That most stupid of engineering blunders a break of gauge has already become a serious nuisance on the through line between Melbourne and Sydney, and it is, perhaps, not too much to hope that the powers that be in Victoria and New South Wales may before long see their way to reforming it, either by reducing the Victorian gauge or widening the New South Welsh. The latter would be the better, as it would cost a little less, and would provide a larger cylinder-space in future engines, which will

be found of great value as goods traffic develops. Whether, however, the Queensland gauge question could be tackled at the same time is more doubtful, but it will have to be done some day, and the sooner the cheaper. Western Australia is perhaps too poor to venture on anything more expensive than the lightest 3 ft. 6 in. lines. H. C. S.  
Feb. 19th.

The Student's Column.

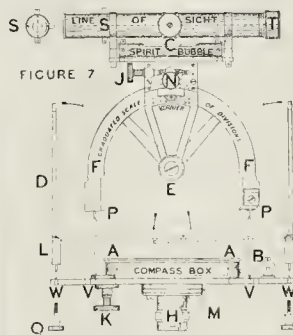

FIELD WORK AND INSTRUMENTS.—IX.

Surveying Instruments.

VIII.—THE CIRCUMFERENTOR (continued).

THE efficiency of instruments to be used as circumferentors has of late years been improved in many ways. In Lean's miners' dial, illustrated by fig. 7, it will be observed, in the first place, that the gimballing action which was seen to be attached to the compass-box in figs. 1 to 5 of our last article is here omitted, and that the two side arms which carry the folding sight-vanes are permanently fixed parallel to the compass dial. The sight-vanes, D, can be removed and the direction ranged by a telescope, which traverses a vertical arc, marked F, above the compass-box, by which arrangement all vertical angles are measured. The vertical arc consists of a flat metal ring about 1 1/2 in. wide, 3/8 in. thick, with pieces radial to its centre marked E, to which is attached a saddle body-piece carrying the telescope. Upon each face of the arc a scale of divisions is engraved,—one scale shows vertical angles in degrees from zero to 90°, marked from about the centre outwards, the subdivisions being recorded by a vernier upon which an index-arrow registers the angle to be read. The vernier-plate is attached to the traversing body-piece of the telescope. By means of an index arrow marked upon a plate fixed at the back of this vernier-plate, and which points to a scale upon the other face of the arc, the horizontal equivalent of any measurement taken along an inclined plane can be arrived at; the scale giving the difference between the hypotenuse and the base of a right-angled triangle in terms of the number of links to be deducted from one chain's length of 100 links, when measuring up or down a plane inclined to the vertical at the angle indicated by the scale of degrees marked upon the face of the arc first described. The difference arrived at by calculation would amount to 154 links in 100 links for an angle of 10°, 644 links in 100 for 20°, 1544 in 100 for 30°, 3055 in 100 for 40°, and 4144 in 100 for 45°. The arc upon which the scales are marked gives the nominal size of the instrument. If the circle of divisions has a diameter of 6 in., this instrument would be called a Lean's 6-in.

LEANS DIAL

miner's dial. Both the sight-vanes, D, and the vertical arc, F, are each secured as required to the side arms of the compass-box by the set-screws marked Q, the sight-vanes being attached at the holes marked W, and the vertical arc at the holes marked V. The telescope can be clamped to the arc by means of the milled-headed screw marked N, the tangent screw, marked J, being intended for slow motion in final adjustment when the screw, N, is tightened. When the index attached to the sliding vernier stands at zero, the line of sight in the telescope (which joins the centre of the diaphragm, marked S, with the optical centre of

the object-glass, T) should be parallel to the dial in the compass-box, and when the telescope is so clamped the compass-box can be set level by means of the long spirit bubble, marked C, which is fixed under the telescope, and the transverse or short bubble, marked B, upon the projecting arm of the compass-box. The needle is set free by withdrawing the lever stop-piece, M, and having set the N or 360° marked upon the compass-dial so as to coincide with the north point of the magnetic needle when at rest, as described in our last article, the compass-box with the arms carrying the sight-vanes, or arc and telescope may be made to turn round the dial by means of the milled head, K, of the pinion working the revolving gear.

In Hedley's dial, which is so well known among mining engineers, by a special arrangement of the plates the vernier is often placed on the outside circumference instead of inside the compass-box. The necessity of reading from above the dial face is thus obviated. The concentric action of the dial plates in this instrument may be tested by setting the needle and vernier to 360°, and then revolving the plates by means of the vernier screw and reading off the four quarters.

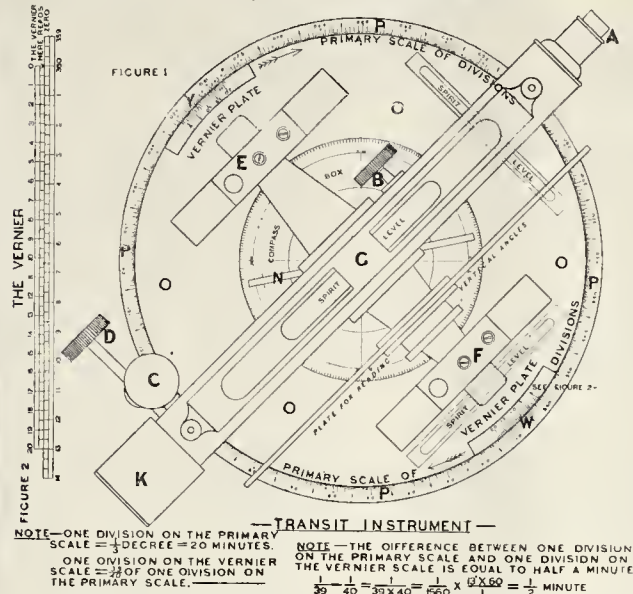

In the more expensive forms of circumferentors to which a telescope is attached we find parallel plates sometimes substituted for the ball-and-socket head. These plates clamp the body of the instrument and are screwed on to the head of a tripod stand, the horizontal position of the compass-box being determined in setting up by means of one or more spirit levels so fixed as not to interfere with the action of the needle. The circumferentor under these circumstances so nearly resembles another instrument, that the further additions, made with a view to its improvement, will be best understood by proceeding to describe the theodolite.

IX.—THE THEODOLITE.

In mining operations all angles are measured from the magnetic meridian, and the attachment of a telescope and outside vernier to a circumferentor is often asserted to render the instrument capable of performing the same operations in surveying, as a theodolite. The superiority of a theodolite will be admitted, when it is remembered that the accuracy of observation in an ordinary dial entirely depends upon the fine performance of the needle, while the theodolite records angles between any two or more given directions independent of the magnetic meridian. Great care must be exercised in taking the bearings with a circumferentor. Any iron plates or rails near the instrument would exert an influence to disturb the needle. The ordinary magnetic needle when mounted so as to be free to move in any direction would come to rest in a position which would be not only so many degrees to the west or east of the astronomical or true north, but its north end would also dip. The mean magnetic dip at Greenwich is at present equal to an angle of about 67°. The needle in a compass-box is, however, so pivoted as to be constrained to move in a horizontal plane only, and by means of a sliding counterpoise, which is attached so as to be adjustable upon the needle itself, the tendency to dip is obviated. The compass-box attached to a circumferentor being usually of a large diameter, it is necessary to ascertain that the long needle which it contains is properly balanced to obviate the effects of dip.

Referring to fig. 1, which illustrates the plan of a theodolite, it will be seen that the eye-piece of the telescope is marked A, and the object-glass end, K, that the telescope is balanced upon an axis which is supported upon verticals marked E and F, which are attached to a top-plate carrying one or more verniers. Thus, the telescope can be reversed in its standards, both at the eye and object-glass ends. In fig. 1 two verniers are shown in positions marked W and Y, and the plate marked O, which carries them, slides over another plate marked P, the outer edge of which is bevelled to the figure of the frustrum of a cone, and contains the primary scale of divisions graduated to read continuously round it with the sun, to 360 degrees. The faces of the verniers are continuations of the same conical surfaces, and are graduated to read to the required sub-divisions. The vernier shown in fig. 1 reads to 30 seconds. An arm projecting from the vernier-plate marked O carries the screw

THE THEODOLITE

C for clamping the verniers, after the telescope has been ranged, when viewing an object in a manner about to be described; and the tangent screw D is for moving the vernier-plate a small amount, in order to accurately set it to any required angle, or to set the line of sight in the telescope truly in the correct direction. The object viewed is focussed in the telescope by means of the milled-head marked B, which acts upon a rack and pinion inside the telescope, and moves an inner tube containing the object-glass backwards and forwards in a perfectly straight line within the outer tube, which holds the eye-piece. For convenience of reading the verniers they are placed in any suitable position upon the arc, but not under the line of the telescope. In fig. 1 they are shown in a line at right angles to the telescope. The lower plate, marked P, is made to revolve round the vertical axis of the instrument, and can be clamped in any required position, as will be explained in our next article. The diameter of the circle formed by the graduations of the primary scale of divisions gives the nominal size of the instrument.

4,603, Bench Plugs. J. Rawlings.  
The subject of this invention consists of two or more iron plugs dropped into holes in the bench made at suitable intervals, whereby the work is held fast while being operated upon. Rubber rings or washers may be used in conjunction with the plugs if required.

7,455, Automatically Latching Doors. J. Kaye.  
The principal object of this invention is to temporarily latch one of a pair of folding-doors. The principle on which it works is by employing a latch which is the segment of a circle mounted on a fulcrum, as in locks previously patented by the same manufacturer. A lever affixed is free when the second door is open, but on pressure being applied to the door held by the automatic latch, it will yield, thereby allowing the door to be opened. The automatic latch is also applicable to single doors, and may be used instead of a ball-latch.

12,333, Ventilators, &c. J. Weatherhead.  
The object of this invention is to make cow-heads of the ordinary funnel shape, in fewer parts and with less riveting than by the old methods. Two blocks are used, and these, with a series of springs, are fixed, and on hydraulic pressure being applied the cowl is bent to the required form.

2,707, Mounting Gutters. E. J. Hurley.  
For the support of the gutters, wrought-iron brackets are, according to this invention, constructed, so that in addition to the nail or screw support at the top and bottom, they may be further secured from the outer edge of the bracket encircling or supporting the gutter or trough, and by means of a long screw passing through this outer edge of the bracket over the gutter and into the fascia-board.

2,701, Improvements in Chandeliers. W. F. Stanley.  
This invention consists in rendering the chandeliers more slightly and compact by hiding the chain and weight arrangement, at the same time offering greater security from accidents and preventing the evaporation of water. A plated textile band is used in place of the chains and weights, slide in a double tube, which hides the action from sight. The arrangement can also be adapted to electroliers.

6,360, Burglar Alarm. National Manufacturing Company.  
The subject of this patent consists in an arrangement of bells and striking mechanism set in motion by the opening of door or window. An index-hand tells where an entrance is attempted.

6,337, Spirit Levels. W. W. Hulse.  
This patent relates to a spirit level with a graduated vertical limb, so that vertical lines and surfaces may be tested without the use of a square, and provision is also made for testing small deviations from vertical and horizontal positions by the marks on the separate limbs.

\* The principle of this invention was more fully described and illustrated in the *Builder* for October 9, 1886, p. 639.

6,444, Wedges or Keys. W. Strapp.  
In place of the wooden keys used in constructive work for sleepers, and the like hollow wedges of steel, iron, or phosphor bronze are, according to this invention, used.

6,474, Hoists and Lifts. John Barrett.  
To open and close the doors automatically, rack and pinion gearing is used which is actuated by cords or chains passing over grooved pulleys. The top doors on each floor being connected by a cord or chain to a barrel attached to the respective pulleys which actuate the doors below.

NEW APPLICATIONS FOR PATENTS.  
Feb. 4.—1,759, C. Ford, Surface Tiles for Walls, Ceilings, Floors, &c.—1,784, J. Griffin, Saw Sharpening, Setting, and Ranging.—1,789, J. Lockerie, Locks and Latches.—1,790, J. and E. Podmore, Rush Fasteners.—1,782, G. Harvey, Gutter Brackets.—1,811, W. Thompson, Warming and Ventilating Building.  
Feb. 5.—1,836, R. Cozens, Door Handle and Spindle.—1,889, R. Holmes and B. Suggen, Operating Bars for Doors or Hinged Windows for Excluding Cold, Rain, &c.

Feb. 7.—1,893, E. Allwright, Cowl or Wind Guard for Chimneys or Ventilators.—1,908, S. Kristensen and A. Jensen, Casement Fittings.—1,919, P. Cornish, Pavements and Curb Stones.—1,927, R. Scott, Decorating Detachable Wall and Ceiling Surfaces.  
Feb. 8.—1,943, H. Peach, Roof Glazing.—1,954, G. Smith, Door Fasteners and Locks.—1,960, G. Redfern, Constructing Harbours, Piers, Breakwaters, &c.—2,000, R. Rew and Others, Heating and Ventilating.  
Feb. 9.—2,008, G. Evans, Roof Tiles, Single Lap and Weathertight.—2,015, W. G. Winnett, Corrugated Iron or Metal Roofs.—2,029, P. John, Electric Bells.

Feb. 10.—2,112, J. Harris, Water-closets, and Ventilating Soil-pipes of same.—2,113, Walker and Bell, Raising, Lowering, and Securing Window Shades.  
Feb. 11.—2,148, W. Bruce, Covering of Walls, &c.—2,160, Middleton and Brown, Flushing Water-closets.—2,161, T. Higgins, Dentsils for Finishing Wood Mouldings.

Feb. 12.—2,217, W. Eaves, Window-sash Fasteners.—2,244, F. Taylor, Door Bolts, Latches, and Locks, and Attaching Knobs and Handles to Spindles.  
Feb. 14.—2,281, J. and T. McCallum, Ventilation of Saws and Drains.—2,290, Young and Moss, Fireplaces.—2,291, Young and Moss, Ventilating Apparatus.—2,300, R. Fyne, Window-sash, Casement, or Door Fastener.—2,305, Doulton and Parker, Ornamenting Pottery, Tiles, or Glass.—2,307, D. Doyen, Closing and Securing Doors.—2,315, H. Lake, Ventilating Apparatus.

Feb. 15.—2,323, J. Hookham, Fittings for Sliding Sashes, &c.—2,325, J. Morley, Flush-out Water-closets, Traps, Fittings, &c.—2,337, Taylor and Davis, Attaching Door and other Knobs to Spindles.—2,363, Arnold and Young, Cement.  
Feb. 16.—2,412, H. Hoole, Attachment of Fire-bars to Register and other Grates.—2,428, Sir G. Chubb and Others, Locks and Door Fastenings.

Feb. 17.—2,460, M. Cockburn, Cooking ranges.—2,482, W. Tuffe, Manufacture of Portland Cement, Bricks, Tiles, &c.—2,508, J. Sutherland, Mortising Machine.—2,513, Little and Hall, Construction of Timber Roofs.

PROVISIONAL SPECIFICATIONS ACCEPTED.  
15,904, R. Davison and W. Creed, Wood block flooring.—16,357, R. Warwick, Farquetry Work.—16,840, J. Reid, Rendering Doors, Windows, &c.—Draughtproof.—16,922, E. Clarke, Briquette.—11,116, E. Moore, Curing Dam Walls.—215, H. and A. Cunningham, Wood Screws.—315, G. Hardingham, Iron Cement.—577, P. Justice, Cement.—584, P. Barrett, Counterbalancing Sliding Sashes or Windows.—777, N. Leroy, Portable Wooden Houses.—811, G. Harcourt, Door Check.—1,167, A. Boul, Lighting Gas Burners by Electricity.—1,178, W. Sinclair, Spiral Staircases.—1,191, R. Walker and F. Mills, Securing Wood Flooring Blocks.—1,327, C. Williams, Covering Ironwork with Fireproof Encasements.—16,496, J. Myatt, Drain Chains or Rods.—797, Hussey and Clark, Roofing Tiles and Slates.—1,272, E. Gietart, Door Locks.—89, H. Owens, Opening and Closing Fanlights, Skylights, Ventilators, &c.—609, Bradie & Prior, Fire Grates.—642, F. Hadlow, Artificial Stone or Cement.—1,414, W. Barnes and Others, Paint Brushes, &c.—1,448, J. Bidder, Chimney Cowl or Ventilator.—1,567, J. Guest, Ladders and Steps.—14,071, W. Ellis, Spring-bolt for Securing Doors and Windows.—16,094, J. Seymour, Window Fastenings.—16,847, F. Gilling, Bolts for Doors, &c.—17,019, C. Hensley, Building Hollow Walls.—296, Francis & Carey, Combined Latch and Bolt for Doors.—325, A. Boul, Adjusting Saw Blades in Saw-mills.—388, A. Beauvais, jun., Automatic Bolt for Double Doors.—1,188 and 1,190, E. Ellington, Hydraulic Lifts.—1,463, B. Bancroft, Automatically Closing Doors.—1,636, M. Stansfield, Counterbalancing Sliding Windows or Sashes.—1,688, D. Sorfleet, Automatic Draught-Preventer for the Bottom of Doors.—1,730, Gibson & Clazier, Closing the Space Underneath Doors when Shut.—1,733, W.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.  
3,290, Drawing-boards, &c. B. K. Wehber.  
In order that the T-square and drawing-board may be used with greater accuracy and facility, and to protect the same from damage, the inventor makes a groove parallel to the edge of the board, and at right angles to the top and bottom. The head of the T-square is then fitted in the groove, or a fillet is fitted so that the blade of the square is at a perfect angle. By an arrangement of thumb-screws the blade of the T-square may be moved to any desired angle, while the head of the square is kept true to the groove in the board.

3,318, Bending or Shaping Timber. J. A. Dover.  
This invention refers to an arrangement for curving timber, and consists of a series of bolts fixed on a platform, to which a flexible bar is bent to curves which are adjusted by means of screws. The timber to be bent is steamed and then laid along the bent bar, and clamped to it until it assumes its shape.

3,549, Dovetailing. S. Warburton.  
This invention relates to a combination of saws and cutters fixed in a socket to form a chisel that can be used in an ordinary mortising machine. The saws are taper, and a chisel is fixed between the two saws, so that a feather-edge is cut when this combination tool is used. The wood is placed also at an angle, and the saws used without the chisel, and this produces a groove for the dovetail. A slight modification also insures a "blind"; that is, where the dovetails do not show through.

Reynolds, Substitute for Stained Glass.—1,740, J. Geta, Forming Water-tight Joints for Doors or Windows.—1,754, Purdon & Walters, Door Closer.—1,811, W. Thompson, Warming and Ventilating Buildings. &c.

COMPLETE SPECIFICATIONS ACCEPTED. Open to Opposition for Two Months.

1,816, W. Joy, Charing Cement Kilns.—3,028, R. Beattie, Air-light Inspection Chamber for Drains.—3,013, G. Buffham, Ventilators.—4,784, T. Walrod, Connecting Drains to Main Drain or Sewer, &c.—4,765, J. Kaye, Locks for Sliding Doors, &c.—4,803, C. Bellamy, Fire Grates.—4,824, B. Verity, Ventilating and Warming Buildings.—4,921, C. Taylor and A. Ross, Coupling Piece for Gas and Water Pipes and Fittings.—6,103, E. Flint and W. Knowles, Hinges.—16,983, W. Thompson, Planing and Dressing Slates.—17,008, W. Sonnet, Portland Cement.—4,235, Stoffert and Dykes, Girders and Timber and Fireproof Floors.—4,887, Giles and Petrie, Decorating Lincrusta Walton, &c. for Walls.—3,547, Brodie & Prior, Fire-grates.—3,790, Brodie & Prior, Stuffing-mounting Glass and applying it to the covering of Walls, Ceilings, &c.—5,237, T. Fawcett, Brick-making Machinery.—5,241, W. Cheal, Attaching Soil-Pipes to the Earthenware Water-closets, Drains, &c.—5,371, J. Macmillan, Inlet Ventilators.—643, J. Cropper, Window Sashes and Frames.—2,566, P. Bowden, Brick and Tile Making Machinery.—3,303, J. Denny, Embossed and Geometrical Tiles, Mosses, &c.—5,351, R. Bradshaw, Carrying-off Table for Brick and Tile Machines.—9,778, A. Black, Up-Current Ventilator.—12,277, J. Goodwin, Window Sash-Fastener.—781, H. McDonnell and Others, Ornamental Coverings for Walls, Ceilings, &c.—788, A. Boul, Water-closets.

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table with columns for date (e.g., FEBRUARY 14, FEBRUARY 15), property description, and price. Includes entries like 'St. Pancras—19, Hastings-street, 19 years, ground-rent 6l. 5s.' and 'Walworth—18 to 24 even, York-street, freehold...'

MEETINGS.

SATURDAY, FEBRUARY 26. Architectural Association.—Visit to St. George's Cathedral Schools. 2.30 p.m. (See advertisement this week.) Civil and Mechanical Engineers' Society.—Visit to the new drainage works at the Houses of Parliament. 2 p.m. Edinburgh Architectural Association.—Visit to Catholic Apostolic Church and College of Physicians. MONDAY, FEBRUARY 28. Royal Institute of British Architects.—Mr. Josiah Conder on "Domestic, Civil, and Palatial Buildings in Japan." 8 p.m. Royal Academy of Arts (Lectures in Architecture).—Mr. G. Aitchison, A.R.A., on "Doorways." 8 p.m. Society of Arts (Lectures).—Mr. W. Y. Dent on "Building Materials." III. 8 p.m. Clerks of Works Association.—Fourth Annual Dinner. Professor T. Roger-Smith in the Chair (Holborn Restaurant, 7 p.m.). TUESDAY, MARCH 1. Institution of Civil Engineers.—Mr. John James Webster on "Dredging Operations and Appliances." 8 p.m. Society of Arts (Foreign and Colonial Section).—Mr. Edward Cunliffe-Owen on "The Colonial and Indian Exhibition." 8 p.m. Society of Biblical Archaeology.—Miss Gornio on "The Casils, and the Mosque of Mecca." 8 p.m. Birmingham Architectural Association.—Mr. J. W. Tonks on "Heraldry in Modern Art." 7.30 p.m. WEDNESDAY, MARCH 2. Carpenters' Hall, London Wall (Free Lectures to Building Artisans).—Mr. Banister Fletcher on "English Carpenters and Foreign Competition." 8 p.m. British Archaeological Association.—(1) Dr. Woodhouse on "Inscriptions in Fulham Churchyard." (2) M. Ch. Roesler on "Discoveries at Trepert." (3) Rev. Dr. Hooppell on "Excavations at Vinovia." 8 p.m. Civil and Mechanical Engineers' Society.—Mr. B. Houghton on "Ware Percussion." 7 p.m. Society of Arts.—8 p.m. St. Paul's Ecological Society.—Mr. W. Bolton on "Some Little Known Churches near London." 7 p.m. Builders' Foremen and Clerks of Works' Institution.—8.30 p.m. THURSDAY, MARCH 3. Royal Academy of Arts (Lectures in Architecture).—Mr. G. Aitchison, A.R.A., on "Windows." 8 p.m. Royal Archaeological Institute of Great Britain.—(1) The Rev. Preceptor Venables on "The Recent Discovery of the Foundations of St. Hugh's Ape at Lincoln Minster." (2) Mr. H. S. Dale on "Glastonbury Abbey." 4 p.m. Edinburgh Architectural Association.—Mr. D. MacGibbon on "Architecture in the South of France." 8 p.m. FRIDAY, MARCH 4. Architectural Association.—Mr. A. Baker on "Welsh Churches." 7.30 p.m. Society of Arts (Indian Section).—Major-General Sir F. J. Goldsmid on "Our Trade Routes to the East." 8 p.m. Institution of Civil Engineers (Students' Meeting).—Mr. Sidney H. Wells on "Propelling-Machinery of Modern War-ships." 7.30 p.m. SATURDAY, MARCH 5. Association of Public Sanitary Inspectors.—Mr. J. A. Davenport, C.E., on "Rural Sanitation." 6.30 p.m. Architectural Association.—Visit to the Church of Corpus Christi, Brixton-rise, and St. Mary's Church, Clapham. 3 p.m. (See advertisement.)

MISCELLANEA.

"Charing Cross-road, W.C."—At the meeting of the Metropolitan Board of Works on the 18th inst., on the recommendation of the Works and General Purposes Committee it was resolved that the name "Charing Cross-road, W.C." be applied to the new thoroughfare just formed by the Board between Charing-cross and Tottenham Court-road. We think the name a very cumbersome and awkward one, and adhere to the opinion expressed by us last week (p. 276, ante), that "Nelson-avenue" as proposed by us, would have been both distinctive and appropriate, as commemorating a great personage in English history, whose name is not associated with any important street in London. A correspondent writes suggesting the name "Alexandra-avenue," in compliment to H.R.H. the Princess of Wales. The new street is to be opened this Saturday, the 26th inst., by H.R.H. the Duke of Cambridge.

The Proposed Imperial Institute Competition.—It is announced that the following are the names of the architects who have been selected to prepare competitive plans for the Imperial Institute:—Dr. R. Rowand Anderson (Edinburgh), Mr. Arthur W. Blomfield, Mr. Thomas E. Colcutt, Messrs. T. N. Deane & Son (Dublin), Mr. Thomas G. Jackson, and Messrs. Aston Webb & E. Ingress Bell. The committee of selection consists of Lord Herschell, the Earl of Carnarvon, Sir Frederic Leighton, P.R.A.; Sir Frederick Abel, C.B., D.C.L., F.R.S.; and Mr. Alfred Waterhouse, R.A.

Clerks of Works' Association of Great Britain.—Prof. T. Roger Smith, F.R.I.B.A., will preside at the fourth annual dinner of this Association, which will take place at the Holborn Restaurant on Monday evening next.

New Colonial Warehouses in Wapping. A large block of warehouses and offices has just been erected in High-street, Wapping, by the Colonial Warehouses Company. The buildings have their main frontage to High-street, 95 ft. in length, and are carried to a mean depth in Crown-street of 144 ft. They are 40 ft. in height from the street level, and contain eight floors, in addition to a basement of the structure in depth, the entire floorage of the structure being thus close upon 11,000 ft. The principal frontage in High-street, and also the return elevation in Crown-street, are faced with stock brick and blue Staffordshire brick, all the windows to the several floors having segment heads and iron sashes. A massive cornice, 6 ft. in depth, in Portland stone, surmounts the two frontages, above which is a very good flat roof, surfaced with Claridge's asphalt. All the floors rest on iron columns, varying from 9 in. to 15 in. in diameter, the whole of the columns to the several floors being 200 in number. The basement and ground floors, like the roof, are laid with Claridge's asphalt. Iron doors to the several floors shut off from each other the different compartments, these, with the internal dividing walls, being a preventive of communication in case of fire. These doors and other ironwork in the building, have been supplied by Messrs. Jewiss & Son, of Gainsford-street, Bermondsey. A lift in the basement, worked by steam-power, connects the different floors from the ground to the top of the building. A bridge, crossing High-street, at the level of the second floor, connects the warehouses with those of the company on the wharf on the margin of the river. In carrying out the works, the sanitary arrangements of the structure have received special attention. These, including the lavatories, closets, and urinals, have been furnished by Messrs. Jennings, of Stangate, Lambeth. The architect is Mr. Horace Alexander, of Cannon-street, E.C., and the contractor is Mr. B. Nightingale, of the Albert Works, Lambeth. Mr. Place is clerk of the works, and Mr. J. W. Read the general foreman. The asphalt portion of the works has been admirably carried out under the superintendence of Mr. West, manager to Claridge's Company. The estimated cost of the buildings is from 20,000l. to 25,000l.

Building Operatives at Toynbee Hall.—In response to an invitation of the Warden and residents of Toynbee Hall, Whitechapel, about fifty of the workmen employed by Messrs. Lathey Brothers, of Battersea, in building Toynbee Hall and Library, met the residents there on Thursday evening, the 17th inst., where they were warmly welcomed by the Rev. T. G. Gardner on behalf of the Warden (the Rev. S. A. Barnett), who was unavoidably absent. After an excellent supper, the Chairman spoke thanking the company for their attendance and complimenting them on the satisfactory manner in which the works have been carried out, and concluded by proposing the prosperity of the firm of Lathey Brothers. This was responded to by Mr. Edwin Lathey. The party then adjourned to the drawing-room, where a most enjoyable evening was spent, readings, recitations, and singing forming part of the programme. A hearty vote of thanks, proposed by Mr. E. H. Middleton and seconded by Mr. Lathey, was carried unanimously.

The Laws of God in Relation to Health.—This was the subject of an interesting and suggestive address by Professor Atfield, delivered last week by him as President of the Hertfordshire Natural History Society. The address dealt with "the food we eat," "the fluids we drink," and "the clothing we wear," in a manner which might be expected from a professor of chemistry and analyst, and it included much good counsel. We are not a little doubtful, however, of the wisdom of all that the lecturer said about the carriers of effete matters. If considerations of space permit we may return to the subject next week.

"Wrought Iron."—This was the title of a paper read by Mr. J. Starkie Gardner, F.G.S., before the Applied Art Section of the Society of Arts on Tuesday evening. We will return to the subject next week.

Lifts.—The new branch of the Bank of England, adjoining the Royal Courts of Justice, will be fitted with three hydraulic lifts, to be constructed by Messrs. Clark, Bunnett, & Co.

**British Archaeological Association.**—At the meeting of this Association on Wednesday, the 16th inst., Mr. C. H. Compton in the chair, the progress of the arrangements for holding the Congress at Liverpool was reported. Mr. Roach Smith, F.S.A., referred to various Roman interments found in Kent in relation to the leaden sarcophagus which has recently been found at Plumstead. The sarcophagus was found of cast metal, the lid being bent over the sides, and a cross salivire was scratched upon it. The interment was that of a young female. No articles whatever were found. It is more than probable that the site is that of a Roman cemetery, since urns with bones have since been found. The Rev. Mr. Lewis read a description of some curious fourteenth-century glass in the Church of St. Edmund, Kingsdown, Kent,—a building which is found to possess a Saxon tower, while the cores of the walls of the church most probably also belong to the same early period. Mr. Earle Way produced several fine fragments found in Southwark, and Mr. Loftus Brock, F.S.A., some examples of Castor ware found in the Eastern Counties. The Rev. S. Surtees described the little-known Frith Stool, in Sproughton Church, Yorkshire, and referred to the boundary crosses in the locality which marked the extent of the ancient sanctuary. The bases of several of these he had discovered. They appear to be of Saxon date, the same early period being claimed for the Stool, which is of stone, carved with figures. A paper was then read on the Communion-plate in Peterborough Cathedral, by Mr. J. T. Irvine. The great bulk of the articles are of comparatively modern date. A second paper was then read, prepared by the Rev. L. H. Ward, on some parochial records preserved at Wing Church, Bucks, transcripts of which were read by Mr. W. De Grey Birch, F.S.A., in the absence of the author.

**Sale of Suburban Building Land.**—Last week Messrs. Baker & Sons submitted for sale at the Auction Mart, several plots of building land in Chelsea, Baling, Harrow, Finchley, and Teddington. For the plots in Chelsea, on the "New King's-road Estate" of the National Land Company, there was only a limited demand, but those at Baling, on the "Ealing Park Estate"; at Harrow, on the "Metropolitan Estate"; at Finchley, on the "Older's Hill Estate"; and at Teddington, on the "Teddington Weir Estate," were all sold. The Ealing plots, each containing frontages of 16 ft. and a depth of 110 ft., were sold for 25l. each. Those at Harrow, containing 18 ft. frontage and a depth of 140 ft., realised from 34l. to 42l. each; the Finchley plots, 35 ft. frontage and 140 ft. in depth, were sold for 91l. and 92l. each; and the Teddington plots, 25 ft. frontage and 140 ft. in depth, realised from 51l. to 53l. each. The total proceeds of the sale amounted to about 1,800l.

**The New Offices of the "Yorkshire Post," Leeds.**—Mr. J. C. Edwards, of Ruben, writes to say with regard to this building, illustrated and described by us last week, that the "red Ruben bricks" and the terra-cotta were manufactured at his works.

### Exeter.

THE second of the series of volumes on the Historical Towns and Cities of our Country is now before us.\* Its appearance will be welcomed by, we hope, a large number of readers, not only on account of the im-

portance of the city whose history it relates, but from the circumstance that it is written by the Regius Professor of Modern History at Oxford in his happiest and most fluent style. The interest never flags, and in the narration of the beginnings of the city in the unrecorded dim ages of the past, equally with that of its modern growth, the attention of the reader is sustained, and both subjects, diverse as they are, are set forth graphically in well-chosen words.

While it has always been the head town of its district, Exeter is happily described as having kept its name essentially the same through all changes, and its being and its position unbroken throughout all ages. It is the one great city of the Roman and of the Briton which did not pass into "English" hands "till the strife of races had ceased to be a strife of creeds, till 'English' conquest had come to mean simply conquest, and no longer meant havoc and extermination. It is the one city of the present England in which we can see within recorded times the Briton and the Englishman living side by side. It is the one city in which we can feel sure that human inhabitation and city life have never ceased from the days of the early *Cæsars* to our own." It is satisfactory to think that in the case of Exeter so much can be said by the Regius Professor. It is to be hoped that further research will show the same of some others of our English cities, and that we shall learn in time to believe that the various hordes, the mixed races who made happy hunting-grounds of the land of the Romano Briton, were not guilty, as so many of us have been too long taught, of the utter extermination of the race well advanced in most of the arts, then occupying the soil.

Reference is made to the good reasons for supposing that the site of Exeter was occupied by the ancient Britons. Its site is very similar to what was chosen elsewhere by that people for an *oppidum*. It stands, as so many of us well know, on an elevated table-land

rather than a hill, there being a valley west and east, and the broad river of the Exe on the south, the approach being by a narrow ridge of land on the north-east. Such a position seems to have been formed by nature as the site for human habitation, and accordingly there is evidence that early inhabitants occupied it, not only in its name, *Penholt Keyre*, a singular mixture of Welsh and English, by which it is called in some dim traditions of very doubtful authenticity, but by a few discoveries of relics which can be classed as ancient British, or better still, as prehistoric. It is also called *Caer Wise*, this being the earliest form of its present name, "the City on the Exe."

Geographers, like Ptolemy, bear witness of its existence, and there can be but little doubt but that Exeter actually stands on the site of the Roman city *Isca Damnoniorum*; for although some attempts have been made to assign the position of the city so called to another site, yet none has yet been found on the banks of the Exe, which so completely fulfils all the conditions which we should expect to find on the site of a Roman city. It was walled at an early period, and indeed several writers have endeavoured to show that portions of the walls still standing are of Roman workmanship. Dr. Freeman is, however, content to think that the Roman-looking masonry which remains has been re-used on some rebuilding. The Icknield-street is to be traced up to and across the city. Roman coins of early date, bronze penates of great beauty, pottery, a very few traces of tessellated pavement, and other relics of the Roman race have been discovered, but no inscribed stones have been found within the area of the walls. Still, it is the name which the city has borne unchanged through so many ages that tells us of its continuance. Thus the *Isca* of the Roman becomes the *Exanceaster* of the Saxon, which like the *Caer Wise* of the olden time, can but mean, like the Exeter of to-day, the City on the Exe. Dr. Freeman passes over entirely some recent discussions relative to the position of Exeter in Roman times, but to us the continuance of the name to the present site seems at once to refute these, and the more so since no such continuance of name can be shown in relation to the other sites spoken of.

The hook before us gives a few notices of discoveries made, but still it must be matter of comment that Exeter has yielded so very few evidences of its early history during any of the recent excavations that may have been made during drainage works or the rebuilding of houses. This is a subject which we would commend to the attention of local antiquaries, in the belief that many discoveries have to be

made within the area of the walls, which must of necessity throw light on the early history of the city. Those few who doubt the position of *Isca* readily assent that modern Exeter actually stands on a Roman site.

"And now comes in the great distinction of all between the history of *Isca*, or of any other city of Britain, and the history of almost any city of Gaul. It comes to this, that there is no history of *Isca*. We have no record to tell us either when the peninsula hill came under the power of the Roman, or when it passed away from his power." Even the plan of the modern city, which presents an arrangement of two main roads crossing one another at right angles, with gates of entrance through the walls fairly well in the centres of their principal faces, which would agree with the cardinal points, were the city quite east and west, which it is not, is shown to have grown to its present form in recorded times. This relates, however, only to the roadway from the east. There is fair evidence that the present line supersedes another more to the south, which would have connected the two gates in a fairly direct line, the steep nature of the descent of the bank of the river Exe having to be taken into account. Allowance being made for this, it must be acknowledged that the modern plan of Exeter shows its streets laid out with so much system, at right angles to one another, as to render a fair reason for belief that they run fairly close to the plan of the Roman city. It is almost superfluous to say that the arrangement of laying out a city, in Roman times, by streets at right-angles to one another, is now proved by their actual discovery at Silchester, Verulamium, and many other places, while the tradition of such arrangement exists in several other cities of Medieval date, such as Oxford, which has no evidence of Roman origin.

The fate of the Roman city is unrecorded, and our author's belief that it did not pass into the hands of the Saxon invader until the days when the latter had embraced Christianity is founded on the slenderest of inferences,—at any rate, so far as regards the temporary occupation of the city. It agrees fairly well with what is known, and that is not much, of the progress of Saxon conquest westward. The failure of evidence relating to the early history is certainly a curious feature for comment in the annals of the city; and this is as true of the early Saxon period as of Roman or British times.

Our author feels himself on surer ground when he speaks of the state of parties in the reign of King Athelstan. In 926 it is apparent that a certain number of the inhabitants were British, for in that year, the king being on the point of proceeding against the Britons

\* Historic Towns, Exeter. By Edward A. Freeman, D.C.L. London: Longmans, Green, & Co. 1887.

further to the west of Exeter and in Cornwall, took the prudent but forcible precaution of removing the Britons from the city, considering that it was not safe to leave a probable enemy behind him in his progress. This statement shows us that for previous years the two races,—the original possessors and their conquerors,—lived together in the same city. The existence of the vanquished race is accounted for from the belief that the Saxon conquerors were Christian, and that this prevented the extermination which would have befallen them, had the victory been of earlier date. May it not rather be that all the tales of the extermination of Briton by Saxon are exaggerations? That terrible slaughters and burnings did occur no one can question; but that this amounted to the annihilation of the entire race, as some suppose, seems hard of belief. Here, at Exeter, at any rate, is agreeable evidence, almost as soon as direct history comes to render its testimony on matters relating to the city, of the two races living side by side.

Dr. Freeman suggests that the lines of demarcation were so exactly defined that one portion of the town was the Englishry, the other the Welshry, with its distinctive churches dedicated to British saints, such as Sts. Kerian, Petrock, &c. St. Sidwell's, the church of the local saint, was, however, outside the walls.

It is in the century before the date just named that the earliest historical event is recorded. This is the Danish occupation of the city in 876, up to which time it was undoubtedly in Saxon possession. It was recaptured by Alfred under circumstances which show us that it was then a place of strength, and there is occasion for fair inference that the burh, or castle, was erected at this time. The position of the castle is at the north corner of the city. The line of the city walls encloses it, there is no external break or projection, its area being wholly within the city, like the donjon of a Norman castle, in relation to the walls of the outer ballium. Its age is, doubtless, open to much speculation, for the steep scarp sides of the hill have many features in common with British works, while the lines of the city wall show that when the Romans drew around the city their ramparts of stone, they so carefully brought them around the castle hill as to enclose it wholly within the inhabited area.

The walls are recorded by so good an authority as William of Malmesbury to have been built by Athelstan, with towers and with squared stones. This work was probably only a substantial repair of the older masonry, and it is of interest as being one of the very few records of military works stated to have been executed in stone in Saxon times. Although the Saxons appear from recorded history to have been such great builders of churches and castles, yet in the majority of cases we are forced to believe that the works executed were of timber and not of stone, so far as the churches were concerned; and of earth and stockades to the castles. The non-existence of Saxon works of importance must ever be matter of surprise and regret. The almost universal overthrow of their works points to the supposition that a general want of durability must have characterised them. On no other supposition can we account for the almost complete disappearance of the Saxon churches, all their castles, except the mounds, and all their other constructive works. When a piece of walling is met with in some of the churches, of only moderate size, which alone remain, it is of poor, or at least, not good masonry, particularly in the earliest examples. Some few of perhaps the latest in date we are ready to admit are equal to or better than the earliest Norman work. It is, of course, something akin to heresy to breathe any word of disrespect of anything Saxon to our author. In these pages, too, as in all his other works, the mixed hordes of Saxon invaders who harried the land before they settled upon it, appear only to be known to him as "English." This little conceit of his must be not a little confusing to general readers, who will be loth to believe in the existence of "English" until Briton and Saxon, Dane and Norman, and

their associated tribes, had all grown together so as to form our present race.

The Danish invasion brought more than one attack upon Exeter, and in the last, in 1003, the city was taken by Swegen and plundered. On this occasion a large portion of the wall was broken down. The ecclesiastical history of the city must have had its beginnings in early times, but, like the civil history, it is unrecorded. The earliest authentic record that has come down to us is of the time of Ethelstan, when there is evidence of the foundation of a monastery by him, this being afterwards augmented or altered in some manner that is not clearly indicated by King Edgar in 968. But the great change of all in the ecclesiastical history was when the city became, but only at a comparatively late period, the site of the united bishopric of the West. In the reign of Edward the Confessor two or more bishoprics were sometimes united under a single bishop, and thus we find the adjoining Sees of Devonshire, Cornwall, and the distant See of Worcester all held by Lyfing, the seat of the first of these then being at the town of Crediton, which, apparently, must always have been a smaller place than Exeter. Lyfing's successor, Leofric, however, in 1050 effected a change which has for ever since associated the bishoprics with Exeter. While he united the two Sees of Cornwall and Devonshire together, a work which has only been undone within the last few years, he removed the seat of the bishopric from the smaller to the more important city, a change which has been attended with happy results. The history of the cathedral church is well told by our author, and his clear outline of its rise and progress will be read with interest. The aim of this volume and of the others of the series, is not to produce a mere guide-book of the city or town described, and for several reasons this is undesirable. Still, the architectural history of the cathedral being given as it is makes us regret that some more space was not given to a description of the fabrics of the parish churches or of the remains of the monastic establishments. We may here make a digression from the arrangement of the book before us and refer to the curious group of parish churches which is shown to have existed in Exeter in early times. As in the case of the majority of the churches of London, there is no record of their foundation.

Indeed, except in regard to two of the churches, from the evidence before us, the earliest general record of their existence appears to be in the reigns of Richard and John, when their number, with chapels, was over thirty. If any of our readers will turn to a map of Exeter and consider the comparatively small size of the city within the walls, they must, while making due allowance for a certain amount of suburbs, be surprised at the state of society which should have called forth the foundation of this remarkable number of churches. It is apparent that later times, following the reigns of the kings named above, did nothing for increasing the number of these parochial churches. It was left entirely for modern days to meet the needs of increase of population. On the contrary, it is apparent that subsequent years witnessed the destruction of many of them. A settlement of the number of parishes is spoken of under the date of 1222, when they were reduced to nineteen only. What became of the suppressed churches does not appear. This number was reduced to four by Act of Parliament, 1656, when the cathedral was formed into two separate churches, in addition to the four referred to, by a wall being built to divide the nave from the east end. The two portions were then used by two congregations.

The names of the saints to whom these churches were dedicated show not only a strong Celtic, but also a Saxon element. Many of the names also are curious from their suffixes to indicate position or difference, such as St. Mary More, St. Mary Steps, St. Mary Arches, Allhallows-on-the-Walls; while several are unusual dedications, such as to SS. Sidwell, Cuthbert, Pancras, and Keryans. The name of the British St. Petrock occurs, as does also that of the British St. David.

St. Martin's Church was dedicated in 1065, and St. Olaf's is mentioned a little earlier, but none of the others appear to be referred to until the period already named.

Not a little curious is the record of the foundation of the monastic houses of Exeter, which here, as in so many other places sprang up in different quarters of the city, and at their beginnings at least "the bishop and clergy looked with no friendly eye on the new comers." The hospitals were numerous, and the evidences of the long continuance of leprosy are not a little curious.

We have already referred to the probable foundation and continuance of Exeter Castle in early times. Its history during the Norman period is more clearly indicated. The Norman William, whose easy capture of the rebellious city, and breaking up of the Western opposition, is graphically told, entrusted the erection of the castle to Baldwin. As was usual in almost all our early fortresses, it had its separate chapel within the enclosure of its walls, and this, like Dover, Hastings, Windsor, and many other places, was collegiate. It was dedicated to the Virgin Mary. The castle appears to have been strong enough not only to hold the city in check, but to have been built so quickly as to enable the attack made by the sons of Harold in 1069, to be easily beaten off. The history of the Temporal Lords of Exeter is no less interesting than that of the Spiritual, but that of the third governing power, the municipality, now demands our notice.

One of the most interesting features which the volume before us reveals is the municipal record. We find mention of the Portreeve early in the eleventh century, when he acted on behalf of Queen Emma. We find him, again defending the city against William the Conqueror; but we then find some other authority in addition. "In the narrative of the Conqueror's sieges we have seen two classes of men, and seemingly two assemblies in which they met and acted." "Were the men who disowned the submission a popular assembly, reversing the decision of its magistrates, or a patriotic army throwing off the authority of heart-hearted officers?" Be this as it may, it is curious to note that the more ancient portreeve or provost lived on by the side of the mayor, in the shape of two or four bailiffs, seneschals, or stewards." Here, at least, the portreeve did not merge into the mayor. His court was called the *prætorium*. The name is as old as 1254. The name "is most likely connected with the belief that a Romanesque building in Waterbury-street, which survived till the present century, and which we would fain believe was the Guildhall of William Hoel, the portreeve, was the Roman *prætorium*."

We find the mayors of the charters which were granted in succession to the city by kings and lords, assisted by various officers and a council, sometimes of twelve, sometimes a double jury, and even of thirty-six. "It is hard, indeed, to grasp the details, but it is easy to trace the main outlines of the constitutional history of Exeter. An oligarchy grew up which displaced an older and freer system." "It was not hereditary." "It came of self-election."

The guilds, trading and religious, or a mixture of both, are heard of at an early period; but here, as is the case so frequently elsewhere, there is nothing whatever to show how they began. Our author tells us that he has not examined the archives in the Guildhall, or which, let us say, ought to be in the Guildhall. This is to be regretted; for, since the earliest history is so meagre, and the beginnings of things so completely unrecorded, it is highly desirable that any information to be derived from either the municipal or the ecclesiastical records should be carefully sought for. The documents relating to the early bishopric are not numerous, and they have been of late years critically examined by more than one student of our early history. May what can be derived from similar examination of the treasures of the Guildhall be speedily set before us! The record of documents, and the record of what may be learned from the investigation of whatever relics may be met

with in excavations: to these two sources may we hope for further evidences of the history of the city.

The work contains interesting chapters on the relation of Exeter to the kingdom of England, 1225 to 1688; others on municipal and ecclesiastical Exeter; while the concluding chapter treats of the modern period from 1688 to 1886. In the latter, the demolition of the old city gates, the removal of Bedford House, the destruction of many of the buildings of the ancient castle, and of the old Collegiate Chapel, are referred to. In recent years the rebuilding of the Church of St. Mary Major has been effected "with a spire of Northamptonshire fashion, which has oddly changed the look of that part of the close." Why this old church should have been swept away must be matter of regret to more than the Exeter folk, and the more so since it occurred such a short time ago, in days when the antiquarian and art value of our old buildings had been recognised throughout the country.

Passing reference might have been made with advantage to another Exeter loss, since it is one which was intimately connected with the early history of the town. St. Sidwell is reported by tradition to have been beheaded near a well, and Hedwylmed, at St. Sidwell's, was pointed to as the site. The progress of the railway works here in 1855 revealed the well, with masonry of so ancient an appearance as to lead to the supposition that it was in part of Roman date. A coin of Nero was also found, together with a number of pipes by which water had been laid on to the city, and the precinct in Medieval times. The whole of the remains were destroyed as soon as found, although it is matter for congratulation that an appreciative observer was at hand, whereby we have some record of what otherwise would have been lost to history.

Exeter, which is happily described as "the city which, as not becoming English till Christian times, has lived the most uninterrupted life, Roman, British, and English, while it has largely shared with York the character of an abiding capital." "The city which has sat on its hill as a dwelling-place of men, with an unbroken life of more than eighteen hundred years,—the city by the side of which most of the capitals of Europe are things of yesterday,—can hardly sink, like some of its fellows, to be a forsaken ruin or a common market-town. Still, Exeter," says our author, "is emphatically a city of the past." We venture to think that the increase of the city and its surroundings is more hopeful for the future. We know of new streets and avenues laid out, new buildings erected. We see evidences of life and progress on every side.

The volume is illustrated with two interesting reproductions of old engravings, the frontispiece being a bird's-eye view of the city from Brown and Hohenberg's "Civitates Orbis Terrarum," 1618, which agrees extremely well with Isaac's map of the seventeenth century. There is also an imaginary plan of the city in the eleventh century, and a good map of Exeter of to-day.

We have said enough to show the nature of this interesting volume. In conclusion, we can but express the hope that its varied contents and its moderate price will cause it to be in the hands of a great many of our readers.

#### NOTES.

**T**HE Government Railway and Canal Traffic Bill was introduced into the House of Lords on Monday, by Lord Stanley of Preston, but no statement has yet been made regarding it, this being reserved for the occasion of the second reading. We intend to review the provisions of the Bill in an early number, but may now remark that, while very much on the lines of Mr. Mundell's abandoned measure, there are striking points of difference—chiefly relating to the constitution of the Railway Commission, and the attention given to the subject of canals. We have recently alluded to the inadequate nature of the proposals affecting this latter point in previous legisla-

tion, and are pleased to find that the Government are now dealing with it in a vigorous manner. The unauthorised application of a railway company's funds to the acquiring of canal property is absolutely prohibited, the clauses dealing with this subject being definite and drastic; and they serve to show more clearly than ever the way in which mischief might have been prevented had such prohibitions existed in time past. A great deal of responsibility rests upon the Board of Trade, as before, in respect of deciding as to rates and charges, and opposition on the part of the railway companies to this part of the measure may be regarded as certain. They have also views of their own upon preferential rates, which are shared by very high authorities, but this is a large question, and must be deferred for the present.

**I**T is to be regretted that the Labour Statistical Bureau, which was inaugurated a few months ago with the concurrence of Parliament, should be in difficulties almost at the very outset of its career, having broken down on the point which is generally fatal to these inquiries, viz., that of wages. When any private attempt has been made to examine this subject, it has almost always collapsed when this question is asked; for, although the inquirer may occasionally have been successful, he has usually found that employers have the greatest repugnance to stating how much they pay their "hands." One would have thought that a circular under Government supervision would be more fortunate in obtaining information; but it appears that the Board of Trade has formulated its inquiries with so little discretion, and with such an air of dictation, that it has excited the greatest indignation amongst some of our largest trades, such as those connected with engineering and iron-working, and many of them decline to answer. Those who are at the head of the movement ought to have kept themselves better advised as to the extreme jealousy that prevails in many trades on the subject of wages. Many a valuable point of information would doubtless have been forthcoming, if the inquiry had been made as a matter of courtesy rather than in the shape of a demand. We fear that we are still a long way distant from the excellent statistical information which the American Government furnishes to the public.

**T**HE National Memorial to the late Professor Fawcett, M.P., executed for the subscribers by Mr. Albert Gilbert, A.R.A., and lately fixed in Westminster Abbey, is a very happy departure from the conventional form of monument, in that it emphasises rather the man himself than his mere outward form and appearance. The memorial is of bronze, and fills the trefoiled head of an arch in the wall-arcading under the south-west tower, rather too much above the level of the eye to be examined with ease or comfort. The upper lobe of the trefoil is occupied by a medallion portrait of the face, half-turned to the spectator, and a little upwards, expressive of the blindness,—which is frankly acknowledged, and which turns to pathos the gentle resignation of the strong and intellectual features. The lower and larger part of the monument is filled up by a series of seven small figures expressive of Fortitude, Justice, Sympathy, Zeal, Industry, and Brotherhood, against an architectural background, which has, unfortunately, been made too poor—probably in the endeavour to give it due subordination, and which sadly wants, as it stands, some definite terminations or enclosing lines. The figures are beautifully modelled, and full of intellectual interest. Fortitude, which occupies the centre of the group, and whose head towers above the rest, is represented by a knight in armour, holding his lance, and resting one hand on his shield. It is a very fine and expressive figure. Justice is blindfolded, and holds the conventional sword and scales. Sympathy is expressed by a nude and dejected-looking damsel, to whom a hramble is closely clinging. Industry holds a beehive, and Brotherhood is represented by seated figures of an English labourer and a half-clad savage, who occupy the end arches

of the series. The bronze is brightened, and the prominent parts of the work emphasised with gilding, and a few bright-blue stones sparkle in the background.

**R**AILWAY COMPANIES are, as a rule, far from particular as to the sanitary arrangements and condition of the buildings which they erect under the powers of their respective Acts. They are disposed to think that, under cover of their Acts, they are not amenable to the by-laws of the Local Board or authority, whatever the character or purpose of the buildings which they erect. The London Railway Companies are in the habit of building cottages for their men on their own land, generally near some suburban station; and there are numerous instances where those companies have never deposited plans with the Local Board, and where they have in other important respects completely ignored the requirements of the building by-laws in force in the district. They are, no doubt, exempted from these requirements in the case of "buildings used for the purposes of the railway," such as stations, offices, and sheds; but it cannot be fairly said that rows of workmen's cottages, though built on railway land, are "for the purposes of the railway," and therefore exempt from supervision under the local by-laws. Mr. Bridge, the magistrate, gave what appears to be a sensible decision on this point in a case which occurred some time ago at Hammersmith. He held that such cottages as those indicated were not exempted buildings under the railway company's Act, and that the by-laws in force in the district must be complied with. The Acton Local Board have, we notice, raised the same question against the London and South-Western Railway Company, which has erected some workmen's dwellings on its own land in the parish of Acton, without depositing plans with the Local Board. The latter is, therefore, officially ignorant of the mode in which these cottages are built or drained. The principle involved is a most important one, because it should not be in the power of individuals or companies to entirely exempt themselves from the provisions of the local by-laws, sanctioned by the ruling authority under the Public Health Act, 1875, viz., the Local Government Board.

**T**HE movement for the construction of new waterways is already beginning to bear fruit, and it will not be very long, probably, before the Midland and other Railway Companies begin to find it out. An extensive coalition has been formed amongst the mercantile communities of some of the most important West Midland towns, with the object of placing Birmingham in direct communication with the sea. To this end the proprietors of the Gloucester and Sharpness and of the Birmingham and Worcester Canals, have joined forces with the municipal corporations of Gloucester, Birmingham, Wolverhampton, Kidderminster, Stourbridge, Worcester, &c., and there can be no doubt but that this formidable array will carry everything before it in the way of opposition. The present Sharpness Ship Canal is to be extended, so to speak, by carrying it to a mouth five miles lower down the Channel, the effect of which will be that vessels of 2,000 tons will be able to enter at any tide, and go direct to Gloucester. Great alteration and improvement will also be made in the canal from Gloucester to Birmingham, so that probably a considerable portion of traffic may be taken into the heart of the Midlands direct. The expenditure on the whole scheme is estimated at a million and a quarter.

**O**N the recommendation of their Law and City Courts' Committee, the Corporation of London have established a fund wherewith to maintain the open space at Kilburn which has lately passed into their charge. This fund is derived from a residuary bequest to them of the late Mr. William Ward, of The Lawn, Brixton Hill. Mr. Ward, in his will, provides for the benefit of "the poorer classes." The civic scheme formed the subject of a Chancery suit, wherein Mr. Justice Chitty

overruled the Attorney-General's objections that it did not strictly apply to those whose advantage the testator specifically intended to promote. The scheme, as sanctioned by the Court, is at present limited to the land at Kilburn, but powers are given for the framing of a subsidiary project to extend to the Highgate Woods, as lately taken over by the Corporation, in the event of the income proving to be more than is requisite for keeping up the Kilburn property. The Mercers' Company have undertaken to subscribe 150 guineas to the Bishop of St. Alban's scheme, if accomplished, for the purchase of the Pavilion Gardens at North Woolwich as a place of recreation for the inhabitants of West Ham and Silvertown. The Gardens, extending over 12 acres, have a frontage of 1,000 ft. along the riverside, and are set out in the first sheet of the Surveyors' District Map which we issued to our subscribers in January last.

UNTIL 1805 an ancient timber-built house, having stone chimneys on the ground-floor, and massive beams of oak and chestnut wood, stood in Gresham-place, a mean court opening out of Sweedland's-passage (corruptly known as Sweeting's or Sweedon's passage, and Sweed's-court), that joined Moor-lane with Grub-street. Remarkable for a prominently projecting staircase, that quaint structure, together with its neighbours, Prince Rupert's Palace in Beech-street, and General Monk's house in Hanover-court, supplied a favourite subject to illustrators of a past style of domestic architecture; as witness the drawings of J. T. Smith (1791), T. H. Shepherd (1800), and others. Whilst scarcely old enough, in itself, to justify the tradition that would claim it as a home of Whittington, this house may very well have been, as the story goes, a relic of that which was occupied some 150 years afterwards by Sir Thomas Gresham, *temp.* Queen Elizabeth. At that time, by the way, Grub-street lay on the outskirts of the town. A stone set in the face of one of the three now dismantled tenements which arose on the site is thus inscribed, in defiance of all chronology:—

GRESHAM HOUSE  
Once the Residence of  
SIR RICHD. WHITTINGTON  
LORD MAYOR 1314  
Rebuilt 1805.

"1314," *sic*, on the stone. In London guide-books and catalogues, &c., the date is commonly misquoted as "1406." Our *Flos Mercatorum*, however, was mayor in the years 1397, 1406, and 1419. But since the rebuilding of 1805, the quondam home of Foxe, Speed, and Dr. Johnson's friend, John Hoole,—the quarter which Marvell was the first to stigmatise,—has changed its name for Milton-street, albeit not so, he it noted, in memory of the poet, who died in what was formerly Artillery-walk, hard by. Sweedland's-passage and Butler's-alley have lately given place to Butler-street, and the three small houses we indicate are now being demolished to make way for yet more of the large business premises that arise all round. Still, there remain in Milton-street, on its western side, two plaster-fronted houses which were coeval with the sorry times when Pope identified authorship with misery, squalor, and gin.

SOME very interesting facts and figures were stated at the last meeting of the Mansion House Committee of the Imperial Institute, as to the great value of sites in the metropolis. The Governor of the Bank of England said that, in their hunt after a site for the Institute they had found that the land for the new Admiralty would cost 160,000*l.* per acre, the Charles-street site is estimated at 250,000*l.*, an acre at Charing-cross at 224,000*l.*, the site at the Embankment (Blackfriars) 400,000*l.*, and the Christ's Hospital site at 600,000*l.* These are stupendous figures, and bring before one more forcibly than anything else the greatness of London. It is allowed that 300,000*l.* would buy the best site in London for the Institute, and although

this is of course a large sum, it is as nothing compared with the magnitude and importance of the scheme, or with the riches of London. Moreover, the Lord Mayor, while accepting the South Kensington site, acknowledges that there must be a supplementary commercial museum or museums in the City, thereby unconsciously showing that the Institute cannot be fulfilling its proper destiny if located at South Kensington. An exhaustive museum is half the scheme, and even that will have to be established at great cost in the city. There either appears to be a failure to realise the possible grandeur of the whole thing as Imperial, or else the financial glamour of the various exhibitions is permitted to exercise undue sway.

THE Chapel of St. Mary Magdalen, at the Brompton Oratory, has just been decorated, under the direction of Mr. J. Cosgreave, who has designed much of the decorative work in the church. Gilding has been used with that lavishness which usually produces the extreme either of vulgar gaudiness or of rich beauty, and the effect in this instance is decidedly good, assisted as it is by some beautiful plaster work by Messrs. Jackson. Some of the Italian marble work in the walls is very rich and effective, but the architraves and pediments of the doorways, which looked well in wainscot, are poor and cold copied in grey marble.

MR. AXEL H. HAIG'S new etching of Limburg-on-the-Lahn, now being exhibited at Mr. Dunthorne's gallery, if not quite superior to all his other works, has all the old charm for those who believe in the capabilities of architecture for becoming the theme of a picture. The picturesque cathedral of St. George stands in the full sunlight on the edge of the cliff overlooking the river, and is contrasted with the dark mass of the buildings on the hill in the shadow to the left; in front is the river, and a mill, also in strong light; on the right are some dark trees; the glimpse obtained between these of the bridge and the country beyond is one of the best bits in the whole composition. The figures in the foreground are pretty, but a little too conventional.

THE *Illustrated London News*, in its column devoted to "Art and Archeology" last week, referred to the sacrifice of many historical and art associations which the making of the new street from Charing Cross to Tottenham-court-road, has involved,—associations some of which, by the way, were descanted upon in the *Builder* for June 26, 1886, p. 955. After mentioning the names of Hogarth, Sir James Thorahill, Burke, Reynolds, Johnson, Sir Thomas Lawrence, and others, our contemporary says:—

"We most cordially associate ourselves with more than one of our contemporaries in entering a protest against the name proposed to be given to the new thoroughfare. If from amongst the names already cited (not one of which, we believe, is in any way connected with any of our streets or squares) it is not thought expedient to select one to keep alive the memories of the past, then the title of Nelson-avenue seems to us a singularly effective and proper appellation for the new street. It is strange that, although there are two Trafalgar-squares in Western London, Nelson's own name is only connected with a somewhat dingy square and noisy street in Southwark,—as if Englishmen had been eager to profit by his successes, but were unwilling to recognise the man who achieved them. There seems, too, something which touches our sense of fitness to place beside Shaftesbury-avenue a public thoroughfare which recalls that, not only in war but in peace, England expects each man to do his duty, and honours him for having done it."

As the proposal to name the new street "Nelson-avenue" first appeared in our columns we are very glad to find that we are not alone in the view we took, and still hold, that the name "Charing Cross-road" is not a good one, and we hope to see it altered, in spite of the fact that, as all the newspapers inform us, the new street was last Saturday formally "dedicated to the public for ever by the name of 'Charing Cross-road.'" The Metropolitan Board of Works is not always happy in deciding on questions of street nomenclature, as we have had to point out on several occasions, notably when they proposed to

call the new street from Bloomsbury to Piccadilly-circus by the absurd name of "Piccadilly-road." We protested against the unsuitability of such an appellation at the time, and suggested the name "Shaftesbury-avenue." We had the satisfaction of seeing our protest and suggestion re-echoed by the press, and ultimately, though not without much discussion, the Board abandoned the name "Piccadilly-road" in favour of "Shaftesbury-avenue." The appellation "Charing Cross-road" for the thoroughfare opened last Saturday will be attended with many inconveniences.

#### LETTER FROM PARIS.

WE have been much occupied with a new fight about the Eiffel tower. A number of artists and literary men well known to the public, and nearly all members of the Institut, have made a collective protest against "Podieuse colonne de tôle bouillonnée," which quite represents the general feeling on the subject, but which has unfortunately come too late; and though the protesting party are entirely in the right, they conched their remonstrances in a tone somewhat too solemn for the occasion, and which has excited the railway of M. Lockroy, the Minister of Commerce, who replied to it in a satiric style, amusing enough in itself, though not quite in keeping with the dignity and responsibility of his office. M. Garnier, one of the signers of the protest, has replied on his part with equal energy and irony; but things remain as they were. M. Garnier has consented to remain consulting architect for the Exhibition, and the protesting party, in spite of their well-turned sentences, have to await in resignation the arising of this new tower of Babel, from its foundations to the ordained height of 300 mètres, whence, like a morning star, it is to shed

"Des torrents de lumière  
Sur ses obscurs blasphémateurs."

For the moment, work is in full activity. For each one of the four piers of the tower a quadrangular excavation, 31 mètres square, and 4½ mètres in depth, has to be made; which lays bare the gravel stratum on which the *béton* will be run. Two hundred men are at work on these excavations, which will probably be terminated by the end of the month. On the neighbouring site of the Ecole Militaire, where the machinery gallery is to be erected, 410 pits of 3 to 8 mètres deep have been sunk, 300 of which are already filled with concrete. Lastly, in the midst of the Champ de Mars, there extends a huge cutting intended to receive 4,000 square mètres of masonry footings. The important question of the lighting of the exhibition is at present under consideration. According to the scheme of M. Georges Berger, the lighting of the Champ de Mars enclosure will be carried out by a kind of syndicate of all the French and foreign electricians, and he is contemplating an illuminating power for this area, equal to about five times the whole of the Paris gaslighting power. The "Exposition des Eaux et Forêts," which was of such interest in 1878, will be arranged on the left slope of the Trocadéro Gardens, while the right slope will be set aside for the Ministry of Public Works, which proposes among other things to erect a great lighthouse. The rest of the Trocadéro Gardens will be for the exhibition of the National and Central Horticultural Society of France. We may just note here, proposing to describe them more in detail afterwards, that various novel projects are spoken of, such as "trottoirs roulants," flying bridges, electric and rope railways, &c.

But though industrial Paris looks with hope to the exhibition as a promoter of work, artistic Paris is deeply concerned at the loss of its annual central place of exhibition in the Palais d'Industrie, which piece of State property, long lent for the annual *Salons*, must now be utilised for the purposes of the Exhibition, and the artists will have the enjoyment of it no more after 1888, after which they must look out for some other locality, which it will be very difficult to find.

Meantime, various exhibitions are being organised on this site, which the "Société des Femmes Peintres et Sculpteurs" is now occupying with its creditable mediocrities. On August 15th will be opened there the second exhibition of decorative art, which will last till November 25th. In regard to the Musée des

Arts Décoratifs," an important step has been taken since our last letter. Thanks to M. Antonin Proust, Parliament has been occupying itself with the matter, and the Musée is to become, after a lapse of thirty years, the property of the State, in exchange for the giving up of the ancient Cour des Comptes. This arrangement, hardly the best in regard to economy or to the real interests of industrial art, will, at least, cause the disappearance of those ruins of the Communist war which have given such a sad aspect to one portion of modern Paris.

Of Government work now in progress, besides the Musée Guimet (of which we have already spoken, and the sculptural decoration of which is commenced), the "Direction des Bâtimens Civils" is occupied with the completion of the portion of the Bibliothèque Nationale which faces the Rue Richelieu. A monumental gate of bronze, executed from the designs of M. Pascal, architect, will shortly give access to the principal court, the decorative treatment of which is carried out on the lines of the old Hôtel de Nevers. It is to be hoped that funds will be forthcoming for commencing at last the projected buildings facing the Rue Vivienne, which will complete the great quadrangle of the national French library. The new arrangements at the Louvre are still in progress, and the gallery of Egyptian antiquities will be shortly opened, as well as the "Gallery of the Colonnade," as it is called.

The Government is now apparently occupying itself seriously about the monument commemorative of the Revolution, which has been the subject of so much discussion for the last two years. The new Ministry of Fine Arts is about to nominate a special committee to consider the project and to bring it before Parliament as soon as possible. The project will give rise to a public competition in sculptural and architectural design. There is, however, many a slip between cup and lip in these matters, and it may be observed that the monument proposed to be erected at Versailles, in honour of the National Assembly, has never gone any further since the jury awarded the premiums for the best designs seven or eight years ago. The State, in fact, shows much less zeal in artistic matters than the Municipality, which, besides, has the well-earned reputation of paying much more generously than the State; and thus we have an almost unbroken record, from month to month, of new artistic efforts on the part of the City of Paris, which are highly appreciated by artists.

This month the second stage of the competition for decorating the Mairie of Pantin, of which we have already spoken, has been decided. In the first competition three artists, M. François Lafon, M. Henri Lévy, and M. Schommer, had been selected to compete with cartoons the size of the work to be executed. M. Schommer has been successful. His composition, intended for the ceiling of the grand staircase, represents Alsace, under the guise of a young woman clad in the costume of the country, the standard of France unfurled at her feet. Above her is a winged figure symbolising France. M. Henri Lévy, whose high talent has been often proved, especially in his work at the Pantheon, has been unsuccessful here, and his rather tame and colourless allegory has had to yield place to M. Lafon's commonplace idyll, an Arcadian country scene, quite out of place in prosaic Pantin. The result of the matter is that M. Schommer will decorate the grand staircase and the Salle des Fêtes of the Mairie, at a cost of 36,000 francs. M. Lafon will have the Salle des Mariages, M. Lévy the Council Chamber, and the two latter artists will receive a sum of 8,000 francs each, in addition to the premiums awarded. The Municipality is also about to undertake the decoration of the new Salle des Fêtes constructed by M. Ginain for the Mairie of the Sixth Arrondissement, and several mairies in suburban districts will be the objects of similar projects.

Whether we shall now have the question of the decoration of the Hôtel de Ville settled is a matter of speculation. The Council must do something about it before they separate in May; and there is a difference of opinion as to whether there should be a public competition or direct commissions to selected artists. The Fine Arts Committee of the Council leans towards the latter course, which we are disposed to think is the best in order to obtain designs entirely in harmony with

the building. The committee proposes to select for treatment subjects connected with the history of Paris, the freedom of the Communes, the life of Étienne Marcel, and sundry great events of the Revolution. No objection can be made to this; such subjects will certainly offer more of interest than the usual cycle of mythological allegories. As to where the commencement of the work is to be made, nothing is yet decided, although some important inaugural celebrations are already under consideration, and for the first hall at the end of March, for which 5,000 invitations will be sent out, it will be necessary to mask the want of decoration by tapestries and other temporary expedients, which will necessitate an immense expense.

The statue to Louis Blanc was inaugurated on February 24, the anniversary of the revolution of 1848. As politics do not enter into our *métier*, we may pass over in silence the more or less anarchist manifestations which saluted the work of the sculptor Delhomme, of which we have before spoken. By the time this letter is published there will also have been inaugurated at Père-la-Chaise cemetery the new crematorium, built from the plans of M. Formigé, and which is provisionally to be used at present for the destruction of hospital *débris*.

Another novelty to be shortly opened is the new panorama of the battle of Rézonville, by M. Détaillé, which succeeds to that of Champsigny, painted by the same artist in collaboration with the late M. de Nenville.

One of the municipal schemes that may be mentioned is the reconstruction of the Temple of the Sibyl in the Park des Buttes Chaumont. The work, which has presented a good many difficulties, is just completed, and the fine promenade adjoining the temple is again open to the public.

M. Tony Noël, whose fine decorative sculpture for the Mairie of Neuilly has been illustrated in the *Builder*, has been appointed a member of the Senior Committee of Instruction at the Ecole des Beaux Arts, in place of M. Delaplanche, who has been nominated a professor in the same institution.

The competition in the section of architecture at the Ecole has now been decided. The subject given was "a hippodrome." From among forty-four designs submitted, the jury gave the first medals to MM. Comier and Chédanne, pupils of M. André; the second to M. Astruc, pupil of M. André, and to MM. Desnos and Malgras, pupils of M. Ginain. Eighteen designs have received honourable mention. In the sketch design competition (subject, the ceiling of a gallery), the first medal has not been awarded. M. Gérard, pupil of MM. Daumet and Girault, and M. Schaltenbrand, pupil of M. Guadet, have received second medals; and M. Eustache, pupil of M. Ginain, has obtained honourable mention.

At the Institut, M. Chaplain, the eminent medallist to whom we owe the splendid medal commemorative of the Hôtel de Ville, has been chosen President of the Académie des Beaux Arts for 1887. M. Chaplain has also been appointed by his colleagues to go to Brussels to model the portrait of the Duc d'Annam, whose profile is to figure on the medal to be struck in memory of his generous gift of the domain of Chantilly.

The exhibition of the artistic club called "the Mirlitons" contains a sufficient number of interesting works executed by genuine artists, pretty well drowned in a sea of amateur works. Of these latter we will say nothing, confining ourselves to the mention of two fine portraits by M. Carolus Duran, and two others by M. Elié Delamury. The Water-Colour Artists' Exhibition, in the Rue de Sézes, is of a very different order; and here the public at least obtain, as the phrase goes, something for their money. The only complaint one can make against the Society is that of not having been firm enough in adhering to their principles, and having the last year or two opened their doors to rather too large a number of works. Nevertheless, there is always a sufficient number of works of the highest class to attract and interest the discreet visitor. The success of the exhibition, as usual, belongs of right to the remarkable works exhibited by MM. François, Détaillé, Vibert, Harpignies, Maurice Leloir, François Flameng, John Lewis Brown, and, lastly, by M. Eugène Lamy, that octogenarian who remains eternally young, and whose compositions show all the same brilliancy and vigour as those of forty years ago. Among the lady

exhibitors, the landscapes of Mme. Nathaniel de Rotbschild divide the honours with the flower and fruit paintings of Mme. Madeleine Lemaire.

M. Bosnard deserves a word of special mention for his exhibition, which contains above forty works, including a good many portraits finely studied and exquisite in colour. There are unfortunately some water-colours more remarkable for eccentricity than for real success; but the whole collection is the work of an artist of real genius whose eccentricities even are not without their interest.

#### MORE ABOUT THE EDINBURGH MUNICIPAL BUILDINGS COMPETITION DESIGNS.\*

WHETHER it be due merely to the local circumstance that Edinburgh is popularly known as "The Modern Athens," or whether it is to be accepted as further evidence of a general return to Classic architecture, certain it is that Gothic architecture has had but few exponents in the competition for the proposed new Municipal Buildings, and these, as a rule, do not approach the highest standard of excellence. To this statement, however, exception must be made in favour of the design under motto "Queen Sabe!" which is by far the best rendering of Gothic submitted in the competition, and a design in which the style is treated throughout in a manner peculiarly suited to modern civil requirements. The particular phase of the style selected is termed by the authors "The Scottish Palatial Gothic of the Fifteenth and Sixteenth Centuries, as exemplified in Falkland and Linlithgow Palaces, Stirling Castle, and other Scottish edifices." Its prototype, more fully developed in Spain, has in this design been drawn upon for a lighter character to the fabric, and greater variety of detail. The elevation to Cockburn-street is very imposing, and shows a large square central tower with two smaller ones at the corners, octagonal on plan. All three are finished with short spires whose surfaces are divided into panels enriched with pierced tracery. The High-street front is also well disposed; the treatment of the gables in the east and west elevations is particularly clever, and the interior of the quadrangle has some most excellent work. The windows throughout are very rich, with thick mullions and elaborately traceried heads. The plan has the buildings round the four sides of a quadrangle, with the Council suite on the first floor of the north wing. The arrangement of this part has not a little dignity, but there are some doubtfully-lighted corridors and other defects visible in the planning. The estimated cost is 151,000l.

Another Gothic design of considerable ability is that under motto, "For Queen and Country." A late phase of the style (fifteenth century) has been chosen; the masses are well disposed, and if carefully detailed would turn out well. The Cockburn-street front has a central gable, and two side gables, each divided by narrow buttresses into three bays. All three bays of the central gable have oriel windows carried through three stories, the side gables an oriel in the centre bay only. The High-street elevation is somewhat similar in disposition, steep-pitched gables divided into three bays terminating the east and west wings, while a higher gable, divided into three bays with oriels, and a square tower rising up behind, form the central feature of the courtyard. On plan, this courtyard is 90 ft. broad and 60 ft. deep, measured from the building line of High-street, with two small courtyards behind lighting staircase and corridors, somewhat akin to the arrangement of "Nineteenth Century." The City Chamberlain is placed on the ground-floor of the north wing, the Council Chambers on the first floor of the north wing, with the Town Clerk on the same level, in the west wing. The internal arrangement of the Council suite is lacking in dignity, but the plan has many good points. "Aihlius" is the motto of another Gothic design of some merit, but of earlier (thirteenth century) type, and more restrained treatment. The plan is irredeemably bad.

"Scotia."—The High-street front of this design has a charm quite its own, arising from the quaint disposition and treatment of its door and window openings, and the skilful combination of horizontal cornices and string-

\* See p. 311, *ante*.

courses with the vertical lines of pilastered buttresses and gables. While full of sympathy and harmony with its intended situation in the heart of Midlothian, the design is hardly important enough for the Municipal Offices of the Capital of Scotland. A central tower, not very happily managed, is flanked by buildings of two stories and attics, with niches and statues between the first-floor windows. The ends of the frontage are composed with triple gables, divided by pilastered buttresses. The other elevations are also of considerable merit, but the plan does not call for any special mention.

"Tannabill."—In this design the author says,—“No attempt has been made to imitate any special style, except so far as in the adoption of some details derived from Medieval Scottish architecture, but even those mostly with a good deal of modification.” The result is a design of marked originality, showing considerable thought and individuality, but which, with all its cleverness, looks much better in the excellent drawings by which it is illustrated than it would ever do in execution.

"Waverley."—The design (No. 1) submitted under this motto is deserving of notice, not only from the merit of its architecture and the quality of the drawings, but also from a striking peculiarity in its plan. The buildings are arranged round three sides of a courtyard, as so many others are, but in this instance the open end is to the north, not to the south, as in every other case. The south wing extends along the building line of High-street, and the east and west wings run northwards from this, their ends being occupied by semicircular staircases rising from the Cockburn-street level to the top floor of the building, with passenger lifts placed in the wells. The three wings or blocks being double, i.e., with rooms on each side of the corridors, the lighting of the corridors is at various places more than doubtful. The elevations are in the style of the French Renaissance. Towards Cockburn-street the wings are carried up to a considerable height, and are connected for some distance above their base by a screen of lower buildings. Behind and above these are seen the gables of the back of the High-street block, with a great central tower rising above all. The grouping of the masses from Princes-street would be most effective, while the sheet of details exhibits an intimate acquaintance on the part of the author with the style chosen.

"Edina" is the motto of another design in the same style, handled with much less skill. The plan is cumbersome and bewildering.

"St. Giles."—Either as the result of a curious coincidence, or as the product of the same author, two designs are submitted under this motto, in which a similar type of plan has been adopted and that different from any other yet referred to. The principal entrance from High-street gives access to a long covered court or hall running north and south, with galleries all round at the different floor levels, giving access to the surrounding apartments. The Classic design (No. 45) is both in plan and external treatment superior to its Gothic brother, No. 46, the three great gables with open arch and balustrade between in the Cockburn-street elevation of the former being a most effective feature, while the arrangement of the Town Clerk's and City Chamberlain's offices and of the Council Chambers is particularly good.

"Heart of Midlothian."—This is a design which might have been expected to appeal in a special manner to Mr. Waterhouse had that gentleman been influenced at all by elevations in making his selection, while the plan is not without a great deal of merit.

"Waverley" (with thistle within a circle).—The municipal buildings in this plan are confined to a rectangular space, 210 ft. from north to south, by 170 ft. from east to west, the Clydesdale Bank being entirely isolated in a separate building placed at the eastern extremity of the High-street frontage. The plan has been arranged with considerable dignity in the matter of entrance-halls, ante-halls, grand staircases, and corridors, but too much has been sacrificed for this, and the working departments are not arranged with a single eye to carrying on business in the most efficient manner. For example, there is a distance of fully 120 ft. between the door of the Town Clerk's own room, and that of the public office of his department, the communication between the two being by a corridor quite open to the public.

"Rob Roy" sets the main portion of the High-street block 25 ft. back from the east and

west wings, which project forward to the building line, and in this point improves upon other quadrangular plans, which keep the whole south block forward to the building line. The court in the centre of the site is of irregular shape, and gives light only to staircases, corridors, and lavatories, the offices being lighted to the outside of the square. The Council Chambers occupy the High-street block on the second-floor level,—a height to which few other competitors have cared to raise them. The official departments on the first floor, those of the Town Clerk, City Chamberlain, Burgh Engineer, Dean of Guild Court, &c., are well arranged in relation to each other and the work to be carried on within them. The elevations are somewhat commonplace, securing their effect rather by bulk than originality; but the large-scale drawing exhibits a correct knowledge of Classic detail.

Present upon Shield.—The design bearing this device is the only one submitted in competition which proposes to utilise the existing buildings, and on this account Mr. Waterhouse called attention to it in his report. It may be enough to say of it that it either goes too far

#### JAPANESE ARCHITECTURE.

At the meeting of the Royal Institute of British Architects on Monday evening last, Mr. Waterhouse, R.A., Vice-President, in the chair, Mr. Josiah Conder (as elsewhere mentioned) read a paper on "Domestic, Civil, and Palatial Buildings in Japan."

In describing the domestic architecture of Japan, the author should, he said, have occasionally allude to certain habits of life pertaining to the people of that country; some of them the natural results of climate, many of them closely associated with romantic tradition, but not a few belonging more to the passing than to the modern type of civilisation. In Japanese houses separate rooms are not set apart for distinct and particular household purposes, as is the case in European dwellings. The bedroom, as a distinct apartment, can hardly be said to exist in the ordinary dwellings. As a general rule, any room is converted into a bedchamber by spreading sleeping quilts and pillows upon the matted floor. During the daytime such bedding is secreted in spacious closets arranged between the walls of the

Front Elevation of a Japanese Theatre-Tea-house.

or not far enough. 50,000*l.* is too much to spend on patching up an old building without obtaining a satisfactory result, especially when designs are submitted in competition and recommended by the professional assessor for an entirely new building, arranged exactly as the requirements of official business dictate at a cost little more than double that sum.

Other designs of considerable pretension and more or less merit are "Finis coronat Opus," "Line upon Line," "Heriot," "St. Andrew," "In my Defence" (No. 12).

Taking a general survey of the drawings, after a careful examination of each individual set, one returns with satisfaction to the plans recommended by Mr. Waterhouse. For systematic setting out, convenient and dignified arrangement, and efficient lighting, they are not equalled in the room, while the elevations of "Nineteenth Century," "Ora et Labora," "Fortuna," "N. D. I. V.," and "Fiat" are welcome assurances that, with all the striving after novelty and cheap superficial effect which the spirit of the age tends so much to develop, there are some among us who still understand and value the breadth, solidity, and nobility of true Classic art. It is at the same time to be regretted that there have not been submitted, in conjunction with a first-class plan, elevations in which full advantage is taken of the grand possibilities of the French Renaissance, the style, above all others, pre-eminently suited for the proposed building, with its site and surroundings.

The Japanese make constant use of the hot bath, and all the best houses are provided with a bath-room. The usual time for taking the bath is the afternoon or evening, so that the morning ablutions are simple, and are conducted, not in the sleeping apartment, but in the lavatory, or in some cases, even at the well-side in the garden or kitchen court. Privies are provided at the end of the verandah passages, and just opposite to them, in the garden, is invariably an ornamental water-basin provided with a ladle. The mats called *tatami*, used to cover the floors of all living-rooms, are of the fixed size of 6 ft. by 3 ft., and rooms are described by the number of mats that they contain. Passages, verandahs, part of the kitchen, and the closets are boarded, such boarding quickly assuming a natural polish from the daily rubbing with wet cloths which it receives. Food is served to the different rooms upon small trays, one to each individual. In winter large metal-lined boxes, or bronze vases of live charcoal, are placed in a room when in use, and in summer smaller fire-boxes are provided for lighting the pipe at. The candlesticks or lamps used at night, one or two chests of drawers, small low tables for writing upon, boxes containing paper and ink, little shelves for the cups, and occasionally, in the most luxurious dwellings, a small lacquered cabinet and a screen or two, complete the furniture of an ordinary house. In every house, one room or more will be provided with an alcove or recess, called *tokonoma*, and a corresponding recess, occupied

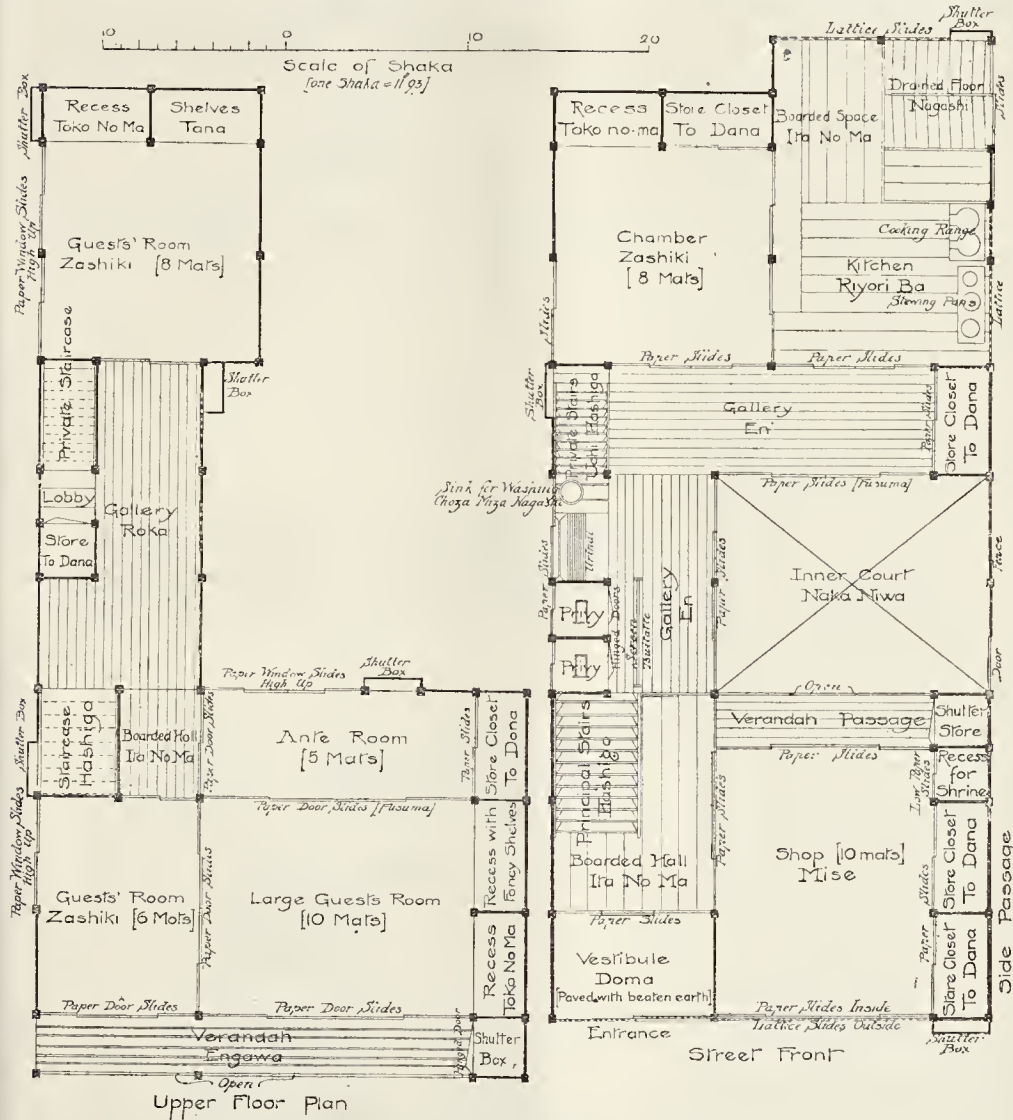

either by ornamental shelves, or by a closed store closet.

The general mode of living in a Japanese house being understood, it would be easier, the author said, to appreciate the different arrangements which the builders have produced for administering economically to such wants. He showed a drawing of a small middle-class house, and another of a somewhat larger one-story building, formerly occupied by a private gentleman of the upper class. The former contains a vestibule, a small three-mat ante-room, one large even-mat room, another room of six mats

wood, having some quiet pattern cut through, free or conventional. The other drawing shown was a good example of the best class of bonso, secondary only to the large summer pavilions of the nobles and their old feudal mansions. The approach is under a porchway, paved with cement, having a high wooden step leading to the enclosed matted hall, four mats in area. At the side of this hall is a three-mat room for domestics, with large and small closets. The hall opens into a small inner hall or lobby of two mats, communicating with one of the principal sitting-rooms of

four smaller rooms, one eight-mats, and the others six-mats in area; of this group one has a *tokonoma* and *todana*, or closet, and the others closets only. At the back of the whole residence is an oblong block containing a large store and two small rooms for female servants, with separate entrance. As is almost invariably the case in the best houses, the principal rooms form an internal angle or L-shape towards the garden, which is generally on the south side of the building. The whole of this side has a boarded verandah with a latrine at the end. Other conveniences are provided,

Plans of a Japanese Theatre-Tea-house.

with a *tokonoma*, a kitchen, closets, privy, and back entrance. Such a dwelling would be surrounded on two sides by a little garden containing a few shrubs, evergreens, stones of irregular shape, perhaps a stone garden-lantern, and a hill or two. A small miniature pond might also be introduced. The whole would be surrounded by a gardeu-fence, entered through a picturesquely-roofed wicket-gate. The internal constructional woodwork and the boarded ceilings of such a house would be carefully selected, and some pale neutral tint would be given to the plastering. The *ramma*, or frieze space, would be filled in with thin planks of clean

eight mats in area; and at the back with an inner gallery which surrounds a central court or garden. On the right of this garden is a wing containing kitchen, servants-hall, and bath-room; and this wing, towards the front, adjoins the room devoted to hall servants, though somewhat set back from the main frontage of the house. Beyond the eight-mat room mentioned is the principal room of the house, fifteen mats in area, and decorated at the further end with an ornamental recess (*tokonoma*), and decorative shelves (*tana*). Behind this room, and forming a group on the further or west side of the inner garden, are

one near the bath-room, and one at the back of the further block. A house such as this would be provided with an extensive garden on the south and west sides, and a small garden of different character in the internal court or area. The style of garden employed within would be what is called the *Hake-niwa*, a flat garden of beaten earth, kept slightly damp and cleanly swept, dotted with quaint paths of stepping stones, and rather thickly planted with low trees and shrubs. The outer garden would be of more free and open character belonging to what is called the *Sansui* type, a word implying mountain and water scenery; gardens in this

style being designed to suggest some natural landscape.

The refined Japanese gentleman of the old school will generally boast some acquaintance with the philosophy and ceremonial of tea-drinking, and will adorn his grounds with one of those curious little buildings, called *Chashitsu*, intended for the preparation and enjoyment of this refreshing beverage, amid the hospitable formalities with which the pastime is surrounded. The construction of these buildings is in keeping with the tinyness of the arrangements, and the most exquisite care and neatness are displayed. The author showed a plan of one of these buildings designed by the greatest professor of the *Cha-no-yu*, Sen-no-Rikiu, and described its arrangement and mode of construction in detail.

Numerous types of houses used by the upper classes might be given, but the one previously described was sufficiently characteristic. The time at the author's disposal did not admit of his describing these at length, nor of reading all that he had written on the subject of the *Yashiki*, or town residences of the territorial nobility; and of the castle-palaces. The latter consist of an extensive group of one-storied buildings, compactly arranged, and divided at intervals by inner courts or small gardens. The principal palace of the latest *Shogun*, or Military Regent, in the Castle of Yedo, which was years ago burned to the ground, covered an area of more than two acres. The military character of such buildings necessitated greater compactness in planning than was adopted in the Imperial palaces; and whereas the latter, as may be seen in Kyôto, consist of a number of almost detached blocks connected by long covered ways, the former were more under one roof, the succession of rooms was less broken, and the inner courts and gardens were introduced only where absolutely necessary for purposes of light and ventilation. In the matter of internal decoration, however, the castle-palaces are far more gorgeously embellished than those of the Imperial buildings. The *ramma* are elaborately coloured and gilt, the ceilings have painted silk panels and lacquered frames, and the only undecorated portions are the posts and lintels, which are invariably of plain white wood. The author said he had with some difficulty obtained a plan of this palace, and also of one formerly situated within the inner citadel of the same castle,—which he exhibited. The Imperial Palace still existing at Kyôto, the former Capital, was illustrated by a general plan and several drawings of some of the buildings. The palace consists of seven principal blocks of residential buildings, connected by covered corridors and arranged in an irregular manner, so as to present the best aspects to the wide gardens and courts surrounding them. At the back of these buildings are large groups of administrative offices, kitchens, ward-rooms, stores, and apartments for officials and domestics; and at various parts of the enclosure are fire-proof stores and outbuildings. A special block is arranged for worship, originally also intended as a repository for certain sacred treasures. The complete group of buildings is surrounded by an irregular oblong fence, constructed of clay and tiles set in heavy wooden framing and plastered between the frames. The fence is crowned by a wide and picturesque tiled roof with ridge ornaments. At certain points in the boundary are gates, each of some different design, and intended for special uses. The longer side of the enclosure measures about 2,400 ft., and the narrower side about 1,440 ft. Taking into account certain depressions, the whole boundary measures about 8,436 ft., or nearly 1½ English miles. The first building reached through the principal entrance gateway is the *Shishinden*, or ceremonial hall, which is used only on special occasions. This is a large hoarded hall, measuring about 100 ft. by 50 ft., with a wide corridor behind and recessed galleries at the sides. At the back it is connected with a passage leading to the Imperial chambers, and in front, towards the garden, has a broad flight of steps communicating with an exterior raised gallery. The court in front of this hall contains several storehouses for the Imperial cars, palanquin and other ancient utensils, and immediately before the threshold are two sacred trees, to which great antiquity is attributed. The next block reached is the *Seriden*, or Summer Palace, used only for special summer ceremonies, and not matted as all purely residential buildings are. The small

chambers at the sides, used as retiring-rooms, are named mostly according to their decoration; thus there are the Wisteria Chamber, *Lespedeza* Chamber, and the *Fiend* Chamber. On the opposite side of the court separating this building and the *Shishinden*, is the *Kogoshô*, or Small Palace, having its principal aspect towards a garden on the east side. The walls and slides are richly decorated in cream colour and gold, with paintings of landscapes and

by a wide passage, and an outer gallery thrown open in summer time to the breeze. On the south side is a suite of three rooms, the floor of each successive room being raised above that of the other. The author then described the decoration of the wall spaces, ceilings, panels, and slides of the room contained in this block. Many buildings, he said, destined for far less important uses, are to be seen in Japan with gorgeously decorated ceilings; but a neat sim-

A Japanese Gateway.

figures in pale colours, interrupted by cloud-shaped streaks of rich blue. The next block of rooms on the garden side is called the *Gakumonjo*, or Imperial study. A winding corridor leads from this block to the *O-Tsunegoten*, or Imperial residence proper, which is a large block of rooms, measuring about 60 ft. by 100 ft., and with a small corner block attached. It consists of fourteen rooms, arranged in an oblong block, and surrounded

by a wide passage, and an outer gallery thrown open in summer time to the breeze. On the south side is a suite of three rooms, the floor of each successive room being raised above that of the other. The author then described the decoration of the wall spaces, ceilings, panels, and slides of the room contained in this block. Many buildings, he said, destined for far less important uses, are to be seen in Japan with gorgeously decorated ceilings; but a neat sim-

construction these rooms are a true type of the Chasbitu, or tea clubs.

The whole of the Imperial buildings are, with- out exception, of one story only, and present very few striking architectural features on the outside. The roofs are of picturesque curve, though decidedly heavy looking, and are covered with thick layers of pine shingles. Terminals and ridges are executed in wood, covered with copper-plate, and with a little gilding in parts. The gables have bargeboards and carved pen- dants. The eaves, with the exception of those the Shishinden, have not the rich bracketted cornices generally found under them in temple buildings, but are much simpler.

The principal features of interest upon the exterior, are the elegant halustrades and hand- rails of the external galleries and staircases, and the wooden screen divisions which separate the verandahs into parts. The vista of interior rooms, always seen from the outside, attaches interest to an otherwise bare and monotonous elevation.

The author then referred to the summer pavilions used by the emperors and regents as temporary residences for retirement. They are of two or three stories in height, contain small painted chambers of great delicacy and beauty, and are surrounded by magnificent gardens. He then proceeded to describe some of the more important town buildings for the public use. Among the principal of these are the bath houses, tea houses, restaurants, inns, lodging- houses, theatres, lecture-rooms, and dancing- rooms, most of which were illustrated by draw- ings, showing plans and elevations. These and the other buildings described were also illus- trated by means of a numerous collection of photographs and paintings made by the author and by Japanese artists.

Mr. Octavius Hansard proposed a vote of thanks to Mr. Conder for his interesting paper. Mention had been made as to the general angle of the roofs of Japanese buildings being from 30 to 40 degrees, with large and extending eaves projecting from the main to the extreme extension. He believed the climate of Japan was often somewhat similar to that of England, and as the roofs were to a great extent covered with shingles or materials of a similar nature, how was it that a mass of snow was kept from weighing down the construction of such slight roofs? He would also like to know how in so changeable a climate the eaves or outside shutters were prevented from being blown to pieces? He also desired to know whether the Japanese had been able to use glass, without loss of picturesqueness, in connexion with their buildings?

The Chairman said that the meeting would willingly accord a sincere vote of thanks to Mr. Conder for his interesting paper. He had given many curious details relating to Japanese architecture and gardening. Mr. Conder had mentioned the Chinese style as being exhibited in some of the older buildings, and he (the speaker), therefore, imagined that Japanese architecture had been derived from China. Nothing had been said in the paper about the tenure of land in Japan, in regard to which he felt some interest. On one occasion he thought he would have something to do with a Japanese building, but it came to nothing. At the time, however, he was much puzzled as to how the building was to be designed on a site he had never seen, and as he knew nothing about the dimen- sions and levels. He was told, however, that there need be no difficulty, because in Japan the projector of a building could purchase any bit of land he wished. The owner of the land was bound to register his own valuation of the land, and at that value he was bound to sell it if a purchaser came forward to buy it. There was also little fear of too high a valuation being put upon the land, as the registered value formed the basis for levying income-tax.

The vote of thanks was then put, and was cordially received.

Mr. Conder suitably replied, and in answer to Mr. Hansard's queries, said that a slope of from 30 deg. to 40 deg. was rather a vague definition. No Japanese roof was of one con- tinuous slope, the slope being steeper towards the top of the ridge, with a flatter slope at the bottom, the two slopes combining with a slight parabolic curve. These roofs, especially when covered with snow, were of extreme weight, but in Japan the idea of carrying the whole weight of the roof on to the external walls by means of ties, posts, and so forth, was not

followed. The roof was supported from as many points in the interior of the building as possible, so that the weight was spread over a wide area. With regard to the running shutters, a Japanese house in a storm was rather a noisy place; the shutters rattled, and it was necessary to see that they were tightly fastened to prevent the risk of one or two being blown out. At the same time, as the whole build- ing could not boast of any great solidity, the shutters were as well-off as any other part. Since glass had been introduced it had become customary to use it. If the whole of the sides of the building were filled in with glass it would give a bleak and bare appearance to the rooms; but a sort of compromise could be effected by using a central pane of glass and leaving the remaining ones of paper. Referring to Mr. Waterhouse's remarks on the Chinese style, Mr. Conder said that, of course, Japan originally took her architecture, as well as her arts, from China. Many modifications had taken place in the style as introduced from China, while changes had also occurred in China, the result being that the present Chinese style was very different from the Japanese. It was, therefore, difficult to know how far the present Japanese style was like the old style which she first took from China. It was prob- able that in those days the Chinese style was also a wooden style, though now-a-days the Chinese used more solid materials. The pagodas in Japan were of wood, whilst those of China were coated with brick, and even porcelain. With regard to the question of land tenure in Japan, he could scarcely explain it without going into a long political history of the present con- dition of Japan. That country was not quite under what could be termed a free Government, but rather under an autocratic Government, which could do pretty much as it liked in matters of securing land, especially in the capital. Indeed, the greater part of the land belonged to the Government, and it was easy to obtain what was wanted by the use of a certain amount of diplomatic pressure and persuasion. Mr. Conder, in reply to a query, said that his brother had already gone into the question as to whether the Japanese specially constructed their buildings to escape destruc- tion by earthquake. He (the speaker) main- tained that there was nothing in the construc- tion of the buildings in Japan to make them in any way fitted to withstand earthquakes. They were extremely top-heavy, and were with- out tiers or braces of any sort. In the ordinary earthquake seasons in Japan the buildings swayed about in the most alarming manner, and no native builders or architects of the old style had ever laid claim to their buildings being earthquake-proof. The central post of the pagoda, too, had been merely put in to stiffen it against wind and render it more stable. The curious fact that certain of the posts did not touch the ground had already been scientifically explained.

We give plans and an elevation of one of the tea-houses referred to by Mr. Conder. The proprietors of these tea-houses, in accordance with ancient custom, make it a prominent feature of their business to take charge of would-be theatre-goers, whom they personally conduct to places of amusement, entertaining them before and after the performance at their own inn, and much to their own advantage. We also reproduce two drawings exhibited by Mr. Conder of one of the gateways, which are among the most characteristic features of the architecture of the country.

**Hydraulic Lift Service in the City.**—The Winchester House Company of Old Broad- street, City, have just started their third and largest hydraulic passenger lift. It is of excep- tional size, having a total travel of 90 ft., and a solid steel ram measuring 53 in. diameter by about 35 ft. in length. The two previous lifts about 80 ft. each. All are in constant use at a speed of 250 ft. per minute, and are yet under perfect control. In these three lifts the Winchester House Company possess a service unexcelled by any other building in the City. The type of lift selected for this important installation was Stevens & Major's hydraulic balance, and the work has been carried out by Messrs. Archibald Smith & Stevens, under the supervision of the architect for the building, Mr. F. Pilkington. The power is supplied by the London Hydraulic Power Company.

#### LECTURES AT THE ROYAL ACADEMY.

PROFESSOR MIDDLETON ON MEDIEVAL SCULPTURE.

The Slade Professor of Fine Art at Cam- bridge delivered his second lecture on this subject at the Royal Academy on the 25th ult. He commenced by pointing out that the chief existing plastic works which were produced during the Byzantine period were a number of large bronze doors for cathedrals and abbeys—churches. These belonged to the close of the early period, and were, so to speak, the first suggestions of the Renaissance which was soon to come. Though made for very different places,—Germany, Pisa, Southern Italy, and Sicily,—yet, in general design, in technical execution, and even in the style of their detail, they were very similar, and were striking examples of the widespread prevalence of one type of art. They were designed in two folds, with a number of square panels, each enriched with a relief of some saint, or, more usually, some Scriptural subject. In all the design was very simple, and of much decorative value, in spite of the very rude modelling of the figures. The framing of the doors was, in some cases, ornamented with reliefs of foliated pateras, magnificently designed, full of spirit in every curve, and finished with the minute detail of a piece of jewelry. These magnificent specimens of early bronze-work were produced during the greater part of two centuries,—the eleventh and twelfth. The earliest example, that at Hildes- heim Cathedral, was due to the skill of Bishop Bernward, a real precursor of the Renaissance, who, two centuries and a half before the Pisan Nicola, examined and appreciated the beauty of Classical art, and did his best to throw off the dull Byzantine formalism and to introduce some increase of artistic beauty into the mod- elling of the human form. This Bishop of Hildesheim, like St. Dunstan in England and St. Eligius in France, was himself a skilful worker in gold and silver, and also, on a larger scale, in bronze. He died in 1022, and for a while there was no successor to carry on the revival which he began, although his influence was traceable in the similar bronze doors at Augsburg (dating from the second half of the eleventh century) and in those at Gnesen. Most of the bronze doors in Italy, some of which were signed, appeared to be the work of Byzantine Greeks resident in Italy. Those at Pisa and Monreale, by the Pisan sculptor and architect Bonannus, were, in style, simply copies of those of the Byzantine sculptors. The Monreale example was dated 1186. Having mentioned other bronze doors existing at Rome, Monte Cassino, Amalfi, Ravello, Trani, and elsewhere, the lecturer said that one outside Rome, made for the Basilica of St. Paolo fuori le Mura, was of the eleventh century, and was signed as the work of a Greek named Staurachios, who also cast the doors at Amalfi in 1066. The doors made for the basilica referred to were richly decorated with niello-work, and though a good deal injured by the fire which destroyed the nave of the basilica in 1824, were not lost or destroyed, as many people believed, but were now kept in a great closet in the sacristy, and were not shown to visitors. Passing on, the lecturer said that another fine class of bronze-work of about the same date as these doors were the large bronze fonts in some German churches, such as Hildes- heim and Osnabruck. The reliefs on the out- side of the bowl usually represented Bible scenes of baptism in very high relief. One of these fonts was, for its date, one of the most remark- able works of art in the world. He alluded to the bronze font at Liège, the work of Lambert Patras of Dinant, early in the twelfth century. There was a cast of this work in the South Kensington Museum. Its figures, representing Christ being baptised by St. John, with attendant angels, were modelled with wonderful grace and refined beauty in expression and attitude, and in the simply-designed carving lines of the drapery. Professor Middleton said he knew of no other work of art so strikingly in advance of its time. Except for some slight stiff- ness of pose, the reliefs were worthy of the best sculptors of Florence three or four centuries later. In England, little sculp- ture of merit seemed to have been pro- duced till the great renaissance of art under Henry III. During the Saxon and Norman periods, the chief productions of the sculptor's art were apparently the reliefs and statuettes in gold and silver which were used in so lavish a way for retables of altars and for shrines to

contain the bodies of saints. These works, though magnificently decorative in effect, owed but little to any merit in the figure modelling. Large works in bronze were not produced in England, and the lead fonts of the eleventh and twelfth centuries were but feeble in their design and treatment as compared with the noble bronze fonts of Germany. Some very curious large stone reliefs\* now in Chichester Cathedral exhibited a very degraded state of the sculptor's art in the eleventh century. They represented two scenes from the Raising of Lazarus; the figures were stiff, the pose very clumsy, and the drapery of an exaggerated Byzantine character, with long stiff folds. The hair was treated like a bundle of ropes, and the hard ugliness of the faces was accentuated by the insertion of bits of glass or enamel in the eyes. In the twelfth century the Norman churches of England were often very richly decorated with sculpture, which though in itself rudely modelled and badly proportioned, was yet always very skilfully designed to suit its special position, and was usually of very great decorative value. But in the main, the stone sculptor in England till the thirteenth century was not an artist of a high class, but simply a mason with a strong feeling for decorative design. At that time the goldsmith was the artist-sculptor, and hence we found that in the time of Henry III. the old goldsmiths' family of the Fitz-Othos came to the front when sculpture of a high class was needed. England had always been remarkable for skill in the working of gold and silver, and the training which so many of the Mediæval sculptors went through in the manipulation of the precious metals had an important effect on their larger works in the shape of bronze statues or reliefs. It taught them to aim at minute delicacy of detail and perfection of surface, qualities which did much to increase the beauty of bronze work. The lecturer, after referring to the traces of this influence as seen in the works of Donatello, in the two bronze effigies by William Torrell, in Westminster Abbey, and in the works of Ghiberti, passed on to speak of the sculpture of the thirteenth century in England,—one of the most remarkable periods in the history of the development of art that the world had ever seen. At the beginning of the thirteenth century, in the reign of John, all the arts seemed paralysed by the troubled state of the country; and yet, by the end of the century, England had reached the climax of her artistic splendour, and was, on the whole, the foremost art-producing country in Europe. In all the chief branches of the arts, in painting, sculpture, illuminated MSS., embroidery, and work in the precious metals, England was alike surpassed by no other nation. In one only of the lesser arts, that of pattern-weaving, was England surpassed, the best work of that kind then produced being done by the Moslem silk-weavers of Palermo, and by the carpet-weavers of the East. As an example of the remarkable power and skill of the English sculptor of the second half of the thirteenth century, the lecturer referred to the wonderful series of statues and reliefs which covered the west front of Wells Cathedral,—works which, he said, for their special purpose had never been surpassed in more recent times. There were more than six hundred figures in the round or in relief, arranged in tiers one above another, and covering the whole front with one mass of sculptural splendour. The tympanum of each doorway was filled with a relief, and above were rows of colossal statues of kings and queens, knights and prelates, prophets and saints, forming a wonderfully comprehensive scheme of theology and history. Many of the heads of these figures were full of soft beauty and delicate grace, with the hair flowing in wavy tresses or drapery thrown like a hood over the head. All the figures were remarkable for extreme dignity of pose, and the simply-designed lines of the draperies were all most thoughtfully arranged to suit the main lines of the building which formed the background and frame to the figures,—a fact from which the lecturer concluded that the sculptor was also the architect. Indeed, the perfect decorative value for which so much of the English and French sculpture of the thirteenth century was remarkable, was due to the fact that the architect and the sculptor were one man. The work of this period was characterised by reserve and

restraint on the part of the sculptors. In conclusion, the lecturer mentioned the number of different materials used by the Mediæval sculptors, and described the processes and limitations attaching to each. The sculptors of old with a true sense of what was of value in art, despised no material, but they felt that beauty and dignity of form ennobled any material.

MR. G. AITCHISON, A.R.A., ON DOORWAYS.

On Monday evening last Mr. Aitchison delivered the first of a series of three lectures on architectural subjects. In this lecture he treated of doorways. He observed that the poet found language, human joys, sufferings, and passions ready to his hand. These he had to observe and describe in words that evoked corresponding emotion in his hearers, and he had to set the whole to a tune. He captivated his hearers if he could coin a striking phrase; he was called great if he could picture to us higher joys or deeper sufferings than those of our own days, if he could portray the grander passions of a more vigorous age, or enlist our sympathy with a nobler enthusiasm or higher aspirations. The painter and the sculptor had their models always before them in the shape of Nature's works, but they had to choose those graceful lines and that happy combination of colours that were mostly momentary and evanescent, and fix them for ever for our admiration. We called the painters and sculptors great if they could perfect the types suggested by eliminating those defects which were due to accidental or untoward circumstances. But architecture, like music, could only gather slight hints from Nature, and must elaborate on those until she could please, move, or entrance man. Unhappily, at the present moment he was "like the deaf adder that stoppeth her ear; which will not hearken to the voice of charmers, charming never so wisely." Hence there was no architectural language, and each architect tried some paraphrase of some bygone architectural harmony which once entranced mankind, and hoped he might captivate the multitude. It was not difficult to say, "Plan conveniently and with ingenuity, and, when occasion offered, strikingly"; nor to say, "Construct soundly and daringly," and to more or less point out how these things should be accomplished. It was equally easy to say, "Design beautifully," but when one was asked what sort of beauty now pleased, one could only reply, "You have to find that out." The sublimity and perfectness of Greek architecture, the magnificence of Roman, the luxuriance of Byzantine, the savage grandeur of Romanoesque, the gorgeousness of Saracenic, the mystery and wondrousness of Gothic, or the ornate subtlety of Renaissance, produced neither delight nor admiration. The lecturer was consequently driven to seek some of the necessities of structures, and to make those forms that once pleased pass before his audience like the procession of kings before Macheth. He had chosen "Doors," "Windows," and "Balustrades," and he would begin with doors. The first point to be noted was that where mankind began to build with stone, the theoretical doorway would be a triangle formed by corbelling over each course of stone on each side until the two touched at the top. He took Early Greek work for his illustration, and showed that the doorways at Misalonghi were of that triangular form, only the projecting corners of each corbelled stone were worked off to the line of the triangle. Openings of the form of a pointed arch were next made, to get more headway, and eventually the bottom part only of the opening was thus built, and a stone lintel thrown across the top. The inward sloping of the jambs narrowed the opening for the lintel, which was an advantage, for in early times there was difficulty in getting long stones, and much labour had to be expended in getting them to the spot and in forming earth slopes on which to haul them up to the height at which they were to be placed. The inward inclination of the sides of doorways was eventually made in straight lines, and this was continued even when stone uprights were used as jambs. The Lion Gateway at Mycenæ was instanced as one of the earliest examples of this. The lintel was allowed to project on both sides beyond the jamb, to increase its strength, and these sloping sides and the projecting lintel were continued in civilised times, on account of the whole doorway forming an æsthetic balance. When the jambs and lintel were moulded on the outer

edge, the projecting ends of the lintels formed the "knees" to the architrave. Vitruvius handed down the tradition of forming "knees" on the architraves of doorways, so that the form was common in Roman times for several centuries, and after its abandonment in Byzantine, Romanoesque, and Gothic times, it was again introduced by the Italian Renaissance architects, and still continued to be a favourite form in Europe. That not only showed the conservatism of mankind, but also the rarity of successful invention, as there was every reason to believe that it was adopted in, or shortly after, the Bronze Age (all these developments were illustrated by diagrams and drawings). The lecturer pointed out that Diocletian's palace at Spalato, built about the end of the third century, was one of the most interesting buildings in existence, as it showed the epoch at which the Romans began to think for themselves, when they throw aside the post and lintel construction of the Greeks, with which Roman buildings had hitherto been adorned, and used their own arches springing direct from the capitals of the columns, thus laying the foundation for Byzantine, Romanoesque, and Gothic architecture. The "Porta Aurea," of that palace was the prototype of the majority of Byzantine doorways throughout the East. Mr. Aitchison next pointed out that the arch on two columns came to be looked upon as an ordinance, and was then used in Romanoesque doorways in successive layers, so to speak, each one including the one before it. The beautiful doorways of St. Trophime at Arles and at St. Gilles were the most perfect forms of that kind of doorway, which was the prototype of Gothic doorways. The excellence of the two examples named was due to the influence of the Byzantine work in Central Syria. The fine sculpture of those two doorways was due to the imitation of the imported figure work from Constantinople, and to the study of the Gallo-Roman sculpture. The Mosque of Touloun in Egypt, built by a Christian architect in 885 A.D., had its four columns to the *Kiblah* placed as "nook shafts," and the *Kiblah* had a pointed arch. Hence he might be excused for mentioning it in connexion with doorways. Fergusson, in his "History of Architecture," said that from that mosque "we must date the complete foundation of a new style." And truly there we saw the beginning of honeycomb work, which was found in the pendentives of the dome in front of the *Kiblah*. The architect of the mosque was imprisoned by Ahmed Ibn Touloun, the Governor of Egypt, for advising him to use old columns for the mosque. The Governor said that marble perished by fire, and he wanted an original mosque of brick, that would withstand fire and the inundations of the Nile. The architect from his prison managed to let the Governor know that he could build him what he wanted, and when summoned before him took a skin of parchment and drew out the plan without a column, but said he must be allowed four columns for the *Kiblah*. The plan, with the original treatment of the piers, so pleased the Governor that he told the architect to build the mosque. He gave him 100,000 pieces of gold for the workmen's wages, and promised to furnish him with all the materials he wanted. Two years afterwards the mosque was opened for service, and the Governor was so pleased with its convenience, appearance, and originality, that he presented the architect with 10,000 pieces of gold, and gave him a pension for life as well. A royal gift like that must have been a great stimulus to architects, but the Arabs were as famous for generosity as the English were for meanness to the architects. One of the capitals to these four columns bore a strong resemblance to one at San Vitale at Ravenna, executed in the time of Justinian, after 525 A.D. By way of advice to his hearers, Mr. Aitchison said:—"When a doorway is on the front of your building, and not behind a portico, try and concentrate on it a due amount of importance without making it so obtrusive that it will not compose and harmonise with the front. Do not make it a mere hole in the wall, into which the owner may sneak. Also, carefully consider what elements of beauty are most in accordance with your own taste; then study the style that contains the greatest number of those elements, and endeavour to so vary and add to them that your variations may be an improvement, and mark the style as your own. No architect, I think, should desire to be like 'three labourers of Babel' by using different styles, for if he

\* Illustrated in the *Builder* for Dec. 11, 1886.

really an architect he must have some convictions, and what sort of work can a man do when he is working against his conviction? I may, perhaps, be allowed to paraphrase one of the political cries, and say, "One man, one style."—Besides other advice and admonitions to the student, the purport of the lecture was to show that the widest variations in architecture were got by gradual addition to or suppression from an original type, just as the widely-differing wings of the albatross and the apteryx had been derived from one common type.

Mr. Aitchison's second lecture was on "Windows," and was delivered on Thursday evening. His third and concluding lecture, on "Balustrades," will be delivered on Monday evening next. On Wednesday next Mr. Reginald S. Poole will lecture on "Medals."

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The seventh ordinary meeting of this Institute for the present session was held on Monday evening last, Mr. Alfred Waterhouse, R.A. (Vice-President), in the chair.

The Liverpool Cathedral Memorial.

Mr. John Oldrid Scott asked leave to make a personal explanation arising out of the matter of the memorial in reference to the Liverpool competition. This was a question in which he, as well as all church architects, and, indeed, all members of the profession, had been deeply interested, and when the matter was decided he and others felt very strongly about it. He met one of the competitors, Mr. Bodley, and Mr. Brooks, and sympathised with both, as he felt that their designs, in his humble opinion, were a long way ahead. That was a mere private matter, but out of it had grown all this disturbance, which he very much regretted. The matter went through various phases, and ultimately came to the memorial, which was sent out in a particular form. After it had received a considerable number of signatures, he had a call from Mr. Aston Webb on behalf of the Competitions Committee of the Institute. Mr. Webb then informed him that the Committee objected to the memorial because, on the face of it, it appeared to discredit Mr. Christian's report, and also to invite expressions of public opinion. At that time Mr. Webb laid before him a corrected copy of the memorial, with two alterations, one being a mere matter of form, and another an essential correction. Mr. Webb had drawn his pencil through the words, "for the purpose of eliciting the best skilled and widest public opinion upon them." This was an essential alteration, because it struck out what seemed to be considered objectionable by the Competitions Committee. The other alteration was a mere suggestion as to the transposition of certain words, and he therefore looked upon it not merely as an expression of opinion, but as an actual suggestion for an altered form of memorial. The Committee also suggested this alteration in the construction, viz., that the following words should be placed at the end,—

"On which so much depends respecting the future of the English church, and the art of architecture throughout the kingdom." He therefore looked upon it as an actual suggestion from the Committee to alter the memorial. Mr. Seddon, with whom he was acting, was out of town, and being unable to communicate with him, he took it upon himself to accept what he thought was the suggestion of the Competitions Committee. He desired to communicate with the competitors as early as possible, and so he wrote to the building journals as follows:—"At the suggestion of the Committee on Competitions of the Royal Institute of British Architects, the proposed memorial, which has received about 300 signatures, will be modified in the following terms," and then it went on in the terms he understood the Committee to suggest. He now felt that it might have been more civil in him to have waited another week, but his not doing so was purely an error of judgment. He trusted he had made it clear that he was acting, as he thought, fairly in the matter. It was not as if he had half accepted the proposals of the Competitions Committee; he had accepted them *in toto*, and, therefore, he had no idea that the matter should have been referred back to them. He saw now that it

would have been more courteous had he submitted it again to Mr. Webb to be laid before the Competitions Committee, and regretted he had not taken that course. He hoped he had said sufficient to explain his action in the matter, to the satisfaction of the Institute.

Mr. Aston Webb remarked that the Competitions Committee would doubtless accept Mr. Scott's explanation. Mr. Scott had referred to alterations being made in pencil, but he had made a mistake in regard to that, as he (the speaker) distinctly recollected that they were made in ink. Mr. Scott had also omitted to mention two important points. The Committee objected first to the sentence which asked for an exhibition in order to elicit further opinion, and also to its being asked for before a decision had been arrived at by the Committee. Those were the two points in the memorial the Committee considered as most objectionable. It was true, no doubt, as Mr. Scott said, that he had not out everything to which the Committee strongly objected; but, on the other hand, they objected to have the memorial fathered on the Competitions Committee. Had it been referred to the Committee they would probably have taken no further steps in the matter; but, at the same time, they would have raised the objection to its being fathered upon them.

The Chairman added that it would be undesirable to prolong the discussion. Mr. Scott had made a fair explanation, and the members had also had the benefit of Mr. Webb's re-statement of the case, which appeared to have fully met with their approval.

Obituary.

Mr. William H. White (Secretary) announced the decease, on the 19th of February, of a distinguished French scholar in the domain of archaeology, M. Olivier Rayet, an Hon. Corr. Member of the Royal Institute of British Architects. M. Rayet, who died at the early age of thirty-nine, after a serious illness resulting from overwork, was a member of the School of France at Athens, a Professor at the Collège de France, and Directeur-adjoint of the Ecole des Hautes-Études. But he would be best remembered as author of the "Monuments de l'Art Antique," which would have caused the portals of the Institut de France to open to him before the age at which such an honour is usually accorded. His other great work, "Milet et le Golfe Latmique," was the result of researches made in Asia Minor, in conjunction with Mr. Albert Thomas, Hon. Corr. Member, at the cost of some of the Rothschild family,—a work not yet completed, only the earlier parts having been received for the Institute Library from the talented authors.

Japanese Architecture.

Mr. Josiah Conder then read a paper on "Domestic, Civil, and Palatial Buildings in Japan," of which we give an abstract, with illustrations, on preceding pages.

The Chairman then announced that the next meeting, on the 14th inst., would be a special general one for the election of the Royal Gold Medalist; after which a paper would be read by Professor Kerr on a professional subject.

COMPETITIONS.

*Memorial Fountain, Reading.*—About twenty-five designs were received from various architects in an open competition for a memorial fountain to celebrate the Jubilee Year. The committee were unanimous in selecting the designs by Mr. G. W. Webb, A.R.I.B.A., of Friar-street, Reading, under the motto of "Faith, Hope, and Charity." The fountain is to be built of stone, and to cost 400l.

*Kendal Grammar School.*—We are informed that seven local architects competed for the above buildings, and that the design submitted by Mr. Stephen Shaw, of Kendal, has been accepted, and will be carried out at once under his superintendence. They will be of limestone, with freestone dressings and Westmoreland slated roof.

*Guilford Castle and Bowling Green Estates.*—For the laying out of the Guilford Castle and Bowling Green Estates, twenty-four sets of drawings have been sent in, and the Council have awarded the premiums as follow:—First (30l.), to Messrs. Littlewood & Aston, Great James-street, Bedford-row; second (20l.), to Messrs. Cheal & Son, Crowley; and, third (10l.), to Mr. Fletcher, Princes-street, Cavendish-square.

CENTRAL ASSOCIATION OF MASTER BUILDERS OF LONDON.

The fifteenth annual general meeting of the Central Association of Master Builders of London was held at the offices, 31, Bedford-street, Strand, on Wednesday, the 23rd ult. In the absence of the President, Mr. Frederick J. Dove, was voted to the chair.

Copies of the balance-sheet having been handed to the members present, the Secretary read the balance-sheet prepared to the 31st of January, 1887, and signed by the auditors. It was resolved,—“That the balance-sheet as audited and signed be approved and adopted.”

The Secretary next read the following report:—

“The committee have the pleasure to present their fifteenth annual report to the members, and it is so glad to be able to state that they believe its usefulness is generally appreciated by the trade; they are also hopeful that the present year will show the long-looked-for improvement in the building trade.

The committee regret to state that the guarantee fund has not yet been fully subscribed, but trust that during the present year the Secretary may be enabled to obtain subscriptions for the small amount which is deficient, and members will be pleased to learn that although the member on whose behalf the fund was raised was not successful in his appeal, still the action of your committee was instrumental in benefiting him to the extent of nearly 700l. Members will be glad to learn of the success of a contractor who carried a somewhat similar case (Wood v. The Tendrill Board of Guardians) to the High Court.

This association, in connection with the Institute of Builders and the National Association of Master Builders, appointed a sub-committee to watch the proposed amendments to the Employers' Liability Act in Parliament last year, and Mr. Bird and Mr. Cowin gave evidence before the Select Committee of the House of Commons appointed to inquire into the working of the Act. The Select Committee have since issued their report which, among other things, recommends the withdrawal of the clause rendering it compulsory for notice of injury to be given to an employer within six weeks, and that a contractor shall be held responsible for accidents caused to sub-contractors' workmen. As members are aware, the Act expires with the present year, and two new Bills to amend it have been again introduced into Parliament, but these will probably be withdrawn, notice having been given by the Government of their intention to introduce a measure dealing with the matter at the earliest opportunity, and in view of the above-mentioned report there is reason to expect that every effort will be made by the trade's unions to increase the already great responsibility of employers.

A Bill has been introduced into Parliament by Sir James McGarel Hogk with reference to the removal of ash-soil under streets, and the laying of mains or pipes in new streets.

A Bill to amend the law relating to the rating of machinery has also been introduced.

The Sanitary Assurance Association have arranged for the introduction of a Sanitary Registration of Buildings Bill during the present Session, to make it compulsory on the part of the owner, lessee, sub-lessee, or occupier in towns or districts of 2,000 inhabitants, to deposit with a registration authority a certificate that the sanitary condition of all schools, colleges, hospitals, asylums, hotels, and lodging-houses is satisfactory.

The foregoing matters will be carefully watched by the committee, and such action as may be deemed advisable in the interest of the trade generally will be taken, in conjunction with the several kindred associations.

The action taken by the Plumbers' Company in granting certificates to plumbers was referred to in the report of the committee last year, and your committee think it desirable that the position of the trade in reference to this matter, and also to the question of plumbers working different hours to other branches of building mechanics, should have the earnest consideration of the Association.

A movement was made in the Newcastle district last year to establish an eight-hour league, with the object of obtaining the co-operation of the trades' unions throughout the country, and there is little doubt great exertions will be made to give effect to it.

In view of the proposed Amendments of the Employers' Liability Act, the committee wish to direct the attention of members to the Builders' Accident Insurance, Limited. The Company has been in existence for over five years, and may, therefore, be considered to be firmly established, as, in addition to having a premium income of over 5,600l. per annum, the funds in hand on the 31st of May, 1886, amounted to 7,250l., and the committee believe it to be the only company covering the same number of risks for the premium charged of 1s. The Company also covers risks to the outside public at the extraordinarily low rate of 1s. for every 100l. paid in wages.\*

After some remarks by the Chairman upon the several matters therein, and by Mr. Maton in respect to the clause referring to the Guarantee Fund,

The Chairman moved, it was seconded by Mr. J. W. Hobbs, and resolved, “That the Report as read be adopted.”

It was moved by Mr. Adamson, seconded by Mr. Greenwood, and resolved,

“That the thanks of this meeting be accorded to Mr. George Burt for his able services as President during the period he had been in office, together with an expression of regret that indisposition should have prevented his being present.”

The Secretary reported the changes in the officers and committee, and stated that the balloting-list had been prepared in accordance with Rules XV. and XVI.

The Chairman, officers, and committee then retired from office, and it was moved by Mr.

\* See in report. It should be Tendrill (see *Builder*, p. 100, ante).

H. Staines, seconded by Mr. Moslin, and resolved,

"That the officers, committee, and auditors, as printed on the list forwarded to all members with the notice convening the meeting, be and are hereby elected."

The newly-elected members then took office, and, in the unavoidable absence of Mr. Bird, Mr. F. J. Dove was again voted to the chair.

Some discussion took place in reference to the subjects mentioned in the report, in which Messrs. May, Rider, Macey, Hobbs, Adamson, Greenwood, Wall, and Colls took part, and it was resolved,—

"That with reference to the several Bills before Parliament affecting the building trade, that it should be left to the committee to take such steps as they might consider best in the interest of the trade to alter or oppose them in the House of Commons."

It was moved by Mr. Rider, seconded by Mr. Hobbs, and resolved,—

"That it is desirable that the working hours of plumbers should in the future be the same as those of all other branches of the building trade, and that the committee be requested to take such steps as they may think fit to produce the result."

Finally, on the motion of Mr. Wall, seconded by Mr. Hobbs, a vote of thanks was passed to Mr. Dove for his services in the chair.

### WROUGHT IRON.

FROM MR. J. STARKIE GARDNER'S interesting paper on this subject, read by him before the Applied Art Section of the Society of Arts on the 22nd ult., as briefly mentioned in our last, we quote the following:—

It is perfectly obvious that the smith of today has a much easier task than his predecessors of the Middle Ages. It appears impossible to trace the exact forms of the bars which found their way to market from the Forest of Dean or the Weald of Sussex, say, in the days of Elizabeth; but considering that the bars had to be beaten out on an anvil under the relatively primitive tilt-hammer, it is improbable that any great variety of section was produced, or that the angles of the bars were mathematically true. The "bars" were, in fact, probably analogous to the "puddle-bars" of today, that is, very elongated ingots ready to be fashioned into finished bars, but not themselves available to be cut up and used without labour, like the bars from the rolling mills at the present day. The fact alone that the smith had to beat out most of the sections himself in the Middle Ages has caused a most pronounced difference between Mediaeval and nineteenth century smiths' work, and must ever be kept in mind in contrasting together the work of such widely different ages. Few of us probably sympathise with those who affect to prefer as a matter of taste the ugliest old production to the most beautiful modern one, but it is perfectly true of old ironwork that it possesses interest and attractions that few examples of modern work can possibly equal. If you enter a cathedral where some happily surviving antiquity has been made the theme for reproduction in modern times, such as the grill work in Canterbury, Winchester, or Chichester cathedrals, you immediately become conscious, without being an antiquary or specialist, and without being able at first perhaps to define precisely why, which is the old and which the new. The explanation is simply that the old-time smith cut a piece from his shingled bar, which he judged by the eye would beat out into a rod of a given length, and curl up into a scroll of the desired form. More or less sufficed for him, and by his method of work he produced an irregularity and play in even the most monotonous design, which is artistically charming to us, but which was perhaps even a source of chagrin to himself. The modern smith, on the other hand, when he receives a commission, buys the required number of rods, cuts them up into pieces of exactly the same length, makes a standard pattern, and if there is much repetition, a tool to gauge the scrolls and insure their uniformity. If there is any irregularity it is considered bad smithing, and if under the conditions it is the result of mere carelessness, the result may be inartistic. The aversion to straight bars seen in the oldest examples was also probably due to the fact that perhaps the most difficult task that could be set a primitive smith was to handle a long heavy bar, and to beat it out perfectly true with mathematically exact and sharp angles. Another reason for the generally artistic superiority of the old work may have been that it was only entrusted to those who had

a special aptitude, and if such a workman was not forthcoming, the work was either not executed, or was made in the simplest form; whilst, if he were forthcoming, the details at least of the design were left to his own fancy, and were, therefore, well within his own powers. In other words, it was the existence of the skilled smith that created the demand, rather than the demand that created the smith, and it seems a reasonable inference that none such had to beg for work in the Middle Ages. When a grill was wanted for Westminster Abbey, it was not the local man who had the commission; but a smith from Leighton, or a smith from Lewes, was fetched and maintained until the task was completed. Finally, it is only reasonable to suppose that the smiths of those days were not fettered by estimate or bound by time, and that the art-work was produced for art's sake, by a genuine artist, whose brains were not picked, as in these competitive days, by a crowd of imitators who copy every original design that is accessible, until the originator is weary of his happiest ideas before he has been able to derive any adequate benefit from them.

The first thing the modern smith requires is a design, and very often a working drawing showing the exact sizes of iron to be used, and the method of fixing them together. Some day, perhaps, our training schools may turn out a class of artisans such as exists in France and Italy, capable of designing as well as accomplishing the manual labour. One cannot but believe, so practical are the old designs, that in most cases they were created by the smith who executed the work, after merely a consultation with the architect. The few smiths who can do this now work at an advantage, as, unless the artist who makes their working drawings has a thoroughly practical knowledge of the craft, he will introduce needless difficulties and intricacies, which renders the work unnecessarily expensive. . . . Hinge-work is, perhaps, the one branch of smithing in which the smith of to-day stands in absolutely the same position as the smith of eight centuries ago. Rolling mills have done nothing to lessen his task, and no sections of iron can be bought ready made that are of much avail.

### Illustrations.

#### NEW PREMISES, CHELSEA.

THIS is an illustration of four new shops and dwelling-houses being built for Mr. J. J. Stroulger, at the corner of Sloane-square and the eastern entrance to the Cadogan Estate. The materials used are red brick, with light-red terra-cotta dressings. The building is designed so that the objectionable, but necessary, party-walls may be hidden when breaking through the roof. The gables and return ridges are built in solid brickwork, the ridges and upper courses of tiles being laid in cement. The contractors are Messrs. Stimpson & Co., Brompton-road, and the terra-cotta is supplied by Mr. G. Jennings, of Parkstone, Dorset. The building has been erected under the superintendence of Mr. Frederick G. Knight, architect.

#### DESIGN FOR STAINED GLASS.

THESE two designs, were made by Mr. E. Burne Jones, A.R.A., for a window at Paisley executed by Messrs. William Morris & Co. Our illustrations are from photographs by Mr. Frederick Hollyer.

#### YORK PROBATE REGISTRY.

THIS building has been erected in Duncomb-place, facing the Cathedral, to afford better accommodation for the deposit of wills. These were formerly stored in a building erected in the angle formed by the south aisle and south transept of the Cathedral, while the Registrar's offices were on the opposite side of the street. The two have now been combined in the new building, which also includes a residence for the Principal Clerk.

The dressings are of Stainton stone from near Barnard Castle, and the walling is from the Heaton Quarries, near Bradford. On the ground-floor are the general offices and the strong-room, which is 66 ft. long and 24 ft. 6 in. broad and 15 ft. 6 in. high, surrounded by iron shelving,

the upper tiers being accessible by a gallery. On the first floor is the Registrar's private office and waiting-room.

The site was provided by the Corporation, and the building was erected by Messrs. Bull & Co., from the designs of Mr. Henry Tanner, Architect to Her Majesty's Office of Works.

#### THE "ORME" BEDE HOUSES, LOUTH.

THESE almshouses and grounds, situate in the centre of the town, and forming a picturesque feature, were formally opened in August last for the accommodation of ten men. They are the generous gift of the Rev. Frederick Orme, late rector of Lyndon, in the county of Rutland, who was a pupil at King Edward VI.'s Grammar School in Louth, some sixty years ago, and his father, the Rev. Thomas Orme, was head-master of the same school in 1796. The houses were handsomely endowed by the donor, who appointed seven trustees to carry out the trusts contained in the deed by which they were appointed. The donor has erected and endowed these almshouses in grateful recognition of his own and his family's connexion with King Edward VI.'s Grammar School. The Rev. Frederick Orme died on the 18th of December last.

The buildings are of brick, with stone window copings, and other ornamental features. Each cottage contains two rooms, with scullery and other offices. This arrangement is shown on the small plan. At the end of the grounds there is a lodge for an attendant. The whole site is enclosed by a handsome iron railing on a solid low wall. Mr. Fowler, of Louth, was the architect, and the buildings were erected under his immediate supervision.

#### BUSINESS PREMISES, ST. PAUL'S CHURCHYARD.

THESE six warehouses occupy two-thirds of the former site of St. Paul's School, in St. Paul's Churchyard, which site it was at one time proposed to throw into the public way, a scheme which had to be abandoned on the ground of cost. The six buildings illustrated comprise the north wing and central feature of the façade, of which Mr. Delisse Joseph is the architect,—the south wing, by another architect, having been given in the *Builder* for Oct. 9, 1886. The architects had originally prepared independent designs for their respective portions, but it was eventually decided so to modify their designs that the whole frontage could be treated as a harmonious composition. The frontage to St. Paul's Churchyard of the buildings, forming the subject of the perspective, is carried out in Portland stone, with granite pilasters and bases on the ground floor, the Old Change frontage being in glazed bricks and Portland stone,—the stone having been worked by Mr. Barnes, at Portland, from details sent down by the architect, and the granite being supplied by Messrs. Fanning & Co. There is a large amount of structural ironwork in the buildings, which was supplied by Messrs. Williams & Co. The goods lifts are by Messrs. Waygood. The builder was Mr. Thomas Pryor, of Kingsland, the architect being, as before stated, Mr. Delisse Joseph of Basinghall street.

#### ROOD SCREEN, WARFIELD CHURCH.

THIS interesting example of Late Gothic woodwork stands in the village church at Warfield, about five miles east-north-east from Wokingham, in Berkshire. It will be noticed that the old rood-loft remains. The screen and other parts of the church were restored by the late Mr. G. E. Street, R.A.

#### Birmingham Architectural Association.

The eighth ordinary meeting of the current session was held at Queen's College, on Tuesday evening last. The Vice-President (Mr. John Cotton) was in the chair. Mr. E. E. Westwood was elected a member of the Association. A paper was read by Mr. J. W. Touks, on "Heraldry in modern Art." The lecturer gave a very succinct account of the rise and development of heraldry, and illustrated his remarks by some fine impressions of seals, &c. A vote of thanks, proposed by Mr. J. Cotton, and supported by Messrs. A. V. Inghal, W. H. Bidlake, and Victor Scrutton (hon. sec.), was unanimously accorded to the lecturer. After a response from Mr. Touks the meeting terminated.

THE ARCHITECTURAL ASSOCIATION:  
DISCUSSION ON MR. WALTER CRANE'S PAPER.\*

The Chairman (Mr. J. A. Gotch, F.R.I.B.A., President), in inviting discussion, said that the lament Mr. Crane had given utterance to was one that occurred as often as the question of modern art was discussed; and, unfortunately, the voices of those who joined in the chorus of lament outnumbered those which showed any reasonable way out of the difficulty. In fact, he had never heard a solution of this difficulty advanced at all, and it was a question in his mind whether, along with other changes that were taking place in the world, they would not eventually have to alter their notions of what art ought to be, and in what beauty consisted. The whole of modern life was different to what life was in what were termed the palmy days of art. Life was much more diverse now, whereas one of the great charms of Mediaeval life, and one of the incentives to the beauty then existing, appeared to have been the much greater simplicity which obtained. The calls upon a man's inventive faculties were very much less.

A sort of school was spontaneously established in every branch of art, and in those schools all men and artists worked towards one common aim, and on common lines. The result was that where one man left off another man took up the matter and pushed it further on. Each man did not require to learn for himself the whole history of art, as was expected at the present day. Now, however, before the architect could really think of art he had to apply a very large amount of scientific knowledge to his work. For instance, the sanitary question discussed at the last meeting involved important additions to the work of the modern architect as compared with him of the Middle Ages, when people did not know what a drain was. Thus the time devoted by the unfortunate architect of to-day to acquiring a knowledge of sanitary science could have been devoted by his forerunner solely to the study of beauty. Then, again, the whole conditions of modern life, as Mr. Crane had said, were antagonistic to picturesqueness in a way. Take, for instance, the extension of towns. It was perfectly obvious to all who had to do with the laying out of new neighbourhoods, that matters of economy and convenience must override every other consideration. The properties had to be laid out in straight lines, to avoid complications, and it was only in certain neighbourhoods, where money could be spent in preserving picturesqueness, that a departure could be made from this rule. The only thing that architects could do under the circumstances, in this ordinary hum-drum work, was to try and make "reach-me-down" architecture as good as possible. He could not agree with Mr. Crane in deploring the manner in which art had been brought home to everybody in the present day; indeed, Mr. Crane was a standing example of one who had helped in that very work. Another thing that tended to the detriment of modern architecture and of art generally was the fact that our craftsmen were not designers; they had to carry out the design of some one else, and the designer necessarily did not acquire that knowledge of the use of tools which was so useful in designing, and which the old designers possessed in so marked a degree. It was no good, however, adding to the volume of work which Mr. Crane had poured forth. He only hoped some of the members would be able to throw a little light upon this gross darkness.

Mr. William White, F.S.A., proposed a vote of thanks to Mr. Crane for his interesting lecture. The members had been accustomed to have rather practical subjects brought before them at these meetings, but that evening they had been carried far above practical matters, to the theories and foundations of art. Mr. Crane had lamented that art was at a very low ebb, but it seemed that the origin of his complaint was, for one thing, in the marvellous increase of population, the vast necessity for the support of the people, which presented so wonderful a contrast to the old times when things grew up gradually, and when there was, as it were, the growth of the individual. The strikers of those days framed the schools of art to which the Chairman had called attention, and which schools formed the bases of development for centuries. The art of the Mediaeval craftsman was wholly traditional, but was not necessarily stagnant. Art was transmitted in two

distinct modes; in the one case by the development of scientific principles applied to the art, and in the other case it was wholly, or almost wholly, traditional by rule, and not by principles. The growth of art all through the Middle Ages in Europe was the growth of style from one century to another; whilst there was reason for believing that in India, China, and other Eastern countries it was a tradition of rule. Hence it was that they could see the exact reproduction as far as the principles and design were concerned, in carpets, curtains, and fabrics of every description, continued from century to century, almost the same. But when he spoke of the development of art through schools by the application of science, it was most evident that that was the case from the early times of the Greeks down to the fifteenth century. The geometrical proportions, systematically carried out by the Greeks in all art buildings, as demonstrated by Professor Hyster Lewis, Mr. Penrose, and others, would clearly show that, and if they were to look for the development of art at all, they must not be crammed with all that they were to learn *ab initio* from outside, so to speak. Here they were put into the position of what was termed education for art, everything being instilled into them by that means. Some could be taught, and others could not. The man who was an artist could be taught, and he would evolve from his own mind, from his own life, and from applications of nature, that which it was in his power to produce, while another man was unable to do it. The only way of growing towards this was through the schools of art, if they were but carried out in a more theoretical way,—having everything taught by precedent. He did not believe for a moment they would arrive at the development of art through any amount of federal life, or communistic society. The ideas giving rise to the communistic, social, and federal life, arose more, as he had said, from the enormous increase of the population, and the necessities of life, than from what was sometimes called the "robbery" of those who appropriated the good things to themselves.

Mr. F. T. W. Miller, in seconding the vote of thanks, remarked that the lecture turned more on the art of architecture than on "The Architecture of Art." There were two things on which he would join issue with Mr. Crane. The first was a sort of reference to the idea that under free and communistic governments, republics, and so on, great works were and would be produced. Whether they would be produced, time only would show, but that they had not been produced in the past was easily demonstrated. All the great works of the artists of old, whether in the shape of architecture, sculpture, painting, or poetry, had been produced under despotic governments. This was the case with Venice and the whole of Europe during the Middle Ages, when art culminated and the bud developed into the flower. The flower had since gone to seed, from which possibly might rise again a more glorious blossom, though not in our time. Then, again, Mr. Crane, having made several artistic wails, seemed to wish that they should go back to the manners of the Middle Ages. He (the speaker) used at one time to imagine that the men of bygone ages were somehow or other of a higher, better, and nobler type than the present class of persons who walked about in 40s. suits. He had abandoned that idea long ago, and believed there was as much "jerry building" in the Middle Ages as now, only the "jerry building" had disappeared, leaving merely the strong and stately fabrics. He did not believe men were any better in the old times. Art was always changing, and must ever do so with men's situations and needs. They had been passing, during the last forty or fifty years, through a strange experience of human life; they were in it now, and so were not well able to judge of it. It would rather be for the men of future generations to do so. Had the old masters been under the present condition of things would they have done better than the men of to-day? He very much doubted if they would. The men of to-day were in the rush and traffic of a mechanical and scientific age, and art had to stand by; but that it was dead for one did not believe.

Mr. W. Randolph did not believe that any nations had ever set themselves to be picturesque; they were so, but it was those who came after who had discovered it. He could not agree with some of the rather heretical propositions of the last speaker. The Middle Ages, in spite of certain superficial abuses, were, as

Montalembert said, bristling with liberty. No doubt there was building then which was not so good as that which had come down to the present time, but in Bruges, Lubek, and Nurnberg common-place Mediaeval buildings could yet be seen. Of course, the monumental architecture was more splendidly done, but he believed that in those days everything was honestly and well done. If artistic nity depended on social unity, this itself depended on religious nity.

Mr. H. O. Cresswell remarked that a reference to the "jerry builder" always sufficed to raise a laugh in that room, but he believed if there were no "jerry buyers" there would be no "jerry builders." When a man desired to have a magnificent house fitted with all the modern requirements for half of what he ought to pay then the "jerry builder" did his best to supply him, cutting out in the thickness of the walls what he supplied in extra accommodation.

Mr. Leonard Stokes said that the tone of the paper seemed to be that of a lament that more time was not devoted to each individual object, but it should be remembered that architects nowadays had a very great many things to attend to. In fact, they were expected to do too much and to know all about every trade from the beginning to the end of a specification, and as much of art as came into it. That was the reason why the specialists had such a great pull over the architects. The paper, although a little dismal in tone, was most admirable and interesting one. The members would do well to take it to heart and endeavour to spend as much time as they could over the various things they had to do, and not scamp their designing in the way that builders scamped the execution.

Mr. Barrow thought that if architecture and art were now in their decline, it was owing to pecuniary causes. The architect or artist had so much to do for his money that he could not devote his time to the beauties of his art. Hence it was, he believed, in a great measure, that architecture are not so brilliant as in the old days, when great men were set aside for erecting cathedrals and public buildings. Art might be revived again if money could only be dissociated from it, and if every man who had the necessary taste could be allowed to devote himself to it, without thinking of the pecuniary return.

Mr. Francis Hooper expressed a doubt whether the cause of art would be furthered by the propagation of socialistic theories. A communism amongst the workers of various crafts was desirable, embracing both employers and employed, but in Classic and Mediaeval times the patrons of art were found amongst the highly educated and wealthy members of the community. As to the lack of individuality in design now so lamented in what was termed artistic work, much was due to the ever-extending use of machinery which had supplanted the handicraft of the past. A motive power without intellect was at the root of many troubles. That, however, might be stigmatised as the abuse rather than the use of machinery. For to it we owed much work which but for its aid would be either too expensive or too scarce for the enjoyment of the masses.

Mr. Max Clark thought that if they, as architects, devoted the greatest amount of energy they possessed to the work in hand, they would have made one step towards what might be called socialism.

The vote of thanks was then put and very cordially received.

Mr. Walter Crane, in replying, said he was glad that his paper had evoked so many expressions of opinion. He was sorry, however, to have heard it termed a lament without any grounds of hope. The members had even seemed to think that he regretted the lapse of Mediaeval habits and customs, but that was not exactly his meaning. He had pointed here and there to periods of history which he thought had the advantage, but he had no desire to live in any other age than the present. He was certainly very far from being the hopeless person some of them had imagined. He had also been taken to task for what were termed his Socialistic views, but he quite realised that no single man was answerable for the present state of things. It was the result of a course of evolution, which he who ran might read; no one could alter it at once, and he did not pretend to offer a solution which any one might put in his waistcoat pocket. He would rather be quite satisfied if people would think it out for

\* Printed in extenso in *Builder* last week, see p. 313, ante.

the Institution was a deserving one, and seemed to have ready to hand all the machinery for carrying out a great deal of good work.

Mr. Thos. Stirling seconded the motion, which was carried.

On the motion of Mr. Roe, the retiring officers were thanked for their services.

Mr. Trollope, in reply, said it quite seemed to him, from what had fallen from the proposer, that his poor efforts had not been appreciated, and he could only say that what he had done had been a pleasure to him.

Officers for the present year were afterwards elected.

Mr. Brooks then proposed for adoption a new section to the Orphan rules, which, after some opposition, was carried in the following form, viz.,—

"That no more than two children of one family shall be receiving the benefits of the Orphan Fund at the same time. And should there be no presentation vacant at the time when an application for the second child be made, no further presentation shall be purchased until the Committee have another eligible candidate before them, when after due notice an election by ballot shall be declared."

The proceedings closed with a vote of thanks to Mr. Freeman for his kindness in presiding on the occasion.

**PROPOSED COMPLETION OF THE OPEN SPACE BY PICCADILLY CIRCUS.**

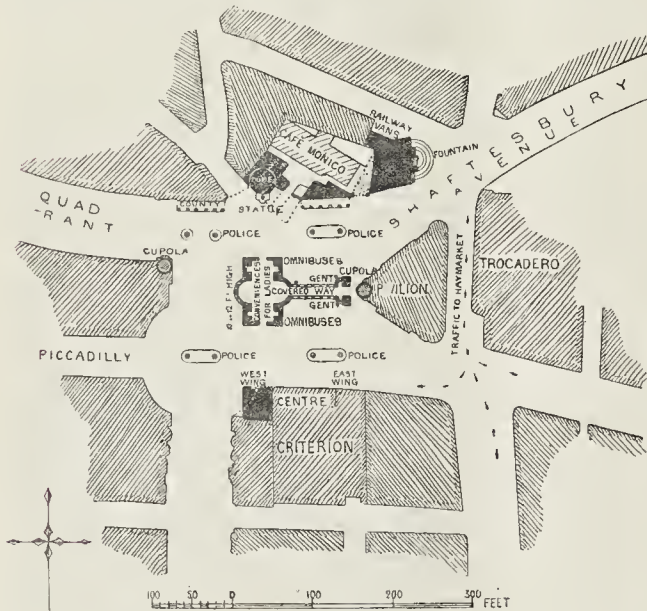

SIR,—Shaftesbury-avenue has connected St. Pancras and Bloomsbury with Piccadilly and Victoria, and a new service of omnibuses has naturally availed itself of the new route, while

and it would, no doubt, be better, as was then pointed out, to complete the open space by some further enlargement.

Several important but incongruous elements have to be dealt with in such an operation. We have three quarters of a Circus, two-thirds of a Criterion, the eccentric County Fire Office, and the "Pavilion" with three fronts facing as many different widths of thoroughfare. These things have come into existence, and there is no intention here of criticising any of them, but rather of seeing how they can be brought into harmony.

Now, in any scheme of this sort vested interests have to be considered. Hendrie's (the perfumer's) shop, in Tichborne-street, has already been dealt with. Next comes the Café Monico, chiefly hidden away in the background, but with a frontage to the street, and an access partly through a courtyard. By building on this courtyard and adding a second frontage, the capacity and publicity of the café would be improved. The accompanying plan shows how this can be achieved on a line of frontage set back so as to throw the Quadrant and Shaftesbury-avenue into one continuous sweep. This gets rid of the promontory that blocks the view from the Quadrant, and, at the same time, it throws the western angle of the Pavilion into the centre of a noble space.

The north side of this space has next to be considered. It is bounded east and west by

the existing traffic from Regent Quadrant to Waterloo-place and Coventry-street is as crowded as ever it was. There are thus two lines of vehicles crossing each other at an obtuse angle, and yet observed from each other by a solid promontory of houses just where they meet. Add to this the line of traffic east and west between Piccadilly and Coventry-street, besides a host of railway vans obscuring the view of foot-passengers, and we have only to wait for the London Pavilion Music-hall to be converted into a hospital, with plenty of accident wards.

There is, however, a pleasanter way of meeting the case, and that is by bringing the traffic under easy control.

In the *Builder* of October 24, 1885, a plan was suggested for converting the line of the former Tichborne-street into a pavement for foot-passengers only, and of re-erecting a portion of the former Circus as a valuable block of shops, and thus replacing the now lost symmetry of Nash's grand thoroughfare. When an open space, however, has been once gained, people are loth to see it blocked up again, even though the nation and the parish would reap very substantial profit from this scheme;

Swan & Edgar's and the Pavilion. These could be easily emphasised by a pair of cupolas, such as Nash has placed on other buildings in Regent-street. Between these a centre line is struck towards the north obviously marking a site for the statue of Lord Shaftesbury, not isolated, but placed in front of the wall of a dominant central building. A repetition (let us hope in stone) of the County Fire Office to the east of this central building would complete the north side of the space, forming a composition which could be taken in at a glance from many points of view.

The three remaining quarters of the circus are awkward: a semicircle is far preferable. Let, therefore, the Criterion be completed, and absorb the south-eastern quarter of the Circus, to the manifest improvement of both. Mr. Verity's fine design would then be enjoyable as seen from the north, and the encroachment upon the Circus would be valuable as ground-rent.

Lastly, there is a demand for public "conferences" which should be met if they can be made obvious, but not conspicuous. Delicacy has to be considered. A covered way is, therefore, suggested, to answer both as a waiting

place for omnibuses and an approach to ladies' lavatories; the gentlemen's conveniences being separately placed and approached.

The whole structure might be surmounted by a terrace for flower stalls, and yet be kept quite low; while its position would achieve the object first mentioned of checking the dangerous traffic in this crowded crossing.

Feb., 1887. EDWARD J. FARVER.

**WORKING STUDENTSHIPS AT SOUTH KENSINGTON.**

SIR,—I am directed to request that you will be so good as to allow me, through the medium of your columns, to inform manufacturers and others engaged in industries in which art is more or less concerned, that the Lords of the Committee of Council on Education have decided to make arrangements for the admission of a limited number of persons employed in those industries, to study in the South Kensington Museum, Library, and Schools, without the payment of any fee, for periods of from two to nine months according to circumstances.

Detailed rules with regard to these Working Studentships will be sent on application to the Department. Briefly, the conditions may be stated to be, that the designer or workman, for whom admission is sought, shall show that he is sufficient power of drawing and sketching to be able to profit by the opportunities afforded; that he is actually engaged in some art industry, and that the proprietors of the works in which he is engaged undertake to maintain him while he is studying at South Kensington. When admitted, the working student will be set, under direction, to study in the Museum and Art Library from examples relating to the industry in which he is employed, and he will also receive instruction in drawing and designing in the Art School, suited, as far as may be, to his special case.

My Lords have taken this step with a view to render the Museum of more special and direct use to the country, and they trust that the valuable collection of examples of applied art, which has now been brought together, may thus be more fully appreciated and taken advantage of by the directors of industry in the country.

J. F. D. DONNELLY.

Science and Art Department, Feb. 28.

**THE LIVERPOOL CATHEDRAL COMPETITION.**

SIR,—In signing the circular sent round by Mr. J. O. Scott and Mr. Seidon, I, in common with Professor Kerr and others, intended merely to ask for an opportunity of seeing the drawings in London, certainly not to attempt to upset the award of Mr. Christian.

I should have written to withdraw my name when I found others understood the special point of the circular to be a reconsideration of the award, but I noted that it had been modified. I still hope it will be the means of affording us the treat of seeing the competition drawings in London.

In proof of my own bona fides in the matter,—though it is otherwise of no importance,—I may say that, as far as I have yet seen, I quite sympathise with the conclusion come to by Mr. Christian, having known something of Liverpool in former years.

C. F. HAYWARD.

Museum-street, Feb. 23.

**THE IMPERIAL INSTITUTE COMPETITION.**

SIR,—Without wishing to question for a moment the ability of the six gentlemen who have been selected to compete for the above, it does seem a hardship to the large number of architects in the United Kingdom that they have not the opportunity of showing their ability in so important and national an undertaking.

Following the precedent of the competition for the Houses of Parliament, the Government Offices, and the new Admiralty Offices, why should not the design for the Imperial Institute be thrown open to all? The result could not fail to be a success, besides being satisfactory to the profession, who, I am sure, feel aggrieved that the competition is at present limited to only six. If the drawings were limited to a small number, and to sketches only with plan to a small scale, the work of selection, with Mr. Waterhouse on the committee, would be a light one, as his practised eye would soon separate the "wheat from the chaff," and every architect who competed would have a satisfaction in feeling that he had had, at all events, a chance in the race, and would retain his design in view to come as his effort for the "Jubilee Building of Queen Victoria." The 1,200, allotted as prizes might be divided into, say, twenty-four of 50l. each instead of six at 200l., as now intended.

I feel sure that, if the Royal Institute of British Architects were to take the matter up and present a memorial in the terms I have suggested, the committee of the Imperial Institute would concur

in the proposal. It seems fitting and proper that so national a building should be dealt with in its inception on a broad and liberal basis. It would involve no extra cost, but be productive of satisfaction to a great many architects who now feel somewhat slighted at the course adopted.

LOYALTY.

VALVE AND "WASH-OUT" CLOSETS.

SIR.—The controversy between the "valve" closet and the "wash-out," again provoked by Professor Corfield's Lecture, does not seem likely to be settled just yet. The "valve" is objectionable as likely to run dry, and as having a space between it and the trap beneath for the generation and accumulation of foul air. The usual "wash-out" is objectionable in practice as very often failing to wash-out without a disgusting vortex, and in principle as having a trap beneath, almost out of sight, which very often does not clear itself; and having also a considerable surface of pipe leading down to the trap from the basin, which gives off exhalation in drying, and is consequently not so free from smell as a well-conducted closet ought to be. In these respects the usual "wash-out" is undoubtedly worse than a good "valve." It is but a mere trifle, if at all, better than a common hopper-pan, which is commonly deficient in the force and direction of its flush; and which likewise is not always clean in its use, but is otherwise quite as sanitary.

I believe that medical science requires the pan, whatever it may be, to contain a surface of water measuring 9 in. or 10 in. in diameter and 3 in. or 4 in. in depth within 7 in. or 8 in. of the seat. The valve closet certainly does fulfil these conditions perfectly, so that it has strong arguments in its favour as against a defective "wash-out." But it is not so essential that the "wash-out," although I know of only one which is free from those enumerated, and really fulfils the required conditions. It contains the requisite surface and depth of water within reasonable depth of the seat; it traps within the basin at its exit, and not beneath. It has no half-hidden pit of pipe beneath to accumulate the smell, and to exhale in drying. The basin is well rinsed in flushing. But, as your correspondent observes, all basins require to be kept properly and regularly cleaned. I am, sure I shall never be satisfied with any closet which falls short of it in any of these respects.

WILLIAM WHITE, F.S.A.

Wimpole street, February 27.

SIR.—I notice a letter from one of your correspondents, on p. 331, who seems to object to my views upon the "wash-out" closet, and who mentions that he was much struck at the prejudice shown against the wash-out water-closet in the discussion at the Architectural Association. Your correspondent states that "those who spoke have had no experience of the wash-out closet." I think you will allow me to state that it is just my experience, as a practical plumber and as an employer of some of the best plumbing talent known in London, which leads me to the conclusion I expressed at the meeting. In a few remarks I made I mentioned cases in which water-closets had been fixed of the wash-out type many years ago, and had to be abandoned, and I may, for the information of your correspondent, say I have seen many scores of closets on this principle, which, instead of being sanitary improvements, are, to my view, a perfect nuisance. I am glad, however, that I am not the only practical man who holds the same views on this important subject.

Your correspondent says "there is no action beneath the seat to corrode." Now, it is just the action beneath the seat I object to, and perhaps if your correspondent had attended the meeting he would have altered his views.

JOHN SMEATON.

Great Queen-street, W.C., Feb. 25.

\* \* We have also received a letter on this subject from Mr. S. Symes, architect, Lower Dominick-street, Dublin, who gives it as the result of his experience that there is no closet equal to the "wash-out," if properly arranged and constructed. But we do not think that anything will be gained by the insertion of further letters in reference to the matter just now. Each side has had its say, and we have expressed our own opinion on the subject.

**The "Lancaster" Pneumatic Door-Check.**—This is the title of a new door-check which is certainly neat in appearance, compact, and readily fixed. It is claimed that the door may be held partially or entirely open for any length of time without injury to the check; that it effectually prevents the door from slamming; that it is capable of the most delicate adjustment; and that only one size is required for either large or small doors. From examination of the contrivance it appears to possess these qualifications, but we have not yet had one fixed on trial. When we have done so we may be able to say something more in its favour. It is made by Messrs. Anthony Bell & Sons, Lancaster.

The Student's Column.

FIELD WORK AND INSTRUMENTS.—X.

Surveying Instruments.

IX.—THE THEODOLITE (continued).

FIGURES 3 to 9 show elevations and details of the instrument illustrated in plan by fig. 1 of our last article.

