majority committed themselves to the policy of union in the speech from the throne. The House dissolved on the issue, and, sentiment having changed, in the new election, the unionists were returned by a large majority. New Brunswick is one of the four original members of Confederation. See CANADA — CONFEDERATION; NEW BRUNSWICK.

Prince Edward Island.—The large crescent-shaped island in the southern part of the Gulf of St. Lawrence is supposed to have been discovered by Cabot, and afterward by Cartier, who named it Isle Saint Jean. After the conquest, it was still called Saint John's Island until 1780, when the local legislature named it New Ireland, an act disallowed by the British Government. In 1794, it was re-named Prince Edward's Island in compliment to the Duke of Kent, the father of Queen Victoria. After the treaty of Utrecht, Acadians from the main land settled at the southern central harbor and named it Port La Joie, the present Charlottetown. It was governed from Louisbourg. In 1752 the population was 1,354. Three years later, after the fall of Beausejour and the expulsion of the Acadians, many took refuge there. At the fall of Louisbourg in 1758, the population was at least 4,000 souls, in four thriving parishes. The fertile "Garden of the Gulf," as the islanders love to call their little sea-girt province, was even then worthy of the name. Casgrain calls it a second Acadie: for hence also the Acadians were expelled. When Capt. Holland made his survey in 1764, he found only 30 Acadian families "on the footing of prisoners," and a tiny British garrison in a miserable fort.

In 1763, the year of its cession to England, Lord Egmont proposed a plan of settlement worthy of Sir William Alexander in its feudal character. One feature was a chain of baronial castles from one end of the island to the other; but the plan was never carried out. In 1767, the entire island was divided into 67 lots or townships, of some 20,000 acres each, and granted, by lot, in one day to a number of influential Englishmen, on the old condition of settling so many emigrants within a certain time; they were to pay a perpetual quit-rent, or land-tax. Here began the curse of the absentee landlord, which laid the island under a blight for more than a century. At first, it was annexed to the government of Nova Scotia, but in 1768 it was, on the petition of a majority of the proprietors, erected into a separate province. In 1770, the first royal Governor, Col. Patterson,

CANADA — THE MARITIME PROVINCES TO CONFEDERATION

arrived with his official staff, whose salaries were to be paid from the quit-rents. The formative ideas here were also high Tory. Roman Catholics were not permitted to settle; no schoolmaster from England might teach without a license from the Bishop of London. Population grew slowly; for few of the proprietors fulfilled the conditions on which they got the land. In 1773, the first House of Assembly was elected. Its first act was to confirm all the past proceedings of the Governor and the Council.

On the outbreak of the Revolutionary War, two American vessels, sent to cruise in the Gulf for British ordnance store ships, raided Charlottetown and carried away some prominent officials. For this Washington cashiered the delinquent officers and released the prisoners with expressions of regret. Another raiding expedition from Machias came to nothing, and the island remained free from molestation till the close of the war. In 1781, proceedings were begun in the Supreme Court against the townships in arrears with quit-rents, and various holdings were escheated and sold, it was thought, without due notice to the landholders. The unimproved waste land was an obstacle to colonization; the owners neither planted settlers nor paid the quit-rents, on which the revenue depended. The landlords argued for the defense, that some of them were officers on active service, that the war had prevented settlement, and that the lands were sold to persons on the ground at absurdly low prices. In rebuttal, Patterson urged that in the midst of a disastrous war, both money and purchasers were scarce; the Island might have been captured or ceded back to France. He admitted that he bought up escheated land, but held he was within his rights as a citizen in doing so; he had also, at his own risk, saved out of the sales, various lots for the absentee owners. In response to various petitions from the proprietors, the home government granted them relief, and sent a draft bill to Gov. Patterson, making the sales voidable. This he was to submit to the Assembly, but he suppressed it for two years. A new Assembly was elected in 1784. It resolved to complain to the King against the governor for disposing of the lands so hastily, when he dissolved it.

The war was now over; the exiled Loyalists were pouring into Nova Scotia, and Patterson hoped to divert the desirable stream of emigration into his own province. Many Loyalists came; by special favors he secured them to his interest, settled some of them on the lands sold in 1781, and in 1785, secured an Assembly certain to support him. It passed an act approving his conduct in escheating the unimproved estates, but the home government disallowed the act and recalled the disobedient official. In 1786, the governor submitted at last the English draft act, already mentioned, to the Assembly, which passed it with haste, as also another act of the Governor's framing restoring the escheated lands to the rightful owners, but saddling them with heavy expenses; this the home government disallowed and dismissed the members of the Council concerned in it.

The new Governor, Edmund Fanning (q.v.) arrived in November, but Patterson refused to vacate his office, and the winter was spent in the quarrels of these two kings of Brentford; but in the spring, Fanning was firmly established. The escheated lands remained in the

quiet possession of their purchasers, some of whom came to terms with the original grantees. Fanning was a native of New York, a graduate of Yale, and a D.C.L. of Oxford. Through the Revolutionary War, he commanded the King's American Regiment and was twice wounded. In his administration, the land question smouldered. The chivalrous Earl of Selkirk, who also planted settlements in Upper Canada and the Northwest, brought out, in 1803, 800 of the Clan Ronald Macdonalds and settled them about Point Prim.

Fanning was succeeded by Des Barres, a Swiss officer in the British service, famous for his surveys, his amours and his great age; he jumped over a settle when he was more than a hundred years old. His administration was uneventful, but not so that of his successor, Charles Douglas Smith, brother of the famous Sir Sidney, who foiled Napoleon at Acre, was a fine example of the old-fashioned high Tory royal governor. His first address to the Assembly, when it met in November 1813, was insolent and dictatorial. In the following January, he prorogued it and did not convene it again until 1817. Between this and 1820, the Legislature was three times assembled and dissolved, after short sessions, by this exponent of personal rule. His proceedings in regard to the quit-rents were also oppressive. In 1818, in opposition to the express commands of the home government, Smith enforced the payment of quit-rents in arrears. His action, however, the British government disallowed, and ordered part of the exactions to be refunded. Then, for three years, no attempt was made to collect the odious tax; in some instances, payment was refused by the Receiver-General. In 1823, another effort was made by the governor to enforce payment. The Gaelic-speaking Highlanders of King's County were required to pay dues that seemed obsolete, or give promissory notes at 10 days. In the depth of winter, they must haul their farm produce to Charlottetown and sell at a sacrifice to meet these demands. Without a legislature, the people petitioned High Sheriff MacGregor to call public meetings for the discussion of grievances. The gathering at Charlottetown drew up an address to the King, rehearsing a long list of charges against the Governor, and requesting his recall. Smith retorted by opening a libel suit in the Court of Chancery, over which he himself presided, against the committee on the King's address in Queen's County. His object was to prevent the petitions reaching England, but the custodian of them escaped to Nova Scotia. For merely publishing an account of the proceedings, the editor of the local paper was brought into the Court of Chancery for libel. When he revealed the names of the writers, they were admonished by the chancellor-governor in the vein of Judge Jefferies. This energetic ruler, who shook his fist at the Speaker of the Assembly and gave him three minutes by the watch to adjourn the House, was recalled in 1824, when he had brought his long-suffering province to the verge of rebellion.

Governor succeeded governor; the Island grew in population and prosperity; fisheries and husbandry thrived; but the land question was an open sore. It had now become complicated by the fact that the original proprietors had died and bequeathed, or had transferred their rights in the Island. In 1859 Sir Samuel Cunard

CANADA — CONFEDERATION

(q.v.), the Halifax merchant who founded the famous line of steamers bearing his name, proposed that the whole question be referred to a commission of three members, one to be appointed by the Crown, one by the Island Assembly, and one by the proprietors. To this all agreed. Howe was the nominee of the Assembly. The commission sat in the Colonial Building in Charlottetown, examined many witnesses, though not on oath, and heard counsel on behalf of both parties. They afterwards visited the shire towns and acquired a vast amount of information on the difficulties. Their report is dated 18 July 1861. It condemns the original method of granting the Island, commends the land purchase act, by which the Selkirk and Worrell estates had been acquired for the people, and considers some such system to be the solution of the vexatious problem. It recommends the British government to guarantee a loan of £100,000, which would enable the local government to enter the open market for the purpose of estates. But the home government refused the loan, and the landlords refused to be bound by the findings of the commission. The old difficulty remained until the Island came into the Confederation in 1873, when the Dominion government placed \$800,000 to the credit of the province for the purchase of estates, and the local legislature made the sale of estates, on evocation of commissioners compulsory.

Charlottetown was the scene of the historic conference of delegates from the maritime provinces to discuss union, when the representatives of the Canadas came knocking at the door, but the Islanders were not in favor of any change in their status. There was prejudice, the conception of a new nation was hard to grasp, and the main issue was befogged by parish politics. Although Islanders took part in the Quebec and London conferences also, the Island remained outside Confederation until 1873, when the crippling of the provincial means by extensive railroad building led the people to a reconsideration of the matter. The Dominion Government gave generous terms, and the little province while losing nothing of autonomy, entered into a larger national life. Professor of English Literature, Dalhousie College, Halifax.

7. Canada — Confederation. In 1837 there took place two rebellions; one in Upper and British, the other in Lower and French, Canada, simultaneous, but almost unconnected, and scarcely united in sympathy, since the British Protestants of the upper province were by no means fraternally linked with the French of the lower. In Upper Canada the rebellion was a rising of a democratic party, including many of the most recent colonists and some from the United States, against the personal rule of the imperial governor and the domination of a political circle nicknamed the Family Compact, and consisting largely of U. E. Loyalists, which monopolized public offices and emoluments. Its leader was Lyon Mackenzie, a man honest and

right in his main aim, if responsible government is right, but wanting in wisdom and capacity as a leader. The object of the extreme wing was an independent republic or annexation to the United States. That of the less extreme wing was responsible government on the British model. The political crisis and the outbreak of civil war were brought on by the indiscretion of an inexperienced governor, Sir Francis Bond Head, who (1836-8) threw himself into the arms of the Family Compact and the Tory party. In Lower Canada the rebellion was a rising of the French, the conquered race, who formed the great majority, against the monopoly of office and power by the British and conquering race, exercised largely through a council appointed by the imperial governor. Its object was the assertion of French equality and right. It had been preceded by a series of angry controversies between the French patriots and the governor with his British councillors and the Colonial Office at their back. Both rebellions were quelled (1838) with ease and without much bloodshed; that in Upper Canada by the loyal militia, that in Lower Canada by the Queen's troops. There were few executions, but some of the leading insurgents were driven into exile. The constitution of Lower Canada was suspended, but that of Upper Canada was not.

The Liberal party in the mother country was now in the ascendant, having carried Parliamentary reform. It looked with sympathy on the struggle of the Canadians for free institutions. Lord Durham (q.v.), son-in-law of the Whig prime minister, Earl Grey, and though an aristocrat a strong Liberal, was sent out (1838) to study the situation. In a report of remarkable ability, which has been regarded almost as the gospel of colonial liberty, he decided in favor of extending to Canada responsible government on the British model, requiring the governor, instead of ruling personally, to be guided, like the British sovereign, by the advice of responsible ministers, who were to be designated by the choice of the people. The report at the same time recommended the reunion of the two provinces, a measure the sure result of which its author imagined to be the complete ascendancy of the more powerful race, the destined heir, in his opinion, of the whole North American continent.

Durham, having exceeded the limits of his power, and incurred censure by condemning some ex-rebels to banishment of his own authority, his mission was cut short (1838) but his main recommendations were carried into effect (1839). The provinces were re-united, the measure being carried in the lower province, the constitution of which had been suspended, by the fiat of the Crown; in the upper province, after some debate, by a vote of parliament. Responsible government was introduced. The governor was instructed thenceforth to be guided, like the British sovereign, by the advice of his ministers, who were to be responsible to the people.

In a despatch from Lord John Russell (q.v.) (5 Feb. 1841) the governor-general was instructed to call to his councils "those persons who, by their position and character, have obtained the general confidence and esteem of the inhabitants of the province," and "only to oppose the wishes of the Assembly when the honor of the Crown or the interest of the empire

is deeply concerned.⁹ There soon followed a general amnesty, with return of exiles, and Lyon Mackenzie sat in Parliament under the new régime.

About the same time, and by the action of the same general forces, including the ascendancy of the Liberal party in Great Britain, responsible government on the same model was introduced in the maritime provinces. In Nova Scotia the change was brought about largely by the eloquence of the patriot leader Joseph Howe (q.v.) (1838).

The transition was smoothed by the wisdom of the new governor, Poulett Thompson, Lord Sydenham (1839-42), a man of business, trained in commercial life, who adapted himself steadily and with general success to the introduction and working of the new system. Sir Charles Bagot, who followed (1842-3), though a Conservative, took the same line. But the idea of colonial self-government had hardly taken root in the policy of the Colonial Office or in the minds of British statesmen. Sir Charles Metcalfe (1843-5), the next governor, had been trained in the imperial government of Hindustan, and brought with him the impression that in every dependency the governor was still personally supreme and responsible for the choice of his ministers and for their policy. Acting upon this principle, he attempted to form a ministry (1843) of his own without regard to party designation. A political storm, with furious pamphleteering and ministerial interregnum, were the results. The upshot was failure on the governor's part to form an effective ministry, and his consequent defeat. The colonial secretary, Lord Stanley, however, emphatically endorsed the governor's conduct, and was authorized with his own approbation to convey the personal approbation of the Queen.

The new system was finally installed and brought into order by Lord Elgin (q.v.) (1847-55), one of the best and wisest servants of the empire, who entered fully into the spirit of responsible government, contenting himself with the exercise of an informal influence, rendered important by his character and ability. He could even flatter himself that he did more in this way than he could have done with the formal powers of the governor. He came in, however, for the last of the storm. The Liberal party, now in power, passed an act called the Rebellion Losses Act (1849), indemnifying those who had suffered losses by the destruction of their property in the suppression of the rebellion. This the Tories regarded as the indemnification of the rebels. Their cry was taken up by the Tory party in Great Britain. Elgin gave his assent to the act, reluctantly it seems, in compliance with the rule which required him to be guided by the vote of Parliament and the advice of his responsible ministers. The Tories, now playing the part of insurgents in their turn, rose, burned the Parliament House at Montreal (1849), with its irreplaceable archives, and stoned the governor-general, who had a narrow escape from their fury. Elgin, however, remained firm and was supported by the home government. After this his reign, or rather his term, was peaceful and generally popular, though more popular with the Liberals than with the Tories. The triumph of the free trade policy in Great Britain, depriving Canada of her colonial privileges, while she remained fet-

tered by the Navigation Laws and was excluded from the market of the United States, bred commercial depression and discontent. The consequence was a manifesto signed by leading commercial men and pointing to union with the American republic as a remedy in the last resort. To put an end to this movement by removing its cause, Lord Elgin went to Washington and negotiated a reciprocity treaty with the United States (1854). This, following the repeal of the Navigation Acts and the release of the Canadian trade from the fetters which they imposed, restored prosperity, allayed discontent, and put an end to the desire of annexation. (See CANADA — RECIPROCITY BETWEEN CANADA AND THE UNITED STATES.)

After the Rebellion Losses Bill, the most hotly debated of the political questions was that of the secularization of the clergy reserves (1854) (see CANADA — CLERGY RESERVES), tracts of land which, before the revolution of 1837, when the Church of England was established in Canada, had been set apart for the maintenance of the clergy of the state church. After a long struggle, secularization was carried, and the state church, with its privileges, ceased to exist. King's College, Toronto, which, so far as the teaching staff was concerned, had, like Oxford and Cambridge, been Anglican, was turned into the University of Toronto (see TORONTO, UNIVERSITY OF), and thrown entirely open to all denominations. Under Bishop Strachan, the powerful Anglican leader of the day, high Anglicans seceded from the University of Toronto and founded the University of Trinity College (1852). Other churches, during the continuance of the exclusion, had obtained charters for universities of their own, and dissipation of resources not more than sufficient, if collected, to maintain one great university, was the result.

The abolition of the seigniories (1854) in French Canada (see CANADA — SEIGNIORIAL TENURE), relics of the old Bourbon régime, with the oppressive privileges of the seignior, was another change obviously demanded by the new order of things. It was accomplished peacefully, without violation of the rights of property, and with entire success. Another necessary change was the abolition of the aristocratic custom of primogeniture in succession to land, for which was substituted the democratic principle of equal partition, "gavel-kind," as the movers called it. The Tory party, sympathizing with aristocracy, faintly resisted the change. The progress of democracy was further marked by a change in the constitution of the Legislative Council which formed the Upper House of Parliament. Instead of being nominated by the Crown, as it had hitherto been, it was in 1856 made elective.

The party system of government was now in full play, but the principles and relations of parties were far from being definite or stable. There was a Tory party representing the U. E. Loyalists, and the traditions of the Family Compact under the leadership of Sir Allan MacNab, who opposed the secularization of the clergy reserves and the abolition of primogeniture. There were on the other side moderate Liberals under Baldwin and more advanced Liberals under Hincks. But the lines of political party were crossed and perplexed by the nationality of French Quebec. The French Catholics,

CANADA — CONFEDERATION

instead of succumbing politically to British predominance as Durham had imagined that they would, closed their ranks, showed their force, played on the balance between the British parties, and put a Frenchman, in the person of La Fontaine, at the head of the government. For a time it became an understanding that a government, to hold its ground, must have a double majority; that is, a majority both in the British and the French province. The act of reunion had given to the provinces general representation in Parliament, though the population of the French province was much larger than that of the British. Presently the balance of population turned in favor of the British province. The Liberal leaders of the British province, the most pronounced of them at least, then demanded a rectification in its favor. With the political strife about representation by population, "Rep. by Pop.," as it was called, mingled the religious antagonism of the British Protestants of the upper province to the Roman Catholics of the lower. The great advocate of representation by population, and at the same time the extreme exponent of the feelings of the Protestants against the Catholics, was George Brown (q.v.), a Scotch Presbyterian, and founder of the Toronto *Globe*, the most powerful organ of the British Canadian press in those days. On the other side appeared Mr., afterward Sir, John Macdonald (q.v.), one remarkably gifted with the arts of party management, and with an address in dealing with men which in his chief antagonist, George Brown, was wanting. Macdonald supplanted in the leadership of his party the old-time Tory, Sir Allan MacNab (q.v.), Liberalized it, and set it free from all incumbrances in the way of reactionary principle by which, up to this time, it had been weighted in the struggle for place. It was a stroke of strategy something like that performed in England by Sir Robert Peel (q.v.) when, accepting the consequences of the Reform Bill, he changed his party from Tory to Conservative. Between Macdonald and Brown there was, and to the end continued there to be, enmity, personal as well as political. But Brown was no match for Macdonald in playing the party game. Once for a moment, by a casual defeat of the government of which his rival was a member, he set his foot on the steps of power (1858); but he immediately fell again. Sir Edmund Head, then governor-general (1855-61), having, by an unwonted exercise of the prerogative, which Brown furiously resented, refused him the dissolution and appeal to the country which he demanded (1858). Questions and principles of all kinds were crossed by personal ambitions and connections, as well as by the national sensibilities of Quebec, which naturally carried her to the side of the Conservatives rather than to that of the advocates of representation by population, the hot Protestants and the Orangemen.

The end, after a rapid succession of changes of ministry, producing a total instability of government, was a ministry with a majority so narrow that it was said that the life of the government depended on the success of a page in finding a member at the moment of critical division. The upshot was a deadlock. The relation between the two races, owing to the persistent attacks of George Brown's party on the French Catholics, had at the same time become critical and dangerous. From this position an

escape was sought by merging the antagonism of British and French Canada in a confederation of all the British colonies in North America. The credit of proposing confederation has been assigned to different politicians, to George Brown, to Sir John Macdonald, to Sir Alexander Galt. Of the party leaders, it was George Brown who first came forward holding out his hand to his rival, Sir John Macdonald, to propose coalition for the relief of the situation. But Mr. Brown's original proposal was not a confederation of all the provinces, but a substitution of a federal for the legislative union between the British and the French province. What Sir John Macdonald, as a strong Conservative and monarchist, preferred was not a federal but a legislative union of all the North American colonies under the British Crown. What all alike wanted was a relief from the situation, and for this purpose a coalition government comprehending the two rivals and enemies, Sir John Macdonald and George Brown, with followers of both, was formed (1864). The fact is that the real author of confederation, so far as British and French Canada was concerned, was deadlock.

The three maritime provinces, Nova Scotia, New Brunswick, and Prince Edward Island, were inclined to a separate union among themselves, especially with a view to a reduction of the expenses of government. A conference of delegates from those three maritime provinces was held at Charlottetown (1864). To that conference delegates were sent by the coalition government of Canada to propose a wider union. The result was a conference at Quebec (1865), at which 12 delegates were present from Canada, 7 from New Brunswick, 5 from Nova Scotia, 7 from Prince Edward Island, 2 from Newfoundland. That conference sat for 18 days and passed 72 resolutions, on which the act of union was afterward based and which each delegation undertook to submit to its own government.

By the Parliament of the two Canadas the scheme was at once accepted and by a large majority, though there was a long debate, in which a speaker of the opposition glanced at the geographical unfitnes of the long and broken line of provinces for political union. New Brunswick, not being adroitly approached, at first rejected the scheme, but presently acquiesced. In Nova Scotia the resistance was very strong, but it still remains a mystery by what arguments a legislature elected expressly to oppose confederation was brought round to its support. Brought round, however, the legislature of Nova Scotia was. Howe, after a vain appeal to the British Parliament to set Nova Scotia free, himself took office in the confederation government. Prince Edward Island held out, but came in at last. British Columbia threatened repudiation of the union, till the construction of the Canadian Pacific Railway, which was the condition of her entrance, was assured. Newfoundland still remains unfederated. But a great addition was soon afterward made to the Dominion by the purchase of the Hudson's Bay country now comprising the province of Manitoba and the Northwest Territories. The accession of Newfoundland alone is wanted to complete the scheme of confederation. The scheme having been framed by the colonial legislature, was laid for revision before the British government, and

by it embodied in the British North American Act. (30 and 31 Vict. Cap. 3; 1867.)

When confederation was passed, party lines were drawn again. Brown seceded from the confederation government and the political enmity between him and Sir John Macdonald became as bitter as before.

The Federal constitution was never submitted, like the Constitution of the United States, to the people. It was alleged that in a general election which followed, and in which the confederation government was sustained, the people virtually expressed their approbation. But it is obvious to remark that in this election other issues were submitted and other influences, that of party especially, played their part. So that it cannot be truly said that the constitution of Canada has even been distinctly ratified by the Canadian people.

8. Canada — Since Confederation. On 1 July 1867 there were great rejoicings in Canada for it was the birthday of the new Dominion. But at that time the work of founding a Canadian nation was only begun; much remained to do. As it stood on 1 July 1867 the Dominion included only four provinces: Nova Scotia, New Brunswick, Quebec, and Ontario. (q.v.) and of these Nova Scotia was profoundly discontented and, since her people had never voted upon the question, desired to withdraw from the confederation. Nor did Canada possess the entire East. The two important islands, Newfoundland (q.v.) and Prince Edward Island (q.v.) still held aloof; not until 1873 was Prince Edward Island persuaded to join the Dominion, while Newfoundland still stands apart. The vast Northwest, to-day the chief pride and promise of Canada, was not then included within her territory, nor was its entry brought about without discontent and bloodshed. It had long been a hunting preserve for the Hudson Bay Company, but in 1870 by paying to the company £300,000 to extinguish its rights Canada removed every obstacle to her absorption of those regions. In 1871 British Columbia (q.v.) consented to enter the Union, but was long restless and threatened to withdraw unless a transcontinental railway was promptly built. With all these jarring elements assuredly Canada, when confederated, had no real union, and the subsequent work of her statesmen has been chiefly to consolidate her scattered fragments.

The leader who played the chief part in this work of consolidation was Sir John A. Macdonald (q.v.). In many ways, in wit, in intellectual agility, sometimes in cynical carelessness as to the means he used to secure his ends, he was strikingly like Lord Beaconsfield; but whenever the vital political interests of Canada were concerned, invariably, according to his light, he showed a whole-hearted patriotism. He was filled with passionate devotion to the British

Crown and treasured for Canada the ideal that she should be a kingdom modeled on that of Great Britain, taking her place on equal terms as an auxiliary of the United Kingdom. He did not favor federal government, and would have preferred to give Canada one all-powerful legislature like that of Great Britain. But in these respects conditions were too strong for Macdonald. His cherished "Kingdom of Canada" became the "Dominion of Canada" in deference to the supposed prejudices of the American republic against a monarchical neighbor, and he was obliged to assent to a federal system because the French in Canada insisted upon a measure of autonomy only to be secured in this way. It was the pending "Alabama" question that made Britain so anxious at this time to defer to the opinion of the United States. This and questions more directly affecting Canada were settled by the Treaty of Washington, 1871 (q.v.).

Macdonald was Prime Minister of Canada for the long period, 1867 to 1866, with the exception of an interval of about five years, lasting from November 1873 to October 1878. Inevitably he did the work of proving the federal system which he had helped to create. There was trouble from the first. When as a result of the bargain with the Hudson Bay Company Canada assumed jurisdiction in what is now Manitoba, some of the settlers already established there objected to being handed over like cattle to a new government. Surveyors sent in by Canada were turned back; officers going into the country to assert Canadian authority met with a like experience; and at last the half-breed inhabitants under their leader, Louis Riel (q.v.), set up a provisional government at Fort Garry, now Winnipeg (q.v.), and defied the Government of Canada. They tried and summarily executed Thomas Scott, a citizen who opposed their proceedings, and they threw other leaders into prison. See RIEL REBELLION.

In 1870 it was not easy for Canada to assert her authority in the remote settlements on the Red River. She might not use for military purposes the territory of the United States, which offered the most convenient route, and she was therefore obliged to send troops through the vast wilderness lying north of Lake Superior. The present Lord Wolseley, then holding a military command in Canada, was chosen to lead a small army to Fort Garry and did the work with brilliant success. After a toilsome journey through hundreds of miles of wild and barren country Wolseley at length reached Fort Garry only to find that Riel and his provisional Government had fled at the approach of the Canadian force. Rebellion crushed, the work of pacification was conducted partly with the aid of Mr. Donald A. Smith, now Lord Strathcona, an official of the Hudson Bay Company. Manitoba soon became a full-fledged province in the Canadian federation and has since played an important part. In view of the present status of Winnipeg, the third city in Canada, with nearly 100,000 inhabitants, it is interesting to remember that it had not even the telegraph in 1870 and that the railway did not reach the town until 1878.

The trouble in Manitoba settled, Canada had next to pacify her remote Pacific Province, separated from her by an immense and almost unpeopled wilderness. In 1871 British Columbia

CANADA — SINCE CONFEDERATION

entered the confederation on the condition that a railway across the continent should be begun within two years and completed within ten. At the time the province contained but a few thousand people of European origin, and there were complaints in eastern Canada that the vast expenditure involved in the bargain would burden too heavily the country's resources. But, on pain of her withdrawal from the union, British Columbia insisted angrily that the bargain should be carried out, and her attitude brought to the front the building of the trans-continental line which was to prove of supreme moment to Canada.

That Canada's small population should spend a hundred million dollars on this undertaking was a stupendous proposal; on the basis of the proportionate cost for each head of population a project for the United States to spend \$2,000,000,000 would be its equivalent. But to build the railway was the condition of national existence in Canada, and in the end the thing was done. Not, however, before the project had long disturbed Canadian political life and threatened to overwhelm its promoters with ruin. When the Canadian Pacific Railway (q.v.) was projected Canada was face to face with the question that has perplexed all the progressive states of modern times. Should the railway be a government or a private enterprise? Though a similar line, the Inter-Colonial Railway, connecting the eastern provinces, was a state enterprise, the cabinet of Sir John Macdonald shrank from saddling the country with so vast a burden as a railway to the Pacific, and it was resolved to hand over the task to a private corporation.

In 1872 there was a general election in Canada, and in the session of Parliament which followed the Canadian Pacific Railway Company with Sir Hugh Allan as president, secured a charter to build the road, and with this went also assurances of assistance from Canada amounting to many millions. But when, as a result of the exposure by the Opposition, the fact came out that Sir Hugh Allan had contributed more than \$350,000 to Sir John Macdonald's campaign fund for the recent election, this "Pacific Scandal" brought the downfall of the Government, which had accepted the obvious bribe. Amidst huge excitement Sir John Macdonald resigned and the Liberals with Mr. Alexander Mackenzie (q.v.) as prime minister took office in November 1873.

For five years the Liberals remained in power. Throwing less energy into the construction of the Pacific Railway than had been promised, they met naturally with discontent in British Columbia. The menace of withdrawal from the confederation was renewed and at length the matter was referred for arbitration to Lord Carnarvon, the colonial secretary, in London. He decided that the original terms were too onerous and proposed new ones under which a trans-continental railway should be opened by the end of the year 1890. When the Liberal Government thought even this almost impossible of accomplishment, "Carnarvon Terms or Separation" became the war cry in British Columbia. Financial depression overtook Canada in 1876-8 and this heightened the difficulty of the question. But in 1876 the Governor-General of Canada, the Earl of Dufferin, visited British Columbia to soothe her discontent, and he helped to tide over the period of danger. It is interesting to specu-

late whether an attempt to withdraw from the Canadian union would have been resisted, if necessary, by force of arms. Probably the Canadian and Imperial Governments would have agreed in using coercion.

The financial depression that helped to delay contentment for British Columbia produced effects in Canada even more far reaching, for it led to the cleavage of political parties on the question of Protection (q.v.) or Free Trade (q.v.). In 1878 Canada had a tariff of 17½ per cent, which was hardly sufficient for her growing revenue requirements. During a generation she had tried to secure a free exchange of natural products with the United States and in 1854 her governor, Lord Elgin, had succeeded in making a Reciprocity Treaty on this basis. But the Treaty was not long in force and when abrogated at the close of the Civil War a heavy tariff upon Canadian products was soon imposed by the United States. Over and over again Canada tried to secure the reversal of this policy but always in vain. Meanwhile the low Canadian tariff permitted American manufacturers to supply the Canadian market at prices with which the necessarily smaller producers in Canada could hardly compete, and in time the cry for increased Protection was often heard. Had Mr. MacKenzie's Government taken it up in 1878 probably Sir John Macdonald would have rallied his forces under the banner of Free Trade. But when the Liberal leader refused tenaciously to adopt Protection, Sir John Macdonald proclaimed it as a "National Policy" for building up Canada, and the Canadian electorate, forgetting the discredit which attached to him in connection with the Pacific scandal, returned him to power by an overwhelming majority. Since that time Protection has retained its hold upon Canada, for though the Liberals favored free trade they disturbed the system but slightly on their advent to power in 1896. See CANADA — RECIPROcity BETWEEN CANADA AND THE UNITED STATES.

An era of great expansion followed the adoption of a protective tariff in 1879. A great many factories were established, and the building of the Canadian Pacific Railway was pushed on with unparalleled energy; in 1885, five years before the time named in the contract, the last spike was driven in the line connecting Western and Eastern Canada and British Columbia's grounds for discontent were finally removed. Once completed the road's value not only to Canada but to Great Britain was soon apparent. Not only did it unite the Canadian provinces, it furnished a ready all-British land route to the East. The Canadian Pacific Railway Company in time established lines of steamers crossing both the Pacific and the Atlantic, and the project, looked upon as a doubtful possibility in 1878, has now become one of the chief arteries of world commerce.

The completion of the Canadian Pacific Railway was almost co-incidental with a second rebellion of half-breeds in the Canadian West. On the banks of the Saskatchewan, not far from a village called Prince Albert, there was a colony of these people. They had long lived remote from the larger world, and when their country was invaded by the pioneers of modern movement, they began to doubt whether they should be left in permanent possession of the lands they had long occupied. Upon these lands they were

technically "squatters" for they had no patents and no surveys had been made. When at length Canadian surveyors came to lay out their fields on a uniform plan, disregarding the divisions which they had established, the half breeds protested and demanded that they should be granted patents for their lands as they stood. At Ottawa their protests were filed but remained unheeded. The official mind was aghast at the prospect of land grants not based upon the usual survey; the half breeds could get nothing done and they grew ever more restless at the supposed menace to their rights. Disinterested observers sent to Ottawa warnings of a probable rising but official supineness was invincible, and the result of neglect and delay was that in March 1885 the despairing half breeds attacked a body of police, killed 12 out of 40 engaged, and defied the authority of Canada. Since it was not unlikely that they would be joined by the Indian tribes the outbreak was serious.

The half breed leader was the same Louis Riel (q.v.) who had caused trouble in 1870. On its hands the Government now had a difficult task. As in 1870 it might not send troops through the United States, and the railway on the north shore of Lake Superior connecting Eastern and Western Canada was not yet completed. In bitter March weather, with the thermometer often below zero, the regiments of militia summoned from Eastern Canada, all unprepared by previous hardship to endure the cold, traversed the desolate shores of that frozen region. Sometimes in open flat cars, for more than a hundred miles on foot, they proceeded over the snow. An experienced officer of the expedition declares that the task was more severe than Napoleon's passage of the Alps, for Napoleon had a beaten road and an abundant commissariat, while both were wanting in the Canadian wilderness. The regiments soon poured into the West in overwhelming force and though the few half breeds made a brave stand against great odds, they were quickly crushed. Their Indian allies the Canadian troops wearily followed to their almost trackless haunts, and so the Rebellion was put down. A few of the rebels were hanged; a good many of the Indians were imprisoned; Riel, the leader, was taken, and then his fate became a question of national concern in Canada.

With Riel the French Canadians had ties of faith and of blood. French Canadians had been pioneers in the Northwest and at times they had dreamed of holding that vast region for their language and faith. If fate was against them, if it was the Anglo-Saxon who was occupying the country and in influence was destined to dominate, none the less was chivalrous support due to the few people who stood in the West for the ideals of France and of the Roman Catholic Church. In 1870 Riel had appealed not in vain to the French in Quebec for help in his time of trouble and it was probably the strength of their sympathy which then saved him from the scaffold. Since in 1885 the men who took up arms had more real grievances the Church espoused their cause. In the Province of Quebec Liberals and Conservatives forgot their quarrels to protest in the name of justice and French Canadian nationality against rigorous treatment of the rebel leader, Louis Riel. On the other hand the English demanded that the law should take its course. Riel had led a revolt in which

law-abiding citizens were shot down. If he was a murderer the penalty of murder was his due. The demand was too urgent to be disregarded. Riel was tried; in the eye of the law the penalty of his crime was death, and in November 1885 he was hanged at Regina, the capital of the Northwest Territories. See RIEL REBELLION; see also CANADA — JESUITS ESTATES ACT for another religious and racial question in Canada in 1888-9.

The Government's course in regard to Riel was a defeat for the French Canadian Bishops who had long played an active part in political life. They claimed that even in secular affairs the authority of the bishops was final and that when they spoke the laity were bound to obey. If the Church chose to indicate her desires in regard to the merits of candidates seeking election, it was the duty of the voter to heed the voice of his spiritual directors. Some of the bishops claimed the right to use spiritual censures to influence electors. Newspapers who opposed the wishes of the hierarchy must not be read by the faithful, and when *L'Electeur*, a daily newspaper in Quebec, opposed the bishops' *Mandements* in 1896 it was denounced from the altar, and under penalty of grievous sin and the refusal of the sacraments all the bishops forbade formally anyone to read it, subscribe or contribute to it, to sell it, or in any manner whatever encourage it. The denunciation commanded obedience and made the continued existence of the paper under its existing name impossible. It promptly became *Le Soleil*, and seemed to suffer little real injury, but the incident showed the authority claimed and exercised by the bishops.

With this attitude on their part occasions of strife were not likely to be wanting. In 1890 the Manitoba Government passed an Act establishing a non-sectarian system of education. Owing to the peculiar conditions of older Canada the Protestant minority in the Province of Quebec had secured the constitutional right to devote the taxes paid by them for education in support of their own schools. In Ontario the Roman Catholic minority possessed a similar privilege. For some time Manitoba had followed the example of Ontario, but, impressed by the obvious advantages of a uniform system, the legislature passed the Act of 1890 which deprived Roman Catholics of former privileges. At once a vehement agitation broke out. The Federal Government possesses, within certain limits, the right of disallowing statutes enacted in the provinces and urgent demand was made upon the Government of Sir John Macdonald to disallow the Manitoba School Bill. This, on the ground that Manitoba was acting within its constitutional rights, the Government refused to do. Appeal was then made to the courts to determine the authority of the respective Governments in the matter and the case was finally carried to the Privy Council in London, which decided that the Federal Government possessed the right of intervention in regard to the Manitoba schools.

Extraordinary pressure was then brought to bear upon the Federal Government. The hierarchy of the Province of Quebec took up the question with much heat, while the Protestant Province of Ontario was also aroused in support of the opposite side. In 1891, when Sir John Macdonald died, his successors were left with the legacy of the Manitoba School Question.

The agitation dragged on for five or six years. Retreat from their position the Manitoba Government would not, and finally, in 1896, the Federal Government endeavored to put through Parliament a Remedial Bill for restoring to the Roman Catholics of Manitoba the privileges which had been taken away.

It was this question that brought the downfall of the Conservative party so long dominant in Canada, a process accelerated by evidence adduced in 1891 of a share by responsible leaders in the Province of Quebec in the misuse of public funds. In 1896 Sir Charles Tupper (q.v.) became Prime Minister and in a general election appealed to the country to do justice to the minority in Manitoba. On this question many of his Conservative allies broke away from him and he fought a stern but losing contest. The Liberals too were in a difficult position. When Sir John Macdonald's old rival, Mr. Alexander MacKenzie retired from the leadership of the party in 1880 he was succeeded by Mr. Edward Blake, who, in turn, proved unable to overthrow the Conservative chieftain. In 1887 Mr. Blake retired and was succeeded by Mr., afterwards Sir Wilfrid, Laurier. In personal charm and tact the new leader was not unlike his formidable rival, and he had, besides, remarkable gifts as an orator. French Canadian by birth and also a Roman Catholic, it was not easy for him to lead the Liberal party, which was committed unreservedly against interfering in Manitoba. In Mr. Laurier's own Province of Quebec the hierarchy were still unanimous in demanding intervention to re-establish the Roman Catholic schools. The election of 1896, fought chiefly on this issue, resulted in a conspicuous Liberal triumph and it was in Quebec that Mr. Laurier found his most striking support. Either the issue in regard to Manitoba had been obscured or the "*habitant*" wished to assert his right to pass judgment for himself in political matters independent of the views of the hierarchy. At any rate Mr. Laurier became prime minister of Canada. The Manitoba Government made some minor concessions and the matter passed out of view, but an important warning against interfering with the authority of the Province had been given to the Federal Government.

The Liberal party had long championed the cause of freer trade and declared itself the enemy of Protection; it was therefore committed to some modification of the existing Protective system. But, once in power, it found that, since important industries had grown up under the tariff, this could not be changed in any radical manner without ruin to those concerned. While doing something to reduce Protection the Government took a further remarkable step. The year 1897 saw the completion of 60 years under Queen Victoria's sovereignty, and there was a general desire to draw more closely together the different sections of the empire, and thus to assert British unity. In pursuit of this idea Mr. Laurier's government announced that a preference of 25 per cent (later increased to 33½ per cent) would henceforth be allowed to countries whose tariff gave a favorable opening to Canadian products. Since Britain alone gave such treatment the preference was confined to her, though other countries might share in it on the terms laid down. Both in England and in Canada the Preferential Tariff aroused great enthusiasm and no doubt it aided in bringing to a

head Mr. Chamberlain's scheme, announced a few years later, for a Preferential Tariff in the mother country for colonial products. See CANADA — BRITISH PREFERENTIAL TARIFF.

In 1898 the Liberal Government had a renewed opportunity to proclaim its devotion to British connection. When war broke out in South Africa and soon proved more serious than had been thought possible, Canada promptly volunteered to send military contingents in reinforcement of the British troops. The contingents saw some service and a good many Canadian soldiers lost their lives. Naturally the French Canadian showed less enthusiasm for what was in large degree a racial war than did the British element. Only a few French Canadians served in the contingents, and some voices protested against Canada's participating in British wars. But the overwhelming opinion of the country supported the rally to Britain's aid; when the Government appealed to the country in 1900 it gained an easy victory, partly upon this issue.

A little earlier the discovery of gold in remarkable quantities in the Yukon Territory, arousing as it did world-wide interest, naturally attracted attention to a part of Canada hitherto thought of little value. The possession by the United States of the adjacent coast of Alaska (q.v.) through which lay the best route to the new gold country, seriously impaired the value to Canada of the territory. The boundary between Alaska and Canada had long been the subject of dispute, the Canadians contending that since, under the terms of the determining treaty, the line should run from headland to headland, the land at the head of the inlets which furnished the most ready access to the Yukon were in reality British territory. Canada's cause was prejudiced by the fact that (though not without occasional protest) she had acquiesced in the American contention that the boundary line followed the sinuosities of the shore. A disputed boundary is always dangerous. Besides this question there were other matters requiring settlement between the United States and Canada, and at last, in 1898, a Joint High Commission, including prominent representatives of both the American and British side, was appointed and sat for some weeks at Quebec and then at Washington. In addition to the Alaska Boundary the Commission was, if possible, to agree upon a settlement of the differences in regard to the seal fishery in Behring Sea and the Atlantic fisheries; and besides minor matters was to consider the general trade relations between the two countries. Points of variance proving too great, the Commission effected nothing but in the end the two Governments agreed that six jurists of repute, three to represent each side should be appointed with authority finally to settle the Alaska Boundary. In the end a majority of the commissioners gave, in 1903, a decision favorable to the claims of the United States. Lord Alverstone, the British commissioner who supported the American contentions, was severely censured in Canada for an attitude that seemed more diplomatic than judicial, but in spite of a passing irritation there was general satisfaction that a troublesome issue had at last been settled. See ALASKAN BOUNDARY COMMISSION.

If the recent history of Canada has not been dramatic it shows none the less a record of great progress. For a long time the population of the

country increased very slowly. While successive decennial censuses in the United States usually showed increases of about 25 per cent in the population, the increases in Canada were hardly 10 per cent. In recent years, however, an improvement is apparent. Population is increasing rapidly. While formerly there was extensive emigration from Canada to the United States there is now a considerable movement from the United States to Canada and a good many American farmers are occupying the wheat lands of the West. (See CANADA — SETTLEMENT OF THE CANADIAN WEST.) So striking is this Western development that in 1904, further to open up the western country, a second trans-continental line of railway, the Grand Trunk Pacific, was begun, and a third line, the Canada Northern, will probably be completed before many years. These railways will traverse regions far north of Canada's southern frontier, and by extending northward the cultivated area will help to remove from Canada the old reproach that she is "length without breadth." Canada now has confidence in herself to which she was long a stranger. The troublesome domestic issues which played the chief part in her history since Confederation are pretty well solved; the old racial cries are not often heard, and when uttered they usually bring political disaster to those raising them. See CANADA — CONFEDERATION; CANADA — RELATIONS TO GREAT BRITAIN.

GEORGE M. WRONG,

Professor of History, University of Toronto.

9. Canada — The Canadian West. It is doubtful if a British sovereign ever made a more munificent grant to a company of his subjects than did Charles II., in the year 1670, to "The Governor and Company of Adventurers of England trading into Hudson Bay." The sweeping terms of the royal charter defined an area stretching from Hudson Bay to the Rocky Mountains, to which was given the name of Rupert's Land, in honor of the king's cousin, Prince Rupert, the company's first governor. In spite of the hostility of the French Canadian government and the competition of rival traders, the Hudson's Bay Company succeeded in holding this territory down to the date of its cession to Canada two centuries later. Although a century had elapsed since Sir Francis Drake had sighted the snowy peaks of the Pacific coast, and half a century since the ill-fated Henry Hudson had discovered the bay which became at once his grave and the monument of his achievement, yet the history of the Canadian West may be said to date from the founding of the Hudson's Bay Company. See CANADA — THE HUDSON'S BAY COMPANY.

The presence of the English company upon the shores of Hudson Bay was from the outset a serious menace to French Canadian influence in the Northwest. The newcomers were drawing off the trade of the northern tribes. English and French were face to face in a struggle for commercial supremacy in the West, and their rivalry was bound sooner or later to break into a clash of arms. The Hudson's Bay Company had strengthened its position by the establishment of four trading-posts: one upon the west shore near the Nelson, and the other three, Forts Albany, Hayes, and Rupert, on the south arm of the bay. In the spring of 1686 the progress of trade was rudely interrupted. Chevalier de

Troyes and a company of 80 adventurous Frenchmen, ascending the Ottawa, worked their way slowly by stream and lake over the height of land to the neighborhood of James Bay. So sudden was their coming, and so spirited their attack, that the three lower forts fell almost without resistance.

In 1697 Pierre le Moyne D'Iberville, who had been De Troyes' right-hand man, entered Hudson Strait, under orders from Quebec, to attack Fort Nelson, the most important trading-post on the bay. The Pelican, which carried the commander, became separated from the rest of the fleet, and fell in with three English ships belonging to the Hudson's Bay Company. In the encounter which followed the Pelican sank one of the company's ships and disabled a second, while the third made off under full sail. Rejoiced by his missing ships, D'Iberville soon forced Fort Nelson to surrender. In 1713 the Treaty of Utrecht put an end to hostilities and left the English traders in undisturbed possession of their posts.

Meanwhile French Canadian traders were extending their trade beyond Lake Superior. With these there was ever present the desire to find *La Mer de l'Ouest*, which they thought could not be far distant. The ambition to discover this "Western Sea" possessed the mind of Pierre Gaultier de Varennes de la Vérendrye, the commander of a little post on Lake Nepigon. It was late in August 1731 that Vérendrye and his party passed over Le Grand Portage leading over the height of land to the waters flowing toward Lake Winnipeg. The mouth of the Maurepas (Winnipeg) River had been reached when troubles began to crowd upon the unfortunate explorer. The merchants who were to forward supplies failed to do so; his nephew died; and, as a climax to his misfortunes, 21 of his company, including his eldest son, were butchered by a band of murderous Sioux. It was not until six years later that Vérendrye again turned his face westward. The course of his travels was marked by a series of trading-posts built at successive stages. Among these were Fort La Reine, near the site of the present town of Portage la Prairie, and Fort Rouge, whose name still clings to a suburb of the city of Winnipeg.

During the last century of the French régime the Hudson's Bay Company had held its own throughout the dangers of war and the competition of trade. Its forts had fallen into the hands of De Troyes or D'Iberville, but had been restored by the Treaty of Utrecht (q.v.). Though the dangers of war were past, the rivalry of the Canadian traders had still to be met. Despite the long overland journey, the latter penetrated to the neighborhood of Hudson Bay, attracting the Indians with showy trinkets, and too often with brandy. The majority of the natives, however, were not easily drawn away from the old company's forts. Every spring the rivers and lakes were dotted with fur-laden canoes making their way to Lake Winnipeg, the meeting place of the hundreds of natives who journeyed annually to Hudson Bay. As many as 500 canoes in a year made the long and toilsome journey to York Factory. Here they exchanged their dearly-earned furs for coats, blankets, kettles, and tobacco, or for necessities of the hunt, such as guns, powder, powder-horns, shot, hatchets, and knives.

The conquest of Canada by Great Britain brought about an immediate and complete change in the fur trade. With the passing of the French régime, monopoly and licenses disappeared. The officers of the French company withdrew from the country rather than live under the British flag. The *coureurs de bois*, suddenly cast adrift, lacked the capital necessary to continue the fur trade. New employers, however, were soon at hand. The old route from the East, up the Ottawa and across Lake Superior to Grand Portage, had scarcely forgotten the passing of the French traders when it was traversed afresh by British merchants from Montreal. Alexander Henry, Thomas Curry, James Finlay, and the Frobisher brothers were the hardy forerunners of a new race of traders, whose enterprise and daring soon carried them into the Saskatchewan and Athabasca districts. In order to compete the more successfully with their long-established rivals, the newcomers, who at first traded individually, decided upon union, a decision which led to the founding in 1783 of the Northwest Company. Under the stimulus of competition the operations of both companies quickly extended northward to Lake Athabasca and westward to the foot-hills of the Rockies.

The necessity of enlarging the field of trade gave a remarkable impulse to exploration. In penetrating the unknown lands, north and west, the pioneer traders rendered invaluable service to their country. The honor of leading the way into the northland belongs to Samuel Hearne, a servant of the Hudson's Bay Company. Setting out from Prince of Wales Fort, Hearne succeeded, after two failures, in reaching the Coppermine River. He was the first white man to arrive at the Arctic shores from the interior. The men of the Northwest Company were not slow to follow the example of their rivals. No name holds a prouder place in the annals of American travel than that of Alexander Mackenzie. Fort Chipewyan, situated upon the shores of Lake Athabasca, the trade centre of the north, was the starting point of his two great journeys. The "Western Sea," the elusive goal of Vérendrye's travels, was the object of Mackenzie's quest. His first journey, made in 1789, terminated at the Arctic Ocean. Choosing a more westerly stream for his second attempt, Mackenzie ascended the Peace River to its source in the Rockies, crossed the height of land, and, after descending the Fraser River a short distance, struck out across country for the sea. The successful issue of the journey was proclaimed by the following words inscribed upon the face of a rock overlooking the waters of the Pacific: "Alexander Mackenzie from Canada by land, the twenty-second of July, one thousand seven hundred and ninety-three." Two other Nor'westers, Simon Fraser and David Thompson, also made their way to the Pacific Ocean, the former in 1808 by the river which bears his name, the latter in 1811 by the Columbia.

While British explorers were forcing a way across the continent, British seamen were making good their country's claim to the Pacific coast. In 1778 Captain Cook touched at Nootka, on Vancouver Island. At this centre of trade Captain John Meares 10 years later established a settlement, which unfortunately was soon destroyed by the Spaniards. In 1792 Captain

George Vancouver, being sent out to inquire into the action of the Spaniards, forced the latter to withdraw from the scene of their outrage. As the result of arbitration Great Britain received the entire coast line.

Down to the close of the 17th century the ruling interest of the West centred in the fur trade. Lord Selkirk it was who first conceived the idea of planting a settlement at the heart of the continent. From the Hudson's Bay Company he secured a grant of 110,000 square miles in the valley of the Red River, a district henceforth called Assiniboia. Settlers were hurried out from Scotland, and in 1812 a small company, 70 in number, made its way inland from York Factory.

The newcomers were looked upon as intruders by the Nor'westers, who suspected that Lord Selkirk, being a shareholder in the Hudson's Bay Company, had planted his colony to interfere with the trade of the Canadian company. The early years brought trying experiences to the settlers. So great was the scarcity of food that the governor, Miles Macdonell, issued a proclamation to the effect that "no provisions, flesh, fish, grain, or vegetables were to be taken out of the lands of the settlement for a year." This action brought the hostility of the Nor'westers to the point of violence. Some of the colonists were bribed to desert, the remainder were driven out by a band of Métis, or half-breeds. Almost immediately, however, the refugees returned, reinforced by another company of immigrants. With the new arrivals came Robert Semple as governor.

Meanwhile Lord Selkirk had arrived in Canada. Hearing at Montreal of the misfortunes of his colonists, he had engaged the services of 100 discharged soldiers and set out for the West. While he was yet on the way, stirring events were happening in the Red River Valley. The Nor'westers, angered by the destruction of their fort on the Red, bestirred themselves to destroy the settlement. A strong band of half-breeds was gathered at Portage la Prairie, under the leadership of Cuthbert Grant. Upon 19 June 1816 Governor Semple was informed that a body of horsemen was approaching over the prairie. Taking a small force, he marched out to inquire the purpose of the intruders. This move precipitated a skirmish at a spot now marked by the Seven Oaks monument. When the firing ceased Semple and 21 of his followers lay dead or mortally wounded. By this disaster the settlers were forced to again leave their homes.

The news of Seven Oaks was the signal for great rejoicing at Fort William, the headquarters of the Northwest Company. The joy of the Nor'westers, however, was rudely dispelled by the sudden arrival of Lord Selkirk. The latter, acting in the capacity of magistrate, arrested several of the leading partners, and sent them down to York, Upper Canada. In the following spring he pushed on to the Red River, where he promptly restored the ejected colonists to their farms, settled his soldiers about Fort Douglas, and made a treaty with the Indians.

When the news of the tragic death of Semple and his men reached England, the Imperial government at once interfered. Both parties to the quarrel were ordered to give up all posts and property seized. The death of Lord Selkirk in the year 1820, though to be regretted,

was beneficial to the West, removing as it did the last obstacle in the way of a union of the fur companies.

After the union, which took place in 1821, the management of the company's affairs rested with an official known as the governor of Rupert's Land, assisted by a council of chief factors and traders. A strong man was needed for the governorship, and such an one was found in the person of a young Scotchman named George Simpson, who ably guided the fortunes of the company during the next 40 years. To the enterprise of the Hudson's Bay Company, in no small measure, Great Britain owes her control of the Pacific coast. From the north Russia, from the south the United States, were pressing rival claims which threatened to shut out Great Britain entirely from the sea. Under Simpson's aggressive administration the country between the Rockies and the Pacific was occupied. A fleet of six armed vessels protected the company's coast trade, of which Fort Vancouver was the centre.

Meanwhile the Selkirk settlement, clustering about the historic walls of Fort Garry, was winning its way to prosperity. The hardships of pioneer life in the East were here repeated. Spade and hoe, sickle and cradle, flail and quern, all told of the day of small things. A series of disasters, in the form of grasshoppers and floods, failed to shake the courage of the sturdy settlers. The growth of the colony made necessary a change of government. The people complained that the members of the council of Assiniboia were paid servants of the company, and did not, therefore, represent the popular will. Discontent was a sign of progress, a sign that the settlement was growing beyond the control of a fur company.