The telescope is fitted with achromatic glasses, the object of which is to remove the indistinctness of vision which would be caused by chromatic aberration within the telescope. We know by experience that the rays of light, unless acted upon by some external cause, travel in straight lines, but that when a ray of light passes obliquely out of one medium into another of a different density, it becomes bent or refracted, and its several component colours are separated and dispersed in a definite order, the red portion of the ray being the most refrangible and the violet the least refrangible. A ray of light, in passing obliquely from the atmospheric medium into a lens, undergoes a compound deviation, known as spherical and chromatic aberration, which it becomes the business of an optician to remove in the production of an achromatic telescope. The spherical aberration is obviated by making the lenses of suitable shapes, and the chromatic aberration by re-nitting the colours, so that a colourless image may be formed at the focus within the telescope. The object-glass is fixed at the outside end of the inner tube, and is made of a comparative large size and of large focal length, in order that not only may sufficient light fall upon it to produce a distinct vision, but also that the rays of light may be the more accurately refracted. When a ray of light passes from a denser into a rarer medium, the angle of refraction is greater than the angle of incidence; but when the ray passes from a rarer into a denser medium, the angle of refraction is less than the angle of incidence. It is the property of convex lenses to diminish divergency, and of concave lenses to increase it.

The object-glass is formed of three lenses, held together and encircled by a thin brass ring, over which an outer brass ring is fitted. It consists of a double convex centre of light flint glass, with outside concave surface of green crown glass.

The colours, which are separated by the refraction of the first lens, are partly re-united by the refraction of the second or central lens, but the introduction of the third lens practically perfects the result.

After the lenses in the object-glass are adjusted in their relative position to one another they are secured by the makers with a pin soldered within the cell which holds them. A notch being cut in the edge of each lens, the object-glass slides upon the pin, and is thereby guided and secured in its proper position. The outer ring is turned closely round the edge and burnished in a lathe.

The eye-piece used is the Ramsden or positive eye-piece, consisting of two plano-convex lenses with the convex surfaces inside the eye-piece facing one another. The lenses are placed at a distance apart equal to half the sum of their focal lengths. In a positive eye-piece the focus lies beyond the lens which stands inside the telescope and therefore a positive eye-piece is adapted for use with instruments having fixed spiders' threads in the focus of the object-glass. In a negative eye-piece the two plano-convex lenses are placed with both the convex surfaces towards the object-glass, and hence the passage of rays from an achromatic object-glass after refraction in the glass of the eye-piece next the object-glass come to a focus within the eye-piece.

The line of sight within the telescope is technically called the line of collimation, derived from an old Latin word, "collimare," for which the word "collimare" is now substituted, and signifies to direct something straight at a mark ("con" together, and "linea," line). This line forms the optical axis of the instrument, and joins the optical centre of the object-glass with the intersection of cross hairs in a diaphragm plate, which are situated at the common focus of the object-glass and of the eye-piece, marked A. The diaphragm plate is sustained within the outer tube by four capstan-headed screws, by means of which the line of collimation is adjusted in a manner about to be described. Upon this plate, as shown

in fig. 7, are fixed the "cross-hairs," intersecting one another within a circular hole in the centre of the plate, and consisting of spider's lines, one horizontal, two vertical, and two deviating slightly to opposite sides of a central vertical line, arranged so as to define a central point as well as to guide the eye in both a horizontal and vertical direction. The web used is that of a common garden spider, not the house-spider. The house-spider spins his web in sheets, but the spider found in gardens during the summer and autumn spins his web in geometric patterns formed of thin cords. These webs may be obtained by bending a piece of wire in the shape of a two-pronged fork, with a space of 2 in. or 3 in. between the prongs, and turning it over in the hand while the spider is allowed to drop from one prong to the other, so as to collect the line of web formed by the spider in the fall. These webs can then be readily affixed to the diaphragm-plate in their proper position. The short eye-piece, as shown in fig. 6, may be removed and taken to pieces for the purpose of wiping the glasses when required, but, as will be observed, when the eye-piece is withdrawn, the diaphragm plate is totally unprotected, and care must be taken not to destroy the cross-hairs on wiping the open end of the telescope. The object-glass may also be taken out and wiped with a soft silk handkerchief, or a soft piece of chamois leather, so as not to scratch the surface, but should be screwed back to the exact position it occupied before removal, as its optical centre is assumed to have been set true by the makers when fixing it into the telescope. To effect this, it is well upon receiving a new instrument from the makers to scribe carefully a mark across the ring, and the end of the inner tube to which the object-glass is attached, and then, after removal, to screw it back in its place, and observe that the lines so marked coincide. When the object-glass becomes dull, as will be found the case after working in wet weather, the best way to eliminate the moisture which may have gained access between the lenses is to take out the object-glass when packing up the instrument in its box, and wrap it up in a piece of clean blotting-paper, leaving it in a dry and warm place for a few hours. The dark glass cap supplied in the box with the instrument fits on to the short eye-piece, and is intended for use as a sun-glass.

One of the first adjustments requisite in the use of the telescope is known as the adjustment for parallax, a term derived from the Greek παρά (para), beside, and ἀλλοίωσις (alloiosis), to change or alter a little. A parallax is likely to lead to an inaccurate reading or observation, and can be detected when the observer moves his eye up and down or sideways when looking through the telescope. The eye-piece marked A is moved in and out of its socket until the cross hairs are not simply observed, but seen distinctly. This adjustment, which will obviate any apparent change in the position of an object caused by a slight change of position in the observer, may be best effected by directing the telescope towards a white ground, or towards the sky, so as to project the cross hairs upon a clear disc. It must be verified each time that the instrument is set up for use. As the socket which holds the eye-piece is screwed on to the rear end of the telescope, it is advisable, in order to avoid unscrewing the socket when varying the distance of the eye-piece, to revolve it in the direction of the hands of a watch. When this socket is unscrewed, a diagonal eye-piece, consisting of two tubes with a rectangular elbow fitted in a separate socket, as shown in fig. 5, can be attached for observing great altitudes; a ray of light entering by the axis of one tube is reflected by the mirror centrally through the other tube. It will be observed that the image of the object viewed is inverted within the telescope when the short eye-piece is used, but by the substitution in the socket of an additional tube, shown in fig. 8, an erect vision may be obtained. The extra glasses and additional length of tube, however, cause a loss of light, and hence the long eye-piece is seldom used. After adjusting for parallax, the side milled head, marked B in fig. 1, is turned until the foci of the object-glass and of the eye-piece coincide. This is known by the distinctness of the image in the telescope. The clear vision is aided by the introduction of stop-pieces, shown in fig. 9, and fixed within the inner tube, as indicated by dotted lines in fig. 3. These serve to avoid reflected light, and to give

THE THEODOLITE  
TRANSIT INSTRUMENT.

sharp definition. They have holes of such diameters and are arranged in such positions that the only rays of light which reach the common focus of the object-glass and eye-piece at the intersection of the cross hairs in the diaphragm plate are those rays which are included within the cone of vision converged by the object-glass.

The extent to which the inner tube can be moved in and out is indicated by the dotted lines in the diagram, and the slide shade marked K is intended for use when the sun is shining powerfully upon the object-glass, or when rain is falling. The nearer the point viewed, the further out must the inner tube be propelled so as to focus the object. The name theodolite is derived from the Greek θεώματα (theomai), or θῆμα (theomai), I see, or θῆ (theo), I run, and δολικός (dolikos), long, and the instrument is specially adapted for long vision; but it is the maker's business to see that the telescopic action of the tubes is sufficiently perfect, in order that the line of collimation when adjusted for a long distance may be correct for a short one. Should wet work in between the two tubes in the telescope, as will be the case when using the instrument in showery weather, the inner tube must be continually moved in and out, and carefully dried each time until nearly all the moisture is removed, when the heat of a warm room will complete the drying. The inside of the tube and stops are covered with a dull black pigment, in order that no light may be reflected by its surface.

The magnifying power of a telescope is found by dividing the distance between the diaphragm and the nearest surface of the object glass by the focal length of the eye-piece. When looking through the telescope from the eye end with the eye-piece removed, the eye being near the focus of the object-glass, the whole of the object-glass should be seen, and all parts of the intervening tube concealed, otherwise the stops are not properly fixed.

Over the top horizontal plate are fixed two small spiral-levels at right angles to one another. They are adjusted in position by the makers by means of the capstan-headed screws attached to them. The long bubble attached to the telescope is seldom used in ordinary surveying. Great pains are taken by the manufacturers to make these bubbles sensitive. The inside or soffit of the level-tube is carefully ground with emery powder and water upon a brass rod which is bent to a slight curve longitudinally upon the inner upper surface, so as to insure the steadier action of the bubble when the tube is filled to the required amount. Spirit is found to be a more manageable medium in adjusting the bubbles than water. It is also less liable to freeze in cold weather. The grinding of the tubes may be so accurately executed as to enable the steady deviation of the bubble from the centre of its run, to register small angular deviations from the horizontal. It will be found that the length of the bubble is affected by temperature, and hence the glass tubes are generally graduated upon their upper surfaces to guide the eye in setting the bubbles level.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

2,302, Improvements in Water-closets, &c. R. B. Phillips.

According to this invention, the basin is of earthenware fitted with an outlet-pipe of lead. This lead or metal pipe is then scoured with cement. The basin is so formed as to retain water in its lower part, and the lower part of the pipe is so constructed that its margin dips into the water in the basin, so that should the jointing fail between the metal and the earthenware, the escape of foul air is prevented by the water sealing at the lower extremity of the metal pipe.

2,671, Chimney or Ventilating Caps. C. Swindell and W. Clifford.

By this invention a chamber of an annular shape is used, the roof or curved sides of this annular chamber being continued to the centre so as to form a close top to the space enclosed by the inner wall of the chamber. The hole or slots for emission of the smoke or updraft of wind are guarded by louvres which deflect the current, all being arranged radially at a tangent round a common centre.

3,420, Basic Bricks. G. A. Jarvis.

The patentee mixes burned magnesian lime with flint spar, silicates, and chlorides of different chemical substances, and then presses them by hydraulic power into moulds. The bricks are heated to a high temperature.

3,569, Wall Bonds and Damp Course. J. Dyson.

According to this invention, a brick is made in two parts, which in use are dovetailed together in the outer part of the wall. The part for the outer wall is burned as an ordinary brick; the other part, which will be the wall cavity, is glazed, is dished in the centre, and grooved. All water percolating through the outer wall, falling into this glazed groove, is carried down the cavity and into the earth. Thus the walls are made damp-proof, and the bricks act also as a bond to the wall.

4,239, Steps, Ladders, &c. A. W. H. Wood.

This invention relates to a combination of steps with the ordinary rungs ladder. The parts are connected by means of a hinge fastened to the bottom of each side of the upper part and to the back of the lower part near the top rung. They thus fold close together, but when opened at an angle form steps, and may be fastened with a hook and staple or a metal loop, passing over the two parts above the hinge on each side.

6,426, Floors, Roofs, and Arches. W. Parry.

According to the invention, blocks of bricks, terra-cotta, or building stones are formed with vertical projections down or along one side of the bottom edge fitting into corresponding recesses or grooves on the opposite side of the stone or block. Thus the blocks register with each other in the process of building, and bind the work in such a manner that it forms a mass which the inventor claims to be incapable of being riven asunder or cracked.

NEW APPLICATIONS FOR PATENTS.

Feb. 18.—2,634, Stephens and Clark, Portland, Roman, and Other Cements.—2,635, Harcourt and Shaw, Apparatus for Closing Doors.

Feb. 19.—2,590, E. Poole, Roofing Tiles, to Prevent Stripping by Wind, &c.

Feb. 21.—2,637, J. Duckett, Water-closets.—2,659, B. Crook, Fastening Knobs to Spindles.—2,668, Smith and Roome, Repeating Wood Carving and Shaping Machine.—2,685, R. Adams, Door-Closing Appliance, and Checks for Same.

Feb. 22.—2,716, S. Hart, Connecting Metal Pipes, &c., for Water or Gas.—2,725, D. Cheetham, Preventing Draughts, &c. from passing between the Sashes of Windows.—2,742, Shaw and Chittick, Flooring or Roofing Warehouses, Bridges, &c.—2,785, W. Gaultier, Stop Blocks for Doors, Gates, &c.—2,786, S. Wilding, Pressing Floor Boards together.

Free Lectures at Carpenters' Hall.

The first of the present series of Free Lectures on matters connected with building was given on Wednesday evening last at Carpenters' Hall, London Wall. The lecturer was Mr. Banister Fletcher, F.R.I.B.A., Warden of the Carpenters' Company, who chose as his subject "English Carpenters and Foreign Competition." There was a large audience, who frequently applauded the delivery of the lecture, a report of which will appear in our next.

**Polytechnic Science, Art, and Technical Classes.**—We are informed that the Right Hon. the Marquis of Hartington, M.P., has consented to distribute the medals, prizes, and certificates to the successful students of the Polytechnic science, art, technical, and trade classes, on Wednesday, March 16th.

### The New Railway Bill.

**L**ORD STANLEY of Preston introduced the Government Railway Bill into the House of Lords last week without preface or comment. It consists of four parts and forty-six

clauses, together with a short schedule, and, in the arrangement of the parts, as well as in many of the provisions, is almost identical with Mr. Mundella's measure of last year. It was inevitable that the permanent appointment of the Railway Commission should occupy a prominent place; and the first part of the Bill, as before, deals with this subject. Last year's proposal was that the re-constituted Commission should consist of three members,—a Judge of the High Court as Chief Commissioner, with two "practical men of business" as his colleagues. Although the eminent services of the present Commissioners warranted a belief that they would not be passed over in the selection, the terms of the Bill left it open for the Government to appoint men who were not so thoroughly acquainted with this particular subject. Lord Stanley's scheme provides that there shall be three appointed, and three *ex officio* Commissioners, and with regard to one of the former, experience in railway business is made a necessary qualification. The Chief Commissioner is to be "of experience in the law," so that, as regards the three appointed Commissioners, the constitution of the Court is similar to that of the existing Commission, except that the "legal" member was not previously named as the chief. Although the *ex officio* members are three in number, there is really but one added to the strength of the Court, as these members are to be Judges of Superior Courts for England, Scotland, and Ireland respectively, so that one of them may attend important cases in whichever part of the kingdom it may be necessary that they should be heard. The fact that the permanent Commissioners are to devote their whole time to their duties under the Act is a distinct improvement upon Mr. Mundella's arrangement, under which the President of the Court would be at times occupied with other and varied business. The jurisdiction given to the Court is much the same as that conferred upon the Railway Commission by the Act of 1873. They may hear and determine any disputes as to tolls and rates, and order any reasonable traffic facilities,—notwithstanding any agreements existing between companies,—and award damages in cases where any aggrieved party

may, in their opinion, justly claim them. Rating appeals to which railway and canal companies are parties may be transferred to them, and this part of the Bill should be satisfactory to the companies themselves, as they sometimes seem to think that they receive scant justice at Quarter Sessions. A necessary clause,—but one which will probably meet with opposition,—is that giving a *locus standi* to associations, &c., for the purpose of making complaints without there being any proof that such authority is aggrieved in the matter. This is essential, as the forces are so unequal in a contest in which an isolated individual or firm enters the lists against a railway company. The law of "might is right" has too often prevailed, and under a system allowing a corporate body to prosecute such cases, they would have a much better chance of being carried to a fair and legitimate conclusion. A safeguard against vexatious actions is provided by a clause making it necessary for such an association to obtain a certificate to the effect that it is, in the opinion of the Board of Trade, a proper body to make such complaint.

The main bone of contention will be the clause dealing with rates and charges, which is again No. 24. In comparing this part of the Bill with that of last year, and finding clauses deemed unsatisfactory by both parties re-inserted almost word for word, one is irresistibly reminded of a recent utterance of Sir Edward Watkin's. Speaking of the trade of this country, and that of the United States, he said:—"The American Ministers are men of business, but our governing body are not. The great interests of the country are best served by being in the hands of men who have risen from business to statesmanship. *Our people have no initiative.*" The present Government are flattering Mr. Mundella in adopting his plan for settling the difficulty,—though it is quite probable that he in turn had adopted it from a predecessor in office,—but as this plan has already been discussed and found but little favour, it is somewhat disappointing to find that we have still no alternative proposition. At the same time, it must be allowed that the difficulties in the way of satisfying the demands of those interested are very great, and the Government doubtless trust to receiving suggestions during the passage of the measure through the House, which they may adopt in amendments, and which may tend to render it more acceptable. The directions to the railway companies are rather more definite and precise, and are that within twelve months from the commencement of the Act (January 1st, 1888) they shall submit to the Board of Trade revised classifications of *merchandise traffic*, and revised schedules of charges,—the words in italics now appearing

for the first time. They are instructed to set forth the nature and amount of all terminal charges, showing the circumstances under which such charges are proposed to be made. The Board of Trade are to receive and consider objections, and to endeavour to bring about an agreement on points of difference, and submit the classification and schedules to Parliament as finally revised for the purpose of being made law. If the parties fail thus to agree, the Board of Trade are to decide upon a classification which appears to themselves to be just and reasonable. The Board is also constituted arbiter in case of subsequent dispute, with power to relegate such matters to "any other competent person" who will act as negotiator. It seems strange that this responsibility should be put upon the Board of Trade with a permanent Railway Commission in existence, and the authority given to the former body to depute some person outside the Board to communicate between the disputants indicates that it is foreseen that they themselves may not be sufficiently acquainted with the details of railway work to deal satisfactorily with the cases which may arise. It is worthy of remark that a Bill recently brought into the House of Commons (the St. Austell Valleys Railway and Dock Bill) provides that if any question shall arise as to the reasonableness of the rates charged for certain services, the same shall be from time to time referred to and determined by the Board of Trade, so that the promoters of that measure, at all events, are not disinclined to submit to the arbitration of the Board. It is probably intended to relieve the Commission of cases which can be disposed of without their intervention, those in which no amicable settlement can be arrived at being eventually referred to them. It is quite possible that the system may be found advantageous from a public point of view, as the results of such proceedings are to be reported to Parliament. Very definite directions are given for the publication of rates and charges of every description, and a great point will be gained if the public are enabled to tell readily what the railway companies are really empowered to charge, this being next to impossible at present. The conditions under which "group rates" are legalised are clearer, but the clause, as before, clashes with those relating to preference rates. A practical way of reconciling these matters would be very welcome, but in this also we look in vain for "initiative" in the present measure.

Preference rates are again strictly prohibited, but with a mischievous reservation, which destroys the value of the clause from the home-producer's point of view, and which should

reconcile the railway companies to this part of the Bill, as it makes their position stronger than before. This saving-clause (adopted without alteration from last year's Bill) runs thus:—"In deciding whether a lower charge or difference of treatment does or does not amount to an undue preference, the Commissioners may, so far as they think reasonable, in addition to any other considerations affecting the case, take into consideration whether such lower charge or difference of treatment is necessary for the purpose of securing the traffic in respect of which it is made." The letter of "B." in the *Times* of February 9th, commenting upon the statement that the Great Eastern Railway charged twice as much for bringing fish from Harwich as they do from Rotterdam, says,—“They would charge more for the Rotterdam traffic if they could, but if they did they would not get the traffic. The fish would come direct by sea, or not at all. They do not make the Rotterdam rate low to give the Dutchman advantage, but simply because they cannot help it. They do not exact double profits from the home trade to make up a loss on the foreign. They do not act unfairly or unjustly to the people of Harwich because they make some profit on the foreign trade. The railway company would not construct its railway to carry Rotterdam fish at the price at which it carries it, but the railway being there it ekes out its miserable profit by carrying at the rate it does.” It would appear that if, as is stated, some profit is made on the foreign trade, this result can only be arrived at by ignoring a great part of the working expenses in calculating this profit, simply because these expenses are already incurred in connexion with home traffic. But if, as would naturally be supposed, the amount of profit is arrived at by comparing the total of receipts from both sources with the total expense incurred, the profit on the inland traffic must be enormous. The railway managers assert that they carry no traffic at a loss, even the lowest rates yielding a margin of profit over working expenses, and if this be true in the case in question, our conclusion must be true also; or, on the other hand, it must be inferred that the preference complained of can only be given at the expense of the English fisherman. It will be hard to convince the latter that he is not thereby prejudiced, even though the consignee, and not he, has to pay for the carriage; for were he not thus handicapped he would get a correspondingly higher price for his fish (to which the fact of his being nearer the consumer entitles him) and thus be encouraged to send larger consignments, instead of, as is frequently the case, being compelled to labour for nothing. Lower prices rule than formerly, too, for agricultural produce, owing to the exceptional facilities given to the imported traffic and when the inland rates are not lowered, the percentage of carriage to value is so far increased that it ceases to be profitable to grow many crops, except for local demand. The way in which both the trains and delivery vans of competing companies race each other for the import traffic indicates that it is considered remunerative, and although (according to the argument of "B.") the railways were not constructed for the purpose of carrying this traffic, it is driving out of the market many of those for whose benefit they were constructed. Of course, we are not going so far as to say that the railways were intended for the benefit of this or that class only, and that the consumer is not to be considered, for it is precisely the extent of the consideration which these interests are respectively entitled to that lies at the root of the question.

The following definition of "terminals" is given in clause 43, putting a very different and much wider construction upon the term than that implied by the phrase "handling terminals." "The term 'terminal charges' includes charges in respect of stations, sidings, wharfs, depots, warehouses, cranes, and other similar matters, and of any services rendered thereat." Several railway Bills now before Parliament contain clauses empowering the companies to charge for a long list of special services, the enumeration concluding with the words "and for any other accommodation or

service of whatever kind." If similarly unlimited powers were possessed by all lines with regard to both "handling" and "station" terminals, it is doubtful whether they would not take an undue advantage, for, to say the least, they entertain ideas as to reasonableness differing very widely from those of the public.

There are six clauses relating to canals, and we are quite prepared to give the Government credit for a bold and vigorous policy in this respect. Detailed returns are required from all canal companies, showing the accommodation they are capable of affording, and the state of efficiency they are in, also reports of any intended stoppage. Provision is also made for the inspection of canals by officers of the Board of Trade, and the Department are to be furnished with copies of all by-laws, lists of tolls, &c., for their approval. Clause 36 prohibits any railway company or officer from applying any of the company's funds to the acquisition of canal property or interest, under very heavy penalties, and if this part of the Bill becomes law it will prevent any further development of what Mr. Mundella has described as the "throttling" of canals which compete with railways. It is, of course, too late to remedy the evils already existing, and it is useless to complain that the Bill is not retrospective, seeing that the canal property which is already in the hands of railway companies was acquired when they were unfettered by any such prohibition, and were free to take any course which they might consider to be conducive to the prosperity of their own undertakings.

The companies are naturally preparing to resist such clauses in the measure as point to a curtailing of their privileges, though it is to be hoped that they have modified their opinions as to the justice they may expect from Parliament, and will approach the subject in a more temperate attitude than they did last year. At one of the "anti-confiscation" meetings, a speaker said that there were now a larger number of Members of Parliament who had no great stake in the country than at any previous time, and that the House was hardly capable of taking a proper view of the question. Although loudly applauded when uttered, we do not think this opinion was seriously entertained by the majority of railway shareholders after the excitement occasioned by exaggerated statements had worn off, and we trust that a calm discussion of the new Bill may result in a beneficial railway reform.

#### KUGLER'S HANDBOOK OF PAINTING.

ALTHOUGH the Handbook of the Italian Schools of Painting, "based on the handbook of Kugler," has been edited and re-edited, and received many additions from various hands, its re-appearance from time to time in these more or less modified forms is a tacit testimony to the soundness of the original work. It is only in the case of a book that has been well done to begin with that it is worth while to make those periodical revisions which are required to bring it up to the date of the most recent criticism and investigation. And in its main characteristics Kugler is a model handbook of the kind. It is just the right size for a handbook, not unwieldy, giving the historical outlines of its great subject in a concentrated and business-like manner, not wasting space with irrelevant analysis or enthusiasm, but weaving into its historical record just enough of criticism on the leading schools and their leading names to vary the baldness of historical narrative, and to render the treatise to some extent suggestive to the imagination and fancy of the reader as well as instructive to his faculty of acquiring and retaining facts and dates. The small but careful outline illustrations, increased to nearly the number of 250 in the present edition, form adequate memoranda of the works referred to, and are sufficiently explanatory of the descriptions and remarks in the text, without laying any claim to an actual transcription of the artistic quality of the paintings, which would be impossible on the scale, and within the restrictions as to cost, of a popular handbook

The English form of the work, itself a modification of the original, has passed through several hands, so that it is rather difficult now to assign to every one his or her part in the fifth and latest edition. The German original, "Handbuch der Geschichte der Malerei von Constantin dem Grossen his auf unsere Zeit," was published at Berlin in 1837. In 1851 a translation of the portion relating to the Italian schools was published in England under the editorship of Sir Charles Eastlake. Since then the labours of Messrs. Crowe and Cavalcaselle added so far to the available knowledge of the lives and works of Italian painters as to render a new edition desirable, and this was undertaken by Lady Eastlake in 1874. The present edition (the fifth) is revised and partly rewritten by Sir Henry Layard.\*

The present editor's main reason for the appearance of the present edition is the publication, since Lady Eastlake's edition, of Signor Morelli's work "Italian Masters in German Galleries," first published under the assumed Russian name of "Lermolieff." The appearance of a work which has brought so much new knowledge to bear on the subject, and unsettled so many old convictions, would alone, in the eyes of the present editor, have rendered a new edition of the handbook necessary: the proper object of a "Handbook" being, of course, not to investigate or propagate new views, but to place in a compact and condensed form the accepted views of the best authorities. In addition to this, many pictures have been removed from the sites in which they were originally referred to in the Handbook, to local galleries and museums, which changes of place require record; and, last, but not least, our own National Gallery has of late years received such numerous and important additions as to call for revised notice and description. Sir Henry Layard, who is a Trustee of the National Gallery, adds a note in regard to this regretting that the want of space in the National Gallery "and the defective construction of the building itself, considering the purpose for which it was intended," render a complete systematic and chronological arrangement of the pictures, according to schools, impossible. We quite agree with him in thinking that the want of such arrangement of the pictures on a definite system is a great misfortune; but we should like to understand exactly what he refers to in regard to the defective construction of the building. The National Gallery has grown up in a rather piecemeal manner; but when the last important additions were made, did the authorities suggest to the architect any systematic scheme of arrangement for which the building should be planned and prepared? And if not, whose was the fault? Or does Sir Henry mean to express his regret at the cheese-paring policy whereby the projected rebuilding of our National Gallery, on a scale and in a manner suitable for its important functions, was put a stop to? If so, we are entirely with him.

The critical judgments expressed in the book are mostly still those of Kugler, coloured more or less by those of his former editor, Sir Charles Eastlake, and accompanied by occasional expressions of dissent or modification through the medium of the footnotes of the present editor, though these marginal suggestions of difference are but few. But an important modification has been made in the classification of the subject. The old division into "Periods of Development" has been discarded, and the chapters deal successively with the characteristics of the most distinct styles and schools of painting, as divided or grouped by chronology or topography or both; the Byzantine style, the Romanesque style, the Florentine school, the Umbrian school, &c. "Hard- and- fast lines," the editor truly remarks in his preface, "fixing periods of development, are not to be drawn in the history of art. They can at best be but arbitrary and scientific." The editor suggests the adoption of Morelli's classification; the "heroic" period, in which the religious

\* Handbook of Painting. The Italian Schools. Based on the Handbook of Kugler. Originally edited by Sir Charles Eastlake, P.R.A. Fifth edition, thoroughly revised and in part re-written by Austen Henry Layard, G.C.B., D.C.L., &c., with nearly 250 illustrations. 2 vols. London: John Murray. 1887.

sentiment is dominant, and paintings of sacred subjects are made for the encouragement of piety; the second period, in which the artist gave himself to the study of anatomy and perspective and to the closer imitation of nature, and which Morelli terms the period of "character"; and lastly the period of "Renaissance," in which the technical process of painting reached their highest perfection. The first of these periods, that of the especially religious art, where the interest consists not so much in the execution of the painting as in the sanctity and significance of the figures or the event which it represents, is, no doubt, traceable in the early period of all national art in which the representation of the human figure is concerned; and the distinction between the painting made for a purely religious purpose, and the painting made for the sake of artistic beauty and intellectual enjoyment, is one of the broadest and most marked distinctions which the history of art can show. But for the other two of Morelli's divisions, as summed up here, they appear to us pretty nearly as arbitrary, and as capable of misapplication, as any others that have been made. A classification of some kind, no doubt, assists the study of the history of an art, or the writing of the history, at all events; but with the exception of the broad distinction, just alluded to, between subjective and objective art, all these classifications depend on the point of view from which we choose to consider the whole subject, and what is true for one student or for one view of the subject is incomplete or misleading for another.

The minor divisions into local schools during a certain period of Italian painting are, of course, by no means arbitrary, and their well-marked distinctions afford a good suggestion for grouping the subject into chapters in dealing with this portion of the history. The strongly-marked local characteristics in the early period of Italian Renaissance art are of curious interest, and, occurring in regions so little removed geographically from each other, tell an unmistakable tale of the difficulties of communication, and the conservative jealousies of the small States, in the Italy of that period. As Sir Henry Layard remarks, "The connexion between race and art would form an interesting subject for study and investigation. The zones in which the fine arts have flourished, and those in which the populations have no natural disposition for them, might almost be marked out geographically on a map of Italy."

Concerning the larger business of mapping out chronologically the epochs of Italian painting and their achievements and characteristics, which is the main object of the Handbook before us, space would not serve here to speak at length, nor is it necessary, beyond remarking that whatever changes and modifications have been made in the literary form of the present edition, they are such as tend towards increasing its efficiency and usefulness as a *vide mecum* and book of reference. It is impossible, of course, not to reflect, in turning over even such an outline of the subject as can be given in a handbook of this size, on the extraordinary and varied interest of this long history of the use of the faculty of pictorial representation in one region only of the modern world. The study suggested is not merely that of the various technical means of pictorial representation, and their use and development, but of the intellectual attitude of the Italian mind, at various stages of its career, towards the scenery presented by the outer world; the spectacle of human life and of the landscape in which it is framed. Nothing in the critical portion of the book is better than the characterisation of the once widespread Byzantine school, that gilded mummy which kept up for so many generations the solemn semblance of life, and in which, as Sir Henry Layard puts it, the worn-out forms of the old world were found embalmed for the benefit of posterity. The gradual awakening of this dead art, the stirring of these dry bones under the first breathings of the new life of the early Renaissance, forms a chapter in the intellectual history of mankind, which has an interest quite beyond what are usually supposed to be the limits of artistic history.

The distance from the Byzantine art to that of Raffaele is like a voyage to the intellectual antipodes of the subject. In the former, the art is the obedient and formal handmaid of a church whose own life was almost smothered in the hands of ceremonial; in the latter, art is freely walking her own path, breathing her own atmosphere, taking her forms and inspiration from human life, and only affecting a kind of traditional respect for a church which, from being the mistress and director of art, is now suing to the great painters of the day to decorate her churches according to their own tastes and intellectual aspirations, and ready to take thankfully what they are pleased to give. Something of reverence and earnestness may have been lost, no doubt, in these times of Pagan joyousness and energy of artistic life; but it was *life*, at all events, and the Byzantine art, however rich in its trappings, represented but the formal lying-in-state of the dead body of the art of the ancient world.

Among the critical portions of the second volume, the extremely just and well-balanced view taken of Titian's genius may be commended to notice; doing full justice to its intellectual greatness, while not blind to its spiritual coldness and want of sympathy with the pathetic side of human life, of which, indeed, the princely and pleasure-loving Venetian master must have seen and known but little. The estimate of Tintoretto as originally given is retained in the text, but protested against in a note, as doing inadequate justice to a painter whose great qualities have been better recognised since the earlier editions of Kugler were published. The actual estimate of Pordenone attaches more importance to his work than the popular mind has yet realised, but we believe with justice. One may note, in the grand design of the altar-piece from S. Giovanni Elemosinario at Venice, given as an illustration of his manner, a remarkable similarity to the style and feeling of some of Blake's figures in the attitude and lines of the figure of St. Sebastian on the left of the picture.

In the preface to the present edition special attention is drawn to one deplorable subject,—the extent to which many of the works of the great masters of Italian painting have been "restored." It is painful to read that "the celebrated altarpiece of Titian in the Church of the Friari, with the portraits of the Pesaro family, has, it is believed, been restored seven times" (1). The Italian authorities have systematically employed persons in their galleries for these abandoned purposes, and are now beginning to find out their mistake after the mischief has been done, and when that has been taken away which no Government and no funds can restore.

## NOTES.

**I**T is not without uneasy feelings that we read in the daily papers that "several applications have been received from Schools of Science and Art in the colonies and dependencies of the United Kingdom to ally themselves with the Department of Science and Art, and to have the benefit of its examinations," and that arrangements are in progress for having a still further centralisation of art-examinations, in regard to work from the colonies as well as from the provinces. No doubt the aims and aspirations of the colonists are most praiseworthy, but if they knew the opinion of many persons in this country as to the deadening effect of this artistic bureaucracy, they would perhaps think twice about their move. What we should desire would be to see the colonies striking out new lines of their own in art, under new social and climatic influences. As it is, we seem threatened with having the whole of our dependencies turned into one big machine for grinding art on the approved South Kensington pattern.

**T**HE Metropolitan Board of Works have resolved to apply to Parliament to allow of an appeal to the Appeal Committee of the Board (which is a Committee of the whole Board)

in the case of dispute with regard to the decision of general lines of buildings by the Superintending Architect. It was not stated in what form the sanction of Parliament will be sought, but, judging from the past practice of the Board, they will probably seek to effect the alteration they desire to make by means of a clause in an Omnibus Bill, as, since the defeat of the Metropolitan Management and Building Acts Amendment Bill of 1874, the Board have not attempted any comprehensive alteration of the law, and have contented themselves with homocopathic measures of reform introduced in such a manner as to escape observation. In whatever form it may be introduced, it is very doubtful whether Parliament will acquiesce in such an amendment of the law, looking to the fact that the present machinery has worked satisfactorily for the last twenty-five years. The Select Committee to whom the Board's abortive Bill of 1874 was referred reported emphatically that it was not desirable to alter the language of the existing Acts in any case in which the necessity of an alteration has not been demonstrated by experience. The Chairman of the Board was a member of this Committee, and will find a difficulty in recommending Parliament to adopt a change, not merely of language but of principle, dealing with a matter of great public interest in face of this declaration and his own acquiescence in the report of the Committee.

**I**N the discussion (reported in another column) that took place at the Metropolitan Board of Works on the 5th inst., with reference to this question, a suggestion that the appeal should be to the Royal Institute of British Architects was received with derision. The majority of the Board appeared to be of opinion that the duty of deciding general lines of buildings was the easiest thing in the world, in which view they differed from Lord Selborne, whose opinion on the subject we quoted last week, and this, from the constitution of the assemblage, was only what one might expect. One member went so far as to say that he considered the Board to be quite competent to decide general lines of buildings for themselves, it was only a matter of common sense. It was stated in the course of the debate that out of 337 decisions given between the years 1863 and 1886, there were only twenty-five cases in which the decision of the Superintending Architect had been disputed, an average of one case a year. We notice that several of the daily papers which are not usually particularly enamoured of the Board and its doings commend its action in this matter, and give their reasons for such commendation. The very statement of these reasons is sufficient to invalidate the judgment arrived at by the writers. We have often noticed that the glibness with which the daily journalist comments upon matters appertaining to architecture is in an inverse ratio to his acquaintance with the subject.

**A**CCORDING to the *Times* of Saturday last, "The Duke of Westminster, the Archbishop of Westminster, Viscount Falkland, Viscount Lewisham, M.P., General Lord John Taylor, Lieutenant General Sir Gerald Graham, V.C., K.C.B., Sir Frederic Leighton, P.R.A., Sir James D. Linton, P.R.I., and the Mayor of Croydon are among those who have already joined the National Committee for the maintenance of the Crystal Palace as a national institution." That is all very well, but do these good people understand that in that case they must begin by making the building such as would render it a permanent national possession? And how are they going to accomplish that, unless by rebuilding it in a more monumental manner?

**F**ROM Mr. Plunket's reply to a question asked on Monday last, it appears that the exclusion of fog from the House of Commons by special appliances is contemplated. The First Commissioner of Works on that occasion stated that during a November fog many years ago Dr. Percy made an experiment of filtering through cotton wool the air which was supplied

to the House of Commons from the Commons court, and that it was so far successful as to impress him with the hope that by this kind of filtration the interior of the House of Commons might be rendered fog-proof at but a trifling expense; but that before applying this process of fog filtration to the interior of the House of Commons it would be necessary to make preliminary experiments, and Mr. Plunket had asked him to make such experiments on the earliest convenient opportunity. As the Smoke Abatement Society has not yet succeeded in abolishing the London fog, according to the hopes which it somewhat rashly held out to a suffering public, there seems to be here an opening for a new industry in London in the manufacture of fog-filters.

IT appears that on Friday, last week, Mr. Conybeare, of all persons in the world (or in the House), asked the First Lord of the Treasury why there were so few architects invited to compete for the Imperial Institute, and why "no competitors had been selected from Liverpool, Glasgow, Manchester, Birmingham, Leeds, and other great representative towns." We are also of opinion that there should have been at least an open sketch competition; but we fear we can hardly regard Mr. Conybeare's question as evincing any interest in getting the best architecture possible.

— "Timeo Danaos et dona ferentes"

is the feeling it awakens on our part; it is probably only a move on behalf of some provincial constituent, of the pure Radical faith.

THE demolition of some old tenements which formed the southern side of Bleeding Heart-yard has quite altered the aspect of a quarter which Charles Dickens rescued for a while from obscurity during the publication of his "Little Dorrit." The buildings in question stood against the end of what was once Union-court, and the blank wall that blocks off Ely-place, Holborn. Union-court, site of Scroope's Inn, formerly opened into Charles-street,—ever memorable as the home of Joseph Strutt, author of "Sports and Pastimes"—and was rebuilt about fifteen years ago as Viaduct-buildings. The steps leading down hence into Great Saffron-hill, locally known as "The Hill," are indicative of the court's elevation above the course of the River Fleet. It is to be observed that the sign of the tavern in Charles-street, by the yard corner, is with easy impartiality, spelt both as Bleeding Heart and Bleeding Hart. The origin of the name is doubtful. Some may derive it from the sweetly-smelling dark red wall-flower, the "bloody warrior" of Norfolk and Dorset peasantry, and which in our Midland and Western counties is frequently known as the "bleeding heart." In his Poems of Rural Life, in the Dorsetshire dialect, the late Rev. W. Barnes gives a gloss on this name, whilst among the flowers of a cottage garden described in one of the poems he enumerates "jelli flowers" and "bloody wayors stained w' red." Others connect it with the supposed tragical end of the Lady Elizabeth, daughter of Thomas (Cecil), first Earl of Exeter, wife to Sir Edward Coke, Attorney-General, and widow of the nephew and heir of the great Sir Christopher Hatton. That imperious and wayward dame, who never allowed her second husband to enter her house here, is said to have contracted her soul to the devil. The compact determined on the night of a grand festival (January 2nd, 1646) at Hatton House. The evil one accordingly joined the festivities in cavalier guise, and after treading a stately measure with his hostess, allured her into the garden, where he tore her to pieces. On this spot was found her heart, still beating; in the same garden, perhaps, wherein Richard, Duke of Gloucester, when, as he says, last in Holborn, had seen the good strawberries of my Lord of Ely. Yet the name of Bleeding Heart for this place would not appear to have been adopted before the middle of the eighteenth century. About thirty years since at Aton, Warwickshire, the sign of the White Hart Inn was depicted as a white heart, or ace of hearts.

THE Metropolitan Board of Works have begun operations in pursuance of their Woolwich Ferry scheme. For this, the first free ferry to be established by the Board, have been acquired the sites of some premises, many of them perhaps 300 or more years old, in the High Nile, and Surgeon streets, Woolwich. The Board have accepted the designs and tender of Sir W. Armstrong, Mitchell, & Co., of Elswick, for two steam ferry boats to carry foot passengers, cattle, and vehicles, each vessel to cost 10,050*l*. The boats will travel to a point on the opposite shore close by the North Woolwich Railway Station and the Pavilion Gardens, to which we referred in our last week's number.

WE are not aware what has been the result of the application of Messrs. Bucknall & Jennings, which appeared in our issue of the 26th ult., for funds to carry up an appeal from the decision of the County Court Judge at Swansea, who had allowed them less than 2½ per cent. as payment for taking out quantities. It may be well, however, to point out that a decision of a County Court Judge upon a question of amount is no precedent at all. One judge may think the amount of percentage is reasonable, another may fix it at some other figure. Again, if a Divisional Court of the Queen's Bench Division were to allow 2 per cent. or 1 per cent., that again would not form any precedent unless it was the logical result of a definite principle laid down by the Court. It has more than once been pointed out by us that the 5 per cent. remuneration usually paid to architects can only be obtained in an action at law if the judge or the jury considers it a reasonable sum. In the same way a charge by quantity surveyors, though it may be usual, is not one which can be recovered at law unless the tribunal considers it reasonable.

BETTER late than never! At last it has seemed good to the authorities of the Louvre that the two archaic "Apollo" statues from Actium should be published. They appear in the *Gazette Archéologique*, année 12, pl. 29. They were discovered by M. Champoiscau, then French Consul at Janina, in 1868. They are perfectly well known to every travelled archaeologist, they are alluded to in every serious work on Greek sculpture, their importance in the history of archaic Greek art no one questions, and now, after nearly twenty years, they are accessible to the student in two good heliograph plates. They will now fall into their place in the familiar procession of the Apollos of Thera, of Orchomenos, of Perdicovrysi, of Tenea, and the Strangford and Choiseul Gouffier Apollos. The plate is accompanied by an interesting article by M. Collignon. He declines to settle the vexed question whether these familiar type are in reality Apollos or statues of athletes, or, again, funeral monuments. The two Actium figures, found, as they were, close to the precinct of Apollo, may reasonably be supposed to be statues of the god. On the other hand, they may be votive statues of athletes, victors in the Actium games (*τὰ Ἀκτιακά*). M. Collignon gives a list of the "Apollo" statues, and classifies them according to provenance. From his classification it appears that the type is common to northern and central Greece, the islands, and Sicily. So far no instance occurs in Asia Minor. The origin of the type has been matter for much discussion. It has certain analogies with Egyptian sculpture, but is marked by a naturalism and vigorous anatomy that differentiate it. M. Collignon suggests that the "Apollo" stone statues are copies, or, rather, developments, of more rigid wooden originals, and that these originals were themselves conceived under Egyptian influence.

THE same periodical (*Gazette Archéologique*, pl. 37, 38) publishes two interesting terracottas from the collection of MM. Rollin et Fenardant. The first, which is of very delicate workmanship, represents Pan seated by the side of a Nymph in front of a term of Priapos. The Nymph, in play or in self-defence, seizes

Pan by the right ear. Probably to the nymphs, as well as to the "reverend graces," Pan was, as Pindar says, a "darling joy" (*μίδμηνα τροπάρω*). The second terra-cotta has a more serious subject, the rape of Cassandra by Ajax. Cassandra is not, as she usually appears on vase paintings, clinging to a temple image, but simply seated on an altar, Ajax catches her by the hair, but her face betrays but little of terror, his still less of ferocity. There is a manifest intent to euphemise the scene. The figure of Cassandra is of quite disproportionately small size, but the same may be said of all the black-figured vase representations. This seems to have been a traditional means of emphasising the helplessness of the victim.

A CORRESPONDENT has favoured us with a circular emanating from a remote little place in Devonshire, where a committee has been formed for erecting a cottage hospital, the cost of which is "limited to 1,200*l*., including all sanitary, heating, cooking, and lighting apparatus and fittings." Other requirements of the Committee are that "the plans, specifications, and bills of quantities," are to be sent in by a certain date named. (The italics are ours.) The Committee further announce that "they will pay for no plan," although they add that "the architect whose design is accepted will be paid the usual commission of five per cent. on the outlay, to include all his expenses." Nothing is said about the appointment of a professional assessor. From the fact that the copy of the circular which has reached us was sent to an architect in Liverpool, we suppose it has been pretty widely distributed, but we can only express the hope that the response to it will be as limited as the conditions deserve.

THE opponents of the erection of the proposed Dust Destructor at Notting Hill, by the Kensington Vestry, whose empowering Bill has passed a Committee of the House of Commons, condemn the apparatus in extravagant language, but the experience of most of the large provincial towns in the Midlands, where efficiently-working destructors are in operation, often in thickly-populated districts, does not seem to warrant this unqualified condemnation. It should be borne in mind that the complete sewerage system of London renders unnecessary the objectionable general or mixed midden still to be seen in many of the large provincial towns, and that it is only, for the most part, the dry ashes and dust of the households and the streets which need be consumed in the destructor. The excreta goes away in the sewers, and the offal, fleshy, and other offensive animal refuse can be, as is already successfully done in several instances, conveyed to the country as manure, mixed with that quantity of dust and trade refuse which would make it conveniently carriageable. Owing to its low value as a manure, the metropolitan districts find increasing difficulty in disposing, except at a serious cost, of their dust. Even Chelsea, with its barging and railway facilities, finds that the cost of its dust disposal has nearly trebled within a very short time, so that, along with the other districts, it is forced to consider the question of the application of other means of getting rid of ashes and dry refuse. Almost all sanitary engineers are of opinion that destructors of an efficient and tried kind can be worked in a thickly-populated district without creating a tangible nuisance to the neighbourhood.

THE *Journal of Education*, commenting on the delay in opening Holloway College, states that it is reported that the delay has been occasioned not only by the difficulty of finding a principal, in the choice of whom the Council are much hampered by the founder's statutes, but also by a more substantial impediment, the absence of drains, a detail which the *Journal* observes that architects have a way of overlooking. This is a preposterous charge, which it is not worth while contradicting. That there may be some defects in the drainage of the College is only too probable, these occurring, as our readers know

only too well, in spite of every care on the part of the architect, but that there should be no drains at all is, of course, impossible. The *Journal of Education* may be able to educate itself on this point by referring to the *Builder* for July 3, 1886, p. 37.

ACCORDING to the San Remo correspondent of the *Times* (March 8th), the earthquake in that quarter has proved a practical critic of jerry building, and all the houses that have come fairly down are "of wretched construction,"—"mortar which one can rub into dust, all kinds of stone thrown together any way," &c., &c. If this is the mission of the earthquake we might even welcome it here. It would at least be a purifying influence from the point of view of true architecture, though to throw down all the jerry-built houses in London would, perhaps, be a task beyond the powers even of any average earthquake.

#### CROYDON PALACE.

CROYDON PALACE for more than a century has ceased to be a residence of the Archbishops of Canterbury; but, although it has very much fallen into decay, and has been converted to secular purposes, the largest portion of the structure still remains,—more than enough to enable us to form an idea of its extent and magnificence in days gone by. In a paper on "The Architecture and Heraldry of Croydon Palace," by the Rev. J. Cave Browne, read last year at a meeting of the Surrey Archaeological Society, the author remarks:—"Happily, at the present time Croydon Palace is not a ruin; may it never become one! Its once palatial walls are alive with what the poet calls 'reverent history'; for in their very massiveness and range we may read the tale of the piety, the perils, and hospitality of the so-called 'Dark Ages' in which they arose."

The most perfect part of the group of buildings at Croydon is the Hall, which was built in the fifteenth century by Archbishop Stafford, on the site of an earlier structure, which probably owed its original foundation to Stephen Langton in the earlier part, or to John Peckham towards the close, of the thirteenth century. Both of these prelates in their day were great builders; and they were great benefactors to the old manor-houses appertaining to the see of Canterbury. Bunsard, in his account of the Old Palace at Croydon, says that the manor, as is known from "Domesday Book," belonged to the see of Canterbury ever since the days of Archbishop Lanfranc, who became primate a few years after the Norman Conquest, and died in 1089. When the manor-house was first built cannot be ascertained with certainty; but its origin is generally attributed to Archbishop Langton, in the time of King John. Be that as it may, there are few Archbishops between the thirteenth and eighteenth centuries with whom the manor-house cannot establish its connexion. The palace was probably much enlarged by Courtenay and Arundel in the beginning of the fourteenth, and found its most magnificent restorer in Stafford in the middle of the fifteenth century.

The palace, substantially almost unaltered, stands on the south and east sides of the parish churchyard, and through its moat ran, formerly, a clear stream that abounded in trout. Previously to its partial demolition, the buildings formed a large square court or quadrangle, and comprised, besides its banqueting-hall, guard-chamber, long gallery, and chapel (all of which are still standing), various ranges of apartments for the servants and retainers, &c. The hall and adjoining offices, which remain, are built of stone; the rest of the apartments are mostly cased with red brick.

The great hall, with its fine, open-timbered roof, is still in good preservation; but "the date, on which the lord of the mansion and his guests were wont to sit in days when the proudest noble deemed it no dishonour to eat his meals in the common hall with the humblest of his servants, has disappeared." The arms of Archbishop Stafford (1443-52), which appear conspicuously on the corbels below the windows, prove that it was built by that prelate. The withdrawing-room,—generally, though erroneously, styled the guard-chamber,—with its fine oriel window, owes its construction to Archbishop Arundel (1396-1414), the friend of

Bolingbroke, whom he crowned as Henry IV., and so is about half a century earlier than the present hall. The earliest mention of a chapel in the Palace of Croydon was in 1283, at which date Archbishop Peckham held an ordination within its walls; both Cramer and Ridley are known to have officiated in that chapel. On the knobs of the oak benches at the west end of the choir are carved the arms of Archbishop Laud (1633-1660), who was in the building when intelligence was brought him of the assassination of his friend, the Duke of Buckingham. The arms of Laud's successor, Archbishop Juxon, who attended Charles I. on the scaffold, adorn the east end benches of the chapel; and it was he who probably caused the arms of his predecessors to be sculptured there along with his own.

Although, as stated above, among the heraldic decorations of the great hall, the arms of Archbishop Stafford are the most conspicuous, still it must not be overlooked that there are evidences of an earlier building. Two lancet windows, which formerly pierced the flank gable at the east, but were lost in the fall of the entire eastern wall in 1830; the Decorated porch on the north, with its finely-grained roof; the corresponding garden door and doorway on the south, clearly must have belonged to a building of earlier date, which Stafford probably found in partial decay, and restored with his wonted liberality. Though inferior in size and grandeur to the hall of Lambeth Palace, that of Croydon is a building of goodly proportions, being nearly 60 ft. long by 48 ft. wide, and it is divided into four bays, each containing a three-light window, except the eastern one on the north side, where the space is occupied by a small room over the entrance porch; this was used either as a minstrels' chamber, or as a passage room to a minstrels' gallery running along the eastern wall over a wooden screen. Under the screen were, no doubt, the three usual doors, leading respectively to the buttery, the kitchen, and the cellar; but along with the downfall of the eastern wall, gallery and screen and doorways have all disappeared. To the windows in their present mutilated form it is scarcely possible to assign even an approximate date; for crowbar or chisel and mallet have effectually removed all trace of cusp and curve, and left only the bare battered mullions, while the widening and less pointed arches and mouldings of the windows themselves may indicate any part of that vague period of transition between the Decorated and Perpendicular, which would comprehend the styles both of Courtenay's and Stafford's times. The roof, however, remains unimpaired, with its wide-spaced tie-beams of Spanish chestnut, its arched principals without kingpost or brace, and its timbers open to the very roof, resting upon what constitutes the great beauty of the hall, a series of angel corbels, supporting shields, once rich in heraldic blazonry. Conspicuous among these, at the western end, as stated above, are the arms of its chief restorer, if not rebuilder, Archbishop Stafford, which appear singly,—a chevron, with and without the mitre of difference, and also per pale with those of Canterbury and of his former see of Bath and Wells; while on the neighbouring shields are the arms of his noble kinsmen, Henry, Earl of Stafford, and Humphrey, Duke of Buckingham. On the more eastern corbels are also the arms of Laud, Juxon, and Herring, who were the more recent restorers of the building.

At the upper end of the hall, in the centre of the dais, once stood the stone chair or throne used by the archbishops on State occasions, over which projected a canopy of stonework of massive proportions and remarkable construction. In front, upon a square panel between angel supporters, is a shield bearing the arms of Edward the Confessor impaling the royal arms, England and France, quarterly,—a device which would itself assign it to the reign of Henry VI., who proclaimed the Confessor the patron saint of England. The angel supporting the whole carries a scroll inscribed, "DOMINE SALVUM FAC REGEM," and rests upon a shield bearing the arms of Archbishop Stafford; while in the north angle of the projection is a shield bearing the family chevron without the mitre, and in the south angle the saltire of the see of Bath and Wells. This massive block of stonework fell down in the middle of the last century, and apparently destroyed the seat for which it had served as a canopy. Archbishop Herring (1747-1757),

anxious to preserve it as a strange, yet historic, device, placed it on its present plain haemset of masonry, close against the west wall; and although layers of yellow wash have quite obliterated all the rich colour with which the angels and the shields were bedecked, the faces and figures, as well as the heraldic changes and the general character of the whole group, have been remarkably well preserved. At the southern end of the dais is a shallow recess, with the usual oriel window, not unlike that at Hampton Court Palace. It is only fair to add that while this building was used as a leaching factory, the greatest care was taken by its occupiers, Messrs. Oswald, to protect these exquisite corbels and the other architectural details from injury; and if they should be repainted heraldically again it will be found that they have not been injured, but preserved, by successive coats of whitewash.

The withdrawing-room or guard-chamber, has been utilised as a dwelling-house. This part of the palace, "judging by its heraldry," remarks Mr. Cave-Browne in the paper above mentioned, "was clearly the work of Arundel; yet, possibly," he adds, "if we read aright the arches of the stone" roof, his was the honour of completing the work designed by his predecessor, Courtenay. There can be no doubt that an apartment of imposing dimensions stood here previously, though known by a different name; for it was in *principali camera sui manerii de Croydon* that Peckham received the pall 600 years ago, and above a century before Arundel, or even Courtenay, succeeded to the primacy. It is probable," he adds, "that the need of a guard-chamber was the more fully realised by the soldier-minded Courtenay when he was appointed custodian of no less distinguished a prisoner than the young Duke of Rothesay, afterwards King James I. of Scotland, who had been captured at sea while flying to France to seek an asylum for his unscrupulous uncle, the Regent, Duke of Albany. From the rigours of his first imprisonment in Pevensey Castle he was transferred to the milder guardianship of the chivalrons Primate at Croydon, where he lived for some years." In this apartment, or in the great hall, how many historic scenes have been enacted! More than once the pall, brought fresh from Rome, has been placed here on the shoulders of the successors of St. Augustine; and royal and other illustrious personages have doubtless been entertained with music and dancing, and masques and revelry.

The chief gem of this withdrawing-room is an oriel window, which once looked out into a small quadrangle, but now commands a view over only a few tiled roofs of offices. It was formerly enriched with painted glass, which exhibited the arms of England and of the illustrious house of Courtenay.

On the south, close to this once noble chamber, ran the Long Gallery, in which Queen Elizabeth delighted to dance "galliards" with her courtiers, and in 1687 she is recorded to have bestowed the Great Seal of England on the handsome and courtly Sir Christopher Hatton. The Long Gallery is still intact, so far as concerns its outer walls; though it has been cut up internally into a variety of bedrooms and sitting-rooms. At its eastern extremity is Queen Elizabeth's State bedroom; but its oak paneling, its ornamental ceiling, rich with heraldry, and the rest of its decorations, are entirely gone. The whole of this chamber and of the Long Gallery was cased in solid red bricks by Archbishop Wake, more than a century and a half ago. Its windows looked out upon the Archbishop's private gardens and "pleasance," now turned into a field.

Beyond the "guard chamber" is another large apartment, a century older still, if we may judge from its plain-timbered roof, which is still as sound and good as when it was first erected. It is divided into two parts by a floor; and the upper part, which has an opening looking down into the guard-chamber, is commonly known as "the music gallery." It may, however, be doubted whether this name is correct: possibly it was used as a dormitory for guests.

A slight wooden gallery, apparently of the sixteenth century, connects this part of the buildings with the chapel, which in its internal arrangements is very like the chapels of some of the smaller colleges at Oxford and Cam-

\* The roof is not of stone; the original timber roof remains above the modern wagon-shaped ceiling which conceals it from view, and which has been painted a dull stone colour.

bridge. The Tudor arches of the windows mark the approximate date of the present building, which doubtless superseded a previous structure. The whole of it is cased in brick; but the brickwork is very finely executed, especially at the west end, which looks into the parish churchyard, where the Keys of St. Peter are worked into the wall in black brick very conspicuously. It is said that the chapel, as it now stands, is the work of Archbishop Bourchier, but all papers and documents relating to its foundation and erection have long since been lost.

"The existence of an earlier chapel," writes Mr. E. Walford, in his "Greater London," "is clear. Archbishop Peckham's Register expressly states that his reception of the pall took place in *camerâ principali*, and his confirmation two days afterwards in *capellâ sui manerii de Croydon* in the year 1382: and the learned but persecuted archbishop, Reginald Peacock, was consecrated in the chapel at Croydon in 1414. But it is with Land that the present building is especially associated; for, according to his custom, and more fully even than at Lambeth itself, he has recorded here in heraldic characters the history of his rise. On the carved poppy-heads of the western stalls appear his arms in connexion with those of every preferment that he held, impaling the Principality of St. John's College, Oxford, the Deanery of Gloucester, and the Sees of St. David's, Bath and Wells, London, and Canterbury, while on the eastern block are those of Archbishop Juxon."

This, however, is scarcely correct; for it would seem on a close examination that all the carving of the stalls in the chapel is of one date, and, if so, it must have been the work, not of Land, but of his successor, Juxon.

From Land's time the history of Croydon Palace is well known, and may be told very briefly. At the Great Rebellion it was confiscated and sold to Sir William Brereton, who turned the chapel into a kitchen, to gratify his own taste, for he is described in a pamphlet of his time as having "terribly long teeth and a prodigious stomach." Archbishop Juxon, as already stated, did what he could to restore the chapel to its former pious uses; but since his day it has received but scant care and attention. The communion-table was removed in 1810, and the stonework and the carving of its windows were covered with stucco, plaster, and white-wash, while its stall-work and poppy-head carvings were daubed over with brown paint. Of late years it has been used, at one time as an armoury for the local militia, and at another as a parish day-school,—for girls, fortunately, as it is to be feared that they have suffered still more cruel mutilation at the hands of from the penknives of the same number of boys.

Two meetings of local and metropolitan antiquaries were held in December last within the walls of the palace, at which Mr. E. P. Loftus Brock, F.S.A., explained with great care and minuteness the most interesting features of the building; and an appeal has been made by an active member of our two leading archaeological societies to the patriotism of the people of Croydon not to allow such a building,—one of which they may well be proud,—to be swept away needlessly. The newly enfranchised borough of Croydon has a population of between 90,000 and 100,000 souls, and the four or five thousand pounds which would be necessary to repair it and to convert it into a fit receptacle for a museum and public library, or into a training college for school teachers, ought not to be any difficulty to so wealthy a body of residents. We are told that the addition of a quarter of a farthing in the pound to the local rates would be ample for the purpose.

#### Manchester Architectural Association.

The members of this Association visited the works of Messrs. Morrison, Ingram, & Co., sanitary engineers, brass and iron founders, Corabrook, on the 4th inst. They commenced by going through the warehouse and examining the latest improvements in sanitary appliances, both in earthenware and metal. Mr. Ingram then conducted them through the iron and brass foundries to witness the casting. The process of both enamelling and decorating was next viewed, after which they passed on to the fitting-up and brass finishing and testing rooms. The visit was rendered most interesting and instructive by Mr. Ingram explaining the value and utility of every article and process.

#### EDINBURGH NOTES.

The interest taken by the citizens of Edinburgh in the competitive designs for the municipal buildings is worthy of notice. Large numbers have visited the Waverley Market, where the drawings are placed, and their respective merits are keenly commented upon, not only verbally, but in numerous letters to the press. The designs as a whole are generally admitted to be of exceptional merit, but the variety of opinion as to the most suitable is wide. Although the design to which the first place has been awarded is considered to be in itself a refined and elegant composition, few who appreciate the unique character of the site and the traditions associated with it would like to see it occupied by "Edina Classica." Had the north side of St. Andrew-square been the spot selected (as at one time proposed), there would be little hesitation in accepting the design submitted by the Messrs. Leeming. But the old town,

"Whose ridgy back heaves to the sky,  
Filed deep and massy, close and high,"

is not the place for a structure of this character. The visitor to Edinburgh who is possessed of æsthetic proclivities cannot but be struck by the ragged sullenness of the ridge of the High-street, as seen from the new town, and anything which would tend to destroy or modify this characteristic should be carefully avoided. Indeed, the north or back elevation is that which will attract most notice, and this fact has been kept in view by every competitor; but there is much variety in the treatment of the sky-line, a most important point in the present instance. Other competitors besides "Edina Classica" break the sky-line by means of a dome and subsidiary adjuncts, but a tower forms the culminating feature of most of the designs, and such would be much more suitable for the position, provided always that it did not compete with or overpower the well-known tower of St. Giles's Cathedral. To obviate such objection some of the competitors have placed the tower at the south-east angle, where it would be furthest removed from the Cathedral.

The exhibition of the designs has had the effect of weakening the former opposition to the proposal for new buildings, but not a few are strongly in favour of retaining the present buildings, with alterations and additions. "This building, known as the 'Royal Exchange,' was begun in 1754 by Lord Provost Drummond. It still stands out as architecturally superior to almost everything that has been done since in this city in the same style of architecture. It is designed in that phase of Italian that marks the middle of the Eighteenth Century, and as then used in Great Britain, it became distinctively national in feeling and application as compared with the same style and time in the other countries of Europe. Although simple and somewhat severe, there is a feeling of manly vigour about it; its detail and proportions are scholarly and elegant; it has a purpose-like look and much common sense, and it is most substantially built. It marks an important epoch in the history of Edinburgh, and the reign of one of our most energetic and far-seeing provosts; and I hold that Edinburgh would be distinctly poorer in interest and in architecture if this building were removed. The building is in the form of a quadrangle, but the north-west corner of it was never built." This quotation is taken from a pamphlet issued by the author of the design submitted under the motto, "Crescent in Shield." His scheme, he says, "provides for completing the north-west corner of the quadrangle, and for making an addition on the west side of it, a small one on the east side, removing the entire roofs and giving them a steeper pitch, and rebuilding all the chimney-heads; also for an alteration of the portico on the south side of the quadrangle." He closes his brochure by pressing his scheme strongly on the Corporation, for the following reasons:—

"First,—It will preserve to the City one of the best buildings we have, and the cost of taking down the present building on the site would be greater than the value of the old materials obtained.

Secondly,—A less amount of property will have to be purchased. It will only be necessary to acquire those parts of the quadrangle not belonging to the city, and the strips of old property on the east and west sides.

Thirdly,—The present quadrangle, if completed and re-arranged, will give all the accom-

modation asked for, and leave something for future increase.

Fourthly,—The cost of the scheme submitted will be certainly one-fifth, and probably one-seventh or one-eighth part of the cost of an entirely new building.

Fifthly,—The conduct of the business of the city would not be disarranged by having to remove to other, and in all probability more inadequate, accommodation than in the present building.

Sixthly,—The cost of hiring other buildings for probably eight years would be saved.

Seventhly,—The building operations will not interfere in any way with the city officials now using the present chambers. The east and west sides of the quadrangle could be taken in hand first, and as soon as completed, occupied. The minor alterations on the present council chambers can then be carried out, and the whole could be completed in three years."

This is all very well in its way, but, after all, the design thus submitted did not comply with the terms of the competition, and, strictly speaking, should not have been exhibited along with those which did so. The author seems to plume himself upon having struck out an original idea, but there are others to whom it also occurred, and who are equally entitled to consideration should such a scheme be finally resolved upon. The Town Council have resolved that a *plébiscite* of the electors be taken on the question whether the Municipal Buildings Bill should be withdrawn or prosecuted, and it was remitted to the Lord Provost's Committee to draw up the form of *plébiscite*, and report to a special meeting of Council.

#### MR. AITCHISON'S LECTURES AT THE ROYAL ACADEMY.

WINDOWS.

MR. GEORGE AITCHISON, A.R.A., delivered his second lecture\* this session to the students of the Royal Academy on the 3rd inst., when he took for his subject "Windows." At the outset he showed that our word "window," or "wind-eyes," meaning a hole for the winds to get in, was directly derived from two Latin words, *ventus*, the wind (probably pronounced *ventus*), and *oculus*, the eye (the same as the Greek *okhos*), the old Latin form of *oculus*, which meant a little eye; and not from "windore," as Butler had it,—

"Knowing they were of doubtful gender,  
And that they came in at a window,"  
*Hudibras*, pt. 1, c. 2, line 214.

We had only to look at the houses we passed by daily to see that the bulk of the windows, when they were not mere holes in brickwork, both as to shape and dressings, came down to us, like the name, almost direct from Classic times. A window was much more complex in its relations than a doorway. Doubtless the earliest doorways were mere holes to creep in at, though they eventually became ornamental features of a building; but, big or little, their main uses were as exits and entrances for man. Windows were at first peepholes,—mere chinks or crannies for the safe observation of enemies, whether those enemies were men or wild beasts. They were, in fact, the loopholes of fortresses; and it was not until we arrived at a time when cities were defended by walls that what might be called "civil" windows were to be found. All early windows, too, were unglazed, and the exclusion of the wind, not to speak of cold, was certainly as important as the admission of sufficient light. Besides the consideration of cold, there was the exclusion of rain, hail, and snow in cold countries, and it was even more necessary to guard against these than to admit a due amount of light. And what was true of cold was true of heat. In hot countries, the exclusion of heat from buildings was one of the great problems. As soon as windows came to be glazed, the size of them depended on the size of the rooms and the country they were in, for the amount of light varied with its intensity. A very small opening would admit enough light where the light was intense. We in England were of course most interested in the quantity and quality of light we got here, and we ought to proportion our windows to the strength of the light and our own requirements. There were also other points to be considered. How should our windows be proportioned and disposed so as to get the greatest amount of

\* For summary of first lecture, on "Doorways," see last week's *Builder*, p. 318.

light and effect from them? Too little attention had been directed in modern times to the æsthetic effect that could be produced by variety in the size and position of windows, so as to obtain gradations of light, shade, and shadow, particularly in structures built mainly for effect. By the word "window" the lecturer said he meant an opening for light in a vertical wall. There was a well-known hypothetical rule in England for lighting a room whose length, breadth, and height were in due proportion, namely, that 1 ft. superficial of unobstructed light would sufficiently illuminate 100 cubic feet of space. In the case of skylights under the clear sky of Italy, the Pantheon at Rome might be cited as an instance of the large proportion of cubic space that could be lit by 1 ft. of skylight. Taking the diameter roughly as 145 ft. 6 in., and the height as 147 ft., the dome being a hemisphere of 145 ft. 6 in. diameter, the cubic contents would be 2,041,711 ft. The eye was 27 ft. in diameter, the area of this being 572 ft. 6 in. The cubic contents lit by each foot of aperture were therefore 3,565 cubic feet. In R. Morris's "Lectures on Architecture, and Architectural Proportions in Buildings" (London, 1734), he gave the following rule for lighting,—"If you multiply the height, length, and width of a room together, and extract the square root, this will give the real lighting area required." Suppose the room to be 20 ft. by 16 ft., and 12 ft. high, these dimensions multiplied together gave 3,840 cubic feet. The nearest integral square root was 62 ft., and that area, if divided into three equal windows properly proportioned, and placed at the end of the room, would sufficiently light it, *i. e.*, 1 ft. of opening lit 62 cubic feet. But as the square root would vary, that could not be a true solution, as a bigger room would get less proportionate light. For instance, let the room be 50 ft. by 30 ft. by 20 ft. high, the cubic contents would be 30,000 ft.; the nearest integral square root was 173. If the smaller room required to light it 1 ft. superficial for every 62 cubic feet, the larger room would be very dark if it had but 1 ft. of light to every 173 cubic feet. Mr. Aitchison quoted Viollet-le-Duc's remarks about windows, in his article on that subject. Those remarks the lecturer characterised as admirable, though the introduction to the article was in direct opposition to what was taught in optics, and so far as the lecturer could judge, contrary to fact. In Gothic times, as far as churches were concerned, the one great aim of the architects was to convert the walls into picture galleries, and as fine stained glass produced the most gorgeous and entrancing effects, the problem was to make as much of the walls window as possible, by gathering together all the supporting and necessarily blank parts, and by lessening them as far as possible in size. In England, where so much of the stained glass had been destroyed, many of the more important late Gothic churches looked like conservatories; but when we saw churches abroad that had not been treated in that manner, but had preserved their old stained glass, we could not be surprised at that desire, as the effect was lovely; and when the eye was satisfied with the beauty of the colour, there was amusement in deciphering the story. Strasbourg Cathedral was a favourable example of that, so far as the nave was concerned, but it was surpassed in grandeur by the effect of the earlier sanctuary, with the dark apse behind. It would be superb were it not that the apse had a small central window in it. We must, as a rule, go to the early churches before Gothic times to find studied effects of light and darkness, though there were some magnificent effects behind the choir of Westminster Abbey. At San Miniato, at Florence, besides the lovely and delicate tints that pervaded the church, whose resultant was a pearly greenish grey, the dark background of the choir set off the altar in light, just as some rich dark-coloured velvet set off a jewel framed in pearls. But the lecturer was not sure that the lighting was so well managed anywhere as at St. Mark's, Venice, where floods of light came through the immense end windows of the nave and transept, while the aisles and choir were in twilight. Nearly all the temples of antiquity were now doorless, windowless, and roofless, but we could not help believing that the greatest care was bestowed in producing effects at once grand and impressive by light and

shade. In the Temple of Diana at Nîmes a good effect was produced in one of the side passages by the middle of the vault being raised higher than the ends, so that the light came in by two lunettes. The lighting of ordinary rooms must naturally be more or less prosaic, for there the one thing wanted was to see. Still even there the architect might blunder. A long room that must be lit on the long side was often lit by two windows with a blank in the middle. That was a bad method of lighting, as a window in the middle, of the size of the two side ones, would light the room better, and would not be so offensive to the eye. The light should always be massed instead of being frittered away in morsels. Philosophers told us that cosmic energy was gradually dissipated in the making of dust. Some writers had praised the English Medieval architects for making the east ends of their cathedrals square, and putting an enormous window there, and had blamed the taste of the French architects, who kept to the round end. To the lecturer nothing was so marvellous as the square end; there was no "mystery" in it, and in the morning nothing was more painful than to have one's eyes put out by a glaring light. He could not help thinking that the perpetuation of such a blunder must rather be attributed to the power of the corporation of glaziers, than to the want of taste of the architects, in Romish times particularly, when the high altar was the important feature. Even in houses, vistas could often be managed in halls, and looking from light to gloom, or vice versa, was both striking and agreeable, not to speak of the cases where charming gradations of light could be obtained. Apropos of Viollet-le-Duc's remarks on the lighting of spaces, the lecturer observed that if the sizes of the windows were proportioned to the requirements of the rooms they were to light, the variety of the sizes would give great scope for architectural ingenuity. We did not now want to have the windows thrown haphazard over a front, as if they had been shot out of a cannon, and stuck. A few small windows well arranged gave scale to the large ones, and importance to the building. The Cornaro-Spini Palace might be taken as an example. Every architect must have noticed the absurdity of lighting in many modern houses, where two windows very imperfectly lit a large room, while a small room alongside was made almost as light as a conservatory, by having nearly the whole of one side taken up by the same-sized window. He (Mr. Aitchison) had seen cases where the large room got but 1 ft. of light to every 114 cubic feet, while the small one got 1 ft. of light to every 26 ft., though the big room was nearly three times as long as the small one, and though light varied in intensity as the square of the distance. There was, moreover, a feeling of satisfaction engendered when the outside of a house told us something of the inside, not to speak of its necessarily imparting its character to the building. Our fellow-workers in France said we gave ourselves no trouble about stamping their distinctive characters on our buildings,—that no one could tell whether a building was a court of justice, a hospital, a museum, a cathedral, or a school of art, by looking at its outside. Nearly all the Classical Greek remains that had come down to us were temples, public halls, theatres, and gateways, with the exception of a few tombs and monuments. We had no considerable ruins of palaces, houses, or other buildings, and the temples were mostly lit by some arrangement in the roof. At the Erechtheum, however, and at the Temple of Jupiter Olympius at Agrigento, we had specimens of windows; those of the former building were like some of the simpler doorways, a frustum of a triangle with a keeled architrave; and in the latter building they were, as shown in Professor Cocherell's restoration, plain oblong openings with inclined sides. There was little doubt that Classic windows were generally protected by pierced slabs of stone or marble, or by wooden or bronze lattice-work, and by shutters. Vitruvius said little about windows, only that their height was to be equal to one and a half times their width. We knew, however, from the remains at Pompeii and Herculaneum that doorways, windows, and niches were frequently adorned with pediments both triangular and segmental, and sometimes with pilasters. From the pierced slabs already mentioned the Gothic tracered windows were no doubt evolved. In tracing the genealogy of the features of archi-

ecture, however, it must be borne in mind that the greater number of buildings erected had perished "by time, war, flood, and fire," and that as yet we had but imperfect notices of those that still remained. In conclusion, the lecturer urged his hearers to endeavour to solve modern architectural problems in modern ways, not by slavish adherence to old models. He was not, he said, idiot enough to suppose that some clever fellow could sit down one evening and invent a new style by the next morning; but he thought we had new wants which must require new arrangements. We had new materials which had revolutionised construction,—cement-concrete and iron to wit,—and both those materials had to be studied in order that it might be seen how they could be made available, particularly iron, which had to be rendered fireproof. Suppose, said Mr. Aitchison, you imagine that some sensible person wants you to build him a church, fitted for Protestant worship, and for a certain number of worshippers (when I say "fitted," I do not mean in the shape of a cross with a long central stem, in which the bulk of the congregation can neither see nor hear; nor one surrounded with mortuary chapels); that the founder means it to be filled with stained glass, and to be fit for use (in other words, that it is not to be a greenhouse); that for the structure nothing but iron and cement concrete should be used, so that the church should not be burned down if the seats took fire; and that the building was wanted to be decent-looking inside and out, and not Gothic. With such a programme you would have plenty of opportunity for trying new sorts of windows. As soon as the public begins to think about public edifices, they will want them arranged in the best possible way for the purpose they have to fulfil.

## BALUSTRADES.

MR. AITCHISON'S third and concluding lecture was on "Balustrades," and was delivered on Monday evening last. The lecturer pointed out that the humble office of protection that balustrades fulfilled was by the genius of architects converted into the noble one of providing a new ornamental feature that gave scale, beauty, and finish to buildings, and that parapets and battlements were not distinguishable from balustrades, if the sense in which this word was used in France was allowed here, as French architects spoke of pierced and unpierced balustrades. With the exception of unpierced fence walls to stairs, balustrades were unknown to the Classics, who appear to have used fences of wood or metal when they did not use walls, and this practice appeared to have continued until the Christian architect built the mosque in Egypt for Ahmed Ibn Touloun in A.D. 885, and used pierced battlements. He explained the reason why the Medieval architects substituted perforated slabs in one piece for the open arched balustrades built of small stones, *viz.*, that numerous horizontal joints caused the balustrades to buckle, while the single slab was tongued into the cornice and remained firm. He traced the various forms of piercing used, and adverted to the practice of putting letters, names, or emblems in openwork parapets in the Medieval work, which was continued by the Renaissance architects of France, and he pointed out the great skill used in designing the balustrades of the Francis I. staircase at Blois. He also dwelt on the beauty of the design and execution of the pierced marble slabs forming the balustrades round the altar of Sta. Maria dei Miracoli at Venice, and the persistence there of balustrades formed of small slender shafts, which came down from Medieval times, until the introduction of the single and double-belled balusters, which are now the favorite forms. He suggested that they were probably derived from the turned woodwork of the Saracens. The first illustration of double-belled balusters he had found was in the first illustrated edition of Vitruvius of 1511. The first instance of the use of the word he had found was in Philander's edition of Vitruvius of 1586, where they are called "alustrice" or "alustice," on account of their resemblance to the flower of the wild pomegranate, *Balanasterion*, *Balanistum*. In his remarks on the difficulties involved in the use of balustrades from an æsthetic point of view, as they could not be well less than 3 ft. high, he pointed out how admirably this difficulty had been solved by the architect of Ismael Pasha's fountain at Cairo;

the halustrade of the upper floor was divided into two heights, the lower half filled with panels of lattice work, while the upper half was composed of small arches, which gave scale to the open arches above them, but which would have been dwarfed had the halustrade been in one height. The lecture was illustrated by diagrams, drawings, and pictures, and with a large collection of photographs.

#### WELSH CHURCHES. ARCHITECTURAL ASSOCIATION.

The tenth meeting of this Association for the present session was held on Friday, the 4th inst., Mr. J. A. Gotch (President) in the chair.

Previously to the ordinary meeting a special business meeting was held, when it was unanimously resolved to amend Rule 3 by the insertion of the words, "a periodical publication," after the words, "classes and lectures for the study of specific subjects (Rule 4)."

At the ordinary meeting held subsequently a paper was read by Mr. A. Baker on "Welsh Churches." After some introductory observations, the lecturer said,—

The flourishing independent state of the British church was exhibited when the college of Bangor Isaacod (numbering 2,000) refused to submit to the authority of St. Augustine when he came as the Papal Legate to solicit their assistance in evangelising the Saxons.

The British Church maintained its independence till the year 1175, when it submitted to the Roman Pontiff, who rededicated some of the churches to the saints in the Roman calendar, but the measure was so unpopular that he changed his plan and conciliated the people by canonising the old British worthies, and investing their memory with a halo of legendary miracles. But whatever objections they had to the rites and doctrines of the Romish church they had none to their architects who introduced the Norman style. I have noticed two varieties of plans in the small village churches of this date, the one a parallelogram, the other a nave and a chancel connected with it by a very small arch. In most churches where you now see modern chancel arches I think they have been substituted for these early arches. The disrespect in which the Normans held early British work is shown by instances having been found of their using the old British crosses for building materials, as, for example, the fragment found at Efenechtyd. Of the most beautiful examples of transitional work is the little church at Llanaber, near Barmouth.

Owing to the great destruction of church property which took place during the wars of Henry III.'s reign, the remains of Early English work are scanty. St. Asaph Cathedral was hurried in 1282. This brought about reaction favourable to the church, and in 1284 certain clergy of the diocese of St. Asaph travelled through the country with the famous copy of the gospels belonging to the cathedral for the purpose of obtaining funds for its rebuilding, which was completed in 1296. The very beautiful double lancet choir window discovered during the restoration of the cathedral was most probably created at this period. A general renovation of the churches ensued. I have some good specimens of the Decorative style then prevalent,—the arcade at Gulsfield and windows at Gyffylliog, Meifod, and at Llanrhaidr. Again troublous times followed. When Owen Glendower revolted, great injury was done to the churches. The fifteenth century was an era here as elsewhere of great church activity. In every parish may be seen evidences of work of this date, both in windows and roofs and other structural features, as well as in the screens, seats, and fittings necessary for the sumptuous ritual of the time. The roof-screens were of various types, some having flat roofs while others, as at Conway, are groined. Only a few of these remain, though every village church, however small, contains evidence of their existence in former times.

I was fortunate enough to discover in the restoration of Meliden Church that even the smallest churches were fitted with stalls similar in construction to those used in cathedrals. I have an illustration of a curiously-carved

bench in Rathin Church, which from its size and construction, I imagine it to have been a Llany stool.

One of the most beautiful architectural features of this period was the hammer-beam roof, of which many beautiful examples exist. That of Cilcen, a little village at the foot of Moeel Famma, is especially fine, being remarkable for the great size and elaborate moulding of its timber. A local tradition says that this roof was brought from Basingwerk Abbey, but this may be doubted, as it does not bear any evidence of having been refixed. The paneled chancel-ceilings are very numerous in this district, of which there is a very beautiful example in Llanrhaidr, where all the tracery panels vary, and are of the most elaborate and delicate designs. At this period timber porches with paneled sides and carved large-boards were placed over the entrance doorways; good examples of these are very numerous. The superstitious piety of the period is evidenced by a few remaining churchyard crosses, which were once universal. I exhibit a fine specimen from St. Donat's, Glamorganshire, and an equally beautiful one may be seen at Derwen, in Denbighshire. The existence of such beautiful and elaborate work in a poor mountainous district may be accounted for by the large sums of money offered to relics and the holy wells. A fragment of one of the most profitable of these relics may be seen in the porch of Llandderfel Church, at Bala. This relic was once a horse, made of wood and plated with silver, bearing on its hack St. Derfel, the patron saint of the church. At the Reformation the saint was detached from the horse, brought to London, and burned at St. Paul's Cross. All that now exists is the trunk of this horse, in its present state highly suggestive of a child's dilapidated toy. The streams that abound in these mountainous districts were utilised as holy wells, some having small chapels built over them, as at Llandullo Yarlhos, while others were covered with most gorgeous erections, as at Holywell, where the Countess of Richmond, the mother of Henry VII., built a chapel of unsurpassed beauty; it is well worthy of a pilgrimage of all art devotees.

The outward signs of prosperity in the Church, as exhibited in building, appears to have continued as late as the Reformation, in Henry VIII.'s reign, when it suddenly ceased; and in Edward VI.'s time, when the energies of the Church seem to have been directed rather to education and the revision of the liturgy, little or nothing appears to have been done. I suppose that this was also the case in Queen Mary's reign, as the Church's entire time and exertions were occupied in the restoration of the decorations and ritual abolished during the previous reign. Elizabeth's reign was marked by a general repair of fabrics, but more especially of the roofs, as there are but few churches that do not appear to have been re-roofed at this period. These roofs were notable for a construction unlike any of previous date, the trusses being of unusual depth, and 5 in. in thickness, the timbers in the rafters and purlins very broad and thin, and the purlins strengthened with carved wind-braces, the advantage gained by the use of the broad timbers being to allow for the deep tenons. The covering consists of alternate thick and thin boards. These roofs are well worth a very careful study, as their good preservation testifies to the excellence of their construction. During this reign what is commonly known as Jacobean work was introduced in England, but I have not seen any of it in the Welsh churches which can be attributed to a date as early as this. In Charles I.'s reign a number of small chapels were built, upon many of which great sums of money must have been spent. That at Rüg, near Corwen is the most interesting specimen, and well worth a visit. In the construction of this chapel some of the materials of the decorated parish church of Llanaelhafran were used, the fine hammer-beam roof being altered to fit the chapel, its timbers decorated with a rose pattern, and the date of its re-erection (1637) carved on the tie-beam. In addition to the Jacobean fittings there are now in the church very curious fifteenth-century benches. There is also a west gallery, which is the earliest example I have seen, and a chancel screen without a loft. Within the altar-rails are two canopied seats, remarkably like four-post beds. In Gyffylliog Church there existed a framing which once carried a bell-turret, of which few examples yet remain. This one, as

well as the porch, I regret to say, was destroyed by the present vicar.

In the time of the Commonwealth orders were given for the destruction of images, altars, tables turned altars, emblems, superstitious pictures, monuments and relics of idolatry, and commands were issued for the Communion-table to be placed in the body of the church. In 1643 there were orders for the sale of copes and surplices. In 1644 all images in the open air to be destroyed, and crosses removed from all plate. These orders were carried out except where private influence was sufficiently powerful to prevent them. Many fonts have been preserved for menial offices, as flower-pots and drains. I have found, too, that coal-holes were a favourite receptacle for the condemned ornaments.

In Llangyhalaf Church, in the Vale of Clwyd, I saw some interesting seats in which were illustrated the art of planing. The earlier specimens being very rude attempts to plane on thick timbers; the mouldings and workmanship become more delicate and true as the timbers were decreased in thickness till the standard of 1½ in. was reached.

At the restoration of Charles II. a spirited effort was made to put the churches into a fit state for worship, every church containing examples either of Jacobean seats, pulpits, or fonts. This was followed by the terribly uninteresting Georgian period, the age of plaster and "three-deckers," though I do not think one ought to say much against the three-deckers, as they were a necessity arising from the existence of galleries, which, at this time, assumed enormous proportions.

During the early part of the religious revival which ushered in the century there arose a feeling of the unfitness of the churches for public worship, and, owing to the ignorance of their value, it resulted in a terrible amount of destruction, which was happily, however, checked by the Gothic revival. I believe that if the labours of Pugin and Scott had been estimated at their true value, we should not have heard anything of the Association which, under the specious title of the "Society for the Preservation of Ancient Buildings," has misled so many.

Because many ignorant of Gothic art and church history have been allowed to lay their sacrilegious hands on our ancient monuments, an argument has been put forward that the only safeguard against further destruction is that they should be left entirely alone, and only such repairs effected as may from time to time be absolutely necessary.

Let us see how this will work out in practice. Let a church which is in a radically bad state of repair be tinkered up to suit the views of the society whose theory of preservation Time, which is the great destroyer, will, in the course of another generation, upset, and when in a succeeding generation this subject has faded from public view, and the school of architects trained to conservative restoration has died for want of patrons. What will be the feelings of an architect when he is called to view such a Church as Meliden, near Rhyll, and finding it apparently utterly devoid of all architectural features, the walls and ceilings a waste of plaster and whitewash? Would he not succumb at once to the appeal of the Vicar to "pull down" the ugly old place, and build a pretty new church? And the end of that church would certainly be destruction and not preservation. Now, what a loss to the diocese would this church, containing an unusual number of features of interest, be; for, having had the pleasure of restoring it, I found behind the west gallery some remains of the Early English west window, and the apex stone of the hell gable, of fourteenth-century date, was dug up. On taking down some rotten plastering, the different eras in the building of the church could be clearly seen by a comparison of the various kinds of masonry employed; the coursed masonry denoting the early thirteenth-century work, the work abutting against it being of the fourteenth century. This fourteenth-century work was done to repair the damage caused by the wars of Henry III.'s reign. At the east end there was evidence that it again suffered much injury, and was repaired in the fifteenth century, as all the eastern part of the church is of this date. When the north door was opened out, the old font was found buried in the wall. If this was done when the edict was

\* The object of this alteration is, we believe, to enable the Association to start and carry on a small journal which it is thought may be useful as a means of communication between the officers and members.

made for the destruction of fonts, the ohnrch must have been without a font for forty years, as the present font bears the date 1686. In surveying this church I had to summon up all the faith I possessed in its hidden value, and you see how I was rewarded. If my faith had not been inspired by education and strengthened by experience, I am sure I should have given it up as worthless and have gone in for the "nice new church."

The last piece of experience I have to give you is that relating to the cost of restoration work, which I hope will be accepted as a weapon with which to meet "the nice new church" suggestion.

I have found that the cost of restoring village churches of ordinary type averages from 15s. to 17. per superficial foot of the whole area of the church, the new fittings, if required, being of oak, and the roofs repaired with oak, and re-slatted. Allowing 7 ft. superficial for every member of the congregation, this would make the cost from 57. 5s. to 71. per sitting. A new church could not be built for the former sum, and for the latter it would be a poor skinny affair, with thin walls, poor details, and deal roofs and seats, and to produce a church as substantial and elaborate as the old church restored would cost at least 121. or 151. per sitting, and it would lack the historical interest of the old building.

The Chairman, in opening the discussion, remarked that Mr. Baker's paper was a striking instance of the interest that might be extracted from such a subject by one who had thoroughly studied it. It was also an encouragement to architects not to think too lightly of a church which at first sight appeared to possess little interest for them, because even if there were a scarcity of sketchable work in it the building was pretty sure to be of some historical value. No apology was required in bringing forward the subject of any branch of architecture, and although it did not fall to the lot of every one to restore churches, they had still a little attention to spare for the description of such work. It was impossible to discuss Mr. Baker's paper detail by detail, but there were a few points he would like to refer to. One was that a great deal more blame had been cast upon the Commonwealth than it really deserved. He believed the great era of ecclesiastical destruction was at the time of the Reformation. He would like to ask Mr. Baker what he did with a "three-decker" pulpit when he came across one? Did he regard it as coming within the category of works that ought to be retained or did he abolish it along with the galleries? A great many "three-deckers" were very interesting and beautiful specimens of work, which he (the speaker) would be very sorry to see destroyed. He was pleased to think that in the present day the Gothic appetite was not quite so voracious. Some ten or twenty years ago, if a church possessed a beautiful Jacobean altar, or panel, or anything of the kind, or even a Georgian reredos, as at Kettering Church, it was completely cleared away, and common place Gothic work put in its stead. No doubt this would be in keeping with the church, but it seemed to him that art suffered from the change, and he was therefore glad to think that, at the present time, people were not quite so mad on Gothic, or ready to regard a piece of Jacobean work as unworthy of retention. As Mr. Baker had forcibly pointed out, all these things were of interest in the history of the church, and could not well be spared. The real difficulty was to decide where the history began, whether with the "three-decker" or earlier.

Mr. Leonard Stokes, in proposing a vote of thanks to Mr. Baker, said he could not quite agree with that gentleman's views about church restoration. Mr. Baker had told them how he had restored several churches which seemed almost hopeless, and how after a good deal of trouble he had found out their whole history. But did Mr. Baker consider that, supposing any of his hearers went down to these restored churches, they would be able to find out their history, however much trouble they spent upon them? Had not Mr. Baker rather destroyed some of the history of those churches by restoring them so thoroughly? A few pounds per foot super. was spent over the whole churoh, the result being that though there was an admirable building, the history of it was more or less lost. Indeed, might it not be well in such cases to stipulate with the architect to write a

history of the building, including an account of the restoration. He believed that in restoring a church its value was considerably lessened from an artistic and archaeological point of view, because the restoration was so admirably effected that the difficulty was to tell "of other from which." He was glad to hear the Chairman say a word for the "three-decker," which was undoubtedly a part of history. He agreed with the Society for the Protection of Ancient Buildings in thinking that restoration was much over-done. In dealing with an old church, as much of the old work as possible should be left, and he admired Mr. Baker's spirit in throwing up a job when he had firmly made up his mind as to the nature of the restoration, to which his client would not agree.

Mr. H. W. Pratt said he had studied the church work in South Wales, but his impression of North Wales was that there was very little architecture to sketch. It was, therefore, agreeable to learn from Mr. Baker that there was some interesting work to be found in that part of the Principality. Referring to the long narrow oblong churches, he would like to ask how, in cases where they possessed rood-screens and lofts, without signs of external staircases, access was obtained to the lofts? He would also like to know if any of the village churches still existing in North Wales had a separate chancel, or were built in one plan? Mr. Baker had given reason to show that the roof-work had been executed at a much later date than that of the type of design, but that would seem to show that the Welsh people had been much behind the English people. With regard to the question of restoration, Mr. Baker had shown in the buildings he had dealt with, that although he had acted in a very conservative spirit, he had also acted in a most rational manner. To retain "three-deckers," and leave the history of a church to speak for itself, in restoring, would be impracticable, while in restoration such as Mr. Baker advocated, by the mere fact of using the old materials and fittings, it was possible for the architect to write the history of the church in stone and wood, instead of on paper. He seconded the vote of thanks.

Mr. A. C. Balmer Booth said that Mr. Baker had frequently mentioned oak roofs, but he would like to know if he had found chestnut used anywhere? At one time chestnut and oak were the two timbers used, deal not being obtainable then.

Mr. T. E. Pryce (Hon. Sec.) did not quite agree with Mr. Stokes in his remarks upon restoration, as a church covered with plaster and so on would not easily tell its history. Mr. Baker had shown them that there was a great deal to sketch in Wales. Wrexham Church, in particular, was a very fine edifice, but many of the small village churches were well worth inspection. Wales had also a great deal of half-timber domestic work to show, all along the Border. It was an undoubted fact that a great many of the rood-screens were destroyed in the time of the Commonwealth, and in his own native town of Welshpool the rood-screen, which had a reputation for beauty all over the country-side, was burned by Middleton's soldiers, while similar destruction went on in others. The date assigned by Mr. Baker to the common type of roofs in Wales seemed later than their form and detail here out. Guilsfield, diagrams from which hung upon the walls, possessed a roof of this type, with a rich and beautifully carved wooden ceiling below, evidently an addition at a later period than the erection of the outer roof, itself of much earlier workmanship than the time of Queen Mary. The approach to the rood-screens in some of the small churches was from outside the church altogether. At Llanegryn, near Towyn, this was the case, and access to the loft over its magnificent screen is still obtained in the same way, though a later piece of work now encloses the entrance.

The vote of thanks was then put, and carried by acclamation.

Mr. Baker, in replying, said that he did not wish specialism to be confined to one or two, but that the subject of church restoration should be taken up by the architectural bodies, which might confer their diplomas on students who had distinguished themselves in that course of study. If that were done the clergy would then know where to apply. Under the Commonwealth there was undoubtedly great destruction, and it was well known that the

old plate was destroyed, as new plate had to be afterwards supplied. He could not, however, agree with the Chairman that there was so much damage done in the time of Henry VIII., when art was more respected than during the Commonwealth. The Jacobean work in Wales was, he believed, long behind the time when it was used in England. He had been asked whether the "three-decker" should be left or not. His idea was that matters of church arrangement should be left in a great measure to the clergy who were responsible for the ritual; but, on the other hand, he sometimes found it necessary to use his influence to prevent the clergy from being hampered by ideas of ecclesiastical correctness, for instance, in preventing a pulpit being put on the north, which was supposed to be the correct side, when half the congregation could not see or hear the preacher. It was, therefore, the right of the clergyman to say how he would like his church arranged, and it was the province of the architect to carry out his wishes in such a way as not to destroy the historical interest of the building. Thus, while the clergyman had the right to make the history of the nineteenth century, the architect had the right to preserve the past history to the utmost of his power. Because the architect might be imbued with a taste for Gothic, there was no reason now-a-days that he should be voracious. Sir Gilbert Scott deplored many of the things he did at first, and the older he became the more conservative he got, so that, with more knowledge, he respected work he did not respect in his earlier days. A church restorer should therefore respect all the work he saw in a church; he should not ruthlessly destroy anything because he considered it ugly; and should not alter anything unless there was an absolute necessity for so doing. Every diocese should have a museum where all the old relics found in churches which could not be used should be deposited. Then if every architect, when he restored a church, would only write an account of the edifice, it might be inserted in the archaeological journals, or, better still, if the Institute or the Association took up the matter a sort of record might be established. A question had also been asked about the rood-screens, and he might reply that in the church at Drwenn, for instance, where the rood-screen took up two-thirds of the space, there was a stone staircase slightly projecting in the thickness of the wall. Some of the churches he had referred to possessed a separate chancel. With regard to the use of chestnut, he had found many practical carpenters who had difficulty in detecting it. When new it was easy to detect the difference between chestnut and oak, but that was not the case when the timber was of great age.

#### LECTURES AT CARPENTERS' HALL.

##### ENGLISH CARPENTERS AND FOREIGN COMPETITION.

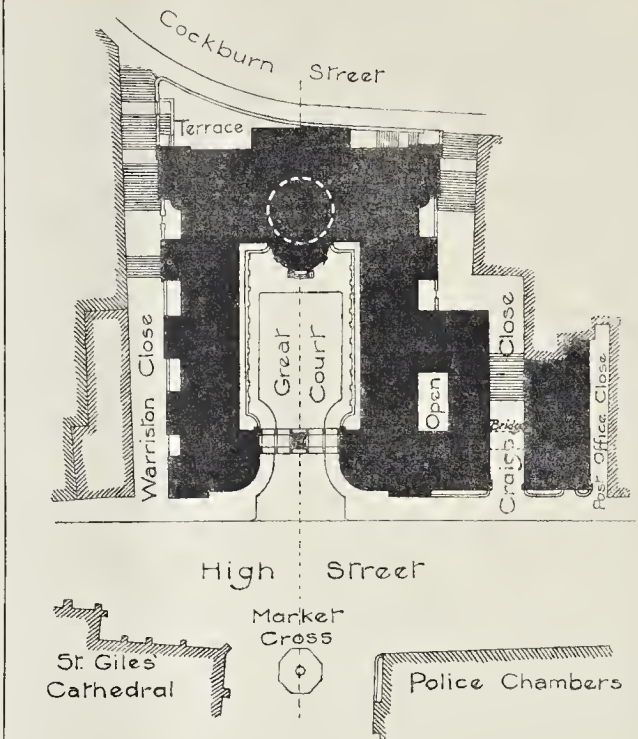

THIS was the subject of the first of this year's course of free lectures to artisans and others connected with the building trades, and it was treated very fully by Mr. Banister Fletcher, who had a large audience, on the 2nd inst.

The lecturer quoted at some length from recent Blue Books on the Depression of Trade, and then read the following pithy and pertinent remarks, which really sum up the whole subject, by Mr. F. Dashwood, Secretary of the Clerks of Works' Association:—

"The importation of foreign joinery, which has been steadily increasing for some years past, must seriously affect the home producers. Take one single article,—doors. For each door imported,—and there are thousands sent into this country every year,—it means the loss of one day's work to an Englishman. I more particularly mention doors, as that was the earliest branch of joinery imported which was extensively used. This extensive use of foreign joinery is little known outside the trade. The purchasers and tenants of houses are rarely able to distinguish the difference between English and foreign, and care but little whether it is the one or the other. The question arises, which is the better of the two? There is, I think, no question as to which is the cheaper, as the great sale of the foreign article to those acute judges of cost,—the speculating builders,—quite disposes of that. Some in the trade might be inclined to think that the 'jerry' builder with his piecework contractor, having boys and young men,—called improvers,—working at a low rate of wages, could do it at least as

cheap as it could be done abroad, and then have to add to the cost of manufacture the ship freightage, the delivery from the docks to the warehouseman or agent, the agent's profit, and then the cartage to the suburban 'villa.' But it is not so, and why? The fault lies in the bad system at present in teaching the young workmen their trade, and the bad supervision,—or no supervision,—as to the quality of the work done. The foreign workman is under a proper system of supervision, is taught to do good work rapidly and to carefully study the working in of the materials with the least waste. There is no loss in capital through keeping the timber for any length of time after it is felled, for in a very short time it is passed through a quick process of artificial drying, and then into the workshop, where the drying process is still kept up, the men working in a very high temperature. The waste on material is comparatively nil, as can be proved by inspecting the panels of the doors, which are often in three and four pieces in their width, carefully glued together. This is so well done that one seldom sees a broken joint, and my reply as to which is the better is, I am sorry to say, the foreign,—that is, in comparison with the article which would be turned out by the mechanics (so called) in the employ of the speculating builder from the wood green from the timber-stack, prepared in a shed adjacent to the 'villa,' with no means of drying either before or after being framed together. I will now state the case of a better-class of joinery (hardwood). Sixteen years ago tenders were invited for fitting up with oak a town-hall in the North of England. Eight or ten firms sent in prices. The highest was that of an English contractor, 11,000*l.*; the lowest that of a Swiss firm, 6,500*l.* The details were full of work of a most elaborate character, carving profusely introduced, the doors, and framing richly moulded, with linen-fold panels, &c. The Englishmen thought it could not be done at such a low price, with all the expense of freightage, &c., the work being prepared on the banks of the Lake of Geneva. It was in due course delivered and fixed. The wood was of excellent quality, dried and prepared in the manner above described, and the workmanship gave every satisfaction. It was turned out with a good finish, but to a practical joiner there was room for fault-finding in the method of framing. This, however, was the only fault. Some three years after it was as good as when first fixed,—this being a sufficient test of its quality. Again, to take another example from the present time. A German firm prepare parquetry for flooring at Altona, near Hamburg, and can successfully compete with English contractors, having recently laid floors at several buildings in the City, viz., the Baltic Sale Rooms, the Scottish Imperial Insurance Company, the Union Bank of Australia, &c. The oak is generally German grown, but sometimes brought from Russia and Austria. The work is very simple. The floors are laid on open-jointed deal floors, the oak being about 2 ft. 6 in. long, 4 in. wide, and 1 in. thick. These pieces are laid in 'herring-bone' courses, grooved and cross-tongued all round, and secret-nailed. The battens are prepared at Latoria, being first thoroughly dried and worked to exact sizes; they are then packed in bundles and sent by ship to London and laid by Swiss and German workmen. These men are very frugal and temperate in their habits. They work much longer hours than the Englishman, working with a will, and take a great pride and interest in all they do. The oak and herring-bone parquetry floor is laid complete and twice waxed for 1*s.* 4*d.* per foot super. Why should not our English joiners do this work? The reasons are not far to seek. 1. There is no superfluous timber to pay carriage for, and no waste, the timber being prepared in most cases very near the spot on which it grew. 2. The workmen live simpler lives, and can therefore afford to work for less wages. Young English mechanics,—more particularly in London,—too much abuse their spare time. They have too little self-culture. If young mechanics would only take to their trades with a will and an interest, spending their spare time in technical schools, avoiding encraving and useless pleasures, the foreigner would soon find his way back to the Continent."

The lecturer then proceeded to quote from the Final Report of the Royal Commission on the Depression of Trade, and he said that in order to enable English workmen to maintain

The Edinburgh Municipal Buildings.—Block Plan of First Premiated Design.

their own it was necessary to strongly insist on greater technical study and application on their part. With regard to employers and manufacturers, he would say that what leeway they had made by some of them having sent abroad inferior articles, whereby the great prestige of the English manufacturer's name had been injured, must be made good by combined and continued efforts of all trades to raise and maintain the standard of British goods to its old goodness, remembering that the old adage "Honesty is the best policy" was as true to-day as when first spoken, and that the Biblical injunction, "Be honest and just in all your dealings," was meant to apply to every-day life.

The second of the present series of lectures was given on Wednesday evening last at Carpenters' Hall, London-wall. The lecturer on this occasion was Professor A. B. W. Kennedy, M.Inst.C.E., who chose as his subject "Girders and Beams," and was listened to by the largest audience that has attended any of these lectures. A report of the lecture will appear in our next.

**Fairfax House, Putney.**—We have received from the sub-committee appointed to take steps for the preservation of Fairfax House a statement which shows that their want of success is not due to any lack of effort on their part, but is solely owing to the owner insisting upon a higher sum for the purchase-money than that at which it was originally understood he would sell it for. In a few days the house will have disappeared. We gave a view of it and some details of the staircase in the *Builder* for Feb. 12 last.

**The "Victoria Terminus," Bombay.**—The Great Indian Peninsular Railway Terminal Buildings, Bombay, erected from the designs and under the supervision of Mr. F. W. Stevens, F.R.I.B.A., A.M.I.C.E., has been named the "Victoria Terminus," in commemoration of H.M. the Queen's Jubilee, held in India on the 16th of February. These extensive buildings were illustrated in the *Builder* a few months ago.

## Illustrations.

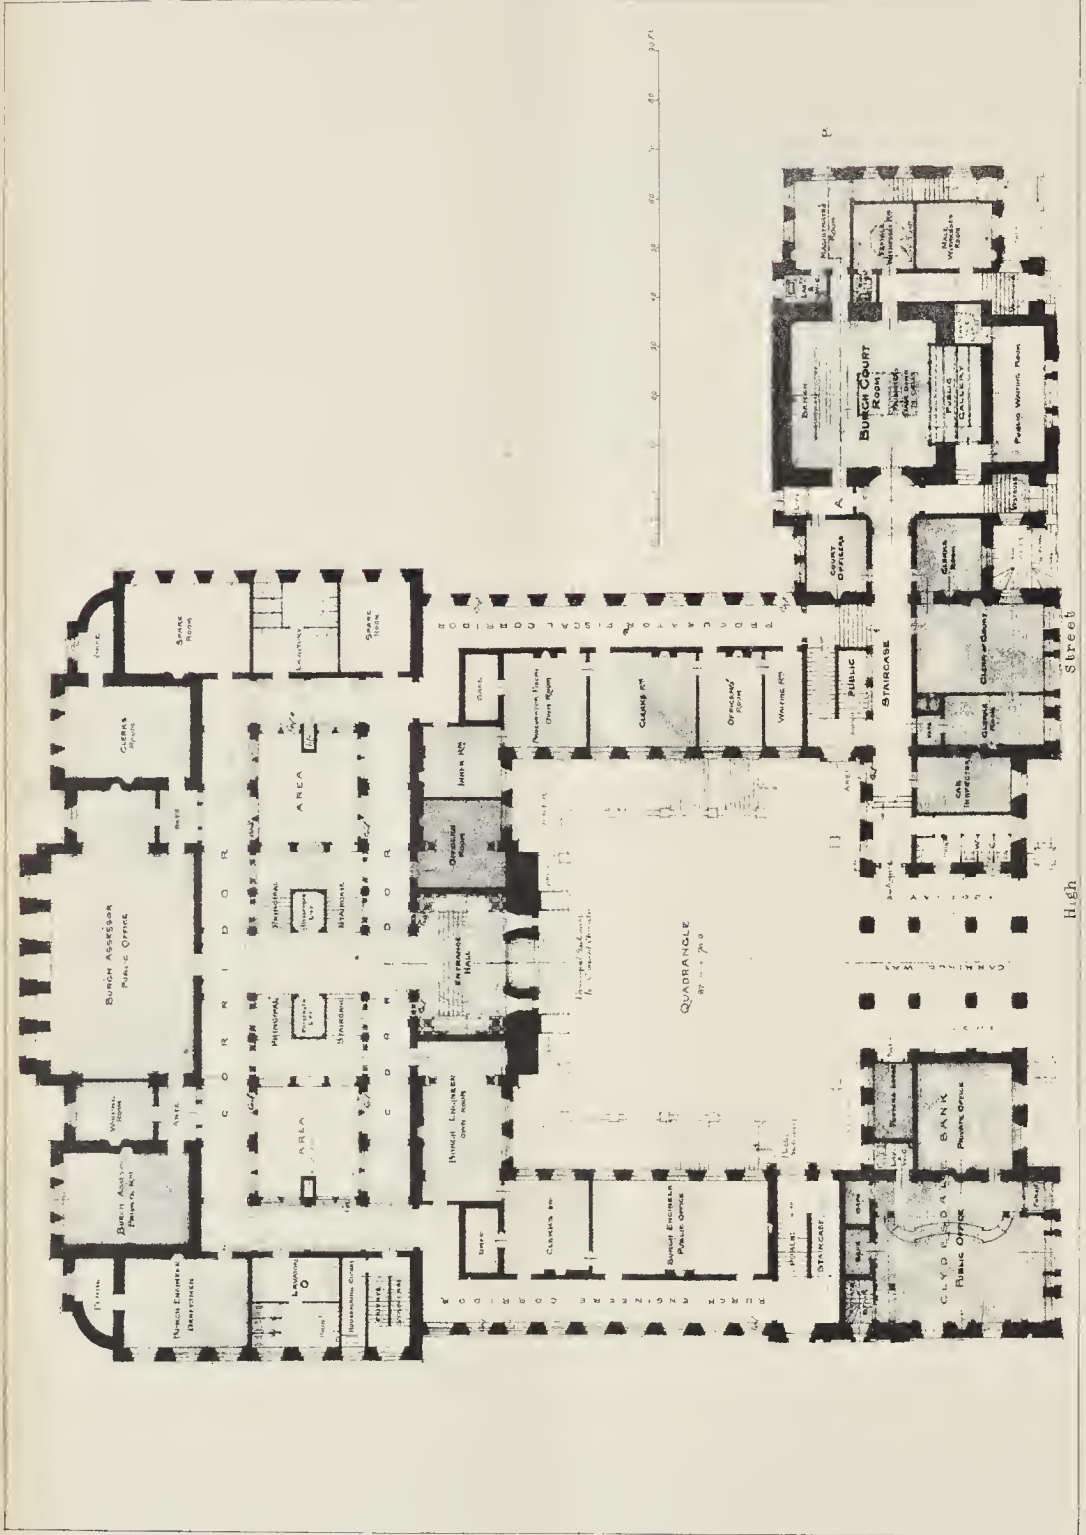

### THE PROPOSED MUNICIPAL BUILDINGS AT EDINBURGH.

THE whole of our illustrations this week are devoted to the premiated designs submitted in the Edinburgh Municipal Buildings competition. Of the design which took the first premium, that by Messrs. Leeming & Leeming, we give the elevation to the High-street, and the elevation to Cockburn-street, as well as plans of the lower ground floor and upper ground floor. Of the second premiated design, submitted by Mr. Malcolm Stark, of Glasgow, we give the elevation to Cockburn-street and the plan at the High-street level; while of the design to which the third premium was awarded, that, namely, by Messrs. J. W. Simpson & E. J. Milner Allen, we also give the elevation to Cockburn-street and the plan at the level of High-street. For further particulars regarding the designs we refer our readers to Mr. Waterhouse's report, which was recently published in our columns (see p. 330, ante) and to our own recent notices of them (see pp. 311, 341). We hope to further illustrate these designs, as well as some of the others, in future numbers.

**The Late Mr. M. E. Hadfield.**—A memorial has been placed in St. Marie's (R.C.) Church, Sheffield, in the north transept, in memory of the late Mr. M. E. Hadfield, architect. It is executed in choice white alabaster, and consists of a canopied niche with the Pietà in high relief, and below, a marble slab, with inscription in raised letters. It has been designed in the style of the fourteenth century, the church itself having been planned by the late Mr. Hadfield and his partner, Mr. Weightman, after careful study of that of Heckington, in Lincolnshire, which they drew and measured early in the Revival, about 1846. Mr. Frank Torry, sculptor, a student of the Lambeth School of Art, now of Sheffield, who has twice gained the National Silver Medal for modelling from the antique, has executed the work, and Mr. C. Hadfield was the architect.

PLAN OF FLOOR AT HIGH STREET LEVEL

placed at every point where there was a change of line or gradient. The sewage was received in tanks and applied to the land by contract with a farmer. In other parts, Bailey Denton's automatic tank, Field's flush tanks, and the spongy iron filter were in operation. The closets and ashpits were dealt with on the pail system, Manchester pattern, in 2,000 out of the 7,500 houses in the district. In the five most populous townships contractors emptied the pails every ten days, freely using carbolic acid, "Sanitas," and other disinfectants supplied by the sanitary authority. Closets with covered cesspools were scavenged quarterly. The lecturer considered the frequent removal of human excreta one of the most important factors in the problem of disease-prevention. He was in favour of the pail-closet, but would prefer a weekly removal. Closets and ashpits should be at a minimum distance of 20 ft. from the dwelling-house. New buildings were erected subject to sanitary by-laws, which at first caused much friction, but were now submitted to almost without a grumble. Up to the end of last year 1,070 new buildings had been passed, the influence for good of the regulations having proved very great. The extra expense involved at the outset was amply compensated to the owner by better work and better value, and to the tenant by increased comfort and health. He counselled his brother inspectors to agitate for the general adoption of building by-laws, so that old errors might for ever be done away with. Questions of overcrowding and of slaughter-houses were also dealt with, and the lecturer said he had taken great interest in the Canal Bats Act, his report on the subject having, he believed, been of much assistance to Mr. George Smith in procuring the passing of the Act. The good done by the efforts of sanitary reformers was well illustrated by comparing the 80 per 1,000 rate of mortality in London in 1855, and the 50 per 1,000 of 1875, with the 24 per 1,000 of 1885. With science still advancing, who would dare to say what the rate would be in 1895?

The paper was exceedingly well received, and the Chairman and the several succeeding speakers highly complimented Mr. Davenport on its quality, a cordial vote of thanks being accorded.

Previously to the reading of the paper, a statement said to have been made at a recent meeting of another society, reflecting upon the character for integrity of sanitary inspectors generally, was mentioned, as a question of privilege. The matter was left in the hands of the Council.

#### THE ROYAL JUBILEE EXHIBITION, MANCHESTER.

THIS Exhibition, which has already been alluded to in our columns, bids fair to be a great success. The primary object of its promoters is to illustrate the art-progress of the British nation during the Victorian era. The Council of the Exhibition very wisely entrusted the collection of examples for the Architectural Court to the Manchester Society of Architects, who have associated with themselves representatives of various architectural societies throughout the kingdom. In response to the advertisements which appeared in the professional papers, and through the action of the above-named societies, we are informed that a very fine collection of architectural drawings of buildings erected during the past fifty years is being got together, and will be hung in a prominent position in the Exhibition. Some attempt will be made at a chronological arrangement of the drawings, and to this end examples have been promised of works by the late Sir Charles Barry, Edward Barry, C. R. Cockerell, Sir M. D. Wyatt, Thos. H. Wyatt, H. Tattersall, G. E. Street, Ed. Walters, Sir B. and S. Smirke, Sir G. G. Scott, and others; while the examples by living architects will comprise contributions from the following gentlemen:—D. Brandon, J. P. Seddon, G. Truefitt, C. Hadfield, Paley and Austin, J. Brooks, A. E. Street, C. Douglas and Scllars, Hansom, Emersou, Champneys, Pugin, Collcutt, Chas. Barry, Sir Horace Jones, Alfd. Waterhouse, T. Worthington, Mills and Murgatroyd, E. Salomans, T. D. Barry and Son, G. Grayson, T. G. Jackson, C. F. Hayward, R. Edis, J. O. Scott, B. E. Ferrey, H. B. Sang, and very many others.

Messrs. Elliott, Edminson, and Olney, of Manchester, have received orders to proceed

at once with the construction and erection of the whole of the steam and other extensive cooking appliances, also the fitting up of the several kitchens, larders, and other offices required for the dining and refreshment departments of the Exhibition.

#### OBITUARY.

Mr. M. Ogle Tarbotton, C.E.—We record with much regret the death of Mr. M. O. Tarbotton, which occurred late on Sunday evening last at his residence, The Park, Nottingham. It appears that for some time past the state of Mr. Tarbotton's health had occasioned considerable anxiety, his illness resulting (according to the *Nottingham Guardian*) from over brain work and nervous prostration. He had been an official of the Corporation nearly twenty-eight years, his appointment as Surveyor being made in 1859, the year in which the Corporation adopted the Local Government Act. Subsequently, as Chief Engineer, Mr. Tarbotton was charged with the responsibility of carrying out many important public works, notably the Industrial Exhibition held in Horse Fair Close (the site of the present University Buildings), and the new Trent Bridge which was constructed from his designs, and the works in connexion with which were carried out under his supervision. Upon the Corporation acquiring the undertakings of the Nottingham Gas Company and the Nottingham Water Company, Mr. Tarbotton relinquished the office of Borough Engineer, in which he was succeeded by Mr. Arthur Brown, and was appointed engineer to the Gas and Water Committees and consulting engineer to the Corporation. He was also engineer to the Sewage Farm Committee. Mr. Tarbotton was frequently called as a witness before Parliamentary Committees, and as a specialist in questions connected with gas, water, and sewage, his advice was much sought. He was a member of the Institution of Civil Engineers, a Fellow of the Geological Society, and a Fellow of the Royal Meteorological Society. It is only quite recently that he read a thoughtful paper at the Parkes Museum on "Engineering and Architecture in Relation to Sanitary Science," the substance of which we printed in the *Builder* for Feb. 12.

#### IMPORTANT CASE UNDER THE METROPOLITAN BUILDING ACT.

BOVILL v. GIBBS AND INBER.

THIS case, which is of considerable importance to builders, came before Mr. Justice Denman and Mr. Justice Mathew, in the Queen's Bench Divisional Court, on the 23rd ult., by way of special case. It appeared that on the 1st of February, 1886, Mr. Bovill, the District Surveyor of St. Pancras, North, summoned Messrs. Gibbs & Inber, builders, at the Highgate Petty Sessions, for erecting a dwelling-house and shop with an insufficient open space in the rear thereof, as provided by the 14th section of the Metropolitan Management and Building Acts Amendment Act, 1852 (45 Vict., cap. 14). On the 1st of April, 1885, the District Surveyor received notice from the builders that they were about to erect in High-street, Highgate, three shops, and they commenced to build one shop early in April, 1885. On the 1st of August, 1885, the District Surveyor gave the builders notice under the Metropolitan Building Act, 1855, that the open space in the rear of one of the proposed buildings was of insufficient area, and not in accordance with sec. 14 of 45 Vict., cap. 14. The builders, prior to the receipt of this notice, had erected and covered in the shop in question. On the hearing of the summons the builders contended that the district surveyor was out of time in taking proceedings, because the six months' limitation during which he should take proceedings ran from the month of April, 1885, when their notice was given, and the building commenced. On behalf of the district surveyor it was contended that the offence was a continuing one, and that even if it were not continuous, the time did not commence to run until forty-eight hours after the 4th of August, the day when the builders received notice from him. The Magistrates, being of opinion that the builders were right in their view of the law, dismissed the summons for not being taken out in time, but consented to state a case for the opinion of the superior court, the question for the opinion of the court being whether the summons was taken out in time.

Mr. Tickell appeared for the appellant, and Mr. Lane for the respondents. Mr. Justice Denman, in giving judgment, said that the offence was making default in complying with the District Surveyor's notice, and not the erection of the building. He therefore allowed the appeal, and remitted this case to the magistrates to convict.

#### QUARRY-WORKED STONE.

SIR,—I trust you will again grant me space in defence of quarry-worked stone.

First, in reply to "G. C. W." [p. 331]. From his remarks it is very evident he has never seen stone whilst being worked at the quarry,—hence he is altogether erroneous in stating the cause of the cheapness of quarry-worked stone "is not far to seek, to a practical man, as a quarry-owner uses fresh-quarried stuff, which is, of course, soft and unseasoned." Allow me to state that the real cause is, the first cost of the material at the quarries is much less than when delivered in London or elsewhere, and the quarry-owner escapes the payment of railway carriage on waste, which is generally a considerable item on rough blocks. He is also satisfied with the profit only upon his worked stone, instead of a profit on block, as a farmer does on the worked stone, although this second profit must be obtained by men working it in other places than the quarry.

Then with reference to his remarks as to "newly-quarried stone being used instead of well-seasoned stone" he is far from correct. In this place, the working of stone was commenced with the sole object of working up a grade or seasoned stone, which was rarely accumulating on account of buyers in London and country, as a whole, refusing *in toto* to purchase anything but the softest and most newly-quarried stone, and it always has been that the vendors of the softest stone (never mind its fitness or otherwise) always had, and have, the greatest demand for their stone.

The curse of the stone trade has been through people away from the quarries using the wrong stone,—choosing that which works the easiest, regardless of its durability, and hence it is we find Beer stone being used for Portland, Dumfries stone for Mansfield stone, and the like, all on account of their being in each instance the softer, and consequently the less durable stone, being much more cheaply worked on the increase. I think if architects and builders only had their stone worked at the quarries, they would insure, at least, having the stone which was specified, and I hesitate not to say the stone used would be that most thoroughly seasoned.

Then, also, another benefit is reaped from the fact that, by doing away with the profit on the raw material and the profits of intermediate men, the right stone (not Beer or Dumfries palmed off, as I declared is done) would be obtained as cheaply as the baser or less suitable stone.

Secondly, in reply to "G. R. J." [p. 331], I think the foregoing facts enough to convince any architect of the utmost necessity of having stone worked at the quarries. And, seeing that such is continually and considerably on the increase, I think we may rightly conclude they are alive to the tricks that have been played them, and that in future we may reckon upon seeing the major portion of the stone worked at the quarries, and our stone buildings in future being better constructed, and much more durable, than those of latter-year construction have been since the introduction of these unworthy practices.

A QUARRY OWNER.

Portland.

SIR,—In the correspondence on "Masons' Wages," I notice "G. C. W." [p. 331, ante] says,— "A quarry-owner uses fresh-quarried stuff, which is, of course, soft and unseasoned. It is obvious that, he it limestone, gritstone, or freestone [sic], it should be well seasoned before being wrought; if it is not so, it cannot be expected to resist the London atmosphere." Allow me to enter my most emphatic protest against the assertion that stone should be seasoned before it be wrought. I have for years past been trying my utmost to dispose of this false but too prevalent opinion. Our old master builders almost invariably took their stone from the quarry nearest to their building, and worked it as soon as quarried, and the result is that it has stood well. For instance, Ancaster stone, not to mention a host of others, is said to stand well in its own locality, but to be unfit for the London atmosphere. Now, the reason it has stood well in the churches and other buildings in its own neighbourhood is simply because it was worked when it was soft and unseasoned. If any one doubts this, let him go to some old church, say of the thirteenth century, where he finds the stone thoroughly "well seasoned," and as sharp as when it left the masons' hand, and let him re-work the face of it, and I care not whether it be in the country or in London, he will assuredly find that in two or three years it will utterly decay. If he prefer a more modern example, let him send for a block of "summer-dried stone," such as we see advertised, and, if he get it, he will find the outer face very hard and non-absorbent, but the interior, when cut, will be found much softer, and will never become so hard as the outside. This is a simple fact well known to every mason. The lesson to be learned is equally simple. If you want to use stone properly, work it as soon after being quarried as possible. Season it *after*, not before, it is wrought; and stone which stands well in its own locality will stand practically equally well in the London atmosphere. Nature has provided a protection, but if we choose to deprive stone of this, she will not repeat the process, and we must suffer for our ignorance.

In three churches I am building in London, the stone has been worked at the quarries by Messrs. Randell & Saunders, of Corsham, and by Mr. Robert Lindley, of Mansfield and Ampeter, and both have admirably carried out the work entrusted to them. The slight defects occasionally caused in transit they have ever been ready to remedy, and I may say the same with regard to Continental firms who are supplying me with marble. Well-seasoned stone may be a treasure to the jerry-builder "running up" houses in mid-winter, but should be carefully avoided by every architect who values his reputation. Stone should be cleaned down as the work proceeds, if at all, and never scraped after long exposure to the air.

HUGH ROUMIE GOUGH.

Regent-street, Feb. 28.

WASTE WATER FOR FLUSHING WATER CLOSETS.

SIR,—My letter on the above subject, which appeared in your issue of the 26th ult. (p. 352, ante), appears to have interested your readers to some considerable extent, as I have received communications from Leeds, Stratford, London, Brighouse, Brighton, Darford (Kent), Slough, and Raabon, soliciting further information. If you will kindly insert the following in your next, you will save me much trouble, and, at the same time, convey the information required.

Several attempts have been made to utilise the waste water from slop-stones, sinks, lavatories, &c., for flushing purposes, but, perhaps, with one exception, they have met with very little, if any, success.

One arrangement which, I believe, is in use in some towns, is to convey the waste water from the sink, &c., direct into the trap of the water-closet, which thus supposes to effectually flush. This arrangement cannot, however, I think, be considered to be successful from a hygienic point of view, as it frequently happens that after a deposit has been made it will have to remain in the trap until sufficient water has been passed down the sink to carry it away, which may easily be some hours; and then the quantity and force may not be sufficient to thoroughly cleanse the trap.

The prevailing idea has, however, been to bring about an automatic flushing of the closet by conveying waste water from the slop-stone into a receptacle or tumbler, constructed in such a manner that, when full, it should discharge its contents direct into, or perhaps a little above, the trap of the water-closet, and immediately afterwards right itself, or, in other words, return to its original position for the reception of subsequent discharge from the sink. This arrangement has not, however, to my personal knowledge, met with approval, on account, I suppose, of the delicacy of adjustment of the apparatus and the accumulation of sediment at the bottom of the tumbler, which together renders it inoperative.

The exception referred to is a recent introduction in this neighbourhood, and the mode of operation may be described as follows:—The waste water is conveyed from the sink, &c., into a tumbler, contained in a chamber or box situated a little above the trap of the closet, and which, when charged, remains so until actuated by a handle and connexion somewhat similar in construction to those of ordinary water-closets. On pulling the handle, the contents of the tumbler, which may be of a capacity of four gallons, more or less, are discharged, with some impetus, into the trap of the closet, which it flushes most effectually. When the tumbler has become charged, the surplus water overflows at the top into the outlet of the chamber or box, and thence through the trap into the drain. It will be observed that this constant flow of, say, 100 gallons of water per day through the closet trap, has a most salutary effect.

With respect to the cost of construction of water-closets on this principle, as compared with those generally in use, I may say there is a saving of 40 per cent.

In addition to the saving in the first cost of erection, it will be interesting to ascertain the amount which may be saved by using waste water in place of town's water. To do this we will assume we have a large town, having, amongst other arrangements 10,000 water-closets, which, we will suppose, serve 50,000 inhabitants, five persons to each closet. Allowing that each person uses the closet twice in every twenty-four hours, and taking two gallons of water for each flush, 200,000 gallons of water per day would be required, or 73,000,000 gallons per year; this quantity at the low rate of 9d. per 1,000 gallons would amount to 2,737,104s.

In addition to these figures we should also take into consideration the reduced expenditure brought about by the reduction of the volume of sewage, which, if treated by the precipitation process, would amount to 300l. per year.

JAS. T. PEARSON.

Doroging Engineer's Office, Burnley.  
\*S\* Our correspondent does not make it apparent how this system of flushing would answer where and when the waste water thrown on the sink or slop-stone is not sufficiently large or constant in volume to keep the "tumbler" always full and ready to discharge. We presume, however, that when the waste water runs short the "tumbler" could be replenished by turning on the draw-off tap over the sink for a moment.

NON-ACCEPTANCE OF LOWEST TENDER.

SIR,—We are the unlucky victims of another instance of the unjust application of the usual clause in bills of quantities:—"The lowest or any tender not necessarily accepted."

The facts are these:—We were invited by the architect, under whom we are constantly doing a large quantity of work to tender for the erection of a saw-mill, &c., for the Improved Wood Block Pavement Company, at East Greenwich, and out of eleven builders we were the lowest by 30l. The Company, notwithstanding the competition was thus by invitation, set aside our tender in favour of the next lowest, that of Mr. Stubbs, their usual excavating and concrete contractor.

The Company's explanation, in reply to our protest and request for remuneration, is that "they were very particular to state in the invitation that the lowest or any tender may not be accepted" (which, however, is incorrect, although on the bill of quantities it was so stated). We think that this case is just such a one where the clause quoted operates unjustly, and therefore ask your kind insertion of this, as we think that the more these cases are made public the less will be the chance of their recurrence.

F. & H. F. HIGGS.

Loughborough Junction, March 3.

BUILDERS' DEPOSITS.

SIR,—Will you kindly allow me, through your valuable paper, to ask the seventeen builders who tendered for residence at Claygate, Surrey, and which you published in your issue of February 5th, if they had returned to them the 10s. deposit for quantities, and if not, why not?

SNEEL & Co.

Maidenhead, March 5.

WALKERN CHURCH, HERTS.

SIR,—When at this church a short time back, I was much grieved to see that the old newel stairs leading up to the bells had given place to a modern set of steps. The old stairway stood inside, under the tower, and was a curious piece of fifteenth-century oak framing. The church was admirably restored about three years ago by Mr. H. H. Gough, and the stairs then were left by him in excellent condition.

S. B. CHITTENDEN.

Stevenage, March 8.

The Student's Column.

FIELD WORK AND INSTRUMENTS.—XI.

Surveying Instruments.

IX.—THE THEODOLITE (continued).

THE telescope, as shown in figs. 3 and 4, is mounted to turn both upon a vertical and a horizontal axis, so that when the theodolite is in perfect adjustment it is not necessary for the objects which are ranged by the instrument to be either in the same vertical or in the same horizontal plane. To the underneath of the bottom horizontal plate or limb of the instrument, marked P, is attached a hollow body-piece, having a solid conical axis working within it, upon which the top horizontal plate or stage, marked O, is fixed. Both of these work concentrically within a jacket, which forms the connecting-piece to the parallel plates, as shown in fig. 3. The upper parallel plate is attached by a screwed end to this jacket, and the lower parallel plate is connected by a half-ball-and-socket-joint, the bearing being maintained by three or four elevating screws, which are marked U and Z. All the wearing surfaces are turned and bored so as to fit accurately, and the concentric pieces are secured by a washer and set screw, which is shown beneath the half-ball-and-socket joint. The parallel plates are held in a relative position to one another, in figs. 3 and 4, by means of a stop-block, within which one of the screws is placed, and the fine thread requisite for minutely adjusting the plates is provided with elongated nuts, which are bushed into the upper plate.

The screws marked U and Z have large milled heads provided for turning them. It must be remembered that in a four-screw combination of parallel plates the centre lines of opposite screws cross one another at right angles in plan. In adjusting the parallel plates, as shown in figs. 3, 4, 13, and 14, two opposite screws are held between the thumb and first finger of each hand, and are turned simultaneously in contrary ways one to the other, so that by moving the corresponding screws U, U, or Z, Z, both round towards the centre of the parallel plates, or both out from the centre of the plates, the upper plate is by this action lowered upon one side and raised upon the other. These screws should always work easily. If one of them

appears hard to turn, it indicates that this screw is being unduly strained, and that it must not be further tightened until the opposite screw has been slightly loosened or slackened.

The delicacy obtained in the process of levelling, by the fineness of the pitch given to the threads of the elevating screws, is further increased in the three-screw arrangement of parallel plates, shown in figs 15 to 18, by the comparative greater distance from the vertical axis of the instrument at which these screws are worked. The parallel plates here form a triach, having three radiating arms or branches, near the outer extremities of which the connecting adjustment screws are placed. The upper plate is about 1/4 in. thick, with a vertical flange carried round its edge, and at the projecting extremities of each arm solid bosses of a suitable depth are cast, which are tapped to receive the threads of the elevating screws. In fig. 16 each screw terminates in a semicircular ball, which rests in a socket upon the lower parallel plate, and is secured by a locking plate, which is clamped by tightening one or more of the three set screws. Thus a uniform motion is obtained without indenting the lower parallel plate on which the screws rest. In a four-screw combination of parallel plates they are, on this account, often made to bear upon small thin pieces of leather, glued to the top of the lower plate, under each screw. In order to avoid heading the central connecting portion when adjusting the parallel plates by means of their elevating screws, a slot shown in the section (fig. 14), and marked "opening" in the plan (fig. 13), has sometimes been introduced into the upper plate. With a four-screw arrangement of parallel plates care must be taken that all four screws bear upon the lower plate or the instrument cannot be expected to work steadily. If one screw be moved more than the other, one of them is apt to be raised off its bearing plate, and the upper portion carrying the limb and stage will then rest upon the three remaining screws and be liable to rock. Hence both hands are necessary to be applied in adjusting the opposite screws, but with a three-screw arrangement of parallel plates the screws may be adjusted with one hand. The disposition to rock is also obviated, as the instrument requires at least three points to rest upon, and the elevating screws form the only attachment when locked between the tripod head and the instrument. In the arrangement of a three screw combination of parallel plates shown in figs 17 and 18, it will be observed that any tendency to vibrate in working the instrument is kept below the locking plate, and that the locking plate, a plan of which is shown in fig. 19, assists to maintain the rigidity of the parallel plate connexion. Fig. 20 illustrates the detail attachment of one of the vertical screws, and fig. 21 shows the washer plate for securing the locking plate in position by means of the clamp screw. To counteract any wearing away that may occur after some time in the screw portion of the projecting arms to the upper plate, a vertical slit is generally made in the end of each arm and a side capstan-headed screw provided to each for clamping the joint.

In order to set up the theodolite, the lower parallel plate is screwed to a tripod head or centering stand, and the parallel plate screws are adjusted at the outset, so as to bring the upper and lower plates parallel to one another. The instrument is then so placed with its vertical axis plumb over a station point, that only a very slight range of obliquity to the parallel plates may be requisite when finally adjusting the hmbles to the centre of their run. Skill in working these screws can only be acquired by practice. They should be hand-tight, but never forced, otherwise their threads will soon be destroyed, and the perfect action of the instrument impaired. On the other hand, slack screws are as prejudicial to the working of the instrument as tight screws are dangerous to the mechanism. Fig. 22 shows a plan of a theodolite mounted upon a tripod stand. In the case of a four-screw combination of parallel plates, the levels marked Q and T are first turned parallel to the diagonal direction of two opposite parallel plate-screws. In the case of a three-screw arrangement of parallel plates, one level is set parallel to the direction of two adjacent parallel plate-screws, and then the other level will be parallel to a line at right angles to the line which joins these two screws,

# THE THEODOLITE

and which passes through the other screw. This will be evident upon comparing the centre lines which cross one another at right angles in figs. 13, 15, and 17. Having done this, the next thing is to set these bubbles approximately in the centre of their run by extending the legs of the tripod marked as No. 1, No. 2, and No. 3 in fig. 22, taking care at the same time so to finally place the instrument that the plumb-bob which is suspended from a hook or chain under the head of the instrument hangs freely exactly over the centre of the fixed station. To effect this it will be found the best plan in practice to consider one leg of the tripod fixed, and while keeping the eye both on the station point and the bubbles, to work with the other two legs, taking hold of one with the left hand and the other with the right hand. Supposing that the leg marked No. 3 has been selected as the fixed one, the bubble marked Q is adjusted to the centre of its run by moving the leg marked No. 1 in the direction indicated by the arrows, and the bubble marked T by the leg marked No. 2. In thus adjusting the legs, care must be taken to lift each leg only just clear of the ground, no more, otherwise the level of the other bubble will be considerably affected thereby. The process must be repeated, first as regards one bubble, by means of its corresponding leg, and then with the other bubble by means of the other leg, until both bubbles appear level. Then, observing that the plumb-bob remains over the station point, press the legs gently but firmly in the ground, and finally adjust the levels Q and T by means of the parallel plate-screws.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

3,123, Locks and Latches. H. Rothery.  
This invention consists chiefly of a combination of latch and bolt, which may be used separately. A tubular extension is arranged at the top of the lock into which a bolt is fitted; this may be drawn forward or backward or may be moved by the mechanism of the lock. It is actuated by a spring and may be fastened in its position either drawn forward or backward by a pin inserted through the door to retain it.  
3,941, Door Knobs and Handles. W. G. Macvite.  
According to this invention, two squares are used in the connexion of the spindle to the knob; the spindle is square, and a brass cap fits on to it. This cap is fastened with a set screw, and when pushed or screwed home fastens the knob and spindle together.  
4,101, Chimney Tops. S. B. Bamford.  
The chimney-top which is the subject of this invention has a clear passage for smoke, and for the sweep's brush. It has also a vane with a rotating jacket so arranged that, in whatever direction the wind is, it produces an upward current of air in the chimney. No cowl is employed, but the jacket has several slits in it, which assist the updraught.

4,331, Roofing and Flushing Tiles. G. H. Couch.  
The object of this invention is to produce a strong and light form of tile so as to more effectually resist the effects of wind and weather than those now employed. This is done by grooving in diagonal lines, and by a groove and tongue, which locks the tiles one with the other.  
4,439, Cowl and Ventilator. J. A. Sharp.  
According to this invention, a double funnel is used,—a trumpet-shaped funnel, designed to be fitted at the small end in a chimney, and surmounted by a second funnel bell-shaped. The form of these prevents the passage of a down-draught, while a free passage is maintained for the updraught.  
14,384, Ventilation, &c. S. S. Robson.  
Below the ventilating opening the chimney is contracted. This will cause a strong current of air to pass through the ventilator, whether the chimney is heated by a fire or not, and there is no danger of smoke coming into the room through the aperture.  
17,016, Windows. C. Flagstad.  
According to this invention, the sashes are hung with hinged pivots and sliding blocks, so that the window-sashes may at will be set open in the middle or to one side of the window-opening. They open and shut with greatest ease, and are free from rattling. The windows can be cleaned from inside, and may be left open at the top without danger to children. Instead of the windows opening in the ordinary manner they project into the room in the form of a *bay*. They have special devices for locking and raising. The invention is of Norwegian origin.

NEW APPLICATIONS FOR PATENTS.  
Feb. 25.—2,912, J. Barber, Slove Grates.—2,913, D. Cowan, Coaking Ranges.—2,923, J. Kershaw, Machines for Coaking Mouldings.—2,957, T. White, Decoration of Tiles, Panels, &c.—2,962, H. Lewis, Hand or Foot Power Saw Benches.  
Feb. 26.—3,035, W. Pierce, Latches.—3,064, D. Graham, Pneumatic Apparatus for Buildings.  
Feb. 28.—3,073, J. Knowles & Sons, Window Sash Fastener.—3,107, H. Hunt, Bath and Lavatory Fixings.  
March 1.—3,115, R. Groot, Fastening Knobs to Spindles.—3,116, W. Clapham, Joiners' Clamps or Cramps.—3,120, E. Taylor, Attaching Door and other Knobs to Spindles.—3,121, T. Cudlipp, Stoves, Ranges, Grates, &c.—3,156, G. Capewell, Nail Extractors.—3,168, Trickett & Noad, Hydraulic Cements, Limes, Mortars, or Coconetes.  
March 2.—3,209, W. Hurdall, Paints for Iron-works, &c.—3,216, W. Wall, Door Bolt and Automatic Indicator.—3,220, H. Wethered, Regulator for Waste Closets.  
March 3.—3,256, G. Jeffery, Roofing Cloth.—3,269, Ellis & Trippitt, Appliance for Preventing Draughts, Dust, and Wet passing through the Bottoms of Doors, &c.

PROVISIONAL SPECIFICATIONS ACCEPTED.  
1,111, J. Colbran, Fireplaces.—1,336, R. Cozeds, Door Handles and Spindles.—1,954, G. Smith, Door Fasteners and Locks.—2,291, Young & Moss, Ventilating Apparatus.—2,423, Sir G. Chubb and Others, Locks and Door Fastenings.—17,130, A. Mack, Artificial Boards, Slabs, Mouldings, &c., for Building Purposes.—268, Oshay and Lamal, Drain-Traps.—440, G. Hempstead—8, Goldhurst-terrace, 91 years, ground-rent 8l. .... 485

By C. & H. WHITE.  
Lambeth—48 to 60 even, Clashmore-street, copyhold ..... 1,250  
111 to 121 odd, Tyers-street, and 2, Miller's lane, copyhold ..... 550  
Kennington—19 to 29, and 37, 39, and 41, White Hart-street, 44 years, ground-rent 20l.; and ground-rents of 6l. 10s., same term; and five policies ..... 1,863  
Peckham—Ground-rents of 24l. a year, reversion in 63 years ..... 600  
Lambeth—4 and 5, Lemon-place, freehold; and 1, 2, 3, 6, 7, and 8, Lemon-place, 60 years, ground-rent 30l. .... 625  
Kennington—29, Prince's-square, 24 years, ground-rent 5l. 12s. 6d. .... 410  
Wandsworth-road—108, 110, and 112, term 22 years, ground-rent 25l. .... 460  
Clapham—16, 20, and 22, Courland-grove, 28 years, ground-rent 11l. 6s. .... 749  
Camberwell-green—10 to 18 even, Brishane-street, 77 years, ground-rent 15l. .... 450

MEETINGS.

SATURDAY, MARCH 12.  
South Kensington Museum.—Mr. Whitworth Wallis on "Pompeian Architecture and Art." 1. 15 to 3 p.m.  
Edinburgh Architectural Association.—Visit to Liberton Tower, Inch House, &c.

MONDAY, MARCH 13.  
Royal Institute of British Architects.—(1) Election of Royal Gold Medalist. (2) Professor Kerr on "Some Observations on the Architects' Functions in Relation to Building Contracts." 8 p.m.  
Society for the Encouragement of Arts, Manufacturers, and Commerce.—Adjourned discussion on Mr. William P. Marshall's paper on "Railway Brakes." 8 p.m.  
Society of Antiquaries of Scotland (Edinburgh).—3 p.m.

TUESDAY, MARCH 15.  
Society of Arts (Applied Art Section).—Mr. Alfred Phillips on "The Application of Gems to the Art of the Goldsmith." 8 p.m.  
Institution of Civil Engineers.—Colonel E. Maitland, R.A., on "The Treatment of Gun-Steel." 8 p.m.  
Statistical Society.—Mr. T. H. Elliott on "The Annual Taxes on Property and Income." 7 45 p.m.  
Birmingham Architectural Association.—Address by the Vice-President, Mr. John Coitton. 7.30 p.m.

WEDNESDAY, MARCH 16.  
Carpenter's Hall, London Wall (Free Lectures to Builders and Artisans).—Mr. Francis Chanters, F.R.I.B.A., on "Joinery." 8 p.m.  
British Archaeological Association.—(1) Dr. Woodhouse on "Memorials in Fulham Churchyard." (2) Rev. S. M. Mayhew on "Roman Sculptures found in London." 8 p.m.  
Civil and Mechanical Engineers' Society.—Mr. Herbert D. Appleton, F.R.I.B.A., on "Rural Sanitary Authorities." 7 p.m.  
Royal Meteorological Society.—Two papers, and Exhibition of Instruments. 7 p.m.  
Society of Arts.—Mr. Percy Fitzgerald on "Machinery and Appliances used on the Stage." 8 p.m.

THURSDAY, MARCH 17.  
Parkes Museum of Hygiene.—Dr. E. F. Willoughby on "George Varrostrapp, Sanitarian and Philanthropist." 8 p.m.  
Society for the Encouragement of the Fine Arts.—Mr. J. W. Bradley on "Women, in the History of Illuminated Books." 8 p.m.  
Edinburgh Architectural Association.—Mr. W. Scott Dalgleish on "Thronetjem Cathedral." 8 p.m.

FRIDAY, MARCH 19.

**Architectural Association.**—Mr. H. Lovegrove on "Architect and Contractor," 7.30.  
**Institution of Civil Engineers (Students' Meeting).**—7.30 p.m.

SATURDAY, MARCH 19.

**Architectural Association.**—Visit to the National Gallery and the Houses of Parliament, 2.30 p.m. (See advertisement.)  
**South Kensington Museum.**—Mr. Whitworth Wallis on "Pompeian Architecture and Art." II. 5.15 p.m.

### Miscellaneous.

**The College of Preceptors.**—We are informed that the New College Building in Bloomsbury-square will be opened by H.R.H. the Prince of Wales and H.R.H. the Princess of Wales, on Thursday, the 31st March.

**Society of Engineers.**—At a meeting of this Society, held on the 7th inst. at the Westminster Town Hall, Professor Henry Robinson, President, in the chair, a paper was read on "Bridge Floors: their Design, Weight, and Cost," by Mr. Edmund Olander, A.M.I.C.E. After showing the importance of the subject, and that it had not hitherto been specifically treated, the author described the various forms of flooring based on cross girder construction, analysed their strengths, and pointed out the variance in weight and cost between different examples. The great weight of some, owing to unnecessary thickness of ballast, and in many instances a too extravagant use of the materials of which the structures were composed, was shown to involve waste of iron in the girders of the bridges to enable them to carry the undue load. The floorings noticed were those of timber alone, of timber on cross girders, and of cross girders with rail-bearers. Passing on to the modern system of trough floors, he analysed the strength and cost of nine different forms, and discussed the important question of the length over which the moving load should be considered to be spread. In connexion with this he gave the details of two tests by dead weight, which had been carried out under his direction, and which demonstrated the strength of the new forms. He showed also that they were more economical as well as more durable than the old systems. The results of all his calculations were collected in a comparative summary, giving numerous details, and the paper was illustrated by a large number of diagrams and drawings.

**Sale of the late Sir John Kell's London Leaseholds.**—On Wednesday Messrs. Fares-brother, Ellis, Clark, & Co. offered for sale, at the Auction Mart, the London leasehold properties of the late Sir John Kell, the eminent builder and contractor, of the well-known firm of Kell & Lucas. The several properties submitted are all situated at the West End, and comprise a mansion in St. James's-square, at the corner of King-street, arranged in suites of residential chambers, held for an unexpired term of fifty-seven years, at a ground-rent of 100*l.* per annum; also five dwelling-houses in Margaret-street, Cavendish-square, on the Portland Estate; a set of stabling in Grosvenor-square; the lease of No. 80, Eaton-square, and improved ground-rents in Eaton-square, amounting to 104*l.* per annum. Sir John Whittaker Ellis, M.P., conducted the sale. The set of stabling at the rear of Grosvenor-square, under-leased for a term of twenty-one years from December, 1881, at a rent of 150*l.* per annum, was sold for 2,525*l.* The leasehold properties in Margaret-street, Cavendish-square, were submitted in six lots. They were described as held from the Duke of Portland for an unexpired term of eighteen years, at an aggregate ground-rent of 135*l.* per annum, and under-leased to capital tenants at rents amounting to 595*l.* per annum. They were sold at prices amounting together to 6,000*l.* The biddings for the mansion in St. James's-square commenced with an offer of 9,000*l.*, and 15,600*l.* having been reached without any further advance the property was withdrawn. The Eaton-square property was submitted in three lots. An improved ground-rent of 48*l.* per annum, on 65, Eaton-square, held for an unexpired term of thirty-seven years, was sold for 730*l.*; and a similar improved ground-rent of 60*l.* per annum on the adjoining house realised 950*l.* The town mansion, No. 80, Eaton-square, adjoining the residence of the Duke of Bedford, held by under-lease from Mr. Cubitt for an unexpired term of thirty-two years, at a ground-rent of 64*l.* per annum, was withdrawn at 10,600*l.*

**Progress of the Preston New Docks and River Works.**—Mr. Walker, the contractor for the new docks and for the improvement of the river Ribble at Preston, now going forward, has about 1,000 hands at work, and very active progress is being made with the undertaking. The works in connexion with the docks are in a very advanced state. The south wall of the 40-acre dock is nearly completed, whilst other portions of the structure are being actively pushed forward. As regards the deepening of the channel of the river to a depth of from 26 ft. to 30 ft., this section of the undertaking is being proceeded with. The plans involve the deepening of the channel to the extent of twelve miles in length, in the direction of the Irish Sea, and this is being carried out by powerful dredgers. Upwards of 1,000 cubic yards of material are removed by the dredgers weekly. The material consists chiefly of clay and boulder stones, some of the latter being of great size. It is stated that a few weeks ago one of these boulders, weighing three tons, was taken from the bed of the river and placed on the deck of the dredger. In anticipation of the completion and opening of the docks some of the great railway companies are taking steps for securing communication with them for the coal and other traffic. The London and North-Western Company have already a branch railway from their line at Preston to the Ribble, and a staff of surveyors in the employ of the Company has lately been busily engaged in preparing surveys and plans of intended new lines connecting with the docks, and that considerable extensions are about to be carried out by the railway company in order to provide facilities for the shipping traffic from the docks. The Manchester, Sheffield, and Lincolnshire Company are also taking similar steps for connecting their system with the docks by means of their Wigan and Preston Junction Railway, which is about to be commenced.

**British Archaeological Association.**—At the meeting of this Association on the 3rd inst. Mr. Thos. Morgan, F.S.A., in the chair, the Rev. S. M. Mayhew exhibited a variety of antiquities recently found in various parts of the City, the most remarkable being a sculptured bust, in marble, of a young Roman lady, found at Walbrook. The material is marble, and the features are of great beauty. Some burnt Samian ware was found at the same time, while at a lower level and at no great distance a flint instrument was discovered, one of the few prehistoric relics which have been met with in London. Mr. Cecil Brent, F.S.A., exhibited some curious Merovingian bronze personal ornaments, similar in general character to some of early Saxon date found in England. Mr. Round exhibited a unique impression of the seal of Warwick, the King Maker, which, with the warrant to which it is attached, the latter bearing Warwick's autograph, was recently found in a loft over a stable, at the seat of a relative of Mr. Round's, in Essex. Mr. Earle Way produced some Roman pottery found in Southwark, and Mr. Loftus Brock, F.S.A., described a very early vase found at Cyprus. The first paper was on the Roman Villa, at Yatton, Somerset, by the Chairman. The villa stood on very low-lying ground below the level of the present bed of the River Yeal, only about 50 ft. distant. The rooms which have been excavated have curious relation to two parallel walls which have been traced up to the modern river bank. There are two pavements of very elegant designs, much injured, one of which has a floriated cross in the centre. The second paper was by Mons. Rössler, on recent discoveries at Fécamp. Several discoveries of Roman pottery have been made, many of the objects being of great beauty. The tomb of a young Roman lady has also been found, the date being about A.D. 400. The epitaph of William, third Abbot of Fécamp, was described. It is a curious example of the use of Roman numerals, the date being 1107. The paper was read in English by the author. The Rev. Dr. Hoopell described a curious Roman balance, in perfect condition, of bronze, which has recently been found at Catterick, Yorkshire.

**New Malden Sewerage.**—The Local Board of New Malden have decided to carry out a scheme of sewerage designed by Mr. Lockwood Howard, C.E., and have accepted the tender of Messrs. B. Cooke & Co., of Battersea, the contract amount being about 13,000*l.*, subject to the sanction of the Local Government Board being obtained.

**Sale of Brickfields and Building Land near Tilbury.**—On the 4th inst. Messrs. Baker & Sons offered for sale, at the Auction Mart, a freehold property at Corringham, near Tilbury, covering an area of 136 acres, and comprising the "Tilbury Brickfields," occupying nearly 55 acres, and the Brickhouse Farm, 81 acres in extent. The property was offered in two lots, the first lot submitted being the Tilbury Brickfields. It was stated that brick earth and sand of the best quality abounded on the estate. Included in the sale were the workshops and several other buildings incidental to the working of a brickfield. The auctioneer stated that the land had, until recently, been in the occupation of the Tilbury Brickfields Company, and that having in view the proximity of the estate to the Tilbury Docks, and the extensive building operations which were taking place in the neighbourhood, a company would always find a ready sale for bricks and tiles manufactured by them. The conditions provided that certain carpenters' shops and moulding sheds, also a quantity of machinery and other plant, would have to be taken by the purchaser at a valuation. The biddings commenced at 2,000*l.*, and the property was ultimately sold for 3,625*l.* The Brick Hoase Farm, of 81 acres, was next submitted. It was sold for 2,500*l.*, the total proceeds of the estate, including the brickfields, being 6,125*l.*

**Cemetery Chapel, Edmonton.**—The new cemetery chapel, in connexion with the Church of England in the Edmonton Cemetery, was consecrated on Monday, the 21st ultimo, by the Bishop of Bedford. The Nonconformist chapel is connected with it by a gateway surmounted by a wooden fêche. The style generally is fifteenth-century Gothic. The walls are of brick faced with Kentish rag, the dressings of Smisdon's Monk's Park stone. The windows are throughout of lead quarry glazing, by Mr. W. Ramsey, of Farringdon-street, E.C. The hot-air stoves were supplied by Messrs. W. Poore & Co., of Cheapside. In a detached building, water-closets, &c., are provided, also mortuary and tool-house. Mr. W. Hickinbotham was the contractor, and Mr. T. Peto Ward clerk of the works. The cemetery was provided by the Edmonton Local Board.

**Monument to the late Dean of Chester.** A brass in memory of the late Dean Howson has been fixed to the wall of the north aisle of the choir of Chester Cathedral. The brass is contained in a sunken panel of Runcorn stone with carved Early English border, and bears the following inscription:—"To the memory of John Saul Howson, D.D., late scholar of Trinity College, Cambridge, and from 1867 to 1885 Dean of this Cathedral Church, which, mainly by his devoted efforts, was during those years recovered from decay to a state of beauty and fitness for the worship of God and for the ministry of the Word. Ob. Dec. 15, 1885. 'Crux est potestas Dei.'" The design is by Mr. Blomfield, of London.—*Times.*

**The East Sussex and West Hants Infirmary, Chichester.** was re-opened on Tuesday, after having been closed in sections for three months, during the renewal and re-modelling of the sanitary arrangements and drainage of the building, at a cost of about 1,000*l.* The work has been designed and carried out by Mr. Mark H. Judge, A.R.I.B.A., and on Tuesday Mr. Judge went through the whole of the work with the committee and governors of the institution, explaining in detail the arrangements, including a new system of sub-irrigation drains which has been substituted for the cesspools, which had hitherto existed. Several members of the staff were also present, and all expressed their satisfaction at the great improvements that had been effected.

**Pompeii, Pompeian Architecture and Art.**—The Department of Science and Art announce that three lectures on this subject will be delivered by Mr. Whitworth Wallis, F.R.G.S., in the Lecture Theatre of the South Kensington Museum on Saturday afternoons, the 12th, 19th, and 26th of March, at 5.15 o'clock. Each lecture will be illustrated by plans and views shown by the oxy-hydrogen light.

**The Prudential Assurance Company.**—The summary of the thirty-eighth annual report of this company, which appears in our advertisement columns, contains figures which testify to the remarkable development of its business, particularly in what is known as the "Industrial Branch."

### The Building Trades in Morocco.

THE Moors resist the encroachments of civilisation by all the means in their power. They feel they cannot compete against the energy and the scientific knowledge of the European.

But, in spite of the diplomacy arrayed against them, Europeans daily obtain a firmer footing in Morocco. The incalculable wealth of this country, lying within six days' sail of England and three to four days from Marseilles, would long since have been brought into the world's markets but for the exceptional political difficulties that stand in the way. It must be borne in mind that the coast line extending from Cape Spartel to Ceuta is as important for the maintenance of British communications with the East as the neutrality of the Suez Canal.

From Tangier to Tarifa the Straits of Gibraltar are only fourteen miles in width. Any great Power in possession of the coast line on either side of Tangier, and acting in consort with the Spaniards on the opposite shore, could effectually block the Straits of Gibraltar. Access to the Mediterranean thus rendered impossible, the Suez Canal becomes useless. With modern artillery the heights of Algeciras dominate the bay and harbour of Gibraltar, and there is not the slightest doubt but that to make our position secure, from a military point of view, England must also hold Tangier. But England is not at all anxious to burden herself with more colonies, particularly as, in this case, both Spain and France, and, perhaps Italy also, consider they have a prior claim. The policy of England has, therefore, consisted in using every effort to keep other nations out of Morocco. So long as Tangier is held by the Moors, who possess neither fleet nor artillery, there will be no difficulty in passing through the Straits of Gibraltar.

Such is the political situation, and its bearing on commercial interests is absolutely paramount. The Moors have been quick to profit by it, and, in skilfully playing off the jealousies of one nation against the other, have managed to exclude one and all. Hence the valuable deposits of copper, lead, antimony, iron, and coal remain untouched in the rich soil of the Empire of Morocco. Vast tracts of fertile land are still uncultivated. Plentiful harvests of corn are at times allowed to rot on the ground because there are no roads, and it is not worth while to bring the grain down to the coast for foreign exportation. On the other hand, if we

picture to ourselves what will happen the day the barriers raised by Moorish exclusivism fall to the ground, any one who has a knowledge of the country will at once appreciate the far-reaching possibilities of such an event. In the meanwhile the gradual pressure of each legation, seeking to forward the interests of those traders and others in Morocco who belong to its nationality, has hrought about some improvements. Prohibitory tariffs and the refusal of the Moorish authorities to grant any concessions for the working of mines, &c., have not prevented the steady increase of the European population in Morocco. In spite of all, there is a considerable trade, and of all forms of human endeavour it is, perhaps, in the building trade that the greatest activity has been displayed.

To the architect and the builder Morocco is a country of peculiar interest, while it is a veritable paradise to the artist. From all parts of the world painters come to study in a land where every house, every corner, every street, every group of people, is a picture in itself. Even Venice does not provide a better school for painting from life and nature. Then, when we remember the great triumphs of the Moors in Spain, it is only natural that the home from whence they invaded and half conquered Europe should attract and interest all thoughtful students of history, art, and architecture. Unfortunately, the Moor of today serves principally to illustrate how great may be the fall of a powerful nation. But little remains of his former prowess in science, arts, and manufacture. The Moor seems, on the contrary, to have relapsed into the barbarism from which he emerged during the tenth century. For the moment, therefore, we will leave the Moor and the ruins of his former greatness, and deal only with the condition of the building trade in Morocco.

So far as the interior is concerned, little or no alteration has taken place. Practically speaking, there are no European inhabitants, and the Moors build as they have built from time immemorial. Some of the most recent constructions at Fez, Mequinez, and elsewhere, are equal in their artistic beauty to anything done within the last century or two. There are still artists who seek to perpetuate the great traditions; and, even at Tangier, the new gateway of the Marina elicited the admiration of every visitor. It is in the towns along the coast, however, and especially at Tangier, that innovations have been made. The European colony has brought over its workmen and its methods of building, and thus a great change, but not always a progress, has been achieved. Many have sought, and wisely, to combine Moorish style with some European improvements. But those who have,

on the contrary, constructed houses resembling in every respect European dwellings, have, in some measure, not only spoiled the picturesque aspect of the sites they occupy; they have also built houses that are not suited to the climate. At Tangier, it is true, the climate is so temperate that this error is not a grave consideration; but lower down the coast, and in the interior, the consequences would be severely felt. Tangier is swept by fresh breezes from the Mediterranean on one side, and from the Atlantic on the other, while the hot winds from the south are cooled in passing over the eternal snows of the Atlas Mountains. Thus this most favoured spot is destined to become, at no distant date, a favourite health resort for all who seek to avoid Northern winters. Already a great number of people go there exclusively for their health, and the benefit they derive from the climate is likely to induce many others to follow their example. Consequently, new and better houses will be required every year, and already a great change may be noted in the beautiful environments of Tangier.

As a special privilege, Europeans have been allowed to purchase land in the neighbourhood of the town. At first, however, they found it no easy matter to build houses such as they cared to inhabit. The material required had to be brought from considerable distances; and, in the absence of competition, very high prices were charged. Now, however, the building trades are better organised, and the cost for material has fallen within the last three years something like thirty per cent. This one fact alone shows how great and sudden is the development of Tangier as a residential town for Europeans. The fall in prices, of course, is the result of efforts in various directions, but Swedish enterprise has, perhaps, taken the lead in this evolution. There is now in Tangier a large assortment of ready-made doors, windows, &c., imported direct from Sweden. Dealers find it cheaper and less trouble to buy this ready-made joinery than to employ Moorish and Jewish carpenters. Thus the latter are thrown out of employment, though the consumer does not benefit to the full by the change. It is the middle-man who, for the present, pockets the lion's share of the economy realised. The general all-round price for each opening, whether door or window, is eight dollars, or 17. 12s.

The iron used for building is, for the most part, imported from Belgium, and costs about 12s. the 100 kilogrammes. The stones are cut out in a very primitive manner from a mountain some two miles distant, and brought to town on the backs of small donkeys. These stones are very irregular in shape, of a greyish colour, and somewhat hard, considering that

they are composed of a mixture of sand and chalk. The charge for the stones delivered in town is four shillings the cubic metre. If a line could be laid down, trucks substituted for the Barbary donkeys, and if blasting powder were used instead of merely cutting the stones out, the cost would, of course, be very greatly reduced. The marble employed is generally imported from Italy, and can be obtained for the same price as in Spain. But the tiles or *carroaux* of Marseilles are in much greater demand for flooring. These are brought over by the Transatlantic and Pacquet line of steamers, and occasionally by a sailing vessel. Bricks also come from France, and are sold at the rate of six dollars the thousand.

There are some very excellent woods in Morocco used for cabinet-making and for building. The best is the Arar (*Callitris quadrivalvis*), a finely-grained, somewhat fragrant, and heavy wood. It can resist the action of water, but has many knots, and is therefore somewhat difficult to work. Vast forests of this wood exist in the neighbourhood of Mogador. From the inaccessible Reef country another sort of wood is obtained, sometimes called Latis, but more generally known as the reef wood. It is hard, and gives off a fragrant and strong odour. Evidently it possesses considerable antiseptic properties, for vermin will not settle upon it. Unfortunately this wood cannot be obtained for joists or rafters of more than about 9 ft. in length, and this accounts for the long narrow shape of so many rooms in Tangier. The climate, combined with the uncleanly habits of many of the inhabitants, facilitates the growth of vermin and explains the popularity of this wood. To the same reason may be ascribed the total absence of wall-paper in Tangier. Whitewash, plain or mixed with glue, is universally used, and it has certainly the advantage of not harbouring insects. In spite of the special qualities which distinguish the native woods, the importations from Sweden are beating them out of the market. A most enterprising firm, Messrs. Sundt, Toussaint, & Co., of Stockholm, have chartered a special steamer to visit all the ports of Morocco. At Tangier they have opened a large *dépôt*, where everything required for building is to be found. Formerly, when Swedish pine had to be bought from the Gibraltar merchants, the average price was 14 dollars for 168 feet run of deals measuring 3 in. by 9 in. Now that these deals come direct to Tangier from Sweden the price has fallen to 12 dollars, or 2l. 8s. Not content with this, Messrs. Sundt & Toussaint are about to open steam saw-mills near Tangier, and also propose to manufacture bricks in the neighbourhood. They further intend to import ready-made wooden houses from Sweden, which can be taken to pieces and put up again wherever convenient.

The supply of labour is plentiful. Good carpenters receive from 3s. 3d. to 4s. a day. They are Spaniards, Moors, and Jews. With the exception of two very clever but somewhat expensive carpenters, the Spanish are the worst workers, and the Jews the best. The Moors do not know their trade thoroughly, but are a little cheaper, and suffice for ordinary work. Thus may now be found at Tangier all that is necessary for building, with one all-important exception, there is no architect. Certainly the work to be done at present would be but a small inducement for an architect to establish himself in the town; but enough has been said to show that his business might grow in time, and any one with a delicate chest, sentenced by his medical advisers to winter abroad, might combine a little business with healthy relaxation in such a place as Tangier. Actually, a person who desires to build must make his own plan, and, even then, it is of little use. The Moorish mason looks to a piece of wood and a string rather than to a design, to tell him where he must lay his stones, and most of the planning is done on the ground itself. The result is sometimes peculiar, but tradition and custom help where knowledge and system are failing, and it is only the advent of an increasing European colony that will render the presence of an architect necessary. Perhaps some enter-

prising member of the profession may think it worth while to take time by the forelock and secure a good footing in Tangier before political and commercial progress have finally beaten down existing barriers, and completely thrown open the country.

#### REPORT ON THE PATENT OFFICE.

THE Departmental Committee who were appointed more than twelve months ago to inquire into the duties, organisation, and arrangements of the Patent Office have just presented their Report to the Board of Trade. Having practically confined themselves to the system which now obtains of examining the specifications lodged by would-be patentees, they are unanimously of opinion that certain clauses *ad hoc* of the Act of 1883 should be repealed. The statutory provisions in question had been inserted in the Bill when it was in Committee, at the instance of certain Members who claimed to represent the interests of inventors. They demanded that if an application has been made, but before a patent has been sealed, another application is made bearing the same or a similar title, the examiner should report to the Comptroller whether the specification appears to him to comprise the same invention as the earliest (*sic*) application. If the report be in the affirmative, the Comptroller is bound to advise the applicants accordingly. The amount of scrutiny and correspondence hereby involved may be estimated from the fact that on an average 16,000 applications are deposited yearly, as compared with the 6,000 under the former Act, and when, as the Comptroller says, a man might lodge the same patent twenty times a day and all would be taken without question. It appears, moreover, that these 16,000 specifications are dealt with in their provisional and completed forms at a rate of about fifteen a week to each examiner.

The Committee are agreed in concluding that this course of examination by search and comparison has not only failed of its purpose, but "has been rather mischievous than otherwise. Complaints have been made on the one side that notices are frequently given under the Act when the applications are not really for identical inventions, and on the other that the office has frequently omitted to give notice when the inventions were in fact identical. . . . The failure has resulted in truth from difficulties inherent in the very nature of the case." They are further of opinion that the revision of the assistant examiners' work by the principals is carried to an extent which "is greater than the necessities of the case require, and that there is in this respect room for economy in the working of the office." The ten or twelve officials thus set free should be transferred to the Indexing and Abridging Department, a branch whose duties are of admittedly the utmost value and utility, but which has fallen considerably into arrears. Here, indeed, we might profit in emulating the conditions that prevail in America.

In introducing the existing Act of 1883, the Government took considerable *kudos* to themselves for the regard and encouragement which they meant to extend to the not infrequently inappreciative inventor. But, in effect, the reduction of fees is, we do not say altogether illusory, yet less in substance than appearance. The applicants' payments go to support a very costly course of procedure, for which the Legislature must take responsibility; *in Vos vobis, Georges Dandin!* Nevertheless, the system is one for which the general public are not, and as matters at present stand could hardly be, very grateful. According to an estimate cited by the Deputy-Comptroller in his evidence, the cost of examining 14,000 provisional specifications is about 5,500l. a year. Now of these one half are in practice abandoned. "Of the whole 14,000, in 22 per cent. there is some question raised. In about 13 per cent. questions are raised with regard to fair description, which is a point that requires skilled men to determine." He goes on to say that an initial fee of 10s., instead of 20s., would cover the whole office expenses in dealing with provisional specifications.

The authorities at the Patent Office are confessedly in favour of the making of applications in all cases, and they are actually preferred in three cases out of four, through the medium of a "patent agent." It is impossible not to see that there is one unfortunate individual of whom everybody, all round, fights shy. We mean the economical, or, as it more often happens, the poor inventor. Patent agents, of course, are loudly wroth against his shifts and incapacities. At the Office the bad specifications are laid to his charge; and, *teste* the Comptroller, "it is clear that nine times out of ten, it is impossible for the poor inventor to draw up his own specification in English." So this is undertaken for him, much to the agents' complaint. Mr. Inury, President of the Institute of Patent Agents, tells an amusing story which goes to illustrate that in this direction even an official, albeit highly trained in scientific acquirements, may have something yet to learn. But since, as would appear, the two chief officers of the examining branch are largely occupied in receiving members of the public, we can only hope that an equitable share of their time so employed is bestowed less in controversial matters than in aiding those who need advice or guidance. Whilst some witnesses pressed for the proposed monopoly, the Committee do not recommend that a register of duly accredited or qualified agents be set up for the expressed purpose of binding the Patent Office to deal only either with the inventor himself or with an agent whose name is inscribed on the roll. At the same time they suggest that advantage would be found to lie in determining a standard of qualification for the title and practice of patent agent. They advocate the establishment of such a roll for general purposes, admission thereupon being made both possible and easy for all persons properly qualified, with an enactment for penalising any one who, not being on the register, shall outwardly assume the style or diploma of patent agent. The serious losses occasionally suffered on the part of inventors at the hands of negligent or unscrupulous agents might probably by some such scheme be reduced to a minimum. Amongst the witnesses called before the Committee were Professor Sir William Thomson, F.R.S.; Admiral Selwyn, Vice-President of the Inventors' Institute; Mr. Arthur Paget, on behalf of the Institution of Mechanical Engineers; Mr. S. J. Mackie; and Mr. H. Trueman Wood, Secretary to the Society of Arts.

#### NOTES.

THE Railway and Canal Traffic Bill was read a second time in the House of Lords on Monday, after a judicial and critical discussion on its main provisions. Lord Stanley of Preston spoke in a somewhat apologetic strain with regard to some of the clauses which have provoked criticism, regretting, for instance, the removal of the present Chief Commissioner (Sir F. Peel), which is a necessary effect of the provision requiring that that post be held by one possessing high legal qualifications. He also acknowledged that the measure entailed great responsibilities upon the Board of Trade, for which he had no special liking; but maintained that he had made a virtue of necessity, as the work must be done by some one. Lord Ebury, speaking for the railway companies, considered that the complaints against them would dwindle down to nothing if referred to a Select Committee, and that it was unreasonable that they should be interfered with in the management of their own concerns to the extent proposed. His arguments proceeded, however, upon assumptions as to unfair uses being made of the provisions of the Act which are most unlikely to be justified. "If, by arbitrary interference with the managers of the railway companies," urged his lordship, "the Board of Trade strove to reduce the rates below a remunerative point, he feared, in spite of what had been said, that they would come very near to confiscation. If they impeded commerce, or put shackles upon industrial enterprise, they struck a blow at that freedom

of action which was the life and soul of commercial success." The Act being essentially intended to promote industrial undertakings and commerce generally,—an end no one would dream of attaining by ruining the railways,—it is very certain that there is not much foundation for Lord Brabourne's apprehensions. Lord Bramwell spoke in a resigned sort of tone, deprecating the Bill as an unjustifiable attack upon the railway companies; and, although absolving its promoter from any intention of plundering, evidently looks upon it as belonging to a class of impending measures of a confiscatory nature. Other speakers dwelt upon the consumers' interest in the proposed legislation, and Lord Stanley stated that he has endeavoured to keep in mind that, in the matter of preferential rates, the rights of this class are the paramount consideration; thus, apparently, putting both the companies and the traders into the background, and looking at the interests of the community at large.

WE have received a copy of the memorial in favour of the exhibition of the Liverpool Cathedral designs in London, with the list of signatures appended to it. This includes some good and well-known names, but a very large proportion also of names unknown to fame. Those who are apparently considered the great guns are printed first, and the rank-and-file follow alphabetically,—a piece of rather questionable taste. We observe that the preamble commences, "We, the undersigned, as architects, venture to request," &c., but among the first column of names we find Mr. Alma Tadema, Mr. Arncliffe, Mr. Calder Marshall, Mr. Holiday, and others, who are certainly not "architects." As we have before said, we should be very glad to see the plans exhibited in London; but, inasmuch as the obvious object of those who have promoted the memorial (we do not say of all those who have signed it) is to upset the assessor's award, we have no sympathy with the motive of it, nor with the spirit in which it has been carried out.

THE supplementary Charter asked for by the Royal Institute of British Architects has been granted, the disingenuous opposition got up against it by a clique of persons who had their own purposes to serve having probably produced no effect whatever, except to bring out a number of special petitions in favour of the Institute from the leading provincial architectural societies. We may have further comment to make on the subject.

WE are glad to hear that the vacant Professorship of Architecture at the Royal Academy is at last filled up by the appointment of Mr. George Aitchison, A.R.A., to that responsible position. As is well known, Mr. Aitchison combines practical and artistic knowledge in a degree which renders him peculiarly fitted for such a position in connexion with the Royal Academy.

IN terms of an Act passed two years ago, the London and South-Western Railway Company are about to construct the suburban line which they took over from its original promoters,—the Wimbledon and West Metropolitan Company. The new line will connect the South-Western Company's main line station at Wimbledon and the Putney Bridge Station, in Fulham parish, of the Metropolitan District Railway. Starting from a junction on their Tooting and Hayden's-lane loop line, it will pass by Garratt and Earlsfield to a station in Wimbledon Park, and thence to Southfields,—thus serving the large population which of late years has settled southwards of Wandsworth. From Southfields Station the railway will be carried across their Richmond, Staines, and Windsor branch, and proceed in a north-westerly direction to Putney. Here is to be built an iron bridge, of five arches, across the Thames, thus effecting a junction with the District Railway's present terminus by the bridge-foot on the river's left bank. To provide for the anticipated great increase of traffic, it is proposed to make an extensive enlargement of the District junction station at South Kensington. The route we indicate should

furnish a useful and fairly direct means of communication between those portions of western London that are separated by the river, as avoiding the long circuit through Clapham Junction.

FROM the report which was adopted at their meeting on the 5th March it appears that the Council of the Royal United Service Institution must soon relinquish their present premises in Whitehall-yard. Formerly a residence of Sir Charles Stuart, our ambassador to the French Court, a grandson of John, third Earl of Bute, who was elevated Baron Stuart de Rothesay in 1828, and died, without male issue, in 1845, this house stands between what was the Confectionary of Whitehall Palace and the site of Fife House. Whilst successive War and Admiralty Ministers have frequently eulogised its supreme advantages and capabilities, this Institution has been suffered, nevertheless, to support itself as best it could. A Government grant, certainly, of 600*l.* a year was obtained in 1864, yet this meagre sum is more than exhausted in the necessary costs of maintenance, which include over 210*l.* for rent of Stuart House, with 165*l.* for rates and taxes. The members' subscriptions and fees, together with some trifling legacies, rank as a set-off against annual expenses calculated to exceed 4,500*l.* The museum and library are already overcrowded, but not with visitors. The contents of the former, indeed, are less familiar than they should be to the general public, who seem to awaken to the museum's existence only in times of polemical strife. The topographical department is rich in cognate exhibits, maps, surveys, and charts. Here are some interesting relics of Nelson, Franklin, and Napoleon; models of Sebastopol and of Linz with its camp, as also Captain Siborne's painfully elaborated reproduction, with figures, of the field of Waterloo, to a scale of 9 ft. to the mile. Having cost its author upwards of 4,000*l.*, this unique work was purchased for the Institution by subscription. A corresponding model of the fight in Trafalgar Bay is hidden away in a dark attic of Greenwich Hospital.

A STATEMENT recently made in a mining journal, simple as it is in itself, is nevertheless deserving of more than a passing thought. It was to the effect that at a Glamorganshire colliery near Pontypridd, called the Albion, the great four-foot seam had been successfully reached, this being, according to the writer, almost the last unworked ground in the South Wales smokeless coal basin, and, in a certain sense, the beginning of the end of that splendid field. For some time past we have not had any panic as to the duration of coal in Great Britain, though, on the other hand, there does not appear to have been any serious attempt at reducing the consumption, save that which necessarily arises from depressed trade and restricted manufactures. Hitherto most of our coal-fields have arrived within a computable limit of exhaustion, but the South Wales field, from its comparative newness of working and the great depth of its measures, has always seemed to be a great reserve, outlasting all others. And so it probably will, for by the time that it is necessary, there will be an almost certain extension of depth at which the coal may be worked. Still, the statement has rather an ominous sound about it, and when we consider that nearly all of the Welsh waste measures and many of the steam coal measures on the north crop are worked out, it ought to set our scientific economists thinking.

IT requires but scant powers of observation to notice that many of the railway bridges which cross our suburban main and bye-roads were never intended to meet the circumstances of the development, in the near future, of rural lanes and grass fields into thickly populated areas. The railway engineer naturally enough confines his attention to the engineering requirements of the line which he is constructing, and he may be satisfied with, and the empowering

Bill may be passed for, the erection of bridges only 25 ft. or 30 ft. wide over lanes or bye-roads which in a short time become the principal roads in the neighbourhood. It is therefore one of the very obvious duties of Local Authorities to examine carefully any Railway Bill affecting their district, and see that in the fixing of the width of the bridges proposed to be erected over roads, due consideration has been given to the probabilities of the future development of the surrounding district. A Local Board in the western suburbs has just achieved a decided success in this direction. The Bill being promoted in Parliament for the construction of the new line to Ealing provided, in many cases, for the erection of only 25-ft. bridges; but the Local Authority in question called a public meeting of the inhabitants, and obtained consent to incur the expense necessary to secure a *locus standi* to oppose. The result is that the promoting Company have very effectively disarmed opposition from this quarter by agreeing to erect bridges 50 ft. wide in almost every case where this width has been sought.

A VALUABLE City property will soon be in the market. The Trustees of the Wesleyan Centenary Hall and Mission House, No. 17, Bishopsgate-street Within, are resolved to sell, by private treaty or at auction, this their freehold estate, and its site extending over more than 8,000 sq. superficial, being one for which they refused 200,000*l.* some years since. The Missionary Society's House was built in 1842 as a depot for the missionaries' foreign outfits; the Hall in 1839, at the celebration of the first centenary of Methodism. A fresh site for a new hall has just been secured on the Victoria Embankment, and it is confidently expected that the cost of the ground and projected buildings will be amply covered by the sale of the property at Bishopsgate.

FEW subjects have given rise to more legal disputes than covenants in deeds not to exercise a particular trade in a manner detrimental to one party to the agreement. In Davies Brothers & Co. v. Davies, Mr. Justice Kekewich has lately had to decide on the meaning of such a covenant. The retiring partner agreed "not to trade, act, or deal in any way so as to either directly or indirectly affect the said Edward Davies and Edward Albert Davies." The question to be decided was whether this covenant was so vague as to be against public policy. The plaintiff carried on trade in galvanised iron-ware at Wolverhampton and London. The Judge held that the covenant was not too vague to be enforced, nor against public policy, and restrained the defendant from carrying on business in Middlesex. Owing to modern facilities of communication the tendency of the law is to treat these covenants in such a way as to give them great scope. Thus, any one who retires from a firm should be careful to have local limits fixed by agreement within which he may not trade. If he leaves the matter open he may find his area of trade very small indeed.

A NEW engineering scheme, of considerable importance to our Indian commerce and shipping, is being put forward with every appearance of success, the more so as it has received the approving sign-manual of Sir John Coode. It will be seen by referring to the map that between the north point of Ceylon and the south-eastern termination of India is the island of Ramasserim, only separated from the Indian coast by a very narrow waterway, kept permeable at a great expense by the Madras Government, and yet only available for small coasters. Large vessels and steamers sailing to Madras and Calcutta in the Bay of Bengal cannot use this waterway of the Gulf of Manar, and are consequently obliged to go all round Ceylon, a distance of many hundred miles, and then sail due north to Calcutta. The proposal, therefore, is to cut a broad ship canal through the island of Ramasserim, and thus open the way

to Palk Straits and the Coromandel Coast, obviating the necessity of the long Ceylon route. There are plenty of reasons why the India Government, and particularly the Madras, should sympathise with the scheme, as the latter would thus rid themselves of the obligation to keep up the unsatisfactory waterway at present existing. The railways of the South of India are also favourable to the scheme, as doubtless it will soon result in the establishment of a large canal port on the mainland just opposite the island.

FROM the *Berliner Philologische Wochenschrift* (March, No. 10) we learn that a remarkably fine new group from the Pergamene fragments has just been successfully put together. Fifty pieces have gone to the making of it. The composition represents a goddess in long floating drapery, advancing from the right, to deal a deathblow to a giant, who has already fallen. She is just plunging her sword into his thigh. He tries in vain to ward off the blows. The giant ends in two snake coils, and these are in part furnished with fishy scales; the snake-heads seem to be bisecting at the goddess, and one of the snakes has set its teeth in the robe of the goddess. The group has been provisionally placed next to that with the goddess hurling the snake-bound jar (die Schlangentöpfungsfertig). The goddess wears an ivy wreath, faint traces of which are preserved. It seems possible she may be Ariadne, in which case she must have fought close to the Dionysos group. When the small size of some of the fragments is considered, the group must be allowed to be a masterpiece of restoration, and reflects great credit on the industry and ingenuity of the two sculptors, Freres and Possenti. It is expected that very shortly the smaller frieze, with the Telephos adventures, will be so far reconstructed as to be set up in its entirety.

ARCHAEOLOGISTS and art-students alike will be glad to hear that the editors of the new *Classical Review* (just published by Mr. Nutt) have decided to give regularly a report of the acquisitions to the British Museum. The first instalment in the present number is by Mr. Cecil Smith, and he prefaces the report by a brief but very interesting notice of the present prospects of archaeology in relation to the Museum collections. He hopes, and we think justly, that the issue of the *Classical Review* will do much to stir up an interest among the general educated public in our annual national acquisitions. Hitherto those who have desired news of this sort had to consult the Parliamentary Blue Book where the official report appeared, or,—low be it said,—they had to seek for information in a German periodical, the *Archäologische Zeitung*, which gave an abstract of the report.

WE cannot say Mr. Cecil Smith's account is altogether encouraging. He tells us of the "melancholy fact that the grant for purchases has of late been steadily decreasing in inverse ratio to the growing difficulty experienced in obtaining works of Greek and Roman art from abroad. Not only is the export of antiquities everywhere either jealously restricted or absolutely forbidden, but English excavators, except in one or two isolated instances, can no longer obtain even reasonable terms in which to conduct scientific research." Saddest of all, even on our own ground, Cyprus,—a feeble field,—our impetuous condition is a hopeless bar." Some of us, if our leanings are rather towards art than archaeology, will say we have had enough of Cyprus, with its endless hybrid Greco-Assyrio-Egypto-Phœnician statuettes. Any one so minded should ask to see the three "gems of the first water" which Politis-Chrysohou has just sent to the British Museum,—the silver ring with the golden fly,—the lovely alabaster painted in polychrome (P)asiades, and, perhaps most fascinating of all, the lekythos, decorated with a subject so far unique, the slaying of the Sphinx by Œdipus (we adopt the spelling of the

*Classical Review*, though for an old friend like Œdipus it seems a little severe). If henceforth people do not go to see the new treasures of the Museum it can be only because they do not care.

IN regard to the correspondence upon Quarry-worked Stone which has found place in our columns the last few weeks, we believe that the remarks of "A Quarry Owner" (pp. 302 and 410) are in the main correct. The principal cause of quarry-worked stone being cheaper than when it is elsewhere worked is the saving of carriage of waste material, bad blocks, &c. At the same time, the reasons adduced by "G. C. W." (p. 331), also influence, though in a much lesser degree, the cheaper production of quarry-worked stone. The causes, however, would probably vary with the differences in the methods of carrying on business of respective quarry owners. With reference to Mr. H. E. Gough's remarks (p. 410) on the desirability of using unseasoned stone—if he restricts his observations to such stones as are chemically so constituted as to be capable of producing a protective crust, he is so far correct. It is obvious that all stones cannot do this. When this crust is formed it should not be removed; and, as he rightly observes, it should "never be scraped after long exposure to the air." But we cannot agree with him that "stone which stands well in its own locality will stand practically equally well in the London atmosphere," even though it be seasoned after it is wrought. This may be the case in many instances, but the general statement should rather be put the other way about. The different compositions of the country and London atmospheres unquestionably produce widely different effects on certain classes of stone, so that a general rule cannot be laid down. An intimate knowledge of the characters presented by different kinds of stone is essential to the proper selection of the material.

A DEPUTATION of the heritors, or landowners, of the parish of Dunblane presented a memorial to the First Commissioner of Works, on March 8, to ask the assistance of the Treasury to carry out a proposed restoration of the nave, aisles, and chancel of Dunblane Cathedral, Perthshire, at an estimated cost of from 14,000*l.* to 16,000*l.*, according to the materials used. The Cathedral, which is well known to tourists, is a picturesque ruin, standing on the east side of the river Allan, in the broad valley which separates the Grampian mountains from the chain of the Ochils. The choir, however, which has no aisles, is used as the parish church. The building is the property of the Crown, and the deputation to Mr. Plunket suggested that the entire restoration and re-roofing of the nave and aisles would be an appropriate memorial of the Queen's Jubilee. It was stated that a partial restoration of the choir, which has been used as a parish church for some time, was effected about fifteen years ago, at a cost of 3,000*l.*, and that an immediate expenditure of at least 600*l.* was necessary for the preservation of this part of the fabric. It was further stated that the landowners had undertaken to assess themselves in the amount which would be required to provide a new parish church, which was estimated at 3,500*l.* (a sum which would appear scarcely adequate for the purpose), provided that the Crown would agree to the Cathedral being used hereafter as the parish church, and that one of the parishioners had offered to guarantee 6,500*l.*; but whether this sum was in addition to the 3,600*l.* provided by the heritors is not clear. Mr. Plunket, in reply to the deputation, stated that the Government were anxious for the preservation of the Cathedral, and promised to inquire if there would be any difficulty in the Treasury undertaking the maintenance of the fabric after its restoration. If the Government are really anxious for the "preservation," in the true sense, of the Cathedral, they must be very cautious what they do in the way of its "restoration."

\* Two views of the Cathedral were published in the *Builder* for Nov. 21, 1835.

THE works exhibited in Messrs. Arthur Tooth & Son's spring "exhibition of high-class pictures" are not all what we should call "high class," but they include some very good works. Unfortunately some of the best in execution are among the least attractive in feeling; witness Jacquet's "Chanson d'Amour" (38), a painting of most remarkable technical finish, but utterly vulgar in character and motive. One of Gallegos' brilliantly-painted church festival subjects, "Rehearsing the Easter Anthem" (43) suggests the same criticism; the varied expressions of the faces of the monks and the choir-boys are admirably studied; but the tone of the whole is harsh and *criarde*, as painting, and it suggests the idea of being painted with a sneer in the painter's mind, so to speak. M. Enginè de Blaas exhibits an admirable Venetian flower-girl, which most visitors will at first sight attribute to Mr. Fildes; Mr. Leader, Herr Heffner, and Mr. Halswelle exhibit landscapes with their usual hard finish and brilliant effectiveness and more than their usual mannerism. A painting of foxes by Rosa Bonheur (87) should be looked at, as well as other and smaller works. Mr. Goodall's picture of Christ and the child, which has been for some time on view at the same galleries, we have not before referred to. There is evidently a serious attempt on the part of the painter to give an ideal conception of Christ, and there is a noble character in the head, but such as is not suitable, in our thinking, to the special incident and situation portrayed. We should rather have thought of Christ with His look and attention fixed on the child whom He had called to Him, instead of this abstracted gaze directed into space. Much of the talk made about the picture is the offspring of religious sentiment rather than intellectual judgment; and we strongly object to the bad taste, not to say impertinence, of affixing to the catalogue a "gushing" laudatory letter from a well-known ecclesiastic, as if people were to follow his lead, and be influenced by his praise. What is it to us what Canon Duckworth thinks of the picture as a representation of Christ? This kind of thing is on the increase in picture-galleries; it is merely an attempt to impose an opinion on ignorant persons who have no opinion of their own, and it ought to be stopped.

THE collection of bronzes to be seen at Messrs. Bellman & Ivey's galleries in Piccadilly includes, besides some good reproductions in bronze of recent French sculpture, a considerable number of small bronzes by Russian artists, mostly of a highly realistic type, battle-field and hunting-field scenes, &c. A good many of these show remarkable truth of action and force of modelling, especially in the treatment of horses, bears, and other animals. The groups by Professor Lieberich are specially to be noted.

THE sketches by Mr. Wimperis, now on view at Messrs. Dowdeswell's, and said to be "principally from the New Forest and its neighbourhood," exhibit all the breadth of style and the true and characteristic water-colour treatment to which we have been accustomed in the works of this excellent water-colour artist; but we must be allowed to say that they certainly recall very little of the character of the country from which they profess to be taken, and that where the New Forest landscape is recognisable in general character, the colour effect of it is not realised. The New Forest is a tract of landscape full of colour; Mr. Wimperis gives it to us translated into dark and neutral tones. We have always admired his work when regarded as what may be termed abstract landscape; but when we compare it in this case with the special landscape supposed to be represented, one cannot help feeling that there may be too much "breadth" and elimination of detail.

MR. DAVID MURRAY exhibits at the Fine Art Society's rooms a collection of sketches made in Picardy. This is another of the exhibitions which shows how much

more favourable to one's estimate of an artist's powers a sketch exhibition may be than a finished painting. None of Mr. Murray's oil paintings at the Academy exhibitions have presented as much of interest or as much of real open air effect as this collection of sketches. There is rather too much of an appearance of imitating Corot about many of them, which may be partly accounted for by the fact that this was Corot's country, and that similar causes tend to produce similar effects; so Mr. Murray's friends say; but we rather think Corot showed him the way. There is great variety in the character and treatment of the sketches, however; some aim at topographical accuracy, others have a more poetic aim; many gain an extra attraction from the local characteristics which they exhibit; the decoratively-treated iron cross set up in the midst of the fields; the "Fête des Morts" (65) and "A House of Sorrow" (76) showing the Picardian funeral observances; "The Reed Reaper" (44), in huge, and it is to be hoped waterproof, boots, plashing through the marsh after his work. The collection is well worth a visit, both from the artistic and the topographical point of view.

THE question as to the treatment of the entrance to St. Martin's-lane will certainly not be satisfactorily solved by the removal of the steps in front of the portico. Little will be gained in width of roadway unless the foot pavement is removed also; and then where are the foot-passengers to go? One inconvenience will give place to another, and the front of St. Martin's will be seriously damaged in its architectural effect. The narrowness of the roadway at this point is an inconvenience, but not a very serious one to put up with for a time. When the façade of the National Gallery is rebuilt in a manner worthy of the site and of the importance of the institution, then the lines of the new façade can be modified to allow of the widening of the roadway. We had better wait for that event than hopelessly spoil the architectural effect of St. Martin's Church, which, with all its faults, is one of the best and most dignified buildings of its class and date.

DR. HENRY BENNET'S letter from Mentone, in Thursday's *Times*, confirms what a previous correspondent of that journal had remarked in regard to other situations affected by the recent deplorable earthquake, that the houses brought down were mostly such as had, so to speak, no right to expect to stand against an earthquake, or even without one. Dr. Bennet says—

"One hundred and twenty-five houses have been condemned by the surveyors, most of them tumble-down erections of the olden town, in the last stage of decay, many hundreds of years old, huddled together in Medieval Italian style, and only wanting a push to bring them down, like houses of cards. In the modern part of Mentone of late years, houses have been rather scamped than built, as in the outskirts of London and Paris, not in freestone, as of old, with wide solid foundations, but of lath, plaster, and stucco, with mortar made with the dust of the road instead of pure river or rock sand. Not one well-built stone house has fallen, to my knowledge. This dire catastrophe will teach builders on the Riviera to return to the old time honoured solid Mediterranean style of building, with wide stone foundations and thick stone walls, and to give up lath, plaster, rubble mortar, and stucco as the principal materials of the house."

Dr. Bennet adds that one practical result of the earthquake will probably be that "the old picturesque houses on the Riviera, which travellers visit with such pleasure and curiosity, will have to be pulled down and replaced by modern buildings. They have become from age a mere heap of rubbish, a blot on the creation, a danger to their inhabitants. Several of these houses have been condemned to destruction by the Italian authorities." We have no doubt, however, that the "Society for the Protection of Ancient Buildings" will issue an appeal against their removal. It will be just the kind of thing they will enjoy.

How a Marble Statue is made.—Mr. J. A. P. Macbride gave a lecture on this subject in the Dulwich Schoolroom on Monday last. The chair was taken by Mr. A. H. Gilkes, the Master of Dulwich College.

#### THE FORGE, ST. CLEMENT DANES, FICQUETT'S CROFT; AND THE NEW BANKRUPTCY OFFICES SITE.

"TENANTS and occupiers of a certain tenement, called the Forge, in the parish of St. Clement Danes, in the county of Middlesex, come forth and do you service!" Thus, year after year, is proclamation made before the Queen's Remembrancer at the Royal Courts of Justice, and as often does the City Solicitor respond by counting six horseshoes and sixty-one nails, whereupon the Queen's Remembrancer declares, "Good number." This quaint ceremony, immediately following upon the rendering and cutting of two faggots for the waste ground called the "Moors" in Shropshire, is symbolical of certain rent service due from the Corporation to the Crown in respect of a forge formerly held by them in St. Clement Danes, London, and which, having been pulled down in a riot, *temp.* Richard II., was not restored. Until the passing of an Act in 1859, these two "services" were wont to be discharged on the annual presentation of the sheriffs at the Exchequer Court, Westminster. There is question, though, whether the second function will not shortly fall into abeyance, since the (by some) supposed site of the forge will probably be taken over by the Crown.

For by a Government measure, which was introduced in the House by Mr. Plunket on Tuesday, the 15th inst., it is proposed to enable the Commissioners of Her Majesty's Works and Public Buildings to acquire certain lands and buildings in St. Clement Danes parish for new offices in connexion with the Bankruptcy Court, at present in Portugal-street, or for such other public service as the Treasury may prescribe. The property to be acquired lies south-west and south-east of King's College Hospital, having Carey-street to its north-east with Clement's and New Inns to the west, and extending southwards as far as the vacant space alongside of the Royal Courts of Justice. Owing to sundry demolitions that have been made here from time to time during the past three or four years much of the site is laid bare. The development of the Government scheme will again complete the building over of a once open space which was known as Fickett's Field or Croft, and also as the Campus Templariorum or Templars' Field. That space, of about eleven acres, is mentioned in the Liber Johannis Stillingfleet, compiled in the year 1484,\* in connexion with Gerard's Hall as follows:—"Willielmus Cotterell (12 cent.) dedit aulam vocatam Gisour's Hall in civitate Londoni in parochia S. Mildredæ cum aliis diversis tenementis et redditibus in Fletestrete, et pasturam vocatam Fickettfield." In his second edition, 1850, Peter Cunningham quotes (without date) another, and what he declares to be the earliest extant, grant. There we learn that the ground served "Pro Saltationibus Turamentis, alisque Exercitiis Equitum Militumque Regni nostri Angliæ presertim vero Equitum Sancti Johannis Hierosolimitan." It has been plausibly conjectured that the Forge was established at this spot for the farriers who were employed in shoeing the combatants' horses and in repairing their armour or weapons. We say combatants advisedly, for it is not easy to predicate whether the field was exclusively reserved, if indeed, it was so reserved at all, for the Knights Templar or the Knights of the English langue, or language, of the Hospitaliers of St. John. If the forge was destroyed for good by Wat Tyler's men it disappeared in the year 1381. Just sixty-eight years before that date Bertrand the Goth, Pope Clement V., had decreed at the Council of Vienne the despoilment and dispersal of the Knights Templar. In the year following (1313) King Edward II. gave to Aymer de Valence, Earl of Pembroke, "the whole place and houses called the New Temple at London, with the ground called Fickett's Croft . . . that belonged to the Templars" (Stow, Thome's edit., p. 149). That property then passed to Hugh le Despenser, the younger, on whose attainder, 1326, it was given over to the Priory of St. John of Jerusalem at Clerkenwell. In or about the year 1341 the hospitaliers demised their New Temple property to the two existing Societies of Professors and Students of the Laws of England. Under date 1376, we find mention of the Fickett's, or Fyckett's, field as a place wherein the clerks of the Chancery,

apprentices and students of the law, and the citizens of London daily exercise their common walks and diports. In 1535 Robert Sherborne, Bishop of Chichester, demises for ninety-nine years, at 10 marks per annum, to William Sulliard (who received an absolute conveyance in 1536 from Bishop Sampson) "all that great messuage called Lincolli's Inn . . . together with the way through Field Gate . . . to hold to them . . . by the service therefore due . . . to wit, of the Lord Prior of St. John of Jerusalem." The field, doubtless, gave its name to this gate, which then stood in Chancery-lane, over against the Domus Conversorum or the Rolls. The way through the Field Gate, and the field itself, are cited in various subsequent sales and conveyances, and orders of the Lincoln's Inn benchers, to the end of the sixteenth century.\* Meanwhile the priory possessions went to the Crown at the Dissolution, and with them Fickett's Field. Since this name is sometimes spelt as Fitchett, we may recall that the Black Friars, removing from High Holborn to near Baynard's Castle, were granted, for building materials, the ruins of Mount Fitchett Tower there.

A grant of nearly all this ground by King Henry VIII. to one Anthony Stringer has been preserved. We can further trace its subsequent proprietors down to Henry Serle, or Serle, who in 1600 "died intestate, much in debt, and his lands all mortgaged."† Most of the topographical works on London say that the present New-square (*antiquè* Serle-court, or Serle's-square), completed soon after Serle's death, was built on open ground formerly styled Little Lincoln's Fields or Fickett's Croft. The building area is so named in articles of agreement between Serle and the Society of Lincoln's Inn, 1682. But according to a plan in Parton's account of St. Giles-in-the-Fields parish, and to the Ordnance Survey, that area was once part of the Coney Garth or Cotterell Garden, Lincoln's Inn. In these maps the Croft is marked as lying to the south and west, comprising at this date part of the Courts of Justice site, together with Portugal, Serle, and Carey streets, and the southern portion of King's College Hospital.

The ground that lies next south-east of the Vestry-hall, and contiguous to the hospital site, is proposed to be taken for purposes of the Bill under review. Jackanapes-lane, now Carey-street, an early home during the period 1816-1820 of Sir Henry Taylor, author of "Philip Van Artevelde," was re-named after Sir George Carey. In her memoirs, Lady Fanshawe speaks of taking a house there of Sir George Carey for the year 1656. All, excepting a very small length of the southern side, was pulled down for the New Courts of Justice, whilst part of the northern side, to the west, between Carey and Serle streets, has been rebuilt as New Court. In the South Kensington Museum may be seen a mantelpiece, with a mirror or picture frame above, from a house here; and also a door-case and door in carved deal, of early eighteenth-century work, from No. 18, at the corner of old New-court. There was a good doorway too in the house, last used as a dining-house, and adjoining to the soup-kitchen, which stood at the north-eastern corner of Yeat's-court; and one yet remains by the opening into Grange-court.

Whilst the actual position of the forge cannot now be ascertained, it is significant to observe that in its immediate neighbourhood were a Three Horse-shoe tavern in Milford-lane, of wood, and pulled down in 1831; and two Horse-shoe courts. Of these latter one still survives in the shape of the foot-way that leads out of Clement's Inn into Yate's, or Yeat's, court, which latter communicates with the south-western bend of Carey-street. The new buildings will close this thoroughfare, and will further obliterate almost all that is yet standing of Clement's-lane, and of the once fine old house (an early home of Mrs. Keeley, the actress) along the southern side of Grange-court, next south of King's College Hospital.

Turing, however, from the past, a consideration of more practical importance to the modern wayfarer presents itself. The Clement's Inngate at the end of the Horse-shoe passage is closed at an early hour every evening. The foot-traveller from Lincoln's Inn westward to the Strand is then obliged to pursue his course either

\* *Teste Purton Cooper's* privately printed (but incomplete) volume, 1840, embodying Will. Melmoth's "Great Importance of a Religious Life."

† "Autobiography of Sir John Bramston," quoted by Cunningham, *id supra*.

\* *De Nominibus Fundatorum, Hosp. S. Johannis Jerusalem in Anglia.* See the "Monast. Angliæ," vol. vi., p. 832, edit. 1817-50.

by way of Clement's Inn-passage or further through the devians and far from agreeable by-ways of Clare Market. For road traffic accommodation is even more poorly provided; and all vehicles have perforce to go by way of the ridiculously re-named Sardinia and Kemble streets. In our paper of November 18, 1882, we published Mr. Charles Forster Hayward's proposal for constructing fresh communications between Holborn and the Strand. That gentleman's scheme embodies two streets opening from the Strand at St. Mary's and St. Clement Danes' churches, and to meet in a circus at the angle of Sheffield and Portamouth streets. Failing this, a less ambitious alternative is feasible. It has been suggested\* that a thoroughfare be made to join the western end of Portugal-street and the Strand. Such a street would necessarily have to mount the incline which is now marked by the flights of steps alongside of the Courts of Justice. It would there pass over ground that is already held by the Commissioners of Works. At the same time, it is clearly patent that the new Bankruptcy Offices will only render the need more imperative for readier means of access from the one quarter to the other than is at present to be found.†

#### THE SOUTH AFRICAN RAILWAY SCHEME.

AFRICA is promising to succeed America as the scene of big railway enterprises. When the Black Continent has once started building great railways, we may expect some very fine feats of engineering. Already there is a scheme started which opens up a grand vista to the imagination, and promises to bring the Cape into direct railway communication with the Portuguese frontier and Delagoa Bay. The scheme owes its origin to the sudden and unexpected discovery of enormous mineral wealth in the Transvaal. As far back as 1884, President Kruger, when at Amsterdam, gave a concession to a Dutch syndicate for a railway from the Portuguese frontier of the Transvaal to Naelspruit, a town in Boerland, which was to be ultimately continued to Pretoria. This concession, which was an exceedingly advantageous one, was passed and confirmed by the Boer Parliament or Volksraad. The railway was to be seventy miles long; the Dutch were to be allowed fifteen years in which to make it, and at the end of that time fresh terms were to be made for the continuation of the line to Pretoria. The route the railway was to take was based on a survey made by a Portuguese engineer, Colonel Machado, which made a considerable circuit to the north in order to take in the undeveloped Leydenburg gold-fields. Two conditions were imposed on the Dutch syndicate. The first was that the company should be fully established within twelve months of the concession, and the second was that the company should deposit 18,000*l.* caution money with the Transvaal Government. Neither of these conditions was fulfilled, and so the concession became void.

In the meantime the discovery of the De Kaap gold-fields and of the existence of coal near Pretoria, altered the complexion of affairs. In April, 1886, 1,735,000 acres had been thrown open to the public by Government as gold-fields, and De Kaap was soon over-run by English. These felt very keenly the want of a railway, and set on foot a project of their own. This new line was to run straight from the Portuguese frontier to the De Kaap gold-fields, without going north to Leydenburg at all, and was to be continued through more gold-fields,—as yet undeveloped,—and a very rich coal district to Pretoria, the capital of the Transvaal, whence it was undoubtedly the intention of the promoters to connect the line with Kimberley, and thus bring the Transvaal into direct communication with the railway system of South Africa. The English had their money ready, and the scheme was submitted to the Volksraad and fully discussed. Here, however, national and political feelings came into play. The Dutch are jealous of the rapid growth of the English population in Boerland, and very distrustful of anything likely to bring them into close communication with their old enemies at the Cape.

\* Vide a letter in the *Times* of December 7, 1884.

† Since the foregoing was written the writer has received a communication from the Office of Works, from which it appears that St. Clement Danes parish pay to the Corporation a small quit-rent in respect of a house (7 a wharf) in Milford-lane, &c., south of the Strand; and that, as far as indeed, as the Office is aware, the proposed line would not seem to cover that of the old Forge.

The President, therefore, tried to obtain an extension of six months to the concession granted the old Dutch syndicate to enable them practically to copy the new plan. This was granted, and a kind of commercial missionary has been sent over to Holland to preach the gospel of the new railway and try to get the Dutch to help it with their money. If he should prove unsuccessful in his endeavours it is quite possible that he may come over here to raise the money in the English market. It is, however, very undesirable that the Dutch should have the making of the railway, as they have stipulated for fifteen years to make 70 miles of railway. Besides, as the railway will be principally used by the English gold-diggers and colonists, these do not like the prospect of seeing the line in the hands of the slow and routine-loving Dutch. They also argue, and with truth, that English engineers have more experience of building railways in new countries, and would not require thirty years to make a line of only 140 miles' length, nor would English engineers be likely to spend so much money over the enterprise as the Dutch. There is, therefore, a considerable prospect of a speedy commencement of the line is somewhat remote; nevertheless, a railway must soon be built, for things cannot long continue as they are, the inconvenience and expense of bullock transit being so great.

The Portuguese Government are, moreover, building a line from Delagoa Bay to the Transvaal frontier, and it is not probable that this railway when completed will be allowed to remain unconnected with Pretoria. As soon as the line to Pretoria has been constructed, the line from thence to Kimberley must follow, and the Black Continent will in a great measure be at last opened up. So great a scheme is dazzling to the imagination, and must make the mouths of engineers and contractors water with hope and expectation. We sincerely trust they will not be disappointed. A line such as the one we have sketched out will give an enormous impulse to African trade, and be an incalculable boon to all connected with it.

#### THE GLASGOW "SUBWAY."

A SCHEME of locomotion for which a reasonably appropriate name has yet to be invented is that contemplated by the "Glasgow Subway" Bill, the third reading of which was on the 14th inst. passed by the Lords' Committee. It is neither a railway of the ordinary type worked by independent locomotives and trains, nor yet a rope-tracked line on any system hitherto tried. It admits of up and down trains passing and re-passing each other constantly, and yet it is only of single-line width and is expected to be built on a scale of corresponding economy. The "subway" is designed to supply an acknowledged want in Glasgow,—speedy transit from the city to the western and north-western suburbs, an area left unaffected by the underground railway recently completed. The "subway" project is the product of the ingenuity of Mr. Simpson, C.E., Glasgow (the engineer for the finished underground railway just mentioned), and the promoters are confined to a few who have examined the novel idea closely, and come to a thorough belief in the inventor and his scheme. The cost of the line is stated at between 200,000*l.* and 300,000*l.*, and the length of it will be fully two miles, exclusively in tunnelling, and for the most part following the course of the main street arteries to north-westward and west. Commencing in St. Enoch's-square, in front of the Glasgow and South Western and Midland termini, and proceeding by Buchanan-street, New City-road, and Great Western-road, it finds its western termination at Victoria Cross, in the select residential quarter of Hillhead and Kelvinside. There are eight stations, including the two terminals, the distance between each of these being the same throughout, viz., 700 yards. A stationary engine works an endless rope, stretching its double length from end to end, and supported on raised pulleys on either side just outside the outer rail. On this rope, at exact distances of 700 yards also, are strung the seven light trains which are to perform the service. Though a track of only 12 ft. wide by 12 ft. high, and thus of single dimensions only, as ordinarily estimated, it is fitted with distinct up and down rails, these occupying almost the same ground within the tunnel, but

separating entirely at the stations. The station spaces are of double-line width, exclusive of up and down platforms; and it is at these extra widths the up and down trains, which seem as if constantly threatening intersection, are made to pass each other. The locomotion is by jerks, as it were, of 700 yards each; and at each stoppage only three of the intermediate stations and one of the terminals are touched, all the others being empty. At the conclusion of the next move of 700 yards the reverse is the condition, of course, and so on regularly over the working day so long as no hitch arises. The most interesting feature, it will be seen, is the method of getting trains past each other, the stations in this particular fulfilling two most important functions. The whole affair, indeed, from terminus to terminus, is one compactly connected machine, and perhaps the most unpromising feature in the outlook of the project arises from this, because any accident or miscalculation, however trifling *per se*, will suffice to throw the entire arrangement out of gear. The line is incapable of co-operation with other railways, in the ordinary sense, and once constructed it will be next to impossible to enlarge it, however desirable that might become, without reconstruction on a scale almost equal to building anew. The proposal has provoked much local criticism, and the opposition arrayed against it, including the City Corporation and the tramway proprietors, is rather formidable, although the promoters profess themselves sanguine of pushing their Bill through the remaining stages in the Commons.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS:

##### THE NEW SUPPLEMENTAL CHARTER.

At a special general meeting of the members of this Institute, held on Monday evening last, Mr. Edward T'Anson, F.C.S., President, in the chair, the minutes of the special general meeting held on Monday, the 17th of January, were read and signed as correct.

The President asked for the attention of the meeting while the Hon. Secretary made a statement in regard to the application for the grant of a Supplemental Charter.

The Hon. Secretary.—Mr. President and Gentlemen: It will be in the recollection of some, if not of all present, that, after an amount of consideration which may fairly be described as protractive and exhaustive, the special general meeting which was held April 5, 1886, approved and passed, subject to certain amendments and alterations, the draft of the extension of our Charter, which had previously been prepared by the Council. Those alterations and amendments necessarily and naturally took some time to arrange, but after consultation with our solicitors, and after taking the opinion of distinguished counsel, we succeeded in presenting the draft Charter to the Privy Council on Aug. 24. Most of you are aware that opposing petitions were thereupon lodged with the Privy Council by two bodies, who, in spite of their short-lived existence, appear to have thought that they were justified in taking such unfriendly and questionable action towards this ancient and respectable corporation, thus endeavouring to thwart the laudable endeavour of the Institute to consult the welfare and promote the interests of the profession at large. This opposition resulted in petitions being submitted in support of our action from various representative societies of established reputation. The Manchester Society of Architects, the Liverpool Architectural Society, the Leeds and Yorkshire Architectural Society, the Leicester and Leicestershire Architectural Society, the Glasgow Institute of Architects, and, lastly, the Architectural Association of London, lodged with the Privy Council separate petitions praying that our Supplemental Charter might be granted. The opposing petitions were sent to us by the Privy Council, and in due course we answered them. The sequel to all this is the intimation which it is now my privilege to make to you, and which is briefly this.—That at a Council held at Windsor on Monday last, the Queen approved and signed our Charter. The matter, therefore, may be looked upon as an accomplished fact. There are certain legal details still to be completed, but these are mere matters of form, and the sooner, now, we set to work to frame and to rearrange the By-laws in accordance with the Charter, which may now be looked upon as

passed, the letter. The Council propose to take immediate steps in this direction, and I earnestly hope that this year,—the Jubilee of our beloved Queen,—which is to see so many auspicious events, may witness not only the completion of our Charter, but of the By-laws which depend upon it.

A question was asked by Mr. T. Searnske Archer concerning the obligation of members in respect of the Schedule of Professional Practice and Charges, and a conversation ensued, in which Messrs. Lucy W. Ridge, Arthur Gates, Charles Barry, Professor Kerr, E. A. Gruning, John Hehh, and the Hon. Secretary joined.

#### The Royal Gold Medal.

The By-law LXXVI., referring to the nomination and election of Royal Gold Medalists, having been read, the President read the notice convening the special general meeting, and no other candidate having been proposed, moved the following resolution, the terms of which had been previously issued to members. Whereupon it was unanimously resolved,—“That, subject to her Majesty's gracious sanction, the Royal Gold Medal for the year 1887 be presented to Mr. Ewan Christian, Past President, Architect to the Ecclesiastical Commissioners.”\*

A Paper, by Professor Kerr, Fellow, on “The Architect's Functions in Relation to Building Contracts,” was read by the author. We give an abstract of this paper hereafter. In the discussion which followed, Messrs. William Woodward, T. Searnske Archer, Edwin T. Hall, Sydney Young, Thomas Blashill, George Aitchison, A.R.A., T. M. Rickman, F.S.A., Ralph Nevill, F.S.A., and the President joined. A vote of thanks having been passed by acclamation, Professor Kerr replied, and the proceedings terminated.

### THE ARCHITECT'S FUNCTIONS IN RELATION TO BUILDING CONTRACTS.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

This was the subject of a paper read on Monday evening last, at a special meeting of the Royal Institute of British Architects by Professor Kerr, as mentioned above. Referring to the apparent desire of both architects and builders to reconsider the “Conditions of Contract,” which were adjusted by a Special Committee of the Institute and the London Builders' Society a good many years ago, both sides now complaining of their want of clearness in certain respects,—the lecturer said his object was, not to discuss those conditions, but to submit a few observations upon the less superficial aspects of the architect's difficulties, and to advocate the more formal recognition of a kind of liberality of dealing which he considered would be found to characterise the administration of the best architects, and also to meet the approval of the best lawyers. The difference between the simple contract of every-day trading, and the always highly complex building contract, was pointed out; and he laid it down that the comparatively small amount of building litigation must simply be due to the fair dealing

of architects. A building contract has for its real purpose not any necessity of science, but the relief of the proprietor from his own natural risks and uncertainties, by imposing them upon a contractor. For this he employs first the architect, and secondly the quantity surveyor; and, in strict law, it would seem that it is this purely commercial supervision of the contract that is generally regarded to be the supreme service of an architect, all else being of minor moment. The questions, therefore, which he would consider were what the proprietor expects, what the builder expects, and what the lawyers expect. At any rate, lawyers do not expect an architect to play the lawyer; his jurisdiction is to be expert in good sense, not in jurisprudence; and this especially when great lawyers are never tired of telling us that law is only the essence of common-sense,—common-sense the principle, law the mere exponent. The proprietor, then, expects two things: to get his work done economically, and to know the cost beforehand; and he pays for both. But he must not over-strain economy, or the contract may snap; to seek the advantage of an unwary reckoning is something like a fraud, and the architect ought to protest against an unsafe bargain. In expecting a conclusive estimate of cost, also, the difficulties must be duly kept in mind; for “extras” seem to spring up sometimes like weeds in a field. Then what the builder expects is profit and not loss; and, having regard to the pressure of competition tendering, he trusts to the architect for fair dealing, honourable treatment from him whatever may happen. Alluding to the daily dependence of a contractor upon the architect's almost arbitrary directions, the lecturer argued that the extraordinary complexity of the transaction lifts it quite above the common level of commercial contracts, and demands a different code of fair dealing. As for what the lawyer would say to all this, it would be that to introduce him and his ways into such business without urgent need is not fair dealing; and thus also, whenever building business has the misfortune to fall into the terrible trap of litigation, the legal agents on both sides demand the direction of architects, nominally witnesses, really advisers and advocates, without whose aid the suits are always fallacious. Turning to the very peculiar understanding whereby the architect, although the responsible agent of one of the contracting parties, acts the part of an arbitrator between the two,—a difficult point in law,—the remarkable confidence of the builder in the traditional impartiality of the architect would be manifested even when the employer was most exacting and unreasonable; and for such reasons as this the lecturer deprecated the specious affectation of some architects who say they “take their instructions from the solicitor”; for when a lawyer of high class calls in an architect it is to take his advice and defer to it, not to make him the instrument of artifice. The next point referred to was competition tendering, described as a plausible practice, whose true efficiency is obviously inversely as the complexity of the contract. In the hands of the skilful profession of Quantity Surveyors the process of estimating has been brought to considerable perfection; but the pricing by builders is not always equally scientific, which may nullify the more scientific part of the work; and another difficulty which thus arises is that felt by the architect at the end, when a badly-priced bill is sprung upon him from under seal for his valuation of deviations. Nevertheless, the acceptance of the bill of quantities as a basis of contract is to be approved; and especially with the view of relieving the builder from risks impossible to be appraised. To self-evident axiom, as it is called, that an employer is entitled to know the exact cost beforehand, the lecturer denied to be self-evident, contending that it is much more reasonable that unforeseen risks should remain with him, and nothing be put upon the contractor which the quantities cannot accurately define. As regarded the correction of errors in the quantities, there would be little chance of anything serious being wrong in the work of careful surveyors; but there was another point, and he must pronounce his opinion to be that all speculation clauses in specifications are unlawful, in saying which he believed he would be supported by sound lawyers, even of the most strictly commercial order. A bargain which it is impossible to fulfil it is inequitable to enforce; as in diplomacy, an unworkable treaty must be

revised. It is also pretty much the same thing to say, with reference to building, that a bad bargain for one side is had for both, wherefore speculative conditions are essentially unsafe. A perfect building contract, therefore, would be one in which the quantities provide for every hazard with precision, and he was disposed to think that all liberal-minded architects must be already in favour of the abolition of the system of repudiating the bills of quantities the moment the contract is signed. The question of the quality of work was then discussed, and the constant use of the phrase “the best of its kind” was affirmed to have no discriminative meaning; the only practical discrimination being a knowledge beforehand by the architect of a builder's customary work. The practice of open tendering by all comers who can offer sureties the lecturer regarded as dangerous to all parties, and especially to the architect. Then upon the question of “extras” he was of opinion that they are generally of the employer's making. It must be a necessary consequence of competition tendering to demoralise contractors; but he could give great credit to some in this respect as compared with others. The chief difficulty, however, in dealing with “extras” is not so much the dissatisfaction of the employer financially at the disappointment of his expectation of relief from his risks. The wisest course, however, is to keep him well informed of what is accruing; and when young architects are timid in this respect it is a serious mistake. “Extras” ought never to be priced at a loss; but to overprice them is not allowable. Vague general clauses, whether in specifications or contracts, the lecturer then proceeded to deprecate, on the principle that he who takes the incidental benefits ought to take the incidental risks. It is wrong to say the architect has only his client's interest to look to unless his agency either ceased or commenced with the signing of the contract. Impartiality during the execution of a contract implies the same impartiality during its negotiation. The doctrine of the “insurance” of general risks he regarded as fallacious; and he could not be sure that an unscientific item in the quantities might not be an act of negligence involving responsibility. There was no merit in these general clauses, but rather a confession of carelessness. The arbitration clause in contracts he considered to be always advisable; but the appointment of the arbitrator ought not to be made carelessly, and a stranger ought to be preferred. In most disputes a respectable architect would probably be in the right; but a contractor who is losing money can scarcely be undeserving of sympathy, especially if it be the architect's duty at the outset to avoid a losing contract as an unsafe one. In connexion with this, the lecturer offered the suggestion whether an arbitration covenant between architect and client as to professional charges might not be of advantage. The last point of detail to be dealt with was the action of an architect in a formal reference taking the place of litigation; and he affirmed that there is no possible matter of dispute under a building contract in which an architect is not the best adjudicator. Litigation, in its relation to ordinary business, is acknowledged to be a failure, and the growing dissatisfaction of the whole commercial public with its inefficiency and outrageous cost is becoming one of the movements of the day. Hence the custom of taking building cases to expert arbitration. Surveyors had been the chief referees, for obvious reasons; but architects, even the more artistic of them, ought to possess all the qualifications, and the time was come for doing away in a great measure with the fallacy that the architect and the surveyor are two, not one. He had seen many legal authorities, and granted their value; he had also seen arbitrators and arbiters; but he never saw a qualified building-arbitrator whose decision, even when he split the difference and divided the costs, was not far and away more intelligent and acceptable than that of any Court of Law. In adding a few miscellaneous remarks regarding arbitration generally, the lecturer recommended the principle of the court of three surveyors appointed by the Building Act for party-wall cases, as being preferable to that of the one referee, and as affording greater scope and freedom to advocacy, besides opening a door for negotiation. He also would encourage the employment of architects instead of lawyers as advocates before a single referee. He pro-

\*No. 10 of the *Journal of Proceedings* of the Institute enumerates some of the work which Mr. Christian has carried out during the last forty years. The *Journal* says,—“From among a list of more than forty new churches, may be cited those of St. Mark at Leicester, of St. Matthew at Cheltenham, and of Allhallows at Bromley by Bow; from among some 150 restorations of churches,—from that of St. Mary at Scarborough to the little church at Skilton, near York, restored only last year, though the monograph of it was published by Mr. Christian as early as 1846,—may be cited those of Westwell (Kent), East Meon (Hants), Stabrope (Durham), Thorington (Essex), Bosham (Sussex), Alcombury (Hants), St. Dunstan (Canterbury), all interesting examples of Medieval architecture; Episcopal residences at Norwich, Gloucester, Manchester; Capitular residences at Exeter, Landaff, Bangor, St. Asaph, and in Amen-court for St. Paul's, London; rectories, vicarages, parsonages, and curates in every county in England (except Northumberland, Cheshire, and Cornwall), and in Wales,—not fewer than 20 in all; numerous schools; and a still larger number of country houses, among which are Lexington Manor (Wilt), Ashurst, and Broadwell (Glos.), Lillingston Dayrell (Bucks.), Ascot Wood, for the late Sir J. Shaw Lefevre, and Castle Malwood in the New Forest, for Sir W. Harcourt, M.P. As the architect and acting architect, since 1832, of the Ecclesiastical Commissioners for England, he has had to report on plans submitted for churches and other ecclesiastical works, amounting on an average of ten years to about 218 yearly, and also upon the Cathedral of Chester, Durham, Lichfield, Canterbury, St. David's, Worcester, Ripon, St. Paul's (London), Carlisle, the last named having been restored by him; and upon Southwell Minster, the continuous restoration of which, intrusted to him for the last thirty years, is still unfinished.” To this we may add that among Mr. Christian's buildings for commercial purposes is the Economic Life Assurance Office, New Bridge Street, Blackfriars.

tested against the specious allegations that expert arbitrators are costly; and was opposed to arbitrators being either arbitrators or assessors, having perfect faith in the architect. In conclusion, he had to submit that liberality, loyal justice to all concerned, impartiality that is warm and sympathetic with life as distinguished from that which is frigid and dead, is the best, strongest, and safest policy for the architect to pursue, leaving all harshness to lawyers, whose province it is. This spirit he was advocating as the law of architects; and he believed it to be recognised by all the best of them. But he had to go further, and to say that the principle would be supported by lawyers, as a principle of law, that the architect as a specialist shall not permit his judgment to be warped by legal formulas and dogmas, which it is the prerogative of lawyers to handle. In this doctrine there might appear to be material for differences of honest opinion; but he was sure, whatever controversy there might be, it could only be upon ambiguous words, not upon patent principles of uprightness.

#### LECTURES AT CARPENTERS' HALL.

##### GIRDERS AND BEAMS.

The second of the present series of free lectures on matters connected with building, was given on the 3rd inst., at Carpenters' Hall (as mentioned in our last issue). The lecturer was Prof. A. B. W. Kennedy, M.Inst.C.E., who chose as his subject, "Girders and Beams."

The lecturer commenced by telling his large audience that he intended to speak about very technical matters of considerable importance to all engaged in any work connected with construction, viz., about beams, which, although familiar to most of them in appearance, were of a somewhat complex character. Beams were used in every kind of structure, and it was therefore important that workmen should understand the way in which they acted. When a piece of material was strained in a structure, the force applied commonly fell under one of four classes:—(1) tension, as shown in a tie; (2) compression, as in a strut, column, or pillar; (3) torsion or twist, as in a shaft; and (4) bending or transverse loading, as in a beam or girder. In the first and second classes the load was supposed to be applied in the direction of length, while the position of loading was always supposed to be the same, viz., axial. It was really only with No. 4 that he had to deal that evening, but in order to better explain his subject he would point out its relation to the simpler cases of Nos. 1 and 2. If they took a tie-rod, they would find that length and shape were of little importance, its strength being dependent on its sectional area or size; while the more it was pulled the straighter it became. In the case of a strut, they were at once met with the difficulty that its strength did not depend only on its sectional area. In compression, length and shape were all-important, as was the method of fixing the ends, the tendency being to buckle. Torsion, again, was not of so much importance in a structure. If they wished to wrench a shaft in two, they would do so by putting a lever on the end, and the longer the lever, the less would be the force required; so that it was not a question simply of how much force was required to twist it, but also of where the force should be exerted. In the case of a shaft, the force acted with a certain leverage, and the effect of the force depended upon whether it acted with a large or a small leverage. Thus the effect would be the same if a pressure of one ton were applied at a leverage of one foot, or two tons at half a foot. This could be measured by multiplying the force by the leverage; and as it was convenient to have some name by which to indicate this combination, he would use the term given by all writers on mechanics, viz., that of "moment." The strength of a shaft, therefore, was dependent upon the force applied to twist it and the leverage multiplied together, i.e., upon the "moment" applied to the shaft, which might be in foot-tons or inch-pounds, or what not. With respect to a beam, the same principle applied. A beam was not broken by a force simply, but by a force in a particular position. The strength of a beam therefore depended, first, on the load put upon it, and next on the particular position of the

load, measured in feet from somewhere or other. So that the strength of the beam depended on what he had termed "moment," i.e., on a load having a certain definite position. The lecturer showed that in the case of a beam resting on two walls with a great deal of loading, the forces acting upon it were, first, all the loads distributed over it, and, secondly, the upward pressure of the two walls. It was necessary to remember that these upward pressures were as real as the downward pressures, and had to be considered in the same way. As it was not easy to measure the pressure upon the wall, he exhibited a model of a beam suspended from two small spring weighing clips, which registered 5 lb. each with a 10 lb. weight hung on the centre of the beam, and 1 lb. and 9 lb. when the weight was hung close to one end. The pressure on the wall would, therefore, be the same, though differently distributed, and unless in the case of every beam the upward forces were exactly equal to the downward forces, the whole thing would move bodily either up or down. One force could not bend a beam; it was the "moment" of the force about the centre that caused it to deflect in the middle. A beam could carry twice the load if distributed all over it that it could carry if the weight were in the centre. It was easy to find the strength required in a beam loaded in the centre if the bending action or bending moment of the forces on it could be ascertained, viz., by multiplying half the length by half the load, and expressing the result in foot-pounds. This, of course, applied to a beam loaded at one point, say in the centre, while in one equally loaded all over there would be only half the tendency to bend. He had thus endeavoured to give some idea of the forces that tended to bend a beam, but what was going on inside the beam whilst it was being strained? If a tie-rod were pulled with a force say of ten tons, it pulled back with exactly the same force. There would be a stress in the metal, which would stretch the tie-rod a little, after which the pull of the iron would be exactly equal to the outside pull. That was just what happened in the case of beams; the particles of wood resisted change of position, and there was stress in the beam balancing the outer forces. But it was not quite so easy to explain what happened in the case of the beam, for this reason, that in the tie-rod there was only the plain tension, while in the beam there was a bending moment. In order that the beam might not be broken, there must be something that could be measured in foot-tons or inch-tons to balance the moment which was trying to bend it. The Professor here exhibited a model of a cantilever, cut off from its supports, and showed how in order to hold it up it must not only have a corbel beneath it, but also a small tie at the top of a small strut at the bottom, connecting it to the wall. The cantilever showed tension along one part, and compression along another part; but it was not so easy to show this by a model of a beam supported at both ends. As long as the beam did not break the moment caused upon it by the load must be exactly equal, and neither more nor less than the moment inside the beam, just as the whole stress of the tie-bar must be equal to the pull exerted upon it. It was their business to keep this in view, as they must want the beams to be as strong and at the same time as light weight as possible. It was easy to see in what direction they had to work in order to do this. The strength of the beam depended on the moment between the internal tension and compression, and the further apart those two forces or "stresses" were kept the better. In a rectangular beam there was a great quantity of material in the middle which had very little stress, and this did little good. What was wanted was to get as little metal as possible into the middle, near what was called the neutral line of the beam. If an ordinary rectangular joist were used as a beam it would be weakened but little by cutting a piece off each side. Of course no one would think of doing this, but there were other materials than wood in which the same state of affairs would not apply. If he took the same weight of material and put the cut-out pieces on the top and bottom he would have done some good. There would be no more weight than there was at the beginning, but he had put the weight just at the place where it did most good; what he would have done would be really to increase the leverage,

and therefore the internal moment of the beam. This, he believed, was at the bottom of the whole modern practice of architects, engineers, and builders, viz., the trying wherever they could to put the material of the beam in two masses, as far apart as possible. They took one mass of metal, in which they intended to have tension, and another, in which they wished to have compression, and joined those together by a light web, so that they got the form of the rolled joist, the meaning of its section being that there was a considerable amount of metal at top and bottom, with a thin web joining the flanges together. To find the weight that any rolled joist of a certain section and span would carry what course should they pursue? If they took a 4-in. flange of the thickness of 1 in., and a total depth of 10 in.,—a 10 in. by 4 in. joist,—what area of metal had they got for tension to act in? Neglecting the middle part, they might say there were 4 square inches on which tension was acting at the bottom, and 4 square inches on which compression was acting at the top, the two areas being about 10 in. apart. The strength of a piece of iron in tension was about 20 tons per square inch, though they would not, of course, put anything like that weight on the beam. Supposing, therefore, as was reasonable, they put on 5 tons per square inch, they might allow 20 tons of total tension or compression in the 4 square inches, and the moment of the stress would be 20 by 10 in. = 200 inch-tons. That rolled joist then would be quite safe if the bending moment did not exceed 200 inch-tons. Now, as to the bending moment that was to go on the joist, if the span was 20 ft., what possible uniformly-distributed load would it bear? To find this they must reduce the 20 ft. to inches, and divide by 8, the result being 30. This divided into 200, the moment already found, would give 6 2/3 tons as the safe uniformly distributed load, or half this, viz., 3 1/3 tons, as the load which could be applied in the centre. The breaking load would be 27 tons. How now came to the question of what sections were available for use which fulfilled the necessary conditions of concentrating the metal at the top and bottom. The angle or T irons were unsuitable. The most useful things were what were called rolled joists, which had been imported for a good many years from Belgium. These were made of iron, which could not always be said to be of the best quality, but at the same time they had been useful for their purpose, and of late years it had even been possible to get them of steel. The C or channel iron was useful, and the I form was very suitable and could be had up to 16 in. or so deep. The two I forms were often placed vertically above each other, but the middle flanges were of no use, the whole being only about twice as strong as one joist of the same size. But if something stronger than the mere section were desired, the next thing was to use a couple of I joists side by side, putting plates top and bottom right across them to stiffen and hold them together. It would thus be seen that a much larger amount of metal was put outside than what existed before. At the same time it must be borne in mind that some metal must always be lost in this combination because of the rivet-holes, and they must therefore allow for this, by deducting the metal cut out. In the case of the dimensions being too great for single joists, it was usual to build girders up with plates and angle-irons at the top and bottom, their capacities for carrying weights being easy of calculation. He had been speaking of wrought iron, but it must be remembered that cast iron differed from wrought iron in that it possessed a greater resistance to compression than to tension, and that when they used a cast-iron beam they could put a smaller area of metal in compression than could be put in tension. That involved a different kind of design for cast iron as compared with wrought iron beams, the top flange being much smaller than the bottom one, because the top flange had only to resist compression for which the metal was comparatively strong, whereas the bottom flange had to resist tension for which the metal was comparatively weak.

The third of the present series of lectures was given on Wednesday evening last. The lecturer was Mr. Francis Chambers, F.R.I.B.A., who chose as his subject "Joinery." A report of the lecture will appear in our next.

## MR. R. S. POOLE ON MEDALS.

Mr. REGINALD STUART POOLE, Keeper of Coins and Medals in the British Museum, lectured on "Medals" on the 9th inst. at the Royal Academy. This was the last Academy lecture this season.

Mr. Poole, in the course of his introductory remarks, said he had been trying for more than thirty years to help forward the very interesting and, when properly understood, really great art of the medallist, and he was glad to feel that signs of progress were evident. Those who wished to form a right idea of what a medal was should think of it, not as a coin merely, but as something in the form of a coin which was intended to commemorate some person and some great event in his life, or some city and some important incident in its history. In the great period of art, that of the Greeks, there was no distinction between a coin and a medal in point of art; the coins which passed current among the people were equal in execution to the more special works of the medallist. Those who looked only at the present coinage of this realm might be pardoned if for a moment they seemed, after studying ancient Greek coins, to despair of progress. Let them look, for instance, at the ordinary penny of our current bronze coinage. On the obverse they would see the head of the Queen, — a very pleasing portrait of Her Majesty as she was fifty years ago; but why, he asked, should the same type of face be continually repeated, without the least regard to fitness and historical accuracy? On the reverse of the penny was scathed the figure of Britannia, whose head measured about one-eighth of the total length of the sitting figure, a proportion which would give far too great a height to the figure if standing up. Perhaps the best reverse to any of our coins was that of the dragon sovereign, and that was by an Italian artist. Even in this, however, in the grouping and relative proportions of horse and rider there was no approach to the perfection of Pheidias, for the artist had missed the most beautiful proportion between man and horse which Pheidias always observed. One cause of the comparative inferiority of modern coins consisted undoubtedly in the mechanical processes by which they were produced, for mechanical methods were contrary to the spirit of art, although, no doubt, the coins were very exact as to size and weight. Nevertheless, as he had said, he did not despair for the future of the medallist's art, especially seeing what had been done within the last thirty or forty years in two other arts, — viz., architecture and music. In these two branches of art he considered that we had recovered ourselves in a most remarkable degree. With regard to architecture, it was not too much to say that since the time of the initiation of the Gothic revival by Pugin and others there had been produced works of architecture worthy of any period of Gothic architecture. As a case in point he instanced the Church of St. John, Red Lion-square, Holborn, by Mr. J. L. Pearson, R.A. The lecturer next referred to the uniformity and continuity of excellence in Greek coins over a long period as contrasted with the varying excellence of Greek sculpture in different localities, even at its best period. He pointed out how different in character were the sculptures of the Phigaleian frieze, and those of the Temple of Zeus at Olympia, from the known works of Pheidias as seen in the Parthenon. Admirable as were these sculptures in design and in general motive, they were evidently from their execution only the work of local sculptors. The lecturer also pointed out the value of the study of Greek coins as throwing light on vexed questions of ancient history and archaeology. After a passing mention of the works of the Italian, German, and French medallists, he referred to the excellent work that is being done by Professor Legros, Mr. Poynter, R.A., and Mr. Fremantle (of the Royal Mint) in connexion with the Society of Medallists. This society offers prizes to students for the production of medals, and the most successful of these productions, a medal of Cardinal Newman, the work of Miss Eleanor Hall, was exhibited to the students, and highly praised by the lecturer, who, in conclusion, spoke to the students in much one of the qualifications needed by any one who aspired to be a successful medallist, and of the technical processes, conditions, and limitations of the art. From what he said we infer that

the art-students who have succeeded in becoming medallists are nearly all ladies, who seem to show peculiar aptitude for this work.

## ARCHITECTS' BENEVOLENT SOCIETY.

THE thirty-seventh annual meeting of this Society was held on the 9th inst., in the rooms of the Royal Institute of British Architects, Conduit-street.

Mr. William H. White, the Honorary Secretary, read the annual report of the Council, which was as follows:—

"Six meetings have been held by your Council during the past year, at which they have distributed in grants the sum of 509*l.* among 32 persons; while they are happy to state that they were enabled to pay three pensions of 20*l.* each, in place of the one pension of 20*l.* paid in 1885, making a total payment of 509*l.* The amount received by subscriptions has slightly increased, from 361*l.* 3*s.* in 1885 to 366*l.* 7*s.* in 1886. Fifteen new members were added to the list, but your Council regret having to state that the subscriptions in arrear at the end of 1885 amount to over 23*l.* In the present depressed state existing in every profession and business, this is scarcely to be wondered at; but it is hoped that these arrears may be shortly paid. 599*l.* 16*s.* was received by donations, including a legacy of 100*l.* left, free of duty, by the late Mr. Sancton Wood, one of the oldest contributors to the Society, and a member of the Council for several years, from 1853-61. The generous proposition of Mr. George Godwin, F.R.S., of contributing 100*l.* to the funds has been the means of adding 609*l.* New Three per Cent. Stock to the capital of the Society; the total amount of property invested, which in 1885 was 6,422*l.* 19*s.* 10*d.*, being at the present time 7,026*l.* 14*s.* 10*d.* The remainder of the donations was received from,— The President; the Hon. Treasurer; Mr. J. Macvicar Anderson; Mr. A. W. Blomfield, M.A., F.S.A.; Mr. Henry Cursey, Mr. Wm. Emerson, Mr. John Gibson, Mr. W. Grellet, Mr. J. Jennings, Mr. J. S. Phené, J.L.D., F.S.A.; Mr. F. W. Porter, Mr. R. P. Pullan, F.S.A.; and Mr. E. C. Robins, F.S.A. Your Council cannot refrain from expressing the hope that an example so advantageous to the Society may be even more generally followed in the present year. The contributions from corporations or societies have been very few; namely, ten guineas, a subscription from the Architectural Association of London, five guineas, a donation from the Nottingham Architectural Association; and, as in former years, the income of the small charitable fund of the Royal Institute of British Architects. The lamented death of Professor Donaldson caused a vacancy in the number of trustees, to fill which the Council have nominated Mr. Thomas Cundy, who, should the annual general meeting approve, has consented to hold the office. The trustees of the society will consequently be Mr. Charles Barry, Mr. George Godwin, and Mr. Thomas Cundy. Your Council have to announce with sincere regret that Mr. J. Goldcutt Turner has retired from the Council, owing to a deafness which prevents him from fulfilling his trust to his satisfaction. Mr. Turner has been a subscriber since 1869, more than twenty years, and besides being a member of Council for several years, was Honorary Secretary from 1876 to 1879. It having become necessary to obtain assistance in the business of the Society, your Council have appointed Mr. Heron B. Verity, Assistant Librarian, R.I.B.A., Assistant Secretary to the Society. The income account and balance sheet for the year ended December 31st, 1886, are herewith submitted. Your Council wish to call attention to the fact that nearly one-third of the fifteen new subscribers are Irish architects, recruited by Mr. Albert E. Murray, the Honorary Secretary of the Royal Institute of Architects of Ireland. If each member would emulate Mr. Murray, the Society's income would become doubled or trebled. Your Council have decided to hold a Dinner this year with the object of augmenting the funds of the Society. It is proposed, by the kind permission of the Worshipful Company of Carpenters, that it should be held in their Hall on the forty-second anniversary of the formation of the fund, namely, Monday, October 31st, 1887, and your Council look with confidence to each member of the Society doing his utmost to ensure the success due to so desirable an object."

The foregoing report having been read and approved, was adopted by the meeting. A vote of thanks was passed to the outgoing Members of Council, namely, Messrs. Cole A. Adams, William Emerson, Lewis Solomon, George J. J. Mair, F.S.A., and J. Macvicar Anderson. In order not to lose the benefit of Mr. G. J. J. Mair's advice on the Council, it was passed, by acclamation, that Mr. Mair should be requested to act as the Hon. Vice-Treasurer. A vote of thanks having been passed to the auditors, Mr. C. Forster Hayward, F.S.A., and Mr. W. Hilton Nash, the President, Hon. Treasurer, and Hon. Secretary were re-elected, and the Council were elected in the following order:—President, the President for the time being of the Royal Institute of British

Architects; Members of Council, John Hebb, B. St. A. Rommeu, Thomas Cundy, George Scamell, F.G.S., Thomas M. Rickman, F.S.A., Charles R. Pink, Banister Fletcher, William Grellet, W. M. Fawcett, M.A., F.S.A., Arthur Cotes, E. A. Grünig, H. D. Appleton, C. Forster Hayward, F.S.A., W. Hilton Nash, and G. P. Raggett. Hon. Treasurer, Prof. T. Hayter Lewis, F.S.A.; Hon. Vice-Treasurer, Mr. Geo. J. J. Mair, F.S.A.; Hon. Secretary, Mr. William H. White.

The auditors appointed by the annual meeting are Mr. Charles Fowler and Mr. George Inskip.

## "ALEXANDRA HOUSE," KENSINGTON GORE.

THE opening ceremony of "Alexandra House" took place on Monday last, and was performed by their Royal Highnesses the Prince and Princess of Wales. This institution specially owes its origin to the Princess of Wales, who, in 1839, charged Sir Philip Culliffe-Owen with a mission to organise a committee in order to consider the best means of providing a home in London for the rapidly-increasing class of young women who, desirous of earning their livelihood, were in attendance as students at the various Schools of Art, Science, and Music. The necessity for this committee was for a time obviated by an offer from Sir Francis Cook, hart, of Doughty House, Richmond, to defray the whole cost of the erection and furnishing of a suitable building for the purpose, and to place it, when complete and in full working order, at the disposal of H.R.H. the Princess of Wales. This munificent offer was at once accepted, and communications were opened with her Majesty's Commissioners for the Exhibition of 1851, who, recognising the project as coming within the scope and terms of their Charter, agreed to provide a site for the building. This site was one in immediate connexion with the Royal College of Music. Upon these arrangements becoming publicly known, many leading firms offered to assist; Messrs. Lucas Bros. undertaking the erection of the building at prime cost of material and labour. Sir Frederick Bramwell, with much time and labour, contributed a scheme of lighting and ventilation, carried out under his immediate superintendence by Messrs. Galloway, of Knott Mill Ironworks, Manchester, also at prime cost. The Porcelain Manufactory at Worcester, Messrs. Bradford (of Manchester), Messrs. Elkington (of Regent-street), Messrs. Webb (of Stourbridge), Messrs. Starkie Gardner, Vincent Robinson & Co., The American Elevator Company, Gilroy & Co., Doulton & Co., Willis & Co.,—all of these firms offered to furnish portions of the building at prime cost. Messrs. Doulton, in addition, presented a series of large pictures in tile work for the decoration of the dining-room, and fireplaces and mantelpieces in the principal rooms, and the figures at the entrance designed by Mr. Ledward. Messrs. Chubb & Sons presented all locksmith work for the building. The design for the building was prepared by Mr. C. Purdon Clarke, C.I.E., who, in 1833, went to America to study similar buildings. Upon his plans being approved, they were transferred to the late Mr. Robert Down for execution, Mr. Clarke, as an officer of the Science and Art Department, not having time to attend to the work.

The building, which occupies a site of irregular form, comprises fifty-six suites of rooms, in each of which two students are allotted two bedrooms and one sitting-room between them. A large concert hall, in which there is an organ presented by Mr. Frederick Cook, a gymnasium, a suite of practising-rooms for instrumental music, and art studios are also provided. An extensive range of kitchens is placed on the top floor of the building, whilst the dining-room, 90 ft. in length, is placed in the basement. The large drawing-room is made to serve a double purpose, being also the library, surrounded as it is with dwarf bookcases and cabinets containing a collection of books presented by Mr. Wyndham Cook. The building is solidly constructed in hard red brick, in accordance with the wish of Sir Francis Cook, who recommended the architect to study solidity in preference to showy decoration, the only portions of the building selected for special ornamental treatment being the entrance vestibule in glazed terra-cotta, the concert-hall, and drawing-room, all of which are in the Jacobean style. The fireplaces and railings were supplied by the Coalbrookdale Company (Limited).

CHURCH OF ST. MARY MAGDALENE,  
CHISWICK.

This church, which was built about thirty-eight years ago for the use of the Rev. Mr. Tooth, consists, at present, of a small building, 50 ft. by 20 ft., with shallow transepts all under one roof.

At the request of the present vicar, the Rev. Arthur Murray Dale, a scheme has been prepared by the architects, Messrs. Newman & Newman, of Tooley-street, London Bridge, by which the church will be enlarged sufficiently to accommodate 500 adults, exclusive of choir. This, as shown upon the plan, will be effected by pulling down the west wall and adding a nave, aisles, baptistery, narthex, and tower, and continuing the present transepts into the aisles, forming respectively a side chapel and sacristy. The Ecclesiastical Commissioners have practically approved the scheme, and also the Bishop of London, the former having promised an endowment. The view of the interior is taken looking eastwards, and it is hoped that the work will be commenced this Spring. It will cost about 6,000l.

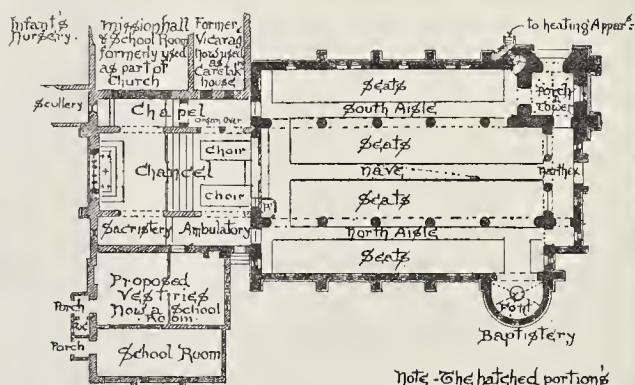

Illustrations.

THE CENTRAL PORTAL, ROUEN  
CATHEDRAL.

ONLY a small portion of the immense western façade of Rouen Cathedral is here shown, and this, perhaps, is not the most interesting, though it is, without doubt, the richest in sculpture and ornamentation. The rose-window and the upper stage of the central block belong to somewhere about the year 1515, whilst the porch below, with its beautiful pierced canopy, is considerably earlier, and of purer detail. Observe the great pinnacle on the left-hand side, and the manner in which it has been left in block for future carving. The minor entrances on either side of the principal portal form a curious contrast to it in workmanship and detail. They are of the end of the twelfth century, and though rude and coarse in execution, as is most of the carving of that early period, they do not suffer by comparison with the richer work of the fifteenth century adjoining,—indeed, some would go so far as to say that it is immeasurably superior. Whether this be the case or not, the subjects are most vigorously treated. The northern door illustrates the death of John the Baptist, and in it may be seen the daughter of Herodias dancing,—or rather tumbling, as Murray says,—before Herod. That in the south represents the Virgin with Salome, whilst the tympanum bas-relief in the centre is a tree of Jesse, a subject which the old builders seem to have been extremely fond of, if we may judge from the innumerable examples of its use which are to be met with in France, not alone in sculpture either, but in fresco, and perhaps to a still greater extent in the stained-glass windows. Who can forget after once seeing it the gorgeous twelfth-century example of coloured glass with this subject in the western lancet window of Chartres Cathedral? Rouen is rich in work of both early and late date, and will prove an inexhaustible field of work to the student.

EDINBURGH MUNICIPAL BUILDINGS.

We give this week further illustrations of the first and second premiated designs in this competition. Further consideration of the designs certainly does not lessen the surprise which we partially expressed before at the choice, for so picturesque and suggestive a site, of a design so entirely commonplace in its architectural treatment as that to which the first premium has been awarded. The plan is a very fine one, and we have always held and maintained that plan is the first thing to be considered in adjudicating on competition drawings; but surely something is to be considered besides plan. The curious thing is that architects who show so true a perception as to both the practical and effective arrangement of plan, should be apparently so entirely devoid of originality or the perception of picturesqueness and effect in architectural design. We cannot help feeling that, so far as the architectural effect is concerned, the erection of the building would be almost a misfortune for Edinburgh, though it would no doubt be a convenient and commodious building in a practical sense; not have we met with any difference of opinion on the subject so far.

Note.—The hatched portions on Plan signify Oldwork, and the tinted portions New work.

## THE BUILDING TRADES' EXHIBITION.

The eighth annual Building Trades' Exhibition at the Agricultural Hall, Islington, was opened to the public on Monday, but was more than usually incomplete and unready. Even up to eight o'clock on Tuesday evening a great deal remained to be done, and considerable spaces remained vacant, although we noticed several stands which were devoted to "fancy goods" and other articles baring not the least connexion with building. No doubt the perennial unreadiness which characterises this exhibition is mainly due to the dilatoriness of exhibitors themselves, but whoever may be responsible for it, the middle was so great even on Tuesday evening that it was with exceeding difficulty that we were enabled to take note of many of the exhibits. The phenomenal weather of Tuesday last outside the Agricultural Hall, and the cold, forlorn, and dreary appearance of the interior (for there were few visitors) together constituted as gruesome a combination of circumstances as ever Mark Tapley could have desired as a concomitant of enjoyment. As year after year passes, we become more than ever confirmed in the justice of the opinion which we have often expressed, namely, that these trade exhibitions are held at too-frequently recurring intervals to render them of any interest and value. One sees the same things, year by year, which were shown in the earlier exhibitions,—or rather, some of the same things, for many of the best-known of the old exhibitors have ceased to exhibit during the last two or three years. The consequence is that there is little if anything that is specially noteworthy in the present exhibition, and very few novelties of any kind. Owing to the incomplete condition of the exhibition at the time of our visit, and to imperfections in the catalogue, we cannot pretend to notice the exhibits precisely in the order in which the stands are numbered, and we therefore omit the numbers of the stands.

Beginning under the Gallery at the Islington Green end of the Hall, we notice that Messrs. Shanks & Co., of Barhead, near Glasgow, had a fairly-good display of baths and sanitary fittings, including a pedestal closet named the "Citizen," which is an improved form of hopper closet; the manufacturers call it a "wash-down" closet. It has excellent flushing powers. A little further on, the Britannia Company, of Colchester, exhibit a very convenient portable saw-bench, to be worked by hand or treadle, and capable of performing the two operations of boring and sawing simultaneously. The Patent Victoria Stone Company exhibit their material, not only in the form of paving and steps, but in the shape of architectural features such as balusters, which are cleanly moulded, though their pale ashy grey colour is not pleasing. Mr. C. G. Tebbutt exhibits Tebbutt's patent safety bricks for stables, yards, &c., which provide a sure foothold and permit of drainage without the use of iron channels.

Among the few novelties in the Exhibition the first that we noticed was at the stand of Mr. Ernest Homan, who shows specimens of Homan's "Venetian Marble Mosaic Tiles," which are formed of variously-coloured marble tesserae embedded in cement and afterwards subjected by hydraulic power to a pressure of 4,500 lbs. per square inch. It is claimed that the density thus obtained for the tiles renders them impervious to moisture and as durable as the hardest stone. The designs are very good, and as this new flooring material is cheap we think it likely that it has a future. One of the specimens exhibited, however, is not very carefully laid. At the same stand are exhibited specimens of Homan's quartz, granite, and metallic stone paving, and sections of Homan & Rodgers' admirable flat-brick fireproof floors.

Messrs. W. R. Crow & Son exhibit some well-made but cheap joinery. Mr. J. Matthews, of Weston-super-Mare, exhibits Poole's patent bonding-roll square-cornered roofing tiles, whose merits have before now been recognised. Messrs. J. E. H. Andrew & Co. exhibit some very compact, simple, and smooth-working and quiet gas-engines. Messrs. C. Kite & Co. have a good display of ventilators, though nothing very new. The exhibitors who trade under the name of Stent's Patents, Limited, show Stanley's patent corrugated woven-wire fireproof "lathing," for plaster-work. The corrugations impart additional stiffness to the "lathing," which is very readily fixed, and

affords an admirable key for the plaster. Stent's patent flexible and spiral steel door and gate spring, which is mortised into the stile, and concealed from view, is an excellent contrivance; it is inobtrusive, and immediately detachable at will. Messrs. Henry & Morant exhibit Henry's patent sash-line fastener, which is easily fitted to any window-sash, and, once fixed, it enables a broken cord to be removed and a fresh one adjusted without taking out the sash. Messrs. Bradshaw & Co. exhibit samples of Seyssel, Trinidad, and Limmer asphalt.

Messrs. Stuart & Co. exhibit their patent Granolithic, which is an artificial stone of great strength and durability. It is specially adapted for use as paving, and for the floors of basements, sculleries, stables, &c. It has been very largely used in all parts of the world. Turpin's Parquet Floor Joinery and Wood-Carving Company, Limited, have a very excellent display of good parquetry and carved woodwork. Messrs. Brazier & Son exhibit a serviceable direct-action water-closet, of the "improved hopper" type, having a good depth of water at the bottom. Mr. Julius Sax includes in his show of electric bells and apparatus all the latest improvements and adaptations of those useful appliances. Messrs. Broad & Co. have a good representative show of sanitary stoneware, including a new grease-trap, called the "Excello."

Messrs. Hayward Bros. & Eckstein show their admirable stall-board lights and patent semi-prism reflecting pavement lights. Their patent self-locking coalplate, which we described some two or three years ago, supplies a long-felt want. Sheringham and other ventilators in variety, and circular staircases, are among the other exhibits of this firm. Mr. C. G. Roberts shows his ingenious rain-water separators, which have also been described in our columns. Messrs. Edward Smith & Co. make a very good display of red and buff terracotta and moulded bricks, together with a variety of floor and wall tiles (some of them hand-painted) embossed and incised tiles, mosaic work, &c. Messrs. Thomas Wontner Smith & Son exhibit what they claim to be non-poisonous sanitary paints, which are exhibited under a test which seems to show that (when first applied, at any rate) they are waterproof.

Radeke's Decorative Wood is a form of wall-decoration which has some claim to notice, inasmuch as, altogether apart from the samples exhibited, good effects may be got by its use at very much less cost than that of carved work. Although it somewhat resembles, and by the uninitiated and non-technical observer might be taken to be, carved work, it is not put forward as such. It is a German product, and consists of wood-pulp laid on a thin veneer and then stamped by hydraulic pressure to the required design, which is imparted by a steel or bronze mould. A great variety of work can be produced by this process, and with a surface of almost any wood. The work, which is fairly sharp and clean in execution, ranges from "sculpturesque" figure panels to mouldings and enrichments such as the familiar egg-and-tongue. Of course the effect of under-cutting is necessarily precluded by the conditions of the process, and as the new material shows on the face of it that it is not carved work, it will perhaps not be regarded as an irredeemable sham.

Mr. Henry Bassant makes a capital display of parquetry floors and borders in various woods and of different designs. The workmanship and materials are excellent. Wilkos's Metallic Flooring and Eureka Concrete Company occupy the centre of the hall with a variety of their specialities. This Company's well-tried materials are being largely used, but we prefer to see them used constructively. The Venus of Milo, statuette size, in the ashy grey material shown, does not attract us. We spoke, at the outset of this article, of the depressing condition of things which prevailed at the Exhibition on Tuesday, when this Company's exhibits were not all in place, and were not even all on the spot. But things might have been worse, for in the catalogue we found that among this Company's exhibits was to be "The 'Jubilee' Coffin, in Specular Granite, designed and registered by Mr. W. Miller" (!) Happily we were not privileged to see this fearfully-made and wonderfully-named "casket," as our American cousins would call it, but from inquiries we made we found that it had, probably (barring acci-

dente) be on view on Wednesday or Thursday. We further learnt that it was meant to take the place of lead as an air-tight and worm-proof receptacle for mortal remains, and that it would weigh about 5 cwt. We sincerely trust (as, no doubt, will the undertakers' men, when they hear of the new "invention") that this concrete coffin will not come into use, not merely because of its outrageous name, but on account of the retrograde step, from a sanitary point of view, which its use would involve. Advocates of "earth-to-earth" burial or of cremation are not likely to give the "Jubilee" coffin much quarter.

Messrs. William Wooliams & Co. have, as usual, some excellent wall-papers on view, designed by Mr. Owen W. Davis, Mr. J. West, Mr. G. C. Haité, Mr. A. F. Brophy, Mr. A. E. Sedding, Miss Louisa Ammonier, and others. These papers, which consist wholly of raised flocks upon mica grounds, are rich in effect and non-arsenical, but one drawback of wall-papers of this kind is the facility they afford for the lodgment of dust. Messrs. Musgrave & Co. exhibit their new patent "Ulster" slow-combustion ventilating stoves, and a model of their excellent stable stalls and fittings. Mr. Joseph F. Ebner shows his admirable hydrofuge system of laying parquet-work or wood blocks on concrete, stone, or ordinary fireproof constructions, also some excellent parquet work, wood mantels, and mosaic work. Messrs. J. H. Heathman & Co. have a good display of apparatus for the prevention and extinction of fires. Hitchens's Fireproof Plastering Company have again a good exhibit, a speciality being a model of a fireproof slung ceiling as fitted by them under the floor of the ball-room at the Eyre Arms Assembly Rooms, St. John's Wood.

The Bracknell Pottery and Tile Company exhibit some good red bricks and tiles, and the same may be said of Mr. Thomas Lawrence, of Bracknell. Messrs. Humpherson & Co. exhibit another *tour de force* in lead-working, some plumbers' brasswork of excellent quality and finish, and some good water-closets, including the "Beaufort," which combines in one fixture a w.c., urinal, and slopsink; this closet, like one or two others in the Exhibition, is of the pedestal type, and consists of an improved form of hopper, with a good flush. The Tees Scoria Brick Company exhibit their patent granitoid and scoroid paving sets, made from blast-furnace slag, and very durable under heavy traffic. Messrs. M. C. Duffy & Son show their "Acme" solid wood block flooring, of which we have spoken on former occasions. Mr. J. Stanna's exhibits one of his hydraulic dinner-lifts, with hollow run, to save weight, and capable of being worked by the low pressure of the ordinary water supply. A small hand-power lift and other specialities are also shown at this stand. Messrs. J. Wright & Co. exhibit their fireproof "fixing blocks" in various applications.

The St. Paneras Ironwork Company exhibit models of stable fittings, some iron staircases, and one or two delicately-executed wrought-iron grilles. Messrs. Steel & Garland exhibit the new patent "Marlborough" grate, which admirably embodies the main principles of construction and arrangement advocated by that indefatigable worker in the cause of fireplace reform, Mr. Pridgin Teale. Messrs. E. & J. M. Verity exhibit the "Rumford-Armstrong" and the "Rumford-Teale" grates,—not "Rumford," as erroneously printed on the catalogues and circulars. These grates have much to recommend them, and deserve the attention of visitors. Messrs. Ashton & Green (Limited) exhibit some very good and useful ranges and kitcheners, besides slow-combustion stoves, grates, and chimneypieces.

On the north side of the hall Messrs. Eddington & Stevenson exhibit various useful items of brickmakers' and contractors' plant. Perhaps the largest space occupied by any exhibitor is allotted to Messrs. A. Ransome & Co., who show in action a variety of wood-working machines, several of them being novelties. Among them we may name a new planing and moulding machine, which is very compactly arranged. It is capable, it is claimed, of doing a given quality of work at about twice the speed of ordinary machines for the same purpose. Another novelty is a large band-saw machine, readily adaptable for the sawing of deals, which it does much more quickly than

the frame-saw. One or two ingenious machines for sharpening saws should also be looked at by visitors to this Stand. Messrs. F. Rosher & Co. exhibit a good variety of bricks, tiles, copings, diapers, strings, &c., which deserve inspection. Among other exhibits of the kind in the hall is the safety casement sash exhibited by the Patent Sliding Casement Sash Company, and which was described and commended by us last year.

The principal exhibitors in the arcade entrance from Islington Green are Messrs. Chambers, Monnery, & Co., who show their well-known iron wall-ties, and a good assortment of builders' ironmongery. They also make a varied display of stoves, grates, and kitcheners. We may direct particular attention to the "As you Like it" register grate, which we have on a former occasion described, and the "moveable-canopy" grate.

#### ARCHITECTURAL SOCIETIES.

**Auckland Institute of Architects (New Zealand).**—We have received a report of the fifth annual meeting of the Auckland Institute of Architects, which was held on February 1st, Mr. W. F. Hammond, president, was in the chair, and delivered an address, in the course of which he said the membership of the Institute has been placed upon a broader basis, similar to the parent Institute in Great Britain, enabling persons interested in art to become honorary members and associates. The rules of the Institute have been revised. Connected with the Royal Institute of Architects in Great Britain, we enjoy a relationship which will doubtless tend to the mutual interests of both Institutes. We have added another secretary to our officers; Mr. Mahoney, jun., has become the first honorary secretary appointed under the rule adopted by our parent Society. The membership has increased by six full members, three associates, one honorary member, and nine honorary associates. During the session we have been the means of bringing under the notice of the public many products of the colony, such as limes and building stones. Many valuable papers have been read upon subjects connected with building—viz. timber; burnt clay for concrete works and roads as superior to scoria; the safety of people congregating in large buildings in cases of fire; permanent material, &c. The subject of the building regulations of the city is under the consideration of the Council, together with other subjects which are being prepared to lay before the members. A competition has been originated for the encouragement of planning and designing amongst our pupils. This is the first, which emanates from a gift of two members, Messrs. Grainger (of Melbourne) and Mr. Jackson, to be established as a prize fund, and capable of being increased, for the purpose of offering annual prizes, under the direction of the Institute. We have taken measures to obtain reform in competitions, similar to those adopted by the Royal Institute of British Architects. It was moved and seconded that the President's address be adopted and printed in pamphlet form. The Treasurer then produced the balance-sheet for the year, which showed a most favourable result, representing about £70 to the credit of the Institute, deposited in the Auckland Savings Bank. The following officers were then elected for the year:—Mr. H. G. Wade was unanimously elected president; Mr. E. Bell, vice-president; Mr. F. H. White, treasurer; Mr. T. Mahoney, hon. secretary; Mr. F. Hammond, secretary; and Messrs. Hammond, Baber, and Crey, members of Council; Dr. Murray Moore was nominated as an hon. associate; and Mr. J. Sanderson, architect (of New Plymouth), was unanimously elected a member.

**Birmingham Architectural Association.**—The ninth ordinary meeting of the current session of this Association was held at Queen's College, on Tuesday evening last, Mr. W. Doubleday in the chair. Mr. John Cotton (vice-president) gave his annual address, in which he dwelt upon the coming necessity for a more systematic training for architects than that at present in vogue under the pupillage system. A vote of thanks, proposed by Mr. Victor Scruton (hon. sec.), and supported by Messrs. W. H. Kenrick, H. H. McCounal, and W. Doubleday, was unanimously accorded to the author for his address.

**Edinburgh Architectural Association.**—On the

10th inst., this Association met at 20, George-street, Mr. Hippolyte J. Blanc, the president, in the chair. After the transaction of some formal business, Mr. David MacCibbon, architect, read a paper on "Architecture in the South of France," in which he drew attention to the ancient history of Southern Gaul, remarking that its first civilisation was entirely Creolian in character, the effect of which was apparent in its ancient monuments, although these belonged chiefly to the first three centuries of the Roman Empire. This part of France was particularly rich in Classic remains, most of which were illustrated, and described. The continuance in Christian buildings of the Roman style of architecture during the early centuries of the Christian era and throughout the Dark Ages was then dwelt upon and illustrated by buildings still existing in Southern France.—On Saturday last, the members visited Liberton House, Liberton Tower, and Inch House. The party, numbering about forty, were conveyed by rail to Newington, and from thence proceeded to Inch House. Mr. John McLachlan, the leader of the party, read a paper in which he stated that, architecturally, the house of Inch was very easily described. When stripped of its modern excrescences it was simply a Scotch L-shaped mansion of the beginning of the seventeenth century. The party afterwards visited Liberton House, and Mr. Cunningham, the tenant, gave a very lucid explanation of the architectural features of the building. He will probably read a special paper on the subject before the Association in about a month. Mr. H. J. Blanc, the President, before leaving, expressed the thanks of the company to Mr. Cunningham. Arriving at Liberton Tower, Mr. McLachlan gave an interesting account of its situation, its more prominent features, &c. The tower was without doubt one of the fifteenth century, similar in many respects to Elphinstone Castle, Rosyth Castle, and many others. Mr. McLachlan was cordially thanked, on the motion of the President, for his interesting explanations.

#### THE VICTOR EMANUEL ARCADE, MILAN.

THE Victor Emanuel Arcade (La Galleria Vittorio Emanuele) at Milan having fallen into a state of dilapidation, a commission (presided over by Sig. Carlo Maciachini) was appointed by the municipality for the purpose of considering the various proposals which have been made with a view to its restoration, and deciding what steps should be taken for that purpose. The Arcade was built in the years 1865-67 by a public company (the City of Milan Improvement Company) which was launched in England under the auspices of Baron Grant and the Crédit Foncier of England. It was erected from the designs of Signor Giuseppe Mengoni, who met with his death during the progress of the works by falling from a scaffold. The late Sir (then Mr.) Digby Wyatt was a director of the Company, and took an active part in the work of constructing the gallery, and in recognition of his services was decorated with the Cross of the Order of St. Maurizio and Lazzaro by the King of Italy, and was made an Honorary Member of the Royal Academy of Arts of Milan.

The first stone was laid by King Victor Emanuel on the 4th of March, 1865, and the Arcade was publicly opened by the king on the 15th of September, 1867, the time occupied in its construction having been thirty months, during which time about one thousand workmen were employed upon the building. There is a description and interior view of the Arcade in the *Builder* for 1868 (vol. xxvi., pp. 297-9), and a view of the entrance in the same volume (p. 491).

Cavaliere Broggi proposes to renew the decorative portion of the design with natural coloured terra-cotta, and to veneer the rest of the building with red Verona marble in slabs. The cost of the work, including the scaffolding, but not including the cost of superintendence, is estimated by the architect at 250,000 lire (10,000*l.*).

The Dell' Ara Company (Ditta dell' Ara) suggested the employment of majolica in lieu of terra-cotta for the ornamental parts, and marble for the plain surfaces. This would considerably increase the cost, which is estimated by the author at 350,000 lire, or 12,000*l.* As an alternative the Company proposed the substitution of kaolin or China clay

for majolica for the decorative features, which would reduce the total expense to 275,000 lire, or 11,000*l.*

Other designs were submitted by Signor Novi, of Genoa, and Signor Minnai, of Milan, but none of the designs met with the approbation of the Commission, who recommended the refacing of the whole of the building with marble, the replacing of the plaster statues by marble, the restoration of the frescoes, and the lighting of the arcade by electricity. The cost of this proposition is not stated, but it must necessarily exceed the cost of the designs by Sig. Broggi and the Dell' Ara Company.

#### QUARRY-WORKED STONE.

SIR,—Having had considerable experience in the conversion of stone by machinery, both in the quarry and on the contract, I can, speaking generally, corroborate Mr. Hugh Gough's view [p. 411, ante] that stone should be worked soon after it is quarried, and this is more particularly the case when it is moulded. There is, no doubt, a long-standing idea that stone should be well-seasoned before it is worked; but what do we find on the softer and more absorbent stones sold as seasoned? Simply a hard outside crust. If the stone was seasoned right through like a block of wood it could possibly be worked with advantage on the contract, but otherwise the outside is formed by the air is simply removed, and a much more perishable surface is exposed. I take it there are other reasons why stones perish in large towns besides their exposure to a deleterious atmosphere; for instance, stones used of an improper character for the work. I have seen stones short and crumbly or laminated in their nature used for moulded work simply because they can be worked easily and make a show, at any rate for a time. These can be bought cheaply; and as extreme, or what may be termed unfair, competition is at present the rule, very little of that work described by the Elizabethan Poet Churchyard as being,—

"So bravely wrought, so fair and finely framed,  
That to the world's end the beauty may endure,"

is to be seen: would that it were otherwise.

Author of "Stoneworking Machinery," &c.

\* \* This must close the correspondence. Our own comment on it will be found among "Notes" of this week.

#### THE BUILDING ACT (AMENDMENT) ACT.

##### TEMPORARY STRUCTURES.

SIR,—A matter of some importance to builders and shopkeepers rebuilding has lately been brought forcibly to my notice. It is as follows:—

I am carrying out the rebuilding of business premises, and as the owner desired to carry on his business during the rebuilding, part of the shop was temporarily enclosed. As the work proceeded it became necessary to erect a temporary shop on another portion of the site. The District Surveyor required that a special application should be made to the Board of Works under Section 13 (Amendment Act), and, needless to say, this entailed considerable delay.

Following the section referred to, there is an exemption for "any wooden structure of a temporary character erected by a builder for use during the construction, repair, or alteration of any building."

I contend that this exemption applies to all temporary structures, whether for the builder or occupier, during rebuilding. The District Surveyor is of opinion that the exemption applies to temporary structures for the builder's use only.

I should be glad if you, or any of your readers, could inform me if there has been any legal decision on the point.

I have made several inquiries, but have found great difference of opinion on the matter. II.

\* \* We are of the same opinion as the District Surveyor in the case, that the exemption refers only to structures for the contractor's use; but we have not seen any legal decision on the point.—Ed.

**Design for Art Museum, Geneva.**—In reference to this design, of which an illustration appeared in the *Builder* of February 12th, Herr Koch, the author of the design, writes to say that his design, though nominally a second premium one, received the highest premium awarded in the competition for which the drawings were made, the first premium not having been awarded. The competition was rather for an ideal building than for one to be carried out; two proposed sites being given for treatment by competitors, both of them presenting considerable difficulty owing to the variety of levels. We hope that Herr Koch may nevertheless have an opportunity of carrying out his fine and stately design.

OPEN SPACES IN THE REAR OF BUILDINGS.

BOVILL v. GIBBS AND INNER.

THE defendants, who are builders, were summoned to the Highgate Petty Sessions by Mr. Bovill, District Surveyor of St. Pancras under the Metropolitan Board of Works, for neglecting to provide 40 ft. of air space at the rear of a building,—a shop and residence,—in High-street, Highgate. In the first instance the summons was dismissed upon the defendants' contention that the case was not commenced within the time specified by the Act. A case was taken to the Queen's Bench on this point, and the Court (as stated in last week's *Builder*, p. 410, *ante*) overruled the decision of the magistrates. On Monday last the case again came before the Bench on the main issue.

Mr. Ward, barrister, appeared on behalf of the Metropolitan Board of Works, and Mr. Thomas Cleary represented the defendants.

It having been proved that there was less than 40 ft. air space at the rear of the building, which has been sold and is occupied, Mr. Ward asked the Bench to make an order upon the defendants to provide the requisite 40 ft. of air space.

Mr. Cleary claimed a right to have the summons dismissed on the ground that he had provided ample light and air space, not from the back, but from a side road. The place being well lighted and ventilated from the side, he contended that he was not bound to provide an inch of space at the back. He was aware of the Act setting forth that there must be 40 ft. of air space at the rear, but it must be read with the more recent Act, which sets forth that this must be done unless all the rooms are lighted and ventilated from a street or alley adjoining.

Mr. Bodkin said it was true that a building might be lighted and ventilated in that way, provided the builder got the permission of the Metropolitan Board of Works to so light and ventilate it; but in this case defendant had not obtained the consent of the Board of Works, and consequently they were bound to provide the 40 ft. of air-space in the rear.

Mr. Cleary said Mr. Bovill passed the original plans showing the lighting from the side, and that he submitted was equivalent to the consent of the Board of Works.

Mr. Bodkin held that the consent of the District Surveyor was not the same thing as the consent of the Board of Works.

Mr. Cleary said Mr. Bovill not only passed the plans but visited the building from week to week, and it was not until months after the building was completed that he complained of the want of sufficient air-space. Under these circumstances, how could the Bench order him to pull the premises down, which was what he would have to do if he had to provide 40 ft. of air-space at the back?

Mr. Bovill was examined, and denied that he passed the plans. They were certainly submitted to him, but he had no power to pass them. When he saw them, however, he pointed out that they were not in accordance with the Act.

Mr. Cleary said it would be extremely hard if the Bench made the order asked for, considering that the building was supplied with quite as much light and ventilation from the side, as 40 ft. of open space at the back would give.

Mr. Bodkin said, however hard it might be, the Act must be complied with. The Bench would make an order for the open space to be provided at the rear in accordance with the Act, and give defendants two months to carry out the order in. They would also have to pay the costs. The two months would give them time to try and get the consent of the Board of Works to the building being lighted and ventilated from the side.

and dated the 14th of January, 1885, as the plaintiff's invention did its work without the assistance of an air-valve, on the other hand, the evidence showed that the alleged anticipations consisted at the utmost of the exhibition of waste preventers acting by means of an air-valve, and consequently the defence failed. After remarking on the straightforward way in which the witnesses on both sides had given their evidence, and dealing with the other points in the case, his Lordship decided that the plaintiff was entitled to an injunction with an account of profits, and costs on the higher scale.

An application for a stay of execution pending appeal was refused.

The Student's Column.

FIELD WORK AND INSTRUMENTS.—XII. Surveying Instruments.

IX.—THE THEODOLITE (continued).

THE importance of paying careful attention to accuracy in setting up the theodolite is evident when it is remembered that an arc of a single minute subtends a distance of from 4½ in. to 4½ in. in a radius of 20 chains or one quarter of a mile. Figs. 23 and 24 show the usual form of wall-plate adopted for setting up the instrument over a permanent station, such as a brick or stone pier. When the coping stone is being fixed it

the tripod head to suspend the plumb-bob from, is preferable to a long-shanked hook rigidly fixed, as it adjusts itself better to a vertical line when the legs stand upon uneven ground.

With the view of facilitating the setting up of the theodolite over a given station point, and to maintain the line of the plumb-bob in the same line as the vertical axis of the instrument, various kinds of centering stands have been manufactured. Messrs. Troughton & Simms attach to all their three-screw combinations of parallel plates connected with theodolites a centering locking-plate, in which provision is made to allow of a motion of 1 in. in any direction for the adjustment of the plumb-bob over the station point, the centering-plate being tightened after setting over the station by a screwed washer-plate. This plate is somewhat similar in shape to the washer-plate shown in fig. 21, but has a raised thumb-piece at its outer edge, for screwing up or down the collar which holds the vertical axis of the instrument. By this means the locking-plate and the instrument are both clamped to the tripod-stand, or released without the addition of extra clampscrews. Messrs. Troughton & Simms also make a framed stand, shown in fig. 25, with an arrangement of plates shown in section in fig. 26, and in plan in fig. 27. With the usual form of tripod, the range over which

FIG 25

IMPROVEMENTS IN WATER-WASTE PREVENTING CISTERNS.

HUMPHRESON v. SYER.

THIS was an action tried in the High Court of Justice (Chancery Division), before Mr. Justice Kekewich, on the 7th inst. It was brought by Mr. Frederick Humpherson, trading as Humpherson & Co., of 297, Fulham-road, South Kensington, and formerly of 331, King's-road, Chelsea, against Mr. Milton Syer, of 35, Rye-lane, Peckham, for an injunction to restrain the defendant from infringing his Patent, No. 2,492, of the year 1885, for an improved waste-water preventer, chiefly used for flushing water-closets.

The defendant, by his pleadings, denied the infringement, and set up the plea of want of novelty, the impropriety of the alleged invention as subject matter for a patent, that the plaintiff was not the first and true inventor, and insufficiency of the specification.

Mr. Aston, Q.C., and Mr. B. P. Newman were for the plaintiff, and Mr. Moulton, Q.C., and Mr. W. R. Bonsfield for the defendant.

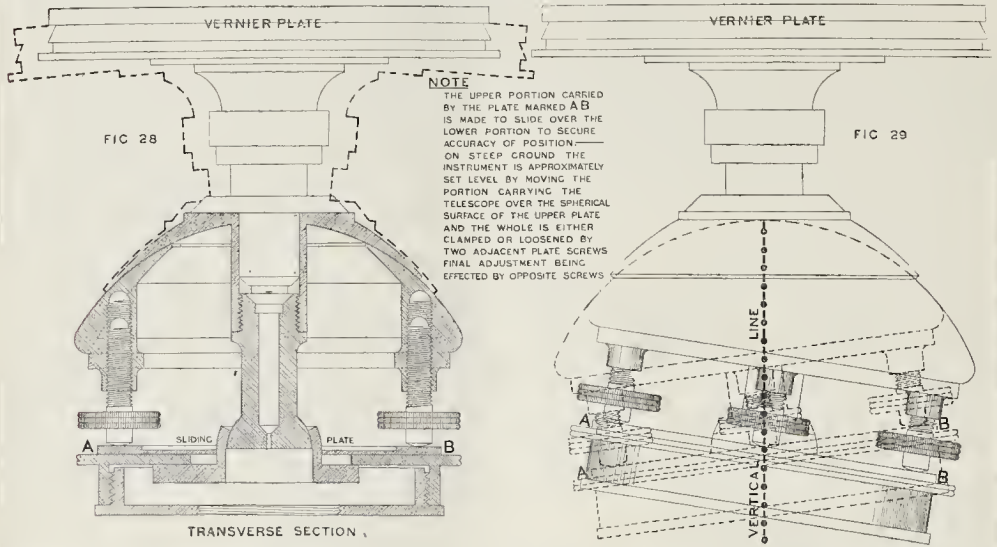

Mr. Justice Kekewich, in delivering judgment, said the principal defence was that the plaintiff was not the first and true inventor. In the first place, it was urged that the patent of the plaintiff was forfeited by Winn's patent, No. 3,582; but his Lordship was of opinion that this was not the case. He also declined to adopt the suggestion that there was an injunction by defendant's patent No. 505,

should be hedged true and the upper surface squared, so as to save trouble in subsequently working with the instrument when setting it up in this position.

With the use of an ordinary tripod head much time is employed in levelling the instrument over a fixed peg or station point, during which time the assistants are generally kept waiting. The plumb-bob is usually hung from the centre of the head of the tripod by means of a piece of stretched thin cord. A short piece of chain attached under the centre of

the head may be shifted in adjusting the plumb-bob is necessarily very limited, but with a framed stand a larger opening in the base of the system can be introduced for this purpose. The theodolite is fixed at B by the ordinary screw attachment to the hosed plate marked C. The middle plate marked E has two pivot connexions, the centre lines of which meet at right angles to one another at the centre of the plate. To one of these pivot connexions, the top plate is attached by a screw-bolt, which is secured by a

THE HOFFMAN TRIPOD HEAD

capstan-headed nut, shown at the left-hand side of the section. To the other pivot connexion the lower plate is attached in a similar way at a point near G in plan. The lower plate marked K is connected to the framed stand at the points marked H. The radial movement of the top plate over the middle plate and of the middle plate over the lower plate is regulated by a quadrant slot in the middle and lower plates, and the circular hole of 3 in. diameter in the lower plate allows ample play for the adjustment of the plumb-bob line to the vertical axis of the instrument. The top plate is clamped to the middle plate in any required position by the thumb-screw marked D, and the middle plate is clamped to the lower plate by the thumb-screw marked F. Thus the theodolite can be levelled first, when approximately set up over a station point, and finally moved accurately over this point by adjusting the centering plates.

The Hoffmann tripod head, shown in figs. 28 and 29, is an American invention, combining the action of a ball-and-socket joint with the rigidity of the ordinary parallel plates. The upper plate is made in the shape of a circular curve, concentric with the half ball and socket-joint, and the hook or chain from which the plumb-bob is suspended, is fixed at the centre of these curves. The elevating screws to the upper plate rest upon a sliding-plate, and their centre lines will at all times be parallel to the vertical axis of the instrument in any position that the horizontal limb and stage over which the telescope is mounted may assume with regard to the tripod head. The amount of range available for thus setting the head of the stand level upon steep ground is indicated in fig. 29. The shifting head of the tripod and its sliding plate are clamped by tightening any two adjacent screws, final adjustment of the levels Q and T being effected by opposite screws in the usual manner.

**The Proposed New Municipal Buildings at Kingston.**—The carrying out of the proposed new buildings at Kingston by the Corporation, which was noticed in the *Builder* a short time since, is, it appears, to be deferred for the present. A meeting on the subject, convened by the local Ratepayers' Association, has just been held, at which a resolution was passed to the effect that, considering the heaviness of the rates and the large expenditure which the sewage scheme will entail, it is inexpedient at the present time to proceed with the scheme for the erection of municipal buildings. This resolution formed the subject of discussion at a subsequent meeting of the Corporation, when it was eventually decided to postpone the erection of the proposed buildings.

## Books.

*The Naturalistic School of Painting.* By FRANCIS BATE. London: Published at the Offices of the Artist, 185, Fleet-street.

**T**HIS is a very interesting book on modern art, though it is rather difficult to epitomise within a reasonable space all the specific doctrines of the new school which are treated of in it.

Ignoring as false much of the treatment of light and shadow by artists of the present day, our author claims that, turning anew to nature, he and his followers have so far advanced in the knowledge of atmosphere, light, and colour as to have had disclosed to them "mysteries the full force of which had never been dreamed of."

Starting with the proposition that "the first impression of a good picture must be the first impression of nature, and all the qualities which reveal themselves upon examination of nature must be subordinate to the first impression of a picture and subsequent in their appeal to notice," he goes on to point out that this first impression consists of light and colour, and that our perceptions of form, &c., such as houses and trees, only follow on closer inspection.

As to shadow, Mr. Bate is, no doubt, philosophically correct in asserting that during sunshine objects in shadow, such as the side of a street, are, in fact, no darker than they were before the sun shone on them; in his own words, "Light has been added to one side, and not taken from the other."

On these premises, and fully admitting the immense difference between the light of the sun and the highest tints, even of the purest white, at the command of the artist, the shadows and half tones, he contends, should be painted true in tone, and the high lights as true and bright as they can be got; by this means it is claimed that "two-thirds of the painting can be quite correct, and it is not the artist's fault that the remaining third is not correct also."

Now, if the work of the artist is to be confined to what he sees as a first impression (though this proposition is qualified with respect to immediate foreground objects in a later part of the book), no doubt light and colour will predominate, and as certainly form will be absent or very vague, but we do not think that any man who has accustomed himself to the study of nature would be satisfied to be bound within any such limits. It is true that the educated eye may take in far more at a glance than could the casual observer; but what would the work of the architectural artist, for instance, be worth on such conditions as these?

It is quite certain that in all human art we must be content to use our brightest pigments to constitute our high lights, as against the transcendent illumination of sun-light; but, ingenious as the impressionist's theories may be, we submit that a far truer impression of the light, shadow, and tone of nature is conveyed by a picture possessing a due contrast between the lights and shadows, even though, to produce that contrast, it has to be painted in a lower key than that of nature, to compensate for the inevitable fact that the lights must be so far below those of the sun.

The impressionist theory, on the other hand, by keeping the shadows proportionately much too high to give value to the lights, must in practice destroy all balance, and turn out tame and feeble in effect, and the further of the two from the real impression of the original.

Whilst dissenting from some of the author's theories, we have read with great pleasure the chapters upon colour in shadow, reflections, broken surface in lights, &c., through which we have not room to follow him, but for which we must refer our readers to the book itself.

We perfectly concur in the opinions he expresses in condemnation of the objectionably heavy black or brown shadows we sometimes see even in otherwise good work; and in the importance of retaining a sense of local colour in them and keeping them cool, with warm lights, in outdoor work. The student will find much that is interesting and instructive on these subjects, as well as on those of atmospheric effects, transition of colour from light to shadow, and other kindred topics treated of in these pages.

The Naturalistic school lays great stress

upon observing the "centre of vision" in pictures, calling special attention to the fact "that the objects near and around it are most distinctly seen; further from the centre we see indistinctly; while outside the base of the cone of visual rays all is blurred."

This natural law, which it no doubt is, applies to objects near the eye in a far greater degree than to those at a moderate distance, for then the lateral range of vision rapidly increases.

In landscape, therefore, where even the foreground is generally supposed to be at some distance from the spectator, the observance of this rule is less imperative than in some figure-pieces, and more especially in portraiture. The "vignette" seems to suggest that this law has been long recognised in art; but may it not be observed with something like exaggeration when a picture is gradually shaded off on each side to such a "blur" as to disfigure the whole work, unless the nose of the spectator be kept close to the canvas?

At the head of Chapter viii. Mr. Bate quotes the reply of Constable to the question of Sir George Beaumont as to the style in which he intended to paint: "In God Almighty's style, Sir George." And well we know the result of his labours as a worshipper at Nature's shrine. Like Turner, he painted light, from the bright sunshine of midsummer to the fitful gleams in light and shadow of a showery or stormy day; nor can the work of either of these great men be accused of being deficient in tone, yet they depended for their impressions of nature upon contrasting their high lights not only with deep shadows, but also with the delicate gradation of half tints, on the importance of which in the production of tone the writer of this book very justly lays great stress, but which, with deference to him, is no new thing among artists of reputation.

Many of us who can look back a few years must call to mind many supposed fresh departures in art, often based on far-differing theories. Some thirty and more years ago there arose a school, commenced almost in a vein of caricature, while possessing abundant detail and elaborate and often grotesque form, it had at first little comeliness, but it seems now to be absorbed into the art of the day (a more vigorous and careful one, probably, than that which preceded it), till almost every vestige of its original features are lost. In like manner let us hope that whatever is true and good in the present movement, almost the reverse in theory of the one referred to, may survive, and tend to the progress of English art, not splitting its practice into sects and schisms, but strengthening its growth as a united national school.

Mr. Bate's book is well, and in parts eloquently, written, and the sincere love of nature which is evident throughout it claims the sympathy of every true admirer of nature or of the painter's art.

*Iron Bridges of Moderate Span: their Construction and Erection.* By HAMILTON WELDON PAXDEN, late Inspector of Ironwork to the Salford Corporation. London: Crosby Lockwood & Co. 1887.

This little book by a practical engineer is the latest addition to Vesley's Rudimentary Series, and is typical of the works by which the perennial youth of that noted series is maintained. The author describes in very close detail the manufacture and erection of iron bridges of from 100 ft. to 150 ft. span, and shows throughout an intimate knowledge of the actual requirements for carrying out such work satisfactorily, but we are not quite sure that we grasp his meaning when he tells us "the working conditions of the bridge are in no sense fixed data, and even as the nigger could not count one pig of a drove, because he ran about so, so in like manner with a bridge." The fact is, engineering writers too frequently get into pitfalls when they attempt to be "humorous."

Commencing with the selection of the site, and the mode in which the foundation is determined from borings, considerable emphasis is laid upon the necessity for a thoughtful appreciation of the manner in which the parts have to be prepared and fixed together, particularly as regards the preparation of the drawings and specification; and we are then introduced to the first operation upon the wrought-iron plates selected for the bridge, viz., the testing. The ordinary tests are de-

scribed, together with the appearance of the samples, and what is to be learned from them. The general design of the main girders is illustrated, and various modes are shown of connecting the main to the cross girders. The drilling-out of the work in the shop, and the drilling of the plates, receive ample attention, but the author reverses the current opinion when he says that a ring of iron round the punched hole is injurious, while this is not the case with steel. He has evidently had "large" experience, for he mentions girders whose flanges consist of "twelve, fourteen, or even many more plates piled one upon another," and rivets with a length of "18 in. or more," but he was probably not thinking of these when he described the rivets as being "1½ diameters longer than the hole," without any mention of the number of plates they pass through.

We are next taken to the site, and can mentally see the erection being accomplished, so minute and careful is the statement of the various details. The remarks are not confined to the particular example selected; every opportunity is taken to interpolate "wrinkles" and hints likely to be of service to any one about to engage in the duty of inspecting ironwork. The description is, however, marred by sundry blemishes of diction, as, "replacal," "judgmentally," "Tweddle" (for R. H. Tweddell), &c.; but these may be forgiven for the sake of the valuable technical information disclosed, with which none but practical men are personally acquainted. The author tells us that he "has had a good deal to do with contractors for ironwork, and though he has met some 'sharp' hands, the far greater number have been till their death, or those living, are as upright, honourable men as could be met with." We are pleased to hear this, but should prefer to see it stated in Queen's English, especially in Jubilee Year. The remainder of the book consists chiefly of extracts from the writings of Clark and Fairbairn; papers read by Graham Smith; an American specification conched in general terms, the contractor being left to make the design; and an English specification for a lattice-girder bridge of 140 ft. span.

To the "iron man" in a drawing-office the book will be very acceptable; the literature on the subject is so extremely sparse that the smallest contribution is welcome, and this work contains just the kind of information that is most difficult to obtain.

*Expansion of Structures by Heat.* By JOHN KELLY, C.E. London: Crosby Lockwood & Co. 1887.

THE object the author has set before him is to show the effects of heat upon metallic and other structures. The aim is a laudable one, for this is a branch of physics upon which the engineer or architect can find but little reliable and comprehensive data in books. It is true that a certain amount has been written in various works, more especially those relating to iron bridges, but the subject has always, so far as we are aware, been treated as subsidiary to other and wider considerations. After a short preliminary chapter, in which coefficients of expansion and contraction for various substances are given, the author proceeds to lay down general rules, and from them to formulate the data, so that calculation can be made as to the effect of expansion and contraction on inclined straight bars, bent or curved bars, rings, &c. Amongst other substances dealt with is india-rubber, which, unlike most other substances, contracts when heated. Examples of the effect of these rules are given as to girders, chains, pipes, &c. For investigating the laws which govern the expansion and contraction of simple frames, exposed to atmospheric influence only, the author assumes (1) that all bars of any frame are formed of materials having the same expanding and contracting coefficients; (2) that all bars of any frame are subjected to the same variations of temperature at the same time; and (3) that all bars of any frame are at liberty to expand and contract freely. Working with these assumptions, the author goes on to explain that an equal rise in temperature will produce a relatively equal expansion of parts, and is at considerable pains to show that such expansion will not change the figure, although it will increase the size of a structure.

The next section of the work treats of complex frames and plates, in connexion with which subject many useful instances are given, and although perhaps the explanations may appear

to those versed in the subject somewhat diffuse, it is well sometimes to remind students of facts not altogether unknown to them. We next pass to another part of the work, which the author considers under two heads, viz.:—1st, the power of bodies to absorb and conduct heat; and 2nd, the force developed in bodies during expansion and contraction caused by variations of temperature. Under the first head the action of heat on metal frames when exposed only to the action of the atmosphere, or to the direct action of the sun's rays, is discussed, and structures surrounded by earth or water are afterwards treated of from the same point of view. Under the heading of the "Mechanical Force of Heat" the strengths of various materials are given, and the changes of temperature caused by sudden application of force are considered. As a rule the author expresses his meaning in plain and sufficient language, but in the section of the work we have now arrived at,—that relating to the work of expansion and contraction,—we find more difficulty in following him. He says "the elementary principle that action and reaction are equal holds good in the case of expansion and contraction, as well as of all other applications of mechanical force." A horizontal bar is supposed to be at liberty to expand by heat in both directions, in which case the centre will be a fixed point. This may be accepted, but when an obstacle is placed at one end of the bar we fail to see how the rules given for finding the neutral section apply. The obstacle is supposed to offer a definite resistance, P; but no count is taken of the resistance the bar itself offers to expansion by reason of its friction against the substance it rests upon. To find the neutral section, or section of no motion, this latter element is necessary. In one instance, however, P is supposed to be infinitely great, and then the neutral section is at the extreme end of the bar which is contiguous to the obstacle. Leaving out the friction of the expanding bar, as the author does, the neutral section would always be in that position, but this does not accord with the results attained by the author's mode of working. It would seem, then, that the principles the author lays down are just, but that they are not duly considered in the formulæ. The movement of inclined bars downwards, when resting on a plane, in which case P is the gravity of the mass, is treated in the same manner, and a practical illustration is given in the movement of the lead on the roof of Bristol Cathedral, and another in the creeping of rails, an effect so noticeable in the case of the St. Louis Bridge,—which is more generally ascribed to the working of the traffic, as the author points out. In discussing the practical bearing of expansion by heat, the author points out that it has been calculated that in the Britannia Bridge the unequal expansion, caused by one part being in sunshine and the other in shade, will develop more strains in an hour than would be caused by the heaviest rolling loads or the most violent storms. It is comforting, therefore, to learn that the error allowed by practice in the length of bars between pinholes is  $\frac{1}{4}$  in.; and further, that under the most extreme conditions of distribution of sunshine and shade, the expansion and contraction of any parts of a structure will not cause a greater variation than this, supposing the bars of which it is composed are not more than 5 ft. in length. The Crystal Palace is also instanced as an iron and glass structure of great length, and which has not been appreciably injured by variations of expansion and contraction, although the conditions are more than ordinarily unfavourable. "In short," the author says, "it has been shown that it is only in exceptional cases that special calculations need be made with reference to strains caused by an unequal distribution of temperature." Then follow some remarks on deflection, the effects of friction, and the book concludes with a short chapter on masonry structures.

*Elements of Geodesy.* By J. HOWARD GORE, B.S. New York: John Wiley & Sons, 15, Astor place, 1886.

ANY one interested in the historical literature of this subject will accept Mr. Gore's book on the "Elements of Geodesy" as a valuable addition to his library. The object of the work is clearly stated in the preface, and so far the author has kept to his text, but the book is scarcely likely to be of service in this country, as it deals with surveying upon a large scale

only, and supplies numerous mathematical formulæ and calculations which apply more to trigonometrical work in new countries, than to the comparative limited areas that have to be specially surveyed at home in connexion with new works. Pages 28 to 35 contain some practical advice connected with the adjustment and method of observation in telescopic instruments. The pages which follow are, however, of far too mathematical a character to be studied by the ordinary surveyor. We find a useful index at the end of the work, and we praise the author for enumerating his authorities at the end of each chapter. These authorities are among the best known, but it is not every author who has the privilege of a lady's help in such an abstruse treatise. We notice in the preface that the author expresses his indebtedness to his friend, Miss Lizzie P. Brown, for her suggestions, and for the elimination of errors that otherwise would have seriously blemished the work. Under these circumstances, Miss Brown is certainly entitled to share with the author our praise of his book.

*Graphic and Analytic Statics in their practical Application to the Treatment of Stresses in Roofs, Solid Girders, Lattice, Bracing and Suspension Bridges, Braced Iron Arches and Piers, and other Frameworks.* By ROBERT HUDSON GRAHAM. Containing diagrams and plates to scale, with numerous examples, many taken from existing structures. Specially arranged for class-work in colleges and universities. Second edition, revised and enlarged. London: Crosby Lockwood & Co. 1887.

WHEN a work of this character reaches a second edition in a short time, it is sufficient proof that the subject at least is one that commands attention, but it does not always follow that the method of dealing with it is the best possible. For instance, in constructing the reciprocal diagrams of framed structures, Bow's practice of lettering the spaces, for which figures can equally well be used, so very much facilitates the construction of the diagram that it might well have been adopted here; even after the student has attained a fairly ripened experience he finds this an advantageous method, particularly where any of the force-lines in the diagram overlap each other, and it may also be applied to polar diagrams where these relate to forces upon structures. And again, in any book "specially arranged for class-work in colleges and universities" we expect to find a systematic arrangement of the whole, with a gradual building-up of the subject from elementary principles, yet it is not until we reach p. 33 that we are reminded of the necessary and sufficient conditions for equilibrium in a system of forces, viz., that the force polygon and the polar polygon will simultaneously close; although the preceding pages are occupied with the discussion of forces under various conditions. We seem throughout the book to be repeatedly starting in new directions, and should imagine that with more experience in teaching, the author would desire to re-arrange much of the matter therein contained; in other respects the work is fairly creditable. There are many good points in the author's handling of specific subjects, and a considerable amount of valuable analysis is presented in combination with the corresponding graphic treatment of various cases. A useful feature is the addition of practical examples at the end of each chapter in the form of question and answer, mostly relating to existing structures, of which some carefully-drawn diagrams are given. Chapters I. to VII. of Part III. show the most connected order, and towards the end give evidence of originality. They comprise the general theory of direct stress, extension under stress, couples of forces, resultants and centres of force, centres of gravity, bending and other moments, moments of inertia, and, lastly, an investigation of straight beams and girders under various loads, and in equilibrium. The book closes with a new and interesting chapter on the Culmann Arch method, the principal facts of which have been previously made public by the author in the pages of one of our contemporaries. The science of graphic statics, although of modern growth, is progressing with strides proportionate to its facility of application and the consequent interest it evokes. Its practical adoption, however, depends so largely upon the manner in which it is put before the rising generation that it behoves every author to take the utmost pains to so weave his facts together

that their necessary sequence shall be patent to all, and thus encourage the student to follow the argument until he sees and appreciates the advantages of mathematical analysis. There seems to be a growing tendency among writers on statics to assume that because the application of mathematics secures greater accuracy, no results worth mentioning can be obtained otherwise, whereas we all know how little real use is made of precise methods in our everyday work, and it should be the aim of professedly educational works to demonstrate rather than to assume the utility of precision.

3,044, Ventilators. G. Nic.

The object of this invention is to render smoke and other ventilators more effective by preventing all leakage or draught, and keeping them at the same time noiseless. This is effected by fitting the ventilator with a highly sensitive valve mounted on an oscillating frame eccentrically hung, so that the ventilator is open or closed by the slightest up or flat against the face plate of the ventilator as to render it absolutely smoke and draught tight.

3,419, Roofing Tiles. C. E. Davis.

The object of the improvements which are the subject of this invention is to allow rain-water to pass off a roof covered with tiles without percolation, even when the roof is constructed at a very slight angle from the horizontal. Recesses and projections are so arranged that the tiles fit very compactly, and the tiles when fixed allow no rain-water to drip through the joints.

3,597, Self-acting Water-closets. J. Lawson.

By this invention no valve is required in the action of the closet. A small cistern carries the flushing water to a height so as to give force when flushing. A small vertical pipe rises in this cistern, and an air-tight vessel or float is suspended by levers. When the closet is in action, the levers lift the float out of the cistern, the ball-cock falls, and the water in the small cistern is emptied down the flushing-pipe.

4,245, Floors. J. Brierley.

According to this invention, the floors are made of wood and earthenware combined. Along the back of each tile, a dovetail or recess is made. The boards or timber on which the floor is laid has also recesses, which are filled with cement, and these hold the tiles in position flush with the surface portion of the floor.

4,332, Ridge and Hip Tiles. G. H. Conch.

According to this invention, the tiles are made in three parts,—two wings, and a centre or connecting part. The wing portions have the edges curved, and provided with engaging teeth and grooves. They thus lay together the tiles at any angle, and may be doweled when in position for further security.

115, Portable Houses. W. M. Duckes.

This invention consists of a frame house wherein the pieces are specially numbered and arranged for fixing. It is so designed that it may be taken down or set up by the ordinary skill of workmen, so light that it may be easily transported in a convenient vehicle, readily adjusted to inequalities of the ground protected against fire, may be heated and ventilated, and constructed cheaply. The way in which all this is effected is by an ingenious complication of numbered parts or pieces, which when fitted to each other form the house.

##### NEW APPLICATIONS FOR PATENTS.

March 4.—3,296, J. Taylor, Chimney Pots.—3,299, G. Moss, Ventilating Apparatus.—3,329, T. Arrol, Trough Decking or Flooring for Bridges and Structures.—3,330, A. Quinlin, Ratchet and Swing Braces.—3,331, T. Rymer-Jones, Refractory and Non-conducting Bricks, Tiles, &c.—3,349, J. Elmer, Parquet Flooring, &c.—3,351, R. Spence, Fireproof Floors.

March 5.—3,353, R. Fickwell, Water Waste Preventer.—3,390, J. McKee, Register Grates or Stoves.—3,404, S. Coombs, Rotary Door Check.—3,415, J. Wilson, Roofing Tiles.

March 7.—3,431, J. Duckett, Water-closets.—3,432, T. Gill, Water-closets.—3,445, G. Goodhue, Timber Structures for Mines.—3,459, F. Sage, Door Stops, &c.—3,470, W. Moore, Preventing Water-pipes from Bursting.

March 8.—3,486, G. Newman, Door Checks and Springs.—3,488, S. Hill, Door Spring.—3,495, W. Danelly, Separating, Holding, and Laying Newly-formed Bricks for Drying Purposes.—3,507, J. Pope, Construction of Walls of Houses, &c.—3,538, E. Dummer, Window Fasteners.

March 9.—3,565, G. Girding, Artificial Stone.—3,574, Cassidy and Woodfield, Fastenings for Doors, Windows, &c.—3,595, R. Ash, Ventilating Apparatus.

March 10, 3,624, J. Summerscales, Hinge for Step-ladders and Trestles.—3,640, T. Jones Ladder.

PROVISIONAL SPECIFICATIONS ACCEPTED.

16,683, W. Grayston, Safety Hinge for Painters, Plasterers, or Joiners' Trestles, &c.—533, J. Mitchell, Joiners' Bench, Stop, and Cramp...

COMPLETE SPECIFICATIONS ACCEPTED.

4,496, T. & J. Holt, Flushing Cisterns for Water-closets.—5,638, J. Russell, Cooking Ranges.—5,843, C. Howe, Cement or Plaster.—6,100, W. Macfarlane, Water-closets.—6,155, J. Siddler, Lavatories...

RECENT SALES OF PROPERTY.

ESTATE EXCHANGE REPORT.

Table listing estate exchange reports with columns for property description, agent, and price. Includes entries like 'Chelsea—1 to 5, Foundry-place, freehold' and 'Regent's Park—11, Mornington-place, freehold'.

Table listing estate exchange reports for March 10, with columns for property description, agent, and price. Includes entries like 'Waltham-green—5 to 10, Euter-piece, a cottage' and 'Barnsbury—6, Barnsbury-road, 7 years ground-rent'.

Table listing property sales for Canonbury-road-23, Canonbury Park North, 49 years, ground-rent 4/10s, and other properties with their respective agents and prices.

MARCH 11.

Table listing property sales for Peckham—Ground-rent of 18/18s, reversion in 63 years, and other properties with their respective agents and prices.

MEETINGS.

SATURDAY, MARCH 19. Architectural Association.—Visit to the National Gallery and the Houses of Parliament. 2.30 p.m. South Kensington Museum.—Mr. Whitworth Wallis on "Pompeian Architecture and Art." II. 5.15 p.m.

MONDAY, MARCH 21. Surveyors' Institution.—Mr. P. E. Pilditch on "Disinfection Practice," followed by a discussion upon this and Mr. Wheeler's paper, read at the previous meeting. 8 p.m.

TUESDAY, MARCH 22. Institution of Civil Engineers.—Discussion upon Col. E. Matfield's paper on "Gun Steel." 8 p.m. Manchester Architectural Society.—(1) Paper on "Sanitary Science," (2) Election of Officers. 7.31 p.m.

THURSDAY, MARCH 24. Society of Telegraph-Engineers and Electricians.—Mr. A. E. Kennelly on "The Resistance of Faults in Submarine Cables." 8 p.m.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to New Municipal Buildings Glasgow.

Miscellaneous.

The District Surveyorship of West Hampstead.—At the meeting of the Metropolitan Board of Works on the 11th inst., the Building Act Committee recommended that Mr. R. Plumble, District Surveyor for South Islington, be transferred to the district of West Hampstead, vacant by the resignation of Mr. T. Blashill, now the Superintending Architect of the Board.

Tunnel under the Straits of Messina.—An Italian engineer, Signor Gabelli, has framed a plan for a tunnel under the Straits of Messina from Italy to Sicily, a proposal which, by-the-by, is not a new one. He estimates the length of the tunnel at eight miles and a half, and proposes that its depth below the surface of the sea be about 500 ft.

A Jubilee Project for North-West London.

Mr. John Leighton, F.S.A., has made a proposal for making a new avenue through Regent's Park to Primrose Hill Park and Eaton Fields. He points out that within the precincts of the parishes of St. Pancras, St. Marylebone, and St. John, Hampstead, about forty years since, Parliament purchased a plot of ground, which it dedicated in perpetuity as a place of recreation for the people.

The Sanitary Registration of Buildings Bill.—At the meeting of the Council of the Sanitary Assurance Association on Monday last, a communication was read from the Association of Municipal and Sanitary Engineers and Surveyors requesting the Council to convene a conference on the subject of the Sanitary Registration of Buildings Bill, and, in the event of the request being acceded to, offering to co-operate in the matter.

That in compliance with the request of the Association of Municipal and Sanitary Engineers and Surveyors, a Conference be convened to consider and report upon the principle and details of the Sanitary Registration of Buildings Bill, which is now before the House of Commons: that at the first meeting of the Conference be held on Monday, April 4th, at three o'clock p.m., at Sir Joseph Fryer, K.C.S.L., M.D., F.R.S., Sir Vincent H. Kennet Barrington, Mr. Mark H. Judge, A.R.I.B.A., and Mr. H. Bultford, Barrister-at-Law, be appointed to represent the Sanitary Assurance Association at the Conference; that Mr. C. C. Leitch, M.P., Dr. R. Farquharson, M.P., Sir W. Guyer Hunter, M.P., M.D., Dr. Charles Cameron, M.P., and Sir Henry E. Roscoe, M.P., F.R.S., be invited to attend the Conference; and that the governors of bodies of the following institutions be requested to appoint four gentlemen to represent them at the Conference.—The Royal Institute of British Architects, the Institution of Civil Engineers, the Royal Institute of Architects of Ireland, the London Sanitary Protection Association, the Society of Medical Practitioners registered as qualified in Sanitary Science, the Institution of Surveyors, the Association of Municipal and Sanitary Engineers and Surveyors, the Society of Medical Officers of Health, the Sanitary Institute of Great Britain. Further, that the question of inviting other bodies to join in the Conference be left in the hands of the Conference.

Tunnel under the Straits of Messina.—An Italian engineer, Signor Gabelli, has framed a plan for a tunnel under the Straits of Messina from Italy to Sicily, a proposal which, by-the-by, is not a new one. He estimates the length of the tunnel at eight miles and a half, and proposes that its depth below the surface of the sea be about 500 ft. The cost of the tunnel is calculated at about 3,000,000*l.*, and the time of construction at five years. From preliminary soundings it has been found that the character of the sea bottom is favourable to the construction of such a tunnel. Another proposal which has been made to the Italian Government is for a bridge across the Straits, the length of which is estimated at about nine miles, but in all probability the former proposal will be the one adopted. The inhabitants of Sicily are strongly in favour of such a tunnel, which they believe would be a financial success.

Edinburgh Free Library Buildings.—At a meeting of the Free Library Committee, held in the Council Chambers, Edinburgh, on Monday afternoon, it was agreed to limit the competition for plans to Edinburgh architects.

**The Water Supply of Paris.**—The destructive influence of the changes of temperature upon aqueducts of masonry has shown itself in the structure which carries the water of the Vanne to Paris, in consequence of which some districts of the city had recently to be furnished temporarily with Seine water. The aqueduct, which crosses the valley of the Bièvre near Arcueil by seventy-seven walled arches, is supported in some portions by the Maria de Medicis Aqueduct, dating from the seventeenth century, the fine piers of which form one of the architectural attractions of Arcueil. The modern aqueduct, a lofty and hold structure of limestone, carries the waters of the Vanne to Paris. Owing to the recent frost, a crack was found in one of the arches, causing the water to percolate, and threatening the destruction of the masonry. The crack, which involves not only the modern, but also the older structure, is a very narrow one, and was plugged with lead, the water being drained off during the repairs. In order to ensure an uninterrupted supply of pure and fresh water to Paris, and to serve the water at all elevations, it is intended to bring the waters of the Vigne springs (department of the Eure) to the city. It is hoped by this new source to prevent the interruption of the supply during repairs of the old aqueducts that may become necessary, as well as in times of drought.

**Wellingborough.**—The new steam flour-mill at Wellingborough, for Mr. J. B. Whitworth, have just been completed. The new mill, which is situated close to the London and North-Western Railway station, with siding, is built of Wellingborough bricks on concrete foundations, and is divided into three distinct fireproof compartments,—the warehouse, engine-room, and the mill proper. These all have exterior iron doors opening on to landings, and no internal communication, this reducing risk in case of fire. Over the engine-room a tower has been carried up to carry a large cast-iron cistern to hold 7,000 gallons. The boiler-house and chimney-shaft (100 ft. high) are on the south side of the building. The stables are fitted with Tebbutt's patent stable-floors and Messrs. Green's stable fittings. The contract was taken by Mr. Geo. Henson, of Wellingborough. The milling machinery has been erected by Messrs. Robinson & Sons, of Rochdale. The engine, which is condensing 150-horse-power, together with boiler and economiser, is by Messrs. Timothy Bates & Co., of Sowerby Bridge. The electric light has been fixed throughout the buildings by Messrs. Christy & Son, of Chelmsford. Pipes are laid from the tank to every portion of the building with hydrants and hose on each floor, and also automatic sprinklers. The whole of works have been carried out from the plans and under the personal superintendence of Messrs. Usher & Anthony, architects, of Bedford.

**The Polytechnic Science and Art Classes.**—On Wednesday evening Lord Hartington presided at the fourth annual distribution of prizes, certificates, and medals to the successful students of the science, art, technical, and general classes, in connection with the Polytechnic Young Men's Christian Institute, Regent-street. Mr. W. T. Paton, hon. sec., opened the proceedings by making a statement as to the position and work of the Institute. He said that the total number of students during the session ending June 30, 1886, was 6,875. In 1883, the year of inauguration, the number of students had been 3,200, and since that date a steady increase had taken place. In the last four years the students had gained sixty of the medals offered by the City and Guilds of London Institute for open competition throughout the United Kingdom, and nineteen of these medals had been won by the students of last year. The ceremony of distributing the prizes having been completed, Lord Hartington followed with an interesting address.

**The Examination Hall of the College of Surgeons.**—This building,—the foundation-stone of which was laid by the Queen,—was opened on Monday last. We gave a view and plans of the building a year ago, viz., on March 20th, 1886. Mr. Stephen Salter is the architect. The locks and door furniture throughout were supplied by Mr. James Hill.

**Lifts.**—Mr. J. Stannah is now making for Messrs. Glyn, Mills, & Currie's bank a hydraulic lift which will be one of the largest and most powerful bank lifts in existence. It will be worked by water from the Hydraulic Power Company's mains.

**Appointment of City Engineer for Dublin.**—At a meeting of the Corporation of Dublin on Tuesday last, Mr. Spencer Harry was elected City Engineer of Dublin, in succession to the late Mr. Park Neville, at a salary of 750*l.* per annum. There were eighteen candidates.

**Edmonton Cemetery Chapels.**—The entrance-gates and railing in connexion with this work (mentioned in our last) were executed entirely in hammered iron by Mr. George Rowe, from the designs of Mr. Ricketts, Surveyor to the Edmonton Local Board. The work is artistic in character, and shows some originality of design and treatment.

**Nottingham School of Art.**—On the 14th inst. the medals, the Queen's and other prizes, gained by the students of the Nottingham School of Art in the National Art Competition and Government examinations of 1886, were distributed in the large hall of the Mechanics' Institution by the Bishop of Ripon. The chair was occupied by Mr. T. I. Birkin, J.P., in the absence of the Mayor of Nottingham (Ald. Turney, J.P.).

**Baths at Buxton.**—Considerable additions have just been made to the baths at Buxton by the Duke of Devonshire. Spacious new bathing establishments connected with the old baths in the Hot Bath Colonnade have been completed, or nearly so, and it is here that the latest and most improved form of massage treatment can be obtained. For some months past the new buildings have been in course of erection under the direction of Mr. Curry, the Duke's architect, and the personal supervision of Mr. J. D. Simpson, clerk of works. The work of fixing the baths has been entrusted to Mr. John Smeaton, sanitary engineer, of London, whose foreman was Mr. Alexander McKay.

**The Estate Exchange.**—At the annual general meeting, held on the 7th inst., Mr. B. J. Bridgewater in the chair, it was moved, seconded, and carried, "That the report and statements of account be entered upon the minutes." The following resolutions were also carried:—"That the retiring members of the committee, viz., Messrs. C. Oakley, R. Reid, E. W. Rushworth, P. St. Quintin, and A. Savill, be re-elected." "That the auditors, Messrs. Samuel Green and P. St. Quintin, be re-elected." "That Mr. G. B. Smallpeice and Mr. Samuel Walker be elected to serve upon the committee." A vote of thanks was unanimously passed to the Chairman for presiding.

**Burial Reform.**—The reply given by Mr. Plunket in the House of Commons to the question recently put to him by Mr. Baggallay respecting Brompton Cemetery suggests very serious reflections as to our present mode of burial. From that reply it appears that the cemetery contains in all 38 acres and 20 perches, and that there now remain 4 acres and 34 perches available for burial purposes. The space already used is therefore less than 34 acres, and in this there have been buried the enormous number of 135,617 bodies, an average of 3,988 per acre. It has been calculated that 1,000 graves can be made in every acre of land set apart for burial purposes, leaving a reasonable margin for spaces between graves, walks, &c. Hence, as the depth of graves is often 11 ft. or 12 ft., and sometimes even deeper, the figures, large though they at first appear, are not excessive. Nor would there be anything to fear if it were the truth that all these bodies are really buried. But, as Mr. Seymour Haden has said, speaking of modern burial, a large proportion cannot be considered as buried at all. The first burial in Brompton Cemetery took place in 1840, and, as it has always been what may be termed a fashionable place of interment, the probabilities are that a large proportion of the burials have been in lead coffins and in vaults or bricked graves. The result is, as it always must be when the dead are disposed in this manner, that the cemetery becomes filled with what Mr. Haden severely, but truly, describes as a mass of boxed-up putridity. It appears, moreover, that the burials therein still average in round numbers 5,000 yearly, and that the Government derived last year a profit of 7,070*l.* from the cemetery. Considering all these circumstances, and also how completely the cemetery has become surrounded by dwellings, it appears only reasonable that, if burials are to continue there, every inducement should be made by reduced tariffs, &c., to bury in perishable coffins and in graves.

**Housing the Working Classes.**—The twentieth annual general meeting of the Artizans, Labourers', and General Dwellings Company, Limited, was held on Thursday, the 10th inst., Mr. Ernest Noel presiding. The report showed that the rental for the year 1886 amounted to nearly 96,000*l.*, the net revenue being 66,047*l.*, out of which interim dividends upon the preference and ordinary capitals amounting to 38,628*l.*, had been paid. It was now proposed to pay a dividend of 5 per cent on the ordinary share capital for the second six months of the year, carrying over 1,000*l.* to revenue reserve, 3,000*l.* to capital reserve, and 1,602*l.* to next year's accounts. The increase of capital during the year had been 83,650*l.*, the total amount paid up to Dec. 31 was 1,317,930*l.*, the authorised capital being 1,000,000*l.* in ordinary shares, and 750,000*l.* in preference shares 4½ per cent. The completed estates of the company in London are Shaftesbury-park, S.W., and Queen's-park, W., comprising nearly 3,400 separate houses. At Noel-park, N., at the close of the year, 1,041 houses were completed, 870 being let and occupied. This estate, when completed, will comprise 2,600 houses. The new block-buildings in Lisson-grove were progressing rapidly.

### Professional Wire-Pulling.

WE have briefly noticed in our last, the Supplemental Charter asked for by the Institute of Architects has been conceded, as every one expected it would be, and the clique of persons who got up a factious opposition to it to serve some purpose best known to themselves, and under the guise of an assumed concern for the welfare of the profession, may have the satisfaction of knowing that they have gained nothing by their disingenuous attack upon the leading representative body of the profession except to raise a general feeling against themselves,—which has already found expression at public meetings,—and the tortuous tactics they have employed, and to evoke the formal and official support to the Institute of the leading provincial architectural societies, as well as that of the only London architectural society besides the Institute which has any important or recognised position. The last number of the *Journal of Proceedings* of the Institute contains, printed in full, the two petitions which were got up with such a flourish of trumpets against the Institute, and the categorical reply of the latter body; and it is as well that those of our readers who are not members of the Institute, who may not, therefore, see the *Journal*, and who may have been appealed to by the specious representations of the clique in question, should know a little about the facts, which one or two quotations will show them quite sufficiently.

We have referred to the two petitions in opposition; but even this pretended dual form is a piece of hogsw. One petition professes to issue from a certain "Society of Architects," the other from an "Architectural Federation Committee." The two, as is pointed out in the answer of the Institute, "to all intents and purposes emanate from the same source, the directing spirits being in both the same individuals, namely, the officers of the 'Society of Architects.'" Concerning the said Society, the protest of which comes second on the list, the Institute rejoinder says:—

"The Royal Institute, although it is in intimate communication, and in regular correspondence, with every, or almost every, architectural Institute, Society, or Association in the empire, as well as with the principal architectural bodies in Europe and America, and although it periodically presents to, or exchanges with, them its *Kalendar*, its *Journal of Proceedings*, and its annual volume of *Transactions*, has never received from the 'Society

of Architects' any official notice of the constitution, the rules, or even a list of members, of that body; and the Royal Institute has, officially, no knowledge of the Society. Furthermore, the statement made in this clause (7) of the Society's petition, that the Architectural Association (of London) is merely a students' society, is incorrect. The Architectural Association of London, which has been established for more than forty years, is composed of architects, architects' assistants, and architectural students, to the number of one thousand, located in London and various parts of the country."

The Architectural Association, the importance and activity of which are well known in the profession, was one of the six bodies which sent in counter petitions in support of the Institute, and therefore it was the policy of the opposers to endeavour to represent it to the official authorities as a juvenile body of students. But, turning to the opposing petition of the "Architectural Federation Society," which comes first on the list, and to which the answer of the Institute is mainly directed (since the second opposing petition was very little more, essentially, than a duplicate of the first), it will probably enlighten some of those who have been urged to sign petitions and circulars in opposition to the Institute, to see side by side the statement of the opposition as to their status and position, and the counter statement in the reply of the Institute. The third and fourth clauses of the opposition document run as follows:—

"3. That your Memorialists were appointed at a Conference which was publicly advertised and convened by notice addressed to all existing Societies and members of the Architectural profession in the United Kingdom, held at the Freemasons' Tavern, Great Queen-street, on the 6th day of April, 1886, whereat architects from all parts of the United Kingdom, and members of nearly all the existing Architectural Societies, including the said Royal Institute of British Architects, were present, and at such meeting the following resolutions were passed:—

"That in the interests of the Architectural Profession and of the Public alike, it is desirable that all architects in the Kingdom should be united in one body, having branches in the Provincial Cities and Towns, and a Central Council in London, including amongst its members representatives from the Provinces.

That a Committee be formed without delay to give effect to the foregoing Resolution, and to facilitate the formation of Committees in the Provinces.

That it is the opinion of this Meeting that instructions should be given to the Committee to consider the means necessary in order to obtain an Act of Parliament making it compulsory for all architects to hold a Government diploma.

"4. That your memorialists were appointed as the Committee to carry out the objects of the said Conference of Architects, and they have issued the following form to about 2,500 out of about 8,063 members of the Architectural professions in order to obtain the respective opinions of such members, namely:—

"Whereas we, the undersigned, are of opinion that it is for the benefit of the Public and the Architectural Professions alike that legislative powers should be obtained, so that all persons hereafter entering the Professions shall be duly qualified by examination; We are desirous that

Committees should be formed to promote the object in view, and to obtain the necessary Act of Parliament."

"That this form of Declaration has already been signed by 1,257 members of the Architectural professions in all parts of the United Kingdom during the short period of two months, and signatures are daily being added, whereby the said number of signatures of members of the professions will be largely increased; indeed, it may fairly be assumed from the foregoing figures that when forms of declaration have been sent to the whole of the members of the professions, the total number of signatures will be at least 4,000."

Now, let the candid reader compare with this a portion only (for we have not space for the whole) of the replies under the same headings on the part of the Institute:—

"3. The Royal Institute did not receive any official notice of the Conference referred to. It was convened to be held in connexion with a Building-Trades Exhibition by a self-constituted body called 'Society of Architects,' of which Society the Royal Institute has no official knowledge, and the meetings in question were held on the 6th of April last, the Royal Institute not being officially represented at them; nor did any provincial society (according to the published reports) send to them any duly-authorized representative. The two meetings of the Conference to which the memorial refers were attended for the most part by juniors; not a single architect of age, leading, or reputation supported any of the resolutions, nor did any gentleman announce himself, nor was he announced from the chair, as a representative of any provincial society. . . .

"4. Mr. H. R. Gough and Mr. E. Farman, on behalf of the memorialists, state that they were appointed as 'the Committee' to carry out the objects of the Conference of April last, but they do not describe the manner of their appointment, nor do they furnish a copy of the resolution appointing them, which was as follows:—

"That the Committee do consist of the following gentlemen, with power to add to their number (at least twelve members of the architectural profession not belonging to any Society being included), viz.:—The President and Vice-Presidents of the Royal Institute of British Architects (four); the President and Vice-Presidents of the Society of Architects (three); the President of the Architectural Association (of London); the Presidents of existing provincial Societies (about sixteen); the Royal Institute of British Architects' Federation Committee (about seventeen, minus the Presidents of provincial Societies); Mr. R. Norman Shaw, R.A., Mr. Robert Walker (of Cork), Mr. G. A. Audley, F.R.I.B.A., Mr. Henry Hall, F.R.I.B.A., Mr. C. H. Robertson, and Mr. Walter Emson."

"The Conference of April last thus decided that the question should be dealt with by about forty-seven persons, some forty of whom were to be members or representatives of the Royal Institute and of Provincial Societies, and at least twelve members of the architectural profession not belonging to any society. But the greater number of those who were then designated by the Conference, as the 'Architectural Federation Committee,' declined to accept the nomination, and wrote stating that they so declined. The Committee were consequently reduced to the following:—

- The President and Vice-Presidents of the 'Society of Architects' (London).
- Birmingham Architectural Association.
- Presidents of Edinburgh Architectural Association, Northern Architectural Association, of the New York Architectural Association, and of the Royal Institute of the Architects of Ireland.
- Mr. Basil Champneys (London).

could not help remarking the many people on Saturday afternoon and Sunday morning last, in particular about Primrose Hill and Hampstead Heath with newspapers in their hands; he was led by curiosity to inquire the cause, and found they were perusing the plan, and taking a survey of the new (Queen's) road that was proposed in our last Saturday's paper, from the bottom of Portman-square by Hampstead to Finchley Common. It was pronounced by all parties to be the greatest and most practicable improvement in the roadway that ever was made about the metropolis, the new Islington and City-road not excepted." This is now Baker-street and Finchley-road. Professor Cockerell, R.A., again, in the *Builder* of July, 1853, published a map of Primrose Hill and Hampstead Heath. He started a road from the middle of the Albert-road, behind the Zoological Gardens, but without any connexion from the Crown land southward,—a great defect; from the Albert-road he went with a magnificent sweep over the hill to Belsize, utilising the avenue of ancient elms, to where the Vestry-hall now stands, and so on by Pond-street, where there was a break, to Traitors' Hill, and round to the "Spaniards." At this time the country was open, and Fitzjohn's-avenue had not been thought of; this latter, with the improvements in High-street, Hampstead, in course of completion, now giving a better route. In 1863, on the occasion of the tercentenary of Shakespeare's birth, Mr. Leighton proposed a route from Portland-place to the Hill, where he proposed to place a monumental tower of many stories, to contain a statue of the poet, with museums of the stage, relics, costume, &c., the whole being surmounted by an observatory and a time-hall. Regarding the Hill Park, it may be remarked that George IV. once thought of building a palace there, and that it was measured for the first International Exhibition, 1851. A few years since the Hill was proposed as a site for the Wellington statue, now at Aldershot,—an infelicity it was happily spared. The most remarkable fact connected with the formation of so important a feature as the road proposed by Mr. Leighton through the Regent's Park to Hampstead is the few obstacles that would have to be overcome, there practically being none, save the acquisition of the Eaton Fields, which would give unity to the whole. This ground might possibly be acquired in exchange for land at Windsor, as was done when the Hill park was first acquired. Two of the principal pleasure resorts, the Zoological and Botanical Gardens, would flank "The Victoria Avenue" on either side, and be brought into direct communication with town. The Hill enclosure might be named "The Jubilee Park."