The steadily growing importance of the Pacific country made it imperative to determine the boundary line between American and British territory in the West. The 49th parallel was the accepted line as far as the Rockies, and it was agreed that for the time being the country beyond the mountains should be "free and open" to both nations. In 1846 the Oregon treaty continued the boundary line along the 49th parallel to the channel separating Vancouver Island from the mainland. The line was to follow this channel southwesterly to the Pacific Ocean. For several years the ownership of the Island of San Juan was in dispute. The question was finally referred for settlement to the emperor of Germany, who gave his award in favor of the United States.

To maintain order among the lawless miners whom the discovery of gold had drawn to the Pacific coast, a separate government was established on the mainland. New Westminster, on the Fraser River, became the capital. This arrangement, however, proved unsatisfactory; and at times there was talk of annexing Vancouver Island to the United States. Fortunately a strong British sentiment prevailed, which led to the reunion, in 1866, of the island and the mainland, to form the province of British Columbia. Victoria was chosen as capital.

The British North America Act made provision for the admission to confederation at any time of British Columbia, Rupert's Land, and the Northwest Territories. The first Do-

minion parliament petitioned the British government to hand over to Canada Rupert's Land and the Northwest. It was claimed that the rule of a fur company did not tend to the general development of the country, and, moreover, that the extension of the Dominion westward would be a safeguard against any aggression on the part of the United States. The Hudson's Bay Company finally surrendered to Canada its control of Rupert's Land and its monopoly of trade. The company, in return, received the sum of £300,000, one-twentieth of all land thereafter surveyed for settlement, and also retained its posts and trading privileges.

At the time of confederation (q.v.), the only occupants of the land beyond Lake Superior were roving bands of Indians, a few scattered traders, and 12,000 settlers in the valley of the Red River. Ten thousand of these 12,000 were half-breeds, Scotch and French. Into this community, without warning, flocked Canadian surveyors to lay out roads and townships. The country had been handed over to Canada and the interests of the natives were to be sacrificed. Such was the thought of the half-breed element. The storm centre was the French half breed party, the Métis, led by Louis Riel (see RIEL REBELLION). There was no one in the colony to restrain the latter's madness. Fort Garry was seized and a "provisional government" established. There was every prospect, however, of a bloodless settlement of the situation, when suddenly Riel, in a moment of recklessness, ordered the execution of a young Ontario immigrant named Thomas Scott. The news of this brutal murder raised a storm of indignation in the East. In a remarkably short time a volunteer force under the command of Col. Garnet Wolseley, reached Fort Garry, only to find that the instigators of the rebellion had fled across the American border.

Out of the strife of rebellion arose a new province. Even while Wolseley's force was on its way up from the East, the Manitoba Act passed the Canadian Parliament. Manitoba was admitted into Confederation as a full-fledged province. The claims of the half-breeds were fully met by a generous land grant. Many of Wolseley's men remained in the new province to share in its making. The little settlement about Fort Garry was soon transformed into the populous city of Winnipeg. Manitoba drew her first governor from the far East, in the person of a distinguished Nova Scotian, Adams G. Archibald.

A year later the westward expansion of confederation was continued. British Columbia became part of the Dominion, subject to a very important condition, namely, that a transcontinental railroad should be begun within two years and completed within ten years from the date of union. In 1872, therefore, Sir John A. Macdonald introduced the question in Parliament. The great enterprise was well under way when the ministry, charged with corruption, was forced to resign. Alexander Mackenzie, who succeeded Sir John, proposed to construct the road gradually, as the finances of the country allowed. This delay put a severe strain upon British Columbia's loyalty to the Dominion. The Macdonald government, returning to power in 1878, immediately took up again the railway question. Construction was

CANADA — THE CANADIAN WEST

begun from both ends; and with such vigor was the work pressed forward that the last spike was driven by Lord Strathcona in November 1885. The completion of a transcontinental railway cemented the bond binding the East and the West.

No sooner was order restored after the Riel rebellion than settlers began to flock into Manitoba. Many farmers from eastern Canada moved west, while from Europe came an ever increasing number of colonists, of British, Scandinavian, and German stock. The newcomers spread beyond the limits of Manitoba, many finding their way into the valley of the Saskatchewan, a few even to the foothills of the Rockies. This Northwestern Territory was governed by the lieutenant-governor of Manitoba, and a council of 11 members. In 1876 a change took place. The eastern section of the country, called Keewatin, was placed under the personal control of the lieutenant-governor of Manitoba, while the western was given a resident governor and a council of five members. A few years later four districts were organized, Alberta, Assiniboia, Athabasca, and Saskatchewan. Regina, being situated upon the main line of the Canadian Pacific Railway then under construction, was chosen as the seat of government.

The advent of the railway gave promise of peaceful and rapid progress, when suddenly a second rebellion broke out. At the close of the Red River rebellion many of the Métis withdrew westward and settled upon the banks of the Saskatchewan, among their near relatives, the Cree Indians. Here they were disturbed by the encroachment of a hated civilization. Their unrest was increased by a fear of losing their lands through the failure of the Dominion government to issue title deeds. The sudden return from exile of Louis Riel was all that was needed to provoke rebellion. Near Duck Lake, within the angle formed by the North and South Saskatchewan, the first clash took place, between a band of Métis and a force of mounted police and volunteers.

The position of the white settlers of the Saskatchewan valley was serious. The real danger lay, not in a revolt of the Métis, but in the possibility of a general rising of the Indians, of whom there were over 30,000 in the Northwest. Prince Albert, Battleford, and Fort Pitt lay exposed to attack. The most serious risings of the Indians took place near Battleford and Fort Pitt, among the followers of Poundmaker and Big Bear. The heart of the rebellion was the village of Batoche, the centre of the Métis settlements. The news of the fight at Duck Lake was the signal for an outbreak among Big Bear's warriors, who massacred the male inhabitants of Frog Lake and then drove out the garrison of Fort Pitt. When the report of the rebellion reached Ottawa, the Dominion government took prompt action. The call for volunteers met with an eager response on all sides. In spite of the great distance, within less than two months 4,400 men were placed in the field, all save the Winnipeg contingent being from eastern Canada.

General Middleton, commander-in-chief of the Canadian militia, who arrived at Qu'Appelle in advance of the main force, made the

Canadian Pacific Railway the base line of his operations, and prepared to crush the rebellion in all its centres at once. Three places were in immediate danger: Prince Albert, Battleford, and Fort Pitt; three relief expeditions were provided for in the plan of campaign. General Middleton was to advance from Qu'Appelle to Batoche, Riel's headquarters, Colonel Otter from Swift Current to Battleford, and General Strange from Calgary to Edmonton. The three movements were successfully carried through, the divided forces converging upon Battleford. The bulk of the fighting fell to Middleton's column, which met with determined opposition at Fish Creek and Batoche. With Riel, Poundmaker and Big Bear finally in custody, the rebellion was at an end. Riel and eight Indians suffered the death penalty.

The rebellion was not without its good results. In recognition of their growing importance, the Northwest Territories were granted representation in the Dominion Senate and House of Commons. The need of a stronger government in the Northwest became obvious. The old council was abolished and its place taken by an elective assembly, which first met in 1888, at Regina. But this was not, of course, a final settlement and in 1905 the vast district between Manitoba and British Columbia was divided into two self-governing provinces — Saskatchewan and Alberta.

The discovery in 1897 of rich deposits of gold in the Yukon (q.v.) was the signal for an influx of fortune-hunters. As a result the long standing dispute over the Alaskan boundary gathered new importance. In taking over Alaska from Russia in 1867, the United States secured all the rights of that nation as laid down in the treaty of 1825, between Russia and Great Britain. The interpretation of the terms of the treaty was left to a commission, composed of three representatives from the United States, two from Canada, and Lord Alverstone, the chief justice of England. The commission met in London in September 1903. The decision was, upon the whole, favorable to the American claims. See ALASKAN BOUNDARY COMMISSION.

The growth of the West during the last quarter of a century has been very marked; the inevitable result of the expansion of the Canadian railway system. The Canadian Pacific Railway (q.v.) worked a marvelous change. At the terminus of the road there sprang up, as in a night, the bustling city of Vancouver, while the line throughout was soon dotted with villages. Many of these have now risen to the dignity of towns, a few even aspire to take rank with the cities. To north and south the road has thrown out branch lines, everywhere developing new districts. No sooner has one transcontinental railway opened up a broad belt of land than a second is suggested. Already a new company, the Grand Trunk Pacific, has entered into a contract with the Dominion government to build another railway from coast to coast. When this contract is carried out, the second line will run parallel with the Canadian Pacific, and will open a new Northwest.

CANADA — THE SETTLEMENT OF THE CANADIAN WEST

10. Canada — The Settlement of the Canadian West. Without a just appreciation of the attractions and possibilities of the "Canadian West," as the larger half of the Dominion situated west of Lake Superior has commonly been called, neither the Canada of to-day nor that of the future will ever be understood. One of the first acts of statesmanship after the consummation of Confederation (see CANADA — CONFEDERATION) was the purchase by the Canadian government from the Hudson's Bay Company (see CANADA — HUDSON'S BAY COMPANY) of the immense territory forming the basin of Hudson Bay and known as Rupert's Land, over which that company held proprietary rights. British Columbia, in 1871, entered the Dominion thus brought up to her borders. Some 14 years later followed the completion of the Canadian Pacific Railway (q.v.), an enterprise of splendid self-confidence in so young a country. A railway was needed to fulfil the conditions upon which British Columbia had joined the Confederation, and without it the vast territory between that province and Ontario could not be developed nor preserved to Canada. The purchase of Rupert's Land created the conditions which brought about and justified the building of the first transcontinental railway, and the prolonged discussions over the policy of the government of the day in respect to the public assistance given to that road began the process of popular education in eastern Canada in the extent and resources of the West. A seemingly limitless sphere for internal development has gradually been revealed, and the necessity on two occasions for the employment of armed force against half-breed rebellions, with some sacrifice of blood, has sealed the sense of possession. Pioneers proved the fertility of the soil and the richness of the mines, and with the assurance of a rapidly increasing population the whole national life has received an access of vigor and hopefulness. External policy, as well as internal, has been influenced. A country that can produce and export staple foodstuffs in quantities capable of indefinite multiplication, and has vast stores of timber, coal, and metals, can support great home industries and also be a prominent factor in international trade. It can work at home and bargain abroad. It can make choices. The idea of a trade union of the British empire, for example, has presented itself in practical form largely because of the potentialities of the Canadian West. Population only has been needed to show results, and the movement of population into this part of Canada is therefore a subject of interest and importance.

The country lying west and northwest of Lake Superior in Canada is of vast extent and great variety. It includes the extreme western end of the province of Ontario, the provinces of Manitoba, Saskatchewan, Alberta, and British Columbia, while beginning again at the east and lying to the north of these districts are the Northwest Territories and Yukon. Prior to 1905 the only provinces were Manitoba and British Columbia. The remainder constituted the "Territories." Now "the Territories" signify the vast northern region stretching from Labrador to Yukon. The land area in these districts in acres is:

District	Area in acres
Ontario (western end) approx.....	20,000,000
Manitoba.....	41,169,038

District	Area in acres
Saskatchewan.....	155,092,480
Alberta.....	160,755,200
British Columbia.....	227,502,400
North West Territories (Labrador to Yukon).....	1,197,475,200
Yukon.....	132,113,280

For present purposes the northern Territories, with the exception of Yukon, may be disregarded, since they have not yet attracted population to any marked degree. The western end of the province of Ontario is rich in timber and minerals, and possesses stretches of good agricultural land. The prairie region begins at the eastern boundary of Manitoba and extends to the Rocky Mountains, embracing the provinces Manitoba, Saskatchewan, and Alberta: wooded prairie and open prairie, rolling and flat, broken by hills and some rocky ridges and drained by great rivers that flow eastward and northward into great lakes with outlets into Hudson Bay. No richer agricultural lands and no better grazing ranges exist than are here found. Of the 350,000,000 acres in this combined district it would be idle to estimate the proportion of good grain land. It is very large, as attested by the successful farms now scattered throughout the whole region. In 1903 only 5,073,424 acres had yet been put under crop. It is known, moreover, that the fertile belt extends up into the northern tier of Territories. British Columbia is a land of magnificent mountains rich in minerals, and of valleys of the very highest agricultural possibilities, nearly the whole clothed with splendid forests. See CANADA — AGRICULTURE; CANADA — MINERALS; CANADA — THE FORESTS AND LUMBER INDUSTRY.

In 1901 the Canadian West, not including the portion of Ontario, was shown by the census to have a population of 645,517. Out of this number 250,901, or 38.87 per cent, had been born in the West; 154,581, or 23.94 per cent, had been born in the eastern provinces of Canada; 83,579, or 12.94 per cent, had been born in the British Isles; and 145,369, or 22.52 per cent, had been born in foreign countries, while 8,299, or 1.28 per cent, had been born at sea or failed to give their birthplace. Indians numbered 61,518 and half-breeds 28,255. By origin 356,411 were of British stock, 29,579 of French stock, 54,714 of German, 23,836 of Scandinavian, 23,460 of Russian, 16,949 of Austro-Hungarian, and 20,073 of Chinese and Japanese. All the leading nationalities and races of Europe were represented. To understand the nature and the rate of the movement of population into the Canadian West indicated by these figures, many general considerations must be borne in mind. Conditions as they have existed in the United States are among the most important of these considerations. Until the closing years of the last century the United States was an irresistible magnet. It drew the best, as well as much that was not the best, of the movable population of all countries. From Canada itself it attracted a larger proportion of the native population than from any other country. Its relative advantages over Canada, in the eyes of those who sought to better their condition, consisted in its advanced stage of development. Not only were there more varied employment and larger opportunities in industrial and commercial life, but its fertile lands were opened up by railways from ten to forty years before

CANADA — THE SETTLEMENT OF THE CANADIAN WEST

those in the Canadian West and the mineral wealth of its western mountains was discovered and advertised to the world years before the riches of Canada in this respect were even suspected. The prairie regions of the Canadian West had to wait for transportation facilities, and then they had to wait until their profitability was established. Since people are not predisposed to believe in the security of agriculture in northern latitudes, this meant, practically, that they had to wait until the prairies in the United States were tested right up to the border. Before that time even official crop returns could not be widely effective as inducements to immigration. Moreover streams of migration are not easy to divert. Where many have gone others tend to follow.

To what extent the United States drew upon Canadians up to 1900 is shown in the census returns of that year which record the residence in that country of 1,181,255 persons born in British North America, that is, in Canada and Newfoundland. How little the United States had given in return appears from the comparatively small number of 127,899 natives of the United States resident in Canada when the Canadian census was taken in 1901. But conditions have changed. The flow of population from Canada to the United States has been checked and the tide has turned. Canada has made steady and substantial progress and her industries now provide opportunities for all her own people who desire industrial employment, while the large immigration into the cities of the United States from Eastern and Southern Europe has rendered industrial life in the United States less attractive. But what is of more direct importance to the present subject, the cheap, good lands in the United States are now very largely occupied. Prosperity and a good birth-rate among the farming population have created a host of landseekers of native birth apparently more than numerous enough to take up, within a few years at least, what good land is still easily available; and the price of land has rapidly risen. In the Canadian West, on the other hand, millions of acres of the most fertile land are obtainable at low cost; this land has been proved; and railway facilities and railway rates put the crops within profitable reach of the markets.

The history of the settlement of the Canadian West may conveniently be divided into three periods: the first embracing the time before railway facilities existed or, say, up to 1885; the second from 1885 to 1901; and the third beginning in 1901. So far as the prairie division is concerned fur traders visited it and dwelt in it from early times, but no attempt was made at colonization previous to that of Lord Selkirk in the decade succeeding 1812. That his venture, beset with misfortunes though it was, left a permanent result was shown by the fact that in 1873 as many as 530 of the original Selkirk settlers or their white children were found to claim the grants of land offered by the Canadian Parliament. Other independent colonists had made their way into the country and there were, of course, the employees of the Hudson's Bay Company, but in 1869, when the purchase by Canada was made, the total white population numbered only a few hundreds. Some members of the military expedition of 1870 remained as settlers and other accessions

were received at about the same time. In 1871 the Dominion Government appointed the first immigration agents in the West, one in Manitoba and another in the Territories, and authorized the establishment of an "immigration shed" at Winnipeg, a hamlet then possessing 241 inhabitants. The work of promoting immigration to Canada had been undertaken by the Federal Government in 1868, the provincial governments co-operating, and the appointment of agents in the West brought that section into direct touch with the general system having agents in Great Britain and Europe. It is interesting to note that in his annual report to the department for 1872 the agent at Winnipeg estimates the arrivals during the year at 1,400, of whom 954 came from Ontario, 78 from Quebec, and 115 from the United States. During 1872 and 1873 the Dominion Government entered into negotiations with a colony of German Mennonites living in southern Russia who desired to emigrate. Delegates visited Canada and in 1874 1,349 of these people settled in southern Manitoba. This is important, not only because it led to further immigration from the same source but also because the attention of the Dominion Government was thus directed to the question of special colonization in the West. In 1874 Scandinavian and Icelandic delegates were shown through the country and a small beginning was made in Icelandic settlement through the moving up from Ontario of 285 Icelanders. The years 1874 and 1875 may be noted also because the Dominion Government then first appointed Canadian immigration agents in the United States, chiefly for the purpose of effecting the repatriation of Canadians. Results were at once obtained and agents reported some 400 repatriated Canadians as immigrants into the West in 1876 and some 800 in 1877. In 1879 a delegation of tenant farmers of Great Britain visited the country and their reports resulted in an increase in immigration from the British Isles. The projected transcontinental railway had met with difficulties and delays, but in 1875 work was begun at Thunder Bay, the head of Lake Superior, on the section to Winnipeg, and in 1878 a line from the United States border at Pembina was completed to St. Boniface, opposite Winnipeg across the Red River. Although the line from Lake Superior was not completed until 1883, the line from Pembina increased the facilities for reaching Winnipeg (q.v.), and the railway building combined with other not unnatural causes led to a "boom" in real estate, accompanied by a rush of speculators and prospective settlers. In 1881 the immigration agents estimated the arrivals in Manitoba at about 25,000, in 1882 at almost 70,000, and in 1883 at 50,000. Eastern Canada and the United States contributed the great proportion of these visitors, as most of them proved merely to be. The boom "burst" in 1883. By the census returns for 1881 some estimate of what was permanent in the immigration of the previous years can be reached. Manitoba was given a total population of 65,954, of whom 18,020 were born in Manitoba itself, and 6,422 in the Territories. Of these two classes 6,767 were Indians, but the halfbreeds were not separately enumerated. From outside the largest number was furnished by the province of Ontario, namely 19,125, Quebec supplying 4,085 and Nova Scotia 820. Natives of England and Wales numbered 3,457, of

CANADA — THE SETTLEMENT OF THE CANADIAN WEST

Scotland 1,836, and of Ireland 2,868. Russia supplied 5,651, chiefly Mennonites; Germany, 220; Norway, Sweden and Denmark, 121; and France, 81. The United States had contributed 1,752. In the same year the white population of the Territories was 6,974, of whom 517 were born in Ontario, 101 in Quebec, 98 in England and Wales, 136 in Scotland, 62 in Ireland, 27 in France and 116 in the United States. As the Canadian Pacific Railway was pushed through real settlement followed at a faster rate than ever before and in 1886 when the first train was run from Montreal to the Pacific coast the net gain in population from the principal sources, over the figures just given for 1881, was: From Ontario 14,096, from Quebec 1,891, from Nova Scotia 497, from New Brunswick 303, from England and Wales 6,865, from Scotland 4,146, from Ireland 753, from Iceland 1,500, from the United States 570; while each of the other countries showed small gains. The chief sources of increases in the Territories were Ontario 8,300, Quebec 1,200, England and Wales 3,750, Scotland 2,000, and the United States 890.

It will not be necessary to follow in detail the records of the succeeding years up to 1901, which form the second period. The Canadian Pacific Railway Company, which had received large grants of land, became an additional agency in the organizing of immigration movements as also to a limited extent did the colonization societies which had purchased tracts of land in 1882, 1883 and 1884. A movement which began in 1889 and 1890 and ultimately attained considerable proportions was that from Austria-Hungary. The year 1890 was marked by a considerable immigration from Great Britain. Migration from the eastern provinces of Canada remained moderate until 1898. In 1899 over 7,000 Doukhobors were brought in and established in colonies. According to the census of 1901 Manitoba had a population of 238,934, not counting Indians and half-breeds. Those born in Canada numbered 164,582. Of the Canadians 67,566 were born in Ontario, 8,492 in Quebec, 1,536 in Nova Scotia, 820 in New Brunswick, 419 in Prince Edward Island, and 167 in British Columbia. In England there were born 20,036, in Scotland 8,099, in Ireland 4,537, and in Wales 356; in Austria-Hungary 11,570, in Russia 8,854, in Iceland 5,403, in Germany 2,285, in Norway, Sweden and Denmark 2,090, in France 1,470, and in the United States 6,922. The Territories had a population of 185,335, exclusive of Indians and half-breeds. Of the 65,231 born in Canada, Ontario was the birthplace of 28,229, Quebec of 4,075, Nova Scotia of 1,169, New Brunswick of 669, and Prince Edward Island of 488. Those born in England numbered 10,752, in Scotland 4,226, in Ireland 2,158, and in Wales 186; in Austria-Hungary 13,407, Russia 14,585, Norway, Sweden and Denmark 2,462, Germany 2,170, France 1,023, Iceland 424, and the United States 13,877.

Before touching the movement of the past three years into the prairie region a few words may be said of the progress of settlement in British Columbia. In 1901 the population of that province was 149,708, again excluding Indians and half-breeds. The composition of the population of British Columbia differs from that of the districts we have just been considering in several interesting respects. In the first

place, it contained in 1901 relatively a larger number born in the United States, namely, 17,104. Then there were 14,576 Chinese and 4,515 Japanese. Ontario contributed 23,642, but Nova Scotia came next among the provinces with 4,003. These features are easily explainable. The chief attractions of British Columbia have been its mines, its forests, and its fisheries. The first named have in many different years caused rushes from the United States and they have been an added attraction to the people of the province of Nova Scotia. The man from Ontario is a good pioneer under any conditions. And the same causes that drew Chinese to California have operated in the case of British Columbia. The first gold rush to British Columbia occurred in 1858, nine years after the memorable rush to California. It is said that between 20,000 and 30,000 prospectors from California invaded the province in that year. Systematic exploration, however, was not attempted and the mining population came and went in waves, the years 1858, 1861, 1864, 1865, 1869, and 1872 marking the influxes. Up to 1893 nearly all the gold produced was placer gold and the values ran from \$705,000 in 1858 to \$3,913,563 in 1863, continuing at an average of over \$3,000,000 until 1868, when with variations a decline set in. The working of lode mines since 1893 has given an element of permanence to the mining population and the product of gold has risen in 1902 and 1903 to \$5,900,000. The copper, silver and lead mined exceed gold in their total value. Coal was known to exist from early times and seems to have been mined since 1836, but it was not until 1875 that the annual production exceeded 100,000 tons. The increase has been steady and the product in 1903 exceeded 1,600,000 tons. The magnificent timber resources of the province have given employment to an increasing number of men and the yield of the fisheries has grown from \$100,000 in 1876 to \$7,900,000 in 1901. In 1871, when British Columbia became a province in the Dominion, the population was 36,247, of whom 25,661 were Indians. In 1881 it had increased to 49,548, in 1891 to 98,173, and in 1901 to 178,657.

The Yukon territory might perhaps be classed with British Columbia. In 1896 the gold discoveries were made there which caused the famous rush in 1897. The census of 1901 gave the Yukon a population of 24,357, exclusive of Indians and half-breeds. Natives of the United States numbered 6,707, of Ontario 1,940, of Quebec 1,349, of Norway and Sweden 1,205, of England 1,153 and of Germany 746; not specified 6,573.

The part of Ontario included in the Canadian West has interests of its own in mines and fertile land, but its progress in settlement has been largely bound up with that of the prairie region to the west. The mines in the Lake of the Woods district caused the establishment of the town of Rat Portage, now Kenora, the continued prosperity of which, however, came to depend to a great extent on the lumber industry for the supply of the demand in Manitoba and the territories. Port Arthur and Fort William on Thunder Bay, Lake Superior, are at the head of lake navigation on the Canadian route, and the summer traffic in goods for the West and in grain and flour from the West is there transhipped, the towns possessing immense storage and shipping grain elevators. These towns are

CANADA — THE SETTLEMENT OF THE CANADIAN WEST

growing rapidly, particularly since 1901, and their growth will keep pace with the development of the West. The completion of the Canadian Northern Railway between Port Arthur and the wheat fields, running through the southern part of the province, has not only assisted Port Arthur but has opened up the valley of the Rainy River and new centres for the lumber industry. In 1901 Rat Portage, now Kenora, had 5,202 people, Fort William 3,997 and Port Arthur 3,212. Since that date the population, especially of the two last mentioned towns, has greatly increased and new towns have sprung up along the line of the Canadian Northern.

The third period in the settlement of Manitoba and the Territories began in 1901. Conditions to which reference has previously been made had developed and the time was ripe. In the United States a greater movement of land-seekers was taking place than at any previous time, with the exception perhaps of the early eighties, and good available lands for pioneers were fast becoming occupied. This movement was not directly from the more thickly settled Eastern and Middle States to new lands, but from these States to the Northwestern and Southwestern States. The newcomers were willing to buy lands under cultivation at prices which were comparatively large to the men who had broken them. It was the men who had entered the Northwestern States as pioneers ten, fifteen or twenty years before who were offered tempting prices, and in thousands decided to become pioneers again. This movement of population was directed by the railway companies and by private land companies, the managers of which had their connections in all parts and thoroughly understood the business of land settlement. The new feature in the history of immigration into the Canadian West in 1901 was the advent of these United States land companies. As soon as prospects seemed to indicate a good crop in that year, their agents appeared in considerable numbers and purchased large tracts. This continued in 1902. To show the magnitude of the operations it may be mentioned that one of these companies purchased in one block about 1,000,000 acres. The lands thus secured could be offered to land-seekers in the United States at from \$4 to \$10 per acre. In certain localities, or in the case of improved farms, the price was higher. The man who could sell his farm in the Dakotas, Minnesota, or Iowa, for example, at from \$30 to \$75, or even \$100 per acre was offered land in Canada, which returns showed was capable of producing more bushels to the acre, for a price which would not only pay the expenses of the transfer but leave him with a bank account. In most cases the large blocks of land purchased were sold in smaller lots to middlemen and the number of agents thereby largely increased and distributed. Enterprising Canadian land companies also existed and greatly increased in numbers. By 1903 the first phase of this new development, that is, the purchase of large blocks of land by speculating settlement companies, had almost come to an end. The policy of the government is opposed to selling except to the actual settler and the Canadian Pacific Railway Company, the Hudson's Bay Company and the Canada Northwest Land Company, the other largest owners of land, were likewise unfavorable to the too extensive operations of speculative middlemen.

It was to the interest of the railway company, particularly, to secure the actual settler as soon as possible and it was believed that prices could most effectually be kept at an attractive level by retaining the retail selling of the lands in the hands of the company. Large sales were, however, made by these Canadian companies in blocks as well as in farms during 1901 and 1902. Their returns show these total sales:

CANADIAN PACIFIC RAILWAY COMPANY.			
Year	Acres	Value	Average price
1901.....	831,732	\$2,646,237	\$3.18 per acre
1902.....	2,420,265	8,140,598	3.36 per acre

HUDSON'S BAY COMPANY.			
Year	Acres	Value	Average price
1901.....	71,703	\$351,487	\$4.90 per acre
1902.....	196,844	999,685	5.08 per acre

CANADA NORTHWEST LAND COMPANY.			
Year	Acres	Value	Average price
1901.....	121,069	\$ 629,130	\$5.19 per acre
1902.....	515,800	2,518,000	4.88 per acre

The elimination of speculative buying caused smaller returns for 1903. The Canadian Northern Railway Company, which possesses a land grant of considerable size, has recently handed over the selling of its lands to a powerful private company. The government still has millions of acres of homestead lands, as well as lands held for sale, and the following returns of homestead entries for the last four calendar years will indicate the demand existing:

Year	Entries
1900.....	7,850
1901.....	9,108
1902.....	22,215
1903.....	32,682

Among the factors at work during this period, the immigration department of the government must be given a chief place. The number of agents in Europe and the United States had been increased and more money than ever before was spent in advertising Canada. In January 1904 the United States and Canadian land companies interested in Western Canada and leading business men in Winnipeg and elsewhere organized what is called the Western Canada Immigration Association and raised a fund of \$50,000 for a two years' campaign of education through the press of the United States. To this fund the Dominion Government, the government of the province of Manitoba and the city of Winnipeg gave contributions. The effect of the increased immigration from the United States was not alone in additions to population from that source, but the fact that United States farmers were seeking Canadian lands was an excellent advertisement in Europe. The most telling advertisements of all, however, were the splendid crops of 1901 and 1902. The government returns for Manitoba and the territories for the six years up to 1903 are as follows:

MANITOBA WHEAT

BARLEY

Year	Acres	Bushels	Yield per acre
1898	17,092	449,512	26.19
1899	14,276	337,521	23.62
1900	17,044	353,216	20.72
1901	24,702	795,100	32.18
1902	36,445	870,417	23.88
1903	68,974	1,842,824	26.72

No Government crop reports were issued for the Territories before 1898, but in Manitoba they have been issued for 20 years. For that period the average yield per acre in Manitoba has been 19.05 bushels of wheat. The yield in 1900 was much the smallest on record and when the total production of wheat for the Canadian West jumped from 17,000,000 bushels to 63,000,000 bushels in a single year the attention of the world was startlingly attracted. The unsurpassed excellence of Manitoba hard wheat had been recognized, but a yield of 63,000,000 bushels for the first time gave the Canadian West a regulating influence in the world's markets. If a comparison of the above figures of yield per acre is made with the returns for Minnesota and North Dakota it will be seen what a powerful aid they became to the various advertising agencies. For the last four years the yield per acre in bushels of wheat in these two States and the average yield for the whole United States have been:

	1900	1901	1902	1903
Minnesota	10.5	12.9	13.9	13.1
North Dakota	4.9	13.1	15.9	12.7
United States	12.3	15.0	14.5	12.9

As to the results accomplished during the past four years it is impossible to present complete or reliable statistics. The figures given by the immigration department for the total immigration to Canada, during the fiscal years ending June 30, are:

	1903	1902	1901
English and Welsh	32,510	13,095	9,401
Scotch	7,046	2,853	1,476
Irish	2,236	1,311	933
United States	49,473	26,388	17,987
Galicians	10,141	6,550	4,702
Germans	1,887	1,048	984
Hungarians	2,156	1,048	546
Austrians	798	320	228
Scandinavians	5,448	2,451	1,750
French and Belgian	1,240	654	492
Russians, Finlanders	7,217	3,759	1,726
Miscellaneous	8,152	7,902	8,924
Totals	128,364	67,379	49,149

The unrevised figures for the fiscal year 1904 give a total of 130,329, of whom 50,915 came from the British Isles, 36,241 from the continent of Europe and 43,173 from the United States. The greater part of this total immigration was directed to the Canadian West and there was also a large migration from eastern Canada, estimated by the immigration commissioner at Winnipeg at 8,604 in 1901, 12,530 in 1902, and 17,286 in 1903. By the same authority the increase in the population of the Canadian West in the fiscal year ending June 30, 1903, from the above sources, was 115,000 and in 1904 about 110,000. See CANADA — THE CANADIAN WEST.

Editor of 'The Telegram,' Winnipeg.

II. Canada — The Constitution. In the Canadian draft of the bill, Canada was styled a "Kingdom." For that title "Dominion" was substituted at the instance of Lord Derby, who thought that the title "Kingdom" might be offensive to the Americans. Sir John Macdonald, as a strong monarchist, deplored the change, feeling that had the title "Kingdom" been adopted the Australian colonies would have been applying to be placed in the same rank as the kingdom of Canada. As it is, the Australian colonies have adopted the title "Commonwealth," suggestive rather of progress in democratic sentiment.

The term Confederation has been applied to two forms of polity materially different from each other. One is confederation proper; the other is nationality with a federal structure. The instance of confederation proper in ancient history is the Achaean League; in modern history, instances are the original Swiss Bund, the United Netherlands, and the Union of the American colonies during the Revolutionary War. Instances of a nation with a federal structure are the United States of America under their present constitution and the present Swiss Bund. A confederation proper is formed for a special object, usually that of common defense. The several States entering into it do not resign their sovereign power. Nor does the federal council

exercise, like a national government, authority over the individual citizen, but only over the States. Its legislative power is confined to the fulfilment of the special object of the federation. Nor has it any power of taxation, but only a power of requisition. In the case of a federation proper, the Federal government is an organ of the States governments collectively. In the case of a nation with a federal structure, the States are severally organs of the federal government. The Canadian confederation belongs, as its name Dominion of Canada imports, to the class of nations with a federal structure. So does the newly formed Commonwealth of Australia.

The Canadian constitution is embodied in the act of the British Parliament called the British North America Act, which can be amended only by the power by which it was passed. In common with the other colonies, self-governed as they are styled, Canada remains in the allegiance of the British Crown, retains the constitutional forms and nomenclature of the monarchy, and is, to a certain, though of late years diminishing, extent, under the actual control of the Imperial government. The legislation of the Imperial Parliament is in all things binding upon Canada. To the king's government under the control of the Imperial Parliament belong the treaty-making power and the power of peace and war. By the Imperial government the governor-general, the legal head of the Dominion, is appointed. The supreme jurisdiction is still the British Privy Council, and in it is vested the interpretation of the Canadian constitution. The command of the army is still Imperial. So is the fountain of honor. The territory of the Dominion is part of the domain of the empire, at the disposal of the Imperial government, which has exercised its power in boundary cases. The tendency, however, since confederation, has been constantly toward practical independence. The veto power has been very sparingly exercised, and only in special cases, as in that of copyright where the colonial act conflicted with the Imperial law. Appeal from the colonial courts to the Privy Council has been restricted. Military occupation has ceased. Though the command of the army remains in the Crown, the military administration has passed, not without friction, into the hands of the Canadian minister of militia. The dispensation of titles and decorations, to which great influence is attached, still remains Imperial, though even in this the wishes of the Canadian government probably make themselves felt.

The Dominion of Canada and the other self-governing dependencies of the British Crown faithfully reproduce the forms of monarchy. The governor-general of Canada, as the representative of the British sovereign, has the prerogative of calling and dissolving Parliament, of appointing the members of the Privy Council, of nominating the Senate. Parliament is opened by him with a "speech from the throne." But, like the monarch whom he represents, he reigns but does not govern. Very rare have been the instances since the confederation, and those not cases of general policy, in which he has exercised his personal power. Only of the pageantry of his office and of his assumption of state has there since confederation been an increase, favored by those who desire to foster the monarchical sentiment. The lieutenant-govern-

ors of provinces, nominally appointed by him, are really appointed by his ministers, and invariably from the ranks of their own party. When one of them was dismissed it was apparently against the wish of the governor-general and manifestly on party grounds; yet on reference to the home government the governor-general was directed to conform to the opinion of his constitutional advisers.

The legislative power is divided between the central legislature and those of the provinces, the subjects of legislation assigned to each being set forth in the Act: The exclusive legislative authority of the Parliament of Canada extends to (1) The public debt and property; (2) The regulation of trade and commerce; (3) The raising of money by any mode or system of taxation; (4) The borrowing of money on the public credit; (5) Postal service; (6) The census and statistics; (7) Militia, military and naval service, and defense; (8) The fixing of and providing for the salaries and allowances of civil and other officers of the Government of Canada; (9) Beacons, buoys, lighthouses, and Sable Island; (10) Navigation and shipping; (11) Quarantine and the establishment and maintenance of marine hospitals; (12) The coast and inlet fisheries; (13) Ferries between a province and any British or foreign country, or between two provinces; (14) Currency and coinage; (15) Banking, incorporation of banks, and the issue of paper money; (16) Savings banks; (17) Weights and measures; (18) Bills of exchange and promissory notes; (19) Interest; (20) Legal tender; (21) Bankruptcy and insolvency; (22) Patents of invention and discovery; (23) Copyright; (24) Indians, and lands reserved for the Indians; (25) Naturalization and aliens; (26) Marriage and divorce; (27) The criminal law, except the constitution of courts of criminal jurisdiction, but including the procedure in criminal matters; (28) The establishment, maintenance, and management of penitentiaries.

To the provincial legislatures are assigned (1) The amendment from time to time, notwithstanding anything in the act, of the constitution of the province, except as regards the office of the lieutenant-governor; (2) Direct taxation within the province in order to the raising of a revenue for provincial purposes; (3) The borrowing of money on the sole credit of the province; (4) The establishment and tenure of provincial offices, and the appointment and payment of provincial officers; (5) The management and sale of the public lands belonging to the province, and of the timber and wood thereon; (6) The establishment, maintenance, and management of public and reformatory prisons in and for the province; (7) The establishment, maintenance, and management of hospitals, asylums, charities, and eleemosynary institutions in and for the provinces, other than marine hospitals; (8) Municipal institutions in the province; (9) Shop, saloon, tavern, auctioneer, and other licenses, in order to the raising of a revenue for provincial, local, or municipal purposes; (10) Local works and undertakings other than such as are of the following classes: (a) Lines of steam or other ships, railways, canals, telegraphs, and other works and undertakings connecting the prov-

ince with any other or others of the provinces, or extending beyond the limits of the province; (b) Lines of steamships between the province and any British or foreign country; (c) Such works as, although wholly situate within the province, are before or after their execution declared by the Parliament of Canada to be for the general advantage of Canada or for the advantage of two or more of the provinces; (11) The incorporation of companies with provincial objects; (12) The solemnization of marriage in the province; (13) Property and civil rights in the province; (14) The administration of justice in the province, including the constitution, maintenance, organization of provincial courts, both of civil and of criminal jurisdiction, and including procedure in civil matters in those courts; (15) The imposition of punishment by fine, penalty, or imprisonment for enforcing any law of the province made in relation to any matter coming within any of the classes of subjects enumerated in this section; (16) Generally all matters of a merely local or private nature in the province.

Powers not specifically given to the provinces are reserved to the Dominion, whereas under the American constitution powers not specifically given to the Federal government are reserved to the States or to the people.

The judges are appointed by the Federal government and, as in Great Britain, for life or during good behavior, in contrast with the practice of the United States, where judges are elected for a term of years. They can be removed only by the governor-general on an address from both houses of Parliament.

The Canadian Parliament consists, like the British, of two houses. The House of Commons, in which supreme legislative power practically resides, is elected almost by manhood suffrage. The North America Act apportions representation to the several provinces on the principles of population and provides for decennial readjustment to meet changes in the balance of population. Members are paid, whereas in Great Britain they are unpaid, and non-payment of members there forms a strong conservative institution. The Senators are appointed nominally by the Crown, really by the head of the party in power, and almost invariably on party grounds. Senatorships are for life, not hereditary like seats in the House of Lords, so that the political analogy is imperfect. On the other hand, party, which appoints the Canadian Senate, controls it. It might otherwise block legislation and there would be no remedial force; while the British House of Lords, it is well understood, must give way to the will of the nation when persistently declared. As it is, when the outgoing party happens to retain a majority in the Senate, there is danger of a block. The House of Commons is elected for a term of five years, subject, however, to the prerogative of dissolution.

The provincial legislatures are miniatures of those of the Dominion. The forms like those of the Dominion Parliament are monarchical, the lieutenant-governor formally nominating the ministers, as does the governor-general those of the Dominion. The practical working is popular, elective, and partisan. The party divisions run through the provinces severally as well as through the Dominion at large. Quebec and

Nova Scotia, like the Dominion Parliament, have each two chambers: the rest have only one. The Federal government has a veto on provincial legislation.

The treatment of the Northwest Territories, as provinces, presents a certain analogy to that of the Territories of the United States, executive and legislative powers being given to a lieutenant-governor with an elective council subject to instructions by order under Federal council or by the Canadian secretary of state.

The Parliament is by law bilingual; the French language as well as the English being recognized, though practically English prevails. The civil law, in which the *Coutume de Paris* and the Code Napoleon are blended with the common and statutory law of Great Britain, remains the law of Quebec.

In its generally democratic character the Canadian constitution approaches to that of the American republic, but in their structure they materially differ. The American constitution, in accordance with the principle laid down by Montesquieu (q.v.), separates the Executive from the Legislative. The members of the President's council, miscalled a cabinet, have not seats in the Legislature, nor is their continuance in office dependent on its support. They are the nominees of the President alone. Under the Canadian constitution, as under the British, the members of the cabinet have seats in the Parliament, on the confidence of which their tenure of office depends, and in which they initiate and control legislation. The head of the American republic is elected for a term certain. The terms of members and the times of election are fixed by law, whereas the Canadian Parliament is called in the name of the Crown by the prime minister, the head of the party in power, who wields in the interest of his party the prerogative of summoning and of dissolution. The members of the Canadian Senate are chosen by the head of the party in power, whereas the American Senate is elected by the legislatures of the several States. Thus the Canadian constitution lends itself more aptly to the working of the party system of government, which, with all its accessories, political and moral, has prevailed, though the general influence of party cannot be stronger than it is in the United States.

In Great Britain the cabinet, in which the real power of government resides, is a growth of political party unrecognized by law, while the Privy Council, recognized by law, has become honorary. In Canada the Privy Council is the cabinet, at the same time conferring the honorary rank, but the relation to the Crown, the relation to Parliament, and the working of the system in both cases are the same.

The British North America Act does not, like the American constitution, prohibit the establishment of a particular religion by the state. It leaves untouched to the Roman Catholic priesthood of Quebec the power of levying tithes on the people of their own communion. In the section respecting education it perpetuates the privilege of denominational schools. Since confederation the government of Ontario has practically aided a denominational university. But since the secularization of the clergy reserves and the opening of the University of Toronto, non-interference of the state with religion may be said to have been established as

CANADA—LOCAL GOVERNMENT

a general principle and may be regarded as practically part of the constitution. See CANADA—CONFEDERATION; CANADA—LOCAL GOVERNMENT; CANADA—IMPERIAL FEDERATION; CANADA—UNDER FRENCH RULE; CANADA—UNDER BRITISH RULE.

GOLDWIN SMITH,

in the University of Oxford, and Emeritus
Professor of Cornell University.*

12. Canada—Local Government. Under the British North America Act of 1867, which is virtually the constitution of the Dominion of Canada, the organization of local government is placed within the jurisdiction of the different provinces. There is consequently considerable variety in the structure of rural and urban government in the different parts of the Dominion. Certain general features are, however, to be observed. The fundamental principle of organization is that of local autonomy by the means of representative elected bodies. The provinces are divided into counties, subdivided into townships, in which again school sections are formed. The county and the township are not everywhere found side by side. Indeed, the provinces of Canada present the same contrast between the predominance of the township and the county as is found in the United States. In Nova Scotia and New Brunswick the county is the unit of local government; in Ontario and Quebec both township and county are found; throughout the West the township system prevails, the county being only a judicial area. In addition to these rural areas of government, there are found incorporated villages, towns, and cities. In Ontario and Manitoba incorporation takes place by virtue of a general statute; elsewhere it is done by special legislation. The details of local government may best be understood by first passing in review the organization and powers of rural governing bodies in the different provinces, and treating separately the question of town and city government and municipal franchises. Ontario, the most populous of the provinces, contains 43 counties and 423 townships. Both of these divisions vary greatly in size and population. The largest county (Grey) contains 1,071,642 acres, the smallest (Brant) only 196,800 acres. Thirty-two townships contain less than 20,000 acres, 11 of them more than 80,000 acres each. There are in addition the districts of Muskoka, Parry Sound, Nipissing, Manitoulin, Algoma, Thunder Bay, and Rainy River, not yet organized as counties, but in the settled portions of which 83 townships have been incorporated. The affairs of the townships are managed by a reeve and four councillors elected yearly. For the county there is a county council, varying in number from 8 to 18, two members being elected from each of the districts into which the county is divided. The cumulative system of voting was introduced in 1896. The franchise for all local elections is extremely wide. It includes all men, widows, and spinsters of 21 years and upward, rated for real property to an extent varying from \$100 in the townships to \$400 in the cities; those assessed for an income of \$400 and farmers' sons of full age living at home. The township council is chiefly concerned with the maintenance of roads and bridges, the levy and collection of school taxes and the collection of the county tax. Assessors

appointed annually by the township council make a valuation of real and personal property. The other principal officers of the township are the treasurer and the township clerk. The latter, though legally holding office at the pleasure of the council, enjoys a practically permanent tenure. He prepares the collector's rolls, statute labor lists, voters' lists, etc., registers births, deaths, and marriages, and performs many other duties assigned to him by separate statutes. The county council meets at the "county town," under the presidency of a warden whom it elects annually. It acts largely through committees, both standing and special. It appoints a treasurer, a county clerk, an engineer, a public school inspector, and two auditors. The county council provides accommodation for the courts of justice, maintains county buildings, roads, and bridges, houses of refuge, etc. The county rate is collected with the local taxation, but the county council has power to "equalize" the valuations of the local assessors if it thinks necessary. For organization of school districts, and control of schools in Ontario and elsewhere, see article on PUBLIC EDUCATION IN CANADA. Local government in the province of Quebec is organized under a municipal code enacted by the legislature (24 Dec. 1870), and revised in 1888. The larger towns and the cities are incorporated under special charters granted by the legislature. Of the counties some are divided into parishes, others into townships. For each county there is a council composed of all the mayors of the included municipalities. At its head is a warden (*préfet*) whom it annually elects. The county council meets in regular session four times a year; its duties consist chiefly in the construction and maintenance of roads, bridges, etc., the locating of the circuit court, provision against forest fires, etc. The subordinate local councils (parish, township, united township, village, and town) consist of seven councillors elected annually throughout the province, each council having a mayor as its head. The powers of these minor councils extend to highways, bridges, ferries, regulation of public health, etc. For all local purposes direct taxes are levied on all real estate, except the property of the government and that of religious and educational institutions. (For organization, etc., of schools, consult article on PUBLIC EDUCATION.) The seigniorial tenure of land, which once carried with it certain powers of local administration, is also treated in a separate article. The local government of New Brunswick is regulated by a consolidated statute of 1858. Each county has an elected council, meeting twice a year. The larger cities have a representative in the county council as well as their own local council. The officers of the parishes are appointed by the county council. In Nova Scotia there are elective county councils, choosing its own wardens. Their by-laws are subject to the approval of the legislature. The counties of Prince Edward Island are electoral and judicial areas, but, owing to the small size of the province the legislature itself acts as the organ of local government; villages and towns are, however, incorporated with elective councils. In Manitoba, in the Northwest Territories, and British Columbia local government centres in the township, administered by a council of four to six members, with a reeve at its head. The unorganized territories (Yukon, Mackenzie, Keewatin, and Ungava) are

4. Louis H. Fréchette.

controlled by the Dominion government, and have no representative institutions. The government in Canadian cities is regulated by statutes of the provincial legislatures. This fact permits of frequent change, and a continuous development of organization to meet the circumstances of the hour. In Toronto, for example, and in many other cities, it is the practice to suggest to the Parliament from year to year such alterations of the municipal act as seems advisable. In the majority of the Canadian provinces towns and cities are incorporated by special legislation; in Ontario and Manitoba, by virtue of general statutes on proclamation by the lieutenant-governor. Even in these provinces, however, special declaratory acts are usually passed announcing the incorporation and making provision for liabilities, etc. The typical form of Canadian urban government consists of a single chamber of aldermen (varying in number from 9 to 26) with a mayor. Both the mayor and council are generally elected for one year. In Montreal and Quebec the mayor is elected for two years, and in the latter city is chosen from among the aldermen. In Montreal, Quebec, Winnipeg, Brandon, and Vancouver the aldermen are elected for two years. A board of control (the mayor with four aldermen), whose function it is to prepare the annual estimates, has recently (1897) been adopted for the cities of Ontario (except Hamilton) having a population of more than 45,000. Municipal offices are, in most cases, filled by appointments made by the mayor or the council. In the cities of Ontario and British Columbia, in Winnipeg, Charlottetown, and Saint John, police appointments are made by commissioners independent of the civic government. The liquor licenses are almost everywhere under the control of the provincial authorities. The municipal suffrage in Canada is more restricted than the rural or parliamentary. Throughout Ontario, in Montreal, Quebec, Calgary, and the four largest cities of British Columbia a special qualification of real property or income is demanded. The chief sources of civic revenue are found in taxes on real property (averaging 21.8 mills on the dollar in Ontario 1898), betterment taxes, and, in some cases, license taxes and percentage receipts from city franchises. Municipal indebtedness, incurred mainly for waterworks and education, has much increased of late years, but the rate of interest on city debentures, which formerly stood at 6 and 7 per cent, has now in many instances fallen to 3 or 4. The total debt of Montreal in 1902 was \$27,000,000, of Toronto in 1901 about \$22,000,000. Except for waterworks there is but little municipal management of public works. Winnipeg, New Westminster, Three Rivers, and a number of minor towns in Ontario own and operate electric plants. Street railway franchises are granted for periods varying from 15 to 30 years; in Toronto, Montreal, Hamilton, Ottawa, and Halifax the city receives a percentage of gross receipts.

Lecturer in Political Science, McGill University.

13. Canada—Relations to Great Britain. When the Canadian Confederation was formed its founders believed that they were establishing a nation. Their hopes have been slow of fulfilment, for, though the phrase "The Canadian Nation" is frequently used, that *status* Canada has not really attained. She is still under tutelage. Her Parliament exists not by the will of her own people, but under an enactment of the Parliament of Great Britain, which, in theory, may at any time change the Canadian constitution without reference to the Canadians themselves. Canada possesses no treaty-making powers. She has no authority to make either war or peace. She does not even control her own copyright laws. (See COPYRIGHT, CANADIAN.) There is an appeal from her courts to the king's privy council in London. But while on these lines a formidable list of restrictions could be drawn up, the will of the Canadian people is in fact supreme in regard to Canadian affairs. Authority once granted, the Imperial Parliament would never venture to revoke, though from time to time in the borderland of rival jurisdiction the cabinet at London has caused annoyance in Canada by what seem unreasonable checks. Again, British statesmen vie with each other in generous statements as to Canadian autonomy.

It is becoming more and more obvious that to Great Britain's policy and needs in the present day the co-operation of Canada is necessary. The Dominion occupies the middle ground between the East and West, and has in geographical situation the advantages possessed by the United States. The Canadian wheat fields are increasingly necessary for Britain's food supply. While in Canada there is striking devotion to the political tie with Great Britain, it goes hand in hand with a resolute conviction that her own domain Canada must rule for herself. No coercion of Canada by Great Britain would have any prospect of success. Probably the thought of coercing Canada would never occur to British statesmen. In any case the Dominion has her destiny in her own hands.

When Canada is called a "colony" the epithet is resented by the Canadian people; and Mr. Chamberlain, Lord Rosebery, and other British statesmen have avowed their sympathy with this dislike, since the title carries the brand of inferiority. It is sometimes suggested that the word "Dominion" in Canada's title should be changed to "Kingdom," since "Dominion" implies possession by some other power, while "Kingdom" asserts an equal status with England, Scotland, and Ireland. It is not improbable that in the future increased attention will be given to this proposal. There is no doubt that Canada is a little restless in her present situation and resents the patronizing attitude often adopted toward her in Great Britain. But to become a kingdom she must assume the full burdens of equal *status*. At the present time the British government spends considerable sums in maintaining fortifications in Canada and in keeping up military and naval establishments on the Atlantic and the Pacific. Canada's excuse for permitting these things to be done for her are two-fold; she has been spending enormous amounts in building railways that among other things serve military purposes, and she claims too, that since she has no voice in regard to war or peace, those who control these issues may properly bear the expense of defense.

CANADA — IMPERIAL FEDERATION

The relations of Canada to the United States are hardly less important to her than those of Great Britain. It has been difficult for many to understand why Canada, with so many ties in blood and ideals to the United States, with so much to be gained commercially by the step, should not join the Union. It may be answered that smaller nations have always been jealous of absorption by great neighbors. During centuries Scotland fought the proposals for union with England. At the present time little Holland, linked in blood with Germany, dreads the prospect of any political tie. There were periods when Canada seemed likely, to a superficial observer, to consent to annexation. In 1849, from the depths of great commercial depression, some of her political leaders, one of whom, Sir John Abbott, afterward became prime minister, openly proclaimed their desire for annexation. From 1888 to 1891, in a similar time of distress, commercial union with the United States, which would almost certainly have involved political union, was strenuously advocated by a powerful wing of the Liberal party. In spite of this the calmer judgment of the Canadian people has always been that it is best to remain a separate state. The United States and Canada together would be continental in size; if it is desired to prove that a state may become too big, the present condition of Russia need only be pointed to.

While this is true there is no doubt that throughout Canada a better feeling than was formerly apparent towards the United States now exists. Traces of hostility are still often found. The American commercial policy of a high tariff has hit Canada very hard and every attempt to soften its rigor has met with failure. With this present fact and the other fact that English-speaking Canada is in large degree descended from Loyalists driven out at the period of the revolution, it is not strange that hostile utterances should occasionally be heard. But though family traditions serve to perpetuate the old *animus* the issues of the revolution and of the War of 1812 are very, very ancient, with hardly more reality now than has Jacobite sentiment in England. When Canada was less important she was more sensitive and touchy and differences with the United States aroused greater feeling. Her present self-reliance has encouraged a better temper. Moreover the troublesome questions between the two countries have been for the most part settled. The only conflict possible is the commercial war involved in high tariffs and this is not likely soon to cease. Canada despairs of reciprocity in trade with the United States and has found markets elsewhere. See CANADA — RECIPROcity BETWEEN CANADA AND THE UNITED STATES.