CONSIDERABLE feeling has been aroused in Chelsea by a departmental project to exclude the public in future from the open space before Chelsea Hospital. This valuable area, of about twelve acres, known as "Burton's Court," and containing a fine avenue of trees which gives a name to the houses beyond, was bought with public money in 1662, and for generations past has formed a favourite playground and resort with the inhabitants around. An arrangement has just been made with the War Office and the Commissioners of Chelsea Hospital for leasing the land as a cricket and football ground for the soldiers quartered in London; and a grant of 800*l.* will be asked for in Parliament towards that purpose. That our soldiers should have a Campus Martius for their games is, in itself, a very good thing; but the local grievance is aggravated by the following circumstance. About twenty years ago the public, and the military pensioners as well, were thenceforth denied admittance into the Hospital grounds that lie between Wren's central quadrangle and the river. Those terraced gardens, carefully tended and beautifully situated, would seem to be appropriated to lawn-tennis courts and the like thereto, for the sole enjoyment of the Hospital officials and their friends. These proceedings certainly seem to be in violation of a stipulation which, as we are informed, was made in 1850, to the effect that the Governor and his staff should

have no privileges as against the public in respect of these grounds, which are held in trust by the Commissioners.

THE announcement of the death of Captain Eads, the American engineer, at a by no means advanced age, is of quite sufficient interest for a notice in an English technical journal, if only for the great originality with which his undertakings were stamped. The fact of his being of very humble origin is nothing, for American industrial life teems with such cases; but it is certainly seldom that we find in an uneducated person such a rare talent, not only for seeing what might be done, but also how it was to be done. It will be enough to mention three of the undertakings which were directly of his conception and carrying out (although he has not lived to carry out the last). The first was the magnificent steel bridge which crosses the Mississippi at St. Louis, bearing upon it the converging rails of some eight or ten great systems, to be united on the other side with those of the far West. Captain Eads's attempts to deepen the mouth of the Mississippi at New Orleans were crowned with success, and by means of his original and gigantic works seaward, that city has become a more important port than it ever had been. His last and biggest scheme was in rivalry with M. de Lesseps and the Panama Canal, and was to consist in carrying out a broad ship canal, which was to unite the Gulf of Mexico and the Pacific Ocean, starting from the Bay of Tehuantepec. How this great scheme will be affected by the engineer's death it is impossible to say, but it must evidently receive a considerable shock.

WHAT is called the "D. C. Green ventilating system," of which demonstrations have been given this week at the offices of the agents for the system, in Queen Victoria-street, presents some points which promise well for its usefulness. The principle is to send a current of air from a compressor, at a pressure of 3 to 5 lbs. per square inch, through a specially designed nozzle at the end of a pipe of the necessary diameter, the nozzle being placed in the axis of a tube or conduit of much larger diameter, discharging parallel with the sides of the conduit, and setting up an induced current in the conduit, which is supplied with air from sources independent of the mechanical agency. The action in the model we saw in operation appears to be powerful and certain; the quantity of air requiring to be mechanically driven is a very small proportion of the whole, the bulk of air supplying the induced current being simply drawn from natural sources through any conveniently placed opening communicating with the conduit. By a very ingenious arrangement of a double brass cone controlled by a spring, the nozzle is made to accommodate itself to varying pressures of air so as to preserve always the same velocity at the point of discharge; or nearly the same, let us say, for there is a perceptible difference in the discharge at the end of the conduit when the pressure is altered, but nothing at all proportional to the change of pressure. The nozzles can be placed so as to act either as inductraughts or extractors. A great advantage is the small space occupied; a nozzle, about 3-in. diameter and 9-in. long, doing the work of a pretty large fan. The rush of the air produces an unpleasant noise; but (except in small houses, for which mechanical ventilation would hardly be employed) it could be got in a sufficiently remote position in a basement or elsewhere to be out of hearing. The pipes serving the nozzles are only small pipes of 1 in. or 1½ in. diameter, so that they can be easily led about a building; and the conduits take somewhat the place of "Tobin" tubes. The system is certainly worth the attention of architects.

THE photographs of works of English architects which are to be sent out to the Adelaide Exhibition will be on view to the public at the rooms of the Institute of Architects next week. The show will not be a very large one; it includes about a hundred photo-

graphs; but varieties of recent English work are fairly represented. The photographs of Holloway College make a good show, and will probably be admired. Mr. Jackson's Divinity Schools, one of the best and most original buildings of the recent English school for which it is so difficult to find a distinctive title (perhaps one of the best things that could be said for it), are among the selection; Mr. Waterhouse has contributed photographs of his Manchester Town-hall, perhaps his most typical work, and of the Natural History Museum; an Audley-street house by Mr. Aitchison, and interiors by Mr. Edis and Messrs. George & Peto (the latter duo of architects being well represented) are among the set. Works by London architects, as might be expected, predominate; the few examples of provincial architectural ability are not among the best that might be produced.

THE studies by Mr. Bridgman, the able French-American painter, and pupil of Gérôme (American by birth, French by training), which are on view at the Fine Art Society's Gallery, fully sustain the reputation of the painter. They include a great many architectural sketches in oils, exteriors and interiors, brilliant in effect, and full of light and colour, though slightly painted. Some excellent studies of animals should also be noticed.

THE exhibition at Mr. Wallis's gallery, open this week, contains two noteworthy works by Firlé, a North-German artist, whose work would at first sight suggest that it is by one of the French-American painters who have come to the front lately; it is far more delicate and transparent in colour than most German work. The two paintings by which this artist is illustrated are "Ein feste Burg" (34), a group of girls singing to the accompaniment of a piano, and "The Sower soweth the Word" (73), a school interior. This is a picture full of careful study of individual character in the various heads and figures; and it has the great merit of having something of moral beauty as well as of mere technique. Both paintings are in low and delicate tones, and form a great contrast in style to the majority of the contents of the gallery. Professor Müller is as powerful and as prosaic as ever in the "Camel Market, Cairo" (15), the crude force and heat of which are intensified by the juxtaposition of two silver-grey Corot's, one of them, "Le Lac de Garde" (18), an exquisite specimen of this painter's genius. "A Summer Idyll" (44), by Carl Marr, is a painting of cattle and figures remarkable for its truth of evening effect and for its harmonious composition in regard to line and grouping,—a source of expression in painting which is much neglected now, and the recognition of which is even thought pedantic by many, but which is a real means of expression in this case, at all events. The exhibition includes Meissonier's remarkable study called "The Smoker" (116); a good specimen of Heffner's effective but stagy landscape (103); two or three capital little works by Seiler; a curious study of a draped Egyptian head, by Professor Müller, entitled "A Living Sphinx" (109); and works of more or less interest by Rougier, Joanowits, Munthe, de Blaas, and others.

WE are informed that the exhibition of the "New English Art Club" will be open in April and May, at the Dudley Gallery, and that the "Jury of Selection" have already been elected from, and by the votes of, members; this being the first instance in this country in which this system of electing a "Hanging Committee" has been adopted. The list of jurors includes the names of Messrs. Aumonier, Fred. Brown, G. Clausen, A. Parsons, Jacob Hood, J. M. Whistler, and T. Stirling Lee. Mr. T. B. Kennington is the honorary secretary.

WE fear that Mr. Hodges will gain little by his appeal to the Institute\* with regard

\*On Architectural Competitions in general, with some references to one in particular." By E. F. Hodges, A.R.I.B.A.

to the Fulham Town-hall competition. Mr. Hodges is not happy in the statement of his case, which he contrives to make appear as if it were a wrangle as to the superficial area of a part of the building, instead of one involving an important question of principle, and his remarks with regard to the conduct of the competitors are too vague and general to excite the attention of the Institute or the public. The allusion to "the professional gentleman who permits his friends to see his drawings during their preparation, who is at pains to point out their merits, who is careful to let them know his motto, and does all he can to render impartial judgment difficult or impracticable," will, we much fear, be lost upon the generality of the public, who will see nothing to condemn in such practices, and perhaps a good deal to admire. It is an old proverb that a man who supps with the devil must have a long spoon; and an architect who enters into a Vestry competition cannot afford to be thin-skinned if he wishes to succeed.

IT has been announced in the daily papers that a circular was to be issued this week "to all interested in Manchester and the neighbouring districts" calling upon them to invest money in the Manchester Ship Canal scheme, as unless five millions of share capital are issued and accepted by the 6th of August next, the powers to construct the canal will lapse. The directors, it is stated in the circular, "confidently recommend the canal as an investment"; but directors have that way with them. We should be very glad to see the canal made, but we cannot think that the financial prospects of a scheme that requires to be nursed in this way are very brilliant. Capital has a way of finding its way into things that tend to remuneration, and of eschewing those things that are contrary to the same, and will not hearken to the voice of directors, direct they never so wisely.

ARCHITECT AND CONTRACTOR.

MR. HENRY LOVEGROVE, A.R.I.B.A., read a paper on this subject at the meeting of the Architectural Association on the 18th inst. In the course of his introductory remarks the lecturer said that when he selected the subject of his paper he had hoped not only to say something of architects and something of contractors, but more about the document which forms the connecting link between them,—the contract; but on the latter head he had been to a great extent forestalled by a very able friend of the Association [Professor Kerr], who had read a paper on the subject at the last meeting of the Royal Institute of British Architects.\* After some observations on the way in which the architect is regarded by other professional and business men, Mr. Lovegrove said,—

Much has been done by the Royal Institute of British Architects to define the status of the architect, and there is no doubt in my mind about the effect of the regulation as to admission to the Institute by examination only. If the Institute has been lethargic in the past, it is so no longer. Its many departmental and other committees are steadily working away to reduce the accumulated matter into proper order, and to so prune the branches that the stately and respected tree may bring forth truly excellent fruit. I grant that examinations will not make able architects, still less architects of high artistic powers; but none can deny that those aspiring to be architects should be able to answer the very fair and reasonable requirements of the Architectural Examination, which may be regarded as a definite minimum of the knowledge and skill to be possessed by one who seeks to belong to the ranks of the practitioners of a profession. The mere preparation for the Examination is of immense benefit; the systematic study and wide range of reading enlarge the mind of the student and extend his technical knowledge. In the furtherance of architectural education, theoretical and practical, this Association has led the van.

The new Charter of the Royal Institute of British Architects appears to meet the wants of the hour, and I for one cannot understand that the necessity existed for the

formation of another architectural society. Such a movement must tend to weaken the influence of the old and well-known society, and retard the progress of architectural knowledge, against which the activity of members, and awards at building exhibitions, can be no adequate compensation.

After some remarks on pupillage and the commencement of practice, Mr. Lovegrove continued—

I should like, while addressing a body of fellow-members of the Association, to be able to speak in glowing colours of the future of the architectural profession. On that point I am a pessimist, and as I cannot help my convictions,—the result of a considerable acquaintance with the building world,—I will briefly give my grounds for such belief. It is hardly necessary for me to refer to the good old times, gone for ever, when there was plenty of work to do, and very few architects to do it; but I will take things as they are in this present year of grace, the Jubilee year of one of the best sovereigns that England has had. Agriculture is in a deplorable condition; the country gentleman's income has been so considerably reduced, that neither he nor the other country residents can contribute to new buildings, the rates he pay for the sorely-needed cemetery or Board school being quite a sufficient tax on their impoverished resources. Under these circumstances, improvements to farm buildings, or extensive alterations to the mansion of the squire, are quite out of the question. In cities and large towns trade has been depressed for so long that nothing beyond really necessary work can be indulged in, and the comfortable suburban "villa" which was at one time built by the thriving shopkeeper is a thing of the past, as the formation of "stores" has nearly destroyed the retail trader. All these causes have reduced the work of the architect. The spread of education, and especially the almost universal instruction in drawing, will in time take much work out of the hands of the profession, and especially from the younger men, by depriving them of employment to prepare drawings for builders, and by their services being dispensed with altogether, the builder undertaking to provide drawings for nothing. Many large contractors can well afford to, and do, keep an architect; but in the future many builders will have sons who have not only learned to draw, but who have acquired considerable skill and proficiency. Meaning for builders has often been the means of gaining a few pounds by the struggling practitioner, but in the future many in the employ of the contractor will be able to perform such duties. I shall be told that the spread of education and culture will induce people to insist on the employment of able architects for public buildings, and I admit the truth of the assertion; but public buildings and decorative designs requiring the highest skill will not give employment to one-tenth of the practising architects. At present it appears to me that there are from three to six architects after each job, and so eager are they for work, that advertisements for designs, offering the most unfair terms, are answered by a large number of competitors.

The subject of competitions has received so much attention here that I can do no more than briefly refer to it. I have heard some strange stories of public and advertised competitions, of small premiums paid and the work carried out by a local builder and architect. One limited competition particularly struck me; the School Board of a rural district met to settle who should submit plans, and after the selection of two or three members of the Royal Institute of British Architects, the Chairman, a clergyman,—a man of education and, presumably, of culture and intelligence,—proposed a carpenter in an adjoining village as one of the competitors! There can be no doubt about the fairness of a professional arbitrator provided that the one selected be one of the highest position, but I can call to mind two instances in which the arbitrator, after the premiums were paid, submitted a plan of his own and eventually carried out the work! I noticed in a church newspaper last week an advertisement addressed to the clergy by an architect who "offered his services on moderate terms,"—a clear indication that many must be finding the struggle severe, and, if they have not a good connexion, almost hopeless.

I have shown that the outlook is not bright; but still, I must urge you to work hard and

make a good fight; you have put your hand to the plough, and there must be no looking back.

The future of that branch of the profession to which I have more particularly given my attention has an outlook even more gloomy than that of the architect proper. The fierce competition of these days necessitates the acquirement of every pound, and the commission on the quantities is a temptation, so that dahlhing in quantities seems to be getting every day more common. I think that a knowledge of quantity-taking is most useful to every member of the profession, but that it is better for an independent surveyor to prepare the quantities, and not the architect of the building. Some bills of quantities, and especially provincial ones, can hardly be said to be worthy of the name, although the commission charged is the maximum. It is only reasonable to infer that the man who now and then takes off quantities cannot possess the same skill as one who is constantly engaged on the work. I notice that in the heads of a paper which will shortly be read before the Institute reference is made to the system of taking out the quantities as "made intelligible to the architect." It is impossible to anticipate what the lecturer may say upon this point, but it appears probable that he will advocate the provincial method of writing descriptions of the items and partly disposing with abstracts. This method may render it easy for the architect to find the items, but I maintain that the end and aim of a bill of quantities is that the work may be fairly and accurately priced without reference to the architect's after-convenience; and after all, if his specification is sufficiently detailed and his drawings clearly made and well figured, very little reference need be made to the quantities.

The word contractor is somewhat comprehensive, so I will explain that I refer only to the building-contractor. At the present day in London the entire work in erecting and completing a building is undertaken by one individual or firm,—a very nice, comfortable arrangement for the architect. In many parts of the country some five or six separate contractors are engaged, and seem to manage very well; but the work of the architect is greatly increased by this plan. My experience proves that two or three individuals privately arrange to submit a lump-sum tender for a country job; thus the bricklayer, carpenter, and plumber join,—in some cases the name of one appearing, in others those of two. In other cases I have frequently known the contract taken in one name, but of course the work in its various branches is undertaken by other local tradesmen; and although the architect can only officially recognise one contractor, he is often in communication with others, and if not careful may be mixed up with subsequent disputes.

Many of our building firms carry out excellent work as regards the actual erection of the building, but finishings are often very improperly done for want of a responsible and competent head of the subordinate branches. The general foreman thoroughly understands his own branch of building, but in such an important trade as that of the plumber, the work is not so skillfully devised or so thoroughly overlooked as where an experienced master plumber is responsible for it.

We in London are often inclined to think that country work is inferior to that done in London, and we are wrong. I have seen first-class work turned out by country artificers. Only last week I looked over some joinery prepared in a distant provincial town which could probably be equalled by one of the best London firms, but would not be excelled. The country contractor is nearly always a practical man, who has been brought up to the business, and he gives continuous personal supervision. Our larger London contractors could not personally supervise all their work, so that an efficient staff becomes necessary, and I can testify to the great skill and ability of some of these gentlemen.

A contract has been defined to be an agreement between two or more persons to do some definite thing or things. A contract may be express or implied, and, if express, the terms are usually defined. For example,—A is about to build a house, and agrees with an architect that the total amount of remuneration for services shall be 50l., with a definition that two sets of tracings and two copies of specification, shall be supplied, and all superintendence. This would be an express contract; but if A simply

\* For summary of this paper see last week's Builder, p. 453.

structed the architect to prepare drawings, &c., then there is a contract implied on the part of A to pay the reasonable charges of the architect. An architect is not a party to a building contract; he is the arbitrator under it, as for many years the conjunction of architect and builder has been abolished, and no architects of any position are connected with the execution of building contracts or the supply of materials. I think that civil engineers are not so particular in this respect, as I have known of eminent firms in some cases acting as engineers to plan and superintend works, and in others to take a contract and execute the same. If I am in error or have been misinformed I regret it, as I much respect the profession of the civil engineer.

The first step in a building contract is the engagement of the architect, and this is binding if not in writing; thus, a client may call and request you to prepare sketch-plans, and afterwards return and ask you to prepare the working drawings, which in due course you do. You are retained and engaged to perform a particular service, the retainer being a request in terms to the architect to hold himself engaged. If an architect is engaged to perform certain duties for a particular term over a year, then such retainer should be in writing. As a matter of business it is well to get a letter actually ordering the work to be done, and to word your own letters to the client so as to imply the fact of your being retained or instructed to do the work. With some persons it is absolutely necessary to get a formal written order, to prevent the necessity for going to law; and having advised you to get the written order, I add the precaution,—get it stamped. If engaged as architect to a public body or corporation, it is essential to get a written appointment under seal. Although one would suppose that the minutes of the corporate body, if correctly entered, would contain quite sufficient evidence of the decision to engage a particular architect without requiring the production of a formal deed, yet in law such appointments are required to be made under seal.

An architect is supposed to exercise care and skill in the practice of his profession, and by holding himself out as a member of the profession undertakes to use a fair, reasonable, and competent degree of skill.

Actions against architects for want of skill are fortunately very rare; failures in construction may and often do arise from some neglect on the part of the builder, and in cases where an incompetent man gets into a muddle the matter is, if possible, concealed from the world. But actions by architects to recover their charges are more frequent, and usually arise where contemplated works have not been carried out. The client having no building for his money thinks that a very small sum will compensate the architect for his plans and specification. Still less does the ordinary mind grasp the idea of paying for quantities for abandoned work; yet, after due explanation, I have generally obtained my fees,—not always, I admit, for the whole sum.

We shall get in time a set of conditions of contract more clear in some respects than the "Heads of Conditions of Contracts" settled by the Special Committee of the Royal Institute of British Architects and the London Builders' Society, and until we do it will be well to use those. Many architects settle for themselves, with or without the advice of a solicitor, what shall be the form of contract in use in their offices, and some such forms are far better than the very wordy documents drawn up by solicitors if left to their own devices. If any of us wonder at times at the builders objecting to certain clauses in the contract and desiring their modification, we should remember that the arbitrator under that contract is paid by the opposing party, the employer. The contractor is, therefore, justified in seeing that the terms are equitable, as, although he may have a confidence based upon tradition and increased by acquaintance with the architect and a knowledge of his fair dealing, the architect may disagree with the client, and another, with very different views of fair dealing, may by his arbitrary conduct subject the contractor to heavy loss. "Extras" will arise, and they are often of the employer's own making. It is well to provide a provisional sum for contingencies, or, at least, a few rods of brickwork or something similar, to prevent unpleasantness at the completion of the work, as you have not only to get over the

fact that the client objects strongly to the payment of any sum beyond the contract, but he feels that he is a much injured man in not being relieved of all risks. Young architects especially are afraid to tell the client of the extras as they arise; hence unpleasantness at the end.

I am not an advocate for the quantities being made part of the contract in law, although they are generally so in fact. The great use of quantities in settling up is that there is a definite basis for the settlement of variations. Quantities are often very badly priced. I have been astonished when measuring up at the completion of the work to observe the want of system and the inequality of the pricing, while the moneying-out is often very carelessly performed. I have known many instances of this, such as a large quantity of an article at 1s. per foot being carried out at 1d.; a large provisional sum carried into the rate column instead of the pounds; with errors in casts innumerable, both in the body of the bill and in the summary. Your duty, gentlemen, will be to see that your clients get all that they contract for, but you must never forget that you are to act fairly and honourably to the builders. Sharp practice never has succeeded in the long run, and it never will.

[For a report of the discussion which followed, see p. 165].

#### LECTURES AT CARPENTERS' HALL: JOINERY.

As briefly mentioned in our last, Mr. Francis Chambers, F.R.I.B.A., lectured on this subject at Carpenters' Hall on the 16th inst.\* After an interesting historical sketch of the trade and of the position and functions of the joiner, the lecturer dealt with the adaptability of different woods to the requirements of the joiner, and went on to say,—

The boundary between the provinces of the carpenter and joiner is vague and ill-defined. Very often the one or other invades the domain of his fellow-craftsman; thus in rustic buildings the carpenter nails down the rough oak or elm boards upon the joists, &c., and practically completes the floor; but in business of a higher class the floor proper is now always the joiner's work. Good flooring is a test of a builder's work. The neasey floor, with creaking boards and splintering edges, gaping joints and curling section, compared with the close platform, flat as a table-top, rigid and smooth, with joints almost imperceptible, marks the difference between the cheap house, built to sell, and the house built for the man who means to dwell in it and enjoy it. Old surveyors, when I was young, used to carry an old worn gd. to test the joints, and no floor would pass muster when the gd. would penetrate. Few of the modern floors can stand that test. One hundred or fifty years ago there were comparatively few builders in London who did not store their floor-boards for years before they used them. Now, the builder gives his order to the saw-miller, and in twenty-four hours he gets an acre of floor-boards, and they are laid complete within a week. It is not surprising that the result is unsatisfactory, even if the deals have been long stacked. The sawing of them into boards exposes fresh surfaces of fibre to atmospheric influence, and the wood begins to shrink and warp and crack. The boards should be stacked under cover for at least a year before they are laid. Our old master builders kept them stacked for five or six years; but I fear only the pianoforte makers keep that good custom now.†

There is no royal road to the efficient seasoning of timber. The desiccating processes seem to have only partial success. They have in some cases a tendency to make the wood over-sensitive, or absorbent of damp, and I have seen floors of desiccated wood well laid, by change of weather swell and curl and crack, and even start the nails. Either for good old port or old deals, time seems to be still of the essence of the contract.

The hand-to-mouth practice of our time has led to a reduction of the width of floor-boards. It is evident that a plank 5 in. or 6 in. wide will not shrink so many parts of an inch as one 9 in. or 10 in. wide, the aggregate shrinkage being spread over double the number of joints;

but the effect of dock-planking, with joints some 3 in. apart, is not so pleasing as in a really good floor of wider planks, and the labour is of course greater. The tendency of some boards to curl and take a concave outline is corrected in good floors by ploughing and tonguing the joints, and in later times the tongue is frequently of hoop iron, inserted into a saw-cut on each edge. This plan, when the board is thick enough to be nailed through the edge, forms a very close floor, almost water-tight and dust-proof,—a great advantage where there is no ceiling beneath it. It has a disadvantage in the difficulty of access to the cellular space between floor and ceiling. The iron tongue stops the saw or chisel, and the floor is destroyed in taking it up.

In the old times, a floor once laid was rarely disturbed, but now, when the gasfitter, the plumber, the hot-water engineer, and the electrician hide all their abominations beneath the joists, a floor is rarely at rest.

The joiner should lay a straight-edge over the joists on which he is about to lay a floor, and if any of them do not come even with it they should be furred up or adzed down; inequality in the joists is a frequent cause of a bad floor. If the floor-board does not take a firm bearing flat on every joist there will result a floor uneven, or creaking at every step. Whenever practicable heading joints should be avoided. There are few rooms exceeding 24 ft. in length, and floor-boards can be had in greater lengths. The nail-heads should not be seen in a good floor. If they are punched in they lacerate the wood, and it splinters. If countersunk and plugged, as was sometimes done, a row of ugly spots was left; the boards should be edge-molded,—it entails more labour if done carefully, but is well repaid by increased wear of carpet and improved appearance of the finished floor. It is still more desirable now the good custom obtains of showing a wide margin of the stained and wax-polished floor.

In laying oak flooring it is safer to lay a rough 1 in. or 1½ in. deal floor first as a bed. Oak is more rigid than deal, and will not adapt itself so well to irregularities in its bed. It, moreover, gives opportunity to arrange the floor in diagonal or lozenge pattern parallel to the lines of joists, and the oak can be reduced to ½ in. or even ¼ in. in thickness.

Parquetry, from the French *parquet*, which simply means the floor, makes tentative efforts to obtain a hold with us, but without much success. It depends much on glue or cement, which is much affected by the dampness of our climate; but for shops, show-rooms, and picture galleries it is admirably adapted. It is easily swept and kept clean, and saves the cost of linoleum or carpet.

The door was probably the earliest work on which the joiner tried his prentice hand. It was, at first, a very simple structure; vertical planks joined together formed a flat sheet or table top of wood, which was then cut or sawn to the size of the opening it was intended to fit. All ancient doors were of this type. They were sometimes, as in the case of Solomon's Temple, carved on the face in low relief. They were studded with bronze or iron nail-heads, shaped, and arranged in patterns, at d (but not till many centuries had passed) they were decorated by the curled and twisted filaments of the wrought-iron hinge, which, like a growing plant, spread its foliage in fanciful and beautiful curves over the rough surface. The vertical planks were at first set side by side with square edges, secured together by nails or wooden pins to cross-bars at the back, or a sinking was formed in the connected planks and the cross bar let into the substance of the planks for half its depth; or, to get a tighter hold, and to depend less on nail or pin, the edges of the groove were splayed and the cross-bar dovetailed. The cross-bars were braced with diagonal struts to throw the weight of the heavy door upon the pivot. The edges of the vertical planks were related or grooved and tongued, so that when the wood shrank it should not leave an open seam, stitched, as it were, together with dovetails or pins to reduce the weight of the door by spacing the vertical planks fitting in the interval with a thin board. Halving the cross-bars on the two extreme styles and tenoning the intermediate styles into the cross-bars or rails was the happy thought of some Medieval joiner, whose stock of wood, perhaps, had run low, or whose heavy doors had displaced the pivot and struck fast against the stone reveal; however it chanced, he became the unconscious inventor of the panelled door

\* For reports of the previous lectures, see *Builder*, pp. 383, 424, ante.  
† Not all of them, for there are "jerry" pianofortes as well as "jerry" buildings.—Ed.

in all its infinite variety. And it was a great advance. The door became lighter and stronger, and adapted to the simplest decoration as well as the most elaborate.

It is a mistake to mould the bottom edge of a panel. It becomes dust-trap, and, in external doors, frequently a water-trough for thirsty sparrows.

In early joinery the moulding of the panel was always cut on the edge of the stile or rail. In modern joinery the moulding is generally applied on the face of the panel, butting on the square edges of styles and rails. In good work it is rebated to fit into a groove.

The labour entailed in stopping or mitreing the moulded edge is considerable, and where machinery was introduced it was found impracticable to use it for this purpose; but the applied mouldings are produced at a cost so slightly exceeding the prime cost of the slip of wood that it is not surprising they have become almost universal, except in high-class work. I note that in the Palace of Justice in London there is not a single case of applied moulding,—all decorations in the beautiful joinery of the palace springs from the design of its framework, and is a lesson to the joiner in honesty and fitness. Formerly, the panel was narrow,—did not exceed the width of 9 in. or 10 in.,—but about the end of the sixteenth century they were much wider. A door, instead of two styles intervening, making it three panels in width, had one, or sometimes was framed as a two-panel door, with panels 2 ft. 6 in. wide, but their wood was dry and well-seasoned. They could do with impunity what would not result in total failure; panels of such a width would now soon be lattice work; but a panel may be any width, if the joints of the boards of which it is built are shown with the junction either rounded or V-jointed, and they can be treated with slight labour, so as to be highly decorative.

There is a French proverb, "A door must be shut or open." Some modern doors hardly conform to it, as when shut they are still open to draughts, to smells, even to vision; but it is clearly the function of a door to swing upon its pivot or hinge, and close at will the opening to which it is attached. It should be hung firmly, open freely, and close exactly upon the rebate of its frame. Its edge must not touch the jamb, but so nearly touch it that a worn sixpence should be the measure of its windage. The pivot was the earlier hinge, and when the door was on the face of the wall,—covering the opening,—not set in a rebate of the masonry it was the best form of hinge. It enabled the door to turn through the half circle and fall back flat upon the wall. The pivot hinge is still used. There are some conditions in which nothing else is practicable, as in swing doors, and the outer doors of lobbies, where the external door is required when open to form the panelled side of the lobby and to be flush with the frame. A very good example is the entrance doorway of the Carlton Club. But the difficulty of hanging or unhanging a pivot door was great. The joiner had not yet invented the contrivance now so familiar, by which the pivot becomes a short rod concealed in the hanging stile and is raised or lowered by a screw thread.

The pivot fell into disuse, and the clasp hinge,—embracing the hanging stile, and throwing out long arms and branches along the rails,—became the hinge which, while it greatly strengthened and adorned the door, was easily fixed and as easily removed.

At the end of the seventeenth century some barbarian invented the lutt hinge. It was weak and ugly,—it held by screws only to the edge of the door and to the surface of the jamb, but it was cheap,—the labour to fix it was reckoned by minutes, and it could be cast in iron or brass and multiplied in thousands from a single pattern. In the struggle for existence the hinge of beauty and of strength faded too quickly into nothingness. It has, within the experience of most of us, revived to a small extent. I am glad to hear that the cheap cast shams, entirely disconnected with the hinge, and which once threatened to be the fashion, now cover the shelves of the ironmongers as unsaleable articles.

In the practice of the architects who flourished from the close of the eighteenth century to the reign of William IV., curved surfaces of walls and partitions were more frequent than they have since been. The ends of rooms, the halls, vestibules, and staircases were planned circular or elliptical, and the doors of them were made

of necessity circular on plan; and as there was also a fashion of circular-headed or elliptical arched opening, it was a palmy day for the joiner. He had reached "circular-circular," as the measuring surveyor calls it,—"double double toil and double,"—but the square of double when the bill came in. The tortured wood was strained and twisted, glued and blocked, built up on moulds with infinite wasted labour, ingenuity, and skill.

I remember once planning a quadrant Spanish mahogany partition, about 12 ft. radius, which had two doors in it. They were to fit semicircular arched openings. I received tenders for the house; they were far above my estimate, and my client hesitated to accept it. The first glance at the priced quantities disclosed my mistake. This unlucky quadrant with its doors had been priced at a fabulous price, bearing a large proportion to the whole cost of the house. I have steadily avoided "circular-circular" ever since.

These circular framings were very frequent in those days, and you will find in the "Joiners' Assistants" and "*Vade Mecum's*" of the period elaborate instructions for the construction of columns and diminished columns, of niches and sunk hemispheres, and many other curious contrivances, of one and all of which I say, "Avoid them, for they are shams, shallow conceits to distort and caricature in one unsuitable material forms which are natural and fitting in another." On the screen are two examples of the kind, diminished columns in King's College, London, where the wood casing is, as usual, the mask of the iron columns or stanchion which is doing the work.

The lecturer, in conclusion, proceeded to treat of windows, shutters, and staircases.

#### TIMBER HOUSE FRONTS.

This was the subject of the fourth lecture of the series, which was delivered on Wednesday evening last by Mr. Lacy W. Ridge, F.R.I.B.A.

Mr. Lacy Ridge said it was within the comparatively narrow limits suggested by this title that he wished to speak, partly because the subject of "Half-Timber Houses," or, as they might more properly be called, "timber-houses," was so extensive and complicated for anything like adequate treatment in a single lecture, and partly because, by confining himself to one portion of the subject only, he hoped to be able to consider the treatment which it had received at some four different and distinct periods of architectural history, which would enable them to see how men working with varying materials, and under differing surrounding circumstances, had solved a problem in all its essential points alike, and had produced results distinguished from one another by marked characteristics, each style being in its way admirable and true to the causes which gave it birth. He proposed to start the consideration of the subject at a period when architectural art was far advanced, and to call attention to a class of building specimens of which might be easily reached by any who had retained a healthy love of fresh air and exercise, at the cost of a few pence expended on a railway fare just to put them beyond the suburban region which had been handed over to, and, alas! as a rule, rendered hideous by, the speculative builder. At the beginning of the fourteenth century, beyond which few, if any, existing timber houses of this country dated back, Gothic architecture had been flourishing in this country for more than a century in its purest forms. Its most important works, and the noblest of the remains which had come down to us, were of stone; but whatever building or manufacturing work was undertaken at that period always showed in its design a sense of fitness, a following out of the nature of the material employed to its legitimate conclusion in design that argued a high sense of constructive art in the workman,—the result of traditional training in his trade guild. Another peculiarity of this epoch in England, which continued for some time afterwards, and in a slight degree reached even our own day, was the clearing, as society quieted down and population increased, of the great woods by which large portions of the surface of the country had been covered. Where the woods were thickest and the largest clearings were made, there oak, the characteristic timber of England, was most plentiful, and there naturally timber houses most abounded. No counties exceeded in fitness for the study of the subject the Home counties by which London was

surrounded: Essex, Hertfordshire, Surrey, and particularly the weald of Kent and Sussex. The great forest of Anderida, extending over the Weald,—it was said to be some 100 miles in length and thirty in breadth,—shut off the little kingdom of Sussex, the smallest of the Heptarchy,—that is the South Downs and the little strip of land between them and the sea, whose watering places are now so familiar to the Londoner,—from the outer world. In later times that forest furnished boundless stock of material for houses, and afterwards for our ships of war in the days of our "hearts of oak." Therefore timber houses abounded in that part of the country. The lecturer then called attention to an illustration of an old house, formerly the vicarage of Alfriston, in Sussex, of which he said that whatever of art there was in its front, whatever there was in it capable of giving us pleasure, was done without decoration of any sort; a more genuine piece of carpentry it was impossible to imagine. The charm of such buildings consisted largely in the naturally-twisted outlines and roughness of the oak, and in the lavish profusion with which it was used. One might study such buildings as this for picturesque quality of outline, for variety of light and shade; but one could not imitate them in Baltic timber "sawn like square," and valued at per foot cube. In some instances the floor was made to project to the sides as well as to the front, in fact, that was very common in corner houses in our villages. In such cases a principal joist or hinder was set diagonally across the corner, and was carried on a corner post with brackets set diagonally both outside and in. A house at Charing, in Kent, illustrated this point. By selecting pieces of the tree where branches jutted out from the main trunk, the post and brackets were got from one piece of timber, and we could not doubt that the material that happened to be available largely influenced the design. The house at Charing had unfortunately been rather badly treated, and, for some reason or other, an important part of the upper bay had been plastered up and its gable weather-boarded over. Nevertheless, it was a good study, in which the bay-windows were made to give variety to the projecting upper stories, modifying and breaking up the very heavy shadows and greatly increasing the play of light and shade and the interest of the building. The windows themselves, with their solid moulded mullions and transoms, were fairly complete. The windows had been subjected to such continuous alterations that it was difficult to find an ordinary window in a straight wall in its original condition. Where they were not content to mould and rebate the main timbers and glaze into them, a process like that shown on a door-head at Shoreham, in Kent, might have been used. The lintels and posts were moulded; the head was a shaped timber placed in a rebate, and the jumbs are moulded and had a splayed joint next the main timbers. The brackets at Charing were of a somewhat late and conventional type, probably seventeenth century. A simpler and earlier form was shown in the corner of a house at Eynsford, Kent. In that case the bracket was a piece by itself, tenoned into beam and upright. This house was very picturesquely situated near the bridge in the village, and was a striking object. It had a good barge-board, apparently of the fourteenth or early fifteenth century. Barge-boards gave an excellent finish to the gables, and were frequently, or, in fact, almost always, richly carved. As they did not require any great thickness of material, and could easily be carved in deal, they had at times been much used in modern work; but not, the lecturer regretted to say, with such taste or such success he confessed to some feeling of prejudice against that partial detail. The old ones were always excellent, and were merely boards carried on the projecting ends of plates, purlins, and ridges to cover their ends and protect the gable wall. Occasionally the two boards were framed into a central flutal or drop at the ridge. The way in which plates were cut to take them was noteworthy. They did not cover the projecting eaves. When that was tried the effect was bad. Alluding to a small drawing of some houses from Chester, showing enriched semicircular arches, panels and strings, grotesque pilasters, and bold consoles or brackets, the lecturer said that there were not wanting those who wished that the use of these

Classic forms had stopped here, and that our native arts had been allowed to continue their course and to expand unaffected by the desire to make things look like something else, and to reproduce in a shop-front the columns of a temple of Jupiter. Such things as these, however, did not affect the houses far away in the country, and timber houses of the genuine kind continued to be built during the course of the seventeenth century. In Hertfordshire and Essex plaster panels were to be found relieved by surface decoration of lines drawn thereon in more or less freely-treated geometrical patterns. After the revival of brickmaking, the panels were not infrequently filled in with brickwork, sometimes set in herring-bone patterns, and consisting of bricks some 2½ in. wide, and longer than our regulation brick. The introduction of the piece of bright colour which bricks afforded was often valuable, and added to the picturesqueness of the building. Large numbers of these timber houses and cottages were now remaining in our old villages and towns in disguises which might not at first sight be recognised. Although the construction was very substantial, and it was well known in our villages that these houses were warmer and more weatherproof than the great mass of the more modern cottages, still they must in course of time have required repair. The plaster filling-in could only exceptionally have lasted more than a century or two, and if the timbers, especially those standing on the ground, or having an end grain exposed, were neglected, and the damp allowed to get in, decay must have ensued. What a temptation, then, did those fronts present to the plasterer, who, thinking within himself "There is nothing like plaster," remarked aloud, "Lor', sir, you'd better let me plaster all over those rough and rotten old timbers [probably a little sap had gone off an arria or two]; it will never make a smooth surface." As if anybody in the world but the plasterer wanted a smooth surface! However, on went the lath and plaster all over the different stories, leaving nothing but the projecting strings, which he could not manage to cover up, and which, moreover, accorded more or less with the fashion of the period to show the original design. It was pretty much in that condition of plastered-up, all but the string-courses, the openings, and the gables, that such few old timber house-fronts as had come down to us in London were now to be seen. There were the houses in Holborn, where Middle-row once was; houses in Wych-street, Strand; and possibly a house or two still standing in Bishopsgate, at Aldgate, and where the famous inns once were in the Borough. All that gave real value to them as timber houses was covered up. Where that plastering process had been adopted in the country, though the front might be concealed, we often found the ends or hack still showing their old construction. He (the lecturer) had great respect for bricks and brickwork, and no desire to disparage the neat and trim formal brick fronts which, under the Dutch influence of William III., were adopted in this country, and were really "Queen Anne" architecture,—unlike, to the last degree, to some of the fantastic vagaries that now went by that name. Only he should prefer that the said formal brick fronts should be applied to houses of the same period. Very largely, as a matter of fact, they were built up and had incorporated with them old timber house fronts. Not infrequently, along the great roads out of London, and in our prosperous market towns, the brick house of Queen Anne, as one supposed, hid behind its ample parapet an old timber house. When one went round to the back the timber work was visible enough. Fashion led people as far as refronting their houses, but not as far as rebuilding them. There was a curious invention, much used in Lewes and its neighbourhood, for giving an apparent brick front to old wooden houses. This consisted of tiles which looked like bricks, having usually a black glaze; but which had, however, an upper part which was capable of fitting in behind the next course, through which nails for securing the tile to the boarding were driven. The illusion was very perfect, and many persons of intelligence who had lived in the town all their lives were quite unaware that these fronts were not really brickwork. Such tiles were also a good deal used at one time in Brighton and Worthing, but, being probably on a more slender fir frame, they had an uneven and shabby look. There was one mode of covering timber framing for which the lecturer felt great sympathy, and that was hy

weather-tiling. It had been used for centuries in the Weald, and of late years had been adopted very largely in our so-called "Queen Anne" work. As a protection against the weather it was very perfect. Its red, toning more gradually than the tiling on the roof, gave great variety of colour. Being itself picturesque, and fitted into the quaint shapes of the gables and other parts of the old houses, it added a charm to the buildings seen against the greens of the well-timbered country. In many parts of the Continent timber houses, designed on principles similar to those recognised in this country, were to be found. Normandy and Brittany were full of them; the Isle of France, Belgium, the Rhine, and parts of Germany, had many admirable specimens. Those best known in this country were chiefly town houses, some three, four, or more stories in height. They had the same framings and projecting floors. The braces, however, and the timbers generally were straight, as though their trees were of straighter growth, and the St. Andrew's cross was a constantly recurring feature. Lintels, with heavy mouldings, stopped at the ends, played an important part in the corbeling out of the stories, the weight of work over being in such cases carried on the principal joists, and not distributed over the lot. A good deal of curving and ornamental work was introduced in the brackets and lintels, and there were dormers of the most charming character to be found. One important feature not found in English work was the trussed barge, framed up of different timbers of no great scantling. A few weeks ago there was published in the *Builder*\* a sketch of a house-front in Rouen. The house had perished, but the front had been preserved, and was really a beautiful piece of joiner's work. The lecturer then proceeded to refer to Swiss timber houses, as to which he said that the bracketed paranas were very curious, and exactly opposite in principle to our English brackets. Some of the framed brackets under eaves were very strange. As the work was executed in practically the same material which we used now in this country, the details of the joints were not only curious, but worthy of the study of our own practical carpenters.

[The next lecture will be given on Wednesday evening next by Professor T. Roger Smith, who will treat of "Bricks and Brickwork."]

#### LEEDS AND YORKSHIRE ARCHITECTURAL ASSOCIATION.

"BUILDING WITH BEAUTY" was the subject of a lecture delivered by Mr. P. T. Baggalay on Monday evening before the members of the Leeds and Yorkshire Architectural Association, Mr. C. R. Chorley presiding. The lecture was in the form of a supposed conversation between architects of more or less experience, and in the course of the dialogue attention was called to the great variety of opinion, and even of differences, existing in the profession as to artistic matters. The inside of a house, one of the persons to the dialogue was made to say, might be for a man's self, but the outside was for the public; for an exterior was a matter of general interest. It not only helped to form the public taste, but would benefit or defile, according to its character, the whole landscape. What was really ugly and in bad taste was often regarded by the public as passable or inoffensive, and was sometimes praised for the very qualities for which it should be condemned. Practical matters, of course, must be attended to, and it was to be regretted that the designs which exhibited the most artistic skill were so often found defective in practical requirements. It should always be remembered, however, that in public buildings, beauty, both inside and outside, was of greater importance than in structures reared by private individuals. A noble and beautiful building was an illustration of the arts which a town was capable of producing. When a Government, imperial or municipal, recognised its duty, and set an example to its people in the admiration and encouragement of art, it had always found its reward in the great thoughts and noble aims and ambitions which resulted, and which dispelled those sordid and impure habits that undermined the lives of nations. Was not, the lecturer asked, the knowledge daily growing that the crutch on which the architect had leant

so long,—the crutch of imitation of the past,—was no guide, and useless to help him forward? Had not this knowledge caused some to kick away the crutch altogether? Was it not, then, possible to lay down a few principles on which every one could agree, and which might serve to guide them in building with beauty?

On the proposition of Mr. Connon, Mr. Baggalay was accorded a vote of thanks for his lecture.

#### BRITISH ARCHAEOLOGICAL ASSOCIATION.

At the meeting of this Association on the 16th inst., the Rev. S. M. Mayhew in the chair, it was announced that Sir James Picton, F.S.A., had been elected President of the coming Congress of the Association at Liverpool. The Rev. Dr. Hoopell sent for exhibition a series of photographs of some remarkable pieces of sculpture found at St. Andrew's, Auckland. They are of Saxon date, but vary considerably in style. They consist of fragments of shafts of crosses and other pyramidal objects, sculptured slabs, and the like. Some of the shafts are covered with interlaced foliage and figures of great beauty and delicacy of execution, in high relief, evidently executed with a chisel, and by an artist of ability. They open a new chapter in the history of early art. Mr. Loftus Brock, F.S.A., described a large number of jettons and abbey pieces, found in England, and also, for comparison, a series of French examples. A paper was then read by Dr. Woodhouse on the sepulchral epitaphs in Fulham Church, which was accompanied by the register which he had compiled of the whole of the inscriptions in the church and churchyard. After referring to many events in the old history of the parish, and of the changes which have altered its aspect, he passed in review the more ancient of the inscriptions, some of which still exist in the recently rebuilt church. The paper was illustrated by notices of several of the Bishops of London who are buried at Fulham. Dr. Woodhouse received well-merited thanks for his painstaking labour. A paper was then read by the Chairman on certain sculptures of Roman date found in London, and it was accompanied by an exhibition of Roman relics mostly found along the course of the Walbrook. A discussion ensued, in which Col. Adams and others took part.

"George Varrentrapp, M.D., Sanitarian and Philanthropist," was the subject of a lecture delivered at the Parkes Museum, on the 17th inst., by Dr. E. F. Willoughby, Dr. George Buchanau, F.R.S., in the chair. George Varrentrapp, the pioneer of sanitary progress in Germany, was born in 1809 at Frankfort-on-the-Main, where his father was a physician of repute. In boyhood he gave but little promise of the extraordinary industry and energy that marked his subsequent career, but it was at the university that his character, like that of so many other great men, first developed itself. At the age of eighteen he matriculated at Heidelberg, and afterwards went to the University of Strasburg. The outbreak of cholera in Frankfort recalled him from a tour through the principal cities of Germany, in which he had formed friendships with the leaders of thought and action,—political, social, and scientific,—and for ten years he assisted his father in his hospital and lunatic asylum, as well as in his private practice. In 1842, when thirty-three years of age, he succeeded his father in his appointments, and married, after having made a wider tour through Belgium, Holland, Great Britain, and Ireland, for the purpose of studying the arrangements and administration of hospitals, asylums, and prisons. He was soon afterwards elected a member of the town council of Frankfort, a position he held to the last, and which enabled him to carry out reforms in every department of municipal administration, the result of which has been to make Frankfort what it is,—the healthiest city in Germany, and, perhaps, of its size in the world. He initiated the movement in favour of sanitary reform in Germany; founded the German Society of Public Health, and the section devoted thereto in the Association of German Naturalists and Physicians, as well as the *Vierteljahrsschrift*, or quarterly journal of public health, which he conducted until his death.

\* See *Builder*, Feb. 10 last.

## THE ARCHITECTURAL ASSOCIATION.

The eleventh meeting of this Association for the present Session was held on Friday, the 18th inst., at 9, Conduit-street, Mr. J. A. Gotch (President) in the chair.

The following new members were elected, viz., Messrs. A. D. Toll, E. C. Arnold, A. J. Crichton, E. J. Stubbs, P. Goddard, and H. C. Flack.

Mr. H. Lovegrove then read a paper on "Architect and Contractor," the greater part of which we print on another page.

The Chairman, in opening the discussion, said Mr. Lovegrove had mentioned among other things that in the provinces quantities were taken out by the architect instead of by the surveyor, which proceeding he naturally and logically, from his point of view, objected to. On the other hand, the provincial architect might take a different view of the matter. But there was this to be said about quantities to be used in the provinces, that in small places the builders were unaccustomed to elaborate quantities, and were puzzled by them. He had had elaborate sets of quantities taken out by London surveyors, which were quite wasted on the provincial contractor, and there was a great deal to be said for quantities being taken out to suit the local understanding and customs. The country contractor was very different from the contractor in London. In the country the mason took the masonry and brickwork, the carpenter took the carpentry and joinery, and then there was the plumber, and it depended on circumstances as to which of the three men was looked upon as the contractor. It was, of course, more convenient to the architect to have only one man to deal with, but the advantage of the country system was the personal supervision of the man who was responsible for his own particular trade, and above all it was an advantage to have the plumbing work done by a competent man who had a personal acquaintance with it. As to the document which was the basis of the work, the contract, he had found it advantageous to have a printed contract, because it was obvious to a man at once that it would contain probably nothing but what was usual, and it could be grasped better than a written document of ten or twelve pages. There was no doubt that the contract the heads of which had been drawn up by the Institute was a much more favourable document to the contractor than a good many of the contracts used in works carried out under Government superintendence, some of which really appeared to deliver the contractor bound hand and foot into the power of the architect. It was absolutely necessary to have a certain sum allowed for contingencies, and he invariably regarded that as being an amount intended not to meet any extra orders on the part of the client, but rather matters which could not in the nature of things have been foreseen in the contract itself. In contracts also questions of great difficulty sometimes arose when mistakes had been made by the contractor; for instance, when he had made an error in casting, and had thus had the job. It was not easy to correct an error of that kind. Builders, after pricing out their quantities carefully and reasonably, sometimes took a percentage off in order to get the job, and what were architects to do in a case of that sort if they regarded it as a schedule of prices, because owing to the percentage taken off the total, every price ought to be somewhat less? It was a great help in considering tenders to observe whether they were consecutive or not, because if they ran evenly it was almost a certainty that they had been carefully priced out, and did not contain any glaring error.

Mr. E. W. Mountford proposed a vote of thanks to Mr. Lovegrove for his paper, which he said contained many ideas. Every point that had been touched upon was one with which he (the speaker) had experienced more or less difficulty. He agreed with Mr. Lovegrove as to the desirability when doing work for public bodies to have some formal contract, and in the case of a corporation to have it under seal, without which the document was not worth the paper it was written upon. Mr. Lovegrove naturally objected to architects taking out ordinary quantities. There was a good deal to be said on the other side, but that was hardly a question before the meeting. He had had some peculiar experiences of the manner in which quantities were taken out; but he could not agree with Mr. Lovegrove in considering all

mention of the "labours" as useless. Builders, he believed, read those, although they did not price them in detail, and from the amount of labour they saw mentioned they priced the material. The question of "provisions" in connexion with the quantities was very striking. A builder who did a large amount of work for a certain public body told him that when he began competing he was always at the top of the list; when he deducted 2½ per cent. he still found himself near the top; when he took off 5 per cent. he got about half way down; on deducting 7½ per cent. he was near the bottom; and when he took off 10 per cent. he was often at the bottom of the list and got the work. But in pricing up any "extras" at the end this man would get 10 per cent. more on these than he received for the actual work under the contract. Mr. Lovegrove had referred to the commencement of his paper to a certain society of architects; though that was not, perhaps, the place to express one's opinion of the said society, he would have liked to say a good deal on the subject. All he would say was that that body had done more harm to the profession during the short term it had existed than could be counteracted by all the good it would be able to do should it last for a hundred years.

Mr. Pryce Cunson seconded the vote of thanks, and remarked that he could not agree with Mr. Mountford upon one point which he had raised, viz., that when a builder takes off say ten per cent. from the summary, and thereby reduces his tender without adjusting the detail prices in the quantities, he could claim to deduct that percentage from any lump sum provisions when they came to be adjusted in settling up the accounts at the completion of the contract. Being a quantity surveyor, he, of course, had some experience on this point, and he could only say that he should not think of allowing such a claim. As to taking the labours on stone, builders who understood quantities at all looked most carefully at the labours, even if they did not price them out in detail, omitting to do this partly to save time, and partly because they did not like in some cases to give a detailed schedule of prices to measure up by. Mr. Lovegrove had spoken somewhat against quantities being made for the architect to understand; but, nowadays, the foreman often had the bills to refer to, and used them almost as largely as the specification; and that being so, it was a question whether it was not advisable to arrange bills of quantities so that they could be referred to as easily as possible. It doubtless made the bills longer, but certain surveyors in London acted on that principle, and personally he was in favour of it. On the other hand, he could, of course, only condemn the lumping system which had been referred to. Mr. Lovegrove had also referred to the advisability of getting a written order from the client, but in many cases the client seemed to think, if asked for it, that his honesty was doubted. He did not agree with Mr. Lovegrove as to the advisability of including in the accounts the fees for measuring up work. He always tried to get architects for whom he took out quantities to let the client pay direct. There ought to be nothing to be ashamed of in their fees. As to provisions, care should be taken that if rods of brickwork and so on were put in they should be very distinctly stated to be provisions. With regard to contingencies, it was a question whether it was not wise, especially for young architects, to let the client see plainly that every probable contingency had been included, but to let him understand at the same time that they could not foresee every possible contingency. There was a good deal in what Mr. Lovegrove had said with regard to checking the moneying-out and casting of the priced bills of quantities before using them as a schedule in pricing the accounts. It was a thing that should be carefully gone into, because mistakes affected the prices.

Mr. A. C. Blumer Booth said that Mr. Lovegrove was quite right when he spoke of civil engineers becoming the contractors for works, as well as making the designs for them, and that was not at all an exceptional state of things. The lawyer's contract was often full of words, though if examined carefully it would be found to embody pretty well the usual form, with more phraseology than the architect put into the clauses. As to "provisions," no work, even as low as 500l., should be entered upon without some small provision being put in to meet any points which were not noticed at the

time of making the drawings. "Extras" more or less, were always occurring, though sometimes they were the fault of the client. These were easy of adjustment, provided there was a properly priced and moneyed bill of quantities to form a good basis. It was an excellent practice to have a priced and moneyed-out bill to correspond exactly with the tender given by the builder, and deposited with the architect at the time of tendering, or shortly afterwards. It was a useful document for ascertaining the value of work done when granting certificates. Mr. Lovegrove had objected to quantities being made part of the contract, but he did not see why they should not be. The contractor undertook to do certain work based on the quantities, and anything not included must necessarily be an extra; therefore why should the contractor be asked to pay for that which the owner never expected, as far as he knew, to get?

Mr. H. W. Pratt said that though, in his opinion, the architect should not take out his own quantities, he should have a good grounding in the subject. He did not consider it wise or expedient that the quantities should form part of the contract. If a builder took the contract at a low price, and had doubts as to the quantities, it would mean that the whole work had to be measured over again, thus putting the client to considerable expense. The client was entitled to expect from the architect that the work should be carried out for the amount of the contract, or as nearly as possible, except for things that might afterwards arise. The best way to deal with quantities in respect of the contract was to have an understanding with the builder on tendering that the quantities should be accepted as the schedule of prices. There was no difficulty then in measuring up the extras and omissions, and valuing them afterwards. He was rather an advocate of the lump system of taking out quantities, and did not consider it was over-desirable to go into all the minutiae of little labours. The detailed method had been reduced to such a system that the large firms of contractors who employed good men to price out quantities understood it, but a good many builders did not. With regard to specifications, the members could not do better on starting in practice than to make up their minds that these should be thoroughly well written. If a general clause were given, the argument against it was that it might be vague, but it was possible to make a general clause which should cover a wide area, and yet at the same time be quite intelligible.

The vote of thanks was then put and carried.

Mr. Lovegrove, in replying, said he was afraid he had not made himself perfectly clear as to the commutation of the labours on stone. He did not mean to convey the idea that they were unnecessary, but he adopted a different system for country towns to what he did for London. Within a radius of 100 miles of the metropolis it was well to follow the London system, but for Lancashire or Yorkshire he would not take off the labours on stone. He arranged for the stonework and work of a similar kind being put together, cubing it, and if necessary, describing and illustrating it by sketches, but it would be waste of labour on a job in some remote country town to take off all the labour on stonework. At the same time, he did not mean to say that the measurement of the labours was useless. Another reason why builders did not price out the labours was that most of them got the work done by a sub-contractor. He preferred a lithographed form of contract to a printed one, because, the lines being wider apart, anything could be put in or ruled out more conveniently. As to the principle on which builders took off a percentage on the total amount of their estimates, he had not ascertained, in his experience, how it was arrived at, but he believed it was done in some such way as that in which architects arrived at the price per foot cube of a building for which they were sending in competition designs. He was always careful in settling up the extras and omissions to deduct the same percentage as had been taken off the contract amount by the contractor. He had touched lightly upon the society of architects which had been referred to, because they had been so kind as to invite him to many of their meetings, a privilege, however, he had not availed himself of (laughter). As to the fees being paid direct he would like them to be paid

thus, both for the quantities and the measurements; but then the client generally wished the surveyor to take less, while if the building was intended for philanthropic purposes, something was looked for by way of a donation. He did not see why they should object to have their fees from the builder, who was really only a bailee. The word "provisional" was the right term to use, although extraordinary ideas as to it were sometimes prevalent in the law courts, one barrister having even asked whether the "provisions" were for him (Mr. Lovegrove) when he was measuring up! (laughter). An eminent London architect considered that if the builder signed the specification and drawings a sixpenny stamp put on the tender was sufficient for all practical purposes.

### Illustrations.

#### EDINBURGH MUNICIPAL BUILDINGS COMPETITION.

**W**E give this week some further illustrations from the second and third premiated designs in this important competition. We shall have further illustrations to give from among the designs not premiated.

We may observe that all the illustrations of the Edinburgh designs which we have given up to this date have had to be photographed *in situ*, so to speak, under an unfavourable light; as, owing to the designs being retained for exhibition for three weeks, there was no means of giving any illustration of them at the moment except by sending specially to Edinburgh and having them photographed on the spot; but we believed our readers would prefer to have some knowledge of the character of the works selected as speedily as possible.

#### THE SOUTH PORCH, ST. NICHOLAS, LYNN.

The south porch of St. Nicholas's Chapel at King's Lynn is a favourite subject for illustration. The whole chapel is rich and worth study, more particularly, perhaps, on account of the small amount of material used in its construction; the walls are thin and almost all window, whilst the piers of the nave arcade are remarkable for their slenderness. The glass and the wood carvings for which the chapel was famous have almost all gone, but the benches that remain deserve some attention.

#### NAVE PIER, WEST WALTON CHURCH, NORFOLK.

The village of West Walton is situated about three miles out of Wisbech, and the church, though in a sad state of dilapidation, is a fine specimen of Early work. The nave piers, one of which forms the subject of our illustration, are characteristic of the period; the carving is full of vigour and of the Lincoln type. Many of the Purbeck marble shafts have disappeared, and others are much damaged; in fact, neglect and decay are everywhere apparent. It is to be hoped that some energetic steps will soon be taken to secure the building from further injury.

**Professor Aitchison.**—We mentioned in last week's *Builder* (p. 419), the appointment of Mr. George Aitchison, A.R.A., as Professor of Architecture at the Royal Academy. The *Athenæum* joins us in our congratulations, and adds,—"Although this chair has been vacant since Street's death in 1880, numerous 'outsiders' have lectured to large audiences at Burlington House on architecture and allied subjects, such as the Professor is expected to treat. The Professors of Architecture since the foundation have been as follows: T. Sandby, 1768-98; G. Dance, 1798-1805; Sir John Soane, 1805-37; W. Wilkins, 1837-9; C. R. Cockerell, 1839-53; S. Smirke, 1860-6; Sir G. G. Scott, 1867-72; E. M. Barry, 1874-9; and G. E. Street, 1879-80."

**Institution of Mechanical Engineers.**—The spring meeting of the Institution of Mechanical Engineers will take place on Monday, the 16th, and Tuesday, the 17th of May, under the presidency of Mr. E. H. Carbutt. H.R.H. the Duke of Cambridge will honour the Institution by dining with the members on the evening of the 17th.

#### HOUSE LIGHTING BY ELECTRIC BATTERY.

IN June last year Messrs. Woodhouse & Rawson invited a number of electricians and others interested in electric lighting to visit their factory at Hammersmith, to see the first installation of a chlorine gas battery. The idea at that time was a novelty, and Messrs. Upward & Pridham, the inventors, were complimented for their ingenuity, as they had produced the only really promising primary battery applicable to domestic lighting. After a lapse of nine months Messrs. Woodhouse & Rawson have again invited their friends to see another installation of even more interest, as it is an improved edition of their former installation; but this time they have fitted the more perfect apparatus in the basement of the large block of buildings in Queen Victoria-street, in which their offices are situated, and they have lighted up the rooms they occupy very brightly from it with small incandescent lights. The present installation accords altogether with the conditions under which a country-house or a single mansion in town could be lighted without any lavish expense, and for which the electric lights could be supplied at a cost not extravagantly exceeding the cost of gas, and without any serious difficulty or trouble. The installation which was shown last year had even then been working for some months; and in the interval Mr. Cunyelmane has had a similar installation fitted in his house at Fulham. Both are still in proper order.

The new battery may be regarded as of a permanent Leclanché type, in which the practical improvement consists in putting the manganese in a separate generator from which the chlorine evolved is transferred by pipes to the battery cells. In the old way of making chlorine by the action of sulphuric acid upon common salt, solid masses of sulphate of soda were produced, which were difficult of extraction without fracture of the containing vessel in which they were formed; but by the substitution of hydrochloric acid in connexion with manganese dioxide, assisted by the application of a small amount of heat, a residue is produced which is easily dischargeable through an ordinary tap. Hence the first stages of manipulation of the gas battery are simplified to the most primitive conditions. The apparatus may be placed anywhere that may be convenient. In the present case a well-hole of brick is provided with a pipe leading to a drain as a convenient means of discharge. Over this is placed a common earthenware pan for the manganese, and an earthenware jar with a tap for the hydrochloric acid. The battery is formed of glazed earthenware cells containing the ordinary carbon plates, surrounded with crushed carbon alternating with zinc plates in the usual manner, the chambers being filled with plain water. In the present installation several of these elements are congregated within a large earthenware pan, the whole being sealed down by a covering, an inch thick, of marine glue. There are two of these compound cells, and the installation is consequently denominated a "two-cell" installation. To work these batteries all that is required is to turn once a day a small quantity of the hydrochloric acid by means of the tap attached to its receptacle on to the manganese, and the necessary quantity can by means of a gauge be ascertained without the acid being either seen or handled. The gas will now be generated as long as there remains any of the hydrochloric acid to act upon the manganese. The gas passing through the cells one after another in series is taken up by the water to the extent of saturation, and the surplus gas passes to gasometers conveniently formed by up-ended earthenware drain-pipes connected together, and closed at top, except by a small pipe which connects one gasometer to another in the number provided for storage of the gas, the end pipe passing out of doors for the escape of any surplus gas which may occasionally be produced. As the chlorine is more than twice the weight of air, it flows from one gasometer to another by displacement, and its presence is made manifest by its yellow-green colour, seen through glass globes attached to the gasometers. The battery generates its electric current perfectly steadily and uniformly with no tendency whatever to polarisation. For the lighting of the mansion or house, the current generated by the gas battery is turned on to a series of accumulators,—in the present instance ten in number,

and of large size. Each of these is by a clock-work contact-maker charged by the current for half an hour, and in this way their efficiency is adequately kept up.

The advantage of the series of accumulators is that the battery can be in action all day, providing for the requirements of the lighting at night; and, as applied to country churches, or buildings in which the lighting is similarly intermittently required, the gas battery could be working continuously, charging a larger series of accumulators required for a considerable number of lights for a short period of duration. The whole installation works automatically, except the one supply of acid daily, and the occasional replacement of the zincs; but which is needed not more than twice in the course of a year. In this act there is no trouble, each zinc being successively withdrawn, and another put in its place. There are no fumes, no handling of corrosive materials, and if any primary battery at all is ever to be employed for domestic lighting, the present system stands the most promising in prospects of success. Such an installation of the "two-cells" capacity can be purchased for 56l., and, with the ten-storage cells included, will give 700 Watt-hours current at the incandescent lamps. Twenty-two lamps of ten-candle-power can be thus supplied, and these lamps run with so steady a current, are amply bright and sufficient for household purposes, and superior in illumination to ordinary gas-burners. The acid contained in the jar, and the manganese, are adapted for a fortnight's duty; and the spent manganese can, it is said, be re-converted at a cost of only one-tenth of its commercial value.

#### THE NATIONAL GALLERY.

##### VISIT OF THE ARCHITECTURAL ASSOCIATION.

The fourth Saturday afternoon visit of the Architectural Association took place on the 19th inst., when the new buildings at the National Gallery were visited. Mr. Taylor, of the Office of Works, who designed the alterations, attended and explained the buildings. The alterations consist of a new staircase, with two large galleries and cabinet rooms. The staircase has some very good marble work, with Naxian marble door-jambes, and giallo antico linings to the walls. Cipollino is used for some of the pilasters, and some New Zealand marbles for the bases of the columns. The roof of the large gallery adjoining the staircase is ingeniously arranged to avoid the use of girders crossing the lantern light: this was managed by means of iron cantilevers which cross the walls of the cabinet room and are bolted down in the wall. The lantern light in the second gallery could not be arranged in this manner, there being no means of getting the cantilevers tailed and bolted down. The new buildings will form the exact centre of the complete design; the work remaining to be done to complete this will take up some portion of the St. George's barracks. The general scheme of decoration, which is being carried out by Mr. Craze, is a red ground for the walls and olive green in the cornice; the colour treatment will be very much quieter in character than that in the late Mr. E. M. Barry's portions of the building. The rooms are lighted with large lanterns, which will not have glass ceilings as in the other galleries, but will be open right up to the top. No artificial light of any kind is provided, and the doorways are closed by jack-in-the-box iron doors, the revolving shutters being found to get out of order. It is expected that the galleries will be opened in June.

The members afterwards proceeded to inspect the new drainage works at the Houses of Parliament, which were fully described (with illustrations) in the *Builder* for Jan. 29 last. The whole of the work was carefully examined, and the action of the ejectors explained by means of a working model.

**A Rich City Company and an Open Space.**—According to the *Standard*, the Goldsmiths' Company have offered to contribute 5,000l. towards the expense of laying out and beautifying a recreation-ground of twenty-six acres on the Uxbridge-road for the parish of Acton, which the Local Board of that parish propose to purchase. The Goldsmiths' Company are owners of large areas of land in the district, and it is proposed to purchase the ground in question from that Company and the Ecclesiastical Commissioners.

pose as a miaser's dial, in addition to the more extended usefulness of a theodolite.

In the daytime sufficient light is admitted into the telescope to see the cross wires in the diaphragm-plate distinctly; but in setting out tunnels underground, or when used at night in astronomical work, the wires would not be clearly seen. Fig. 4 exhibits a small oil lamp, which rests upon a side stand attached to one of the upright frames, marked F. When required for use, it is provided with a specially prepared wick. One of the trunnions upon which the telescope revolves is perforated in the line of the horizontal axis, and fitted with a glass stop-piece. By means of a small diagonal reflector, carried by an arm which is screwed into the outside tube of the telescope, axial illumination is obtained. The reflector and its connexion to the outer rim of the telescope are made as small as possible, so as not to impede the passage of the cone of rays in their conveyance from the object-glass to the cross wires. Thus, when the object observed is also illuminated, clear vision of the point desired along the line of collimation is obtained.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

3,018, Inspection Chamber for Drains. R. P. Beattie.

The subject of this invention consists of a chamber of glazed stoneware or other material having junctions at the ends and sides for connecting to the drain. A metal frame is secured on the top of the chamber, and is covered with another frame, into which is inserted a glass panel. The upper frame is made with a hollow rim, into which the lower frame fits, and is made airtight by packing.

3,019, Ventilators. R. Buffham.

By an arrangement of two wheels formed of segments of glass, and which form alternate spaces, ventilation is obtained, and controlled by the turning of one or other of the wheels. Rubber packing is used to make the joints water-tight, and to allow for contraction and expansion.

3,115, Coal Plate. G. Kyte.

This invention consists of a plate fitted with latch bolts, which engage beneath the lower edge of a fillet, and lock the plate into its socket. It is actuated by a tumbler, which falls by gravity when the coal-plate is dropped into position. It cannot be turned over, nor can it be opened from above, but is easily removed by pressure from below.

3,134, Cooling, Warming, and Moistening Air. J. Howarth.

This invention consists in an arrangement of chests or pipes, in a grid or such like means of warming and moistening air, the moisture being effected by the use of a syphon pipe, which saturates the air passing near or through it.

4,539, Fittings for Baths. A. Barn and John Macdonald.

The fittings which are the subject of this patent have reference to mixing the hot and cold water supply before it is used in the bath, both being turned on by one central distributing tap. A central chamber is also formed for receiving and mixing the hot and cold water, and distributing it to the different baths at any desired temperature.

4,824, Warming Buildings, &c. B. Verity.

According to this invention, a current of washed air is induced by the action of a jet or jets of water. A deflector breaks up the jet into fine mist or spray, which cleanses the air passing through it. When it is desired to warm the air, a boiler, heated by an Argand burner, is used.

4,837, Improved Wrench. H. Lucas and A. H. Bishop.

By this invention the adjusting jaw, instead of sliding over the leg or stem of the wrench, slides in a slot cut through the leg or stem, giving greater strength and convenience.

5,708, Hopper Wagons. T. Rodger and Others.

This invention consists in fitting a hopper into an ordinary railway wagon of such construction that on opening the door of the hopper at the bottom the whole contents of the wagon will run out by gravitation without the assistance of manual labour; while doors at the side are also added to facilitate emptying the trucks.

NEW APPLICATIONS FOR PATENTS.

March 11.—3,690, H. Owens, Rim Locks.—3,740, W. Edgington, Mower Mills.

MEETINGS.

SATURDAY, MARCH 26. Edinburgh Architectural Association.—Visit to New Municipal Buildings, Glasgow.

MONDAY, MARCH 28. Royal Institute of British Architects.—Mr. W. H. Crossland on "The Holloway Sanatorium and the Royal Holloway College." 8 p.m.

Society of Arts (Gaston Lectures).—Professor W. C. Unwin on "Machines for Testing Materials, especially Iron and Steel." 11. 8 p.m.

TUESDAY, MARCH 29. Builders' Clerks' Benevolent Institution.—Ninth Annual Dinner. (Holborn Restaurant, 8.30 p.m.)

Institution of Civil Engineers.—Further Discussion upon Col. E. Maitland's paper on "Gunn Steel." 8 p.m.

Birmingham Architectural Association.—Annual Dinner. WEDNESDAY, MARCH 30.

Carpenters' Hall, London Ward (Free Lectures to Building Artisans).—Professor T. Roger Smith on "Bricks and Brickwork." 8 p.m.

Civil and Mechanical Engineers' Society.—Mr. E. Nelson Boyd, M.Inst.C.E., on "The Panama Canal," 7 p.m.

Society of Arts.—Mr. A. Reckenzau on "Electric Locomotion." 8 p.m.

FRIDAY, APRIL 1. Architectural Association.—Members' Soiree. 8 p.m.

Institution of Civil Engineers (Students' Meeting).—Mr. E. W. Moir on "Hydraulic Appliances at the Forth Bridge Works." 7.30 p.m.

SATURDAY, APRIL 2. Architectural Association.—Visit to Lambeth Palace. 3.30 p.m.

Royal Institution.—Lord Rayleigh on "Sound." 3 p.m.

Association of Public Sanitary Inspectors.—Dr. Alfred Carpenter, J.P., on "Disinfection." 6.30 p.m.

Miscellaneous.

Exhibition of Marine Meteorological Instruments.—An interesting and instructive exhibition of marine meteorological instruments, organised by the Royal Meteorological Society, was opened on Tuesday, the 15th inst., in the Library of the Institution of Civil Engineers, 25, Great George-street. Specimens of almost every kind of instrument used for taking meteorological observations at sea were included in the exhibition; sets of instruments as supplied to the British, French, Dutch, and other navies being shown. There are numerous forms of deep-sea thermometers, including Johnson's registering metallic, the records of which are obtained by the varying expansion of brass and steel bars acting upon indices; Miller-Casella maximum and minimum; and Negretti & Zambra's reversing thermometer. Special interest attached to the instruments which were used on board the Challenger, many of which were constructed by Mr. Buchanan during the voyage of that vessel. The instruments and apparatus used at the Scottish Marine Station, Granton, near Edinburgh, and at the Lochbinn Marine Institute, Isle of Mull, were also shown. In addition to the above there were various forms of anerometers, rain-gauges, logs, current meters, clinometers, &c., for use on board ship.

The New Law Courts for Birmingham. Her Majesty the Queen on Wednesday last laid the foundation-stone of this important public building, of which Messrs. Aston Webb & E. Ingress Bell are the architects. After the laying of the foundation-stone, the architects were presented to Her Majesty. We gave a view and plan of the buildings in the Builder for July 31 last.

H. J. & C. Major, Limited.—The prospects of this new company, which has been formed to carry on an old-established roofing tile, pottery, and brick-making business, will be found in our advertising columns.

**Value of Building Land on the Thames Embankment.**—On Wednesday Messrs. Daniel Smith, Son, & Oakley submitted for sale, at the Auction Mart, the freehold building site on the Victoria Embankment, covering an area of about 8,836 ft., the buildings upon the site being at present occupied by Messrs. Woodfall & Kinder, the well-known printers. The property has a frontage of 82 ft. to the Embankment, and 50 ft. to Milford-lane, with an average depth of 120 ft. The existing premises, in the occupation of Messrs. Woodfall & Kinder, containing three stories, were included in the sale, and it was stated that as they were only held until Michaelmas of the present year, the purchaser would have possession at that time. In offering the property, the auctioneer pointed out that land on the Embankment, more especially between Somerset House and Blackfriars, where this property was situated, was daily increasing in value. It adjoined the offices of the London School Board, the land immediately adjacent to those offices having since been sold for a much higher sum than the School Board authorities gave for theirs. On the property being submitted the highest offer was 18,000*l.*, on which the auctioneer announced 25,000*l.* as the reserved price at which the property would be sold, but no offer of that amount being made, the property was withdrawn. We may add that new printing works and offices are about to be erected for Messrs. Woodfall & Kinder in Long-acre, Mr. W. S. Witherington, of Mark-lane, being the architect. Messrs. Patman & Fotheringham are the builders.

**Building around Epping Forest.**—The acquisition of Epping Forest by the Corporation has been followed in succession by the owners of several estates in the neighbourhood of Chingford and other localities adjoining the forest utilising their properties for building upon. On these estates new roads have been formed, and building has already been commenced. In connexion with one of these properties, known as the Hartwell Estate, situated in High-street, Chingford, Mr. Richard J. Collier conducted a sale of building sites on Saturday last, at the Royal Forest Hotel. The estate is near the new parish church, and within a short distance of the Chingford Railway Station. There was a large attendance at the sale. The number of plots offered was sixty-three, some of which have frontages to High-street, and others to a new thoroughfare named Warren-road, which has been formed through the centre of the estate. The plots submitted have frontages of 20 ft., with average depths of about 125 ft. Several of these were sold at prices ranging from 35*l.* to 40*l.* each. For a corner plot at the junction of High-street and Warren-road, having a frontage of 40 ft. and a depth of 150 ft., 95*l.* was offered, but this sum not amounting to the reserve it was bought in at 105*l.* It may be added that the building operations now going forward in the neighbourhood include the erection of a large new banqueting pavilion in the grounds of the Royal Forest Hotel, Mr. Morter, of Stratford, being the contractor. The Great Eastern Railway Company have also erected a much enlarged station at Chingford.

**Sugar in Mortar.**—In reply to inquiries as to the use of sugar in "chunam" (the marble-like coating of Indian rooms) and in ordinary mortar, a correspondent in the Ganjam district of the Madras Presidency kindly informs us that the natives rarely use sugar in mortar for building purposes, but they use a highly prepared mortar for plastering walls, ceilings, and verandah pillars, which takes a high polish and makes a capital imitation of marble. It will stand washing with soft-soap water, and is composed of the following:—100 lb. good slacked shell lime, 1*½* lb. country sugar (cheoney), the white and yolks of sixteen eggs, 4 lb. good butter-milk, 25 lb. well sifted cleaned fine sand, 1 lb. butter, 50 lb. water. These articles must be well mixed and placed in a covered tub, and allowed to remain so for three days before using. If this marble mortar could be tinted, it might be very useful in the inner walls of English houses, and in its white state it would come in for ceilings. Washable walls and ceilings of a permanent character are a great desideratum in this country for sanitary purposes, and especially in our smoky towns. Our correspondent gives the following composition as having been used for ordinary building purposes, and found very serviceable: 120 lb. lime, 240 lb. sand, 2 lb. Jaggery sugar, water in proportion.—*Produce Markets Review.*

**Lectures for the Instruction of Sanitary Inspectors.**—We have received the prospectus of a course of lectures and demonstrations which are to be given at the Parkes Museum on Tuesdays and Fridays during April and May. These lectures are intended for the instruction of sanitary inspectors. The following is a list of them:—April 15th, introductory lecture, "General History, Principles, and Methods of Hygiene," by Dr. Alfred Hill, M.R.C.S.; April 19th, "Ventilation, Measurement of Cubic Space, &c.," by Capt. Douglas Galton, R.E., C.B., F.R.S.; April 22nd, "Water Supply, Drinking Water, Pollution of Water," by Dr. Louis Parkes; April 25th, "Drainage Construction," by Professor H. Robinson, M.Inst.C.E.; April 29th, "Sanitary Appliances," by Professor W. H. Corfield, M.A., M.D.; May 3rd, "Scavenging, Disposal of Refuse and Sewage" [no lecturer's name given]; May 6th, "Food (including Milk), Sale of Food and Drugs Act," by Mr. C. E. Cassal, F.C.S., F.I.C.; May 10th, "Infectious Diseases and Methods of Disinfection," by Dr. R. Thorne Thorne; May 13th, "General Powers and Duties of Inspectors of Nuisances, Method of Inspection," by Mr. J. P. J. Sykes, B.Sc., M.R.C.S.; May 17th, "Nature of Nuisances, including Nuisances the Abatement of which is Difficult," by Mr. J. P. J. Sykes, B.Sc., M.R.C.S.; May 20th, "Sanitary Law,—General Enactments, Public Health Act, 1875, Model By-Laws," by Dr. Charles Kelly; May 24th, "Metropolitan Acts, By-Laws of Metropolitan Board of Works," by Mr. A. Wynter Blyth, M.R.C.S., L.S.A. A nominal fee only for the course will be charged to cover expenses, and students attending the course will be granted free admission to the Museum and Library from April 1st to June 1st.

**Tendering at the Antipodes.**—The Sydney Daily Telegraph of Feb. 5 reports that at a special meeting of the New South Wales Public Works Contractors' Association, the subject of maintaining the system of letting all public works by public tender and securing honest tendering was discussed, and the unfair action of the Minister for Works in Queensland in passing by the lowest tenderer for a Government railway and giving the contract to a seeming favorite, and thus making a direct blow at the purity of public tendering, was strongly commented upon, and the following resolutions were adopted:—

1. "That this Association strongly protests against the manner in which Mr. Miles, the Minister for Works in Queensland, has manipulated the tenders for the second section of the Cairns-Herberton Railway, and that his treatment of Messrs. Carey & Maund, the lowest tenderers, should be well noted by contractors for public works as a warning not to waste their time and money in tendering for Queensland works, and that the matter be referred for advice to the Association's solicitors as to what steps it is advisable to take on the subject, and, further, that this Association views with suspicion the action of the Minister."

2. "That the above resolution be circulated throughout the press of the Australasian colonies."

It was also mentioned at the meeting that no instance of such unfair dealing with tenders had been recorded against the Tender Board or the Minister in the colony of Victoria, but that it was quite possible that the liberties taken by Mr. Miles in this and other tenderings might be copied by other Ministers if public protest were not secured.

**Railways in Turkey.**—The Constantinople correspondent of the Daily News telegraphs:—"Negotiations have been going on for some time between the Porte and a French group of financiers for an extension of the railway from the Bosphorus to Ismid as far as Angora. Another group of English, German, and French capitalists had tendered for the same extension. The former proposals have now been definitely rejected, and as the Sultan is convinced of the urgent need of the railway in order to prevent famine, and to give work to the unemployed, it is believed that the project of the latter group will be immediately accepted, and the works proceeded with."

**The Baths at Buxton.**—With reference to the paragraph in our last (p. 454) in reference to the Buxton Baths, Mr. Smeaton writes to say that he not only fixed the baths, but also manufactured them, and that they are to his special patterns. We may take the opportunity of adding that the general building work was done by Mr. James Salt.

**"Colour: its Laws of Contrast."**—This was the subject of a lecture delivered last week at the St. Alban's Public Library, by Dr. R. C. Puckett, head master of the St. Alban's and Watford Schools of Art.

**Masonry Classes.**—The Class of Masonry which has been conducted by Mr. Lawrence Harvey at the City Guilds Institute came to a close for the present on the evening of Tuesday, the 22nd, after receiving the sanction of an official committee deputed by the Institute, composed of Mr. T. Anson, F.R.I.B.A., Mr. Barry, Mr. Cates, Mr. Aitchison, and Mr. Banister Fletcher. Mr. T. Anson having taken the chair, a testimonial, signed by all the members of the class, was presented to Mr. Harvey by Mr. Herbert D. Appleton, Hon. Sec. of the Architectural Association, and after Mr. Harvey had thanked the class for this recognition, every member of the deputation of the R.I.B.A. spoke in turn as to the advisability of having the class permanently established, and they promised to use their influence collectively and individually to bring this about.

**Proposed Statue to Mozart.**—It has been decided that a statue of Mozart shall be erected directly in front of the Opera House at Vienna. For some time past the different authorities had been unable to agree with regard to the site for the monument, but this difficulty has at length been happily removed, the spot selected being undoubtedly the finest and most appropriate for the purpose in the Austrian capital. A competition will shortly be initiated for the best design for the statue. Up to the present date a sum of 63,000 forins, or more than 5,200*l.*, has been raised by public subscription for carrying out the project.

**Metropolitan Board of Works.**—At the meeting of the Board convened for Friday, March 25, a few hours after these lines are published, the first business will be the election of a District Surveyor for South Islington, vice Mr. Rowland Plumb, transferred to the West Hampstead District. The Works and General Purposes Committee will present a report recommending several increases of salary, including that of Mr. John Hebb, Assistant Architect, from 600*l.* to 700*l.* a year.

**The Wenham Company (Limited).**—The directors of this company (the sole proprietors and manufacturers of the Wenham Patent Gas Lamp) announce that although the accounts of the company are only finally made up and audited yearly to the 30th of June, the business of the half-year ended December 31st, 1886, has resulted in a very satisfactory profit, which enables the Board to declare an interim dividend of 1*s.* per share for that period (10*s.* per annum) leaving a large disposable amount.

**Lifts.**—Messrs. Archd. Smith & Stevens are making a large one-ton lift for Messrs. Fry & Sons' new premises in the City-road. This lift will travel the full height of the building, and be fitted with Stevens & Major's patent "Robiano" safety gear. A similar lift has just been completed for Messrs. Brand & Co.'s new premises in Lambeth-road.

**Technical School and College Buildings.** Messrs. Whitaker & Co. announce for early publication a comprehensive reference book on this subject, by Mr. E. C. Robins, F.S.A., whose special acquaintance with the subject is known to many of our readers. Such a book is much wanted, and ought to be very useful. The work will be largely illustrated.

**Wesley Chapel and Sunday Schools, Camborne.**—The awards in this competition have been made. In the case of re-seating the chapel the plans of Mr. Oliver Caldwell, of Penzance, have been selected; and in that of the schools, to the plans of Mr. John Bood, Camborne.

**TO CORRESPONDENTS.**

Registered Telegraphic Address, "THE BUILDER, LONDON."

H. H.—R. S. H.—"Inquirer" (we are not in the habit of making such invitations as you suggest).—T. H. M.—J. S. G. (found enough, but hardly worth powder and shot).—W. M. (we have no space for your letter, and if we could print it, it would only be to point out that your sanitary objections are utterly wrong, and that you do not understand what you are speaking of. What are termed "horizontally closed ceilings" are simply a means of giving convenience and ultimate intensity to the danger. Unless creation is to be adapted, the sanitary principle of the future is wanting to facilitate as much as possible the ventilation of human beings with the soil—what has been called the "earth-to-earth" system. The statement as to weight, which you say is incorrect, was furnished by the attendant at the stand)—W. G. B. (too late to be printed).—T. C. Z. (annoying should be well)—C. Y. (the name)—R. & S. (too late for this week).—H. T. (should have been put into proper form for insertion).  
 All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

**Not.**—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.  
 We cannot undertake to return rejected communications.  
 Letters or communications (beyond mere news items) which have been duplicated for other journals, are NOT DESIRED.  
 All communications respecting literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

**Best Bath Stone.**  
**CORSHAM DOWN, } SUMMER DRIED.**  
**FARLEIGH DOWN, }**  
**BOX GROUND, COMBE DOWN.**  
**WESTWOOD GROUND.**  
**RANDELL, SAUNDERS & CO., LD.,**  
**CORSHAM, WILTS.**

**Bath Stone.**

**BEST QUALITY OF ALL KINDS.**

**PICTOR & SONS,**  
Box, Wilts. [Advr.]

**Doubling Free Stone** For prices, &c., address S. & J. STAPLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants,  
**BLUE LIAS LIME** Stoke - under - Ham, (Ground or Lump), Ulminster. [Advr.]

**Doubling Freestone.** The stone from these quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England.  
**THE BRAMBLEDITCH STONE.** Is of the same crystalline nature as the Cheylynch Stone, but finer in texture, and more suitable for firebricked work.

**HAM HILL STONE.** Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice. Prices, and every information given, on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ulminster, Somerset. *London Agent:—* Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [Advr.]

**Asphalte.**—The Seyssel and Metallic Lays Asphalte Company (Mr. H. Glenn), Office, 33, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, lun-rooms, and terraces. [Advr.]

**Asphalte.**  
 Seyssel, Patent Metallic Lava, and White Asphaltes.  
**M. STODART & CO.**  
 Office:  
 No. 90, Cannon-street, E.C. [Advr.]

**NOTICE.**—THE BANNER SANITATION CO. beg to give Notice that having sold over 10,000 BANNER'S PATENT VENTILATORS, also a proportionate number of other Sanitary Appliances, and wishing to keep pace with the times, they have decided to reduce the prices of their goods from 25 per cent. to 40 per cent., thus offering to the public the best appliances at the lowest prices.

**BANNER VENTILATORS.**

The Strongest Exhaust Ventilators for all Buildings, Public Halls, Churches, Billiard-Rooms, &c. **HIGHEST PRICES at all the most Important EXHIBITIONS**

**Gold Medal. Health Exhibition, 1884.**

For further Particulars and Revised Prices, apply to  
**BANNER SANITATION COMPANY,**  
 Wessex House, Northumberland Avenue, Charing Cross, London, W.C.

### "Mycene Vases."

HEN in 1879 the "Mykenische Thongefässe" appeared, it was well known that the book, important though it was, was only an instalment of a larger work. The illustrations were strictly confined to such vases as had actually been found in the graves of the Mycene acropolis, and could therefore, in the strictest sense, from their provenance, be called Mycenean. The joint authors of the present book\* see their way to much larger issues; by localities as far apart as Athens, Syracuse, Corneto, and Phocis they have collected specimens of a kind of pottery analogous to that found at Mycene, and in the belief that the head centre of fabrication was Mycene, they have given to this scattered material the name of Mycenean,—in fact, they have added a fresh chapter to the history of pre-Hellenic fictile art. The work of classifying these materials was begun in 1878, just when the excitement of Dr. Schliemann's Mycene discoveries was at its height. Public interest centred, however, almost entirely on the more costly objects found, the ivory, gold, and other metals; the mountains of broken pottery were comparatively neglected; and as yet, as Dr. Furtwängler points out, in regards chronology, these vase fragments were of supreme importance. The gold objects were found in some only of the graves, pottery in all. Further, analogous pottery had been discovered elsewhere, so that materials for comparison were at hand.

The amount of material was colossal. The whole of the contents of the graves were brought to Athens, as well as all the most important fragments from outside the graves. A small mountain of broken bits still remains to be observed. The method of classification adopted was simply this: the whole of the fragments were first divided into two great classes, according to the technical procedure of the decoration. In Class I. the decoration is dull (Mattmalerei), in Class II. it is glazed. Class I. is much the smaller of the two. It falls itself into two groups: a, red-clayed vases; b, pale clay vases. At Mycene Class I. only appears in the lowest strata of graves, so at Thera and Tiryns. At Nauplia it does not appear at all. It is sparsely represented at Egina,

Orchomenos, Daulis, Amorgos, and Melos. Most authorities agree that this class of vases, with the Mattmalerei, is a development of the rudest kind found in the Cyprus graves. On this it shows a distinct advance, as it bears evidence of the use of the potter's wheel, and painting is employed for decoration in place of rude plastic ornamentation, stuck on, and scratched lines. Whereas the pottery of the kind described in Class I. is common to Phœnicia, Egypt, and other Oriental races, Class II., with the glazed decoration, is distinctively Hellenic, only Greeks and those who learned from the Greeks manufacturing it.

Drs. Furtwängler and Loeschke then proceeded to divide Class II. into four groups, according to the character of the decoration employed. Into these minutiae of classification we need not follow them. It is more important to note their views as to the origin of this "Mycene" pottery generally, and its precise place in the history of Greek art.

To begin with the question of where all this widely-scattered pottery was made. They state without hesitation that, spite of all minor distinctions, the general character of the work is so uniform that they are obliged to suppose a common *fabricque*. The difference between e.g. the vases of Mycene and Ialysos is no greater than that between Attic vases found in Attica and those found in the Crimea. Hence the conclusion obviously is that most of the places where these "Mycene" vases are found imported them. The import does not seem to have been contemporaneous, e.g. there is evidence to show it began earlier at Thera than at Ialysos. They also think it probable that at the place where the head manufacture was there may have been several workshops, each characterised by differences of manner, just as in the days of Attic pottery we have the different styles of different potters, who each set their several fashions.

Further, in accounting for different styles, the variable taste of purchasers had to be considered; e.g., it seems that by preference the Cyprians bought large kraters ornamented with chariot scenes, and wine jars decorated with concentric circles to imitate the grain of wood.

The head place of manufacture they hold to be undoubtedly Mycene, because there, and there only, have we an uninterrupted sequence of the different styles in their chronological development. At Mycene, further, we never find vases which have the appearance, as some have at Thera, Orchomenos, Cyprus, and other places, of being local imitations. Probably the manufacture took place all over the district of Mycene, but as the mature character of the ornament shows, the influence of the sea-coast must have been very strong.

Technique and systems of decoration alike show that the manufacture was in the main free from admixture of foreign influence. Naturalistic ornament prevails. Among favourite motives are patterns suggested by sea-waves, fishes, starfish, polypi, coral, sea snails, mussel-shells. Sea shells were, no doubt, worn for ornament by the makers of the vases themselves, and they transferred this simple system of decoration to their pottery.

Further, it is noteworthy that, whereas the gold ornaments, ivory, and the like begin to show evidence of foreign influence, the pottery remains true to itself, deep-rooted in local tradition. It enlarged its sphere of decoration by admitting the quadruped world, birds and men, and later by copying textile fabrics, but in all the long series of Mycene vases one never meets an Oriental hybrid monster, a griffin, or a lion, or even an Oriental vegetable motive, till the time when the Mycene style of pottery is all but extinct.

Still also essentially autochthonous as to motives of decoration in form and technique, the Mycene pottery came to borrow much from metal-work, and in this respect the comparison of the pottery and the gold work is highly instructive.

We come next to the important and difficult question of date.

First, we are obliged to own that, unless the whole of the pottery was imported from some locality unknown, it is pre-Doric in character. In order, however, to get some sort of definition into this vague chronology, it is necessary to consider the relation between the "Mycene" pottery and the pottery known as "Dipylon."

The dome-shaped building at Nicuidi was definitely closed when the third style of the second class of Mycene vases came into vogue. In the dromos we find pure fragments, which give evidence of a long-continued cult of the dead lasting on through the succession of several styles of vases, e.g., Mycene third style, Dipylon vases, proto-Corinthian, Corinthian, and Attic; these are clearly successive, though, of course, in part they overlap. Also, in the dromos of the dome-shaped building near the Lion Gate we find fragments of the third Mycene style mixed with Dipylon fragments, whereas no fragments of the fourth style are certain here. So also at Tiryns the third and fourth styles are weak, the Dipylon strong.

The conclusion is manifest; the third style immediately precedes, the fourth style is contemporary with, the Dipylon vases.

As regards the Dipylon vases, their full-blown appearance has always been difficult of explanation; there is no evidence of long apprenticeship to the art; the manner seems from the

\* Mykenische Vasen, Vorhellenische Thongefässe aus dem Gebiete des Mittelmeers. Im Auftrage des Kaiserlichen Deutschen Archæologischen Instituts in Athen. Herausgegeben von Adolf Furtwängler und Georg Loeschke.

first well assured,—we can have no development.

An interesting hypothesis to account for this is offered by the two authors. During the third Mycenaean style, *i.e.*, about the tenth century, there was, in all probability, an incursion of a Doric stock, who had recently attained to the "Bronze" stage of civilisation, and whose chief industry, except graving on metal, was weaving highly-conventionalised and developed patterns. This Doric stock learned from the Achaeans of Argos to make pottery with the wheel, and they then, having acquired the potter's art, introduced their textile patterns into the system of vase-decoration, specially the notable so-called "triglyph and metope" pattern. These patterns were, in part, taken over into the third Mycenaean style, and a few motives from the Mycenaean style were borrowed by the Doric makers of Dipylon vases.

Whether the first Dipylon vases were made in Argos remains an open question. Be this as it may, the great mass of the Dipylon vases were made at a further stage in the Doric wandering,—possibly, as is suggested by the motives of the sea fight and Pyrrhic dance,—at Crete.

We have thus arrived at a terminus *ad quem* for the Mycenaean vases. We have now to look for a terminus *a quo*. Here Egypt comes in to help. It has recently been made almost certain, by a process of reasoning we cannot here detail, that the Mycenaean sword-blades date about the time of the first Rameseids (about the sixteenth century). On the wall of a tomb of Rameses III. a vase is painted, which was evidently done from an original of the third Mycenaean style. We must suppose, then, that as the Mycenaean style was then in a late period of development the early specimens must be as early as the fourteenth century.

The peculiar merit, then, of this Mycenaean pottery is to give evidence of a *pre*-Doric civilisation and a *pre*-Doric art, a time when the Greek people were as yet untouched by Oriental impulse,—when their desires were indeed narrow, but prompted by that love of naturalism which was the mainspring of all that was ultimately best in Greek art.

The gold and ivory objects found in the graves show us this same people, but under foreign influence in direct relation by trade with all the wonder world of the East. But Greek art remained true to itself, and we are able still to feel the autochthonic impulse of naturalism, even where the technique is foreign. In the wide spread of exports from Mycenaean two places hold a position of special interest,—Rhodes and Attica. In each of these places not only is there a whole necropolis full of Mycenaean wares, but the very form of the graves and the manner of burial shows that the influence of Mycenaean was stronger here than that of mere trade: a colony must have been founded. Presumably this took place under external Doric pressure in the mother city of Mycenaean. With this, literary notices agree, and the fact that the name *Αχαια* is found in Rhodes.

After the Dorian invasion, Greece a second time went to the East to learn, and again, but this time with more lasting results, she incorporated Oriental elements into her own naturalistic art.

It cannot be doubted that between Achaean and post-Dorian art there is a gulf caused by some great ethno-political upheaval, but a few scattered links can be picked up to cross the breach, and such are the continuance of the glazed pottery, certain peculiarities in gem engraving, and some few ornaments and figured types. In conclusion, it is well said that if Diapheus and Scyllis came, as tradition has it, from Crete to Argos and Sicyon, they, the sons of Daedalus, came back to their old home and brought the arts of cutting, carving, and inlaying to the place where centuries ago they had been known, *i.e.* to this country of Mycenaean. The history of Greek art and of all Greece begins in the Peloponnese, and "the first chapter of that history is the story of the 'Mycenaean Vases.'"

We have given the theory of the book in some detail, both because the work from its

great size and cost is not easily accessible except in the largest libraries, and also because its importance in regard to the subject with which it deals can scarcely be over-rated. For the detailed support of the theory, which can only be rightly understood by constant reference to the splendid and accurate plates, we must refer our readers to the original.

#### "MODERN ORNAMENTATION."

HIS is the somewhat too comprehensive title given to what is really a collection of fifty plates of decorative design published by Dr. Dresser,\* and which is described in the preface as being "all original designs which are the work of the author, his assistants, and his pupils collectively." It is a proof of the degree in which Dr. Dresser has really created an atelier of design, that these plates produce the impression of being all by the same hand and devised by the same mind, in spite of the admitted fact that they are not so. The title of the work is hardly chosen; it is, of course, difficult to select a distinctive title for a work of this kind; but "Modern Ornamentation" is a title which certainly conveys the idea of a comprehensive work giving illustrations of all the various schools or manners of modern decorative design, rather than of a limited collection of designs put forth from a single studio. "Examples of Ornamentation," or "Suggestions in Decorative Design," would have been a title more correctly conveying the nature and object of the publication, which consists of fifty plates of designs founded on ancient types or on nature, or in a few instances distinctly original, that is, having no special precedent that can be pointed out.

The latter title would, in fact, have precisely tallied with what the author says in his preface as to the object of the publication: "However creative our minds may be, we are all glad to have the thoughts of others brought before us for our consideration, and by contemplating strange works, and, if I may so express myself, re-digesting them, we often originate things differing widely from what gave rise to the thought, and imbued with all the special characters of our own minds. In this way it is hoped the present work may be found useful."

This reflection as to the suggestiveness of any ornamental idea for the working out from it of fresh combinations, sometimes differing entirely from what first suggested them, is one entirely borne out by the experience of every designer. A mere subsidiary incident, the manner of turning a scroll or of filling up a corner in a design, may catch a new eye and give rise to the development of an entirely new idea. This is one of the forms of similarity between music and ornament; purely instrumental music being, in regard to its forms, a kind of pattern-designing in sound in accordance with certain proportions and principles; and thus, as in some well-known instances, a slight incident in sound,—a series of rhythmically repeated knocks at a door, or a turn in the song of a bird, has furnished a great musical designer with the suggestion for an extended and highly-elaborated composition.

These plates, then, are to be regarded as abstract ideas in ornament, not designed for any special place, process, or material, but simply as ornaments which may be adapted wholesale, if the manufacturer have absolutely no ideas of his own, or may furnish starting points and suggestions to be developed by each worker in his own way, and in reference to the material in which he is working. Taking them first as abstract ideas in ornament, without reference to material, we remember that when the first two out of the ten parts were sent to us some time ago, we were not favourably impressed with them as examples of the kind of thing of which the work was presumably to consist. The design on Plate III. especially,

with dummy suggestions of birds with rosette eyes, and which we observe is noted in the preface as a kind of thing that would make a grotesque border for the dabo of a smoking-room, repelled us notably; it looks more like a joke than a piece of real decorative design; and unfortunately it is a joke of which the humour is not very apparent. Some other designs in the book are open to the same objection; they are not only jokes, but rather poor jokes. The designs described as Celtic,—*i.e.*, based on Celtic motives,—show some of the oddity of that ancient and venerable school of ornament, but without its power and picturesqueness. Then, again, we have great doubts as to the system of trying to make ornament express a definite meaning, which Dr. Dresser has tried a good while ago on other occasions. Ornament which is imbued with definite meanings has unfortunately a great tendency to cease to be ornament. It certainly has ceased to be so in the "Evening" panel on plate 26, which is a mere kind of *olla podrida* of beetles, moths, and spiders, with a substructure of vegetation. We protest, "in the name of all the gods at once," against this kind of thing being regarded as decorative design. It appears to us inherently vicious.

There are, however, a considerable number of the plates which keep quite clear of these kind of "notions," and which, taken collectively, do present a large body of suggestions, many of them very good ones, for the filling-in of spaces and the devising and combining of diapers; and many of these, which are professedly based on known styles, are of value in another way, as suggesting the variations which may be played on the elements of those styles. There are not, we confess, many that appear to us to rise to the highest type of ornament; and we are rather inclined to think that this is an indication that it is a somewhat dangerous thing to put out ornament in the abstract, as specially invented and showing novelty either of idea or treatment. For there is then an almost irresistible temptation to the designer to, as it were, exhibit his cleverness; and cleverness is the note of these designs. There is a kind of *chic* about too many of them; a want of real feeling; a too-evident intention to make something clever; an intention which is realised, be it said; but then cleverness is not all we want in original ornament. Some of the designs display a larger and broader style than this, and a finer feeling; notably, the one we have selected for illustration (see lithograph plate in this number), and which is described as "a form of Italian Renaissance ornament." A great deal of the detail in this, however, is treated in a way quite new, and there is a largeness and breadth about it, a kind of enthusiasm in the design, which is very striking.

We alluded just now, in passing, to the idea that the craftsman might apply these designs, or suggestions from them, modified according to his own taste or to the material in which he worked. In regard to the latter point, however, few of the designs appear to be evolved with reference to the capabilities of any special material. A few of them are mentioned in the preface as suitable for execution in this or that material, but we hardly discern any decisive or necessary suitability, certainly not any of that inherent feeling for the material which is so important an element in decorative design. It is not sufficient, from our point of view, to say such a design may be suitable for stone carving; to be properly suitable it should have that sort of stone character in it, as if the idea of its working in stone were present to the mind of the designer from the first. The author may say he did not profess to publish designs for special materials, but only general motives. Our idea is that the motive itself should be partly governed by the consideration of the material in which it is to be worked.

**St. Pancras Workhouse.**—The Local Government Board have approved of the plans of Mr. H. H. Bridgman, submitted by the Guardians of St. Pancras for the reconstruction of the remainder of the workhouse, at an estimated cost of 50,700.

\* "Modern Ornamentation": being a series of original designs for the patterns of textile fabrics, for the ornamentation of manufactures in wood, metal, pottery, &c., also for the decoration of walls and ceilings and other flat surfaces. By Christopher Dresser, Ph.D., &c. London: B. T. Batsford. 1886.

## NOTES.

**T**HE House of Lords disposed of the first twenty-three clauses of the Railway Bill in two or three hours on Tuesday, but not without adopting several rather important amendments. They agreed to a proposal made by the Earl of Jersey for altering the constitution of the new Commission by appointing two Commissioners instead of three, with a Judge of the Supreme Court presiding on all occasions. A certain amount of indifference was manifested on the subject, for, although Lord Stanley contended that the clause as it stood would meet all the requirements of the trading community, and Lord Salisbury complained that the judges were already overworked, no division was taken. An addition to Clause 17 provides that the Commissioners shall not award damages in respect of any matter arising more than a year before the complaint was made,—a limitation greatly affecting the scope of this clause. Clause 17 provides that appeal shall lie upon questions of law from the Commissioners to the Court of Appeal, and from thence by special leave to the House of Lords. The traders look upon this double appeal with great aversion, but Lord Grimthorpe, supported by Lord Bramwell, proposed to add to the yoke by permitting appeal upon questions of fact also; and the amendment was only defeated by two votes. Lord Bramwell (who was probably the author of the *Times* letter signed "B.") had made a very unusual proposition in the House of Lords on Monday with regard to this measure. His Lordship urged that the South-Eastern Railway Company might be heard by counsel at the bar of the House in opposition to those parts of the Bill interfering with their existing Parliamentary powers; and unintentionally created much laughter by gravely alluding to the company mentioned as "my clients." This motion was, of course, negatived, as every opportunity will be afforded for the measure to be discussed in Parliament in all its bearings in the ordinary course before it becomes law, and Lord Stanley has met the various deputations which have waited upon him on the subject with answers very much to this effect. It will be seen that the most important clauses of the Bill have not yet been reached.

**T**HE result of the *plébiscite* on the Edinburgh Municipal Buildings Bill is an adverse vote of 13,426, and intimation has accordingly been given to withdraw the Bill. This result is only what might have been expected. The resort to a vote of the ratepayers in a matter involving additional taxation is not likely to be successful, unless in exceptional cases, where the individual wants of the voters is concerned. In the present instance those opposed to the scheme have been unscrupulous in circulating statements of the most mendacious kind, and in imputing motives where none existed. The resort to post-card voting was an entire mistake, into which the Town Council allowed themselves to be forced by avowed opponents to the scheme, who will doubtless rejoice at the result of their tactics, but it is a poor matter to be proud of. Something, it is clear, must be done, but the less done at present the better: it should only be in the nature of a temporary makeshift, leaving to a future time the carrying out of an efficient scheme. It is exceedingly unfair to the architectural profession that they should have been deluded into spending so much time and thought on a competition for a building, the erection of which seems to have been all along a more than doubtful matter. Why was not the *plébiscite* taken before designs were asked for, instead of after? The whole procedure in the matter has been most vexatious and unbusinesslike, and the architectural profession have really been made fools of in being drawn in to compete for a castle in the air.

**A** PRETTY long and rather acrimonious discussion took place in the House on Thursday last week, on what was called the Kensington Vestry Bill, which was to empower the Vestry to erect a Refuse Destructor on a site in their parish. The Bill was read a third time, but as a strong opposition was made to it on the ground that the destructor would be a nuisance, we made some special inquiries as to Whitechapel and the destructor there, which was referred to as a case in point. We are informed that the destructor there is to some extent regarded as a nuisance in consequence of the deposit which it makes of a small, fine ash from burnt paper, which, being very light, is carried up the flue by the strong draught before it is entirely consumed, and falls in a powder around the neighbourhood. It has been suggested that the mischief might be remedied or avoided by the application of a small subsidiary furnace at the junction of the horizontal flue with the chimney-shaft. The nuisance appears to be, at all events, within the category of preventable ones, and not a sufficient drawback to cause the abandonment of destructors just yet.

**D**ECENT falls of snow have brought into prominence several questions involving the extent of the duties of Vestries and Local Boards in the matter of the clearance of that wintry element. One or two important judicial decisions have been given on these points. According to a judgment delivered a few days ago by Mr. Justice Denman, it appears that local authorities are not liable for damages when an accident occurs in consequence of a vehicle being overturned by a frozen heap of snow left at the side of the street for a reasonable time after the fall. The successful defence was that snow must necessarily be heaped at the side of the street, and remain for some time, if the road is to be expeditiously made available for traffic, and that drivers, under these exceptional circumstances, ought to exercise increased care in driving through and turning the corners of streets, and so avoid the heaps of snow. The case came before the Court in proceedings instituted against the parish authorities of St. George's, Hanover-square; and the victory of the defendants will doubtless quietly dispose of the large crop of claims for damages which arose out of the previous fall of snow. Then the liability of Vestries to clear the snow from the footpaths round the enclosures in squares is also a matter of general dispute, and, in order to test the case, the Chief Commissioner of Police has, at the invitation of the Vestry of Chelsea, issued two summonses against that body for non-removal of snow from the footpaths described. The decision will be looked forward to with interest; for if judgment adverse to the local authority is given, it means that the first hundred men that can be got must be drafted away to perform the comparatively useless work of clearing these footpaths, and so binding the more pressing work of clearance of the main roads and bigways.

**S**HEFFIELD appears to be in the throes of an internecine quarrel about its water supply. It appears that the existing water company has within the last quarter of a century spent a couple of millions in providing that necessary article, though it has not been successful from a financial point of view, partly owing to the bursting of a huge dam in 1864, which caused an immense loss of life and property, and partly from the badness of the times, resulting in the shutting up and removal of various manufacturing concerns, and the consequent decline of the population. All this affected the company to such an extent, that the dividends fell from 5½, and even 7½, to 2½ per cent. One would have thought that a property, so confessedly in want of prosperity, would not have excited any jealous aspirants; but, curiously enough, the Sheffield Corporation has more than once sought to possess it, and on the present occasion is struggling in the House of Lords for powers to compel the water company to sell the waterworks to it. The object of the

company is to obtain an extension of certain increased rates, which was granted for twenty-five years in 1864, and which would naturally soon expire. A great incubus upon the water company has always been the large compensation that it has had to allow mill-owners. At present, the drainage area is 15,200 acres, yielding about 19,000,000 gallons daily, of which 9,000,000 is charged for compensation. From the engineering evidence, it looks rather as if the Corporation would not be able to do any better for the town than the company has already been doing.

**A** MEMORIAL, signed by many influential personages, has been presented to the Secretary of State for War, praying that the public may be no longer shut out from the Tower Gardens and riverside Promenade. The signatories, being some 5,500 in number, comprise the Lord Mayor, with several aldermen, common councillors, magistrates, local authorities and medical officers, guardians of the poor, clergymen and ministers, chairmen of dock companies, &c. They represent how greatly such a boon would be appreciated by the inhabitants of the densely crowded districts around,—Aldgate, Whitechapel, St. George's-in-the-East, Limehouse, Poplar, and Wapping. The promenade, it appears, was open until the outbreak of the war with Russia in March, 1854, when it was reserved as a loading-place for service stores. Its pristine uses for that purpose are clearly apparent from an inspection of the Fleming Van Den Wynngaerde's map of London (circa 1550), of Aggas's map, and of Haiward's and Gascoigne's Survey of 1597. Stretching from the Iron Gate to the Tower stairs, near to the Thames subway, it lies between the river and the moat, or ditch, beneath the outer ballium wall. Since visitors are now admitted into the Tower between the bours of ten and four only, and most of the Ordnance warehouses have been recently pulled down, there seems to be small reason why this privilege should not be restored. The public are, as a rule, excluded from the precincts beyond Bell, Wakefield, and White Towers, and, indeed, from all portions of the fortress where its ancient military architecture can be best studied. There may be good objections against these restrictions being relaxed, yet the posting of warders or sentries at Byward and Cradle Towers, and by the new gate next eastwards of St. Thomas's Tower (over Traitor's Gate), would restrain the too curious from trespassing from the promenade into the forbidden ground. A portion of the gardens which overlook the moat, that has been dry ever since 1843, is divided into plots for cultivation by members of the garrison. The south-eastern slip, by the site of the older Galleyman (Develin), or Iron Gate Tower, was used for awhile (1829-1847) as a burial-ground, but has just been appropriated for the northern approach to the Tower Bridge, now in course of construction.

**M**ISS OCTAVIA HILL, of 14, Nottingbam-place, W., appeals for subscriptions in furtherance of a highly-deserving project. Having reasonable hope of certain funds in aid of the erection of six cottages, that lady is anxious to secure, by purchase, a certain plot of land adjacent to the cottages' site. The ground in question is situated in Red Cross-street, Southwark; being close to the old "Cross Bones" burial-ground, which is now occupied as a builder's yard. On this ground Miss Hill proposes to establish a people's hall, to be open in both summer and winter, for "music, flower shows, reading-room, and library . . . and for concerts, lectures, parties," &c. The remainder of the ground would be laid out as a garden, and for this latter purpose a donation is forthcoming. The hall and land together will cost 2,500*l.*

**A** PUBLIC subscription has been set on foot for the purpose of restoring Preston Castle or Tower near Prestonpans, in East Lothian, N.B. Major-Gen. Sir Wm. Hamilton, the proprietor of the castle, has subscribed 50*l.*, and the Marquis of Eute and Lord Wemyss are also among the donors to the fund. The

lower dates from the end of the fourteenth century, and is in a very dilapidated condition, having suffered at least three burnings,—once by Hertford in 1544, by Cromwell in 1650, and again by accident in 1663. It is now a mere roofless and windowless ruin, partly overgrown with vegetation, but is said to retain some features of interest, among which may be mentioned the dungeon in the basement, which is stated to be nearly perfect. The amount required for immediate purposes is estimated at about 350*l.*, which appears to be more than enough for merely repairing the building, which is all that should be done. It is stated, as an inducement to subscribe, that arrangements will be made in the future for the admission of subscribers and such of the public as desire to inspect the tower. Preston Castle is illustrated in the first volume of Messrs. MacGibbon & Ross's work on the "Castellated and Domestic Architecture of Scotland from the Twelfth to the Eighteenth century," p. 317.

BY the sudden collapse on Saturday afternoon last of the Occidental Tavern, in Fountain-court (Savoy-buildings), Strand, Mr. Terry, the actor, can boast that he "has brought down the house" at a very early stage of his enterprise. For here he is about to open, next autumn, the new theatre for which Mr. W. Emden's drawings were passed by the Metropolitan Board of Works in April, 1886. The chief entrance into the theatre will be at what was Bland's gun-shop, No. 106, Strand. The court is so called after a once famous tavern of that sign in the Strand,—its site now that of Simpson's divan and dining-rooms,—where used to meet the Fountain Club, as politically opposed to Walpole. In one of his letters Dennis, the critic, describes a meeting here whereat "after supper we drank Mr. Wycherley's health by the name of Captain Wycherley." Strype speaks of the "one very fine tavern which had the sign of the Fountain," with its good rooms and wine; as also of the "alley that leadeth to Fountain-court, a very handsome place with a freestone pavement, and good buildings, which are well inhabited." Little the perfumer's was known as being next door to the Fountain; thence he removed, after a fire, into the premises since familiar to us as the shop of the late M. Eugene Rimmel. The Occidental Tavern, at the rear, has for some time past formed a chosen haunt of players and their associates. It was popularly known, too, as the Coal Hole; and there, as Procter tells us, Charles Kean would enjoy a steak, though ill at ease amongst "the dress and ceremony and good behaviour incident to 'company.'" Ceremony, however, did not distinguish the gatherings for which in earlier days the Coal Hole was notorious under the presidency, or rather misrule, of the *soi-disant* Chief Baron Nicholson, together with the libidinous accompaniments of his judge and jury. These entertainments found a later home for a period, in the Cider Cellars, Maiden-lane, and in Leicester-square, on the eastern side. The ruin of the tavern, itself some 250 years old, and of the two houses next thereto, has fortunately spared an opposite house, being No. 3 in the court, where lived the painter of the "Ancient of Days" and the "Last Judgment," the author of the "Songs of Innocence and Experience."

THE paper recently read by Mr. Percy Fitzgerald at the Society of Arts, and published in their *Journal* of March 18th, on "scenic illusion and stage appliances," besides giving some information interesting to the many persons who have little idea how stage effects are worked, touches upon one or two points in regard to the principle of the matter which are open to consideration. Mr. Fitzgerald raises the question, for instance, whether too elaborate and realistic modelling of architectural details in a scene may not in one direction defeat its own end, by imparting a look of flatness to those portions of the scene which cannot be thus modelled, and must rely on illusory painting on a flat surface alone. Mr. Fitzgerald, again, questions the idea that the proscenium is the fourth side of the room,

into which the audience look; he holds that the audience are in the position of an interested person on the stage, and that the fourth wall is behind them. In real life, such a spectator, he argues, does not see a complete room, but only a part of the room in which the action that interests him takes place, and on which his attention is concentrated. Therefore, the argument is, to put the spectator in the same position he needs not to be shown a *complete* room with one wall knocked away, but a portion of a room in which he is supposed (in a sense) to be. Mr. Fitzgerald is adverse to too complete a realism. He quotes Charles Lamb's dictum: "Not all that is optically possible to be seen is to be shown in every picture," and applies this as against the necessity of practicable doors. "By the old system the player went off or came on to the scene; that is, he passed, as it were, from the zone of action and merely disappeared at the wing." This reminds one of the delightful excuse for the want of stage doors made *per* Dr. Johnson's *Ghost* in "Rejected Addresses":—"Permanent stage doors we have none. That which is permanent cannot be removed, for, if removed, it soon ceases to be permanent." There was no realism in having the same door for the palace and the cottage. Mr. Fitzgerald's position, that no doors at all, and only a disappearance into the wings, is the arrangement best in harmony with the conditions of the drama, depends of course upon how much you choose to "make believe." The most realistic drama is make-believe to some extent; consistency is the main point. The modern domestic drama tends to be so very realistic in most senses that it seems to require the realism of doors to the rooms to keep up consistency. Dramas of more ideal kind may dispense with this kind of furniture, no doubt. There is one point in which, we may observe, realism is never successfully carried out on the stage,—architectural detail. It is nearly always bad, even in the most "regardless-of-expense" mountings of plays; the Gothic is poor weak stuff, and all sorts of vagaries are played with Classic detail; it may be realistic to the lay spectator, but it is not so to the architect.

THE monthly paper published under the title of *Scientific News*, with the rider "for general readers," of which two numbers have appeared, seems to answer well to its title, and to provide accurate information in a form intelligible to the non-scientific mind. Such a paper may do real service in bridging over the gulf between the scientific and the non-scientific public.

WE are glad to see, from the answer given by Mr. Ritchie to a question in the House on Monday night, that the Conservators of the Thames intend bringing house-boats under stricter sanitary regulations as to their discharges into the river, and that "any closet communicating with the river" will be an infraction of their proposed by-law. This is a step in the right direction, at all events.

THE report in the last week's number of *Nature* of Captain Abney's exceedingly interesting Friday evening lecture at the Royal Institution on "Sunlight Colours," should be read by every one who is desirous to assist his scientific perception in regard to the causes and meanings of variations of tone and colour under different conditions of sunlight and atmosphere. Landscape-painters, who are often too prone to slight the researches and opinions of the scientific student of nature, ought to find something to set them thinking in this lecture. One sentence in it, by the way, opens up far-reaching conjectures as to the possibly different ways in which different persons (painters included) see nature. Captain Abney says, after describing some of his ingeniously-contrived tests for colour perception, "We have tested several eminent artists in this manner, and about one half the number have been proved to see only three-quarters of the amount of red which we see. It might be thought that this would vitiate their powers of matching colour, but it is not so. They paint what they see, and though they see less

red in a subject, they see the same deficiency in their pigments; y see they are correct. If totally deficient, the case of course would be different." One question that suggests itself after this is, What is "correctness" in such a case? Probably we all see nature (and pictures) differently.

#### LETTER FROM PARIS.

ON Saturday night the Hôtel de Ville, blazing with electric light, will receive for the second time the guests of the Municipality; but in spite of the fifteen years that have elapsed since the commencement of the works, it is still necessary to hide by a *velum* the scaffolding of the Salle des Fêtes; the empty niches are waiting for statues, and the decorators have completed the framework only for the historical paintings which the City Council have not yet persuaded themselves to commission.

A step, however, has been made in this direction. After two long discussions, the Council, much divided between the principle of direct commissions and that of public competition, have at last decided on a middle course which is to satisfy all parties. A mixed committee of thirty members is to prepare a programme to be submitted to the Council. The committee will include the architects of the Hôtel de Ville (M. de Perthes and Formigé), the members of the Fine Arts Committee of the Municipality, twelve Town Councillors, and twelve members chosen by the Council for their special fitness. This committee will draw up a scheme of subjects and places for decoration, to be summarised under two groups, one for direct commissions and the other for open competition. "All's well that ends well," for we have now a committee practically composed of experts, instead of one purely political, and perhaps some part of the immense scheme of intended decoration may now be accomplished by 1889.

There is not much new to say about the Exhibition work this month: the work is going on, rather slowly it is true, partly kept back by the recent inclement weather. It is now settled that the special exhibition of Algeria will be placed along the Quai d'Orsay, on the right of the Esplanade des Invalides. The naval and military exhibitions will be situated opposite, on the left. Behind Algeria will be raised the pavilion of Tunis. It has been decided that the Exhibition is to be kept open, lighted by electric light, till eleven each night; and M. Paul Sédille has been appointed "chef du service" of the French and foreign installations for the Exhibition.

The Municipal Administration intends to take an important part in the Exhibition. It will occupy a site of 3,000 square metres on the terrace of the Champ de Mars, opposite the exhibition of the Beaux Arts. Its pavilion, surrounded by gardens peopled with a crowd of statues, will contain the documents and *matériel* of a number of public services. The total cost of this special exhibition will be about 600,000 francs, without counting the cost of the buildings themselves.

The last day of March was the last for receiving works for the *Salon*, which will include 2,500 pictures and 500 drawings. In the interim, before the *Salon* opens its doors, there is erected opposite the Palais d'Industria the statue which is to be raised in Algeria to the memory of Sergeant Blandan, who died in 1842, after greatly distinguishing himself in the combat at Beni-Mer. The statue is the work of M. Chas. Gauthier.

The *Salon* this year will have a special interest owing to the paintings of military subjects, commissioned from various artists by General Boulanger, and also by the presence of some of the paintings which are to decorate the new Sorbonne. Among these the most important is the cartoon of an immense composition by M. Puvion de Chavannes, 26 metres in length by 6 metres high,\* symbolising the ancient Sorbonne, and Eloquence recounting the Struggles and Triumphs of the Human Intellect. This main work, intended for the large amphitheatre, is to be accompanied by two subsidiary panels representing Philosophy, History, Botany, Mineralogy, Geology, and the Muses (.)

\* *L.*, about 55 ft. long by nearly 20 ft. high. How would the Hauging Committee at the Royal Academy greet an artist who offered them a picture of those dimensions?—E.D.

The cupola of the amphitheatre will be ornamented with allegorical paintings by M. Galland.

MM. Flameng and Chartran, on their part, are preparing for the grand staircase of the Sorbonne two vast allegorical compositions, representing one the records of French Literature, the other the records of Science. M. Flameng, who is to figure in the *Salon*, represents Abelard and his class of philosophy, with a view of ancient Paris in the distance. M. Benjamin Constant is also commissioned, for the Salle du Conseil Académique, to execute five large panels, of which the principal one is to represent the present rector, M. Girard, surrounded by the Deans and representatives of all the Faculties. In one of the Salons de Reception, a painting by M. Winckler will represent the laying of the foundation-stone of the Sorbonne. In one of the committee-rooms M. Lhermitte is to have two panels, one representing St. Claire Deville discovering aluminium, the other Claude Bernard lecturing on anatomy. M. Jobbé Duval is to paint for the "Salle des Actes" of the Faculty of Science the subject of "Science presiding over Modern Discovery"; and M. Olivier Merson is to paint, in the Rector's room, allegorical representations of the Sixteen Provincial Academies. Other painters who are to be employed in decorating other apartments of the building are M. Clairin, M. Roll, M. Cazin, and M. Lerolle.

Out of 150 students who have applied to enter "en loge" for the Prix de Rome, the École des Beaux Arts has selected ten, whose names we give in order of classification:—

|                                  |                           |
|----------------------------------|---------------------------|
| M. Tournaire, pupil of M. André. | M. André.                 |
| M. Chéname                       | M. Guadet.                |
| M. Lafon                         | M. André.                 |
| M. Bertone                       | M. Girardin.              |
| M. Sordais                       | MM. Danuet and Girard.    |
| M. Eustache                      | M. Girardin.              |
| M. Gustave Consin                | MM. Coquard and Gerhardt. |
| M. Houbes                        | M. Pascal.                |
| M. Raphael                       | M. Raulin.                |
| M. Comil-Lacoste                 | M. Girardin.              |

M. Darnot has been commissioned to propose the programme of the deciding competition, of which the subject is "a Gynnasium."

Another very important competition to take place shortly will, no doubt, give ample employment to French architects,—that for the monument of the French Revolution, which has found a determined supporter in M. Berthelot, the new Minister of Arts.

Adieu to the grand projects for the "emplacement" of the Tuileries; adieu to the idea of the splendid palace which was to unite the Chamber of Deputies and the Senate House in one building, in the heart of the city, and in close proximity to all the ministerial offices. All these plans are abandoned, and M. Charles Garnier has been obliged to give up his own views, for it is just on this site that it is proposed to erect this said monument, which may either be purely symbolical, or may be composed of various edifices united by monumental façades or porticos, and containing the statues and bas-reliefs relating to the history of that turbulent epoch. The precise scheme is not yet made known, but the vote asked for is twelve million francs, and 50,000 francs will be given in premiums in the competition.

The tomb of Berlioz, in the Montmartre Cemetery, is to be inaugurated. This funeral monument, the work of the architect Jouvain, is of great simplicity and of fine character. Above a tombstone in grey granite rises a stela adorned with inscriptions, of which the upper part carries a medallion of Berlioz under a garland and relieved against a gold ground. The medallion, a very good likeness, was executed by M. Godebsky. The opening of M. Formig's Crematorium, which was to have taken place immediately, is deferred for some months, as also the inauguration of the monument to Gambetta on the Place du Carrousel, at first fixed for the 14th July next, but so much of the sculptor's work remains to be done that the ceremony cannot probably take place before next year.

The new block of the St. Lazare railway station, to the progress of which we have from time to time referred, is to be opened immediately to the public. For some weeks back the façade has shown clear of its scaffolding, a simple, elegant, but eminently practical piece of architecture, doing great credit to its designer, M. Juste Lisch.

The centre of the new façade is occupied by three large openings, giving access to a stone staircase, conducting directly to the large *Salle des pas perdus* of the suburban railways. It is airy, well lighted, and with ample approaches and exits. The demolition has already commenced of the properties in the Rue St. Lazare, which will give place to the great court, behind which will extend a monumental façade 80 metres in length, uniting the pavilion in the Rue de Rome with that which M. Lisch is soon to erect at the angle of the Rue d'Amsterdam. The goods station adjoining the Pont de l'Europe, of which we have before spoken, is now completely finished and ready for service.

At the Museum of Cluny the decorators are putting the last touches to the exhibition gallery that has been constructed in the court, the floor of which gallery will be laid with a fine piece of work in marble mosaic, somewhat similar to that in the vestibule of the foyer of the Opera House. At the Palais de Justice, where the work has been suspended for a year, an effort is to be made to complete, for the Exhibition year, the portion of the building between the Sainte Chapelle, the Quai des Orfèvres, and the Place Dauphine. There is, therefore, a considerable amount of building work going on or in immediate preparation; but, unfortunately, the most important *chantier*, next to that of the Exhibition, remains closed; that, namely, of the Metropolitan Railway, the execution of which seems, by dint of Parliamentary delays, to be adjourned to the Greek Kalends.

In connexion with public works, we may note the curious discovery made recently in constructing, on the southern slope of the Butte Montmartre, a new water reservoir for the city. At a depth of about 5 metres the workmen came upon two large subterranean galleries running parallel in a straight line towards the extremity of the apse of the ancient church of Saint Pierre de Montmartre. These remains, the existence of which had been suspected by no one, appear to date from the commencement of the twelfth century, and were, probably, intended to place the church in communication with a Benedictine Abbey founded by Louis VI.

At the École des Beaux Arts an exhibition has been opened of the works of Ferdinand Caillard, whose death we announced in our last letter but one. The exhibition is a very interesting one, as making known to the public the talent of an artist of no ordinary attainments both as a painter and an engraver. The exhibition of the "Artistes Indépendentes," organised in a temporary building in the Cour du Carrousel, exhibits as little talent as last year. One can only commend the courage and hardihood of the exhibitors.

Another has to be added to the melancholy list of suicides among French artists,—that of Gustave Guillaumet. Domestic unhappiness is supposed to have been the cause of this tragic end, which could not, in his case, be attributed to want of success or to financial difficulties. Guillaumet was only forty-seven years of age. His instructors were Felix Barrin and Picot, and he obtained in 1863 the second Prix de Rome. After a long stay in Algeria, which had decisive influence on his career, he obtained medals at the Exhibitions of 1865, 1869, and 1872, and a "troisième médaille" at the International Exhibition of 1878. He was a decided Orientalist, a lover of the rich colouring and picturesque costumes of Africa. Among the works which obtained well-merited success may be mentioned especially his view of Laghouat, purchased by the State at the *Salon* of 1879.

The earnest artist Hillemecher is dead, at the age of sixty-nine years. He leaves two sons, who both obtained the Prix de Rome in music; a rather rare occurrence. He was pupil of Léon Cogniet, and after receiving medals in 1848, '57, '61, and '65, and a decoration in '69, he devoted his latter years to book illustration. His last work was a series of drawings in illustration of Shakspeare.

**Royal Birmingham Society of Artists.** The twenty-second Spring Exhibition of this society was opened at the Gallery in New-street on Thursday. The whole of the great round room is this time occupied by water-colour paintings.

#### ARCHÆOLOGICAL DISCOVERIES IN MOROCCO.

During recent years the Danish Consul at Beyrout, Herr J. Løitved, has collated a number of Phœnician, Roman, and Greek antiquities and casts of inscriptions in Morocco, chiefly from the site of the ancient city of Palmyra, which are of great archaeological and artistic interest. They are now principally in the possession of the well-known Danish Mæccenas, Herr C. Jacobsen, jun., the wealthy Copenhagen brewer, and have recently been the subject of research by the celebrated French Orientalist, M. Clermont-Ganneau, of the results of which we give the following particulars:—

The collection contains, among other objects, a mummy in perfect condition,—the first specimen of its kind,—found at the necropolis of the city of Zenobia, and some memorial busts in high relief. Among the latter those of the women are of most interest, on account of the clear details of toilette displayed,—as, for instance, the shape of the coiffure, the diadems, necklets, medallions, ear-rings, bracelets, embroidered garments, &c. The execution of the female busts is far superior to that of the busts of the males, the types of the former being very marked, and betokening a decidedly Jewish and Semitic origin, some being remarkably handsome. Fifteen of the busts have epitaphs, which are written in the Armenian dialect common in Palmyra, some peculiarities of which are very interesting, as, for instance, the names "Raitha" and "Hanuata," reminding one of the Jewish names "Ruth" and "Hannah," as well as "Caddatha," "Bathai," "Mols," and "Athihana." The fifteenth inscription is that of an altar, raised by a person named "Wabbattath" or "Walaha," for the saving of his brother in honour of a deity, who is designated with the vague description, "To him whose name is blessed in all Eternity." In this inscription, which was rather common in Palmyra, M. Ganneau considers that the omission of the name of the deity is purposely committed, just as it is prohibited to the Jews to pronounce the word "Jehovah," a superstition prevalent in the ancient world, chiefly prompted by a desire not to reveal to strangers,—a term at that time synonymous with enemies,—the true name of the deity of the city, in order that his aid should not be invoked. Below the inscription are carved two hands, a symbol of worship well known in Oriental archaeology. The latter inscription is dated in hieroglyphics from the month Sivan (June), of the year 502, in the era of the Selenides, corresponding with the year 191 of our own time.

Among other antiquities collected by Herr Løitved is a semi-column, about one metre in height, bearing the following inscription, in Greek:—"To the noble Lord Baal-Markod, also called Megrin, by command of the Aremthenian god, Maxinos has consecrated [this] in gratitude." The name of this god, by whose command the column was consecrated, is of interest, as it seems to refer to a hitherto unknown city of Aremtha. This column was found at the Maronite convent of Deirel Kaida, on the Lebanon, about ten miles east-south-east of Beyrout, which is believed to have once been the site of a temple consecrated to the god Baal-Markod. This assumption is supported by the discovery on this spot of several Greek and Roman inscriptions referring to this Semitic god.

Another inscription, unfortunately less complete, but still remarkable in several respects, was discovered by Herr Løitved at Masoub, near Ptolemais (St. Jean d'Acre). It is as follows:—"The Porticus towards west and north, which Elim, despatched by Moloch-Astarte and his servant, Baal-Hammon, have raised for Astarte in Akera, the Temple of Hammon, in Ptolemais, 26[th] year. The lord of kings, the highly famous Energetes, son of Ptolemaeos and Assinoc, the twin gods, of the people of Tyrens, 53 years . . . have also erected all the rest . . . which are in the land, in order that it may be them . . . [to eternal honour]." This inscription evidently concerns partially the building of a temple.

Several other inscriptions, of which Herr Løitved has taken casts, refer to various great and small secular buildings. Thus on a house in Bostra is an inscription as follows:—"Under the greatest esteemed Cones Hesycios, Megemon and Scolasticus, the dwelling of the general-in-

chief was raised from the ground, inasmuch as the greatly esteemed . . . and Cosmos have had the supervision of the same,—the 30 Indiction (September 1st) in the year 489" (B.C.) Another inscription informs us that Rufus Magnus has built the tower at his own cost, it being finished in Damascus in the year 683, i.e., 377 B.C.

At Djasim Herr Löitved discovered this inscription: "The Lord Marcus Flavius Bonnis, the most noble Comes of 1 Class and Dux, who has governed us mercifully, has established peace and security as well for travellers as for residents."

On the other hand, there are several inscriptions which refer to non-secular edifices. Thus there is an epitaph at Lihka, which states that "a man from the land of the Canates (Canaanites?), brave and wise, Zobedanes, has raised me,—a tomb like a temple. May Providence impart to his children, himself, and his tender wife constant happiness. May it be to me (my fortune) to receive the oldest first when they in happy old age have completed the course of life. Zamagedos has built (me)." The inscription forms three sentences.

An inscription at Irbid says:—"In the year 95 after the founding of the city Lucius Domitius Manorus has caused this tablet (or column) to be erected for himself together with the ornament thereon." The inscription dates from the year 193 B.C. At El-Heyat the following inscription was discovered on a stone:—"Proclus, son of Ammos, has at his own expense raised this Hermes for his son Agrippianos," and in the same spot is a similar inscription according to which this man also raised a Ganymede for the same son.

Finally the following two inscriptions found on the door-horns at Djasim may be quoted:—"Lord Jesus Christ, show your grace towards the whole family of Gerontios. Lord preserve . . ." and the second "Georgios, the pious lecturer . . ."

The number of antiquities and casts collected by Herr Löitved is about 200, and they embrace the period of the whole history of the country, from the time of the Phœnicians down to the first centuries of the Christian era.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The eighth ordinary meeting of this Institute for the present session took place on Monday evening last, Mr. E. P. Anson (President) in the chair.

##### *Architectural Photographs for the Adelaide Exhibition.*

Mr. Ralph Nevill asked permission to say a few words of explanation in regard to the photographs about to be sent to the Adelaide Jubilee Exhibition. Nothing, he said, could have been easier than to make a fancy ideal of what a thoroughly representative collection should be, but nothing could be more difficult than to realise that ideal. The collection which had been got together should not be judged by any fancy standard or ideal. The time at the disposal of the Committee was short, and when they set to work they found in existence only a small number of accessible photographs. They therefore came to the conclusion that it was of no use to waste their strength by trying to make it a thoroughly representative collection, but that they must do the best they could with the material before them. The various provincial associations willingly responded to the invitation of the Committee, and promised to do what they could in the short time at their disposal, but, unfortunately, when the time drew near they heard from Manchester and elsewhere that the weather had interfered very much with the taking and printing of the photographs. He believed this was the first official exhibition of architectural photographs, and many of the members might be sceptical as to the success of such an exhibition. Having said so much to explain why he deprecated the application of what would be an unfair standard to the collection, he would claim for it that it was of extreme interest and value, and, on the whole, very typical and representative of the prevailing tendency of the art in the present day. The number was limited to 100 photographs, and it would be ridiculous to suppose that the whole of English architecture could be represented by that number. He had always been very much of opinion that photographs were the truest illustrations of archi-

teature, after making allowance for all their shortcomings, while for interiors and details they were more correct than any drawings ever could be. He hoped that the day was not far distant when architectural photographs would be admitted to the walls of the Architectural Room at the Royal Academy.

Mr. Octavius Hansard proposed a vote of thanks to the secretaries of the Art Committee for the trouble they had taken in connexion with this matter.

Mr. Charles Barry, in supporting it, suggested that the Council, in sending this collection, should take advantage of Mr. Nevill's observations, and point out the difficulties that had been met with in forming the collection, and the impossibility of its being a purely representative one.

##### *A Carved Oak Beam at Colchester.*

A drawing was exhibited by Major Bale, R.E., Associate, of a curious carved oak beam in a house at Colchester, known as the Marquis of Cranly. The description of the beam will appear in the Transactions.

A vote of thanks was, on the motion of Mr. C. F. Hayward, passed to Major Bale for his communication.

##### *The Holloway Sanatorium and the Royal Holloway College.*

Mr. W. H. Crossland then read a paper entitled "The Holloway Sanatorium and the Royal Holloway College." The following is an abstract of the paper:—

The author prefaced his description of the College by a short account of the Holloway Sanatorium, Virginia Water, and of how it fell to his lot to execute that building. The author and the late Mr. J. P. Jones submitted a design for the Sanatorium in a limited competition instituted by the late Mr. Holloway, who acted in the matter under the advice of Mr. George Godwin, the late Professor Donaldson, and the late Thomas Henry Wyatt. That design was placed first by the professional assessors, and the joint authors proceeded to modify their design to meet the views of Mr. Holloway and of his advisers. Mr. Jones died suddenly, shortly after the commencement of the building operations, and the author was entrusted with the duty of superintending the carrying out of the work. He had to put on one side the whole set of working drawings and to prepare a fresh set, a change necessitated by the substitution of Portland stone dressings for cut and rubbed brick. When the time came for opening the Sanatorium, new Acts of Parliament for the protection of lunatics had been passed, and the Commissioners refused to pass the building as at first constructed. Consequently the whole of the internal arrangements had to be altered at considerable cost, and practically back to their original form. Passing to the main subject of his paper, the author then described the discussions held between Mr. Holloway and himself, at the time that the building of the Sanatorium was fully in hand, as to the best means of carrying out Mr. Holloway's intention of erecting a large college for the higher education of women, and as to the style of architecture most suitable for such a building. The result of these consultations was that Mr. Crossland was commissioned to measure up and sketch the châteaux in the valley of the Loire, more especially that of Chambord, with a view to the adoption of the French Renaissance style of architecture in the new college. That was done very thoroughly, and a design was prepared which was ultimately adopted for the new building, notwithstanding the pressure brought to bear upon Mr. Holloway by others interested in the new building, to adopt a style of architecture similar to that in which most of the colleges of Oxford and Cambridge are built. The working out of the design to  $\frac{1}{8}$ -inch,  $\frac{1}{4}$ -inch, and  $\frac{1}{2}$ -inch scales, and the preparation of the full-size details, occupied the author for two years,—when it was decided to employ a quantity surveyor to take out the "quantities" after a plan which had been agreed upon between Mr. Holloway and the author. He was anxious above all things to have the quantities made intelligible to himself, so that in case of disagreement on the questions of certificates, extras, or deductions, the point in dispute might be determined without the aid of the surveyor. The result of the method employed, viz., that of cutting the building up into blocks, had been that the contractor not

only has had no extras on either the original contract, or upon other contracts priced from the same bills, but had not even asked for an order for extras. Ten building firms were asked to tender upon the quantities thus prepared, and, in the end, Mr. Thompson, of Peterborough, was entrusted with the execution of the work, and had carried it out to the complete satisfaction of the author. A clerk of works, Mr. George Rogers, was appointed by Mr. Holloway, and was directed to confine his duties to the inspection of the actual works, and to undertake neither correspondence nor drawings of any description. He dispensed altogether with the luxury of an office, and during five years never passed a day, hardly even a working hour, away from the works. When the works were fairly started, the author had a bungalow built, and went into residence on the spot. For the next four years and a half he found himself leading the life of a Mediæval architect,—such a life as architects read about, but which few experienced. The author then briefly described the plan of the College.\* The scholastic department is contained in the two main blocks, and these are connected by rooms, cloisters, and balconies. The refectory and kitchen are arranged on the usual college plan, and are divided by the central hall or vestibule. The museum and library, also the recreation-hall, communicate directly with the two main blocks. These rooms, and also the refectory, are 100 ft. by 30 ft. by 30 ft. high. The chapel is 125 ft. by 30 ft. by 35 ft. high. Each student will have two rooms, study and bed-room, each 12 ft. by 10 ft., 10 ft. 6 in. high, and a common-room is provided for every six students, where they can hold tea-and-toast parties or other entertainments. The building is planned to accommodate 250 students, but on so liberal a scale that fifty may be added to this number, and, including servants, 400 may be set down as the actual accommodation. Some twelve months after the commencement of the works the author had to select and appoint a sculptor, and was fortunate enough to secure the services of the late Signor Fucigna, member of the Academy of Ferrara, who was willing, like the author, to live on the works, and to devote all his time to them. The illustrations of his work, which were exhibited, were sufficient to show the stamp of Signor Fucigna's genius, and that the profession lost in him a sculptor of rare ability, who did not think architectural sculpture too poor a ground for the exercise of his talent. The genius of such a man and of such sculptors as the late Alfred Stevens, and the Frenchman Briants, neither of whom was properly appreciated during his lifetime, might often be secured by prosperous men in the architectural profession, to the advantage, not only of themselves, but of the nation and of the whole world. The principal work executed by Signor Fucigna at the college consisted of the filling of the four pediments which formed centres in the two quadrangles over the principal staircases, the carving of a series of heads, forming keystones to the chapel and recreation-hall windows, the execution of the subjects in the chapel ceiling in very bold relief, and of various heraldic subjects and smaller panels in the heads of the windows, at various points all round the building. The only portions of the building decorated internally in colour are the central vestibule, between the dining-hall and kitchen, and the chapel. This latter has been decorated in oil colour and gold, the warm ivory-tinted free-stone used in the construction forming the basis. The strongest stroke of colour is applied to the lower division of the wall, forming a very rich and elaborate dado from the floor to the window sills. The flat wall spaces above this are of a soft green, broken by deep red in the niches between the windows. The wagon vault of the ceiling is treated with gold as a ground-work, but this is divided into panels by longitudinal and transverse belts, corresponding with the architectural divisions below, and in the panel spaces thus formed are circular medallions containing figures of the six Archangels, *e.g.*, SS. Michael, Gabriel, Raphael, Uriel, Zophiel, and Chamuel, with their distinctive attributes. These, like the subject on the semi-dome of the apse, are on line drawings. The groups of figures on the

\* A Ground Plan and four views of the College were given in the *Builder* for July 3 and July 10, 1886; and further illustrations and descriptions will be found in previous volumes. Plans, views, and descriptions of the Sanatorium will be found in our volumes for 1875, 1877, and 1882.

ceiling and in the apse are treated delicately in colour, somewhat in the manner of old ivories, that is, the colour is worked into the hollows of draperies, &c., and rubbed off the more salient surfaces, thus avoiding heaviness. The general scale of colour obtained by this means is not unlike that of the Sistine Chapel. In the apse, and in a line with the side niches, are three recessed arches, in which are placed standing figures of Our Lord, St. Mary, and St. Cecilia. Right and left of the organ, at the west end, are two medallions, each containing two angels singing and playing on musical instruments. The author then described the fittings, noticing particularly the baldacchino, the organ-case, the library fittings, and some wrought-iron gates, grilles, and low screens in front of the west chapel, the former made in walnut and oak, and the latter of wrought and welded iron, and without rivets or screws. The brass fittings, such as lamps, electroliers, and brackets, also made from the author's designs, are of a high class of workmanship. In the electric light installation there are ninety-six 32-candle power incandescent lamps, 216 16-candle power, and 100 10-candle power, making a total equivalent of about 750 10-candle power lamps, which may now be taken as the standard lamp. The principal portions only of the building, such as principal entrance, chapel, recreation-hall, dining-hall, lecture theatre, museum and library, kitchen and scullery, are provided with the electric light at present. The electricity is generated from dynamos driven from two engines of Messrs. Davey, Paxman, & Co.'s make, through intermediate gearing. The dynamos, two in number, are of American manufacture, one being held in reserve. Both are connected to the main cable, and are each of them more than sufficient for the present number of lights wired for. Edison screw sockets and lamps are used throughout. The heating of the building is effected by means of steam radiators, made of 1-in. wrought-iron pipes, fixed vertically in a hollow cast-iron base, with an entablature of ornamental design. A main 6-in. steam-pipe leads direct from the boiler-house to the centre of the main building, where a receiver is fixed, from which all branches are taken through reducing-valves. To insure the delivery of steam at all points, three pipes are employed,—one supply 4-in. bore, one return 3-in., both running in the same direction, and from the extremities a condensed water-pipe is led back to a container in the basement, from which the water of condensation returns by gravity to the boiler to be re-used. The steam plant power, the gas service, the water supply, the fire service, and the sanitary arrangements were then described. The drains pass around the building in straight lines from point to point, with manholes at all changes of direction and gradient. The sizes of pipes are 6 in., the main outlet being 9 in. in diameter. The soil-pipes and wastes deliver into inspection chambers, beyond which an interceptor trap severs connexion with the main drain. Flush tanks of 500 gallons capacity, built in brick and cement, are fixed at the head of each main drain. The building, Mr. Crossland stated, has been opened before it is in a really working condition. Several important additions, such as a laundry and a complete system of fire service, will be necessary before the whole will be completely finished. The author would in conclusion, he said, draw particular attention to three points referred to in his paper, viz., his experience of clients in general, and of Mr. Holloway in particular, as a model client; secondly, to the subject of quantities; and thirdly, to a subject that he had himself particularly at heart, the unity which he thought should exist between architect and sculptor on all works of importance. He thought that if architects who are entrusted with large public buildings were to associate themselves with some sculptor of equal ability, we should not only get more interesting buildings, but should be spared the shame and dishonour of seeing such men as Alfred Stevens and Brian Stables taken away without leaving more examples of their great genius for the benefit of succeeding ages.

In the discussion which followed,

Mr. David Chadwick, one of the Governors of the College, remarked that the completion of Holloway College was an achievement of which the Royal Institute of British Architects might well feel proud as the work of one of its members. Mr. Crossland had given a well-

deserved heed of praise to all the parties with whom he had been associated, and he had been fortunate in having a client with a long purse. At the same time, although he had almost unlimited funds to draw upon, he had achieved the success of completing the building without any extras. Whether regarded from an artistic or sanitary point of view, all the arrangements of the building had been carried out as perfectly as the appliances of the present day were capable of permitting. He (the speaker) looked upon the Holloway College as the most perfect building that had been erected during the present generation, and there was not a dark room or an unventilated corner to be found in the whole structure.

Professor T. Roger Smith, in proposing a vote of thanks to Mr. Crossland, remarked that he had always thought that the most useful papers that could be procured by the secretary from members of the Institute were accounts of important buildings. They were therefore extremely indebted to Mr. Crossland for his paper, and for filling the room with drawings and photographs which enabled them to form some guess as to the extent and dignity of the structures. He wished, for the sake of those who had not had the advantage of seeing the building, that some of the leading dimensions had been given, but having himself had an opportunity of seeing the building, that gave the architect an idea of the effect of great size. There were not in this country many very large architectural buildings. There were many small and moderate-sized buildings, but the number of structures in which the dimensions were of great length, and the effect of great extent, were to be studied, was small. Such buildings as Versailles, the Louvre, and the Tuileries, which gave one an idea of enormous size, were scarce in England, but the Holloway College was one, and if for no other reason than that, it deserved to be seen and studied by those who wished to appreciate that particular element. The style adopted was one which merited probably more extensive usage. There was no more beautiful version of Renaissance architecture than that of the time of François Premier in France, and which the late Edward Barry to some extent adopted. The Holloway College, however, was the largest and most important building in that style which had been erected in England, and on that account alone it was of extreme interest to architects.

Mr. William Woodward said Mr. Crossland had claimed that his peculiar system of taking out the quantities, he had avoided all extras, and he hoped, in replying, that a little more information would be given on that important matter. Men in practice, of course, were well aware that there might be great merit in a building being carried out without extras, or no merit whatever. The merit or demerit depended almost entirely on the manner in which the quantities had been taken out, and the way in which the building had been studied before it was commenced. He would therefore like to know whether, before the building was commenced, the drawings and details were fully completed? The name of Alfred Stevens had been several times mentioned in the paper, but there was considerable difference of opinion as to his work, and particularly with regard to the Wellington monument in St. Paul's Cathedral.

Mr. Henry Lovegrove supported the vote of thanks, and asked whether extras were avoided by some very heavy "provisions"? And he wished to know whether it was advisable that it should go forth from the Institute that it was desirable to advertise for surveyors at so much a day or week? Because, if that practice were sanctioned, they would have architects advertised for in the same manner.

Mr. Ralph Nevill asked whether the warning of the college was done by steam?

Mr. Crossland, in reply to some of the questions asked, said, that as to the quantities, he was at work with all his staff for two years on the plans, which were of the most detailed description, and these were placed at the disposal of the surveyor. The completed plans were bound up in three large volumes, and were never afterwards altered. In regard to extras, he had with him a copy of the quantities very carefully illustrated, and by the plans and sections he could show how it was arranged. Each story formed a separate bill of quantities, and though there was undoubtedly great repetition, the arrangement proved useful for checking, and that to a great extent

accounted for the accuracy of the quantities, and the non-existence of extras. Moreover, Mr. Thompson, the builder, had not only had no extras, but he had not even applied for an order for them. The clerk of works had not interfered with the drawings, and so had not needed an office; in fact, he (Mr. Crossland) had been his own clerk of works, living on the building. What the clerk had to do was to walk round and round the scaffolding ten or a dozen times a day, and one of the things which he did was to see that the perpend of the brickwork were as true as a line could make them. Mr. Crossland then gave some further particulars as to the lighting and warming of the building.

Mr. C. F. Hayward, F.S.A., said that the effect of the size of the College was very great, and the way it grew upon one was a proof of the character of the work itself. Though he himself had a rather stronger sympathy with work of the Gothic school, he could not help feeling that the design had been worked out in the spirit of true art. The alliance between architect and sculptor, and the high ground on which Mr. Crossland had placed the necessity for that union, was deserving of the recognition of the Institute.

The President, in closing the discussion, said that Mr. Crossland had with great personal modesty given the meeting the history of a most interesting building. He appeared to have led the ideal life of the architect, with a munificent patron, almost unlimited means, and having visited with his patron such interesting and picturesque monuments on the Loire as Chambord, Chenonceaux, Chaumont, and Blois, he came back with his mind full of the object he had to carry out, and able to devote his whole time to the development of his work. Mr. Crossland had been his own architect and clerk of works, and nothing could be more satisfactory to the architect than to have the means of carrying on his work in that agreeable manner.

The vote of thanks was then passed by acclamation.

The President added that Mr. Chadwick gave him authority to state that a visit to the College would be arranged to take place on Tuesday, the 3rd of May, during the coming General Conference of Architects. He also announced that a business meeting would be held on the 18th of April to consider the Schedule of Professional Practice and Charges of Architects.

**The Smoke Nuisance in London.**—The Bill introduced by Lord Stratheden into the House of Lords for abating the nuisance arising from the smoke of furnaces and fireplaces in London will have little chance of becoming law if he insists upon retaining the clause which includes private dwelling-houses in its operation. Lord Stratheden proposes to enable the local authority,—that is, the Commissioners of Sewers in the City, the Vestry in a parish of schedule A of the Metropolitan Management Act, and the District Board in combined parishes of schedule B,—to make bylaws, not only for regulating but even for prohibiting, the emission of smoke from any building. These bylaws might exempt from their operation buildings below a certain rateable value; or they might limit the hours within which they are to be in force; or they might contain any other restrictions thought expedient. By these bylaws reasonable penalties might be imposed on offenders against them. But without the Attorney-General's consent no proceedings could be taken for the recovery of a penalty by any one but the local authority. Before being of any validity the bylaws would have to be confirmed by the Home Secretary, and opportunity would be afforded to any person affected to send his objections to that Minister. Other bylaws might also be made under the Bill by the Metropolitan Board of Works as to new buildings. All fireplaces or furnaces intended to be used in these could then be required to be so constructed as to effectually consume, as far as possible, all smoke arising from them. While no reasonable man would object to the proposal to have new dwelling-houses provided with fireplaces consuming their own smoke, and in accordance with the aim of the Bill, any attempt to include existing private houses will result in its rejection, or at least in such a mutilation of its provisions as will practically render them inoperative.—*Iron.*

ELECTIONS OF DISTRICT SURVEYORS.

At the meeting of the Metropolitan Board of Works on the 25th ult., the first business proceeded with after the confirmation of the minutes of the previous meeting was the election of a District Surveyor for South Islington, in the room of Mr. Rowland Plumble, transferred to the District of West Hampstead. There were thirty-five candidates, not counting two who failed to put in an appearance. In accordance with the usual practice of the Board, a show of hands was taken on behalf of each of the thirty-five candidates who were present, with the view of retaining the six candidates who obtained the highest number of votes for the final contest, which was, in conformity with a motion made by Mr. T. W. Williams, decided by ballot. The candidates present were—Messrs. T. Battersbury, H. Blackhour, H. H. Bridgeman, J. W. Brooker, H. Cheston, P. Cowper, E. E. Eales, G. Edwards, F. R. Farrow, J. M. Ferguson, R. F. C. Francis, J. Goodchild, W. Grellier, F. W. Hamilton, J. Hamilton, G. Hamilton-Gordon, W. J. Harcastle, E. Haselhurst, A. Heyes, G. Inskipp, G. Jackson, N. E. Jennings, G. A. Lean, H. Lovegrove, E. W. Mountford, R. C. Murray, W. H. Nash, H. A. Pelly, C. G. Saunders, M. L. Saunders, W. Smallpeice, W. L. Spiers, W. H. Stevens, H. W. Stock, and E. Woodthorpe, jun., M.A.

The preliminary voting on these names placed the following six names highest on the list, viz., Battersbury, 32; Harcastle, 25; Lovegrove, 34; Saunders (M. L.), 33; Spiers, 26; and Stock, H. W., 32. The subsequent voting was as follows:—

|                 | 2nd  | 3rd  | 4th  | 5th  | 6th  | Final |
|-----------------|------|------|------|------|------|-------|
|                 | Vote | Vote | Vote | Vote | Vote | Vote  |
| Battersbury     | 9    | 15   | 16   | 15   | 30   | 21    |
| Harcastle       | 1    | 1    | 1    | 1    | 1    | 1     |
| Lovegrove       | 12   | 16   | 16   | 18   | 27   | 27    |
| Saunders (M.L.) | 14   | 13   | 16   | 15   | 19   | 19    |
| Spiers          | 3*   | 3    | 3    | 3    | 3    | 3     |
| Stock           | 3*   | 3    | 3    | 3    | 3    | 3     |

The ultimate result of this curious contest, in which, as will be seen, there were three "ties," was that Mr. Henry Lovegrove was declared to be elected.

The Works and General Purposes Committee have considered the reference made to them by the Board as to the future mode of conducting the election of District Surveyors, and have resolved to recommend:

(a) That the number of candidates be reduced to six, at a meeting of the Board, by one ballot, at which each Member may vote for six names out of the printed list; the result of such first ballot to be ascertained by scrutineers consisting of two Members of the Board, to be appointed for that purpose, together with the Clerk or his representative;

(b) That the six thus selected be balloted for, each Member of the Board voting for one candidate only, until some one candidate has the votes of a majority of the Members present, and that at each ballot the name of the candidate having the smallest number of votes, or the names of all candidates who have less than twenty per cent. of the total number of votes, be struck off.\*

Mr. Williams has given notice that when the report of the Committee comes before the Board he will move, as an amendment to the First (a) of the above recommendations:—

"That the number of candidates be reduced to six, at a meeting of the Works and General Purposes Committee, by one ballot, at which each Member may vote for six persons whose names are in the printed list; the result of such first ballot to be ascertained by scrutineers consisting of two Members to be appointed for that purpose, together with the Clerk or his representative; and that the names of the six persons thus selected be taken up to the Board at the following meeting, in order that the Board itself may make the ultimate selection."

NOTES FROM SWEDEN.

A NEW theatre, with very handsome appearance and fittings, called the Wasu Theatre, has just been opened in Stockholm. It seats 700 persons, and is lighted by the electric light.

The great new building of the Stockholm Telephone Company, in which the central station will be located, is approaching completion. The principal operating hall will be lighted from the roof, which is of glass, and at night the electric light will be employed. On the walls of the hall will be hung some fine

\* Both names dropped at this stage by resolution of the Board.  
 † To decide which of the three names previously voted upon should be dropped.  
 ‡ To decide whether Battersbury or Saunders should be dropped.

paintings illustrating great events in the history of science, and they will also be decorated with the coats of arms of the towns of Sweden which have adopted the telephone.

The well-known German circus proprietor, Herr G. Schumann, having petitioned the Corporation of Stockholm for permission to erect a large modern circus building in one of the central parts of the town, the sanitary committee of that body has refused the same, on the ground that, however carefully such an establishment be built and tended, an unpleasant and injurious smell therefrom cannot be avoided.

During the last two or three years attempts have been made in Scotland with cultivating saplings of pine and spruce brought from Sweden and Norway, and, as appears from a recent report from the coastal for those countries at Leith, with the most satisfactory results. Attempts to grow these trees from seed have, however, not been so successful, most probably, it is believed, from want of sufficient care. In consequence, several Swedish and Norwegian societies interested in this matter have decided upon sending competent persons to this country with a view to promote the import of saplings and seed from these kinds of trees. In Sweden, as is generally known, replanting goes hand in hand with de-forestation, though, of course, the former operations necessarily demand a longer time in showing results.

Formerly, the imports to Scotland of Swedish glass wares,—chiefly bottles,—was very considerable, but of late years it has fallen off greatly, owing to several works near Leith and Glasgow having imported a number of Swedish glass-blowers, who, as they work for lower wages than the English, enable the manufacturer to produce the goods at a cost less than in Sweden. This is felt as a serious blow to the Swedish glass industry.

A company has been formed in Scania, in the South of Sweden, for the purpose of manufacturing salt-glazed drain-pipes, paving-stones, tiles, &c., articles which have hitherto been imported from abroad. The company has purchased the well-known Skromberg clay deposits, which are estimated to last for several hundred years, for a sum of 25,000*l.*

Great satisfaction is felt in Sweden at the circumstance that the pedestal of the statue of Hugo Grotius, the celebrated Dutch lawyer, which was recently unveiled at Delft, is of Swedish granite. It was cut in Berlin, after a drawing by M. Garnier, the French architect, and weighs over half a ton, and is 12 ft. high. It is considered an illustration of the high renown which Swedish granite enjoys abroad.

BUILDERS' CLERKS' BENEVOLENT INSTITUTION.  
 ANNUAL DINNER.

The ninth annual dinner in aid of the funds of this Institution was held on Tuesday evening last, in the Venetian Saloon of the Holborn Restaurant, Mr. W. R. Freeman (of the firm of John Mowlem & Co.), President, in the chair, supported by so large a number of friends that an "overflow" party had to dine in another room. The usual loyal and patriotic toasts having been duly honoured (Mr. T. P. Rider proposing the "Army, Navy, and Reserve Forces," and Col. Trollope, of the Queen's Westminster Rifles, and Mr. George Burt, jun., of the Royal Naval Reserve, responding).

The Chairman, in proposing the toast of the evening, "The Builders' Clerks' Benevolent Institution," said he had to plead the cause of an Institution which he was able to say was very carefully and economically managed by a thoroughly earnest and painstaking committee, and which undoubtedly supplied a great want. He therefore felt that he should not plead in vain. The Institution was founded in 1866, and therefore it attained its majority in this present year of Jubilee. During its existence it had received a total income of about 8,500*l.*, and had expended, in pensions and relief, upwards of 3,000*l.* There had been in all twenty-five pensioners elected on its funds, the number on the books at the present time being fifteen. The male pensioners received, according to their necessities, from 20*l.* to 25*l.* per annum, and the female pensioners from 15*l.* to 20*l.* per annum. The Institution also afforded temporary relief to the extent of not more than 10*l.* in one year to as many deserving cases as possible, and it also provided

burial-money and other relief to widows of builders' clerks dying in distressed circumstances, every case being most carefully inquired into without delay. At the same time, care was taken to prevent the pauperising of the recipients of the Institution's aid. Personally he had great pleasure in advocating the claims of the Institution, for he was much indebted to builders' clerks for his business education, and had, indeed, served as a builder's clerk himself. The Institution was one which must commend itself to all connected with the building trade, but in a special manner to the clerks themselves, who should, he could not help thinking, support it in greater numbers than they did. The master builders took the kindest interest in its welfare, while the builders' merchants were liberal supporters. So convinced was he of the utility and absolute necessity of the Institution in these days of competition and the consequent sad vicissitudes of builders' clerks, that had no such Institution been in existence he should have done his part in founding one. Fortunately, that work had not to be done, for it was done twenty-one years ago, and the Institution had now arrived at manhood's estate; and as it had increasing claims upon it, it would probably want a little more scope and a little more cash than hitherto in order to enable it to fulfil its mission. On these grounds he warmly commended the claims of the Institution to the building trade and all connected with it, and asked the company to drink to the success of the Institution.

The other toasts were "The Architects and Surveyors," proposed by Mr. J. Howard Colls (President of the Institute of Builders), and replied to by Mr. W. E. Stoner; "The Builders," proposed by Mr. E. C. Roe, and coupled with the name of Mr. Joseph Randall (Kirk & Randall); "The Past Presidents," proposed by Mr. Edwin Brooks (Treasurer), and replied to by Messrs. Thomas Stirling and G. Hayward Trollope; "The President," proposed by Mr. G. H. Trollope; "The Visitors," proposed by Mr. G. C. Kentish, and coupled with the name of Mr. Stanton William Preston, Clerk of the Worshipful Company of Carpenters; and "The Committee," proposed by the Chairman, and coupled with the name of Mr. H. J. Wheatley, the indefatigable Secretary, who during the evening announced subscriptions and donations to the total amount of 38*l.*

ARTISANS' DWELLINGS  
 NEAR GROSVENOR SQUARE.

The Improved Industrial Dwellings Company (Limited), having acquired from the Duke of Westminster several sites lying between Oxford-street and Grosvenor-square, have commenced operations in earnest in that locality, and on Wednesday last a block of tenements, to be known as "Stalbridge Buildings," was opened by the Duke of Westminster. This block is situated in Lumley-street, and is to be followed by eight other blocks in the immediate vicinity. The block in Lumley-street contains accommodation for 46 families; the next, to be erected between Lumley-street and Balderton-street, will provide for 72 families; and the remaining seven blocks will provide for about 258 families. These, with the 38 families in Clarendon Buildings, Balderton-street,—erected in 1872,—will represent a total of nearly 2,000 persons of the working class resident on this part of the Estate. The cost of the whole will be about 80,000*l.* The general plans, elevations, and working drawings have been prepared in the Company's offices, and the buildings are being erected by the company's workmen. Each dwelling contains separate domestic conveniences, and the wood-work in the rooms is painted, grained, and varnished, and the walls neatly papered. Wash-houses are provided on the roofs. The company has, during the past seventeen years, erected in other parts of the Grosvenor Estate, 381 separate dwellings for about 1,900 persons. The company now possesses thirty-nine estates in various parts of the metropolis, chiefly in the Central and Eastern Districts, thirty-seven of which are completed for occupation by 24,000 persons of the working classes; and when the new buildings in Mint-street, Southwark, are occupied, and those on the Grosvenor Estate completed, there will be accommodation in the company's buildings for 23,000 persons. The total expenditure will then have been about 1,025,000*l.*

Wrought-Iron Sign, "Builder" Office.—Designed by Mr. H. H. Statham.

**THE "BUILDER" SIGN.**

The wrought-iron sign, of which a sketch is given, was one of the last things carried out at the forge of the late Mr. Alfred Newman before his lamented death. The long leaf-forms which are the principal feature in it are conventionalised from a spray of a tropical plant (*Licuala horrida*), sketched in the hot-house at the Botanic Gardens. The spray as originally sketched is given at A, and the end of a leaf, nearly full size, at B. It was at

first intended to make the wrought-iron leaves of the same kind of ridge-and-furrow section (C) as in the natural leaf, forming each leaf in an oblong shape first and then nipping the ridges close at the springing, as in nature. But it was found the metal in this form was too recumbent in regard to the bend and curl which it was desired to give the leaves, and the forgers suggested that a similar effect could be obtained by a section as at D, making each

ridge a separate piece, and the whole would then prove ductile and tractable, which was accordingly done. The sign is now fixed above the publishing office of the *Builder*. H. H. S.

**COMPETITIONS.**

**Board Schools, Bristol.**—At the meeting of the Bristol School Board on the 25th ult., the plans of Messrs. Hansom & Bond, of Clifton, were unanimously adopted for the new schools in Easton-road. Thirty-eight sets of designs were sent in.

**Wesleyan Schools, Forest Gate.**—We are informed that the building committee have selected the plans submitted by Mr. F. Boreham in this competition. Six designs were sent in.

**Wilkesden Public Offices.**—The successful competitors for the above, according to the award of Mr. Christian, are:—First Premium, "Favete Linguis," Mr. E. Harnor; Second Premium, "Plan," Messrs. Newman & Newman.

**The South Kensington Exhibition Sales.**—The second and concluding sale, by Messrs. Horne, Son, & Eversfield, of the materials of the galleries, courts, and annexes lately used for the successive exhibitions, took place last week, the sale occupying three days, and finally terminating on Friday, the 25th of March. The materials disposed of comprised nearly six hundred lots, the principal portion consisting of the materials of the Chinese pavilion and tea houses, the Maltese court, the Canadian and west galleries, and the ornamental bridges across the basins. The sale also included the office furniture and fittings, upwards of one thousand iron and pitch-pine garden-seats, and several hundred iron hurdles. The proceeds of the sale amounted to between 2,000*l.* and 3,000*l.*, which, added to 6,000*l.*, the amount of the first sale, brings up the total amount for these portions of the materials to between 8,000*l.* and 9,000*l.* The three days' sale, by Messrs. Wheatley, Kirk, & Co., of the engines, boilers, and other machinery, and the electric plant, realised upwards of 10,000*l.*; the aggregate proceeds of the varied properties on the grounds belonging to the Royal Commissioners amounting to between 19,000*l.* and 20,000*l.* The grounds have already been cleared to a great extent of the machinery and materials sold within the last month.

**Illustrations.**

**MODERN ORNAMENT.**

BY DR. DRESSER.

**H**IS fine and effective design is reproduced in accordance with the kind consent of the publishers that we should reproduce one plate from Dr. Dresser's recently-completed series of designs, published under the title of "Modern Ornamentation." The plate is slightly reduced from the size of the original, and the colour modified for convenience of printing in connection with other plates; the plate in the work being printed in a rich red tint.

Some general remarks on the work will be found in another column.

**DOORWAY, PALAZZO TOLOMEI, SIENA.**

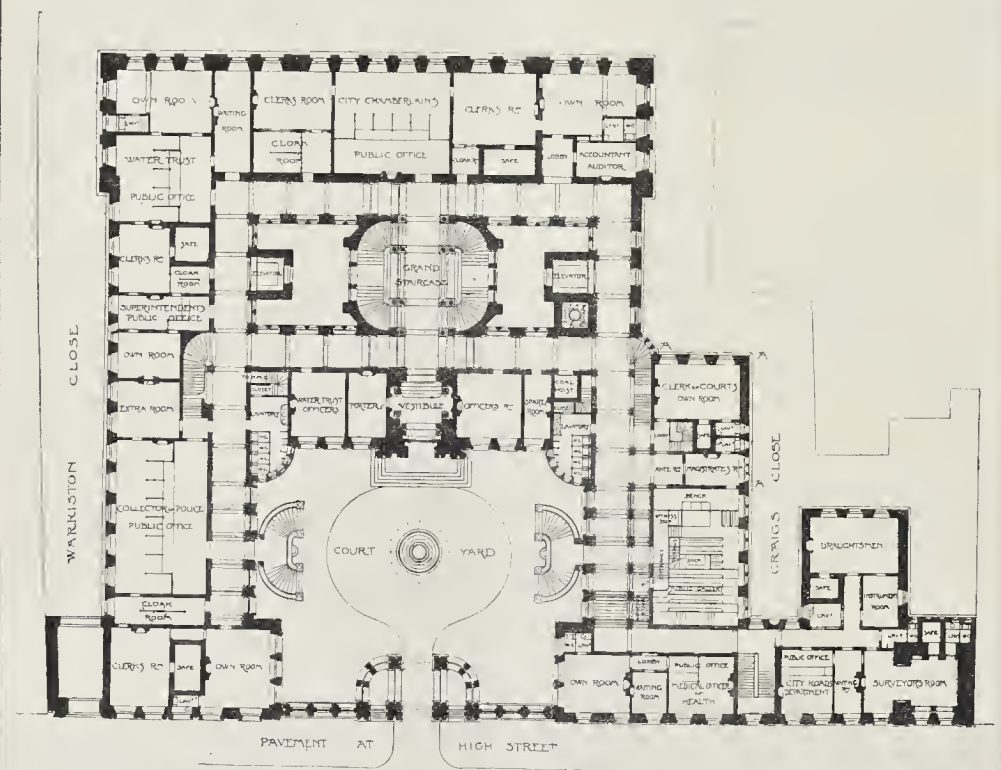

The Palazzo Tolomei is one of the smaller and less well known of those in Siena. It was built by Il Tozzo in 1295, and, notwithstanding subsequent alterations, is still a good specimen of the Italian Domestic Gothic architecture of the first half of the thirteenth century. This doorway seems, from the appearance of the tympanum, to have had its share of modification; but whether the rather incongruous ogg and dentil ornaments are original, or a later insertion, we cannot say.

**ST. GEORGE'S CHURCH, BECKENHAM.**

We give a view and plan of this church, which has been erected at a cost of about 16,000*l.*, exclusive of tower and spire, from the designs and under the superintendence of Mr. W. G. Bartlett. The walls are built in hammer-dressed rag; the chancel roof is of pitch-pine, and the other roofs of deal; the chancel fittings are of oak, the remainder of the fittings of deal, and the floor of wood blocks, excepting in the chancel, chapel, and passages, which are tiled. The roofs are covered with Broseley tiles. The builders were Messrs. Cornish & Gaymer.

**EDINBURGH MUNICIPAL BUILDINGS COMPETITION.**

We give this week illustrations of the design submitted by Messrs. Morris & Hunt, under the motto "Ora et Labora." Our comments upon it will be found on page 312, *ante*, in the course of the article devoted to the designs in our issue of February 26th.

Part of the "Queen Anne" Addition, Fairfax House.  
From a Sketch by Mr. J. Alfred Jones.

FURTHER NOTES ON FAIRFAX HOUSE,  
PUTNEY.

We give some more facts and sketches about this old house, the demolition of which has excited so much regret. In regard to its supposed occupancy by General Fairfax, the real story we believe to be in this wise:—When king Charles I. lay at Hampton Court, in the year 1647, the Roundhead forces made their head-quarters at Putney, with the double purpose of keeping the king under control and of over-ruling the capital, together with the Parliament. Fairfax's chief officers are said to have met in council around the altar-table of St. Mary's, the parish church by the ferry-stairs. At this crisis Ireton, in his capacity of Commissary-General of Victuals, possibly found lodging at the so-called Fairfax House. That house shortly afterwards passed to one John Petteward, in whose family,—still large land-owners of the parish,—it for many generations remained. John Petteward acquired it in virtue of his marriage with Sarah, daughter and heir of Henry White, then of Fairfax House, who

served as sheriff for the county in 1653. Ireton also lodged at Putney House,—dating from 1533,—in the Upper Richmond-road, which was lately demolished. This was the famous Putney School of some generations since, and a reputed home of the Duke of Hamilton, as also of Louise de Querouaille, the Duchess of Portsmouth. Fairfax is said to have stayed here for some months; but there is good evidence to show that the house he *did* occupy was one which, by name of "The Palace," in commemoration of Queen Elizabeth's visit there, stood to the west of old Putney Bridge. That house had been rebuilt, 1596, on the site of a mansion of the Welbecks, by John Lacy, citizen and clothworker, and his Company's arms were carved in the drawing-room ceiling. In 1647 it belonged to the high sheriff, Sir William Wymondsold. It then passed to Sir Theodore Jansen, whose trustees sold the property to Mr. Paul d'Aranda, and continued in possession of his family until about ninety years ago.

The oldest portions of Fairfax House were apparently of no earlier date than say the end of the sixteenth century. The interior wood-work of the oak panelled room,—Queen Elizabeth's breakfast parlour,—is of the Restoration epoch. Additions were made to the main fabric in Queen Anne's reign, their date being recorded on one of the two sun-dials on the walls, one of which is shown in the accompanying illustration of this portion of the house, from a sketch by Mr. J. Alfred Jones, who has also forwarded to us for publication the two measured drawings of the decoratively-treated lead cisterns. We understand that the present possessor had leased the site of the house with its spacious and well-wooded garden at the back for building purposes, and that the lessee proposes to lay out a new road through the middle of the property, to erect shops along the wide street frontage, and cover the ground with rows of low-rented houses.

#### LECTURES AT CARPENTERS' HALL: BRICKS AND BRICKWORK.

PROFESSOR T. ROGER SMITH lectured on this subject at Carpenters' Hall on Wednesday evening last, his discourse being the fifth of the present series of free lectures on matters connected with building given under the auspices of the Carpenters' Company. The lecture was illustrated by a large number of drawings, lent by Mr. James Brooks, Mr. Waterhouse, R.A., and Mr. Stevenson, besides some from the collection at University College and others prepared for the occasion. There were also specimens of bricks lent by Mr. Brown, of Norwich and London, and from the collection at University College. Mr. A. Preston (Past Master of the Carpenters' Company) occupied the chair, and there was a good attendance.

The lecturer commenced by giving an interesting historical sketch of the manufacture and use of bricks by the Egyptians, Assyrians, and other nations of antiquity. With regard to the Romans, he said they made bricks everywhere and used them constantly. They were fond of mixing two or more materials together, as, for example, building walls in concrete and inserting brickwork at intervals, in horizontal layers, to act as courses of bond. They also erected buildings of which the walls were wholly of brick. They turned arches of wide span in brickwork, and they frequently laid in their walls, at regular distances apart, courses of bricks on edge, and courses of sloping bricks, to which antiquaries have given the name of herring-bone work. The Roman bricks were interesting as records, for it was customary to employ the soldiers on brickmaking, and to stamp the bricks with names and dates, and thus the Roman bricks found in this country gave us some information as to the military commanders and legions occupying different parts of England at different periods. After the Roman time brickmaking seemed to have almost ceased in England for many centuries. It was true we found remains of a certain number of massive brick buildings erected not long after the Norman Conquest; but on examination it turned out that these were put up at places where there had been a Roman town, and were built of Roman bricks obtained by pulling down previous buildings. About the time of the Tudors, say the reign of Queen Elizabeth, the making of bricks was resumed in England, and many dwelling-houses and some few churches were built of good brick-

work in that and succeeding reigns. We found in such buildings as Hampton Court Palace, St. James's Palace, and Chelsea Hospital, examples of the use of brickwork in important buildings near London at later dates. The Fire of London, in 1666, gave a sudden check to the use of timber in house-building in the metropolis. Previously to that date the majority of houses had been of a sort the most ornamental examples of which were copied in "Old London" at the recent Colonial Exhibition. The rebuilding after the Fire was largely in brick; and in the suburbs, in the latter part of the seventeenth and eighteenth centuries, many dignified square brick mansions, with bold overhanging eaves and high roofs and carved ornament, entered through a pair of florid wrought-iron high gates, were built, some few of which still lingered in Hampstead and other suburbs. The war-time at the beginning of this century was a trying time for builders, with its high prices and heavy taxes, and some of the good-looking brick buildings of that day turned out to have been very badly built when they were pulled about for alterations. With the rapid and wonderful increase in population and wealth in this metropolis during the last fifty years a vast consumption of bricks had taken place, and a year or two back it was reported by the Commissioner of Police that the extensions of London equalled in a year seventy miles of new house property, practically all of brick. Bricks were heavily taxed in the war-time which had been referred to, and the tax was levied before burning. There was a maximum size for the raw brick, which it was supposed served to keep bricks uniform, and the expectation was entertained that when the duty came off many fancy sizes of bricks would be used. That had not, however, turned out to be the case. The duty had been entirely taken off for years; but the differences in the size of bricks in England were little more than what was due to the different rate of shrinkage of brick-carb under burning. It must not, however, be supposed that they had always, and in all countries, been of about the same dimensions. The size and proportions of bricks had varied extremely in different countries and in the same country at different periods. Some bricks of unusual shapes had also been employed from time to time. Other countries besides England possessed districts which from various circumstances had been more or less densely built on, but did not yield much stone or timber; and, accordingly, brickwork was to be met with in many localities. Holland and Belgium, for example, were countries where brickwork was largely used; and the old connexion between Holland and England led to the introduction among us, in the reign of William III., of the Dutch style of building, which had been in our own day revived under the rather incorrect title of "Queen Anne" architecture. Another great brick district existed on the plains of Lombardy and the northern part of Italy generally, and beautiful brickwork, often with enrichments in marble, was to be found in such cities as Milan, Pavia, Cremona, and Bologna. Many cities and towns in Northern Germany were also brick-built, and furnished good examples of the successful treatment of the material. In some of these German buildings, indeed, difficult pieces of construction, such as we were in the habit of thinking could only be executed in stone, were successfully attempted in brick. For example, they executed large tracery windows in that material. Great brick gables, often with the stepped outline known as crow's-feet, were an excellent architectural feature of these German brick-built towns. In parts of France, also, ornamental brickwork was from time to time made use of, but not extensively. Good brick earth was not simply clay, but a God brick earth was not simply clay, but a compound substance; and what was essential was that it should burn hard, or, in other words, partly vitrify under the action of heat. The brick-earth was usually dug up in the autumn, left for the frosts of winter to break it up, and worked up in the early spring. The moulding was to a very large extent done by hand,—sometimes in a wet mould, sometimes in a dry sanded mould,—and the bricks were first air-dried, often under some slight shelter, as the rain or frost damaged them when first made; and then when that process had made them solid enough to handle, they were burned, and sorted into qualities. The ordinary, or stock, brick of London and the neighbourhood presented a peculiarity the origin of which was not known,

and which was not met with, so far as the lecturer knew, in other parts. Very fine coal or cinders was mixed with the brick-earth, and when the bricks were fired the minute particles of fuel scattered through the material would all of them burn, and serve to bake the heart of the brick. Stock bricks were burnt in a clamp made of the raw bricks themselves with layers of fuel, and erected on earth slightly scooped out near the middle, so that as the bricks shrank they dropped together and did not fall over sideways. Most other varieties of bricks were kiln-burnt. Having described the various types of brick-making machinery, the lecturer said that the sorts of brick that were to be met with in the London market were very varied. To enumerate them all would make a tedious list; to describe them all would be equally tedious. He would endeavour, however, to give some idea of the most conspicuous of them, and would begin with that family of bricks of which the London stock brick was the type. It had been said these were clamp-burnt, and almost all the internal brickwork,—and not a little of the external,—of the metropolis was of stock brickwork. A good London stock brick was an excellent brick for general purposes, but could not be called beautiful. When a clamp had been burnt its contents were found to have been unequally fired, and were part of them under-burnt, part well-burnt, part over-burnt. They were sorted accordingly into "shuffs," "grizzles," "stocks" of two or three qualities, "shippers," and "burrs." Several sorts of malm stocks, which were superior in colour and texture, were made, and were used for facing-bricks and for cutting; and what were called pavions, which were dark and strong bricks, were also made. The London stock was erroneously but usually described as grey; it was really of a pie-crust yellow of various tones. Sometimes it was the same colour when cut, but the hardest stocks were of a dark, dirty purple or brown, or sometimes nearly black inside. A stock brick was rarely quite square or quite true; its surface was often disfigured by black specks and small pits, and a stock of them often looked uninviting; yet a skilful bricklayer, by throwing out the worst, by placing those of bad colour or much out of shape in the heart of the wall, and by bringing to the front the best end or side of those bricks which formed part of the face, could always make the bricks in his work look far better than in the stack. Another important group was the group of Suffolk and Norfolk bricks, red and white. These were very largely employed as facing bricks, and for arches and cut mouldings. Moulded bricks were also to a large extent made of the same material. These bricks were brought to London in large quantities; they had a sanded face, were mostly square, true, and of uniform colour, but they were usually porous, soft, and absorbent. Still, they were in great demand as facing bricks, and the moulded bricks enabled the architect to produce many architectural effects at a moderate outlay. These fields furnished many sorts of bricks, which were called rubbers, and which were employed (as malm stocks also were) for arches of the more elaborate sort, where each brick is cut to its shape and rubbed true, and for mouldings, and even sometimes for carving. Mouldings that were formed by cutting the bricks could be got more perfectly true than when moulded bricks were used; but the expense was greater, and when it was done the material was less durable, for the softer sorts of brick were naturally used for cutting, and the moulded face was less sound than the original burnt face of any brick. Red bricks such of London; but the best came from some distance. Red Suffolk bricks had been alluded to; there was a considerable importation of red Farchan bricks, brought all the way from the vicinity of Portsmouth; these were good both in quality and colour. Good red bricks were also now made at Ascot, and were being used to a considerable extent in the metropolis. A strawberry-coloured brick from Linton had been extensively used at Hampstead. It was hard, and of a colour which contrasted well with stone, but not very pleasing used alone. Glazed bricks of all colours were obtainable: they were usually very hard and square, and the use of them where an impervious glazed face was required,—as, for example, in a good stable,—was better than the employment of glazed tiles, in the use of which there was always a possibility of part of the lining becoming loose or falling off.

There was a difficulty in obtaining a large quantity (of some colours, at least) exactly uniform in tint. Bricks with a very hard face, but not glazed, were obtainable. What was called a washed brick was now made in various colours, adapted for the lining of interiors, and there were hard bricks of a very pale straw colour, known as Beatt's patent bricks. These bricks had the peculiarity of being pierced with holes about  $\frac{1}{2}$  in. in diameter, passing quite through the brick, and they were extremely hard, partly because these holes permitted the hot air and smoke in the kiln to approach very near to the interior of the brick. The lecturer was of opinion that the glazed or dull qualities of hard bricks might with great advantage be often introduced into London streets. What we wanted was something that would wash. The rough surface of stocks or Suffolk facing bricks caught the blacks in the London atmosphere, and gradually got dark and dull. But a perfectly hard face was washed clean by every shower. To return to the bricks in the London market: we had fire-bricks made of fireclay, and almost vitrified and capable of standing intense heat. These were used for lining furnaces, ovens, flues, &c. Then we had almost, if not quite, as refractory a material in Staffordshire blue brick used,—in various forms,—for paving channels, jambs of archways, &c. There were also small bricks called clinkers, chiefly used for stable-paving. Dutch clinkers, formerly imported largely from Holland, were small, rough bricks laid on edge, and affording a good foothold for the horse. Adamantine clinkers, made of gault clay, were much used; they should have chamfered edges, otherwise they made too smooth a floor for a stable. Many other varieties were obtainable in London, and were more or less used, but these were the most prominent. In many parts of England special varieties of brick were to be found, and every here and there one met with a good brickmaker who was able to produce good moulded or embossed or ornamental bricks, such as those which were supplied years ago by Mr. Gunton, and more recently by Mr. Brown, both of Norwich, or by Mr. Cooper, of Maidenhead. It was of importance to those whose business it was to look after or engage in building operations, that they should early learn what to look out for in each material. He (the lecturer) therefore made no apology for trying to put before his hearers the points of a good brick, and in so doing he should partly quote from a memorandum published now a good many years ago by the Manchester Society of Architects. A good brick was uniform in size; standard, 9 by  $4\frac{1}{2}$  by 2 $\frac{1}{2}$ ; weight about 7 lb. each, = 110 lb. per foot cube; was rectangular, true faced, but only one end and one side need be smooth, had no print or sinking on either face, but a hollow on one or both beds. When saturated with water, a brick should not absorb more than 20 per cent. of its own weight of water, should absorb it reluctantly, and part with it freely at ordinary temperatures. It should be uniformly burnt, should be sound, free from cracks, flaws, stones, lumps of any kind, but especially lumps of lime; should be of a good colour for its sort (whether red, yellow, or white), should have a metallic clang when two bricks were struck together; when broken should be sound right through; should be tough and pesty in texture, not granular; and should require repeated blows to break it rather than one hard blow (such bricks would withstand cartage and handling best).

So much for bricks. To make brickwork, however, another ingredient was required, namely, mortar or cement. All mortars, and, in fact, all the cementing materials used (except bituminous ones) in bricklaying had lime as their base, and depended upon the setting quality of quicklime, which had to be mixed with sand or some suitable substitute for it, to make mortars. Limes and cements were far too wide a subject to be dealt with as part of an evening's lecture on another topic, and no doubt they would hereafter form the subject of a lecture or lectures. Ordinary brickwork might be divided into brickwork in mortar and in cement, but there were many qualities of mortar and several sorts of cement. Mortar made with what were called fat or rich limes,—that was to say, nearly pure limes, such as was got by calcining marble or pure chalk, set slowly, with difficulty, and was rarely tenacious. Burnt clay or brick reduced to powder improved

the setting of such lime, especially if the two materials were calcined together; so would an admixture of cement. Mortar made with what was known as slightly hydraulic lime,—that was to say, lime containing a small proportion of clay, such as the grey-stone lime of Dorking, Merstham, and that neighbourhood, set well, and was tenacious and strong. Mortar made with hydraulic lime,—that was to say, lime with a considerable admixture of clay, such as the lias lime,—set under water or in contact with wet earth. It was best to use that lime ground to powder, and not to mix so much sand with it as was used with stone lime. A sort of mortar called selenitic mortar, the invention of the late General Scott, had been made use of in many of the buildings of the School Board for London, and was first employed on a large scale in the erection of the Albert Hall. Its peculiarity consisted in the addition of a small dose of plaster of Paris (sulphate of lime) very carefully introduced, and intimately mixed. The result was that the mortar so made set rapidly, and was very hard. It was claimed that a larger proportion of sand could be used with selenitic than with ordinary lime, thus counterbalancing the extra expense occasioned by royalty under the patent, and by the special care required in mixing. When a limestone contained from 20 to 40 per cent. of clay, it became what was called a cement, and its behaviour was different from that of limestones with less clay. Brickwork in mortar would always settle and compress to some extent. Not so brickwork in cement, which occasionally expanded, but was never to be compressed. That quality, and the rapid setting, tenacity, and strength of brickwork in cement made it a most valuable material to use in those buildings or parts of a building where great steadiness and strength were wanted, and in the sewerage and dock work where there was water to contend with. A good many cements made from natural stones used to be employed, such as Medina, Harwich, Atkinson's, or Roman cement. The last named was the only one which was now much employed, except locally. It had the quality of setting with exceptional rapidity, and was on that account sometimes the best material to employ; but for almost every purpose the artificial compound known as Portland cement was preferable. Portland cement was made largely near Rochester. Its materials were simple and cheap. They might, without much departure from the truth, be said to be Thames mud and chalk; but the process of manufacture required care and thoroughness. The article supplied, when of the best quality, had great strength, and was quick-setting, and was far better than what was manufactured from stones in which the ingredients existed in a state of nature. In England we slaked our lime and made use of it while it was fresh; but in Italy and parts of France it was customary to slake the lime long before it was wanted, and to deposit it in a pit and cover it up with earth. In that condition it was left for months,—in Italy for a year,—and when taken out it was still, but still a pasty substance. It was beaten, and more water added, and it was then made into mortar with sand. It was claimed for mortar made in that way that it was exceptionally strong.

Now that he had considered bricks and partly considered mortar, it remained to pay some attention to brickwork. The simplest and most familiar work for a bricklayer to do was to build a wall. In doing that his object should be to make it as stout as possible for the thickness, and that stoutness could only be obtained by interlacing the bricks. If they were simply laid on the top of each other the wall would be no more than a row of disconnected piles of bricks liable to tumble down. When the whole were so adjusted that throughout the entire wall the joints in one course should rest on solid bricks and should be covered by solid bricks again,—in short, when the whole should break joint,—then the wall was said to be properly bonded, and had as much stability given to it as it could possibly possess. There were two systems of bonding in use in London, known as "English bond" and "Flemish bond." English bond was the method which we found followed in ancient brickwork in this country. In that system a course of bricks was laid across the wall, showing their heads at the surface, hence called "headers," and next above came a course of bricks stretching lengthways of the wall, called "stretchers," and so on alternately.

With the Dutch fashions came in Flemish bond, in which, in each course, a header and a stretcher alternated. In either case, at the corners, a quarter-brick called a closer has to be used in each alternate course to complete the breaking joint. There was not much to choose between these methods where the walls were only one brick thick; but where they were thicker the English bond had a decided advantage, for in walls built in Flemish bond of one and a half brick thickness or more there must be a few broken bricks, or bats, and there was a strong temptation to make use of many. If that took place, the wall was unsound. Many of the failings of brickwork in London houses arose from the external walls, where they were  $1\frac{1}{2}$  brick thick, being virtually in two skins; the inner 9 in. did the whole of the work of supporting floors and roof, and when it began to fail, the outer face bulged off like a large blister. He had known cases where that had occurred, and where there was no header brick for yards, so that one could pass a 5 ft. rod into the space between the two skins and turn it about. That was rather less easy to accomplish with English bond, and there were other advantages in the use of that bond which made it decidedly preferable, and it was now coming back into very general use. There were some odd varieties of bond, such as garden-bond and chimney-bond; but of these he only wished to draw attention to what was called cross-bond. The name was not quite a happy one. Diagonal-bond was hardly better. The thing itself was to be often met with on the Continent, and it was almost unknown here; but it would be worth introducing, as the effect of it was very good. French cross bond, otherwise diagonal bond (*liaison en croix*), was English bond, but with the peculiarity that in every fourth course one header was made use of in the stretcher course at the quoin. The result was that the stretchers broke joint with each other, and all the joints ranged themselves in diagonal lines, and if in any part of the work headers of a different brick were introduced, the appearance of a cross was at once brought out; and even without that, the diagonal arrangement of joints was very perceptible and pleasing. The lecturer next entered in detail into a description of the many other kinds of work which the bricklayer has to do, such as the formation of fireplaces, flues, and chimneys, and the execution of underpinning, &c. He described very fully the methods to be observed in the construction of arches, treated of the question of strength of brickwork, and, in conclusion, enumerated some of the best specimens of modern brickwork produced by architects and engineers.

The concluding lecture of the series will be given on Wednesday evening next, when Professor A. H. Church, M.A., will discourse of "Wood: its Chemistry, its Decay, and its Preservation."

#### ARCHITECTURAL SOCIETIES.

*Edinburgh Architectural Association.*—The usual fortnightly meeting of this Association was held in the Professional Hall, George-street, last week, when Mr. Scott Dalgleish read a paper on "Trondhjem Cathedral, with special reference to its Restoration." After sketching the rise of the ancient capital of Norway, Trondhjem,—in German Drontheim, that is, Throne-home,—the paper referred to the career of St. Olaf, to whom the cathedral is dedicated. Both the town and the church had strong claims on the regard of Scotsmen, seeing that for several centuries,—from the middle of the ninth till the very close of the fifteenth,—the Bishops and Archbishops of Trondhjem were the ecclesiastical superiors of the Bishops of Orkney and of the Bishops of Sodor and Man. The striking fact was that the ecclesiastical supremacy continued for two hundred years after the civil jurisdiction of the kings of Norway over the Scottish Islands had been given up. The fame of St. Olaf, which yearly attracted many pilgrims to his shrine, caused the extension of the town, and led to the erection of the cathedral. The building was begun by Olaf III., who reigned from 1066 to 1093, and who founded the bishopric of Trondhjem. His church corresponded with the choir and the chancel of the present cathedral. The transepts and the chapter-house were the work of Eystein, the third Archbishop, who ruled from 1158 to 1188. The style of archi-

teature down to that date was the Romanesque. Eystein's successors, between 1188 and 1248, rebuilt the whole of the eastern part of the church in the English Pointed style. That accounted for the mingling of Romanesque with Early English features, which was the most noteworthy fact in the architectural character of the edifice. The fourth and last period in the history of the original building dated from 1248, when the nave was begun by Archbishop Sigurd. Before the close of the thirteenth century the completed church must have stood forth in all its splendour. Its period of decadence followed quickly on its completion. It was destroyed by fire in 1328, and on four other occasions between that year and 1719 it suffered from "the devouring element." It suffered still more from the Reformers who committed assault and battery upon it in their efforts to adapt it as a place of Protestant worship. At the beginning of the present century, the nave was a roofless ruin; and the transepts were fitted up with galleries and wooden pews as a parish church; and in the other parts of the building the delicately-carved stone-work was obscured by plaster, paint, and wooden partitions. The towers, the statues, the altars, the rose-window in the western gable, were gone. The present restorations were begun in 1869, and already good progress has been made, but so elaborate was the scale on which the work had been projected that it was expected to extend over other thirty or forty years. The chief features in the restoration of the octagonal choir, of the chapter-house, and of the chancel, were described in detail, and were illustrated by beautiful photographs. The restoration was being carried out on the soundest principles, the old models, both in plan and in detailed ornamentation, being strictly followed. It had been undertaken as a national enterprise, and its cost was estimated at not less than 250,000*l.*, drawn partly from Government grants and partly from local and private contributions. The present grant amounted to 2,500*l.* a year, while a sum of 1,250*l.* a year was drawn from the profit of the Savings Bank of Tromsø. The Norwegians were, on the whole, a poor people, and that they should voluntarily tax themselves to that extent for the erection of a national memorial, was, the lecturer remarked, a noble testimony to their patriotic feeling, and to the depth and correctness of their devotional feeling.—On Saturday afternoon last, the members of the Association, to the number of about eighty, visited the new Municipal Buildings at Glasgow, which are now nearing completion. The visitors were conducted over the buildings by the architect, Mr. W. Young. We gave a view of the principal elevation of the buildings in the *Builder* for Nov. 11, 1882.

*Glasgow Institute of Architects.*—The annual dinner of the Glasgow Institute of Architects took place on the 26th ult. in the Royal Hotel, when a company of about forty sat down. The chairman was Mr. David Thomson, and the croquiers Messrs. W. F. Salmon and James Sellars. The President and Council of the Edinburgh Architectural Association; the President, Vice-President, and Secretary of the Glasgow Architectural Association; Mr. William Young, architect, London; and other gentlemen, were present as guests. In proposing "The Glasgow Institute of Architects," the chairman made an interesting speech, calling attention to some of the subjects the Institute had had under consideration during the past session. The toast of "The Lord Provost, Magistrates, and Town Council" was proposed by Mr. William MacLean, and replied to by Mr. W. F. Salmon; "Kindred Societies" was proposed by Mr. J. J. Burnet, and responded to by Mr. Blain, President of the Edinburgh Architectural Association, and Mr. M'Nab, President of the Glasgow Architectural Association; "The Allied Arts" was given by Mr. T. W. Stevenson, R.S.A., sculptor. Mr. Young's health was proposed by Mr. David MacGibbon, of Edinburgh, and responded to by that gentleman.

*Glasgow Architectural Association.*—The last of the present series of lectures was delivered on the 23rd ult. by Mr. T. L. Watson, F.R.I.B.A., his subject being "The Crypt of Glasgow Cathedral." The President, Mr. M'Nab, occupied the chair. After some introductory remarks on the unique position among the crypts of British cathedrals held by the subject of his paper, the vaulting ribs, as per-

haps the most interesting feature, were considered in detail. The lecturer congratulated the members on their intention of fully measuring and delineating the whole cathedral. At the conclusion, after some remarks from Mr. Gildard, a vote of thanks was awarded to Mr. Watson.

*Manchester Architectural Association.*—At a meeting held at the Diocesan Buildings last week, Mr. Frank Mee, Vice-President, in the chair, the following officers were elected for the session 1887-1888:—President, Mr. A. H. Davier-Colley, A.R.I.B.A.; Vice-Presidents, Mr. Frank Mee and Mr. F. R. L. Edwards; Committee, Messrs. F. W. Ward, P. E. Barker, T. Chadwick, A.R.I.B.A., E. Hewitt, A.R.I.B.A., J. H. Woodhouse, W. Perry, H. E. Stelfox, W. M. Law, and J. Horsfall; Treasurer, Mr. A. H. Davier-Colley; Librarian, Mr. J. S. Hodgson; Registrar, Mr. Frank Mee; Hon. Sec., Mr. J. D. Mould. Mr. Stelfox then read a paper entitled "The Work of the Association," in which he criticised its doings and questioned if it was fulfilling to the best of its abilities the objects for which the Association was formed. A discussion followed, in which the following members took part:—Messrs. F. W. Ward, R. Booth, A. Leresche, J. A. Coe, H. Dolphin, and the Chairman.

#### CASE UNDER THE METROPOLIS MANAGEMENT AND BUILDING ACTS, 1882.

At the Lambeth Police Court, Mr. J. P. Smith, builder, of Coleman-road, Camberwell, was summoned by the Metropolitan Board of Works for that, at Dowlas-street, Camberwell, he did fail to fulfil the conditions annexed to the consent of the Board to the erection of houses in the said street, and dated the 27th day of March, 1882, by not erecting the houses in conformity with the letter of application, and as shown on the plan accompanying it, contrary to 45 Vic. c. 14, s. 9.

Mr. Thomas Burton, solicitor, appeared for the Board, and Mr. Forrest Fulton, M.P., and Mr. Bourcier for the defendant.

Mr. Burton stated the facts were as follow. The defendant had applied to the Board for their consent to the erection of houses in Dowlas-street, beyond the general line of buildings in that street. After the consent had been given, he formed a new street, called Rainbow-street, two of the houses of which had side windows in that street, but the front doors were in Dowlas-street; and this he had done in total disregard of the plan, as assented to by the Board as to Dowlas-street. He called Mr. Millward, the surveyor of the Board, who proved these facts.

Mr. Fulton, for the defence, said he relied upon the De Vere Gardens case, as being a case on all fours with the present one, and asked for the summons to be dismissed, with cost.

Mr. Chance, the magistrate, said he would consider the case of the De Vere Gardens, and adjourned the matter for that purpose, but he did not think it applied.

Upon the adjourned hearing, Mr. Chance, in giving judgment, said the De Vere Gardens case did not apply to the present case, and he should find the defendant 40*s.*, and 8*s.* costs.

#### "A BOOK ON TIMBER WANTED."

SIR,—Referring to the letter in your last number [p. 484] on this subject, it may be as well to remind your readers of "Lastett on Timber and Timber Trees" (Macmillan).<sup>\*</sup> Of course, Barlow's work is well known. New books will add little to our knowledge without reliable experiments on timbers of the scantlings used in practice. That the constants derived from small scantlings are misleading, and therefore useless, may be readily demonstrated by comparing them with the actual breaking-weight of beams, as shown by any of the existing experiments on those of ordinary size. For instance (Clark), a sound red deal beam, 6 in. by 6 in. and 7 ft. 6 in. between the supports, broke with a weight in the centre of 65½ cwts.

Taking Hurst's formula, we have  $W = \frac{C b d^2}{L}$ , where C is stated to be 4 cwts.,  $b, d$ , breadth and depth in inches, and L length in feet. Result, 115.2 cwts.

Again, taking Barlow's figures:  $S = 1,200 \text{ lb.}$ ,  $\frac{4 \times 1,200}{12} = 37 \text{ cwts.}$

The division by 12 is consequent on length being taken in feet. Result, 103 cwts.

<sup>\*</sup> An admirable work, but not exactly the kind of book suggested in Mr. Aitchison's letter.—En.

It is somewhat surprising that the handbooks continue to give these high constants, as it is perfectly well known that those derived from selected pieces 1 in. or 2 in. square are entirely inaccurate for larger scantlings, even of the best timber. In Molesworth, twenty-first edition, p. 122, K is given equal to 14 cwts. for deal; and as K is the same co-efficient as Barlow's S,  $4K = 56 \text{ cwts.}$ , which, divided by 12 (the length here being in inches), gives 4½ cwts., yielding a still higher result.

Now Stoney says "The few experiments on large timber indicate that the values of S must be reduced to very little more than half those given in the table when applied to practices of large size, such as occur in ordinary practice." Again, Col. Seddon, "Builder's Work," Appendix 3, says,—"I have discarded all the records of experiments made on pieces under 2 in. square as not only untrustworthy, but actually misleading."

A few words may not be deemed superfluous on the various moduli in use. One is obtained from the breaking-weight of a beam 1 in. square and 12 in. long, loaded in the middle and supported at each end. Let us call this  $m$ . Another is the "modulus of rupture"  $M$  or  $f$ . This is the case of a beam loaded as above  $= \frac{3WL}{2bd}$  (using the symbol  $\omega$  for area of cross section or  $bd$ ). The first modulus  $m$  is  $\frac{1}{3}$  of  $M$  or  $f$ , the modulus of rupture.

Another is  $S$ , the "coefficient of rupture," which is obtained from the breaking weight of a cantilever 1 in. square and 1 in. projection. This applied to a beam loaded in the middle and supported at each end  $= \frac{WL}{4bd}$

The constant C being equal to 4 S for a beam as above, we have to sum up,

$$C = 4S = \frac{2}{3}f = 12m.$$

If the example we commenced with be taken, it will be found that C is from experiment 29 cwts., the length being taken in inches, or in feet  $\frac{29}{12} = 2\frac{3}{4}$  cwts. in lieu of 3.57, 4, or 4½ cwts.

The discrepancy in the constants for small and large scantlings is doubtless due to the fact that wood, owing to the existence of knots and the manner of its growth, is not isotropic. With respect to deflection, that of the 6 in. by 6 in. beam was 0.1 in. for every 6 C wt.

The deflection of a piece of spruce 4 in. by 12 in. and 17 ft. span was (according to another author) 0.13 in. per 1,000 load. The further consideration of this, however, would involve another modulus, that of elasticity.

WILLIAM DUBOON.

#### KITCHEN BOILER EXPLOSIONS AND SAFETY VALVES.

SIR,—I noticed some few weeks ago that in reporting one of these explosions you strongly advocated the use of safety-valves as preventives. I think it would be useful to your readers if you and some of your practical subscribers would give considered opinions on the matter at greater length. My remarks are confined, of course, to close boilers, each forming part of what is called "low pressure" hot-water circulation, otherwise hot-water circulation with an open relief pipe or open tank at the highest point.

I presume that the best is a "dead-weight" safety valve, and that it should be fixed in a position where it may be free from the corroding action of fire or smoke, and not liable to contact with cooking utensils, or other accidental interference; if so, it should not be fixed on the boiler itself, but as near to it as possible. A fixing to project from the front of the chimney-breast over the mantel-shelf, or from the side of one of the projecting jambs is, therefore, indicated as suitable. I also conceive that it is not good to fix on the flow or return pipes, as these so frequently have their internal diameters reduced by the lime firing from hard waters, so that a separate short non-circulating pipe should be taken from the boiler direct to the safety-valve.

Now, having got our safety-valve, let us see what are the objections to it. If it be not looked to, lifted, and cleaned at proper intervals of time, it is likely to set fast and be of no use; but if it is lifted or the weights raised for this purpose, or by reason of meddling curiosity by a servant ignorant of its action, the servant will be instantly scalded. On the other hand, if it be covered and locked up, the probability is that no one will attend to it.

But what is the use of the safety-valve at all? The most common cause of these explosions is the irruption of water into a highly-heated empty boiler, the consequence of which is that the boiler, suddenly cooling, contracts unequally and ruptures,

at the same time that an enormous volume of steam is evolved, which the open circulation pipes and the safety-valve cannot, either separately or combined, allow to escape quickly enough to prevent its expansive force from bursting the pieces of the boiler in every direction.

The commonest case is, that the supply of water is stopped by the freezing of the return, or supply, pipe; the boiler then becomes emptied either by drawing off the water or by evaporation by means of the fire, or both. The boiler gets red hot, the supply-pipe thaws, and the water suddenly rushes in; then the explosion, which no safety-valve will prevent.

Another case is that the water companies in some districts frequently shut off the supply at night, and if it be turned on again when the boiler is empty and red-hot, then, of course, a similar explosion.

Yet another case. When houses become untenanted, the water companies cut off the supply altogether. In one such case, when the house was let again, a plumber ("expert," no registered plumbers then) was employed to do some work in the house, and to meet the company's men, who were to restore the connexion of house supply-pipe with the company's main. The plumber, arriving early, made himself comfortable by lighting a fire in the kitchen range. Bricklayers had been before him, and finding no other water for their work in the house, drew off what there was in the boiler, and so emptied it. Mr. Plumber then makes it red hot; the water company's men next connect the pipe, and turn on the water whilst the plumber is in the kitchen, boiler explodes, and he pays with his life the penalty of either his ignorance or his thoughtlessness.

I take it that a safety-valve is good to put on, not to prevent an explosion, but only so that if an explosion does occur, it can be pointed out to the corner as evidence that every precaution had been taken. But the risk of scalding from intermeddling with it is sufficient, I think, to outweigh any possible advantage.

Note also that safety-valves do not prevent explosion of engine steam-boilers, when they are allowed to get hot from absence of water, and then are suddenly filled with that fluid.

Fusible plugs, thin copper discs, and safety draw-off cocks are all equally ineffectual against the kind of explosion above described, and they sometimes awkwardly act at improper times, and flood the house with hot water.

The precautions to be taken to prevent explosions are (1) never to have a draw-off tap in the boiler; the lowest draw-off should be on one of the circulation pipes at a height above the level of the top of the boiler. When the draw-off tap is thus fixed, the boiler cannot be readily emptied, and whilst there is water in the boiler, it cannot get red hot. [This does not, of course, prevent the fixing of a special emptying pipe, with screwed nipple or cap for use only when the apparatus is under repair, or is being altered.] (2) Immediately it is discovered that there is a stoppage of cold or hot water supply in the house, draw the fire, and discontinue to draw water from any of the hot-water cocks. (3) Before resuming the fire in the boiler range, see that the cold-water supply is restored, and that the boiler and pipes and tanks of the hot-water system are full of water.

ROBERT WISTON.

**The Assistant Architect, Metropolitan Board of Works.**—At the meeting of the Metropolitan Board of Works on the 25th ult., the Works and General Purposes Committee presented a report as to increases in salaries in the Architect's Department, their first recommendation being that the salary of Mr. John Hebb, the Assistant Architect, be increased from 600*l.* to 700*l.* a year. Mr. Edwards, the deputy chairman of the Board, moved the adoption of the recommendations of the Committee, whereupon Mr. T. W. Williams moved that the recommendation re Mr. Hebb be referred back for further consideration, as it had been somewhat sprung upon the Board. Mr. Shepherd seconded this amendment. Mr. Lindsay observed that, in agreeing to the increase to Mr. Hebb, he had been animated with a feeling that Mr. Hebb had some claim on the Board (hear, hear). Mr. J. Jones thought the matter should go back. These were not the times to give well-paid officers an increase of salary (laughter). Mr. Jolly said he hoped the Committee's recommendation would be agreed to, and Mr. Selway said he thought it only fair that Mr. Hebb should be recognised in the manner proposed by the Committee. The amendment was negatived by twenty to eleven, and the Committee's recommendations were agreed to. At the same meeting of the Board it was resolved that Mr. Hebb and Mr. F. W. Goddard be paid 105*l.* each for additional duties discharged by them between the date of the death of Mr. Vulliamy, the late Superintending Architect, and the appointment of his successor, Mr. Blashill.

#### PROVINCIAL NEWS.

**Plymouth.**—At a recent meeting of the Plymouth Town Council, it was resolved to complete the southern block of the new market buildings before proceeding with any part of the northern block, so that the proposed widening of Market-place and East-street may be carried out, and thus obviate the necessity for making a carriage-way through the market from Market-place to Cornwall-street. At the same meeting of the Council it was resolved to call in Mr. Baldwin Latham to advise the Council on the sewerage scheme for the Western District, and on the other drainage requirements of the town.

**Ramsgate.**—It is proposed to make a new "Jubilee" road to connect the two cliffs in Ramsgate, and the President of the Board of Trade (Lord Stanley), together with Mr. H. G. Calcraft (Permanent Secretary), and Mr. C. Cecil Trevor (Assistant Secretary, Harbour Department), and other gentlemen, visited Ramsgate a few days ago in reference to the proposed improvement in the approaches to the Cliffs and Sands, which, it is asserted, will interfere largely with the harbour property if carried out. The Mayor (Alderman W. F. Pygott) and Councillor Pearce (Chairman of the Sands and Cliff Approaches Committee), on behalf of the Town Council, and Capt. Jones (Harbour Master), Mr. G. Keyto (Harbour Engineer), Mr. W. A. Hubbard (Town Clerk), and Mr. W. C. Barley (Borough Surveyor), were also in attendance. The interview was of a purely private character.

**Southport.**—On the 24th ult. Major-General Hutchinson attended at Southport for the purpose of inspecting, on behalf of the Board of Trade, the new tramways constructed by the Birkdale and Southport Tramways Company, extending their system to Birkdale South, in substitution of the present omnibus service. The whole of the works have been carried out in accordance with the plans, &c., prepared by and under the superintendence of the company's engineer, Mr. C. A. Atkinson, of Liverpool, by Mr. William Winward, contractor, of Wigan. The tramway has been constructed in a substantial manner with concrete foundations, cast-iron sleepers, steel rails and fastenings, best Haslingden paving grouted in asphalt, the paving sets being specially dressed upon the ground, and the roadway for the whole length of the tramways widened and repaved. The district served by this extension is rapidly increasing in population, building operations being very brisk at present, according to the *Liverpool Daily Post*.

#### CHURCH-BUILDING NEWS.

**Bamber Bridge (near Preston).**—St. Saviour's Church, Bamber Bridge, near Preston, has lately been consecrated by the Bishop of Manchester, after enlargement. The church was built in 1837. Plans were made in 1876 for an extension by Mr. Myres, but the project was postponed until 1881, when the matter was again taken up, and in May, 1886, the tender submitted by Mr. Charles Walker, contractor, of Preston, was accepted, amounting to 2,621*l.*, but the total outlay, including fittings and all contracts, amounts to close upon 3,000*l.* The additions comprise a spacious chancel, with circular spire, lighted by nine windows; north and south transepts; a spacious organ-chamber on the north side; and a vestry on the south. The chancel is fitted up with roomy choir-stalls in selected pitch-pine, and the floors are laid with Minton & Co.'s encaustic tiles. The roof is circular and open-timbered. The old nave roof has been boarded diagonally. The nave and transepts have been fitted up with new pitch-pine open benches, having easy sloping backs. A new baptistry has been formed under the present tower and spire at the west end. The church is well lighted and ventilated, and the present accommodation is for 791 persons. The whole of the works have been carried out under the supervision of Mr. T. Harrison Myres, A.R.I.B.A. (Messrs. Myres, Veevers, & Myres), Preston, Mr. John Yates, of Bamber Bridge, acting as clerk of works.

**Croydon.**—It is proposed to renovate the interior of Christ Church, Broad Green, Croydon, and to carry out a general scheme of decoration from designs by Mr. C. A. Monday, A.R.I.B.A.

**Gnaton (Devon).**—The *Western Morning News*

reports that under the title of St. Mary's, Gnaton, a chapel adjoining Gnaton Hall, the residence of Mr. Michael Williams, was opened on the 24th ult. by the Bishop of the diocese. It is really a private chapel attached to the mansion, but wishing to make it as useful as possible to his neighbours, who, like himself, are some two miles from the parish church of Newton Ferrers, Mr. Williams has kindly made a separate public approach to it, and opened its services to all who wish to attend them. Mr. Geo. Fellowes Prynce is the architect of the chapel, which is erected on the north side of the hall. The roof is covered with red Broseley tiles, and surmounted by a bell turret. The walls are of a local stone of a warm bluish tint from Mr. Williams's own quarries, the dressings being, in the exterior, of Box Ground, and in the interior of Corsham Down stone. The contractors for the building were Messrs. Laphorn & Goad, of Plymouth; the carved wood-work was done by Messrs. Wippell & Co., of Exeter; the brass and iron work came from Messrs. Singer & Co., of Frome; the stained-glass windows are by Messrs. Clayton & Bell, of London; the marble work is by Messrs. J. & E. Goad, of the Phoenix Works, Plymouth (who, in regard to the Kitley marble dado, which runs all round the interior of the chapel, were joined by Mr. Gully, of Yealton); and the decoration of the roof was carried out by Messrs. Kingcome, of Yealton.

**Hoghton.**—Through the liberality of Sir Charles de Hoghton, Bart., who has rebuilt the tower from designs by Mr. Birtwistle, architect, of Blackburn, the ancient parish church of Hoghton has been presented with a new clock, specially made by Mr. J. W. Benson, of Ludgate-hill. It has gun-metal wheels, steel pinions, and Graham's dead-beat escapement, shows time on two copper dials, 5 ft. 6 in. diameter, strikes the hours on a tenor bell of 13 cwt., and chimes the celebrated Cambridge quarters on four smaller bells.

#### The Student's Column.

#### FIELD WORK AND INSTRUMENTS.—XIV.

##### Surveying Instruments.

##### IX.—THE THEODOLITE (continued).

**T**he transit instrument, the horizontal axis forms the centre line of the trunnions attached to the telescope, as shown in fig. 4. The trunnions are shouldered down at their outer ends, and are connected at their inner ends to the telescope by means of a collar-piece fixed round the outer tube at or near its centre. The axis is supported and movable upon V-shaped sockets or angular bearings, technically termed *Ys*, in which it is held by movable clips, consisting of thin flat brass plates, attached to one branch of the *V* by a fixed screw, and secured to the other branch by a small milled-head screw, as shown in figs. 39 and 40. In Colonel Everest's theodolite (figs. 41 to 44) the telescope is permanently fixed to its horizontal axis as in a transit instrument (figs. 39 and 40). The supporting frames are made low for sake of compactness, but the telescope can be reversed end for end by unfastening the clip pieces and lifting the horizontal axis out of its bearings. There are two opposite sectors graduated in degrees from zero to 50°, as shown in fig. 41, instead of a complete vertical circle, as in figs. 39 and 40. These sectors traverse with the telescope, as indicated by the dotted lines in fig. 41, and are placed so as to allow the telescope to traverse within an angle of about 45° above or below a horizontal line, as in a plain or *Y* theodolite (fig. 35). The long spirit level which was seen in figs. 3 and 34 to be attached to the telescope in both the plain and the transit types of instruments, is in an Everest instrument attached to the index bar. The index bar carries a vernier at each end, by means of which subdivisions of a degree in measuring vertical angles can be recorded. Instead of the two spirit levels marked *Q* and *T* in figs. 22 and 38, there is only one spirit level, marked *Q*, in fig. 42, which is fixed parallel to the horizontal axis of the telescope, as shown in fig. 44, the spirit level marked *T* in figs. 41 and 42 being substituted for the spirit level *T* in figs. 22 and 38.

In comparing the detail of these instruments the reader is recommended to study their illustration with the aid of a magnifying glass, as

| Birmingham Architectural Association.—Mr. H. H. McConnell will read a paper entitled "Notes on a Tour in Germany." 7.30 p.m.                                        |  |
| WEDNESDAY, APRIL 6.                                                                                                                                                 |  |
| Carpenters' Hall, London Wall (Free Lectures to Building Artisans).—Professor A. H. Church, M.A., on "Wood, its Chemistry, its Decay, and its Preservation." 8 p.m. |  |
| Parkes Museum of Hygiene.—Mr. J. Bailey Denton, M.Inst.C.E., on "Metropolitan Sewage Disposal." 5 p.m.                                                              |  |
| British Archaeological Association.—(1) Dr. Hoopell on "Discoveries at Vinovia." (2) Mr. C. Lysons on "The White Ladies of Brewod." 8 p.m.                          |  |
| SATURDAY, APRIL 9.                                                                                                                                                  |  |
| Edinburgh Architectural Association.—Visit to Duntarvie Castle and Niddry Castle.                                                                                   |  |

## Miscellanea.

**School Hygiene.**—A correspondent sends us his own experience of the sanitary condition of private schools, which is, no doubt, shared by others who have directed attention to this subject. He sent his son to a private day-school, where the drainage and ventilation were defective, and an attack of gastric fever resulted in his removal to another school, where, again, the house was not free from unwholesome smells. A complaint to the schoolmaster was met with the request that the boy should be withdrawn. A third school was found, but this had the important disadvantage of being so constructed that the pupils were required to work in shadow while they faced the full glare of windows. Our correspondent pleads for some proper control over these institutions; the matter is, indeed, very much in his own hands and those of other parents. If schoolmasters found that the guardians of children required satisfactory evidence of the hygienic condition of the schools to which they propose to send their children, there is but little doubt the necessary improvements would be effected. It is not probable the Legislature would consider that school-houses should be dealt with differently from dwelling-houses; nor, indeed, if sanitary authorities were endowed with special powers for these institutions, can it be expected they would be adequately exercised. It is, therefore, desirable that efforts should be made to induce parents to recognise the importance to their children of health conditions, and we might suggest that schoolmasters would be consulting their own interests in meeting the reasonable requirements of those who entrust their children to their care.—*Lancet.*

**The American Exhibition Buildings at Earl's Court, Kensington.**—The works on the buildings of the American Exhibition of the Arts, Industries, Manufactures, and Products of the United States, which are being erected on a large area of land, nearly twenty-three acres in extent, between the Earl's Court and West Brompton stations of the Metropolitan District Railway, are being very actively proceeded with, upwards of one thousand artisans and labourers being at present engaged on the works. For the varied purposes of the Exhibition, several buildings, distinct from each other, are in course of erection. The main building is situated at the extreme western boundary of the site, running northwards in the direction of Earl's Court from its principal frontage at West Brompton, near the West Brompton station, and approached from Lillie Bridge-road, close to the locomotive works of the District Railway. This building is 1,230 ft. long and 120 ft. wide, covering an area of upwards of 125,000 ft. Its elevation in the Lillie Bridge-road is faced with Portland cement. The chief business offices in connexion with the exhibition are on the east and west sides of the frontage. Immediately to the west are separate buildings, one forming a dining-room, 250 ft. long and 90 ft. wide, and the other an art gallery, 160 ft. by 80 ft. The whole of these three buildings are fast approaching completion. The height of the main building to the apex of its angular roof, which is being covered in with corrugated iron and glass (the sides also being in corrugated iron), is upwards of 60 ft. The flooring is considerably advanced towards completion, and it is expected that this main section of the exhibition buildings will be ready for the reception of exhibits in about a fortnight. Amongst the numerous other structures which are in progress are several pavilions and sheds at different points on the ground, and the attractions of the exhibition will likewise include a theatre on the north-west side of the ground. On the north-east side, between four and five acres have been appropriated as an open air encampment, which is intended to be utilised as a hunting-ground, where scenes illustrative of the "wild West" and prairie life will be given. On the south side of the encampment an immense grand stand has been erected. The ground in front of the stand will be formed into a racecourse over a third of a mile in length. This encampment fills a triangular space, having on one side the West London Railway from West Brompton to Addison-road, and on the other sides of the triangle the District line from Earl's Court to Hammersmith, and the District branch from Earl's Court to West Brompton. The encampment, as well as the exhibition grounds generally, will be approached from Earl's Court station, in addition to the Lillie Bridge-road approach, by four bridges at different points on the District line. It may be added that a considerable portion of the space is being formed into colonnades, divided, in American fashion, into "First-street," and so on in succession up to "Tenth-street." The works and buildings have been designed by Mr. O'Driscoll, who is acting as engineer to the Exhibition Commissioners, and are being carried out by the Commissioners' own workmen.

**Crane's Ventilating Warming Coils.**—We have had an opportunity of seeing some of these coils in action, at the Tottenham-road Board Schools, Kingsland. They appear to do their work of supplying the rooms with warmed fresh air most efficiently, and even on a cold day (such as the one when our visit was made) rooms containing a large number of children are comfortably warm, but free from "stiffness." Each coil consists of a series of upright columns, connected with top and bottom boxes, through which the water or steam circulates. Inside of each column is a 2 in. pipe with both ends open. An opening through the wall, next the heater, with air grating, is made to the under side to admit fresh air, which is caused to rise by the heat of the pipes through the inner tube, and being warmed on its way passes out of the top grating and thus enters the room. The room is thus supplied with clean warmed air. The apparatus is made by Mr. Robert Crane, of Stockwell Park-road. The coils are not unsightly, and need no casings or grilles.

**The Zolus Waterspray Ventilating Company** have removed to 124, High Holborn.

**Mitis Iron.**—The following particulars respecting the so-called mitis iron, the patent process for which was recently sold by M. Nordenfolt to an English Company, may be of interest. It was discovered by a Swedish engineer, Herr Witenström, and has for a year been subjected to various trials at Messrs. Faustman & Ostberg's Engineering Works, at Karlsvik, near Stockholm. Mitis iron castings the name being derived from the Latin word *mitis* "weak," "soft," is produced by the direct smelting of soft forged bar-iron, and possesses all the qualities of the latter. According to experiments carried out at the testing establishments of the *Järnkontor* (Iron Board), it has shown an absolute tensile strength of 1.5rd kilograms per square millimetre (fourteen tons per square inch), with a final elongation of 15 per cent. A variety of articles have been most successfully manufactured from this kind of iron at Karlsvik, as, for instance, carriage springs, tools of all kinds, agricultural implements, and even soles for boots, which are to be coated with india-rubber, ordered by an English firm for a South American army. The cost of articles manufactured from this kind of iron is about 50 per cent. higher than that of such made from ordinary cast-iron, but they are much cheaper than hand-forged goods, and in comparison with the former articles of mitis iron show far greater strength and toughness, and with the latter a better finish. Generally very little filing of the edges of mitis cast goods is required, and at Eskilstuna, the Sheffield of Sweden, mitis iron has even been used successfully as raw material in the manufacture of finer steel goods. The new method will doubtless be largely introduced into the Swedish works in preference to the old methods of reduction, and is also sure to affect the hand-forged iron and steel industry of that country.

**Paris Railway Exhibition, 1887.**—As has already been mentioned in our columns, the fiftieth anniversary of the introduction of railways into France will be celebrated by the Grand International Railway Jubilee Exhibition, to be held in Paris this year, under the patronage of the Ministry. We are informed that every description of railway plant will be represented, including the most recent improvements, which will illustrate, by comparison with obsolete material, the railway progress made in different countries. The grounds upon which the Exhibition will be held form part of the Bois de Vincennes, and will contain many attractive features, among which may be noticed representation of the Ports of Havre, New York, and Rio Janeiro, to be erected on the Lao Daumesnil, which is within the grounds. The latter are three miles and a half in circumference, and will be girt by a line illustrating the railway systems of different countries, a special feature being the stations and villages typical of each nationality, which will be placed along a line.

**An Iron House.**—A house built of iron has been sent from Hamburg to the Cameroons. It is stated to be very warm in the summer, and, therefore, cannot be said to be very suitable for hot climates; but, on the other hand, such iron houses are easily taken to pieces and put up where required, hence their advantage. Everything is done to reduce the heat, the walls of the upper stories being double, and the intervening space filled with a material bad for conducting heat, whilst the walls are coated with clay inside. The roof is covered with moid outside, which again in the hot season is covered with straw. A verandah runs, in Swiss style, all round the building, and the stairs to the upper stories are outside the house. The cost is very low, being only 40 marks per square metre of inhabited area.

**The Sanitary Registration of Buildings Bill.**—The Surveyors' Institution, the Association of Municipal and Sanitary Engineers and Surveyors, and the London Sanitary Protection Association, have appointed representatives to attend the Conference of Architectural Engineering, and Medical Institutions on the Sanitary Registration of Buildings Bill, 1887.

**Drying Bricks.**—We hear that Mr. James Brown, of Cannon-street, whose face and ornamental bricks are well known to many architects and builders, is about to put up a new brick drier, on the system of the Universal Cool Air Drying Company (Limited), whose process as applied to the drying of timber was described in our pages in October last.

A Useful Desk-book.—"The Architect and Contractor's Compendium, Specialist's Directory and Diary" (London: James Sears & Sons, Crane-court, Fleet-street) has lately been issued, under the editorship of Mr. John E. Sears, A.R.I.B.A. It is a very useful and handy publication for architects, builders, clerks of works, and foremen. It contains, besides an office diary, a synopsis of Building Acts and By-laws, legal and general information, and tables and memoranda. Without vouching for the accuracy of all this matter, we may say that, so far as we have been able to put it to the test, we have found it to be trustworthy. One important feature of the work is a directory of building materials, manufactures, and specialities, classified and indexed. This will be not the least useful part of the work, which is clearly printed and indexed. We hear that the second issue is now in preparation for publication in October next.

Hydraulic Lifts for the Colonies.—Messrs. R. Waygood & Co. are now making the hydraulic lifting plant for Messrs. W. Gardner & Co.'s Sydney premises. The plant will consist of one of Waygood's patent hydraulic balanced passenger lifts, three goods lifts, two 10-cwt. hoists, accumulator, pumps, and two Otto gas engines for working the latter. The same firm of engineers has just completed fixing a hydraulic passenger lift for the Victoria Coffee Palace Company, Melbourne, and are now erecting one of their hydraulic balanced passenger-lifts in Brisbane, Queensland.

The Excavations at Delphi.—The Daily News correspondent at Athens telegraphs:—The Chamber has ratified the convention with France respecting the excavations at Delphi. The terms of the convention are most liberal to Greece. All the objects excavated remain in the country. The French Government reserves for a definite period the sole right of publishing the inscriptions, photographs, &c. The modern village of Campi being built on the site to be excavated, the French Government agrees to compensate the inhabitants for the land or houses required.

METALS (continued). Table with columns for metal type, weight, and price per unit. Includes Yellow Metal, Lead, Pig, Spanish, English, common brands, Sheet, English, Spelter, Silesian, special, Ordinary brands, Tin, Straits, Australian, and English ingots.

OILS. Table with columns for oil type, weight, and price per unit. Includes Lined, Coconut, Cochin, Ceylon, Palm, Lagos, Rapeseed, English pale, brown, Cottonseed, refined, Tallow and Oleine, Lubricating, U.S., refined, Turpentine, American, in casks, Tar, Stockholm, and Archangel.

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS.

Epitome of Advertisements in this Number.

COMPETITIONS.

Table with columns: Nature of Work, By whom required, Premium, Designs to be delivered, Page. Example: Jubilee Clock Tower, Margate.

CONTRACTS.

Table with columns: Nature of Work, or Materials, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, Page. Includes Broken Granite, Broken Granite, Repair to Parapet Walls, Erection of Billiard-Room, Ladies' Swimming Bath, Alterations and Additions to Town Hall, Erection of Board Schools, Making-up and Paving Road, Sewage Works, &c., Re-building "New Market" House, Drainage Works, Cast-Iron Water Mains, Erection of Baths, Bournemouth, Repairs to Hospital Steward's House, Road Materials, Roads and Sewers, &c., Wrought-Iron Kitchens, Tar Paving, Restoration of Church, Clifford, Removal of Dust, Removal of Street Refuse by Barges, Polesworth Waterworks, Construction of Aqueduct, Detached Villa, Ashford, Concert Hall, &c., Bethnal Green.

PRICES CURRENT OF MATERIALS.

Table with columns: Material type, weight, and price per unit. Includes Timber (Greenheart, E.I., Segonia, U.S., Canada, Birch, Elm, Fir, Dantale, Oak, Canada, Pine, Canada red, Pine, Canada red, Yellow, Lath, Dantale, St. Petersburg, Waincoat, Riga, Odessa, crown, Dean, Finland, 2nd and 3rd, Riga, St. Petersburg, 1st yellow, White, Swedish, White Sea, Canada, Pine, 1st, 2nd, 3rd, Spruce, 1st, New Brunswick, &c., Battens, all kinds, Flooring, Boards, sq. 1 in. prepared, Second, Other qualities, Cedar, Birch's-eye, Honduras, &c., Australian, Mahogany, Cuba, St. Domingo, cargo average, Mahogany, Mexican, cargo av., Tobasco, Honduras, Maple, Bird's-eye, Rose, Rio, Bahia, Box, Turkey, St. Domingo, Porto Rico, Valbut, Italian, Metals (Box-Bar, Welsh, in London, in Wales, in St. Domingo, London, Sheets, single, in London, Hoops, Nail-roads, British, cake and ingot, Best selected, Sheets, strong, Chili, bars).

PUBLIC APPOINTMENTS.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in, Page. Includes Building Inspectors, Clerk of Works, Inspector of Nuisances.

TENDERS.

Table with columns: Tender name, amount, and other details. Includes BRIXTON (erecting new parochial rooms), CHELSEA (enlargement of the Sherbrooke-road School), CHELSEA (alterations to shop front at 16, King's-road, Chelsea), CHELSEA (erecting of Chelsea Conservative Club).

Table with columns: Tender name, amount, and other details. Includes CHILWORTH (erecting of a new vicarage at Chilworth, Ham), HORNCASTLE (formation of roads and sewers, Woodhall Spa), HURSTPIERPPOINT (erection of business premises, Mr. George Jupp), REW (construction of a new road and sewers on the New Gardens Station Estate).

**LEIGHTON BUZZARD**.—For stabling, &c., to Golden Bell Inn, Leighton Buzzard, for the Trustees of Duncombe's Charity. Mr. Frederick Gotto, architect, Leighton Buzzard.—

### The Musée Carnavalet, Paris.

N the middle of the Quartier du Marais, near the Place des Vosges, so picturesque with its red brick houses, there rises, No. 23, Rue Sévigné, a house as silent as a convent, whose melancholy walls still present, under the dull patine which Time has impressed on the stone, decorative details of great purity of style. At the angle of the building a slab of white marble bears the following inscription:—

"Marie de Rabutin-Chantal,  
Marquise de Sévigné,  
habita cet hôtel  
de 1674 à 1696."

These simple words suffice to transform the aspect of the edifice: they awaken a crowd of associations with the history of a great and brilliant epoch. It was, in fact, in this house that Madame de Sévigné spent the closing years of her life. "Nous voilà arrêtés à Carnavalet," she wrote to her daughter; "le ciel soit loué, nous ne pouvions mieux faire."

She could, in fact, hardly at that time have found a better abode than that hotel of which Pierre Lescot had given the plan to Bullant, and which Jean Goujon decorated with some of his best sculptures. A decorator, one Maître Pouce, whose name history has transmitted to us, had executed the carving on the façades, and the first proprietor of the house, Jacques de Ligneris, had engaged, for the interior decoration, the same Italian painters who had come to Fontainebleau with Rosso.

The Hôtel Carnavalet is one of the numerous specimens of Renaissance architecture the elegant lines and delicate ornament of which succeeding generations seem to have found pleasure in cutting up and spoiling. In this case it is not the present generation, at all events, which is to blame for such depredations, and the municipal administration of Paris has shown an enlightened and discreet spirit in dealing with the necessary enlargement of any of the old buildings in which historic collections are preserved. The blame in this instance must be credited back to a certain Claude Boislevé, a rich financier, whose fortune was shipwrecked in the great disaster in which the *Surintendant* Fouquet was concerned. The valuable documents recently discovered by the learned Librarian of the City of Paris, M. Jules Cousin, enable us to recover the chronological succession of the proprietors of Carnavalet,—of which Madame

de Sévigné was only a tenant,—and to ascertain that it was Boislevé, with the tasteless ways of a *nouveau riche*, who ordained the clumsy restoration of the work of Pierre Lescot. The sole excuse for him is that he did employ François Mansard, who employed as assistant a heavy-headed Flemish artist, one Van Obstal, whose evil deeds have lived after him. This is the cause why, while the ancient façade of the Hôtel is remarkable for its grace of composition and detail, the wings afterwards built present only heavy masses of building devoid of character. Fortunately, while enlarging the building, which he beautified with the inevitable "Mansard" roofs, the architect employed by M. Boislevé respected the old sixteenth century gateway of Du Cerceau, ornamented by Jean Goujon with some remarkable bas-reliefs, which time has dealt gently with.

Above the entrance is a figure of "Abundance" standing on a mask such as are used in carnival time (a reference to the title, "Carnavalet"). In the tympanum, two genii bearing palms form supporters to an escutcheon which formerly bore the Ligneris arms. In panels on each side two lions *passant* are sculptured on a ground of military symbols. One of them, which holds his paw on a globe, is well known as the "Lion à l'Écu," and is regarded as a kind of model of decorative sculpture of this class.

The elevation we give, reproduced from an old engraving (see next page), shows the general design and proportion of the principal façade; the other exterior façade, which looks towards the Rue Francis-Bourgeois, offers but little of interest, in spite of the bas-relief with which Van Obstal has decorated it, and which symbolises, with mythological extravagance and in very bad taste, the marriage of Louis XIV.

The principal entrance leads, by a passage with a vaulted ceiling, to the *cour d'honneur*, a rectangular space whose four faces present each a different decoration. The one next to the Rue Sévigné reproduces very nearly the exterior design. It is ornamented with two large seated figures of Fame, holding palms, and grouped with a keystone figure in relief which stands for Authority. There is a frieze ornamented with delicately-carved foliage. Above the roof there was a figure of Flora, which was so dilapidated as to threaten a fall, and which is now in a corner of the courtyard awaiting indispensable repair or "restoration."

The façade on the left, crowned by a balustrade, is divided into six bays. On the first-floor level are four figures in bas-relief, symbolising the elements. In the sixth bay, two genii, holding torches, are reclined on the cornice of the doorway. The opposite façade

reproduces the same disposition of parts. The figures on the first-floor level personify Juno, Hebe, Diana, and Flora. Van Obstal has made clumsy affairs of these subjects, which, above all others, ought to have been graceful. This heavy and commonplace sculpture serves as a good foil, however, to the façade parallel to the Rue Sévigné, which is the most interesting from an artistic point of view; the figures, which symbolise the four Seasons, being all the authentic work of Jean Goujon.

Behind the main pile of building extends a large rectangular space, which is to be transformed into a "square," and on or amid which stand various remains of old Paris; on one side the Pavillon de Choiseul,—a remnant of an hôtel of the seventeenth century, destroyed when the Rue de Quatre Septembre was made through the site; a little further on the façade of the old Bureau des Marchands-Drapiers, formerly situated in the Rue des Déchargeurs, and which has been very successfully rebuilt here under the care of M. Roguet, after the drawings of Jacques Bruant, "Architecte des Bâtimens du Roi," who died in 1664. We give an illustration in this number of the upper portion of the building, showing the modern sculpture of M. Gautier, and the carved decoration by M. Villenot.\*

Opposite the Pavillon de Choiseul has been erected, under the superintendence of M. Bonvard, a gallery of communication in which is to be framed one of the most curious remains of the "île de la cité," the arch of Nazareth, constructed under Henri II., to form a communication between the Galerie des Archives and the Chambre des Comptes. Greatly injured by the fires of the Commune, and pulled down some years ago to make room for the new Cour d'Assises, this small monument is now preserved under a shed until the approaching completion of the Musée Carnavalet. The sculpture on it is excellent, especially four figures with palms, of which Jean Goujon need not have been ashamed.

If we now enter the Hôtel, we find, on turning to the right of the vaulted passage out of the Rue de Sévigné, several rooms devoted to the exhibition of pre-historic implements of the Flint Age. The greater part of the specimens came from Levallois, Perret, and Meudon. In another room, devoted to the Gallo-Roman epoch, we may see some of the stones of the first enclosure wall of the ancient Lutetia, found in the sandy deposits on the left bank of the Seine. Some are pierced for poles; others exhibit rudely-cut letters or figures. The succession of rooms in the direction at right angles to the Rue de Sévigné contain a great number of objects of the Roman and

\* See prototype illustration in the present number.

Façade of the Hotel Carnavalet.—From an old engraving.

Merovingian epochs; a double staircase, situated in the last chamber in this quarter, leads to a gallery containing various fragments of the Christian basilica which preceded Notre Dame, and to another containing a collection of sarcophagi of the fourth and fifth centuries. In an angle of the basement we find disposed, with a certain kind of scenic effect not quite in good taste, a number of casts of skeletons discovered in 1870 in the "Arènes de Lutèce."

We come now to a room which still shows remains of its original decoration. The beams of the ceiling bear the monogram of Carnavalet with the S interwoven with it, which, in the symbolic language of that day signified "grandesse," "tendresse," and "fermesse" (*fidélité*). This room contains a fine chimney-piece ornamented with caryatides, baskets of flowers, and palms, the cornice decorated with an escutcheon bearing the arms of Carnavalet.

In the next room, the interest is centred in a curious collection of potteries, vases, bronzes, and other objects found in the Gallo-Roman Cemetery of the Nicole. Among these there is to be seen, under a glass case, a perfect impression or cast of the figure of a child, which was found in the cement lining of a sarcophagus discovered in 1872. This little inhabitant of Lutetia, dead about 1800 years ago, seems as if sleeping, with all the details of its small features preserved, by a fortuitous event, intact to our day.

On leaving the ground-floor galleries, a stone staircase gives access to the first floor, where is situated the collection of engravings, and the fine municipal library founded in 1871, thanks to M. Jules Cousin, who, in those bad days, and just after the burning of the Hôtel de Ville, generously presented his own library of books to the city. Rich as the library is today, one cannot forget the treasures that were lost sixteen years ago, of which the most precious jewel was the incomparable missal of Juvenal des Ursins, destroyed by the iconoclasts of the Commune.

Following this are the Galleries of the

Municipal Museum, among which may be remarked a small room, of which the ceiling is richly decorated with foliage and garlands painted and gilt, and with mythological subjects in cameo. In a neighbouring room a pedestal, in rather bad taste, covered with tricoloured plush, supports a model of the Bastille, made out of stone which formed part of that fortress. Among a number of objects connected with that turbulent epoch may be observed a copy (very rare) of the official announcement of the death of Louis XVI., the sword of Latour d'Auvergne, and a portrait of Marie Antoinette, taken at the Conciergerie. Unfortunately these and other things, to which a serious interest is attached, are nearly lost in a crowd of trifles of little interest, and placed there merely to make a show.

The buildings which surround the Pavillon de Choiseul are specially devoted to the revolutionary museum left by M. Liesville, who had by time and patience amassed a numerous collection of faience, insignia, decorations, jewels, and medals, the great merit of which is that they are authentic, while a great proportion of similar collections elsewhere are mere modern imitations. The Pavillon de Choiseul itself forms a gallery filled with wood carving in the Louis Quinze style, which came from the old Hôtel des Stuarts, Rue St. Hyacinthe Saint Michel. Among other things in this room is a fauteuil which belonged to Voltaire, another which was the property of Béranger, and various other pieces of furniture belonging to these two illustrious Parisians.

The interior of the Pavillon des Drapiers contains, on the first story, a large square chamber adorned with Doric pilasters with gilt flutings. The ceiling, restored some years ago by M. Maillot, was the work of Lebrun. It represents Mercury presenting Hebe to Jupiter. In a vaulted recess a fine terra-cotta bust of Madame de Sévigné, by Chatrouse, is carried on a gilt console.

The decoration of the neighbouring gallery

comes from the ancient Hôtel of the famous Marquis de Dangeau, who wrote the history of the Court of Louis XIV. Although the wainscot, with its Corinthian pilasters with fluted and gilt shafts, is in had taste, and the allegorical ceiling paintings have almost entirely disappeared, the general effect of the room is still fine.

We have unavoidably neglected, from considerations of space, the mention of many things in the museum worth attention, in the course of a description more directed to the buildings themselves than to their present contents. As will be gathered, there are, besides the municipal collection, a certain number of architectural curiosities which are in themselves worth the attention of the visitors and strangers who, on two days of the week (Sunday and Tuesday), can enter the City Museum free; and, apart from the historical side of the matter, the building may well be a subject of much interest to artists, as one of the remnants of that fine period of French Renaissance of which Jean Goujon was the prominent ornament. None of his work is better than that at Carnavalet; none has more of grace and artistic vigour. And the interest of the buildings at present is not confined to the old house of Kernevenoy (the Breton name which has been softened into Carnavalet), but extends to the modern portion, with its restoration or reconstruction of various architectural monuments of old Paris, full of interest, both from the historic and the architectural point of view.

**Edinburgh Municipal Buildings Competition.**—The names of the authors of the design illustrated in our last should have been given as Messrs. "Morris & Hunter," not "Morris & Hunt."

**Early Church Architecture.**—On the 29th ult., Mr. S. Slingsby Stallwood, of Reading, delivered an interesting lecture at Wokingham on "Early Church Architecture," which is reported in last week's *Reading Mercury*.

ON THE THEORY OF THE ABANDONMENT OF ANCIENT LIGHTS.

BY GEO. H. POWELL, BARRISTER-AT-LAW.

**D**URING the course of the last year there has once more been brought before the Court of Appeal an important case,\* involving the question of the exact meaning of the legal term "abandonment." The following remarks, which have no pretension of representing a scientific inquiry into the subject, aim merely at working out, if possible, in a simple and practicable form, some definite principle which could be applied to the decision of such cases as that above alluded to.

Now, whenever a prescriptive right to light has been acquired in respect of a certain window, the position of which in the original wall is subsequently altered (by the aperture being either raised or lowered), or the plane of which is altered by an alteration in the site and plane of the wall, the first material question is, of course, "to what 'quantum' of light was the owner of the window,—the plaintiff, let us say,—originally entitled?"

Now the prescriptive right,—according to the natural interpretation of the statute,—is a right to all the light which has access to the window in question, i.e., to the "general light of the sky,"† so far as "intercepted," to use the common expression, by the window. It is usual to speak of this as a "cone" of light,—by which expression is meant presumably the whole volume of light poured (so to speak) through the aperture of the window from all quarters of the area of sky visible from any part of such aperture. What amount of illumination this "cone" would represent in the case of any given window would clearly depend not only on the nature, height, and extent of the obstacles which obscure or tend to obscure it, but upon the exact nature of the aperture, the amount and quality of the glass (where glass is employed), &c.

But for practical purposes (legal and not scientific) we need hardly consider the matter in so much detail. Starting only with the necessary assumption that all parts of the sky are equally luminous, we proceed to consider what pencils of light from any part of the whole area of the sky fall, at any angle, upon the plane of the particular aperture. Whether the aperture be well or ill glazed, or not glazed at all, does not affect this question, so long as some appreciable quantity of light passes through it.

The statute says nothing about glass; and though the use of this material necessarily involves a waste\*\* of a certain quantity of light which would pass through an unglazed aperture, yet it could hardly be maintained that the volume of light which reaches the plane of the aperture (glazed or open) is not in any case "used and enjoyed" in a legal (and practical) sense, so long as the diminution, from any cause, of the light without the aperture would always produce a proportionate diminution of the light within.

The extent of the intercepted area of sky seems therefore the only material thing to be considered.

For a simple example, let us take the case of a square horizontal skylight, set in the centre of a square courtyard surrounded by four walls of equal height, facing (let us suppose) north, south, east, and west respectively.

The base of the inverted pyramid shown in fig. 1 A will accurately represent\* the required area, being bounded on the north by a straight line,  $b'a'$ , parallel to and in the same plane with (1) the south side of the aperture  $abcd$ , viz.,  $ab$ , and (2) the line  $gh$  representing the obscuring horizon on the north side; similarly on the east side by the line  $a'd'$ , which is parallel to and in the same plane with (1) the line  $hk$  (the obscuring horizon on the east side), and (2) the line  $ad$ , the west side of the aperture  $abcd$ . And similarly with the other sides, so that if we imagine the base of the pyramid to be a visible superficies, and further imagine one of the four sides surrounding the square courtyard removed in order to give us a view of it, the rectangular area of sky represented by the said base would appear, when viewed in perspective from below, in the form of the figure  $a'b'c'd'$ , in fig. 1 A. It can easily be seen that the figure would be exactly pyramidal only when the dimensions of the aperture and surrounding walls were as assumed above.

Fig. 1 A.

But if we wish to consider the whole volume of light reaching the aperture  $abcd$  from any part of the aforesaid area of sky, in so far as it is below the level of the obscuring horizons  $fg, gh, hk$ , and  $kf$ , this will be represented not by any part of the pyramid in fig. 1 A, but by the six-sided figure having for opposite sides the squares  $abcd$  and  $ghhk$ , shown (in perspective) in fig. 1 B, and formed by drawing straight lines from the points  $abcd$  to the points  $ghhk$  respectively. It will be seen that the apex of the pyramid in fig. 1 A would fall within this figure, also that supposing the straight lines  $af, dg, ch$ , and  $b'h$ , were produced to any distance, the side  $fgghk$  would always fall within the base of the pyramid. Thus the upper side of the figure shown in fig. 1 A (were the figure produced to any length) would never represent the area of sky intercepted by the aperture  $abcd$ . But, as has been said, fig. 1 A shows this area of sky, represented by the base ( $a'b'c'd'$ ) of the pyramid; whereas fig. 1 B shows the "channel,"† so to speak, through which all direct light must travel, below the level of the obscuring horizon, to reach the aperture  $abcd$ . It is important to observe this, merely because the sides of this figure  $afgd, dghc, chkb$ , and  $b'kfa$ , represent the planes beyond which the buildings on the west, north-east, and south sides of the aperture respectively cannot be advanced without obstructing the passage of the light at present intercepted by it.

The base of the pyramid (fig. 1 A) representing, as has been said, the area of sky from some part or other of which all the light that reaches the aperture  $abcd$  must come, the directions of the various pencils of light must clearly cross one another at various points

within the figure representing the volume of light below the level of the obscuring horizon shown in fig. 1 B. The apex of the inverted pyramid (fig. 1 A), a point some distance above the surface  $abcd$ , will be the point where the pencils of light from the extremities (north, south, east, and west) of the intercepted area of the sky  $a'b'c'd'$  intersect one another.

Fig. 1 B.

It will be seen, moreover, that the pencils of light from the extreme N.E., N.W., S.E., and S.W. points respectively of the area  $a'b'c'd'$  will be intercepted at the extreme S.W., S.E., N.W., and N.E. points of the aperture  $abcd$  respectively, and may be represented, as in fig. 1 A, by the lines  $a'a$ ,  $b'b$ ,  $d'd$ , and  $c'c$  respectively. The case of a horizontal skylight in the position above described is only here referred to because it affords, perhaps, the simplest illustration of the principles involved. Moreover, it can be easily seen from this illustration (as represented in the sketch) what would be the effect of moving the position of the aperture  $abcd$  (for example) in a direction due east. It is clear that the area of sky would be extended on the west and proportionally diminished on the east side, while its breadth from north to south would remain unaltered. Suppose the aperture to be moved in the E. direction till its side  $cb$  falls on the base of the wall  $hk$ ; then suppose its movement continued upwards in a plane at right angles to the horizontal (in which it was originally), and for the skylight we now have a window, of the same size and shape, in the wall on the east side. What is the effect of this change of plane upon the sky area intercepted? In the first place, that area has been reduced on the east side, since the side  $ad$  (now the lower side of the window  $abcd$ ) has moved a considerable distance eastward, and, therefore, the line  $a'd'$  (which, as explained above, must always be in the same plane with and parallel to the lines  $hk$  and  $ad$ ) must have moved westward, and would now ( $ad$ , as has been said, being in the plane of the wall) be in the plane of the wall produced. In the second place the sky area will have been extended in a westward direction, since, in proportion as the line  $cb$  advances in one direction the line  $c'b'$  will have advanced in the other. Meanwhile the breadth of the sky-area from north to south will have been enlarged. In the simple case first considered the intercepted "sky-area" would be represented by the base of an inverted pyramid. In the case of a window the intercepted area would be represented by the base of an irregular figure to some extent resembling a pyramid and having as many triangular sides as there were different planes in the obscuring horizons. But the extent of the said area in any given direction could clearly be estimated on the principles applied above.

For instance, let  $ab$  in fig. 2 represent a window in a vertical plane placed in a wall facing south (viewed in section), and  $g$  the

\* Represented by the part shaded dark in fig. 1 A.

\* Scott v. Pape, reported in 31 Ch. D., 566.  
 † 2 and 3 Wm. IV., c. 71 (1832), s. 3.  
 ‡ Homersham Cox on "Ancient Lights."  
 § See judgments and arguments in the case cited above, and in Ancient Light cases, *passim*.  
 ¶ It will be observed that "direct" light alone is here considered, for the following reasons—(1) That it may (it is submitted) be assumed, with sufficient nicety for practical purposes, that the amount of reflected light would vary, *ceteris paribus*, as the amount of direct light; and (2) there seems no ground for supposing that a right could be acquired to "reflected" as distinct from "direct" rays or pencils, or that the mere alteration by the owner of the servient tenement of the reflecting properties of its surface, could form the subject of an action at law.  
 ¶ Which is assumed, in the following argument, to which, however, the point is immaterial, to be the same plane as that of the surface of the wall in which it is set.  
 ¶ For the scientific expression of this, and the trigonometrical measurements of the illumination and obscuration of a glazed window, see the "Optics" of "Ancient Lights" in Mr. Homersham Cox's work on the subject.

\* For, whatever be supposed to be the surface of the area or arc of sky from which the light is (*ex hypo.*) derived in the first instance, every part of that area must be included in the *figures* represented at any given altitude by the plane figure  $a'b'c'd'$ , as viewed from any point within  $abcd$ .  
 † When regarded as a solid figure, it represents the volume (see above), the whole body of light reaching the aperture.

obscuring horizon on the south side. The sectional area of sky intercepted from *a b* will clearly be bounded on the north side at the point *c* in the plane of the wall produced, and on the south side at the point *d* in the line *a g d*; and consequently the line *c d* may be taken to represent the sectional area intercepted from north to south, by the window *a b*. Supposing there were other obscuring horizons on the east and west, S.E., S.W., or any other quarter, to be considered, figures could be drawn similar to the above (fig. 2), showing the sectional area that would be intercepted in a plane at right angles, or in a plane at any angle (according to the position of the obscuring horizon) to the plane of *c d*.

Fig. 2.

Having reminded the reader of the above principles, we pass on (still considering, for the sake of simplicity, the sectional area intercepted by the window in one plane only) to inquire what the law provides in the case when either the position of the window in the wall, or the plane of the wall itself, is altered. To what extent are the supposed plaintiff's rights affected or impaired (for, of course, they cannot be increased) by such alterations? Let us suppose the plaintiff has acquired a prescriptive right to the access of light to the window *a b* (fig. 3), the obscuring horizon of the servient tenement being represented by the point *g*. Then let the plaintiff's wall be advanced from the position *X* to the position *Y*. Now in considering exactly what is meant by "abandonment," we may begin by observing that the mere advance of the plaintiff's wall from the plane *X* to the plane *Y* will necessarily deprive him of the enjoyment of a considerable quantity of light which he before enjoyed, viz., of all the direct light coming from the sectional area of sky, *k l*. But inasmuch as this deprivation is entirely due to the plaintiff's own act (and could not in the nature of things affect the rights of the defendant, the owner of the servient tenement), we may dismiss it from consideration. The only "abandonment" which it is necessary to discuss may be defined as the relinquishing by the plaintiff of some right which restricted the defendant in the enjoyment of his property. In fact, if we say that whatever acquired right the plaintiff intentionally ceases to enjoy, constitutes a corresponding restoration of or addition to the rights of the defendant, this statement will only require to be modified by the legal maxim, "De minimis non curat lex."

Now, for the legal answer to the question propounded above, we need refer no further back than to the afore-mentioned case of *Scott v. Pape*,\* in which the most important decisions on the subject are reviewed. The legal right is there stated to be retained in respect of a new window, "which includes in its area a substantial part of that of the original window," i.e., which if the new wall

were laid upon the old wall so that their bases coincided, would substantially coincide with the old window. Dozens of judicial expositions of this principle might be cited, were it not well known to be supported by all authority. So long as there is a preservation of a material part of the old aperture so long there is no abandonment of the right, and if there is no preservation of any material part of the old aperture, the right is understood to be abandoned, and therefore lost. This is a perfectly plain and simple principle, and in accordance with it the plaintiff in the aforesaid case of *Scott v. Pape*\* (decided in February, 1886) did not venture to ask for relief (in the form of an injunction) with respect to those of his new windows (his building having been advanced towards the servient tenement), which could not be proved to "correspond" with ancient lights in the original building.

But the various declarations of the law on the subject seem to suggest, in conjunction with the above, another and a different theory, which has only been imperfectly developed. We find it authoritatively stated† that if the plaintiff continues to use, through his new apertures, "the same or substantially the same cone of light" which he enjoyed before, then there is no legal abandonment.‡

In another place§ the prescription stated is defined as the right "to have arrive for the use of your house" the pencils of light "which during the twenty years passed through the original aperture," to have "the space within" lighted in the same manner "in which it was lighted through the old windows. At the same time "structural identity" is not, we are told, "the test." The measure of the enjoyment is not the aperture itself, but "the size and dimensions of an aperture in that position" (scil. that of the original window). To apply these principles of law to the case supposed (see fig. 3), the sectional area of the sky, intercepted by the original window *a b*, will be represented by the line *k-a'*. It is clear that there will be pencils of light from the extremity *a'* of this area passing along the line *a-a'* through the aperture *a b* to *a*, some object within.

Fig. 3.

Now, if in the new wall, a window, *e f* (in exactly the same position, relatively, as *a b*), be substituted for the original window, there will be, according to the first principle stated above, no abandonment at all; for the window, *e f*, not only substantially, but exactly, coincides with the original window, *a b*. But it is clear that no pencils of light from the point *a'*, or,

\* See p. 556 of the Report in 31 Ch. Div.  
† E.g., per Cotton, L.J., 31 Ch. Div., p. 570; and see the cases cited.

‡ Of the meaning of this language we have spoken above. It has been already submitted that the material points to consider are not so much the form in which the light is thrown into the building, lessened or not by refraction, but (1) the "volume" of light (below the level of the obscuring horizon) which illuminates the plane of the aperture (glazed or otherwise); and (2) the area of sky from which the pencils of light constituting that volume are derived.

§ See remarks of Bowen, L.J., 31 Ch. Div., pp. 572-4.  
¶ *Id.*, per North, J., whose decision was affirmed by the superior Court.

indeed, from any point of the sky area between *c'* and *a'* can possibly "arrive" at *e f*, and that the "space within" is therefore not (in any ordinary sense of the words) lighted "in the same manner" as before. In fact, no direct light arriving from any point of the sky area between the points *c' a'* can possibly reach any window placed below the point *c*. But if the access of light which was enjoyed before is now no longer enjoyed, surely it has been in fact and in law abandoned? Conversely, it is obvious that if the plaintiff, having acquired the supposed rights in respect of the window *a b*, wishes to continue in the enjoyment of these rights in so far as is compatible with the alteration in the plane of his wall, far from placing his new window in the position (*e f*) of the old one, he must raise it to the position *c d* (the point *d* being supposed to be in a straight line with the points *g* and *b*). If he puts his new window in any position lower than this, he will, in fact (if not in law), be ceasing, to a greater or less extent, to enjoy the access of light, to the enjoyment of which he has acquired a right. Is it possible, then, to follow such clear enunciations of the law as are quoted above with regard to "pencils of light," "cones of light," &c. (the only sensible interpretation of which points to the above conclusion), and, at the same time, carry to its logical results the principle which seems to attach such a magical importance to identity of position,—in fact, to a fictitious "correspondence" between the old and new windows? Suppose, for example (in fig. 3), the window *c d* were the original window, intercepting the area of sky, *l a'*, and the plane of the wall were moved from *Y* to *X* (i.e., retired from the servient tenement). If for the original window, *c d*, a new window, *a b*, were substituted, then according to all authority, the rights acquired in respect of *c d* would be "abandoned," notwithstanding that, as a matter of fact, the same pencils (to a considerable extent) pass through *c d* as passed through *a b*, and this could not be the case with a window in the position *e f*. Why then is the latter said to be lighted "in the same manner" as *a b*? Again, supposing *e f* to be the "original" window intercepting the area of sky *l e'*, and the wall (*Y*) to be pulled down and rebuilt in the same plane, the only alteration in the building being a substitution of a window *c f* for the original window *c e*, according to the principles of law at present applied, the plaintiff has "abandoned" the right he had (see hypothesis) acquired in respect of the window *c e*. Yet all the area of sky intercepted by the aperture *c f*, and a good deal more,\* is still intercepted by the aperture *c d*.

CUSTOMARY CHARGES.

HERE is unquestionably a common idea existing among professional men that what may be termed "customary charges" are binding on those with whom they do business. This idea is perhaps more strongly rooted in the minds of architects than of any other body of men. It arises from the fact that the usual remuneration for an architect's services, viz., 5 per cent. commission on the total cost of the works executed from his designs, forms the subject of the first of the schedule of rules issued under the sanction of the Institute. In the same way, quantity surveyors usually have a regular charge, and land surveyors and house agents have scales of remuneration which are almost universally the same among all members of the particular profession. There can be no question that a customary scale of charges, if it be a reasonable one, has many advantages, for it may be taken

\* But this, the enjoyment *pro tem.* of more than he had a prescriptive right to, has (since the decision of Tapping v. Jones, reported 11 Ho. of Lords Cases, p. 260) no prejudicial effect on his existing rights. Probably it would never have occurred to any but a legal mind to maintain the contrary, which was equivalent to arguing that the owner of a right of way should lose that right if he trespassed in his neighbour's field; but, if possible, more absurd, since the plaintiff's action (in the case of lights) could hardly, by any stretch of language, be described as a trespass.

† To be continued.

to be a fair average profit for the person who receives it, and a fairly reasonable payment to be made by the customer, based on a considerable mass of experience. On the other hand, there is always this danger, viz., that the person who habitually charges a sum common to most of his professional brethren regards it as one which he has a kind of legal right to be paid, and consequently he takes, in many cases, no special precautions to have this sum agreed upon before the work is begun. The consequence is that in some cases the customer disputes the amount, and the professional person—architect, surveyor, or what not,—finds to his surprise that his account is docked by a British jury, who, whatever may be their professional feelings out of the box, are usually actuated by a kind of corporate pleasure in cutting down the charges of professional persons. More cases of this description occur than many people are aware of. They very often do not, indeed, come into court at all; sometimes they are settled by the acceptance of a smaller sum than that originally charged for the sake of peace; sometimes they are referred to arbitration, and so do not find their way into the public prints. Not very long ago, for example, the surveyor to a water-works company who had done work in surveying for the purposes of a Parliamentary Committee had his account largely docked by an official referee. We allude to this case not in anyway for the purpose of commenting upon it, but merely as an instance of the manner in which from time to time these professional charges are cut down. The fact is that no charge of a customary character, even one so generally recognised and accepted as the five per cent. charge of architects, is legal unless it is a reasonable charge. The tendency of all persons outside a particular profession is to minimise the value of professional services. They are apt to overlook the value which must be paid for experience, for professional education, and to suppose that because an architect takes a comparatively small time over a plan, or a lawyer over the composition of an opinion, they are to be paid for the work without taking other matters than the mere expenditure of time into consideration, just as if a professional man were a day labourer, who occupied a certain number of hours in digging a certain plot of ground. There is no question that the charges of land surveyors are to the outside world frequently startling, but the public are apt, in connexion with them, to overlook the many things which are requisite in regard to the formation of a surveyor's opinion. On the other hand, there probably exists an opposite tendency in the minds of professional men to overvalue the indirect elements for which they make a charge. When all these different tendencies and conflicting views have to be taken into consideration by one or more individuals, whose minds may also have some individual leanings of their own, the difficulty in a disputed case of arriving at what may be regarded as a reasonable sum, can scarcely be overrated. But it cannot too often be pointed out that the proper course for every professional person to follow is, as a rule, to let his charges be known beforehand, and obtain, at any rate, a verbal assent to them. If this were done, many unfortunate disputes would be avoided. So far as architects are concerned, this is, in regard to matters falling within the first of the Rules of the Institute, the simplest thing in the world. Nothing is easier than to show a client a copy of the rules or to inform him that it includes the scale to be charged, and to obtain from him an assent to this. Whether the customary charge be in the particular case reasonable or unreasonable then becomes immaterial, for there is an express contract by the client to pay at this particular rate. But unless a professional man can, as a solicitor is empowered to do, charge a fee settled by an Act of Parliament, he must sooner or later find himself in difficulties when he relies on obtaining in every case and from every client payment of a customary charge. A customary charge, convenient as it may be, cannot from its very nature, in all cases, be a fair one, and its very

convenience and general use thus makes it in some instances a trap. There are, it is obvious, other objections to a customary charge, as that individual labour receives no greater remuneration than work done by means of a subordinate. Persons may differ as to which disadvantages are of the least weight, but there can be no doubt in regard to the point to which we have chiefly confined ourselves, viz., that a customary is not necessarily a reasonable and a legal charge.

## NOTES.

**T**HE Railway Bill passed through Committee in the House of Lords on the 1st inst., and several discussions took place upon the traffic clauses, Lords Bramwell, Grimthorpe, and Brabourne again displaying great energy on behalf of their "clients." A motion to restrain the companies from making charges for station terminals was withdrawn, as it was opposed by the noble lords just named with an ardour which is interesting and significant to contemplate, and did not receive much support from the rest of the House. Only one amendment to clause 24 was adopted, providing that the maximum rates and charges under the revised classifications shall be, on the whole, equivalent to those which the companies have already been authorised by Parliament to receive. The apparently apathetic way in which the House thus agreed to the important provisions of this clause may be attributable to Lord Salisbury's remark that they were not by this Bill giving final sanction to any decisions of the Board of Trade. When the latter arrived at decisions involving any change Parliament would be asked to say whether they were reasonable or not. A division was taken on sub-section 2 of the "undue preference" clause, which, it will be remembered, allows the Commissioners to take into consideration whether reduced charges are necessary for the purpose of securing traffic. The railway companies, whose adherents numbered 49 against 11, assert that their action in giving special facilities to imported traffic is out of consideration for,—or, at least, results in benefit to,—the community at large; so the clause is retained, ostensibly in the interests of the consumer. The "conciliation" clause was struck out altogether, it being argued that the reason this system had answered in America was because they had no other court to go to; and the 29th clause, relating to the publication of tolls and charges, is also omitted. It is significant that these amendments were all recommended by the manager of the Great Western Railway (Mr. Grierson), in a long letter to the *Times* on the same day; and Lord Stanley appears to admit, by the manner in which he has abandoned some of the provisions of his measure, that they were only inserted on account of having appeared in last year's Bill. Further alterations, and possibly some additions, may be looked for when the measure is before the House of Commons.

**W**E have received a circular emanating from some commercial gentlemen in North Wales, calling attention to the desirability of altering the law in regard to limited liability companies. The object is to prevent directors giving orders in excess of the means of the company, whereby on the winding-up of a company creditors become losers. The means suggested to prevent this mischief are (a) to make directors personally responsible for expenditure beyond the resources of the company, (b) that there should be a compulsory reserve not to be used except when a company is wound up. The amount suggested is 10s. uncalled for every pound of capital called up. There is a good deal to be said in favour of this proposal. It would be very desirable to make directors more careful, and to prevent companies spending their last shilling; on the other hand, those who give credit to companies of doubtful credit have only themselves to thank if in consequence they lose money. It is possible to obtain information and guarantees. Much of the loss complained of arises, in fact, from reckless competition, and those who give

credit without taking security, or without inquiry, must bear the blame if they go unpaid on the winding-up of a company.

**T**HE value of land in New York does not appear to be so high as in the City of London, if one may judge from a recent sale of two plots in Broadway, which, as all the world knows, is one of the principal thoroughfares in that city. Nos. 135 and 137, Broadway, two contiguous plots, one of which was a corner plot, were put up for sale by auction. The inside plot was purchased by the Niagara Insurance Company, and realised 142 dobs, or about 29l. 10s. per square foot, which is much less than the value of land in Cornhill and its neighbourhood, where it has reached as much as 40l. per foot. The corner plot, with a frontage of only 15 ft. on Broadway, realised upwards of 73,000l., but the rate per foot superficial is not stated.

**I**N all likelihood the Bank of England governing body will appeal from the decision in a case heard last week in the Queen's Bench, by Mr. Justice Day and Mr. Justice Wills, in the matter of the Mayor and other officers of the Staple of England. In reversal of a verdict obtained at the trial before Mr. Baron Pollock, the Court adjudged, though, as Mr. Justice Day said, with some reluctance, that the Bank should recoup to the Corporation a certain, their sole remaining fund of 4,250l. Consols, which had been misappropriated by their clerk. The plaintiffs represent a now effete Guild-merchant. Under protection of King Edward III. the Woolstaplers were established (1353) in the New Palace ward of St. Margaret, Westminster, parish. Yet Stow says that "this church [St. Margaret's, as rebuilt by Eadward the Confessor] continued till the days of Edward I., at which time the merchants of the staple and parishioners of Westminster built it all of new, the chancel, excepted, which was built by the Abbots of Westminster." Having for a long while exercised main control over the once staple product of our country, the Corporation gradually sank into insignificance on the increasing importation of fleeces from beyond the seas; nor can the charter which they obtained from Charles II., together with a mace and silver common seal, be regarded as more than a passing *succis Vestime*. Tradition goes that Richard II. removed them to fresh quarters in Holborn, which having been converted, *temp.* Henry V., into an Inn of Chancery, yet retain the style of Staple Inn. A woolpack, by the way, formed the cognisance of that lately-dissolved society. Still, the Staplers did not sever connexion with their earlier home, for in 36 Henry VIII. they established on their Westminster property an almshouse, known as St. Stephen's Hospital. Demolished *circa* 1745, that hospital was rebuilt in the neighbouring St. Anne's-lane. At that time, too, were pulled down a watergate and strong round tower, being the Long Staple,—site of the present Bridge-street,—for the western approach and abutment to Labeleye's (old) Westminster Bridge. An assessment of "Orlando Gibbons, ij<sup>d</sup>," in the Woolstaple is entered, in 1628, upon the overseers' books for the parish of St. Margaret. With the name of Staple Inn may be compared that of Steel, or Stapel, Hof, corruptly termed the Steelyard, as appertaining to the Hanse and Almaine, or Easterlinge, merchants, who originally settled by All Hallows, in Upper Thames-street, in 1250. Yet in a law of Æthelred the Easterlingas, coming with their ships to Billingsgate, are cited as "the Emperor's men," and receive royal protection accordingly.

**T**HE competition designs for the new façade at Milan are to be sent in on the 15th. There seems to be an anxiety (not unnatural), on the part of some German competitors to ensure the presence of some German and English representatives on the jury. The appointed members of the jury are mostly Italians, and the competitors, among themselves, are to vote for four other members. A German correspondent begs us to put before English competitors the consideration that

if English competitors vote only for Englishmen as judges, and German competitors only for Germans, neither will get votes enough to be elected, and the specially elected will consist entirely of Italians, and, at the most, one Frenchman. He therefore suggests that English and German competitors should arrange to vote for two Englishmen and two Germans, to be agreed on among themselves, so as to secure the election of German and English representatives on the jury. Our German correspondent proposes, as the German members to be voted for, Herr Hase, Privy Councillor and Baurath, of Hanover, and Herr von Statz, Baurath, of Cologne; and writes, "please recommend the names of two English gentlemen for whom the German competitors may unite their votes." Whether the German and English competitors generally will accept this suggestion we cannot say, but as we certainly agree that it is desirable that English and German architects should be represented on the jury of this international competition, we have recommended the names of Mr. Pearson and Mr. Waterhouse as the other two judges for whom the German and English competitors should unite their votes.

ON the motion of Mr. D. Plunket on Tuesday night, it was agreed "That a Select Committee be appointed to reconsider the plans and proposals for an Admiralty and War Office; and that it be an instruction to the Committee to report whether some or all of the existing buildings of the Admiralty may not, with advantage, be retained." The following were appointed the Select Committee:—Sir William Harcourt, Lord George Hamilton, Mr. Henry H. Fowler, Mr. Jackson, Mr. Selater-Booth, Mr. Shaw-Lefevre, Colonel Malcolm, Mr. Howell, Mr. Isaacs, Mr. Dillwyn, Mr. Edward Hardesty, Mr. William Bright, Mr. Seager Hunt, Sir William Crossman, Mr. Patrick Joseph Power, Mr. Byrne, and Mr. David Plunket. The Committee includes an architect (Mr. Isaacs), but we are not aware that any of the other members appointed are publicly known for any interest in or knowledge of architecture. The question whether some of the existing buildings of the Admiralty may with advantage be retained is of course put in purely for the economists, architecture being generally regarded in the Legislative assembly as merely a matter of pounds, shillings, and pence, not of beauty or of national honour and glory. The point which ought to be impressed on the Committee is that the design which Mr. Shaw-Lefevre has endeavoured to put upon the country is one which, from an artistic point of view, is exceedingly devoid of genius or interest, the execution of which in its present form would cause general disappointment to the few Englishmen who care about architecture.

THE collection of works by Mr. Watts, which was on view at Christie's at the close of last week, drew a considerable number of visitors, who were, it must be said, enticed there under rather false pretences, the preliminary notice which was got into the *Times* specifying, among the works to be seen, "Love and Death," "Love and Life," and two or three others of the painter's greatest works, without giving any suggestion that these were not the large paintings, but only small replicas or studies. The collection (the property of the late Mr. Rickards, of Manchester) was, however, a fine one as far as it went, including some of Mr. Watts's best portraits, and a number of imaginative paintings, studies of ideal characters, portraits of children under various ideal titles, &c. Among these, one called "Pretty Lucy Bond," which had never been exhibited, is a very charming child study, rather after the feeling of some of Sir J. Millais's child studies, though, of course, sufficiently different in technique. Another was the exquisite half-length of a blue-eyed child with a shell, entitled "On the Seashore," one of the most beautiful child pictures ever painted by any artist, ancient or modern. Among the things that exhibit Mr. Watts's power of con-

veying intellectual interest or deep pathos through the medium of very slightly-executed studies, two were to be remarked, the "Sir Perceval," a small sketch of a knight in armour walking through a forest, and "The Bridge of Sighs," a mere indication of a drowned figure and the cold water flowing past the bank, but of deeper interest than many a lesser artist's most finished works. "The Return of the Dove to the Ark," which has been "cracked up" rather immoderately in the communications furnished to the daily papers, appeared to us now, as it did when painted many years ago, a failure, owing to the totally impossible treatment of the water, in long parallel ridges as if the waves were drawn with a ruler. Among the portraits was the earlier (and not the best) of Herr Joachim, of whom the artist painted a finer and more dignified portrait at a later period, and that of Mr. Russell Gurney, one of the best and most characteristic of all Mr. Watts's portraits. The collection, including more than fifty works, formed a beautiful exhibition of what may be called the poetry of colour, even considered apart from subject, of which Mr. Watts is such a master.\*

THE loan exhibition of the works of Bonington, Cattermole, Holland, Nash, De Wint, and William Hunt, which was held for three days last week at the rooms of the Society of Painters in Water Colours, served to remind us of the peculiar faculty of Jas. Holland in painting architecture. His Venetian pictures are remarkable for the brilliant effect of light in them, and for the solidity and clearness with which the architecture is delineated. De Wint's architecture, on the other hand, is in many cases very bad; it is a mere wash with no stone or brick texture, and an utter ignoring of detail. His view of the west front of Lincoln Cathedral is a travesty. On the other hand, the "Old Houses, Lincoln," lent by Mr. Huish, is a superb bit of the kind, going to the very root, as it were, of the picturesque properties of old buildings of this kind. Here there was no architectural detail, properly so called, to paint; only the varied surfaces of old bricks, stone, and timber, and their various stages of decay and lapse from the perpendicular. The drawing illustrates better than most the peculiar union of breadth with the greatest delicacy in gradation and contrast of tone which characterises De Wint's execution when at his best. Cattermole's works, despite their brilliancy, when collected together have an air of great sameness, and a want of distinctive character in the countenances and figures, for which his brilliant execution and perception of colour cannot altogether atone. In the large work called "Montrose," for instance, which is obviously intended as an illustration of that scene in "The Legend of Montrose" where Montrose, disguised as Lord Menteith's attendant, is suddenly made known to the assembled Highlanders, the countenances are those of so many dummies or "supers"; the arrangement of the picture is effective in a stage sense, but that is all. Nash's large interior of Westminster Abbey is an illustration of the change in ideas of pictorial treatment of architecture; the effect is fine and true in general, but it will not bear looking into; there is neither the texture of stone, nor the true detail of the carving, &c. Nowadays we have become accustomed to demand so much more from the artistic illustrator of architecture than the last generation demanded. Holland comes nearer the modern mark in this class of work than either De Wint or Nash. There were some capital flower studies of Holland's also in the collection. As to the examples of William Hunt, they were marvellous as examples of splendid realistic painting of flowers and still life of various kinds, combining the most brilliant execution with the most delicate perception of form and colour. In this class of art one can hardly suppose that Hunt can ever be superseded; he carried it to perfection.

\* Since the above remarks were written, we have had occasion to observe the remarkable prices brought by many of these small works at the sale which followed; a gratifying practical proof that, in spite of the realistic and sensational tastes so prevalent, there is a public, "as it were," that knows the value of intellectual work like that of Mr. Watts.

IN answer to a question from Sir A. Borthwick on Monday, Sir W. Hart Dyke said that the Committee appointed in July last to consider the question of the action of light on water-colours was deferring its report until a series of experiments by scientific experts on the action of light on various pigments and their mixtures had been completed. We hope it is to be inferred from this answer that we are likely to get some definite information as to facts when the report of the Committee does come out, since a Parliamentary Committee has been appointed on such an inquiry. The subject seems, to say truth, rather out of the proper line of the Legislature.

WE greatly regret to learn from an article in the *Indian Engineer*, that the series of "Professional Papers on Indian Engineering," for many years periodically issued from Roorkee College, have put in their last appearance, and will be seen no more. The publication, which seems to have been carried on at a pecuniary loss for some time back, was a very well got-up one, often containing papers of unusual and special interest, to the consideration of which we have from time to time devoted some space. We are very sorry to have seen the last of them.

THE "Society of British Artists" has been drawn yet further into the meshes of Whistlerism this year; the number of works hung is still further reduced; the draping of the gallery is as effective as ever; and artists who have not before been known as "impressionists" are vying with each other in their efforts to catch the style of the presiding genius. Mr. Whistler's own contributions are not happy this year. His portrait of a lady, under the title "Arrangement in Violet and Pink" (157), is not pleasant in colour, and the face of the sitter is made to look as if it were in want of a thorough scrubbing with soap and water. The "Nocturnes" hung on either side of this have the same kind of merit as many others by the same artist; they are good as effects; even this cannot be said of "Harmony in Grey,—Chelsea in Ice" (165), which appears to be an effort to try how much people will swallow. Among the known and professed followers of Mr. Whistler, Mr. Jacobus Hood has an ugly but characteristic portrait of a lawn-tennis player, "Game and Set" (103), in flannels, and relieved against a white wall, according to the now favourite trick of composing paintings entirely of various whites. M. Roussel's "Portrait of Mortimer Menpes, Esq." (121), looks as if it were a good likeness, but a more ridiculous piece of affectation than the treatment of the whole it would be impossible to imagine; the sitter is in evening dress relieved against a pink wall, with a red fan hung on the floor beside him. The efforts of M. Ludovici, jun., to be ridiculous in the prevailing mode are even more noteworthy, and in such a thing as "Youth" (18) he seems to reach the acme of vulgarity possible in painting. Among the things which it is any pleasure to look at (and they are a small proportion of the whole) are "The Approach to London" (116), up the Thames that is to say, by Mr. Wyllie; the fine interior of Nuremberg Cathedral (126), by Mr. Wyke Bayliss; and a large painting of a coast scene in a gale, with a ship outside, "Helpless" (146), by Mr. T. C. Gotch and Mr. Ayerst Ingram: we presume the sea is due to the latter artist, and the figures to the former; the sea carries off the honours of the day; there is a fine wild effect of wind and boiling sea in the picture. The exhibition is certainly more interesting in a sense than the exhibitions at this gallery used to be for a long time; but there seems to have been a rush from the extreme of dulness to the extreme of affectation.

THE exhibition of "The new English Art Club," now open at the Dudley Gallery, includes a good many names not familiar to us, but we fail to discover any predominant principle which is to distinguish this collection of artists, or give a *raison d'être* for their special exhibition, except a tendency to paint

unfinished pictures: and some works which look at first sight very original are found on consideration to owe this impression a good deal to the fact of their being splashily painted and with no attempt at showing detail. The "Landscape" by Mr. Walton (36), and "Study of a Cloud," by Mr. W. L. Wyllie (85), both exhibit a vertical column of cloud piled up in a grand mass, but the cloud is laid on with a trowel, so to speak, and seems more solid than the ground over which it hangs; and this coarse, rough work gives a sort of special *cachet* to the painting, which is what is wanted. Mr. Sargent has a life-size portrait of a lady (55) which has plenty of character, and the background is very effectively sketched; but it would be every bit as good if the arms were more like flesh and less like dough. Mr. Roussel's life-size of a "Reading Girl" (3) hangs at the opposite end of the room, showing a "young person" reading before her fire *in parvis naturalibus*, her clothes being thrown over the chair back. The figure is well drawn and expressive enough, though ugly (but ugliness is beauty in the New Art Club), and the rather washy style of execution and unreal and dingy flesh colouring are perhaps of service in giving a slightly ideal appearance to what would otherwise be a too realistic work. That is one of the advantages of not finishing a picture; the conception may be the most prosaic, but a sort of poetry is imparted to it by leaving out detail. Mr. A. Harrison's big picture "In Arcady" (78), has not this assistance even: it shows a scene in a wood with flashing sunlight through the leaves, very vividly represented, in which two or three vulgar blowsy milkmaids have stripped themselves for the fun of the thing. Technically the picture is very clever; in other respects, more especially in connexion with the idea and associations of "Arcady," it is a piece of blatant vulgarity. "Stone Pickers" (32), by Mr. G. Clausen, one of the "dauntless three," shows feeling and character, but is not of a power to make all Royal Academicians tremble for their laurels; and two or three of the best landscapes in the room are the inferior works of well-known painters, such as Mr. Aumonier and Mr. Parsons. By far the best picture in the room, if feeling and pathos as well as technique are to count for anything, is "The Battle of Life" (32) by the secretary, Mr. T. B. Kennington: the interior of the home of a working man who cannot get work; each figure is carefully studied; the result is a picture painful certainly, and which few would hear to keep in their room, but marked by true and unaffected pathos, the more notable from the many affectations by which it is surrounded.

WE referred some little time back (see p. 378, *ante*) to an extraordinary statement made by the *Journal of Education*, to the effect that the delay in opening the Royal Holloway College was partially due to the absence of drains. We showed that this statement was unfounded, and we now learn that the *Journal of Education* has apologised to Mr. Crossland, the architect of the building, for its serious misstatement. The fact is that the drainage arrangements are stated by Sir Robert Rawlinson to be "in all respects complete and satisfactory." So much for the *Journal of Education's* would-be smart quip that drains are "a detail that architects have a way of overlooking."

DR. TANNER inquired of the First Commissioner of Works, on Tuesday, whether his attention had been called to the danger to pedestrians which the improvements at Hyde Park Corner had brought about. We pointed out long ago the certain inconvenience which the blundering in laying out the site would cause, independently of its utter ineffectiveness. Now, after it is done, people are beginning to find out the mistake; but that is the way we do in London.

IN addition to the new theatre that is about to be built in the Strand, and to which we adverted in our columns of the 2nd inst., sites have been taken in London for three more. Of these, the first lies in Oxford-street, between

Hanway-street and the Oxford Music-hall, being where the Star Brewery used to stand. Some of our readers may remember the two ravens that used to mount guard at the yard-gate. The second site is in Shaftesbury-avenue, whereon Mr. Hollingshead intends to erect a large playhouse having three frontages, the principal one to face towards the Avenue. The third proposed new theatre is a suburban one, and is to be located at Brixton, in Canterbury-road, just behind the London and County Bank, and opposite to the Police-station, near the end of Stockwell-road. Mr. C. J. Phipps, F.S.A., is designated as the architect of this theatre.

THE first London Exhibition of the "Société d'Aquarellistes Français," opened this week in the Goupil Galleries, is an artistic event of some interest. If we take it to fairly represent French water-colour art, it may be said at once that in landscape, at all events, the branch of art so specially suited to the capabilities of water-colour, the French can come nowhere near to the leading English water-colour artists of the day, the best landscapes in this collection being such as would be passed over as of little account at the Society of Painters in Water Colours. The exhibition is a peculiar one as compared with our own; the works of each artist are grouped together; the numerous and brilliantly-painted military groups of *Détaille* give a special character to it. Further on we have a set of sporting pictures by M. Bêthune and M. Olivier de Penne; a painting of "setters" by the latter (41) is remarkable for truth and spirit of action in the animals. Framed designs for fans abound. The strong point of the exhibition consists in the brilliant execution of figures in pure water-colour; the point in which our own water-colour exhibitions, in spite of Sir James Linton and Mrs. Allingham, are on the whole the least conspicuous. In addition to the work of *Détaille*, may be mentioned in this respect "Les Loisirs d'un Réserviste" (6), by M. Loustaunau, and the brilliant and charming little series of illustrations to "L'Ahbé Constantine," by Madame Lemaire. This gifted artist's flower and fruit pieces are also beautiful, and she appears to show equal mastery in both classes of subject. MM. Maurice Leloir & Paul Pujol contribute some good architectural subjects. The exhibition should be seen, both for the sake of the admirable work in certain lines which it contains, and for the characteristic contrast it affords with English exhibitions of the same class of work. It may be added that the works of the "impressionist" exhibitors, in the smaller room, may afford the English visitor the consolation of knowing that in this respect there are even greater humbugs on the other side of the Channel than on this side.

#### ST. OLAVE'S CHURCH, OLD JEWRY.

THE Wednesday Divinity Lecture which was delivered on the 23rd of March was the last religious function to be celebrated within the walls of St. Olave, Old Jewry. The parish is to be united with certain others, and the church is marked for speedy demolition. Scarcely has the last brick been removed of St. Matthew's, Friday-street, Cheapside, before another work of the same architect, Wren, has to share a like untoward fate. Its effacement forms part of a scheme that has just been accomplished for the union of the parish of St. Olave with the parishes of St. Martin Pomeroi, St. Mary Colechurch, St. Mildred, Poultry, St. Christopher-le-Stocks, St. Margaret Lothbury, and St. Bartholomew-by-the-Exchange; and for the appointment of the Rev. Prebendary Ingram, rector of St. Margaret, as the first rector of the united seven parishes.

Most of the names we mention carry us back to very early times. St. Martin Pomeroi, or Pomary, by the Orchard, one of the smallest parishes in London, was joined to St. Olave after the Great Fire; no trace of it remains except the graveyard between that church and Ironmonger-lane. So similarly with St. Mary Colechurch, also in the Ward of Chepe, which was united with St. Mildred, Poultry. Named after its founder, and situated in Old Jewry, at the southern end of Coneyhoop-lane, where now is Frederick's-place, this church is only remem-

bered, perhaps, in connexion with its chaplain or clerk, Peter, who died just four years before the completion, in 1209, of his stone bridge<sup>\*</sup> across the Thames, and was buried in the chapel of St. Thomas thereon. Yet Stow reminds us "that Henry IV. granted license to William Marshal and others to found a brotherhood of St. Katharine therein, because Thomas à Becket [who was born in a house on the site of the Mercers' Chapel hard by] and St. Edmund the Archbishop were baptised there." The churchyard, to the south-west of Old Jewry, is now built over. St. Mildred's, Poultry, as rebuilt by Wren, was standing until about fifteen years ago behind the houses in the Poultry that lay between St. Mildred's-court (prius Scalding-alley) and Chapel-place, and close to the site of the Poultry Compter, the only prison, by the way, in London that had a separate ward for the durance of Jews. The site of St. Christopher-by-the-Stocks-market, otherwise known as St. Christough, in Threadneedle-street, was taken for the south-western portion of the Bank of England at the enlargement of the Bank in 1788. There its graveyard is still preserved as "the Garden"; whereby, under the statute 9 Anne (1709-10), was established "the General and Chief Penny Post-office." Hutton, in his "New View," gives a succinct account of the church of 1462, and says that "the Walls were not burnt down by the terrible flames of Septemb. 1666; but the church was very much damnify'd, the Pillars and Arches, the Pews, Lead, and Six Bells being destroyed. . . . All the old Part which the Fire left is of the Gothick order; but the Pillars within, &c., are of the Tuscan." Its three-storied tower, with angle pinnacles, are shown in T. Malton's aquatint of October 1st, 1781. The present Sun Fire Office, Threadneedle-street,† denotes the position of St. Bartholomew-by-the-Exchange, which was founded by Nicholas Yeo (Sheriff in 1438) and Thomas Pyke. Having been restored by Wren, it was demolished in 1840 at the building of Sir William Tite's Royal Exchange. The general design, including the four singular doorways or window-frames with which Wren terminated the old tower, is reproduced in Cockerell's Church at the corner of Moor-lane and Tenter-street.

The tale of Wren's City churches that have been destroyed is lengthening apace: the first to go was St. Christopher, followed, after an interval of about fifty years, by St. Michael, Crooked-lane, for the approach to new London Bridge. Then followed St. Bartholomew-by-the-Exchange, and its opposite neighbour, St. Bennet Fink, conspicuous for its domed ceiling, borne upon eight columns of Corinthian order. Next we lost the beautiful spires of St. Michael, Queenhithe, and St. Bennet, Gracechurch-street; the pinnacled tower of All Hallows, Bread-street, which surely a reverence for Milton's memory might have spared; the perfect Ionic façade of the eastern front of St. Dionis Backchurch; and then St. Antholin's, so rich in its associations of religious life during the sixteenth and seventeenth centuries; the wanton destruction of whose exquisite stone steeple leaves us small hope for Wren's already threatened masterpieces of St. Margaret Patens and St. Mildred, Bread-street. Truly enough, his Church of St. Olave, Old Jewry, has no ambitious design; yet its tower, rising from the ground in four stages, and surmounted with angle obelisks capped with balls, is very pleasing. The vane staff, capped with a gilded ship, is appropriated for a multiplicity of telegraph wires, that must now find support elsewhere. The daily press is pleased to deny to this fabric any architectural attractions whatever. He who writes this is dead to any appreciation for the well-devised eastern elevation, immediately over against Old Jewry-chambers, with its large and nobly-planned window. This church, formerly known as St. Olave Upwell, is of ancient foundation, being scheduled in the survey of Ralph de Diceto, dean 1181-1204, as one of those collated to the Dean and Chapter of St. Paul's. A north aisle was added in 1450 by Thomas Morestead, who was churchover to the kings Henry IV., V., and VI. He was buried in that aisle, and Weever has preserved his epitaph:—

"Thomas Worsted gist icē,  
Dieu de s'aine est mortel.  
Amen."

\* Peter is said to have constructed a wooden bridge a few yards eastwards of the later one in 1163.  
† The original Sun Office was also taken for the Bank of England.

Of other worthies interred here may be mentioned Robert Large, mercer (1140), a magnificent benefactor to certain civic charities, and the master of Caxton; Sir Humphrey Weld, Lord Mayor in 1608, whose widow's foundation of the Wednesday Lectures was enlarged by Sir John Frederick; and Giles Dewes, servant to Kings Henry VII. and Henry VIII., and, according to Strype's *Stow*, "clerk of their libraries, and schoolmaster for the French tongue to Prince Arthur, and to the Lady Mary." Also Sir Nathaniel Herne (son-in-law to Sir John Frederick), for whom, as for Sir Robert Clayton, "the fanatic Lord Mayor of Dryden's "Religio Laici,"—Wren built two of the fine mansions for which Old Jewry was once renowned. Clayton's house was pulled down about twenty-five years since, having for while served as the home of Professor Porson when librarian to the London Institution. Here too are the tomb and monumental tablet of Alderman John Boydell, died 12th of December, 1804, the celebrated engraver and printseller. To his liberal patronage of the arts, combined with his collection of what is known as the Shakspeare Gallery, may fairly be ascribed a notable impetus to our later school of historical painting. Boydell had removed from the Unicorn at the Queen street corner, Cheapside, to a shop formerly 90, Cheapside, by the corner of Ironmonger-lane. The remains of the dead will be removed to Ilford cemetery, under care of the Commissioners of Sewers.

Destroyed by the Great Fire, St. Olave's was rebuilt in 1673-6 at a cost of 5,580*l.* 4*s.* 10*d.* Hatton gives us the following dimensions of Wren's fabric:—"Le. of the church, 78 foot; br. 84; altitude, about 36; and that of the Tower to the vertex of the Pinnacles about 88 foot; wherein are only 2 bells."\* This is one of the four London churches which were dedicated to the memory of the Norwegian Olaf, son of Harald Ghrinaka, king and Christian martyr, who fell in battle against the rebel Thore Hund, at Stikkestad, on August 31, 1030, the cry of "Fram, Fram, Kristnen Krossmen Koenigmen" resounding from his dying lips. It had one Unfred for priest, temp. Henry II. At the Dissolution the living devolved upon the Crown, having been previously granted, by a lease, to Builey Priory, county Suffolk. Old Jewry commemorates an early settlement here of the Jews before their expulsion from England in 1290 under Edward I. Their synagogue in this street passed into the hands of some friars,—the *Frates de Sacco*,—and ultimately was adapted as a "manse-house" for several lord mayors in succession. On the northern side of Meeting House-yard, a *cul-de-sac* out of Old Jewry, is a gate opening out to a range of steps. The steps lead downwards, and to a much greater depth than one would expect to find, upon an inclined approach to some premises in the rear of Coleman-street. The descent is too sudden and too steep to be explained in the ordinary way; and there is no record of any watercourse or the like thereto which might account for so rapid and deep a depression in the ground level.

#### THE ACTON DRAINAGE SCHEME.

##### EXPERIMENTS IN SEWAGE TREATMENT.

At the laying of the memorial stone in connexion with this work, by Mr. Wm. Robnck, C.E., Chairman of the Local Board, on Tuesday week last, some interesting experiments were made in a new system of treating the crude sewage. Before referring to these, however, it may be interesting to note the somewhat peculiar circumstances under which Acton was compelled to construct the new drainage scheme, now nearly completed, according to the designs and plans of the Acton engineer, Mr. C. Nicholson Lalley, at a cost of nearly 100,000*l.* Unlike the other districts along the Thames Valley, Acton was not driven to the necessity of running its crude sewage directly into the Thames. The Stamford Brook, an ancient waterway, had been the sewage outlet for Acton from time immemorial; but the Metropolitan Board, in order to utilise its carrying power, incorporated it into their drainage system. The Metropolitan Board three years ago, curiously enough, obtained an injunction against the Acton Local Board, restraining them from putting the sewage of houses built after the date of that order into

the Stamford Brook. Although the sewage of all those houses built antecedent to the injunction was still permitted to enter the brook, Acton was compelled to construct a comprehensive drainage scheme, in order to provide for the requirements of the many new houses being built wide apart all over the parish. In some instances, therefore, an expensive long length of sewer is laid for the drainage of one or two new houses. The Acton Board tried earnestly and repeatedly to come to some arrangement with the Metropolitan Board by which the Local Board would divert at once to the river the large quantity of surface storm water from the Harrow uplands which flowed into the Stamford Brook, and increased unnecessarily the cost of pumping at Barking. This the Local Board undertook to do on condition that it was allowed to use its ancient sewage outlet for sewage only. But the Metropolitan Board were obdurate, and preferred to go on pumping millions of gallons of storm-water of which it could easily have got rid. The Acton scheme is carried out upon what is known as the separate system, and consists of a high and low level. The sewage from the high level finds its way to the outfall at the works by a 3 ft. by 2 ft. egg-shaped sewer, and from the low level by a 2 ft. 6 in. circular sewer. The sewage from the latter is lifted to a height of 36 ft., when the high and low level sewage is mixed with chemicals. It then gravitates into the precipitation tanks, each capable of containing 140,000 gallons. There is also an effluent water tank for storing the effluent during high tide in the river Thames when there is a back flow in the effluent sewer. The storage-tank is capable of containing the same quantity of liquid as one of the other tanks. The effluent sewer, which discharges the clarified sewage into the river at Mall Eyot, Chiswick, is 24 in. in diameter, which enables the tank to be emptied rarely for use in thirty-five minutes. In addition to the tanks, some suitable buildings with neat elevations have been erected for the chemical treatment of the sewage. These buildings stand in two blocks; the engine, boiler, and coal-house to the east, and the chemical buildings in one range stand directly in front of the precipitation tanks. At the rear is constructed a sludge-well, into which the sludge from the precipitation tanks gravitates, from which it is pumped into the pressing-room, and pressed by Drake & Mainhead's patent presses, then ground in the grinding room, and after being dried is put into hags as a manure. The works are situated at the lowest portion of the Board's district, between Acton and Belford Park, on a triangular plot of land, comprising in all five acres and a half. Near the entrance of the works is an attendant's lodge in the "Queen Anne" style, and the ground is being laid out round the buildings and precipitation tanks. The cost of the scheme is about 80,000*l.*, and it is confidently hoped that its operation will improve the health-condition and stimulate the prosperity of the district. The Board has not fixed upon any particular mode of chemical treatment, some negotiations for that purpose with the ABC Company having, from some cause or other, fallen through. The Board are desirous, however, of adopting the most effective and economical method that can be found; and through the chairman, an invitation was given to Dr. A. Angell, of the County Laboratory, Southampton, and Mr. Candy, Director of the International Water and Sewage Purifying Company, to demonstrate the capabilities of their system of treatment, and the Acton tanks were put at their disposal. These experiments were of more than ordinary interest, as this was the first occasion on which the company had conducted experiments in dealing with sewage at any public sewage works. One of the precipitation tanks was filled with crude sewage from the Stamford Brook now connected with the metropolitan system, as the main sewers of the new scheme will not be in operation till June next. The sewage was charged with the chemical salts of the company, the principal feature of which compounds is the absence of lime, which is largely used in most other precipitation sewage works throughout the country.

These "sewage salts" consist for the most part of sulphate of magnesia, sulphate of alumina, and a small quantity of sulphate of iron; in addition to which the company use a powder called magnetic ferrons carbon. One of the difficult questions connected with the

chemical treatment of sewage has undoubtedly been how to retain in the sludge the ammonia and sulphuric acid, which are, to a greater or less extent, lost in the "lime process." It was contended for the company that it has solved the problem by the substitution of ferrous or iron compounds for lime, by means of which the manurial value of the sludge is greatly enhanced, and that instead of the sludge lying in offensive accumulations at the pumping stations it will be very extensively used by farmers. It was stated by Dr. Angell and Mr. Candy, in the course of their experiments, that these materials can be used as economically as any other kind of chemicals. The treated sewage in the experimental tank was allowed to remain quiescent for nearly two hours, though it was asserted that precipitation could be completed in an hour, and then run off into the open channel at the mouth of the effluent sewer. As seen against the white glazed bricks of the bottom of the channel, the effluent, it must be admitted, had not that white appearance which is desired in official quarters, but bore a red tinge, though without any opaqueness. It was explained that this tinge was entirely due to the presence in the precipitants of the iron, which it was pointed out, was not only harmless, but rather a purifier of the water of any river with which it might commingle. The presence of iron was demonstrated by the application to a paulil of the liquid of a testing agent, which gave the resulting green colour to the effluent. Some members of the Board expressed a preference, however, for the white effluent; as people generally, and perhaps inspectors, might not always understand that the red colour was due to such an innocent element as iron. It was pointed out that eight grains of the iron compound had been used per gallon of sewage, but a less quantity would suffice, and would reduce to a large extent the red tinge. A small quantity of the red effluent was afterwards put through a miniature filter bed, composed of a central layer of the company's magnetic spongy carbon, with layers of sand on each side, and in a minute or so the iron-coloured effluent came away limpid and clear like filtered water, and without smell.

The contract for main sewers has been executed by Messrs. Nowell & Robson, and by Mr. George Osenton, of Eritch, Kent, whilst the outfall buildings, pumping station, and precipitation tanks have been constructed by Messrs. John Mowlem & Co., of Westminster.

#### GLASGOW INTERNATIONAL EXHIBITION.

Progress is being made against the opening of the Exhibition next year, a design by Messrs. Campbell Douglas & Sellars, architects, Glasgow, having been approved and adopted. The leading idea makes few pretensions to novelty, consisting as it does of a great central avenue or nave lying east and west and intersected midway by a transept of equal dimensions as to width and altitude; the show-courts, fine-art galleries, and dining-rooms filling up the rest of the oblong. The grand hall at the east entrance is on a line with the nave, and, indeed, practically forms a portion of the unbroken promenade when not shut off for those reception and general ceremonial functions for which it is specially designed.

At the intersection of the nave and transept rises the dominating feature of the elevation, a dome 80 ft. in diameter at the base, and rather over 100 ft. in height. The housing of the Fine Arts section is provided for at the south-west angle of the edifice, where, for fireproof purposes, the prevailing timber of the general structure becomes brick for both outer and inner walls, with corrugated iron for roof covering. Distinct from the main building, which measures 880 ft. by 360 ft., to the west of it, and on a 6 ft. lower basement level, stands the less ornate machinery annex, 300 ft. long by 250 ft. broad. The general site flanks the left bank of the River Kelvin, over against the southern façade of Glasgow University, which extensive cluster of stone and lime, including the famous Bute Hall, occupies the bold crest of Gilmorehill, a few hundred yards back from the stream. Opposite the Exhibition and upon the Park ground between the college and the right bank of the river it is proposed to erect a full-sized presentment, in improvised and temporary materials, of course, of the old "Bishop's Palace" of Glasgow, which from early in the fourteenth

\* A New View of London, 1758. Vol. ii., fo. 449.

House, "Oakleigh," Pembury, Tunbridge Wells.—Mr. George Lethbridge, Architect.

century to the close of last century (latterly in a state of hopeless ruin) stood on the line of the High-street in the immediate vicinity of the stately cathedral which has so happily survived it. This reproduction is, in dimensions and architectural details, to follow as closely as the lost original as a somewhat imperfect knowledge of former actual conditions will permit; and it is intended that the larger apartments of the revived palace shall be set aside for that portion of the Exhibition which for its interest depends on the concerns of archaeology and antiquarian rarity. As the old palace was of considerable extent, and possessed some claims to magnificence, even the material likeness now contemplated will prove no light effort in a byway of the builder's art; but if accomplished to reasonable satisfaction, the added attraction will undoubtedly be important. It is remembered with interest in this particular connexion that the rural castle or country quarters of the old bishops of Glasgow stood on the banks of the Kelvin, at only a trifling distance away; and further, that the same building was not so very long since demolished to help in making way for the spreading tereaments of ship-building Partick. The Exhibition site is within the bounds of the city's west-end park, occupying that portion in ordinary times

set apart for football and like pastimes. On three sides it is bordered by streets, and on the fourth or north by the left bank of the winding Kelvin, which, after flowing through the park, and threading the less desirable purlieus of Partick, falls into the Clyde about a mile away. The grand entrance is on the north, facing the western suburb of Hillhead, and in direct line with Bank-street and University-avenue, the approaches across the park from that quarter being served by two bridges, side by side, which debouch right in front of the entrance doors. In style the design is somewhat Oriental in character, and the central dome is relieved and enstained by attendant towers, minarets, and spires at various angles and intersections. The corner of park ground chosen is not perhaps the most desirable, being uneven of surface and offering but poor margin for the adornment of arboriculture; but the finest part of the permanent park is quite at hand, and will sufficiently serve for purposes of outdoor variety to visitors. The Kelvin, unfortunately, is not so pellucid as it was in the days when the old hishops rusticated on its banks; but possibly in view of next year's exhibition the very natural solicitude of the authorities may result in some temporary alleviation, if nothing more, as regards its rather questionable look and odour.

HOUSE, "OAKLEIGH," PEMBURY, TUNBRIDGE WELLS.

THE above illustration shows a new front to this house, the additions consisting of porch and entrance-hall, with bed and dressing rooms, &c., over. The materials used are, for the exterior, Peterhead granite for columns and pilasters, and Portland stone for the other portions of the work. The porch is finished in various coloured marbles, with mosaic ceiling and floor. The entrance-hall has a high dado of mahogany, dull polished, and the upper parts of the wall are furnished with Tynecastle tapestry, with a ceiling of the same material. The floor of the hall is of black and white marble. All the windows are fitted with double sashes, and all the walls are built hollow. The architect is Mr. George Lethbridge.

**Prof. H. G. Seeley's Geological Field Glass.**—It is intended to form a class, including beginners and advanced students, this summer, in the same way as last year, for the study of geology near London, to be conducted on Saturday afternoons, by Prof. H. G. Seeley, F.R.S., King's College.

## COMPETITIONS.

*Glasgow Exhibition Buildings.*—At a meeting of the Executive Council for the Glasgow International Exhibition, 1888, held on the 30th ult. in the Corporation Galleries, Sauchishall-street, the principal business was to adjudicate on the designs for the building. In answer to advertisements, twelve plans had been submitted by competing architects. For the three best designs, premiums of 150, 100, and 50 guineas were offered, and the author of the first one was to have the right to carry through the work of erection at a rate of 2½ per cent. upon the cost of the building, restricted to 30,000*l.* It was remitted to a sub-committee to examine the designs and report as to their order of merit. According to their recommendation it was understood, says the *Scotsman*, that the first prize design was "Industry, Science, and Art"; second, "Bishop's Palace"; and third, "Thought and Experience." After discussion the Council agreed that the three plans recommended by the Building Committee should be voted on by ballot, Drs. Macgregor and Robertson to be tellers. The result was as follows:—For "Bishop's Palace," 38; for "Industry, Science, and Art," 23; and for "Thought and Experience," 2. On the letters being opened it was found that Messrs. Campbell Douglas & Sellers, St. Vincent-street, along with Mr. J. Barr, C.E., were the authors of "Bishop's Palace"; Messrs. J. Burnet, Son, & Campbell, St. Vincent-street, with Mr. Charles Lindsay, C.E., the designers of "Industry, Science, and Art"; and Messrs. P. Smith and H. E. Clifford, St. Vincent-street, of "Thought and Experience."

*New Government Offices at Christiania.*—By Royal Resolution of March 16, designs have been invited for a new Government building at Christiania. The total cost is fixed at 75,000*l.*, the State providing the site. The designs are to be submitted within six months from the above-mentioned date. Five premiums will be offered, of 55*l.* each, and a further sum of 110*l.* awarded for the design chosen.

THIS is an old building rebuilt, and with modern sculpture and carving in the centre portion. For further reference to it, see the article on the "Musée Carnavalet" in the present number.

DETAIL OF PRINCIPAL ENTRANCE,  
CITY HALL, ALBANY.

This is a fine example of the kind of detail, based on Byzantine types, which has been worked out in America by the genius of the late Mr. Richardson. It is reproduced from a photograph.

VESTIBULE OF THE CASINO THEATRE,  
NEW YORK.

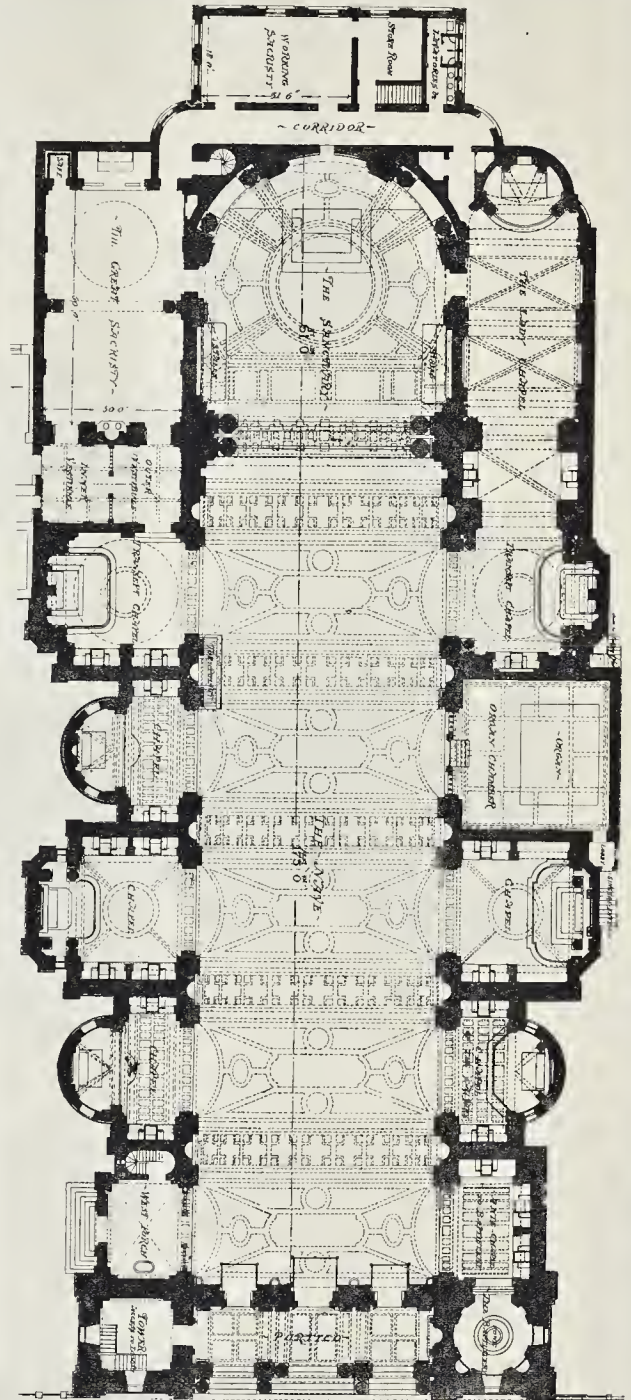

THIS, which is not a new building, but one of comparatively recent date, we give as an example of the manner in which Eastern types of decoration and detail are being adopted more or less in American architecture. In this case there is more of mere reproducing, however, than in the doorway referred to above. It does not fall to many architects to have the genius of Richardson for shaping new forms out of old.

DESIGN SUBMITTED FOR THE LONDON  
ORATORY.

THE design an interior and exterior of which we now publish was that sent in competition by Messrs. Goldie & Child.

The style was, as required by the conditions laid down, that of the Italian Renaissance. The materials proposed to be used were brick for the structure generally; in the interior, slabs of rich marble for the pilasters, panels, &c.; columns and balustrades of the same materials, as also the exposed portions of the floors. The caps were to be of bronze, and the walls and ornaments were to be finished in some fine cement,—designed, as was the vault, to allow of the introduction of a great amount of rich decoration.

The exterior generally was to be faced with marble, with Portland stone dressings. The upper part, the campaniles, and the whole of the west front, however, were to be entirely of the latter material.

Messrs. Goldie & Child's Competition Design for the London Oratory, Brompton.—Plan.

It was owing to the vast outlay which would be necessarily involved by the great scale prescribed for the fabric, that stone was not proposed for the entirety of the exterior of the building, and it was for the same reason that a dome, much as it was to be desired, was not introduced into the design.

Although unsuccessful in the competition, the design will be admitted to be one well worthy to be better known, and its publication at the present moment will, we hope, be accepted as a slight tribute on our part to the memory of the late Mr. Goldie, an architect who has left much excellent work behind him.

THE HISTORY OF THE UNITED STATES

Midship Section of Sludge-Ship for the Metropolitan Board of Works.

Longitudinal Section of Part of Sludge-Ship for the Metropolitan Board of Works.

SLUDGE-SHIPS FOR THE LONDON SEWAGE.

THE public are generally aware that extensive works are being constructed by the Metropolitan Board of Works for the purpose of treating the sewage of London by a chemical process, with a view to prevent the pollution of the Thames. At present the sewage is discharged into the river at two points, one a little to the west of Barking Creek, and the other at Crossness Point, somewhat further down the stream on the opposite shore. The Barking outfall is an outlet for all the metropolitan sewage north of the Thames, while the Crossness outfall in like manner discharges the southern sewage. Works for the precipitation of the sewage and the removal of the sludge are to be established at both the outfalls. The contract for the northern works has recently been taken by Messrs. J. Mowlem & Co., and commencement has been made with the preliminary operations. The contract price is 406,000*l.*, and the works are to be finished in eighteen months. The chemical process has been devised by Mr. W. J. Dibdin, F.C.S., F.I.C., the chemist to the Metropolitan Board, the method having the approval of Dr. Dupré and other eminent chemists. The works, which are very extensive,

and altogether of a novel type, have been designed by Sir Joseph W. Bazalgette, C.E., the Engineer to the Metropolitan Board. Among other remarkable features connected with this undertaking, the plan for getting rid of the sludge takes a prominent place. The subject has engaged the attention of the Institution of Civil Engineers during the greater part of a discussion extending over four weekly meetings, a paper prepared by Mr. Dibdin serving as the text. The debate naturally digressed into a review of the whole of the sewage scheme, but "sewage sludge" and its disposal was the avowed topic. The volume of the London sewage is vast, and the residuum from the precipitated process is of proportionate magnitude. The plan for the removal of the sludge will be the same for each side of the river, and consequently in describing it we refer to the entire volume, north and south. The plans for the Crossness works are being prepared, and the requisite tenders will be invited at no distant date. The entire cost of the scheme is reckoned at three-quarters of a million for the capital outlay, and an annual charge of 118,000*l.*

The precipitation works now being constructed at the Barking and Crossness outfalls are to be adapted for the treatment of 156,000,000 gallons

of sewage per day as the average for a future population of 5,200,000. A grain of solid matter per gallon corresponds to ten tons in the daily total. It is reckoned that 3,000 tons of "settled sludge" will have to be disposed of daily when the works on both sides of the river are in full operation. After debating various expedients, the Metropolitan Board have arrived at the conclusion that the best mode of dealing with the sludge is to have it conveyed beyond the Nore in ships and cast into the sea. For this purpose they invited designs and tenders for suitable vessels, and numerous proposals were received, among others from the Barrow Shipbuilding Company.

The design sent in by this Company was submitted to Sir Frederick Bramwell, in conjunction with Sir Joseph Bazalgette, and received approval. The Company's tender was accepted and one ship was ordered. Future arrangements are, of course, uncertain, but it is expected that as many as six or seven ships of some kind or other will be required, so as to provide for the due removal of the sludge under all circumstances of weather, wear and tear, and other contingencies. The contract with the Barrow Shipbuilding Company for the one ship now in hand was sealed a short time back, and the vessel was to be delivered at Crossness in six months from that period. This will bring the delivery into the month of July, and Crossness is named, inasmuch as the precipitation process is already in partial operation there in connexion with experimental works, and a considerable quantity of sludge has been produced. The contract price for the ship is 15,750*l.* On the whole, something like 100,000*l.* will have to be expended on the sludge fleet. The ship now being built will have a load displacement of 1870 tons and will carry 1,000 tons of sludge. The length between perpendiculars will be 230 ft., the moulded breadth 38 ft., and the moulded depth 14 ft. 6 in. When loaded the draught forward will be 9 ft. 9 in., and aft 10 ft. 1 in. The form of the ship is characterised by considerable breadth in proportion to her depth. She may be described as long and broad, but very shallow. Her light draught forward will be 2 ft. 4½ in., and aft 7 ft. ½ in. When coaled, and trimmed with water ballast, the vessel will float on an even keel with a draught of 5 ft. 9½ in. The material employed in the construction of the ship will be principally steel, of a quality to stand Lloyd's tests. The stem and the sternpost will be of iron, and the main deck of steel. The engines and boilers will be placed abaft the sludge-hold, and propulsion will be given by twin screws, the available speed to be not less than ten knots per hour. The engines are to be of the triple expansion type, in two sets. Steam is to be generated in two multitubular marine boilers of mild steel, with iron tubes, each boiler being 11 ft. in diameter, by 10 ft. 3 in. in length. There will be two of Fox's patent corrugated furnaces to each boiler. Powerful pumps are to be provided for filling the sludge compartments, and supplying the ballast tank forward with water. The consumption of coal will be 11 cwt. per hour, and the hunkers are adapted to hold at least 30 tons. The vessel will have no sails, but simply a mast for signalling purposes. The scantlings are to be in accordance with Board of Trade rules, and a certificate is to be obtained from the Board. The vessel will carry one boat.

The sludge will be transmitted from the precipitation works to the ship along iron pipes laid under the platform of a jetty and pier carried out into the river, the ship lying alongside the pier for the purpose. The cargo will occupy four large water-tight compartments, ranged two abreast, in the hull of the ship. The total length thus occupied will be 60 ft. long. The lowest part of the floor of these compartments is left about 9 in. above the light-trimmed water-line, and slopes down from two sides to the centre, where the outlet valves are placed. Of these valves there will be two, 18 in. in diameter, in each compartment. That portion of the ship which lies below the sludge compartments is simply so much unoccupied space, giving sufficient buoyancy to the vessel to bear up the sludge to the requisite height, so that the water-line shall always be at such a level in respect to the sludge as to permit of a free discharge. As the sludge escapes so the vessel will rise and the due relation of the levels be maintained. The exit of the sludge will follow the raising of the valve, effected by means of a rod leading up to

the deck, where it will be worked by a screw arrangement, so as to lift or depress the valve to which the rod is attached. Passing through the valve the sludge will pass down a fixed cylinder into the sea. The hopper arrangement by which dredged materials are cast into the sea on some parts of the coast would be unsuitable in this case, the specific gravity of the sludge being little more than that of water. In the present plan the sludge will escape from the bottom of the ship several feet below the surface of the sea. From the time when the sewage enters the precipitating tanks at Barking or Crossness until the residuum is discharged into the German Ocean, the sludge will never be seen. Having reached a specified distance of at least ten miles beyond the Nore the ship will commence to discharge its refuse freight. If occasion required the whole could be allowed to escape in ten minutes. But a more deliberate mode of proceeding is to be expected, so as to prevent any palpable pollution of the sea. As the quantity of settled sludge produced at the two outfalls when the works are in full operation will average 3,000 tons per day, three ships will be required for the day's work. It is reckoned by Mr. Dibdin that this quantity of sludge will be spread over a course of some thirty miles. The organic matter in the discharged material will be about 150 tons, and it is calculated that the track of the ships will not be polluted to any greater extent than about 16 grains of organic matter per gallon of sea water. Oxidation, the feeding of fish, and the action of the tide, are expected so to deal with this organic matter as to prevent any nuisance accruing to the contiguous line of coast. As to the volume of the sludge it was stated by Sir John Cooke in the recent discussion at the Institution of Civil Engineers, that the quantity of material dredged and sent to sea by the Tyne Commissioners during a period of years, averaged about four times as much per annum as the weight of sludge to be disposed of annually by the Metropolitan Board.

Two diagrams are appended, to illustrate our text. The longitudinal section shows a portion of the length of the ship, commencing at a point a little abaft the midship line, and proceeding forwards. Two water-tight bulkheads are shown, forming the two extremities of one of the forward sludge compartments, and also enclosing a portion of the cellular space below. The engines and boilers are at the rear of the tanks, with accommodation for the captain and officers further aft. The remainder of the hands on board are provided for in the forepart of the ship, ahead of the sludge compartments. The water ballast tank near the bow is required to bring the vessel's head down when the sludge has been discharged, thereby counterbalancing the weight of the engines aft. The midship section, which forms one of the diagrams, is taken through the sludge compartments, showing in section the longitudinal divisions of the cellular space beneath, and the position of one of the discharge valves.

#### DISINFECTATION IN THEORY AND PRACTICE.

ASSOCIATION OF PUBLIC SANITARY INSPECTORS.

On Saturday last, at the monthly meeting of the Association of Public Sanitary Inspectors, held at the Westminster Town Hall, Dr. Alfred Carpenter, J.P., read an interesting paper entitled "Theory and Practice in Disinfection," in complying with a generally-expressed wish for an elaboration of some advice given by him to the members of the Association a few months ago. Commencing with an exhortation to the members to let reason and science guide them in their acts instead of the method, once nearly universal, of following empirical rules (which the Doctor emphatically called "following instinct"), the lecturer indicated the necessity of a systematic inspection, which ought to be regular in its irregularity. The various causes of infection were enumerated, the formidable list closing with the fouling of sources of water, and then the action of individuals or communities, and then the remedial measures to be adopted were discussed. So simple an action as pouring a solution of chloride of lime into a sewer should have a basis of reason in the mind of the inspector, and should not be done by mere rule and in blind obedience to stereotyped orders. Merely to get rid of nasty smells was not a sufficient reason for applying a disinfectant. The very nonsensical-

ness of a nasty smell generally prevented its doing harm. The object should be to check putrefaction,—to prevent the production of the gases which were causes of smell. The great difficulty of correct disinfection was to destroy the germs or eggs of bacteria as well as living bacteria. He had seen ova covered by carbolic acid and actually preserved by being so covered, with the result that when released from their dormant state by the peeling-off of the acid, they caused a fresh outbreak of disease. Germs such as those contained in the breath of a smallpox patient in the feverish stage would strike root if at once conveyed to the mucous membrane of a susceptible person, but they could not bear the action of light and air, nor the action of ozone, and they would lose their vitality if floated in air for the space of 100 yards. Hence the philosophy of isolation coupled with rapid ventilation, and the danger of the conveyance of smallpox cases through crowded districts. He recommended a particular kind of respirator to be used in such cases, the object to be attained being the retention of the germs in a disinfecting medium, which might be either antiseptic gauze soaked in a solution of carbolic acid, or a thin layer of cotton wool. All matter in which dormant spores might be resting hidden must be destroyed, but even then the process of disinfection would be incomplete unless the disease protoplasm were oxidised. The three necessary conditions of complete disinfection were, therefore,—first, ventilation, to secure complete oxidation; second, destruction of the bacterial life; and third, destruction of the resting spore. Chloride of lime and carbolic acid having somehow failed, and ventilation having proved insufficient, many sanitarians resorted to burning the offending matters, but that appeared to the lecturer wicked waste. Nature provided a better security, viz., vegetation itself. He thought the benefit of lime-whiting arose less from the action of the lime upon organic matter in contact with it than from its absolutely removing the poison from the air of the chamber treated. Aerial disinfection by ventilation and sunlight, and by sulphurous acid fumes, was advantageous for the destruction of insect life, but alone such disinfectants were never enough for infected rooms. Scraping the walls (the scrapings being burnt in a furnace), washing the walls with lime-whiting, and the floors of infected rooms with corrosive sublimate, must follow. The latter was dangerous to use, and expensive, but rapid and thorough in its action. A solution of one part in 5,000 of water would in a quarter of an hour destroy either dormant germ or living thing,—a fact that had been proved by actual experiment. In declaring his conviction that steam heat was superior to every other means for disinfection, the lecturer said he was supported by the experiments of Dr. Koch, and he had no doubt that, in the future, disinfection by heat would take that form. To trust to carbolic acid for destroying the progress of infectious disease was to trust to a broken reed. Spores kept weeks in a five per cent. solution of carbolic oil, or preserved in alcohol, had been found capable of vigorous growth when afterwards transplanted to a favourable soil. Therefore, it was a fiction, and not a fact, to suppose that alcohol, or the use of spirituous liquors, was a remedy against impure water. While sewers were little better than elongated cesspools, and remained a disgrace to the constructing engineer,—i.e., so long as they were not self-cleansing,—all excreta from infectious cases should be disinfected before entering the sewers, and for this purpose the application of green copperas (sulphate of iron) was the best. In the insufficient quantities which ordinarily were used, most of the advertised nostrums were moonshine for purposes of disinfection. Unless used in quantities fifty times more profuse than was usual, it was a wicked waste of material, and the same might be said of permanganate of soda and lime and iron, as recommended by the advisers of the Metropolitan Board of Works. Dr. Carpenter, in conclusion, said,—I trust that I have said enough to show the main basis upon which disinfection should be carried out are: Ventilation, aerial disinfection, or disinfection by chlorine or steam; lime-whiting, washing floors and furniture with solution of mercuric chloride (corrosive sublimate); steam heat, for clothing, furniture, &c.; sulphate of iron, or chloride of lime, in adequate quantities, for flushing; and the wonderful agency of

vegetable life. If these means are effectually applied, infective diseases will be completely banished from our midst, and any local authority which now allows of their continuance is doing defective work.