No party in Canada favors any radical alteration of her present position. The more thoughtful Canadians undoubtedly dislike the existence of an even nominal subservience to the Parliament at Westminster. They want complete independence, but it is "Independence within the Empire," that is to say, independence which involves perpetual alliance between Canada and Great Britain for all national purposes. When Edward VII. was crowned his title was changed to that of "King of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the Seas." This proposal was not found as soothing in Canada as it was intended to be. "I claim independence of

the Parliament of Great Britain," says a Canadian publicist, Mr. J. S. Ewart, K.C., "and I object therefore to Canada being called a 'Dominion,' for the word implies subjection. Further, I object to being called a British Dominion, for I assert that Canada belongs not to the British but to Canadians. . . . And I resent being lumped with Trinidad and Guiana and Barbadoes as 'British Dominions over the Sea.'" The writer then proceeds to give his ideal for Canada: "Canada's Parliament shall be as omnipotent as that at Westminster. The king's Canadian ministers shall advise him upon all things Canadian with the same constitutional authority as that of British ministers to advise their sovereign about all things British; our own men shall decide our own law suits and command our own forces; and our own money shall provide for our own defence and for such mutual aid as we ourselves may approve." This is far removed from the ideal of what is called "Imperial Federation." (See CANADA — IMPERIAL FEDERATION.) Imperial Federation implies a central parliament clothed with at least some power, but Canada, which for generations has been struggling to increase her powers of self-government, will not consent to surrender any of the autonomy that she has won.

GEORGE M. WRONG,

Professor of History, University of Toronto.

14. **Canada — Imperial Federation.** Imperial federation is the name given to the various projects for revising the relations between Great Britain and her colonies, so as to give to the latter a share in the government of the empire. The growth of the colonies, and the increasing burden of national defence, naturally suggest that the colonies should contribute to the imperial revenue; on the other hand, such a contribution, unless accompanied by a voice in the councils of the mother country, would constitute that "taxation without representation" so abhorrent to Anglo-Saxon ideas. Such was the situation during the great controversy of the 18th century between Great Britain and her North American dependencies, and such is again the situation at the present day. Even in the 18th century various proposals were made for solving the colonial difficulty by admitting American representatives to the British Parliament. Governor Pownall (see POWNALL, THOMAS), Edmund Burke (q.v.), and Adam Smith (q.v.) made suggestions of this sort. But the difficulty of communication rendered any such federation impracticable. During the middle period of the 19th century it was currently believed that the manifest destiny of the colonies was independence. With the passing of that idea has arisen the demand for a closer bond of union. The imperial federation movement originated in the early '70s, an informal conference for discussing the subject being held in 1871. In 1884 the Imperial Federation League was founded, its first chairman being the Right Hon. W. E. Forster (q.v.). Lord Rosebery (q.v.), the Right Hon. Ed. Stanhope (sometimes secretary of state for the colonies), and Sir Frederick Young (q.v.) (whose work, 'Imperial Federation,' had appeared in 1876) were interested in the movement from its inception. A significant event was seen in the London colonial conferences of 1887, to which representatives of both the self-governing and the

CANADA — IMPERIAL FEDERATION

crowns colonies were summoned, and at which the subjects of imperial defense and trade were discussed. In 1892 a committee of the Imperial Federation League presented a practical scheme of federation. It recommended the institution of a council of the empire, to which delegates should be summoned from the self-governing colonies, the crown colonies, and India. The function of the council was to consist in the regulation of imperial defense. It was recognized, however, even at this stage of the movement, that there was no sufficient unanimity among the members of the League in reference to the details of the plan to be adopted to enable them to work effectively toward a common end. The League, whose work was declared to be only preliminary and preparatory, was dissolved in 1893 and its place was taken by a number of organizations having each a more definite purpose. Of these the United Empire Trade League became the advocate of the commercial union of the empire by means of protective duties. The Imperial Federation (Defence) Committee urges combined action for defensive purposes, the establishment of a navy supported by joint contributions being its immediate object. Most important, perhaps, is the British Empire League, established in 1894 and extended to the Dominion of Canada. The programme of the League aims at the permanent unity of the empire, the promotion of trade and inter-communication, the holding of periodic conferences, and co-operation in national defense. In Canada, indeed, the movement had already made considerable progress. The Imperial Federation League in Canada had been formed at Montreal in 1885, with branches subsequently established at various places in the Dominion. Under the auspices of the organizing committee of the League a distinguished Canadian, George Parkin, delivered addresses throughout Canada, and in 1889 was sent, on behalf of the parent league, on a tour of the Australasian colonies. In 1894, at the instigation of the Canadian government, a conference was held at Ottawa to discuss intercolonial trade and communication. The Imperial government, Canada, Cape Colony, and the Australasian colonies were represented. Resolutions were adopted in favor of reciprocal preferential duties among the colonies. A still more important conference was held in London in 1897 on the occasion of the jubilee celebration of that year. At this meeting the premiers of Canada, Newfoundland, New South Wales, Victoria, Queensland, South Australia, West Australia, Tasmania, New Zealand, Cape Colony, and Natal discussed with the Right Hon. Joseph Chamberlain (q.v.), secretary of state for the colonies, both the commercial and political relations of the mother country with the colonies. In reference to the former, a resolution was unanimously adopted favoring the "denunciation at the earliest convenient time of any treaties which now hamper the commercial relations between Great Britain and her colonies." The premiers also undertook to confer with their colleagues to see whether a preference could advantageously be given by the colonies to the products of the United Kingdom. In reference to political relations, the majority of the premiers endorsed the following resolutions: (1) "That the present political relations between the United Kingdom and the

self-governing colonies are generally satisfactory under the existing condition of things." (2) "That it is desirable, whenever and wherever practicable, to group together under a federal union those colonies which are geographically united." (3) "That it would be desirable to hold periodical conferences of representatives of the colonies and Great Britain for the discussion of matters of common interest." From the first of these resolutions Suddon of New Zealand and Sir E. N. Braddon of Tasmania dissented, on the ground that the time had already come for a reconstruction of political relations. The Canadian government in the next year (1898) extended to Great Britain and to such British colonies as should reciprocate, a tariff preference of 25 per cent, increased in 1900 to 33½ per cent. In the summer of 1902, on the occasion of the coronation of King Edward VII., a further colonial conference was held between Secretary Chamberlain and the premiers of the self-governing colonies. The meetings of the conference, of which there were 10 in all, were also attended by several ministers of Australia and Canada then present in London, and by the members of the British cabinet whose departments were concerned in the discussion. Chamberlain submitted a paper showing the disproportionate share of the burden of imperial defense at present borne by the United Kingdom. "If you are prepared at any time," he said, "to take any share, any proportionate share, in the burdens of the empire, we are prepared to meet you with any proposal for giving to you a corresponding voice in the policy of the empire." No definite conclusion was reached for the alteration of present political relations beyond the following resolution: "That it would be to the advantage of the empire if conferences were held, as far as practical, at intervals not exceeding four years, at which questions of common interest affecting the relations of the mother country and His Majesty's dominions over the seas could be discussed and considered as between the secretary of state for the colonies and the prime ministers of the self-governing colonies. The secretary of state for the colonies is requested to arrange for such conferences after communication with the prime ministers of the respective colonies. In case of any emergency arising upon which a special conference may have been deemed necessary, the next ordinary conference to be held not sooner than three years thereafter." On behalf of the commonwealth of Australia £200,000 a year was offered toward the cost of the Australian Naval Squadron and naval reserve, from New Zealand £40,000 for the same purposes, from Cape Colony £50,000, and from Natal £35,000 for the imperial navy generally, and from Newfoundland £3,000 for maintaining a branch of the Royal naval reserve. The grants were subject to ratification by the colonial legislatures. Resolutions of a general character in favor of preferential trade were also adopted by the congress. The Australian contribution met with sharp criticism from the Melbourne *Age* as involving taxation without representation. In February 1903 the British Empire League in Canada passed a resolution against the abstention of Canada from naval contributions, and declared that "it would be proper for her . . . to contribute a fair and reasonable

share toward the annual cost of the navy of the United Kingdom.”

The question of imperial defense and colonial contributions has been under constant discussion in the colonies, especially in Canada and Australia, during the last two years. The general arguments in favor of a reconstruction of present imperial relations are very strong. The rapid growth of the population of the great self-governing colonies renders their exclusion from the government of the empire more and more at variance with the spirit of Anglo-Saxon institutions. The population of the United Kingdom (estimated June 1902) is 41,952,510, that of Canada (1901) 5,371,315, of Australia (1901) 3,771,715, of New Zealand 815,000, of Newfoundland 220,984, and the white population of the South African colonies about 850,000. The great discrepancy between the contributions made toward imperial defense by the people of the United Kingdom and those of the colonists is also very striking. The figures presented by Mr. Chamberlain at the conference of 1902 showed the per capita yearly expenditure for military and naval defense to be: for the United Kingdom, \$7.12; for Canada, 49 cents; for New South Wales, 83 cents; for Victoria, 79 cents; for New Zealand, 81 cents; and for the Cape and Natal, from 50 to 75 cents. A further general argument in favor of imperial federation is based on the fact that, though politically united, the various parts of the British empire do not form a commercial unit. The grant of representative institutions to British colonies in the middle of the 19th century carried with it the right to set up a protective tariff against the mother country, a right of which the colonies have made full use. The preferences recently granted by Canada, New Zealand, and South Africa are far from amounting to commercial unification. The cogency of these general arguments is undoubtedly great, but when one passes from general considerations to explicit schemes of federation, difficulties of the gravest character are encountered. This is seen in the great variation in the different plans proposed. The League of 1892, as already said, proposed a council of empire supplementary to the British Imperial Parliament. Here difficulties at once occur. If the council is supreme over the British Parliament, then it would be necessary to effect a radical reconstruction of the sphere occupied by the latter. If it is inferior, it becomes merely an advisory body and represents no real colonial participation in imperial power. To meet this objection plans are proposed for the admission of colonial representatives to the British Parliament. As against this it is urged that the House of Commons, with its 670 members, is already too unwieldy for its work, and is already in a state of chronic congestion from the press of business, both British and imperial, with which it is compelled to deal. The question, moreover, arises as to whether the colonial representatives would be allowed to vote on all matters before the House or only on those of imperial import. The former system would obviously appear unjust to the people of Great Britain, the latter would introduce the cumbrous device of an “in-and-out” parliament, an arrangement notoriously difficult in operation. These objections seem logically to lead imperial federation toward such plans as those of Granville Cunningham (‘Imperial Federation,’

1895) and Sir Frederick Young. By these writers a complete scheme of federation is proposed with an Imperial Parliament and local assemblies. Cunningham assigns a single local parliament for England, Ireland, and Scotland, with a viceroy representing the sovereign. Sir Frederick Young proposes a separate local parliament for each of the three divisions of the United Kingdom. A division of jurisdiction is suggested by Sir Frederick Young (address on ‘Imperial Federation,’ London 1903) as follows: “Imperial questions would comprise foreign relations, peace and war, national defence, revenue and expenditure for national, as distinguished from local, purposes, extensions of empire, the government of India, and generally all that comes within the department of international law.” Such subjects as marriage, domicile wills, coinage, copyright, patents, railroads, might be left, the author thinks, “either to the Federal or Provincial governments without impairing the strength or efficiency of the imperial organization.” Such a division of power would, however, introduce into British legislation the question of constitutional limitations and fundamentally alter the nature of parliamentary statutes and the relation of the judicial and legislative organs of government. The system of representation suggested by Cunningham would distribute the 300 members of the proposed Imperial Parliament as follows: England 185, Scotland 25, Ireland 40, the colonies 50. Of the colonial members he would allot 20 to Canada, 15 to Australia, and 5 each to New Zealand, the Cape settlements, and the West Indies. Such schemes of colonial representation at once meet with the difficult question of the extension of the franchise to the native races. “What,” asks Prof. Goldwin Smith (‘Saturday Review,’ February 1897), “are they going to do with the West Indies? Are they going to import the negro vote into the political and diplomatic councils of the empire?” The same writer considers that colonial representation would carry with it the danger of the obtrusive influence of colonial party politics on the Imperial Parliament, the colonial members voting “in the Imperial councils with their eyes fixed on the ballot-box at home.” A serious difficulty is also presented by India, whose population of 287,000,000 seems admittedly to be outside of the Imperial representation. Whether or not the government of India would fall within the sphere of the Imperial Parliament is a matter of divergent opinion. If it did not, the relations of India with the separate parliaments of England, Ireland, and Scotland would be difficult to adjust. Further trouble is presented by the question of the House of Lords. Would the Imperial Parliament be composed of a single chamber or of two? Mr. Cunningham, who makes the House of Lords the upper chamber of his Imperial Parliament, suggests that it would be necessary to add a few life peers (perhaps 20) to represent the colonies. It is not stated why they should be “few” or why they should only be life peers. Perplexing also is the question of the public finance of the reconstructed empire. The national debt of the United Kingdom and the debts of the colonies would have, in some way, to be adjusted to the new relations. The consideration of revenue raises the question whether imperial federation would necessitate a customs union; in this case either Great Britain must

CANADA—PRIMARY EDUCATION

abandon free trade, or the colonies must abandon protection. These and other difficulties which beset any practical scheme of federation serve for the present to keep the political problem of imperial relations in suspense and postpone its solution until the pressure becomes more intense. To the commercial aspect of the question renewed interest has been directed by Mr. Chamberlain's present agitation in favor of a revision of the British fiscal policy. Consult: Parkin, 'Imperial Federation' (1802); Cunningham, 'Scheme for Imperial Federation' (1895). STEPHEN LEACOCK,

Lecturer on Political Science, McGill University.

15. **Canada—Primary Education.** According to the British North America Act, education within the Dominion was entrusted to the several Provinces. One reason for this was doubtless the fact that in language and creed the Provinces differed so widely. Each Province has worked out a system suited to its own particular needs and conditions, and though there are striking similarities in aims and methods, yet there are great diversities in details of administration and in results attained.

Education Free.—Speaking generally, primary education is free to all pupils of school age, that is, from 5 or 6 years to 18 or 21. In one of the Provinces a fee may be charged, but this is merely nominal. In kindergarten schools and secondary schools, the payment of fees as supplementary to state, municipal, and district aid is sometimes permitted.

The Central Governing Bodies.—In every case the system is administered by a central authority. In Prince Edward Island the Board of Education consists of the executive council, the principal of Prince of Wales College and Normal School, and the chief superintendent of education, the last-named officer being appointed by the lieutenant-governor in council. In New Brunswick the Board of Education consists of the executive council, the chancellor of the provincial university, and the chief superintendent of education, who is appointed by the lieutenant-governor in council. In Nova Scotia the Council of Public Instruction consists of members of the executive council, of whom five shall form a quorum, and the chief officer is a superintendent of education appointed by the lieutenant-governor in council. In Quebec the Council of Public Instruction consists of (1) the Roman Catholic bishops of the Province, (2) an equal number of Roman Catholic laymen, (3) an equal number of Protestants. The last two classes are appointed by the lieutenant-governor in council. This Council of Public Instruction is divided into two committees known as the Roman Catholic and the Protestant committee, each being concerned with the administration of schools of its own kind. The practical administration of schools is carried on through a superintendent of education, who is appointed by the lieutenant-governor in council, and through two secretaries, one for each section of the Council of Public Instruction. In Ontario the Department of Education consists of the executive council or a committee

thereof, and the head of this department is known as the minister of education. In the matter of examinations the department is advised by an educational council of 12 persons, 6 of whom are appointed by the senate of the university. In Manitoba the executive council forms the Department of Education, and an advisory board, consisting of members chosen by the government, the university and the teachers of the Province, has authority in such practical matters as the framing of a programme of studies, the certification of teachers, the authorization of text-books. In the Northwest Territories the Department of Education is presided over by a member of the executive council known as the commissioner of education who is assisted by an educational council of five persons, at least two of whom shall be Roman Catholics. In British Columbia the Council of Public Instruction is composed of the executive council, and the work under its direction is carried on by a superintendent of education.

Local Self-Control.—Though the governing bodies just mentioned regulate education as regards the organization, government, examination, and inspection of schools, the certification and training of teachers, the authorization of text-books, and other matters of like importance, yet much power is given in most of the Provinces to local school boards. Each district selects its own teacher, but must not take any one who has not a certificate to teach in the Province. Within limits each district erects the building it considers most suitable under the circumstances and equips it as it may desire. There is wise supervision in matters of this kind to prevent undue expenditure and to guard against overcrowding of pupils and lack of apparatus. In British Columbia the Council of Public Instruction is supreme in all matters, virtually doing away with district control, except in the selection of teacher.

The Religious Difficulty.—The constitution of the governing bodies in education indicates that there has been difficulty in establishing and administering school systems because of the conflicting religious beliefs of the people. A closer examination emphasizes this fact. In Quebec there are two systems of schools—one for Roman Catholics, one for Protestants. In Ontario there is a system of separate schools. In New Brunswick after a struggle lasting for many years a compromise has been effected whereby separatists have practically all they demand, though they have not separate schools in name. In the Northwest Territories separate schools are supported by the state. In Manitoba, which until 1890 had Protestant schools and Roman Catholic schools, there is now but one system.

Religious Exercises.—Closely connected with the separate school question is that of religious teaching and religious exercises. In British Columbia, schools must be conducted on strictly secular and non-sectarian principles. No religious dogma or creed shall be taught. The Lord's Prayer may be used in opening or closing school. No clergyman of any denomination shall be eligible for the position of superintendent, teacher or trustee. In the Northwest Territories no religious instruction shall be given until half an hour previous to school

closing in the afternoon, after which time any such instruction permitted or desired by the board may be given. It is not compulsory on any pupil to attend during this period. Any school may be opened by the recitation of the Lord's Prayer. In Manitoba, schools may close with the reading of the Bible without comment and the recitation of the Lord's Prayer, and it is possible for clergymen or their appointees after half an hour before closing to give religious teaching to those of their own denomination. In Ontario every public school shall be opened with the Lord's Prayer and closed with the reading of Scriptures and the Lord's Prayer, or the prayer authorized by the Department of Education. Teachers who have conscientious scruples in this matter may be relieved. Attendance during religious exercises is not compulsory. Religious teaching may be given by the clergy or their representatives after the regular hours of school. In Quebec, in the Roman Catholic schools, there is daily prayer and systematic daily instruction in the catechism. In Protestant schools the first half hour is devoted to prayer, Scripture reading, instruction in morals, and Scripture history. No denominational teaching may be given. A conscience clause is operative. In New Brunswick the teacher may open and close the school by the reading of Scripture and by offering the Lord's Prayer. In Prince Edward Island the school is opened with Scripture reading, but no comment or explanation is permitted. In Nova Scotia the law is practically the same as for the last two provinces, local option being permitted.

The Support of Schools.—The schools of the Dominion are maintained by a fund drawn from three sources—a state fund, a municipal or county fund, and a fund yielded from district assessment. The government aid is distributed in different ways. In Prince Edward Island and New Brunswick the grant depends upon the sex and the grade of certificate of the teacher. In Nova Scotia it depends upon grade of certificate and the number of days school is open. In Quebec the sum depends upon the population of the district, and in Ontario it is divided among the counties, townships, cities, and towns in a similar manner. In Manitoba a definite sum depending upon the total grant available is given to each school open the full year, and a proportionate sum to schools open for less time. In the Northwest Territories the grant depends upon the size of the district, the number of days school has been kept open, the grade of certificate held by the teacher, and the percentage of attendance. In British Columbia the government meets practically all the expense of education except in the case of cities. Here a per capita grant is given. In Manitoba and the Territories no less than one-eighteenth of the whole land is set aside for school purposes. It is doubtful if any other country has made such ample provision for education.

The Salaries of Teachers.—In the older Provinces, when free schools were introduced and districts began to be formed, it was natural that every settler should wish to be near the school-house. This led to small school districts. When the burden of supporting the small district fell upon the small district there was a tendency to reduce the salary of the

teacher to the lowest amount possible. The result has been most unhappy. In spite of excellent provision for the instruction and training of teachers it is now impossible to get as many who are fully-qualified for their work as there are schools; and the male members of the profession are becoming fewer every year. This is particularly true in those communities where there is great industrial activity and consequent openings for men. The question of consolidation of rural schools is now under discussion. In the more thickly settled parts of the older provinces consolidation may in time help to solve one of the greatest problems of elementary education in Canada. But it can never be more than a very partial solution. In the west the districts are about as large as they can be made. Consolidation in most cases is an impossibility. Relief can come about in only two ways: (1) There must be an increase of legislative aid; (2) there must be increased local support. The former is probably an impossibility because of the limited resources of the Provinces; the latter will come only as a matter of education. No people are in a better condition financially than the Canadian farmers. The burdens of taxation are comparatively light. Yet the salaries paid to teachers are very meagre. In Prince Edward Island the average salary in 1902 was \$216.09, and a number were living on \$130. In Nova Scotia the salaries vary from \$438 for male teachers of the "B" grade and \$293 for female teachers of the same grade, to \$184 for males of "D" grade to \$167 for females of the same grade. In Ontario the salaries average \$436 for males and \$313 for females. In Manitoba the average for all is \$488. In the Territories the average is \$47.67 per month.

Wherever salaries are small two things are noticeable: (1) The percentage of female teachers is large; (2) the percentage of trained teachers is small. In the Northwest Territories not over 5 per cent of the teachers are untrained; in Manitoba conditions are almost equally satisfactory. In Nova Scotia about 43 per cent of the teachers have taken normal training. In New Brunswick where salaries are small less than 20 per cent of the teachers are men; in Nova Scotia about 18 per cent; in Ontario 24 per cent; in Manitoba 30 per cent; in the Northwest Territories about 43 per cent. The small salaries, therefore, affect the schools in two very important respects, and this is being felt from one end of the Dominion to the other.

Training of Teachers.—The training of teachers is something to which all the Provinces have given much attention, though the system adopted is not uniform throughout. In Ontario, Manitoba, and the Northwest Territories the course is purely professional and based on a definite academic course. In other Provinces the academic and professional work are carried on simultaneously as in many of the normal schools of the United States. (See TEACHERS, PROFESSIONAL TRAINING OF; SCHOOLS, COUNTY TRAINING.) The tendency in professional training seems to be toward a short course for beginners, followed by actual experience in a schoolroom and then a longer and more philosophic course leading to a permanent license. The fact that all certificates are granted by provincial rather than local authori-

ties does much to elevate the standard of the profession.

Teachers' Institutes.—The work of the normal schools is supplemented by teachers' institutes which are of two kinds, (1) Those arranged for and carried on under the direction of the Department of Education; (2) those which are purely voluntary on the part of the teachers. These institutes do much toward developing a professional spirit, toward bringing teachers into touch with educational progress in other lands, and toward bringing school and home into closer relationship. The greatest of these gatherings of teachers is the Dominion Educational Association, which meets every two or three years. All departments of education are here represented. As yet this association is in its infancy, just having held its fourth meeting, but it promises to be to the Dominion what the National Educational Association is to the United States. See COLLEGES FOR TEACHERS.

School Libraries.—It is recognized throughout Canada that school libraries are a necessity in education. In most of the Provinces grants are made to supplement the grants of trustees. The Northwest Territories has made the most complete provision by making it compulsory for trustees to spend annually a portion of the regular grant in the purchase of books for library purposes.

Coeducation.—A distinctive feature of Canadian elementary schools is the coeducation of the sexes. There are exceptions to this rule in Quebec and in a few leading cities of the other provinces. In all rural communities coeducation must continue to be the practice, and it is doubtful whether there will be any departure from customary procedure in cities and towns. The results morally and intellectually under present conditions seem as satisfactory as in lands where separation of the sexes is considered a necessity.

Courses of Study.—The course of study pursued in the various provinces does not differ very greatly from that followed in other civilized lands, though emphasis may not be placed on the same subjects. Though direct moral instruction is not systematically given in all the Provinces, it is doubtful if anything could be more salutary than the influence of the schools. The high moral standing of the Canadian citizen must be attributed in a measure to the faithful labor and supervision of the public school teacher. In addition to the study of the five central subjects,—language, literature, mathematics, geography, and history,—emphasis has of late been given to manual training (q.v.), and nature study (q.v.). The former branch received prominent notice owing to the liberality of one of Canada's most worthy citizens—Sir William McDonald. The work in nature study is carried on successfully in several of the Provinces and with excellent results. In the cities and towns particularly music and drawing are taught. The play impulse is recognized in the games of the school. In these the teacher frequently takes a prominent part. Though physical exercises are usually conducted for a few minutes each day and serve as a relaxation from mental labor, there is lacking that medical supervision in all things pertaining to bodily welfare, which is so necessary.

It is generally recognized in elementary schools that the method of study, and the mental attitude developed in pupils, are of as much importance as the facts learned. The power for self-direction developed in Canadian youth, is amply proven by the behavior of manhood. The method of classification, even in the large city schools, does not appear to have crushed out the individuality of the pupils. It may have removed idiosyncrasies, but it has still left power for independent action. The ideal of school government in Canada, though not fully realized in many cases, is that of a kindly authority which induces power of self-control. In this, the temper of the Canadian people is expressed. However, in the home as well as in the school, well-meant liberty often develops into license. Intelligence, right habits of thought, and good morals are often noted where manners and good taste are in a marked degree lacking. Yet on the whole the type of life represented in Canadian elementary schools is of a very high order.

Canada may be considered the land of the common school. With the one unfortunate exception already noted, there is nothing in the public school system which recognizes class, race, or creed. The school is the most potent agency for unifying the diverse elements of the population. With the exception of the foreigners who are entering the west, practically all children can read, write and calculate. Nearly all go to school for at least a portion of the school year. Probably for this reason no vigorous steps are taken to enforce the compulsory education clauses of the school acts. See ELEMENTARY EDUCATION; CANADA — SECONDARY EDUCATION; CANADA — HIGHER EDUCATION; CANADA — CATHOLIC EDUCATION. See also the section *Education* in the articles on the different Provinces.

W. A. MCINTYRE, B.A.,
Normal School, Winnipeg.

16. Canada — Secondary Education. The public high schools of the English-speaking provinces have been modeled more or less upon those of Ontario, which was the first (1844) to organize a system of public instruction. As a result, there is a very general similarity amongst them. Quebec, however, which is largely French and Roman Catholic, with an English-speaking Protestant minority, has organized its high, as well as its elementary schools, in accordance with its exceptional conditions.

Secondary education in Canada is provided for in three classes of schools which are well distributed geographically and are known sometimes by different names in the different provinces:

(1) Public high schools, in which secondary education alone is provided for. A few do also the first year or the first and the second year work of the universities.

(2) Public high school grades in connection with the elementary schools. Sometimes such grades are as good as the high schools, and often gradually develop into separate institutions.

(3) A small number of private secondary schools. These have usually elementary grades attached and occasionally do the work of the earlier years of the universities. Their fewness is due chiefly to the efficiency of the public systems, which were organized early in the history of most of the provinces. As, however, the

CANADA — SECONDARY EDUCATION

wealth increases, more of such schools are established, but they are now, and will likely continue to be, comparatively unimportant factors in the education of the Dominion.

The public high schools differ markedly from those of the United States in being organized into one system in each province and in being controlled and supported by the province as well as by the locality. The causes which thus tend to uniformity in the individual systems have in most been reinforced by uniform examinations of the different grades, conducted by the central authority. The State-control is exercised by a minister of education, who is a member of the provincial cabinet, or by a superintendent of education, responsible to the cabinet, or by both. Such controlling officers have associated with them an advisory council, variously constituted, with more or less important powers. The functions of the State are legislative and general. Subject to this oversight, which is exercised directly and through government inspectors, and which prescribes text-books, courses of study, and school regulations, local boards of trustees or commissioners have complete control, appointing the teachers and managing the finances. The boards are thus able to deal with local conditions, while the State connection has secured a measure of uniformity and general efficiency of courses and standards. The State contributes often very liberally to the support of the public high schools, the expense of establishment and the rest of the expense of maintenance being provided for by local taxation. Sometimes small fees are also charged.

The private schools are generally proprietary and of denominational origin; and, as a result, nearly all of them are under denominational control. Although affected in their courses and organization by the denominating public systems, they have no connection with the State, except in the case of a few which are affiliated with State universities, or of some Quebec schools which are subsidized under certain conditions. Except also in Quebec, the public high schools are open to and attended by all denominations. The private schools, on the other hand, are usually sectarian, but the religious training given in most of the Protestant schools is such that they are patronized by the adherents of other churches than those with which they are connected.

All the secondary schools have more or less extended curricula, corresponding to those of the United States high schools; but, as there, the entrance and the leaving standards vary according to the system of organization, the efficiency of the elementary schools, the requirements of the universities, and the wealth and population of the different provinces. The Ontario high schools are the best developed and the most efficient, being, as regards standard, on a par with the best in the United States. Besides providing a general education, the Canadian high schools prepare for university matriculation, for commercial pursuits, and for teachers' non-professional certificates. In one important and far-reaching respect they differ from the high schools of the United States: their teachers must all hold certificates of scholastic and professional competency, authorized by the respective education departments, and varying in standard and character according to the conditions of the system. Such teachers are usually obliged to attend professional schools. Ontario, however, is

exceptional in having a normal college, in the city of Hamilton, with a practice school attached, the former being controlled and supported by the government. Here are trained for one year the highest grade of public school and high school teachers. In the other provinces the normal schools provide the general professional training for all grades.

Following are additional details in regard to each of the provinces:

Ontario.—Here the special secondary schools are of two classes, high schools and collegiate institutes. The principal of each must be a graduate in arts of a university in the British dominions, with at least two assistants for a high school, and three for a collegiate institute. The staff of the latter must be specialists (usually with honor university degrees) in Classics, Mathematics, Moderns and History (including English), and Science, with a specialist in art and in the commercial subjects, some having as many as 20 teachers. Both classes of schools must have good accommodations and a minimum equipment—\$800 for a high school, and \$1,600 for a collegiate institute. The latter must also have a gymnasium, for which each school receives a maximum grant of \$160 a year; a special grant of \$80 a year may also be made to a high school which has one. Besides the separate high schools, there are, in connection with the elementary schools in localities where there are no high schools, fifth forms or continuation classes, which also do high school work of a character sometimes as good and as comprehensive as is done in the high schools. The teachers of these grades must hold first class certificates or other professional certificates satisfactory to the inspector and in accordance with the character of the work undertaken, but many of them are university graduates. Pupils pass from the fourth grade of the elementary (called public) schools, (age 12 to 14) into the secondary schools, on uniform examination papers set by the education department and valued by local boards. Just recently, however, city boards have been given the right to set their own papers or to accept, under certain conditions, the promotion examinations of the public school staffs. The standard of entrance in Ontario is at least equal to that of the best United States high schools. Besides the usual courses, these schools may have special art, commercial, manual training, household science, and agriculture departments. These departments are not yet well developed. Already, however, the city of Toronto (q.v.) has a separate technical high school; and there are technical high school departments, with manual training and household science, in six or seven other centres of population. A high school is established by a county (or city) municipal council with the concurrence of the government, and its establishment involves a legislative grant of from \$450 to \$1,600 according to the grade, as well as its proper maintenance by the county and by the municipality in which it is situated. After providing for a minimum grant of \$375 the rest of the legislative grant is distributed on the bases of the attendance, the value of the equipment, the amount of the teachers' salaries, and the character of the accommodations, a system which has greatly stimulated local expenditures and has done much to secure the efficiency of the schools. Some of the boards of

CANADA — SECONDARY EDUCATION

trustees are separate from those of the public schools, and others have charge of both classes of schools as in the United States. In constitution they are peculiar in containing a representative of the Roman Catholic separate elementary school, if there should be one in the municipality (the city of Toronto has two). Until recently, as in the other provinces, the education department held uniform leaving examinations at the end of the course in each form. Now, however, as the consequence of evils associated with so much uniformity, these examinations have been discontinued and the department itself holds only those that are necessary for teachers' certificates. It continues, however, to conduct, through its educational council, the uniform matriculation examinations authorized by the universities of the province. In other matters also the educational policy of Ontario is now one of decentralization. Total number of high schools 138, of which 41 are collegiate institutes and 52 are free. Number of teachers 600, of whom 489 are university graduates (chiefly Canadian), and 368 hold honor degrees or the equivalent. Highest salary, \$3,000; average for principals, \$1,220; for assistants, \$699. Number of pupils, 24,472; total legislative grant, \$112,650; total county grant, \$130,125; total local grant, \$384,401; total fees, \$105,801; total expenditure, \$769,080. Total number of continuation classes (public school and Roman Catholic here separate) 480, of which 65 have each one or more classes doing high school work alone; total number of pupils, 4,804.

The public secondary school system is so efficient and so popular with all classes that there are very few private schools. Of these the chief is Upper Canada College (which, however, is only semi-private), an old historic residential school, at one time under government control, but now under a board of governors partly elected by the "Old Boys," and partly nominated, the State connection being maintained through the minister of education who is an *ex-officio* member. This college has still a small endowment, but is supported chiefly by fees. It does general and university matriculation work for boys, and is attended by pupils from all parts of the Dominion and even from the United States. Besides ladies' colleges which have been established in some of the cities, there are a few other colleges for boys, doing elementary and general work and that for university matriculation. One or two also have mixed classes, the chief being Albert College, Belleville, which was at one time a university but is now affiliated with the University of Toronto (q.v.), providing courses of various kinds and grades, as far as the end of the university work of the first year. With only one or two exceptions all the private schools are connected with denominations.

Quebec.—As has already been stated, the public secondary schools of Quebec differ from those of the other provinces in being denominational, Protestant and Roman Catholic, the latter being French. Of both classes, there are two grades called model schools and academies. The Protestant model and academy courses each extend over three years. On completing the first academy grade, pupils may enter McGill (Montreal) Normal School for teachers, and on completing the academy courses (pass matriculation) they may enter the universities. The Roman Catholic model and academy courses, on

the other hand, extend each over two years and have no classical departments. On completing the four years' courses, pupils enter the Roman Catholic classical colleges to prepare for the universities. These colleges furnish good courses in philosophy, languages and literature, but are defective in science. They confer certain degrees and are a combination of high school and college, attended by boys and young men. Most of them are affiliated with Laval (the chief Roman Catholic) University (q.v.). The model schools of both denominations correspond generally to the United States grammar grades, so that they are not really high schools of the usual type. Occasionally they have grades which overlap the academy and the elementary schools. The Quebec secondary system, although superior in character to its elementary system, is inferior to those of most of the other Provinces, and to the best in the United States. As regards relation to the State, some of the secondary schools are dependent, some are wholly independent, and others are partly so. The dependent schools are controlled and supported similarly to those in Ontario. The independent schools are supported chiefly by fees and are controlled generally by Roman Catholic ecclesiastics; but, when schools of this class follow the authorized courses of study, they are subsidized by the province. Most of the classical colleges have endowments, and some of them are comparatively wealthy. Lay teachers are required to hold professional State certificates; the religious teachers are exempt; but the law in regard to the lay teachers is not well enforced. A model school is established by agreement amongst the school boards of two or more municipalities, and is under the control of the board of the municipality where it is situated. The establishment of an academy (three teachers the minimum) is authorized by the superintendent of public instruction on application of the commissioners of two or more municipalities. Such schools are controlled by trustees appointed from their own members by the commissioners on whose initiative they were established. The principals of the Protestant academies are, with one exception, men, almost all being university graduates. Besides the ordinary model schools and academies, there are certain special secondary schools which do work of a higher character, the Boys' and Girls' High School of the city of Quebec, Stanstead Wesleyan College School, Bishop's College School, Westmount Academy, the High School of Montreal, and one or two others. At the close of the session of the Protestant schools, each grade except the third academy (examined by the university for matriculation) is subjected to a uniform examination on papers prepared under the supervision of the inspector of superior schools.

Of the model schools under control of commissioners, 367 are Roman Catholic, 47 Protestant, and of the academies, 44 are Roman Catholic and 27 Protestant. Of the independent or partly independent schools, 144 are Roman Catholic model schools, 105 are Roman Catholic academies, and 2 are Protestant; there are also 18 Roman Catholic classical colleges. Of 121,126 pupils in attendance, 111,724 are Roman Catholic and 9,402 are Protestant. Of the Roman Catholic lay teachers, 564 hold professional certificates; 109 have none. Of the Protestant lay teachers 306 hold professional certificates, 27

CANADA — SECONDARY EDUCATION

have not. The total number of Roman Catholic religious teachers is 3,242.

Nova Scotia.—There are twelve grades in the public schools of Nova Scotia, grades eight, nine, ten, eleven and twelve being high school. Very many of the rural elementary schools have superior grades which do the first and the second year and even the third year work of the high schools. In the towns and larger villages the high school departments are separate. The law allows one high school, called the county academy, in each county, to share in the \$10,000 which the Legislature grants for secondary education, in addition to the other grants to which they are entitled in common with the high school grades generally; provided the county academy is free to each pupil of the county who passes the uniform departmental entrance examinations. Should, however, the shire town fall below the superior school in equipment and accommodations, the latter may be made the county academy by the council of public instruction. Besides the uniform entrance examinations the education department holds uniform examinations in the courses of all the high school grades, and the universities and colleges of the provinces accept for matriculation the certificate of having passed grade eleven when it indicates a pass in the subjects they prescribe. There are 19 county academies with 59 teachers, of whom 20 are university graduates, class A (the highest) being the necessary professional qualification for the high school teachers of all grades of school. In 1903 the total enrollment was 7,081, of which 822 belonged to grade eleven, and 112 to grade twelve. Of the total attendance about 1,700 belonged to the county academies. Nova Scotia has 16 private schools which report an attendance of 476 as doing high school work.

New Brunswick.—Secondary education in New Brunswick is provided for in grammar and superior schools. The number of the former is 13, with 37 teachers and an enrollment of 1,084. Teachers holding license of the grammar school class receive from the government \$350 a year provided the district also pays the teacher at least an equal amount; but not more than four teachers in any one grammar school can receive this legislative grant. These schools are free to all pupils in the county in grades eight to twelve. Their work is of the usual character. Superior schools may be established in each county, one for every 6,000 inhabitants. The principal must hold a first-class superior license, and receives from the government a grant of \$250 a year. In this case also the trustees must add an equal amount. Superior schools in grades seven and upwards are free to all pupils residing within and belonging to the parish in which the schools are situated. As in the other provinces, many of these schools are high schools in everything except the name, and do the same class of work.

Prince Edward Island.—This province has no high schools proper, but provision for the work has been made in about 30 schools with high school departments, in 34 graded schools, and in some of the best conducted primary schools. In these grades about 1,400 pupils are prepared for entrance into Prince of Wales College and Normal School in Charlottetown (the capital) in a course which corresponds to that of the first two years of a high school. All the schools are supported by legislative aid and dis-

trict assessment, of which the former constitutes about three-fourths of the expenditure. No special grant is made for high school purposes. Whatever is paid extra comes by voluntary vote of the rate-payers of the district.

Manitoba.—In Manitoba, a recently settled province, the high school work is done in intermediate schools, of which there are 46 with 124 pupils, and in collegiate institutes, of which there are three, with 1,160 pupils. The intermediate schools are elementary schools with a high school grade. They do general work and prepare for third and second class non-professional teachers' certificates, but they rarely take up the languages. Such schools receive a special legislative grant of \$300. The collegiate institutes at Winnipeg, Brandon, and Portage la Prairie, in addition to the high school work by the intermediate grades, prepare for first class certificates and matriculation into Manitoba University with occasionally the work of the first year. (See MANITOBA — EDUCATION.) The legislative grant to these three schools is a liberal one, \$8,400 being distributed on bases that recognize their efficiency. Principals of intermediate schools must hold first class certificates; principals of collegiate institutes must in addition be university graduates. The assistants also of both classes of schools must hold professional certificates.

Northwest Territories.—The territories have not as yet developed a high school system. This work is done in grades six, seven and eight of 16 of the elementary schools, with an attendance of 88 in the rural districts and of 493 in the towns and villages. Grade six prepares for third class certificates, grade seven for university pass matriculation and second-class certificates, and grade eight for senior matriculation or the first year examination of the University of Manitoba and for first class certificates. When the languages are taught the principals are university graduates who have had a course of training in a normal school or college. These schools are supported by local taxation and by liberal legislative grants distributed on various bases in accordance with their size and efficiency. A private college has been established at Edmonton (Methodist), that does matriculation and first year work, and there are others at Calgary and Kamloops (both Presbyterian), but as yet these have not developed regular high school courses.

British Columbia.—In this, the most westerly province, there are 8 high schools with 856 pupils and 27 teachers, of whom 17 belong to the high schools at Vancouver and Victoria. (In 1903 two more were established.) These schools do the usual work of the other Dominion high schools. Vancouver high school and college, however, has two divisions which take up the first and second years' courses of McGill University (q.v.) (Montreal) with which this school and Victoria high school are affiliated and which conducts the examinations of the university grades. In cities where high schools are in operation and where the buildings and accommodations are satisfactory to the council of public instruction, a special legislative grant of \$300 is made for each teacher employed. In this province not only is the school system non-sectarian, but no clergyman is eligible for the position of superintendent, inspector, teacher, or trustee. The Methodist Church maintains Columbia College at New Westminster. This college has affiliation relations with Toronto University

CANADA — HIGHER EDUCATION

and does both secondary school work and the work of the first year of the university, the examination papers being sent from Toronto and valued by the university examiners. See CANADA — PRIMARY EDUCATION; CANADA — HIGHER EDUCATION; CANADA — CATHOLIC EDUCATION; CANADIAN UNIVERSITIES; EDUCATION; EDUCATION IN LATIN AMERICA; EDUCATION IN THE UNITED STATES; EDUCATION, CATHOLIC; EDUCATION, SECONDARY.

JOHN SEATH,

Inspector of High Schools and Collegiate Institutes for Ontario.

17. Canada — Higher Education. The history of higher education in Canada is by no means a homogeneous development in all the provinces. Each province, possessing its own machinery of local government and peculiarities of social and economic condition, has, as might be expected, evolved its own system of higher education. It is, therefore, the more remarkable that the beginnings of university education were almost identical in all the older provinces. This was due to the enlightened policy of the British government, which through the executive heads of the colonies began very early to make provision for future educational needs. In Upper Canada (now Ontario) and New Brunswick this provision took the form of an endowment out of Crown lands for the purposes of higher education. In Nova Scotia, already a self-governing colony, the Legislature was encouraged to devote a special grant of money to establish a university and to make an annual appropriation in support of it thereafter, while the Imperial Parliament endorsed this action by voting much more substantial sums both for establishment and for annual maintenance. In Lower Canada (now Quebec) a proposal was made to create an undenominational state university, but the uncompromising hostility of the Roman Catholic Church to the idea prevented it from being carried out. Thus in each of the four colonies or provinces which at the end of the 18th century made up the settled portion of British North America the policy was inaugurated of establishing State universities, either with large land endowments or with the pledge of support by the provincial Legislature. The next stage was also alike in all the provinces of older Canada except Lower Canada. In these a narrower view prevailed, and the State college in each, when established, discriminated in favor of the Church of England against other religious denominations. It was an attempt to implant in the colonies the English institution of an established Church, but the conditions in Canada were very different from those in England; the Church of England was numerically hardly stronger than the Presbyterian, Methodist, or Baptist bodies separately, and certainly no exclusive right to control the State universities should have been given. The other denominations accordingly, seeing the doors of the State institution closed to their members, or open perhaps but with reservations in favor of a rival Church, established their own institutions of higher education. Thus, instead of a single well-supported university in each province there were several universities of a small calibre, none of them, not excepting the State university, coming up to the standard that had been anticipated when the policy of a single State-supported institution

for each province was framed. In course of time the disadvantages of division became more apparent. The denominational character of the State universities was altered and negotiations for alliance were seriously begun. Up to the present time these negotiations have had no result in Nova Scotia or New Brunswick. But in Ontario a third stage has been reached, and the movement to combine resources has met with partial success. In western Canada the history of higher education is different. Profiting, perhaps, by the experience of the older provinces, the State university in Manitoba has been established under conditions that prevent it from being controlled in the interests of any denomination, and at the same time the foundation of denominational rivals has been guarded against. A State university for the Northwest Territories has just been established by act of the Legislature, and it is probable that it will develop on similar lines.

Nova Scotia.—Taking each province in turn, for a more detailed account, we begin with Nova Scotia, the earliest settled of the English-speaking provinces of Canada. The first attempt at establishing a university was made by act of the Legislature in 1789 incorporating King's College at Windsor, where a seminary had been founded a year before by legislative aid. A grant of £500 for a site was also made and an annual appropriation of £400 for maintenance. In the following year the British Parliament gave £4,000 in further aid of the infant institution. It does not appear that actual university powers were obtained until 1802, when a royal charter was granted. At the same time an annual subsidy of £1,000, which was not discontinued until 1835, began to be made by the British Parliament. The charter gave control of King's College to the authorities of the Church of England in the province, and at the beginning of its career the governing body unwisely restricted to members of that Church the right of entering the college as students, thus completely establishing the sectarian character of the State institution. A majority of the inhabitants of the province were now debarred from sharing in the benefits to which they had looked forward, and agitation began for a freer system. In response to this demand Dalhousie College was founded at Halifax in 1821 out of funds at the disposal of the governor for provincial purposes. Attempts at fusion of the two State-endowed colleges were subsequently made from time to time but without success. It was as a result of the refusal in 1835 of the governors of King's College to surrender their charter and amalgamate with Dalhousie College that the imperial grant of £1,000 was withdrawn. Dalhousie College, though founded in 1821 and soon afterward provided with a building, was not opened for academical instruction until 1838, when sufficient funds had accumulated to enable a beginning to be made. In 1841 university powers were conferred by act of Legislature and control was vested in a board appointed by the lieutenant-governor. But a similar mistake had been made as in the case of King's College, and Presbyterian influences had been allowed to preside at the organization in 1838. The Baptist body, therefore, seeing one of the State institutions avowedly under Anglican control, the other practically Presbyterian, pro-

CANADA — HIGHER EDUCATION

ceeded to establish a college of its own at Wolfville. It was named Queen's College, and was formally opened in 1839. The act of incorporation conferring university powers was not passed however until 1840, and another act in 1841 changed its name to Acadia College, which it still retains, with the alteration of "university" for "college." The Roman Catholic Church, which had always stood apart from any system of higher education under State control, established somewhat later St. Francis Xavier's College at Antigonish, in the year 1855. Under varying conditions higher education in the province continued to be carried on for a number of years by the institutions named, two of them being the recipients of government bounty. Dalhousie College, indeed, for want of funds was closed from 1845 to 1863, and on reorganization at the latter date was given a strictly non-denominational character. But the hope of uniting all the existing colleges in a single State university had not been given up. In 1876 an act of the Legislature established the University of Halifax, which should examine and confer degrees upon candidates sent up by the colleges. The latter, however, gave it no support, and continued to exercise their university functions. In 1881 the Legislature withdrew its financial support and at the same time discontinued the annual grant which had hitherto been made to King's College. University federation in Nova Scotia had proved a failure, and no scheme to that effect has since been proposed. At present Nova Scotia possesses five institutions with university powers, a second Roman Catholic college, Saint Anne's College, in the county of Digby, having been established in 1800. The numbers of members of faculties and of students in the several colleges are as follows for the latest year for which statistics have been issued:

character of the new college was strongly opposed by other religious denominations. In 1842 the Wesleyan Methodists succeeded in establishing an institution of their own, Mount Allison Academy, at Sackville. At first only a secondary school, it received in 1858 university powers, which came into operation four years later. Meanwhile agitation against the existing constitution of the provincial college began to bear fruit. In 1845 religious tests were abolished, and in 1859 reorganization on a non-denominational basis was effected and the name changed to University of New Brunswick. A third university for the province was added in 1864, when the Roman Catholic College of St. Joseph was founded at Memramcook. The latest statistics (1903) for the three universities of the province are as follows:

	Prof. etc.	Stud.
University of New Brunswick.....	7	193
Mount Allison College.....	10	175
Saint Joseph's College.....	10	48

Quebec.—Before the cession of Canada to Great Britain in 1763 the control of all education in the French colony had been in the hands of the Roman Catholic religious orders. Laval, first bishop of Quebec, had established the Grand Séminaire at Quebec in 1663, which is perpetuated as Laval University of the present day. The Grand Séminaire, however, was not a university, but a theological training college for the priesthood. The first suggestion of a university in the province was made in 1789, when a committee of the executive, in reporting on the condition of education in the province of Lower Canada (now Quebec), recommended the establishment of a non-denominational university at Quebec. The opposition of the Roman Catholic bishop prevented the suggestion from being carried out, and though the hope was long cherished that the project would be

New Brunswick.—As early as 1786 an endowment of 2,000 acres near Fredericton, the capital, was set aside for the foundation of a provincial Academy of Arts and Sciences, which became incorporated in 1800 as the College of New Brunswick. In 1805 an act was passed authorizing an annual grant of £100 in addition, which was subsequently increased from time to time up to \$8,844, at which sum it has stood since 1829. In 1828 the provincial charter was surrendered and a Royal charter obtained incorporating the institution under the favorite name of King's College, with university powers. In the following year a suitable building was erected and academical work begun. The Royal charter contained, however, the same provision for Church of England control which had already begun to work so disastrously in Nova Scotia, and almost from the moment of its inception the sectarian

renewed under more favorable conditions, no subsequent proposal to that effect was ever formally made. It was left to private enterprise to establish the first university in Lower Canada. In 1813 the Hon. James McGill of Montreal died, leaving by will a piece of land as a site for a university or college and the sum of £10,000 for maintenance. A Royal charter was obtained in 1820, but the college, bearing its founder's name, was not opened until 1829, and on the day of its inauguration the Montreal Medical Institute was united to it as its medical faculty. For more than 20 years the college had a precarious existence, its expansion being, to a certain extent, hampered by the constitution of its governing board, but a new charter was obtained in 1852 entirely freeing it from official control. The history of McGill University (q.v.) since that time is a record of steady improvement. It is

CANADA — HIGHER EDUCATION

not identified with any religious body, nor is it dependent upon any form of state assistance. It owes its present position as one of the leading universities, not only of Canada but of the continent of America, to the generosity of the merchant princes of Montreal, and to the wise and able guidance of Sir J. W. Dawson, principal from 1855 to 1893, and of his successor, Dr. Peterson.

The second university to be established in the province in the interests of the English-speaking inhabitants was the Church of England institution at Lennoxville, called Bishop's College. It was incorporated in 1843, but a Royal charter conferring university powers was not obtained until 1853. In the previous year, 1852, a Royal charter had also issued to the corporation of the Grand Séminaire of Quebec empowering it to confer degrees and exercise other university functions, under the name of Université Laval. The university thus established remains the sole Roman Catholic university of the province, with faculties of divinity, law, medicine, and arts, having affiliated colleges and seminaries in various towns, and an integral branch of itself at Montreal under the name of "Succursale de l'Université Laval." Other colleges in the province without separate university powers, but carrying on university instruction, are Morrin College at Quebec, founded in 1860 under Presbyterian control, affiliated to McGill University since 1862, and St. Mary's College at Montreal, under control of the Jesuit order, incorporated in 1852, and since 1889 entitled by papal brief to confer the degrees of Laval University. There are numerous Roman Catholic colleges affiliated to Laval University, some of them of considerable antiquity. The oldest are Saint Raphael's College at Montreal, established by the Sulpicians in 1773; those at Nicolet, founded in 1804; Sainte Hyacinthe, in 1812; Sainte Thérèse, in 1824; Sainte Anne de la Pocatière, in 1827; and L'Assomption, in 1832. The higher education given at these colleges is chiefly theological. The statistics for 1903-4 of the three universities of the province are as follows:

1840 the charter for Queen's College at Kingston, the Presbyterian institution, was secured and the college was opened in 1842. In 1841 the Methodist theological seminary already established at Cobourg was reorganized as a university. It was not until after the establishment of these rival institutions that the work of teaching was begun in King's College, in 1843. Continued political agitation against the privileges accorded to members of the Church of England in the state university brought about a complete reconstitution in 1849, when the non-sectarian character of the University of Toronto (see TORONTO, UNIVERSITY OF), as it was then named, was firmly established. The chief result of this overthrow of Anglican control was the establishment in 1852 of a strictly Anglican university, Trinity College, through the exertions of the same bishop who had been instrumental, 25 years earlier, in procuring the charter for King's College in the interests of his communion. The only apparent effect of broadening the character of the state university had been to erect another rival. In 1853 reorganization of the University of Toronto took place again on a narrower basis; the teaching faculties of law and medicine were abolished, and the faculty of arts was constituted a separate corporation as University College, while the University of Toronto itself became, after the pattern of the University of London of the day, a mere examining and degree-conferring corporation. The next 30 years saw five more denominational colleges founded in the province, Albert College at Belleville in 1866 (Wesleyan Methodist); Ottawa College in 1866 (Roman Catholic); Regiopolis College at Kingston in 1866 (Roman Catholic); the Western University at London in 1878 (Church of England); and McMaster College in 1881 (Baptist), the last-named at first a theological college only, but in 1887 given full university powers. In spite of this multiplication of small colleges with university powers, a change of sentiment was gradually coming about. The needs of modern education in science called for considerable expenditure on laboratories and instruments. A

Ontario.—In Upper Canada (now Ontario) an endowment of 500,000 acres of Crown lands was set aside in 1798 for the purposes of higher education in the province, but not until 30 years later, in 1827, was a Royal charter obtained for the establishment of a university upon this endowment. The name of the institution, as in the provinces of Nova Scotia and New Brunswick, was King's College, and the unfortunate example set by the older provinces was also followed in providing for the Church of England control. The Methodist and Presbyterian bodies protested against the terms of the charter, and some modifications were secured in 1837, before actual organization of the college, but the concessions made were not sufficient, and these denominations proceeded to establish colleges of their own. In

strong state university in alliance with the denominational institutions could adequately supply the instruction in scientific subjects for them all, while they in turn might maintain their own faculties for teaching languages, philosophy, history, and theological subjects. The federation idea, as it was called, rapidly gained ground, and in 1887 an act of the legislature was passed reorganizing the University of Toronto once more, this time to broaden instead of to narrow the scope of its activity. The scientific subjects and one or two others were assigned to a teaching faculty of arts, the instruction being free to all students of the federated colleges. These, including the state college (University College), were concurrently to give instruction in languages and literature and certain branches of

CANADA — HIGHER EDUCATION

philosophy and history. Teaching faculties of medicine and law were also established in the university. Under this arrangement Victoria College, the Methodist university, became a federated institution in 1891, renouncing its right to confer degrees in any faculty except divinity; and Trinity College, the Church of England university, has taken similar action within the last year (1903). In pursuance of the policy outlined when the federation plan was under discussion, the University of Toronto has added largely to its facilities for teaching the sciences. In 1901 the School of Practical Science, a provincial school of engineering and applied chemistry, founded in 1878, was incorporated in the circle of University institutions by its staff of teachers becoming the faculty of applied science and engineering of the University of Toronto. The provincial colleges of dentistry, pharmacy, agriculture, and veterinary science have been affiliated, and the University holds examinations and confers degrees upon their students. Colleges of music have also been affiliated, and local examinations are held and degrees conferred in music. The expansion of the University of Toronto since 1887, as outlined above, is the most notable event in the history of higher education in Canada. It has been the justification of the far-sighted policy of the British governors of the colony at the end of the 18th century, when they made provision for a single university in each province to be the head of a state-supported system of education. Within a comparatively few years the University of Toronto has developed into the largest university of Canada and has reached the front rank of universities on the continent of America. Its importance is measured not only by the number of its students, but by the place which they take in the estimation of the academic world.