The lecturer was warmly applauded at the conclusion, and after a discussion, in which the chairman (Mr. Jerram) and other speakers took part, a cordial vote of thanks was tendered.

PROFESSOR ROGER SMITH'S LECTURE ON "BRICKS AND BRICKWORK."

SIR.—The Professor quotes in his lecture at Carpenters Hall, as reported p. 519 of last issue of the *Builder*, "A good brick was uniform in size; standard 9 in. by 4½ in. by 2½ in." I wish to point out that with bricks of this size or this proportion you cannot make decently fair work. Try with a common wall one brick thick, Flemish bond: the outer stretchers side by side with a 3 in. joint between would measure 9½ in., whilst the headers being only 9 in. long, cannot reach the face of the work on one or both sides. Then, again, how is "Old English" bond to be worked, if two headers be equal to one stretcher? The header courses must have double the number of perpendicular joints than the stretcher courses require. The proper proportion of breadth to length is that the breadth should be half the length *less half the thickness of a joint*. I prefer a 2-in. joint. The size to be aimed at is 9½ in. by 4½ in. by 2½ in. It will be seen that in this size, or in any size of the same proportion, the bricks will bond perfectly with each other, either in "Flemish" or "Old English." Of course, in stocks, you cannot make bricks all exactly to sixteenths of an inch; but if you adopt this as a proper standard size and aim at making them as nearly that as possible, your bricks will average the proper dimensions. If you want a 3-in. joint, the size should be 10 in. by 4 in. by 2½ in., or 9 in. by 4½ in. by 2½ in.

Whilst writing of bricks, permit me to point out that many admirable facings from the Midlands and other distant parts are too thick to bond with London bricks. Again, others, especially white Suffolk, are too long in proportion to their breadth, being commonly 9½ in. to 9 in.; so that to keep the "perps" with other facings, they have to be shortened, at considerable expense.

In some cases the makers start with a size more or less right, but as the clay at different depths often slightly varies in quality, so that it shrinks more or less in burning, they neglect to follow this variation by the necessary alteration of their moulds, and so the size of brick varies from season to season. A. H.

KITCHEN BOILER EXPLOSIONS, AND SAFETY VALVES.

SIR.—Mr. Wiston, on page 521, in mentioning his "precautions," appears to me to make a mistake; for, while he refers to "tanks" in his third recollection, he says, in his first, that the lowest draw-off tap is to be above the top of the "boiler." Now, if there is a hot-water tank on the hot system, the lowest draw-off should be joined above this tank, so that the said tank cannot be emptied by opening the draw-off taps.

By "tank" here is meant the hot-water receptacle often placed below the ceiling of the kitchen, and not the *cistern* which supplies the boiler with cold water.

Further, another precaution, often omitted, is to see that the hot blow-off pipe has a rise upwards in every part of its course, so that there may not be any obstacle to the easy rise of the steam and heat up the pipe. W. E. BUCHAN.

SIR.—Mr. Robert Wiston has fairly argued this subject. One little point remains to be noted, which has always adopted with perfect success, viz.: to have the dead weight safety-valve on the return pipe—say, just above the kitchen mantel,—and not on the flow pipe. The advantages are, (1) the return pipe never corrodes, as does the flow, neither does the water freeze in this pipe so low as the kitchen mantel. When the water freezes in the pipes, it always occurs somewhere in the upper or coldest part of the house,—assuming the pipes are kept inside. Should the boiler be overflowing with water through other causes, the pipes being free and open, the safety-valve will instantly blow it. I have no interest in saying it, but I have always found J. Tylor & Sons' very effective. No good engineer ever thinks of putting a draw-off cock to a circulating boiler. ROBT. CRANE.

CRANE'S WARMING AND VENTILATING COIL.

SIR.—Observing a notice in your last issue [p. 524] of Crane's warming and ventilating coil, we feel, in justice to ourselves, that it is only right to state that the coil in question is simply a copy of our hydro-caloric warming and ventilating coil, which has been manufactured by us for upwards of 20 years. We enclose our printed particulars, with abbreviated extracts from notices received in the press about seven years ago, the first of which appeared in the *Builder*. J. WEBBS & CO., King's-road, Chelsea, April 4.

PROVINCIAL NEWS.

**Bideford.**—The new Infirmary and Dispensary buildings here were opened on the 31st ult. They have been built by Messrs. W. E. Gent & Son, the contractors for the work, from the designs of Mr. G. Malam Wilson, Bideford. The whole of the hospital departments are on the ground floor. Each of the main wards will accommodate five beds. The premises have been built of local stone and brick, with Portland cement dressings and Aberthaw wrought cast. The contract price for the erection of the building was 1,120l., but, including sundry extras and the purchase of the site, the total cost has been about 2,000l.

**Birmingham.**—On the 31st ult. the memorial stone of the new infirmary which is now in course of construction at the workhouse, Spring Hill, was laid. The building is designed on the pavilion principle, with a continuous corridor connecting the several pavilions with each other. The chief block is placed centrally, so that easy access is not only obtained there from all parts of the infirmary proper, but it is so planned that the laundry and chapel are accessible without any official or inmate getting out in the wet or inclement weather. The design is in harmony with the existing architecture. In the wards about 1,100 cubic feet of space will be provided for each patient, and 80 ft. of floor-space. The whole of the floors, corridors, and gangways will be of fireproof construction,—concrete carried on wrought-iron girders and joists,—and the floors of the wards will be laid with "oak-block" flooring, wrought and polished with beeswax; those on the ground-floor having a layer of bitumen underneath, so as to prevent the slightest damp arising. Mr. W. H. Ward is the architect, and Messrs. Bissett & Sons are the contractors.

**Cardiff.**—The Marquis of Bute has given eighty-eight acres of land at the foot of Penylan-hill as a new park for Roath.—Levin's new Music-hall, in Queen-street, has been opened. It has been erected by Mr. Martin, contractor, Cardiff, at a cost of between 6,000l. and 7,000l., and will seat 800 persons.

**Stockton.**—Stockton New Bridge, which crosses the Tees at a distance of about 20 ft. above the old bridge, was thrown open for traffic on Monday last. The old bridge has five arches, but the new one has only three,—viz., a centre opening of 110 ft. span and two side openings each of 85 ft. span. The crown of the centre arch is 18 ft. above zero of the tide gauge adopted by the Tees Commissioners, being the same height as the crown of the centre arch in the old bridge. The crowns of the side arches are 16 ft. above zero. The old bridge (says the *Leeds Mercury*) was built under the powers of an Act obtained in 1761, the twelfth Parliament of Great Britain, and the work was commenced about the year 1763 and was completed in 1771. The Bridge Board have entered into a contract with Mr. W. C. Atkinson, of Stockton, for the removal of the old bridge, and this will now be proceeded with. The causeway of the new bridge is 60 ft. wide between parapets, this width being divided into a roadway of 49 ft. and two footpaths each of 10 ft. The new structure is of iron and stone. Each arch consists of eight ribs of wrought iron, strongly braced together; upon these are laid transverse iron joists, which in their turn support a flooring of iron "buckled" plates, covering the whole surface of the causeway. Over this plated surface is spread a layer of concrete, forming the foundation for the metalling of the roadway and the York-stone flagging of the footpaths. Over the arches the parapets are of open cast-iron work; over the piers and abutments they consist of massive masonry of granite. All the visible portions of the piers, abutments, and approach walls are of Brumley Fall stone, the masonry of the piers and abutments is of dressed ashlar, and that of the retaining wall, on the Durham approach, is of rough ashlar. Cement concrete has been used in the hearting of both piers' abutments. The subaqueous part of each pier consists of five cast-iron cylinders, filled with hydraulic concrete. The abutment on the Yorkshire side is of masonry and concrete throughout. Here the river bank consists of a deep bed of tenacious clay, which rendered it possible to lay a foundation of concrete at a sufficient depth, and build up the masonry upon it, the water being excluded by means of a timber cofferdam surrounding the abutment.

On the Durham side of the river the case was different; the clay does not extend to so great a depth as on the Yorkshire side, and below it is a bed of running sand, interspersed with boulder stones. Under these circumstances, and considering the depth attained by the channel in an adjacent part of the river, it was considered advisable to have recourse to the same system of foundation as that adopted for the piers, and accordingly cast-iron cylinders were employed. A contract for the execution of the works was taken by Messrs. Whitaker Brothers, of Horsforth, near Leeds, upon an open competition, and the entire work has been carried out by them. The approximate cost of the works, exclusive of Parliamentary and legal expenses and land, is 65,000l., the estimated cost being 40,000l. The engineers of the work were Mr. Harrison Hayter, Vice-President of the Institution of Civil Engineers, and Mr. Charles Neale, M. Inst. C.E. Mr. Sivert Hjerleid, of South Stockton, has acted as clerk of the works.

SCOTCH NEWS.

**Alloa.**—On the 2nd inst., the memorial stone of the new town-hall and library at Marshall, Alloa, the gift of Mr. John Thomas Paton of Norwood, was laid with Masonic honours by the Earl of Mar and Kellie. The building, which, as regards style is an adaptation of Gothic, will be 165 ft. in length; the breadth of the front portion facing Marshall is 87 ft., while the breadth of the main portion, which consists entirely of the hall, is 54 ft. The height of the front portion of the buildings from the ground line to the ridge will be 60 ft., while the height of the hall from ground line to ridge will be 40 ft. The centre block of the front portion will project fully 8 ft. beyond the general line of frontage. Springing from the hall floor, there is on either side a handsome staircase leading to galleries and rooms above. On the ground floor and on either side of the entrance there will be ladies' and gentlemen's lavatories, cloak-rooms, porter's room, &c. In this portion of the structure there are two side entrances to the hall. The hall will be fitted with side and end galleries, with orchestra and space for organ, having also a suite of retiring-rooms at the back of the platform, to which entrance may be had at the extreme north end of the building. On the first floor in the front block is situated reading-room, billiard-room, smoking-room, library, and reference library (Mr. Paton having agreed to give 1,000l. to form the nucleus of a library), billiard and reading rooms. On the second floor there will be provision for the Art School, which will include masters' room, elementary room, model-room, &c.; indeed, the whole of the second floor will be more or less devoted to the purposes of the Art School, and all these rooms will be reached by the main staircases, lighted from above by means of a glass roof. At the north end of the building, on the second floor (immediately to the back of the ball), rooms will be provided for the keeper. The building is from designs by Mr. Waterhouse, R.A., London, and will cost between 20,000l. and 30,000l. The contractors for the work are:—Mason work, Messrs. G. & R. Cousin; joiner work, Mr. Thomas Brown, Glasgow; plaster work, Mr. James Grant; slater work, Mr. R. Macfarlane; plumber work, Messrs. Philip & Hutchison; the clerk of works and local representative of the architect is Mr. Monteith.

**Kirkcaldy.**—New premises have just been erected in Kirkcaldy for the British Linen Company's Bank. The building is Italian in style, and consists of three stories. The ground-floor contains a spacious telling-room, also safe-room and agent's room. The writing chambers of Messrs. T. Dow & Sons are situated in an outbuilding in the rear of the bank. On the first and second floors of the building is the agent's dwelling-house. The bank has been built from plans prepared by Messrs. Kinneir & Peddie, architects, Edinburgh.

**Ancient Monuments.**—An order in Council was passed on the 7th of March last, declaring that the following ancient monuments should come under the provisions of the Ancient Monuments Protection Act, viz., Little Kix's Coty Houses in Aylesford, Kent; the chambered tombs at Buckholt, Gloucestershire; the Druids' circle and tombs on Eyam Moor, Derbyshire; the Pictish tower of Carlaway, the Ruthwell Runio Cross; and St. Ninian's Cave in Wigtownshire.—*Athenaeum*.

## ADIE'S COMBINED LEVEL &amp; THEODOLITE

## CHURCH-BUILDING NEWS.

**Lincoln.**—On the 29th ult. the cap-stone of the spire of St. Swithin's Church, Lincoln, erected at the sole cost of Mr. Alfred Shuttleworth, as a memorial to his late father, was put in its place. The whole height of the spire from the ground level is 200 ft., just 100 ft. short of Louth spire (300 ft.), 74 ft. short of that of Grantham (274 ft. before the recent restoration; now something more), and 20 ft. short of the spire of Newark (220 ft.), but 17 ft. higher than the western spires of Lichfield Cathedral (183 ft.). The architect is Mr. James Fowler, of Louth. The stone was laid by Mr. Browning, the foreman under Mr. Baines, of Newark, the contractor for the work.

**Maldon.**—On the 29th ult. St. Mary's Church, Maldon, Essex, was reopened by the Bishop of St. Albans, after having been closed for restoration and enlargement for more than a year. The church, some parts of which date from Norman times, had suffered much by neglect and had been much pulled about during the last hundred years. The works which have been carried out include the construction of an arcade, with clearstory over, upon the site of the old south wall of the nave, and the building of a new north aisle capable of seating upwards of 100 additional persons. This will give accommodation for 390 persons against 254. At the east end of the new aisle an organ chapel and vestry have been constructed, an entirely new roof has been put upon the nave and also on the chancel, and the walls and windows of both nave and chancel have been substantially restored, and the whole fitted with new benches and paving, care being taken to preserve the old memorial slabs, and also the fragments of interest which were found during the progress of the works. The tower, which is surmounted by a fine old oak heacon, still remains to be restored. The whole of the works have been carried out by Mr. Gozzett, builder, of Woodham Walter, under the superintendence, as far as the nave and aisle are concerned, of Mr. Fred. Chancellor, architect, of Chelmsford, and as regards the chancel, under Mr. Ewan Christian, architect to the Ecclesiastical Commissioners. The total cost of the works as far as carried out amounts to £2,400.

## The Student's Column.

FIELD WORK AND INSTRUMENTS.—XV.  
Surveying Instruments.

IX.—THE THEODOLITE (continued).

THE permanent adjustments of the instrument executed by the makers fix the horizontal limb marked P truly level, when the spirit bubbles Q and T, or T', appear in the centre of their run, and the plane of the vertical arc or circle perpendicular to the horizontal limb. The line of collimation must also be at right angles to the trunnion axis of the telescope, and the trunnion axis of the telescope should be parallel to the horizontal limb. The long spirit level attached to the telescope should be parallel to the line of collimation (see figs. 34 to 44). To test the workmanship of the bearing surfaces connected with the vertical axis, set up the instrument as accurately level as possible, clamp the vernier plate to zero, and turn the limb of the instrument round the vertical axis until the telescope is over two opposite parallel plate screws U U, or Z Z. Tighten the collar R, and finally adjust the bubbles Q and T in the centre of their run by the parallel plate screws. Then unclamp the vernier plate, and turn it half round, so that the telescope, after traversing 180° upon the horizontal circle, is again over the same pair of parallel plate screws. The spirit levels Q and T will now be reversed in position with regard to the parallel plate screws, and if the bubble in each level is not in the centre of its run, the adjustment must be half effected by turning the capstan-headed screws of the bubble tubes respectively, which connect it to the instrument, and the remaining half by turning the elevating plate screws parallel to which it is placed. The operation must be repeated until each bubble remains accurately in the centre of its run in both positions of the telescope. Having accomplished this, perform the same operation with the vernier plate clamped to the horizontal limb by unclamping the collar R, and again reversing the telescope by traversing it round 180° over the elevating plate screws. If the bubbles do not still remain in the centre of their run, the instrument must be returned to the makers,

as it shows that the two parts of the axis upon which the limb and the stage revolve have been inaccurately turned. When both the horizontal limb and the vernier plate are in adjustment,—that is, when the bubbles of the two spirit levels Q and T remain in the centre of their run during all positions of the revolution of either the vernier plate or of the whole instrument round the vertical axis, as above determined,—the line of collimation in the telescope should be horizontal when the bubble attached to the telescope is in the centre of its run, with the vertical arc or circle set to zero. The adjustment of this long bubble for reversion is effected in a similar manner to the adjustment of the shorter bubble T, to which it is parallel. The vertical arc is clamped to zero, and the telescope reversed as before.

However carefully the mechanism of the instrument may be executed, the telescope requires to be tested optically when fitted together. The line of collimation is examined and adjusted (1) for measuring horizontal angles, or angles in azimuth; (2) for measuring vertical angles.

Horizontal angles between vertical planes.

(a). Having set up the instrument level, clamp the horizontal vernier plate to zero, and with the collar R unclamped, direct the telescope to a flagstaff, the weather vane on the spire of a church, or to some small well-defined object, at as great a distance from the instrument as the situation will permit. Then tighten the collar R, and by means of the tangent screw S, make the central intersection of the cross hairs bisect the object viewed. Having done this, release the clamp screw C of the upper plate, and traverse the upper plate from zero, so that a point in another well-defined distant object, which should stand about the same level is viewed, clamp the screw C, and by means of its tangent screw, D, make the cross hairs carefully bisect the second point of observation which has been selected. Then carefully record the horizontal angle traversed, taking the mean of the readings furnished by the verniers, so as to ensure accuracy in registering the sub-divisions. Next before unclamping either the screw C or R revolve the telescope vertically, in the case of a transit instrument, so that the telescope is turned over,

## Books.

*Society in the Elizabethan Age.* By HUBERT HALL, of H.M. Record Office. London: Swan Sonnenschein & Co. 1886.

THE value of this contribution towards our knowledge of the social condition of England in the sixteenth century is considerable. In the hands of a Scott the materials which Mr. Hall has collected would have been woven into half a dozen historical romances, and, although the present editor makes no claim to possess any share of the great novelist's genius, the simple stories which the records themselves embody are replete with interest.

Mr. Hall's object is to make his readers acquainted with the principal phases of life in the Elizabethan age, and for this purpose he takes from each class in society one or more representatives, and tells us,—not what they ought to have done, or what they might have done, in their dealings with others, but,—what they actually did, and often what they actually said. As a specimen of the landlord class he selects a Wiltshire squire, William Darrell, of Littlecote, ill-known as "Wild" Darrell, but, in reality, more sinned against than sinning. Not that his life was a blameless one. He lived freely, gave generously, fought obstinately; but the ruin of his estates was as much due to the expenses of litigation as to personal extravagance. Like some others of his age, he sought to repair his broken fortunes through the favour of the Queen, and he therefore re-appears in Mr. Hall's pages under the character of a courtier. The details of his life in town, drawn from contemporary evidences, are curious, and the letters and accounts are especially valuable.

The other sections of society which Mr. Hall's extracts from the Records in his charge chiefly illustrate are the Civic, the Ecclesiastical, the Official, and the Mercantile. There is also a chapter entitled "The Tenant," which will be read at the present time with special interest. Mr. Hall asserts that the Elizabethan age was distinguished by "a violent land fever which raged in town and country." The Crown (enriched by the spoils of the Church) was a ready seller, and from every rank in the community there came eager buyers. But no sooner did these become landholders than,—like the ancient owners,—they endeavoured by every means to wrest from the sub-tenant his vested interest or fixity of tenure in the land. The great object of the copyholder was to secure a freehold in his tenure, and the great object of his lord was to get as much as he could out of his estates by rents, fines, and other payments. But on the whole, Mr. Hall thinks, "the position of the Elizabethan copyholder, villein, or even serf, as some people would delight to call him, was an independent and prosperous if not an honourable one."

We cannot speak too highly of the value which attaches to such side-lights as those Mr. Hall throws on history. We do not always agree with the conclusions at which he arrives, and his accuracy is not unquestionable. For instance, in the text (p. 106) he speaks of William Waryng as "of Pembroke," but in the appendix (p. 170) the Record describes him as "of Pemhrugh or Pemhruge, in the county of Hereford," i.e., Pembridge, Herefordshire. This error (not the only one) is all the more remarkable as in the index Mr. Hall is a great deal too particular in giving "Brugsy, Sir Egidius,"—an archaic form of the surname and a Latinised form of the Christian name of an old friend, Sir Giles Brydges. These, however, are trifles which do not much detract from the real merit of the book.

*Instantaneous Photography for Amateurs.* By C. W. Bath: Charles Seers. 1887.

THIS is a small pamphlet giving information and instruction in a plain and concise manner as to the methods of taking instantaneous photographs. It is of more use for those who would photograph landscape than architecture, of course; architectural photographers have little need of instantaneous photography, their subjects generally retaining the *status quo* sufficiently for any ordinary length of exposure.

**Newcastle-on-Tyne.**—Additions are about to be made to the National Schools at St. Anthony's, near Newcastle-on-Tyne. Mr. Arthur B. Plummer, of Newcastle, is the architect for the work.

## RECENT PATENTS.

## ABSTRACTS OF SPECIFICATIONS.

2,758, Ventilating Louvres. A. E. Bule.

The louvres constructed in accordance with this invention are chiefly for use in the jalousies common to tropical countries. They are controlled by cords and weights, which automatically check or close the louvres when the pressure of wind is brought against them. In other cases, water placed in a metal tube, and evaporated by the action of sun or temperature of the rooms, will actuate the louvres, which are in all cases held open by counterbalancing weights.

5,076, Sliding Sashes. W. S. Lockhart.

This invention consists in an arrangement applicable to railway doors or windows, and allows the window-frame to be actuated from the side, instead of by the cord in the usual way. A weather board is an important feature of the invention. This is brought into play by a tumblers-like action at the side of the groove in which the sash slides.

4,962, Improved Draught and Dust Excluder. T. J. Porter.

This appliance consists of a composition cast or made into a suitable form, somewhat similar to the draught-tubing in general use, but with the important difference that it may be melted and pressed into the joint or crevice of window or door, and when cold it sets rigidly hard, until heat is again applied to remove it if necessary. The plastic material is covered with felt, which renders it warm and pleasant to the touch and slight, and prevents noise when the material is fixed to doors frequently opened and shut.

5,795, Ventilators. C. Gamaway.

The form of ventilator which is the subject of this invention is for the extraction of vitiated gases or foul air. It is simply an arrangement of double tubing through which air circulates or is caused to circulate by means of a fan or blower or other appliance. The tubes are placed vertically, and are made with suitable openings at intervals. On a current of air being forced down the central tube a strong current is set up in the outside tube, which extracts all foul air or bad gases.

5,820, White Lead. J. Warwick.

The improvements which are the subject of this invention are in the direction of performing the necessary operations with the least possible exposure of the workpeople to the injurious effects arising from the ordinary method of manufacture. This is attained by exposing different surfaces of lead very rapidly to the action of acids, and performing all this part of the work in closed vessels or with facilities for drawing off the fumes at such a distance as to be harmless.

6,292, Chimney Top or Ventilator. G. Sharp.

According to this invention two cones are fitted over the chimney-pot in such a manner as that they have free play to swing or oscillate within given limits. The effect of wind, therefore, is to blow one side of the cone nearer the chimney-pot, closing it, while the other side is opened and the egress of smoke or bad air accelerated.

## NEW APPLICATIONS FOR PATENTS.

March 25.—4,458, W. Barker, Brickmaking Die.—4,463, H. Allan, Soil-pipe Connectors for Water-closets, &c.—4,468, J. Morris, Chimney Top or Cowl.—4,478, E. Shaw, Ventilating Apparatus.

## PROVISIONAL SPECIFICATIONS ACCEPTED.

2,786, S. Wilding, Pressing Floor-boards together.—2,923, J. Kershaw, Machines for Cutting Wood Mouldings.—3,120, E. Taylor, Attaching Door and other Knobs to Spindles.—3,432, T. Gill, Water-closets.—3,740, W. Eddington, Mortar Mills.—3,912, J. Browne, Locks for Doors.—3,961, Young and Co., Ventilating Apparatus.—3,247, W. Evans, Window-sash Fastener.—2,821, W. Turner, Printing on Tiles, &c.—2,957, T. White, Decoration of Tiles, &c.—3,121, T. Cudlipp, Stoves, Ranges, Grates, &c.—3,397, T. Lister, Cramps, &c.—3,918, F. Sage, Show Cases, &c.

reversing the eyepiece and object glass end for end; then unclamp the collar R, and turn the whole body of the instrument round 180° in the direction of the last or second object viewed, leaving the vernier plate clamped as at the last reading. Clamp the collar R, and by means of the tangent screw S, make the cross hairs again bisect this object. Then release the vernier plate by unclamping the screw C, and turn the telescope horizontally round in the direction of the first object without unclamping the lower plate. Clamp the upper plate by the screw C, and carefully bisect the first object viewed by working the tangent screw, D. If the index of the vernier now points exactly to zero upon the lower plate, the line of collimation is correct, and the horizontal angle read between the two lines of sight can be accurately booked; but if the index of the vernier does not return to zero upon the primary scale of divisions, then half the error must be corrected by the horizontal capstan-headed collimation screws, and half by the tangent screw D. Care must be taken to move the opposite side screws in the diaphragm plate, both in the same direction and equal in amount, so that they should be adjusted gradually, in order to turn one as much as the other. The adjustment of the screws is effected by a spindle piece found in the box. (b). In a transit instrument, the adjustment of the line of collimation may be tested with the observation of a single station by first bisecting the object viewed after clamping both screws C and R, then revolve the telescope, so that if the bubble was first above the telescope, it is now below it, and then unclamping the screw C, revolve the vernier plate round 180°, reclamp the screw C, adjust the index by the tangent screw D, and proceed as before. (c.) Another method consists in sighting accurately the centre of a distant object; then without unclamping or in any way disturbing the position of the instrument revolve the telescope with great care and mark a position upon the other side of the instrument, which should be on a continuous line in plan. Then without revolving the telescope or releasing the upper plate, undo the lower clamp R and turn the body of the instrument half round, clamp the lower plate and by means of the tangent screw S make the cross-hairs bisect the first position viewed. Then, again, revolve the telescope vertically without unclamping the instrument, and if the cross hairs now bisect the second point observed on the line produced, the instrument is in adjustment for taking horizontal angles on or upon the same levels, but if not, note the error, and adjust the horizontal screws in the diaphragm plate so that the line of sight may strike half-way between the two points observed upon this side of the line. Repeat the test to prove the accuracy of the adjustment for the measurement of angles in azimuth. In the case of a non-transit instrument, such as a plain or an Everest theodolite, the vernier plate is first clamped to zero as before. The cross wires are set to bisect some well-defined distant object by means of the clamping and adjusting arrangements, R and S. The telescope is lifted gently out of its bearings, and replaced very carefully with the trunnion axis reversed. The screw C is then unclamped, and the vernier plate traversed through 180°. The screw C is again clamped, and the vernier index finally adjusted by the tangent screw, D. If the object viewed be still bisected, it proves that the line of collimation is perpendicular to the trunnion axis, but if not, then the error must be corrected as above explained. Having done this to ascertain if half the error of deviation has been correctly estimated, again traverse or reverse the trunnion axis, and if the line of collimation does not still bisect the object viewed, the operation must be repeated until, by successive approximations, the object is found to be accurately bisected in both positions of the trunnion axis.

**Penarth.**—The Presbyterian Chapel, which has been renovated at a cost of about \$600, was re-opened on Sunday last. The whole of the old building, with the exception of the end and side walls, was taken down, and extended at the front, thus providing sitting accommodation for about 400 worshippers. The work has been carried out from plans and under the superintendence of Mr. John H. Phillips, architect, Cardiff, and the style adopted is a free treatment of Romanesque.

COMPLETE SPECIFICATIONS ACCEPTED.

MEETINGS.

SATURDAY, APRIL 9.  
 Edinburgh Architectural Association.—Visit to Duntarvie Castle and Niddry Castle.

MONDAY, APRIL 11.  
 Society of Antiquaries of Scotland (Edinburgh).—8 p.m.

WEDNESDAY, APRIL 13.  
 Civil and Mechanical Engineers' Society.—Mr. R. E. Middleton on "The Forth Bridge."—7 p.m.  
 York Architectural Association.—Mr. S. H. Adams on "Sanitation."—7:45 p.m.

THURSDAY, APRIL 14.  
 Edinburgh Architectural Association.—Mr. J. Crawb Watt on "The Aesthetics of City Building."—8 p.m.

FRIDAY, APRIL 15.  
 Institution of Civil Engineers (Students' Meeting).—7:30 p.m.

Parkes Museum (Lectures for Sanitary Inspectors).—Dr. Alfred Hill, M.R.C.S., on "General History, Principles, and Methods of Hygiene."—8 p.m.  
 Bradford Historical and Antiquarian Society.—7:30 p.m.

Miscellaneous.

**Rothwell Market House.**—At a public meeting held at Rothwell, Northants, some time since, it was resolved that the most fitting way to commemorate the Jubilee of Her Majesty's accession would be by the completion of the interesting old Market-house for the purpose, primarily, of a reading-room. This building, according to the inscription, "was the work of Thomas Tresham, Knight. He erected it as a tribute to his sweet fatherly and county of Northampton, but chiefly to this town, his near neighbour. Nothing but the common weal did he seek; nothing but the perpetual honour of his friends. He who now puts an ill construction on this act is scarcely worthy of so great a benefit. A° Domini One Thousand Five Hundred and Sev—" Sir Thomas's good intentions towards Rothwell were unfortunately frustrated by the turbulence of the times, and the trials he underwent on account of his religious and political opinions, by which not only did he suffer in fortune and liberty, but his attention was engrossed to such a degree that of all the buildings he undertook (Rothwell Market-house, Rushton Hall, the Triangular Lodge, and Lyveden New Building) only the Triangular Lodge was completed in his lifetime. "Hard to say," says Thomas Fuller, "whether greater his delight or skill in building, though more forward in beginning, than fortunate in finishing his fabricks. Amongst which the Market-house at Rothwell, adorned with the Armes of the Gentry of the County, was highly commendable." The task which was abandoned in Queen Elizabeth's reign it is now proposed to complete in Queen Victoria's. The change of time necessitates a slight departure from the original intention of the founder. The lower story was to have been an open market-house, but there has been no market at Rothwell for many years. It is, therefore, proposed to enclose this story and to let it as an office. By this means a regular annual income will be obtained, which will serve not only to help the building in repair, both of which objects, if left to annual subscriptions, are likely to languish. As to the upper story, it is not clear to what purpose it was intended to be put (it may have been intended for a school), but it is this room which is now to be used as the reading-room. The space in the high-pitched roof will also be utilised. In completing the building it is the intention of the promoters to have the external work done strictly in architectural harmony with the present fabric. The work will be entrusted to Messrs. Gotch & Saunders.

**Society of Engineers.**—At a meeting of this Society, held on Monday evening last, at the Westminster Town-hall, Professor Henry Robinson, President, in the chair, a paper was read on "The Shoues Hydro-pneumatic Sewerage System," by Mr. Edwin Antl. The author introduced his subject by a general consideration of the conditions and difficulties of successfully dealing with sewage, and dwelt on the difficulty of reconciling proper sizes and gradients of sewers with economy in the depth of the sewers below the surface. He urged the advantages of separating the rainfall from the sewage proper, and showed how the Shoues system enabled the engineer to overcome these difficulties. The automatic action of the ejector and the house-sewer flushing-tank was then described by the aid of diagrams. The author then gave particulars of three typical instances of the application of the system:—1. Eastbourne, where it has been added to the original system, and has been in successful operation for about six years. 2. The Houses of Parliament, where it has been applied recently. 3. Henley-on-Thames, where the whole sewerage of the town has been laid out for its adaptation. He mentioned, also, instances of its use for other and more specific purposes at Warrington and Southampton.

**The Architectural Association.**—The Members' Soirée took place on Friday evening, April 1st. This year there was no "play," the entertainment taking the form of a smoking concert. Mr. Mechin Rogers recited very cleverly a selection from Dickens's "Christmas Carol"; Mr. A. Collard gave a skilful performance on the flute; some humorous musical sketches were given by Mr. Kilmister; and songs by Messrs. Balmer Booth and Guy Dawber.—The fifth Saturday afternoon visit of the Association was made on the 2nd inst. to Lambeth Palace. Mr. J. P. Seddon conducted the members over the buildings, the portions visited being the Lollards' Tower, and the chapel, entered from the Tower by a very fine doorway. The chapel was restored by Mr. Seddon, and decorated by Messrs. Clayton & Bell; the altar frontal, designed by Mr. Reeve, and some time ago illustrated in the *Builder*, is a very interesting piece of needlework. The dining-room has a very good open-timbered roof, and contains some interesting portraits of the archbishops. The Librarian, Mr. Kersehaw, met the party in the Library, and showed some of the valuable and curious books and engravings contained in the Library; he stated that Mr. Christian attributed the roof to Sir Christopher Wren, but that that there was no actual record of his having been employed.—We have received the first number of "A. A. Notes," the magazine of the Association, edited by Mr. Herbert D. Appleton. Among the contents is a short article on "Sketching Tours," in which is shadowed forth a project for helping sketchers by information given by or through "consuls," and "vice-consuls," on the plan of the cyclists' touring clubs. Diocesan architects, county surveyors, and architects generally with good local knowledge, are requested to aid in this work.

**The "Hotel Victoria."**—The large and hitherto unoccupied hotel in Northumberland-avenue, originally designated the Northumberland-avenue Hotel, designed by Messrs. Isaacs & Florence, architects, and executed by Mr. J. W. Hobbs, has just been completed, and is to be opened for business during the ensuing month. The structure was described in the *Builder* during the progress of its erection, and illustrations of it have appeared in recent volumes. It is now announced that the building has been purchased by a company, with a share capital of 200,000l., and it is to be opened under the new title of the "Hotel Victoria." It is described as "the largest hotel in the world." Hotel nomenclature in the metropolis appears to be moving in this direction. The Army and Navy Hotel, in Victoria-street, Westminster, has been formed into a company, with a capital of 75,000l., and will in future be known as the "Hotel Windsor."

**District Surveyors' Elections.**—At the meeting of the Metropolitan Board of Works on the 1st inst., after the amendment proposed by Mr. Williams (see *Builder*, p. 498, ante) had been negatived, it was resolved that, in future elections the number of candidates be reduced to six, at a meeting of the Board, by one ballot, at which each member may vote for six persons whose names are in the printed list; the result of such first ballot to be ascertained by scrutineers, consisting of two members of the Board, to be appointed for that purpose, together with the Clerk or his representative. That the six thus selected be balloted for, each member of the Board voting for one candidate only, until some one candidate has the votes of a majority of the members present, and that at each ballot the name of the candidate having the smallest number of votes, and also the names of all candidates who have less than 20 per cent. of the total number of votes, be struck off.

**New Suburban Stations on the Great Northern Railway.**—The continued increase of traffic in the northern suburbs of the metropolis intersected by the Great Northern Railway Company has led the company to rebuild and enlarge several of their stations in these localities, and within the last few months the stations at Stroud-green, Crouch-end, Highgate, and East-end (Finchley) have all for some time past been in course of rebuilding and enlargement, the booking and waiting room accommodation being much extended. With the exception of the East-end Station, now nearly finished, all the above-named stations are finished. It may be added that the new roof on the west side of King's-cross station, which has for some months been in progress, is now approaching completion.

**The Progress of the Panama Canal.**—Mr. Robert Nelson Boyd, M.I.C.E., who has just returned from an exploration of the Panama Canal, read a paper at the last meeting of the Civil and Mechanical Engineers' Society on the subject, describing the present condition of the cuttings and the canalisation of the Chagres river. He stated that only about one-fifth of the work has been done, and that its completion by 1889 is entirely out of the question. The remaining 120,000,000 of cubic metres are being removed at the rate of 12,000,000 per annum, the maximum as yet attained, which was last year. At this rate the work will not be completed before 1897. Even on the showing of the resident engineers of the canal, who maintain that, counting the preliminary buildings, &c., one-third of the total work has been done, it will need ten years before the canal can be opened. But much of the present completed excavation has been in alluvial and other surface ground, and the elevated watershed at Culebra of 300 ft. depth in basaltic rock will in itself take, according to the resident engineer's estimate, at least six years. This alone shows that there must in future be a reduced rather than an accelerated rate of excavation. Mr. Boyd's own estimate of time, even if all the necessary capital be forthcoming, is nearer twelve than ten years. The lowest estimate of money still required is admitted on the spot to be 2,200,000,000 of francs, in addition to the money already spent, which can only be surmised, as accounts are not forthcoming. Taking this unknown quantity at 1,000,000,000 of francs, which is not excessive, it appears that the total capital will amount to 3,200,000,000 of francs, or 128,000,000. Of course it is possible that for less money and in a shorter time a ditch may be made with water flowing from the Pacific to the Atlantic, but not the canal as designed, 29 ft. 6 in. deep, and available for sea-going ships. Mr. Boyd concludes that the slavish following of the methods employed at Suez has been responsible for much of the failure at Panama, and that different methods must be adopted before the new conditions can be dealt with. These methods have now been partially adopted.—*Globe.*

**The Sunday Society.**—The twelfth annual meeting of this society was held on Monday last, at the Conduit-street Galleries, Mr. Robert Carter, F.R.S., in the chair. Mr. Mark H. Judge, Hon. Sec., read the annual report, which claimed for the past year that never before had there been so many and decisive expressions of public opinion in favour of the society's object. Reference was made to the resolution of Sir Henry E. Roscoe, F.R.S., as M.P. for Manchester, and to the resolutions of which he had given notice in the House of Commons. Other matters touched upon in the report were the attempt to open the Colonial and Indian Exhibition on Sundays, the Sunday Art Exhibitions opened by the society, the Sunday opening of the National Art Treasures Exhibition at Folkestone, and the threats of prosecution in connexion therewith. "Another event," the report said, "of great importance to the Sunday opening movement in this year of the Queen's Jubilee is the announcement that the People's Palace at the East End of London is to be open on Sundays, and that her Majesty the Queen has consented to open the building, which is fast approaching completion." Considering the depression which has existed, and the complications in the political world, the society considered it had been well supported in its work, but appealed to the public to strengthen its hands during the ensuing year. The report was adopted, and on the motion of Mr. Mark H. Judge, seconded by Mr. Chas. H. Stanton, Sir George Macfarren, Principal of the Royal Academy of Music, was elected President of the Society for the current year.

**The Institution of Civil Engineers.**—A list of the members of this Institution, corrected to the 1st instant, shows that there are on the books 1,568 members, 2,275 associate members, 20 honorary members, 481 associates, and 949 students, together 5,296, being an increase of 196 in the past twelve months, or nearly 4 per cent. Mr. Edward Woods, President of the Institution, will give a *conversazione* on Wednesday, May 25th (Derby day). It will take place in the South Kensington Museum, by permission of the Lords of the Committee of Council on Education.

**Strike in the Building Trade at Birmingham.**—The *Birmingham Gazette* says that in accordance with a resolution adopted at a mass meeting of operatives on Saturday evening deputations from the Amalgamated Society of Carpenters and Joiners waited upon some of the principal firms of employers in the building trade on Monday morning, and in all cases where a refusal was given to sign an agreement form agreeing to pay the present rate of wages and continue the working rules the men were withdrawn. Amongst the firms who refused to sign the agreement were Messrs. John Barnsley & Sons, Messrs. Taylor (late Briggs), of Bradford-street, and Mr. John Bowen, of Balsall Heath. A number of employers acceded to the wishes of the deputations, and more are expected to follow. Messrs. Sapote & Son's men turned out on Saturday. So far about 500 men have been withdrawn, out of some 5,000 in all who are affected. The painters, who have received a notice from the Painters' Association similar to that given by the master builders, have, at a meeting of the delegates, decided to abide by the action of the general body. The reduction being pressed for by the master builders means to the men a loss in earnings of 4s. 6d. per week. There is a great objection to this, as the wages were reduced 3s. 4d. in 1880, though of this 1s. 1d. has since been given back. Efforts are being made to settle the dispute by arbitration.

**The Registration of Plumbers.**—Last week's number of the *Builder* contained an advertisement, occupying an entire page, giving the names of London and country plumbers, bath masters and journeymen, to whom the Worshipful Company of Plumbers had granted their certificate of registration. We now learn that on Saturday last, the 2nd inst., eighty-two plumbers were examined at the City and Guilds Technical College, Finsbury, by the examiners appointed by the Company. There were twenty-eight master plumbers and fifty-four journeymen from various districts of London, and from Folkestone, Brighton, Eastbourne, Rochdale, Derby, Cardiff, Swansea, and Leeds. The examinations included practical tests in pipe-bending, jointing, gutter work, &c., and the applicants were afterwards examined in various subjects connected with materials used in plumbing, hose-fitting, and sanitation. Among the examiners present were Mr. George Shaw, C.C. (chairman), Messrs. Charles Hudson, C. T. Mills, W. Titmas, W. H. Webb, J. C. Ashdown, R. J. Lyne, H. B. Lobb, L. F. Gilbert, and R. A. Nurse.

**The Forth Bridge.**—On Saturday last the members of the East of Scotland Engineering Association, headed by the Vice-President, Mr. Bennet, and the Secretary, Mr. F. H. Lightbody, paid their annual visit to the Forth Bridge. The piers on both sides of the river, which have been built by gradually raising the girders which they support a few feet at a time, are now nearly completed, and the level at which the trains will run can now be seen. The three sets of cantilevers, which spring from the caissons in the centre of the Forth, and form the main feature in the design of the bridge, are also well forward. Those on the north and south sides have reached to within a few feet of their entire height of 350 ft. above the water, and the arms extending to the girders on either side are being proceeded with. The middle cantilevers at Inchgarvie are about halfway up.

**Terry's Theatre.**—The new theatre for Mr. Edward Terry, on the site of the Occidental Tavern, Savoy-buildings, Strand, has been commenced. Messrs. Holliday & Greenwood have obtained the contract at a reduced tender of 13,857. Messrs. Doulton and Messrs. Wilcock & Co. have orders for executing the terra-cotta and glazed tile work. Messrs. Battiscombe & Harris have been entrusted with the carton-pierre. Messrs. Matthew T. Shaw & Co. have the ironwork in hand. The hydrants and fire appliances have been put into the hands of Messrs. Rose; the whole of this portion of the work has been arranged under the special supervision of Mr. George Harrison, A.M.I.C.E. Sir Seymour Blane's fire-resisting paint will be used for all exposed woodwork. Messrs. Wilkes & Co. have received the orders for the Eureka concrete. The whole of the works are being carried out under the superintendence of Mr. Walter Emden, architect. Mr. Egan is the clerk of the works.

**Dumfries and Galloway Antiquarian Society.**—At the meeting of this Society on the 1st inst.,—Dr. Grierson, of Thornhill, presiding,—the secretary (Mr. J. Wilson) read a communication regarding a cup-shaped urn recently found at Greystone, in the immediate vicinity of Dumfries. It had been found when digging out an old landmark, known as "The Grey Stone," believed to have been one of a Druidical circle, and which had been buried for a long time. The cup is of red clay, hurned, unglazed, 2½ in. high, 1½ in. in diameter at the base, 3 in. at its widest part, and 2½ inches at the mouth, and is ornamented with three rings and a row of dots. No trace of a larger urn was discovered, although this was obviously of the type occasionally found accompanying larger cinerary urns belonging to the bronze age. Dr. Anderson, Regius Keeper of the National Museum of Antiquities in Edinburgh, who had been communicated with on the subject, recommended further careful examination of the spot, being of opinion that it might possibly be found to have been a small cemetery. Mr. Coles, of the Hermitage, Tongland, read a long and copiously illustrated paper on recent discoveries of cup and ring markings on stones in Kirkcubrightshire. He stated that they had in one small district in the parish of Kirkcubright six out of the seven types of these ancient markings described by Sir J. Y. Simpson (four of them being found on one stone at Dunrod), and also several new ones. The only type not found in the district was the spiral. On a stone on the farm of High Banks could be traced an elaborate design, and composed of central cups and rings of cups or cupped circles. The lecturer was not aware that anything approaching this, either in elementary form or in symmetry of arrangement, had ever before come to light. Oblongs and segments of circles were also discovered, and an oblong hollow surmounted by a four-square groove; and a cast was exhibited of an arrangement of cups and lines, being apparently a primitive attempt to represent a tree. The recorded localities in the Stewartry in which such markings have been found now number nearly thirty. Mr. Coles shortly noticed the various theories advanced to account for these archaic sculptures, which are assigned to the Stone Age, and inclined to the belief that they are of symbolic character.—*Scotsman.*

**Art at the Merchant Venturers' School, Bristol.**—Some eighteen months ago the managers of the Merchant Venturers' school opened a department for the teaching of art. Mr. John Fisher was selected as head of the department, the object of which is to teach art of a practical character,—applied art,—and to give instruction, to quote the words of the prospectus relating to the class, "calculated to meet the requirements of architects, wood and stone carvers, decorators in plaster, art workmen in pottery and terra-cotta, designers and modellers in cast metal, chasers and engravers in silver and hrouse, artificers in ornamental smiths' work, and those engaged in surface decoration of every kind, and of both sexes, in the hope that it may prepare them for remunerative employment in applying art to industrial pursuits." Modelling of the figure is also taught, and classes are held in the day and in the evening. The results hitherto of this practically new art feature in Bristol are (according to the *Bristol Times and Mirror*) most encouraging. To begin with, Mr. Fisher had half a dozen pupils; now he has nearly seventy. On the 1st inst. the work of the students was arranged in one of the classrooms for the inspection of a few friends of the students, previously to its despatch to South-Kensington, where it will be placed in the national competition.

**York City Surveyorship.**—At the meeting of the York Town Council on Monday evening last, the Streets and Buildings Committee recommended the Council to accept the resignation of Mr. Styan as City Surveyor, and to appoint him as Consulting Surveyor to the Corporation, at a salary of 100l. per annum for the remainder of his life. The Council unanimously adopted this recommendation, and discussed at some length the question as to whether the salary of Mr. Styan's successor should be 300l. or 400l. a year. Ultimately, after several resolutions had been put and lost, it was resolved that the Committee should be instructed to advertise for a City Surveyor, at a salary not exceeding 400l.

PRICES CURRENT OF MATERIALS.

Table listing prices for various timber types such as Greenheart, Teak, Fir, and others, with columns for quantity and price.

TIMBER (continued). Table listing prices for Box, Turkey, Gatin, St. Domingo, Porto Rico, and Walnut.

METALS. Table listing prices for Iron, Brass, Lead, and other metal products.

GILS. Table listing prices for Linseed, Coconut, Ceylon, and other oil products.

TENDERS.

BICKLEY.—For building additions to Logs Hill, Bickley, for Mr. A. Machin. Mr. H. Appleton, architect.— Arnaud & Son (accepted)..... £334 0 0 [No competition.]

BROADSTAIRS.—For the erection and completion of a dwelling-house at Coney Nook, Broadstairs, for Mr. Blackwell, jun. Mr. B. L. Edgar, architect:— C. Home, Ramsgate..... £285 0 0 C. Collins, Ramsgate..... 840 0 0 J. H. Forwalk, Ramsgate..... 752 2 0 Newby Bros., Ramsgate..... 655 16 0 H. Miller, Ramsgate..... 620 0 0 J. T. May, Broadstairs..... 632 0 0 W. W. Martin, Ramsgate..... 688 0 0 R. Starke, Broadstairs..... 560 0 0 G. M. Dawson, Broadstairs (accepted) 567 0 0

BROMLEY (Kent).—For rebuilding Napier Laundry and dwelling-house, Napier-road, Bromley Common, for Messrs. Emery & Co.:— Arnaud & Son (accepted)..... £1,037 0 0 [No competition.]

BROMLEY (Kent).—For building additions to Westfield, London-road, Bromley, for the Messrs. Clarke. Mr. W. B. Mallet, architect:— Arnaud & Son (accepted)..... £681 0 0 [No competition.]

DOVER.—For additions to the Convalescent Home for Working Men, St. Margaret's Bay, near Dover. Mr. George Simmonds, architect, St. Margaret's, Twickenham:— J. J. Wise, Deal..... £298 0 0 C. Kent, Easton-road..... 238 10 0 H. Stiff, Dover..... 277 0 0 Johnson & Co., Dover..... 243 0 0 H. Richardson, Dover..... 235 0 0 W. J. Adcock, Dover..... 235 0 0 G. H. Denne & Son, Deal..... 228 0 0 W. J. Wiles, Dover..... 218 0 0 Geo. Lane, Dover..... 210 0 0 Wm. King, Dover..... 210 0 0 W. & T. Dennis, Upper Walmer..... 209 0 0 W. G. Claysen, St. Margaret's, near Dover..... 182 0 0 Anstis & Lewis, Dover (accepted) ... 175 0 0

COMPETITIONS, CONTRACTS, & PUBLIC APPOINTMENTS.

Epitome of Advertisements in this Number.

COMPETITIONS.

Table with columns: Nature of Work, By whom required, Premium, Designs to be delivered, Page. Includes Jubilee Memorial, Chichester.

CONTRACTS.

Table with columns: Nature of Work, or Materials, By whom required, Architect, Surveyor, or Engineer, Tenders to be delivered, Page. Includes Making-up and Paving Roads, Erection of Boundary Walls, Infectious Diseases Hospital, etc.

PUBLIC APPOINTMENTS.

Table with columns: Nature of Appointment, By whom Advertised, Salary, Applications to be in, Page. Includes Surveyor, Bishop's Stortford L. B.

FULHAM.—For the erection of the new Fulham Town-hall and offices, for the Vestry. Mr. Geo. Edwards, architect, Queen Victoria-street. Quantities by Messrs. Widnell & Trollope, Parliament-street:—

Table listing tender amounts for Fulham Town-hall project, including Hart, Ashford, Priestley, Stephens & Bastow, Flew, Martin, Wills & Co., Kirk & Randall, Higgs, Avis, Ward & Lambie, Lucas, Messum, Turtle, Higgs & Hill, Brass, Parrell & Son, Stevenson, Gould, Steer, Smith, Howell & Son, Prestige & Co., Nightingale, Edgington & Co., Balsam, Braid, Chappell, Schwabner, Wall, and Treasure & Son, Shrewsbury.

\* Accepted.

NOTICE.—THE BANNER SANITATION CO. beg to give Notice that having sold over 10,000 BANNER'S PATENT VENTILATORS, also a proportionate number of other Sanitary Appliances, and wishing to keep pace with the times, they have decided to reduce the prices of their goods from 25 per cent. to 40 per cent., thus offering to the public the best appliances at the lowest prices.

BANNER VENTILATORS.

The Strongest Exhaust Ventilators for all Buildings, Public Halls, Churches, Billiard-Rooms, &c.

HIGHEST PRIZES at all the most Important EXHIBITIONS.

Gold Medal. Health Exhibition, 1884.

For further Particulars and Revised Prices, apply to

### Bristol.

THE appearance of the second of this series of volumes has been speedily followed by the third.\* As in the second we had the work of Dr. Freeman, one of the editors, so in this volume we have the authorship of the other editor. Both works have, therefore, additional interest, since in them the editors having the care of the series set before us some of their own views of the aims and objects of the whole.

Each of the cities or towns whose histories will be related, as we have already seen in our notice of the City of London,† are chosen as having special features different from those of others. On this account, Bristol has been selected, and selected with judgment, out of some others, since it owes its place in our national history from its having been the greatest purely trading town in a country that owes its greatness to its trade. It was second only to London for many centuries. Bristol history is different from that of London in an important essential. We are told that its history does not begin until a period that seems almost modern. The first fact that can be referred to does not take us further back than about the year 1000. This fact is one which we owe to the science of numismatics. It is, in reality, the existence of a silver penny of that king of Saxon England with the inglorious name of Ethelred the Unready, struck at Bristol.

We have, therefore, this as a starting-point, that at the period indicated the town had risen to be of sufficient importance to hoast the existence of a Royal Mint in its midst. Of its earlier history there appears to be no record. There are, however, some indications to be derived from its position, its name, and some other circumstances which merit attention. Their consideration will, we think, furnish sufficient evidence to warrant the belief that the site of Bristol must have been occupied for many ages; and they might have been dwelt upon with advantage in the pages before us. Its position seems mapped out for the site of a town. Standing on the banks of a wide river, the Avon, whose British name has survived to our own day, as have also those of so many other rivers, it is surrounded on two other sides irregularly by the Frome, the approach being from the east by a tongue of

some what elevated land between the two rivers. Roughly speaking, this, the original form of the town, is nearly the plan of the British and Romano-British town of Exeter\* over again, while the similarity is still greater, from the position of the castle and the crossing of the main streets in the centre of the town at a carfax. In Bristol the course of the city walls is more curved to follow the irregularities of the site than at Exeter, and the main road does not pass in at the east and out again at the west. Although there is a western road it led only to the marsh; the main road turns at right angles at the carfax and goes over the Frome to the north. Speaking, therefore, from the analogy of the plan, we are inclined to believe that Bristol occupies a very ancient site. The name points in the same direction, for we are told that it appears in its earliest form as "Briegston," or fenced place at the bridge. This name is, doubtless, older than the formation of the Mint, and it gives us one more indication of the beginnings of the town. Other circumstances also help our inquiry, which may be briefly noted. Mr. Karlake has shown us that the name of the British Saint Ewen appears in the dedication of one of the churches in the centre of the town. The name of another, St. Brendan, is associated with a high hill near the town. Another of the churches, as at Exeter, is called after the early Saxon Mercian St. Werburgh. There is again, here, as at Exeter, and in so many others of our most ancient towns, a remarkable group of churches close together, in what must in all probability have been the portion of the town which was occupied the earliest, while they are further apart in those portions that are known to be of the latest formation. When we come to inquire for the records of the foundation of these buildings, however, we find nothing. Lastly, although the Castle of Bristol, strong as was its building, and extensive as was its site, is so completely swept away that only very few traces of its existence remain above ground, yet there are historical evidences that ought to make us pause before we assent to the popular belief that it had no existence until founded in Norman times. It appears that there is no historical record of such pre-existence known. There is, however, evidence that it had a lofty earthen mound. The existence of this peculiar feature in our ancient castles has received much attention of late years, and research has rendered it more than probable that these mounds are the remains of the defensive works of Saxon date, afterwards used by the Normans. Some few years ago there were notices in more than one public journal of the

discovery of a series of subterranean passages, which were then supposed to extend to a great distance beneath the town. We have turned with interest to the volume before us in the hope that some critical notice would have been rendered as to the importance or otherwise of the discovery, since it might have some bearing upon the interesting subject of the antiquity of the town. We are sorry that there is no notice whatever of the subject, either to disprove or to attach importance to it.

Be the antiquity of Bristol, however, ever so great, as we believe it to be, this in no way militates against the choice of the history of the town for the purpose of rendering a record of how trade, and trade alone, has caused the place to rise from obscurity to the position of one of the most important towns in the kingdom. This aim our author keeps steadily before him, and his task is evidently a congenial one. To ourselves it is matter for some regret; for the history of a place which has been developed by trade, and whose records are of bold mercantile effort and voyages to distant regions, does not of necessity render so many indications having relation to architectural art as the readers of our journal may care for. On this account, we propose to ourselves to briefly run over such points of the history as may be of interest to every one, to dwell upon the rise and progress of the governing powers, to linger longer upon what evidences there are of the buildings upon which the merchant princes spent some of the money which they had acquired by their adventures and success in trade, and lastly to follow our author in his happy idea of devoting a whole chapter to "odds and ends."

The work is illustrated by four maps, one showing the town as it is presumed to have been about 1066. Another shows the growth made in two hundred years, which certainly appear to have been years of rapid development, for not only was a new channel dug between the town and St. Augustine's, for the purposes of mercantile traffic, but the large area of Temple was occupied, extending from Bristol Bridge close up to the north side of Redcliff Church, and defended by wall and ditch. The third plan shows the town, in 1480, as known to William of Worcester. Rockhyth, which is shown as having been enclosed at the period of the former map, appears as defended by a strong wall and towers in the third map, which also indicates the development of an extension eastward, beyond the Castle shown in the former plan, the latter space alone being very nearly double in extent the area of the older part of the town. These maps, together with the fourth, which shows the lines of fortification drawn

\* Historic Towns. Edited by E. A. Freeman and W. Hunt. London: Longmans, Green, & Co. 1887.  
† See *Builder*, Jan. 1st, p. 1.

\* See *Builder*, p. 337, ante.

around the city during the troubles of the Civil Wars, render very graphic evidence of the growth and increase of the city. They have been prepared by Mr. A. S. Ellis, not from ancient plans, but from historical evidences. A comparison of them affords interesting evidence with respect to the curious grouping of the churches, to which we have already referred. We have ventured to believe that those in the older portion of the town are of ancient foundation, and in this respect they agree with what we have already spoken of in our notices of similar groups in London and Exeter. Here at Bristol their early foundation seems supported by additional evidence of another kind, and it is this: whatever circumstances may have occurred to cause the erection of a number of churches so close together that there were actually three fronting one another at three of the four corners of the carfax, and several others within almost a stone's throw, yet these circumstances did not exist in so marked a degree when extension was made to the area of the town.

The added districts are vastly larger than that which is shown in the map of Bristol, circa 1066, and, as we have seen, these additions were made mostly before 1250.

If we turn, however, to the map dated about 1480, where all the churches are marked, we shall find that the period from about 1066 to the latter date, which is supposed to have been a church-building age, seems to have done little for the largely-increased area by the foundation of parishes within them. The eastern district has only a single parish church, St. Philip, while the larger area of Temple has only St. Thomas à Becket, now known as St. Thomas the Apostle, a dedication which sufficiently shows the period of its foundation; and Temple Church, which only grew into a parish church out of the establishment of the Knights Templars on the suppression of that order.

The district around St. Augustine's, Billeswick, has the parish church of St. Augustine-the-Less, the monks of the future cathedral "being unwilling to allow their tenants, whose houses were now probably lying thickly about the precincts, to use their church." As a set off to this, the priory church of St. James appears to have been an example of a class of buildings of rather rare occurrence, although not so frequent as was supposed a few years since, of a double church, the western portion of which is still in existence, being parochial. These instructive maps show us other interesting phases of the means adopted in the middle ages of supplying buildings for worship, and we can trace in them how the system varied at different periods. The more recently settled district between the old course of the Frome, which ran round the town wall and the Red Causeway, originally part of Avon Marsh, has but one parish church, St. Stephen's, but there were several chapelries, while there were a goodly number of these smaller buildings scattered about, including one on the bridge; but the mode of forming new parishes appears nearly to have passed away. The various orders of Friars had their establishments in various positions as their orders grew into being, and there are no less than four examples of churches erected upon the city walls, over or beside the entrance gates.

The history of Bristol is well told, and it will be read with interest by more than residents only, for it is an interesting page of the general narrative of the progress of our country. Indeed, it will be apparent to the readers of the volume before us that the events which have occurred within the walls of the town have been of extreme importance. This may be equally true of every town of our historic country, in greater or less degree; and we cannot but think that the investigation of the part played in the general history of our land by each of its towns may prove to be one of the most fascinating and useful of studies.

The Norman invasion inflicted no injury on Bristol, and the town and its trade continued to flourish all through the troublous times which followed it. Robert Fitz-Hamon, who was made Earl of Gloucester in 1119, appears

to have rebuilt the strong castle erected, it is supposed, by Bishop Geoffrey of Coutances. At any rate, he raised a square keep, the largest in the kingdom, except the keeps of Colchester and the Tower of London, and the building played no unimportant part in the town's history until its demolition shortly after the Civil Wars. Its site is now so completely built upon that only the fragments we have already alluded to are to be traced.

There are many interesting details recorded of the existence from an early period, and of the rise and progress, of the trading communities, with notices of their resistance to the power of the local nobles. We hear of these from the beginning, and of their acquisition of rights and privileges which were confirmed by successive charters,—the rights here, as elsewhere, appearing to have had the prior existence, and to be only recognised or regulated by the charters, instead of being created by them. In Bristol, too, we find how completely, from an early period, the burgesses were able to hold their own against all local lords; and in our author's chapter on the Great Insurrection, as it is styled, their contentions with the Lords of Berkeley, and their resistance to the Earl of Gloucester, who came against the city with 20,000 men, indicate that a different spirit animated the fathers of our towns to that which is apparent in the history of many a trading community on the Continent, where the feudal lords became paramount. The contrast between the history of most of our English towns and those of the Continent is not a little remarkable in this respect, and it indicates that a far greater amount of personal freedom was enjoyed by the burgesses within the shelter of their walls than was the case out of England.

In the famous parley between Aylmer de Valence and the chiefs of the defiant town in 1316, we find the following reply rendered by them:—"Certain men tried to deprive us of our rights, and we defended them, as reason was we should. If, therefore, the king will take off the burdens he has laid upon us, and will grant us life and limb, chattels and tenements, then he shall be our lord and we will do his will; if not, we will go on as we have begun, and will defend our liberties and privileges even to the death." The temper which animated the utterance of such words was not slow to support them with corresponding deeds, and the liberty of the people was in safe keeping.

At Bristol we find the Reeve of Saxons times collecting the revenues, and we are told of the relation of the town to the manor of Barton. In the charters we can trace the creation of the office of Mayor, with his council, and of the right of choice exercised by the burgesses, although this may soon have become more nominal than real. In addition to this, there is evidence of the gradual loss of the popular vote until the selection of the aldermen became in fact lost to the townsmen, the corporation being self-elected and the government of the town a local oligarchy of capitalists who had it all their own way, although they appear to have had the happy manner of avoiding collision with what was a formidable power for mischief, a Bristol mob. "The change was gradual; it grew up during the fifteenth century, though it was not recognised by charter until the reign of Charles II." The history of this charter, and of its being granted just at the close of the reign of Charles II., is told elsewhere in the pages before us. When the old spirit of independence was dormant, Bristol, as well as other towns, had to surrender their old charters by an arbitrary and illegal act of the king's.

Bristol, owing, as it did and does, its existence and its wealth so entirely to its trading pursuits, might be expected to afford in its history, as recorded in the volume before us, interesting records of those important factors in Mediæval life, the trading and religious guilds, and we are not disappointed. The charter of John, while Count of Mortain, granted probably in 1188, fully recognises the existence of these associations, and at an anterior date. It runs thus: "They may have

all their reasonable guilds as well or better than they had them in the time of Robert and his son William, Earls of Gloucester." We may briefly give the following summary of the nature of these guilds. They all had more or less of a religious character. They acted somewhat like the benefit clubs and mutual insurance societies of our own time; each had its patron saint. A common feast and much drinking together were common features. They existed for special objects, in some the religious element being uppermost. The Guild of Kalendars undertook, in addition to other works, those of education and learning; the name, not uncommon, being derived, it is supposed, from the meetings being on the kalends of each month. Women as well as men were members of the various guilds. Our author objects to the generally-received title of craft-guild, as applied to those societies which were associated with specific trades, for the terms "craft" and "guild" express two distinct ideas. He says:—"A craft or mystery was a particular trade carried on by men who had a knowledge of it; a guild was a means of association based on certain acts of religion and mutual help performed at the common cost." This may be well enough, but surely it is hardly supported by our author's statement which follows on,— "the money necessary for these and for all other acts of the society being raised by a rate or *gylde* levied on each of the members." Surely this definition would apply equally to whatever was the nature of the work which the society had to do, and we cannot but think that the generally received name of craft-guilds is a very good one. The trades or crafts took common action to protect their common interests, whether from the hurgher aristocracy, to shut out external competition, or the like. Our author is on more certain ground when he speaks of the trading associations having more of a corporate existence than those hodies, we think more or less cognate, which were of a more voluntary nature. Still, we can but consider that all such communities had their beginnings in voluntary combinations, and that as they grew in wealth and importance they would seek for incorporation, which they would obtain for payment or otherwise. We are speaking of Mediæval times, but these remarks may perhaps equally apply to the growth of earlier societies in Roman times.

No one might exercise his trade unless he belonged to its guild. The guilds had their own halls. Many had their own chapels, and the Kalendars had a free library. Their mass priests were often turned to good account, we suppose, to fill up their time by teaching or such matters. Indeed, the records of some guilds as to the employment of their priest are not a little curious in evidence of the shrewd bargains sometimes made by our ancestors. Our author does not think that there is reason for belief that the guilds had any connexion with the government of Bristol before the end of the twelfth century, although, he says, there can be no doubt that these institutions existed before the Conquest. So far as one of the guilds, at least, is concerned, our author's own evidence appears to point the other way; for he shows that the important function of choosing the mayor and his assistants was exercised by the most important guild of the town,—that of the merchants. If he means that when there was no popular Government in existence, there could be no guild connected with it, then this is obvious enough. But since we find the election of mayor thus exercised, it appears evident that some sort of government did previously exist before mayors are heard of, and that it was exercised by the principal body, the recognition of government being acquired by it but as a continuance of its already existent powers. The earliest reliable charters are addressed to the burgesses, and this alone is sufficient to show that some sort of associated body of men was already in being. In some cases elsewhere, which are named, the municipal privileges were conferred on the merchant guild, by the terms of a charter, and in these cases there is direct evidence of the governing character of the guild, and also, it must be added, of its prior existence.

The objection taken to the name of craft-guilds is supported by evidence that while all the guilds were suppressed in the time of Edward VI, yet the crafts continued to exist as incorporated societies. May it not rather be that the parts of such societies which were devoted to superstitious usages were suppressed, leaving the remainder intact? The societies which were thus mostly concerned with the finding of money for masses or the like ceased to exist, while the others remained. In London we find much evidence of the suppression of the obits and chantries founded by the various trading or craft guilds, which societies, however, continued to exist notwithstanding.

The various crafts at Bristol, which were inguiled to the number of twenty-six, as in other towns exercised their callings each in its own district. Thus the weavers were established in Temple fee; their guild chapel, dedicated in 1299, still stands against Temple Church. The tuckers or fullers were in Tucker-street, the butchers in Bocherew, the cooks in Cooks-row. The bakers had their hall adjoining the Dominican Priory. The names of the patron saints of several of the guilds have been recorded, and they are curious. Thus, the tailors called upon St. John the Baptist, the bakers St. Clement, the weavers St. Katharine, while the merchant guild appears to have had St. Clement and St. George.

The merchants of Bristol engaged largely in church-building and other like good works. William Canynge the elder, as is so well known, rebuilt a great part of St. Mary Redcliff. John Shipward built the fine tower of St. Stephen's, while the almost equally fine tower of St. Werburgh's appears to have been built at about the same time. The removal of this beautiful monument is not mentioned, nor is any passing remark made as to its re-erection elsewhere.

The recent removal of a great number of the old timber houses of the city, which gave so characteristic an appearance to the older streets, is also unrecorded. But then the volume before us has many passing allusions to matters less architectural, although of no little public interest. Passing onward in our hasty sketch of this volume, we may say that it is replete with references to old-world customs and past events, some of momentous interest, as are those relating to the discovery of America, the planting of New England, and the siege of Bristol in the Civil Wars. Some are but of local interest, as are those of the private warfare of the nobles, the tossing of dogs and cats on Shrove Tuesday, the whipping of thieves, the use of the pillory and ducking-stools; this latter machine of punishment having been used for the last time in 1718. The Mayor's presence at duck-hunting and at the preaching of the boy bishops, the performance of Bristol mysteries,—all come in for passing mention. The continuance of trade, and its fluctuations, are ably treated, well-deserved censure being meted out to the traffic which existed in slaves in early as well as in recent times,—meriting condemnation even by the not too nice Judge Jeffreys in 1685. The soap, the woollen trade, the success of privateers fitted out by Bristol merchants, the building of ships,—all these are mentioned; as are also some of the great merchants, such as Canynge in early times, and Colston in later ones, while the use of sledges for the transit of merchandise is noted. The foundation of the cathedral on the suppression of the monastery is only briefly alluded to, but it appears that the old nave and aisles had been removed for rebuilding prior to the latter event, a work only recently accomplished, and not altogether unlike the contemplated design which has been preserved to us.

We have now said enough to show that the volume before us is of no little interest, and that it forms a worthy addition to the volumes which have preceded it, and we may conclude with two brief extracts:—"Looking back on the history of Bristol, as a whole, we can see that, while the career of a trading town during the Middle Ages was marked by attempts at isolation and was fostered by exclusive privileges the national life of England

has happily been strong enough to make the prosperity of such a town part of the general welfare of the country, and that in tracing its fortunes we have been reading an important chapter in the history of the English people." "While the wiser of her citizens do not look forward to a future in which she will outstrip cities and towns which, though some of them in comparison with her are but of yesterday's growth, have now left her far behind, they have reason for their confident expectation that the commerce of their ancient city will continue to grow and flourish, and that she has a career before her not wholly unworthy of her glorious past."

ON THE THEORY OF THE ABANDONMENT OF ANCIENT LIGHTS.\*

BY GEO. H. FOWELL, BARRISTER-AT-LAW.

FROM these examples it surely follows that if "to abandon" means to cease to use, then the above principle, which requires the position of the new window "substantially to coincide" with that of the old one, is based on a fiction, and that the application of it must constantly produce absurd and (it is submitted) unjust results. Yet it will be observed that learned judges continue to apply it, while, almost in the same breath defining the prescriptive right as a right to a certain "cone" of light, or to the enjoyment of certain specific pencils of light, the access of which has been enjoyed for the requisite number of years. But these pencils of light must come from some part of the sky area, and in so far as they come from a portion of the sky area not intercepted by the new aperture, in so far the new aperture does not enjoy the same light, is not "lighted in the same manner," and finally does not "correspond" (in any sense relating to light) to the aperture of the original window. To refer once more to fig. 3, which we reprint for the convenience of our readers. Surely nothing could be clearer than that *cd* (and not *ef*) is the aperture in the new wall which corresponds, so far as is possible (in respect of the light intercepted by each), to *ab* in the old wall. If the plaintiff's light were derived from an area equal and exactly opposite to *ab* on the surface of the wall of the servient tenement, then and then only could the aperture *ef* be said to "correspond" (in the above-mentioned sense) to the aperture *ab*; for in that case, and in that case only, would identity in position involve identity (so to speak) of light.†

Now, without denying that a principle based on a fiction (legal or otherwise) may sometimes be practically useful, is it not possible here to apply one which is based upon facts, and which would yet afford a sufficiently clear test of the rights attached to the dominant and servient tenements respectively?

The result of the above considerations is this, that a prescriptive right to light having been acquired in respect of the aperture *ab*, over the obscuring horizon at *g*, the owner of the servient tenement is restricted in the exercise of his *prima facie* right to build as he pleases by two lines of limitation shown in fig. 4.

(1.) Below the level of the obscuring horizon *g*, he cannot advance his building (supposing him to have on other grounds the right to advance it) beyond the line *gb*—*gb* representing one side of the sectional volume of light, § *gop*, illuminating the window, *ab*.

(2.) Above the level of the obscuring horizon, *g*, he cannot raise his building (supposing him to have on other grounds the right to retire it, and to raise it) above the line *ga'*,—*ga'* representing (in section) one side of the inverted pyramid shown in fig. 1 A, whose base represents the intercepted area of sky. He can, for instance, advance his building below the present horizon *g* (fig. 4) to the point *n*. He can raise it above the horizon *g* to the

Fig. 3.

Fig. 4.

point *m*. But he can do no more than this. And the positions of the lines of limitation *ga'* and *gb* are (it is needless to observe) always easily determined, depending, as they do, on the angles which *ga*, *gb* (straight lines drawn from the obscuring horizon to the top and bottom of the window respectively) make with the straight line *ab*.

The above being the restrictions imposed on the defendant in the enjoyment of his property, it only remains to add that (assigning but its ordinary common-sense meaning to the term "abandonment") whenever the plaintiff so changes the position of his window that it becomes possible for the defendant to advance or to raise his building beyond either of the aforesaid lines of limitation without interfering with the enjoyment by the plaintiff of whatever of his original prescriptive rights he still continues to enjoy, the defendant can so advance or raise his building with impunity.

Now to return to the questions originally propounded, and to answer them on the principles above laid down.

(1.) When for the original window *ab* is substituted\* a window at *cd* (fig. 3). Here there is no abandonment, since whether we consider the prescriptive right to be a right to

\* Continued from p. 539, ante.

† See remarks of Bowen, L.J., referred to above, and *passim*.

‡ It will be observed (fig. 3) that the aperture *cd* is smaller than the aperture *ab*. If it were not so, *cd* would, of course, intercept a larger area of sky than was intercepted by the original aperture, *ab*. But this would confer on the plaintiff an advantage which he would have no right to retain, and of which the defendant could at any moment, before a fresh period of prescription had elapsed, deprive him. In practice, the plaintiff would often take his chance (since the decision in *Tapping v. Jones*, q.v. ante) of acquiring a new right. We are here considering only the continued enjoyment of his old rights unimpaired.

§ Shown as applied to a horizontal skylight, in fig. 1 B.

\* In this and the following examples, the original window is, of course, assumed to have been blocked up when the new light is opened.

the enjoyment of certain specific pencils\* of light, or a right to intercept (in the manner shown in fig. 1 A) a certain area of sky, the plaintiff is in either case, so far as is compatible with the change in the plane of his wall, in the same position as he was before.

The defendant's rights are similarly unaltered. He is still entitled to advance his building to any point on the line  $g b$ , or to raise it to any point on the line  $g a'$ . He cannot do more than this without obstructing the passage of light which used to fall upon the original window  $a b$ , and now falls upon the new window,  $c d$ ; and on what ground could he be justified in doing this?

(2.) When for the original window  $a b$  is substituted one in the (so-called) "corresponding" position  $e f$ . In this case there is an abandonment of the enjoyment of all the light coming from the sectional area of sky between the points  $e'$  and  $a'$  (fig. 3). At least all the said light (which certainly was used before) is now used no longer; for it is clear, if the sectional area  $e' a'$  were the only luminous part of the whole area  $k a'$ , that, while a window in the position  $a b$  would be lighted, a window at  $e f$  would receive no light from the sky at all. There being, then, to a certain extent, an "abandonment," how far does this affect the defendant's rights?

It is surely of the essence of the theory of "abandonment" that these rights (in the case supposed) should be enlarged in so far and only in so far as those of the plaintiff are, by his acts, shown to be "waived." *Prima facie* if he ceases to enjoy a right he may be taken to have "waived" it. In any case the defendant cannot be deprived of his previous right to build up to any point on the line  $g b$ , as, for instance, to raise an obscuring horizon at the point  $n$  (in fig. 4). Now it is clear that a window "in the same position" as  $a b$  (in the advanced wall) might be totally obstructed by an obscuring horizon at  $n$ . So far the plaintiff would only have incurred a loss by his own act, but the defendant gains something. Whereas he could previously raise his building (above the horizon  $g$ ) to any point on the line  $g a'$ , he can now raise it to any point in the line  $g e'$ , since, as we have seen, the light from the area between  $e'$  and  $a'$  does not reach the plaintiff's window in its new position at  $e f$ , and there can be no reason why the defendant should not obstruct the passage of that which the plaintiff, through his own act, no longer enjoys, and for that very reason has no longer a right to enjoy.

(3.) When supposing  $e f$  to be the original window, there is substituted for it a new window in the same plane, in the position  $c d$ .

Here the original "line of limitation" below the obscuring horizon  $g$ , would be a line drawn from  $f$  to  $g$ .† But since the plaintiff has, by the substitution of his new window,  $c d$ , for the old window,  $e f$ , relinquished the enjoyment of all light passing below an imaginary line  $g d$ , there has, therefore, been an "abandonment," *pro tanto*, an "abandonment" of something affecting the defendant's rights. The latter may now advance his building to any point on the line  $g d$ . But he cannot do more than this without obstructing the passage of light which the plaintiff enjoyed before and is still enjoying.

But the same, or rather a larger area of sky, is intercepted by  $c d$  than was intercepted by  $e f$ . But this, as has been already explained, cannot impose any further restriction on the defendant. He has still the right to raise the servient tenement (above the horizon  $g$ ) to any point on the line  $g e'$ .

(4.) Still supposing  $e f$  to be the original window, for which a new one (in another plane) is substituted in the position  $a b$ . In this case the line of limitation below the obscuring

horizon  $g$  will be advanced to  $g b$ , for similar reasons to those given in the last case, and (also as in the last case) the defendant may still raise his building (above the obscuring horizon) to any point on the line  $g e'$ .

(5.) Lastly, supposing  $c d$  to be the original window, and a window in the same plane in the position  $e f$  to be substituted for it. Here there is indeed a practical abandonment. It only remains (as in the said case, *ante*) for the defendant to take advantage of this. The plaintiff has moved his window into a position where the acquired line of limitation,  $d g$ , is of no use to him, since the defendant, by raising his building, as he had always a right to do, to a point on the line  $d g$ , might totally obstruct the new window at  $e f$ .

This case, therefore, requires no further consideration. The plaintiff has, so to speak, advanced into the defendant's territory, and if he loses by this step has clearly only himself to blame.

It will be seen that of the above five propositions the greater part are directly contrary to the law as at present applied. Yet they all result from the consistent application of a perfectly simple principle, which, moreover, finds a considerable amount of support (implied if not express) in many judicial expositions of the law of ancient lights. The inconsistency (as it is submitted to be) in these expositions, taken as a whole, which suggests the adoption of such a principle, may be shortly summarised as follows:—

It is unquestioned that, according to existing law, when the plane of a wall is advanced or retired the prescriptive right existing in favour of a window in the old wall is held to be retained in favour (only) of a window in the new wall, substantially "in the same position" as the original window.

But when we inquire why this is so, the answers are various, though all equally unsatisfactory.

In one place we are told that it is because the two windows are lighted "in the same manner." But any meaning which can be assigned to this rather loose expression involves an untruth, since both the total amount of light received\* and its angle of incidence are in each case different. In another place what is perhaps the same idea is expressed in more definite language. The new window, we are told, enjoys the same "cone of light" and receives "the same pencils of light." This explanation is even more openly repugnant to common sense and common observation. "The same pencils of light" (assuming the obscuring horizon to be above the level of the window), unless they follow a zig-zag course like that of a flash of lightning, could by no possibility reach the two windows, and the "cones of light" in the two cases are not even similar cones. Therefore, if the object really desired is that the new window should be lighted in a similar manner, or in as nearly the same manner as possible (in respect of pencils, cones of light, and intercepted area of sky), as the original window, then to put the new window "in the same position" relatively to the wall as the old one, is to go out of our way to avoid the attainment of that result.

In fact, if the prescriptive right be a right to the enjoyment of light (as it is universally described) and not a right to the enjoyment of a window in a certain position, the present law, under the pretence of preserving the exercise of that right, in fact insists on its abandonment. The owner of the dominant tenement is constantly held to have abandoned that which he still continues to enjoy, and as often to have preserved his prescriptive right (strangely enough) by giving up the enjoyment of it. Surely such confusion in the theory of the law is not unavoidable. It has been said that a Court of Justice will not listen to elaborate mathematical calculations, and it is, no doubt, in the highest degree desirable that the rules governing the acquisition and destruction of this most important of "urban servitudes" should be clearly intelligible not only to the judicial but to the ordinary lay mind. But if a mere observation of well-known facts

and obvious phenomena provides us with an intelligible test, should we not accept it?

Whether or not the above suggestions contribute to the attainment of such a result the desideratum clearly is this,—That, given the dimensions of the window in the dominant tenement and the position of the obscuring horizon, we should be able at once to lay down a definite line of limitation, any material transgression of which by the owner of the servient tenement, except in so far as such transgression interfered with the enjoyment of that which the owner of the tenement had elected no longer to enjoy, would constitute, *ipso facto*, a breach of the prescriptive right.

#### NOTES.

**T**HE evidence given by Mr. R. N. Boyd, as quoted in our last number, as to the state and prospects of the Panama Canal, should be compared with that given by M. Rodrigues, in September, 1885, by M. Bigelow, in April, 1886, and by M. Beyerler, in October, 1886. One hundred and twenty millions of cubic metres, according to Mr. Boyd, remain to be excavated,—figures which fairly tally with those cited by the other writers on the subject. At the maximum rate of progress yet attained, this will require at least ten years to effect; and the present incidence of interest and sinking fund is one million and a third sterling per annum. The total cost of the canal is estimated by M. Rodrigues at 108 millions, if completed in 1894; by Mr. Boyd at 128 millions, if completed in 1897; and by M. Beyerler at 136 millions, if completed in 1896. The last figure amounts to more than three millions sterling a mile, or fifteen times the cost per mile of the Suez Canal. These figures are for the most part taken from the Reports of the Panama Canal Company. The *Bulletin*, however, ceased to publish the grand totals of excavations executed, in January, 1885. M. Beyerler states the amount at 16 millions of cubic metres excavated up to October, 1886, leaving 134 millions of cubic metres then untouched. The sum for which the Company are now responsible is a little over 59 millions sterling; made up from original capital, 12,000,000*l.*; three loans, 24,747,740*l.*; and new obligations, issued at a rebate of 55 per cent., 18,352,080*l.* How the remaining sixty or seventy millions are to be raised has not been indicated. The terms on which the new obligations are issued are significant.

**M**UCH has been either done or promised during the past few weeks in furtherance of various projects for providing open spaces in London. Before the end of next June the Metropolitan Public Gardens Association will have finished the laying out of certain areas as follows:—Haverstock Hill Playground (one acre); All Saints' and St. Clement's Grounds, Notting-hill (one acre), and the disused burial-grounds of the parish church of St. Dunstan (seven acres), and Holy Trinity, Stepney (one acre and a half). Miss J. Durning Smith undertakes to defray the cost, 620*l.*, of converting the churchyard of St. Anne, Limehouse (four acres); another lady contributes 500*l.* in aid of laying out the closed burial-ground of St. George, Camberwell (one acre), together with a recreation-ground at New Cross. Edward-square, Islington, is to be similarly dealt with, and Mr. J. R. Knight pays for the new gymnastic appliances in the East London Cemetery Playground at Ilford. On May 11th the Countess of Lathom will open a playground in Winthrop-street, Whitechapel, purchased for 2,300*l.*; and the Duke of Westminster has offered to take over Ebury-square Inclosure (half an acre) and to maintain it on behalf of the public. The Metropolitan Board have agreed to advance 1,600*l.* towards the works which are about to be jointly carried out by the St. Pancras Vestry and the London and North-Western Railway Company at the St. James' burial-ground, in Hainpstead-road (three acres); they have also granted a loan

\* *I.e.*, to pencils from a specific point in the sky area,—inclined at any specific angle to the vertical. This is presumed to be the meaning of the expression used in the judgment above mentioned, of Bowen, *L.R.* (see 31 Ch. Div., at p. 572).—The pencils of light which had passed through the original aperture, &c. But pencils of light falling upon two windows in the position  $c d$  and  $e f$  respectively (see fig. 3) must of necessity either come from different points in the sky area, or differ in their angle of incidence; whereas a considerable number of identical pencils would pass through  $a b$  and  $c d$ .

†  $g f l$  would represent the original volume of light illuminating  $e f$ , as shown in section.

\* Which varies as the intercepted area of sky.

of 1,160l. to that same vestry for the throwing open the disused Holy Trinity grave-yard (two acres) in Gray's Inn-road, together with sundry small plots of land at Highgate. It is further anticipated that the burial-ground of St. George-the-Martyr, Holborn, will shortly be thrown into one with the adjacent grave-yard of St. George, Bloomsbury, that was lately opened mainly by the exertions of the Kyrle Society.

THE Hammersmith Vestry, supported by the Metropolitan Board of Works, presented a Bill to the present Parliament for securing Ravenscourt, or Scott's, Park, Hammersmith, as a recreation-ground for the public. But pending the passing of the Bill, we hear that the ground, whereof the estimated value exceeds 50,000l., has been sold into private hands. The enclosure is one of the finest in the neighbourhood of London, and is justly famous for a beautiful avenue of elm trees.

THE room of archaic sculptures in the Louvre has been in part re-arranged, and that to considerable advantage. The statue known as the "Hera of Samos" has been placed in the centre, the only part of the room which is adequately lighted. Every portion of this remarkable and,—in its archaic fashion,—beautiful piece of work can now be examined with comfort. The head of a Laphis belonging to the sixth metope in the British Museum is now enclosed in a glass case at a convenient height. It will be remembered that the head was acquired in 1880, but not identified till much later, by Dr. Waldstein. A cast of the portion of the Parthenon frieze of which the original is in the Louvre is now placed in the archaic room, where the original also stands. The cast—to which we have previously drawn attention—used to stand in the Ecole des Beaux Arts. Its value consists in the fact that it was apparently taken from the original before the heads were lost. In the cast all these, with the exception of one, are intact. At the same time, it is within the limits of possibility that the heads in the cast are restored.

A NEW species of philanthropy, in the shape of Sanitary Aid Associations, seems to be developing throughout the country and in the metropolis. These associations are principally composed of clergymen and ladies, who visit the dwellings of the poor and inculcate the importance of practising sanitary precepts. A movement has been set on foot in Richmond, headed by Lady Russell, to establish an association of this character, and some enthusiastic clerical members of these organisations on the south side of the Thames have posted notices on their church-doors inviting persons in whose houses are sanitary defects to apply to them in order that steps may be taken to have such defects remedied. Although these sanitary philanthropists will find their work in this respect much more delicate and disagreeable than the giving of alms or the preaching of sermons, yet there is undoubtedly room and need for the operations of such associations among the poor. The regular religious visitor sees many insanitary sights, which necessarily escape the view of the inspector or the medical officer, because the law only gives the latter limited powers of initiatory entry and inspection; and a regular system of frequent house-to-house visits would involve an amount of work which only a vastly increased sanitary staff throughout the country could undertake. Such associations may be useful in a special degree in the early discovery of cases of overcrowding, in the notification of infectious diseases, and in assisting to carry out the necessary precautionary measures of isolation and disinfection. The recent fatal case of overcrowding at Chiswick, where two children out of five were suffocated by the impure air of the bed-room in which they slept, was one which could hardly have occurred if an efficient Sanitary Aid Association had existed in the parish, because, though the house appeared externally large enough to amply accommodate the family, death of furniture and clothing had compelled the family to huddle together in one bed-room.

The visitor of the Sanitary Aid Association is much more likely to find out such a state of things than the sanitary inspector or medical officer.

EFFORTS are being made to revive the Southwark Children's Mission by re-building, at an outlay of 2,000l., what is known as the Rowland's Old Castle School, in Castle-yard, a *cul-de-sac* leading westwards out of Holland-street, Bankside. Established by Rowland Hill in 1802, this is reputedly the first Sunday School opened in London, and Castle-yard is considered as the parent home of the subsequent Ragged School movement. The hekkaidetagonal edifice in Blackfriars-road, long known as Rowland Hill's, or Surrey Chapel, but now serving for an agricultural engineers' warehouse,—was opened for worship on Whitsun-day, June 8th, 1783. Here the Rev. Rowland Hill (he had taken deacon's orders) ministered for fifty years. Dying in the parsonage-house adjoining thereto, on April 11th, 1833, he was buried beneath the pulpit, on which occasion his nephew, Lord Hill, Commander-in-Chief of the Forces, acted as chief mourner. After an interval, Hill was succeeded in the Surrey Chapel by the Rev. James Sherman, who in turn was succeeded by the Rev. Newman Hall, who remained here for more than twenty-five years. On July 4th, 1876, his congregation migrated to their new quarters in Westminster Bridge-road, at Christ Church, which, together with the adjacent Hawkstone Hall and Lincoln Tower, had been erected for them at a total expense of 64,000l. Hawkstone Hall was so named from Hill's birthplace, his family's ancestral seat near to Shrewsbury. On April 14th, 1881, Hill's remains were removed to Christ Church. The Primitive Methodists took over old Surrey Chapel, but, failing to secure a renewal of the lease, celebrated a final service therein on the night of Sunday, 20th March, 1881. For their use has been undertaken the erection of a new chapel, close by, and to face towards Blackfriars-road, on the freehold-sites of Nos. 190-2; to which we briefly adverted in our number of February 27th, 1886. Surrey Chapel had been renowned for its organ, built by Elliot. The pulpit we mention was frequently occupied by such eminent Dissenters as James Parsons and Jay, together with the Evangelical churchmen Berridge, Henry Venn, and Thomas Scott, disciples, like to Hill, of Whitefield. This historical chapel, indeed, may he not inaptly regarded as the Westminster of Nonconformists.

THE "British Coffee House," in Cockspur-street, now in course of demolition, was designed about 1770 by Robert Adam. The front is a fine piece of red brickwork, beautifully jointed, the vase in the niche on each side of the large central window being also a good specimen of such work. An elevation, now before us, carefully drawn and shaded in Indian ink, according to the practice of the time in architects' offices, and stated to be from the office of the architect, shows a front of 20 ft., of four stories, including the ground floor, surmounted by a balustrade, and being 46 ft. in height. The centre part on each floor is formed of a large Palladian window, 19 ft. 6 in. wide, divided into three by columns, perhaps projecting one-half diameter. This is recessed between piers, each 5 ft. wide, having an entrance in each on the ground floor. On the first floor is the niche, as above stated, and a small plain window to each of the upper floors. The vases are not shown in the drawing, but one is slightly sketched in pencil. It is to be regretted that so ornamental a specimen of the school of the brothers Adam is being demolished.\*

MR. F. VULLIAMY, the uncle of the late Mr. George Vulliamy, writes to us in reference to the obituary notice of the latter which appeared in the *Builder* of November 20

\* Cunningham, "Handbook of London, 1850," states that "The British coffee-house was kept in 1759 by the sister of Bishop Douglas, so well known for his works against Lauder and Bower, and was then, and indeed, long after, much frequented by Scotchmen. It is now principally used for temporary public meetings."

of last year, to say that it was not Mr. George Vulliamy's father who sank the first artesian well at Norland House, but his grandfather, the father of our correspondent. Mr. F. Vulliamy adds a word in reference to the portrait of the late Architect to the Board of Works, which we published in the same issue of November 20 last year, and which he says is an excellent likeness.

THE house in Fetter-lane at the corner of Fleur-de-lis Court, which is about to be pulled down, has an inscription on the front to the effect that John Dryden resided there. Mr. Saintshury, in his *Life of Dryden*, notices the popular belief that Dryden lived there, but states that he can find no ground for this belief. The house is old and is probably contemporaneous with the poet, and there are some features, particularly the lions' heads, which incline one to think that it may have been designed by Captain William Winde, of Bergen-op-zoom, who had a considerable practice during the Restoration.

A SMALL pamphlet, prepared by Mr. James Thropp, County Surveyor of Lincolnshire, by the direction of the County Authority, containing "Suggestions to Surveyors of Highways on the Management of main Roads and other Highways," contains a great deal of practical advice in a concentrated form. We have some doubts, however, as to the statement that "the practice of picking up and loosening the old surface before spreading a new coat of materials on a road is productive of no good whatever." We should certainly expect that it would aid in the incorporation of the new material with what then becomes its foundation. Mr. Thropp deprecates the frequent annual change and retirement of Surveyors of Highways in some quarters, and urges that their work would be much better done if the same surveyors were to retain the position for some years. We quite concur in this view, if the surveyor means business and does not intend to be only an ornamental official. He can only have begun to know his district and its peculiar conditions in the first year.

THOSE who are not prepared to go to the expense of lighting their houses by electricity, and who, perhaps, think the time has hardly arrived yet when this system of lighting can be advantageously adopted as the general system for private houses, may now, however, utilise electricity to assist them in lighting their gas. Messrs. Woodhouse & Rawson have patented a system whereby gas can be turned on and lighted, and turned off, by electric agency, from any convenient position, irrespective of the position of the gasfittings. They say, "the principle of the attachment is analogous to that of the portable electric gas-lighter, now so well known, i.e., the gas is lighted by an electric spark; but the general arrangements are for permanent fitting." The application is in various forms; by the automatic gas-lighter, the gas may be turned on, lighted, or turned off, by pressing a push button. By the "hand lighter" the gas is lighted by a pull at the end of a pendant chain, after the gas has been turned on by hand in the usual manner. This appears to us rather a pleasing toy than a serious convenience; at least it is hardly worth while to have a special electric mechanism merely to light the gas. The automatic turning on and lighting may be very convenient, as it obviates the necessity of reaching up to gas taps which are not within easy reach, and avoids the chance of burning ends of matches or other lights falling on the tables or carpets. Of course the electric power for this purpose does not require a dynamo, or the expense would be entirely disproportionate to the result; a battery similar to those used for electric bells will answer the purpose. The system requires careful fitting by skilled hands, however; and whether many persons would think it worth while to have an extra system, with its extra chances of getting out of order, for the mere purpose of lighting their gas, remains to be seen. Most persons

who are particular about the manner of lighting their houses, and have money to spend on it, are now avoiding gas to great extent in their residences.

#### SCIENTIFIC OPINIONS ON LONDON SEWAGE.

The recent debate on the disposal of sewage sludge, at the Institution of Civil Engineers, extended over four evenings; and no fewer than thirty-seven gentlemen, the names of most of whom are well known in connexion with the subject, took part in it. Unanimity of opinion is, of course, out of the question. Neither do the regulations of the Institution admit of what is often the most useful result of a debate, namely, a division on some definite issue. But the value of the discussion is not to be discredited for these reasons. The speakers have put on record the most matured views of the different schools that they represented, and the reader may, at all events, have the satisfaction of reflecting that he is in possession of the last utterances of science, much as he may desire that they were more definite and more harmonious.

The motive of the debate appears to have been the endeavour, on the part of the chemical advisers of the Metropolitan Board of Works, to justify the proposal to boat the solid impurities which they may extract from the sewage of the metropolis into the open channel. Sir Robert Rawlinson, who represented the sceptical side in the debate, asked if the Board of Works could be really serious in proposing to barge away to sea a thousand tons of sludge per day, or 365,000 tons per annum. But Mr. Dibdin, the Chemist of the Board, admitted that this large quantity was less than a fourth part of that with which he proposed thus to deal, a quantity which he put at 4,620 tons per day, or 1,686,300 tons per year, for a volume of sewage one-sixteenth less than that now discharged into the Thames.

The essential point, to the inhabitants of London and to those interested in the commerce of the Thames, of what is to be effected by the present scheme of the Board of Works for the purification of the river, was, however, almost entirely blinked by the various speakers. Mr. Dibdin stated that the average London sewage at the outfalls contains 87 grains of foreign matter in the gallon, of which 27 grains are in a state of suspension and 60 grains in a state of solution. Assuming this to be the case, it follows, from the well-known analyses of which we have a large supply, that some 15 grains of suspended matter must either have been dissolved during the run of the sewers, appearing at the outfall in solution instead of in suspension, or that about the same approximate quantity had been deposited in the sewers by the way. The latter supposition is in accordance with the evidence, brought before the Committee on the drainage of the Houses of Parliament, as to the cost and nuisance involved in clearing out the Metropolitan sewers by hand. At all events, it is highly desirable that the chemical constitution of the sewage as collected in London should be ascertained so as to compare with its state at the outfalls.

Of yet more urgent importance is the question, What is the character of the effluent to be delivered into the Thames after the treatment now proposed? It is extraordinary to find no statement of this important feature of the case. Over the broad average of those cases of which the analyses are accessible, the mean result of the various modes of treatment employed has been the removal of about nine-tenths of the matter in suspension, accompanied by an increase of the matter in solution. If this rule applies to the London sewage, as described by Mr. Dibdin, the result of the precipitating process will not very materially benefit the Thames. The remark of Dr. Edmunds that all matters in solution are free from infectiveness, is one that is in contradiction to the views of every other speaker in the debate. That the difficulty of dealing with dissolved impurities is far greater than that which occurs as to suspended matter, is evident from Mr. Dibdin's table, which shows the different effects of the same dose of lime applied to, as far as appears, the same kind of sewage. This is shown to remove, in one instance, two per cent., and in another twenty-six per cent., of oxidisable matter in solution. With such wide differences, not as stated by opposing authorities, but in the same table, it is evident that all discussion is entirely in the air without some

The Water-Gate, Hoorn: View from the Quay.

definite statement as to the effluent actually produced by the process which throws down 4,620 tons of sludge per day, although removing only 337 tons of dry foreign matter from the sewage.

To another point of primary importance an equal want of due attention was betrayed in the debate; that is, the secondary action of any such admixture of lime and salts of iron as is now proposed by Mr. Dibdin. As to this there is ample evidence. Mr. Latham stated in the debate that "at Northampton iron salts were used in the proportion of  $4\frac{1}{2}$  grains per gallon to 15 or 16 grains of lime, with the result that the river was as foul after treatment as before. The sewage at the outfall works was made to appear clear, and the river seemed to be inoffensive; but after it had flowed a short distance, it began to turn, and was soon as black as ink, one putrefying mass." Nor is this experience confined to Northampton, or to the action of either per-salt or sub-salt of iron on lime. At Bradford, at Clifton, and at Cheltenham the same thing has occurred,

chloride of iron being used in some instances, and sulphate of iron in others. Before a vast expenditure is incurred for a process which Mr. Latham says "he knew from personal experiment" would be ineffective for good, it is surely important to show that due care has been taken to prove that, for some yet undiscovered reason, it will not be effective for mischief.

Sir Robert Rawlinson, Mr. Bailey Denton, Mr. Jacob, Mr. Melliss, Dr. Edmunds, Dr. Angell, and Dr. Tidy concurred with Mr. Latham in the view that the proposed treatment of the metropolitan sewage was altogether inadequate. What we want, however, is not to be driven to count, or even to weigh, opinion against opinion, but to balance facts against facts. That a small quantity of lime in solution may be more effective than a much larger quantity in suspension is not a new discovery. Whether Mr. Dibdin has or has not allowed enough is a matter that will have to be brought to the test, not of opinion, but of fact. But that reaction of a most offen-

The Water-Gate, Hoorn: View from the Jetty.

THE WATER-GATE, HOORN:  
VIEW FROM THE QUAY.

THE water-gate of Hoorn is a most picturesque building, whether seen from the narrow quay or on the other side, from the jetty run out into the waters of the Zuider Zee. The elevation towards the quay is the most ornamental, and is built of a warm red brick, a white stone being used sparingly in the string and window jambs and mullions. The upper part projects slightly over the lower at the level of the trefoils (of chamfered brick and stone), just above which are two deeply-recessed mullioned windows, with a small niche between. In the centre of the gable is a small oriel or look-out, surmounted by the arms of Hoorn,—a horn,—and at the top, immediately under the cornice, are two dates, 1552 and 1631,—the latter that at which additions were made and repairs done.

The turret at the side of this gable is quite plain, and the window openings at the top, except one, have been built up. Beyond this turret is the circular end of the gate, seen better in the view from the Zuider Zee. A dark and dangerous way it is up to the tall flèche on the roof. In the flèche is the usual one-handed clock, and in the upper part bells; the whole is crowned by a gilded model of a ship, perhaps one of Schouten's, who first doubled Cape Horn, or Hoorn; or one of Abel J. Tasman's, both natives of this once busy but now dead city.

VIEW FROM THE JETTY.

This side of the gate is built of stone in narrow courses; the only brick used is in the circular corbels to the upper part of the chimney-stack. The stonework is joined abruptly to the brickwork; bands of the stone are carried round to the turret on the other side.

The lower part towards the sea is plain, and only relieved by a tablet with the arms of Hoorn, and three windows with a few masonry holes; but the upper oversailing part has a quaint little oriel or look-out, and many shuttered openings, from which, no doubt, many anxious and joyous faces have watched the coming and going of their own strong fleets when Hoorn built ships which beat the Spanish admirals and sailed up the Thames.

There is another gate, the east gate, but it is not nearly so interesting, and is made hideous by the generous use of white and red paint.

F. T. W. GOLDSMITH, A.R.I.B.A.

PICCADILLY CIRCUS.

THE *Daily News*, in a leading article, on Friday in last week, rejoices at the prospect of the Metropolitan Board of Works erecting a fountain on the vacant site in Piccadilly-circus, but opines that all who are concerned would be glad to know that the fountain to be set up was a fountain of water. Our contemporary, enlarging upon this idea, acknowledges that Piccadilly-circus is not altogether the best place for setting up a haunt of the Naiads, and is even willing to allow that it may be a site demanding something of a compromise between Nature in her most artless and unsophisticated forms, and Art in its stiffest and staliest phases, only it should be a fair compromise, and proceeds to lay down as a postulate that which nobody will be disposed to deny, that a fountain should be "a type and emblem of all that is glowing and generous and never-failing in its bounty," and gives some general directions as to the manner in which the fountain should be designed. We are informed that no decision has as yet been arrived at with regard to the disposal of the site in Piccadilly-circus which has so long remained an evidence of our want of system in matters appertaining to municipal improvements, except those of a negative character, and that there is not the slightest chance of a fountain being established there. We have no hesitation in saying that the site in question is quite inappropriate for the erection of a fountain, unless the design were treated in a somewhat similar manner to the Fontana di Trevi at Rome, or the Fontaine Ste. Michel or the Fontaine Molière at Paris, that is to say, with an architectural background. In these examples the water overflows from a basin, instead of being forced up in a jet, and this treatment is the most appropriate and effective for fountains in cities.

A fountain which is formed by a jet or jets of

sive nature may take place when small quantities of lime are used with apparently good results at first, is indisputable. At Hertford the exact quantity per gallon now proposed by Mr. Dibdin was applied to a very weak sewage. The result was that the effluent contained absolutely more foreign matter per gallon than the original sewage, and that an abominable nuisance was created lower down the river, at Ware.

What public opinion will expect of the Metropolitan Board of Works, before they make any further heavy demand on the ratepayers, we take to be this: first, to explain what effluent they propose to turn into the Thames; and secondly, to show what proof they adduce that the proposed treatment will not, by the secondary action of lime and iron, leave the river nearly as foul as it was before. If we take the figures cited by Mr. Dibdin, 13 per cent. of 20 grains, that is to say 2 2/3 grains, of dissolved organic matter will be removed from the sewage by the proposed process; add to this 90 per cent. of the total suspended matter, which comes to 24 2/3 grains, and we find that, from a total of 87 grains of impurity, 26 2/3 grains will be removed, leaving the effluent charged with 60 1/3 grains of foreign matter, plus so much of the 4 2/3 grains of precipitant as have not been thrown down. If that be the case, the effluent will still be much fouler than the sewage which, in many towns, has been found to be intolerably offensive. And there remains the question, why will such an admixture of lime and salts of iron as has been found to produce an

intolerable nuisance wherever put in practice hitherto, prove innocuous in the Thames? These are not matters of bohoy or of craze, but questions affecting the health of London, and the safety and salubrity of the Thames. We venture to submit that it will be wiser to reply to them now, than to leave them to solve themselves, under the action of natural law, eighteen months hence.

**An Electrical Smithy.**—The *Newcastle Chronicle*, in a long account of the electric lighting installation at the forthcoming Jubilee Exhibition at Newcastle-on-Tyne, says that it has been proposed to erect a small smithy to demonstrate how iron and steel can be welded by means of heat produced by the electric current. "The village blacksmith is likely to open his eyes wide with astonishment at the information to follow. For instance, it has been found that bars of iron which have thus been welded together, when placed under a testing machine have been found to break at any part rather than at the weld. Specimens of this kind of work will probably be appreciated by many who know the difficulties with which the smith has to contend. To produce a current suitable for this purpose at a considerable distance from the engine-house, it will be necessary to use a transformer, whereby a small current of great electrical motive force can be exchanged for a great current at a correspondingly lower pressure."

water forced upwards requires a sheltered situation to set off its beauties, when

"at its height o'erturn  
It shakes its loos'd silver in the sun,"  
and the ill result of an exposed situation may be seen at the Crystal Palace or Trafalgar-square on a windy day, when the effect of the fountains is completely destroyed.

It is certainly time, however, that something should be done with the vacant site in Piccadilly Circus. We recently published designs by Mr. E. J. Tarver and Mr. Leonard Stokes for dealing with the site and the adjacent property, but these designs, although exhibiting considerable ingenuity of treatment, are too ambitious in character to hope for realisation, and would certainly require an Act of Parliament for their carrying out. The suggestion to ornament the space with a statue, a clock-tower, or a fountain appears to us to be inadmissible. What is wanted is to restore the plan of the circus, and this can be best accomplished by placing a building upon the vacant site. The elevation should harmonise as regards height with the existing buildings, but the design of the existing buildings need not be adhered to. If the building were to consist of an open arcade on the ground-floor the effect would be good and the convenience of the public consulted. We hope we have heard the last of the proposal of the Vestry of St. James, Westminster, to utilise the spot for a gigantic public convenience. Such things are greatly needed at the West End of London, but there is no necessity for appropriating one of the finest and most conspicuous sites in the metropolis for that purpose.

#### LECTURES AT CARPENTERS' HALL: WOOD: ITS CHEMISTRY, ITS DECAY, AND ITS PRESERVATION.

The last of the present series of free lectures was given at the Carpenters' Hall on the 6th inst., by Professor A. H. Church, M.A., on "Wood: its Chemistry, its Decay, and its Preservation." The chair was occupied by Mr. Joseph Freston, Past-Master of the Carpenters' Company.

The lecturer said he could only touch the fringe of so extensive a subject, which was connected with a number of the arts, as well as with the sciences of botany and of chemistry. His treatment of it would be essentially chemical, but he would, at the same time, make his observations as simple as possible, and assume that his audience were not acquainted with the intricacies of chemical language. Having given a description, by means of diagrams, of the growth of wood, and the manner in which the rings and bark were formed, the lecturer added that the bark was a very important factor in connexion with the seasoning and preparation of timber. Experiments had shown the enormous influence exercised by the bark in retaining the moisture of the stem, and allowing the wood to dry slowly. Of some young trees, felled in the month of June, half were harked, and the remainder left in their original condition, the whole being exposed to the air in sheds with open sides. The result was that the harked trees had lost 34½ parts of their moisture in July, 39 in August, 39½ in September, and 39½ in October, so that in one month they had practically lost all the water they could get rid of by exposure to the air; while the unharked trees had only lost 0.41 part at the end of July, 0.84 at the end of August, 0.92 in September, and 0.98 part at the close of October. Thus by a judicious paring of the bark it was possible to regulate the amount of water to be lost by a log of timber, and so to get it to dry with more or less rapidity. Passing on to the chemical aspect of wood, the lecturer said its first constituent was air. When wood was put into water it became, sooner or later, water-logged. The gas contained in wood might be said to be common air, but practically it was not so. Common air contained, roughly speaking, three gases, chiefly nitrogen, which was unimportant from this point of view, besides oxygen, a powerful agent for causing chemical change, and carbonic acid. But these gases were not found in timber in the same proportions as they existed in the atmosphere, there being more carbonic acid, less oxygen, and more nitrogen. The quantity of air was greatest in the driest woods; for when the water went out something else must come in. Water existed as an important constituent of the wood in three states.

It was partially free, as in the sap and the cell contents generally, and even amounted to half the weight of the wood. It took sometimes as many as ten years, even in a comparatively thin piece of wood, before the free water disappeared. Even then there was always some water left, which existed in the second condition, and was termed hygroscopic water, dependent for its quantity on the state of the air. On a dry day, with an east wind blowing, wood exposed to the breeze lost a part of its hygroscopic moisture. The lecturer here exhibited a thin plate of sycamore-wood, varnished on one side, which he had placed in a bottle with a piece of lime half an hour previously, the result being that the unprotected side had lost its hygroscopic moisture, and the wood was slightly curved. By putting a similar piece of wood into a bottle containing some water, the result was that the wood curved the other way. It might therefore be taken that dry air produced the concavity, and moist air the convexity of the wood, and that explained the contractions and expansions which were so annoying in various pieces of joinery under certain conditions of the atmosphere, it being this peculiar hygroscopic nature of wood which was most difficult to deal with. Thirdly, there was combined water, requiring a high temperature to drive it out, and sometimes that could not be done without destroying the wood. Water, therefore, was present in these three forms, and they had to consider two of them in dealing with ordinary timber,—free water, which had to be got rid of before seasoned wood could be had; and hygroscopic moisture, dependent on the atmosphere and the temperature. He would say nothing about the mineral matter of wood, as it rarely amounted to 1 per cent. of the timber, and in pine, deal, and fir was often much less than that in quantity. The real substance of the wood was the organic structure, which the water, gases, and minerals had all helped to build. That organic structure consisted essentially of two substances, which he would term cellulose and lignose. The lecturer here took some prepared cellulose and put some sulphuric acid upon it, when the cellulose quickly disappeared. He next tried the same experiment with deal sawdust, but the acid merely darkened the sawdust. Dr. Hngo Miller, who had paid a great deal of attention to the manufacture of paper from different materials, had determined the proportion of lignose and cellulose in several woods. The following numbers represented portions in 100 in different woods, containing also from 9 to 14 per cent. of water:—

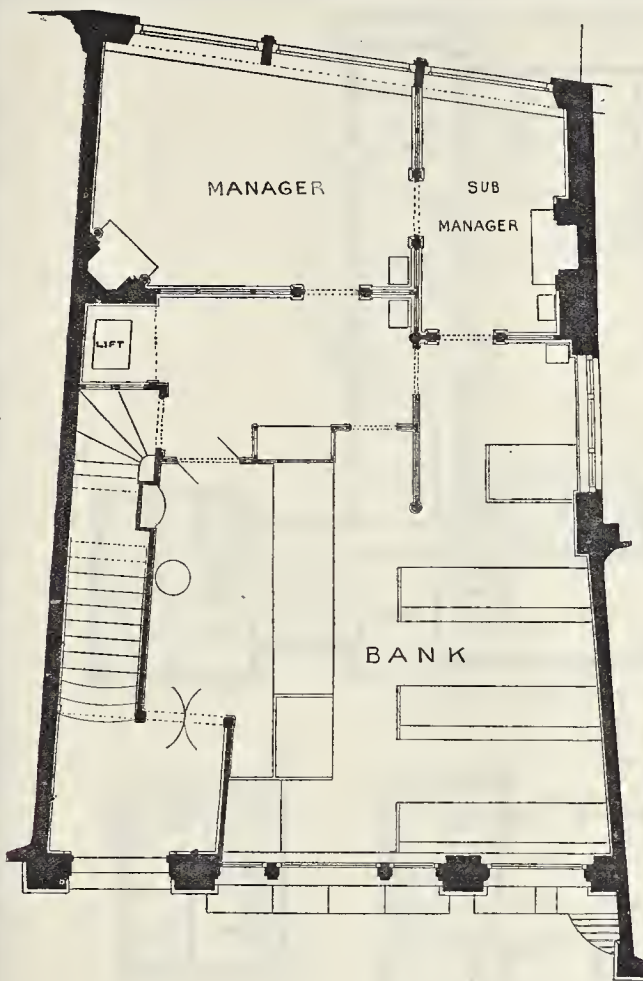

|               | Lignose. | Cellulose. | Extract. | Water. |
|---------------|----------|------------|----------|--------|
| Poplar.....   | 21       | 63         | .....    | 3      |
| Fir.....      | 27       | 57         | .....    | 14     |
| Beech.....    | 23       | 55½        | .....    | 12     |
| Mahogany..... | 28       | 49         | .....    | 12½    |
| Lime.....     | 29       | 53         | .....    | 10     |
| Oak.....      | 34       | 39½        | .....    | 13     |
| Bor.....      | 36       | 48         | .....    | 13     |
| Teak.....     | 38       | 43         | .....    | 13     |
| Beech.....    | 39       | 45½        | .....    | 11     |
| Ebony.....    | 43       | 30         | .....    | 13½    |

The third column consisted of what were termed "extractives." Besides the tissues of the wood there were also the contents of the cells, and these substances were most important. One substance contained in the cells was termed albumen, and was an important thing in the preservation of timber. It was the first substance to decay by any change in the wood, and was the material on which the vegetable and animal parasites fed. If albumen were not present the parasites could not live, or they at least remained dormant and did not multiply; but the moment the albumen was present, accompanied by moisture and a suitable temperature, those vegetable and animal organisms found a material on which to feed. The fibre of the wood was unchangeable unless albumen were present. If, therefore, the albumen was got out of the wood or locked up and made insoluble so as to render it unfit for feeding those minute organisms, the wood did not decay. By locking up those organisms, making the wood poisonous, or saturating it with substances which would not allow the parasites to exist, wood would be prevented from decaying. Professor Church here exhibited a piece of cedar found by Sir A. H. Layard in the small temple at Nineveh, about 2,800 years old. This had been preserved by being excluded to a great extent from the action of the atmosphere, and though the exterior had decayed, the decay had not penetrated to any large degree into the interior. It had suffered some change,

but that change had been arrested or made very slight by the fact that dryness was inimical to the lives of animals and plants which preyed on wood. It was now believed that wood did not decay simply by the action of moisture and air, unless the germs of living beings were also present, and that was the reason why the three classes of materials which prevented decay had been found to be effective. Some of these agents altogether excluded air and water, and were termed hydrofuge substances. A coating of excessively hard paraffin, melting at a temperature of 150 degrees Fahr., excluded all the germs of those minute organisms, and prevented decay. Paraffin was absolutely indestructible, and was unaffected by alterations of temperature or exposure, consequently it offered one of the best materials for the treatment of wood in cabinet or joinery work; and although it slightly increased the inflammability of the material for floors and parquet, nothing was better than paraffin. The second group of substances which prevented the decay of timber were of the poisonous class. Air and moisture might be permitted to penetrate the wood, but by putting minute quantities of chloride of mercury, carbolic acid, acridine, cryptidine, or naphthaline into it, the timber would show no alteration, except that the colouring matter was changed, until the preservative substance had escaped. Then there were substances which were non-poisonous, and not hydrofuges, but which yet prevented decay and paralysed the organisms. A small quantity of the vapour of chloroform, and many other substances, were, without being actually poisonous, able for a time to prevent the decay of wood. On all grounds, therefore, they arrived at the conclusion that timber decayed on account of the presence of living organisms, and not by direct chemical action. The lecturer then touched upon the creosoting of timber, and showed a sleeper (kindly lent, with other specimens, by Mr. S. B. Boulton) which had been in use for twenty-eight years on the London and North Western Railway, the interior of the wood being perfectly sound. Now what was the substance in coal-tar which effected the protection of timber? It had always been supposed to be the creosote,—the so-called tar acids present in the coal-tar. Experiments made lately had shown that although these substances were present in the coal-tar, and were useful in killing the germs and rendering the timber poisonous, so that neither plants nor animals would touch the wood, it was important, if the timber was to be maintained in its integrity, that solid oily substances which were not volatile under ordinary conditions should be present. Prof. Church concluded by saying he had found time to speak only of one or two of the four sections of his subject, but if he had shown that there was something in the chemistry of wood which might appeal to one's ordinary practice, and that a good deal remained to be learned about it, his object in coming there that evening would have been happily answered.

A cordial vote of thanks to the lecturer closed the proceedings.

**The College of Preceptors.**—The new building for this institution in Bloomsbury-square was opened on the 30th ult. by H.R.H. the Prince of Wales. The architect is Mr. Frederick Pinches, and the building and its fittings have cost 15,000l. The style of the new edifice is Renaissance, freely handled. The ground-floor is a few steps above the ground-line; and the façade, which has a breadth of 46 ft., rises to the extent of three stories. The depth of the new building from front to back is 87 ft. The entrance corridor is wide and lofty. On one side of it is a general or club-room for members, and on the other side the secretary's and the clerks' rooms. The Council room is on the first floor. The ceiling is panelled and picked out in colour; and the walls lined to a height of 6 ft. with a polished oak-pannelled dado. The remainder is hung with hand-painted Tynemouth tapestry finished in rich lacquer. Annexed are two smaller rooms, one for the committee, and the other for the officers of the college. The chimney-pieces are of carved oak, and have been executed by the School of Art Wood-carving at South Kensington. The second-floor is wholly devoted to the lecture-hall. Around it are oak book-cases, adapting it also to the purposes of a library. Mr. James Hill supplied all the locks and lock furniture.

Premises of the Commercial Banking Co. of Sydney.—Plan.

room, and guardians' retiring-room, lavatories, and conveniences.

Externally the buildings are faced with best red pressed bricks, with Grinshill stone dressings, the roofs being tiled. Internally all the corridor floors are of concrete, laid with encaustic tiles. The timbers of the board-room roof are partly left to view, panelled and richly moulded. All the internal joiner's work is of pitch pine.

In addition to the open fireplaces provided, the buildings will be heated by employing the excess of steam now generated by the laundry-boilers.

New vagrant-wards, in part on the "separate-cell" system, with caretaker's house adjoining, and new receiving-wards for males and females, are also being erected, from designs by the same architect.

Messrs. Horsley Bros., of Birmingham, are the contractors for the whole of the works. Mr. J. Jackson, of Newcastle, Stafford, has the heating in hand. Mr. Lovatt is acting as clerk of the works.

THE COMMERCIAL BANKING COMPANY OF SYDNEY'S NEW BANK.

This corporation, established in Sydney in the year 1834, has recently constructed new banking premises in Birchin-lane, Lombard-street, of which we give an illustration.

The Birchin-lane front is constructed in Portland stone, with red Peterhead polished granite pilasters and Aberdeen grey polished granite bases.

The building has been designed in a Classic style with somewhat of Greek feeling, in order to give massiveness of character while preserving as much light as was possible under the circumstances of the frontage being to a very narrow street. The rear is lighted from the churchyard of St. Edmund's.

The fittings are throughout in polished fumigated wainscot.

The general contractors were Messrs. Ashby & Horner; the granite was supplied by Mr. A. Nicholson; the constructive ironwork by Messrs. Handyside; the beating apparatus by the Æolus Waterspray Co.; the mosaic work by Messrs. Burke & Co.; the lift by Messrs. Waller & Co.; the strong-room doors and fittings by Messrs. Chubb; and the gasfittings by Mr. Biggs. Mr. E. Roscoe Mullins was the sculptor.

The building was designed and constructed under the direct superintendence of the architect, Mr. W. W. Gwyther.

The Housing of the Poor in Edinburgh.

The question of dealing with insanitary houses in Edinburgh has, it would appear, reached a stage at which it will demand henceforth careful consideration. The Public Health Committee have very large powers of dealing with this class of property. They can (according to the *Scotsman*) summon a proprietor before them, and make him show cause why he should not be called upon to repair the property, or if in the opinion of the Court the houses are past repairing, an order may be issued closing them up altogether. This is only done, however, after a careful report by the Burgh Engineer. In 1885, 309 houses were condemned as being uninhabitable, of which a considerable number were put into decent repair. The rest were either left as they were, or pulled down. Last year the number of such houses reported on was 491, of which 190 were shut up as uninhabitable, while at September last 179 were in course of being dealt with. These houses are of the poorest class, ranging in rent from 30s. to 5s. a year,—the rents being collected weekly. The difficulty which has arisen is in connexion with the housing of the poor people who are dispossessed of their wretched dwellings by the operations of the Public Health Committee. Any new houses which are being built in the poorer localities cannot be let at the same rents, and it would seem that the families who have been turned out of the old houses experience great difficulty in finding shelter. There are several organisations in the city doing something to meet the difficulty, which, it would appear, has been presented to the Public Health Committee in a concrete shape by a report which, it is understood, the Burgh Engineer has prepared on the subject.

Illustrations.

EDINBURGH MUNICIPAL BUILDINGS DESIGNS.

WE give this week plans and elevations of the designs submitted in this competition by Mr. Brightwen Binyon, under the motto "The Heart of Midlothian," and commented upon in our remarks on the collected designs in a former number.

GARRISON CHURCH, STUTTGART.

This church, built a few years since from the designs of Professor Dollinger, is much admired in its neighbourhood, and has not, we believe, been illustrated in England.

It is built of yellow and red brick, with stone dressings, and is vaulted throughout, the actual masonry and brickwork being shown everywhere. The small plan appended shows the general arrangement, and the manner in which the gallery staircases are introduced in the transepts. The nave, which, as will be seen, is planned with side aisles for passage only, is 12 metres wide over all (about 40 ft.). The interior derives a rich effect from the employment of stained-glass windows, as well as the introduction of statues in the niches of the large piers at the crossing. The church seats 1,400 persons.

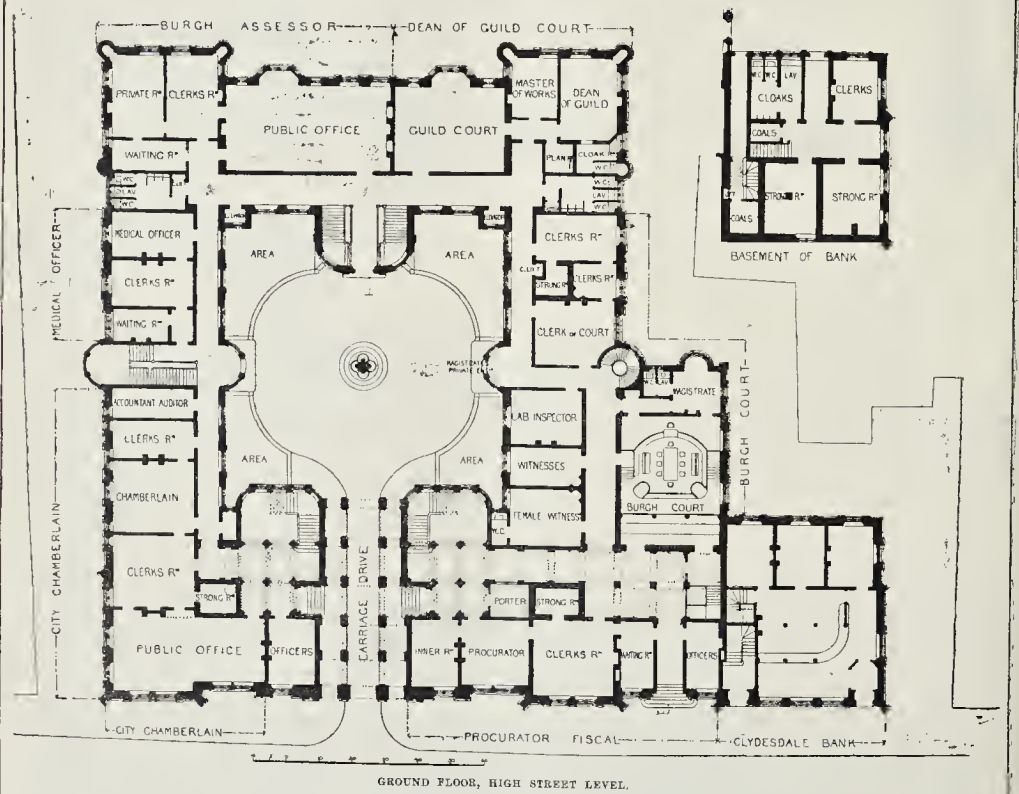

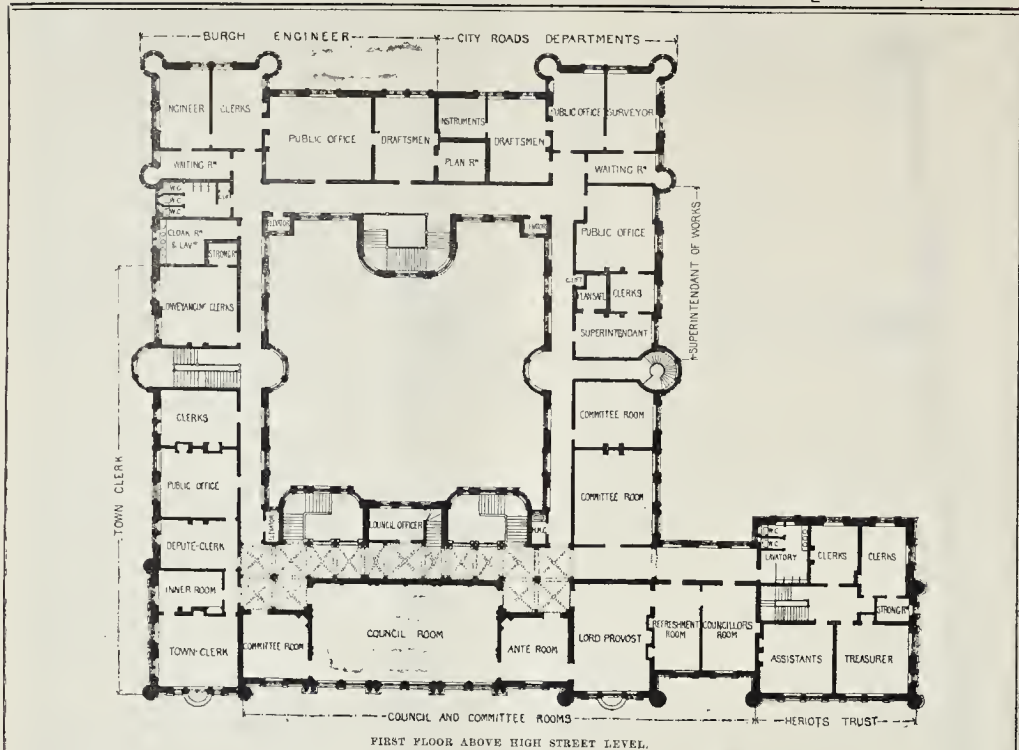

ST. MARGARET'S CHURCH, IPSWICH.

THE drawings which we illustrate to-day are part of a set which obtained the National Silver Medal at Kensington last year for Mr. Harry Percy Adams, of Ipswich; they illustrate a fine specimen of a Suffolk church, containing a beautiful example of a double hammer-beam roof. The church stands on the north side of a large open square facing the town. Among its curiosities is an octagonal font bearing on one side the singular inscription, "Sal et Saliva," on a scroll. On each side of the porch is a gargoyle, that on the west side representing a monk and that on the left a nun.

WEST BROMWICH UNION OFFICES.

THE accompanying illustration represents the new hoard-room and relief offices now in course of erection in Hallam-street, West Bromwich, on land adjoining the workhouse buildings, from the designs and under the superintendence of Messrs. Henman & Timmins, architects to the Board of Guardians.

This block of buildings is entirely detached from the rest of the workhouse, and contains, on the ground-floor, separate entrances for the guardians and for the applicants for relief, two committee-rooms, a large waiting-room and relieving officer's rooms, lavatories and conveniences; on the first floor, the board-room, another committee-room, clerks' offices, strong-

PREMISES FOR THE COMMERCIAL BANKING COMPANY OF SYDNEY.—MR W. W. GWYHER, F.R.I.B.A., ARCHITECT.

THE UNIVERSITY OF CHICAGO

METROPOLITAN SEWAGE DISPOSAL.  
PARKES MUSEUM OF HYGIENE.

A PAPER dealing with this important subject, by Mr. J. Bailey Denton, M.Inst. C.E., was read at the Parkes Museum of Hygiene on the 6th inst. Professor Corfield occupied the chair, and there was a good attendance.

The paper was read by Mr. Bailey Denton's son. At the outset the author said that the subject was unique in the difficulties and contradictions that surrounded it. Sewage in itself was a complex substance, consisting of that which was theoretically very valuable, and practically, at the present time, nearly worthless. Made up of two parts,—the liquid and solid,—sewage, to be dealt with in any way satisfactorily, must have those parts separated from each other, when the liquid portion might become clear and bright, whilst retaining both its fertilising and obnoxious qualities, and the solid portion might be rendered ductile and portable, though it had lost the major part of that which would make it worth the cost of carriage. Upon the question of the value of sewage as a fertiliser of land, England seemed to have changed its mind for a time, not because it had failed in producing an increased supply of food for the people, but because the means adopted for its utilisation had in some instances commercially failed to secure a profitable return. As he did not in any way participate in the views which held possession of the minds of the Metropolitan Board of Works and other local authorities in relation to sewage farming, who made the difficulties attending it (and there were many) an excuse for getting rid of the "nasty stuff" in the quickest way they could, he desired, as a close observer of what could be done in the way of sewage utilisation, and as a sewage farmer himself, to place on record in a few words his conviction that it had been solely owing to the want of technical knowledge on the part of the farm managers that the expectations formed with regard to the application of sewage to land had not been realised. Like every other trade or business, sewage farming could only be learnt by apprenticeship, and only perfectly practised when experience had shown what to do and what to avoid; yet every member of a local board, whether he was a draper, or a printer, or a publican, thought he could direct every step that should be taken, either to cleanse the sewage or to make the farm pay. He believed, in point of fact, that as a member of a local board he knew as much about farming as a Lothian or Lincolnshire farmer, and as much about the cleansing of sewage as a Liebig or a Frankland. That was an anomaly, for he did not find that a farmer or a chemist, however successful, would turn draper, or printer, or publican with equal confidence. Why the governing sanitary authority appointed for the "better management" of London, the capital of the British Empire, and the most important if not the most populous city in the world, should exhibit a twofold want of loyalty to the common interests of the nation by polluting the Thames, at the same time that it disregarded the reproductive value of the sewage to be disposed of, would remain unexplained so long as the Metropolitan Board of Works continued indifferent to one of its primary duties,—for the performance of which it was called into existence,—the purification of the Thames. The fact that Paris, the capital of France; Berlin, the capital of Germany; and Hamburg, Breslau, and Dantzic, the capitals of subordinate states, were turning to advantage the sewage they discharged, whilst St. Petersburg, Moscow, and Warsaw were preparing to do the like,—seemed to have no influence whatever on the Metropolitan Board; although these European cities had all been treated upon examples afforded by, and information obtained in, England. Instead of closely studying what had been done in this country and abroad, the Board had been content to represent to their constituents that it would be extravagant to expend between three and four millions of money in extending the outfalls a distance of twenty miles down the river, although, that plea could be readily shown to be a fallacy. Directly those big figures were turned from capital into interest, they happily meant no greater charge upon the ratepayers than the annual cost of chemicals and labour in mixing would involve, apart from the interest on the capital outlay in additional permanent works at the outfalls. Nevertheless, it had been decided

to construct underground tanks,—which in themselves were very objectionable,—to be followed by an expenditure of three times that amount if persevered in. Most unfortunately for the interests of agriculture, the Board had determined that those tanks should be added to those at present existing at the Barking outfall, in a district where the population was increasing at a greater ratio than in any other metropolitan suburb, and where the extension of building was so rapid that it would soon crowd out all possibility of using the collected sewage free from local nuisance, in the way which Sir Robert Rawlinson had said might be adopted for distant distribution from the outfalls. It was, indeed, difficult to understand how a body of men ordinarily engaged in various important branches of commerce should reject the recommendations given them by the Royal Commission, when a careful investigation with unprejudiced minds would have shown them that for the expenditure of three and a half millions,—meaning a rate of only a penny in the pound,—in extending the outfalls to a point beyond Hole Haven Creek, with an addition for works there of no more money than the Board were now about to expend at the outfalls, they could purchase 4,500 acres of land and construct the necessary works for the treatment of the sewage in a locality where they could not only have secured for future generations the utilisation of the sewage, but could do so in a way to entirely free the river from pollution into the bargain. As his (the lecturer's) name for some years past had been more closely associated with intermittent filtration than with other means of sewage treatment, he wished to say, by way of parenthesis, that he was not less the advocate of wide irrigation, which he deemed to be the most profitable mode of utilising sewage, than his friend Dr. Alfred Carpenter, or Sir Robert Rawlinson, though he adhered strongly to the opinion,—after a somewhat wide experience,—that intermittent filtration ought always to be combined with wide irrigation as a safeguard, or perhaps it would be better to say as a means of removing the difficulties of the sewage farmer when the land under his care required relief on occasions of great downfalls of rain, or by reason of the condition of the cropping, or when it was desirable to save labour in the night time and on Sundays. Up to the commencement of the present century water-closets were unknown; the stately mansions of the wealthy and the humble dwellings of the poor were alike provided with receptacles for fecal refuse, which had to be removed by nightmen, and which process was attended with very great nuisance. When water-closets were introduced in 1810 they were only intended to wash the putrescible matter from dwellings into cesspools, from which the overflow found its way into the watercourses and rivers, thus producing a polluted condition, and substituting one class of nuisance for another. It was not fifty years since the first effort was made at district house sewerage. That was superinduced by the copious use of water attending the introduction of water-closets and the establishment of additional water companies which took place about the same time. Nothing could be more regretted by all earnest thinkers than the conduct of the Metropolitan Board in 1887, which must bring upon us the ridicule of the world, in resorting to the homoeopathic doses of 37 grains of lime and 1 grain of sulphate of iron, with a sprinkling of permanganate of soda, per gallon, for the purification of the sewage of the metropolis in face of the truth that the great towns of the North of England, Leeds, Bradford, Sheffield, &c., after trying every known kind of chemical applicable to sewage treatment, had come to the conclusion that nothing less than one ton per million gallons (taking the average quality of town sewage) could render their sewage effluents admissible into rivers. Common sense told us that to apply a minimum quantity of chemicals, as proposed by Mr. Dibdin, to an average outflow of sewage from a densely populated city of the character of London, was in itself an absurdity, and the manner in which the Metropolitan Board of Works seemed to have arrived at those homoeopathic doses was,—if rumour spoke truly,—as singular as it was unworthy the magnitude of the object. Although Sir Christopher Wren in the seventeenth century proposed certain works connected with the "new sewers and backwaters of Westminster" and the Fleet Ditch and other tributaries of the Thames

were turned into common sewers,—which in the eighteenth century, it was not until John Martin, the eminent painter, had called public attention to the disgusting state of the Thames that it was found necessary by systematic design to intercept the sewage of dwellings and prevent its discharge into the Thames. It was twenty-two years subsequently to Martin's appeal that the Metropolitan Board of Works took the place of the several Commissions of Sewers then existing for "the better management of the metropolis." The Act constituting the Board, however, was not passed until after the Consolidated Commissioners of Sewers had sought plans for the drainage of London by public competition (1849), the result of which was the adoption of the concrete design of Mr. Frank Foster and Colonel Haywood, the present City Engineer. The government of that day, by the First Commissioner of Works, Sir Benjamin Hall, referred the whole question to Captain Douglas Galton, R.E., and the late James Simpson and Thos. C. Blackwell, C.E.'s (1857), who proposed that, instead of adopting the points of outfall recommended by the engineers of the Metropolitan Board of Works, the sewage should be taken down the river and discharged on the northern side of the river, near Mucking Light-house, in Sea Reach, and on the southern side near Higham Creek, in the Lower Hope. He gave this brief history because it was desirable at the present juncture to realise the fact that the referees of 1857 recommended the extension of the outfalls to points almost as far down the river as the point suggested by the Royal Commission on Metropolitan Sewage Discharge in 1844, with the simple but very important difference that, whereas the referees would have been satisfied with the discharge of crude sewage into Sea Reach, the Royal Commission, after the experience gained, objected to any discharge into the river until the solid matter had been separated from the liquid, when they would admit the latter only if carried down and discharged "at least as far as Hole Haven." It was true that the Metropolitan Board, in 1857, successfully over-ruled the opinions expressed by the referees, but that was not done until several leading members of both Houses of Parliament had forewarned the Board that the river might be made (as it had now been made) a main sewer for the whole of London, and that our magnificent river might be turned into a "cesspool" by the discharge into it of the sewage which it was the duty of the Metropolitan Board to dispose of without causing any nuisance. The late Lord Derby called attention to the fact that there was no express provision in the Act constituting the Metropolitan Board that the *modus operandi* was to be by intercepting sewers, though it was well understood, his lordship said, "that the sewage of the metropolis should not be allowed to be poured into the river until it had undergone the process of deodorisation." And what was also true and even more pertinent to the present condition of things, was that Robert Stephenson, whose opinion would ever command the attention of Englishmen, stated that he believed that sewage would eventually be made useful for agricultural purposes, and he therefore thought it impolitic to enter into any larger expenditure than could be helped for the present (1854-5), even if it were found necessary to carry the sewers down to Sea Reach. Robert Stephenson stated those words twenty-eight years ago, and it was "Sea Reach" that the Royal Commission (Lord Bramwell's), after eighty-one days' close attention to the subject, now declared should be the place of discharge, believing "that the existing evils imperatively demand a prompt remedy." Could any words more closely prove the foresight of Robert Stephenson? Lord Bramwell's Commission consisted of men occupying the highest position in practical science, and known to be specially acquainted with the subject they were selected by the Government and appointed by her Majesty to inquire into and report upon, i.e., "the system under which sewage is discharged into the Thames by the Metropolitan Board of Works." They made two reports, and in the second they said:—"We are of opinion that some process of deposition or precipitation should be used to separate the solid from the liquid portions of the sewage. . . . That the solid matter deposited as sludge can be applied to the raising of low-lying lands, or burnt, or dug into land, or carried away to sea. . . . But we believe

that the liquid so separated would not be sufficiently free from noxious matters to allow of its being discharged at the present outfall as a permanent measure. It would require further purification; and this, according to the present state of knowledge, can only be done effectually by its application to land. . . . And if suitable land in sufficient quantity and at reasonable cost cannot be procured near the present outfalls, we recommend that the sewage liquid, after separation from the solid, should be carried down to a lower point in the river, at least as low as Hole Haven, where it may be discharged." Apart from chemical considerations, it had been made manifest that it was not in any way desirable to turn the sewage liquid after separation into the Thames at the present outfalls, however much the upland water might be mixed with tidal water in that locality. That would appear certain from the fact that whereas the quantity of upland water flowing at times down the river to mix with the sewage as it left Barking and Crossness at ebb-tide might be as little as 750,000,000 gallons in twenty-four hours, the quantity of sewage discharged might reach 100,000,000 gallons in the same time, or more than one-fifth of the upland flow; the least proportion of sewage recognised as safe for riparian interests being five per cent. of the river flow, or one-twentieth part. The Royal Commission in their first report called attention to that fact in the following words:—"The flow of sewage proper is estimated at an average of 16,000 cubic feet per minute, which is 23,000,000 cubic feet per diem. Now the river at low water in the neighbourhood of the outfalls is about 2,000 ft. broad, and has a sectional area of about 30,000 square feet, so that there is discharged into it every day as much undiluted sewage as would fill a length of 750 ft. of this part of the river at low water." These facts, the lecturer thought, were sufficient of themselves, without any reference to chemistry, to prove that the metropolis was committing a suicidal act in allowing the Metropolitan Board to maintain a pollution which, though it might be slightly mitigated by Mr. Dibdin's recipe, would still reduce the river into a flow of liquid sewage through the dock region of its course,—a fact which could not fail, on a re-visitation of cholera, to be attended with fatal results. The reason given by the Metropolitan Board, or rather the Works and General Purposes Committee, was most curious. While actually putting on one side the recommendations of the Royal Commission, they stated that, with a view of complying with their recommendations, they had voted 1,000l. for the purpose of experiments on successive quantities of 1,000 gallons of sewage, subsequently increased to 100,000 gallons, and then to 250,000 gallons. Those experiments they afterwards declared were sufficient to show, in face of what all past experience had so strongly proved to be the reverse, that no practical advantage accrued from the additions to the sewage of more precipitating matters than 3·7 grains of lime and 1 grain of sulphate of iron, which they deemed all that was really necessary for facilitating the natural tendency of solids to deposit. They further stated that the effect of adding large quantities of chemicals insured only a more perfect clarification without materially affecting the solid constituents of sewage. The committee having come to these conclusions induced the Board, as a body, to vote a sum of 5,000l. (in November, 1884) for the erection of works at Crossness outfall for the experimental treatment of 1,000,000 gallons of sewage daily, which is just one 160th part of the actual quantity of sewage discharged at the outfalls. The result of those experiments, the Committee declared, confirmed the results first arrived at by the Chemist of the Board, and authoritatively asserted that the sewage could be "sufficiently" clarified by the addition of 3·7 of lime and one grain of protosulphate of iron to each gallon of sewage, which he (the Chemist) had, by that funny calculation of his own, arrived at as the exact quantity that would effect the desired precipitation; and the Committee took upon themselves to add that, in addition to the removal of the solids, the "grosser odours of the sewage are destroyed, and the foul and offensive appearance of the sewage removed." These were strong words after the experiences of the last thirty years. With regard to the Canvey Island scheme, its governing features were that it obviated altogether any discharge of the dry-weather sewage, both solid and liquid, into the

river between Blackwall and Sea Reach, and that its area, 4,383 acres, with its attendant physical conditions, afforded remarkable facilities for (1) the deposition or treatment of the solid portion on its surface without nuisance of any kind or occasion for removal from the site of deposition; (2) the utilisation of the liquid sewage for irrigation on the island or on lands in Essex and Kent; and (3) the purification of the liquid after its separation from the solid by filtration through soil before discharge into the Thames Estuary. The island, which was separated from the mainland of Essex by Benfleet Creek, being  $\frac{1}{4}$  miles from Southend, and well away from all residential properties, was free from any chance of nuisance. Its surface, which was 8 ft. above Ordnance datum, and 6 ft. 6 in. below the highest tides, was as flat as a table, not varying in height more than 12 in. throughout its entire length and breadth. It was at present surrounded by a sea-wall, 9 ft. or 10 ft. high, and there was room within that marginal bank, which formed the island into a monster basin, for the sludge of the whole of the sewage of the metropolis for two centuries to come, if no part of it were disposed of otherwise, without raising the accumulating solid matter above the height of the banks, whilst two-thirds of its extent, i.e., 3,000 acres, would suffice for the treatment of the sewage for 100 years, if the deposit were raised only 100 in. That would leave one-third of the island to be converted into a sewage farm or planted with osiers, or otherwise dealt with, as might be found most advantageous. The soil of the island was alluvium on clay, and as there were no rocks nor stones in it to obstruct steam cultivation, it could be as readily rendered fit for filtration by stirring, trenching, and mixing as any land in the kingdom. It was singularly capable of both surface and under-drainage, owing to its insular character, low tide (near) being 10 ft. below the surface, thus allowing the discharge from the under-drains to be constant by the construction of proper outfall channels connected with internal tidal ponds or reservoirs, which would empty their contents as soon as the tide receded. But the local features which most favoured treatment of the sewage on the island were:—1. That the alluvium would turn into ballast. 2. That under the surface and for a considerable extent there existed a clay-puddle technically termed "cement mud." 3. That on the shores surrounding the island there existed inexhaustible beds of very fine sand and cockle-shell debris,—the best of filtering materials. 4. That on the opposite shore of the river (Kent) there existed chalk, which could be obtained at comparatively small cost, to be ground and used as chalk, or burned into lime if desired, as a precipitant and disinfectant. 5. That within easy reach there existed on the River Medway the well-known cement works. The substances enumerated were specially valuable for mixing with the sewage to give it solidity, and for mixing with the soil to fit it the better for filtration and give that capability of percolation which might be found desirable. The island at present was used simply for agriculture, and having only 300 inhabitants upon it, with one small church, vicarage, schools, and village, all built of wood and easily removable, it presented the most inviting conditions for the utilisation of the sewage of the metropolis, seeing that whatever had been done elsewhere, and might be done in future with the advance of science, could be done upon the island without any nuisance whatever.

The Chairman proposed a vote of thanks to Mr. Bailey Denton for his most interesting and important paper.

Dr. Poore seconded the motion, which was agreed to.

Dr. Drysdale said he considered that Mr. Bailey Denton's scheme was conclusive as against the scheme of the Metropolitan Board of Works. The latter seemed to be in opposition to those schemes of physiological treatment which were being adopted in Paris, Berlin, and other Continental cities. It really appeared as if England would be behind rather than before the rest of Europe in regard to sewage treatment. The effect of Mr. Dibdin's plan would, he believed, be quite appreciable, as no chemical product could have any effect in neutralising the injurious results of sewage in a large city like London. The only chance of dealing with the

sewage of the metropolis was by what might be termed the physiological plan.

Dr. Alfred Carpenter said that the wasteful manner in which the Metropolitan Board of Works intended to deal with the sewage of London should call down shame upon that body. Mr. Bailey Denton's proposal to utilise Canvey Island for the disposal of the sewage commended itself as a sort of half-way house or compromise as between wide irrigation and chemical precipitation. Many people might be convinced that irrigation was the best way to utilise the sewage, while others might think it an unsatisfactory process, and attended with evil consequences. Therefore, until the majority came round to the view that sewage irrigation was a safety and not a danger, it was not likely to be generally adopted. If the Canvey Island scheme could show this it would have done a great work, and would be a step towards preventing the destruction of the trade of the port of London, which must come about if the present condition of things was to continue for another fifty years. The mass of material being deposited in the Thames was preparing the way for what would one day bring down a severe punishment. The Metropolitan Board might as well "spit in the sea" as use chemicals in the manner they propose doing. By the Canvey Island scheme there would be three or four thousand acres of land producing an increased amount of produce, and an enhanced milk supply for the metropolis.

Mr. Shone remarked that he had visited Canvey Island for the purpose of studying the "sewageology" of the place, because he understood that the proposal was to create land out of the *debris* and other sewage matters to be conveyed there. He believed that the island would be a very suitable place for carrying out the scheme designed by Mr. Bailey Denton and Col. Jones, and it would be far cheaper in the end for the Metropolitan Board of Works to purchase the place as a site for a huge laboratory than to keep on conducting their experiments at the outfalls at Crossness and Barking.

Mr. Sillar, though a strong advocate for precipitation versus irrigation or intermittent filtration, did not think one word had been said too strong in denouncing the scheme of the Metropolitan Board of Works, taken as a whole. At the same time, there was something to be said for it. Mr. Bailey Denton appeared to assume that the Royal Commission had given an unqualified approbation to the scheme for conveying the sewage down to Canvey Island; but that was a mistake. What they had recommended was precipitation if possible, and to carry the effluent down the river. If, therefore, precipitation was to be adopted, it was not altogether foolish of the Metropolitan Board of Works to put up works for the purpose, and to delay the carrying down of the effluent water until they found it must be done. After having erected the tanks, if they found they could produce an effluent which might pass into the Thames, it would be a needless expense to erect a costly sewer to carry it further down the river. He must confess that he did not expect the Metropolitan Board to produce such an effluent by the proposed plan, although if they had adopted the Aylesbury scheme,—which, by the way, they did not understand,—there would be no necessity for any lengthened sewers. The Board would doubtless learn the best treatment of sewage by experience when the tanks were constructed, and they would thus save the expenditure of over three millions of money, with its burdensome interest, on an immense sewer, which in the end might be found to be unnecessary.

The discussion was continued by Dr. Poore and the Chairman, who supported Mr. Bailey Denton's views, while Mr. G. R. Strachan and Mr. Helmer took up a somewhat neutral position.

A vote of thanks to Professor Corfield for presiding closed the proceedings.

**Royal Academy: Architecture School.** The Modelling Class having terminated for the session, a course of demonstrations on "Mouldings and Profiling" will be given by Mr. Stannus, at six p.m. on Monday evenings, as follows:—April 18, Use and General Contour; April 25, Composition of Crown and Foot Mouldings; May 2, Composition of Framing Mouldings; May 9, Returns and Suppression of Mouldings; May 16 and 23, Enrichment of Mouldings; June 6, Profiling of Vase Forms; June 13, Profiling of Baluster Forms.

## SANITARY LEGISLATION CONFERENCE.

The first meeting of this Conference was held at 5, Argyle-place, Regent-street, last week, when representatives were present from the following institutions:—Sanitary Assurance Association, Royal Institute of British Architects, Surveyors' Institution, Public Health Medical Society, the London Sanitary Protection Association, and the Association of Municipal and Sanitary Engineers and Surveyors, also Sir Henry E. Roscoe, M.A., and Mr. C. C. Lacaita, M.P., two of the members having charge of the Sanitary Registration of Buildings Bill. The representatives present included Lieut.-Gen. Lord Chelmsford, G.C.B., Sir Joseph Fayer, K.C.S.I., M.D., F.R.S., Sir Vincent H. Kennett-Barrington, Mr. Edward T'Anson, President of the Royal Institute of British Architects, Professor T. Roger Smith, Mr. J. Lohley, President of the Association of Municipal and Sanitary Engineers and Surveyors, Mr. Timothy Holmes, F.R.C.S., Dr. David Finlay, F.R.C.P., Mr. Mark H. Judge, Mr. H. Rutherford, Mr. J. W. Fenfold, Hon. Sec. of the Surveyors' Institution, Mr. Hugh Leonard, C.E., and Mr. E. B. Ellice Clark.

Sir Joseph Fayer was elected President of the Conference, and the following vice-presidents were appointed:—Lord Chelmsford, Sir Gayer Hunter, M.D., M.P., Mr. Lacaita, M.P., Mr. Edward T'Anson, President R.I.B.A., Mr. J. Lohley, President of the Association of Municipal and Sanitary Engineers and Surveyors, and Mr. H. Rutherford. Mr. Joseph Hadley, F.R.S., and Mr. Mark H. Judge were appointed Hon. Secretaries.

Sir Joseph Fayer, as President of the Sanitary Science Association, welcomed the representatives, and explained that the Conference had been convened by the Association on the suggestion of the Association of Municipal and Sanitary Engineers and Surveyors for the purpose of considering the Sanitary Registration and Buildings Bill, which had been introduced by Mr. Lacaita, at the request of the Sanitary Assurance Association, the second reading of which was fixed for the 22nd of June. The Bill had been prepared after most careful consideration by the Council over which he had the honour to preside. They were fully convinced that some measure of the kind was absolutely necessary in the interests of the public health, and they were glad to have been so fortunate as to receive the assistance which this Conference would give to sift the details of the Bill, so that their representatives in the House of Commons might be made aware of the provisions of the Bill, and of its bearing on the general health of the community, in order that the principle of the measure might be embodied in an Act of Parliament. He felt sure that however those present might differ with regard to the details of the measure, the principle of the sanitary registration of buildings would meet with their approval. In a meeting composed of eminent jurists, medical men, architects, and engineers, there was no need for him to speak at any length upon the necessity which existed for improvement in the sanitary conditions in which our people had to reside. It might be urged that Government already dealt with sanitary matters, and had taken charge of the sanitary condition of our towns; but that was only true to a very limited extent. Unless the authorities had reason to believe that a nuisance existed, he believed that there was no power under which public officers could demand admission to buildings for the purpose of sanitary inspection. By the present measure it was proposed to give this power, but they did not seek to impose upon the owners and occupiers of buildings need for public or semi-public purposes, the duty of satisfying the public sanitary authority that such buildings were in a satisfactory sanitary condition. In proposing that addition to our sanitary law, the Bill expressly provided that in no respect whatever would the powers and responsibilities of authorities under existing Acts be interfered with in the least.

Letters were read from some associations requesting to be permitted to send representatives to subsequent meetings of the Conference, but it was resolved for the present to limit the Conference to the institutions already represented, with the exception of the Institution of Civil Engineers, which it was decided to invite to appoint representatives.

The Conference then proceeded to consider the principle of the Bill, upon which Mr. H.

Rutherford proposed,—"That the sanitary registration of buildings is desirable in the interests of the public health." This was seconded by Mr. Holmes, and supported by Mr. Robins, F.R.I.B.A.; Mr. Angell, Borough Engineer, West Ham; Mr. Ellice Clark, Mr. Judge, Professor Roger Smith, Sir H. Kennett-Barrington, and Mr. Lohley, and carried unanimously.

Mr. Lewis Angell proposed, "That it is desirable that the law should forbid any building being used for public or semi-public purposes, unless and until the arrangements for the water supply, drainage, and ventilation of such buildings have been certified as satisfactory by some properly qualified person." This was seconded by Lord Chelmsford, and, after considerable discussion, was carried unanimously.

Mr. Mark H. Judge proposed, "That the provision of a Public Sanitary Register for the voluntary registration of private houses would be instrumental in promoting Sanitary Improvement." Sir H. E. Roscoe, M.P., seconded, and this was also unanimously agreed to.

It was then proposed to consider the details of the measure by taking the Bill clause by clause, and for this purpose the Conference adjourned till April 18.

## BUILDINGS FOR POOR LAW ADMINISTRATION.

*Lambeth.*—Early last year the Lambeth Guardians had seriously to consider the want of sufficient accommodation for the increasing number of inmates at their workhouse, Renfrew-road, Kennington-lane, and after much discussion it was eventually decided to reconstruct the old workhouse, Princess-road, and to transfer the whole of the able-bodied inmates thereto, leaving the aged and infirm at Renfrew-road. In accordance with that decision, the Princess-road workhouse is now being reconstructed, or rather virtually rebuilt, from the designs of Mr. T. W. Aldwinckle, F.R.I.B.A., accommodation being provided for 200 men and 150 women. The new workhouse (the foundation stone of which was laid on the 6th inst. by Mr. George Howlett, Chairman of the Board of Guardians) is to be a "test house," that is, an establishment where a rigid test of isolation and work will be applied to the able-bodied loafers of both sexes,—those who are perfectly able to earn their living outside the workhouse if they were willing to do so,—while the deserving poor will meet with every consideration. This desirable end will be arrived at by a strict system of classification, as already arranged by the same architect at the workhouse at Renfrew-road, and also at the new workhouse of the Wandsworth and Clapham Union. Each sex will be divided into three classes, according to conduct and antecedents, and this classification will be strictly maintained throughout by providing, for each class, distinct and separate day rooms, dormitories, staircases, airing yards, lavatories, baths, &c. This arrangement, while distinctly protective towards the deserving poor, will act as a great deterrent towards those of bad character, as it is found that strict discipline and isolation are very distasteful to the latter.

For all three classes there will be ample opportunities for work, and no one will be allowed to remain idle. Those of the first class (good character) will be provided with associated workshops and workrooms of the usual description, but the remaining classes, comprising those of bad character, will perform their daily tasks in isolation, having no communication with each other. This separate system will, in exceptionally bad cases, be extended to the day rooms and dormitories. In order to ensure discipline, each ward is overlooked by a window in an officer's room, and, with a view to safe exit in case of fire, each large ward has a staircase at each end. Special attention has been paid to the warming and ventilation. The several wards will be warmed by hot-water pipes. For ventilation, fresh external air will be admitted by means of Tobin's tubes and Boyle's inlet brackets, and the vitiated air will be removed by means of vertical brick shafts, terminating with air-pump ventilators, the temperature of the interior of these shafts being raised by means of conical gas-burners. The drainage will be laid in straight lines from one manhole to another, and will have inlet and outlet ventilation, the latter by means of

exhaust-shafts higher than the buildings. The drains will be flushed automatically. Great care will be taken to prevent sewer gas from entering the house. All soil-pipes will have air inlets near the foot, and will be carried up as ventilators above the roof. All waste-pipes will discharge into external traps, giving air-separation from the drains. Every part of the buildings will be of the plainest possible character,—absolutely devoid of all ornament,—and the internal fittings perfectly simple. The buildings will cost 20,000*l.* The contractor is Mr. William Smith, of Eldon Works, Kennington; and Mr. Chutter is the clerk of works. In addition to these works, the Lambeth Guardians, at their last meeting, instructed Mr. Aldwinckle to prepare plans for the enlargement of the Infirmary, Renfrew-road, by 250 beds.

*St. George's-in-the-East.*—The Guardians of the Poor of St. George's-in-the-East have instructed their architects, Messrs. Wilson, Son, & Aldwinckle, to prepare plans for extending and remodelling the casual wards upon the cellular system.

## ARCHITECTURAL SOCIETIES.

*Birmingham Architectural Association.*—The tenth ordinary meeting of this Association for the current session was held on the 5th inst. The Vice-President (Mr. John Cotton) was in the chair. A paper entitled "Notes on a Tour in Germany" was given by Mr. H. H. McConnell. The paper was illustrated by a number of very good pencil sketches by the author. A vote of thanks, proposed by Mr. W. Doubleday, and supported by Messrs. T. W. F. Newton, J. Cotton, A. V. Ingall, and Victor Scrpton (hon. secretary), was heartily accorded to Mr. McConnell for his interesting paper, and after a response from that gentleman, the meeting terminated.

*Edinburgh Architectural Association.*—At the fortnightly meeting of this Association on the 7th inst., Mr. Hippolyte J. Blanc, president, in the chair, an interesting paper was read by Mr. G. Godfrey Cunningham, advocate, upon recent discoveries made by him at Liberton House, originally known as Liberton Place, the ancient mansion-house of the Barony of Over Liberton, and the country residence for generations of the family of Little, now represented by Mr. Walter J. Little-Gilmour, of Lamberton and Craigmillar. Though not possessing many external features to attract the passer-by, the house, in spite of alterations and vicissitudes innumerable, remained a tolerably complete specimen of the domestic architecture of the early part of the seventeenth century, when it was no longer necessary to construct a fortalice to keep off foreign enemies, but when it was still advisable, from the unsettled condition of society, to be prepared against sudden attack by neighbouring marauders. The general plan of the main building was somewhat unique, and investigation has revealed quite an unexpected number of antique features, some of them of unusual interest, which had been for a long and unknown period concealed under lath and plaster and modern masonry. Particular attention was directed to the great fireplace which terminates the drawing-room, to the defences of what was originally the chief entrance of the house, and to the characteristic wall decorations, of which a few traces remain. The absence of any very remarkable associations, historical or romantic, was no doubt a reason why Liberton House had not hitherto attracted the attention of the architect or the antiquary. It, however, well deserved notice for the sake of the name with which it had been linked for so many generations. The Littles of Liberton were prominent citizens of Edinburgh in the seventeenth century. One of them, whose initials might be seen at Liberton, and whose sumptuous monument, with recumbent effigy, stood over the family burial-vault in Greyfriars, occupied the civic chair; and to the literary taste of another the University was indebted for the foundation of its library, a few hundred volumes bequeathed to it by Charles Little having been the nucleus round which it had since grown and flourished. It was to be hoped that the present laird, who had recently done so much to preserve the venerable walls of Craigmillar from sinking into hopeless decay, might see his way to restore, in some measure, Liberton House; or, at least, to remove the modern additions which disfigured the edifice without improving it as a residence. On the

conclusion of the paper, a vote of thanks was proposed by Mr. Thomas Ross, who expressed the opinion that Mr. Cunningham had presented the profession with a most interesting, and until now unknown, study of an old Scottish mansion, and he hoped that both the fabric and its history would undergo exhaustive examination, with a view to the preservation and development of the ancient features that remain, in the prosecution of which objects, he said, the Association would willingly co-operate.—On Saturday last, under the leadership of Mr. Hippolyte J. Blanc, the members of the Association visited the castles of Duntarvie and Niddry. Mr. Blanc said that Duntarvie Castle, situated in the parish of Abercorn, though comparatively unknown, was interesting as an early example of the group of manor-houses classed in the fourth period of MacGibbon and Ross. The building was a long rectangle of about 80 ft. by 23 ft., and had winged extensions to the back at each end. Though not what one would now consider a commodious residence, for its time it was a compact and conveniently-arranged manor. Niddry Castle, in Kirkliston parish, was also described. It was, Mr. Blanc said, a fairly interesting relic of one of the earlier forms of castle structures found in Scotland. It had massive walls, pierced irregularly with small openings for light and observation, and it had also a corbelled parapet and an angle turret. As accounting for the late forms of detail that might be found on the fireplace jambs in the interior, it was recorded that on the 19th of January, 1570, in revenge for the assassination of the Regent Moray at Lintlithgow, Niddry, among other neighbouring castles, was burned by the English army. Those features might, therefore, be the result of subsequent repairs. Mr. Blanc pointed out the architectural features of the castle, and at the close received the thanks of the company for his papers.