Victoria College and Trinity College having both federated with the provincial University, there remains independent but one of the three early rival denominational institutions, Queen's University (q.v.) at Kingston. Although still recognized as the Presbyterian university of the province it imposes no religious tests upon professors or students. Of the other denominational colleges founded later, Albert College has resigned its university powers and become affiliated with the University of Toronto, Regiopolis College was closed in 1869, and Ottawa College became the Catholic University of Ottawa in 1880.

The statistics of the existing universities of the province for 1903 are as follows:

with the sole power of conferring degrees in arts, law, and medicine in the province; degrees in divinity may only be conferred by colleges affiliated with the university. Up to the present year the university has been an examining and degree-conferring body only, all teaching being left to the affiliated colleges. Recently, however, a grant of land has been made by the provincial government for the erection of a building for purposes of instruction in the departments of science and for a university library. Three university lecturers in science have already been appointed, so that a new departure in the university system of the province has fairly begun, the further development of which will be watched with great interest. There are at present four arts colleges and one medical college affiliated with the University of Manitoba. Saint Boniface College is a Roman Catholic institution and was established as a small school so early as 1818; Saint John's College (Church of England) was founded in 1866; Manitoba College (Presbyterian) in 1871; Wesley College (Methodist) in 1888; Manitoba Medical College in 1883. All are in Winnipeg except Saint Boniface College, which remains at the town of Saint Boniface, where it was first established. The numbers of members of faculties and students are as follows for 1903:

University of Manitoba — Students registered in Arts, 184; in Medicine, 100; in Law 18.

	Faculty	Students
Saint Boniface College.....	23	187
Saint John's College.....	10	52
Manitoba College	12	177
Wesley College	12	163

Up to the present time no university has been organized in western Canada except the University of Manitoba. Local examinations are conducted in various centres of British Columbia by the University of Toronto and by McGill University. In the chief centres of population in that province denominational colleges and schools are found, such as Vancouver and Columbian colleges, which undertake some teaching of a university course in arts. The legislature of the Northwest Territories passed an act in the autumn of 1903 to establish a territorial university. The constitution of the governing body is much the same as obtains in the University of Manitoba or the University of Toronto. The power to affiliate colleges and to establish faculties is given to the university senate; but this body has not yet commenced its functions. See CANADA — CATHOLIC EDUCA-

Manitoba.—Higher education in Manitoba is of recent date. By act of legislature in 1877 the University of Manitoba (q.v.) was established,

TION; CANADIAN UNIVERSITIES; HIGHER EDUCATION; UNIVERSITIES. JAMES LOUDON, President of University of Toronto.

CANADA — CATHOLIC EDUCATION

18. Canada — Catholic Education. By the British North America Act of 1867 (see CANADA — CONFEDERATION) it was enacted, "That the local legislature of each province shall have power to make laws respecting education saving the rights and privileges which the Protestant or Catholic minority in both Canadas may possess, as to their denominational schools, at the time when the Union goes into effect." As therefore education belongs primarily to the different provinces, we shall consider each province separately.

Ontario.—One of the earliest tasks undertaken by the United Legislature of Upper and Lower Canada, in 1841, was the improvement of the primary schools. An act was passed in that year providing for denominational schools in both provinces. Taxes were levied uniformly upon all; and these taxes, with the legislative grant, were divided between the two classes of schools in proportion to the number of their supporters. Separate, or parochial, schools were not authorized in towns or cities, where a joint board consisting of an equal number of Catholics and Protestants controlled all schools. To the Catholic section was given full jurisdiction over Catholic schools. This act, on account of the dissimilar educational interests in Upper and Lower Canada, soon proved unsatisfactory. Two years afterward it was repealed, and an act for each of the Canadas was passed, duly recognizing the principle of religious education. The difficulty of adjusting the demands of Catholics, and of legislating for a systematic respect for all concerned, continued for many years with much acrimony, which religious, racial, and political differences tend so seriously to aggravate. A new turn was given the controversy in 1846, when the provincial secretary was relieved of his duties as chief superintendent of education, and a person appointed by the governor of Upper Canada for this position. The first, and indeed only, chief superintendent of education in Upper Canada was the Rev. Egerton Ryerson (see RYERSON, A. E.). The contest was in no way diminished by thus withdrawing the chief from the ministerial ranks and legislative hall. It continued unabated until 1863, when what is known as the Scott Act was introduced and passed. This act, being in operation at the time of confederation, remained the anchorage and basis for parochial education. The following are among the chief benefits of the act "(1) Permitting the union of adjacent rural sections, and allowing any Catholic within three miles of the school to become a supporter; (2) Requiring of lay teachers the same qualifications as for common schools; (3) Giving a share in all public appropriations for elementary education. The schools were at the same time made subject to inspection and to such regulations as the chief superintendent might impose." After remaining unchanged for 14 years some amendments to this act were introduced in regard to the trustees and supporters of the Catholic schools. One important clause was introduced, providing that a "separate school may become a model school for the preliminary training of Catholic teachers." The inspection of separate schools in cities and towns was confided to the high school inspectors, while in rural districts the duty devolved upon public school inspectors. The work of

the former increased so much, and the incompatibility of inspecting schools so different gave no satisfaction. The office of Separate School Inspector was created in 1882, and James F. White appointed. Since that time two others have, on account of the increase of work, been added, so that separate schools are regularly visited and systematically inspected. We quote the following points in regard to the support and teachers' qualifications from 'The School System of Ontario,' by G. W. Ross: "Separate schools are supported (a) by a grant from the provincial treasury, paid upon the basis of average attendance; (b) by a rate levied by the trustees upon the taxable property of the supporters of the school; (c) by fees from the pupils attending separate schools." Practically speaking, no fee is charged. "There are two classes of teachers employed in separate schools: one class, known as lay teachers, who are subject to the same examinations and receive their certificate of qualification in the same way as public school teachers; the other class known as religious teachers—members of religious communities—who are not, by the Separate School Act, subject to any examination." It is just to add that the religious communities are striving earnestly and with marked success to have their postulant and young members qualify in the normal and other technical schools. With regard to religious instruction, the separate schools are supervised by the clergy. "The Department of Education lays down no regulations and exercises no jurisdiction upon the subject."

TABLE OF ROMAN CATHOLIC SEPARATE SCHOOLS FOR THIRTEEN YEARS — 1890 TO 1902.

Year.	Schools.	Pupils.	Average Attendance	Receipts.	Expenditures.

1902....	391	45,964	28,817	485,503	435,441

The work of secondary and higher education devolves upon the voluntary institutions conducted by the religious communities. These institutions, chiefly residential, range from the academy and select school to the college and university. Their programme of studies includes a liberal education based upon the programme of studies provided for by public institutions of a similar grade. Throughout Ontario there are 30 academies for young ladies. There is a Catholic university at Ottawa under the direction of the Oblate Fathers. The Most Rev. the Archbishop of Ottawa is apostolic chancellor. At present the Very Rev. Father Emery, D.M.I., is rector. There are faculties in theology, arts, and law, and a commercial department. The Grand Seminary for the Diocese of Ottawa is in connection with the University, as is also Saint

CANADA — CATHOLIC EDUCATION

Joseph's College. It was unfortunately destroyed by fire on 1 Dec. 1903. The new plans (1904) foreshadow a building of exquisite design and magnificent proportions, which, when completed, will admirably fulfil its purpose as an educational institution and be an ornament to the capital of the Dominion. In Toronto, the educational centre of Ontario, is Saint Michael's College, in federation with the University of Toronto. It was founded in 1852, and is under the charge of the Fathers of the Community of Saint Basil. It conducts the course of Catholic philosophy and history as prescribed by the University of Toronto. Its course includes a commercial, a classical, and a philosophical course. The Basilian Fathers also conduct a large college at Sandwich, just opposite Detroit, entitled Assumption College. This institution was first founded in 1855; but it was not until 1870 that it was entrusted to the Basilian Community, under the superiorship of the Rev. D. O'Connor, now archbishop of Toronto. The present rector of the College is the Very Rev. Robert McBrady. The Diocese of Kingston has Regiopolis College, whose history is in two volumes, the first closing in 1869; the second opened in 1896, when, by the provision of the late Most Rev. James Vincent Cleary, archbishop of Kingston, an endowment was secured for its re-establishment. At present the work of the College terminates with the requirements for the honor matriculation examinations in either the University of Toronto or of Queen's University, Kingston. Saint Jerome's College is situated in the town of Berlin, in the county of Waterloo. It was established by the Very Rev. Father Louis Funcken, a member of the Congregation of the Resurrection. Originally it was intended for the education of young men of German descent. Its usefulness has widened, its professors have increased, and its students multiplied. Since its start in 1865 over 100 priests and a large number in the secular professions are counted among its graduates.

Quebec.—Catholic education in Quebec, the pioneer province of the Dominion, clusters around the Seminary of Montreal and the University of Laval at Quebec, whose early foundations are associated with the dawn of civilization and evangelization of Canada by the intrepid religious of France. The former was founded in 1649, and the latter in 1663 as a Grand Seminary, by François de Laval (see LAVAL-MONTMORENCY, F. X. DE). Even before—in 1615—four Recollect Fathers taught an Indian school on the banks of the Saint Charles. And in 1632 the Jesuits established a college in Upper Town (Quebec), which three years after began to receive pupils. The first school for girls in the colony was the Ursuline Convent of Quebec. This was followed in 1653 by the establishment of a convent in Montreal by Margaret Bourgeois, the saintly foundress of the Sisters of the Congregation. These institutions still remain. Progress marks their history—enlarged buildings and commodious show their success and the confidence in which their teachers are held; but the discipline and spirit is much the same, exercising a most beneficial influence of contentment and steadiness in an age of change and restlessness. Their further advance is marked by their multiplication. In 1773 the Sulpicians founded Montreal College, which they first named Saint Raphael's College. The Petit Seminaire of Que-

bec had been founded over 100 years before (1668). This first served as a preparatory school to the Jesuit College, and afterward took its place. Nor should it be supposed that under the French régime primary education was neglected. Chauveau says: "From the very beginning a large number of those who settled in the country had received a fair education, and the old parish registers still preserved at Quebec and Montreal show that a large proportion of the population could write."

At the beginning of the 19th century the number of schools in operation was 1,321, with 36,000 pupils. This does not include colleges, academies, or kindred schools. Garneau gives a total of 57,000. To advance primary education, Lieutenant-Governor Milnes, in 1801, urged the legislature to vote land, the revenue of which should be expended on education. An act was therefore passed, and the government formed a corporation for educational purposes under the name of the Royal Institution. This institution was neither successful nor satisfactory. After a trial of 20 years it proved so detrimental that Lord Dalhousie entertained the idea of forming two distinct Royal Institutions. This idea was not carried out. Eventually, however, but only after many years—in 1875, and when the Council of Public Instruction had taken the place of the Royal Institution—this idea was modified by the council being composed of two committees, one for Catholics and the other for Protestants. In spite of difficulties arising from legislation and from the disturbed state of the country in 1837–8, education advanced through the redoubled efforts of the clergy. The following colleges owe their existence to this period: Nicolet, founded in 1804; Saint Hyacinthe, in 1812; Sainte Thérèse, in 1824; Sainte Anne de la Pocatière, in 1827; and L'Assomption in 1832. Two Catholic normal schools were established in 1857: that of Jacques Cartier at Montreal, and Laval at Quebec. The support of these normal schools is taken partially from the superior education income fund and the common school fund. They are regulated by the Roman Catholic committee of the Council of Public Instruction, with the approval of the lieutenant-governor in council. These regulations include: (1) their management; (2) the terms and conditions upon which students shall be received and instructed; (3) the course of instruction to be followed; (4) the manner in which registers and books shall be kept; and (5) diplomas granted to students. The professors, directors, and principals are appointed or removed by the lieutenant-governor upon the recommendation of the Catholic committee of the Council of Public Instruction. In 1852 the Seminary of Laval enlarged its courtyards by securing a royal charter as a university. Its privileges were further extended in 1876 by Pope Pius IX., who bestowed upon the University canonical status as such, having for its protector at the Holy See the Cardinal Prefect of the Propaganda. The supervision of "faith and morals" is entrusted to a superior council of the University consisting of the archbishops and bishops of the province of Quebec, under the presidency of the archbishop of Quebec, who is the apostolic chancellor of the University. The ordinary council of the University consists of the rector, the directors of the Seminary of Quebec, and the three senior professors of each of the faculties of theology, law, arts, and medicine.

CANADA — CATHOLIC EDUCATION

The superior of the Seminary is *ipso facto* rector of the University; and the visitor of the University is always the Catholic archbishop of Quebec. This council has full authority concerning the government and advancement of the University. It has power to nominate the professors of the faculties of law, medicine, and arts, and, upon sufficient and just cause, to revoke and annul its own nominations. It has the right to propose names suitable for the faculty of theology as professors, but it is the visitor who makes these appointments. The University is maintained by the Seminary of Quebec, which is still obliged to add more than \$10,000 a year in order to make up the University deficit. A Succursal to Laval was established at Montreal some years ago with the same faculties of theology, law, arts, and medicine. The faculty of theology consists of the Grand Seminary of Montreal, which is under the direction of the priests of Saint Sulpice. The functions of the University are, in this question, limited to the granting of certificates after special examinations at the Grand Seminary. "The public schools of the province of Quebec are divided into elementary schools, model schools, and academies. Some of the public schools are said to be 'under control,' the others are said to be 'subsidized.' Schools under control are those whose teachers are engaged and paid by the school commissioners or trustees." The elementary school course consists of four years, and corresponds to the first four or five years of the public schools in the United States. According to the report of the superintendent of public instruction the Roman Catholic schools under control in 1901 contained 176,799 Roman Catholic pupils, and 587 Protestant pupils. Of these 171,446 were French and 5,940 were English. The next higher grade of school is the model school, which may be established by the union of two or more municipalities. In these cases the school is under the control of the municipality in which it is situated. Next to these are ranked the academies, which have their official origin in a petition signed by delegates who are chosen by the chairmen of the boards of trustees desiring the academy. This petition, addressed to the Council of Public Instruction, is, upon the approval of the Catholic committee of the Council, forwarded by the superintendent of education to the lieutenant-governor, with whom rests the final authorization. When established, an academy is under the control of three trustees. To provide for the building and maintenance of an academy a limited amount may be raised by a tax upon the taxable real property of the school municipality. Each academy fulfilling the required conditions is entitled to a share in the legislative grant for superior education. The course includes, besides religious instruction, grammar, composition, algebra to equations of the second degree, bookkeeping, history, political economy as applied to Canada, and elements of philosophy, geology, and botany.

STATISTICS OF ROMAN CATHOLIC MODEL SCHOOLS AND ACADEMIES, FROM THE REPORT OF EDUCATION FOR 1902.

I. MODEL SCHOOLS.

Number of schools under control of school commissioners	367
Number of pupils attending the above schools, 62,314	
Number of schools partly under control and partly independent	7

Number of pupils.....	902
Number of independent schools.....	137
Number of pupils.....	14,957
Total number of schools.....	511
Total number of pupils.....	78,173

II. ACADEMIES.

Number of academies under control of school commissioners	44
Number of pupils.....	16,185
Number of academies partly under control and partly independent	8
Number of pupils.....	1,623
Number of independent academies.....	97
Number of pupils.....	15,743
Total number of academies.....	149
Total number of pupils.....	33,551

III. ROMAN CATHOLIC COLLEGES.

Number	19
Pupils in classical course.....	3,757
Pupils in commercial course.....	2,417
Total	6,174
Ecclesiastical (including religious) professors,	527
Lay professors	32

IV. ROMAN CATHOLIC NORMAL SCHOOLS.

Students in theology	124	300
Students in law	90	108
Students in medicine	108	180
Students in arts	98	48
Students in pharmacy	6	...

Nova Scotia.—There are two means used by Catholic educationists in Nova Scotia for keeping in touch with the public school system. The first method is by ranking an institution as a county academy. "The county academy is that high school within the county which receives a special grant on account of its agreement to admit free any students from the county who are able to pass the county academy entrance examination." The Saint Francis Xavier College at Antigonish and the French College of Sainte-Anne in the county of Digby avail themselves of this opportunity, and function under the law as county academies, receiving therefor a due share of the academic grant. Both these universities have the power of conferring degrees. Saint Francis Xavier College was founded at Antigonish in 1854, and had for its first president the Rev. Dr. John Cameron, afterwards bishop of Antigonish. Its president for 1902-3 was the Rev. Dr. Alexander Thompson. The College of Sainte-Anne was founded in 1890, and in 1892 was incorporated and chartered as a university. The university was destroyed by fire in 1898, but a larger and more commodious has replaced it. The archbishop of Halifax is (*ex officio*) chairman of the board of governors. The fact that the trustees of public schools "can rent the school rooms of denominational schools, gives rise to the second method by which several Catholic schools are affiliated to the public school system. In some districts the due consent of the town councils and school boards in these localities having been obtained, several Catholic schools were thus affiliated, their work acknowledged, and "they participated in the public grant." The chief voluntary educational institutions other than those already mentioned,

CANADA — PUBLIC EDUCATION

are Saint Mary's College, Halifax, of which Rev. Edmund Kennedy is superior; La Salle Academy, Halifax; Convent of the Sacred Heart, Halifax; and Saint Vincent Academy. The following educational statistics in Halifax and Antigonish are taken from the Church 'Directory' for the year 1904:

HALIFAX

College and academies for boys,	2,	students	210
Academies for young ladies.....	4,	students	420
Parochial schools	10,	pupils in the city—	
		Halifax	3,750

ANTIGONISH.

College	1,	students	150
Boarding schools for young ladies	4,	students	610
Parochial schools	11,	pupils	2,700

New Brunswick.—Catholic education in New Brunswick is more the history of devotion and struggle than of an organized system. At the time of the passing of the British North America Act (1867), Catholics had their schools established and maintained in their more thickly settled districts. These received legislative grants in proportion to local contributions. Matters went on quietly and satisfactorily until 1871 when an act was passed taxing all the property of the country for schools of a non-sectarian character. This act aroused a strong feeling among the Catholics, who claimed that to them it meant double taxation for school purposes, that thus their condition was worse than before confederation. The courts were appealed to, the Dominion Parliament asked to intervene, and the Crown petitioned. As a result, although the act was maintained, some concessions were made by the legislature in 1875. "Local trustees in cities and towns were permitted to lease from the authorities of the Roman Catholic Church the buildings in which the separate schools had up to that time been conducted, to open public schools in these buildings, and to employ as teachers in such schools members of religious communities and others having the confidence of the Catholic clergy, provided, however, that all such teachers should undergo examination in the regular way as to their qualifications and receive a license from the Board of Education." Under this arrangement matters, if not altogether satisfactory, quieted down. Schools increased in number and advanced in progress. Large schools exist in most of the missions. Besides 12 academies for the higher education of young ladies, there are two colleges for the classical and secondary education of young men. Saint Joseph's College at Memramcook, under the direction of the Fathers of the Holy Cross, has both a classical and a commercial department, and ranks as a university in conferring degrees. Within the past few years (1899) a college has been opened at Caraquet, conducted by the Eudist Fathers.

Prince Edward Island.—In Prince Edward Island the Catholic institutions of education are all voluntary. They consist of eight academies for girls and several other schools located in various parts of the island. There is one college—Saint Dunstan's—situated at Charlottetown, in charge of the secular clergy. The Sisters of Notre Dame conduct a school in the Magdalen Islands.

Manitoba.—In the early days of Manitoba

the work of Catholic education was as zealously carried on as circumstances would permit. Settlements were sparsely scattered over a vast extent of country; teachers were few, and what few there were shared poverty and hardship, the common lot of all. The first legislation upon education in the province was passed in 1871. So far as Catholic education is concerned, the main features of the act were as follows: (1) The Central Board of Education, in whose power the whole education was placed, was divided into two sections—one Catholic, the other Protestant, equal in number. (2) Between these two sections the annual legislative grant was equally divided. (3) It was arranged that 12 of the school districts into which the province was divided should be Catholic schools, under the Catholic section of the Central Board. This act was denominational in its principle and action. All was reversed by the Act of 1890. Only one school was recognized. The instruction was non-sectarian; and the taxes for the support of these schools were raised from all the rate-payers alike. This change produced a bitter feeling and roused prolonged opposition. The Catholics of Manitoba strove by every legitimate means in their power to effect a change. At length the Federal and Provincial governments agreed to certain measures calculated to diminish the grievances. An ablegate, Mgr. Merry del Val, was sent out by the Holy See to report upon the whole question. After receiving the report the Sovereign Pontiff wrote in an encyclical: "We have no doubt that these measures have been inspired by a love of fair dealing and good intention. But we cannot conceal the truth. The law made to remedy the evil is defective, imperfect, insufficient." The Catholic schools of the diocese of Saint Boniface number 126, attended in all by about 5,000 children. There is at Saint Boniface a large college conducted by the Jesuits, in affiliation with the University of Manitoba.

Northwest Territories.—In the Northwest Territories the principle of separate schools was recognized. The statistics give for 1898, 44 Roman Catholic public schools and 11 separate school districts, with a total attendance of nearly 2,000.

Catholic Industrial Schools.—A great deal has been done for children who are placed in these schools. Provincial help is given in both Ontario and Quebec. Besides these provincial institutions there are many industrial schools for the education of Catholic Indians, conducted by religious, and supported by public aid. See also EDUCATION, ROMAN CATHOLIC; CANADA — RELIGIOUS CONDITION.

J. R. TEEFY, LL.D.,

President of Saint Michael's College, Toronto.

10. Canada — Public Education. Under the provisions of the British North America Act, control of public education in Canada is vested in the provincial governments. The position of dissentient denominational schools is, it is true, specially safe-guarded under the act (30-31 Vict. c. 3 § 93), and on their behalf the Dominion Parliament may interpose remedial legislation, but with this exception the whole organization, conduct, and maintenance of education lies with the provinces. At the time of confederation the provinces then existing had already in operation a system of free elementary schools, which has since been expanded into the present effi-

CANADA — PUBLIC EDUCATION

cient organization. The figures of the census of 1901 show the high standard obtained in public education in Canada. In a population of 4,728,631 persons over five years old, only 14.4 per cent are illiterate; in the Province of Ontario of the persons over five years old, the illiterates number 8 per cent. There are now nearly 1,000,000 pupils in 19,891 primary and secondary schools of Canada, with about 25,000 teachers. Except in the Province of Quebec all but a small fraction of these schools are government institutions. Throughout the Dominion elementary education is free, compulsory, and co-educational, and the schools controlled (within the scope of provincial statutes and regulations), by locally elected trustees. There are provincial secondary schools everywhere except in the Northwest Territories, and provincial universities in Ontario, New Brunswick, and Manitoba. The following table, compiled from the Statistical Year Book of Canada (1903) and the Annual Provincial Reports illustrates the status of public education in the provinces of Canada:

ing, object lessons, etc. Above these are the public schools of the provinces, whose organization (first placed on a comprehensive basis in 1844 by Egerton Ryerson, superintendent of education), owes much to the educational system of the State of New York. Every township is divided by its council into school sections, and for each section, each incorporated village, town, and city there is a board of trustees. The latter are elected by the rate payers, both male and female. Within the provisions of the statutes of the province, and the regulations of the education department, the trustees appoint the teachers, determine the salaries, and provide and maintain buildings and equipment. The provincial government makes an annual grant of money to each school according to the average number of pupils in attendance. For the rural schools the county council adds an equal grant, the township council contributes \$100 (\$150 for a school with two teachers), and the remaining funds needed are raised from the rate payers. In cities, towns, and villages the legislative grant is supplemented by funds raised by the municipal

* Includes 105 independent Roman Catholic Academies and 2 independent Protestant.

For the organization of education it is necessary to consider the provinces separately. Ontario, the most populous of the provinces and the most advanced in matters of education, having largely influenced the educational systems of the other Protestant parts of Canada deserves the most detailed treatment. The system of public education in Ontario includes, kindergartens, public (primary) schools, high schools and collegiate institutes, and a provincial university, the whole forming an organic unit. Kindergarten schools, admitting children between the ages of four and seven, may be organized at the option of boards of school trustees in cities, towns and incorporated villages. There are at present 120 such schools in the cities and towns of Ontario, with an enrollment of 11,300 pupils. The exercises consist of singing, marching, sew-

council. All the public schools are free, and under an act of 1891, trustees are empowered to supply text books either free or at reduced prices. In the uniform course of study prescribed by the education department chief stress is laid on reading, writing, arithmetic, grammar, geography, and drawing. In the upper forms British and Canadian history and commercial subjects are taught; agriculture is taught in rural schools. Periodic talks are given on temperance and hygiene. Only text books authorized by the education department are allowed. Attendance is obligatory for all children between the ages of 8 and 14 years, not attending separate schools and not under efficient instruction at home. The public schools are strictly non-sectarian, but the schools are opened and closed with the reading of the Lord's prayer

and portions of the Scriptures are read daily. The clergy of any denomination may arrange with the trustees to give religious instruction in the school after the regular hours. Any group of five or more heads of families may, upon giving notice to the municipal clerk, cease to pay school rates, and become supporters of a separate school. This privilege may be used by any religious sect or by persons of color; in actual fact, of the 397 separate schools existing in Ontario all but 6 are Roman Catholic institutions. The course of instruction given in the separate schools is almost identical with that of the public schools, with the addition of special religious teaching. Separate schools share in the legislative grant. For secondary education Ontario has an admirable system of high schools and collegiate institutes; these are almost identical in character, the collegiate having a larger and more highly qualified staff, special facilities in regard to apparatus, etc., and receiving a larger government grant. Any high school may become a collegiate institute on fulfilling the requirements. High schools and collegiate institutes are created by municipal and county councils, and managed by elective boards of trustees. The original cost, and the cost of permanent improvements are defrayed by the local authorities. For current expenditure, the provincial government contributes a yearly grant varying according to situation, attendance, etc., but with a fixed minimum. The grants average from \$500 to \$800. The county contributes an equal amount. The remaining expense is met by the municipality. About one third of the schools are free, in the others the annual fee varies from \$2.50 to \$26. A uniform examination is prescribed for admission. A graded series of four forms leads to the uniform "leaving" examinations (Junior and Senior) conducted by the department, on the results of which certificates are granted for public school teachers. The matriculation examination for the provincial university is almost identical with the junior leaving examination. In 1902 there were in Ontario, 134 high schools and collegiate institutes, with 593 teachers and 24,472 pupils. Coeducation obtains in all of them, 12,843 of the registered pupils being girls. The total expenditure was \$769,680. Special attention is paid in Ontario to the uniform qualification and training of teachers. The lowest grade of public school teachers (third class) must pass the high school primary examination (Forms I. and II.) and attend a county model school. Teachers of the second class must pass the junior leaving and attend the provincial normal school. Teachers of the first class must pass the senior leaving examination, and attend the school of pedagogy in Toronto. To hold a position in a high school a teacher must hold a first class public school certificate, or have passed at least equivalent university examinations. For specialist positions in collegiates, higher university standing is demanded, varying according to the subject. Unless by special permission of the department, only the certificates of the universities in Ontario are accepted. At the head of the system is the minister of education, a member of the provincial cabinet.

The problem of public education in the Province of Quebec, owing to the division of the population between the French and English races, and the Roman Catholic and

Protestant religions is one of peculiar difficulty. The difference of creeds has led to the establishment of a dual system of elementary, secondary, and superior schools. The Roman Catholics of the province, numbering (census of 1901) 1,429,186, have 5,180 schools of all kinds, the Protestant population of 219,712 have 964. At the head of the educational system is a superintendent of public instruction with a council of 35 members, both Protestants and Roman Catholics being represented. Within the council are a Protestant committee and a Roman Catholic committee which control the schools of their respective denominations. Each has its elementary, model, and normal schools and academies. In each parish or township there is a board of school commissioners elected by the owners of real estate. These erect and maintain schools, appoint teachers, and levy the school tax, which falls on real property only. But in any such district a dissentient minority, professing a religious faith different from that of the majority, may organize themselves separately, elect a board of trustees, and conduct a school of their own. In the cities and towns there are separate Protestant and Roman Catholic boards of school commissioners. Real estate is taxed for school purposes according to the religious faith of its owners. Attendance at the elementary schools is free and is compulsory for children between the ages of 5 and 16 years. The cost of elementary schools in 1903 was \$2,270,113, of which \$235,000 was covered by the annual grant of the provincial government, and, \$1,935,113 by local taxation.

In each of the three maritime provinces (New Brunswick, Nova Scotia, and Prince Edward Island) there is a system of public elementary schools, normal schools and academies, grammar schools in New Brunswick), whose organization closely resembles that of the Ontario schools. In each province the executive council, acting through its superintendent of education is at the head of the system. The elementary schools are free, coeducational, non-denominational, with compulsory attendance, placed under trustees elected in each school district, and supported partly by provincial, county, and municipal grants, partly by local assessments. In both Nova Scotia and New Brunswick the annual "school meeting" of rate payers which elects the trustees votes the amount of money to be locally assessed. New Brunswick has separate schools for Roman Catholics in the towns and in some French-Canadian settlements. New Brunswick has a provincial university (see article CANADIAN UNIVERSITIES), whose president is adjoined to the executive council in its capacity of board of education. In Prince Edward Island, the Prince of Wales College at Charlottetown is a secondary school with governmental support.

In Manitoba the executive council, or cabinet, is at the head of public education. There is a minister of education. An advisory board, partly appointed, partly elected by the teachers, aids the government in organizing the school curriculum, establishing teachers' qualifications, etc. The provincial system includes public (primary) schools, a higher grade of which are called intermediate schools, and three collegiate institutes, at Winnipeg, Brandon, and Portage la Prairie. Schools are free and are supported

CANADA — CANADIAN UNIVERSITIES — CANADA — RACIAL POPULATION

by provincial grants, municipal grants, and a local school tax levied by the trustees. School districts are erected by local municipalities, and trustees are elected therein. The whole system closely resembles that of Ontario. For the provincial university see article CANADIAN UNIVERSITIES. The question of separate schools for Roman Catholics was long a subject of acute controversy. Established in 1871, they were abolished in 1890. The agitation in favor of their restoration reached an alarming crisis in 1895. A compromise was made in 1896 whereby religious instruction may be given during the last half hour of the school day, and which permits the Roman Catholic school children of a district, if numbering 25 or more, to have a teacher of their own denomination. British Columbia has a system of free, non-denominational public schools, controlled by the provincial government through a superintendent of education. The expenses of the schools are defrayed by the government, except in the towns of Victoria, Vancouver, Nanaimo, and New Westminster, which supplement the provincial school grant of \$10 per capita by local assessment. There are eight high schools, controlled by local boards of trustees, and a normal school, but no provincial universities. The Northwest Territories have a system of public schools administered by a commissioner of education who is a member of the executive council. The organization is similar to that of Ontario. There is a normal school at Regina, but as yet no high schools.

22. Canada — Racial Population. The last census of Canada stands for the date of 31 March 1901. In the enumeration count was made of the people by family, sex, conjugal condition, religion, origin or race, nationality, birth-place, citizenship, occupation or profession, education and language. The races of men were classed under the general heads of color and racial or tribal origin, without any attempt at classification by physical types, which is a work for experts. In the instructions given to enumerators, only four colors were recognized, viz., white for the Caucasian race, red for the American Indian, black for the Ethiopian or Negro, and yellow for the Mongolian. "Only pure whites will be classed as whites; the children begotten of marriages between whites and any one of the other races will be classed as red, black, or yellow, as the case may be, irrespective of the degree of color." In making the record of racial or tribal origin, enumerators were told that among whites such origin is traced through the father, but that care should be taken not to apply the terms "American" or "Canadian" in a tribal sense. In the case of Indians, the names of their tribes were required to be given; and persons of mixed white and red blood, usually called half-breeds, were to be described in addition to the tribal name with the

name of the white race infused in the blood. For example, "Cree, f. b." would denote that the person is racially a mixture of Cree and French; and "Chippewa, s. b." would denote that the person is Chippewa and Scotch. "A person whose father is English, but whose mother is Scotch, Irish, French, or any other race, will be ranked as English, and so with any others — the line of descent being traced through the father in the white races."

The census of 1891 omitted the enumeration of the people by races and origins, and to obtain a comparison with 1901 it is necessary to go back to 1881, in which year the population of the Dominion was 4,324,810. The following table gives the classification by color for 1881 and 1901:

Color	1881	1901
White	4,190,486	5,203,896
Red	108,547	127,932
Black	21,394	17,437
Yellow	4,383	22,050
Total	4,324,810	5,371,315

In 1881 the white race was 96.89 per cent of the whole population, the red 2.59, the black 0.51, and the yellow 0.01 per cent. In 1901 the white race was 96.88 per cent of the whole, the red 2.38, the black 0.33, and the yellow 0.41 per cent. The increase of the white population in the 20 years was 1,013,410, of the red 19,385, and of the yellow 17,667, while the black population showed a decrease of 3,957.

The population of the country by principal national or tribal races in 1881 and 1901, and the increase or decrease of each race during that period of 20 years, is shown in the next table:

Race	1881	1901	Increase
English	881,301	1,260,899	379,598
Irish	957,403	988,721	31,318
Scotch	699,863	800,154	100,291
Others of British origin	9,947	13,421	3,474
French	1,298,929	1,649,371	350,442
German	254,319	310,501	56,182
Dutch	30,412	33,845	3,433
Scandinavian	5,223	31,042	25,819
Russian	1,227	28,621	27,394
Italian	1,849	10,834	8,985
Jewish	667	16,131	15,464
Swiss	4,588	3,895	723
Indian and half breed	108,547	127,932	19,385
Chinese and Japanese	4,383	22,050	17,667
Negro	21,394	17,437	* 3,957
Various origins	3,952	24,952	21,000
Unspecified	40,806	31,539	* 9,267
Total	4,324,810	5,371,315	1,046,505

* Decrease.

The number of people of the British races in 1881 was 2,548,514, and in 1901 it was 3,063,195, being an increase in the 20 years of 514,681, or 20.19 per cent. The French, who were the pioneers of Quebec and the Maritime Provinces (the old Acadia), numbered 1,298,929 in 1881, and 1,649,371 in 1901, being an increase of 350,442, or 27.75 per cent. In Quebec the French race has grown in the 20 years from 1,073,820 to 1,322,115, in New Brunswick from 56,635 to 79,979, in Nova Scotia from 41,219 to 45,161, in Prince Edward Island from 10,751 to 13,866, in Ontario from 102,743 to 158,671, in Manitoba from 9,949 to 16,021, in British Columbia from 916 to 4,600, and in the Northwest Territories from 2,896 to 7,040. (See CANADA — THE FRENCH CANADIANS.) During the same period the British races grew in Ontario from 1,548,030 to 1,732,144, in Quebec from 260,538 to 290,169, in Nova Scotia from 342,238 to 359,064, in Manitoba from 38,285 to 164,239, in British

CANADA — RACIAL POPULATION

Columbia from 14,660 to 106,403, and in the territories from 2,873 to 85,769. In New Brunswick the number of the British races fell from 245,974 to 237,524, and in Prince Edward Island from 95,916 to 87,883.

A noticeable feature of the five older provinces of Canada is the relative standing of the British races at the beginning and close of the 20 years' period. The English increased from 861,127 to 1,104,602, or 28.27 per cent, while the Scotch only increased from 678,248 to 693,043, or 2.09 per cent, and the Irish decreased from 943,777 to 899,260, or 4.95 per cent. The English increase is mostly in Ontario (165,578); in New Brunswick and Nova Scotia the increase was 42,063. The Scotch increased 26,139 in Ontario and Quebec, but decreased 11,344 in the Maritime Provinces, and the Irish decreased in all the provinces. In Manitoba, British Columbia, and the Northwest Territories the English race increased in the 20 years by 136,123, the Irish by 75,495, and the Scotch by 85,496. An obvious cause of these results in the older provinces is found in this record of population by birthplaces, which is shown for the principal British islands in the following table for the whole of Canada:

Born in	1881	1901
England	169,504	201,285
Ireland	185,526	101,629
Scotland	115,062	83,631
Total	470,092	386,545

There was an increase of 31,781 in the number born in England, but a decrease of 83,897 in the number born in Ireland and 31,431 in the number born in Scotland, and a net decrease of 83,547 in the number born in the three countries. Consequently there was a large falling off during the period of 20 years in the number of immigrants arrived in Canada from the British Islands as compared with years preceding 1881. The growth of the French race in Canada appears to be due almost wholly to natural increase, for the census tables show that in 1881 the number of persons in the country who were born in France was only 4,389, and in 1901 only 7,941. The other races of Continental Europe making up part of the population of Canada comprise German, Dutch, Scandinavian, Russian, Italian and Swiss. In 1881 these peoples together with Jews numbered 298,285, and in 1901 they were increased to 434,839. But to them are to be added for the latter year 18,178 Austro-Hungarians and 2,994 Belgians, which in the table of population by races are included under the head of "various origins." The remaining 3,780 under the same head embrace 1,637 Syrians, 861 Spaniards, 442 Portuguese, 291 Greeks, 225 Flemings, 73 Arabians, 57 Rumanians, 39 Turks, 34 Armenians, 16 Persians, and 9 Bulgarians, and nearly 100 of the minor races.

The Scandinavian race includes 10,594 enumerated as Swedes, 5,324 as Norwegians, 3,161 as Danes, 9,297 as Icelanders, and 2,666 as Scandinavians in general. The Icelandic race is found chiefly in Manitoba, where a colony was established a quarter of a century ago. But there are a few in Ontario and British Columbia and nearly a thousand in the territories, whence they have migrated from Manitoba.

The Russian race is made up largely of the religious body known as Doukhobors, who came to Canada to escape persecution in the closing years of the 19th century. They have settled as

colonies in Manitoba and the territories. Counted with the Russian race also are 5,726 Poles and 1,929 Finns.

The Austro-Hungarian races are composed largely of Galicians, Bohemians, and Slavonians who have settled in the Northwest.

A scientific classification of the European races in Canada's population would no doubt make many changes in the groups as given here, which are arranged generally in the national order. No other arrangement would be intelligible to most of the enumerators employed on the census, and it would happen but rarely that stature, or facial features, or form of the head, or texture of the hair, or spoken language would enable anyone concerned in the work to give or record a scientific answer. In an instance so apparently simple as the determination of race in the descendants of Highlanders who crossed the Grampians to the Lowlands of Scotland a century and a half ago the experts themselves are not infrequently perplexed even on Scottish ground. But much greater the problem becomes in a new world, where climate, environment and other conditions have reconstructed the physical man, in spite of the prepotency of racial characteristics.

The Indian races, including half-breeds, increased in the 20 years from 108,547 to 127,932, or 17.86 per cent. In 1901 there were 93,459 pure Indians and 34,473 half-breeds,—the latter term being officially used to describe a person of Indian and other blood in any degree of strain.

The census record of Indians for British Columbia is not very satisfactory, inasmuch as most of the bands have been described by enumerators by the name of the district they occupy instead of by their tribal names. In the other provinces and territories of the Dominion they have been properly described by tribal names, and the population of the principal ones is given in the following table:

Tribal Name	Population
Abnakis	385
Algonkin	2,369
Amalécite	520
Assinibotin	258
Blackfoot	2,193
Chippeway or Ojibway	13,231
Cree	15,279
Dakota	231
Delaware	432
Dog Rib	697
Huron	228
Iroquois	8,608
Micmac	2,177
Montagnais	1,455
Ottawa	1,939
Peigan	513
Salteaux	600
Sarcee	173
Sioux	366
Slave	620
Stoney	435
Total	51,809

This table includes 22 Chippewas and 10 Crees in British Columbia, leaving for that province 25,456 Indians not described by their tribal names. The remaining 16,194 Indians consist of 3,302 in Yukon and 12,153 in the other far northern territories not described by tribal names, and 739 made up of small tribes or bands in the old provinces—among which are Mistassinis, Nipissings, Tête de Bull and Wapenakis in Quebec, Kioways in Nova Scotia, and Mississagias, Munsees, Shawnees, Wyandottes and one (last of the Mohegans) in Ontario. The Abnakis are almost all in Quebec, and four-fifths of the Al-

gonkins are in the same province. The Amalecites are in New Brunswick, but a few scattered ones are in Nova Scotia and Quebec. The Chipeways are in all the provinces except Nova Scotia and Prince Edward Island, but 10,126 are in Ontario, 1,035 in Manitoba, and 1,950 in the Northwest Territories. The Iroquois or Six Nations are in Ontario and Quebec,—5,660 in the former and 2,880 in the latter, with a few scattered ones elsewhere. The once powerful Hurons now exist as a small remnant at Ancienne Lorette, near the city of Quebec, but 15 out of the 228 are yet in Ontario. The ruins of their forts and the midden heaps of their camps in the rich farmland that lies between Lake Simcoe and Georgian Bay have been for the last 50 years interesting spots of research for the tireless antiquarian. The Crees are the most numerous of all the Indian tribes in Canada, but four fifths of them are in the Northwest Territories. Manitoba has 1,246, Ontario 585, and Quebec 628. The Montagnais are in Quebec, and the Ottawas and Delawares in Ontario. The last named, a branch of the old Lenapes, were brought to Canada by the Moravian missionaries late in the 18th century, and half a township of fine land was given to them by the government. The Blackfoots, Peigans, and Sarcees are in Alberta, and the Slaves and Dog Ribs in Mackenzie of the Northwest Territories.

The records of half-breeds show the Indians to be crossed with nearly all the races of the country, including Ethiopians and Mongolians, and there are some "breeds" in all the tribes. Following is the number under five classes:

Classes of Half-breeds	Population
English	4,447
French	17,886
Irish	1,132
Scotch	5,931
Other	5,055
Total	34,451

The French "breeds" are the most numerous, for the reason that for more than 300 years the French traders and trappers have been coming and going among the Indians, and occupying posts where business of the kind in which they were employed might be carried on in the easiest and best way. The *coureur de bois* or bush ranger sought trade in all the Indian country from Quebec to the Pacific Ocean, and wherever he went he became a member of a family or was adopted into a tribe. The Scotchman and the Englishman came in later as employees of the Hudson's Bay Company, and they, too, became tribesmen through adoption. As a rule the children did not take up the father's language, but they inherited his vices, and the Indian character was not improved by the new cross of blood. The "breed," however, acquired a few words of French, or English, or Gaelic, which helped him in trading, and so made him a useful means of communication between the white and the red races. But often in the far north it is noticeable by phrase and accent that his English has been learned from a Highlander or an Orkney man.

A few words may be said of the Eskimo race, whose habitat is portions of the mainland around Hudson Bay, in the Territories of Ungava and Keewatin, parts of Mackenzie and Yukon near the Arctic Ocean, and the islands in that ocean comprising Franklin. Their number is not accurately known, for a census of only

a part of them was taken at trading posts and mission stations when the yearly visit to these places was made. The chief occupations of the Eskimos are hunting and fishing, upon which their subsistence depends. They are a square-built folk, powerful and hardy; yet it is rare to find more than four or five in a family. Many of them can read well, and write in the syllabic form, although the census records of the East Main show that their whole time at school ranges only from 3 to 10 days. The same remark also applies to the Indians around Hudson Bay, most of whom can read and write and speak English. Like the Indian, the Eskimo finds his chief social pleasure in telling and hearing salacious stories, over which he will laugh uncontrollably. The mother tongue is Eskimo or Innuity, and a few proper names of persons in a family will serve as examples:

Nápártök.....	male	head of family
Evidlak	female	wife
Apáluktak	male	son
Pookta	female	daughter
Kingnaróak	male	son
Kaukelak	female	boarder

The following table gives by provinces the number of the Chinese and Japanese races in 1881 and 1901, but separately only for the latter year:

PROVINCES	1881	1901	
	Chinese and Japanese	Chinese	Japanese
British Columbia	4,350	14,938	4,544
Manitoba	4	206	4
New Brunswick	59
Nova Scotia	106	1
Ontario	22	732	29
Prince Edward Island	4
Quebec	7	1,037	9
The Territories	286	95
Totals	4,383	17,368	4,682

The increase of the two races in the 20 years is 17,667 or 400 per cent, and has been almost wholly by immigration. A capitation tax of \$50 was imposed by the Canadian Parliament on Chinese immigrants in 1886, which on 1 Jan. 1901, was increased to \$100. But neither the first nor the second tax had any effect upon arrivals. On 1 Jan. 1904, the tax was further increased to \$500, and from that date to the end of the fiscal year, 30 June, only one Chinaman landed in the country. This tax does not apply to the Japanese, who continue to come in at a moderate rate. In 1901 they had adopted Canadian citizenship to the number of 1,070 or 22.85 per cent, and the Chinese to the number of 993 or only 5.72 per cent.

Canada has by its constitution two official languages, English and French, and its population five years of age and over is 4,728,631. Of this number 3,709,370 speak English, 1,514,977 speak French, 126,978 English speak English and French, and 529,552 French speak French and English. There are 1,019,261 who cannot speak English, 3,213,654 who cannot speak French, and 160,814 who cannot speak French or English. The third lot comprises many Indians and recent immigrants.

ARCHIBALD BLUE,
Census Commissioner, Ottawa.

23. Canada—The French Canadian. *Geographical Distribution.*—In 1901, according to the last Dominion census, 1,650,000 inhabitants of Canada, that is, a little more than one third of the whole population, were of French origin,

Of these, by far the greater part, namely, over 1,300,000, were settled in the province of Quebec, forming 80 per cent of the total population of that province. But considerable numbers were located in some of the other provinces: nearly 159,000 in Ontario, 80,000 in New Brunswick, 45,000 in Nova Scotia, 14,000 in Prince Edward Island, while 16,000 were to be found in Manitoba, 7,000 in the Northwest Territories, 4,600 in British Columbia, and about 2,000 in the unorganized territories, principally the Yukon. Then, according to the last United States census, there were, in 1900, throughout the Union, nearly 400,000 Canadian-born French; and the total number of people of French Canadian extraction in the United States, if local statistics are to be credited, would exceed 1,000,000. From the point of view of physical and social geography, the French Canadian element in North America is made up as follows:

(1) The main body, 1,500,000 strong, extends uninterruptedly over Quebec, eastern and northern Ontario, and northern New Brunswick. The nucleus of this main body is a compact community of farmers occupying the banks of the Saint Lawrence and the valleys of its tributaries. On the outskirts of this central group, over the wooded and rocky highlands, north and south of the great river, but more especially throughout the plateaus of northern Quebec, northeastern Ontario, and northern New Brunswick, farming is largely supplemented by lumbering, and not infrequently by mining; while along the Gulf and sea-coast of Labrador, the Gaspé Peninsula, Chaleurs Bay, and eastern New Brunswick it is more or less superseded by fishing.

(2) Then, hardly separated from these, and from one another, we have, off the extreme eastern limit of this central group, the French-speaking communities of fishermen of Nova Scotia and Prince Edward Island; while, as a projection from the opposite extreme western border, in Ontario, we find, along the shores of the Saint Lawrence and the Great Lakes, a string of small settlements of French Canadian rivermen, boatmen, and woodsmen, forming an almost continuous chain around that province and connecting, as it were, the two large French groups of Detroit River and Georgian Bay with the still larger one occupying the western bank of the Ottawa. Over one third, namely, about 560,000, of the total French element composing this main body and its projections are congregated in villages, towns, or cities, where they make a living through physical labor, trading, the crafts, and the liberal professions.

(3) As distinct outlyers from the above main group, we have, in the first place, the many French-speaking communities of urban population, which, in very large, though fluctuating numbers, are spread throughout the manufacturing towns of the North Atlantic States of the Union, principally Massachusetts; in the second place, smaller and sparser groups of French-speaking farmers (at times woodsmen and miners as well), to be found in the Western country, in Manitoba, Alberta, and in some States of the North Central division of the Union, especially Michigan, Wisconsin, Minnesota, and Illinois; in the third place, still smaller and sparser groups of French Canadian prospectors or miners, spread in the camps and towns of British Columbia, the Yukon, and

some of the States of the Western division of the Union, principally Montana and California. Lastly, French Canadian families or individuals are to be found in every part of the Union, though in the States of the South Atlantic, South Central, and Western divisions they aggregate in most cases a few units or a few hundred only. About 40 per cent of the total French Canadian element in the United States are located in 160 principal cities.

Social Features.—The most widespread, fundamental, and characteristic type of the French Canadian is the habitant, or farmer, of the province of Quebec (q.v.). From a study of his conditions there may be gathered the clearest idea of the capabilities and limitations of the race as a whole. Three main groupings are distinctive of social life in the French Canadian country: the habitant's household, the range, the parish.

(1) The habitant's household normally consists of two families, that of the senior householder, and that of an associate son and heir; it includes generally sisters and younger brothers of the heir, children of the younger couple, and, in some cases, sisters of the senior father of family. We have thus a group of some 10 or more persons, closely bound together, not only by ties of kinship and family love, but by co-operative effort, community of interest and habits of mutual dependence, which extend, in a measure, even to those members of the group who have settled outside of the family circle. The habitant's household is primarily a labor organism, a workshop. Agriculture is its mainstay; but it is of a type neither extensive nor intensive, its scope being narrowed down to the task of satisfying directly the household's needs, and limited by the household's internal supply of labor. The farms seldom exceed 100 acres in area, and outside hired help is resorted to in very exceptional cases only. To avoid this contingency, women and children are called upon to work in the fields, especially in haying and harvesting time. On the other hand, the object being to provide directly, as far as circumstances will permit, for all the requirements of the family, habitant farming is greatly diversified. On almost every farm there are to be found, beside the kitchen-garden and its few fruit trees, small patches of flax, tobacco, potatoes, Indian corn, buckwheat, and barley, while larger areas are given to other cereals, hay, and pasturage. Similarly, all kinds of stock are kept on each farm, though seldom any in large numbers or of excellent quality. Various home industries, such as the spinning and weaving of both flax and wool, the manufacture of maple syrup and sugar, carpentry, joinery, cooperage, brush-making, leather-working, etc. are an important factor on many farms. Agriculture is seldom the sole means of living of the habitant, since in the newer settlements the mere gathering of natural products, such as fish, game, wild fruits, and wood is largely resorted to, while in the older and more densely populated sections by-industries are conspicuous. Then again temporary emigration to and employment in the manufacturing, mining, and lumbering centres of Canada and the United States is, in all situations, an occasional means of securing capital to start out in life or of bridging over hard times. The methods of farming of the habitant, his rotation of crops, his processes of retting

and breaking flax, dyeing wool, making candles, etc., are traditional and have been in use for centuries in certain provinces of France. However, in recent years, the wave of modern progress has been felt, agricultural machinery has come into fairly general use, co-operative butter and cheese factories have been established, and, especially in the vicinity of railways, improved methods and a more specialized type of farming have been adopted. Through hard work and close economy a capable habitant will succeed, with the help of his family, in building up a homestead of sufficient area to meet the wants of the household. Should his acquisitions of land during his lifetime remain within that limit, then the homestead will be transferred in its entirety to the associate son or heir, who in turn will be charged with providing for the whole family, in the same way as the testator would have done. On the other hand, should the acquisitions of the father of family exceed the area required for the support of an ordinary household, the lots in excess are freely used in helping out other sons who, after contributing to the sustenance and welfare of the paternal household in their early life, undertake to make an independent living through agriculture. Girls receive very little aid from the family estate, as it is considered they will be provided for either through remaining as members of the paternal household, or through marrying into some neighboring family. Likewise, sons who are sent to college and enter the liberal professions or the priesthood, receive very little else from their parents. In the management of the family affairs, the influence of the mother is about on a par with that of the father. As a rule she is better educated than her husband, sees to the correspondence and accounts, is consulted in all matters of importance, and leads in the family worship. Through working with their parents on the farm the children acquire a variety of aptitudes, but no particular proficiency in any of the arts, nor any strong desire of attaining eminence in the various walks of life, barring possibly priesthood and politics. Education is reserved for the few who take to the liberal professions and the Church. The style of living is plain, and in many respects old-fashioned. Food is in abundance, though lacking in delicacy. The house, usually of wood and whitewashed, is often rather small for the accommodation of its inmates, but as a rule kept clean and tidy. Homespun, still in use in a few families in isolated sections, is fast being replaced by the cheap cotton and woolen goods supplied by the trade. Births are numerous, but owing to defective hygienic conditions, or to overwork on the part of mothers, this advantage is partially offset by the high proportion of deaths among infants. Amusements are simple, pertaining to the daily work, the family circle, church festivals. Many of the songs and dances are importations or adaptations from Old France. However, here, as throughout the whole range of social phenomena, outside influences are apparent, and features of recent origin are found grafted on old and quaint usages.