#### OBITUARY.

Mr. Alexander Bassett, C.E., of Llandaff, died on the 9th inst. The *Western Mail* says that he first suggested the advantages of a dock just outside Newport, and, with Mr. Abernethy, planned and carried out the Alexandra Dock, Mr. J. A. B. Williams, the present Water Engineer for the Cardiff Corporation, being the resident engineer and superintending the work as it proceeded. Mr. Bassett was the engineer for the Cowbridge Railway Company, and planned and laid down that line of railway from Llantrisant to Cowbridge. He held the office of County Surveyor for Glamorganshire for over thirty years, and when he resigned that appointment in 1885 his son, Mr. A. B. Bassett, was appointed his successor.

#### COMPETITIONS.

**Lavenham Guildhall.**—We hear that the successful competitor for the restoration of Lavenham Guildhall, in the competition advertised by its present owner, Mr. Cuthbert Quilter, M.P., for which he offered a premium of 25*l.*, is Mr. John S. Corder, of Ipswich.

**Wesleyan Chapel, Helderby, near Ripon.**—For this building, to cost 1,000*l.*, there were eight competitors. The design submitted by Mr. T. Butler Wilson, of Leeds, was selected.

#### COMPETITION FOR THE WEST FAÇADE OF MILAN CATHEDRAL.

Sir,—Referring to your paragraph on this great work in your last week's issue [p. 531], allow me to correct a little misconception. The authorities at Milan nominated at the outset three foreign architects as jurors,—namely, a German (Baron Schmidt), a Frenchman (Professor Dartein), and an Englishman (myself). Now the idea of your German correspondent is altogether excellent, but it would be a misfortune if, through ignorance of any of the above-mentioned appointments, any competitor's vote were thrown away upon those who are already appointed members of the selecting jury.

I would beg, therefore, while acknowledging my deep sense of the honour you have done me by engaging me in conjunction with Mr. Pearson as jurors to be chosen by the com-

petitors, that you should forthwith propose another name in place of my own.

ALFRED WATERHOUSE.  
New Cavendish-street, April 13.

P.S.—I may mention that though the instructions allow the competitors to choose four jurors, only two are to be architects, the others being a painter and a sculptor.

\*\* Then we will beg to suggest Sir F. Leighton as the other name, if the idea of our German correspondent is carried out, about which we can say nothing. We were merely appealed to to assist in enabling him to carry it out, which we did as far as in our power.—Ed.

#### THE VENTILATION OF SEWERS.

Sir,—Under the above heading you recently printed extracts from Professor Atfield's lecture,\* and the suggestions there made should, I venture to think, receive the best attention of sanitary authorities.

Without discussing the assertion that the whole of the fresh air introduced for the purpose of ventilation becomes saturated with the vapour, there can be no doubt that the air, gas, or vapour proceeding from drains or sewers should be conducted to a point above the house-tops. It will also, I think, be admitted that sewers wherein men have to work must be provided with air.

The present method of putting an intercepting trap between the house-drain and the sewer is doubtless a wise one where the ventilation of drains is the exception rather than the rule, and is in self-defence, otherwise the ventilation of the sewer would also be carried out at those points; but if every house draining into a sewer were provided with an outlet vent-pipe at its highest point and carried above the house top, then I think the intercepting trap might be dispensed with, resulting in each house bearing its own share of ventilation of both drain and sewer. The gratings in the roads might then safely remain, and would become the inlets for air. Of course, in this case, inlets to individual drains would be unnecessary.

Under the present system, every house-drain will shortly be supplied with its interceptor, consequently the evils of the exhalations from the road gratings will increase. This was fully demonstrated last summer on an estate where the surveyor is exceedingly careful about the modern system of house-drainage. The stench from the gratings was horrible, and the houses had a very good chance of letting into their doors and windows the enemy they had striven at considerable expense to keep from passing through their pipes, for fear of doing a trifle more than their fair share of the common duty of carrying the foul vapour above the house-tops. H.

#### KITCHEN BOILER EXPLOSIONS AND SAFETY VALVES.

Sir,—I thank Mr. Buchan and Mr. Crane for their letters, kindly printed by you at p. 561 of your last issue; they, however, both ignore the main question as to the desirability or otherwise of having any safety-valve at all. A safety-valve will not prevent the bursting of a boiler by the sudden irruption of water into it when the boiler is highly heated, and this is the most frequent cause of these explosions. For other purposes the benefits to arise from the use of a safety-valve are, in my opinion, more than counterbalanced by the inconveniences and dangers likely to result from it, as pointed out in my previous letter [p. 520, ante]. Is it best to fix such a valve or to dispense with its use?

Replying to Mr. Buchan, I may be permitted to mention that the hot-water system supposed in my letter did not refer to that in common use in the North, where the primary circulation is from the boiler to a hot-water tank in the kitchen, but to the system more usually adopted in London and the South generally, of the boiler at the bottom and a hot-water tank and feed-cistern at the top of the house, or, at any rate, above the highest draw-off. I am not interested in recommending one system as against the other, but take the usual arrangement I find nearest to me. By my third precaution I meant the word "tanks" to include this top hot-water tank as well as the cold feed-cistern, the word in its dictionary sense as a "receptacle for water." I agree with Mr. Buchan as to the necessity for the hot blow-off pipe having a rise upwards in every part of its course, but my precautions were meant as recommendations to householders when they find their pipes frozen or otherwise blocked, and not as advice to engineers or plumbers in fixing the apparatus; and further, I had in my mind the London tap hot cistern practice, where the relief pipe performs a different function to his blow-off pipe, and is almost always of short length, and quite perpendicular, and is merely a steam relief-pipe from the expansion space at the top of hot tank. Mr. Crane gives no opinion as to whether a safety-valve should be used, but advocates the return pipe as a proper part on which to fix one, on account

\* See p. 367, ante.

of the lesser corrosion in that pipe. I, however, submitted that if such a valve be fixed at all, it should be on a separate short pipe from the boiler in which pipe there should be no circulation, and consequently, practically no corrosion, or, at any rate, much less than in either the flow or return pipe. I agree with him that no good engineer thinks of putting a draw-off cock to a circulating boiler; but these hot-water circulations are so often fixed by those who are not as good engineers as Mr. Crane, that I recommended "never to have a draw-off tap in the boiler"; in effect, that where there were such taps they should be removed.

ROBERT WISTON.

#### THRONDHJEM CATHEDRAL.

Sir,—In your report of a lecture at a recent meeting of the Edinburgh Architectural Association [p. 513], delivered by Mr. Scott Dalgleish on the above cathedral, I see him stating that the name was Throndhjem (it should be spelt with an *h*) was derived from the German word "Dronthjem," as signifying "Throne-home." This is doubly incorrect, there being no such word in German, and the name signifying the "Home of the Thrüder," i.e., the exact name given till this very day to the dwellers in Throndelejan, viz., the district around the Throndhjem's Fjord, these forming, at the time when this city was the most important in Norway, the "backbone of the country."

I always understood that the name Dronthjem was a distinct English denomination. I ought also to add that the original name of the cathedral was "Nidaros" cathedral, this being the name of the city down to the fifteenth century. Finally, I may say that the work of restoration is greatly attributable to King Oscar, who devotes particular attention thereto, and has already given a large sum of money towards it.

CARL SIEWERS.

#### PROVINCIAL NEWS.

**Bath.**—The Sanitary Committee of the Bath Town Council has lately been considering a long report from the Abattoir Committee recommending the erection of buildings covering three-quarters of an acre, and consisting of five slaughter-houses for beasts, sheep, and calves, with lairage; one slaughter-house for pigs, with lairage; one cooling-room for pigs; cooling-room adjoining slaughter-house for beasts and sheep; a manager's house, a house for hlood and offal tubs; a hoiler for hot water; two or three pens; a receptacle for dung, and proper sanitary conveniences for men using the premises. The estimated cost, exclusive of land, is 3,000*l.* No decision has yet been come to on the subject, but the report was ordered to be printed and circulated. The butchers are up in arms against the project.

**Cheale.**—The Cheale and Gatley Local Board having applied to the Local Government Board for permission to borrow 1,400*l.* for the purpose of providing offices for the local board and a town's yard, an inquiry was recently held by Major-General Phipps Carey into the scheme, to which there was no opposition. The Clerk stated that the rateable value of the township was 56,855*l.*, the population 7,336, and the area 5,818 acres. The township had no debts under the Sanitary Act.

**Coventry.**—At a recent meeting of the Coventry City Council, a draft deed of conveyance by Mr. David Spencer to the Corporation of property situate at No. 38, Earl-street, was sealed. The property is conveyed to the Corporation in perpetuity "upon trust that the said hereditaments and all buildings now standing and hereafter erected thereon shall be and for ever remain dedicated, used, and enjoyed for technical schools and schools of science, especially the sciences applicable to industry and manufactures, and so far as at any time not wanted for such schools for any other of the institutions contemplated and provided for in and by the Public Libraries (England) Act, 1855 to 1884, and to be so used and enjoyed either gratuitously or on payment by the persons using the same, of such fees for admission or subscriptions as may from time to time be appointed by the Corporation, so that the said fees and subscriptions be expended in the maintenance and repair of the said buildings, and the providing of custodians, tutors, apparatus, furniture, materials, and things in and for such schools or institutions some or one of them." The thanks of the Council were voted to Mr. Chadwick for his gift.

**Hull.**—The new "Globe Warehouses," a large block of buildings erected in High-street by Messrs. Bilton & Co., at a cost of upwards of 30,000*l.*, have lately been opened. The new

buildings have been erected on a site upwards of three-quarters of an acre in extent, which includes the whole area between High-street, Chapel-lane Staithway, Oriel Staithway, and the River Hull, with the exception of the two blocks of offices at the corners of the High-street frontage. The buildings comprise three separate warehouses, divided by areas open to the sky for light and ventilation, and communicating only on the ground-floor by double iron doors. The north warehouse is 40 ft. in width, and extends from the river to the back of Oriel-chambers; the south warehouse is also 40 ft. in width, and extends from the river along Chapel-lane Staithway to the back of the offices fronting High-street; while the centre warehouse is of an average width of 70 ft., and extends from the river to High-street. All the buildings are five stories in height, the floors being supported by cast-iron columns with grooves in the sides to admit of the several floors being divided up into bins by division boards. Two inside staircases lead from the ground-floor to the first floor, but above this level all the floors are reached by two iron staircases on the river front placed entirely outside the building; this arrangement is of great advantage in point of protection against fire, as direct communication between the warehouses and openings in the floors is thereby avoided. All three warehouses have a frontage to the River Hull, and the topmost floor across this frontage is considerably higher than elsewhere, so as to accommodate the hopper and hand machinery in this part of the building. The machinery consists of cranes for discharging barges lying alongside the wharf, and "carriers" for distributing the grain over the floors of the warehouse. The cranes, of which there are three (one to each warehouse), are worked by hydraulic power on the high pressure or "accumulator" system introduced by Sir William Armstrong. They are fixed on the outside of the building, and constructed to make a lift every minute, and as the jibs are of great length, and are fitted with hydraulic lifting or "topping" gear, they will command a double tier of barges lying alongside the quay. The grain is lifted in Priestman's "grab" hockets, holding  $\frac{3}{4}$  quarters of wheat, and discharged into hoppers in the roof, at a height of about 70 ft. above the quay. The buildings have been designed by, and carried out under, the superintendence of, Messrs. Botterill, Son, & Bilson, architects, Parliament-street, Hull. The whole of the works have been executed by Messrs. George Jackson & Sons, contractors, of Witham, Hull, except the cast-iron columns, which were supplied by Messrs. King & Co., Limited, of Hull. Mr. W. Gravel has been the clerk of works. The crane and hand machinery has been designed and executed by Sir W. G. Armstrong, Mitchell, & Co., of Elswick Works, Newcastle-on-Tyne.

**Leek.**—At the Town-hall, Leek, on the 31st ult., Mr. J. T. Harrison, C.E., one of the Local Government Board's inspectors, sat for the purpose of receiving evidence relative to the extension of the gasworks, cemetery, and Town-hall. The first part of the inquiry was with respect to repealing and altering the Leek Improvement Act, 1856, by means of a provisional order, so as to enable the Commissioners to extend the area of the gasworks from two acres to four, and to borrow 1,500*l.* for this purpose. There was but little opposition to this proposal. Then came the question of enlarging the acreage of the cemetery from seven to twelve, and a similar consensus of opinion was elicited. With regard to the extension and alteration of the Town-hall, however, there was strong opposition, about half the Board itself protesting against the proposals made. The relative merits of three sets of plans, prepared respectively by Mr. Waterhouse, Mr. J. W. Critchlow (Leek), and Messrs. Sugden & Son, also of Leek, were discussed at length. The first, which had been adopted by the Board by a majority of one, was characterised as costly and unsuitable; Mr. Critchlow's met with some favour owing to its simplicity and economy; and that of Messrs. Sugden was generally approved as being calculated to remove at a moderate cost some of the defects of "the most defective room in the county." Mr. Harrison, after patiently listening to those who opposed the decision of the Commissioners, said he should advise the purchase of the adjacent property at a cost of 1,000*l.*, and recommended the Board to reconsider the

plans, and make a fresh application to the Local Government Board. He thought the plan of the Messrs. Sugden was a good one, inasmuch that it dealt effectively with a staircase which could not fail to prove highly dangerous in the event of fire or panic.

#### CHURCH-BUILDING NEWS.

**Begelly (near Tenby).**—On the 27th ult. Begelly Church was reopened, after restoration. The architect for the work was Mr. Bruce Vaughan, of Cardiff, and the contractors were Messrs. George Watkins & A. Davis, Begelly, the amount of whose tender was 964*l.*

**Belfast.**—Windsor Presbyterian Church, Belfast, was opened on the 27th ult. It occupies an elevated site at the junction of Derryvolgie-avenue with the Lisburn-road. The plan comprises a nave with transepts. At the rear, the session room, ladies' room, ministers' room, and large class-room, approached by a small staircase, with lavatories, &c., form a distinctive group. The main entrance is situated opposite to Derryvolgie-avenue. The principal feature is the tower, placed at the north-west angle of the church, terminating in an octagonal spire and nave rising to a height of 160 ft. The church is paved to accommodate 520 persons on the ground-floor, and 145 on the gallery. The heating is effected by hot water, carried out by Messrs. Riddell & Co.; the lighting by gas pendants, by Mr. J. Dowling; the stone carving by Mr. J. Malcolm, and the upholstering work by Mr. J. C. Mayrs. The general contractor was Mr. R. Corry, and the architects are Messrs. Young & Mackenzie. The cost of the church, enclosing walls, &c., will be about 6,700*l.*

**Boroughbridge.**—St. James's Church, Boroughbridge, was reopened on Sunday last, after redecoration, which has been carried out by Mr. Knowles, of York.

**Cardiff.**—A meeting of the congregation of St. Catherine's Church, Cardiff, has been held for the purpose of considering the best means of raising the funds necessary for the completion of the church. The building was to have cost 8,000*l.*, 3,250*l.* of which has already been expended in the construction of the nave, and there remains the east portion of the church, consisting of the chancel, transept, vestry, and organ-chamber, also the greater part of the west portion, to be built before the church is completed, the erection of which is estimated will cost 5,000*l.* The architect is Mr. Kempson, the diocesan architect.

**Clerkenwell.**—The exterior of St. John's Church, Clerkenwell, has recently been renovated, from the designs and under the supervision of Mr. John Oldrid Scott, F.S.A., acting under whose direction Mr. Harry Hems, of Exeter, was commissioned to execute a sculptured panel over the western entrance to the church. The panel is in fine-grained wood, and the sculpture is in bold and high relief. In the centre is seen St. John the Almoner, the patron Saint of the Knights of St. John; he is seated, and wears an eastern mitre, which might readily be mistaken for a diadem. He carries the double or patriarchal cross, and is in the act of dispensing alms from an open money-bag. St. John the Evangelist sits upon his right hand, with a chalice (out of which a serpent is issuing) and the eagle by his side. On the north side John the Baptist is seated, clad barely in camel-skins, and hearing and holding a pilgrim's staff. Behind the figures, and at either end, are palm trees, and the heads of the two outside statues are surmounted by nimbi.

**Peebles (N. B.).**—The new Parish Church of Peebles was opened on the 24th ult. It has been erected, at a cost of about 10,500*l.*, during the past two years on a commanding site at the head of High-street, which was occupied by the former church. The church, which contains upwards of 1,200 sittings, has been erected from the designs and under the direction of Mr. William Young, architect, London. It is of stone both outside and inside, and is designed in the style of the thirteenth century period of Gothic of the Scottish type. It is about 118 ft. in length by 63 ft. in width, and is composed of nave, north and south aisles and chancel, with entrance lobby and staircases extending the whole width of the church on the east. A spacious vestry or session-house, which communicates with the chancel, has been added at the north-west corner of the church, and has

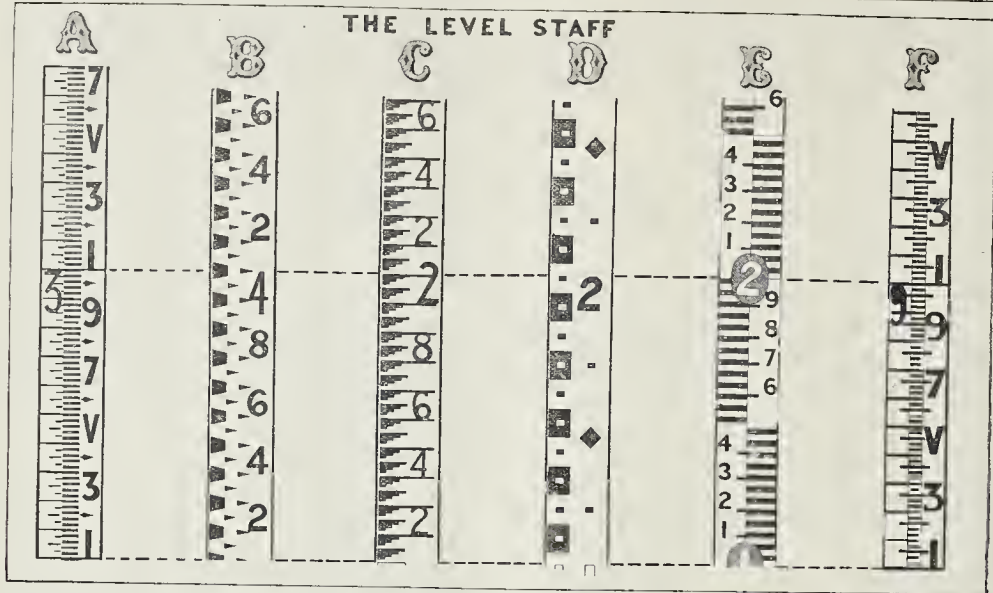

been planned so as to be able to accommodate the Presbytery. The nave, 85 ft. long by 31 ft. wide, is divided into four bays, and connected with the aisles by arcades of four large pointed arches on each side, springing from stone columns with richly-moulded capitals and bases. In the walls of the aisles, opposite each of the arcade arches and central therewith, are triplet windows, with richly-traceried heads, to the two central bays, which are varied by four lancet windows in the two end bays, similar windows being repeated on the return wall of the aisle. The two central windows of the south aisle are made a special feature by being carried up above the gallery, and form double transept gables intersecting with the main roof of the nave. The chancel, which is about 23 ft. by 21 ft., has the floor raised two steps above the level of the nave floor. The principal feature of the church is the tower, which is placed at the south-east corner, and forms a picturesque addition to the view from the High-street and Tweed Bridge. At the base it is about 20 ft. square, the height to the vane being about 120 ft. The contractor for the whole of the works in connexion with the building was Mr. Alexander White, builder, Edinburgh. Mr. William Fox, Peebles, acted as clerk of works.

**Plymouth.**—The scaffolding has lately been removed from the tower of St. Matthias's Church, Plymouth. The tower measures on plan 22 ft. square from wall to wall, and 32 ft. from buttress to buttress, extreme measurement. The walling-stones of this tower, like the material used in the erection of the fabric generally, are of blue limestone from the Pomphlet Quarries; whilst the dressings in the main are of brown-hed Portland stone. Messrs. Hine & Odgers, the architects of the new church, chose the Perpendicular period of Gothic for the style in which to design the church. Each angle of the massive parapet is surmounted by lofty crocketed octagonal pinnacles, from the bases of which spring a number of lesser pinnacles, also crocketed. In the centre of the parapets, on all four sides, are slender pinnacles boldly carved and of graceful form. The belfry windows are double ones, each 25 ft. from sill to head. The higher parts of these are filled with tracery, whilst the louvre panels between the nullions are carved with open work. Lower down, the buttresses break off with carved pinnacles, and the turret at the north-east corner of the tower makes a pleasing and piquant break to the formal outline of the erection generally. Mr. Weymouth, clerk of works, has superintended the course of the building, stone after stone, as the representative of the architects' and building committees. Messrs. J. Finch & Son, builders, of York-street, Plymouth, have erected the tower, and are also carrying out the building of the church. The whole of the stone carving and sculptural work upon the tower and upon the church generally is by Mr. Harry Hems, his foreman of carvers being Mr. George Edmed.

**Streatham.**—On the 2nd inst. a new church in Streatham Park, dedicated to St. Alban, was consecrated by the Bishop of Rochester. It is built in the Romanesque style, from designs by Mr. Edward H. Martineau, of Weymouth-street. It is faced inside and out with red bricks, the columns, dressings, &c., being of red Newhaven stone. There is a substantial open-timbered roof covered with Bracknell red tiles. The floors of the nave, &c., are paved with Gregory's wood blocks, and that of the chancel with mosaic. Messrs. Haden & Son, of Trowbridge, have carried out the heating, and Messrs. Strode & Co. the gas lighting; the general contractors being Messrs. Gregory & Co., of Clapham Junction. The cost of the portion of the building erected is about 6,500*l.*

#### The Taylor Art Scholarship, Dublin.

The *Freeman's Journal* reports the result of the competition for this scholarship, and says that the scholarship and prizes are derived from the income arising from the sum bequeathed by the late George A. Taylor for the promotion of art in Ireland. They are open to all Irish students not exceeding twenty-five years of age, who shall have attended twelve months at least a school of art. The scholarship has been awarded to Mr. Henry Stein Cairnes, for a painting which he has named "The Model."

Various Forms of Level Staff.

#### FIELD WORK AND INSTRUMENTS.—XVI.

##### Surveying Instruments.

##### IX.—THE THEODOLITE (continued).

**I**N the methods described as (a) and (c) two distant points or stations are required. The points ranged by method (a) are both in front of the instrument, and the angle between their directions is observed before and after reversing the telescope upon its trunnion axis, and after traversing the body of the instrument half round upon its vertical axis with the vernier plate clamped. In method (c) the points ranged are upon opposite sides of the instrument. If the surveyor is satisfied that the trunnion axis of the telescope properly reverses over the vernier plate when the latter is set level, and that the vertical capstan-headed screws in the diaphragm plate need no adjustment, then it is not necessary for the two objects viewed to stand upon the same level. In method described as (b) a single station, at as great a distance as possible, is sufficient. The line of collimation is set upon the point selected, and the readings upon the vernier plate are taken both before and after reversing the trunnion axis or traversing the telescope round vertically end for end, but instead of the body of the instrument being traversed half round, as in methods (a) and (c), the vernier plate is traversed half round from the position shown in fig. 39 to the position shown in fig. 40 (page 522, ante).

The accuracy of the azimuthal axis may be further tested by turning the vernier plate 90° upon its vertical axis, or one-quarter round backwards and forwards, so that the telescope may be over the other parallel plate screws marked Z Z, the centre line joining which is at right angles to the centre line U U, joining those over which the instrument has been tested (see figs. 3 and 4, page 370, ante).

The measurement of horizontal angles being the most important function of a theodolite, it is best to adjust the collimation first for horizontal planes and the measurement of vertical angles; then, secondly, for vertical planes and the measurement of horizontal angles. By this means the telescope will remain finally adjusted under conditions in which it is most generally employed.

In order that the telescope may traverse a vertical circle and its line of collimation set out vertical angles or find any number of points in a vertical plane, it is necessary that its trunnion axis should be truly horizontal. It will be

observed in fig. 39, which represents a transit instrument, that one end of the trunnion axis of the telescope, where it rests in the Y's, is arranged with an adjustable block. This block which is technically called a slipping-piece, is raised or lowered by turning the capstan-headed nuts attached to its screw connexion with the upright marked E. A long and sensitive spirit-level, marked H in fig. 4, is placed transversely, spanning the instrument from one trunnion bearing to the other. The feet of the standards to this level are formed of two inverted V-shaped notches filed where they rest on the trunnion as shown in fig. 3. The telescope is placed diagonally over the parallel plate screws U U, and the instrument set up level. The spirit bubbles Q and T will then be in the centre of their run. To adjust the horizontality of the trunnion axis the spirit level H is first placed upon the trunnion bearings and set level if it appears out of the centre of its run, by its under parallel plate-screws marked Z Z. It is then lifted carefully off and reversed end for end upon the trunnion bearings. A small wooden handle, omitted in fig. 4, is often attached to the centre of this level at H to prevent the heat of the hand affecting the bubble when touching it. The bubble tube being properly graduated, it is at once seen if the bubble remains in the centre of its run. If it deviates when reversed, half the error must be corrected by means of its own capstan-headed adjustment screws and half by the two parallel plate-screws beneath it marked Z Z. The trunnion axis will then be parallel to the run of this level marked H, when it is set level, but in adjusting it for reversion the vernier plate as indicated by the spirit-levels Q and T step, therefore, will be to reset the spirit levels Q and T in the centre of their run by working the parallel plate-screws U U, and Z Z, then raise or lower the slipping-piece in the upright marked E until the bubble in the axis level tube marked H is in the centre of its run. By this means the trunnion axis can be set parallel to the level of the vernier plate, when it will be at right angles to the vertical axis of the instrument, and is thus finally adjusted for reversion.

After the preceding operation has been gone through, set the index of the verniers upon the vertical arc to zero, fix the clamp M, and level the bubble on the telescope by means of the adjacent screws marked L L in figs. 3 and 4. Make the bubble reverse by traversing the horizontal vernier plate half round the vertical axis, and adjust half any error that may exist by means of the screws L L, and the remaining half by means of the capstan-headed screws

which connect the longitudinal bubble to the telescope. Having done this, unclamp the screw M and point the telescope to some well-defined distant object. Take the angle of altitude or depression of this object, after clamping the arc and bisecting the object viewed with the cross hairs by means of the tangent screw J to the vertical circle. Then reverse the telescope in the Y's, and revolve the instrument half round horizontally. Repeat the operation of again setting the vertical arc to zero, and level the bubble by the screws L L (fig. 3). Set the telescope upon the point in the object first ranged, and if the vertical angle is found to be the same in both positions, no adjustment of the vertical collimating screws will be necessary, but if the first and second readings do not coincide, set the verniers to the mean angle, taking care all through that the axis bubble H appears perfect, and move the vertical screws upon the diaphragm plate until the intersection of the cross wires accurately cuts the distant point employed for the purpose. If preferred, a distant point upon a level with the line of collimation when the verniers on the vertical arc read zero and the longitudinal spirit bubble is set in the centre of its run may be used for the purpose instead of a point above or below the horizon.

##### X.—THE LEVEL STAFF.

Before proceeding to describe the optical instruments employed for taking levels, it is necessary to be acquainted with the level staff, by means of which heights are read. Six different kinds of graduations are illustrated in our diagram. The vertical distance between the two horizontal dotted lines indicates a height of one foot decimally divided. By placing a straight edge across in any position parallel to these dotted lines the reader will be able to compare the patterns A, B, C, D, E, and F, and to select the one he would prefer for use in the field.

**Romford.**—The new Post-office here is nearly completed, and will shortly be opened for business. It is situated on the west side of South-street, and has a frontage of 51 ft. The front elevation is faced with red bricks, the style adopted by the architect being a modification of what is popularly known as "Queen Anne." The building has been erected for the architect, Mr. E. Clerk Allam, of Romford, by Mr. H. Booth, the plumbing and decorating being carried out by Mr. A. T. Yull. The office fittings have been made by Messrs. Hammond & Sons.

RECENT PATENTS.

ABSTRACTS OF SPECIFICATIONS.

15,203 Pulleys. W. T. Kellogg. The improvement which is the subject of this invention consists mainly in giving a curved shape to the pulley-socket, so that it may be driven into the opening made in the wooden frame by a series of auger-holes. Spikes or projections are made or cast upon the pulley-holes, so as to aid the fixing of the same in the window-frame. 15,552, Roofing Tiles. H. W. Lowden. According to this invention, a double clip or clips is formed upon the back of the tile, which fixes upon the tile lath, and secures the same against falling off. 5,241, Seal-pipes. W. Cheal. By this invention a counter-sunk hole is made in the floor of the water-closet, and a coupling hoop of lead is then affixed and beaten in so that the leaden soil-pipe is joined to the earthenware closet-pipe. Putty is sometimes used for additional security in making the joint, which in every case is made effectually water and gas tight. 273, Corner Clamps. J. Scherbel and T. Kemms. According to this invention, clamps are made with serrations or teeth in such form as that when bent on the corner of a frame the direction of the angle of the teeth shall be against the outside of the frame, and all is held together quite securely. 431, Nail-driving Appliance. J. B. De Forest. The subject of this invention consists of a kind of magazine containing a supply of nails, which are driven downwards by every stroke or concussion of the whole machine. When a nail is driven home, the supply is cut off, only to begin further operations in an exactly similar manner. 1,193, Ventilators. W. Eckstein. This invention is claimed to be an improvement on what is known as "Sheringham's Ventilators." Here the ventilators are made right or left handed, as desired, and a weighted flap is hinged to the casing, as is also the box or door of the ventilator. The improvements are in the direction of economy in the cost of manufacture, and in providing an easier method of opening and closing the apertures. 781, Ornamenting Ceilings, Walls, &c. H. McDonald and others. The object of this invention is to provide an unbroken material for walls, &c., by the use of paper or such like material. The paper is softened by moisture, and when applied in this state to the walls it is worked into the figures and patterns by the fingers of the operator or by suitable tools, thus forming one unbroken covering. NEW APPLICATIONS FOR PATENTS. April 1.—4,855, W. and N. Haigh, Flooring Cramp. April 2.—4,909, A. Nicholas, Door-hells, &c.—4,917, W. Hawkins and Others, Axle Pulleys for Window-sashes, &c.—4,927, J. Wilson, Street Paving.—4,937, A. Boulton, Drain Traps. April 4.—4,985, J. Thompson, Combination Range.—4,997, E. Furnifex, Draught Preventer, &c., for Doors and Windows. PROVISIONAL SPECIFICATIONS ACCEPTED. 1,615, A. Edmeades, By-way Cock for connecting House Service-pipes to Water Mains.—2,557, E. Green, Fastening Hooks for Spindles.—2,755, W. Gaultier, Stop Blocks for Doors, Gates, &c.—3,329, T. Arrol, Trough Decking or Flooring for Bridges and Structures.—3,343, S. Proctor, Key-hole Escutcheons.—3,406, F. Cox, Fastenings for Sashes, Casements, &c.—3,470, W. Moore, Preventing Water-pipes from Bursting.—4,327, C. Henderson, Construction of Chimneys Inside Buildings. COMPLETE SPECIFICATIONS ACCEPTED. Open to Opposition for Two Months. 5,969, J. Rainier, Ventilator and Chimney Cowl for Extracting Foul Air and Smoke from Buildings. 7,018, P. Gay, Sawing, Cutting, Dressing, or Polishing Stone, Marble, &c.—7,811, H. Hadden, Lifts.—10,670, E. Edwards, Iron Grids for Buildings.—1,759, C. (510); Horeleydown-18 to 36 even, Boss-street, 39 years, ground-rent 90s. (920); 7, 8, and 9, Kinross-street, 28 years, ground-rent 7s. (435); Bermondsey-110 to 118 even, Role-road, 46 years, ground-rent 18l. 10s..... 615; South Norwood-Bickton House, freehold (280); Westminister-24, Maraban street, freehold (750); 36 and 37, New Peter-street, and a cottage, freehold (750); Romney-street-Ground-rent of 50l. reversion in 34 years (1,500); Tufton-street-Ground-rent of 25l, reversion in 78 years (630); 65, Tufton-street, and 1 to 3, Tufton-street, and The Two Brewers public-house, freehold (2,820); 1, 2, and 3, Little Tufton-street, 67 to 79 odd, Tufton-street, 62 and 64, Romney-street, and 1 to 4, Lane's Cottages, freehold (4,290); 4) to 46 even, Horseley-road, 39, Romney-street, and 1 to 5, Carpenter-street, freehold (3,560); 48, 50, and 52, Horseley-road, and 8 to 12, Carpenter-street, freehold (2,690)

MEETINGS.

MONDAY, APRIL 18. Royal Institute of British Architects.—Business meeting to consider Schedule of Professional Practice and Charges of Architects. 8 p.m. Surveyors' Institution.—Adjourned discussion on the paper by Mr. Wheeler, Q.C., on "Dilapidations and the Legal Obligation to Repair," and on the paper by Mr. P. E. Pilditch, entitled "Notes on Dilapidation Practice." 8 p.m. Sanitary Legislation Conference.—2 p.m. Victoria Institute.—8 p.m. TUESDAY, APRIL 19. Institution of Civil Engineers.—Papers by Messrs. Grover, Fox, Stocks, and Others on "Water-Supply from Wells, in the London Basin, at Bushey (Herts), in Leicestershire, and at Southampton." 8 p.m. Society of Arts (Foreign and Colonial Section).—Major-General Sir Charles Warren, G.C.M.G., on "South Africa." 8 p.m. Royal Institution.—Dr. John Hopkinson, F.R.S., on "Electricity." 8 p.m. Parker Museum (Lectures for Sanitary Inspectors).—Captain Douglas Galton, F.R.S., on "Ventilation, Measurement of Cubic Space, &c." 8 p.m. Statistical Society.—Mr. N. A. Humphreys on "Class Mortality Statistics." 7.45 p.m. Birmingham Architectural Association.—Open meeting. 7.30 p.m. WEDNESDAY, APRIL 20. Society of Arts.—Mr. A. Reckmann on "Electric Locomotion." Mr. W. H. Preece, F.R.S., in the chair. 8 p.m. London and Middlesex Archaeological Society.—Mr. F. G. Hilton Price, F.S.A., on "Cornhill and its Vicinity." (Geological Museum, Jernyngham-street, 3 p.m.) British Archaeological Association.—Dr. J. Harker on "The Consecrated Wall on Lancaster Castle Hill." 8 p.m. Royal Meteorological Society.—Four papers. 7 p.m. THURSDAY, APRIL 21. Society for the Encouragement of the Fine Arts.—Dr. Phocas, F.S.A., on "Art in Scandinavia." 8 p.m. Parker Museum of Hygiene.—Mr. Alfred Fryer on "Dust and Ashes, and how to deal with them." 5 p.m. Royal Archaeological Institute.—(1) Mr. J. P. Harrison on "Pre-Norman Remains in England." (2) Mr. J. P. Harrison on "Some Celts of Chinese Jade recently found in America." 8 p.m. FRIDAY, APRIL 22. Architectural Association.—Paper by Mr. George Aitchison, A.R.A., entitled "Stray Thoughts on Architectural Education." 7.30 p.m. Royal Institution.—Sir Frederick Abel, F.R.S., on "The Work of the Imperial Institute." 9 p.m. Parker Museum (Lectures for Sanitary Inspectors).—Dr. Louis Parkes on "Water Supply, Drinking Water, Pollution of Water." 8 p.m. SATURDAY, APRIL 23. Edinburg's Architectural Association.—Visit to Dirleton Castle.

Miscellaneous.

Decay of the South Staffordshire Iron and Coal Trades.—The Staffordshire Advertiser says:—Mr. John W. Sparrow, the well-known ironmaster, of Bilston, has this week published a letter on the subject of the local iron trade, which will excite considerable interest throughout the Black Country, if not, indeed, throughout a much wider area. Mr. Sparrow states that he has known Bilston for nearly seventy years, and for nearly half a century he has been actively engaged in business there. For the greater part of that long period he has been distributing in the shape of wages the large sum of 50,000l. a year. Now, however, his mines are closed and his only remaining blast furnace is about to cease working. Twenty years ago, within a three-mile area of Wolverhampton, there were forty-seven furnaces in blast. Now there is only a solitary furnace blowing, and that is the furnace which Mr. Sparrow finds himself reluctantly compelled to close. This state of affairs is of the most serious import to South Staffordshire, and, indeed, to the country at large. Mr. Sparrow attributes the altered condition of affairs to the "eight hours" system adopted by the miners, but for which he declares that his now drowned-out mines would have enabled him and his successors to have carried on the works for another fifty years, but he adds "short hours and great wages have converted what was a profitable business into a heavily losing one, and I can stand it no longer." Without expressing any opinion as to the conclusions arrived at by Mr. Sparrow respecting the cause of the prevailing deplorable state of the South Staffordshire iron trade, the facts cited in his letter are of the gravest import, and demand the serious attention of those more immediately concerned. It would, we think, be wise for employers and employed in the coal and iron trades to meet in friendly council, and endeavour to find some solution for a condition of affairs which threatens almost ruin to the staple industries of the Black Country, the lurid glare of whose furnaces was once proverbial. Those furnaces have now become, in the majority of cases, relics of a decaying industry, and have the appearance of so many miniature "extinct volcanoes," whose gloom and silence proclaim with thrilling effect the want and misery which must be the inevitable result of so many thousands of work-people being reduced to a state of enforced idleness.

The Strike in the Building Trade at Birmingham.—This strike, mentioned by us last week, still continues, but just as we go to press a meeting of the Birmingham Master Builders' Association is being held to consider a suggestion from the Carpenters and Joiners' Association that Dr. Langford should be joined with the Mayor in selecting a person to officiate as arbitrator in the dispute. On behalf of the masters it is pointed out that although there are several branches of operatives, comprising masons, bricklayers, plumbers, painters, carpenters, &c., the carpenters are the only body who have made any distinct advances towards a settlement by arbitration, and that any agreement to be satisfactory must be common to the whole trade. There does not appear to be any indisposition to accept the suggestion that Dr. Langford and the Mayor should jointly nominate an arbitrator. It is officially stated that there is no truth in the assertion that a number of the members of the Master Builders' Association have left the Association since the commencement of the present dispute, or that they are acting at variance with the Association. Mr. Bigwood, the employers' secretary, writing in defence of the action taken by the master builders, states that "in October last, when trade was very bad, and before there was any talk of improvement or of Jubilee erections, they gave the operatives notice of 1d. per hour reduction. Taking these facts into consideration, in conciliation they offered to accept 3d. per hour reduction, or to go to arbitration on the whole question. Further, before the rules lapsed, on the 1st inst., my committee sent a circular to their members suggesting that efficient hands be paid the existing rate."

The Registration of Plumbers.—We are informed that of nineteen journeymen plumbers examined at the last meeting of the examiners, nine candidates passed, and ten failed to satisfy the examiners.

**Restoration of Shrewsbury Castle.**—The exterior of this historic castle has just been restored, at the cost of the Duke of Cleveland, to whom it now belongs. The castle was founded by Roger Montgomery, who held one of the most important commands at the battle of Hastings, and was created first Earl of Shrewsbury; but the alteration of internal arrangement and external detail renders it impossible to say whether the present building is his work, though the massiveness of the walls and entire absence of buttresses lead to such a supposition; and some jambs and arch stones of the principal doorway, which have been found in a disused staircase, are certainly Early Norman and similar in stone and mode of working to the rest of the present building. One of the towers appears to have been altered circa 1200-1250. It is irregular in plan and was partially groined; the central boss, which has been found, being of pure Early English work. The main building was again altered about the time of Edward VI. or Elizabeth, an upper range of very good windows on the south side and the roof being of that period. Next came alterations in windows on the principal floor by Telford, the engineer, when he was constructing the great Holyhead-road, and they may be called good specimens of "Engineer's Gothic" of that period; being in good repair, and somewhat picturesque, they have not been meddled with. The castle was besieged in the Civil Wars of Charles I's time, but was taken by strategy by the rebels, and quietly given up again on the restoration of Charles II., so that no damage was done, and we are no doubt indebted to such peaceful transfers for its escape from the destruction which overtook so many other famous castles. The parapets, probably fifteenth-century work, and the ancient stonework generally, have been thoroughly repaired, the roof entirely re-covered with nearly 20 tons of lead, and the building, which lately looked as if going to ruin, is now safe for another hundred years, and forms a capital residence. The work has been executed by the following tradesmen: Mason's work, Mr. Dodgson, of Northallerton; Joiner's and painter's works, Mr. Morris; plumbing, Mr. Evans; glazing, Mr. Davies (the latter three all of Shrewsbury). The work has been done under the superintendance of Mr. J. P. Pritchett, architect, Darlington.

**Liverpool Engineering Society.**—The usual fortnightly meeting of the above Society was held at the Royal Institution, Colquhoun-street, on the 6th instant, the President, Mr. John J. Webster, M. Inst. C.E., being in the chair, when a paper was read by Mr. J. J. Campbell, entitled "Compound Engines for Atlantic Navigation." The author, after alluding to the interest that attaches to the question of the best type of engines for large Atlantic steamers, referred to the remark made by Mr. John, of Barrow, in his paper read at the Liverpool meeting of the Institution of Naval Architects last summer, that the large Atlantic lines had been rather behindhand in not having adopted the most recent types of machinery. Having described the principal types of engine hitherto employed in Atlantic steamers, he then spoke of the large consumption of coal in these vessels as compared with others, proceeded to express his opinions on the chief causes of it, especially inefficient expansion from the engines being too small for their power, and pointed out that the increase in pressure and piston speed adopted of late years had been utilised almost exclusively in obtaining more power in proportion to size, and not in producing economy of fuel. Having indicated some of the defects in existing types of engines, the author exhibited several combined diagrams from the engines of Atlantic and other steamers, and described the various methods in use for combining indicator cards, advocating the system recommended by Mr. Schönheyder at Middlesbrough.

**Alleged Pollution of the Dee by the Sewage of Wrexham.**—At the last meeting of the Wrexham Town Council, a letter was read from Mr. S. Smith (Town Clerk of Chester) stating that in consequence of marked pollution of the river Dee, their inspector had been examining into the cause, and he reported, after examining the Wrexham sewage farm, that the disposal of the sewage on the land was not satisfactory, as, at the time of his visit, a large quantity was delivered into the watercourse, which discoloured it for a considerable distance. The Town Clerk of Wrexham said he had communicated this letter to Colonel Jones, consult-

ing engineer for sewage disposal to the Borough of Wrexham, who replied that sewage was never delivered into the watercourse on their farm. It was naturally a matter of great anxiety to him to dispose of half a million gallons of sewage daily, without contamination of the stream by which all its liquid not evaporated must necessarily join the river Dee, from which the city of Chester was supplied with imperfectly-filtered drinking-water, and it was satisfactory to be able to say that that was the first complaint for many years from a corporation so deeply interested as that of Chester in watching his operations. It was resolved to send a copy of this letter to the Town Clerk of Chester.

**The Proposed Birmingham Ship Canal.** The Birmingham Town Council, at its meeting on the 5th inst., discussed the question of the proposed ship canal from that town to the Bristol Channel ports, via Worcester, Gloucester, and Sharpness, on a motion introduced by Ald. White, affirming the desirability of improved water communication between Birmingham and the sea, accepting the proposal which has been set on foot to provide this communication by widening, deepening, and otherwise improving the canal and river connexion between Birmingham and Sharpness, and asking for the appointment of a special committee to consider the subject, and to confer with the Town Council of Gloucester, who have already approved the scheme, and with all persons interested in the matter. A provisional committee of prominent citizens of Birmingham, Worcester, Gloucester, Cardiff, Bristol, and Swansea has at present charge of the scheme. A long and interesting discussion ensued on the motion, and in the result an amendment was approved, affirming the general desirability and necessity of improved water communication between Birmingham and the sea, and appointing a committee to consider the proposed and any other schemes which may be brought forward.

**Eyemouth Harbour Extension.**—According to the Scotsman, the harbour extension at Eyemouth has not proved a boon to the port. A plan showing extended quays and a deepened entrance was submitted and approved by the Board of Trade and the Eyemouth Police Commissioners, and the latter body, being assured that a loan of 25,000l. would be sufficient to carry out these works, granted security for this amount to the Loan Board. The 25,000l. has been spent in providing additional inner accommodation, but no attempt whatever has been made to deepen the entrance, and the port therefore derives no benefit in the shape of additional facilities for entrance and exit—the main objects of the works. The result is a great additional burden on the inhabitants without any increased revenue. The income of the harbour for the past year did not meet the payments due on the loan, and the Public Works Loan Commissioners called upon the Police Commissioners to make good the deficiency, by laying on a rate of 1s. 1d. per lb. on the whole rental of the burgh, which is the amount of assessment available for that purpose. The Police Commissioners demurred to this, seeing that the harbour has not been improved in the manner represented. The Loan Board has refused to listen to the Commissioners, and an action has been raised in the Court of Session to enforce payment of the instalments.

\* SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 46, Catherine-street, W.C., not later than 12 Noon on THURSDAYS.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON."

H. H. D. & Son.—W. & R.—W. P. (the experiment, in spite of all theory to the contrary, has proved a practical success in important cases, and we are averse to any attempt to throw cold water on it.)—E. E. O. P. (thanks for photograph returned)—K. J. R.—K. S. (letter too long and not suitable in style)—V. (show our marks)—Inspector write to the secretary of the Association of Public Sanitary Inspectors, 5, Abchurch-lane, Clerkenwell.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.

NOTE.—The responsibility of signed articles, and papers read at public meetings, rests, of course, with the authors.

We cannot undertake to return rejected communications.

Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESTROYED.

All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

PUBLISHER'S NOTICES.

Registered Telegraphic Address, "THE BUILDER, LONDON."

CHARGES FOR ADVERTISEMENTS.

SITUATIONS VACANT, PARTNERSHIPS, APPOINTMENTS, TRADE, AND GENERAL ADVERTISEMENTS. Six lines (about fifty words) or under ... 4s. 6d. Each additional line (about ten words) ... 9s. 6d. Terms for Series of Trade Advertisements, also for special Advertisements on front page, Competitions, Contracts, Sales by Auction, &c. may be obtained on application to the Publisher.

SITUATIONS WANTED.

FOUR Lines (about THIRTY words) or under ... 2s. 6d. Each additional line (about ten words) ... 6s. 6d. PREPAYMENT IS ABSOLUTELY NECESSARY.

\* \* \* \* \* Stamps must not be sent, but all small sums should be remitted by Cash in Registered Letter or by Money Order, payable at the Post-office, Covent-garden, W.C. to DOUGLAS FOURDRINER, Publisher, Addressed to No. 46, Catherine-street, W.C.

Advertisements for the current week's issue must reach the Office before THREE o'clock p.m. on THURSDAY.

SPECIAL.—ALTERATIONS IN STANDING ADVERTISEMENTS OR ORDERS TO DISCONTINUE same, must reach the Office before TEN o'clock on WEDNESDAY MORNINGS.

The Publisher cannot be responsible for DRAWINGS, TESTIMONIALS, &c. left at the Office in reply to Advertisements, and strongly recommends that of the latter COPIES ONLY should be sent.

PERSONS Advertising in "The Builder," may have Replies addressed to the Office, 46, Catherine-street, Covent-garden, W.C. Letters for Editors, Letter-press, &c. should be addressed in envelopes as sent, together with sufficient stamps to cover the postage.

AN EDITION Printed on THIN PAPER, for FOREIGN CIRCULATION, is issued every week.

FIRE BRICKS.

BEST STOURBRIDGE FIRE BRICKS, and Cement Fire Clay, One Kilo, Muller, &c. Bricks for the Highest Heats, for Iron Blast Furnaces, Forge, Rolling, Fitting, and Steel Furnaces, Flint Glass Furnaces, Roasting and Refining Furnaces, Chemical Works, Coke Ovens, &c. Boiler Setting Bricks, Fire Covers, Locomotive Bricks, Tapers, Steel Rammers, Grate Backs. Special Sizes and Shapes made to Engineers' Drawings. Prices quoted to any Port or Railway Station. London Agents:—

R. CULL & SON, Palmerston-buildings, E.C.

GLAZED BRICKS.

OATES & GREEN, HALIFAX. GLAZED BRICKS (White and Coloured), Special Salt-glazed Bricks, Sanitary Tiles, Glazed Earthenware Sinks, Cattle, Sheep, and Pig Troughs, Horse Mangers, Patent Ventilating Gullies and Patent Flush Pans. Ventilating Bricks, Patent Ventilating Gullies and Traps, Patent Chimney Pots for Down Draughts, and SIX PRIZE MEDALS. Copies of Testimonials sent if required. London Agents:—

R. CULL & SON, Palmerston-buildings, E.C.

BLUE BRICKS.

THE KETLEY BRICK COMPANY, KINGSWINFORD Staffordshire, Manufacturers of Blue Bricks. London Agents:—

R. CULL & SON, Palmerston-buildings, E.C.

DRAIN PIPES.

Lime, Cement, Bricks, Slates, Laths, Hair, Plaster, Wall Copings, Channel Bricks, Blue and Red Ridges, Red Plain Tiles and Pan Tiles, Closet Pans and Traps, Bends, Junctions, &c. all sizes. Chimney Pots, Red and White. PRICES on APPLICATION. R. CULL & SON'S Stores, Railway Arches, London-street, Bethnal Green Station, E. Chief Office—72, Palmerston-buildings, Old Broad-street, E.C.

Map of London,

SHOWING BOUNDARIES OF SURVEYORS' DISTRICTS.

The four Sheets, into which the Map is divided (issued with the numbers of January 1st, 5th, 15th, and 22nd), if sent to the Office direct, or through any Newsgate, can be

MOUNTED ON THE FOLLOWING TERMS, VIZ. :—

On Cloth (Rollers) and varnished, 3s. 6d. | On Cloth (Strainer) and varnished, 5s. 6d.

N.B.—In the case of "Strainers," if packed for rail or carrier, 1s. 3d. extra.

\* \* \* Omissions discovered since publication will be corrected before mounting.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied in advance from the Office to residents in any part of the United Kingdom at the rate of 12s. per annum. To all parts of Europe, America, Australia, and New Zealand, 26s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

### Water Transit of Heavy Goods.

**S**OMETHING should be done to put the canals of the country into a condition suitable for the present times. Since railways have been made the canals have been neglected. A few

of them have been converted into railways for short distances, but the principal canals in England and Wales remain, to the extent of about 3,000 miles. These form a sort of network of lines of water communication all over the country, and would be very suitable for the conveyance of heavy manufactured goods and raw materials, if they had outlets into main routes which would convey the goods and minerals to the sea-ports; but the main lines of canal are not of such dimensions as are suitable for present requirements,—at least, in some parts of the through routes. They were mostly made in short lengths and of dimensions suitable for the local requirements. Canals began to be made in England about the middle of the last century, and those now existing were nearly all made between that time and the year 1825. The main lines now require to be adapted to the use of steam as the power for propelling the boats, their dimensions require enlargement, and larger boats would be preferable to those which can now pass along any through route, seeing that we are in the presence of foreign competition, which our manufacturers and other traders have to meet. In some respects it is unfortunate that the necessities of trade at the present time demand the use of the greatest force we can apply to the manufacture and transport of articles of commerce, and this is steam, which we cannot produce without smoke or use without noise, and these perhaps do as much harm to one person as good to another; but we have put our hand to the plough and have gone too far in one direction to stand still now, in the presence of nations which follow the same course. We do not know what the pushing and inconsiderate manner in which the trade of this and neighbouring countries is carried on will produce in course of time, but if we must live as a nation amongst nations of like mind, we must beware in time of what they are doing, and that, for one thing, is to render their waterways as useful and as easily accessible as it is possible to make them. This nation cannot afford to leave the canals in the neglected state in which they now are; greater facilities for the transit of goods is required than railways alone supply, under their present

system of management. Railways, instead of being, as it was expected when they were constituted they would be, important helps to traffic for all alike, have become a trading monopoly for the carriage of everything produced, competing for profits with the proper traders of the country; and to enable them to do this they have been allowed by the Legislature to take possession of more than one-third of the canals, under the supposition that the canals would be used as adjuncts to the railways and continue to afford means of transport as before to those who required their use, not only for necessities of transport then existing, but, of course, also for those which might thereafter arise. If the traders of the country had foreseen the effect of giving Parliamentary sanction to the possession of canals by railway companies, the applications to Parliament for these powers would have been resisted, and probably successfully resisted; but, as it is, the arrangement has become most unfortunate for the general interests of the country. It cannot be denied that the railway management has been conducted with great astuteness, and has got the better of the interests of the general traders of the country. Heavy goods, which are particularly suitable for canal traffic, are carried by railways in competition with the canals, and as the bare cost of haulage on railways is very much greater than on canals, these goods are carried at rates which, although they do not remunerate the railway shareholders, are very burdensome to the traders. The legitimate traffic of railways is in the carriage of intrinsically valuable and comparatively light goods and passengers at a quick rate of speed, while the heavy goods and minerals have no need of quick transit. It happens, however, that from the numerous shuntings of heavy goods trains which are necessary to allow the quick trains to be run on the same lines of rail the practical effect is, in many cases, that the railway transit of these heavy goods is no better in point of time between loading and delivery than it is on canals, where these are maintained in good condition. But the grasping disposition of the railway management forces this heavy traffic out of the hands of canal companies and those who carry goods on the canals, where they are independent of the direct control of the railway companies; and where the canals have been acquired by railway companies the case is even worse, because they interpose on these such tolls as prohibit the through traffic of the independent companies. Forty years ago it seemed to the proprietors of some of the canals that the numerous railway projects would ruin them, and they, not fully comprehending what might arise, were only too eager to sell or lease their

property to the railway companies, who, on their part, were willing to take the control of the canals in order, if necessary or desirable, to extinguish a competitive means of transit; and Parliament, being in novice superior to the general mania for railways, fell in with these views, and sanctioned the control of canals by railway companies to the extent of many hundred miles, exactly in the positions where they could do most harm to the general canal traffic,—a point probably seen more clearly by the railway promoters than by the proprietors of adjoining canals. And it is to be observed that when these canals were acquired by the railway companies, which was mostly in the year 1846, the foreign trade of the country, which requires through routes of traffic, was not one-third of what it is now.

It may be well to look at the origin of canals in England in order to understand their position at the present time. Many of the principal canals were originated by the aristocracy and landowners of the country. For instance, the Barnsley Canal, 1793-1808, had 113 subscribers, amongst whom were the Duke of Leeds, Lord Hawke, the Earl of Wigtown, seven baronets, and almost all the landowners in its immediate vicinity. The Basingstoke Canal navigation, 1778-1793, had 33 subscribers, amongst whom were the Earl of Worthington, the Earl of Dartmouth, the Earl of Portsmouth, and Lord Rivers. The Birmingham Canal navigation, 1768-1818, had 102 subscribers, amongst whom were the Earl of Hertford, Earl of Dartmouth, and Sir Lister Holt, Bart. The Birmingham and Liverpool Junction Canal, 1826, had 323 subscribers, including the Earl of Surrey, Earl Gower, Lord Leveson Gower, and Lord Crewe. The Bridgewater Canal, from Manchester to Runcorn, near Liverpool, 1759-1795, was made solely by the Duke of Bridgewater. The Carlisle Canal, 1819, had 304 subscribers, including the Earl of Lonsdale, Viscount Lowther, Sir James Graham, Sir William Musgrave, Sir Hew Dalrymple, and Sir Joseph Gilpin. The Chelmer and Blackwater navigation, 1766-1793, had 147 promoters, of whom were Lord Petre, Sir John Jarvis, K.B., and Sir John Henniker, Bart. The Coventry Canal, 1768-1819, had 113 subscribers, including Lord Archer and Sir Roger Newdigate, Bart. The Cromford Canal, 1789-1790, had 78 subscribers, of whom were the Duke of Newcastle and Sir Richard Arkwright. The Croydon Canal, 1801-1811, had 204 subscribers, including the Duke of Norfolk, Lord Gwydir, Sir Francis Baring, Sir C. W. Blunt, Sir John Bridger, Admiral Pigot, Sir John Turton, and Sir Benjamin Hammett. The Chesterfield Canal, 1771, had 174 subscribers, of whom were the

Duke of Devonshire, the Duke of Newcastle, Lord Scarsdale, the Dean of York, and Sir Cecil Wray, Bart. The Dearne and Dove Canal, 1793-1800, had 211 subscribers, of whom were the Duke of Leeds, Earl Fitzwilliam, Sir L. Copley, Bart., Sir G. Wombwell, Bart., and Sir F. Wood, Bart. The Erewash Canal, 1777, had 74 subscribers, including the Duke of Rutland. The Thames and Severn Canal, 1783-1813, the subscribers to which included the Earl of Radnor, Lord Dudley, Sir Edward Littleton, Bart., and Sir Henry Mackworth, Bart. In the case of the Grand Junction Canal, the beginning was an instruction by the Marquis of Buckingham to Mr. Barnes to survey the country between Braunston, in Northamptonshire, and the Thames near London, which resulted in the canal being made from Braunston to the River Brent, near Brentford, on the Thames; and so we find a general interest taken in canals by the aristocracy, along with the traders of the country, the one being willing to promote the interests of the other by supporting their applications to Parliament for powers to make the canals, and subscribing towards the carrying out of the works. One would suppose the present owners of the estates through which the canals pass would be equally willing to assist in their improvement, where that is needed, on the main lines. The great hindrance to canal traffic at the present time is the variety of widths of the locks. The Leeds and Liverpool Canal is the only through route on which the locks are of equal width from end to end, 128 miles. They are 15 ft. 2 in. wide. A combination of railway companies acquired the control of the merchandise traffic of this canal in 1850, and charged a through rate greater by the canal than by railway. The canal traffic fell off, but in 1874 the canal was released from the control of the railway companies, and the traffic has since much increased. The canal is now paying a large dividend on the shares, notwithstanding that the rates of carriage are less than by any other means of transit between those two places, and it carries raw material to and manufactured goods from a very large number of places along the route, as well as serving the requirements of the country through which it passes in the transport of general merchandise, the through rate of which has been reduced to one half of that formerly charged by the railway companies.

Other canals which join navigable rivers have locks of similar width, from 14 ft. to 16 ft., and for some distance inland they are of the same width, but in the Midlands the width admits of boats only 7 ft. wide. The one is a barge lock, the other a boat lock, and it is necessary for economical traffic that barges should be able to pass all the locks; and for an improved system of water communication it would be desirable that some of them be lengthened as well. Also, on the main lines, the canal itself would require widening, not, perhaps, by taking more land along the side of the canal, but by the smaller and less expensive measure of building dwarf retaining walls along the water's edge. At present most of the canals have earthen slopes and a rather narrow bottom. To improve the useful width the bottom would be widened and the sides upheld by dwarf walling in the upper 3 ft., which would not only give more boat-room, but would prevent the earth being washed away by the commotion of the water caused by the passage of vessels at a higher rate of speed than is now usual with horse haulage. For steam propulsion this walling would be essentially necessary. The present rate of speed is about two miles and a half an hour, and in all cases on canals, in towing or propelling vessels by whatever means, speed is not the thing to be desired; it is an impossibility; three miles an hour is the greatest rate with the present usual system of haulage, but with steam propulsion this may be increased to from  $4\frac{1}{2}$  to 6 miles an hour, as is done now on the Aire and Calder Navigation for merchandise, a less speed being adopted for minerals.

The sort of traffic which it would be most to the advantage of the country to carry on canals is building stone, bricks, sand, timber, grain,

ironstone, limestone, pig-iron, cast-iron pipes, other large castings and forgings, and especially all such goods as may be delivered direct from the boat to the place where they are wanted. In the case of coals it is an objection that few people want a boat-load of coals at once; whereas, by the railway, single truck-loads of eight tons or so can be delivered. But it has been suggested that this objection may be easily got over by fitting the boats with light iron cells or boxes of one or more tons each, which can be lifted out of the boat and taken anywhere without much expense or trouble. A more serious thing to be looked at is the widening of the locks, and in some cases the lengthening also, if locks are to be used at all, to pass the vessels from one level to another, but this is not absolutely necessary. The time occupied in passing a series of locks is a serious hindrance. When the canals were made the only practicable means of passing boats from one level to another was by narrowing the canal at certain points and putting in a pair of gates, which, while holding up the main body of water in the upper reach of the canal, should allow a lockful of water to be let down to the lower reach at every boat-passage, and where there are several locks together, adjoining each other, to enable greater differences of level to be passed than could be accomplished by one or two locks, all these have to be filled and emptied, one after another, before the boat can pass. The time occupied in opening and shutting the sluices and gates of a series of locks is a great drawback to the usefulness of the canal on main lines of communication. A great improvement which can now be made is to substitute an incline for a series of vertical locks. Since the invention of the hydraulic crane and other hydraulic machinery, requiring for economy a storage of the surplus force exerted by the lowering of heavy weights, and the subsequent invention of the hydraulic accumulator to store this force, it has become easy to raise a heavy weight, such as a canal boat floating in a tank, by means of the surplus force stored up in the accumulators by the previously-passing load downwards, with, of course, some addition of force to compensate for the unavoidable loss by the movements of the machinery. The small additional force required for this compensation can be put into the accumulator in various ways, amongst others by the power employed in hauling the boats.

#### PICTURESQUE ARCHITECTURE.

WHAT is "picturesque" architecture? In the short preface to the publication which is before us under the above title,\* the view seems to be taken that the picturesque quality depends on what may be called the accidents rather than the essentials of architectural subjects, since we are told that the artists who have contributed to this collection are "not aiming at the completeness and precision of strict architectural drawings," they are "dwelling with interest on accidental irregularities, such as the effects of decay or admixture of styles, which often add materially to the picturesqueness of a building, although they may, to some extent, obscure its design." Thus it appears that, in the minds of the able artists who have produced this set of plates, or, at all events, in the mind of their anonymous spokesman (for the literary portion of the work is unsigned), the picturesque element in architecture arises mainly from what from the architect's point of view are defects; from illogical admixture of styles, or from decay of material.

This represents a common and popular view, and one which it is easy to understand. The juxtaposition of incongruous styles in a group of buildings suggests to the spectator considerations beyond mere building,—associations with various times and social states, the contrasted character of the buildings suggesting the contrasted character and feelings of the

men who built them. The mind travels beyond the mere designs into the circumstances out of which they grew, and builds up a kind of history for the scene, more varied than that which any building or collection of buildings in a single style can suggest. Difference of material, too, or in the way of treating it, gives the artist the opportunity for contrasts of surface and texture as well as of design. The element of decay, too, adds to the historic interest of the buildings, and, moreover, harmonises them more with the whole scene. Nature has passed her brush over them, and they become a portion of her scenic effect, instead of a separate creation standing out from it, as a new building must be more or less.

All this is true; yet we do not like to pass this use of the term "picturesque architecture" without a kind of note of interrogation. To adopt it, *sans phrase*, with this meaning is assuming too much. It is a kind of assumption that only old architecture can be picturesque. We candidly admit that not much of new architecture is picturesque; but there is no reason why it should not be. We call that architecture picturesque, whether new or old, which exhibits character, contrast, and play of fancy. There may be architectural design, displaying very fine qualities, which could not rightly be called picturesque; for which such expressions as "stately," "dignified," &c., would be more fitly used. But there is certainly a quality of picturesqueness in architectural design which is quite independent of the accidents either of material decay or of juxtaposition of incongruous styles. The same word "picturesque" is, in fact, capable of two slightly different shades of meaning. It is true as applied to most of the subjects in the collection; we only object to its apparent limitation to architecture of mixed date and decaying condition.

To come to the drawings themselves: the majority are etchings, a method of work which, it must be admitted, is more fitted in general to give expression to ancient than to newly-erected architecture. The free line of etching is somewhat fettered and hampered by being constrained to the expression of the clean lines and firm texture which are characteristic of architectural drawing properly so-called. We doubt if the first plate here (the first after the frontispiece), the interior of Westminster Abbey, by M. Toussaint, quite comes under the head of "picturesque" as defined in the preface. A view straight up the centre of the choir, with the arcade and crossing-piers symmetrically disposed on either side of the picture, represents rather architectural grandeur than picturesqueness, and is not one of the subjects best suited for etching, though one cannot but admire the skill with which the artist has preserved the architectural lines with sufficient clearness while avoiding anything like a hard or mechanical effect. The same artist's "Chapel containing the Tomb of Mary Queen of Scots," in the Abbey, is a finer work, and here the contrast between the Gothic fretwork of the enclosing architecture and the Classic sharpness of the tomb in the centre of the aisle, with its hard glancing lights, is very effective and very skilfully brought out in the handling of the plate. The treatment of the vaulted roof is especially fine. This is one of the very examples of "admixture of styles" specified in the preface as an element of the picturesque; but oddly enough, in the letterpress attached to this particular plate it is complained of as an injury to the Abbey. The writer enters a kind of protest against the Westminster Abbey monuments in general,—too large a question to go into *en passant*; but we may quote the remark in regard to the architecture of Henry VII.'s Chapel itself, about which "cultivated people generally pass through three stages. When they are young and ignorant it seems to them infinitely rich; when they have studied architecture a little they soon find out that the apparent richness is obtained by the repetition of a very few elements, and that the building is not nearly so inventive as they at first believed it to be; but when this discovery has had time to become so familiar as not to be thought about any longer, the mind passes into the

\* Picturesque Architecture. Twenty plates by A. Brunet-Debaines, Ernest George, M. Lalanne, L. Lhermitte, J. Pennell, H. Ralton, H. Toussaint, R. Kent Thomas, and other artists. London: Seeley & Co. 1887.

third stage, in which criticism dies out and admiration begins again. . . . Henry the Seventh's Chapel has the greatest of all merits, it is poetical." True, and was it any less poetical when it was a new thing? This question is touched upon in the remarks appended to M. Lalanne's etching of "a Street in Rouen"; "we ought to remember that the signs of age and disorder, which are attractive to an artist like Lalanne, would not exist when these houses were perfectly new, and the shops under them quite neatly kept and fashionable shops." This fact, that all old buildings were once new and were judged as such, is often forgotten by sketchers of the picturesque, who profess to find all modern architecture inferior to ancient. In the case of the Rouen street the age and dilapidation have unquestionably given the artist the kind of effect he wanted; but the street is picturesque in itself, and it may be questioned whether it would not have looked equally (or in the best sense even more) so when new, as in its present pigsty stage. The artist's contemptuous treatment of the modern cast-iron spire of the cathedral is an amusing bit of practical criticism on it, with which we entirely sympathise. We stumble on the same question in regard to Mr. Railton's drawing of "St. Jacques, Dieppe," where it is noted that different styles of architecture differ very much in their capability of bearing a ruinous state of existence. "The very severe styles, when half ruinous, always look as if they were damaged, but the styles which have a picturesque liberty and variety in themselves appear to accept decay without much loss of beauty, and certainly without loss of charm." Most of us feel in accordance with this view, and certainly Mr. Railton's drawing of the rich crumbling church illustrates it well; but whether it is not in reality a form of association peculiar to the present century, and not permanently implanted in the human mind, *quien sabe?*

Of the other plates in this fine collection, "the Rood Screen of St. Etienne du Mont, Paris" by M. Toussaint, is one of the most remarkable for powerful effect, finish of execution, and a most delicate perception of gradation of tone in the shadows; and the same artist's "House of the Chase, Pompeii," is another excellent example of the highly-finished type of architectural etching. Those of "Dort" and "Bruges," by Mr. Ernest George, though showing less minute finish, form, to our thinking, better illustrations of the special function of etching; the latter especially, which is really a drawing with an old mill in the foreground and the town in the distance, has that free character of line, and broad contrast of lights and darks (the sky being a nearly untouched space), which is the kind of artistic language which etching was really created for. Mr. Kent Thomas's etching of "The Altmarket, Cologne," may assist to point this moral; it is a carefully-finished and most satisfactorily executed plate in its own way; but there is none of the poetry of etching in it; it is a well-executed piece of architectural topography, and that is all. Mr. Edridge's "Tour de la Grosse Horloge, Rouen," free enough in style, loses effect from being too uniformly white. A fine perception of the power of contrast of broad masses of light and shadow is shown in Mr. Briand's "Rue de la Poissonnerie, Montivilliers," though the whole is a little stiff and mechanical in execution. One of the most artistic of the freer sketches is Mr. Pennell's "A Water Gate in Venice"; an admirable little bit of work. The whole collection, if not of equal interest throughout, makes a delightful volume, to be valued by all lovers of architectural and artistic effect, whatever their theories as to "picturesque architecture."

**Sturton-le Steeple (near Retford).**—On Easter Monday the memorial-stones of a new Wesleyan chapel were laid at Sturton-le-Steeple. The plans, prepared by Mr. Chapelow, of Osberton, show a small Gothic building of brick, with stone facings, capable of accommodating about 260 people. The estimated cost of the building is about 800l. The contractor is Mr. John Wilson, of Retford.

## NOTES.

**HERE** seems to be a general movement on the part of foreign Governments to furnish up their respective capitals, and to sanction the undertaking of public works, and especially those which tend to improve them commercially. The latest city that appears to be following the fashion is Lisbon, where the authorities have just granted to a Belgian firm a concession to make new docks, wharfs, and all buildings connected with them, the whole estimate being about 2,000,000l. Whether the Belgian firm was also the inventor and promoter of the scheme is not stated, but one thing seems clear, that we in England lose a vast deal of trade from our indifference to the necessity of a thorough acquaintance with foreign languages. The whole tone of the Consular reports is set to this one tune,—that other countries are far before us in "push," and that the agents who do the work are skilled linguists and thoroughly up in the intricacies of the requirements. We, on the other hand, are too much in the habit of sending out men who know just enough of a language to break down at a critical point, and have not the ability to push, even though they had the will. This is not the way to prosper in foreign business nowadays.

**MR. SHAW LEFEVRE** seems to have taken an early opportunity of blowing his own trumpet in regard to the matter of the War and Admiralty Offices site before the Committee (of which, he it observed, he is a member) for considering the question, by giving lengthy evidence in his own favour, as reported in the *Times* of Wednesday. He "has saved the country a million of money" and there is no doubt of the economy of his site; but that is its only merit. It is capable of being made better at the cost of clearing away the banks and other buildings facing Charing Cross, widening the street, and bringing the line of the Mall through; but economy is everything, and architectural effect nothing. It is interesting to have Mr. Shaw Lefevre's assurances that the design which he has taken under his patronage is superior to any existing public building in London; and no doubt there are plenty of people ignorant and careless enough on the subject to take his word for it, and to suppose that any one who is so ready to give the world instruction in architecture must be an authority thereupon; but we hope there may be some members on the Committee who know better than to take Mr. Shaw Lefevre's architectural perceptions at his own valuation, and who will stand out for having a great building carried out in a manner worthy of a great nation, and not on a merely economic basis.

**FLORENCE** is to be *en fête* from May 4th to 19th, mainly in honour of the unveiling of the new façade of the Duomo, which is to take place on the morning of the 12th. We give an illustration of the cathedral with its new front in the *Builder* of October 2nd, 1886. On the 13th the idea of a historical procession, carried out at Heidelberg last year, is to be repeated at Florence, the time taken being the middle of the fourteenth century. This, if well managed, ought to be a very picturesque spectacle, and there is the gratification of feeling that in modern Italy such a procession can take place without the probability of a free fight in the streets, or any peevish complaint that,—

... "Not a drop of blood was spilt  
When Cino Bocchimpano chanced to meet  
Buocio Viriù—God's wafer, and the street  
Is narrow!"

—as we may read in Browning's *Sordello*, the hook which of all modern works gives the most vivid glimpses into mediæval Italy.

**IT** is not in England alone that disputes in regard to the right to light are numerous, for a correspondent informs us that in Bombay, owing to the increase of new buildings, they are considerable in number, and as the natives are somewhat litigious, the courts of law fre-

quently have this easement brought to their attention. It is noteworthy that the easement of light is practically regulated in India by the English Prescription Act; that is to say, the Limitation Act No. XI. of 1877, and the Indian Easement Act, 1882 (Act No. V. of 1882), are, in the sections which regulate the right to light, very analogous to the English Prescription Act. Thus in one sense the English Prescription Act applies to British India. This being so, it is obvious that those who would seek to alter the statutory law of light in this country have to face the fact that it is also the law of India, and that any alteration of the law here would probably be followed by an alteration of or by an attempt to alter the law in India. This fact seems to make any change in the law of light even more improbable than if the Prescription Act applied only to this country.

**THE** current number of the *Lancet* contains an exceedingly practical communication from Mr. Charles Roberts on "Trees from a Sanitary Point of View," especially as regards their effect on habitations. Mr. Roberts, of course, objects to the fallacy of planting or retaining large trees close to a house, laying down the rule that a tree should not stand so near a house that if it were to fall it would fall on the house; in other words, the root should be as far from the house as the height of the tree. Most persons who have exercised any observation or common-sense at all on the subject would, if they did not anticipate this recommendation, be prepared to agree with it. But much fewer persons are aware of the other fact insisted on in Mr. Roberts's paper, that the practice of planting up houses with thick belts of trees, even when not close up to the house, with the object of shutting them out from view, has often a marked and deleterious effect on the sanitary condition of the habitation, interfering with the circulation of air and lowering the temperature around the dwelling. Mr. Roberts gives some facts in illustration of this. "A dry garden on gravel, in Surrey, surrounded by trees, is generally three or four degrees colder than the open common beyond the trees; and a large pond in a pine wood twenty miles from London afforded skating for ninety consecutive days in the winter of 1885-6, while during the greater part of that time the lakes in the London parks were free from ice." Mr. Roberts complains that the speculating builder commences by cutting down the large old trees which from their isolation are not injurious, and ends by raising mounds and sticking into them dense belts of quickly-growing trees to hide the house as speedily as possible. This is "a true bill," we fear, against the builder, whose destructive propensities in regard to large trees are open and palpable; his "line of frontage" is a sacred institution, and he would rather cut down the finest tree than modify his notion of placing the house on the ground. Every one can see and lament over this kind of vandalism; but the mischief of cutting off one's sunshine from houses by too close a fortification of trees is not so generally appreciated, and it is well that attention should be called to it.

**IT** appears that on the occasion of her last visit to Edinburgh, the Queen, when looking at the restored interior of the Cathedral Church of St. Giles, expressed surprise that no memorial existed in the building of James Graham, "the great Marquis" of Montrose, who was executed in 1650, and whose remains were, according to tradition, huddled under the pavement of St. Giles's. This remark of her Majesty has suggested a scheme which has been warmly supported by leading members of the Graham family, as well as by others who are admirers of the hero, and Messrs. Wardrop & Anderson, architects, have been commissioned to prepare a suitable design. The committee have approved of a design, the execution of which is to be entrusted to Messrs. John & W. Birnie Rhind, who executed the Wemyss tomb which was so much admired at the recent International Exhibition in Edinburgh. The design shows a monument, Renaissance in style, having the effigy of the marquis on a richly-carved sarcophagus, with a canopy rising to a height of 16 ft., supported by

pillars. The figure is to be of white marble, and the accessories of coloured marbles and alabaster.

DR. SALOMON REINACH contributes to the *Classical Review* for April some interesting particulars as to the excavations at Delphi shortly to be undertaken by the French School at Athens. The principal difficulties which stood in the way of the work were,—1. The necessity of expropriating the modern village of Castri, which is built on the ruins of the Delphian temple. 2. A certain reluctance of the Greeks, which already expressed itself in 1875, when the Germans asked permission to dig at Olympia." These obstacles, we are glad to learn, are now removed. The French Minister, Count Monthon, and the Greek Prime Minister, M. Tricoupi, have concluded a treaty on a basis similar to the terms granted to the Germans in 1875. The principal stipulations are:—1. All objects discovered are to remain the property of Greece, and are not to be carried out of Greece. 2. The French School at Athens, which bears the cost of the excavations, has the exclusive right for five years of taking casts of discoveries. A law will shortly be passed by the Greek Government to authorise the removal of the village of Castri. M. Foucaut, for many years director of the French School, is to take command of the expedition. M. Haussollier is to be his chief assistant.

IN the same number (a double one, 2 and 3) Mr. Cecil Smith continues his interesting report of the acquisitions of the British Museum. He devotes most space to Mr. Paton's generous gifts, consisting of his discoveries during the excavations he has, at his own expense,—carried on at Assarlik. "The importance of these discoveries," Mr. Smith says, "cannot be over-estimated in their bearing on the early history of the geometric races." As full particulars, with illustrations, are to appear in the *Hellenic Journal*, we reserve our notice. The *Review* continues to perform admirably its function of the registration of news; it is to scholars themselves the greatest possible boon to be able to ventilate their discoveries and their theories some time before they commit them in the *Hellenic Journal* to formal exposition.

THE Committee for erecting the Harrison Memorial having asked Sir William Fettes Douglas to favour them with his opinion as to the form which the memorial should take, Sir William has suggested that a gateway or ornamental archway at the east end of the new approach to Blackford Hill would be suitable and appropriate, the site being associated with the acquisition of the hill as a place of public recreation through the efforts of Sir George during his tenure of the Lord Provostship of Edinburgh. Dr. Rowand Anderson, Mr. Hippolyte J. Blanc, and Mr. Sydney Mitchell have been asked to submit designs.

ONE can hardly mention the Society of Water-Colours' Exhibition of this year without a degree of enthusiasm. In few years have we seen so high an average of work and so much that is exceptionally fine. Mrs. Allingham, unfortunately, is represented by only one work, "The Picture Book" (225), but some of the best landscape-painters in the Society have surpassed themselves. Mr. Eyre Walker, whose works have been regarded with increasing respect for some little time back, has this year surprised us by a really grand work, "The Shadows of the Evening Hours" (151), one of the finest landscapes in colour, and one of the most solemn and poetic in feeling, that we have seen for a long time, and which gives its author a new position among his contemporaries. Mr. Hunt's exquisitely delicate work, which grows upon one in studying it like nature herself, is best represented in "High Tide" (89), and "A Still North-easter" (196); there is also another edition of "Sonning" (19). Mr. Albert Goodwin's "Waiting for Judgment" (126),—"And there came two Angels to Sodom at Even,"

—is another fine example of landscape full of poetic meaning; a lurid scene full of the presage of some catastrophe. Mr. Tom Lloyd has never done anything better than "Responsive to the Sprightly Pipe" (74), an idyll of the richest colour, and full of graceful sentiment, as well as capital painting of sheep and lambs. Mr. Lloyd knows, what some animal painters do not, what an awkward leggy little animal a lamb is, when you come to study him critically. Mr. Herbert Marshall is even better than usual in his London scenes, especially "The Sanctuary, Westminster," and "St. Paul's" (107 and 136). Sir John Gilbert exhibits a large work representing Wolsey at "the highest point of all his greatness" (117) not only a very effectively grouped and painted work, which we are accustomed to from him, but showing a high power of realisation of historic character in the face and figure of Wolsey, expressive at once of power, determination, and a substratum of vulgarity: a real piece of "historical painting," a phrase so often misused. Mr. Colin B. Phillip, who is one of the later lights of the Society, shows two or three large and powerful studies of bare barren granite scenery in the Highlands, somewhat heated in colour, but which are well worth attention. Mr. George Frigg, in "Lynton, North Devon" (32), and some other drawings, shows as finely as ever as one of the best representatives of the older contemporary school of English landscape-painters. Mr. North, emphatically a representative of a younger school, leaves a little too much detail to the imagination in "The Monks' Fish Pond" (16), nor is the prevailing tone that of early spring,—it is far too warm and rich, except in the meadow in the centre of the scene. Mr. North has made a style of his own, but there seems some little danger of his style running away with him. Mr. Arthur H. Marsh has struck a note of true pathos in his "Men must work and Women must weep" (144). The exhibition is notable for a work by Mr. Holman Hunt, another version of Jesus disputing with the Doctors (67), a study for a mosaic to be placed in Clifton College Chapel. The arrangement of the work is well suited to mosaic, and will look heter in that medium than in water-colour; it exhibits the artist's extraordinary powers and painful perversities in more than the usual degree of contrast. The perspective of the picture is wrong, so that the child Christ in front of the group is larger in scale than the rest of the figures. It is vexatious that a work with such a technical falsity as this, however earnest in purpose, should be placed in a school chapel to give boys wrong ideas of perspective. "Maxima debetur," &c.; boys should be reared on correct drawing. Among other works we have only space to mention Mr. T. J. Watson's fine and rather sombre drawings, with a kind of old-master look about them, of which the "Old Draw-well" (112) is the most original; Mr. Naftel's beautiful little works, especially certain Capel Curig studies, and Miss Naftel's flower-pieces, excellent of their kind; Mr. Walter Field's "Wargrave" (109), a most faithful likeness of a particular bit of the Thames; Mr. Otto Weber's sea-side pieces with figures; Mr. Robertson's "Carpet Bazaar, Cairo" (165); Mr. A. Goodwin's "Durham" (138); and to note that there is a fair proportion of purely architectural subjects in the exhibition, by Mr. Riviere, Mr. Arthur Glennie, Mr. Robertson (his painting of the gateway and mosaic decoration in No. 201 is very good), Miss Montalbo, and others.

IN the last number of the *Bulletino della Commissione Archeologica Comunale* (xv. 3) Signor Visconti publishes, in a phototype plate, an interesting relief representing the adoration of the Dioscuri. Monuments relating to the worship of the twin-gods are, it is known, rare, and such as exist belong for the most part to Greco-Roman date. Special interest attaches to the present relief because it is obviously a piece of Attic work belonging to about the early half of the fourth century B.C. The marble is Pentelic, the style plainly under the influence of the Parthenon

sculptures. The brothers are seated on a rock; they are clearly meant to be side by side, but the exigencies of relief oblige them to be represented one behind the other. Their attitudes are precisely similar; each holds a lance in the left hand, and is accompanied by his horse. A family of five worshippers approaches from the right. The foremost worshipper is of matronly figure, strongly recalling the Eirene of Cephissodoti. It is interesting to note that the Dioscuri do not wear the pilos. It appears that this form of head covering did not become a distinguishing attribute till the third century B.C.

MR. BOEHM'S statue of the late Duke of Buccleuch, to be erected in Edinburgh, has been completed, and the stonework and bronze reliefs, entrusted to Messrs. Clark Stanton, Burnet, and Stephenson, are nearly completed. It is proposed to proceed with the erection of the monument in June, and it is expected to be finished within five or six weeks.

THE publication entitled "The Century Guild Hobby Horse," which is now issued quarterly, seems to have subsided into a somewhat more tempered strain of thought and writing than was foreshadowed in the extraordinary mixture of ambitious sentiments and impossible English in which its advent was heralded some time ago. The number for April commences with an *in memoriam* sketch by Mr. Ruskin of the late Mr. Arthur Burgess; a paper sad enough in tone in more ways than one. Burgess was one of Mr. Ruskin's elect, who were found worthy to work for him. He introduced himself by a wood engraving and a letter, touching in its simplicity. "I can cut wood like this, and an overworked and cannot make my living,—can you help me?" One may admire the simplicity of the one man, and the chivalrous generosity with which the other at once responded to his appeal, without concluding that in reality Arthur Burgess was gifted beyond all other engravers; though the small engravings from flowers that are given show great fidelity, and a desire to get at the actuality of his subject. Mr. Macknurd's article on "Arbitrary Conditions of Art" contains some thought and a good deal of truth, most of which, however, is only new in regard to the phraseology employed. We cordially sympathise with him in his scorn for "the repetition after repetition of the Acanthus, Mask, Mermaid, Cherub, or other hackneyed and long-since ineloquent imagery, carved alike on bank school-house, music-hall, mansion, Salvation hall and beer-house"; but it saves trouble to people who have no ideas, and their name is legion. The worst of the publication is the sense of affectation and posing which conveys; the effort to represent art as the peculiar property of a certain set, whose way alone are right: "we know that we are God, and the whole world lieth in wickedness." The style of the title-page and tailpieces is a mere affectation of Blake's manner. We have a profound veneration for Blake; but we do not care, we confess, for Blakism at second hand. It is to be noted, by the way, that the only quotation from Blake in this rather Blakian periodical (p. 78) is given incorrectly.

THE drawings by Sir James Linton and Mr. Orrock, exhibited at Messrs. Dowdeswell's, and illustrating the writings of Scott form a very pleasant collection, and Mr. Orrock's landscapes show that faculty for rendering atmospheric effects in misty and rainy weather for which his drawings are notable; though the effect is repeated little too often. Bewcastle Moss, when Dandie Dimont and Bertram had their famous encounter with highwaymen, is the subject of more than one fine broad water colour drawing, as also "Dandie Dimont hunting country"; and one or two small studies of Criffel are particularly good. Sir James Linton, of course, contributes figures, which among his best work in regard to execution and rich colour, and in the knowledge of and taste for costume displayed; and in one or two

the rougher characters, such as "William of Deloraine" (an admirable work artistically) and "Nanty Ewart," he gives us some of the character of Scott's personages; but in the higher characters he fails woefully. Marmion was a scoundrel, it is true, but he was a great soldier; something very different in style, we may be sure, from the mild personage here represented. Julia Mannerling, with all her liveliness, was emphatically a lady, and is described as of a haughty and commanding type of beauty; Sir James paints a red-haired and red-cheeked young person with no manner, whom Julia would not have called on; and the figures of "Guy Mannerling" and "Bertram" are absurd as ideals of the personages; they are mere pegs to hang costume upon. In short, our impression is that Sir James Linton is not acquainted with the works he has been illustrating; an impression confirmed by the fact that one drawing is inscribed by the artist, "Alan Fairford, from Waverley"! Scott is not as much read as he used to be, but some of us know our Waverley Novels better than that, at all events.

MORE than one correspondent has drawn our attention to a curious discrepancy in Mr. Binyon's plans and elevations for the Edinburgh Municipal Buildings published in our last issue. The plan on High-street level shows a carriage drive into the courtyard; whereas the elevation to High-street shows a flight of steps in the same entrance. Perhaps Mr. Binyon will explain.

AT the Walker Art Gallery in Liverpool an exhibition is open of reproductions from the works of Raffaele. Mr. W. M. Conway, Roscoe Professor of Art at University College, Liverpool, has compiled a chronological catalogue of the known works of Raffaele, to accompany the exhibition, which will be open till the end of July.

WE have received from a firm of London architects a letter addressed "to the managing clerk" at their office, and by him very properly handed to his principals, from a person undertaking to copy drawings, and which concludes, "I should be glad to allow you 25 per cent. on all work done, which would be paid on receipt of account." We will not give the person making this offer the benefit of an advertisement by citing his name, and we may hope that he is perhaps not fully aware of the gross impropriety of this kind of backstairs business, which is practically offering the managing clerk or head draughtsman a bribe to neglect his own duty and his employer's interests. Probably in most cases such an offer would only be regarded with contempt; but it is none the less reprehensible.

WE are sorry to confess that Mr. Harry Furniss's "Mock Academy" at the Gainsborough Gallery is somewhat of a disappointment. Some of the imitations show real humour and a very clever hitting-off of the leading characteristics of the style of certain well-known painters, but a large proportion of the works are farcical caricature, and, though this may do very well on a small scale in the pages of *Punch*, to execute them on a large scale and hang them in a gallery seems a little more elaboration than the joke is worth. Among those which we noted as conveying something beyond mere caricature are the translation of Mr. Paed (No. 8), the "Three Little Maids" after Mr. Leslie (17), "Discord from Dicksee's Land" (44), the "pretty pretty" school of landscape (5), and the "Three Switches" (48), "Elbow-room" (73), an immense room with one small figure in the corner of it, a humorous exaggeration of Mr. Orchardson's extensive floors; "A Message from the Sea" (50), a really clever and successful rendering of Mr. H. Moore; "Britannia ruling the Waves" (39), in commemoration of Mr. Brett, is also good, but the picture which we find by the catalogue is meant for a compliment to Mr. Colin Hunter (6), most *habitués* of exhibitions would connect rather with the name of

Mr. Hamilton Maellum. "An Effect of Coal on the River" (74), is a very poor pun on the name of a well-known Thames landscapist, attached to a sketch which has no relation whatever to his style. We must complain also of another pun about "fresh *Fildes* and pastures new," inasmuch as the line is "fresh *woods* and pastures new," as Mr. Furniss will find if he looks up his Milton; but it is fair to add that the mistake is one constantly made. The best joke, in what may be termed the farcical portion of the collection, is that which shows how Mr. Horsley translated—

"The city's ancient legend into *this*,"—

a lay-model Godiva draped in a night-dress and seated on a pantomime horse formed by two men; the horse's eyes are modestly blindfolded: the painter just shows his face from behind a curtain. We thank Mr. Furniss for that.

#### ASKE'S HOSPITAL, HOXTON.

A LITTLE-KNOWN relic of an important London charity is about to disappear. By direction of the Charity Commissioners, the Governors of Aske's Charity have resolved to grant building leases in respect of two contiguous properties at Hoxton for the erection thereon of artisans' dwellings. On the one plot, in Pitfield-street, now stands the George and Vulture tavern (No. 63), with four other premises. The other, containing about 21,108 ft. superficial, forms the site of a decayed and detached tenement known as "Haberdashers' House," being No. 55 in that same street. This is none other than the northern wing, once occupied by the master or chaplain, of Aske's Hospital. That charity was originally established under the will (1688) of Robert Aske, citizen and haberdasher. The founder bequeathed to his Company 20,000*l.*, to be laid out in purchasing ground within one mile of London for an almshouse to receive twenty poor freemen, and in buying enough land to yield each pensioner 20*l.* a year. The rest of the money was to be invested in lands for the benefit of as many boys as the same would provide for at the rate of 20*l.* each for schooling and maintenance. Property was bought accordingly in Hoxton and in Kent. The trust, as lately remodelled by the Charity Commissioners, produces about 9,000*l.* per annum. In 1691 the Hospital was built, from the designs of Robert Hooke, the celebrated mathematician. His building was remarkable for a colonnade, which fronted all of the ground-floor between the two residential wings. That feature was partially reproduced in the later building. Proving to be too costly a structure, the old Hospital (with the exception of the portion under review, was pulled down in 1824 and replaced by the existing premises upon a more limited plan, D. R. Roper, architect. Aske's statue stands in the front court. Along with other improvements of the Haberdashers' property in this locality Buttesland-street was made through the left-hand portion of the earlier hospital's central block. The surviving northern wing, of red brick, and in three stories, is readily distinguishable by its high-pitched roof and lofty attic dormers having angle pediments. A model of Hooke's building is preserved at Haberdashers' Hall, whilst it forms the subject of two prints by Cole (1739) and Bowles. Pitfield-street is so named after one Charles Pitfield, who had a country seat with estate in Hoxton. His property here passed on his daughter Mary's marriage to Humphrey Sturt, M.P. for County Dorset, ancestor of the present Lord Arlington, who, we learn, is largely interested in the fortunes of the adjacent Mohhs's estate.

**Tenement Dwellings.**—The Mansion House Council for the Improvement of the Dwellings of the People, in addition to other methods employed for the attainment of their object, have now established a register of tenement properties for sale in the metropolis, and also a list of persons willing to purchase this class of property. These registers are kept at the Central Offices of the Council, 31, Imperial-buildings, Ludgate-circus, E.C., and it is hoped that the facilities thus provided may lead to the transfer of insanitary properties to the hands of those who, whilst expecting a moderate return for their capital, will seek first to insure the sanitary conditions of the dwellings.

#### CONFERENCE OF ARCHITECTS IN LONDON, 1887.

The following is the skeleton programme of the eighth General Conference of Architects:—

MONDAY, MAY 2ND, 1887.

- 3.45 p.m.—Visit to the new Stock Exchange, Throgmorton-street, E.C.  
7.30 p.m.—Opening meeting: reception by the President and Council. Exhibition of drawings by deceased architects.  
8 p.m.—The Fifty-first Annual Meeting, R.I.B.A., open to all architects attending the Conference.

TUESDAY, MAY 3RD.

- 11 a.m.—Visit to the National Liberal Club and Whitehall Court, on the Embankment; also to the Victoria Hotel, Northumberland Avenue.  
2 p.m.—Visit to the Royal Holloway College (by train to Egham).  
8 p.m.—Conference Second Meeting: Paper by Mr. J. D. Sedding, Fellow, on "Architecture and the Handicrafts."

WEDNESDAY, MAY 4TH.

- 11 a.m.—Visit to Harrington Gardens and other domestic buildings at South Kensington.  
12.30 p.m.—Visit to Kensington Court, &c.  
3 p.m.—Conference Third Meeting: Short papers on Education.  
8 p.m.—Conference Fourth Meeting: Paper by Mr. John Slater, B.A., Member of Council, on "New Materials and Inventions."

THURSDAY, MAY 5TH.

- 11 a.m.—Visit to the City and Guilds Institute, South Kensington.  
3 p.m.—Conference Fifth Meeting: Report of the Special Federation Committee.  
9 p.m.—*Conversazione* of the President and Members, R.I.B.A., at the South Kensington Museum (by invitation).

FRIDAY, MAY 6TH.

- 11 a.m.—Visit to the Drainage Works, &c., at the Houses of Parliament.  
3 p.m.—Conference Sixth Meeting: Short papers on the "Registration of Architects."  
8 p.m.—Ordinary Meeting, R.I.B.A.: Presentation of the Royal Gold Medal, and of Students' Prizes.

SATURDAY, MAY 7TH.

- 11 a.m.—Visit to the Diploma Gallery of the Royal Academy, &c.  
7 p.m.—Members' dinner at the Freemasons' Tavern (by ticket).

#### THE EXAMINATION IN ARCHITECTURE.

The following gentlemen have passed the Examination held during the week commencing the 21st of March last, and are qualified to become candidates for the Associateship of the Royal Institute of British Architects, namely:—

- Edmund John Bennett, Gravesend.  
William Henry Bidlake, M.A., Birmingham.  
James William Brooker, London.  
Richard Matthew Dudley Fell, London.  
Henry Hoyle Fox, London.  
Charles Gonray, Glasgow.  
Henry Thomas Gradon, Durham.  
Hubert Alfred Gregg, London.  
Francis Edward Lodge Harris, London.  
Pawlis Houli, Dublin.  
Joseph Lawender, Wolverhampton.  
Herbert Richard Lloyd, Birmingham.  
Frederick William Marks, London.  
Charles John Marshall, London.  
Theodore Moore, Walthamstow.  
Henry Leslie Paterson, London.  
Edgar Harry Selby, London.  
George Cade Smith, Newcastle-on-Tyne.  
James William Stonohill, London.  
Robert Watson, Edinburgh.  
William Henry White, London.  
Robert Williams, Haslemere, Surrey.  
Herbert Winkler Wills, London.  
Arthur Henry Worsley, London.  
Thomas Locke Worthington, London.

**The College of Preceptors.**—It should have been mentioned, in the short account of this building which appeared in our last, that the furniture was made and supplied by Messrs. W. Walker & Sons, of Bunhill-row.

## ON SOME DESIGNERS OF GROTESQUES.

We suppose that no one will deny that there may be both good and bad even in humorous art, and that even grotesques may be classified according to merit; but the classification depends not only on the humour of them, but on their observance, or failure to observe, the ordinary rules of the art. "Consecutive fifth's" are as intolerable in "Humoresken" as in sonatas. He is but a poor punster whose jokes have no point save in their bad grammar. And so it is with the playful side of decorative art: its charm is to be found first in the observance of the fundamental principles of ornamentation; and, secondly, in the touch of wit and humour which is superadded. But we must put our principles to the test by considering some of the examples which we have to lay before our readers.

First and foremost, and prince of artistic humorists of his day, we must place Christopher Jamitzer, born at Nuremberg in 1560, from whose "*Neues Grotteskenbuch*" we have selected some half-dozen examples (figs. 1 to 5). In boldness of conception, in the vigour and dash of the lines, in the way in which every detail is made to subserve the general idea, while endowed with a little playful fancy on its own account, these designs are excellent. Look, for example, at the pig-fish-man (fig. 3); incongruous as it is, a perfect symmetry of design is preserved: there is a feeling that the monster is quite well balanced on its one leg and crutch, notwithstanding the exertions it must have gone through to catch a fish with its disabled claw; so too we feel sure that the little dog will not slip off, nor the candle fall, for the tail scroll which comes off the lobster-like body is in perfect proportion with it. Again, the strident horn-blowing monster in fig. 4 is equally remarkable for the vigour of its main idea, and the perfect way in which the purely ornamental lines flow away from each other. It is a monstrous nightmare figure, no doubt, but even nightmares are not necessarily altogether devoid of good points.

From Jamitzer we pass to another very prolific designer of grotesques, Lucas Kilian, of Augsburg, who was born in 1579, the first of a large family who all attained more or less renown as engravers. Lucas Kilian designed, among other things, a large alphabet, nearly all the letters of which have been reproduced in Reynard's Album. The human figures which he introduces into them are weakly drawn, but the letters themselves and the ornamented back-

grounds are by no means devoid of merit, although they do not possess any very great originality. His grotesques (published about 1607, in a book entitled "*Neues Grotteskenbuch* durch Lucas Kilian, Burger in Augsburg und Kupferstecher, gradiert und an tag geben") are, however, original, and full of interest. They are, as a rule, elaborate compositions, rather than homogenous designs, each filling an ordinary octavo page, and drawn in

Fig. 3.

Fig. 4.

a rather loose and sketchy manner. The artist's chief characteristic is a great knowledge of the essential attributes of graceful curves. The fragment which we have sketched (fig. 6) forms the bottom of one of the pages, and it is typical of all of them. The animals are drawn with a good deal of power, but their extremities are invariably twisted off into a thin decorative scroll. These scrolls are, however, always drawn in a certain symmetrical relation to the rest of the body. The legs and tails of the lion and bull in the sketch are specially noticeable. In fig. 7 we give two other extracts from the plates in this book, in which the human and animal extremities are treated in a still more *outré* manner. The little sphinx, with the excrescence on its tail, sketched in the same figure, will probably strike our readers at once as not coming from the same hand. We have introduced it in close proximity to Kilian's work, to show more by example than by precept, the difference between bad and good work of this class. It is a fragment from a series of plates by Jacques Androuet du Cerceau, published in 1562, in feeble imitation of Kilian. The compositions are merely odd fragments of designs pitched together without definite purpose, and the fragments themselves, of which the sphinx is the best of a bad lot, are without any spirit or humour. The apparent simplicity indeed, of Kilian's designs brought him a great number of followers, Matthew Merian, also a burger of Augsburg (born 1616), and who afterwards taught Kilian's nephew Bartholomew (born at Augsburg, 1630; died, 1696), being foremost among them; but none of them approached their master, Lucas, either in originality of design or grace of treatment.\*

#### OBITUARY.

*Mr. George Reavell*, late Clerk to H.M. Office of Works for the Birmingham District, recently died, at the early age of 48. Mr. Reavell in his official capacity had superintended the erection of the County Court and Post Office in Birmingham, also the Post Offices and other Government buildings in Leamington, Leicester, Derby, Wolverhampton, and in several other Midland towns. He is spoken of as a man of exceptional ability in his profession, and of most estimable character, and his death has caused a deep feeling of regret amongst a large circle of friends and the numerous public officials with whom he had been brought into contact. He was ill only five days. His funeral took place on the 15th inst. at King's Heath Chapel, and was attended by, among others, Mr. J. Williams, of London, late Surveyor to the Office of Works, under whom Mr. Reavell had served for many years.

*Mr. John Sang, C.E.*—The *Scotsman* says that Mr. John Sang, C.E., died at his residence, Whyte's Causeway, Kirkcaldy, on the 14th inst. Mr. Sang had a reputation as an eminent engineer throughout the greater part of Scotland and the North of England. He was in his seventy-eighth year.

#### Manchester Architectural Association.

—On Saturday last the members of this Association paid their second visit to the Royal Jubilee Exhibition, Old Trafford, Manchester, and were conducted over the building by Mr. Take, of the firm of Maxwell & Tuke, the architects, and Mr. Compton. Much interest was shown in the admirable arrangements and in the striking effects produced, and more especially in the dome. The exhibits appear to be in a very forward state, and will no doubt be all complete by the opening day, which has been arranged for the 3rd of May. Leaving the main building, the members proceeded to "Old Manchester and Salford," and were met by Messrs. Darbyshire & Smith, the architects for this portion. After an examination of the model, this epitome of local history was carefully inspected, and a most enjoyable afternoon was concluded with a visit to the Botanical Gardens, which are connected with the Exhibition.

**Re-Building of Christiansborg Castle.**—The Danish Parliament has just decided, by 69 votes against 14, to accept the Government proposal for the re-building of Christiansborg Castle, at Copenhagen, which was almost totally destroyed by fire a couple of years ago. This will of course include the repair of the famous frieze by Thorwaldsen, in the Hall of the Knights. The cost of the restoration is estimated at about 75,000*l.*

\* To be continued.

#### ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE Ninth Ordinary Meeting (Business) of this Institute for the Session was held on Monday evening last.

The following gentlemen were balloted for and declared elected, viz., *As Fellows*: Mr. Thomas Tillman (Associate), Sunderland; Mr. Frederick Dudley, Queen Anne's Gate; Mr. Zephaniah King (Associate), Victoria-street, Westminster; and Mr. Robert Fabian Russell, Moorgate-street. *As Associates*: Mr. Norman Michael Brown, Leicester; Mr. Thomas Ridley Milburn, Sunderland; Mr. Frederick William Kite, Rochester; Mr. Archibald Duncan Watson, Stamford; Mr. Arthur Ernest Barsley, Bromley (Kent); Mr. Arthur Colpoys Wood, St. John's Wood; and Mr. John Coulson Nicol, Acocks Green, near Birmingham. *As Hon. Associate*: Lieut.-Col. John Davis, F.S.A., M. Inst. C.E., Farnborough, Hants.

On the motion of Professor Kerr it was unanimously resolved "That members of the Institute are expected to support the authority of the Schedule of Charges published by the Institute, as the recognised custom of the profession."

#### Federation.

The following is the Report of the Special Federation Committee, which will be submitted to the fifth meeting of the coming General Conference of Architects for discussion, prior to being considered by the Council of the Institute:—

Gentlemen,—The Committee appointed by you on March 1st, 1886, as the Special Federation Committee, consists of the following members of the Royal Institute, with the President, Vice-Presidents, and Secretaries:—

Messrs. C. A. Adams, Fellow.

C. Aldridge, Fellow (Liverpool).

C. Barry, F.S.A., Past President.

\* A. N. Bromley, Fellow (Nottingham).

\* J. W. Cannon, Fellow (Leeds).

\* R. J. Goodacre, Fellow (Leicester).

H. R. Gough, Fellow.

E. T. Hall, Fellow.

G. T. Hine, Fellow (Nottingham).

J. Holden, Fellow (Manchester).

\* J. Honeyman, Fellow (Glasgow).

\* G. G. Hoskins, Fellow (Darlington).

J. D. Mathews, Fellow.

\* J. C. Moncrieff, Fellow (Bristol).

R. Nevill, F.S.A., Fellow.

\* W. Parslow, Fellow (Liverpool).

\* C. R. Pink, Member of Council (Winchester).

\* G. T. Bodmayne, Fellow (Manchester).

T. H. Rickman, F.S.A., Associate.

The References to the Committee were—(1) To report upon the existing relations of the Royal Institute with other Architectural Bodies in the United Kingdom, and its colonies and dependencies; and (2) To consider the question of Federation generally. The Committee have held seven meetings, at which opinions, both oral and written, have been received from most, if not all, of their members, and they now beg leave to report:—

(1) With reference to the existing relations with other Architectural Bodies,—the Royal Institute has for a considerable period been in regular communication with the following Institutes, Societies, and Associations, viz.:—

The Architectural Association of London.  
The Birmingham Architectural Association.  
The Leeds and Yorkshire Architectural Society.  
The Leicester and Leicestershire Society of Architects.

The Liverpool Architectural Society.  
The Manchester Society of Architects.  
The Manchester Architectural Association.  
The Northern Architectural Association.  
The Nottingham Architectural Association.  
The York Architectural Association.  
The Edinburgh Architectural Association.  
The Glasgow Institute of Architects.  
The Glasgow Architectural Association.  
The Royal Institute of Architects of Ireland.  
The Auckland Institute of Architects (N.Z.).  
The Sydney Institute of Architects (N.S.W.).  
Besides the foregoing, the Royal Institute is in communication with other Bodies, not exclusively architectural, viz.:—  
The Berkshire Archeological and Architectural Society.  
The Essex Archeological Society.  
The Exeter Diocesan Architectural Society.  
The Lincoln Diocesan Society, &c.  
The Surrey Archeological Society.

\* We have been requested to make it clearly understood that this Report has not as yet received the sanction of the Council of the Institute; it is, so far, merely a Report for their consideration.—Ed.

\* Marked with an asterisk are the names of members who were nominated by societies as their representatives respectively.

The Sussex Archeological Society.  
The Yorkshire Archeological and Topographical Society.

The Glasgow Philosophical Society (Architectural Section).  
The Historical and Archeological Association of Ireland.

The "Journal of Proceedings" and the "Transactions" of the Royal Institute are furnished periodically, free of any cost, to each of the above-mentioned bodies, and its reports or other papers of general interest which may be forwarded by them to the Royal Institute are printed in the "Journal of Proceedings."

Examinations of candidates desiring to qualify for the Associateship of the Royal Institute have been held by the Glasgow Institute of Architects in 1884, the Manchester Society of Architects in 1885, and the Leeds and Yorkshire Architectural Society in 1886; and the Board of Examiners at each of these Examinations has been composed of members of the respective societies, who were also Fellows of the Royal Institute. All candidates who successfully passed those Examinations were thereby qualified to apply for the Associateship of the Royal Institute.

As a more recent instance of united effort may be cited the fact that the Conference (1887) General Committee, now sitting, is composed of the President and other representatives of twelve non-metropolitan Societies, some of whom are not members of the Royal Institute, with eighteen other members, six of whom were nominated by the Council, and twelve by the four Standing Committees, respectively, of the Royal Institute.

(2) With reference to the *Consideration of the question of Federation generally*—the Committee received a large amount of information and discussion on the proposition, made from all quarters, that the Royal Institute should be, as the best fitted for the purpose, the centre of any federation of the members of the profession within the British Empire; and the object of federation being to establish a closer connexion than now exists between architects generally throughout the British Empire, with a view to promoting the advancement of their art, harmony of practice, and intercommunication, the Committee recommend:—

1. That this object may be best attained by connecting the various local Societies which exist, or which may hereafter be formed, with the Royal Institute of British Architects.

2. That as the Royal Institute is the recognised representative body of the profession throughout the Empire, its prestige and advantages of membership of the Royal Institute shall not be obtainable by any person in any way short of actual membership.

3. That for the purpose of making known in country districts the advantages of professional union, and in order that Societies may be formed where they do not now exist, with a view to federation, the Council of the Royal Institute shall organise visits to such localities as may be deemed expedient.

4. That, with the object of bringing provincial architects more in direct association with the Royal Institute, the Council be requested to arrange that, in future, Conferences be held sometimes in London and sometimes in the provinces.

5. That, in the case of any candidate for membership of the Royal Institute not being personally acquainted with the number of Fellows required by the By-laws to propose him, power shall be given to the Council, if satisfied with his qualifications, to nominate him by special resolution.

6. That the subscription for provincial or colonial members in each class of the Royal Institute shall be the same as that for metropolitan members, less the amount paid by the former to any local Society federated with the Royal Institute, but in no event less than three-fourths of that paid by metropolitan members.

7. That, in any arrangement to be made, the federated societies may retain their identity and name, and shall still, as now, form local centres; and that they may style themselves the "..... Society, federated with the Royal Institute of British Architects."

8. That the constitutional rules or by-laws of federated Societies shall be subject to the approval of the Royal Institute.

9. That the Royal Institute shall not interfere in the management of any federated Society, and *vice versa*.

10. That the Royal Institute shall not be responsible for any acts, expenses, or other liabilities, which may be done or incurred by any federated Society, and *vice versa*.

11. That each federated Society shall adopt the "Schedule of Professional Practice and Charges of Architects" sanctioned by the Royal Institute as the custom of the profession, and may, so far as may not be inconsistent with the spirit of such Schedule, arrange specific terms for the guidance of its own members.

12. That the President of any federated Society which numbers twenty-five members in independent practice (provided that such President be a Fellow of the Royal Institute) shall, during his term of office, be *ex officio* a Member of Council of the Royal Institute.

13. That the Architectural Association of London

Edinburgh Municipal Buildings: Design by Messrs. Hay & Henderson.—Plan at High-street Level.

shall be always represented on the Council of the Royal Institute.

14. That the federated Societies be encouraged by the Royal Institute to afford every practicable assistance to students in their preparation for the Examination in Architecture, and with that view to form libraries of books of reference in accordance with the list issued by the Royal Institute.

15. That local Examinations in Architecture, to qualify for candidature as Associate of the Royal Institute, shall be held, under the control of the Royal Institute, at the instance of any federated Society, or group of such Societies, which shall bring together a minimum of . . . applicants for such examination.

16. That professional members of all federated Societies, although not members of the Royal Institute, and residing not less than twenty-five miles from London, shall, on showing their cards, have the privilege of attending meetings and using the library of the Royal Institute during a stay in London for a period not exceeding one month.

17. That the federated Societies shall transmit to the Royal Institute information affecting the profession generally, together with short reports of the proceedings of such Societies, which may, if considered desirable, be published in the "Journal of Proceedings."

18. That, as a means of intercommunication, professional notes and remarks shall be published (referring to papers read at the Royal Institute, or to other subjects of interest) in the "Journal of Proceedings," which may be communicated by members and others.

The Committee also recommend, as a means of furthering the interests of the Royal Institute in particular and of the profession generally:—

19. That the Royal Institute shall give its opinion publicly, to the effect:—

(a) That the taking out of "quantities" is no part of an architect's duty to his client as an architect.

(b) That there is no reason which should debar an architect from practising as a quantity-

surveyor, should he think proper to do so, and from receiving payment for such services.

(c) That when an architect acts both as architect and as quantity-surveyor for the same building, he should act in the latter capacity only with the previously-expressed concurrence of his client, who should also be informed in what way the charges for the "quantities" are to be paid.

20. That the foregoing paragraphs, (a), (b), and (c), shall be incorporated in the "Schedule of Professional Practice and Charges of Architects," sanctioned by the Royal Institute; and that the Royal Institute shall draft rules for the guidance of those of its members who practise as quantity-surveyors.

They further invite the consideration of the following:—

A. That the Royal Institute shall issue certificates under its seal to all and every of its members who are in practice, which certificates the Royal Institute suggests shall be exhibited by the members in their offices as evidence to the public of the holder's efficiency and assumed responsibility, and that the certificates shall be the property of the Royal Institute, liable to be revoked, and to be recalled, if considered advisable, by the Council.

B. That the use in the Royal Institute, for certain purposes, of voting-papers transmissible by post, and the extension of the Associates' privileges provided for in the Supplemental Charter, will tend largely to the expansion of the Royal Institute itself, and greatly aid the objects of federation.

The large question of compulsory registration is not within the scope of the Reference to the Committee, but they desire to point out that, should the proposals they have made be adopted, there will have been established a better organisation than now exists for eliciting the opinions of the profession generally on that important subject.

The Committee also feel that the following suggestion, made by Mr. Hickman, does not come within the scope of the Reference to the Committee: "That the employment of an architect to prepare

quantities for works under his own superintendence, or the concurrence of the client in the appointment by the architect of a quantity-surveyor, will give the quantities so prepared the same position in the contract as that of the drawings and specification."

**Illustrations.**

**EDINBURGH MUNICIPAL BUILDING COMPETITION.**

**W**E give this week the Cockburn-street front of the design submitted by Messrs. Hay & Henderson in this competition. The authors have realised that the main effect of the building would be attainable on the Cockburn-street side, owing to the great height available there from the fall of the ground; and they may be congratulated on having made a fine and impressive treatment of this front. A plan of one of the floors is added.

**MEMORIAL CHAPEL, EPWORTH.**

THESE buildings are intended as a Methodist memorial to John and Charles Wesley at their birthplace, Epworth, Lincolnshire; and the committee is a representative one from various

Courtyard of the Castle  
Limburg on the Lahn

towns in the North. The scheme altogether is to cost about 5,000*l*.

The plans were selected in a competition limited to ten architects experienced in chapel-building, and those of Mr. James Hicks, of Redruth, were adopted. The contractor is Mr. Kelsey, of Epworth.

#### STATUE OF ROUSSEAU, TO BE ERECTED IN PARIS.

This statue, of which we give an illustration, and which has recently been completed, is the work of a conscientious artist, M. Berthet, from whom it had been commissioned in 1855, after a public competition, in which his design was selected.

The competition was organised by a committee, which intended to offer the work to the City of Paris, after having it cast in bronze; but where the bronze will ultimately be placed has not been decided. The general idea is that it should be placed on the Quai Conti, near the left wing of the Palais de l'Institut, in such a position as to form a pendant to the statue of Voltaire, erected two years ago on the Quai Malaquais.

#### ESTATE BUILDINGS AND STABLES AT CLIPSHAM HALL, RUTLAND.

The buildings illustrated this week were erected some little time since upon the estate of Mr. Davenport-Handley, at Clipsham. The stone used for the walling and dressings was quarried on the estate. The roofs are covered with Collyweston slates, a local stone slating. The plans require no detailed explanation. Messrs. Halliday, of Greetham, carried out the work in a substantial manner; Messrs. Mnsgrave, of Bond-street, and Messrs. Wilkinson, of Great George-street, taking subsidiary contracts. The total cost, including fittings, was 14,370*l*. Mr. Arthur Young was the architect.

The ground plan is given on page 619.

#### TWO GERMAN CASTLES.

Two views given in this number of the castles at Elz and at Limburg-on-the-Lahn, are reproduced from water-colour sketches by Mr. Millard, to whom we are also indebted for the accompanying view of the courtyard of the

Limburg Castle, and of some of the details. They form examples of the kind of "picturesque architecture" referred to in another column. Schloss Elz is one of the few feudal castles remaining much as it existed in the Middle Ages: a group of gables and turrets irregularly piled together, and inclosing an interior as devoid of

Details from Castle, Limburg-on-the-Lahn.

rule or regularity as the exterior. To us of the present day it is a bit of "the picturesque"; to those who built and lived in it, it was no doubt a convenient abode full of the latest improvements, and suited to their way of living. So the world changes, and domestic architecture with it: not for the better in every sense, perhaps.

#### STAINED GLASS DESIGN: THE TRANSFIGURATION.

This window was made for, and fixed in, the east window of St. Mary's Church, Lucan, co. Dublin, by Mr. Wm. Moran, in memory of his first wife. It represents the Transfiguration, and was designed and executed at the Royal Stained Glass Works, Windsor.

**Church Lighting and Fittings.**—The church at Sawrey Infra, Sawrey, Windermere, has just been lighted up by five coronas, fitted with the Hesperus lamp, the patentees and manufacturers of which are Messrs. Jones & Willis, of Birmingham. A brass eagle lectern has also been manufactured by the same firm for Fakenham Church, Norfolk.

#### THE FOUNDATIONS OF THE FORTH BRIDGE.\*

I HAVE undertaken to read before you a paper on the Forth Bridge. It is a work with which I was intimately connected for upwards of three years; otherwise, considering that papers on this subject by Mr. Baker, Membr. of Council Inst. C.E., by Mr. A. Biggard, and by Messrs. Fitzmaurice and Moir, Students Inst. C.E., have already been read, I should not have dared to approach it, and, as it is, it is scarcely possible for me to avoid touching matter which has been admirably dealt with by others; therefore, if I should repeat what has appeared in the pages of the Proceedings of the Institution of Civil Engineers, or in one or another of the engineering newspapers, I must trust to your indulgence.

You are no doubt aware that the position of the Forth Bridge is a singular one. The Forth of Forth, which is some three miles wide above and below, narrows at the site of the bridge to a width of about 5,800 ft., or rather more than a mile, and at a distance of some 1,700 ft. from the north shore is situated the island of Inch Garvie, an upheaval of whinstone rock, about 1,000 ft. long by 200 ft. wide at the widest part, and having sides sloping steeply in all directions. The piers of the bridge rest on the extreme western point of the island, and the foundations of the northern piers are covered even at low water, while those of the southern piers are situated in from 46 ft. to 62 ft. of water at low tide.

On each side of the island, that is to say, in the northern and southern channels, the depth of water is some 200 ft., and the slopes are very steep; but from the southern shore the ground falls gradually, there being only 8 ft. of water 1,300 ft. from the shore, and 36 ft. at 2,000 ft. from the same place, at low tide.

This being the case, it would be next to impossible to build a bridge at any other point, but in this situation equal spans of 1,700 ft. can be obtained bridging the two deep channels, while by the use of the cantilever the remaining portion of comparatively deep water, varying as above mentioned from 36 ft. to 8 ft. in depth

\* A paper read by Mr. R. E. Middleton, M. Inst. C.E., M.I.M.E., on the 13th inst., before the Civil and Mechanical Engineers' Society.

[The text in this section is extremely faint and illegible. It appears to be several paragraphs of text, but the characters are too light to be read accurately.]

ESTATE BUILDINGS AND STABLES, CLIPSHAM HALL, RUTLAND.—MR. ARTHUR YOUNG, ARCHITECT.

Ground Plan.  
Estate Buildings and Stables, Oliphant Hall, Rutland. (See p. 602.)

at low water, is compassed, and short spans of 168 ft. each can be used for the rest of the distance.

The level of the ground on each side of the Firth is high, and the level of the rails, although this is 167 ft. 9 in. above O. D. in order to allow full-rigged vessels to pass under the bridge, runs into cutting on both sides of the Firth almost immediately on leaving the viaduct.

The dimensions of the cutwater piers for the viaduct spans are, at a level of 21'66 ft. above O. D., 46 ft. 6 in. by 17 ft. In plan they have parallel sides with semicircular ends, and in section the sides and ends have a batter at the rate of 1 in 10.

The construction is an average thickness of rock-faced Aberdeen granite of 1 ft. 10 in., built in some cases header and stretcher alternately in the same course, and in others the coursing is header and stretcher in alternate courses. The interior is filled in with Portland cement concrete made in the proportion of about 8 to 1 on the average. At about every 9 ft. vertically is a bond course of two thicknesses of through stones, whinstone or freestone, each thickness being 1 ft. 6 in.

Above the level of 21'66 there is a necking of dressed granite 1 ft. 8 in. deep, and above this a heavy capping, also of dressed granite, from which the above water piers start at a level of 27 ft. above O. D. The dimensions of these piers are at this level 36 ft. by 15 ft., at a level of 67 ft. above O. D. 29 ft. 6 in. by 12 ft. 6 in., and at 139 ft. above O. D. 25 ft. by 8 ft., the ends having a batter of 1 in 32 throughout, while the sides between the levels of 27 ft. and 67 ft. have a radius of 320 ft., the portion above 67 ft. hattering at the rate of 1 in 32.

Above the level of 139 ft. is a necking and capping of dressed granite, and just free of this the viaduct girders are placed, the road being carried on the tops of the girders and cross girders.

The cantilever piers which carry the ends of the main cantilevers, and by their weight help to support the load of the central girders of 350 ft. span, are of very much larger dimensions than the viaduct piers, being 77 ft. 10 in. long by

45 ft. wide at a level of 21'66 ft. above O. D., but in other respects they are similar, the cutwater pier having a batter of 1 in 10, the sides between 27 ft. and 67 ft. above O. D. having a radius of 320 ft., and the ends and all the portion above 67 ft. up to rail level having a batter of one in thirty-two. These piers are, however, built hollow, with cross walls 6 ft. thick, and the hearing is of rubble, not concrete.

The form of the piers which support the main cantilevers is circular in plan, 49 ft. in diameter at a level of 21'66 above O. D., with the exception of the two northern piers, which are 45 ft. in diameter at the same level, the sides hatter 1 in 10, the rock-faced granite has an average thickness of 1 ft. 10 in., and the hearing is of rubble, the upper portion being filled in with rubble of Arbroath stone, which is a very flat-headed, hard freestone, or with strong brickwork.

The top level in the most northerly and most southerly piers is 27 ft. in the others it is 26'80 ft. above O. D., the difference being made up by extra thickness in the bed-plates of the piers built to the lower level.

There are forty-eight bolts of steel 2½ in. in diameter and 24 ft. long anchored at their lower ends with cast-iron anchor plates and built into the masonry, which are intended to secure the hauses of the cantilevers, and round each bolt, with its top level with the top of the pier, is placed a cast-iron washer about 14 in. square by 4 in. thick; these washers are set dead level and a bed of neat cement is laid 1 in. thick to the level of the tops of the washers, and on this bed and on the washers the lower bed-plate rests.

In each washer is a vertical slot, and into this is inserted a small segment of a nut fitting into the thread of the bolt, and this prevents any possibility of the bolt turning round.

The placing of the bolts and washers in their true position was a troublesome and delicate piece of work, and was done by setting a templatia representing the lower bed-plate, at or near the height which the bed-plate would occupy, supported on timber runners which

were carried by whole timbers, fixed sometimes to the staging, sometimes to the caisson which surrounded the pier. This templatia was set in place to 1-16th in. with the theodolite, and its position repeatedly checked.

Unfortunately when the pier was within about 6 ft. of completion it was necessary to remove the templatia so that the masons might get at their work, and consequently large stones constantly came in contact with the bolts and knocked them out of place, and this caused considerable trouble in bringing the bolts into their true position to fit the bed-plate, in which there was only 1-8th in. play round the bolts and which it was necessary to set with great exactitude.

The foundation of pier No. 1 is situated in hard boulder clay, that of No. 2 in sandstone rock, both above high-water mark; those of piers Nos. 3 to 6 are made in sandstone rock, below the level of high water; those of piers Nos. 7 to 9 and the south cantilever pier in boulder clay—all the foundations from No. 6 northwards being below low-water level.

The foundations of piers Nos. 3 and 4 were laid between tides without any dams, of Nos. 5 and 6 with half-tide dams, and of Nos. 7, 8, and 9 with whole-tide dams. The foundation of the south cantilever pier was also protected by a whole tide dam during construction.

The viaduct piers on the north side of the Firth, Nos. 10, 11, and 12, are all founded on the whinstone rock, as is also the north cantilever pier; pier No. 13 is founded on sandstone. All these piers, with the exception of Nos. 12 and 13, are founded above high-water level.

The piers which support the main cantilevers are four in number for each cantilever, and are circular in plan, 49 ft. in diameter at 21'66 ft. above, and 54 ft. 11 in. in diameter at 8 ft. below O. D. Beginning with the four southern or Queensferry piers, the foundations of which are in the boulder clay, the caissons on which they rest are 60 ft. in diameter at the top, 68 ft. in diameter 18 ft. lower, and 70 ft. in diameter at the bottom or cutting edge. The caissons are constructed of iron, 3-8ths in. and 5-16ths in. thick. There is an inner skin of iron, about 55 ft. in diameter, which is braced to the

outer skin by plate and angle iron vertical bracing. The floor is placed 7 ft. above the cutting edge, and is carried right through to the outer skin, holes being left in the annular portion through which concrete can be filled into the shoe. The inner skin is at this level produced outwards to meet the outer skin at the cutting edge. The floor is supported by four main lattice girders, 13 ft. deep, and by plate cross girders, 3 ft. deep.

The upper edge of the caisson is fitted with a horizontal plate attached to it, and to the vertical bracing by means of angle irons, and to this plate are attached the segments of the temporary caisson, numbering fourteen for each lift of 10 ft., this caisson being used to protect the portion of the pier above low water during construction, and is further attached to the permanent caisson by means of outside bolts and shackles hooked into angle-iron lugs, riveted to the latter, so that the whole of the inside bolts might be removed without endangering the lightness of the caisson.

The whole of the permanent caissons were built to within about 12 ft. of the top on ways constructed for the purpose on the south side of the Forth, and were launched in the ordinary manner from these ways. When launched, the draught of water was about 10 ft., the weight of the caisson being about 400 tons.

Within the circumference of the caisson, in positions triangular in plan, were placed three tubes of boiler plate, built in lengths of about 10 ft., with flange joints, and 3 ft. 6 in. in diameter; these tubes were connected firmly to the floor-plates, in which were provided holes of similar diameter, each closed in the under side by means of a balanced flap-door.

These tubes were provided for the entrance and exit of the men employed to excavate the foundations, and for the tubs to remove the material so excavated; and in the tube used for the ingress and egress of the men were placed vertical wrought-iron ladders, one on each side of the tube.

On the top of each tube was placed an air-lock, the top of the air-lock being about level with the top of the temporary caisson, or 3 ft. above high water, when the caisson was at its lowest level.

Two of the air-locks were arranged for the ingress and egress of the tubs used for the removal of the material excavated, and one was made for the use of the workmen.

The shape of each air-lock was circular in plan, and the doors of the tub-locks were horizontal, sliding in grooves and fitted with a packing of india-rubber on one face, and actuated by a ram. The diameter of these locks was 3 ft. 6 in., and the total height, 6 ft.

The man-locks were 7 ft. in diameter outside, and were annular in plan, and had four doors working vertically on hinges and fitted with india-rubber packing. The annular space was divided into two, so that one pair of doors could be used for ingress and the other for exit at the same time. The area of one-half of the annular space would be about 15 ft., and this space has contained eleven men.

The handles actuating the machinery for opening and closing the doors of the tub-locks were interlocked, so that only one door could be opened at a time, but owing to faulty construction the locking was not always effectual, as unless pressure was maintained on the ram which closed the upper door, when the pressure of air in the locks was low this door fell from the upper face, there was a great leakage of air and the door could be easily moved outwards, and this was only prevented by a small locking bolt, which was designed to engage with the ram actuating the door and prevent it from moving. Should this bolt get worn or it be possible to force it up, then a comparatively small force would open the door, and this small force was found in the arrangement of the lifting gear for the tubs. The winding drum being on the same side of the lock as the opening and closing gear, and the rope being led through a pulley attached to the centre of the top door, exerted a considerable pull on this door whenever the rope was loaded.

The door was forced open in this manner on one occasion, the lock was very seriously damaged, and the air escaped from the caisson, which then became filled with vapour, the lights were extinguished, and the men had great difficulty in finding their way to the ladders; fortunately the excavation was in very hard clay, therefore the caisson only sank very slightly when the pressure of air was

removed, and no injury was done to the men or to anything but to the lock itself.

The air was admitted to or expelled from the tub-locks by means of a large valve, manipulated by the man in charge of the machinery for opening and closing the doors and lifting and lowering the tubs, and only a fractional part of a minute was occupied in the admission of the air to the lock or its expulsion from it. Such an arrangement could not be applicable to the man-lock, where very rapid increase or decrease of pressure would certainly be very injurious, and might be fatal to the occupants, and a small valve was, therefore, provided which could be regulated from the interior of the lock. The time occupied in the lock was usually from ten to twenty minutes, according to the working pressure at the time.

It was most important that the pressure should be increased or diminished as gradually as possible, and the longer the time occupied in the lock the less danger there was of any unpleasant consequences resulting from having been under pressure, as it was necessary on entering that the whole body should be permeated by the increased pressure of air and on leaving that the air at high pressure should be removed from the body, and in some cases the unpleasant effects did not come into action until one or two hours after leaving the lock, at others they were non-existent, while again cases of partial paralysis occurred immediately on leaving the lock, accompanied by violent pains in the limbs, such pains being generally removed after a time by the use of the electric current, and the paralysis reduced in the same way. Although the depth of the cutting edge of one of these caissons was 91 ft. below high water, representing a pressure due to head of about 30 lb. per square inch, the maximum pressure used in the sinking of the Queensferry caissons was 25 lb. per square inch, as the clay through which the caissons were sunk prevented the passage of air and also afforded sufficient frictional resistance to prevent the caisson sinking until the air pressure was lowered to a very considerable extent; the highest pressures were used while the caissons were passing through soft mud, and were often reduced in ordinary working to 10 lb. at the lowest depths, and to 2½ lb. when the caisson was lowered, which was done when sufficient material had been excavated.

With 25 lb. per square inch of pressure in the caisson the lifting force would be 6,239 tons; it was, therefore, necessary to have a greater weight of concrete and iron in the caisson to counterbalance this, and to enable the caisson to overcome the frictional resistance when the pressure was reduced.

While passing through soft mud it was necessary that the weight of and in the caisson should be decidedly in preponderance; when the hard clay was entered the surface friction tended greatly to resist rising, and the excess of downward pressure was not so essential.

The greatest pressure of air used was about 35 lb. per square inch.

The means employed for removing the soft mud, in many places 10 ft. deep, which overlaid the hard clay was pneumatic, the mud being forced out of the caisson by the pressure of the air inside it.

Cast-iron pipes about 5 in. in diameter were introduced between the two skins of the caisson, having openings to the external atmosphere at different levels and connecting with the working-chamber of the caisson. To the lower ends of these pipes were attached flexible tubes fitted with valves. The end of one of these tubes was introduced into the portion of mud to be removed which had previously been mixed with water, supplied either from an accumulator or a stand-pipe, and rendered as soft as possible. The valve was opened and the pressure of the air in the caisson immediately forced the soft mud through the pipes to the nearest opening and into the external atmosphere, and this continued so long as there was mud of a consistency thin enough to pass through the tubes.

Soon after the soft mud was passed through bands of sand, shells, and, lastly, boulders were found, before the hard compact black clay which formed the final foundation was reached. This clay was so solid that the pick made little impression on it, and the work of excavation promised to be long and tedious; an hydraulic spade was, however, designed by Mr. William Arrol, one of the contractors, which expedited the work amazingly, and which was most simple

in construction and use. It consisted simply of a brass cylinder in which worked a piston and rod, fitted with a spade end; the cylinder was, of course, provided with suitable valves for admitting and discharging the water, and which were worked by hand. The spade was placed in a suitable position, the end of the cylinder abutting against the roof of the working-chamber, and water being admitted, forced the spade into the clay; the water being exhausted and the cylinder lowered, the latter could be used as a handle or lever, and a portion of the clay removed.

Hydraulic pipes were required in the caisson in any case to provide water for mixing up the soft mud, so that no extra expense was required on this account.

The power of compressing the air was supplied by direct-acting air-compressors, fitted, however, with rotative motion and fly-wheels, in order to maintain an even rate of pumping and a regular pressure on the gauges, and provided with spray-pumps for supplying the necessary amount of moisture to the air. The boilers used were of the locomotive type, and the whole plant was supplied by Messrs. Fawcett & Preston, of Liverpool.

In case of a caisson getting somewhat out of place, the course pursued was to lower the side to which the cylinder tended, thus bringing the caisson out of the vertical, and then to excavate well under the other side, and bring the cutting-edge into a horizontal position again, and so repeat this operation until the desired effect had been produced, or until the caisson was at its final level.

This plan was effectual so long as there was a good depth of hard material on the side to which the caisson tended to move, and not a much greater depth of hard material on the other side; but if that was not the case, what was gained when the caisson was canted was lost again when it was brought back to a vertical position.

When the caisson reached the final level, that is to say, when the top of the permanent caisson was 8 ft. below O. D., the space between the floor of the caisson, or roof of the working chamber, and the clay excavated,—a space generally about 5 ft. in height, but of irregular section,—had to be filled in with concrete before the air-pressure could be removed. This was effected by filling three small wrought-iron tubes, 18 in. in diameter, and provided with doors top and bottom, with concrete; the top door then being closed, and air under pressure admitted to the tube, the bottom door could be opened and the concrete discharged into the working chamber. The concrete when delivered was first placed round the cutting-edge and up the slope of the roof, those parts where the ground was least hard, or towards which the caisson tended to cant being secured first, and well rammed with wooden rammers. If it was desired to regulate the level of the caisson at all, these places were secured as described, and the pressure lowered where the weight of the caisson cut into the ground not concreted. The whole of the circumference having been concreted, the work proceeded towards the centre, concluding at the main tube, the whole being well rammed against the roof; the openings were sealed and the tubes of all sorts above the floor were removed, then the air-pressure being withdrawn, after the concrete had had a sufficient time for setting, the weight of the caisson and its contents rested on its final foundation. The concrete was allowed a further short time to solidify, and then the work of filling such part of the caisson as was not already full of concrete was proceeded with up to a level of 9 ft. below O. D., where the granite pier commenced.

The southern Inchgarvie piers were similarly founded in caissons of wrought-iron, filled with concrete, but as the foundations were rock, the full pressure due to the head of water had to be maintained; this was at the greatest 82 ft., equal to a pressure of 35.5 lb. per square inch.

As the rock was very sloping, there being a difference of level of 20 ft. in a distance of 23 yards in the steepest part, and the general slope did not vary much from this rate of inclination, it was necessary to make provision for the maintenance of the caisson in a vertical position during such time as it took to excavate and remove the rock. For this purpose a large raft 70 ft. in diameter, which was originally made for the purpose of taking accurate soundings from which the contour of the rock might be plotted, was moored in the position to be occupied by the caisson, and from it were

lowered bags of sand to form a breakwater and resting place, and in two positions in the circumference of the raft bags of concrete were laid, which, with a resting-place of rock, formed three points of support for the caisson. As the rock was excavated so were the pillars of concrete reduced until a level surface was secured over the greater part of the area, the remaining portion being slipped and an iron apron provided fitting closely to the contour of the rock and attached to the cutting-edge of the caisson.

It will, of course, be understood that the concrete pillars would not have withstood the weight of the caisson and its contents without the counterbalancing effect of the air pressure under the floor.

The level of the rock at the site of the northern Inchgarvie caissons was in no case lower than 10 ft. below O. D.; therefore, it was possible to excavate, by blasting at low water of spring tides, a trench sufficiently large to receive a caisson 3 ft. deep, to which, when the annular space had been packed with clay and concrete bags and rendered fairly water-tight, the temporary caisson could be bolted; the rest of the rock was then slipped off and the pier constructed.

The two northern Fife piers were founded altogether above low-water mark, and in the case of the eastern pier above high-water mark.

The southern Fife piers were situated on very sidelong ground, and it was necessary to remove a large quantity of rock before the foundation could be laid, and it was decided to do this by blasting, the holes being bored by means of the diamond drill. For this purpose, over the site of each pier were erected three girders laid parallel to the centre line of the bridge and about 35 ft. between the centres, the length of each girder being about 30 ft., sufficient to span the whole diameter of the caisson and a space of some 3 ft. all round it, say 68 ft. diameter. On the girders were laid rails and a traversing platform carrying a gallow constructed of angle irons, from which were suspended four diamond drills, placed about 4 ft. between the centres and driven direct by Willans' three-cylinder engines, one to each drill. Each drill worked inside a tube extending from above the platform to the rock, and down this tube the explosive cartridge, charged as a rule with tonite, was introduced. The charges were fired with a good head of water over them.

The shots were drilled from the front of the sloping rock and fired in batches of four until the whole space to be levelled had been gone over, the intention being to reduce the interior to one level with a trench some 2 ft. or 3 ft. deeper and about 5 ft. wide running round the central portion.

The blasting was not very successful. The stone is at best much fissured, and the force of the explosion was often dissipated through the cracks, and as the drilling and firing was continued without intermission the debris was not removed. It, therefore, became firmly cemented with sand and mud, and its amount prevented the shots fired behind it from taking full effect; thus when the time came for the removal of the material it was exceedingly difficult of detachment, and the uniform level required could not be obtained without further blasting.

Another difficulty met with was that, though it was believed that a fairly accurate contour of the rock had been taken, this was not the case, the portion below low water being filled in with large boulders, which had been accepted as rock, and the solid rock was met with on the seaward side at a considerably lower level than was expected, extending in the eastern pier to 10 ft. below the contour taken. This, of course, necessitated a large amount of extra labour, and whereas it had been expected that a small caisson not much deeper than those used for the northern Inchgarvie piers would be sufficient for the purpose, it was found necessary to construct a dam for each pier, and as there was little or no mud for the piles to be driven into, and they were really secured to a large extent between boulders, great difficulty was experienced in making the dams sufficiently strong and tight. Indeed, in the eastern pier, where a timber exterior with iron interior dam was used this desideratum was never secured, and in order to be able to get in the foundations a sump was cut in the rock to a depth of about 10 ft., reaching below the lowest level of the rock touched by the dam; pipes were laid from the strongest leaks to the sump, from which

two centrifugal pumps of 12-in. and 9-in. diameter drew the water. The laying of the foundation was then proceeded with up to a somewhat higher level than the top of the sump, the pipes were plugged and the sump built up so far as practicable, vertical pipes were led up from the sump and the position of the strongest leak to above high water level, and when the masonry was somewhat further advanced cisterns were constructed at the heads of these pipes, and were filled with grout of neat cement, which when mixed was allowed to pass down the pipes to fill any spaces which might exist. About 35 tons of cement were used for this purpose.

As many of you may be aware, an unfortunate accident happened to the north-west Queensferry caisson, which delayed the completion of the pier by twelve months.

The caisson had been floated into its place, and additional plates were being added to it in position in the usual way, while concrete was also added internally to weight the caisson down, so that it should sink sufficiently to touch the ground, it being very desirable that this should be done as soon as possible, as if heavy weather came on while it was fully afloat it might do serious damage to the stage. At this time the New Year's holidays intervened, and the works were idle for three days; the caisson had been left with a rather small margin of flotation at the internal tubes, and the weather becoming somewhat stormy, a certain amount of leakage took place into the caisson, which set it down still further in the water, and finally caused the caisson to sink at its moorings. This would have been of no great consequence if the slits had been of large size and had been immediately opened, but this not being the case, when the tide fell the great weight of water in the caisson added to the weight of the caisson itself, and some 3,000 tons of concrete in it, in all about 4,700 tons, forced the caisson into the mud, and the ground, having at this part a slope of 1 in 6, it at the same time slid down the incline for a distance of 30 ft., until about half of it was submerged at low water, and it lay perpendicularly to the slope of the ground, or at a slope of 1 in 6.

Probably, if it had been possible to turn the caisson over into deep water and sacrifice it altogether, this would have been the course pursued, but the difficulty was to do it: the caisson was so situated that without its removal another caisson could not be placed in the required position, therefore it was decided to lift it, and immediate steps were taken to effect this purpose, and to bring it back into its proper place.

Thick plates were built up on the lower side to raise the skin above the level of high-water, and at the same time the interior was strutted with timber to prevent the skin collapsing. It may naturally be supposed that, as the caisson would, in the ordinary course of erection, have to withstand an even greater head of water than would press on it if pumped out under present conditions, it ought to do the same under existing circumstances, but many reasons combined to render this view fallacious. In the first place, the interior skin had not been built up to its full height, and this greatly reduced the power of resistance of the outer skin; secondly, as concrete was constantly being added to the caissons as they sank, to counterbalance the increased upward pressure of the air, and this was added to the annular space between the skins at a greater rate than to the interior, it helped to support the outer skin; lastly, as the caisson was canted over with a slope of 1 in 6, the line of pressure of the water exerted its force, not on a cylindrical, but on an elliptical body.

As the greater portion of the strutting had necessarily to be done under water, and very muddy water, by divers, and as the shape of the caisson was constantly altering with the set of the water produced by the rise and fall of the tide, it was most difficult to obtain a firm bearing for the struts; indeed, it may safely be said that this requirement was never thoroughly secured throughout, as when the caisson was pumped out rather lower than usual and the tide rose rapidly, a portion of the seaward side, some 50 ft. by 18 ft., collapsed, and the whole work had to be commenced *de novo*, and on an entirely different plan, as the plates were rent to such an extent that it was quite impossible to make any new attachments to them.

The new plan was to enclose the caisson in a dam, the piles being whole timbers with a V-

shaped groove on one side and a corresponding projection on the other; packings of felt or cloth were nailed into the lower extremities of the timbers, where they would rest against the caisson, and tarred felt was placed between each pair of timbers, and in some places pieces of canvas were nailed on outside, and this was continued until a barrel of timber was formed round the caisson. This when completed was hooped round with iron about 6 in. by 1 in. in three places.

Internally, two wrought-iron circular plate girders were inserted to support the skin at different levels, and these were again strutted from each other and from the concrete in the caisson. Timber strutting was also inserted between the heads of the piles and at other levels in the caisson. When the whole was considered to be secure, so much as possible of the mud having been removed from the southern side by means of a grab, air was admitted under the floor of the caisson, and the water lowered somewhat inside the caisson by the use of centrifugal pumps; leaks were made good, and the water was further lowered, and so on. The position of the caisson was in the meantime carefully measured and observed, and any movement noticed. The movement was for several days very slight and uncertain, amounting at the most to a few inches; then there was a movement towards righting of a couple of feet or so; and finally, one Sunday morning, the caisson suddenly lifted considerably, and floated, and within two days it was back in its place, and secured by chains and hawsers provided for the purpose. So large a portion of the caisson having been damaged or destroyed, it was found necessary to build a brick caisson inside the outer skin, reaching from the concrete already deposited in the annular space to the top of the permanent caisson; the brickwork varied in thickness from about 6 ft. 6 in. at the bottom, and the weakest portion of the caisson, to 2 ft. 2 in. at the top. This wall having been completed, and the large amount of mud and dirt collected in the caisson removed, concreting was proceeded with, the caisson sunk, and the pier built. With the completion of this pier the construction of the foundations ended.

In dealing with this subject, I have been obliged to restrict my remarks solely to foundations, or I should have altogether overstepped the limits of your patience, and as it is I have found it necessary to enter very little into the details of the work, on which a considerable volume might easily be written.

**A Railway Building Feat.**—If everything goes well, the Manitoba Railway Company will accomplish the greatest feat in railway construction in 1887 ever attained, even in the United States, the electric light being called in to enable the contractors to push on the work without interruption. It is proposed to build 580 miles from the western end of the Manitoba road to Great Falls, Montana, and 90 miles from Great Falls to Helena. This extraordinary step, it appears, is rendered necessary because of the delay caused by negotiations with the Northern Pacific Railroad. This latter road, which was the only one that could transport the steel rails to the other end of the proposed route, so as to enable the Manitoba Company to build from both ends at the same time, placed such a heavy freight-rate upon the carriage of the rails that it amounted to a prohibition. The contract has now been let for the whole work, which stipulates that it shall be completed on or before November 23rd next. In order that this may be accomplished, the services of more than 5,000 graders will be required, and in laying the rails the contractors propose to use a steam track-laying machine, and to employ three separate gangs of men, who will work eight hours each day, using electric lights at night, which, it is expected, will enable them to complete five miles per day. In this way the vast work will be done, and the Manitoba Company will have advanced its western terminus to within 750 miles of the Pacific coast. In addition to graders and track-layers, large gangs of men will be required to build bridges, culverts, water-tanks, stations, telegraph lines, &c.—Iron.\*

\* Perhaps the carrying out of this kind of "feat" in the construction of railways against time, explains why we hear of so many bad accidents on American railways.

## THE DIETZSCH KILN.

We take the following section and description from a paper recently read by Mr. C. O. Trechmann before the North of England Cement Manufacturers' Association:—

"In this kiln it has been sought to combine the principle of the cone kiln with the advantages of the circular kiln, and instead of allowing the heat to circulate through the mass, to pass the material with the aid of gravitation through a canal kept at a constant high temperature. This is achieved by dividing the vertical shaft of the former horizontally into two parts and connecting the upper with the lower by a horizontal channel, thus reproducing in a manner several chambers of the circular kiln; not in a horizontal plane, but vertically superimposed. The upper part of the lower shaft is retained at a clinkering temperature by the addition of fuel, and all superincumbent weight on the clinkering cement is obviated, thus permitting it to descend by its own weight, so soon as the decrease in volume, due to the completion of the calcining process, takes place. With this movement a disturbance of the mass ensues, and a partial cooling, together with a slightly conical form of the shaft, tends to prevent adhesion.

The Dietzsch Kiln for Cement Burning.

The annexed figure represents a double kiln, produced by simply building two kilns back to back. The individual kiln consists of three essential parts, of which the two lower ones C and D lie in a different vertical plane from the upper one A. A may be called the warming or pre-heating chamber, C the calcining chamber, and D a continuation of it, the cooling chamber. At E are doors or openings for charging A with dried slurry. The covered calcining-chamber C is connected with A by means of the arched horizontal channel B, and the cooling chamber D terminates with ordinary firebricks H through which the air to supply the whole system enters.

The finished clinker is drawn at H, and the calcining chamber C, as the central point of the system, is the one where the main operation of burning is carried out, where the cement becomes soft and plastic, alters its form, and eventually welds into larger or smaller blocks, and inclines to adhere to the walls of the furnace. This part is therefore arranged in such a manner that it is accessible from all directions, by means of small openings G, for the removal when necessary of adhering lumps.

In order to put the kiln into operation A is filled with dried slurry, D with clinker, and C with alternate layers of dried stuff and coal or coke. After the fuel is fired, the heat escaping from C strikes through the dried slurry lying on B, and in A, and is almost totally absorbed, only sufficient passing through to keep up the

requisite draught in the chimney-like continuation of A. As soon as the cement is sufficiently calcined in C, a quantity of clinker is drawn at the bars, causing the whole mass in C and D to sink; thereupon fuel is introduced through the furnace doors F, and preheated slurry is, with the aid of flat shovels, turned over from B into C, the fuel and dried mass being placed in layers until C is filled again. This operation is repeated at intervals of a half or three quarters of an hour, and the burning proceeds continuously without further interruption than may be caused by the adhesion of clinker to the sides of the furnace.

It is apparent from this description that the fuel is utilised to its utmost extent, for the cold air entering at the firebars, coming into contact with the hot descending clinker, becomes gradually heated to a white heat before reaching the fuel, thus producing a combustion akin in intensity to that of the regenerative furnace. It is, however, not completed at this point, but the mixed products of combustion, which entail such an enormous loss of available heat in the ordinary kilns, here strike the dried mass lying at B, and which at this point is in a state of bright cherry redness and incipient fusion, and are completely burned.

This system of burning cement, lime, &c., therefore offers a double advantage over most previous systems: firstly, in the complete utilisation of the fuel, combined with a minimum loss of heat, since the unavoidable radiation is restricted to one part of the kiln; secondly, because the mass to be burned remains for the shortest possible time at the point of greatest heat, the critical period where over or under calcination so easily takes place."

## INFRINGEMENT OF BUILDING BY-LAWS.

## DAMP-COURSES.

MR. HENRY POTTER, contractor, of Clapton, appeared at the Berks Sessions, held at Windsor a few days ago, to answer an adjourned summons issued by the Windsor Sanitary Authority charging him with omitting to insert a proper damp course in a dwarf concrete wall supporting a brick dwelling-house, and also with failing to give notice of completion to the Surveyor to the Sanitary Authority.

The defendant pleaded guilty, but Mr. Blelock, who appeared for the defence, asked the Magistrates to have regard to the exceptional position of the defendant. The building was in the midst of a forest, and he was not aware of the existence of the Sanitary Authority. The building was now finished and handed over to the owner, who had let it on a twenty-one years' lease, and he was unable to amend the work. The damp-course was omitted by the deliberate intention of the architect, who contended that it was unnecessary.

Mr. Christopher Shiner, a London architect, was called, and gave evidence as to the state of the house, and the depth and nature of the concrete.

Mr. Tyler, the architect to the building, was called, and stated that in his opinion a damp-course was in this case unnecessary, but that the responsibility of satisfying the Surveyor to the Sanitary Authority rested with the contractor.

The owner having intimated his intention to amend the work, the Magistrates remarked that they could not consider concrete as a damp-course impervious to moisture, and fined the defendant 10*l.* and costs.

## THEORY OF ANCIENT LIGHTS.

Sir,—In the two last numbers of the *Builder* a barrister, uncramped by scientific theory, has exceedingly well pointed out the true equivalent of an ancient light when placed in a wall rebuilt either behind, or in advance of, the original wall. In Fig. 3 (see p. 559 *ante*) he shows that the light claimed for a window at *a b* would be obtained really at *c d*, and not at *e f*, and the establishment of this principle ought unquestionably to be made available for protective purposes. Its importance and value, however, are as nothing when a further factor is taken into account; a factor which has been completely lost sight of and ignored, whether by the law, or by expert evidence of alleged damage. This factor is the interception of diffused light by the nearness of the obstruction upon the line which limits the measurement of sky area. The geometric measurement, or other computation, of the obstruction of "sky area" has become the scientific principle upon which alone all such claims are based, and the almost sole basis of expert evidence, as apart from the evidence of practical inconvenience in the use of a room. And this evidence has been necessarily conflicting

in proportion as the obstruction of diffused light also has, or has not, had any real influence on the result. The ignoring of this element is a fallacy underlying the whole structure of "sky measurements." The "sky" is the great dispenser of diffused light, even when the sun is not shining. Without this we should be left in total darkness when the sun is out of sight; and it is not unnatural, therefore, to claim for the "sky area" its full significance in the measurement of such obstruction. And it will no doubt hold its own so long as the scientific facts of the origin and cause of the light which emanates from the sky area are not duly and fully recognised.

But before discussing this it is useful to say a word as to the nature and value of reflected light in our own more immediate neighbourhood. When any claim in respect of reflecting surfaces has been put forward, it has been scouted as ludicrous, impracticable, and impossible to deal with. It has been set aside on the ground that no one can control the colour which a neighbor shall please to paint or construct his reflecting surfaces. This, however, has nothing on earth to do with the question of the amount and measurement of the area of such reflecting surfaces. Unless such surfaces be made absolutely black, or absolutely white, by way of malice or of goodwill, or mutual arrangement, the colour which such surfaces may naturally assume is of very small consequence as compared with their amount. So when Mr. Powell (fig. 4) makes the line *g b* to be the sole measure as affecting the light of the window, *a b*; when he assumes that, having only the wall at *g*, no obstruction to the light of *a b* will be caused by building an intermediate wall at *n*, because it happens to come below this line, he puts out of sight altogether one of the most important elements of the case. He is quite justified in doing so under the present state of intelligence and legal ruling; but it is this which requires readjustment, and it is to be hoped that the facts here stated will receive a larger amount of study and attention than they have as yet obtained. Surely it must be evident that the space between the wall *n* and the window *a b* becomes a dark hole as compared with the space between the wall at *g* and the same window. The angles of light falling from the sky surface upon the walls themselves are reduced enormously in amount, and the walls as well as the ground are thrown into deep shadow. Take the instance of a large van when standing opposite one's window. Even if its roof comes very far below the roof-line of the opposite houses to the very bottom of the window, it casts its shadow on the ceiling and causes a very considerable obstruction of light.

A very large proportion of the light we have within our dwellings comes not directly from the sky area but from the surface of the ground, or floor, reflected on the ceiling. This may be seen from the fact that the patch of light upon the ceiling over a window is the lightest part of a room after the floor itself, and it is by reflection from the floor within and the ground without that the ceiling, and indeed the room itself, is mainly lighted. This is a fact which ought to be faced if there is to be even a semblance of legal redress in such disputed cases. Either the whole of existing expert evidence and legal rulings must be thrown to the winds, or they must be readjusted in accordance with the scientific facts.

And now as to the light emanating from the sky area. It was supposed formerly that the blue sky derived its colour from the direct rays of the sun diffusing the atmosphere with light, through which we looked at the infinite darkness beyond. This has now been found to be quite otherwise. The rays pass to the earth without interception, and it is solely the reflection from the earth itself which lights up the atmosphere, and, in fact, produces the diffused light. Diffused light results from reflection alone, reflection from the earth; and if it were not so we should be left in darkness not only when the sun is out of sight, but when he shines in his full strength. He would be to us merely a ball of fire shining through the blackest night. As it is we enjoy a very large amount of light even when he is not shining. The earth derives from the sky an enormous amount of that light which she has already contributed to the sky by reflection from her surface. So far, perhaps, this all goes to confirm the value of "sky area" as the measure of available lighting power. But equally so does it confirm the value of the measured area of the reflecting

surface upon which that light falls. And as the proportion of reflecting surface (*cæteris paribus*) varies in direct ratio with the distance of the object of observation, so it will be seen that the obstruction at *n* is so much greater than an obstruction at *p* would be, as to make all the difference between a very serious damage, and none at all.

One must be quite prepared for such a contention to be scouted as ludicrous; but so one may fairly be still more prepared to find it eventually acted upon when it shall have received due consideration from those who aim at arriving at true and practical conclusions upon this very difficult subject.

WILLIAM WHITE, F.S.A.

#### KITCHEN BOILER EXPLOSIONS AND SAFETY VALVES.

SIR.—Mr. Wiston's letter on p. 520 is a very able one, and his reply on p. 536 shows he understands the subject fully. I do not think his arguments prove that it is better to want a safety-valve than to have it, but rather that precautions should be used in fixing it. I have a safety-valve on the hot pipe from the kitchen boiler in my own house, fixed above the kitchen mantelpiece, and I think there is less danger from it to a man in the kitchen than from the boiler. This valve should only be opened occasionally by some adult person in the house, and the children could be warned it was dangerous.

As Mr. Wiston stated, no fire should be on when the water stops running at hot draw-off cock of the kitchen sink.

I think that not having a rise up in every part of the rising hot and blow-off pipe is a great cause of danger to boilers, owing to allowing freezing more easily.

W. P. BUCHAN.

#### BRISTOL v. EXETER.

SIR.—In your interesting article in the *Builder* for the 16th inst., reviewing Messrs. Freeman & Hunt's new book upon Bristol, passing reference is made to a preceding volume, by the same authors, upon Exeter, and when the early British and Saxon churches of the two cities are touched upon, we read: "another of the churches (at Bristol) as at Exeter, is called after the Early Saxon Mercian, St. Werburgh." This is a mistake: St. Werburgh's name does not occur in the Exeter volume of "Historic Towns."

In Exeter, old churches are dedicated to St. Petrock and St. David (the latter rebuilt), both British saints,—whilst the dedications to SS. Pancras, Keryans (now destroyed), Cuthbert, and Sidwell are, I presume, Saxon. But no record of a church to the honour of St. Werburgh exists.

The nearest church to Exeter dedicated to St. Werburgh is the quaint old fifteenth-century edifice perched upon the rock, in solitary stoneliness, at the mouth of the picturesque river Yealm, upon the eastern side of Plymouth Sound. This is, as the cross flies, fully six-and-thirty miles from Exeter.

Now, St. Werburgh, or Werberga, or Werburghie (as she is variously called) was the daughter of Wulfhere, king of Mercia. She was born at Stone, in Strathshire; her mother was Ermgilda, and she was a niece of the famous St. Etheldreda. Ultimately, of course, she became abbess of Bepandum and patron saint of Chester, and died A.D. 699.

At first glance, with such a pedigree, one wonders how this north-country saint came to get her name perpetuated in the far west; and this is not at all clear until it is recollected that her father, the Saxon king, Wulfhere, conquered the west country, and, being himself converted from Paganism to Christianity, turned every beathen temple he came across into a Christian church. Not many miles from Wensbury is the village of Ermington, which rather suggests some affinity to St. Werburgh's queen-mother's name, Ermingilde.

In speaking of the Bristol churches, mention is made of John Shipward, who built the superb tower of St. Stephen's. Another merchant, whose name must for ever remain historical, is buried in St. Stephen's Church, and that is no less a personage than Edward Blanket, an enterprising Bristol woollen merchant, who first invented and made a certain well-known item of comfort which, from that day to this, has been called a "blanket." Mr. Blanket died A.D. 1340.

HARRY HEMS.

Exeter, April 18, 1887.

#### DIMENSIONS OF SEWERS.

SIR.—I shall feel obliged if you will kindly insert the following question in your next issue:—

"What are the rules for ascertaining the size of a sewer for a town of a certain population,—for instance, given a town of 20,000 population, with gradient of outfall sewer 1 in 500?"

SANITAS.

#### THE MAINTENANCE OF ROADS.

SIR.—Will you allow me to reply to your remarks on my small pamphlet (p. 561, *ante*) on the maintenance of roads, particularly with reference to the practice of loosening the surface with a pick before spreading new material on? I may first remind you that the book was written for the use of Surveyors of Highways in an agricultural district, and where even the Local Boards of Health cannot indulge in the luxury of a steam roller. When the Highway Authority of a large city or borough has a steam roller, then I admit that to loosen the surface and spread a coating of granite, 3 in. or 4 in. in thickness, with binding material and water in duo proportion, ready for rolling, is the best course to adopt, and one which will result in a good even surface in a few hours, but in a country parish, or in a town where there are no means for heavy rolling, I find from practical experience that to loosen the surface before coating the road is an injurious, an expensive, and unsatisfactory method. The first coating or spreading of material should be done, one stone in thickness, in November, when the roads are moist or wet, and consequently yielding, the granite will soon become embedded, especially if the ends of the coating be tapered to facilitate the traffic to run over the edges in both directions, and thus the many vehicles in time will do the work which could be accomplished by a steam-roller in a few hours.

It is found that a coating of stone assists in keeping the road moist, and so prepares the old metalling to receive the new; old metalling, when screened, consists of very small stones indeed, and mere dust.

It is a fact that many of the late distripricked roads in Lincolnshire have only 3 in. or 4 in. of metalling on them; you will, therefore, understand how serious the result would be to pick the surface of them over before coating, it would indeed be, as some surveyors of highways expressively say, "all alive." My note on this subject was necessary, as I have had to contest this point with members of Local Boards of Health, where the old roads in their towns have had no better foundations than those outside.