(2) The farms are in the shape of long, narrow rectangles, 20 or 30 arpents in length, by 2 or 3 in breadth. The farm buildings are all built at one end of these rectangles, along the public road, which crosses them at right angles, thus giving a close succession of houses and

barns. Not infrequently the buildings of two abutting ranges are situated on opposite sides of the same road, making a double row of almost contiguous houses, somewhat like a village street. The ranges, of which there are four or five in parallel line in every parish, connect with one another and with the village by means of "routes" or transverse roads, along which no buildings are erected; so that each range is isolated from the rest and forms a distinct grouping within the parish. This type of settlement, which differs from that of the isolated homestead to be found in some parts of France and throughout the Anglo-Saxon world, and also from the central village type observed in other parts of France and Europe, is a distinctly French Canadian creation, which the habitant takes with him wherever he settles in numbers. The range seems to have been the outcome of the desire on the part of the habitant, while residing on his own farm (which the village settlement would not allow him to do), to secure the benefit of his neighbor's assistance and company in a more effective way than the isolated homestead would permit. What the habitant cannot accomplish with the help of his family he endeavors to do through the free help of his neighbors. However, while the nearest neighbor, on either side, may be called upon now and then to lend a hand in the ordinary work of the farm, the summoning in numbers of the near-by farmers is resorted to in exceptional cases only, such as the clearing of land, the "lifting" of a barn, or the relief of some destitute family. Each range looks after its poor, by means of voluntary contributions, principally in kind. Each range has its cheese or butter factory, its school house, also its large wooden cross along the highway, in commemoration of some religious revival.

(3) The roads leading from the various ranges all centre toward a village, generally small, comprising a few lodgings, workshops, and stores, besides the priest's house and the church. A community wherein the highest aim of the farmer, the basal element, is to cater to all the needs of his household directly through the labor of his own family and the occasional assistance of his neighbors, does not leave much scope for the development of other social factors. The ambitions and efforts of the most capable being restrained within that limit, equality and similarity of condition is the rule. Commerce, industry, the liberal professions remain embryonic. In the absence of leaders in agriculture, industry, and commerce, learning becomes the standard of distinction. A few wise old farmers, the doctor, the notary, the lawyer, are looked up to; but, on account of the exalted nature of his function, the parish priest is decidedly the dominant factor. Like the family and the range, the parish is primarily an organism for mutual support, both in the physical and moral order. It plays to a certain extent the part of an insurance company, as barns, for instance, destroyed by fire are restored through contributions from all the parishioners in material or labor. On Sundays and feast days the habitant meets at church his co-parishioners, who are all relatives or close acquaintances, the doctor, the notary; he listens to the admonitions of the "curé," to the announcements made by the public crier, and receives the intelligence and impressions which will be his mental

food for the remainder of the week. To all intents, the parish may be considered as an enlargement of the family, with the parish priest as its patriarchal head. Then, the parish is the main organ of local government in the French Canadian country, the school commission and the municipal corporation, of British origin and of comparatively recent introduction, remaining mere adjuncts, only partially developed, of the parish proper. The revenues of the latter often exceed those of the school commission and municipal body put together. Many localities have no town-hall other than the vestry. In practice the curé is much more the maintainer of the peace and the arbitrator of disputes within the parish than are the mayor, the local magistrates, and court. His powers extend even to a close supervision of family affairs. The law of the province allows him the 26th bushel of all cereals grown by his parishioners within his territory, and his influence over the church wardens and flock generally enables him to obtain from close-fisted farmers the expenditure of comparatively large sums of money on church buildings. His influence is exerted as well over the school commission and municipal council, whose policy and decisions are usually made to conform to his wishes. On the other hand, practically the only check on the curé is the far-off bishop, who visits the parish and inspects the books every third year, and may remove him at will. The school commission and municipal corporation are administered in a spirit of parsimony. School buildings are inadequate, and the teachers, generally girls, receive very little pay and give correspondingly poor results. Illiterates are still in large numbers. As each individual farmer is required to look directly after that part of the public highway which faces his property, and to contribute his share of the labor necessary for the maintenance of the cross-road leading to the village, the municipal council has little to do apart from supervising, in a general way, the repairing of roads or the occasional building or repairing of bridges within the limits of the parish. Similarly, county councils have not acquired in the French country anything like the importance which they have in English sections, and are content with looking after roads, bridges, or water courses common to two or more parishes. On the other hand, Provincial and Federal politics have taken quite a hold on the habitant; but the interest which he takes in them is more the outcome of his inclination for clannish warfare and oratory, and of his craving for the petty favors of officialism, than the result of a desire on his part to insure the proper management of public affairs, which he does not always grasp. These are the prey of organized political parties, whose leaders are recruited mainly from the liberal professions and the cities. Church and politics are, in the mind of the habitant, the only avenues open to those desirous of rising in the world. And this accounts for a rather remarkable development of institutions of classical and literary teaching in a community wherein common schools are markedly deficient and technical and business training neglected.

Evolution.—On the basis of the classification of societies proposed by F. LePlay and his followers, H. de Tourville and the French school of social science, the French Canadian is

a semi-patriarchal or semi-communistic type; that is one in which social organization and life, while swayed by tradition and habits of mutual dependence to a less degree than in the purely patriarchal or communistic types of the Orient, still are not permeated and uplifted by that spirit of private independence and enterprise distinctive of the individualistic or "particularistic" types, as exemplified in the Anglo-Saxon races. His semi-communistic training the French Canadian holds from France. His social ancestors were mainly the Gaul, on the one hand, the Frank on the other. The former, with his clan organization, village life, and neglect of agriculture, was a distinctly communistic type. The particularistic Frank broke up, to some extent, the clannish and communistic spirit and institutions of the Gaul, and gave a strong impulse to agricultural pursuits; but his influence, for reasons which it would be too long to set forth here, was not so lasting nor so far-reaching in France as was that of his duplicate, the Saxon, in England. Thus there sprung up an intermediate type presenting many of the qualities and defects of the Celt, with something of the qualities of the Saxon. A farmer, an artisan, a trader, though generally in a small way and still conserving a fondness for nature and primitive, easy-going occupations; a race lacking ambition and ability to rise in the ordinary callings of life, having for its sole leaders the clergy and the military or civil officers of the Crown; and these leaders, though in many cases sprung from the people, isolated from them by class interests and training and unfit to lead adequately in practical pursuits. Under the trying conditions of New France—the dense forest to clear, the rigorous climate to provide against, the lurking Iroquois to evade—the peasant from north central France, single-handed, made rather slow progress at colonization. Agriculture was neglected, while the more attractive, more remunerative, though deceptive, fur trade became the means of sustenance of both the individual and the colonial government, with a consequent rapid but superficial expansion of the colony and constant warring. The French settler, fond of home and of quiet, evolved into the adventurous and hardy type of the *coureur des bois*. Under British rule, and especially in the course of the 19th century, through the restoration of peace and the advent from Great Britain of a class of business men, the fur trade, carried on by large companies, receded toward Hudson Bay and the Far West, vast lumbering operations were carried on, with a consequent impulse to agriculture, extension of settlements, increase in population; a period of unprecedented prosperity for French Canada. Then, in the latter half of the 19th century, the worldwide evolution of commerce and industry set in, with its marvelous applications of steam and electricity, its powerful machinery and means of transportation, the progress of manufacturing centres; and the French Canadians developed a class of factory operatives, together with a vigorous undergrowth of artisans and traders in the large cities. CANADA — RELIGIOUS CONDITIONS

24. **Canada — Religious Conditions.** The religious and ecclesiastical life of Canada cannot be understood without some reference to the sources from which it sprang. The same great forces and influences which molded the history of the Old World re-appear here, but modified in their action and combinations by the new and freer environment in which they work.

General History.—The Roman Catholic Church is the oldest and largest of the ecclesiastical bodies in Canada. It has its chief seat in the province of Quebec. In Canada, under French rule, it was all-powerful. In its origin it was distinctively missionary. The Jesuits were the pioneers and, from the Saint Lawrence to the Rockies, have left an imperishable record. Mgr. Laval (see LAVAL-MONTMORENCY, FRANÇOIS XAVIER DE) in 1674 obtained the erection of the diocese of Quebec and laid the foundations of a regular system of ecclesiastical government. Parishes were established and provision made for the support of the clergy and for the performance of divine worship. The system of tithes was inaugurated in 1663. The Church grew in wealth. Of all the lands, exclusive of islands, granted by the French government previous to the cession to England, at least one fourth came into the possession of the Church. The Jesuits acquired extensive estates, which subsequently became the subject of litigation and political agitation. By the Treaty of Paris (1763) (see PARIS, TREATIES OF) the French Canadians were allowed full liberty "to profess the worship of their religion according to the rites of the Romish Church, as far as the laws of Great Britain permit." This was confirmed by the Quebec Act of 1774, by which also the tithes and rights of the Roman Catholic clergy were secured. The Church in Canada, under the French dominion, was modeled after the National Church of France. The ecclesiastical laws of France were extended to Canada, and with them the so-called Gallican liberties (see GALLICANISM). After the conquest these continued for some time to be more or less observed, along with the assertion of the rights of the sovereign, from which, in France, they had never been separated. It was evidently the intention of the British government to maintain in Canada the previously existing relations between Church and State as defined in Gallicanism, subject only to such changes as the laws of England might necessitate. After many futile attempts to secure some form of concordat with the Papal authorities, it became evident that this Anglo-Gallican policy was impracticable. The more stringent regulations fell into abeyance. In 1806 the Pope appointed M. Plessis (see PLESSIS, JOSEPH OCTAVE) to the See of Quebec, which had been vacant for some time on account of difficulties with the government. From this time the Roman Catholic Church, while richly endowed by the state and practically established by law, was independent in its internal government and as free from state control as other Churches. Besides the political causes which contributed to the failure of the British attempt to perpetuate the Gallican policy, account must be taken of the change within the Church itself by which Gallicanism was rapidly supplanted by Ultramontanism, just as it was in France. The French ecclesiastical law was superseded by the Roman canon law, the Gallican liturgy gave place to the Roman

liturgy, and the attitude of the clergy generally toward the civil power changed greatly. This development was accelerated by the publication of the decrees of the Vatican Council (q.v.) in 1870. In Canada, as in France, Gallicanism is a mere matter of past history. But during the last decade not a few significant indications have appeared of a reaction towards a more tolerant and liberal spirit especially among the laity. In the other Provinces the Roman Catholic Church holds a strong position. In the Maritime Provinces there is a large French population, especially along the shores of the Gulf of Saint Lawrence and the Straits of Northumberland. In Cape Breton and the contiguous districts of Nova Scotia many Roman Catholics from the highlands of Scotland settled. Irish Roman Catholics are numerous, especially in the cities of Halifax and Saint John. In all, there are not less than 300,000 members of the Roman Catholic Church in the Provinces by the Sea. The French Canadians have flowed over the boundary from Quebec into Ontario; and they have emigrated extensively into Manitoba and the Northwest Territories. In all these districts are also found both Irish and Scotch Roman Catholics. In Ontario there are, in all, nearly 400,000 Roman Catholics out of a population of upward of 2,250,000. In Manitoba and the West there are about 110,000. The total Roman Catholic population of the Dominion is about 2,230,000.

The Church of England in Canada may be traced back to the few and scattered settlers who followed the British regiments into Nova Scotia and Quebec in the latter part of the 18th century. It received its first accession of strength in the Loyalist refugees who flocked into Canada in 1783-4, many of whom were attached members of the Episcopal Church. The organized life of the Church began with the consecration of the first bishop of Nova Scotia, Dr. Charles Inglis (q.v.), 12 Aug. 1787. In 1798 Dr. Jacob Mountain was consecrated bishop of Quebec. The diocese of Montreal was set apart in 1850. In 1838 Dr. John Strachan was consecrated bishop of Toronto, with the whole of Upper Canada as his diocese. So far the Church had been chiefly dependent for its support upon the English societies, especially the Society for the Propagation of the Gospel. An important step toward self-support was taken in 1842 by the inauguration of the Church Society of the Diocese of Toronto, for the purpose of collecting and disbursing funds for the support and extension of the Church's work. The year 1851 was signalized by a notable advance in the development of the Church. Hitherto the bishops had been appointed by the Crown and the chief ecclesiastical superintendence was in the hands of the archbishop of Canterbury. Now the Church was given self-government in each diocese, by a synod consisting of the clergy and duly elected representatives of the laity, with the right to elect its own bishops. As the Church grew, the diocese of Toronto was gradually subdivided, until now it comprises within its former limits the five dioceses of Toronto, Huron, Ontario, Ottawa, and Niagara, and also the missionary diocese of Algoma and the greater part of the dioceses of Keewatin and Moosonee. In 1845 the diocese of Nova Scotia was subdivided, and that part of it which now forms the province of New Bruns-

CANADA—RELIGIOUS CONDITIONS

wick was erected into the new diocese of Fred-ericton.

For many years each diocese was independent; there was no organic connection binding them together, beyond their common relations to the Church in England. In 1861 the Provincial Synod was constituted, and comprised within its jurisdiction all the then existing dioceses of Eastern Canada. But there had grown up in the Far West another distinct organization. In 1820 the Hudson's Bay Company (see CANADA—THE HUDSON'S BAY COMPANY) sent out to Fort Garry the first missionary, who ministered assiduously to the servants of the company and the few settlers, both Church of England and Presbyterian, and made some feeble efforts to evangelize the heathen Indians. Others followed. The work was so far advanced in 1849 that the diocese of Rupert's Land was created. It was, for many years, chiefly a missionary work, sustained by the Church Missionary Society, but the federation of all the Provinces into the Dominion of Canada and the opening up of the vast territories hitherto traversed only by the Indian and the trapper led to the rapid influx of population and gave a strong impetus to the work of the Church. The dioceses of Saskatchewan, Calgary, and Qu'Appelle were created. There were also set apart the missionary dioceses of Mackenzie River and Athabasca, and on the Pacific coast the dioceses of New Westminster, Kootenay, Caledonia, and Selkirk. In 1890 an important conference was held in Winnipeg, the object of which was to adopt a scheme for the unification of the Church throughout Canada. This scheme, with little change, became the basis of the constitution of the General Synod, which first met in Toronto in 1893. The Church of England in Canada, from the Atlantic to the Pacific, was now one organized body, possessed of all the powers of self-government.

The Presbyterian Church of Canada traces its descent to several distinct sources. The attempt made in the 17th century to found Huguenot settlements failed disastrously and few traces remain of their existence. Among the Presbyterian Loyalists who came to Canada at the close of the Revolutionary War there was a goodly number of descendants of Huguenots. In 1749 Protestant colonists were brought into Nova Scotia from England and the Continent, in order to counteract the disaffection of the Acadians. Again in 1755, after the expulsion of the Acadians, many Protestants from Great Britain and older colonies along the Atlantic coast were induced, by the promise of liberty of conscience and of worship, to occupy the vacant lands. Then there was a large influx of immigration from the north of Ireland and from Scotland. Some districts, such as the county of Pictou, were almost exclusively occupied by Scotch Presbyterians. These people naturally clung to the various ecclesiastical bodies into which Scotch Presbyterianism was divided. And accordingly there were Presbyteries constituted with relations to the Kirk of Scotland and the Secession Church in its two subdivisions of Burgher and Anti-Burgher, and also adherents of the Reformed Presbyterians, or Covenanters. The great disruption of the Church of Scotland in 1843 extended to the colonies and added to the existing divisions the Free Presbyterian Church. But in 1861 the process of reunion

began with the union of the United Secession Church (inclusive of both Burgher and Anti-Burgher) and the Free Church of the Maritime Provinces into one synod.

The history of the Presbyterian Church in the Western provinces followed similar lines but with new complications. Soon after the conquest, Presbyterian congregations were organized in the cities of Quebec and Montreal. Among the Loyalists were not a few Presbyterians. But there was scanty provision for their religious needs. Applications for ministers made to the churches in Scotland met with no response for many years. A similar appeal made to the "Associated Reformed Church" in the United States resulted in the incoming of a number of ministers from that country. Other ministers followed from Scotland and Ireland. In 1818 was organized "The Presbytery of the Canadas." In 1831 there was organized a synod in connection with the Church of Scotland. In 1840 the two synods were united into one. But in 1843 the great disruption in Scotland again rent it asunder and two synods resulted, one in connection with the Established Church of Scotland and the other in connection with the Free Church of Scotland. Besides these there were other independent Presbyteries, one at Niagara and the other at Stamford, composed of ministers from the United States, and a third originated by ministers from Scotland and from Nova Scotia, connected with the "United Presbyterian Church." The first two were disbanded and absorbed into the larger bodies. The third, in 1861, united with the Free Church and the combined body received the name of the Canada Presbyterian Church. In 1875 the greater union was consummated by which all the Presbyterian bodies throughout Canada from east to west, were united in one great Canadian Presbyterian Church.

Until the greater union was consummated little had been attempted by the Presbyterians in the evangelization of the Northwest. In 1812 and 1816 a large body of Highlanders had settled in the Red River district, but the only ministers they had were those of the Church of England until 1852, when the Rev. John Black, a devoted missionary, organized them into a congregation. Little more was done until after the federation of Canada and the complete union of the Canadian Presbyterians. In 1881 the General Assembly appointed the Rev. Dr. James Robertson to be superintendent of Presbyterian missions in the Northwest. This remarkable man laid the foundations of Presbyterian organization throughout those vast territories and covered the whole country with a network of Presbyterian missions.

The Methodist Church in Canada traces its origin to two distinct sources, England and the United States. In 1770 Lieutenant-Governor Franklin sought English settlers for the province of Nova Scotia in the East Riding of Yorkshire. Among them were the earliest Methodists of Canada, one of whom was the noted preacher and evangelist, John Black. In 1784 he went to the United States, and his appeal to the Baltimore conference led to the coming of a number of Methodist ministers to the Maritime Provinces. In Quebec the first Methodist preachers were connected with the British regiments. As early as 1778 Methodists

CANADA — RELIGIOUS CONDITIONS

from New York State came to the Eastern Townships and to Upper Canada. The Methodists did a noble work in laying the foundation of religious life and worship in many districts in Canada, especially in the province of Ontario. Until the War of 1812 Canadian Methodism was closely connected with that of the United States. Negotiations were then entered into with the British Wesleyans. Unhappy dissensions followed. While one party was anxious to maintain the American connection, the other insisted that, as loyal British subjects, they should look to the mother land. A compromise was arrived at by which the American connection was to be observed in Upper Canada, while the British missionaries were to be free to enter Lower Canada. This compromise was of short duration; for when, in 1828, the American conference relinquished its jurisdiction over the Canadian conference and the latter was independently organized under the name of the Methodist Episcopal Church in Canada, the British conference decided not to confine its work to Lower Canada. After much controversy, in 1833 a union between these two branches of Methodism was consummated under the name of "The Wesleyan Methodist Church in North America." But, notwithstanding this union, the Methodist Episcopal Church survived in a new form and increased very rapidly.

Methodist missionary work in the Northwest began about 1840. Its annals abound with noble achievements. There now existed in Canada five principal Methodist bodies. In addition to the two main bodies already mentioned, different branches of British Methodism had been brought into the country, namely, the Methodist New Connection, the Primitive Methodist body, and the Bible Christians. All these became firmly rooted in Canada and developed into strong bodies. The need of unification began to be earnestly discussed as early as 1866; but it was not until 1883 that, at a general conference held in Belleville, the union was consummated. Then all the Methodist bodies, hitherto locally or ecclesiastically separated, were brought together; and, from the Atlantic to the Pacific, there is now one great Methodist Church of Canada.

The Baptist Church derived its origin from the American Baptists. From 1760 onward there are traces of individual Baptists in different localities in Nova Scotia. In 1820 the first Baptist association was formed for the Maritime Provinces. The first Baptist Church in Lower Canada was formed in 1794, and consisted chiefly of Loyalist refugees from Connecticut. In 1795 another was organized in Upper Canada. The first Baptist Church in Montreal was not organized until 1830. The Baptists in Canada are chiefly close communion. There is a body of "Free Baptists" which maintains open communion as in Britain, and welcomes all Christians, by whatsoever mode baptized, to the Lord's table.

Congregationalism has never found a strong footing in Canada. A few scattered adherents came from New England to Nova Scotia in 1758. In the eastern townships Congregationalism was founded in 1811 by settlers from Massachusetts, and in Ontario some 10 or 12 years later. Nothing was done west of Ontario until 1870, when work was begun in Winnipeg.

The Lutheran Church in Canada dates from

the middle of the 18th century. The first German Lutheran landed at Lunenburg, Nova Scotia, in 1749. The first Lutheran congregation in Upper Canada was founded in 1775. Others came in with German immigration. In 1853 the Canada Conference of the Lutheran Church was founded.

There are a number of small religious bodies in Canada, none of which exercises any appreciable influence upon the religious life of the country; chief among them are The Disciples and The Brethren. There are a few Unitarians and Quakers. The Salvation Army has acquired a considerable foothold in the larger cities and towns.

There are four paramount considerations which have profoundly affected the whole religious history and development of the country, namely, the relations of the Churches to the state and to education, their beneficent and missionary activities, and the problem of church union.

Church and State.—In the 18th century neither the principles of responsible government nor the special conditions of Canada were rightly understood by its rulers. It was believed that an Established Church was necessary in order to secure the loyalty of the colonists, and it was, without doubt, the intention of the British government to maintain an Anglican establishment in Upper Canada the counterpart of the Roman Catholic establishment in Lower Canada. In 1792 Lieutenant-Governor Simcoe urged upon the home government the necessity of establishing the Church of England in Upper Canada, as the only means of fostering the spirit of loyalty in that Province. There was nothing in the conditions of the country to warrant the monopoly of religious functions and privileges by any denomination, but the Anglicans had the prestige of their relations to the Established Church in England. The Constitutional Act of 1791 reaffirmed the provision of previous legislation, giving the king the right to set apart for the support of the "Protestant clergy" the seventh part of all ungranted Crown lands. This was the origin of the "clergy reserves" (see CANADA — THE CLERGY RESERVES). The ambiguity of the term "Protestant clergy" admitted of a variety of interpretations. The Anglican clergy maintained that they alone were intended by the designation. The few clergy connected with the Established Presbyterian Church of Scotland contended that they had an equal right to it, and their claim was supported by eminent legal authority in England. The Methodists, in general, resisted such an appropriation of the public lands, but the British Wesleyans urged an acceptance of a portion of the "clergy reserves." This, for a time, created a division among them. Their resistance and the disruption of the Presbyterians hindered the carrying-out of the scheme. In 1836 the lieutenant-governor, Sir John Colborne, erected and endowed 44 rectories in Upper Canada. Futile endeavors were made to secure the lands for educational purposes. Acts to that effect were repeatedly passed by the House of Assembly and rejected by the Legislative Council. At last, in 1854, in the face of the protests of Bishop Strachan and other Anglican leaders, the act was passed by the legislature of Upper Canada, by which the lands were handed over to the municipal

corporations of the province for secular purposes, provision being made to satisfy the claims of existing incumbents. In lieu of these claims there was paid over to the Church of England the sum of \$1,103,405; to the Church of Scotland, \$509,739; to other Presbyterians, \$8,962; to the Wesleyan Methodists, \$39,074; and to the Roman Catholics in Upper Canada, \$83,731. The Anglican Church was thus delivered from what threatened to be its ruin, and the people of the Province released from a grievous injustice and a source of political discontent and strife.

The representatives of the Churches of England and Scotland, especially the former, had a certain status accorded to them, denied to other denominations. The Methodists were most unjustly charged with disloyalty, to which their connection, in origin and government, with the United States gave some color of plausibility. Until 1830 the Methodists and other dissenters had no right to hold land for places of worship or for the burial of their dead, nor had the Methodists and their ministers the right to solemnize matrimony, even among their own people. It was only after long and bitter controversy that laws were passed authorizing the various religious bodies to hold land for churches, parsonages, and burial grounds, and empowering their ministers to celebrate marriages. The struggle in the other provinces was less acute, but of a similar character. The Northwest was singularly free from these difficulties. The outcome of this controversy throughout Canada was the complete separation of Church and State, with the exception of the peculiar position held by the Roman Catholic Church in Quebec, secured by treaty and the terms of British occupancy of that province.

The Church and Education.—So long as France held Canada, education was entirely in the hands of the Roman Catholic Church. The Jesuits, Franciscans, and other orders laid the foundations of the colleges and seminaries which hold an important place in the education of Lower Canada. Thus the system of education was entirely ecclesiastical. Under British rule the attempt was made to establish free schools common to the whole population and unsectarian in character. This was found to be impracticable. With the union of the two provinces in 1841 separate schools had to be conceded to the Protestants in Lower Canada because the public school system was essentially Roman Catholic; and when, in the same year, the first attempt at a general system of public schools was made in Upper Canada, the Roman Catholics there secured the concession of separate schools, but in a very limited way. This, for many years, was a subject of controversy, political as well as religious, the Liberal party demanding the abolition of separate schools and the Roman Catholic authorities seeking the complete control of the education of their children. Finally, on confederation in 1867, the separate school system was bound upon the province of Ontario; although, as is noteworthy, there are more Roman Catholic children in the public schools of Ontario than in the separate schools. In the Maritime Provinces and in northwestern Canada there are no separate schools.

While public school education has been removed from the control of the churches (except in Quebec) the great body of the people

are anxious that it should not be divorced from the sanctions and influences of religion. In the Province of Ontario, the public schools are, with few exceptions, opened daily with prayer and the reading of the Scriptures. In not a few, the Bible is carefully taught. But much depends not only upon the character of the teachers, but also upon the disposition of the school trustees, to whom the law gives a large discretion in this matter. There is a strong feeling growing in the community at large and expressed by resolutions of the different church legislatures that there is urgent need of more ethical and Biblical teaching in the schools and that it is possible to secure it upon lines acceptable to the great majority of the people and with proper regard for the conscientious convictions of those who may differ from them.

Sectarian jealousies greatly hindered the development of higher education in all the older provinces. The struggle in Ontario occupied a very large place, both in the politics and the religious life of the province. The attempt to create a national university was for a long time prevented by the exclusive policy of the Anglican authorities, who used public funds for the establishment of King's College in 1843 (the charter was obtained in 1827) upon an exclusively Anglican basis. In 1849 King's College was secularized and became the University of Toronto, upon a broad undenominational basis, but not until the Church of Scotland, shut out from King's College, had established Queen's University, and the Methodists founded Victoria University, afterward federated with the University of Toronto. Other denominational colleges sprang into existence. After the secularization of King's College, Trinity University was established by Bishop Strachan, upon an exclusively Anglican basis. The leaders of the broader policy had been broad-minded Anglican laymen, and it was laymen of the same type who, in 1877, established Wycliffe College, federated with the University of Toronto and upon a distinctively evangelical or "Low Church" basis, as opposed to the High Church position of Trinity University. The latter has not realized the expectations of its founders, and now, in 1904, has abandoned its position of isolation and connected itself with the University of Toronto as a federated college. The result is that, in Ontario to-day, there are Church of England, Presbyterian, Methodist, and Roman Catholic colleges federated with the Provincial University; while, apart from it, there still stand the Presbyterian University of Queen's, the Baptist University of McMaster, and several Roman Catholic institutions. In Montreal, McGill is virtually a Protestant university, and has affiliated with it Presbyterian, Methodist, Congregational, and Anglican schools of theology. In Quebec, Laval University is a Roman Catholic institution and the oldest in Canada. In each of the provinces of Nova Scotia and New Brunswick a university was founded under the name of King's College and sustained by means of land and money from the public treasury, but upon an exclusively Anglican basis. The one in Fredericton was remodeled and became the University of New Brunswick, upon a broad, undenominational basis; the other, in Windsor, Nova Scotia, ceased to receive provincial support but remained an Anglican university and theological college. Dalhousie University, in Halifax, while unde-

CANADA — RELIGIOUS CONDITIONS

nominal, has not the status of a provincial university. The Presbyterians have a theological college in connection with Dalhousie. The Baptists have a university in Acadia, Nova Scotia; and the Methodists a university and theological college in Sackville, New Brunswick.

The Work of the Churches.—The Roman Catholic Church carries on a great variety of charitable work in asylums, houses of refuge, and reformatories. In the Province of Quebec all the provincial institutions are under Roman Catholic control. In the cities the Protestants have distinct institutions controlled by boards representative of the chief Protestant churches. In Ontario, the Roman Catholics are upon the same footing with Protestants in the provincial institutions. In many cities and towns the former have their own hospitals and reformatories, which receive provincial aid in proportion to the number of patients treated. This plan also prevails in the other provinces to a less extent. In other cases, special provision is made for Roman Catholic religious services in addition to the Protestant services.

The charitable work of the Roman Catholic Church is carried on by the various religious orders, many of which are specially devoted to the relief of the poor, the sick, and the fallen.

The work of home missions within the Dominion in connection with the different churches reaches out to every corner of the land, and to the Indians and Eskimos. Foreign missionary work is prosecuted with great vigor by all denominations. Among other good works of an undenominational character may be mentioned the Bible Society, the Religious Tract Society, the Evangelical Alliance, the Young Men's Christian Association, the great Christian movement organized by Mr. Mott among university students, the Young People's societies, such as the Christian Endeavor, the Epworth League, and the Saint Andrew's Brotherhood. The organization of women in the home and foreign missionary work of all the churches and in various other associations has greatly stimulated religious life and work. The reverent observance of the Lord's Day throughout Canada has been a marked feature in its religious life. Church attendance has, on the whole, been well maintained. The laws against Sunday excursions and other violations of the Sabbath rest are effectively enforced. The Lord's Day Alliance has the co-operation of the labor unions as well as of the churches in the protection of the Lord's Day. The Protestant churches in Canada exercise a very strong influence upon legislation, education, and the press. While not unaffected by modern controversy, their attitude generally has been, on the whole, conservative, while the general tone is more liberal and less aggressive than in the past.

Many old prejudices have passed away. A noteworthy illustration of this is furnished in the public worship of the Presbyterian Church, one section of which refused to use anything except the metrical version of the Psalms, regarding even the use of the paraphrases as a serious and hurtful innovation. Now all are united in the use of a hymn book which contains hymns of all sections of the Church of Christ. In many cases the worship has become

more liturgical even in non-liturgical churches. Old controversies have passed into oblivion. Greater liberty both in action and in thought is found in all communions.

It is more than possible that with this enlargement and liberty, there has been a corresponding diminution in the intensity of the religious spirit and a growing laxity within the churches which many regard with apprehension. Family worship is not observed as it once was, the children are not as familiar with the Scriptures as were their parents, and many things are tolerated in professedly Christian families which would a generation ago have been rigidly excluded. It is a time of unrest and transition. But in the midst of much change, the churches in the main hold firmly to the fundamentals of the Christian faith, and in all are found devoted men and women who earnestly follow after the ideals of truth, purity, and righteousness.

Among the Anglicans, while the Oxford or Tractarian movement has exercised considerable influence, especially among the clergy, it has seldom reached the extremes seen in England. The majority of the laity have only been slightly affected by it, and they have continued decidedly Protestant. The Presbyterians have exercised a strong influence upon the national ideals of righteousness, and have set a high standard in the education of the ministry. The Methodists have been leaders in Christian liberality and in benevolent enterprises. The Baptists and Congregationalists have borne consistent testimony to the supremacy of the individual conscience and the independence of the Church from state control. Thus each denomination has contributed essential elements to the general religious well-being of Canada, each has in its own sphere accomplished a good work and manifested distinctive excellences, the value of which is coming, more and more, to be recognized by all.

Church Unity.—The general tendency among the Protestant denominations has been toward the unifying of the Christian churches, and this appears the more remarkable when the present religious condition is compared with that of 100 or even 50 years ago, with its polemics and antagonisms. There has been a breaking down of barriers and a marked diminution of the jealousies and rivalries of the past. The old sectarian spirit has, to a large extent, disappeared and a cordial spirit of good-will has manifested itself even in those bodies which special privileges or exclusive theories had tended to separate from others. This is seen in the increasing co-operation in good works, in the frequent inter-denominational comity, and in the general attitude of the churches toward each other. It is remarkably manifested, as we have seen, in the changed attitude of most of the churches in regard to higher education. Federation of denominational colleges in a common state university has been accepted by many who were once strenuously opposed to it, as the best solution of our educational problems. In the three chief Protestant churches of Canada, the Methodist, the Presbyterian, and the Anglican (they are named in the order of their numerical strength), which are each now a unit throughout the Dominion, the tendency is toward a still larger union. Negotiations are at the present time (1904) in progress, looking toward the union of the Methodist, the Presbyterian, and the

CANADA — MILITARY EQUIPMENT

Congregational churches in Canada, and there is a reasonable possibility of some substantial result flowing from them. The very fact of the consideration of such proposals by the different bodies concerned is a striking proof of the strong tendency that exists toward the unification of the Protestant churches of Canada.

JAMES P. SHERATON, D.D., LL.D.,
Principal of Wycliffe College, Toronto.

25. Canada—The Roman Catholic Church. See ROMAN CATHOLIC CHURCH IN CANADA.

26. Canada — Military Equipment. The military defense of Canada, so far at least as a resident garrison is concerned, is entrusted entirely to Canadian troops, with but two exceptions, to-wit, the Imperial forces stationed at Halifax and Esquimault, and the reason for their employment in the Dominion is found in the fact that these two ports are important British naval bases, and as such of joint importance to Canada and the motherland. In both stations the resident militia drill each year with the British regulars, so that they may form a well-trained auxiliary force to the latter if attacked. In the case of Esquimault the Canadian government bears one half the annual expenditure for maintenance, under an arrangement with the home government. Up to this date, 30 June 1904, the end of the Canadian fiscal year, there has been practically no naval defensive force in the Dominion, the strength of the country in this respect being confined to a small number of fishery protective service and customs craft, for while the old Militia Act made certain provisions for a naval service, nothing had been done to convert the paper force into an actuality. The government of the day, however, has decided entirely to separate the land and naval militia hereafter, and a bill will shortly be introduced by the Minister of Marine and Fisheries which will be the starting point for a real defensive force operating upon Canadian waters. With regard to the land forces a very important bill has been introduced, and will this session become law; we cannot do better than deal with some of its provisions to show the present legal status of the Canadian army, and the liability of citizens to service therein.

The command in chief is vested in the king, and will continue to be exercised by His Majesty, or by the governor-general as his representative. The actual military command, however, may be given to an officer who shall hold rank not below that of a colonel in the militia or in His Majesty's regular army, subject to the regulations and under the direction of the minister of militia. Here we find a change in the law which opens the door to the highest command for officers of the Canadian militia; formerly only officers of the regular army were eligible. The new bill also gives power to appoint an inspector-general, to be charged with the general inspection of all the military forces in the country. We thus have a continuation of the old power to appoint a general officer commanding, and with it a new power as to an inspecting general, in the latter case following the recent change in army administration in Great Britain.

The general supervision and administration of the military affairs of the country is entrusted to the Minister of Militia and Defense, who must be a member of Parliament, and responsible to

that body. Power is taken in the new act to appoint a militia council to advise him in this once again following British precedent in the establishment of an army council there. This body will consist of four military and three civil members, including the Minister, who will be chairman, and will sit at the capital for the transaction of business.

All the male inhabitants of Canada from 18 to 60 years of age, the former only inclusive, are liable to military service. To this general rule there are some few exceptions, for example, judges, clergymen, professors in colleges, policemen and firemen in permanent employ as such, etc. The exempted classes would not muster more than a few thousand men in all, so this provision practically gives the males of 6,000,000 people as a supply to the militia. More than this—in cases of great emergency a *Levee en Masse* may be ordered, when all male inhabitants capable of bearing arms can be called out. Those ordinarily liable to service are divided into four classes. (1) Those 18 years of age to 30, unmarried, or widowers without children; (2) 30 years of age to 45, unmarried, or widowers without children; (3) 18 to 45 who are married, or widowers with children; (4) 45 and upward but under 60. It is in this order the male population may be summoned to the colors.

The active militia of Canada, by which is meant those actually equipped and enrolled, consists of about 42,000 men. Of these a little more than 1,000 constitute a permanent force, the main duty of which is to provide instructors for the balance of the militia in the different arms of the service at a number of schools located in various parts of Canada. On account of the rapid growth of population, especially in the West, this permanent portion of the militia is soon to be doubled in strength, the government having given formal notice of its intention in this regard. The non-permanent portion of the active militia may be called out each year for drill, for a period not exceeding 30 days; as a matter of fact, the usual annual term of instruction is 12 days. A new establishment for the militia has recently been authorized. Under this scheme the peace establishment will be greatly increased, as far as the number of officers and non-commissioned officers is concerned, and while the total number to be drilled annually will still be under 50,000 men, provision will be made to increase that number at short notice to a war strength of 100,000, as a first line of defense, with a second line of equal strength organized on paper for a somewhat slower mobilization. The increase in the peace strength of officers and non-commissioned officers above referred to will be sufficient for the war strength of the first line, with enough in excess to form the basis of the second line. In connection with this point we may state that the militia may be sent on active service "anywhere in Canada and also beyond Canada for the defense thereof," and when in time of war the "militia is called out for active service to serve conjointly with His Majesty's regular forces, His Majesty may place in command thereof a senior general officer of his regular army."

Since the conclusion of the South African war the government has been actively promoting rifle shooting throughout Canada. Rifle clubs are formed under government regulation, the members enrolling therein doing so on the

CANADA — THE ACADIAN REFUGEES

condition that in "case of emergency" they shall at once become members of the active militia. At present the membership in these clubs has passed the 20,000 mark. They are steadily growing in numbers, and as suitable locations for ranges are found these are provided. The government supplies a limited number of rifles to each club, with a fair proportion of free ammunition. It is confidently expected that in a few years these clubs will have a sufficient membership to fill the active militia to war strength.

For a similar purpose, that is, to serve as a feeder to the militia proper, the formation of cadet corps in the schools is being vigorously fostered. The boys in these organizations are given the rudiments of drill, and are instructed as far as possible in rifle shooting, miniature ranges being employed for this purpose. This movement, like that of the rifle clubs, is steadily growing. Since matters of education are under the control of the Provincial governments, the work can be carried on only with their assistance and consent; so far they have very willingly co-operated with the Dominion government. The supply of modern rifles at present in Canada is barely sufficient to arm the militia on a peace footing. To provide for the expansion of war time the government has entered into contracts for the purchase of more arms, and has even succeeded in inducing British capitalists to establish a rifle factory at the city of Quebec. This manufactory has a capacity of 12,000 rifles a year, or double that number if working night and day. Already the first of these weapons are being turned out; they are proving satisfactory. To meet the increased demand for ammunition consequent upon the extension of rifle shooting, and to provide a supply in case of war, the Dominion arsenal has been largely extended, its capacity now being six-fold what it was three or four years ago.

With a rural population very large in proportion to the whole, and chiefly engaged in farming pursuits, Canada has perhaps the best supply of material for mounted troops that can be found in any country containing an approximate number of inhabitants. Knowing this, and recognizing that numbers can, so to speak, be multiplied by speed, the government has recently converted several infantry regiments into mounted corps, and in the formation of new bodies this principle will not be lost sight of.

With the large demands which a new and expanding country always makes upon a national treasury for public works and the increase of transportation facilities, it is impossible to spend large sums upon military development. This being the case, the question arises as to how best to spend the moneys available for defense purposes. It has been felt that the solution is in establishing and perfecting, as far as possible, those more technical and scientific branches which it would be absolutely impossible rapidly to improvise. As a consequence, much attention has been devoted of recent years to the establishment of the subsidiary services. To this end the engineer corps have been increased in number and perfected in equipment, and an establishment thereof added to the permanent force. An excellent army medical corps has been created; schools of signaling are now in course of preparation; an army service corps is in being and well under way; an intelligence branch, with a thoroughly organized corps of

guides, is on the establishment; an ordnance corps has displaced the civil administration of the stores department, and a school of musketry, modeled upon the British institution at Hythe, is doing excellent and rapidly increasing service.

For complete professional training the Royal Military College at Kingston, founded in 1876, has proved of immense usefulness. While this seat of military learning is used chiefly for the instruction of cadets, long courses are also held in connection with it for officers of the militia who desire to perfect themselves in a technical knowledge of their work. Officers of the permanent force in its various branches are sent to England for courses there which the limited military resources of Canada would make it impossible to obtain in the latter country.

In conclusion, we may summarize by saying that the last decade has witnessed a very marked advance in the strength and technical training of Canada's military forces, while everything seems to point to a still further and constant improvement in the future, since the national revenues are increasing by leaps and bounds and the spirit of the people demands that a fair proportion shall be devoted to insure the safety of the country.

ANDREW T. THOMPSON, M.P.,
Lieut.-Col. Canadian Militia.

27. Canada — The Acadian Refugees. After the conquest of Acadia in 1710 — the first and only fruit of Samuel Vetch's grand design for the conquest of Canada, — the Treaty of Utrecht (see *UTRECHT, PEACE OF*) provided for the free exercise of the Roman Catholic religion by such of the French inhabitants as were willing to remain there, but also stipulated that any who should choose might remove within a year. Nearly all remained; but, under various excuses, in the hope of a return of French power, they postponed taking the oath of allegiance to the British crown until 1730. In 1745 war broke out again, and in 1749 the founding of Halifax (q.v.) by several thousand British emigrants excited the jealousy of the officials of Canada and priests of Acadia. The people were a simple and densely illiterate peasantry, taught to obey their missionaries in everything. These missionaries were chosen and directed by the bishop of Quebec and the governor of Canada as agents of French policy, and hence a very difficult position existed, both for the English and for the Acadians. Through the promptings of the fanatical Abbé Louis Joseph Le Loutre (q.v.), and the duplicity of Governor La Jonquière of Canada and the court of France, the Indians were encouraged to murder English settlers and commit other outrages, some of the Acadians even taking part in these crimes. These charges are proved by the citations from French secret documents given in Parkman's 'Montcalm and Wolfe'; and have not been effectively answered. Le Loutre, who was vicar-general of Acadia and missionary to the Micmacs, even paid 100 livres each for English scalps in time of peace; and the money was reimbursed to him by the intendant of Louisbourg. He held constant threats of Micmac massacre over the Acadians themselves, compelling them to acts antagonistic to the English, and moving many of them from their farms and possessions to suit his plans. Yet his inhumanities were evidently justified in his own warped heart and intellect

CANADA — THE ACADIAN REFUGEES

as services to his Church and country. The people, as a whole, would have been quite content to live in peace, being very well treated. In 1751, La Jonquière issued a proclamation commanding all Acadians to enroll themselves in the French militia. A claim was put forward that only a small part of the province was "Acadia," as ceded to the British under the Treaty of Utrecht, and consequently that all the rest was still under the rule of the French. The latter now conceived the definite design of reconquering the province; but the English, obtaining exact information through the spy Pichon, struck first by capturing Fort Beauséjour, on the neck of the Acadian peninsula, on 16 June 1755. Fort Gaspereau, 12 miles distant, then surrendered, and the French fort at Saint John being burnt and abandoned on the approach of an English force, the whole country was left under British control. This entire plan of re-establishment was due to the forethought of Governor Lawrence, aided with due vigor by Governor Shirley (see SHIRLEY, WILLIAM) of Massachusetts.

The chief interest in the Acadians will always, however, be centered in the incidents of the famous dispersion, which were now about to begin. The projected French invasion had aroused the apprehension of the small British population and authorities, an apprehension deepened by the Indian outrages of Le Loutre and the fear of the neighboring stronghold of Louisbourg. The whole of the Acadians also persistently refused the oath of allegiance. In this state of affairs, which not only seemed a great danger but appeared to imply a great ingratitude, after the mild treatment and privileges of property and religion so long extended to them, it was determined by Governor Lawrence that the only safety lay in removing the Acadian population and replacing them by New Englanders. That view had been held for some time by Governor Shirley of Massachusetts and others. Lawrence had complained bitterly to the Lords of Trade before the capture of the French forts "that this lenity has had so little effect, and that they still hold the same conduct, furnishing them [the French] with labor, provisions, and intelligence, and concealing their designs from us." On the capture of Beauséjour, Lawrence exacted an unqualified oath of allegiance from the Acadians; and in response two successive deputations came to Halifax, representing together nine tenths of their entire population. Both absolutely refused to take the simple pledge of fidelity and allegiance to the British sovereign. The governor and council therefore resolved that it was necessary to deport their people, and in order that they should not strengthen the enemy, they were to be distributed among the English colonies. Lawrence now ordered Colonels Moncton and Winslow and Major Handfield,—at Beauséjour, Basin of Minas, and Annapolis, respectively,—to seize the inhabitants, and if necessary to burn their houses. The principal scenes of the expulsion took place under Winslow at Grand Pré and Fort Edward, in the Basin of Minas, just after completion of the harvest at those fair and populous settlements. At Grand Pré all the males over 10 were ordered to the parish church, where Winslow read them the order of removal and detained them as prisoners. They were kept several weeks before deportation, and the

year was nearly ended before all were gone. Tragic scenes of lamentation and distress accompanied the leaving, although it was carried out as humanely as possible. The whole number removed from the province is usually stated as a little over six thousand, although Richard and others place the figures much higher. Some took refuge in the forests or fled to the French territories. Lawrence sent the ships deporting them to the different colonies from Massachusetts to Georgia, where they became a charge on the people and their gradual departure was connived at. Many in the South eventually reached the French settlements of Louisiana, where their descendants are still found in certain parishes and were estimated at 40,000 a few years ago. The sorrows of the dispersion were great, and the death rate considerable. It is regrettable that those who reached Canada and the French West Indies suffered perhaps the most terrible miseries of all from neglect and ill-treatment. Most of the refugees at length found their way back to Nova Scotia and were progenitors of the greater part of the present French population. Their woful story was told in an idealized form in the pages of Haliburton, from whom, passing through a medium of feminine sentimentality in the pages of a lady writer, it reached Longfellow and was immortalized in his 'Evangeline.' The unhappy facts were afterward the subject of heated recriminations, especially by French writers such as Abbé Casgrain and Rameau, against the New Englanders, whose leading defenders are Parkman and Hanney. Edouard Richard in his 'Acadia' ascribes all to Lawrence personally. The dispassionate view would seem to lie in fair allowances for the difficult situation and training of the actors on both sides. In this light the Acadian population must be remembered as a densely ignorant people. Without some education, the measure of natural shrewdness they possessed could not be expected to clear up for most of them the moral problems connected with allegiance to the British crown, and the political problem of the ownership of Acadia as it was represented to them. Most of them were undoubtedly trying to be loyal to France and ready to return the country into its possession, and duplicity did not seem to them improper. This is not only deducible from all the events but plainly set forth in the petition of 3,500 Miramichi refugees to Governor de Vaudreuil in 1756.

For the Indian atrocities, to which some of them gave support, we cannot hold the people as a whole responsible. In view of these considerations the Acadian people must be regarded as unfortunate and misled, and their condition as a conquered people, torn from their compatriots and coreligionists by the fortune of war, as they hoped only temporarily, must be considered. As in the case of ignorant populations generally, it is chiefly their leaders and advisers—Le Loutre, Jonquière, and the bishop of Quebec—who must be held responsible. Regarding Le Loutre, although his character of the peculiarly savage and relentless fanatic led him into acts which place him among the class of murderous criminals, his guiding motives appear to have been a distorted patriotism and allegiance to his religion. These are in a different class from the mean duplicities and false quibbles of La Jonquière and the French ministry, who were well aware both of the untruth

of their pretensions concerning the extent of Acadia, and of the dangerous position in which they were placing the Acadian people. When we examine the motives of the British side, we have to deal with practically only Lawrence and his council at Halifax. A state of war existed, and in their judgment desperate measures were necessary for the safety of the little British colony. The British settlers were greatly outnumbered and held but a small part of the country. Le Loutre and the French authorities were pursuing a treacherous course of savage murder against them, with Acadian participation. The entire people absolutely refused to take a simple oath of allegiance, although repeatedly and plainly warned of the consequence. In Lawrence's judgment no other course than deportation then seemed safe; and although a harsh measure, like its modern analogue, Reconcentration, it proved effectual in removing all doubt respecting the security of the colony. Harsh and drastic as his measures were, he is entitled to be judged, in part at least, as a military man bound to perform a duty; and his freedom of discretion at a difficult juncture must be respected even if it may have been badly used. On the side of France, two instances of a similar deportation policy are cited in defense—the proposal of Governor de Callières, endorsed by the French king in 1689, to seize the Province of New York and deport all the Protestant population (Doc. Hist. N. Y., Vol. I., pp. 285–297); and the actual deportation of the English settlers from the Island of St. Kitts in 1666, to the number of 2,500, an occurrence marked by the striking of a medal by Louis XIV., inscribed "Ang. Ex Insula St. Christoph. Exturbat."

28. Canada — The Quebec Act. From the capitulation of Montreal in 1760 down to the ratification of the Treaty of Paris in 1763 Canada was without any form of civil government, the affairs of the colony being administered by the officer in command of the British armies of occupation. But with the conclusion of peace and the definite cession of the colony to the British Crown this tentative arrangement came to an end and in the autumn of 1763 a royal proclamation decreed the establishment of a civil government in the newly-acquired colony, promising that as soon as circumstances would permit, representative assemblies would be convened. In the meantime the laws of England were to be in force. In virtue of this arrangement General James Murray (q.v.) was appointed to the gov-

ernorship of the colony and a council of eight members was nominated to assist him in the work of administration. For the time being, justice continued to be administered by the military courts at Quebec, Three Rivers and Montreal but in September 1764 a proclamation was issued by the Governor-in-Council establishing a court of King's Bench for the trial of all causes, both civil and criminal, agreeably to the laws of England which the royal proclamation of the preceding year had declared to be in force. At the same time a court of Common Pleas was established for the trial of actions which had arisen before the publication of the proclamation of 1763 and in regard to which the old French law had to be applied.

The immediate result of this change was to inaugurate a régime of utter judicial chaos, for the new judges were completely at a loss to apply the principles of English common law to the causes which came before them, especially where questions of real property were concerned. Accordingly, the Governor-in-Council during the month of November 1764 issued a further proclamation declaring that "in all actions relative to the tenure of land or the rights of inheritance, the French laws and usages shall be observed as the rule of decision." But in all other civil cases and in all criminal cases the common law of England was to be applied. This change improved matters but slightly for the new English judges were slow to master the intricacies of French law and applied it very imperfectly where they endeavored to make it apply. To the application of the English criminal law the French inhabitants of the province made no great objection, although for the time being many of them failed to take kindly to the institution of trial by jury; but there was a widespread demand for the extension of French law to all civil causes. Complaints were likewise made that the judicial officers of the colony were for the most part ignorant of the French language; that they were often dishonest and that the legal fees charged the inhabitants were exorbitant. For all of these complaints there seems to have been considerable foundation and in fact the law officers of the Crown in England reported a recommendation that the French language should be restored in judicial proceedings and that the old French law should be extended to all civil cases.

Matters rested as they were until the appointment of General Sir Guy Carleton (q.v.) to the post of Governor in 1767. The new Governor was not long in grasping the situation and in deciding that the restoration of the whole fabric of French civil law would be advisable. To this end he had the *coutume de Paris* of the old régime carefully re-edited by several colonial jurists of acknowledged ability and the revised text at once became the acknowledged source of law in all cases of land tenure and inheritance. Carleton pressed his proposal on the home authorities and in 1770 went to England to urge its adoption. There he managed to secure the appointment of a commission to examine into the merits of the whole matter and the report of this body, although it was not presented until the closing days of 1772, was on the whole in favor of the Governor's recommendation. In the meantime, however, there was a growing demand among the British inhabitants of the colony for the establishment of a

representative assembly in accordance with the promise made in the proclamation of 1703. At meetings of the British inhabitants resolutions calling upon the Home authorities to take steps in this direction were passed and forwarded to England. But to the adoption of such a step there was grave difficulty, namely, the decision of the question as to whether Roman Catholics would be permitted to sit in the new Assembly. The disabilities of Roman Catholics had not been removed in England at this time and it was hardly to be expected that Parliament would extend to Roman Catholics in a colony privileges which it denied them at home. On the other hand, an assembly from which Roman Catholics were excluded would be very far from representative in a colony where nine-tenths or more of the population professed that religion. This difficulty, together with the fact that the position assumed by the representative assemblies in the British colonies on the Atlantic seaboard at this time was not calculated to inspire the Home authorities with a favorable regard for popular colonial representation, seems to have determined the Ministry in its decision that Canada, for the time being, should not be trusted with an assembly representing the people. On some other points, however, the home authorities evinced a desire to meet the wishes of the colonists.

On 2 May 1774 a bill, popularly known as the Quebec Bill, was introduced into the House of Lords where it passed with little opposition. In the House of Commons the measure was vigorously opposed by a strong minority, but with some amendments was eventually passed, and towards the end of June received the royal assent. By the provisions of the Act the boundaries of the Province of Quebec were extended to include all ancient Canada, including Labrador, and all the territory lying north of the Ohio and west of the Mississippi. Roman Catholics were released from all penal restrictions; the obligation of the tithe was reimposed in favor of the Church, and all classes, with the exception of the religious orders were confirmed in the full enjoyment of their proprietary rights. French law was hereafter to be applied in *all* civil cases while the law of England was retained for the decision of all criminal causes. Both, however, might be modified by ordinances of the Governor and Legislative Council. Inasmuch as it was "inexpedient to call an Assembly" the Act provided for the establishment of a Legislative Council to consist of not less than 17 nor more than 23 members nominated by the Crown. To this body in conjunction with the Governor was given a limited power of internal administration including the right to levy internal and local taxes. But Parliament expressly reserved to itself the right of external taxation and every ordinance passed by the Council was to be transmitted to England where it might be disallowed if the home authorities deemed advisable.

In the New England colonies the passage of the Quebec Act was bitterly resented, partly because of the privileges which it granted a French and Roman Catholic population but more especially because it placed under the almost complete control of the British authorities the vast expanse of territory west of the Alleghanies in the conquest of which the seaboard colonies had borne a heavy share. In Quebec the French inhabitants, while many regretted that provision

had not been made for the establishment of a popular assembly open to Roman Catholics, for the most part welcomed the substantial concessions which the Act conveyed. There is little doubt that these concessions served in some measure to assure the British authorities of at least their neutrality during the turbulent days of the next few years. The British inhabitants of the province, on the other hand, were naturally disappointed but the course of events during the next half-decade was such as to preclude any important manifestation of their feelings. Under the provisions of the Quebec Act the administration of the province was carried on for the ensuing 17 years.

29. Canada — The Ashburton Treaty. The Ashburton Treaty (also called Treaty of Washington), a treaty between the United States and Great Britain, signed 9 Aug. 1842, is chiefly important for its settlement of the Northeastern boundary question. The boundary between Massachusetts (subsequently Maine) and British North America had been in dispute since 1783. The treaty of that year (Art. 2) had made the following provision: "And that all disputes which might arise in future on the subject of the boundaries of the said United States may be prevented, it is hereby agreed and declared, that the following are and shall be their boundaries, namely, from the northwest angle of Nova Scotia, namely, that angle which is formed by a line drawn due north from the source of the Saint Croix River, to the Highlands; along the said Highlands which divide those rivers that empty themselves into the river Saint Lawrence from those which fall into the Atlantic Ocean, to the northwesternmost head of the Connecticut River; east, by a line to be drawn along the middle of the river Saint Croix, from its mouth in the Bay of Fundy to its source, and from its source directly north to the aforesaid Highlands which divide the rivers that fall into the Atlantic Ocean from those which fall into the river Saint Lawrence." The article was doubtless drawn in good faith, but owing to the imperfect knowledge of the geography of the territory concerned, its meaning was soon involved in doubt. The identity of the river Saint Croix, the location of the Highlands referred to, and the ownership of the Passamaquoddy Islands became matters of dispute. The identity of the Saint Croix was settled by a commission in 1798, appointed under the Treaty of 1794. Under the Treaty of Ghent (see GHENT, TREATY OF) (1814) a commission was appointed which settled the Passamaquoddy question by compromise (1817). But the demarcation of the inland boundary seemed long impossible of solution. The American claim located the "northwest angle" at the point where the line due north from the source of the Saint Croix met the Highlands between the rivers flowing into the Saint Lawrence and those flowing into

the Atlantic; this established the angle in question "at a place about 144 miles due north from the source of the River Saint Croix, and about 66 miles north of the River Saint John" (United States commissioner, 4 Oct. 1821). The extreme British claim (at any rate after 1814) placed the angle "at or near the mountain or hill called Mars Hill, distant about 40 miles on a due north line from the source of the River Saint Croix, and about 37 miles south of the River Saint John" (note of British commissioner 4 Oct. 1821). In each case the boundary proceeded westward and southward along the Highlands to the head-waters of the Connecticut. Between the two there thus lay a disputed territory of 12,000 square miles. After fruitless negotiations a convention of 27 Sept. 1827 referred the boundary to the arbitration of the king of the Netherlands. His award, however, in 1831 was rejected by the United States.

Meantime the district of Maine had become (1820) a State, and was eager in the defence of its claim to the disputed region. The progress of settlement naturally led to conflict and disturbance on the border line, known as the "Aroostook War." By the year 1840 matters had reached an apparent deadlock in which the adoption of a conventional line seemed the only solution. In addition to the northeastern boundary, various other matters of controversy were outstanding between the two nations. The English claim of a "right of search" for the suppression of the slave trade created a standing difficulty. The destruction of the *Caroline* (q.v.), an American vessel, by a party of Canadians during the revolt of 1837 had led to a demand for redress. The British government had met this claim by asserting that the destruction of the vessel was a legitimate act of war, the *Caroline* having carried supplies for the insurgents. A Captain McLeod, a Canadian, accused of participation in the affair, was arrested and brought to trial in New York; in all probability nothing but his acquittal prevented actual hostilities. A further complication had arisen in the case of the *Creole*, a slave ship on which the negroes had revolted (1841), and which they had carried to a British port in the West Indies, where they were allowed to go unmolested. There was also in question the boundary of Oregon. To settle these various points at issue, Lord Ashburton (see ASHBURTON, ALEXANDER BARING, LORD) was sent to Washington (April 1842) and in conjunction with Daniel Webster, secretary of state, arranged the treaty commonly known by his name. Ashburton, formerly Mr. Alexander Baring, a prominent financier, and for nearly 20 years a member of the House of Commons, had previously resided in America, where he married a daughter of Senator Bingham. His known desire for a good understanding between Britain and America rendered his relations at Washington most cordial. He was widely entertained, and is said to have "spread a social charm over Washington, and filled everybody with friendly feelings toward England." With Webster his relations were especially amicable, and their negotiations assumed an altogether informal character. (See Schouler, 'History of the United States,' Vol. IV., ch. xvii.) To this fact has been partly due the impression ever since prevalent in Canada that the inter-

ests of that country were sacrificed to the expansiveness of Lord Ashburton's feelings. Under the terms of the treaty, the northeast boundary was settled thus (Art. I.): "It is hereby agreed and declared that the line of boundary shall be as follows: Beginning at the monument at the source of the River Saint Croix, as designated and agreed to by the commissioners under the fifth article of the treaty of 1794, between the governments of Great Britain and the United States; thence north, following the exploring line run and marked by the surveyors of the two governments in the years 1817 and 1818, under the fifth article of the Treaty of Ghent, to its intersection with the River Saint John, and to the middle of the channel thereof; thence up the middle of the main channel of the said River Saint John into the mouth of the River Saint Francis; thence up the middle of the channel of the said River Saint Francis, and of the lakes through which it flows, to the outlet of the Lake Pohenagamoock; thence southwesterly in a straight line to a point on the northwest branch of the River Saint John." This locates the main part of the boundary; for details of the further extension of the line, the text of the treaty may be consulted ('Treaties and Conventions,' Washington 1889; 'Annual Register,' 1842). The treaty provided further for the survey and permanent marking of the boundary, which was completed in 1847. Of the disputed territory the United States received about seven twelfths and Canada five twelfths. Rouse's Point, on Lake Champlain, was also declared to belong to the United States, the government of that country binding itself to pay to Maine and Massachusetts \$300,000 on account of the relinquished territory. The right to carry timber down the Saint John River was granted to the United States. By Article 8 of the treaty, it was agreed that each country should maintain on the coast of Africa a sufficient naval force, carrying not less than 80 guns for the purpose of enforcing, separately and respectively, the laws, rights, and obligations of each contracting party for the suppression of the slave trade. The treaty passed over the *Caroline* and *Creole* cases (see CREOLE CASE), but declared (Art. 10) that "each party, on requisition from the other, shall deliver up to justice persons charged with murder, assault with intent to murder, piracy, arson, robbery or forgery, upon sufficient proof of their criminality." The question of the Oregon boundary was also omitted.

The boundary award of the treaty met with great dissatisfaction in Canada. It was currently believed, and the belief largely persists, that the interests of Canada had been unduly sacrificed. The Canadian view of the case is presented in Dent's 'Last Forty Years of Canada' (1881), and in more extreme form in Coffin's 'Quirks of Diplomacy' (1874). The supposed sacrifice of Canada by Lord Ashburton has become a commonplace of Canadian political discussion. Later investigation, however, is strongly in favor of the American claim. The whole subject of the boundary has recently been exhaustively treated in an admirable paper by Dr. William Ganong of Smith College ('Proceedings of the Royal Society of Canada,' 2d series, Vol. VII., 1901). Dr. Ganong, though a Canadian, decides that Maine was right and New Brunswick wrong in the

CANADA—THE CLERGY RESERVES

northwest angle controversy. He bases his decision on the text of the treaty of 1783, on the maps of the time, on the admissions of Governor Carleton and others, and on a petition of the New Brunswick legislature of 1814, virtually admitting the American claim. The Mars Hill boundary line was not advanced, he says, until 1814. In the controversial discussions of the treaty the episode of the "red line" map has played a considerable part (see 'North American Review,' April 1843, and Winsor's 'America,' VII. 180). This was a map found in the French archives and supposed to have been given to Vergennes by Franklin in connection with the treaty of 1783. A boundary line favoring the English claim was marked upon it in red ink. A copy of this map was in Webster's possession during the negotiations but was not shown by him to Lord Ashburton. It was shown by him to the Maine commissioners; played some part in securing their assent to the Ashburton Treaty." But it is not proved that the marking of the map was by Franklin, and it is also possible that it was wrongly marked with intent to deceive (see Hinks, 'Boundaries Formerly in Dispute,' 1885). To offset this map, the original of which has disappeared, there is still in the British Museum an English map favoring the American claim. See also UNITED STATES—DIPLOMACY 1815-61; TREATIES OF THE UNITED STATES WITH FOREIGN NATIONS.

30. **Canada—The Clergy Reserves.** The clergy reserves were lands set apart, by virtue of the constitutional act of 1791, for the maintenance of the Protestant clergy in Upper and Lower Canada. The intention of the act was to reproduce in the colony an episcopal establishment similar to that of Great Britain, to whose primate it was to be subordinate. The provincial governors were directed under the act to reserve one seventh of the land for the support of the Protestant clergy. The reserved blocks of land were to be distributed among those granted to settlers. In Upper Canada a full seventh of all the land was to be granted. In Lower Canada reserves were to be made only in proportion to new settlement and not in respect of lands already occupied. No reservations were made in the latter province until 1796. Reservations were made each year until 1838 (except in 1813). The total reservations made in Lower Canada amounted to over 930,000 acres: in the Upper Province to about 2,400,000 acres. The crown was also empowered to authorize the lieutenant-governor of each province from time to time to erect parsonages, to endow them with a portion of the reserve lands and to present incumbents to them (constitutional act, Secs. 38, 39, 40). The operation of the system thus established was not at first felt as a serious grievance. Land being still plentiful, the reservations remained unsold and were leased at extremely low rentals (10 shillings for 200 acres during first seven years). With the progress of settlement however the rentals constantly rose. The question of the clergy reserves became a subject of increasing complaint. The members of the Church of England were in a decided minority, not only in the Lower Province, but in Upper Canada itself. The ques-

tion early arose whether the wording of the act,—"allotment and appropriation of lands for the support of a Protestant clergy"—could not be construed in favor of the Presbyterian and Dissenting denominations. The matter being referred to the home government, the law officers of the crown decided (November 1819) that the Scotch Church had a claim for a share of the rentals, but that no other denominations had a claim at all. The irritation thus caused rendered the question one of acute difficulty during the succeeding thirty years, and has been designated by Dr. Bryce, the Canadian historian, the "Thirty Years' Religious War in Upper Canada." The distribution of the population of Upper Canada among the different denominations in 1839 was as follows: Church of England, 79,754; Methodists, 61,088; Presbyterians, 78,383; Roman Catholics, 43,029; Baptists, 12,968; others, 57,572. The claims of the Church of England were stoutly upheld by the Rev. John Strachan, subsequently Bishop of Toronto (1839). Egerton Ryerson (see RYERSON, A. E.), a young Methodist minister, strove with equal zeal on behalf of the Methodist Church.

In 1827 the assembly of Upper Canada asked the crown to devote the reserves to the creation of schools and of churches of all denominations. The same request was repeated in each of the three following years with considerable popular agitation. Meantime the endowment of rectories as provided by the act of 1791, was authorized by instructions from the crown in 1825. The excited state of public feeling delayed for some years the execution of this project, but in 1836, 54 rectories were endowed with 400 acres each. The discontent thus caused helped to precipitate the rebellion of 1837. With the suppression of that movement the question of the clergy reserves still earnestly demanded solution. An act of the legislature of Upper Canada in 1839, proposing to re-invest the reserves in the crown, was disallowed by the home government. In the following year the legislature passed an act for the sale of the reserves, one half of the proceeds to go to the Churches of England and Scotland, and the other to be divided among the other religious denominations. This again was abortive, the British judges, on question by the House of Lords, deciding that the provincial legislature had exceeded its authority. The Imperial Parliament now intervened and passed an act (7 Aug. 1840) for the settlement of the question. Part of the reserves had already been sold by authority of a statute of 1827. The proceeds of these sales were to be divided between the Churches of England and Scotland, the former receiving two thirds: the unappropriated lands (1,800,000 acres) were to be sold, and the amount realized to be invested, one half of the interest being given to the two above churches, in the proportion already mentioned, the other half to be applied by the governor and executive council for public worship and religious instruction. The income thus accruing was divided in the ensuing years among the churches of England and Scotland, the Wesleyan Methodist, Roman Catholic and Synod Presbyterian churches and the United Synod Presbytery. The question was still far from settled. It was claimed that the lands were sold by the crown at insufficient prices, and Bishop Strachan led an agitation for the sharing up of the lands themselves. The assembly refused to petition the

crown to this effect, but demanded the repeal of the act of 1840. The Imperial Parliament complied by a statute of 1853, which placed the reserves in the control of the Provincial Parliament (the two Canadas being now united). The Canadian Parliament elected in 1854 strongly reflected the general public feeling in favor of secularization. A statute to that effect was passed. A lump sum of £188,342 was paid to the Church of England, representing the guarantee of stipends then charged on the reserve fund, called for by the imperial act. The reserved lands were sold and the proceeds given to the municipal authorities for education and local improvements. Consult: Lindsay, 'The Clergy Reserves' (1851); 'Memoir of Bishop Strachan' (1870); Ryerson, 'Story of My Life' (1883).

STEPHEN LEACOCK,

Lecturer in Political Science, McGill University.

31. Canada — Seigniorial Tenure. The system of Seigniorial Tenure was that system of public and private relations based upon the tenure of land which the French government undertook, during the course of the 17th and 18th centuries, to introduce into its North American colonies, and more especially into the colony of New France, now Canada. The system of feudal—or as in its later stages it came to be called—seigniorial tenure, was deeply rooted in France, and it is easy to understand how its introduction into the colonies appealed to Richelieu as a means of providing estates for many of the landless aristocrats of France. Moreover as feudalism was now so far advanced in decay as to be no longer a menace to the central power, it is easy to see how the system appealed to the Bourbon monarchs as likely to permit, in the colonies, of that centralization of authority which characterized France at this time.

As regards Canada, the seigniorial system had its origin in 1627 when the French King granted to the Company of New France, more commonly known as the Company of One Hundred Associates, the whole of the French possessions in North America as one immense fief with full power to sub-grant it in seigniories to settlers. During the whole 35 years of its existence, however, this Company devoted almost its entire attention to the development of the lucrative fur trade; very few settlers were sent out to the colony, with the result that while over 60 *in extenso* grants of seigniories were made, almost none at all were ever taken possession of by the grantees. But in 1663 the Company was compelled to surrender its charter and extensive territorial rights, the Crown taking into its own hands the supervision of colonial affairs and providing New France with a royal government corresponding roughly to that established in the French provinces at home. From this time on settlers came in increasing numbers; power was given the colonial Governor and Intendant to make grants of seigniories subject to royal ratification, and during the last quarter of the 17th century these were made freely. In no case were grants made to absentees; each applicant for a seigniorial grant had to prove himself a *bona fide* colonist. Large numbers of the settlers were sent over at the royal expense and once in the colony, every inducement was given them to remain. Even the detachments of French regular troops sent out to the colony

were disbanded there and both officers and men were encouraged, by liberal grants both of land and money, to become permanent residents of New France.

As to the size of the seigniories granted, there was no fixed rule: they varied from small plots containing a few square *arpents* to huge tracts ten by twelve leagues in area. Much depended on the position occupied by the settler before his immigration to the colony and upon the available means which he had for the development of his grant. But whatever the area of the grants, they almost invariably assumed the same shape,—that of a parallelogram with the shorter end fronting on the river. On receiving his grant the new seignior was under obligation to repair at once to the Château de St. Louis in Quebec, there to render his fealty and homage to the Governor as the representative of the Crown. Within the next forty days he was required to file with the Registrar-General his *aveu et dénombrement*, or statement showing clearly the location, extent and nature of his seigniorie. A similar statement containing full information regarding the development of the holding was required every time the seigniorie changed owners. No payment was exacted from the seignior in return for the original grant, but an exaction known as the *quint* became payable on each mutation of ownership by sale, gift, or inheritance other than in direct succession. This amounted to one fifth of the estimated value of the seigniorie, but of this amount it was the custom of the Crown to give a rebate of one third. As the seigniories increased in value very slowly this burden was never an onerous one. In making the grants, the authorities usually reserved the right of taking, from the granted seigniories such locations as might at any time be found necessary for the construction of fortifications or other public works, such oak and pine timber as might be found suitable for use in the royal shipyards and the right to a share in all mines and mineral deposits found in the seigniorie.

In France the seignior was under no obligation to sub-grant the lands within his seigniorie, but by a series of royal edicts,—more notably the Edict of Marly (1711), this obligation was imposed upon the seigniors of New France in the interest of colonial development. From 1711 onwards it was incumbent on all seigniors in Canada to sub-grant portions of the unoccupied lands of their seigniories to any settlers who applied for such grants, on whatever terms were customary in the neighborhood without exacting any bonus or *prix d'entrée*. If the seignior refused to do this, power was given the Governor and Intendant to step in and to make the grant, the seigniorial dues in such case to become payable to the Crown. Furthermore, from time to time various edicts revoked or curtailed the grants made to such seigniors as did not seem to be showing sufficient zeal in having their lands granted to settlers. In this way every seignior was compelled to become, after a fashion, the immigration agent of the colonial authorities, and it was this particular feature which serves most prominently to differentiate the seigniorial system in Canada from its prototype at home.

Grants made by the seigniors to settlers were called grants *en censive*. These likewise varied

considerable in size, but almost invariably assumed the same shape as the seignior within which they lay. Over them the seignior retained a variety of rights, some financial, some judicial, and some merely ceremonial or honorary in their nature. Among the former was the annual payments known as the *cens et rentes*, the former payable in money, the latter usually in produce. The *cens* was a very small due, amounting usually to a few *sous* per superficial *arpent* and valuable to the seignior mainly as establishing his claim to other and more important rights. The *rentes* was payable annually in grain, cattle or poultry but might be commuted by agreement of the parties into a fixed money payment. Then there was the *lods et ventes*, a mutation fine payable at every change of ownership. This amounted to one twelfth of the mutation price, and of it the seignior usually remitted one fourth, although he was under no legal obligation so to do. To guard himself against loss of his proper *lods et ventes* through sales of *en censive* holdings at less than their actual value, the seignior possessed the *droit de retraite* by virtue of which right he might pre-empt any holding thus sold by payment to the purchaser of the mutation price, within forty days from the date of the sale. Then there was the *droit de banalité* or the exclusive right of the seignior to erect a grist mill within the limits of his seignior and to compel his *censitaires* to have their grain ground there and not elsewhere on pain of confiscation. The amount of toll receivable for this service was fixed by a royal edict at one fourteenth of the grain ground. During the greater part of the French régime this incident bore more heavily upon the seignior than upon his *censitaires*, for except in the more populous seigniories, the amount of toll received rarely sufficed to pay expenses. At the same time the colonial authorities compelled the seigniors to provide mills in their seigniories on pain of losing the right for all future time. Finally, there was the much-detested *corvée*, or right of the seigniors to exact from their *censitaires* a certain quota of labor on the seigniorial lands without compensation. The amount allowable varied in different seigniories but as a rule the *censitaires* were permitted to commute it into a fixed money payment. An ordinance of the Superior Council in 1716 forbade the exaction of *corvée* during seed time and harvest. In addition to the foregoing main rights the seignior ordinarily reserved for himself the privilege of taking from the lands of the *censitaires* such wood and stone as might be found necessary in the erection of the seigniorial manor house, mill or church, and in some cases the right of taking wood for fuel. In many cases he likewise reserved the right of claiming a share in all the fish caught by his *censitaires* in the waters of the seignior.

Most of the seigniors possessed certain judicial rights. These, however, were not inherent in the ownership of a seignior, but were specifically granted by the Crown. This grant might convey merely the right of *basse justice* in which case the seignior was empowered to deal with minor causes in which the amount in dispute did not exceed a few *sols*. The grant of *moyenne justice* gave him a large jurisdiction, while the grant of *haute justice* gave full judicial power in all cases except those such as

treason and counterfeiting in which the Crown was directly concerned. As a rule all three degrees of judicial power were conferred on the seignior. But in every case an appeal lay to the royal courts of the colony. As the exercise of his judicial powers brought the seignior very little profit the seigniorial courts never became a very important element in the colonial judicial system.

The remaining rights of the seignior were merely honorary and afforded him no financial return. He was entitled to the fealty and homage of his *censitaires*, to a front pew in the parish church, to certain precedence at the Sacraments, to the erection of a Maypole at his door each Mayday and, in general, to the respect and deference of his dependents. A number of seigniors who showed zeal in the development of their holdings received patents of nobility but it must be borne in mind that the possession of a seignior in New France did not of itself give noble rank. Herein Canadian feudalism again differed from its prototype in France. The French seignior was always a noble; the Canadian very rarely.

At the close of the French régime nearly eight million *arpents* of land had been granted out to be holden under the seigniorial tenure. The system had become so deeply rooted in the colony that the English authorities, after the Conquest, did not venture to take the drastic step of supplanting it in favor of the English system of tenure in free and common socage. The old system was allowed, therefore, to remain intact but as the colony became more thickly settled, many of the seigniorial exactions became burdensome. The *droit de banalité* became especially so. Moreover, the new English courts failed utterly to afford the *censitaires* that protection against the seigniors which the authorities of the old régime had given. From time to time the Legislature of Lower Canada sought to deal with the growing complaint that the operation of the system was retarding the development of the province but found it extremely difficult to devise any plan which would be satisfactory to the tenants and at the same time protect the vested interests of the seigniors. In 1825 an Act was passed giving to the parties concerned the right to commute all seigniorial dues into a lump sum by mutual agreement but very few took advantage of the legal permission thus accorded. It was not until 1854 that by the Seigniorial Tenures Abolition Act a general scheme for the compulsory commutation of all seigniorial obligations received the assent of the Canadian Legislature. This Act provided for the establishment of a Special Court to determine just what seigniorial claims were justifiable and on a basis of its decisions each seignior was awarded a certain indemnity for the loss of his rights. Part of the amount was paid him from the public treasury; the balance became an annual rent charge on the lands of the tenants, which annual charge, again, might be commuted into a lump sum if the tenant so desired. In any case all lands formerly holden *en seigneurie* or *en censive* were thereafter to be holden in fee simple. Thus by one stroke of legislation the whole system of territorial law in Lower Canada was revolutionized and the last vestige of Canadian feudalism disappeared.

32. Canada — The Hudson's Bay Company.* This great trading company has been in operation under its present charter for two and one third centuries. Its charter, which is a very generous one, was given by easy-going Charles II. The company owes its origin to the adventures in the New World of two French Huguenots, Pierre Esprit Radisson and Medard Chouart (afterward Sieur de Groscheillers, or familiarly "Mr. Gooseberry"). It is claimed that in 1662 these daring spirits reached James Bay, the southern lobe of Hudson Bay. This is entirely improbable, as in that year they are known to have been in Lac des milles Lacs, now northern Minnesota. (See the discussion on this matter in the author's 'Remarkable History of the Hudson's Bay Company.') Persecuted in French Canada, the adventurers fled to New England and thence to England, where they had an audience with the king, and through the influence of Prince Rupert (see RUPERT, PRINCE), the king's cousin, a strong company was afterward formed, being created by royal charter. The first expedition to Hudson Bay was made for the adventurers in the ship *Non-such* Ketch, Capt. Zachariah Gillam, a New England mariner. Arrived at the destination, a fortress was erected on James Bay (lat. 51° 20' N., lon. 78° W.), called Charles Fort. On the return of the vessel to England the charter was granted (1670). Prince Rupert was made the first governor, and the vast territory covered by the charter became known as Rupert's Land. He was followed by the king's brother, James, Duke of York, and the third governor was the famous Duke of Marlborough, who has left his family name on Fort Churchill. England's great rival, "La Belle France," immediately began to lay claim to the bay as a part of Canada. Several expeditions were sent out to drive off the English, the most notable being that under Pierre Le Moyne d'Iberville. See IBERVILLE, PIERRE LE MOYNE D'. He achieved so great a naval victory that the whole bay fell into French hands, comprising at that time seven forts, of which Charles, Nelson, Moose, and Albany were the chief. The territory under dispute was restored to England by the famous treaty of Ryswick, 1697. Up to the time of the French forays rich dividends had been declared by the partners, that of 1690 being 75 per cent of the original stock, and the king's share was rendered in guineas instead of pounds. The com-

pany, which included many distinguished men, such as the Duke of Albemarle (Gen. Monk), (see MONK, GEORGE), and Sir George Carteret (see CARTERET, SIR GEORGE) was very influential. Prince Rupert presided at the London meetings, and a sub-committee met regularly to buy and sell, went to Gravesend to see the goods shipped, the men paid, and the like, in the good ships *Prince Rupert*, *Wyvenhoe*, or *Bark Craven*, which sailed around the north of Scotland and thence to Hudson Bay. Every year, about 1 June, for more than two hundred years, one ship at least has cleared for its northern port on the bay, latterly generally *York Factory*. How small the beginnings of trade were may be seen in the inventory of goods sent out in 1672: "Two hundred fowling-pieces, and powder and shot; 200 brass kettles, size from 5 to 16 gallons; 12 gross of knives; 900 or 1,000 hatchets." In October the ship returned with its valuable cargo of furs, which was sold in London, often by auction.

The second period of Hudson's Bay Company history is that involving the local opposition in England to the traders. Between the treaties of Ryswick (1697) and Utrecht (1713), the menaces of the French destroyed the fur trade, but after the latter treaty, from which time the bay has remained continuously English, the affairs of the company improved. This roused the envy of a number of merchants, a leader among them being an Irish gentleman named Arthur Dobbs. He advocated an expedition to explore the Northwest Passage, raised by subscription a large sum to send out a ship to rival the company, and though his expedition did not accomplish much, yet the Hudson's Bay Company was disturbed, was put on its mettle, and the struggle as recorded in the Government bluebook of 1749 became very interesting. A more serious movement, however, began in French Canada. The charter of the company gave it the trade of all the lands and streams within "Hudson's Straights," with one most important limitation, namely, except those "which are not now actually possessed by any of our subjects, or by the subjects of any other Christian prince or state." Long before the Hudson's Bay Company penetrated Rupert's Land, the French ascended the Great Lakes, and 20 or 30 years before the English had reached the Saskatchewan River from Hudson Bay, explored the river system of Rupert's Land and came in sight of the Rocky Mountains. This feat was accomplished by Sieur de la Verandrye, who in 1738 caused a fort to be erected on the site of the present city of Winnipeg, and took possession of the country for the king of France. The conquest of Canada by Wolfe put an end to this French occupation, but as later discussions show left it a part of Canada. Soon after the conquest of Canada, however, a critical movement took place in the effort of the Hudson's Bay Company to penetrate the interior from the bay, on whose shores for nearly a century it had lain in slumber. This advance was under the leadership of one of the captains of exploration, Samuel Hearne, a Hudson's Bay Company officer, sometimes called the "Mungo Park of Canada." Hearne discovered the Coppermine River and followed it to its mouth on the Arctic Sea. He, too, first of white men saw Great Slave Lake. But, also, shortly after the transfer of Canada from France to England,

*The charter of this company is given to the "Governor and Company of Adventurers of England trading into Hudson's Bay." From this it has been usual to employ the title "Hudson's Bay Company," using the possessive form of the name of Hudson, the discoverer. The bay itself, as in the case of Hudson River, has its name split by the geographers without the apostrophe and s.

CANADA — THE HUDSON'S BAY COMPANY

Scottish traders from Montreal began to ascend the waterways of Canada, and to pass from Lake Superior on to Lake Winnipeg and the Saskatchewan River, the very centre of Rupert's Land. Alexander Henry (1760), Thomas Curry, James Finlay, and the brothers Frobisher, traders from Montreal, led the way and reached the Saskatchewan. Hearne from Hudson Bay heard of the Canadian traders having built a fort at Sturgeon Lake, and two years later (1774) accepted the gage of battle, and built Fort Cumberland alongside of his rivals on the Saskatchewan. The war of the giants had now begun, and for well-nigh 50 years it raged with increasing rancor and bitterness. Out of the movement of the Scottish merchants named, from Montreal, grew the union of traders (1783-4) known as the North-West Company. Its leading traders were Frobisher, Mackenzie, McLeod, McGillivray, Grant, Cameron, and greatest of all Simon McTavish — familiarly called "Le premier," and the founder of the North-West Company. The magnates of this great company Washington Irving has characterized as the "Lords of the Lakes and Forests." Their trade was enormous and extended to the coast of the Pacific Ocean itself. Toward the end of the century (1795-9) one year's production of furs was 106,000 beavers, 32 martens, 11,800 mink, 17,000 musquash — counting altogether 184,000 skins. At this time the North-West Company employed besides officers and partners, 50 higher clerks, 71 interpreters and clerks, 1,200 canoemen, and 35 guides. But the Hudson's Bay Company was not to be beaten. They were able to carry goods from the sea-coast of Hudson Bay to the inland parts of Rupert's Land earlier in the season, even in the Red River districts, than the Nor'-Westers were able to do by the long river and lake route from Montreal. They duplicated all the forts of the North-West Company. The confusion became worse confounded when the North-West Company divided (1796) into two rival factions, the rebels forming themselves into the "New North-West Company" or "Alexander Mackenzie and Company," more familiarly, however, known as the "XY," the name being from the letters of the alphabet following the initials of the old company N.W. The young company was intensely active, and about this time, but only for a short period, the introduction of dangerous amounts of strong drink took place among the Indians. After eight years of unprofitable trade the two sections were reunited as the "North-West Company."

Early in the 19th century a new problem arose. A Scottish nobleman, the Earl of Selkirk, obtained control of the stock of the Hudson's Bay Company and proceeded to settle up the fertile lands along the Red River, bringing his colonists chiefly from Scotland by way of Hudson Bay. This invasion of the fur-country (1812-15) by farmers the Nor'-Westers strongly resented. They several times drove out, or incited away many of the Highland settlers, who were beginning to till the soil within two or three miles of the site of the present city of Winnipeg. Two forts represented the opposing parties — Fort Gibraltar, the North-West Company fort — Fort Douglas, the Lord Selkirk stronghold. The descendants of the Nor'-Wester French voyageurs, whose mothers were Indian women, were now becoming numerous and went

by the name of Metis (Halfbreeds) or Bois-Brûlés (Charcoal faces). They were chiefly in the employ of the Montreal company, while the servants of the Hudson's Bay Company, largely Orkney-men, were called by their opponents "Les Orcanais." Attacks on the forts were begun by the hostile factions, and in 1816 Gov. Semple and 20 of his officers were killed by the Bois-Brûlés, and Fort Douglas was captured. In the next year Lord Selkirk arrived supported by a band of several hundreds of discharged mercenary soldiers who had fought in the war of 1812-15 in eastern Canada. These his lordship had hired and with their aid Fort Douglas was retaken and the colonists re-established in their farms. About the year 1811 John Jacob Astor of New York engaged a number of men who had been in the North-West Company and with these established Astoria, a trading post, on the Columbia River. This movement took place by way of the Cape Horn route and the rendezvous was in what was known as the Oregon region. The Nor'-Westers taking advantage of the state of war between Great Britain and the United States seized Astoria and employed the greater number of the Astorians in their posts in New Caledonia, as the region of British Columbia was then called. The conflicts of the various companies in different parts of Rupert's Land, the Mackenzie River district, and New Caledonia well-nigh destroyed the fur trade. Now arose a man who was to be the pacificator and leader of all the fur-traders. This was a young Scottish clerk in the Hudson's Bay Company — George Simpson (See SIMPSON, SIR GEORGE.) On the union of the worn-out companies in 1821, Simpson was made chief officer and in time he became "Emperor" of the fur country. For 40 years he built up the united company, and spent a portion of his time at Fort Garry, the chief point in Rupert's Land, as it was also the capital of Assiniboia, as the Selkirk colony was legally called. In Assiniboia a community of 12,000 grew up, 5,000 Metis, 5,000 English-speaking or locally called Scotch halfbreeds, and some 2,000 whites. Not only in this chief settlement, but from Labrador in the Atlantic Ocean to Vancouver Island on the Pacific did the little despot rule. Great forts were scattered over this wide domain, such as Fort Victoria on the Pacific shore, Fort Simpson in the Mackenzie River district, Fort Chipewyan on Lake Athabasca, Fort Edmonton on the Saskatchewan River, old Fort Cumberland on the same river, Norway House on Lake Winnipeg, York Factory, and Fort Churchill on Hudson Bay, Fort William on Lake Superior, Sault Sainte Marie, between Lakes Huron and Superior, the king's posts on the lower Saint Lawrence River, and Rigolette in extreme Labrador. From Lachine, his residence, Sir George Simpson dictated law throughout this vast extent of country, and compelled order and industry. The company quoting its charter-rights was from the first repressive in dealing in its territory with traders other than its own. The usual metaphor for describing Rupert's Land was that it was "surrounded by a Chinese wall." After a revolt of the Metis in 1849 this largely ceased to be the case. The company always retained the confidence of the Indians, and with practically no police or military, maintained a fair state of law and order. The fertile plains of Rupert's Land were visited by several exploratory expeditions shortly after

CANADA — THE WASHINGTON TREATY

the middle of the 19th century. Some of these were that of Palliser and Hector, 1857, of H. Y. Hind in the same year, and of Milton and Cheadle a few years afterward. A famous parliamentary investigation took place in London in the year of Palliser's expedition. Canada was at this time becoming alive to the importance of the Northwest. Negotiations took place between the British and Canadian governments which culminated in 1808-70 in the virtual decision that Rupert's Land, and the Northern and Western territories which were leased to the Hudson's Bay Company, should become Canadian. Unskilful dealing on the part of the Dominion Government with the people of Red River Settlement led, however, to the Riel rebellion, 1869-70. A military expedition of British troops and Canadian volunteers was sent by the old fur traders' route to Red River, but the rebels disappeared before the arrival of the troops. In 1870 the sum of \$1,500,000 was paid by Canada to the Hudson's Bay Company to satisfy its claims, the new province of Manitoba was formed by the Canadian Parliament, and thenceforward the West as far as the Rocky Mountains became a part of Canada. Several years afterward British Columbia came into the Dominion as a province.

The Hudson's Bay Company, though shorn of all political power, still survives, and is vigorous. It still seeks for furs in the far North, and is the largest land company in Canada, owning one twentieth of every new township, which the government surveys. This serves to give the Hudson's Bay Company a strong interest in building up and developing the newer portions of the country. In addition to this the company has largely devoted itself to conducting large shops in the leading business centres of western Canada. The largest of these is the store in Winnipeg. This with its different departments does an enormous trade not only in Winnipeg, but in supplying by the use of the mails the needs of all parts of the country. Important stores are maintained by the company in Portage la Prairie, Rat Portage, Fort William, Calgary, Vancouver, Edmonton, and Prince Albert. The present governor of the Hudson's Bay Company is the predominating figure, Lord Strathcona, the Canadian commissioner in London. As the writer has elsewhere said, "for the last 15 years the veteran of kindly manner, warm heart, and genial disposition, Lord Strathcona and Mount Royal (q.v.), has occupied this high place. The clerk, junior officer, and chief factor of 30 hard years on the inhospitable shores of Hudson Bay and Labrador; the commissioner who, as Donald A. Smith, soothed the Riel rebellion, and for years directed the reorganization of the company's affairs at Fort Garry and the whole Northwest: the daring speculator who took hold, with his friends, of the Minnesota and Manitoba Railway, and with Midas touch turned the enterprise to gold; a projector and a builder of the Canadian Pacific Railway; the patron of art and education, and the patriot who sent out at a cost of between \$1,000,000 and \$2,000,000 the Strathcona regiment of horse to the South African war has worthily filled the office of governor of the Hudson's Bay company, and with much success reorganized its administration and directed its affairs." 33. Canada — The Washington Treaty. The Treaty of Washington, between the United States and Great Britain, was signed on 8 May 1871, and had reference to the Alabama claims (q.v.), the fisheries question, the lake, river and canal navigation, the bonding privilege, and the Vancouver water boundary question. In the years immediately following the Civil War several causes of acute friction existed between the two countries. Of these the principal was the question of indemnity for the depredations committed by the Alabama and other southern cruisers, whose construction in England was claimed by the United States to be a violation of neutrality. The second main cause of contention was the question of the coast fisheries. Under the Reciprocity Treaty of 1854, the fishermen of each nation were admitted to the inshore coast fisheries of the other. With the expiration of the treaty in 1806 the rights of American fishermen on the Atlantic coast of Canada were limited to the privileges secured under the convention of 1818, with a modification of 1845 admitting them to the Bay of Fundy. By this they were excluded from taking fish within three marine miles of any coasts, bays, creeks, or harbors of British North America, except in special parts of the Newfoundland and Labrador coast, and off the Magdalen islands. The proper interpretation of this three mile limit had been a standing subject of controversy. It was claimed by Great Britain that the terms of the treaty precluded entrance into the bays: by the United States that it merely forbid a nearer approach to the shores of the bay than a distance of three miles. This left in dispute the right to fish in the Bay of Chaleurs and other important places. (See Cushing, 'Treaty of Washington,' ch. v.) As a temporary expedient since 1806, the Canadian government had sold licenses to American fishermen for a nominal fee. This scheme had proved abortive, for the raising of the license fee in 1808 had resulted in an almost complete cessation in their use, only 25 being taken out in 1809. The Dominion government, in consequence, by an order in council (8 Jan. 1870) abandoned the system of licenses and equipped cruisers to protect its claims in the coast fisheries. The Alabama claims and the fisheries had been for some time a standing subject for negotiations. A treaty of January 1809 (known as the Johnson-Clarendon Treaty) was rejected by the Senate. Negotiations were renewed under President Grant and, at the suggestion of the British government, it was finally decided to appoint a joint high commission to meet at Washington to settle outstanding matters of dispute. The commissioners for the United States were Hamilton Fish, secretary of state; Gen. Robert Schenck, Judge Nelson of the Supreme Court, Ebenezer Hoar, and George H. Williams. The British commissioners were Lord de Grey, Sir Stafford Northcote, Sir Edward Thornton, Professor Montague Barnard, and Sir John Macdonald, prime minister of Canada. Their deliberations lasted from 27 Feb. until 6 May 1871. Of the different points in the treaty agreed upon the most important is that in reference to the Alabama

CANADA — JESUIT ESTATES ACT

claims, on account of its bearing upon international law. The matter at issue here was the extent to which Great Britain had been guilty of a breach of neutrality. The Alabama had been built in Birkenhead. The purpose of her construction had been a matter of general notoriety. The British government had refused to listen to any representations that fell short of being technical evidence. Even when the American consul at Liverpool furnished the needed proof, the dilatory action of the government permitted the cruiser to depart unmolested. The question was whether, in reference to the Alabama and other Confederate cruisers, the government of Great Britain had shown the diligence demanded of a neutral power (see 42d Congress, 2d Sessn. Senate Exec. Doc. 31 November, pp. 146-51). The commission decided that the claims thus arising "shall be referred to a tribunal of arbitration to be composed of five arbiters," one to be named by the President of the United States, one by Her Britannic Majesty, one by the king of Italy, one by the president of the Swiss Confederation, and one by the emperor of Brazil. The questions considered were to be decided by a majority. Article 6 of the treaty declares: In deciding the matters submitted to the arbitrators they shall be governed by the following three rules, which are agreed upon by the high contracting parties as rules to be taken as applicable to the case, and by such principles of international law not inconsistent therewith as the arbitrators shall determine to have been applicable to the case: A neutral government is bound: First, to use due diligence to prevent the fitting out, arming or equipping, within its jurisdiction, of any vessel which it has reasonable ground to believe is intended to cruise or to carry on war against a power with which it is at peace; and also to use like diligence to prevent the departure from its jurisdiction of any vessel intended to cruise or carry on war as above, such vessel having been specially adapted, in whole or in part, within such jurisdiction, to warlike use. Secondly, not to permit or suffer either belligerent to make use of its ports or waters as the base of naval operations against the other, or for the purpose of renewal or augmentation of military supplies or arms, or the recruitment of men. Thirdly, to exercise due diligence in its own ports and waters, and, as to all persons within its jurisdiction, to prevent any violation of the foregoing obligations and duties." The tribunal thus arranged met at Geneva (December 1871) and in September 1872, rendered its decision "that the British government had failed to use due diligence in the performance of its neutral obligations," and awarded an indemnity of \$15,500,000 to the United States. In regard to the fisheries, the treaty practically re-established the status under the Reciprocity Treaty of 1854, throwing open the inshore fisheries of the Atlantic coast north of latitude 39° to the fishermen of both nations (Art. XVIII., XIX.). It also established reciprocal free trade in fish and fish oil (Art. XXI.) and decided that commissioners should be appointed to determine what extra compensation, if any, should be paid by the United States for the privileges thus acquired. A compensation of \$5,500,000 was subsequently awarded by the Halifax Fisheries Commission (1878). The location of the north-western boundary (see NORTHWEST BOUNDARY

DISPUTE) which under the treaty of 1846 was declared to follow the 49th parallel "to the middle of the channel which separates the continent from Vancouver's Island and thence southerly through the middle of the said channel and Fuca Straits to the Pacific Ocean," was left (Art. XXXIV.) to the decision of the German emperor. It was further agreed (Art. XXVI.) that the navigation of the river Saint Lawrence shall forever remain free and open for the purpose of commerce to the citizens of the United States. The United States in return declared the Yukon, Porcupine and Stikine open to British commerce, (Art. XXVI.) granting also to British subjects the right of navigating Lake Michigan, the use of the Saint Clair Flats Canal on terms of equality with inhabitants of the United States. The bonding privilege (Art. XXIX.) was mutually conceded. The fisheries provisions were not to go into effect until the "laws required to carry them into operation" should be passed by the British and Canadian Parliaments, the legislature of Prince Edward Island, and the Congress of the United States. The entire treaty was to remain in force for 10 years, after which certain articles—the fisheries arrangement, the right of navigating Lake Michigan, and the bonding privilege—might be terminated on two years' notice from either party. The fisheries clauses of the treaty were subsequently renounced by the United States, and after due notice, expired 1 July 1885. For further details the work of Cushing (mentioned above) may be consulted. The text of the treaty is in 'Treaties and Conventions of the United States' (1889). For the part played by Sir John Macdonald (q.v.) in the negotiations and their relation to Canadian politics, see Pope, 'Memoirs of Sir John A. Macdonald,' Vol. II., ch. xix.-xxi. See also UNITED STATES — FOREIGN AFFAIRS, 1861-1904; TREATIES OF THE UNITED STATES WITH FOREIGN NATIONS. STEPHEN LEACOCK, *Lecturer in Political Science, McGill University.*

34. Canada — Jesuit Estates Act. This measure passed by the legislature of Quebec in 1883, gave rise to an agitation which occupied public attention throughout all parts of Canada during the following year and for a time threatened to bring about a reconstruction of political parties. Under the French régime, which ended in 1763, the Jesuits had owned considerable landed estates at various points in the valley of the Saint Lawrence—particularly at Quebec, Montreal, and Laprairie. After the conquest of Canada by the English the religious orders were permitted to retain the property which they held under grant from the French crown or by other legal title, with the exception of the Jesuits. This order had been banished from France, 1767, and was suppressed generally by the papal brief *Dominus ac Redemptor* (1773). Although Gen. Amherst brought influence to bear upon the government to secure for himself the estates of the Jesuits in Canada, his efforts proved unsuccessful. Despite personal pressure and the papal brief the "black robes" at Montreal and Quebec were not immediately molested by the British authorities, who refrained from taking over their property until the death of Father Casot, the last remaining member of the society. This event occurred in 1800. Once possessed of the Jesuits' estates the Crown had to determine what should

CANADA — GEOGRAPHY

be done with them, and after a certain amount of indecision it was decided that their income should be used for the support of education in the province of Lower Canada. In vain the Roman Catholic bishops maintained the legality of the Church's claim to the property. The government stood its ground and appropriated the revenues.

From having been originally assigned to Lower Canada, the Jesuits' estates passed at Confederation (1867) into the hands of the province of Quebec. It was found, however, by the local government that their actual value was impaired by the ecclesiastical claims which stood against them. The bishops did not cease to protest against their retention by the state and the Jesuit order, revived under papal warrant, defended the justice of its own title. Had these lands been situated in a Protestant community the representations of bishops and Jesuits might have carried little weight, inasmuch as they could not be vindicated by an appeal to the courts, but where the mass of the population was Catholic the reiterated claims of the Church had their effect upon the market. After Confederation the rent of the property decreased until it became almost negligible in comparison with the valuation, and when the government sought to effect a sale no purchaser could be found. In 1887, after the question had been put off by several preceding administrations, Mr. Mercier, a French Nationalist of pronounced views, endeavored to effect a final settlement of it. Whatever the motives which actuated him, to criticize them would be to raise a matter of opinion. He introduced a bill which gave \$400,000 to the Roman Catholic Church as compensation for the property which the Crown had seized in 1800. This sum was, for the moment, to constitute a special deposit which eventually should be distributed by the Pope in return for a relinquishment of all claims to the Jesuits' estates that had been advanced by the bishops or by the Jesuits themselves. As a matter of fact the Pope divided the money between the Jesuits, the bishops, and Laval University, but in the meantime this recognition of his right to allot what were considered public funds among members of his own Church, drew forth cries of remonstrance from a large number of Protestants. A simultaneous grant of \$60,000 to Protestant schools in Quebec did not allay the feeling of hostility.

It should be observed that two distinct questions were raised by the agitation which proceeded from the Jesuits' Estates Act. The first had its root in the opposition of religious systems; the second was due to the federal character of the Canadian constitution. In 1888, Col. O'Brien, a Protestant member of the House of Commons, proposed that the Dominion Parliament should disallow the action of the Quebec Legislature in appealing to the Pope and setting aside \$400,000 as a subsidy to Roman Catholic institutions. The debate which followed was marked by a series of able and aggressive speeches from all quarters of the House. The chief supporter of Col. O'Brien's motion was Mr. Dalton McCarthy, while against him were ranged the premier, Sir John Macdonald, and Mr. Laurier, the leader of the Opposition. On the one side an appeal was made to the alleged political misdeeds of the Jesuits throughout the whole course of their history and to

their expulsion from the chief countries of the civilized world. On the other, it was maintained that the Dominion Parliament could not, without extreme danger, disallow provincial legislation and that "the subject-matter of this act was one of provincial concern, only having relation to a fiscal matter entirely within the control of the legislature of Quebec." The vote of 188 to 13 against Col. O'Brien's motion conveys but a faint idea of the public interest in this debate and in the issues which lay behind it. The fundamental claim of the extreme Protestant party was that recognition of papal authority and the encouragement of the Jesuits were direct blows at British freedom; while the leaders of both parties united to point out the constitutional dangers which would accompany disallowance.

Outside the House of Commons the agitation caused by the Jesuits' Estates Act led to the formation an "Equal Rights" party, which was recruited from the ranks of the more pronounced Protestants. It proved impossible, however, to break down existing political lines by giving central importance to an anti-Catholic movement. Despite many public meetings and an active campaign in the newspapers, the attack upon the Jesuits' Estates Act has left no lasting trace upon party organization in Canada.

CHARLES W. COLBY,

Professor of History, McGill University.

35. Canada — Geography. I. GENERAL.—*Area and Boundaries.*—With the exception of Alaska, Greenland, Newfoundland, and the two small islands of Saint Pierre and Miquelon, all the northern half of the North American continent is comprised in the Dominion of Canada. Alaska, the great peninsular projection at the northwest corner of the continent, with a narrow strip of coast depending from it southward, belongs to the United States; Greenland, a huge island at the northeast corner, is Danish; Newfoundland, another island blocking the mouth of the Saint Lawrence estuary on the east coast, is British, and Saint Pierre and Miquelon, lying off Newfoundland, are French. To the north of the continent there is a cluster of large islands, divided from the mainland and from one another by comparatively narrow channels. All of these form part of Canada and are included in its area, but as yet they have been only partially explored, and their exact dimensions are not known. The official estimate, as nearly accurate as it can be made at present, gives the total area of Canada, including the great fresh-water lakes wholly within its boundaries, as 3,729,665 square miles. The boundaries separating Canada from its only continental neighbor, the United States, are to a great extent meridians of longitude or parallels of latitude. Between Canada and Alaska, beginning from the north, the boundary follows lon. 141° W. from the Arctic Ocean to Mount Saint Elias, within 20 miles of the Pacific, from which point it is an irregular line running about parallel with the coast round the heads of all bays and inlets of the sea at a distance of 20 to 30 miles inland. It reaches tide-water again at the head of Portland Channel, down which it passes, terminating in the Pacific Ocean. All the islands of the coast south of lat. 54° 40' belong to Canada as far as the southern extremity of Vancouver Island.

CANADA — GEOGRAPHY

The international boundary begins again in Juan de Fuca Strait. It takes a devious course from Vancouver Island to lat. 49° on the coast of the continent, and then follows the 49th parallel as far east as Lake of the Woods. A water boundary here begins, up Rainy River and its head-water series of lakes, cutting across the height of land to another chain of small lakes and following Pigeon River to its mouth in Lake Superior. From this point the boundary is the chain of Great Lakes and the Saint Lawrence River to its intersection with lat. 45°. The line now follows a more or less arbitrary course along the 45th parallel for some distance, then rising irregularly to the north almost to lat. 47° 30', then down the upper course of the Saint John River, then due south to the headwaters of the Saint Croix River, which it follows to its final termination in the Bay of Fundy.

The areas in square miles of the individual provinces and territories are as follows:

	Land	Water	Total
Nova Scotia	21,068	360	21,428
New Brunswick.....	27,911	74	27,985
Prince Edward Island.	2,184	2,184

Total.....	3,603,998	125,748	3,729,656

Main Physical Features.—The four principal surface divisions are: (1) The Appalachian region, forming the extreme southeastern corner; (2) the Laurentian plateau or peneplain, with its fringes and outliers of lowlands, comprising the remainder of the eastern half of Canada; (3) the central plain; and (4) the mountain region to the west. Each of these divisions represents, on the whole, a different geological formation and has its own peculiar physical features. I. The Appalachian region of Canada is the northern extremity of the system of parallel ranges of mountains pushed up, as it were, from the southeast against the great archæan, or Laurentian, area. The ranges all run from southwest to northeast, the Nova Scotian peninsula being without a corresponding extension in the United States. The hills are composed of older rocks, rising out of the carboniferous strata which once overlay the whole district, but of later formation than the Laurentian plateau to the north. They are much weathered and the river valleys have been comparatively well eroded. II. The Laurentian plateau or peneplain which covers about half the entire area of Canada is, geologically speaking, the nucleus of the continent. It presents a shield-shaped surface of archæan rocks, broken into on the north by Hudson Bay, and extending south to the Saint Lawrence River. As is implied by calling it a peneplain, it is a much-weathered surface, nowhere rising to any great height, but maintaining a fair elevation

above the sea-level, except along the west shore of Hudson Bay. It is a country of hard, crystalline rocks, everywhere scored by glacier action, and sparsely covered with soil in which pine, spruce, and other northern trees grow more or less densely, giving place in the higher latitudes to mosses and lichens. As a result of the melting of the glaciers which covered this region in the last geological period, the whole surface is a net-work of small lakes and streams. The latter have been unable to wear down the hard rocks to any appreciable extent, and consequently present all diversities of level with many falls and rapids in their course. The western limit of the plateau is marked by a series of great lakes, from Great Bear Lake in the north to Lake Huron near the southern extremity. Adjoining the Laurentian plateau on the north and south there is, as it were, a fringe of later geological formations. Most of the large islands north of Hudson Bay as of the mainland west of it appear to consist chiefly of older sedimentary rocks in undisturbed arrangement, but the partial glaciation of these islands has hitherto prevented any detailed geological or other survey. South of the Laurentian plateau again occurs a lowland area, consisting of the valley of the Saint Lawrence River and the peninsula enclosed by the three lower members of the chain of great lakes. It is small in extent, but of great importance in the history of Canada, because the first European settlements were established mainly within its limits and it still contains the greater part of the population. III. The central plain is of vast extent, reaching from the Arctic Ocean to the Gulf of Mexico, so that only its northern portion lies in Canada. It is the elevated bed of a carboniferous sea, and from a breadth of 800 miles at the international boundary it is gradually narrowed toward the north by the westerly trend of the Laurentian plateau and broken into by subsidiary ranges of the Rocky Mountains. Still farther north, where it terminates at the Arctic Ocean, it again expands to a width of about 300 miles. There are three steppes of different elevations in this great plain, rising from east to west, and the general slope is from the southwest downward to the east and north. IV. The fourth great region, the mountain belt, is also of vast extent, being traceable in greater or lesser width from the Tierra del Fuego, at the extremity of South America, to the farthest western point of Alaska. In Canada this mountain, or Cordilleran, region attains a breadth of about 400 miles, the greatest average elevation being in the southern portion. The Rocky Mountains, the most easterly range, are paralleled by a succession of smaller ranges, the most westerly of which is represented by the mountains of Vancouver Island and the Queen Charlotte Islands. The geological age of this division is more ancient than that of the central plain, and the changes in the crust have been violent and recent, resulting in the upheaval of the Rocky Mountains, the youngest of the ranges of the Cordilleran System.

Altitudes and Slopes.—The greatest altitudes in Canada are in the Saint Elias range of mountains, a small group near the Alaska frontier, not far from the Pacific Ocean. Mount Logan is the highest of these and is estimated at 19,539 feet. The next greatest elevations are

CANADA — GEOGRAPHY

in the southern portion of the Rocky Mountains and the parallel ranges immediately to the west, where several peaks exceed 12,000 feet, although only one, Mount Robson, possibly reaches 13,500. The height of the ranges west of the Rocky Mountains becomes less and less as they approach the Pacific Ocean, and in Vancouver Island the highest peak is under 7,500 feet. The next greatest altitudes are in the extreme east of the Laurentian plateau, in northern Labrador, where a range of hills occurs, bordering on the Atlantic Ocean, which attains a height of 6,000 feet. Elsewhere in Labrador the Laurentian plateau seldom exceeds 1,800 feet, and on the west side of Hudson Bay the Laurentian area is lower and gradually merges in the central plain. The Appalachian region contains ranges of low hills nowhere exceeding 4,000 feet, which is only reached in the extremity of the Gaspé peninsula. The central plain rises in three steppes from the valley of the Red River, about 800 feet above sea-level, to the foothills of the Rocky Mountains, where it has an extreme elevation of 4,200 feet and an average elevation of about 3,000 feet. The Saint Lawrence lowlands are nowhere much higher than 1,000 feet, or about 500 feet above Lakes Huron and Erie, and sink gradually with the Saint Lawrence River to its mouth.

Water Ways.—The distribution of land and water in Canada has rendered the interior continental area peculiarly accessible. The Gulf of Saint Lawrence is a large arm of the sea affording ready means of entrance from the east, and leads to the broad estuary of the Saint Lawrence River. Exploration naturally followed this highway. No mountain barriers occur to obstruct or divert approach by the rivers Saint Lawrence and Ottawa to the chain of great lakes that extend to the very centre of the continent. The length of continuous waterway from the Atlantic Ocean at the Straits of Belle-Isle to the head of Lake Superior is 2,388 miles. Similarly Hudson Bay, a huge land-locked sea, communicating with the Atlantic by Hudson Strait, reaches even farther west than Lake Superior to the south of it. It was by way of Hudson Strait and Hudson Bay that the English explorers arrived at the great interior plains, just as the French *voyageurs* penetrated to the same region by the Saint Lawrence and the Great Lakes. The first systematic attempt at settlement of what is now the province of Manitoba, where the prairies begin, was by way of Hudson Bay, when Lord Selkirk established his colony of Highlanders at the junction of the Assiniboine and Red rivers in the first years of the 19th century. Two great waterways are found in the central area leading up from Hudson Bay and from the Arctic Ocean to the very base of the Rocky Mountains. These are the Nelson-Saskatchewan and the Mackenzie-Athabasca river systems, both of which were well-traveled highways for *voyageurs* and fur-traders long before settlements along the Saint Lawrence Valley had reached the Ontario peninsula. In the Appalachian region there is one river of considerable length, the Saint John, which flows across the ranges into the Bay of Fundy. The mountain region possesses its great rivers in the Columbia, the Fraser, and the Yukon, all of which originate at the western base of the Rocky Mountains and empty into the

Pacific. But the rivers of this region are obstructed by numerous and fierce rapids and have not afforded the same facilities for navigation as the rivers of the central and eastern areas. In recent years, however, the Yukon has become a great highway leading to the gold-fields of Alaska and the Yukon Territory.

Climate and Vegetable Productions.—The climate of Canada has the usual characteristics of a continental climate in its extremes of heat and cold, but the presence of vast bodies of water, Hudson Bay and the Great Lakes, in the very heart of the continent, has introduced modifications of temperature which differentiate Canada from other great continental areas. Thus, the Laurentian lowlands enjoy a temperate and fairly equable climate, and are wholly free from periods of drought. The central prairies, moreover, though subject to extremes of temperature, obtain sufficient moisture for growing wheat, except in the extreme southwest portion. Here an area of about 20,000 square miles forms part of the semi-arid region which has so great an extension south of the international boundary. The grassy plains are liable to frosts in the early and late summer, perhaps in consequence of the general slope down toward the Arctic Ocean, with no intervening chain of mountains. It has been found, however, that where the ground has been broken up for agriculture over considerable areas these unseasonable frosts do not occur, and at the same time there is a marked tendency to an increase in the average precipitation. The western portion of the central plain enjoys milder winters than the eastern, and this contrast is even more marked in the north than in the south of the area. In the mountain region great variations are presented both in temperature and humidity. The islands and the coast of the mainland up to the crest of the first range of mountains upon it have a very mild and very moist climate. The western slopes of the ranges farther inland also receive abundant rainfall and are clothed with dense forests. But the interior plateau receives very little moisture, and its altitude and dryness combine to give it extremes of temperature in summer and winter. The northern part of the Laurentian plateau on either side of Hudson Bay is, for climatic reasons, uninhabitable. The forests that clothe the southern portion of the same plateau give place to grasses, sedges, and mosses, and ice remains in the rivers and lakes throughout the brief summer. This tundra region, some of which has not yet been explored, covers an area of perhaps 200,000 square miles west of Hudson Bay, where it goes under the name of "the Barren Grounds," and half as much east of Hudson Bay, in the Labrador peninsula. The climate of the Appalachian region is influenced by its proximity to the Atlantic Ocean, and presents no peculiarities. There are three well-defined belts of vegetation in eastern and central Canada. The southern part of the central plain is a region of treeless, grassy prairies, once the home of countless buffalo. In the extreme north, on either side of Hudson Bay, are the Arctic tundras, the Barren Grounds, where only mosses and other lower forms of vegetable life can exist, affording food to enormous herds of caribou and a smaller number of musk-oxen. Between these two treeless regions is the great forest belt

CANADA — GEOGRAPHY

which covers the whole of eastern Canada and extends across the central plain to the mountains, verging continually north in consequence of the decreasing severity of the winters, until in the valley of the Mackenzie River it reaches beyond the Arctic circle. In the northerly latitudes the forest is composed chiefly of pine, spruce, tamarack, and aspen poplar, but in its southern extension, and especially in the Saint Lawrence lowlands and the Appalachian region, deciduous trees, such as the maple, beech, and ash, are mingled with the conifers and even replace them in the river valleys. Before the advent of the white men, a dense growth of forest covered the Appalachian region and the Laurentian lowlands, which have since been cleared to a great extent and agriculture introduced. The process is still going on, settlement is pushed farther and farther north, and forest is giving place to farms wherever the soil is suitable. The prairie region is being rapidly converted to agricultural uses, even the semi-arid corner being capable of cultivation by the aid of irrigation. The mountain region, throughout almost its entire extent, is heavily wooded near the coast and on the western slopes of the inland ranges. The enormous height and girth to which trees of some species, such as the Douglas fir and western cedar, may attain are well known. The river valleys and alluvial flats of the southern portion are suitable for agriculture, but the interior plateau does not receive enough moisture and is given over to ranching.

II. THE PROVINCES.—[For the sake of convenience and completeness, the physical features and topography of the provinces comprising the Dominion are here briefly treated. The articles in this work on the individual provinces should be consulted for further information.]

Nova Scotia.—The province of Nova Scotia, the most southerly member of the Appalachian region in Canada, consists of a peninsula about 250 miles long and 100 at its greatest breadth, and its continuation, the island of Cape Breton, which is separated from Nova Scotia proper by a narrow strait, the Gut of Canso. More or less parallel to the length of the peninsula run ranges of low hills, which near the Atlantic become mere ridges of rock. The country on this, the southern side of the province, is wild and rocky, covered with forests and dotted with small lakes. Agriculture is confined to the alluvial land along the river valleys, and the villages and towns for the most part are situated on the coast at the heads of the numerous bays which here indent it. The north shore of the peninsula is of a totally different aspect. The extended ridge of trap which forms the southern shore of the Bay of Fundy is broken into in a few places only, and long narrow bays are thus formed, into which the tide rushes with great force. The chief agricultural district of the province is behind this protecting wall of trap, and the hills beyond are covered with fertile soil and clothed to their tops with dense hardwood forests. The marshes formed by the enormous tides of Minas Basin and Chignecto Bay, the two heads of the Bay of Fundy, have been reclaimed and diked, and form a rich pasture country. The orchards of the sheltered valleys on this side of the peninsula are celebrated. The chief region of mining and industrial development is the northeast por-

tion, facing Northumberland Strait and the Gulf of Saint Lawrence. Here coal and iron are extensively worked; gypsum also occurs in large quantities and is exported principally from the district around Minas Basin. Gold, on the other hand, is found in the wild rocky region along the southern or Atlantic coast, and is mined on this side from one end of the peninsula to the other. The fisheries of Nova Scotia have always been an important industry, carried on from every harbor of the province. Cape Breton Island, of irregular shape, about 100 miles long by 80 broad, forms part of the province of Nova Scotia. An arm of the sea, entering from the northeast, almost divides the island in two; actual division is accomplished by a canal across the narrow neck of land. A great part of the island to the north is a high forest-covered table-land, and the centre about the Bras d'Or channel is the most picturesque district in the province. At the east side occur the coal and iron ore deposits which are making Sydney, its chief town, one of the industrial centres of Canada.

New Brunswick.—The second in importance of the maritime provinces is New Brunswick, occupying the centre of the Appalachian region of Canada. It forms an irregular square of about 200 miles in extreme length and breadth, bounded on the north by the Bay of Chaleurs and the province of Quebec, on the east by the Gulf of Saint Lawrence and Northumberland Strait, on the south by Nova Scotia (at the isthmus) and the Bay of Fundy, and on the west by the State of Maine and the province of Quebec. Two lines of hills traverse the province; one follows the coast-line of the Bay of Fundy, the other, starting from the same southwestern angle, runs diagonally across the province to the northeast. Between the two lies a triangular low-lying plain, sloping down to the east coast, and beyond the diagonal range of hills the northwest region of the province is a rolling country, fertile and well suited for agriculture, but at present covered with forests. New Brunswick is a country of fine rivers, which have cut broad valleys through the soft rocks of the interior and afford access from the sea-coast to the innermost recesses of the province. The Saint John River flows south from the extreme northwest angle, entering the Bay of Fundy not much more than 50 miles from the international boundary. The Saint Croix, forming the boundary, also falls into the Bay of Fundy. The Restigouche, flowing into the Bay of Chaleurs, the Mirimachi into Mirimachi Bay in the Gulf of Saint Lawrence, and the Richibucto, into Northumberland Strait, are the other large rivers. A dense forest, chiefly spruce, still covers most of the province, and lumbering is the principal industry. The fisheries are second in importance. Agriculture follows the river valleys mainly, but the marsh lands at the head of the Bay of Fundy have been converted into rich pastures, and new land in the interior is continually being brought under cultivation. In time, no doubt, the whole of the level area in the centre of the province will be devoted to agriculture, when the forest wealth has been exhausted in that region. The mineral resources of New Brunswick have not yet been developed to any extent.

Prince Edward Island.—Prince Edward Island, the smallest province of the Dominion,

CANADIAN SCENERY.

2. Lachine Rapids. St. Lawrence River.

CANADA — GEOGRAPHY

is an island in the Gulf of Saint Lawrence, 145 miles long, with an extreme breadth of about 30 miles, separated from New Brunswick and Nova Scotia by Northumberland Strait, which varies from 9 to 30 miles in width. The curving coast on the north side of the island is broken by a deep bay with a narrow entrance, and terminates in long, narrow points. The south coast is very irregular, presenting a succession of bays and inlets. The island has a uniform, gently undulating surface, everywhere fertile, and for the most part cleared of woods and brought under cultivation.

Quebec.—The oldest province, Quebec, formerly a French colony, is still largely inhabited by French-speaking people, although in the extreme south a group of counties, commonly known as the Eastern Townships, were settled almost exclusively by English-speaking colonists. The province of Quebec is one of the largest in Canada. It extends north and east into Labrador, bounded in the latter direction by the strip along the Atlantic coast which belongs to Newfoundland. Its extreme northwest corner touches James Bay, from which its western boundary runs due south to the Ottawa River. The southern boundary is irregular, consisting of the Ottawa River nearly to its mouth, then the 45th parallel of latitude, and the rest of the international boundary eastward as far as New Brunswick, and finally the Restigouche River and the Bay of Chaleurs separating it from that province. The island of Anticosti and the Magdalen group in the Gulf of Saint Lawrence belong to Quebec. The whole of the valley of the Saint Lawrence River, from a short distance above Montreal, lies within its boundaries and constitutes, with the Eastern townships, the chief agricultural district. The valleys of the principal affluents of the Saint Lawrence are also cultivated, and two new agricultural districts, that watered by the upper Ottawa and the country about Lake Saint John, out of which flows the Saguenay River, are receiving a great influx of settlers. Except for the area in the extreme northwest of the province, which drains into James Bay, all the rivers empty into the Saint Lawrence River or Gulf. From the north come the Ottawa, the Saint Maurice, the Saguenay, and many others of less note farther east, while from the south the only ones of importance are the Richelieu, flowing from Lake Champlain, and the Saint Charles, emptying nearly opposite the city of Quebec. The general slope of the country is thus apparent. The southern edge of the Laurentian plateau, which runs not far from the Ottawa and Saint Lawrence rivers, comes quite down to the coast of the Gulf. South of the Saint Lawrence River the fertile lowlands are bounded by the ranges of the Appalachian system, which approach ever nearer to the river until, in the Gaspé peninsula, they also reach the water's edge. Next to agriculture the chief industry of the province is lumbering. The immense extent of the forests on the Laurentian plateau provides a source of supply that is virtually inexhaustible, and the recent development of the manufacture of pulp-wood has given new value to the smaller and softer trees such as the spruce. The mineral wealth of Quebec is not so great as that of Nova Scotia, but it is considerable, nevertheless. Asbestos of the best quality is found in the southeastern part of the province,

and virtually constitutes the world's sole supply of the mineral. Mica is also extensively mined, and gold, copper, and iron to a lesser extent.

Ontario.—The province adjoining Quebec on the west, Ontario, is the most populous and wealthy of Canada. It extends from the province of Quebec to Lake of the Woods; its northern boundary is the Albany River, which flows from west to east into James Bay, and its southern limit is the international boundary from Lake of the Woods to Lake Superior and the chain of Great Lakes and the upper Saint Lawrence. The whole of the province is thus to the north of the great waterway, but as both the lakes and the river in its upper course lie at the very southern limit of the area which they drain, Ontario contains all the tributary rivers of the Saint Lawrence system as far down as the Ottawa River. These, however, are not as numerous as might be expected, for the height of land between the Hudson Bay and Lake Superior slopes runs very near to the lake. Almost all the northern part of the province, therefore, drains into James Bay by the Albany and Moose rivers and their tributaries. The Nipigon, issuing from Lake Nipigon, flows south, exceptionally, into Lake Superior. In the extreme west a corner of the province belongs to the Lake Winnipeg drainage area. There are no ranges of mountains in Ontario. The Laurentian plateau includes the northern half of the province, while the rest is part of the Saint Lawrence lowlands. The lowlands, and especially their western extremity, the peninsula between Lakes Huron, Erie, and Ontario, are the chief agricultural district. The peninsula is favored with an excellent climate and soil, and its southern portion is the principal fruit-growing district in Canada, the chief products being peaches, grapes, strawberries, and apples. Hops, tobacco, and flax are also cultivated successfully in this part of Ontario. The northern part of the province beyond Lakes Huron and Superior has recently begun to be opened up, and its agricultural possibilities are being developed with great rapidity. Lumbering has always been an important industry, but the available timber limits producing pine have begun to show signs of exhaustion. The increasing demand for wood-pulp has however given new value to the great northern belt of forest, which is mainly spruce and practically inexhaustible. Ottawa is the chief centre of the manufacture of lumber; its situation on the Ottawa, the great log-carrier of two provinces, and the magnificent water-power of the Chaudière Falls, utilized for operating the saw-mills, give it advantages over all competitors. The mineral resources of Ontario have begun to be turned into account. Gold is found in various places, chiefly in the Lake of the Woods or Rainy River district. Iron is found in many different localities but the ore is principally mined in the Algoma district, northeast of Lake Superior. The water-power of the rapids in the Saint Mary River connecting Lakes Superior and Huron has been utilized, and great iron and steel manufactures have been established at the town of Sault Ste. Marie. The Sudbury district north of Lake Huron is rich in copper and nickel, the latter metal being found in quantity only there and in New Caledonia in the Southern Pacific Ocean. In the western part of the Ontario peninsula petroleum wells have long been worked.

CANADA — GEOGRAPHY

Manitoba.—The next province westward is Manitoba, a square of 270 miles to a side. It has Ontario and the North-west Territories to the east, the North-west Territories also to the north, Saskatchewan to the west and the international boundary on the south. The southern part of the province is at present the chief wheat-growing district of Canada. It consists of a perfectly level plain, the alluvial bed of a former lake, through which winds the Red River. This first prairie steppe is bounded on the east by the Laurentian plateau which covers all the eastern part of Manitoba beyond Lake Winnipeg. Westward, an escarpment, nowhere rising higher than 500 feet above the level of the first steppe, runs in a northwesterly direction and marks the beginning of the second prairie steppe, which presents a more undulating surface. More than two-thirds of Manitoba is thus prairie land, for the northern belt of forest only covers a small corner of the province. The area covered by water is considerable. Lake Winnipeg, a very large lake, is mainly within the boundaries of Manitoba, as are also Lake Manitoba and Lake Winnipegosis, with others of smaller size. The chief river of the province is the Red River which enters Manitoba from the south and empties into Lake Winnipeg. At Winnipeg the Red River is joined from the west by the Assiniboine, which with its affluents waters all the western part of the province.

Saskatchewan.—The province of Saskatchewan, established by Act of Parliament in 1905, is bounded on the south by the international boundary and on the north by the 60th parallel of latitude, and extends from the Manitoba boundary, and a straight line running north in continuation of it, westward as far as the 110th meridian. It is thus a huge rectangle about equally divided between prairie and wooded country, the limit of each lying north-west and south-east across the province. Most of the north-eastern half is comprised within the Laurentian area, where the forest is scantier and the trees more stunted than in the belt of woodland contiguous to the prairie section. In the northern portion there are several very large lakes, such as Lake Athabasca, Rein Deer Lake, Wollaston Lake, and the chain of lakes which constitute the head waters and upper course of the Churchill river. The Saskatchewan river flows through the middle region of the province, and the Qu'Appelle river waters the prairie section farther south. The general slope being from west to east, all the rivers flow across the province to the east or north-east, except in the extreme north-west where the slope is north toward Lake Athabasca and the Mackenzie river basin. The prairie section comprises all of the second prairie steppe not included in Manitoba and a portion of the third and highest. The escarpment of the latter runs north-west, appearing from the lower level like a range of low hills. When the crest is reached the third so-called steppe is found to be a much more irregular surface than the rolling plain below. Certain portions of it form small isolated plateaus, standing as high as 2,000 feet above the surrounding country.

Alberta.—Adjoining Saskatchewan on the west is a second province, Alberta, established by Act of Parliament in 1905. Like Saskatchewan it extends from the international boundary to the

60th parallel of latitude. Its western limit is the summit line of the Rocky Mountains from the international boundary to the point where that line crosses the 120th meridian of longitude, very nearly in lat. 54°, and from this point the 120th meridian to lat. 60°. Alberta, like Saskatchewan, is divided almost equally between prairie in the south and woodland in the north. Its prairie land is altogether within the limits of the third prairie steppe described above; much of it constitutes a semi-arid district, not suitable for agriculture except by the aid of irrigation, but making excellent pasture-land. The extreme north-eastern corner of the province touches upon the rocky Laurentian area, but the rest of the northern half of the province is well-wooded country, broken by prairie openings, with abundant streams and small lakes, suitable alike for grazing or crops. The Peace and Athabasca are the main rivers in this half of the province, while the North and South Saskatchewan rivers with numerous small affluents rising amid the mountains and foothills cut their channels deeply into the rolling prairie of the southern portion. The climate of Northern Alberta is much milder than the latitude would indicate, and wheat can be grown successfully in the valley of the Peace river near the northern boundary of the province. Besides agricultural possibilities, both Saskatchewan and Alberta, and especially Alberta, have a valuable asset in extensive coal fields.

British Columbia.—The largest of the provinces is British Columbia, occupying the whole of the mountain region from the international boundary to lat. 60°. It also cuts off a portion of the central plain, where the eastern boundary of the province leaves the Rocky Mountains and runs north along long. 120°. Vancouver Island and the other islands off the mainland are included in the bounds of the province. West of the broad chain of the Rocky Mountains, which form the eastern boundary, three older ranges run approximately north and south and are thus confined to the southern part of the province, being extinguished northward by the more recent upheaval of the Rockies, whose axis inclines to north-west. These smaller and lower ranges are, in order from east to west, the Purcell, the Selkirk, and the Gold ranges. Near and parallel to the Pacific coast another broad mountain system, the Coast Range, extends northward into Yukon Territory and Alaska, where it reaches its greatest elevation. Between the Coast and Gold ranges there is the interior plateau, about 100 miles in breadth and from 2,000 to 3,000 feet in elevation. To the north it is cut off by transverse ranges of mountains. Vancouver Island and the Queen Charlotte islands are the submerged remains of a subsidiary mountain range west of the Coast Range. The rivers and lakes of British Columbia occur in deep valleys between the ranges. The Columbia River and its chief affluent, the Kootenay, take a remarkable course through the valleys between all the eastern ranges, running north and south in great loops. The lake-like expansions of both rivers form the chief navigable inland waters of British Columbia. The Fraser River which rises in the Rocky Mountains flows at first north, but soon turns westward round the head of the Gold Range, and finally runs almost due south cutting

a deep channel in the interior plateau. It breaks through the Coast Range and reaches the sea not far from the international boundary. Its chief affluent is the Thompson. Both are very turbulent streams and form an additional obstacle rather than an assistance to inland communication. The northern half of the province is still very imperfectly explored. In a central elevated plateau many rivers take their rise, some flowing south to join the Fraser, others, such as the Liard, east into the Mackenzie basin, others again like the Skeena and Stikine westward into the Pacific Ocean. What British Columbia lacks in a system of navigable inland waterways is more than made up by its deeply indented coast line, where many magnificent harbors for sea-going vessels of any draught are available, from Port Simpson at the north to Burrard Inlet at the south extremity. The coast of Vancouver Island is also well supplied with harbors. British Columbia, although so mountainous, is not without its agricultural industries. The interior plateau forms a good ranching country, and in the sheltered valleys, where irrigation can be introduced, fruit farms are very successful. Lumbering is one of the great industries of the province, and the mineral wealth is very great. Gold has been found in many localities from the international boundary to Atlin district on the borders of Yukon Territory. Placer mining alone has been carried on in most of these places, but in the Kootenay district in the extreme south, where communication by railway and water is easy, scientific treatment of ores has been practised for some years. The metals, besides gold, produced by this method are silver, lead, and copper. The exceedingly heavy growth of timber has added to the difficulty of making roads and even of prospecting. Iron ore has been found both on the mainland and on Vancouver Island, but is mined principally on Texada Island in the Strait of Georgia. Coal is obtained chiefly on Vancouver Island at Nanaimo and Comox and in the Rocky Mountains at Crow's Nest Pass. Another great industry of British Columbia is the salmon-fishery, which is carried on chiefly at the mouth and in the lower reaches of the Fraser River. Canneries are also established at the mouths of the Naas, Skeena, and other rivers.

Yukon.—The Territory of Yukon, under the government of a Commissioner and an Executive Council, lies north of British Columbia and is bounded on the west by Alaska. It has also a northern coast-line on the Arctic Ocean, but a comparatively short one, its eastern boundary being an irregular line sloping from south-east to north-west, for the most part following the easternmost range of the Rockies. It does not lie entirely outside of the Mackenzie river basin, for the mountain boundary is low and the upper waters of many streams tributary to the Liard river, which flows into the Mackenzie river, take their rise in the south-east part of the Territory and flow south. In the north portion also the Peel river, flowing parallel to the Mackenzie, is contained within the boundaries of the Territory for most of its course, but bursts through the mountain barrier near its mouth and empties into the Mackenzie where the delta of the latter begins. The greater part of the Territory, however, is watered by the Yukon and its tributaries, the Teslin, Lewes, Pelly, Stewart, and

Klondike rivers, all flowing from south-east or east, and in the northern portion the Porcupine, which begins by flowing north-east as if to join the Mackenzie, but turns sharply and flows due west until it crosses the boundary into Alaska. The mountain system of the territory is the series of parallel ranges of the Rockies, decreasing in elevation as they run further north and turning eastward into the Alaskan peninsula.

The North-west Territories.—The remainder of Canada, north of the provinces and east of the Yukon Territory, including the islands in the Arctic Ocean and the peninsula of Labrador, except the strip of coast along the Atlantic which belongs to Newfoundland, is broadly described as the North-west Territories, the former provisional districts of Mackenzie, Keewatin, Ungava, and Franklin having been discontinued. This vast country is under the direct control of the Dominion Government. It is very sparsely populated by Indians and Eskimos, together with a few white trappers and traders in the employ of the Hudson's Bay Company, and missionaries. The valley of the Mackenzie river in the west is fertile and covered with trees almost to the very mouth of the river in the Arctic Ocean. The climate in that region is not so severe as the high latitudes would seem to imply; the summers, though short, are hot and the summer days long, and vegetables and some cereals have been raised by Hudson's Bay Company's agents at most of their posts in the district. Coal moreover occurs and possibly petroleum. The region immediately to the south-west and south-east of Hudson Bay has also possibilities of settlement on account of the magnificent water power of the rivers flowing through it into the Bay. The opportunity these afford for cheap development of electrical energy may yet be turned to account for manufacturing purposes, especially if it is found practicable to make exports by way of Hudson Bay. The fur-trade, which is still a considerable industry, is carried on over the whole area covered by the sub-Arctic forest, and much of this vast northern territory will remain the home of many species of fur-bearing animals as long as that forest remains to shelter them. But the northern portions of the country on each side of Hudson Bay must remain a hunting country only. The Arctic archipelago has at present only a sentimental value. The series of daring British explorers who, in their search for a northwest passage, discovered the various islands and claimed them for British territory, are commemorated in the names given to the islands themselves and to the principal bays, straits, and headlands. For ordinary purposes and for men of the white race they are utterly uninhabitable.

H. H. LANGTON,

Editorial Staff, (Review of Historical Publications Relating to Canada.)

36. **Canada — Agriculture.** Fish and furs were the earliest products of Canada. Agriculture, however, in time became the chief industry of the people, and to-day far outweighs the other three great natural products, furs, fish, and minerals. Canada possesses a unique record of national growth in the various census enumerations that cover nearly two and a half centuries. The earliest is that for 1665. Students of statistics will find the successive records from 1665 to 1871

CANADA — AGRICULTURE

in Vol. 4 of the Census of Canada for 1871. The following table has been compiled from the last three census takings, and, while valuable for reference as to the main items in the agricultural industry, it is also a statistical statement of 20 years' growth.

DOMINION OF CANADA — CENSUS STATISTICS OF AGRICULTURE.

ITEMS	1881	1891	1901
Acres occupied.....	45,358,141	60,287,730	63,422,301
Acres improved.....	21,899,181	28,537,242	30,163,496
Acres in field crops..	15,112,284	15,662,811	19,763,740

Cheese, pounds.....	63,901,152	114,981,514	220,833,269

Having given the above totals for Canada as a whole, it may now be interesting to give details by provinces. The following tables compiled from the same sources as the preceding will enable the reader to compare the various provinces. The following conclusions may be drawn; farms west of Lake Superior are more than twice as large as those east of the lake; from eighty to ninety per cent of the farms of Canada are owned by the occupiers; Ontario possesses nearly one half of the farm wealth of Canada; while mixed farming is followed in Ontario, the live stock industry is paramount and far exceeds that of all the other provinces combined; Manitoba has become the chief wheat-producing province of the Dominion.

The agricultural growth of Canada has far outstripped its increase in population. The confederation of provinces took place in 1867. The following table gives the year by year exports of agricultural products taken from the Trade and Navigation Returns wherein they are arranged under two groups; animals and their products, and field products. These totals can be

given only for Canada, not by Provinces. In the Government returns the exports are entered under the provinces whence they are shipped. Students are cautioned against considering these as the provinces of production. For example, as Montreal (Quebec) is the main port of export for Ontario, most of the Ontario agricultural exports are entered in the Blue Book as shipped from Quebec Province.

TOTALS OF EXPORTS — FIELD PRODUCTS AND ANIMAL PRODUCTS. 1868-1903.

	Animals and products of	Field products, etc.	Total
1868.....	\$ 6,893,167	\$12,871,055	\$19,341,387

1902.....	59,161,209	37,152,688	94,517,019
1903.....	69,817,542	44,024,321	114,441,863

In the above table the years end 30 June: they are fiscal years, not calendar years.

Having given the totals as showing the steady upward movement in surplus products, it will next be in order to give some details that we may see the causes of the main increases. The following table shows that in field products the increase is due mainly to wheat and flour, and the recent increase of wheat farming on the prairies of Manitoba and the North West Territories is the key to this. The export of live animals has not changed much in the past twenty years. In animal products, cheese, bacon and butter largely account for the increase. The total of the exports of these three products in 1891 was \$10,701,907, whereas in 1903 the total was \$47,122,735. When it is considered that these are concentrated products, the result of higher agricultural skill, the secret of Canadian agricultural prosperity in recent years may be readily understood.

The Minister of Agriculture for Canada is a member of the Dominion Government and Parliament. He has under his control a well-organized department with specialists in charge of the various branches. The transportation and marketing of farm products is a matter that comes particularly under his

* Hay not included (forage only) as it is got from the prairie grass. Some timothy is grown in Manitoba.
† Low average due to failure of grain crop in census year.

care. The starting of various lines of work in the newer provinces, such as dairying and stock raising, has received special attention, the practice being to hand this work over, when successfully going, to the local Provincial Departments. The Dominion Department has a well arranged series of experimental farms. The central farm is at Ottawa, Ont.; the branches are at Nappan, N. S.; Brandon, Man.; Indian Head, N. W. T.; and Agassiz, B. C. All are under the control of one Director and each farm is interested in carrying on experiments profitable to the Province in which it is situated.

Ontario.—The settlement of Ontario began in 1784, when several thousand Loyalists, mainly from New York and New Jersey, moved in at the close of the Revolutionary War. They were of mixed nationality and took up land on the frontier from Detroit in the west to the present eastern limits of the Province on the St. Lawrence a few miles above Montreal. In the clearing away of the forests timber and potash were the two marketable farm products. As the cleared land increased wheat became a surplus product. The over-sea immigration began in 1816 after the close of the Napoleonic wars, became quite large about 1825, and continued

down to the middle of the century. Up to this time the population was mainly rural: the following statement of population, therefore, will fairly indicate the growth of the farming population.

1784.....	about 10,000	1841.....	about 500,000
1812.....	about 75,000	1848.....	about 726,000
1824.....	about 157,000	1851.....	952,000

The middle of last century was the "growing time" in Ontario, and at that time wheat was king. This branch of farming received a remarkable impetus during the Crimean War, 1854-6 and at the same time the Reciprocity Treaty between Canada and the United States permitted the interchange of the natural products of the farm. (See CANADA — RECIPROCITY BETWEEN CANADA AND THE UNITED STATES.) This period of inflated prices was prolonged by the Civil War in the United States and continued down to 1865. The year 1866 marks a new era in Ontario agriculture. The Reciprocity treaty was discontinued and a tariff wall erected in its place. European grain prices had come down and wheat growing in Ontario suffered as a consequence. The British settlers that had been coming in a steady stream across the Atlantic during the pre-

Total farm products.....	\$28,197,936	\$40,740,269	\$38,358,546	\$78,108,380	\$95,261,099	113,210,933

* This list does not include Furs, as they are not agricultural products. This accounts for the totals of this table being somewhat less than those of preceding.

vious two decades had introduced a new element — they brought with them an acquaintance with and love of high class stock of all kinds. Dairying, sheep breeding, the rearing of pure bred beef animals and of heavy horses, now brought some relief to the farmer. Gradually he built up also a big barley trade that was temporarily very profitable but ultimately ruinous to the farm lands. The competition of the rich cheap farm lands of the Western States now began to tell upon Ontario farming and the struggle was acute. Here and there a bright year intervened. The 6th of October 1890 started a new era, apparently worse than the preceding, for then the McKinley Tariff came into operation and at one sweep the agricultural trade with the United States completely disappeared. Barley, eggs, butter, mutton, poultry, horses and many other products that had been shipped to the South, dropped in value and the farmer was face to face with the most serious situation he had known since the days of pioneer hardship.

The tale as told in figures is interesting. In the three years prior to the McKinley Tariff (1888, 1889 and 1890), the Canadian Agricultural exports to the United States amounted to \$46,500,000; in the three years following the same, (1892, 1893 and 1894) they amounted to only \$20,400,000. There is, however, another side to the story and this is an interesting part of Canadian history. In the three years, 1888, 1889 and 1890, Canada's exports to Great Britain averaged \$20,000,000 a year; for the three

years, 1900, 1901 and 1902 they averaged \$71,500,000. The loss in the United States market has thus been made up over and over again in the British market. This forced seeking for a new market has brought about a very important change in Ontario farming, and the progress made in the past six years is most remarkable. The following statement briefly tells the story. It is taken from the annual reports of the Ontario Department of Agriculture.

PRODUCTION OF ONTARIO FARMS.

	1896	1902	Increase
Beef	\$12,000,000	\$23,000,000	\$11,000,000
Bacon and pork.....	10,000,000	20,000,000	10,000,000
Cheese	9,000,000	15,000,000	6,000,000
	\$31,000,000	\$58,000,000	\$27,000,000

If we add other products, we may state that in 1902 and 1903 the farm products of Ontario were worth from \$35,000,000 to \$40,000,000 more than they were six to ten years ago. In other words, the average income of the 175,000 farmers in 1903 was at least \$200 more than six years ago. As it cannot be supposed that all farmers have participated equally in this gain, it will be seen that the increased profits of the more progressive among them must have been very great. Therein is the explanation for the continuance of good times in Ontario down to the middle of 1904, when this article is being writ-

CANADA — AGRICULTURE

ten. The steady increase in the numbers of live stock kept on Ontario farms has resulted in a steady improvement in the production of grain and forage crops, but these have not been marketed as crude products but have been turned into beef, bacon, and cheese. The above table, in brief, represents the greatest and most important factor in the Ontario agriculture of recent years.

Fuller details cannot be given here, but those who may desire a more minute study of this question will find full information in the annual reports issued by the Ontario Bureau of Industries, the statistical branch of the Department of Agriculture, Toronto, Ont. The breeding of pure bred stock is an important part of Ontario agriculture. Clear air, clean water in abundance and good pasture are there found, while as stated above a large number of the farmers have come from the British Isles where live stock breeding and feeding form so important a part of farm work. Fruit growing is steadily increasing in the Province. The most southern point of Ontario is in the same latitude as Chicago and Boston, and Southern France and Central Italy. The Great Lakes have a modifying and controlling influence on the climate. The consequence is that while apples grow to perfection in nearly all parts of the Province, cherries, plums, pears, peaches and grapes are very profitably grown along the borders of the lakes. As a rule the fruits of Ontario are of high flavor. Probably the greatest surprise that comes to a stranger in making a personal study of Ontario is the finding of such a wide range and great abundance of sub-tropical fruits of large size and fine flavor. As an outcome of this there are many extensive fruit canning plants in Ontario. Dairying has for many years been a leading industry. Butter making in creameries has not been so extensive as cheese making in factories. In 1883 there were 635 cheese factories: in 1902 the number was 1,127. The output in the same time increased from 53,500,000 lbs. to 1,46,800,000 lbs. Most of these factories are conducted on the co-operative plan. The improvement in agricultural methods and the increasing production of concentrated high class products should show an effect in increasing farm values. The following table is therefore interesting as summing up in a condensed form the farm progress of the past few years. It is compiled from the annual reports of the Provincial Department of Agriculture.

ganized along all lines of agricultural work having, under the Deputy Minister, specialists in charge of the various branches. Through it is directed the Agricultural College and Experimental Farm at Guelph; Farmer's and Women's Institutes, that hold about one thousand meetings every year; three dairy schools at Guelph, Kingston and Strathroy; thirty instructors who give instruction at the cheese factories and creameries; six live stock associations that are interested in the breeding and exporting of pure bred stock and the holding of Winter Shows at Guelph and Ottawa; the direction of twelve fruit experiment stations; the superintendence of 300 Agricultural Societies; and many other lines of work. The Department prints and publishes all the bulletins and reports prepared at the Agricultural College and by the various Societies and Associations, and also collects, compiles and publishes annually bulletins and reports on crops and farm statistics.

Quebec.—The rural population of Quebec consists of two classes or nationalities. The original settlers from France were located as tenants on the seigniories along the Saint Lawrence River; while the English-speaking settlers from Vermont, New Hampshire, and other northern States, coming in by way of Lake Champlain, settled in the district adjacent to the Lake, still known as the Eastern Townships. These two classes carry on agricultural work of an entirely distinct nature. The French Canadian farms are long and narrow; their houses and outbuildings are peculiar; their cattle and horses trace back to Norman and Breton types, and their methods of work are characteristically French. The English-speaking farmers of the Eastern Townships make specialties of live stock and dairying and their style of farming is quite similar to that of Ontario.

The Minister of Agriculture at Quebec has a department to carry out his work. He is assisted also by a representative Council of Agriculture. Agricultural Societies exist in all the counties. There is a vigorous Provincial Dairy Association, having supervision of a Dairy School at Saint Hyacinthe. There are agricultural schools or colleges in various parts of the Province conducted by religious orders that are assisted by the government.

Nova Scotia.—This Province has 172 agricultural societies with about 10,000 members. Through these societies pure bred animals are imported and distributed. Dairying is increasing,

VALUES OF FARM LANDS, BUILDINGS, IMPLEMENTS AND LIVE STOCK.

The public direction of agricultural work in Ontario is by the Provincial Department of Agriculture at Toronto, presided over by the Minister of Agriculture, who is a member of the Provincial Government. This Department is or-

there being in 1903, 18 creameries, 13 cheeseries and 4 condensers. Fruit growing, however, is the most advanced branch of Agriculture. The apples of the Annapolis and other valleys have a world wide reputation. In order to extend this

CANADA — AGRICULTURE

industry the Provincial Department of Agriculture has started model orchards in various counties. The Province exports from 500,000 to 1,000,000 barrels of apples in good yielding years. There is a school of horticulture at Wolfville. A school of agriculture is now being organized at Truro. Agriculture is taught in the public schools of this Province.

New Brunswick.—Like Nova Scotia, New Brunswick has derived its wealth from fisheries and forests rather than the cultivated field. Agriculture, however, is improving. Dairying is extending: there being now 40 butter factories and 55 cheese factories. A very successful dairy school has been conducted for some years at Sussex, N. B.

Prince Edward Island.—This is a fertile province with mild summer climate and possessing all the requirements for a fine stock country. Potatoes and mutton are the two special products. There are 52 cheese factories. Agriculture is taught at the Prince of Wales College, Charlottetown, the Professor of Agriculture having charge of experimental work for the whole Island.

British Columbia.—The largest Province of Canada, derives its wealth from forests, mines and fisheries. Agriculture as a serious business is of comparatively modern origin. The long valleys of the south and west possess a very rich alluvial soil and have a mild climate. Fruit culture is one of the most promising branches; the trees mature early and yield heavily. There is now a limited quantity of fruit available for export. The more progressive farmers are, with the help of the Provincial Department of Agriculture, importing pure bred breeding stock from Ontario, the great centre of live stock for all Canada.

Manitoba and the North West Territories.—The agricultural story of this great region is told most briefly in the following tables

	Acreage prepared for crop 1904	Total suitable for cultivation
Manitoba	2,385,505 acres	27,000,000 acres
N. W. Territories	1,706,100 acres	144,000,000 acres
Totals.....	4,091,605 acres	171,000,000 acres

Land cultivated in 1904 is therefore 2.3 per cent of the cultivable land.

CANADA — MINERALS

Manitoba has a vigorous Department of Agriculture, collects and publishes crop bulletins, maintains a dairy school, and is just now establishing an agricultural college near Winnipeg. See CANADA — THE GRANGER MOVEMENT; CANADA — COMMERCE, TARIFFS, AND TRANSPORTATION; AGRICULTURE.

C. C. JAMES,

Deputy Minister of Agriculture for Ontario.

37. **Canada — Minerals.** From a country so vast and of such varied geological structure as Canada one expects a wide range of mineral deposits, and the expectation is not disappointed, for already most of the minerals known to exist elsewhere have been found in the Dominion, and often in important deposits, though only its southern fringe has been explored. However, up to the present, Canada's mineral production must be looked on as at the stage of promise rather than performance, except in a few substances where nature has given her the lead. For example, the world's supply of asbestos comes from the province of Quebec, and more than half of its supply of nickel is obtained from a single mine in Ontario, while the richest placer gold region is in the Yukon territory (see KLONDIKE, THE; ALASKA). On the other hand, Canada is backward in the production of iron and steel, basic factors in the development of a country, and stands low as a producer of coal, though the fact that the only deposits of good coal on tide-water in America, both on the Atlantic and Pacific, are Canadian is a fact of much importance which has produced great metallurgical industries in Nova Scotia.

Until recently the exploitation of Canadian mineral resources has been largely due to foreigners, especially Americans; but Canadian skill and capital are now turning in this direction. In 1903 the total value of the mineral products of Canada was \$63,222,510, about \$11 for each inhabitant, as compared with \$15 per capita in the United States, where the total reached \$1,250,000,000 in 1902. The area of Canada is about equal to that of the United States, and in the parts best explored its mineral resources give promise of equaling in value those of corresponding States of the Union; so that an immense expansion in mining is to be looked for in the next generation.

The mineral production of Canada is very unequally distributed among the provinces, British Columbia coming first, followed by Ontario, the Yukon and Nova Scotia, with the remaining provinces far in the rear. In per capita production the order is different, Yukon territory, with its tiny population of 20,000 or 30,000, almost equaling Ontario with more than 2,000,000 inhabitants, while British Columbia stands second and Nova Scotia third.

Of the maritime provinces of eastern Canada only Nova Scotia can be described as a mining region, gold and coal having been produced there for nearly half a century. Quebec is not of great importance except for its asbestos mines. Ontario produces a variety of minerals, nickel being the foremost, while British Columbia provides gold, silver, copper, lead, and coal; and the Yukon gold.

Following the usual classification, the minerals of Canada may be taken up under three heads, metals, non-metallic minerals, and structural materials.

METALS.

Ores of 13 metals have been mined in Canada, antimony, chromium, cobalt, copper, gold, iron, manganese, mercury, molybdenum, nickel, platinum, silver, and zinc, and minerals containing a number of other metals have been found, though they have not yet been mined. Only six of these metals are prominent economically, gold, silver, nickel, copper, lead, and iron, and attention will be directed mainly to them.

Gold.—The gold areas of Canada are widespread but the production has been very fluctuating, the value in recent years varying from \$907,601 (in 1892) to \$27,908,153 (in 1900), and standing at \$18,834,490 in 1903. In 1900 Canada was third in rank as a producer of gold, being surpassed by the United States and Australia only; but has dropped to the fifth place since then, yielding to South Africa (see AFRICA — *Geology, Minerals*; TRANSVAAL) and Russia (see RUSSIA — *Minerals*). Three provinces and one territory are gold producers at present. Nova Scotia has carried on quartz mining, on "saddle reefs" like those of the famous Bendigo region in Australia, for more than 40 years, and of late has exceeded \$500,000 per annum, the value reaching \$627,357 in 1902. Ontario also produces gold from quartz mines, but with less steadiness than Nova Scotia, the value running from \$421,591 in 1899 to \$188,000 in 1903. Before the sudden rise of the Klondike, British Columbia was the greatest gold region of Canada, its history beginning with the times of wild excitement in the '60s, when thousands of miners from California swarmed into the rich placers of the Fraser and Columbia rivers and washed out millions of dollars worth, reaching the climax of \$3,913,563 in 1863. The easily available placers were gradually exhausted, the value falling in 1893 to \$379,535, a little less than the output of Nova Scotia in the same year; but the production of lode gold, especially from the smelting ores of Rossland, on the southern edge of the province, has once more placed British Columbia in the first rank. In 1902 the yield was \$5,961,409, of which \$1,073,140 came from placer mines, mostly in the Cariboo and Atlin districts in the north, the rest from smelting ores and a few quartz mines in the south.

The territories have furnished a small amount of placer gold from bars on the Saskatchewan and other rivers for a number of years, but it was not until the working of the Klondike placers in 1897 that gold mining assumed importance in the north. This region, in lat. 64°, 500 miles below the head-waters of the great Yukon River, is unique as a placer mining country, reminding one of the famous placers of California and Australia, but surpassing them in difficulty of access and of working conditions, as well as in richness. For its length Eldorado Creek, a tributary of Bonanza Creek, was the most productive ever mined, but its gravels are nearly worked out, and the yield of gold, though still great for so small a region as the Klondike, which is about 40 miles square, has fallen since 1900, when it was estimated at \$22,275,000, to \$12,250,000 in 1903. The gold-bearing gravels are perpetually frozen and usually buried under several feet of frozen muck, so that the ground must be thawed before it can be worked. At first this was done by building fires, but more recently steam delivered from steel pipes driven into the ground has been employed, and it is

CANADA — MINERALS

found, also, that when stripped of moss the warm summer's sun thaws layer after layer, which may then be sluiced off in the ordinary way. As methods are improved and the cost of living diminishes, much poorer gravels can be worked profitably, so that the placers of Yukon territory will no doubt be productive for a generation to come, even if no important new finds are made. It is probable, however, that the Klondike output will slowly diminish or only hold its own in the future, and that the British Columbian production will increase, leaving the total for Canada not very different from what it is now. See **GOLD**—*World's Production*.

Silver.—A generation ago Ontario was the chief province for silver, the Silver Islet mine near Thunder Bay, on the north shore of Lake Superior, being credited with a production of \$3,250,000, while several other mines were worked west of Thunder Bay; but in recent years British Columbia has taken the lead, beginning in 1895 and culminating in 1897 so far as value is concerned, with more than \$3,000,000 worth. The fall in the price of silver, and also of lead, with which it is always associated in British Columbian ores, has caused a serious shrinkage in production, only 3,182,000 ounces, valued at \$1,700,779, having been reported from the whole of Canada in 1903. Of this a small amount was derived from the gold of the Yukon and trifling quantities from Ontario and Quebec, the rest from British Columbia, where the mines of the Slocan region in the south are most important. See **SILVER**—*Silver-producing Districts*.

Nickel.—This metal has become of practical value only within the last 20 years, and methods of reducing its ores are still somewhat in the experimental stage. The world's supply comes almost entirely from two regions, the Sudbury district in northern Ontario and the French penal colony of New Caledonia. Until the last year or two New Caledonia was somewhat in advance, but in 1903 Sudbury passed it in production and seems likely to hold its position in the future. The mines are all situated round the edge of a basin-shaped sheet of eruptive rock 37 miles long and 15 broad, and among them the Copper Cliff, which is about 1,000 feet deep, produces the richest ore, while the Creighton, a few miles to the west, is the greatest nickel mine in the world, supplying 18,000 tons of ore per month. Nearly as much copper as nickel is produced in these mines, and also small amounts of cobalt, gold, and platinum, the last metal occurring in the rare arsenide sperrylite, first found in the district. In 1903 matte smelted from the roasted ore contained 6,998 tons of nickel, mostly mined and treated by the Canadian Copper Company. The value of the nickel in the matte was placed at \$2,499,068, while the refined metal was estimated to be worth \$5,000,000. See **NICKEL**.

Copper.—Copper has been mined in Newfoundland, Nova Scotia, New Brunswick, Quebec, Ontario, and British Columbia, but only the last two provinces are important producers. The copper of Quebec is a by-product of the iron pyrites of the Eastern Townships; and most of the copper from Ontario is, as shown above, produced as an accompaniment of the Sudbury nickel ores, though mines of copper alone are worked at Massey and one or two other points in western Ontario, not far from the

once well-known Bruce mines, north of Lake Huron, which were prosperous half a century ago but are no longer worked. British Columbia supplies more than three fourths of the copper mined in Canada, chiefly from the gold-copper ores of the Rossland region and the large low grade deposits of the Boundary district, but numerous other deposits are known along the Pacific coast of the province and in the White Horse district of Yukon territory. The total production of copper in the Dominion in 1903 was 21,640 tons, valued at \$5,728,261. See **COPPER**, *WORLD'S OUTPUT OF*.

Lead.—Almost the whole of the lead mined in Canada comes from the silver-lead ores of southern British Columbia, which began to be opened up extensively in 1893 and furnished 31,500 tons in 1900, but sank in 1903 to 9,000 tons with a value of \$762,660. The falling off is attributed to adverse conditions imposed by the smelters of the Western States, which had bought the ores at advantageous rates in former years. To stimulate lead mining and smelting in British Columbia the Dominion government has provided a bounty on lead smelted and refined in Canada, and it is expected that lead mining will recover some of its former prosperity. See **LEAD**.

Iron.—In regard to the most important of all metals, iron, Canada is backward, largely from the fact that the ore deposits and the fuel for treating them are generally widely sundered. Nova Scotia, Quebec, and Ontario are producers of iron and steel, the first province having the great advantage of supplies of coking coal on the seaboard, at Sidney in Cape Breton Island and other points, so that two large iron and steel plants are in operation there. Most of the ore smelted is, however, in a sense foreign, coming from Bell Island, off the coast of Newfoundland. The province of Quebec has for generations smelted a small amount of bog iron ore in charcoal furnaces near Three Rivers, the product being of high grade and used for special purposes. Charcoal iron furnaces were operated on a small scale in different parts of Ontario, also, from 50 to 100 years ago, but when railways began to bring in British iron the industry ceased. Within the last few years large furnaces using American coke, and in part American ore, have sprung up at Hamilton, Midland, and the Sault Sainte Marie, and some charcoal furnaces have come into operation.

Deposits containing millions of tons of fair grade ore have been found in Hutton township, Michipicoton, and other points in northern Ontario in rocks similar to those of the great iron regions of Michigan and Minnesota, so that iron production is likely to increase in the future, particularly since the governments of the Dominion and of the province have provided bounties for iron and steel of home production. British Columbia also possesses large deposits of iron ore and excellent coking coal, so that an iron industry like that of Nova Scotia may be expected to grow up as the province becomes more populous. In 1903 the amount of pig iron produced in Canada was 297,885 tons, valued at \$3,742,710, of which, however, only 42,052 tons were from Canadian ore, the rest being from Newfoundland and American ores. The quantity of steel produced is not given, but in the previous year it was 182,037 tons. See **IRON AND STEEL INDUSTRY IN AMERICA**.

CANADA — MINERALS

NON-METALLIC MINERALS.

Twenty-three non-metallic minerals are reported in the statistics for 1903, and several others occur in lists of former years, but attention may be confined to a few of the more important ones, beginning with the mineral fuels.

Coal.—In 1903 the coal raised in the Dominion amounted to 7,990,634 tons, valued at \$15,957,940, Nova Scotia producing more than 5,000,000, and British Columbia most of the remainder, though the territories are credited with about 500,000 tons. The coal supply of the great manufacturing province of Ontario comes entirely from the United States; but, on the other hand, Nova Scotia exports 500,000 tons to the New England States and British Columbia 750,000 to California and other Western States. Besides the rich bituminous coal beds of Nova Scotia and of Nanaimo and the Crow's Nest Pass, in British Columbia, which are the most important producers in Canada, lignite or lignitic coal of poorer quality is mined at numerous points on the prairies, which are largely underlain with seams of the kind, and valuable mines are worked in the foot-hill region near the Rockies. A few small areas in Bow Pass, nipped in during mountain building, approach anthracite in quality. Great coal fields are known to exist near the Skeena River and at other points in northern British Columbia and the territories to the north and east. The coal fields of western Canada are mainly of Cretaceous age, unlike those of Nova Scotia and the Eastern and Southern States, which are Carboniferous. In all there are probably not less than 100,000 square miles of coal fields in Canada, and the extent may prove to be much greater than this. See *COAL—Coal Fields of the World.*

Petroleum and Natural Gas.—At present Ontario is the only producer of petroleum, which comes from a small area in its southwestern peninsula. Crude oil and its products to the value of \$1,586,674 are reported in 1903, but the supply is slowly diminishing and before long will be exhausted unless other pools are struck. Petroleum is known from Gaspé in Quebec and from the Crow's Nest Pass in the Rockies, and great stretches of "tar sands" along the Saskatchewan and Athabasca suggest oil deposits, though productive wells have not yet been sunk in these regions. (See *PETROLEUM INDUSTRY, THE.*) Natural gas has been exploited in Essex and Welland counties of southwestern Ontario, but the yield of the Essex field has greatly fallen off in the last two or three years. In 1903 the wells of Ontario furnished gas to the value of \$196,535. Gas is known also and slightly put to use at Medicine Hat and Langevin, on the prairies. (See *GAS, NATURAL.*) Peat bogs exist over thousands of square miles of northern Ontario and Quebec, a reserve of fuel that may some day be drawn upon, but which is barely touched at present, though a few plants have been operated for drying and compressing peat to serviceable briquettes.

Minor Economic Minerals.—After the fuels come several less important minerals, asbestos being the chief one, with an output of 42,328 tons, valued at \$904,853. The whole product, which means practically the world's supply, comes from a few mines in serpentine rocks in

the Eastern Townships of Quebec. The value of this beautiful silky-fibred mineral depends on the fact that it is an incombustible material which can be spun and woven. Next in value is gypsum, the raw material of plaster of paris, of which 307,489 tons are reported, worth \$384,259, mainly from New Brunswick and Nova Scotia. Salt is produced to the amount of 53,537 tons, valued at \$334,088, from wells in southwestern Ontario; and mica is mined in the provinces of Ontario and Quebec, to the value of \$159,473. Ontario being the largest producer in the world of this mineral, so important as an insulator in electric machinery. Pyrites, used chiefly in the chemical industries, is produced to the value of \$126,133 in Quebec; and a new item has recently appeared in the statistics of Ontario, corundum, the hardest mineral next to diamond. In 1903 the output was valued at \$87,600, and the crushed material is beginning to replace emery as an abrasive. Although these deposits of corundum are the largest known, the gem varieties, ruby and sapphire, have not yet been found in the province. Among minor non-metallic minerals may be mentioned chromite, mineral paints, graphite, feldspar, diatom earth, and arsenic, having an annual value of from \$15,000 to \$35,000 each.

STRUCTURAL MATERIALS.

Building-stone, clay for brick-making, and marl or limestone and clay for the manufacture of cement are, of course, found in all the provinces; but the greater part of the clay products and almost all the cement are manufactured in Ontario, which in 1903, according to the Bureau of Mines, made brick, tile, etc., to the value of \$2,185,509, and Portland and natural rock cement worth \$1,252,118. Quebec is the greatest producer of granite and other building and ornamental stones, but definite statistics regarding them are hard to obtain. In 1903 the Geological Survey gives the following statistics of structural products of the Dominion:

Cement, natural rock.....	\$ 75,655
Cement, Portland	1,090,842
Granite	150,000
Pottery	200,000
Sands and gravels (exports).....	124,006
Sewer pipe	317,970
Slate	22,040
Terra-cotta, pressed brick, etc.....	386,532
Bricks, stone, lime, etc.....	5,650,000
Total	\$8,017,045

It will be noticed that the Ontario Bureau of Mines shows a greater value for the cement manufactured in that province than the whole Dominion is credited with in the table just given, showing the uncertainty of the statistics of this class of products.

Summing up the mineral production of Canada in 1903, we have the following results as shown by the Geological Survey:

Metals	\$33,707,403
Mineral fuels	18,716,543
Other non-metals	2,485,519
Structural materials	8,017,045
Estimate of minerals not reported.....	300,000
Total	\$63,226,510

This shows a falling off since 1901, when the total was \$66,339,155, but the difference is much more than accounted for by the diminished production of gold in the Klondike. In

CANADA — THE FORESTS AND LUMBER INDUSTRY

all other departments, except the mining of silver and lead, there has been a steady advance, which may be expected to remain.

The following table, showing the production at five-year intervals, illustrates the rapidity of the increase since statistics have been kept by the Geological Survey:

1886 (first year of statistics).....	\$10,221,255
1888	12,518,894
1893	20,035,082
1898	38,697,021
1903	63,226,510

It will be seen that the mineral production has nearly doubled every five years, and has increased at a very much more rapid ratio than the population, which has been far from doubling since 1886, though the mining industry has gained six-fold. The prospects of advance in the future are bright.

Statistical information as to the mineral production of the country as a whole may be found in the annual reports of the Geological Survey of Canada (Section of Mines, compiled by Elfric Drew Ingall), and in the annual volumes of the 'Mineral Industry.' The mining departments of the provinces of Nova Scotia, Ontario, and British Columbia also publish annual reports of much value, in which information is given as to their special mining industries. The statistical materials for this paper have been largely drawn from these sources.

A. P. COLEMAN,

Professor of Geology, University of Toronto.

38. Canada — The Forests and Lumber Industry. Until further explorations are made it will be impossible to give more than a rough estimate of the vast extent and value of the forests of Canada. The total area of the Dominion is estimated at 3,315,647 square miles. Of this about 40 per cent, or 1,326,258 square miles, is supposed to be in forest. Not only is the area of vast extent, but the varieties of trees are very numerous, and among them are found some of the most valuable species. Professor John Macoun gives 121 as the total number of indigenous species. Among these are the different varieties of the pine, spruce, fir, hemlock, cedar, oak, maple, beech, birch, poplar, basswood, elm, ash, hickory, walnut, and various others of more or less commercial value. The white pine is the tree that has brought most wealth to the people of the eastern provinces, while the fir, the cedar, the hemlock, and the spruce are the varieties of greatest value west of the Rocky Mountains. Within recent years the development of the pulp industry has brought into more general use the wood of the spruce, it being particularly well adapted for that purpose, and as it is one of the most widely distributed of Canadian trees, extending from the Atlantic on the east to Alaska on the west, and from about lat. 45° N. to the limit of tree growth, the Dominion holds an almost unlimited supply for this purpose. The Federal government has charge of the forests on Dominion lands proper. These embrace the province of Manitoba, the Northwest Territories, and also a part of British Columbia known as the Railway Belt, the last named consisting of a district 40 miles wide, 20 miles on each side of the main line of the Canadian Pacific Railway, and containing about 20,000 square miles. It is estimated that the area of forest thus under

Dominion control (not including the Indian reserves in the old provinces or those in British Columbia) is 742,578 square miles, while that under the control of the Provincial governments is 506,220 square miles. It has been the policy for many years of both the Federal and Provincial governments to grant licenses permitting the holders to cut timber on certain areas of the Crown domain. These licenses are obtained by public competition, and only give the owners the exclusive right to cut within the areas specified. They get no rights to the land, and in addition to the bonus paid at the time the license is given a specified annual ground rent is collected, and also in most cases stumpage dues of a stated amount per thousand feet when the timber is cut.

The report of the Department of Trade and Commerce for the year ending 30 June 1903, shows the value of the exports of forest products of the Dominion for that year to be \$36,386,015. The figures also show an average increase for the past five years of nearly \$2,000,000 per annum, while the increase of last year over the preceding one is over \$4,000,000. This trade is at present mostly confined to Great Britain and the United States, the exports to the former last year being valued at \$16,742,435, and to the latter at \$16,977,232; while those to all other countries only amounted to \$2,666,348. But with the increased demand for lumber in foreign countries, and especially of those bordering on the Pacific Ocean, both in South America and eastern Asia, and the ability of British Columbia to furnish a large supply, it is improbable that these proportions will be long maintained. This province is destined in a few years to take a prominent, if not a leading, place with her sister provinces of the East in the lumber trade of the country. It should be noted that the exports give only a comparatively small part of the total products of the forests, and as the census returns for 1901 are not yet (1904) fully tabulated it is impossible to give as full information as is desirable. These returns, however, give the value of the products of the saw- and pulp-mills alone for the previous year as \$53,051,865, while the capital invested was \$67,164,226, the number of employees 54,726, and the wages paid \$12,198,914. They also show the raw products to amount to \$51,082,695, made up as follows: From Ontario, \$21,351,898; Quebec, \$18,969,716; Nova Scotia, \$3,409,528; New Brunswick, \$2,998,038; British Columbia, \$2,634,157; Manitoba, \$950,057; Northwest Territories, \$484,263; Prince Edward Island, \$285,038. But all these figures together give only a part of the value that the inhabitants derive from their timber. It is used by the backwoods pioneer in a rough state for his dwelling and other farm buildings, for fencing and fuel, and for numerous implements in his daily use, and it furnishes employment to a large section of the population in the manufacture of articles in which wood is the chief ingredient. Not only are the forests of Canada of vast extent, but the facilities for floating logs to the mills for manufacturing are perhaps unequaled in any other country. It is pre-eminently a land of forest, lake, and stream. Great stretches of country form the basins from which certain large rivers derive their waters. Within each of these is an almost endless number of lakes of all dimensions, connected by streams

CANADA — THE FORESTS AND LUMBER INDUSTRY

of varying sizes, but all serving as feeders to the great river which serves as their outlet. The timber is usually cut in the winter and drawn to one of these streams. There it remains till the spring opens, when it is carried by the current down to its destination. In many cases no rafting or towing is necessary. All that is required is that a few river men watch the "drive" till it reaches the boom at the mill. The facilities afforded for the development of water-power are very great, and many of the saw-mills, pulp-mills, and various other industrial establishments are run by such power. While the percentage of land in forest in Canada as a whole is very large, there are many districts in the older provinces where the denudation has gone far beyond what good economic conditions demand, and the yearly destruction caused by spring floods is followed by the consequent summer drought. The census of 1901 gives the percentage of woodland on the farms in the five eastern provinces as follows: Ontario, 22 per cent; Quebec, 38 per cent; New Brunswick, 57 per cent; Nova Scotia, 56 per cent; and Prince Edward Island, 30 per cent. But this favorable condition is made by the large proportion of forest still existing on the farms of the pioneer settlers in the newer districts, counterbalancing the prairie-like condition of many of the older settlements, in some of which 5 per cent of woodland would be an over-estimate.

The practice of reserving from settlement certain areas of land for timber reserves has been adopted within recent years in Dominion territory, and also in the provinces of Ontario and Quebec. The object of reserving these tracts is not only for the supply of timber they will afford, but more especially to conserve the water supply at the sources of rivers and streams. These reserves are nearly all in elevated situations, such as the Rocky Mountains, the Riding and Moose mountains, on Dominion lands; the Algonquin Park, the Temagami and Mississaga reserves, which embrace large tracts of land at the sources of several of the large streams of northern Ontario, in Ontario; and the Laurentides National Park, at the summit of the Laurentian range of mountains, in Quebec. In 1903 the areas set aside for such purposes by the Dominion government aggregated 9,686,880 acres, while those in Ontario contained 6,928,383 acres, and in Quebec 1,619,383 acres. Forest fires have destroyed vast quantities of timber in all parts of the country, but more especially in the coniferous regions extending from Nova Scotia and New Brunswick to British Columbia. Within the last few years, however, public attention has been awakened to the necessity of greater attention being given to the subject of forestry, and the Province of Ontario and the Dominion have now each established a forestry office as a branch of the public service. The Dominion office was started in 1899. The officials consist of a superintendent, assistant superintendent, inspector, several supervisors of tree planting, and a number of forest-fire rangers. The rangers are employed for a longer or shorter time each summer, as the necessities of the case require. The Ontario Bureau of Forestry is presided over by a director, and the work of the large staff of fire rangers employed has been the means of lessening the loss of timber to a very marked extent.

Similar results have followed the work of the government fire rangers on Dominion lands, and also in the Province of Quebec.

Co-operation with the settlers in forest tree planting on the prairie lands of Manitoba and the Northwest Territories has been established within the last three years, and is now assuming large proportions. The system adopted may be briefly stated as follows: Any land owner desiring to avail himself of the co-operation of the government applies to the Forestry Branch at Ottawa. These applications are tabulated and the land of the applicant is visited by one of the supervisors the following summer, when a plan of the proposed plantation is made. The next spring seedling trees are sent by express from the government nurseries free of charge. The settler enters into an agreement to set aside a certain portion of his land as a permanent forest plantation, to carefully prepare his soil according to the directions of the supervisors, to plant the trees on their arrival, and to cultivate and keep the ground clean till such time as the trees are of sufficient size to no longer need such attention. The varieties planted will vary according to the district of country where planted and prevailing soil and climatic conditions. The work is also designed to be educative and to furnish practical object lessons of the possibilities of tree culture on the open plains. In 1901 44 settlers received an aggregate of 58,800 trees; in 1902, 415 an aggregate of 468,900 trees; in 1903, 616 an aggregate of 920,000 trees; in 1904, 1,026 an aggregate of about 2,000,000 trees. Heretofore the seedling trees for distribution have been grown on the Government Experimental Farms at Brandon and Indian Head, but it is now proposed to centralize the work, and 160 acres of land have been obtained for a forest nursery station near Indian Head, Assiniboia, where buildings are being erected and preparations made by which the supply for the whole country will be grown in, and distributed from, that place. The Agricultural Department of Ontario has also this season (1904) started to grow forest trees at the Experimental Farm at Guelph for distribution to the farmers of that province.

A Canadian Forestry Association was organized in 1900, which is proving a very useful institution and doing much in the interests of forestry. Its purposes, as stated in its constitution, are: (1) To advocate and encourage judicious methods in dealing with our forests and woodlands. (2) To awaken public interest to the sad results attending the wholesale destruction of forests (as shown by the experience of older countries), in the deterioration of the climate, diminution of fertility, drying up of rivers and streams, etc. (3) To consider and recommend the exploration, as far as practicable, of our public domain and its division into agricultural, timber, and mineral lands, with a view of directing immigration and the pursuits of our pioneers into channels best suited to advance their interests and the public welfare. With this accomplished, a portion of the unappropriated lands of the country could be permanently reserved for the growth of timber. (4) To encourage afforestation wherever advisable, and to promote forest tree planting, especially in the treeless areas of our northwestern prairies, upon farm lands where the proportion of woodland is too low, and upon highways and in the parks of

CANADA — FISHERIES

our villages, towns, and cities. (5) To collect and disseminate, for the benefit of the public, reports and information bearing on the forestry problem in general, and especially with respect both to the wooded and prairie districts of Canada, and to teach the rising generation the value of the forest with the view of enlisting their efforts in its preservation. The officers embrace leading men from all parts of the Dominion, and reports of the annual meetings are printed in attractive form and widely distributed. The Association is now about taking another forward step in publishing a quarterly periodical, which will be devoted entirely to forestry. Action is also being taken to establish a course of study in forestry in certain colleges in the country. Altogether, the attention of the general public is now being directed in various ways to the necessity of greater attention being given to this subject than has been the case in the past.

E. STEWART,

Dominion Superintendent of Forestry.

39. Canada — Fisheries. Among the great industries of Canada the fisheries stand fifth in the order of value. The farming industry (mainly grain-growing) is estimated to yield \$208,000,000 per annum; the lumber industry \$80,000,000; stock-raising \$75,000,000; mining \$65,000,000, while the fishing industries are estimated to produce, on the whole, \$35,000,000 to \$36,000,000 annually. This estimate is much in excess of that reported in official returns. The latest report of the Marine and Fisheries Department, which gives the value for 1902, places it at \$21,959,433; but when account is taken of the amount of fish consumed by wandering tribes of Indians and Eskimo, with their hordes of fish-eating dogs, as well as the amount used as food by isolated settlers, miners, prospectors, lumberers and sportsmen and, above all, the employees at the Hudson's Bay Company's posts in the remoter parts of northern Canada, the total amount must be greatly in excess of official statistics.

Completely accurate returns are hardly possible, admirable as the Canadian system of gathering statistics is, so admirable that the late Prof. Brown Goode, head of the United States Fish Commission, declared at a fisheries conference in 1883 that “. . . other countries ought to study it with a great deal of care.” The domestic consumption of fish in the Dominion is stated, on high authority, to be not less than 100 pounds per head annually, as compared with 30 pounds in Britain.

The expansion of the Canadian fisheries since 1870 is sufficiently shown by the figures given below:

1870.....	\$6,577,391	1887.....	\$18,386,103
1871.....	7,573,199	1888.....	17,418,510
1872.....	9,570,116	1889.....	17,655,256
1873.....	10,754,997	1890.....	17,714,902
1874.....	11,681,886	1891.....	18,977,878
1875.....	10,350,385	1892.....	18,941,171
1876.....	11,117,000	1893.....	20,686,661
1877.....	12,005,934	1894.....	20,719,573
1878.....	13,295,678	1895.....	20,199,338
1879.....	13,529,254	1896.....	20,407,425
1880.....	14,499,079	1897.....	22,783,546
1881.....	15,817,162	1898.....	19,667,121
1882.....	16,824,092	1899.....	21,891,706
1883.....	16,938,192	1900.....	21,557,639
1884.....	17,766,404	1901.....	25,737,153
1885.....	17,722,973	1902.....	21,959,433
1886.....	18,679,288		

Number of Boats, Fishermen, etc.—Over 1,200 vessels (valued at \$2,620,661) and 41,667

boats (valued at \$1,199,598) are employed, while the fishing gear used, including nets, lines, lobster-traps, etc., is valued at over \$3,000,000. Certain branches of the fisheries have developed in a special degree, such as the salmon canning industry on the Pacific coast, and lobster packing on the Atlantic coast. The former, embracing about 80 canneries, represents an investment of about \$3,000,000, while the Atlantic lobster canneries, in Quebec and the three maritime provinces, numbering over 750, are valued at about \$450,000. Smoke-houses, curing and refrigerating establishments, in operation, are officially recorded at \$3,153,838 in value. In other words, a capital of over \$12,000,000 is employed in these various branches of the fisheries.

The total number of persons engaged either in fishing or in handling fishery products in Canada reaches about 80,000, of whom 60,000 take part in Atlantic fishery enterprises. On the Pacific coast 4,000 or 5,000 fishermen follow salmon netting, and 10,000 or 12,000 hands find employment as cannery workers, etc. The inland (fresh-water) fisheries engage a considerable number of fishermen, over 2,000 being employed in the Ontario or Great Lake fisheries, while, in Manitoba and the northwest territories, 3,000 or 4,000 men take part in the fishing operations.

Seven Fishery Districts.—Seven territorial divisions may be distinguished in a general survey of the fisheries of the Dominion, viz.:

1. The Atlantic division, from Grand Manan in the south to the coast of Labrador, including the Bay of Fundy (8,000 square miles), and the Gulf of Saint Lawrence (80,000 square miles), and characterized by deep-sea and inshore fisheries for cod, mackerel, haddock, halibut, herring, hake, lobsters, oysters, seals and white whales (*beluga*). Annual value, \$10,000,000.

2. The estuarine and inland waters of Quebec and the Maritime Provinces, including fisheries for salmon (by stake-nets, drift-nets and angling), striped bass, smelt, shad, gaspereau (alewife); and in the lakes, ouananiche or land-locked salmon, lake trout, togue or lunge, etc. Annual value, \$3,000,000.

3. Great Lakes division, including Lakes Ontario, Erie, Huron, and Superior, which Canada shares with the United States, the international boundary passing practically through the centre of these vast inland seas, all of which finally empty into the river St. Lawrence. This complex system of waters, with innumerable subsidiary lakes and rivers, abounds in lake whitefish (*Coregonus*), great lake trout (*Cristivomer namaycush*), lesser whitefish (erroneously called lake herring), sturgeon, pike-perch (doré or pickerel), black bass, brook-trout, maskinongé, pike, and numerous carpoid suckers, and bearded catfish. Annual value, \$2,000,000.

4. Manitoba and northwestern division, including Keewatin, etc., whose wide expanses of fresh water, such as Lake Winnipeg, Great Bear Lake, and Great Slave Lake, yield enormous quantities of whitefish, sturgeon, pike-perch, tullibee (a peculiar lesser whitefish), pike, gold-eye (a true fresh-water herring), large river-trout and catfish. Value, inclusive of an extensive “caviare” or sturgeon-roe industry, over \$1,000,000.

5. Pacific Interior division, extending from the Okanagan, Kootenay, and Arrow waters, in

the south, to the Yukon district, in the north, and covering an area of plain, valley and mountain 1,000 miles north and south, by about 500 miles east and west, intersected everywhere by rivers and lakes, and comprising limited fisheries for lake-trout, whitefish, land-locked salmon, river-trout, grayling, and numerous carps or suckers, not identical, for the most part, with eastern species. Annual value probably not exceeding \$500,000.

6. Pacific Coast division, the fisheries of which are little developed, if we except the estuarine and coastal salmon fisheries. The various species of salmon (belonging to the genus *Oncorhynchus*) include the blue-back or sock-eye, the spring salmon or quinnat, the coho, dog-salmon, humpback salmon, and a true *Salmo*, namely, Gairdner's salmon or steel-head. Halibut, skill or black cod, oolachan (candle-fish), anchovy, herring, sardine, smelt, and a great variety of other fishes, abound, which are not to any adequate extent utilized. Shark, dog-fish, rat-fish or chimæra, and whale fisheries exist, and there are limited oyster fisheries, while the famous fur-seal fishery (value \$400,000 to \$500,000 per annum, and employing nearly 1,000 men) is of importance, and is mainly an oceanic industry. Annual value, \$6,000,000, though in special years that amount may be exceeded.

7. Hudson Bay and Peri-Arctic division, from Ungava Bay, Labrador, to the Mackenzie River, or rather Herschell Island, Yukon district. Whale, walrus, sea-trout, Hearn's salmon, (a great spotted trout), the inconnu (resembling a river whitefish), pike, suckers, sturgeon, and possibly, salmon and cod, occur in these vast northern waters, of which Hudson Bay alone exceeds the Mediterranean in extent and has an estimated drainage area of 2,700,000 square miles. The richest whaling grounds in the world are in these remote regions of the Dominion, whose tidal channels, as the late Sir John Schultz declared, "are destined to be the last home of the leviathans which within the memory of living man have been driven from Newfoundland latitudes to the places where their survivors have now sought retreat." Hair-seals of various species, and white whales (*Beluga*), abound in these sub-arctic waters, and constitute valuable fisheries; one station, according to Dr. Robert Bell, securing no less than 2,800 of these small whales in one season.

Marine Fishing Grounds: Area, Kinds of Fish, etc.—The waters grouped in this seven-fold manner afford a field, hardly to be surpassed, for the development of extensive fisheries. The grounds, where fishing can be remuneratively carried on, off the eastern and western sea-board, embrace a total area of no less than 200,000 square miles, the Atlantic shore being over 5,000 miles in length, while the Pacific shore (British Columbia) exceeds 7,000 miles. On this latter coast, Hecate Straits (20,000 square miles) and the straits between Vancouver Island and the mainland, namely, the straits of Georgia and Fuca (15,000 square miles) afford the most remarkable sheltered fishing grounds in the world, being for the most part shielded from the open ocean, and extending inland as placid fiords and deep, salt-water inlets, the total area of these inshore waters being no less than 40,000 square miles in extent. The Canadian fishing banks on the Atlan-

tic coast are historic. They stretch from Labrador, Anticosti, and Gaspé in the north to the West Isles in the southern Passamaquoddy waters, including famous areas like the Bay of Chaleurs, off Quebec Province, Northumberland Straits, off Prince Edward Island, and New Brunswick, and Chedabucto Bay, off eastern Nova Scotia. Between the outer edge of the inshore areas and the deep-sea waters of the Atlantic the feeding and breeding grounds occur for cod, haddock, mackerel, and other valued edible fishes. "There is probably no part of the world," said Mr. P. L. Simmonds, the well-known fishery authority, "where such extensive fisheries are to be found, as in the Gulf of Saint Lawrence." Among the series of banks mainly resorted to by Canadian fishing boats are (passing from north to south) Great Bank, Green Bank, Bank Saint Peter, Misaine, Canso, Quero, Howe, Roseway, La Havre, and George's Banks, apart from the great fishing areas in the open Atlantic, such as the Grand Banks, which are not really in Canadian limits and are indeed mainly exploited by fishermen from more distant countries.

Fresh-water Fisheries.—If, owing to the superficial extent, and, no less, the coldness and purity of the marine waters of Canada, as well as the abundance of natural food, upon which cod, mackerel, halibut, herring, etc., subsist, the sea fisheries rank amongst the best in the world, it may be said of the fresh-water fisheries, that they are hardly inferior in these characteristics. The total area of the fresh waters of the Dominion (lakes and rivers) is estimated at 140,000 square miles. From a fisheries' point of view, the lake systems of Canada may be arranged under five principal heads, namely:

1. The maritime lakes, embracing the numerous lakes of Labrador, Quebec, and the Atlantic provinces. Certain of these, notably, Lake Saint John, Quebec (366 square miles), and the Chamcook Lakes, N. B., are famous for land-locked salmon, so prized for their unique game qualities. Black bass, pickerel or doré, lake-trout, red and speckled trout, abound in these waters, while Clear Lake, Little Seal, Mistassini, and most of the northern lakes swarm with whitefish and sub-arctic varieties of trout.

2. The central lake system, including the Great Lakes (76,562 square miles in total area) and innumerable subsidiary lakes, all utilized for commercial purposes and for sport. The areas and maximum depths of the more important of these lakes are as follows: Superior, 31,200 square miles, 160 fathoms deep; Huron, 23,800 square miles, 145 fathoms deep; Erie, 10,030 square miles, 35 fathoms deep; Ontario, 7,330 square miles, 123 fathoms deep; Lake Nepigon, 1,450 square miles; Lakes Saint Clair and Simcoe, 300 square miles each.

3. The Manitoba and Keewatin system, the principal waters of which are Lake Winnipeg, 9,400 square miles; Lake Winnipegosis, 2,030 square miles; Lake Manitoba, 1,900 square miles; and Lake of the Woods, 1,500 square miles; and in these waters enormous fishing operations are carried on for whitefish, pickerel, or doré, sturgeon, pike, etc.

4. The Athabasca and Mackenzie system, extending from Reindeer Lake to Great Bear Lake, the latter lake no less than 11,200 square miles in area, while Great Slave Lake is 10,100

square miles, and others are: Athabasca 4,400 square miles; Reindeer Lake, 4,000 square miles; Woolaston and Doobout lakes, each over 2,000 square miles in extent. These waters have been little fished, excepting by Indians, Hudson's Bay Company employees, and the like, but being prolific in whitefish, sturgeon, etc., the development of great commercial fisheries in the near future is assured.

5. The Pacific Interior system from Lakes Labarge and Atlin to Shuswap Lake, and the Kootenay, Arrow and Okanagan lakes near the United States boundary. None of the lakes in this western series are comparable in area to the vast inland seas referred to above; but such waters as Babine Lake (250 or 300 square miles) at the head of the Skeena River, and Stuart Lake, and Quesnelle lakes (respectively 100 and 750 square miles in area) at the head of the Fraser River, have an importance wholly disproportionate to their size, owing to the fact that their creeks and tributary streams are the great spawning resorts of various species of Pacific salmon. Whitefish, lake-trout, Pacific trout of various species, and grayling occur in these waters.

Rivers of Canada.— Fisheries are also conducted upon the rivers, which almost without exception, are abundantly supplied with the most esteemed fishes. Apart from a great stream like the river Saint Lawrence, whose drainage area is estimated to be 367,000 square miles, there are rivers, like the Mackenzie (2,400 miles long); the Great Saskatchewan (1,900 miles); the Churchill and Back rivers (each 1,500 miles); the Fraser (750 miles long and draining 100,000 square miles); the Red River (600 miles), and others like the Peace, Nelson, Albany, Great Whale, Skeena (300 miles); Ottawa (600 miles); Saint John (500 miles); Restigouche, Saguenay, and Miramichi; all of which are great rivers, presenting for the most part unsurpassed scenic grandeur, and affording notable sport and extensive commercial fishing. It would indeed be difficult to parallel the Fraser River, with its incredible multitudes of salmon, while the Restigouche and other famous angling rivers emptying into the Atlantic Ocean have no peers in the annals of sport. "Canada," as Prof. Elwyn said, "is the paradise of the angler."

Minor Fisheries, Oysters, Smelts, etc.— The shores of Prince Edward Island, New Brunswick and parts of Nova Scotia furnish oysters of unequalled flavor and comestible qualities. Owing to over-fishing and inadequate protection the yield has seriously declined from 70,000 or 80,000 barrels per annum to half that quantity, valued at about \$140,000 yearly. On the other hand, such an industry as the smelt fishery, mainly carried on through the ice in December, and the early months of the year, has grown from \$117,000 in 1881 to \$400,000 or \$500,000 in value. These dainty fish formerly used as fertilizing material on farm lands, are now shipped, four or five thousand tons per season, in a frozen condition, mainly to the United States markets. The estuaries of the Miramichi, Restigouche and other New Brunswick rivers are the centres of this remarkable fishery.

The sturgeon fishery has witnessed a great development recently, and has much greater possibilities before it. This fish became commercially valuable in Canada, first on the

Saint John River, N. B., in 1880, when 602,500 pounds were shipped to New York. In four years the catch fell to 126,000 pounds, and in 1895 barely 27,000 pounds were secured; but in Lake of the Woods, and on the Great Lakes, and above all, in the illimitable waters of Manitoba, the Northwest, and British Columbia, the sturgeon fishery has received a great impetus during the last five or six years. In 1902 the yield of sturgeon was valued at \$173,315, as compared with \$90,000 20 years ago. Canada, in the opinion of some authorities, is now one of the chief producers of "caviare," which formerly brought 10 cents to 15 cents per pound, and now sells in the cleaned, partly prepared condition at 90 cents to \$1 per pound. Catfish and similar species, as well as eels and coarse fish generally, formerly little valued, are now in demand, bringing to the fishermen from \$750,000 to \$1,000,000 per annum.

Fishing Bounty.— For the encouragement of the Atlantic deep-sea fisheries a bounty system is carried out, the fund for which (\$4,490,882) was provided by the Halifax Award, 1877. The bounties paid annually to vessel owners, vessel-fishermen, and boat-fishermen, amount to about \$160,000.

Government Hatcheries.— An important adjunct to the natural reproduction of fish, aided by close seasons, size limits, etc., is the artificial culture of fish under the Dominion commissioner of fisheries. Twenty-two hatcheries are in operation, and four or five are in course of erection. The output of fry in 1903, amounted to 314,511,500, including Atlantic and Pacific salmon, lake trout, brook trout, whitefish, pickerel or doré, lobsters, etc. The total number of young fish planted in Canada during the last 30 years is no less than 3,704,546,000. Several of the Provincial Governments (Ontario, New Brunswick, and British Columbia) also aid in fish-culture to a limited extent.

Scientific Stations.— Two scientific biological stations are maintained by the government for the study and solution of fishery problems. The Canadian Marine Station, founded in 1898, can be floated from one part of the coast to another, and the staff have been engaged in the investigations of marine life at St. Andrews, N. B., Canso, N. S., and Malpeque, Prince Edward Island. It publishes, at intervals, a scientific bulletin. The Georgian Bay Station, Lake Huron, confines its work to the fisheries of the inland waters. The staff at both institutions, consists of professors and specialists from the Canadian universities.

Bait Freezers, Guano Works, etc.— In the fall of 1900 the Canadian government inaugurated a system of State-aided bait freezers in order to meet the needs of the fishermen, who have suffered much from irregular supplies of bait. Local fishermen's associations can, under conditions, secure a government grant covering half the cost of construction, and an annual payment of \$5 per ton for bait preserved in the State-aided freezers. Twenty-four of these buildings have been built, varying in capacity from 10 tons to 50 tons. Larger freezers, to supply the Canadian "banking" fleets, are included in the scheme, one at Canso, costing \$50,000, having a capacity of 2,000 tons. Government fish-dryers

are also at work aiding the fishermen in preparing their products for the market independently of unfavorable weather. The initial drier was erected at Souris, Prince Edward Island. Further the government have imported Scottish experts, and a staff of Highland girls, to cure herring on the most approved methods. The scheme has proved most successful, and the Canadian fishermen receive instruction, and are enabled to improve the quality of cured herring sent into the markets. The incursions of hordes of destructive dog-fish and the injury to the fisheries resulting from the dumping of fish-offal, etc., in the sea, have moved the government to start fish-waste reduction works at various localities on the coast. These works conducted on the most approved methods, purchase dogfish, cod-heads, etc., from the fishermen, and convert them into guano, fish-oil, etc., under qualified government management.

Fishery Cruisers.—The Fisheries Protection fleet of about a dozen vessels, including a number of armed cruisers under trained naval officers, patrol the sea-coast and the Great Lakes. They enforce the fishery laws, and are under the direction of the commander of the Fisheries Protection Service.

Central Administration.—For the administration of fishery affairs, a special government Department of Marine and Fisheries was created at Confederation (1867) under a minister of the crown, and aided by a large staff of officials (inside and outside service) at Ottawa. A deputy minister, a commissioner of fisheries, about 20 inspectors, and numerous lesser officials carry out the duty of regulation which falls to the Federal authorities. The Dominion expenditure on fisheries approaches \$600,000 per annum. Up to 1898, the Dominion government exercised sole administration; but by a recent judgment of the Imperial Privy Council (London, June 1898) it was decided that most of the Provinces have "property" in the fisheries, and in them is vested the right of issuing licenses, collecting revenue, and enforcing fishery laws, while it falls to the Dominion to frame regulations, exercise jurisdiction and carry out a general supervision in the interests of the fisheries as a whole.

EDWARD E. PRINCE,

Dominion Commissioner of Fisheries.

40. Canada — Manufactures. Canada has become year by year increasingly important as a manufacturing country. In the vast agricultural wealth, the fish, timber, mineral and other resources, her industries have a sure foundation, while the practically unlimited supply of water-power, supplemented by extensive coal areas, have combined with an increasing home and export trade to give manufacturing a development which has been phenomenal.

The grain produced forms the basis of a large milling industry. Much Canadian wheat is shipped direct to Europe, but in addition nearly 6,000,000 bushels are ground yearly in Canada and exported. In 1903, 1,228,000 barrels of flour, 145,000 barrels of oatmeal, and 11,251 barrels of other meal were exported. Other mills manufacture cereal foods. Co-operative butter factories or creameries have become a most important manufacturing industry among the farmers, the factory method of manufacture having, for trade purposes, entirely superseded the home method. In 1903 Canada exported

229,100,000 pounds of cheese and 34,128,944 pounds of butter. Pork-packing (including bacon, ham, and pork) is an important industry which is rapidly developing. In 1903 the exports of pork aggregated 143,288,402 pounds. Beef and mutton are also the basis of important dressed meat enterprises. The raw material of flour and grist mills, butter and cheese factories, meat-packing and slaughtering establishments is almost wholly of the products of agriculture. Their aggregate value in 1901 was \$71,173,295.

Exports of canned meat, fruit, and vegetables have increased rapidly in value from year to year, totaling in 1903 more than \$6,000,000, as compared, for example, with a total of \$3,700,000 10 years previous. The tanning industry, the manufacture of boots, shoes, harness, saddlery, and leather goods are all enterprises more or less directly concerned with the products of the farm, which have shown steady and increasing development.

Connected with the fisheries is the fish-canning industry, a most important one, in which alone it is estimated that 80,000 men and a capital of \$11,000,000 are employed. The fish are smoked, canned, or pickled for export, or shipped in cold storage to Canadian cities, the United States, and the West Indies. The exports for 1902 of the salmon canning industry on the Pacific coast aggregated over 49,000,000 pounds. Lobster canning is a considerable industry on the Atlantic coast.

Lumbering has always been an important industry in Canada. The total value of lumber exports in 1903 was \$36,386,015. Canadian forests are looked upon as a great source of supply of pulp wood, and several mills have in recent years been put in operation for the purpose of converting spruce into pulp wood. The manufacture of furniture, vehicles, matches, and other wood products besides paper, is making rapid progress. The following estimates of the raw material in the several provinces may serve to indicate the basis for future development of this important industry: In 1900 there were in the province of Nova Scotia about 75,000,000 acres of ungranted crown lands covered with forest; in New Brunswick about 12,000 square miles of forest in possession of the crown, of which over 9,000 square miles are under license to lumbermen. In the province of Quebec, standing timber, exclusive of pulp wood and under-sized trees, would produce at least 60,000,000,000 feet of lumber. The northern portion of Manitoba and the Northwest Territories is covered with a sub-arctic forest, and the forests of British Columbia probably cover about 1,500,000 acres. Ontario contains the greatest variety of useful trees, and the greatest number of industries depending upon wood of all of the provinces.

Manufacturing based upon the mineral resources of the Dominion has been of a later development than manufacturing in other lines, but promises to become increasingly important. The bituminous coal of Nova Scotia is well adapted to the manufacture of gas and coke. All varieties of iron ore are found in that province, and are being extensively developed. Asbestos is an important mineral in the province of Quebec. Copper, iron, and mica are also extensively produced. Nickel is the most important mineral in Ontario. In 1903 its production was 6,999 tons, valued at \$2,499,681. In the prov-

CANADA — MANUFACTURES

ince of Ontario during the same year there were mined 208,154 tons of iron ore, and there were produced 87,400 tons of pig iron and 15,229 tons of steel. The total mineral production of the province for the year amounted to \$12,870,931, including the non-metallic minerals, the chief of which were common brick to the value of \$15,615,700, petroleum to the value of \$1,586,674, and Portland cement to the value of \$1,182,979. British Columbia is particularly rich in minerals, the chief of which are gold, silver, copper, and lead. While manufacturing has not developed to any considerable extent in the province of British Columbia, a very great development may be expected. A large amount of capital has been invested at Sydney, N. S., and at Sault Ste. Marie, on Lake Superior in Ontario, in the iron and steel industry. There are also important rolling mills and foundries; and special lines of machinery are largely manufactured in different parts of Canada, especially in the province of Ontario. Among other important industries in the Dominion are cotton and woolen mills, tobacco factories, sugar and petroleum refineries, breweries, and distilleries.

The water-power of Canada is not equaled by that of any other country, and its presence is attracting much capital for manufacturing purposes to the Dominion. Some of the largest industries are being operated by water power. In Sault Ste. Marie the largest pulp mill in Canada and a number of important industries are operated by electricity, developed by the local rapids, 175,000 horse-power having been developed thus far. It is reported that Winnipeg, which is 100 miles west of Rat Portage, with its industries, as well as other places, will be supplied with power from a dam across the Winnipeg River at Rat Portage, with a capacity of about 30,000 horse-power. At Niagara Falls extensive power companies and many large chemical industries have been established, with an aggregate capital of about \$20,000,000, the horse-power to be developed at this point to be 424,000. Large electrical works have also been constructed at Lachine Rapids, above Montreal, and at Chambly, on the Richelieu River. These plants supply electricity for the operation of a street railway and for domestic and street lighting in Montreal. The streets of Quebec are lighted and the Quebec street railway operated by electricity developed at Shawinigan Falls on the river Saint Maurice. The Chaudiere at Ottawa, with a fall of about 40 feet at low water, has been used for many years for driving mills, pumping the city water supply, and generating electricity for light and operating the street railway, 8,000 horse-power being developed. Within a radius of 50 miles from Ottawa there is available water-power energy equivalent to 900,000 horse-power. These are only instances. It is estimated that the Saint Lawrence system places 10,000,000 horse-power at the disposal of Canadian industry.

The favorable conditions for skilled workmen in the manufacturing industry in Canada are reflected by the constant demand for labor which has been general for many years, the comparatively high rates of wages paid to workmen, and the reasonable length of the working day. The several trades are partially organized, their members belonging to unions having for the most part international affiliation with the unions in the United States. During 1903

it was estimated that there were between 1,500 and 1,600 local labor organizations in Canada. Unemployment on any noticeable scale has been practically unknown in the manufacturing industries in Canada since the industrial depression in the '70s, and at the rate at which manufacturing development has been proceeding, it is unlikely that the large demand for labor will cease for some time to come. On the other hand, the favorable condition of the labor market to employers is reflected by the comparatively small number of strikes and lockouts arising throughout the year, and the fact that in many industries, notwithstanding that wages have shown a tendency to increase, profits have been such as to attract a rapidly increasing amount of capital. During the three years 1901, 1902, and 1903, there was an average of only 130 strikes a year in all the trades and industries throughout the Dominion, and of this number only one half were connected with manufacturing establishments.

A comparison of the figures given in the returns of the census for the year 1901 (*) and the returns of previous censuses will indicate the great development which has taken place in manufacturing in Canada during recent years, as well as the nature of the chief manufactures.

It is estimated that in 1891 (†) there were in manufacturing establishments employing five hands or over, in all, 272,033 employees. In 1901 this number had increased to 344,095. The amount paid in yearly wages in 1891 was \$79,234,311. In 1901 it had increased to \$113,283,146. According to the first Dominion census, which was taken in 1871, there were in that year employed altogether in manufacturing establishments in the Dominion 187,942 persons; the amount paid in wages was \$40,851,009. These figures would indicate that the total number of persons employed in manufacturing in Canada has almost doubled during the past 30 years, while the amount paid in wages has nearly trebled in the same time.

Equally interesting by way of comparison are the figures which show the total value of articles manufactured. According to the returns of 1891 the value of the articles manufactured in establishments employing five hands and over was \$368,696,723. This amount had increased to \$481,053,375 in 1901. Compared with the total value of articles manufactured in 1871, which is estimated at \$221,617,773, it will be seen that the total value of articles manufactured has more than doubled in 30 years.

According to the original figures of the census of 1891, in which account was taken of all kinds of manufactures, no matter how few persons were employed, the estimate given of the amount of capital invested in manufactures in Canada is \$354,620,750. In the census of 1901, which relates exclusively to establishments employing five hands or over, the estimated capital invested is placed at \$446,916,487. In the

*The figures made use of in these comparisons are taken from the tables of the 1901 Census, the compilation of which has just been completed. The figures have not, as yet, been published.

†The figures quoted for 1891 are the figures of the Census of that year as revised for comparison with the 1901 Census, a different basis of calculation having been employed in previous years. The Census of 1901 took account only of establishments employing 5 hands and over.

CANADA — COMMERCE, TARIFFS AND TRANSPORTATION

ensus of 1871 the amount of capital invested in manufactures is placed at \$77,904,020. A comparison between the years 1871 and 1901 indicate that the capital invested in manufactures in Canada has increased between five- and six-fold during the period of 30 years.

The following table gives the development during 10 years in the most important of Canada's industries:

Nova Scotia, were valued as a market for British goods and as a field for the furnishing of naval supplies, chiefly sailors, fish and timber. Nova Scotia's trade was almost entirely developed in connection with New England and the West Indies. Trade with French Canada was illegal, on both sides, and for the most part unprofitable, except for furs in exchange for British manufactures. It was but natural,

W. L. MACKENZIE KING,
Deputy Minister of Labor, Ottawa.

41. **Canada — Commerce, Tariffs, and Transportation.** In their earlier condition the various provinces of British North America, now forming the Dominion of Canada, were all alike subject to those general laws which embodied the principles, if not always the practice, of the British Colonial System. Owing, however, to variations in location, natural resources, and the character of the inhabitants, the commerce and tariffs of the various provinces were more or less adapted to their special conditions.

Before the conquest of Canada, the Maritime Provinces, under the general name of

therefore, that, after the conquest of Canada and the independence of the United States, Nova Scotia should still continue to trade chiefly with the New England States and the West Indies, and only to a limited extent with Canada.

Owing to their extensive coast line and numerous harbors, New Brunswick being also well supplied with river navigation, the question of transportation was long a simple one for the Maritime Provinces. For Canada, the Saint Lawrence and its tributaries had always furnished the great highway of the country. But above Montreal the river was greatly obstructed by rapids, hence the trade to the West was first developed along the easier Ottawa route, which passed by way of Lake Nipissing to the Georgian Bay. There it followed the sheltered northern channel and the Saint Mary River, with a portage at Sault Sainte Marie, up to Lake Superior, and on, by numerous lakes and streams, to the vast Indian country beyond.

The coming of the Loyalists, as the first

settlers in what is now the Province of Ontario, rendered necessary a regular traffic up the Saint Lawrence and along the lower lakes. From Montreal to Prescott and Kingston this traffic was carried on by means of various forms of large flat-bottomed boats, known as bateaux, which were towed up the rapids, later with the aid of horses. These bateaux brought up limited supplies of European imports, chiefly British goods, and took down the furs and, so far as their space would allow, the potash and flour of the Western settlements. The Revolutionary War had led to the building of the first British vessels on the Lakes. After the peace, several of these became trading vessels and others were built, the number steadily increasing with the growth of the Canadian and American settlements on either side of the Lakes. The presence of lake vessels diverted the greater part of the Indian trade from the northern to the southern route.

At first most of the surplus produce of the Western settlements found a ready local market in supplying the temporary needs of new settlers, and in furnishing provisions for the Indian posts and the British garrisons. With increasing crops, however, there soon arose a necessity for export, especially of such articles as wheat, flour, peas, salt meat, and various minor provisions. About the beginning of the 19th century the amount of provisions exported from western Canada was nearly equivalent to the amount purchased by the British Government for consumption at the garrisons and posts. In 1801 the total exports of Canada amounted to \$4,800,000. This growing trade required a more extensive and economical means of conveyance than that afforded by the bateaux. A trade in staves and various forms of timber having developed about the same time, and being sent to market in the shape of rafts, these were utilized to convey such provisions as might suffer a little exposure. Large square scows were also built for the purpose of taking provisions to market in bulk.

As regards tariffs and trade regulations in the earlier Colonial period, nothing was left to the Provincial authorities; all was regulated by British statutes and administered by imperial officers. In the matter of taxation, after the American Revolution the British North American colonies had little to complain of, for instead of being taxed to assist Britain the British people were taxed to assist the colonies. In return for her freedom to determine the commercial policy of the colonies and to appoint their officials, Britain had to meet their deficits, besides furnishing the whole of the naval and military services.

The first important change in colonial commercial relations resulted from the recognition of the independence of the United States in 1783. Pitt and Shelburne had desired to continue practically the same commercial relations with the late colonies after the separation as had existed before it, considering that political independence did not alter the value of a profitable mutual trade. Technically, however, such a policy would do violence to the whole commercial and colonial system, including the Navigation Acts,—the system of “ships, colonies and commerce,” upon which the whole British empire was supposed to rest—and this could not be permitted.

Canadians were for a long time too completely absorbed in questions connected with the control of their internal affairs to be much concerned with the fiscal policy of the country. Indeed they rather looked upon Britain's control of the fiscal policy as a means of obtaining increasing assistance from the mother country. The earlier tariffs were simple affairs, the revenue was derived chiefly from duties on spirituous liquors and the molasses from which rum was distilled. The sweeping prohibitions of the Navigation Acts simplified matters very much. There was no trouble with foreign European goods, because they were forbidden to be admitted to the colonies even in British ships, except when they had passed through British ports. It was in Britain, therefore, that the tariff dealt with them and qualified them for entrance to the colonies. In the matter of spirits and such things as were dealt with in colonial tariffs, a variety of preferential duties favored the more as against the less direct trade with Britain and the colonies. After the granting of representative legislatures in the colonies (1791 in Canada) they were permitted to impose customs duties on imports, for revenue purposes only. The right of disallowance exercised by the Crown prevented any unfavorable treatment of British goods.

By the Act of 1778 the British Parliament maintained and freely exercised the right to regulate, by tariff or other restrictions, the commerce of the colonies, but explicitly stated that all revenue incidentally obtained, after paying the expenses of its collection, should go to the treasury of the colony in which it was collected. There was thus a double jurisdiction in the matter of tariffs, the Imperial and the Colonial. But, so far as the colonial and imperial tariffs covered the same ground, only the colonial tariff was enforced. The imperial tariff applied only where its rate of duty exceeded that of the colonial. The colonial tariff was practically only for revenue purposes; the imperial tariff was entirely for the regulation of commerce in the interests of imperial trade.

The first legally recognized trade between the United States and Canada was provided for in the Quebec Ordinances of 1787-8, which permitted the free export of all goods except furs and peltries, and the import of all forms of timber and naval stores, all kinds of grain and other natural products, and settlers' effects. Rum, spirits and manufactured goods were entirely prohibited, but in 1790 pig iron was added to the list of permissible imports. Pitt's commercial treaty with the United States in 1794 greatly promoted trade between the British American provinces and that country. In this he partly realized his earlier idea of permitting a free mutual trade in all ordinary goods between the United States and the British colonies. But, in deference to the Navigation Acts, so far as the trade was conducted by sea it must be in British ships. A direct trade to the East Indies was also permitted to the United States, and later this led to several important relaxations of the British colonial policy.

The Canadian merchants at such western points as Kingston and Queenston (Niagara), sent their orders for British goods to their Montreal correspondents, who imported them from London, guaranteeing payment there, and forwarded them to the western centres, whence

CANADA — COMMERCE, TARIFFS AND TRANSPORTATION

they were distributed to the local dealers in Canada and the United States. The same agents were employed in collecting and forwarding the western produce, consisting of grain, provisions, potash and staves, as well as some of the cash which the original settlers had carried with them to meet their first wants. By these means payments to the Montreal merchants were partly made, the balance being met chiefly by commissariat and other bills of the British Government, for supplies and salaries.

The United States was the first to interfere with the freedom of this trade, duties being imposed in 1801 in the interest of eastern American traders. However, custom houses did not flourish in the wilderness, and for many years trade with the United States was not greatly hampered by tariffs. In 1805 duties were imposed, in Lower Canada, on certain goods coming from the United States, but in practice this applied to the Lake Champlain route only.

The trade relations of the Maritime Provinces, as we have seen, were well established before the United States secured its independence, but, while the United States enjoyed great freedom of trade with all countries, the Maritime Provinces still remained under the close restrictions of the Navigation Acts and the Colonial System. Thus general merchandise, even British and East Indian goods, was cheaper in the United States than in the British American ports. As a natural result there was extensive smuggling along the coasts of Nova Scotia and New Brunswick, and especially among the islands of Passamaquoddy Bay. American vessels supplied the colonists with liquor, tea, tobacco, molasses and other East and West Indian produce, and the chief lines of European and American goods, and received in return furs, fish, lumber, grain, etc., which they carried to their own ports and to the West Indies. Thus the restrictions designed to give Britain a monopoly of the colonial trade and shipping worked to the opposite purpose. Plainly the system had either to be given up or enforced by quite drastic measures. On the death of Pitt the latter policy was adopted, beginning with the Orders in Council, which in turn induced the non-intercourse policy of the United States, and ultimately the war of 1812-15.

While disastrous to the West Indies and most injurious to great Britain, yet the troubles between Britain and the United States were immensely profitable, for the time being, to the British North American colonies. To insure the carrying of the West Indian supplies in British ships, American produce was collected in ports of the Maritime Provinces and in Canada, where it might be taken by sea in either American or British vessels, by overland transport, or by inland navigation. This stimulated the trade and shipping of the Canadian and Maritime Provinces and enriched the colonial produce dealers. The ultimate benefit, however, of these and later abnormal conditions was more than doubtful. After the Peace of 1815, Canada suffered a severe reaction, emphasized by an unfortunate land and emigration policy.

The enormous preference in the British market on British North American timber, which had been built up during the Napoleonic wars, was retained and developed because it enriched British shipowners and timber merchants.

By the new Corn Law of 1815 a preference was granted to Canadian grain, but it was very uncertain in its operation, since the grain was not admitted at all until the price had risen to quite a high level, in the case of wheat to about \$2.10 a bushel.

The international restrictions necessary to preserve a fair equality for British shipping, under the disadvantages of her Colonial System, involved further trouble with the United States. Britain admitted a reciprocal shipping trade between the home country and the United States, and between her colonial possessions and the United States in the inland waters of North America, but denied corresponding reciprocity by sea between the United States and her American colonial possessions. In 1818 the United States retaliated, and direct trade with the West Indies was again suspended. Halifax in Nova Scotia and Saint John in New Brunswick, were then made free ports for American vessels bringing certain lines of goods necessary for the supply of the West Indies. In 1823 American vessels were admitted to the colonial trade generally for all direct dealings between the United States and the colonies. Once more the trade of the Saint Lawrence languished, and complaints poured in upon the home government.

In 1825 Mr. Huskisson, who had revived the policy of Pitt, sought to promote freer trade in America. But he found it impossible as yet to grant perfect reciprocity in shipping. Differential duties were imposed in favor of British shipping in the trade between the United States and the West Indies. The Americans applied the same differentials on their side, and there resulted another period of non-intercourse, from 1826 to 1831, with corresponding activity and prosperity for the Saint Lawrence route and the British North American ports. By admitting to the colonies provisions from the northern nations of Europe in their own ships, Huskisson managed to prevent the Americans from forcing his hand. They came to terms in 1831 and normal trade was once more resumed. But by this time the Colonial System was badly shattered, and almost the only thing left of the Navigation Acts was the British monopoly of the domestic shipping of the empire. The way was being gradually prepared for the final stroke of colonial economic emancipation.

In 1825 Huskisson weakened the corn laws by greatly increasing the preference on Canadian wheat. Regardless of the local price, Canadian wheat was to be admitted at a uniform duty of five shillings per quarter. For a time the exports of wheat were greatly stimulated, but the benefit was not permanent, and the cry for additional preferences was soon resumed.

The prosperous period of 1826-31, augmented by large expenditures on Canadian public works and an increased emigration, continued for a couple of years after the resumption of normal relations with the United States. But trade depression and political troubles brought Canada to a very low ebb in 1837-8. In 1840 the two Canadian provinces were united, their political freedom was greatly enlarged, and trade revived.

In 1843, after urgent petitions, which more or less coincided with the rising demand in Britain for free food, Canada obtained the ominously liberal concession of access to the British market, at the nominal rate of one shilling per quarter, for all the flour she could

CANADA — COMMERCE, TARIFFS AND TRANSPORTATION

grind from her own, or imported American wheat, while the corn laws still stood against the rest of the world. Bad harvests and higher prices in Britain tended to enrich the Canadian merchants and millers, but precipitated the repeal of the corn laws, in 1846, and the adoption of a free trade policy generally.