JAMES THROPP.

County Surveyor's Office, Lincoln.

April 19.

\*\* We only contested Mr. Thropp's general statement that loosening the old surface of a road before putting on new metalling "was productive of no good whatever." His letter amounts to an admission that we are right, and that it is only under special circumstances that his recommendation can hold good.

#### RECENT PATENTS.

##### ABSTRACTS OF SPECIFICATIONS.

5,843, Cement or Plaster. C. J. Howe.

This invention relates to a more rapid process of manufacturing plaster or cement, and consists essentially in saturating the gypsum in vacuo or under pressure, and subsequently exposing it to a forced draught of air.

6,100, Improvements in Water-closets. W. Macfarlane.

According to this invention, a shallow trough or receptacle is fixed at the part beneath the seat where solid matter falls, and channels are deepened in the basin with the view of carrying off the deposit, and preventing the splashing of water when the basin is flushed.

9,560, Improvements in Drain Traps. Henry Dean.

The improvements which are the subject of this invention are in the direction of making the traps self-cleansing. The trap is so constructed that from the surface it diminishes to a small circular section at or near the water-line. From thence the pipe forms an inverted syphon, and on such easy curves and lines as to render it practically self-cleansing. In a modified form of the trap a grid is used, and a grease trap is fitted to this grid or cover. Instead of the outlet being in a line with the syphon, it can be at right angles or any other angle to the same.

6,155, Lavatories. J. G. Stidder.

A strong and convenient lavatory, in places where the same is likely to be roughly handled,—as in schools, &c.—is the object of this invention. The parts are claimed to be extra strong, and of the most durable materials, and all pipes, &c., are so arranged that they are easy of access in case of stoppage or of repairs being needed. Strong brackets and fittings specially shaped and arranged are claimed in the patent.

6,926, Improvements in Sawing Machines. A. M. Clark.

The object of this invention is to economise the cutting of mouldings by circular cutters. This is effected by a combination of a tubular saw and a hollow saw mandrel, and further improvements are made by using a cover to protect the sawed stock from the belt, and by the special arrangement of fixed and movable journal boxes.

16,928, Safety Ladders. J. F. Haskins.

This invention consists in supplying a folding ladder or step apparatus for use in residences, factories, &c. It is applicable to the exterior or

interior of the building, and when not in use can be folded within its own case, protected from the weather and from accident, and be also out of the way. The steps as they fold over can be locked in that position, and they also form a peculiar hinged combination when opened out, part being quite rigid, and acting as a buttress or stay while the ladder is in use. The appliance would be chiefly useful as a fixture to lofty buildings for use in case of fire.

##### NEW APPLICATIONS FOR PATENTS.

April 5.—5,307, Asher & Buttress, Door Locks and Latches.—5,048, C. Emsen, Brick Machines.—5,071, H. Livesey, Holding Sliding Sashes at various Heights.—5,087, Townend & Ullathorne, Sash Fasteners for Windows.

April 6.—5,100, T. Robinson, Wood-planing Machine.—5,115, D. Cowan, Stoves or Detached Fireplaces.—5,138, H. Hutcheson, Chain Fasteners for Doors, Windows, &c.—5,153, G. & R. Clark, Flooring, and Lining Iron and other Buildings.—5,155, J. Hoodon, Portland Cement.

April 7.—5,164, F. Butterfield, Cutting or Shaping Stone.—5,171, N. Helme and Others, Paper-hangings.—5,188, M. Syer, Water-waste Preventer.—5,201, C. Heaton, Ornamental Cloacianic Mosaic Work.—5,204, G. Price, Water-closets, &c.

April 9.—5,211, N. & L. Skelsoy, Disinfecting Apparatus for Water-closets.—5,229, H. Waddington, Ventilators.—5,234, J. Bousfield, Smoke Ventilators for Chimneys.—5,253, J. Killey, Regulating the Discharge of Rain-water from Roofs.

April 12.—5,280, C. Latter, Fixing Sheets and Roll Caps of Copper, &c., for Roofing.—5,288, G. Woolliscroft, Attaching the Knobs of Door-handles to Spindles.—5,331, R. Haddan, Saw-setting Apparatus.

April 13.—5,346, G. Gregory, Window Fastener.—5,349, W. Macrattie, Window Fastenings.—5,351, G. Williamson, Window-sash Fastener.—5,374, J. Shephard, Water-tight Doors.—5,392, W. Bailey, Locks and Latches.

April 14.—5,426, W. Maloney, Ornamenting Buildings, &c.—5,429, F. Wallbrecht, Manufacture of Bricks, Tiles, &c.

##### PROVISIONAL SPECIFICATIONS ACCEPTED.

2,015, W. Gwynnett, Eaves Plates for use with Corrugated Roof and Wall Coverings.—2,799, P. Stringer, Rim Latches.—3,538, E. Dummer, Window Fasteners.—3,630, T. Jones, Ladders.—3,817, J. Wright, Fire Grates.—3,949, G. Quin, Ventilator or Cowl.—4,262, E. Summerfield, Fixing Door and other Knobs to Spindles.—4,468, J. Morris, Chimney Top or Cowl.—4,479, R. Shaw, Ventilating Apparatus.—1,943, H. Peach, Roof Glazing.—5,286, W. Pross, Cistern Valves and Water Taps.—3,331, T. Rymer-Jones, Refractory and Non-conducting Bricks, Tiles, Blocks, Slabs, &c.—3,349, J. Ebner, Parquet Flooring, &c.—3,351, R. Spence, Fireproof Floors.—3,383, R. Pickwell, Water Waste Preventer.—3,488, S. Hill, Door Spring.—3,789, H. Hunt, Register and Other Fire Grates.—3,918, T. Williamson, Saw Sets.

##### COMPLETE SPECIFICATIONS ACCEPTED.

###### Open to Opposition for Two Months.

7,630, J. Betteley, Construction of Sliding Window Sashes and Retaining Same in any Position.—9,252, F. Dove, Cramp for Flooring, Joinery, &c.—13,355, R. Garland, Domestic Fire Grates.—1,083, B. Fryer, Fire Grates.—7,884, Normanton and Major, Outlets for Ventilators, Smoke, and Other Flues.—5,173, E. Wilson, Screw Fasteners for Windows.—9,436, J. Parker, Composition for Floors, Paving, &c.—13,159, H. Price, Sanitary Dust Bin.—3,596, R. Ash, Ventilating Apparatus.

**The Messina Straits Tunnel.**—Among the plans submitted to the Italian Government for a railway tunnel under the Straits of Messina, connecting Sicily with the mainland, is one framed by an Italian engineer, Signor Fredrico Gabelli. He suggests constructing the tunnel between the towns of Pezzo and Santa Agata, and that its length under water should be 13,200 metres, the maximum depth of water over it 110 metres, the thickness of the roof being in this spot 35 metres. The cost is estimated at 65 million lire, and the time of execution six years. The engineer is of opinion that the greatest obstacles to the undertaking would be encountered at the outset, so that the risk attending it would not be very great should these prove to be insurmountable.

**A Substitute for Cement.**—A new material, which is to take the place of cement in the laying of floors, has been introduced in Germany. The new compound, which is stated to be a kind of asphaltic mixture, is reported to possess the peculiar properties of being proof against both oils and acids, and of being unaffected by damp. The material, which has been named "factice," is quite elastic, and possesses this advantage over cement that it has not the dangerous smoothness of the latter. Amongst other places, factice has been used for the flooring of a new cotton mill at Plagwitz, near Leipzig.

TRUGHTON & SIMMS'S LEVEL

The Student's Column.

FIELD WORK AND INSTRUMENTS.—XVII.  
Levelling Instruments.

I.—TROUGHTON AND SIMMS'S LEVEL.

THE chief use of levelling instruments is to compare the heights of different stations with reference to a fixed datum or horizontal line. Fig. 1 shows the fixed telescope of a dumpy level, consisting of an outer tube carrying the object-glass and an inner tube carrying the diaphragm and the eye-piece. The milled head marked B turns a small pinion wheel which works in a rack fixed inside the inner tube, as shown in fig. 6. By this means the inner tube is drawn backwards and forwards in a horizontal line when the longitudinal bubble is in the centre of its run. This bubble is fastened to the telescope at the supports marked U, its fixed position being determined by the instrument-makers, primarily by filing the underside of the pieces attached to each end, through which the connecting screws marked C and Q pass, and finally by adjusting, if necessary, the side screws marked Z Z. In the case of a new bubble tube being inserted, the screws Z Z are called into use, and serve to accurately fix the new longitudinal glass tube, so that the bubble will run level in a transverse direction. A short transverse bubble marked F is usually attached to the telescope to indicate the horizontality of the run of the longitudinal bubble in a direction at right angles to its length. The screws by which the longitudinal bubble is attached to the telescope have capstan heads at C and slot heads at Q. The capstan heads are preferred by the makers, but the position of the transverse bubble necessitates the substitution of slot-head screws at Q. The cross hairs upon the diaphragm are arranged as shown in fig. 4, and the diaphragm plate is attached to the internal tube of the telescope by the vertical collimation adjustment screws marked R R. No horizontal adjustment screws being required for the collimation adjustment of a level, the diaphragm plate is held in the side frames shown in fig. 3, between which it can be moved up and down. The external tube of the telescope is sprung at the eye-piece end, between the eye-piece and the support marked U, by slots in the top surface as shown in fig. 1. A steady and even motion can thus be imparted to the inner tube when drawing it in and out for the purpose of adjusting the focus of objects at different distances from the instrument. The inner tube is nearly conical in length to the outer tube, and carries the stop-pieces marked M and P for limiting the rays of light to the cone of rays formed between the circumference of the object-glass and its principal focus in the diaphragm plate. The effect of drawing the inner tube out, is to lengthen the focus of the object-glass. When

the object viewed is at a short distance from the observer, the operator is compelled to bring the wires of the instrument under adjustment for focal distance, further away from the object-glass, and to move them nearer the object-glass when the object is at a greater distance. Two Ramsden's eye-pieces marked A are supplied with the instrument; the long eye-piece gives more power than the short eye-piece, but the gain in power is attended with a comparative loss of light. The supports to the telescope marked U U are fixed to a horizontal rigid bar marked V by a binged joint at E, and by an adjusting screw connexion at D (fig. 1). Between the supports U U sufficient room is provided in the horizontal connexion for a compass-box, marked J, to be inserted if desired. In some instruments this space is occupied with a small circular level, by means of which the instrument can be approximately set up at once, with the vertical axis at right angles to the horizon. The upper portion of the instrument containing the stage or horizontal bar which carries the telescope revolves upon the body of the instrument marked N. The upper parallel plate forms a portion of this body-piece, and is supported by the elevating screws marked G and H, its centre being connected to the lower parallel plate at O by the half ball-and-socket joint as shown in fig. 1. The stop-block marked I prevents the upper parallel plate revolving upon the lower parallel plate. Sometimes the telescope is constructed to be detached from the parallel plates when not in use for convenience of packing, but some makers prefer to permanently fix it to the bearing-piece which surrounds the body of the instrument marked N.

**The Future of Gaslighting.**—The *Gas Engineer* says:—"Gaslighting will have made a distinct advance on the day when architects are recognised as being responsible for these appointments. For their own sake they will see that the fittings are well supplied with gas, are of proper dimensions, and harmonise with the rest of the room. Then, indeed, we may hope for novelties in gas-illumination, boudoirs coolly lighted, harsh colours tinted, to the great comfort of the tenant. From a hygienic point of view this matter is important. In houses of the poorer class fatal results would follow from impure air were it not for badly-fitting doors and windows, which, urged by the accidental circumstances of a chimney-draught, supply a continual change of air. That this exists in better-class houses is not to our credit, but we must plead guilty to the charge, and admit that perhaps not one house in five is 'ventilated.' And yet gas, in intelligent hands, can be made to do a great deal in this direction. By regenerative lamps the air of a room may be warmed and changed, and more light is given per cubic foot of gas consumed."

MEETINGS.

| SATURDAY, APRIL 23.                                                                                                                                |  |
|----------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <i>Architectural Association.</i> —Visit to Messrs. Dent & Belliver's Works, and to the Church of St. Bartholomew-the-Great, Smithfield. 2.31 p.m. |  |
| <i>Crystal Palace School of Engineering.</i> —Award of Certificates (Sir Robert Rawlinson, C.B., in the chair). 1 p.m.                             |  |
| <i>Edinburgh Architectural Association.</i> —Visit to Dirlston Castle.                                                                             |  |
| TUESDAY, APRIL 26.                                                                                                                                 |  |
| <i>Society of Arts (Applied Art Section).</i> —Mr. J. Hungerford Pollen on "Ornamental Glass." 8 p.m.                                              |  |
| <i>Institution of Civil Engineers.</i> —Discussion on the papers by Messrs. Croxer, Fox, Stooke, and Mathews on "Water-Supply from Wells." 8 p.m.  |  |
| <i>Royal Institution.</i> —Professor W. E. Ayrton, F.R.S., on "Electricity." 8 p.m.                                                                |  |
| <i>Parkes Museum (Lectures for Sanitary Inspectors).</i> —Professor H. Robinson, on "Drainage Construction." 8 p.m.                                |  |
| WEDNESDAY, APRIL 27.                                                                                                                               |  |
| <i>Society of Arts.</i> —Mr. Arthur W. C. Shean on "Appliances for Saving Life from Fire." 8 p.m.                                                  |  |
| <i>Civil and Mechanical Engineers' Society.</i> —Mr. Henry Adams on "The Use and Care of Chains for Lifting and Hauling." 7 p.m.                   |  |
| <i>Sanitary Assurance Association.</i> —Dr. Joseph Ewart on "The Progress of Sanitation at Brighton." Polytechnic Institution, 8 p.m.              |  |

THURSDAY, APRIL 23.

*Society of Telegraph-Engineers and Electricians.*—(1) Professor A. Ryton, F.R.S., on "Measuring the Co-efficients of Induction." (2) Professor John Perry on "Driving a Dynamo with a very Short Belt." 8 p.m.

*National Society for Preserving the Memorials of the Dead.*—Mansion House, 3 p.m.

*Edinburgh Architectural Association.*—Mr. William Bruce will give a "Historical Sketch of Drainage and Sanitary Fittings." 8 p.m.

FRIDAY, APRIL 23.

*Royal Institution.*—Professor H. S. Hele Shaw on "The Rolling Contact of Bodies." 8 p.m.

*Society of Arts (Indian Section).*—Mr. J. F. Hewitt on "Village Communities in India." 8 p.m.

*Parker Museum (Lectures for Sanitary Inspectors).*—Professor W. H. Corfield, M.A., M.D., on "Sanitary Appliances." 8 p.m.

*Institution of Civil Engineers (Students' Meetings).*—Mr. Alfred Chatterton, B.Sc., on "Flour Mills and their Machinery." 7:30 p.m.

### Miscellaneous.

**The Turners' Company's Prize Competition, 1887.**—As will be seen by an advertisement in this week's *Builder*, the Master, Wardens, and Court of Assistants of the Worshipful Company of Turners, according to their custom, propose to offer this year their Silver Medal, the Freedom of the Company to, and (subject to the consent of the Court of Aldermen) will also obtain the Freedom of the City of London for, any workman, whether master, journeyman, or apprentice in the trade, in the United Kingdom, who may send in the best specimen in each of the following, viz. of hand turning in wood, in glass, and in precious stones. Prizes will be awarded. Amateurs will be allowed to compete as a separate class. The competition in wood includes turning in both hard and soft wood. The qualities which will be considered in awarding the prizes are the following, viz.—1. Beauty of design, symmetry of shape, utility, and general excellence of workmanship. 2. Exact copying, so that two objects produced (such as two cups, vases, boxes, or other articles) may be facsimiles in every part, or exact measures of capacity. 3. Fitness of the work and design for the purpose proposed (for instance, turned work for portions of domestic or church furniture). 4. Ability to turn, whether circular or oval, in both classes of wood. 5. Novelty in application of turning, or in design. 6. Carving and polishing are admissible, and if skilfully done, any additional effect produced will be considered, but it must be subsidiary to the turning.

**A Rural Appointment.**—The following instructive paragraph is cut from the *Western Morning News* of Tuesday last:—"Okehampton Board of Guardians, sitting as the Rural Sanitary Authority, on Saturday elected Mr. Samuel Hooper, jun., of Hatherleigh, as nuisance inspector and surveyor, at an annual salary of 50*l.* for the joint offices. Messrs. Isaac Yeo (Okehampton), S. G. A. Petherick, Abell (Hatherleigh), and Copp (Ashbury), were also candidates for the offices. Mr. Hooper received twenty-one votes, and Yeo and Petherick ten and nine respectively, the support given to the other two being very trifling. The successful candidate, who has displaced Mr. Yeo, a servant of old standing, is a sergeant in the local company of rifle volunteers, and is a mason, competent to prepare plans of sewerage works when required,—a fact that influenced the Guardians in their choice. A reduction of 10*l.* has been made in the amount of salary previously paid."

**A Dust Excluder.**—A permanent matrix excluder of draught and dust has been sent to us by Mr. T. J. Porter, the inventor. The excluder is made of a special composition, enclosed in long, narrow strips of warm-coloured cloth, and moulded into a suitable form. The application of hot water enables the excluder to be formed into a long, narrow, solid, and permanent matrix round doors and windows. Mr. Porter says that it makes a practically airtight joint, and entirely precludes the passage of draught and dust between doors and their casings, and windows and their casings.—*Nature*.

**The German Houses of Parliament.**—Since the break-up of wintry weather, great activity has prevailed on the site of the new Houses of the German Parliament at Berlin. The main walls have now risen to a height of 11 metres over the level of the Königsplatz, leaving 12½ metres still to be constructed before the upper ledge of the main entablature is reached. It is expected that the building will be completed in its crude state by the end of 1888.

### Steam Fire-Engine Competition in Australia.

—Details have just been received in England of the United Fire Brigades Jubilee Tournament held at the Friendly Society's Gardens, Melbourne, on February 24th, 25th, and 26th, when fire brigades and superintendents were present from the whole of the Australasian colonies. The prizes were thirty-four in number, and were awarded for every conceivable variety of fire-brigade practice. The Melbourne *Argus* of February 28th gives an account of the steam fire-engine competition. The *Argus* says:—"The Ballarat City and the Ballarat were the only two brigades entered. A good deal of interest was taken in the contest, as the two teams used engines of different makers. The Ballarat City used a Merryweather engine, which looked far more imposing than the smaller Shand & Mason engine belonging to their opponents and townsmen. The City were the first to go, and getting under weigh quickly, galloped round the track to the plug in 90 sec. The fire, fed by coal saturated with kerosene, was meanwhile blazing, and steam was got up very promptly, but 13 min. 22.4-5 sec. elapsed before 100 lb. was registered. The water several times failed to reach as high as the disc, and steam had to be turned off to enable the firemen to throw the jet higher. It was 15 min. 40 sec. from the beginning of the work before the disc was struck with the 1-in. jet. On attaching the 2½-in. jets there was again a deficient pressure to throw the water on to the mark, and this was not accomplished in less than 20 min. 20 sec. Ballarat, on getting the word to go, were a trifle slower than their opponents in harnessing up and starting, but the driver whipped up his team when once they began to move, and brought them to the plug at a fully extended gallop. The little engine, to the surprise of most of the spectators, began very soon to throb with steam, and as soon as the water appeared it shot like a rocket high above the height of the disc. The victory was easily gained by Ballarat without appealing to the time-keepers, whose record was as follows:—Ballarat (Shand, Mason, & Co.'s smallest or A size Volunteer)—From the start to the plug, 1 min. 50 sec.; getting up 100 lb. of steam, 9 min. 57 sec.; striking the disc with 1-in. jet, 10 min. 30 sec.; striking discs with 2½-in. jets, 14 min. 55 sec. Ballarat City (Merryweather's medium size)—From the start to the plug, 90 sec.; getting up steam, 13 min. 22.4-5 sec.; striking the disc with 1-in. jet, 15 min. 40 sec.; striking the discs with two ½-in. jets, 20 min. 29 sec. Ballarat thus won by nearly six minutes in the total time required to do the work, and were quicker at all points except getting to the plug."

**Building at Hornsey.**—The progress of building at Hornsey came before the Hornsey Local Board at a recent meeting. It appears that during the year ending on the 25th of March last, 321 new houses and other buildings had been erected within the district over which the Board have control, whilst 275 are now in course of erection. These returns show a falling off, as compared with the previous year, of 55 houses built and of 79 in course of erection. It further appeared that the total number of houses in the Board's district at the present time is 6,539, of which 770, or about 11 per cent., are now unoccupied. The chairman observed that these figures showed that the district of Hornsey, like many others both in the metropolis and Greater London, was suffering from over-building. Adverting to jerry-building, he said that the erection of this disreputable class of property had been less prevalent in the locality during the year, only thirteen buildings, or portions of buildings, having been condemned by the Board's Surveyor and demolished, as compared with thirty-eight during the previous year. He added that inferior mortar, bad bricks, and walls of insufficient thickness, were features which most predominated in this class of insanitary dwellings. The streets for a time might hide the multitude of hideous deformities in these miserable tenements, in which the poor were to a great extent forced to live. The Board were, however, determined to show the builders of such dwellings no mercy, and the Surveyor had instructions to act accordingly.

**The Nineteenth-Century Art Society.** Thursday, the 28th inst., has been appointed for the reception of works of art intended for the Summer Exhibition of this society, at the Conduit-street Galleries.

### Building Land Sales at Oxted and Wimbledon.

—On Monday last the first portion of the Barrow Green Estate, at Oxted, comprising about twenty acres, was offered for sale at the Hoskins Arms Hotel, by Messrs. Baker & Sons. The estate immediately adjoins the recently-opened Oxted station of the South Eastern and London and Brighton Companies' railway from London to East Grinstead, and has been brought into the market by the opening of that station, which has led to the laying out of the estate for building purposes. The railway passes through the centre of the estate. Several new roads have been formed, both on the east and west sides, and building has already been commenced. Portions of the estate are being planted by the owner, who is also about to lay out a recreation-ground on the south side, containing an area of between four and five acres. The lots offered for sale on Monday were fifty-seven in number, containing frontages varying from 25 ft. to 35 ft., and depths of from 140 ft. to 190 ft., and they were announced to be sold absolutely without reserve. There was a very spirited competition for the property, and all the lots were sold, at prices ranging from 35*l.* to 60*l.* each. A corner shop plot, having a frontage of 40 ft., and a return frontage of 140 ft., was sold for 102*l.* The total proceeds of the sale amounted to upwards of 3,000*l.* As showing the greatly increased value which the opening of the Oxted Station has given to the property [Oxted was hitherto four miles distant from any station] it may be stated that the prices realised at Monday's sale averaged from 1*l.* 10*s.* to 2*l.* per frontage, whereas formerly not more than 5*s.* per foot could be obtained.—On Tuesday evening Mr. W. N. Norris submitted for sale, at the Prince of Wales Hotel, Wimbledon, forty plots of building land, forming part of the Wimbledon Park Estate of the Birkbeck Freehold Land Society. The estate is situated between the Wimbledon and Hayden's-lane railway stations, on the north and south sides of Queen's-road, and Tuesday evening's sale was the first public sale of the property. The lots at the west or Wimbledon end of the estate have frontages of 35 ft. and depths of 280 ft., and those at the east or Hayden's-lane end 25 ft. frontage and about 240 ft. depth. The prices offered for the first-named lots were from 270 to 280 guineas each, and for the last-named lots 150 to 180 guineas each, at which they were withdrawn. The reserves for the largest lots were stated to be about 300 and 200 guineas respectively.

**New Poor-Law Infirmary, Champion-hill, Dulwich.**—The opening of the new infirmary at Champion-hill, which has recently been erected by Messrs. Kirk & Randall from the designs of Messrs. Henry Jarvis & Son, for the Guardians of St. Saviour's Union, took place on the 13th inst. At 3:30 p.m. the Guardians and visitors assembled in the chapel, where a dedication service was held, and an address was delivered by the Bishop of Rochester. The company afterwards proceeded to the main entrance, where the building was declared open by Mr. William Wright Flood, the Chairman of the Board, in the presence of the Bishop, the Vice-Chairman, and the Guardians; the architects, Messrs. H. Jarvis & Son; and the contractors, Messrs. Kirk & Randall. We so recently (viz., in the *Builder*, for Feb. 26th last) gave a view, plans, and detailed description of the building that it is unnecessary to say much about it now; but it may be interesting to supplement the particulars which we have already given by stating that in the erection of this large block of buildings five millions of bricks, about 30,000 ft. cube of stone, 100,000 slates, 70,000 ft. cube of timber, 500 tons of ironwork, 110 tons of sheet lead, 22,000 ft. of lead pipe, 40,000 ft. super. of glass, 13,000 ft. run of rain-water pipes and gutters, 750 squares of roof boarding, and 1,000 squares of flooring have been used. The whole of the works have been carried out by Messrs. Kirk & Randall within two years, including the building, the engineering works, the laying-out of the grounds, and forming and making the roads and pathways.—Mr. Charles Randall acting as their agent, and superintending the work.

**The Phoenix Fire Office.**—At the half-yearly meeting of the Phoenix Fire Office, just held, the ordinary dividend of 3*l.* per share, together with an extra dividend of 6*l.* per share, was declared.

**The Strike in the Building Trade at Birmingham.**

At the meeting of master builders held on the 14th inst. to take into consideration this dispute, Mr. John Bowen (Chairman of the Master Builders' Association) presided, and the representatives of twenty-five firms were present, as follows:—Messrs. Surman & Son, D. & J. Webb, Sapote & Sons, Samuel Taylor, W. J. Whittall, Barnsley & Sons, Smith & Sons, J. Dibble, Gowing & Ingram, Woodward & Smith, R. Folland, Thomas Rowbotham, T. Hallgarth, Bellamy, E. Giles, E. Gill, George Twigg, Archer, William Bennett, and Baby & Sillito. Mr. E. J. Bigwood, the secretary, laid before the meeting the replies of the various branches of operatives to the masters' suggestion that it be left to the Mayor to nominate a person to act as arbitrator in the dispute. According to the *Birmingham Gazette*, the Carpenters' Association replied that they could not accept the offer of the employers in its entirety, but were prepared to nominate Dr. Langford, in conjunction with the Mayor, to appoint an arbitrator, provided that the employers reinstated the workmen late in their employ under the present rules, pending the decision of the umpire. The bricklayers' reply stated that they were surprised that the employers asked them to leave it in the hands of the Mayor to nominate an umpire after they had declined to accept his nomination as arbitrator, and, therefore, they could not accept the offer, with all due respect to the Mayor. The stonemasons stated that they could not recognize arbitration, as always on previous occasions they had settled their differences separately from the other branches of the building trade,—with the masters themselves. They were prepared to meet a committee of the masters at their convenience. The plasterers failed to agree to the proposal, but were willing to meet representatives again, and asked for an appointment at their earliest convenience. The plumbers made no acknowledgment of the masters' proposal, but sent another suggestion to the effect that, with a view to a settlement of the dispute, they were prepared to sign the rules that were in force up to the 1st of April in their entirety with the exception of rule eight, which has reference to arbitration. They would in the event of that being agreed to withdraw their counter notice for advance of 1d. per hour. After a lengthened discussion, carried on with a view to the best and most speedy means of conciliating the men and ending the dispute, the president (Mr. Bowen) moved "That, seeing with regret that all efforts to agree upon an umpire have failed, this association now invites all the operatives to send two representatives of each trade to meet an equal number of masters, with the hope of adopting such measures as may settle the existing dispute in the building trade." This was seconded by Mr. J. Barnsley, and agreed to.

**Short Delivery of Wood Cargoes.**—The Courts of Law are so frequently called upon to settle differences between shipowners and merchants with respect to input and output of cargoes that, in our opinion, more attention should be paid than is done at present to quantities shipped and delivered. Since steam was introduced into the timber-carrying trade there have been more disputes than formerly, and this arises from the working of two, three, or four holds at one time. A mate cannot attend to each hatch and count the pieces of wood as they are taken in, and, consequently, the tallying is delegated to apprentices or seamen, or no check is instituted. The shippers present bills of lading, which the master signs in a perfunctory manner, and when a vessel arrives at her destination the tallying is left to servants of dock companies. According to the practice of the timber trade at Liverpool, all deals, ends, battens, boards, and scantlings are counted daily, and when struck on the end with a hammer the delivery is considered completed, and, when required, a receipt is given for numbers. This is a fair way of settling affairs; but at other ports the counting does not take place till the entire cargo is piled and stacked. Delivery and payment of freight should be concurrent acts, as defined in *Paynter v. James*, Court of Exchequer, May 19, 1868; and *Black v. Rose*, Judicial Committee of the Privy Council, June 30, 1864.—*Liverpool Journal of Commerce*.

**Newvenders' Benevolent and Provident Institution.**—It is announced that Sir A. K. Rollit, M.P., will preside at the Festival of this deserving Institution, to be held at the Grand Hotel, Charing Cross, on Wednesday, June 22.

**British Archaeological Association.**

At a meeting of this Association on April 6th, Mr. Geo. R. Wright, F.S.A., in the chair, a curious Cingalese MS. was exhibited by Miss Kilner. Mr. Astley described an ancient oak beam which crossed the piers above the roof of St. Michael's Church, Coventry. The inscription, in black letters, appears to express the attributes of the nine choirs of angels which formed the hierarchy of heaven. Mr. Wm. Myers, F.S.A., exhibited Roman pottery found by him close to the ancient foundations of the walls of Chichester, laid open by the Association. Among the articles was a prehistoric flint knife, and Mr. De Gray Birch, F.S.A., called attention to it as evidence of the prior occupation of the site by an aboriginal settlement. Mr. Myers exhibited in addition a fine collection of Egyptian antiquities which he had recently brought to England. Mr. Taylor, of Newcastle, exhibited a large plan of the sites of various Roman remains which have been found in the county of Durham, showing also the courses of the Roman roads. A paper was then read by the Rev. Dr. Hooppell on the remarkable excavations which have recently been made on the site of the Roman Station, Vinovia, near Bishop Auckland. This site, now occupied by the small village of Binchester, which is almost in the centre of the country, is on the line of the Watling-street, the road having gone through the station. It stands on high ground, and the river Wear has destroyed a large portion of the approach. The walls of enclosure have been traced in several places, and are found to have rounded corners at the angles. Several large buildings have been laid bare, and a curiously vaulted cave has been found outside the walls, probably a place for the worship of Myhras. A large quantity of pottery and other relics of Roman date have been found, now in the Durham Museum. The important results obtained are due to Mr. John Proud, who defrayed the heavy cost of the excavations, which were superintended by the Rev. Dr. Hooppell. The paper was illustrated by a series of fine drawings, which will be reproduced in the Society's *Journal*.

**The Adelaide Jubilee Exhibition.**—At the time of the departure of the last mails, the building for the Adelaide Jubilee Exhibition was rapidly approaching completion. The list of applications for space was closed on March 1, and it is therefore now possible to form a pretty accurate estimate of the number and extent of the exhibits. Independently of the British exhibitors, whose numbers will exceed the most sanguine anticipations, the amount of space allotted to South Australia is 50,000 ft.; New South Wales will occupy 15,000 ft.; and Victoria probably about the same. The remaining Australian colonies will, it is understood, only require from 1,000 ft. to 2,000 ft. each. The courts devoted to South Australia, New South Wales, and Victoria, in the interior of the main building, will, it is reported, present a similar appearance to the Colonial Courts of the late Colonial and Indian Exhibition at South Kensington. In the decoration of the walls the names of the different towns of Australia will be set off by views of the places referred to. With regard to the exhibition of fine arts, there will be a grand display by the Royal Academy. The major portion of these works of art will be subsequently exhibited in Melbourne, and, perhaps, in Sydney. The paintings will unquestionably prove a great attraction to visitors from all parts of Australia. The specimens of fine art which recently left London for Adelaide with Sir Herbert Sandford on board the Orient steamer *Austral* are valued at 30,000. It is fully expected that the arrangements at the Exhibition will be completed in time for the opening ceremony.

**Society of Antiquaries of Scotland.**—The monthly meeting of this society was held in Edinburgh last week, Sir W. Pettes Douglas, vice-President, in the chair. The first paper was a notice by the Marquis of Bute of the discovery of a cist at Mountstuart, in Bute, containing an unburnt burial of the Bronze Age, which presented some unusually interesting features. The cist was covered by a large slab 5 ft. 3 in. wide and 6 in. thick. When this was lifted the cist itself was found to be about 4 ft. in length by about 2 ft. in width. In it, resting on a bed of small pebbles, were the remains of the skeleton of an adult person. The bones were so much decayed as to crumble away when touched. Under the neck there were found

100 jet beads of different sizes, which, along with six perforated plates of the same substance, had formed a necklace of a form not unusual in connexion with interments of the period, although it was but rarely that all the pieces were recovered and preserved. Close by the place in front of the face, where the hands would have been had not the bones been so completely decayed, there were found some small fragments of bronze, which are regarded as being the remains of one of the small thin triangular blades of bronze so often found associated with similar burials. At the feet, and towards the north-east corner of the cist, lay an arm of the form known as "fool-vessels" 7 in. high and 7 in. in diameter at the mouth, with two flutings underneath the rim, and ornamented with a pattern of zigzag lines impressed by the teeth of a comb.

**Portobello.**—Considerable progress has now been made with the erection of the new railway station at Portobello, and it is expected that it will be, if not completed, at least nearly so, at the time previously stated,—viz., at the end of June,—notwithstanding a good many alterations in the contract.

**PRICES CURRENT OF MATERIALS.**

\* Accepted.

TUNBRIDGE WELLS.—For sewerage, road-making and other works, on the Molesey Park Estate, Mr. W. B. Hughes, architect and surveyor, Tunbridge Wells:—  
 Brooker & Goldsmith, Tunbridge Wells .....

Fulham Town-hall.—In the list of tenders for this building, published by us a fortnight ago (p. 656), it was stated that Messrs. Freasore & Son's tender had been accepted. We are informed that this is incorrect, as Messrs. Freasore & Son have withdrawn from the competition, owing to a clerical error in one item.

Deard School, Grays Thurrock.—In reference to the list of tenders for this job (which appeared on p. 641 of our last issue), we are informed that Mr. Grist has withdrawn his tender of 6,718l., which should have been 6,718s.

\* SPECIAL NOTICE.—Lists of Tenders frequently reach us too late for insertion. They should be delivered at our office, 48, Catherine-street, W.C., not later than 12 Noon on THURSDAYS.

TO CORRESPONDENTS.

Registered Telegraphic Address, "THE BUILDER, LONDON."

W. P. B. (your other letter next week).—W. S. H. (next week).—J. T. (we can give no opinion about a matter of that kind, which depends on local circumstances, and on which we have only an ex parte statement).—E. I. A. & Son.—H. H.—C. G. R.—C. R.—H. E. (quite unavailing).

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender, not necessarily for publication. We are compelled to decline pointing out books and giving addresses.  
 Note.—The responsibility of signed articles and papers read at public meetings, &c., of course, rests with the authors.  
 We cannot undertake to return rejected communications.  
 Letters or communications (beyond mere news-items) which have been duplicated for other journals, are NOT DESIRED.  
 All communications regarding literary and artistic matters should be addressed to THE EDITOR; all communications relating to advertisements and other exclusively business matters should be addressed to THE PUBLISHER, and not to the Editor.

**TERMS OF SUBSCRIPTION.**  
 "THE BUILDER" is supplied direct from the Office to residents in any part of the United Kingdom at the rate of 10s. per annum. Foreign, to all parts of Europe, America, Australia, and New Zealand, 20s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

**Best Bath Stone.**  
 GORSHAM DOWN. | FARLEIGH DOWN.  
 BOX GROUND. | COMBE DOWN.  
 WESTWOOD GROUND.  
 RANDELL, SAUNDERS, & CO., LD.,  
 GORSHAM, WILTS.

**Bath Stone.**  
 Pictor's Monks' Park. | Combe Down.  
 Gorsham Down. | Stoke Ground.  
 Box Ground. | Winsley Ground.  
 Farleigh Down. | West Wood.  
 PICTOR & SONS, Box, Wilts. [Adv.]

**Doubling Free Stone.**  
 The stone from these quarries is known as the "Weather Bed," and is of a very crystalline nature, and undoubtedly one of the most durable stones in England.  
 It is of the same crystalline nature as the Chelwyn Stone, but finer in texture, and more suitable for the unmodelled work.  
 THE CHELYNCH STONE.  
 THE BRAMBLEDITCH STONE.  
 HAM HILL STONE.

Greater facilities have been provided for working these quarries, and the stone can be supplied in large quantities at short notice.

Prices, and every information given, on application to CHARLES TRASK & SONS, Norton-sub-Hamdon, near Ilminster, Somerset. London Agent—Mr. E. WILLIAMS, 16, Craven-street, Strand, W.C. [Adv.]

**Doubling Free Stone.** For prices, &c., address S. & J. STAPLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants, BLUE LIAS LIME, Stoke-under-Ham, (Ground or Lump), Ilminster. [Adv.]

**Asphalte.**—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tin-rooms, and terraces. [Adv.]

**Asphalte.** Seyssel, Patent Metallic Lava, and White Asphaltes. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [Adv.]

**NOTICE.**—THE BANNER SANITATION CO, beg to give Notice that having sold over 10,000 BANNER'S PATENT VENTILATORS, also a proportionate number of other Sanitary Appliances, and wishing to keep pace with the times, they have decided to reduce the prices of their goods from 25 per cent. to 40 per cent, thus offering to the public the best appliances at the lowest prices.

**BANNER VENTILATORS.**

The Strongest Exhaust Ventilators for all Buildings, Public Halls, Churches, Billiard-Rooms, &c.  
**HIGHEST PRIZES** at all the most Important EXHIBITIONS.

Gold Medal. Health Exhibition, 1884.

### Architecture at the Royal Academy.

THE show of architectural drawings this year is a very good one, better if anything than last year's, which was also an improvement on the collections of several preceding years. A high standard seems to have been maintained in the selection; there is a certain amount of unoccupied space in the upper part of the walls, but no drawings on the usual scale of architectural drawings could have been seen if hung on these upper levels; and though one must sympathise with those (we suspect not a few) who have been disappointed by the return of respectably-executed drawings, illustrating no doubt in many cases buildings which had been carried out with care and in a manner suitable for their purpose and with satisfaction to their owners, we cannot think that the Academy are wrong in restricting the exhibits, as has evidently been their intention, to such drawings as illustrate something of what may rightly be called the poetry of architecture, and of architectural drawing, which also has its poetry and its prose. The Architectural Room at the Royal Academy is not to be regarded as a kind of Building Exhibition, where a representation of a building is to be hung up merely because it is an executed work which has cost a good deal of money, and brought a respectable percentage to the contractor and a more modest one to the architect. The object of an architectural room at the Academy is to illustrate architecture as an art,—as the art of giving to buildings picturesque and expressive character, and rendering their objects of beauty and delight as well as of utility. In any other view architectural drawings have no *locus standi* at an Academy of Arts,—a fact which has certainly been forgotten in some previous years, when drawings have been hung representing great hocks of building, the sole interest in which may be said to have been a matter of five per cent. As it is, there are really very few drawings in the room which have not some picturesque interest and character. There is far less of the mere street house element than there used to be; there is a great deal of variety in the style and feeling, and in the methods of execution of the designs and drawings; and the praises which an eminent French architect has recently, in the pages of a French journal, lavished on the English architecture of the day in respect of its picturesque qualities, may he fairly said to be borne out by the very

typical collection in the Architectural Room at Burlington House.

One other comment is suggested by a general look at the drawings; viz., that the Queen Anne heresy in its cruder form seems to be dying out. Some little time ago the rooms used to be full of "Houses in — Place," all exceedingly like each other, all showing the same bald repetition of brick quoins and cannon-ball finials. There may have been more of these sent in than we can conjecture, but if so, few of them have found favour in the eyes of an enlightened Hanging Committee. There are designs which are, no doubt, developments of Queen Anne, but then they are really developments, and have left the cruder stage behind. It may also be noted that there is distinctly more evidence of a leaning to Gothic feeling and taste than we have seen of late years; in this case also not that mere imitation (generally) of Gothic styles which was in favour a good many years ago, but an inventive architecture which uses the old materials after a new fashion; and while the collection is thus of considerable interest to those who study architecture with some knowledge of the subject, the variety and effective character of many of the drawings, considered merely as drawings, and the number of different methods of delineation employed, ought to render the Architectural Room more interesting, even considered merely as an additional "picture room" to the public generally, than it has commonly been considered. Of late years, indeed, we have discovered a certain awakening of interest on the part of the public in the architectural drawings; the room devoted to them is not such an entire solitude as it was wont to be; and it must be said that a good many of the architectural exhibitors are going in the right way, by the fine character of their drawings, to encourage this laudable increase of interest on the part of the general body of visitors to the Academy.

The central positions on two of the walls are occupied by the diploma drawings of two Academicians,—Mr. Pearson's perspective view of Truro Cathedral from the north east (1,631), a highly-finished pen-and-ink drawing, and Mr. Waterhouse's view of "Manchester Town-hall" (1,680), a large water-colour drawing in an effective though somewhat loaded style. The architects do not, it would appear, like the painters, put off their least valuable works on their brethren as diploma deposits. Each of these diploma drawings is very carefully executed, and each shows its author at his best in his own special qualities of architectural design. The Manchester Town-hall is, of course, a pretty old building now, but Mr. Waterhouse made a good choice in presenting a drawing of it

as his diploma work. It is not only one of the most important and best-known of his works; it is of all others, perhaps, the most typical of his method of treating Gothic materials. It is a pity that the plan was not added, for the plan was a remarkably successful one, dealing with a very complicated problem or puzzle in planning; and we may here observe that the absence of any plan of the various buildings illustrated is even more conspicuous than it was last year. Our wish to see more plans of buildings appended to the drawings is by no means at variance with the opinion expressed just now that architectural art, as distinguished from mere building, is the proper element for an Academy Exhibition; for plan is the basis of design; and without the plan it is impossible to understand rightly the meaning of the design, or the manner in which the architect has succeeded in rendering what might have been a mere utilitarian erection a thing of beauty and interest. There is no need that the plan should be large enough to make an extra drawing, or to be a disfigurement to the perspective drawing; a plan to a small scale would suffice to explain all the architectural qualities of the building; and if the Academy, instead of tacitly encouraging architects to ignore plans in their exhibits, would issue an edict that all drawings (except those which are only picturesque illustrations of remains of ancient architecture) should have appended to them a small-scale plan, they would be greatly increasing the interest of the exhibition to architects and architectural students, and they might even in time teach the public something about the relation between plan and design, about which the said public know at present absolutely nothing.

The perspective view of Truro Cathedral shows Mr. Pearson, we have observed, at his best, though that remark must be taken with a certain kind of reservation. It exhibits him as the most complete master of reproduced Gothic architecture since the death of Scott. The drawing shows an early thirteenth-century cathedral, recalling Lincoln more than any other cathedral in most of its details, except in the treatment of the termination of the tower; a picturesque group, with an octagonal chapter-house, rising above the roofs of some low houses which form a foreground to the picture. The drawing is finished with great care, and in this respect is a rather wholesome practical protest against the somewhat too rough and "dashing" style of architectural pen-and-ink which is in vogue with some draughtsmen. But there is not a new thought in the design; it is simply a Medieval cathedral over again. Some years since, when the geometrical drawings for it were exhibited

here, we expressed our regret that with such a splendid opportunity as the building of a large modern cathedral *ab initio*, there had been no attempt made to produce, if a Gothic cathedral, at least some kind of development of that type, both in plan and design, suited to the requirements and feeling of the present day. Other smaller churches by Mr. Pearson have left no doubt of his capability and of his willingness to do this when called upon; we must presume, therefore, that a pure Medieval cathedral was the result wished and asked for; but the most learned reproduction of a Medieval building cannot rank with original thought and design, and therefore we say that Mr. Pearson is really at his best in some of his smaller churches, rather than in this mere re-creation of the architecture of the past.

Another of the important drawings occupying a central place in the hanging is that representing the interior of "The Queen's Hall of the People's Palace for East London" (1,679), by Mr. E. R. Robson. This shows a large hall with an elliptical ceiling covered, on the broad ribs which mark the bays, as well as on the interspaces, with very elaborate panelling and ornament. Each rib springs from a cornice projection carried by two Corinthian columns, the shafts fluted for one quarter of their length below the capital; the architrave breaks over each column, except the corona and upper moulding, which are carried unbroken across the two columns; between each couple of columns is a statue. The columns rise from the level of a gallery about one-third the height of the room, carried on Caryatides standing free on the floor with a small subsidiary column behind each. The lower portion of the wall under the gallery is plainly treated; the gallery has a front projecting in a series of slight curves from bay to bay, with cantilevers under. The effect of the whole is dignified and rich; the weak point is the treatment of the upper portion of the end wall, which is panelled in large square and circular panels in a manner which looks rather bare and bald as contrasted with the richness of the remainder. The drawing, in pen-and-ink line without shading, is an admirable piece of careful and painstaking draughtsmanship, of which we will give a reproduction in a week or two.

Another large drawing is "Charity: a Design for a Stained-glass Window, Philadelphia" (1,733), by Mr. H. Holiday. This is merely a carefully-executed red crayon cartoon, not, of course, giving any idea of the working of the design in glass. In the centre is a triple alcove, shown partly in perspective, the two side alcoves being at an angle with the centre; in the centre alcove stands the figure of Charity, a noble-looking fully-draped female figure; on either side two subordinate figures distribute bread and other provisions to folk on the lower level, in defiance of the Charity Organisation Society's maxims; beneath the centre is a double flight of steps and a platform, on which children are brought and laid before the goddess of Charity. The architectural background, which fills up nearly all the composition behind the figures, shows well worked-out details of Lombard character; on the top of it are reclining figures. The whole is a graceful composition, and the figures, it is almost needless to say, are admirably drawn; but a cartoon of this kind is not the best way of showing a design for stained glass; there is many a slip between the idea and the due working out of it in lead and glazing.

Shortness of time prevents our going further into the collection in detail in the present number; in future issues we will go through notes on most of the designs exhibited, taking them in the order of hanging.

**Timber Drying.**—We are asked to mention that the Universal Cool Air Drying Company, Limited, have opened a new dryer on the cool air system at Macclesfield-street, City-road, E.C., on the Regent's Canal, for the seasoning of every kind of timber. The premises are very large and commodious, and the dryers, specially adapted for timber already finished, are capable of treating about 1,500 squares of 1-in. boards at one operation.

### CANALS, LOCKS, AND CANAL-BOATS.\*

IN continuation of our remarks on the subject of water transit and the importance of putting our canals into working order for present conditions of traffic, it may be useful to add some suggestions more in detail as to the adaptation of canals and boats to present requirements. The size of boat best adapted to an improved canal navigation need not be the same for all canals, but it would be desirable that it should be so for the through routes, and that these main lines should be joined so that traffic may take any direction without change of vessel,—in the same "bottom," to use the navigation term. But the branch canals and those traversing agricultural districts, other than the main lines, would need but little alteration; perhaps none in respect of locks or bridges. A boat drawing 4 ft. of water will carry 50 tons if the length of the boat be 60 ft. and its width 14 ft., or 60 tons with the same width and a length of 70 ft. If the draught be 4 ft. 6 in., the length of the boat 75 ft., and width 14 ft., the weight carried would be 80 tons. This is the least of any of the propositions for enlargement of the present means of transit. If the boat were 110 ft. long, 11 ft. 6 in. wide, with a draught of water of 6 ft., the weight carried would be 120 tons.

As a basis for the scale on which improvements should be made, we ought to consider the opinions of those who are practically engaged in canal operations, although we ought not to be limited by those opinions in any design of improvement in water transit on a large scale; and perhaps it is only on a large scale that anything can be done at all, of any national value. However, amongst the evidence given before the Select Committee of the House of Commons on Canals in 1883 was that of Mr. Morton, a member of the firm of Fellows, Morton, & Co., railway and canal carriers, of Wolverhampton, to the effect that if the canals were adapted for a boat or barge propelled by steam, and capable of carrying 80 tons, the cost of haulage would be reduced to less than one-half of what it is now by the narrow boats carrying 30 or 40 tons. For such an improvement he thinks there is a good nucleus already in existence, and he would propose to open up that line in the first instance, viz., from London to Wolverhampton. The total distance is about 168 miles, and for 110 miles the locks will admit vessels carrying 80 tons. This leaves but 58 miles, or a little over one-third of the distance, which would require extensive alterations; and even of that 58 miles 16 consist of the Birmingham Canal, which he thinks would be wide enough in its present state.

The route here indicated by Mr. Morton from Wolverhampton to London takes the following lines:—First, the "Birmingham Canal," from Wolverhampton to Birmingham, 15 or 16 miles; then by the Warwick Canals to Napton, a distance of 37½ miles; then on a level piece of the Oxford Canal for 5 miles to Braunston; and thence by the Grand Junction Canal to the Thames near Brentford, a distance of 91 miles, and down the Thames about 15 miles, on the average, to the Pool or the Docks. But it may be said that instead of coming into the Thames at Brentford the boat might leave the main line of the Grand Junction Canal at or near Norwood, and proceed by way of Paddington into the Regent's Canal, and so on to the Thames at Limehouse, a distance of 110 miles from Braunston. Mr. E. J. Lloyd, C.E., the engineer and manager of the Warwick Canals, stated that 65 tons is the greatest cargo which can now be carried on the Grand Junction Canal; but it would appear from other evidence that the locks are long enough and wide enough for vessels of 80 tons. Mr. Lloyd proposes that between Birmingham and London the locks be made 120 ft. long, 12 ft. wide, with a depth of water on the sills of 7 ft., and that the vessels be 110 ft. long, 11 ft. 6 in. wide, and drawing 6 ft. of water, carrying 120 tons. As an instance of a through route upon which he

would adopt these dimensions he mentioned to the committee the route between Liverpool and London. Starting from the Thames at Limehouse, with a vessel of 80 tons, the following would be the experience of the present canals, taking the shortest of three possible routes. First, by the Regent's Canal to Paddington, nine miles, and by the Paddington branch, thirteen miles, to the main line of the Grand Junction Canal, where the cargo would have to be reduced to 65 tons, in order to pass along that canal to Braunston, a distance of eighty-eight miles. Here the boat would enter and pass along the Oxford Canal, and the cargo would be further reduced to 30 tons, and carried in a boat 72 ft. long, 7 ft. wide, and drawing 3 ft. 6 in. depth of water, in order to enter the Warwick Canal at Napton, five miles from Braunston. From Napton the same cargo would be carried to Warwick, fifteen miles, and to Birmingham, a further distance of twenty-two miles, where it would enter and pass along the Birmingham Canal for fifteen miles to the Staffordshire and Worcestershire Canal, along which it would pass for one mile and a quarter, and then enter the Shropshire Union Canal, which would carry it to Ellesmere Port, a distance of sixty-eight miles. But it may be observed that after proceeding along the Shropshire Union Canal for about one-third of that distance of sixty-eight miles, the locks become larger, and the cargo might be put into larger boats. We will say, however, that the narrow boat continues on to Ellesmere Port; the cargo is then transhipped into a larger vessel, in order to navigate the estuary of the Mersey, ten miles, to Liverpool; for the narrow boats which alone can pass through the canals mentioned could not safely reach Liverpool through the estuary. Thus the whole length of this route,—and we take it as being similar to many others,—is 246 miles, the separate parts of which are under the following control, viz., the Grand Junction Canal is under that of an independent company; the Oxford Canal, the same; the Warwick and Napton Canal, the same; and the Warwick and Birmingham Canal, also under an independent company; but the next length, the Birmingham Canal, is under the control of the London and North-Western Railway Company. Then, the Staffordshire and Worcestershire Canal has an independent company, but the Shropshire Union is again under the control of the London and North-Western Railway. So that in this route of 246 miles, eighty-three miles are under the control of a railway company.

The amalgamation of the independent companies for the purpose of forming an improved means of water-transit would not be difficult, but it is expected that the railway interest would throw great obstacles in the way of any such proposal. It could probably not be done at all without an Act of Parliament; and, seeing how many railway directors there are in Parliament, and how strong the general railway interest there is, it is probable that any Bill which might be introduced with the object of providing means for the amalgamation of these independent canal companies, or those of any other route on this or other line, would not pass. It might, moreover, by a possible combination with the railways, not have the effect, ultimately, of reducing the cost of transit so as to enable the manufacturers and traders of the country to compete with those of other countries where the cost is reduced, under Government control, to the lowest possible charge,—that is, to a toll sufficient only to cover the cost of maintenance of the works, both of the canals proper and the river navigations; for, in France and Belgium it is considered to be of national concern that full and free means of transit should be afforded to all alike, the consequences of which are that industries arise along these waterways and in their neighbourhood which before had no existence, and they have been the means of improving the general trade of the country. It has been often said that supply waits upon demand,—that demand creates a supply. The reverse is sometimes the case, as it is in the case of free waterways when properly connected: the supply distinctly creates a demand.

\* See article on "Water Transit," p. 563, ante.

There is a similarity in the two cases of French and English canals in this, that the locks there were formerly of different widths, as they are here, and in 1868 this was found to be so disadvantageous that the French Government decreed that thereafter no lock should be constructed less than 17 ft. in width with 6 ft. 7 in. depth of water on the sills. This width was adopted because it was that of some of the then existing locks. One of the witnesses examined before the Committee we have named,—Mr. F. R. Conder, C.E.,—advised that the existing locks of the Grand Junction Canal should be adopted as the general gauge for all others; they are 87 ft. 6 in. long and 15 ft. wide, and Mr. Conder would increase the present depth of water from 5 ft. to 7 ft. He finds that of the whole number of 1,901 locks in this country, 931 are 80 ft. long, or more. The locks are, on many of the canals, as a matter of original design, congregated in series at a few places, rather than, as in some other canals, one or two locks at more frequent intervals, but as an average of the whole of the canals Mr. Conder found that the mean distance apart of all the locks was 1.37 miles. The effect of these many locks is to reduce the average running speed of the boats from two miles and a quarter an hour to two miles; and if the running speed be increased to four miles and a half an hour, the locks would reduce it to an average of three and a half. It is not, however, unlikely that if main lines of canal can be improved and adapted to the present requirements of trade, locks would be superseded by inclines, and in that case the boats or barges would be of larger dimensions. This was recommended to the Committee by Sir Arthur Cotton, R.E., who would have either an incline, similar to that on the Monkland Canal, or a vertical lift, similar to that in use for transferring the boats from the river Weaver to the Grand Junction Canal. This witness stated that even in the present state of the canals there are lines which convey more than a million tons a year, and that there are several lines on which, if improved and made capable of carrying the traffic, we must be prepared for a traffic of at least five million tons. In his "Memorandum" General Cotton says:—"The first thing, of course, would be to take the line of canal out of the hands of the railway, and the next to put the whole line under one management; and I have no doubt, myself, that it should be taken into the hands of Government and put under a Commission, like the Weaver Navigation in Cheshire. The locks should then be enlarged and put into a far more effective state than at present,—that is, be so constructed as easily to pass a boat in three minutes at most."

In order to enable a speed of six miles an hour to be accomplished the canal would have to be 65 ft. wide at the top and 7 ft. deep, if the boats were 12 ft. wide with 6 ft. draught of water. Mr. E. J. Lloyd, C.E., stated that he had no doubt the line of canal we have named could be purchased and improved to the extent he advised for from 10,000*l.* to 12,000*l.* a mile. Estimates made by other engineers were 12,000*l.* and 15,000*l.* a mile for the purchase of existing canals and their enlargement and general improvement. Sir Arthur Cotton adopts this latter amount, and shows that with the large traffic which cheap transit would produce the cost of transit would be but a small fraction of a penny per ton per mile.

The Report of the French Commission in 1872 was that owing to the facility with which the less costly plant of canals can be increased, as compared with railways, and the ease with which boats can be stopped anywhere, water carriage possesses special advantages. The dimensions of the locks there recommended are 138 ft. long and 17 ft. wide, with a depth of water on the sills of 6 ft. 7 in., which would pass vessels of 300 tons. At the last meeting of the British Association, and also at the Birmingham Chamber of Commerce, Mr. Sampson Lloyd, of Birmingham, brought forward this subject, and in a pamphlet subsequently published, entitled "National Canal" (Cornish, Birmingham; and Simpkin &

Marshall, London), he proposes that the locks should admit sailing vessels of at least 250 tons and steamers of 400 tons, joining the navigations of the Thames and the Mersey by one line and the Severn and the Humber by another. The utility of the existing canals would be increased by these means, inasmuch as they would act as feeders of traffic to the National Canal, and would be fed with traffic by it. He enters into the financial question of how the expenses of so great a work are to be met, and suggests that if his scheme be investigated it will be found that it is safe from a monetary point of view, and likewise would be nationally beneficial, so that it should commend itself to the favourable consideration of all.

It would be unreasonable and hopeless to expect that the initiative of a national work, such as this would be, should be taken by persons of any locality, or of any particular interest; but we have endeavoured to give some idea of the variety in the scale of the proposed work indicated by different persons as their view of what it ought to be. First, we have the canal carrier, boat-owner, and general trader in that line of business; he looks to small measures for improving the present locks and line of canal; and the canal engineer and manager wants a larger vessel, and that the earthen slopes of the canal cuttings shall, near the top, be protected by dwarf walling,—a comparatively inexpensive proceeding, but one which present canal companies refuse to sanction, because the traffic is languishing. Then the independent engineer,—that is, one not immediately connected with canal management under a company,—looks more boldly at the situation of affairs, and recommends an enlarged scheme; then, the largest scheme of all, with a suggestion as to how the financial question is to be met. But whatever the scale recommended by these several authorities, they are all agreed upon one point, that the canals and portions of through routes which have been obtained by railway companies, either by purchase or by lease, or by an arrangement with the canal company for the management of one kind of traffic on the canal,—that this control shall cease, as the first step. Wherever we turn in this question of inland water transit the possession of some portions of the canals by railway companies seems to have a paralyzing effect upon the whole system. Another thing upon which all the witnesses before the Committee we have named seem to be agreed,—except such opponents of the improvement of canals as Mr. Bolton, the Chairman of the Caledonian Railway Company, who, by the bye, was not a witness but a member of the Committee,—is that there would, unquestionably, be a large increase of traffic on canals if better means of transit were afforded. They refer chiefly to manufactured goods and to minerals, but we would point out that the agricultural districts cannot be wholly left out of consideration, for they have been to a considerable extent robbed of their previous means of carriage of marketable produce by the substitution of railway stations at wide intervals for the more numerous and convenient canal wharfs. If it be asked why, with all these advantages, there is no greater traffic on canals, the answer is, that under present circumstances no local canal authority,—unless it be in a few exceptional situations such as those of the Aire and Calder, and perhaps the Gloucester and Birmingham Navigations,—will make a beginning of the general improvement which is desirable, for the reasons we have indicated, and which should be taken up comprehensively.

**Dundee.**—A meeting of the committee appointed to promote the movement to establish a Victoria Art Gallery in Dundee, in commemoration of her Majesty's Jubilee, was held the other day. It was reported that of the 12,000*l.* or 13,000*l.* required, between 5,000*l.* and 6,000*l.* had already been promised, and it was resolved to issue a circular inviting further subscriptions. It is expected that the foundation-stone of the gallery will be laid on Jubilee Day.

## NOTES.

**ROM** a letter of the Manchester correspondent of the *Times* of Thursday, it appears that 2,500,000*l.* of the capital of 3,000,000*l.* which was to be raised in Lancashire and the neighbouring counties for the Manchester Canal scheme, by a given date, has been subscribed; so that the prospects of the canal are looking better than could have been expected a little while since. Whether the remaining half-million will "come up to time" remains to be seen. The *Times* correspondent admits that great pressure has been brought to bear to raise the money, and that the investment in the scheme has been urged in many quarters rather as a moral duty than as a prudent venture. If it be so, we make no criticism on such a state of feeling. On the contrary, it is rather refreshing to think of the financial world being for once inspired by an idea, and willing to risk a good deal for glory. But let it be not forgotten that it is a risk. Money invested as a moral duty brings a return in the next world, let us hope, but it is apt to be recusant in regard to this world.

**A**t a meeting of the Hellenic Society, on April 21st, Professor Percy Gardner read a paper by Mr. W. R. Paton on his recent discoveries at Assarlik. Mr. Paton was himself unable to be present. The tombs opened are upon a ridge facing the Acropolis to the south-east. Mr. Paton thinks that he has lighted upon some of those "hurrying-places of the Leleges" mentioned by Strabo (vii., c. vii., 2), as still existing in his time in Caria, together with certain "deserted fortresses." The paper read gave a detailed account of the structure of the tombs, and woodcuts were shown giving sections of two examples, and also specimens of pottery discovered. From these it is clear that, whoever the people were who made the tombs, they were still in the "geometric" stage; the weapons found are iron exclusively, and the bodies of the dead appear to have been in all cases burnt. The impressed patterns found on sarcophagi are closely analogous to similar patterns found at Corneto. Altogether Mr. Paton's find promises to add important links to the ethnic chain between Asia Minor and the early Italian settlements. Mr. Walter Leaf read a paper on a disputed Homeric passage, and afterwards showed photographs taken by himself of a prehistoric house lately discovered at Tiryns, of which no report has yet appeared, and which promises to be of considerable importance.

**T**HE study of geographical science loses a warm promoter by the death of the late Mr. James Wyld. Amongst his varied labours in that direction was the building, in 1851, of the great Model of the Earth within the enclosure of Leicester-square. This quarter of the town, indeed, has been a favourite centre for exhibitions of a similar character: such as the Leverian Museum at Leicester House; Robert Barker's, subsequently the Burfords', Panorama, the first of its kind; the Mississippi River Diorama at Savile House; the Panopticon on the site of the Alhambra; and so on. Mr. Wyld obtained a ten years' lease of the ground for 3,000*l.*, and erected, after Mr. H. R. Abraham's design, a circular structure 90 ft. in diameter and lighted through the dome ceiling, somewhat after the fashion of the Pantheon. The plaster model of the earth, on a scale of ten miles to an inch, was fitted on to the inside of a globe which measured 60 ft. across. Amongst the minor exhibits we call to mind some highly popular models of siege operations illustrating the Crimean war. On the demolition of the "Great Globe," about twenty-five years ago, the enclosure was suffered to fall into a state of squalor and neglect that rendered it a standing reproach, and a constant theme for harter in the comic press. The chief object of attack was the exhumed leaden statue of King George I., which, after undergoing successive mutilations, was finally besmeared with red, black, and white paints. Having been originally modelled by C. Buehard for James Brydges, first Duke of Chandos, it

had been hought by the inhabitants of the square in the famous sale at Canons (1747), and on more than one occasion was deemed worthy of a coating of gilding.

THE Topographical Society of London and the Society for the Protection of Ancient Buildings are surely asleep. Certain statements that have recently appeared in the daily press go to show how great a misapprehension obtains in respect of the *ci-devant* Western Exchange, by Piccadilly. In one paper we find it described as the work of Inigo Jones, thus carrying us back to the days of the Conduit Mead and Brook-shott Fields, as watered by the Aye Bourne, when Piccadilly itself was unknown by that name so far westwards, and to before the time when Queensbury, Clarendon, and Berkeley Houses stood on open ground. In others it is appropriated for the one scene of nearly all the past chronicles of Old Bond-street. Lying between that street and Samuel Ware's Burlington Arcade (1819), it was erected, we are authoritatively informed, within the current century, over the yard of the Red Horse Tavern. A pewter pot hearing that name was found during the alterations now in progress. It was designed as a kind of bazaar or appanage to the Arcade, with which it communicated by a doorway that has been blocked up for years past. The upper floor consisted of a range of wide galleries, supported by plain deal squared posts; the whole being lighted from above. Having been wrecked by the great storm of forty years ago, it was then taken over by its recent occupiers, Messrs. Holland & Sherry, woollen cloth workers and dealers. That firm converted the galleries into offices and side rooms, but did not alter the main character of the structure. They lately let the premises to Messrs. Morgan & Co., of Long-acre, whose architect, Mr. Wheeler, is rebuilding No. 10, Old Bond-street, and is rehabilitating the Exchange at the back thereof. The posts have been capped in gilt, and ornamentally encased; the galleries thrown open again (their original railing being retained), and some light, tasteful decoration is added to the woodwork. Under "Bond-street," in his "Curiosities of London," (1855), Timbs mentions a large hilliard-room at No. 10 as painted, 1850, in encaustic by E. F. Lambert, with panels bordered with arabesques. We are assured that this description does not apply to the premises under review. Messrs. Holland & Sherry have removed to new premises in Warwick-street, where the former feature of a large hall with galleries around has been reproduced. The buildings cleared away included some notorious tenements along the western side of Lower John-street, together with Golden-place (in that street) and the King of Prussia public-house. The northern portion stands on the site of the house, at the south-western angle of Golden-square, which had been identified with that which was fixed upon by Charles Dickens as the home of Ralph Nickleby. Some relics of the old house have been carefully preserved by the present proprietors.

WE learn from the *Scotsman* that Dr. Rowand Anderson has received instructions to proceed with the drawings for the Hall of the Edinburgh University, the cost of which is to be defrayed by Mr. McEwan, M.P. The dome of the old University buildings is now completed, with the exception of a figure of Youth bearing the torch of Knowledge, which is to form the culminating feature of the lantern, and for which a commission has been given to Mr. John Hutchinson, R.S.A., but it will be some months before it is ready to be placed in position. Dr. Rowand Anderson has departed from the original design by Adam,—which was intended to be of smaller dimensions, and entirely constructed of timber and lead,—the lower stages of the dome now erected being formed of stone, and the roof only of lead upon timber. As seen from many points of view, the dome forms an important element in the sky-line of the buildings, but it cannot be seen from some places, such as the Meadows, from which it was expected by many to point out the *locus* of the University; and

even from the west end of Chambers-street the lantern only appears over the roof of the Museum of Science and Art. The chamber within the dome it is proposed to appropriate to the Professor of Fine Arts, and here is to be placed a bust of Mr. Robert Cox, who left the bequest from which the dome has been erected.

FOLLOWING the popular precedents of "Old London" and "Old Edinburgh," a notable feature of the forthcoming Royal Mining, Engineering, and Industrial Exhibition on the Town Moor, Newcastle, will be a reproduction of the old bridge across the Tyne. Having stood for more than 500 years, that bridge was destroyed by a flood in 1771. It was largely constructed from out of the ruins of an earlier structure which had replaced the bridge of Hadrian (A.D. 120). Having a tower and portentils at each end, it was, like old London Bridge, crowded with houses. It had also a central stronghold, together with a chapel dedicated to the Virgin. Here, according to Lanercost's "Chronicle," was exposed the right-side quarter of William Wallace. In later times the remains of an Earl of Northumberland and of other worthies were similarly displayed. Some authentic representations exist to serve as a pattern for this bit of old Newcastle-on-Tyne. The model, being about 110 yards long, and carried upon nine or ten piers, rising 20 ft. above the water-line, will be thrown across a lake in the Elswick Grounds, recently hought and enclosed by the Corporation. It is expected that the cost of construction, some 3,000*l.*, will be recouped by the letting of shops to be opened on the bridge itself. The existing hydraulic swing bridge was opened in 1876.

IF the Institute of Painters in Water-Colour would hang three hundred works in their centre room, instead of hanging more than a thousand over the walls of their three large rooms, they could make a much better and more high-class exhibition. As it is, there are three rooms containing a quantity of mediocre works, and a good many that are less than mediocre, from among which the minority that possess force and originality have to be painfully picked out. Sir James Linton has an effective and beautifully-executed work, "My Tableau of 1885" (609), representing the Emperor Maximilian visiting the studio of Albrecht Dürer; but judging from the architectural character of the room and the dimensions of the one small window shown, it is not very apparent where Dürer gets the light for his work. Among other figure subjects may be mentioned "Little Dorrit's Visit to her Sister at the Theatre" (625), by Mr. C. Green; the face of the little heroine is a very refined and pathetic study; Mr. Henry Stock's "Love's first Dart" (35), one of his ideal fancies, pretty in sentiment and fine in colour; his other one, "Musician invoking a Sea Nymph" (602), is spoiled by the ugly figure of the man; Mr. Dodd's "The Inglorious Arts of Peace" (469), some military men engaged in cooking, is a brilliantly-painted interior, with figures very well drawn and studied,—there is a want of point in the subject. This objection cannot be urged against Mr. Joseph Nash's "The Miser's End" (808), a tragic scene enough of the interior of the miser's room, with a cold dawn breaking in, papers strewn about the floor, and the chair and its deceased occupant overthrown; the idea is perhaps a little staid, but the picture is effective and striking. Mr. Walter Langley's "Betrayed" (974), a village scene in which the central figure is a woman who walks down the street and is the gaze of the villagers, is a drawing with a subject, rather deficient in the detailed treatment of the figures. Mr. Hugh Carter, in his "Scene from the Legend of Montrose" (884), is taking up a new type of subject; the figures are rather wanting in force both of execution and expression; his peculiar style is better suited to the subjects from rustic life which he has hitherto painted. One of the finest works there is a picture illustrating the pathos of animal life: an old white horse has fallen over, dying, after tugging the plough to "The Top of the Hill"

(161), his companion looking down on him with that dull puzzled sympathy which an animal sometimes shows towards another in distress. Mr. Walter Severn has been making another of his brilliant experiments, "Sunlight on Clouds and Sea" (243), very real in parts, but alas! what can white paper do with the dazzling glitter on the water, between the eye and the sun? There are several of Mr. Knight's highly-elaborated, but rather cold and mechanical, landscapes; some very fine works in a higher artistic key, by Mr. Cotman, "Moston Church" (235), "Cley Church, Norfolk" (429), very fine and broad in style. Among other landscapes may specially be mentioned, "A Rainy Day" (408) and "A New Neighbourhood" (72), by Mr. Alfred East; "Setley Heath" (174), by Mr. Wimperis; "A Windy Day on the Moor" (388), by Mr. R. Carrick; "Going to Fold" (527), by Mr. Edwin Dale; "A Shepherd and his Sheep" (573), by Mr. G. F. Wetherbee; "A Sandy Bay" (791), by Mr. C. E. Holloway; "Passing Showers" (114), by Mr. W. A. Ingram. All these are landscapes with true feeling for nature in them, contrasting with such a piece of hard-mannered mechanism as Mr. Fahey's large "Sunset, Martham Broads" (899), the sort of thing which gets an honoured place at the Institute. Mr. Napier Hemy seems to have a new kind of sea, which is not at all equal to his old ones. Among works specially architectural are a fine drawing by Mr. Fulleylove, "An Italian Garden" (681), not possessing, however, the force and depth of colour of some of his works; a Spanish Patio (468), by Mr. Macquoid; Mr. Cyrus Johnson's "Stratton, Cornwall" (254); Mr. R. Barratt's "Library Door, Siena Cathedral" (536), and Mr. R. Dudley's "Fountain of Charles V. at the Alhambra" (32), a very nice bit of architectural representation.

THE Metropolitan Board of Works have adopted a recommendation of the Bridges Committee, based on a report of Mr. Baker, that Lambeth Bridge should be extended and repaired, and the wire cables anchored in the new work, at a cost of 4,000*l.* It was stated in connexion with the report that "the bridge as originally designed was of less strength than was required as a public and not a toll-paying bridge." Thus it will be observed that the abolition of tolls on bridges sometimes involves questions other than those of financial policy merely.

IT is stated that an American gentleman has secured Mr. Herbert's original painting for the fresco in the House of Lords of "Moses bringing down the Tables of the Law from Mount Sinai," and that the artist has been commissioned by the same gentleman to finish the series originally contemplated for the House of Lords, "The Judgment of Daniel," "The Judgment of Solomon," and "The Sermon on the Mount." These paintings, it is understood, are to form "the nucleus of an art college" in the United States. Admirers of the artist's recently exhibited works on the walls of the Royal Academy will, no doubt, realise what an artistic benefit is thus about to be conferred on the fortunate but as yet unnamed locality in the United States.

#### SOME NORFOLK FONTS.

AMONGST the many fine fonts to be found in Norfolk, some of the finest are those in the north-west portion of the county. Although the subjects carved on them are usually the same, yet there are probably not two exactly alike in composition. They thus afford examples of the versatility of the Medieval designer, even when his stock of subjects was necessarily somewhat limited. On the richer fonts the bowl is generally ornamented with groups of figure sculpture,—often the Seven Sacraments and the Crucifixion. Others have seated figures, while the plainer kind usually have either traceried panels, the emblems of the Franciscans, shields with emblems of the Passion, or other simpler modes of decoration. Colour has also been largely used,—blue, red, and green remaining on the ground-work of the sculptured

panels in many cases. The number of steps varies from three downwards, and there are many examples that have lost their steps altogether. Undoubtedly the finest example of a Perpendicular font in Norfolk, — and perhaps in England, — is that at Walsingham.\* The font itself is octagonal in form, with an ogee-headed niche on each face of the howl containing the Seven Sacraments and the Crucifixion. (It may be here noted that in most cases the Crucifixion occupies the side facing west). At the angles are pinnacles which were once supported by angels, now destroyed, while above the niches is a cresting, and below them an embattled moulding. A single patera occupies the space between the angels in the large hollow moulding of the lower part of the howl. The stem is richly ornamented with niches, having four seated and four standing figures (the latter with scrolls), and at the angles smaller niches, on the pedestals of which stand angels. The plinth is bold and plain, but relieved by paterae on four faces, and on the other four broken by the intersection of the figure pedestals. The steps, three in number, have their risers richly panelled with quatrefoils and other tracery, the upper step being in the form of a Maltese cross. The height of the font is 3 ft. 9½ in., the diameter of the bowl 2 ft. 6 in., and the height of the steps 3 ft., giving it a total height from the ground of nearly 7 ft.

Not far from Walsingham is East Dereham, which possesses another fine font. As at Walsingham, the Seven Sacraments and Crucifixion occupy the eight sides of the howl. Instead of pinnacles at the angles, however, are small niches, containing figures of seraphim. These niches are supported by ribs which rise from columna at the angles of the stem. Arches are thrown across underneath the carved panels, and below are angels, with hands together, in the attitude of prayer. The stem has a single standing figure, under a vaulted niche (the canopies are broken away), and below, round the plinth, are seated figures in cows, and three out of the four of the evangelistic symbols. The winged hull of St. Luke is not, for some reason, given, and the angle shaft of the stem merely finishes with a base mitreing on the plinth in the usual way. The great height of this font, 4 ft. 9 in., necessitated a raised step for the officiating priest. This is placed on the west side, and consists of an oblong block, 2 ft. by 1 ft. 6 in., and 1 ft. 4 in. above the upper step. There are two steps, the upper one panelled with quatrefoils, and the lower one plain.

Other examples of a similar kind occur at Walsoken (fig. 1), which has shields bearing at

Fig. 1.—Walsoken.

emblems of the Passion at the angles of the plinth; Binham Abbey, where the Crucifixion is not given on the west front of the bowl, but some other group now too much worn to be made out; Cley, now much worn, and plainer in character; South Creake, an example approaching that at East Dereham in general arrangement, but without seated figures round the plinth, and retaining considerable remains of colour; and others.

\* See lithograph plates in this number for illustrations of fonts at Walsingham, East Dereham, and Leverington.

Fonts of the second kind,—those which have the emblems of the Evangelists in the panels of the howl,—occur at Wymondham, Blakeney, Fakenham, and other places. There are one or two very fine examples of this type near Norwich. Of these probably the font at Wymondham is the finest, but it has been very much defaced. The bowl has the symbols in four panels, and the other four are filled by angels holding shields, one shield being charged with three crowns. At the angles are pinnacles, and the bowl is supported by angels, whose wings cross each other. The stem has, below an embattled moulding and a row of paterae, eight pedestals on the plinth, four having lions seated on their haunches, and four standing figures. The total height of the font is 3 ft. 11 in., and it stands on three steps.

The font at Blakeney (fig. 2) is of the same general design, but without the seated figures at

Fig. 2.—Blakeney.

the base, and has shafts at the angles of the howl instead of pinnacles. Shields bearing emblems of the Passion occupy four sides of the stem, and the plinth itself is square, having four pedestals at the angles, which bear no traces, however, of ever having had figures on them.

Fig. 3.—Fakenham.

The howl at Fakenham (fig. 3) is similar to that at Blakeney (fig. 2), the panels being vigorously carved. The howl is here supported by grotesques, which have a much earlier appearance than the rest of the font,

and the stem has a panel on each face, in which is carved the monogram, "D.L." with a ducal coronet above,—referring to the connexion between the Church and the Duchy of Lancaster.

The example given from Leverington is, although strictly in Cambridgeshire, one of the Norfolk type. It has seated figures round the howl, instead of groups, with bold pinnacles at the angles, supported by angels; a row of canopied figures round the stem, some kneeling; and a plain plinth with paterae on each face. The font is carved out of a soft sandstone, and is much worn.

ON SOME DESIGNERS IN GROTESQUE.\*

In the works of Fantin (his curious little hook was published "à Chastodun, 1619") and of Elias Holl (born at Nuremberg in 1638) we come across another distinct species of grotesque. It is a little difficult to determine to which of the two artists the quaint design, fig. 8, should be ascribed: it is nameless in the British Museum collection, but the treatment of the ornament seems to suggest that it is the work of the German rather than of the Frenchman. The design is typical of a great deal of decorative work executed in the seventeenth century. As we indicated in our issue of January 15, Le Blond and many other designers used to cut those of their paterae which were apparently intended for enamelling in white lines on a black ground. The design, looked at as a piece of engraving, was not very beautiful; but a new effect was produced, and it was seized on by a number of designers of grotesques, not because it gave some idea of the result of a design when finished in enamel, but simply on account of its bizarre appearance. The octagonal centre-piece in fig. 8 is, however,

Fig. 8.

apart from its method of execution, a good study of line for linoc's sake: the space is very evenly covered, and the flow of the lines is exceptionally graceful. Fig. 9 is taken from Fantin's hook, and fig. 10 from Elias Holl's; the main idea in both books is the same; there is little sketch of a rustic scene at the bottom of the page, and "in chief" a curious device in "enamel ornament." In one it takes the form of a beetle,—in another of a leaf: in one a simple lozenge,—in another a heart; and in one the drawing is of two sawyers in a saw-pit, the end of the log on which they are at work being ornamented in this way. Holl's book contains twelve plates of the months, the sketch being of the rural occupations characteristic of each.

In the work of Peter Ahnry, a printseller of Strassbourg, who was born at Oppenheim in 1596, we have another curious and grotesque use of decorative forms. From his *Neues Lauberbuschlein Zufinden* we have extracted a specimen, reproduced in fig. 11. The general idea in all the plates seems to be to treat a shrub in a conventional manner in the foreground of a landscape. The lines of the branches are always very gracefully drawn, and spring naturally from the main stem: the leaf much resembles the one with which we are familiar in the work of Aldreger. Indeed, the whole conception seems to have been inspired by Aldreger's designs, more especially those of his first period: the treatment of the plant has a most remarkable affinity with figures 20 and 21 of our issue of December 12th, 1885 (part II).

\* Continued from p. 600, ante.

of "The Decorative Work of the Early German Engravers"), which are typical of this first period. The disfigurement of the landscape is, of course, Anby's own idea. It is most curious to note how popular this grotesque form of decorative illustration became in the early part of the seventeenth century. Fragments of many books containing them abound, among which are to be noticed those by Baltazar Lemerisier and Hans Georg Mosbach, both published by Baltazar Moncornet in 1623; and that by Pierre Labarre published in 1630, with conventional trees on a much larger scale than Anby's.

But perhaps the most remarkable applications of serious ornament to grotesque purposes are to be found in the extraordinary designs of Wolff Byron von Bismmel, of Nuremberg. We have reproduced two (figs. 12 and 13) of the six which have recently been added to the British Museum collection. They exhibit the most marvellous command of curve-drawing,—every leaf comes away from another leaf, or its parent stem, in a perfect tangential flow. There is not a "dog's hind-leg" anywhere, not even in the dog's hind-leg itself; and there is not a line introduced, with the exception of the pipe and stick, which is not a legitimate line of ornament. The features even of the man's face are formed from the serrations in the leaf,—so, too, are the dog's jaws. The whole of the dog's head is, indeed, a masterpiece of constructive skill. The smoke, too, from the man's pipe comes in for conventional treatment, and forms a link between the early German work and the later French work of Pierre Bourdon, noticed in our issue of Jan. 8.

#### STRAY THOUGHTS ON EDUCATION.\*

We always feel a pleasure in communicating our experience to those who are younger, and when one fancies one has something to say on education, it is fascinating to say it to those who have felt the want of it, and especially to those who have started the only good school of architecture in the kingdom, a school, too, that no one is obliged to attend, so that every scholar is such in fact as well as in name. Every one of such scholars, to some extent at least, knows what he wants to learn, and tries to learn it in the best way he can.

I have always taken a deep interest in education, but I have unfortunately met with few books on the subject of any value. Mr. Herbert Spencer's is at once the best and most original of any that I have read, but that is on general education. He divides education into five heads of decreasing value, as follows:—First, How to preserve your life and health; secondly, how to get your living; thirdly, how to bring up your children; fourthly, how to be a good citizen; fifthly, how to amuse yourself and others. In this last he includes all the fine arts and languages; so it is practically what education used to be. I strongly recommend every one present who has not read his book to read it, though it is not without some doubtful, if not erroneous, matter.

As the general education of the body is to exercise every joint and muscle, so the general education of the mind is to exercise all its powers. In early training the importance of general bodily and mental education cannot be too much insisted on, and this double education should never be wholly relinquished. Most of us, however, have to learn certain particular bodily and mental exercises, partly to get our living, partly to show mankind what we can do, and partly to benefit our fellow creatures.

Architectural education is mainly technical; I might say wholly so, because the art by which the higher emotions are excited in the beholder cannot be taught. The question we have to ask ourselves is how can the powers of each student's mind and body be so exercised as to make him the best architect he can be?

When I first read Adam Smith's "Wealth of Nations," I was struck with this remark that

"Those parts of education . . . of which there are no public institutions, are generally the best taught. When a young man goes to a fencing or a dancing school, he does not, indeed, always learn to dance or fence very well; but he seldom fails of learning to fence or to dance."

The reason is plain, he wants to fence or

dance up to a certain point. So it is with you. A student wants to learn something of construction, or planning, or designing, and he does learn this more or less well.

I particularly wish you to attend to this point, i.e., what *must* be learned. There are many things which it is agreeable to know, and be able to do after one is an architect, but the one object is first to be an architect, i.e., to be able to construct soundly, to plan conveniently, to arrange healthfully, and to design agreeably. Nor can one overlook this fact that there is now an examination to pass before you can enter into that select body of architects that forms the Royal Institute.

The requirements of that examination must have a great influence on your studies, and it is important that there should be nothing superfluous in it.

It is the fashion to talk of architecture as if it were a very easy and simple art, and that unless a man be equipped with many other things besides architecture he has not much to boast of. As Ben Jonson says of the cook, "He is an architect, an engineer, a mathematician, a philosopher"; you may put it down if you please to my incapacity, but I have never been able to agree with this view. You may instance Vitruvius, Orcagna, Brunelleschi, Leon Battista Alberti, Leonardo da Vinci, Michelangelo, or Sir Christopher Wren, and say these men were not only architects, but poets, painters, philosophers, and mathematicians, and what not besides, but these men were rare geniuses who appeared now and then, men of encyclopedian minds to whom the bulk of us are no more to be compared than Hyperion to a Sisyphus. The course should, in my opinion, be rather what the ordinary man proposing to be an architect can reasonably accomplish,—it is of course understood that he does make himself a capable architect,—I was almost inclined to say the average dunce, than to start it on the ground that every man ought at least to know what Wren knew.

Architecture is not one transcendental art, but at least two, science and art, combined with a very large amount of common sense, and one of these is mostly found to belong to a temperament antagonistic to the other, so that a great architect is the rarest sort of genius to be found.

Strong common sense is not infrequently found in persons with great mathematical or with great artistic powers; but you want for a great architect one who has a mathematical mind, refined taste, and artistic invention as well, and the artistic temperament is mostly nervous and opposed to the mathematical.

We may, by stretching the term, call a man a mathematician who has a smattering of plain geometry and algebra, but no sooner do we take up any advanced book on statics than we find we cannot understand it unless we have mastered the differential calculus, and can use it like the multiplication table: yet how few men can master the differential calculus!

In the same way, many men pass their whole term of learning in learning to draw, and even then do not draw very well, setting aside all the difficulties to be overcome in learning to plan, to construct, and to design. There is, too, a vast body of necessary knowledge to be acquired in learning the qualities of materials, and the way they are to be put together. I therefore think we should endeavour to restrict our examination to purely necessary knowledge, and merely allow those who have more capacity to take in as much as they like.

I do not believe you can make a genius out of an ordinary man by any amount of education, but I think that if you will only force and cram a man enough you may turn a genius into an idiot.

Mark Pattison, who had plenty of examining experience, says "accumulated learning stifles the mental powers"; and again, "little did we foresee we were only giving another turn to the examination screw till it has become an instrument of mere torture which has made education impossible, and crushed the very desire of learning."

When the late W. Burgess and I were in Italy we thought a good substratum for an architect would be that he should be able to play the fiddle and hunt, read a Greek play at sight, and be a thorough master of the differential calculus: our ardour was rather damped by the reflexion that both of us would be excluded.

We all know too well the talk of what an

architect should know: he should be a master of English; he should know who designed,—or is supposed to have designed,—every building in Europe, and all the styles of architecture that the world has known; and he should know all history, and at least the Latin, Greek, French, Italian, and German languages; but if we ask ourselves what an architect is wanted to do, we find all this mass of knowledge about as useful as dancing on the tight-rope. A client wants you to build him what he wants conveniently, soundly, and agreeably, and, I need not add, as cheaply as possible. If he asks you to an evening party, and you are young, he likes you to play and dance and sing; if he asks you to his country-house and you are middle-aged, to shoot, fish, and play at billiards; and if you are elderly, to talk well and play a good rubber at whist; but he does not employ you as an architect if all you can do is to waltz, play lawn tennis and amateur theatricals.

The old Duchess of Gordon wanted a cook, and heard that a neighbouring lady was parting with hers, so the Duchess called and asked about the cook. The lady replied, "She is a very decent body." "D— her decency," said the Duchess; "can she cook collops?"

These remarks mainly aim at this:—Is the knowledge of every past style of architecture essential, or is it merely an accomplishment? Is knowing the name, or the supposed name, of the architects of the main buildings of the world essential or not? Did the Arab architects who built the great mosques, palaces, and tombs know who built the Parthenon? Did the Mediæval architects who built the castles, monasteries, and cathedrals know? As we have no national architecture at present, and many of us get our living by tinkering up old buildings in the way they were supposed to be built, I am forced to admit that knowing what mouldings, what ornaments, and what construction people used at certain former periods, may be average ground for enabling some of us to get our living,—but it is archæology and not architecture.

When architects come to be equal to the old Mediæval ones they will not trouble their heads about what their inferiors did, and I think that we might with advantage supplant the present method by asking a candidate how he would make a moulding, or a group of mouldings that would produce a given effect; at any rate, that would employ other powers of mind than mere memory.

I would also abolish the word "style" from the instructions for the design, and say the building is to be made beautiful, imposing, threatening, or what not. We want rather to encourage originality than copying, and considerably more time should be given to this subject than is now allowed. One whole day may be well given to the plan and elevation and another to the practical section and details. In the other questions, too, I would suggest that they be mostly simple and straightforward, capable of really testing the necessary minimum of knowledge, and free from those catch-questions which may have been picked up by an examiner during a thirty years' practice.

I think we lack system in our education. With us all is baphazard. I am not inclined to run this down so much as most people, for "self-taught is well taught," but time may be money, and power too, and if we can teach systematically what is really wanted we can, perhaps, save the time generally lost in blundering about till we find our way.

If it be possible I would have every master (it is the fashion to call them "Professors" now) an architect, because he will be most likely to hear in mind what is wanted for an architect.

I cannot too strongly insist on having the most able man that can be got for each master.

The Jesuits were, I believe, the best school-masters the world has known, and they always put their best and most learned men to teach the elements. Good habits are most important, and the man who is deeply versed in his subject knows what is most likely to be of the greatest ultimate use.

Professor De Morgan used to say, that in teaching algebra, it should be so arranged that it rendered the after-learning of the differential calculus easier; but there is also this to be said, that a man ought to have the gift of teaching, or at least of making people learn. Doubtless, one of the great things is to make each man use his brains as much as possible, but if you

\* By Professor G. Aitchison, A.R.A., being a paper read before the Architectural Association on the 22nd inst., as elsewhere mentioned.

† Education. By H. Spencer. 8vo. Williams & Norgate, London and Edinburgh. 1861.

‡ Book v., chap. 1, p. 168. 8vo. London, 1729.

master has not the gift of teaching he is too apt to be like the man with the seven-leagued hoots, at his first step he is out of sight, and this is discouraging to all but the aptest and most robust scholars; but even such a man is much better than a teacher who is only one or two steps in advance of you,—he cannot really teach you anything but bad habits. I think that practical geometry, stereotomy, and stone-cutting are shamefully neglected amongst the English architects.

All the great architecture of the world has had geometry for its basis, and I fear little that is great and good will reappear until architecture has been again based upon it.

What the architectural teaching in the Middle Ages was is unknown to me, but we all know its results. That geometry in a practical form must have been well known both to architect and mason can be deduced from their work with as much precision as a proposition in Euclid, and we know too that most of the architects were called stone cutters.

The Bons who came from France to build the Ducal Palace at Venice were called stone cutters. Longhena, the celebrated Venetian architect, who was not born until the end of the sixteenth century, was the son of a mason, and carried on the business till his death.

Although T. Hope says that some descriptive geometry was used by the Medieval architects for getting the thrust of their vaults, and Viollet-le-Duc also gives a diagram of this method of ascertaining thrusts, it is probable that their great skill in construction was mainly due to experience, observation, and daring. In the twelfth century, in France at least, a good many of their buildings fell down or went to ruin. If the architects mostly rose from the mason's hanker, they were possessed of practical experience as to the quality and behaviour of various sorts of stone, and I look upon it that they acted as a chair-maker does now,—be has stock scantlings for chair-frames, and he lightens them till some chair gives way; but nowadays we have analyses and easy means of testing the strength of materials, but at the same time we are absolutely without the practical experience and that close knowledge of the materials that these Medieval architects had, and we lack their close reasoning, inventiveness, and daring in construction. Every man preparing to be an architect should be able to solve the statical problems of how thick an isolated wall should be in proportion to its height, to resist the force of wind, to bear a given weight, and to resist a given thrust, the formula for the resistance of uprights to a downright weight with the coefficients for brick, stone, iron, and timber, the pressure of water against the sides of a tank, the thrusts of arches, groined vaults and domes, the statical problem of girders, trussed and otherwise, and of roofs.

There is a shocking want of any good text-book on this subject. There wants to be one made for architects, not only clearly explaining the reasoning and giving the formulas, but working out practical cases in various materials. Is there any book that gives the problems of stone and brick spires, both vaulted and corbelled, or of tall chimney-stacks?

In the same way there wants to be a good text-book for practical geometry, stereotomy, and stone-cutting.

South Kensington has published a book in three volumes on building construction and materials, but I cannot say what its value may be.

An architect must know the main qualities of the principal materials he uses, and how mortars, cements, and concretes are made, and what weight they will bear, after what time; and he must know enough about the methods of putting materials together to ensure safety and success.

He must know, too, the main principles of healthfulness in buildings, and the proper methods of ensuring the results. There must also be added to all this, some of those subjects which are commonly called professional, that touch on the law of contracts, of rights, of easements, and those laws made expressly for buildings.

I would hold forth for your admiration and imitation, the engineers; they had a new material to deal with,—Iron. And by logic, science, daring, and invention they have built structures that rival those of the Middle Ages in lightness, originality, and daring, but the engineers have eliminated beauty from their structures.

The art of planning is primarily the use of common sense directed to this particular object, but after examining many plans of similar buildings we see, that some are much better arranged than others merely as plans, and we also see that amongst the great architects some with this added, that they were more original and effective, and lent themselves to exterior features that are striking or impressive.

Amongst English architects, the plans of Wren and Vanbrugh are excellent and original, and so are those of Soane and the late Sir Charles Barry. Longhena's Sta. Maria della Salute is a marvel, and M. Cbas. Garnier's plan of the Opera is admirable.

The way of teaching, or the way of learning, how to make things beautiful is a different matter altogether.

The English are born constructors, but during the latter part of their career, excluding the present time, we could hardly venture to say that they were born artists.

I think that we may fairly say that proportion is the soul of architecture. How is proportion to be taught? The Greeks had by experience found that certain proportions were satisfactory, and had noted them down as we learn from Plato and Vitruvius, and we try to cultivate our eye, by drawing out Greek buildings and their parts, by calculating their proportions and by studying them, or casts of them, and we pursue the same plan with all buildings, the fame of whose proportions has been accepted by successive ages. And when we are more advanced we apply the same means to ascertain the proportions of those we admire, and we paraphrase them; we also try to improve our sense of proportion and beauty by the study of nature, in every one of her manifestations.

Doubtless man and flowers give us the most beautiful instances, but lessons are to be learned from animals, from trees and rocks, from the heavens and the waters.

On the road to Amalfi there are series of rocky points that at a distance look like the spires and pinnacles of some Gothic town.

"Mouldings," says Viollet-le-Duc, "are architecture." By studying the Greek mouldings we learn the infinite trouble taken to make them elegant and effective, and they are without doubt the finest that the world has seen, but they were made for a sunny climate, and were executed in marble, and are ineffective in England,—absolutely so when the sun does not shine. I think we cannot study them too closely, not for imitation, but to learn the causes of their success.

When the early Renaissance architects tried to give some of the grace and elegance of the ancients to their buildings, they were delightful; but when the later architects raised the Roman orders into divinities that could only be dumbly imitated, their buildings rapidly sank into dreariness and insipidity, and only emerged from it to fall into contortion.

I must perforce boid up the Saracens and the Mediaevals for your imitation, as regards their mental attitude. When they began to build they were little better than barbarians, and what the Romans had done appeared to them to be the work of enchanters; but they soon surpassed their masters, and you can readily fancy with what contempt the architect of the honey-comb domes at the Alhambra, or the architect of St. Urban at Troyes, or of King's College Chapel at Cambridge, looked down on the Roman architects. The works of these Saracens or Medieval architects were like Newton's "Principia" to his seventeenth-century contemporaries; the question was not who else could have written it, but how many people in Europe could understand it when it was written.

We have plenty of examples of artless buildings now in houses and warehouses, which are simply dead walls with holes in them; the question for us is, how can we make them beautiful without copying? We have wood posts and girders and trussed roofs. What can we do to turn these into beautiful objects? Each one of you may possibly say, if I could make these things beautiful to my own taste, how can I be sure that any one will like them? You cannot be sure, and therefore the only hope for architecture is that those who have this noble ambition will consider it to be its own reward; it is only by this self-denial and devotion that any art, calling, or occupation can be ennobled. Read Brunelleschi's life. This able sculptor was ready to travel to Rome and gain his living as a goldsmith, so as to be able

to study Roman ruins and the Pantheon, and to ponder how the cathedral at Florence could be domed. He met with success, and became immortal; but he might have perished unknown in his attempt,—"unwept, unhonoured, and unused."

When I was a pupil all the architectural instruction that was to be had was in an office; books were rare, and the teaching at the Royal Academy was confined to six lectures, and a permission to draw from the antique. Thanks to the Royal Academy, the Royal Institute of British Architects, and to South Kensington, books are only too plentiful; there is some teaching, and a good deal of direction, and, thanks to yourselves, there are the means of supplying in some measure what is deficient elsewhere.

In common justice, I must say the young architects of to-day have in certain respects made a noble use of their opportunities, their powers of delineation are such that in my youth all the architects would have crowded to see them as they did to see the drawings of Barry, Cockrell, and Pugin. The best of them would have been snatched up as illustrators of books. The architectural skill, too, exhibited in private buildings is as delightful as it is extraordinary, and all that seems to me to be wanting is more thorough and systematic teaching, a greater unanimity in the choice of a type, so that all the isolated and divergent energy of the profession may be applied in one direction to the furtherance of our art, that a greater determination to invent rather than to paraphrase may show itself, and that more attention may be paid to the perfecting of monumental art.

I trust that some of you gentlemen will find time to attend the discussion on teaching at the ensuing Conference meeting, and will give us in short any matured judgment you may have formed on the subject.

[For a report of the discussion which followed see p. 654.]

#### HENDON DRAINAGE WORKS.

THESE new works, constructed at a cost of 60,000*l.*, were opened on Saturday last, and the Local Authorities were able to signalise the occasion by securing the presence of Mr. Gladstone, who is residing in the neighbourhood, at Dollis Hill, and who made a speech on the vast improvement in the public health of the country, and the energy and enterprise displayed in the construction of improved systems of sewage disposal within the last few years. The Hendon scheme is on what is known as the lime and filtration system, though there are special features introduced with the view of securing even a greater degree of efficacy than that hitherto attained. It may be mentioned, in the first place, that the system provides for the drainage disposal of the sewage of Hendon, Childshill, Cricklewood, Golder's-green, and Temple Portane. The total length of the sewers is 14½ miles, and they vary in size from a 3 ft. circular brick to a 9-in. pipe sewer. The whole district contains 8,382 acres, and the rateable value is 101,000*l.* The population in 1881 was 10,484, but the scheme provides for a population of 24,000*l.* At the works, which have an effluent outfall into the Brent, the coarse solid matters are removed by straining; lime is introduced for the purpose of defecation and precipitation of some of the organic matters, and the resulting suspended matters are removed by settlement in tanks; the effluent water from the tanks is purified by filtration through specially prepared beds.

At Hendon, lime is, as already stated, used, but differently from the lime treatment pursued elsewhere. It has been considered that the addition of what is called "milk of lime" is not so effectual as if the lime added is lime water, because it is only dissolved lime, or that in solution, which is effectual. All sewage is highly charged with carbonic acid, and the particles of lime in the milk of lime combine with the carbonic acid, and form a coating of carbonate of lime on the outside of the particle which is insoluble, and the lime cannot enter into solution, and is prevented from doing its work. At Hendon works, one-sixth part of the whole sewage is withdrawn from the carriers, and pumped into a continuous mixing vessel, provided with agitating arms. Then milk of lime is added containing lime equal to 15 grains per gallon of

the whole sewage, or 90 grains per gallon of that passing through the lime-water mixing apparatus. The lime is thoroughly dissolved, and the lime-water so obtained is added to the remaining five parts of the raw sewage, mixed by a salmon ladder arrangement, and run into one of the settling-tanks. After five or six hours' rest in the tanks the effluent water is run on to the filter-beds. The sludge is pressed into portable cakes by Messrs. Johnstone & Co.'s presses. The effluent from the filter-beds is discharged into the Brent.

The quantity of lime used for treatment is a little less than 2 cwt. for every 100,000 gallons of sewage entering the works, and about 100 lb. of lime for every ton of compressed cake turned out from the presses.

The annual cost of working the whole system is estimated at 570l. The method of precipitation by lime, supplemented by land filtration, adopted at Hendon was recommended by Professor Frankland and Dr. Stevenson, and approved by Dr. Dupré. They consider that no addition to the lime in the shape of sulphate of alumina is necessary when precipitation is supplemented by land filtration. To carry out the recommendation of properly dissolving the lime in one-sixth of the volume of sewage and afterwards mixing it with the remaining five-sixths required specially-designed machinery, which has been manufactured by Messrs. Johnstone & Co., of Stratford. Some difficulty was experienced when it was discovered that the site of the proposed filter-bed consisted of a stiff clay; but the difficulty has been overcome by the engineer, Mr. Cousins, by placing in the bed 14 in. of burnt ballast, with tranches of that material at intervals, averaging 5 ft. 6 in. in depth; and on the surface 1 ft. of mould. The beds have an area of 30,300 square yards. Mr. Harry Smith, of Chiswick, was the contractor for the works, which have been carried out in a substantial manner. It may be said that the general outline of the scheme was designed by Mr. Pollard, the former engineer to the Hendon Local Board, but many important alterations have been made, and the scheme completed, under the superintendence of Mr. Cousins.

#### CRYSTAL PALACE SCHOOL OF ENGINEERING.

THE Easter term closed on Saturday by the delivery of the report of the examiners on the students' work for the term, and the presentation of the certificates awarded. Sir Robert Rawlinson presided and presented the certificates. The report of the examiners, Messrs. W. Crickman, C.E., and W. Lawford, C.E., having been read.

The chairman addressed the students. This, he said, was the third occasion of his having had the pleasing duty entrusted to him that he had again to discharge. It gave him great pleasure to come amongst the young men, and if any words of his could give them stimulation and encouragement in their work, his doing so would give him personal gratification. Some young men, and elder people also, were disposed to regard the future as a gloomy prospect, and sometimes the discouragement was natural. He advised his young friends to hopefulness. The world was not to be taken by storm; ability, patience, perseverance, and steady application, would succeed in the end. He would advise them not to be too particular as to what they might get to do at first, nor to think they could pick and choose, accept this and reject that, at their pleasure, but to take any honest, honourable, manly work, which was no disgrace to the son of either prince or peasant, that might come in their way, and what their hand found to do, to do it heartily. Vast fields were open and opening for the employment of young engineers of capability and worth. Japan had begun, China was beginning to require their services, they had the fields of India, Barmah, the Australasian colonies, North America, South Africa. Sanitary works were needed in all of them; in some water-supply was an urgent want, roads, railroads, and harbours had to be made, and structures of all kinds had to be put up. In these the young engineers of this country, and of this school, would find ample scope for the employment of their best powers. He hoped that in their future career his young friends would sustain the reputation of England for honour, probity, and truthfulness.

The reports of the Examiners on the students' lecture examination and work done during the term were in highly commendatory terms. They also ascribed unqualified praise to Mr. Wilson, the Principal, and his staff, for their excellent methods and great pains taken with their pupils. The lectures for the term were on "Steam." Twenty-eight of the students were eligible for examination, of whom sixteen received certificates. B. G. Lloyd was first with 238 of an attainable 277 marks. In the drawing office nine certificates were awarded, E. C. R. Nelson first; in the pattern and smiths' shop, ten certificates, J. S. Lea first; in the fitting-shop, ten certificates, J. H. Chute first, also second for lecture examination, with 211 marks. In the Civil Engineering Section, five certificates were awarded for students of the first term; general surveying and preparation of plans for Parliament, W. E. Underwood, first; second term, calculations, plans, and estimates for a railway and dock, eleven certificates, E. J. Prew, first; third term, designing and construction of existing and other engineering works, twelve certificates, F. B. Dixon, first; fourth term, sanitary work and water supply, three certificates, H. A. Minchin, first. Four first-grade and two second-grade certificates were awarded in the Colonial Section. To J. F. Harrison the examiners awarded the Bronze Medal of the School of Art, Science, and Literature. Of the students who have passed through the School, 151 have become Students, and 53 have been elected Associate-Members, of the Institution of Civil Engineers.

#### ARCHITECTURAL SOCIETIES.

*Leeds and Yorkshire Architectural Society.*—The annual meeting of the members of this Society was held on the 21st inst., the President (Mr. C. B. Chorley) in the chair. The Secretary (Mr. E. J. Dodgshun) read the eleventh annual report, in which the Council stated that they saw cause for congratulation in the steady increase in the number of the Society's supporters, and the greater influence which it exerted from year to year by co-operating with other societies for the advancement of architectural education and professional practice. The name of the museum were gradually being more fully understood by the public, and members and exhibitors alike were making use of the facilities which the institution offered. The trades' catalogue library was maintained in efficiency. The sanitary exhibition was open to further extensions. The library had received more attention, a donation of 20l. from the funds of the society, and a gift of 5l. 5s. from Mr. C. R. Chorley having been made. The Council was also indebted to its honorary treasurer (Mr. J. B. Fraser) for a very valuable gift of four large cases of timber samples, together with a MS. descriptive catalogue, which was being printed by the Society. Other members had also made contributions of books. Now that Her Majesty had granted a supplementary Charter for the purpose of effecting certain reforms in the constitution of the Royal Institute of British Architects, the Leeds Society were anxiously looking forward to changes which would enable all provincial architects to benefit more fully from a connexion with the Institute. The Hon. Secretary, Mr. G. B. Bulmer, having resigned, his resignation was accepted with regret, and the best thanks of the Council, on behalf of the Society, were tendered to him for his valuable services during the last four years. Mr. E. J. Dodgshun had been appointed as his successor. On the motion of Mr. J. W. Cannon, seconded by Mr. J. Rhodes, the report was adopted, after which officers for the ensuing year were appointed, including Mr. Chorley as president, Mr. J. B. Fraser as treasurer, and Mr. E. J. Dodgshun as secretary.

*Northern Architectural Association.*—The annual meeting of the Northern Architectural Association was held in the Old Castle, Newcastle, on Tuesday afternoon, Mr. E. Shewbrooks presiding, in the absence of Mr. Hoskins, President. Mr. Frederick Clark and Mr. W. J. Moscrop, jun., were elected members of the Association. The Hon. Sec. (Mr. F. W. Rich) read the report of the 28th session, which stated that reference was made in the last annual report to the probability that, owing to the revision of the rules, the roll of members would be increased, and the committee were

glad to announce the fact that since that date twenty-one members had been added to the roll,—viz., four members, eight societies, and nine students,—and on that day six more members stood for nomination, and two for election. Eight excursion meetings were held last summer,—to New Town Hall, Middlesbrough, Raby Castle, Elswick Works, residence of Captain Andrew Noble, C.B., Jesmond Dene House, and residence of the Hon. Secretary. Sketching meetings were held at Hexham Abbey, Seaton Delaval Hall, Ryton, and St. George's, Cullercoats. The question of federation or registration had engaged the attention of the committee, and they had the pleasure of reporting that the President had been appointed a member of the Special Federation Committee on the Royal Institute of British Architects. It was decided to offer prizes to students for excellence in design and construction. The treasurer's statement showed a small balance in hand. The Chairman, in moving the adoption of the report, said that the Association promised to prosper. The designs which had been sent in reflected great credit on the young gentlemen who had competed. It must also, he thought, be a matter of gratification that they had got at least the nucleus of a library. The report was adopted, and after the transaction of formal business the meeting terminated.

*Edinburgh Architectural Association.*—The members of the Edinburgh Architectural Association visited Dirlton Castle on Saturday afternoon last under the guidance of Mr. David MacGibbon. The conductor first drew attention to the exterior of the castle, and pointed out the advantages of the site for defence, the wall being built on a rock, which, although not lofty, was too hard to be undermined, and the whole being surrounded with a wet ditch. This was crossed by a long wooden gangway, the stone pieces to support which still exist, and part of which formed the drawbridge. The oldest parts of the buildings date from the thirteenth century, and formed a portion of the castle which was besieged and destroyed by Bishop A. Beck in 1298. These consist of three large towers at the south-west angle, and a part of a tower at the south-east angle, all the details of which belong to that period. The castle was rebuilt, to judge from its style, in the fifteenth century. The entrance gateway with the portcullis room above, the hall and other buildings on the east side, are all parts of this restoration. The hall has been a splendid apartment, 72 ft. by 25 ft., with screen and minstrels' gallery at the south end, and the dais and lord's apartments at the north end. The kitchen is on the same level, and has a very lofty vault with aperture for ventilation. It is provided with two large fireplaces and a good service-room; below this are the bakehouse and wine-cellars. Under the lord's private room are guard-room and dungeon. In the sixteenth century a private dining-room and other apartments were erected at the south-west angle of the courtyard,—dining in the hall being then given up. The gateway in the outer enclosing wall and the dovecot were pointed out as deserving of notice. Dirlton belonged in the thirteenth century to the De Vaux family, whose heiress brought it to Sir John Halliburton. His grandson, created Lord Halliburton in 1440, was Lord Treasurer for Scotland, and the castle was probably restored by him. In 1603 the property was conferred by James VI. on Sir T. Erskine, who saved the king in the Gowrie conspiracy. It afterwards passed into the hands of Sir James Maxwell, and in 1663 was purchased by Sir John Nisbet, who, as Lord Advocate, bore the title of Lord Dirlton. The castle still remains in the possession of his descendant, Lady Mary Nisbet Hamilton, to whose taste and liberality the public are indebted for the careful preservation of the buildings and ready access to the beautiful gardens which surround them. At the close of a very enjoyable day a hearty vote of thanks was accorded to Mr. MacGibbon for his interesting paper.

*Paisley.*—The infirmary which for many years has served the wants of the burgh of Paisley has of late seen found altogether inadequate to meet the demands made upon its resources, and increased accommodation has become an imperative necessity. At present the accommodation of the infirmary is limited to about 120 beds, and the directors propose to add 80 to this number, which would entail an outlay of about 8,000l.

Illustrations.

EDINBURGH CASTLE: A SUGGESTION.

The lamentable state of the buildings which compose Edinburgh Castle, as they are now and have been for the past two hundred years, is a standing disgrace to the country. Perched in mid-air, in one of the most prominent positions of any building, ancient or modern, in the world, they stand in the most abject state of desolation as regards architectural beauty. What they were in ancient times can to a great extent be gathered from drawings which have from time to time been published; and the accompanying suggestion is intended to show what might be done to make the present uncouth mass more presentable and more worthy of its past glories and traditions.

The side represented is by far the finest view of the castle, and is taken from a south-east point, somewhere about the position of Heriot's Hospital. It shows the royal apartments or lodgings in the south-east angle, with the Half-moon Battery on the east, and the old Parliament Hall to the south.

This Hall, so rich in historical memories, has been sadly ill-treated from time to time, and is now cut up by floors and partitions, and serves as a hospital for the garrison. The author of the accompanying design (see phototype plate in this issue) had the privilege of examining it through the courtesy of the Engineer officer in command a year or two ago, when alterations were being carried out in the interior, and when some curious discoveries were made in the wall-paintings and floors. Much of the old open roof framing was then exposed from the interior, showing the early fifteenth-century work, very much shorn of its ornament; an enriched stone corbel remains supporting one of the principal rafters of the roof; it seems to be of a much later date than the roof, being decidedly Classic in its character; it is possible that the early and severe corbel may have been carved in this style when the more modern additions were made to the castle in the sixteenth century. The south side of the Parliament Hall is at present disfigured with a corbelled-out erection used for latrines and other sanitary provisions connected with the hospital, and from it an external drain, composed of huge cemented clay-piping, coils its unsavory way down the venerable rocks like an enormous serpent. All the windows of the Hall are blocked up or removed, and the outer roof has sunk below its old level, and is broken up with a row of storm windows of a decidedly workhouse character which peep over the old corbelled parapet. In the drawing all this has been removed, and the large millioned windows have been restored.

The Royal Lodgings, being, as their name indicates, the domestic portion of the castle buildings for the use of the royal household, extend from the east end of the Parliament House round the south-east corner, and terminate at the Half-moon Battery, built by the Regent Morton. These buildings are of several periods, the lowest portions consisting of dark stone arched vaults cut on one side out of the solid rock, which also crops up in the floor, which is simply the virgin rock roughly levelled. These vaults were used as dungeons, some of the iron rings to which the unhappy prisoners were chained still remaining in the walls. Many of these lower vaults and those below the Parliament Hall and in the block of buildings beyond are of a very early date, and are, in all probability, part of the buildings of a very early period. Several curious, straight, narrow stairs, made in the thickness of the walls, lead up to the rooms overhead. The upper part of these walls is mostly of fifteenth-century work.

\* We are not, of course, responsible for Mr. Lyon's opinions or suggestions.—Ed.

although repaired and added to in the sixteenth century, the most modern part being that over the Half-moon Battery, which is dated 1613.

All these buildings are shown with a new roof of a picturesque and varied skyline. The oriels have been restored and the upper part of the buildings generally adorned with corbelled-out parapets, gargoyles, turrets, crows-stepped gables, and details of the sixteenth-century Scottish baronial architecture, all the lower portions of the buildings being left untouched. The more modern part of the Royal Lodgings has been raised by the addition of a high-pitched roof with dormer windows in place of the old flat roof, the angle turrets being finished with ogee terminations.

At the back of the Half-moon Battery is shown a restoration or rather rebuilding of David's Tower as near its original site as possible. This tower was built by David II. about 1380, and was for long the most conspicuous object of the castle buildings, but was hattered down in Drury's siege of the castle in 1573.

The parapets below the Parliament Hall have been restored in accordance with the rest of the proposed work above, and a large circular tower placed on the corner of the block beyond the Parliament Hall to the west. Beyond this, again, is seen the hideous block of barracks erected at the end of the last century. It is proposed to improve this by throwing out towers breaking the monotony of the line of buildings somewhat in the manner of Fyvie and Saltcoats Castles.

WALTER F. LYON.

IN THE HOF-KIRCHE, INNSBRUCK.

We give a reproduction from a drawing by Mr. W. J. N. Millard of the celebrated Tomb of Maximilian I., in the Hof-Kirche at Innsbruck, or rather of a portion of the remarkable group of bronze figures of kings and heroes which surround the tomb, and to which mainly it owes its fame. There certainly never was a more weird or poetic idea in relation to monumental design than that of surrounding a tomb

The Figure of King Arthur, Maximilian Tomb, Innsbruck.

with this guard of solemn, silent, bronze figures, standing as if they had taken up a position for the moment round the tomb to do honour to the remains of the monarch buried there.

The tomb, which is itself adorned with delicate sculpture, and enclosed, like our

Henry VII.'s tomb, with a high grille of elaborate metal work, stands in the middle of the nave, whilst between the columns of the arcade are ranged the attendant figures, face inwards, twelve on each side, with two couples more flanking the entrance to the chancel. The small plan subjoined shows the positions of the figures in the plate, No. 1 in the plan being the foreground figure. They are all gorgeously clad in full armour or dress of the richest description, though as statues they are not all equally well conceived and modelled. In fact, there is something almost grotesque in the pose and general treatment of several; but conspicuous among the company for spirited action combined with fine execution, stands "Arthur König v. England," as runs the legend inscribed beneath him,—a figure of which Mr. Millard gives a separate sketch, and which may well cause an Englishman a passing sensation of pride in being represented at the tomb of an alien monarch by so gallant a knight.

The pictorial effect of the great dark bronze effigies and the polished red marble columns together, opposed to the light streaming in from behind them, is not to be readily forgotten.

FONTS.

For a descriptive article relating to the fonts shown in our lithographed illustrations, see "Some Norfolk Fonts," p. 632.

PREMISES IN BROOK-STREET, HANOVER-SQUARE.

This block of buildings has just been erected next to the gabled house at the corner of New Bond-street, and advantage has been taken of the prominent position to provide saloons above the shops, with large show windows for the display of goods. In addition to the three saloons on the ground-floor, a top-lighted picture saloon has been formed in the rear, and the two upper stories are constructed especially for a photographic studio.

The whole of the front above the shop cornice is in terra cotta, of a warm brown tint, supplied and fixed in a very creditable manner by Messrs. Wilcock, of Barmantofts.

Messrs. N. S. Joseph & Smithem were the architects, and Messrs. Kilby & Gayford the general contractors, Mr. Charles Evans supplying the wall tiles and painted-glass decoration.

ST. SAVIOUR'S UNION INFIRMARY, CHAMPION-HILL.

In our issue of February the 26th we gave a view of a part of this large building, with plans and particulars of it generally. At the request of the architects, Messrs. H. Jarvis & Son, we give a bird's-eye view showing the whole building, as the drawing published before, showing the administrative block to a tolerably large scale, gave no idea of the size of the whole building.

In reference to the description of the work in the Builder for February 26th, Messrs. Jeakes & Co. ask us to state that they executed the work for the steam cooking and steam laundries.

EDINBURGH MUNICIPAL BUILDINGS DESIGNS.

SIR,—I notice in your last issue you call attention to an apparent discrepancy between the plan of my design for Edinburgh Municipal Buildings and the elevations.

The apparent discrepancy arises from the omission on the part of your printer (from the title) of the words "Alternative Plan."

I may add that I asked you to publish the alternative plan, as I thought it rather better than my other plan.

BRIGHTWEN BINYON.

\*\* It is rather illogical, however, to send us up elevations of one design and plans of another.—Ed.

CHAPTER I

THE EARLY HISTORY OF THE UNITED STATES

THE first discovery of the continent of North America was made by Christopher Columbus in 1492. He sailed from Spain in search of a westward route to the Indies, and on October 12th he landed on the island of San Salvador in the West Indies. This event marked the beginning of European exploration and settlement in North America.

The early history of the United States is characterized by the discovery and settlement of the continent by European explorers. The first European to set foot on the continent was Christopher Columbus in 1492. He was followed by other explorers such as Amerigo Vesputi, John Cabot, and Vasco da Gama. The discovery of the continent led to the establishment of colonies and the eventual formation of the United States.

The early history of the United States is a story of exploration, discovery, and settlement. It is a story of the brave men and women who ventured into the unknown and paved the way for a new nation. The early history of the United States is a testament to the human spirit of adventure and discovery.

THE HISTORY OF BRITAIN BY HENRY SPENCER

PREMISES IN BROOK STREET.—MESSRS. JOSEPH & SMITH, ARCHITECTS.

THE HISTORY OF THE UNITED STATES OF AMERICA

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

REPORT OF THE COUNCIL.

The Report of the Council, to be submitted to the Annual General Meeting on Monday next, contains the following passages:—

The official year, which terminates with the Annual General Meeting of 1887, may fairly be reckoned one of the most important in the annals of the Institute. Such were the words used, except in the matter of date, in the Report to the Annual General Meeting of 1877, with respect to the measures taken at that time for the improvement of the Institute. The recommendations made by the two Improvement Committees which sat prior to May, 1877, were, however, restricted in their aim by certain provisions of the Charter of 1837. Such obstacles to extension and development are now removed by the grant from her Majesty in Council of a Supplemental Charter, and the issue of Letters Patent under the Great Seal, bearing date the 28th of March, 1887. The document, which is printed as it was received from the Home Office in the current No. (13) of the Journal of Proceedings, is now in the possession of the Corporate Body.\* But until the new By-laws to be made under its provisions have been adopted by the Fellows, and submitted to and approved by the Privy Council, the Institute is to be administered in conformity in all respects with the Original Charter and the By-laws now in force. The Council have therefore given notice of their desire to receive from members suggestions for altering or amending certain of the existing By-laws, prior to calling a Special General Meeting. Meanwhile they beg leave, on behalf of the Royal Institute, to express their high sense of the increased privileges and obligations conferred on the Corporate Body by the Queen in Council, and their thanks to the seven architectural societies who supported the petition.

In the Report of 1876-77 the Council congratulated the members on the maintenance of the rate of increase in the classes of Fellow and Associate, and they stated that during that official year twenty-eight Fellows and twenty-four Associates had been elected,—a larger number than had been admitted for many years past. At that time there was no Examination test for the admission of Associates,—a test which, it might fairly have been assumed, would reduce the numbers of that class of members; but the facts show that, in the long run, no such reduction has resulted. The number of Associates elected during the present official year is thirty-eight,† and a comparison with that of 1876-77, so far as concerns the election of candidates in the class of Associates, gives the following:—

|         |         |
|---------|---------|
| 1876-77 | 1886-87 |
| 24      | 38      |

A comparison of the total number of professional members in 1877 and 1887 affords equally satisfactory results, viz.:—

|                 |         |         |
|-----------------|---------|---------|
|                 | 1876-77 | 1886-87 |
| Fellows.....    | 330‡    | 431§    |
| Associates..... | 318     | 680     |
|                 | 648     | 1111    |

In the course of the official year, which terminates with the annual meeting in May, twenty-four fellows have been elected, nine of whom were previously members in the class of Associates, thereby making an increase of fifty-three new professional members, as against forty-five in 1876-77; and at the present moment there are twenty-eight gentlemen eligible to become candidates for the Associateship.

The losses by death have been considerable. Amongst the Fellows they are:—R. K. Penson, F.S.A., Edward Hughes, George Key, George Bell, and George Villiamy, Past Vice-President, the Superintending Architect to the Metropolitan Board of Works. Amongst the Associates:—C. B. Thurston, F.S.A., Lionel T. Waller, George Smith, Oswald Adhead, Thomas Farrer, H. Saxon Snell, and R. A. Fraser.

\* We also reprint it in the *Builder* this week.  
 † Except in the period of four years between 1878 and 1882 when the Obligatory Examination came into force, this is the largest number of Associates admitted in the course of twelve months. During the decade preceding 1878, the largest number of Associates elected in one year was 31, the lowest 14.  
 ‡ Including 46 Life Members.  
 § Including 85 Life Members.

Amongst the Hon. Associates:—E. E. Antrobus, F.S.A., Colonel Morant, R.E., and Major-General Moody, late R.E. Amongst the Hon. Correspondents:—M. Prosper Morey, of Nancy; H. H. Richardson, of Boston, U.S.A.; and Olivier Rayet, of Paris.

The Council submit statements, divided into Ordinary and Trust Funds, of the Receipts and Disbursements for the year ending December 31st, 1886, signed by Mr. Alexander Graham and Mr. G. Richards Julian, the auditors appointed by the last annual general meeting. [Here follow the revenue accounts and balance-sheets of both funds.]

The special disbursements incidental to the Conference, and the legal and other expenses incurred in connexion with the Supplemental Charter, will have to be partially defrayed out of capital.\*

In the course of the official year two Examinations in Architecture have been held in London, one during the week commencing November 22nd, 1886, the other during the week commencing March 21st, 1887. Thirteen applicants were admitted to the November Examination, eight of whom passed; and four were relegated to their studies, with the privilege of again presenting themselves without fee. This being the third and concluding Examination of the year 1886, the Board considered the several claims to the Ashpitel Prize of the thirty-nine gentlemen who passed at the Examinations in London and Leeds; and awarded it to Mr. Henry Thomas Hare, of 3, Regent's Park-villas, Gloucester-road, N.W. Thirty-two applicants were admitted to the March (1887) Examination. The examiners who set the questions and assigned the marks were Messrs. H. D. Appleton, S. Flint Clarkson, Alexander Graham, E. A. Cruning, J. D. Mathews, E. C. Robins, John Slater, Ernest Turner, and Aston Webb. The moderators who superintended the written and graphic portions of the Examination were seven in number, namely, Messrs. G. Hamilton Gordon, F. Hooper, J. M. Kennard, W. R. Low, W. Millard, Walter L. Spiers, and C. J. Tait. The Oral Examination lasted two entire days. The Board reported that twenty-five had passed, and that three had not passed; while three were relegated to their studies for one year. Lastly, the Council have required one candidate to present himself again for examination in sanitary science, strength of materials, shoring, &c.

An Examination for Certificates of Competency granted under the Metropolitan Building Act, 1855, and other Acts of Parliament, was held on the 28th and 29th of October, 1886, when nine candidates presented themselves, of whom six obtained Certificates of Competency to act as District Surveyor in London, and one as Building Surveyor under local authorities. Another Examination will take place this month (April).

The report of the Library Management Committee says that:—

"During the twelve months elapsed from 1st April, 1886, to 31st March of the present year, the total additions to the Library amounted to 244 volumes and 124 pamphlets, and to the Loan Collection 12 volumes and 3 pamphlets, exclusive of periodicals, reports, and transactions of societies, and parts of works issued in a serial form. The number of volumes presented to the Library was 224, and to the Loan Collection 5. Of pamphlets, 123 were presented to the Library and 3 to the Loan Collection. The valuable bequest of the late Mr. Ferguson, Past Vice-President, of such of the architectural works in his library as were not already in the Library of the Institute, brought to the Library an accession of 138 volumes and 3 pamphlets, which are included in the foregoing enumeration. Of drawings, engravings, and photographs, 166 sheets were presented, exclusive of the 'Sketch-Book' of the Architectural Association. The other donations included several specimens of timber, and a medal struck by the Corporation of the City of London.

The works purchased comprise 29 volumes and 1 pamphlet for the Library and 7 volumes for the Loan Collection, together with several Parliamentary papers. The want of shelf-space in the Library has been temporarily met by the erection of a new bookcase; but, while recognising this help, it must be pointed out that it cannot be regarded as so final, as an immediate and pressing difficulty, and that the question of further accommodation for books will before long again have to be taken up. The Committee reported to the Council on a scheme for providing shelving for books of reference in the meeting-room, to be left open for readers. This scheme was referred back by the Council for reconsideration. The new bookcase will enable some shelves in the meeting-room to be cleared out for its above purposes.

The attendances of readers in the Library were close upon 3,000, details of which are given in a tabular form in an appendix. The day attendances show an increase of more than 26 per cent., and the evening attendances an increase of more than 31 per cent., as compared with those of last year.

\* The portion of capital now held in Coudsols, which, at the beginning of 1881, after the cost of the building alterations had been met, was £1,760*l.* 17*s.* 9*d.*, has reached the sum of 4,076*l.*

The number of fresh tickets (exclusive of renewals) issued for admission to the use of the Library and Loan Collection was 84, an increase of more than 9 per cent. upon that of last year. The number of volumes issued on loan was 910.\*

The new series of the Journal of Proceedings has, in its third volume, assumed a literary character. On the recommendation of the Standing Committee for Literature, the Council have admitted into the Journal contributions of varied description from members, under the heads of "Sessional Notes," of "Members' Memoranda" on the papers read at the ordinary meetings, and of "Correspondence." The several books, drawings, &c., presented by members and others, have also been separately noticed, and in some cases have been carefully reviewed; while, from the foreign periodicals and the Bulletins of Societies, matter has been obtained for "Foreign Notes," written for the most part by members of the Literature Committee. Indeed, the Council feel that they are greatly indebted to the already large number of contributors to the Journal, and especially to Mr. Alexander Graham, who, as Vice-chairman of the Literature Committee, has taken the greatest interest in the work. Mr. Roger T. Conder, one of the Hon. Secretaries of the Committee, has also regularly assisted on the Wednesdays preceding the day of issue, generally until a late hour of the night. Eight meetings of the Literature Standing Committee\* have been held, and the work of procuring papers for reading and discussion has been materially aided by the energy of Mr. G. Richards Julian, the senior Hon. Secretary of the Committee.

The Standing Committees for Art and for Practice have also met regularly about once a month, and three meetings of the Standing Committee for Science have been held. The memoranda and business of the Special Light and Air Committee have been taken over by the last-named, and, beside other matters of importance, they have commenced an inquiry into the subject of "Rot in Timber."

The business of the original Committee for the Conservation of Ancient Monuments has been taken over by the Standing Committee for Art, and they have brought up careful reports respecting well-known buildings of historical and artistic interest. They have considered a scheme, drawn by Mr. E. J. Tarver, one of the Hon. Secretaries of the Committee, for the improvement, at its southern opening, of the new street from Charing-cross to Tottenham Court-road. On their recommendation, the Council addressed a letter to the Metropolitan Board of Works, and submitted a plan for amending the line of the new street in the eastern frontage of the National Gallery, and for joining the triangular plot at the back, containing a public-house still standing, to the National Gallery, thus absorbing the east end of Hemming's-row. A proposal made by the Fine Art Committee of the Royal Commission for the Adelaide Jubilee Exhibition,—that the Institute should collect and send out, at its own expense, a certain number of photographs of executed works, taken from the buildings themselves,—was delegated to the Art Standing Committee to carry out; and owing to the exertions of Mr. Ralph Nevill, F.S.A., the other Hon. Secretary of the Committee, about 100 photographs were got together. An exhibition of the photographs, which were contributed by thirty-two members of the Institute and others, was held in the Arbitration Room, during the greater part of a week, and the collection is now on its way to Adelaide.

The Standing Committee for Practice have been actively engaged in arranging the preliminaries of an inquiry into points connected with the Metropolitan and Provincial Building Acts, and they are considering the "Heads of Builders' Contracts" now in use. The Hon. Secretaries, Mr. T. M. Rickman, F.S.A., and Mr. E. T. Hall, have further collated, from the Minutes of the Institute, particulars of the several suggestions for Professional Practice, Declarations, &c., made from time to time during a number of years, with other items of information, for the use of the Committee.

The Competitions Committee reported in

\* The four Standing Committees met early in the official year to appoint their officers. The Art Committee called Mr. Atchison to the chair, and Colonel Edis became vice-chairman. The Literature Committee appointed Mr. Blomfield chairman, and Mr. Graham vice-chairman. For Practice, Mr. Curry was made chairman, and Mr. Gates vice-chairman. For Science, Mr. Worthington was chairman, and Mr. Charles Fowler vice-chairman. The names of the Hon. Secretaries of these Committees, two to each are given in the text of the report.

thereof shall subject to the previous sanction of a Resolution of a General Meeting confirmed at a subsequent General Meeting held not less than seven and not more than twenty-eight days after the former Meeting thereon to be exercisable by the Council who shall have the management and superintendence of the said property.

23. The Royal Institute may after complying with all requisites from time to time required by law in that behalf receive and hold any donations or endowments consisting of property of any description real personal or mixed for the general purposes of the Royal Institute and may also receive donations or endowments for Prizes Medals Exhibitions Studentships or Scholarships or for any special objects connected with the Royal Institute which shall not be inconsistent with the provisions of the Original Charter as amended by this Our Charter.

24. The Royal Institute may after complying with all requisites from time to time required by law in that behalf receive and hold any donations or endowments consisting of property of any description real personal or mixed which have been or may be given for any benevolent purposes connected with Architecture.

25. No person who shall hereafter become a non-subscribing Member shall in any case or at any time nor shall any person who shall hereafter become a subscribing Member and shall afterwards cease from any cause whatever to be a Member or any of their representatives have any interest in or claim against the property of the Royal Institute.

#### VII. General Meetings.

26. General Meetings of the Royal Institute including such as may be summoned by the Council on the requisition of Members or otherwise shall be held as By-Laws may from time to time prescribe and at least one General Meeting shall be held in every year.

27. At General Meetings Fellows shall be entitled to be present and to take part in the discussions on any subject brought before the Meetings and to vote at such Meetings.

28. At General Meetings Associates shall be entitled to be present and to take part in the discussions on any subject brought before the Meetings, and to vote at such Meetings, provided always that no Associate shall be entitled to vote in respect of the making and adopting altering revising suspending or rescinding of any By-Law.

29. At General Meetings Honorary Associates shall be entitled to be present and to take part in the discussions on any subject brought before the Meetings and subject to such limitations or restrictions as By-Laws may from time to time prescribe to vote at such Meetings provided always that no Honorary Associate shall be entitled to vote in respect of the making and adopting altering revising suspending or rescinding of any By-Law.

30. At General Meetings Honorary Fellows shall be entitled to be present and to take part in the discussions on any subject brought before the Meetings but unless holding the office of President shall not be entitled to vote.

31. At General Meetings Honorary Corresponding Members shall be entitled to be present and to take part in the discussions on any subject brought before the Meetings but shall not be entitled to vote.

32. At General Meetings any Resolution adopted by such a majority as By-Laws may from time to time prescribe of those Members having a right to vote and voting at such Meetings shall be deemed valid and shall be deemed to be a Resolution of the Royal Institute. In the case of an equality of numbers the person presiding shall have a second or casting vote.

#### VIII. Bye-Laws and Interpretation.

33. The Royal Institute may from time to time by resolution of a General Meeting confirmed at a subsequent General Meeting which shall be held not less than seven and not more than twenty-eight days after the former Meeting make and adopt such Bye-Laws as may be deemed expedient and may in the same manner vary suspend and rescind any Bye-Laws and make and adopt others in their stead but so that the Bye-Laws for the time being be not in any respect repugnant to the law of England or inconsistent with this Our Charter. Provided always that no such Bye-Laws shall be of any force or validity whatever unless and until they have been approved by the Lords of our Most Honourable Privy Council.

34. Subject to the provisions of this Our Charter Bye-Laws shall define regulate and prescribe

(a) The conditions of Membership and the mode of election and admission and the privileges obligations and benefits of the several classes of members of the Royal Institute and the payments to be made by members.

(b) The cases and manner in which a member of the Royal Institute may be excluded or suspended from membership.

(c) The mode time and place of summoning and adjourning the Meetings whether Ordinary Business Special Annual or otherwise and the quorum for and the mode of voting at such Meetings whether in person or by proxy or by ballot or by voting papers or otherwise and the number of Votes which shall form an effective majority at

such meetings and the conduct of proceedings thereat.

(d) The qualification and mode of election of the President and the number qualification and mode of election of the Vice-Presidents and of the one or more Honorary Secretaries and the number qualification and mode of election of the other members of the Council and their respective tenures of office and the mode of filling casual vacancies in the Council and the quorum for Meetings of the Council.

(e) The mode of election tenure of office and duties of two Auditors of the Accounts of the Royal Institute.

(f) The appointment of Standing Committees and the proceedings thereof.

(g) The terms and conditions for such Prizes Medals Exhibitions Studentships or Scholarships as have been or may from time to time be established by the Royal Institute.

(h) The relations of the Royal Institute to such branches thereof as may be established within the United Kingdom or India or any Colony or Dependency of the United Kingdom and to other Societies having kindred aims and purposes.

35. In this Our Charter the expression 'the Council' means the Council of the Royal Institute, and the expression 'the United Kingdom' includes the Channel Islands and the Isle of Man.

And We do also further will and ordain that subject to the provisions contained in this Our Charter, the Original Charter shall be so far as unrepealed have full effect and validity and We do hereby confirm the same accordingly.

In witness whereof We have caused these Our Letters to be made Patent Witness Ourselves at Westminster the Twenty-eighth day of March in the fiftieth year of Our Reign.

#### Schedule referred to in Sect. 1, Clause 1.

The portions of the Original Charter repealed are—From Section Three beginning with the words 'And our will and pleasure is and We further ordain' to the end of Section Ten which ends with the words 'construction and purposes whatsoever.'

By Warrant under the Queen's Sign Manual,  
MULR MACKENZIE.

[Here follows copy of the Great Seal.]

#### WATER SUPPLY FROM WELLS.

##### INSTITUTION OF CIVIL ENGINEERS.

At the meeting of this Institution on Tuesday, the 19th of April, Mr. Edward Woods, President, in the chair, four papers were read on the subject of obtaining water-supply from wells, namely, "Chalk Springs in the London Basin," by Mr. J. W. Grover, M. Inst. C.E.; "Borings in the Chalk at Bushey, Herts," by Mr. William Fox, M. Inst. C.E.; "On a Borehole in Leicestershire," by Mr. T. S. Stooke, Assoc. M. Inst. C.E.; and "The Wells and Borings of the Southampton Waterworks," by Mr. William Matthews, Assoc. M. Inst. C.E.

In the first paper, Mr. Grover began by pointing out what a large and rapidly-increasing water-supply was required for London, and that the Upper and Lower Greensands did not yield water in any quantity, and therefore were not available, as Professor Prestwich had hoped, for furnishing a supplemental source of supply for the metropolis. He showed that the Chalk was the true source, but that care must be exercised in selecting a site for sinking a well into it; and that whilst only a moderate supply of water could be obtained where the Chalk was overlaid with a thick bed of clay, owing to the compression of the fissures by the superincumbent weight, and the distance the water had to travel underground, a large supply might be secured by sinking a well at the outcrop of the Chalk, at a point near a river, which indicated a subterranean flow of water. Consequently there was no prospect that any large volume of water could be obtained from the Chalk under London, or from the Upper or Lower Greensands, owing to the immense pressure upon them. The author then proceeded to describe in detail the various works carried out for supplying the Newbury, Wokingham, Leatherhead, and Rickmansworth districts with water. A plentiful supply was readily obtained for the Newbury district by sinking a 7-ft. well, 13 ft. deep, in the valley of the Kennet, on the west side of the town. The chalk-spring struck there proved of excellent quality, and the water was raised by pumps into two reservoirs, at a high level, each having a capacity of 110,000 gallons, and commanding the whole of the town. The cost of the works had not exceeded 20,000l. Two wells had been previously sunk in the Wokingham district to depths of 366 ft. to 734 ft., through the Bagshot Sands, London Clay, and Woolwich and

Reading Beds, into the Chalk, which failed to give an adequate supply of water, owing, in the author's opinion, to the flowing in of the fine running sand of the Woolwich and Reading Beds. By sinking another well down into the Chalk, which was reached at a depth of 345 ft., and carefully excluding the fine sands of the Woolwich and Reading Beds in its descent, a fine chalk-spring was struck at 405 ft., which rose to 30 ft. from the surface. The well was sunk in twelve months; and several trials were made of the yield of the well, which proved that the spring flowed more freely after pumping, owing, doubtless, to the fissures giving passage to the water being cleared out and enlarged. A lower set of pumps draw the water from 125 ft. below the surface. The upper pumps, capable of pumping 10,000 gallons an hour, lifted the water into reservoirs 144 ft. above the engine-house floor, having a capacity of 220,000 gallons; and a constant service was afforded at a capital cost of under 20,000l. The Leatherhead district included eight parishes in Surrey, having an area of 24 square miles; but it would be possible to extend its limits, and to afford a supplemental supply to South London from the Leatherhead springs, for which no other at all equally available source of supply existed. A 12-in. boring was sunk to a depth of 200 ft. in the chalk, through flint beds containing powerful Chalk-springs; and the yield of water at the depth reached far exceeded any possible requirements, the flints being continuous for the last 40 ft., and forming a natural reservoir, from which the water rose to the surface when liberated by the bore-hole. The catchment area embraced the whole basin of the Mole above Leatherhead, over 100 square miles in extent; the water in the well kept a level of 2 ft. to 3 ft. above the River Mole, and maintained an even temperature of about 53° all the year round. From trials made with the pumps drawing 15,000 gallons an hour, it appeared that 1,000,000 gallons a day could be raised by the pumps from the surface, and by enlarging the borehole down to the great reservoir of flints below the 97-foot level, a minimum daily supply of 4,000,000 to 5,000,000 gallons could probably be obtained. A constant supply was provided from a reservoir, containing 125,000 gallons, the level of which would command South London with a high service. The collecting basin above Rickmansworth was 234 square miles in extent; and the water rose in many places bright and pure from the flint beds in the Chalk. The subterranean flow had been estimated at 70,000,000 a day at Rickmansworth; and from 5,000,000 to 10,000,000 gallons might probably be intercepted. A well was sunk near the River Colne, at a bend in the valley, where the chalk-spring broke out with the greatest volume, to a depth of 300 ft. through Chalk and flint beds. The water rose in the well to a level of about 3 ft. above the adjacent River Colne; and the volume of water obtained from the well was much augmented by enlarging the borehole and further sinking. Trials were made, during the operations, of the effects produced on the water-level by pumping 21,600 gallons an hour, when the water soon regained its original level on stopping the pumps.

Mr. Fox described, in his paper, the works carried out, in the valley of the Colne, for supplying a large district lying between Walford and London. A well and boring were commenced in 1874, and completed in 1876, to a depth of 212 ft., having pierced 20 ft. of hard rock chalk, where it was stopped, owing to no greater supply of water being anticipated from further sinking. Trials of the yield of the well showed that it had decreased from 820,000 gallons in twenty-four hours in 1876, to 650,000 gallons in 1881; but, by lowering the pumps 20 ft., the yield was raised from 900,000 to 1,000,000 gallons, which was found to have been maintained on testing it again in 1885. Observations of the amount of water pumped, the level of the water in the well, and the rainfall, showed that the well and adjacent strata acted as a storage reservoir supplied by the rainfall. In order to increase the supply for an enlarged demand, a new well was sunk, in 1885, down to the Gault, 700 ft. from the surface, at an average rate of 16 ft. a day. No increase of water was obtained in the last 200 ft. The flow of water from the top of the bore-hole, 43 ft. below the surface, into the well had diminished from 656,000 gallons to 555,000 gallons in twenty-four hours, at which rate

it flowed steadily. The water in the new well was conveyed through a tunnel into the old well, from which it was pumped. When the communication was closed by a valve, the water-level in the old well was lowered by pumping without affecting the level in the other well, showing that the sources of supply of the two wells were separate. From the results obtained in sinking the new well, it would appear that a much larger supply of water could have been obtained from the old well by sinking the bore-hole 300 ft. more. The supply was now 1,500,000 gallons a day; but some new pumps could be arranged to draw 15 ft. below the present level of the old well; and by lowering the well this amount, and modifying the pumps, the yield could be increased to 2,000,000 to 3,000,000 gallons a day.

A borehole was sunk, in 1880, to a depth of 754 ft., by the Local Board of Hinckley, in Leicestershire, acting under the advice of Mr. Plant, for seeking a supply of water from the "Waterstones" of the Triassic formation, at the base of the Keuper Marls. The water-line was met with 80 ft. below the surface; and, in 1883, Mr. Stooke advised that pumping should be effected with easily available plant. Boring rods, 3 in. in diameter, and 450 ft. long, served for suction-pipes; and boring-rods, provided with rubbers, were used as pumping-rods to a depth of 300 ft. The pump was worked with a stroke of 18 in.; and 400,000 gallons of water were pumped out of the borehole in April and May, 1883. The water contained about 500 grains of solids, and 40 grains of chlorine, to the gallon. A 3-in. borehole was then carried 51 ft. lower, and gave evidence of more favourable water-bearing strata. A plug was obtained to separate the upper from the lower water, as the tubing had not been carried below 476 ft. from the surface; and the pump was arranged for the plug to act at a depth of 690 ft. The quality of the water, however, was no better, the solids ranging from 425 to 395 grains per gallon. The plug was then placed at a depth of 731 ft., and afterwards as near the base of the original borehole as practicable, without any better quality of water being obtained. On the plug being raised, it did not appear that any water could have passed it; and the water from the upper strata must therefore have passed to the pump through fissures in the rock.

Mr. Matthews, after explaining the hydrographical conditions of the district round Southampton, proceeded to describe the several steps taken to obtain a water supply of 3,000,000 gallons a day for the borough, at a cost of 60,000*l.* A small 3-in. boring was first sunk 105 ft. in the Chalk, just above its outcrop at Otterbourne, where a remarkable convergence of water gradients, as obtained from ninety wells, had been found, with the object of ascertaining the actual presence of water before executing further works. Water was found in the Chalk in good quantity at a depth of 20 ft. Two 12-in. borings were then sunk in eleven days, each 50 ft. from the small boring, and in a line parallel to the outcrop. On pumping continuously from both borings for sixteen days, a mean discharge of 20,960 gallons per hour was obtained with a loss of head of 9 ft. 8 in.; and, on ceasing to pump, the water rose rapidly to its normal level, which is very constant there at all seasons. An adequate yield having thus been proved, the regular works were proceeded with. As the trial borings had been sunk so easily and rapidly by the ordinary "chisel-and-shell" method, the author determined to sink two bored wells, each 6 ft. in diameter, instead of one large well sunk by hand in the usual manner, thereby gaining the advantage of having two independent wells, and saving the cost of temporary pumping-machinery. After executing the foundations of the engine-house, and forming a strong working-floor, the wells were bored, to a depth of 100 ft. from the surface, by breaking up the Chalk and flints by dropping down the iron 3-in. boring rods, furnished with three steel-pointed chisels, and raising the *débris* by the "miser" to the surface. The chisels and the miser were given a rotary motion by manual labour, and the miser usually came up about two-thirds full. The first well was bored in thirty-three days, having been delayed by accidents; but the second well was completed, with slightly altered tools, without mishap, in fourteen days,—a rate of over 5 ft. per day. The wells were lined with 4-in. mild steel tubes, 5 ft. 11 in. in

diameter, in 6-ft. lengths, with twenty-four 6-in. holes in each length, to allow the free ingress of water. The cost of the bored wells was under 1,700*l.*; whereas the author estimated that a single large well, lined with 18-in. brickwork, would have cost between 2,000*l.* and 2,500*l.* The two wells being distinct, with independent pumps, any accident to one would not interfere with pumping in the other, and any deepening could be easily effected in one without affecting the clearness of the water in the other. The author added a short account of the deep well on Southampton Common, bored, between 1835 and 1851, to a depth of 1,317 ft., when it only yielded 130,000 gallons a day. It traversed 850 ft. of Chalk, but did not reach the Upper Greensand; and an attempt, in 1882, to deepen it being frustrated by a broken tool lying at the bottom, it was finally abandoned, having involved a cost of 20,000*l.*

#### ARCHITECTURAL ASSOCIATION.

THE twelfth ordinary meeting of this Association for the present session was held on the 22nd instant, Mr. J. A. Cotch (President) in the chair.

The following new members were elected, viz., Messrs. H. W. Braddock and P. Hayton. Mr. G. Aitchison, A.R.A., read a paper entitled "Stray Thoughts on Architectural Education," which we print on another page.

The Chairman, in opening the discussion, said that Mr. Aitchison's "Stray Thoughts" were most suggestive. His tribute to the Association was well deserved, but, at the same time, it was in one sense a matter of regret to the profession that a voluntary concern should be the foremost means of obtaining an architectural education. There were in reality signs that if care was not taken the Association would eventually outgrow its own strength, and that the multiplicity of work undertaken, if grappled with effectively, would really develop into something more than had yet been attempted. He hoped, therefore, that in the forthcoming Conference some sort of means might be shadowed forth by which this important question might be met. The work done by the Association was most excellent, and he hoped it would be in no way slackened until it was replaced by something which was national in its character. The idea that ran through Mr. Aitchison's paper was an excellent one; it was that people should be made to think for themselves. When Mr. Aitchison said he desired style to be abolished, he (the speaker) could not help thinking of an observation made earlier in the session by Mr. Rickman, when he mentioned how painful was a false quantity in architecture, meaning that the style should be thoroughly mastered and be entirely pure. He (Mr. Cotch) was bound to say that Mr. Aitchison's suggestion for striking out one's own path rather commended itself to him. Nowadays they did not expect every architect to be a genius. There were over 1,000 members in the Architectural Association alone, and they could not possibly be all geniuses,—indeed, the profession would be in a bad way if they were. He had more than once in that room ventured to describe the arts which affected architecture as "common-sense made beautiful," and that struck him as being a not unreasonable definition. The present age was one of eclecticism. People did not go on from step to step in one style, working out their salvation as the Medievalists did, who toiled in ignorance of what had been done before them. In Greek architecture the portico and the pillars were outside, while in Medieval architecture they were taken inside. It was said that the latter course was pursued for the purpose of getting a greater effect of solemnity, but he did not suppose for a moment that the Gothic builders had any idea of Greek architecture. Mr. Aitchison had mentioned the designing of warehouses. Now directly the architect commenced to design a warehouse, he had to be restricted by the essential factors of the problem, so that if a picturesque building was designed, it might be found that some of the elementary notions ruling the designing of warehouses had been transgressed. One of these rules was that almost all the windows would have to be of one pattern, and it would be useless to think out any building of that kind merely as a matter of design; the thing must be based upon the requirements of modern life and the prosaic necessities of trade. The architects of the present day were, therefore, very

much handicapped by restrictions such as were unknown to the Medievalists. At the same time the business of the architect of the present day should be to grapple with those things, and make the best they could of them. If, therefore, they worked upon the lines suggested by Mr. Aitchison, he believed they would come very near solving the problem.

Mr. John Slater, B.A., thought there was a certain amount of contradiction in Mr. Aitchison's able paper, when he first stated that so much information could be obtained from the builder, and then later on told them that the architect should not only know the various methods of joining iron and stone, but also the weights those materials would carry, their compression, tension, and so forth. Now he did not consider that the ordinary builder could go into those technicalities at all. Then, with regard to styles and orders, Mr. Aitchison first said he did not consider it necessary to study the history or the various peculiarities of the ancient styles, but afterwards he said they ought to be studied, not necessarily for imitation, but to find out how the classical and Medieval builders obtained their results. Mr. Aitchison had referred to the Medieval architects and early builders being daring in putting up buildings without any particular knowledge. For a long time he (the speaker) had thought they had erred on the side of excessive strength, and that it would ill become the architects of the present day to refrain from taking advantage of the new discoveries with regard to the strength of materials, or to use an excessive quantity of timber or iron when a less quantity would do. He could not help expressing his personal regret that Mr. Aitchison had not been able to retain his position as one of the Examining Board at the Royal Institute of British Architects, as his services had always been of the greatest value. He agreed with a great deal of Mr. Aitchison's criticism as bearing on the obligatory Examination, though it did not seem to point to a diminution of its stringency, but rather to a division into two. It was a great deal to expect from the candidate to pass from one thing to another so rapidly, and to cram into one week what should be done in two weeks at separate times. Probably, therefore, the results of the coming Conference would tend in the direction of dividing the Examination into two parts. Mr. Slater concluded by proposing a hearty vote of thanks to Mr. Aitchison.

Mr. Lawrence Harvey considered that if a man had worked in stone he would be able to design in that material with much more character than if he had never had anything but sheets of paper before him. He believed he could answer the question as to why the Medieval architects displayed such cleverness in designing. While in Paris he had the *entrée* to a guild of stonemasons, and had seen the way the young men were taught, and the results obtained therefrom. In this case everything was done by means of models, drawings being looked upon merely as a means to make those models, while to be received as a companion of the guild the necessary examination consisted of constructing a model in which every difficulty of masonry came into play. The result was that the head men of the guild were far superior to the professors of stereotomy at the École des Beaux Arts, and the Polytechnic School at Paris, in practical teaching. He considered that the education of architects should be based on practical labour; they ought to be taught carpentry, joinery, stone and wood carving, and, as the basis of all the science of architecture, they should certainly have knowledge of masonry.

Mr. H. O. Cresswell remarked that the paper had created in his mind a feeling that all one's previously-conceived notions of what an architectural education should be were entirely wrong; that they must not study the Greek, Roman, Gothic, or other styles, but begin by being original. That seemed to him to be a dangerous doctrine. They did not come there to learn to be original, for to teach the young architect to be original would be to put a weapon into his hands which would produce very curious results. Mr. Rickman's remarks as to false quantities were entirely opposed to that, and, indeed, Mr. Aitchison would be one of the first to lay his hands upon a false quantity shown in the work of any of the Academy students. If he had misunderstood Mr. Aitchison he hoped that gentleman would correct him, because if the members of

the Architectural Association started on the basis of wishing to be original architects, he did not know where they would be in fifty years' time. He was glad to hear what Mr. Slater had said as to the Examination, because he considered that a great deal too much was crowded into the time; indeed, some candidates had broken down in the course of it. That was introducing into architectural education a system of pernicious cramming, and he believed there were now in the profession one or two men who were architectural crammers. The Examination should be a fair test of whether a man was capable of carrying on the profession of an architect, but it should not be necessary to cram, and he hoped during the Conference some practical turn would be given to the desultory conversations they had frequently had of late years, not only with reference to the Examination but to architectural education generally on this important subject.

Mr. G. Richards Julian seconded the vote of thanks. At the Conference on the 4th proximo several short papers would be read upon education, one by Professor Babcock, of Cornell University, where there was a regular system of architectural education. He believed that these papers, and the discussion that would arise, would do something to further this burning question.

Mr. A. O. Collard said that in thinking of the old architects, he had sometimes wondered how much of their success was owing to their own genius, and how much to the men who worked under them. No doubt Michelangelo designed the outline of the dome of St. Peter's, but he very likely relied more upon some stone-cutter to carry out the work than upon his own ideas of what the thing should be. In the past the architect designed, and trusted to the experience of the men under him, whereas now the practical man trusted to the architect.

Mr. Francis Hooper thanked Mr. Aitchison for his very encouraging paper. As to the voluntary system, the great strength of the Association lay in the fact that they as young men were banded together, and the older men knew what they wanted and had sympathy with the juniors. Young men again were more ready to adopt the latest improvements and innovations than were the older members of the profession, and were more willing to admire the work of contemporaries.

Mr. C. R. J. Hall said that although in the pamphlet supplied by the Institute to candidates for the Examination it was stated there would be nothing recalcitrant in the Examination; some of the questions really required the study of an architectural glossary. An architect could design a thing which a mechanic could not even conceive, and many things based upon theory would frighten carpenters and others. Indeed, he believed that practical experience in building would hamper a man in designing. Ruskin had said in his "Seven Lamps of Architecture,"—which, by the way, seemed badly supplied with oil,—that architecture was a thing which did not exist but as a framework for showing off sculpture and painting, but he could name one brick building in the City without sculpture or painting upon it, and which yet took the notice of every architect. A College of Architecture was essential, and he only hoped the Association would eventually develop into one.

The vote of thanks was then put from the chair, and carried by acclamation.

Professor Aitchison, in replying, observed that it would take too much time to touch upon all the matters referred to in the discussion. The object he had in view in giving this paper was not to gratify his personal vanity, but to see if some clearer idea of what was absolutely wanted for the education of the ordinary architect could not be defined. If a law were enacted that no man should begin to practise as an architect until he had mastered the differential calculus the profession would be tremendously limited, even from a scientific point of view, and much more from an artistic one. What he had wished to point out was, that though the literary and historic part of architecture was delightful, and to some extent useful, it was not absolutely essential. That after a man had sufficient knowledge to enable him to practise creditably the science and art of architecture, he should be allowed to take up those things which would show him to be more highly accomplished as "extra" subjects, the acquirement of which would be regarded as an honour. Architecture without

proportion could hardly be termed architecture at all, and they must learn proportion by studying those buildings that had passed through the ages and had generally met with the approbation of the cultivated. He had not meant to suggest that young students of architecture were not to learn how mouldings had been designed and grouped, and the other effects of architecture were got; quite the reverse. He did not advocate throwing off precedent; all the teaching he had given had been to show how styles appearing to be entirely new and diverse, for instance Saracenic and Gothic architecture, were immediate offshoots from the Roman and Byzantine, while it was new necessities and aspirations which caused the new and peculiar forms. It was very difficult to see, when there seemed no convergence of opinion amongst the profession or the public, how they should teach style, though, he hoped, a beautiful, original, and English style would some day be developed. There was thus striking difference between the architecture of the late Renaissance and that of the Middle Ages. If they looked at the older buildings, they could not help seeing that they were done by somebody consistently on the spot, and that many details were not arranged before hand, showing that the architects were men of originality and invention. The later Renaissance was very different, every part and detail appeared to have been studied and settled before hand. His hearers were those who had to keep alive the feeling for beauty in works of necessity, and although architects were very much overlooked, especially paid, and with little honour, many of their works were the result of great study and very considerable genius.

#### A NEW CUPOLA FURNACE FOR FOUNDRIES.

The German journal, *Stahl und Eisen*, states that Messrs. Greiner & Erpf, of Westphalia, a firm of engineers, some time ago invented a new cupola furnace for foundries. In the ordinary cupola furnace, one of the chief causes of the loss of heat is due to the circumstance that a large portion of the carbonic acid which is formed by the combustion of the coke, becomes, by its passage through the upper layers of red-hot coke, reduced to carbonic oxide, and in this form escapes through the chimney of the furnace. In the Greiner-Erpf furnace, however, the carbonic oxide is by combination with oxygen again turned into carbonic acid in the upper part of the chimney, and the heat produced by this process utilised for the working of the furnace, the escaping gas only containing carbonic acid and no carbonic oxide. The lowest tuyeres before which the coke burned, are constructed as in an ordinary cupola furnace, but at a point above these three rows of smaller ones have been introduced, fixed spirally around the furnace. Each of the latter may easily be opened, tended, and closed, and is also fitted with a peep-hole, covered with a glass disc for the purpose of watching the progress of the combustion within. Experiments with the furnace have shown that there is a certain point in a furnace above the zone of combustion of coke at which, on air being blown into the furnace, the carbonic acid is set on fire and consumed, but not the coke. This point varies somewhat according to the quality of the coke used, the pressure of the tuyeres in the lower hearths, &c., but it may easily be ascertained by observations made in the upper part at different heights. Air is blown in at the moment found most advantageous from these observations, the pressure of the same being regulated by observing through the peep-holes that an even and continuous combustion takes place, and that the coke is not set in blast and consumed. The tending of the furnace is not attended with any particular difficulties. Experiments with the furnace appear to have proved most successful at several ironworks. Thus, for instance, in a furnace 80 cm. in diameter, an experiment was made whereby 100 tons of iron were smelted in twelve smeltings, the results of which showed a consumption of coke of 5.01 per cent. of the iron smelted, representing a saving, according to the proprietors of the works in question, of 33 per cent. of fuel as compared with the old cupola furnace. At some other works where the furnace has been tried the consumption of coke is reported, in percentage of the iron smelted, to have been 4.14, 4.0, 5.7, 4.5 per cent., figures which vary through the quality of the coke used.

#### ARCHITECTURAL ASSOCIATION VISITS.

THE sixth Saturday afternoon visit of the Architectural Association was made on Saturday, the 23rd inst., first to Messrs. Dent & Hellyer's Works, 21, Newcastle-street, to witness some interesting experiments with various forms of traps which had been arranged by Mr. Hellyer to illustrate the remarks he made during the discussion on Professor Corfield's paper read at the Association a few weeks ago. The first trap was a "Bower." This was shown to be untrapped by the discharge of a closet above, and smoke being introduced into the drain, it was seen to pass through the trap. A series of lead syphon traps were then shown, and tested for the amount of water they contained, the point being to show that as good a seal could be got with a pint of water as with 6½ pints, the amount contained in one of the forms. The value of foot ventilation was then shown by means of a length of soil-pipe filled with common gas, and a 1-in. ventilating-pipe over 50 ft. long. The gas burned as soon as the pipe was opened, and went out directly; it was stopped. The next series of experiments were to show the necessity of trap ventilation, and the best forms of traps to prevent syphonage. The construction of valve-closets was explained, and the points of weakness pointed out. The action of flushing-tanks and grease traps was illustrated, and models of manholes illustrating the points to be looked to in their construction pointed out.

The second place visited was St. Bartholomew's-the-Great, Smithfield. Mr. Aston Webb met the members, and explained the restoration of the church which has been carried out under his direction, and which consists principally of work to the apsidal east end. The surrounding property has been acquired, and the next portion of the work proposed to be undertaken is the removal of the forge and the rebuilding of the transepts. As it is not contemplated to rebuild the nave, the organ has been placed at the west end under the western arch of the crossing, and in a position corresponding with the old roof-loft; the stalls underneath will be finished with canopies, so as to screen off the western wall. Only a portion of the woodwork of these stalls is at present carried out. Mr. Webb pointed out that by using blue Bath stone, and, varying the detail, he had been careful to make the restoration work so as not to interfere with the historic value of the old work, and every portion of old work that gave any indication of the various changes in style had been left, as, for instance, the traces of the fourteenth-century square end to the church.

#### THE VENTILATION OF SEWERS.

SIR,—I can endorse all that H. [p. 656, ante] says, on the above subject, and will, with your permission, give the results of my experience.

1. I covered an estate with thirty-three blocks of industrial dwellings. The drains were formed without any intercepting traps, and the soil-pipes were prolonged and carried up well above the roofs, two to each block. Here the drains are kept clean by the pressure of the water from the soil-pipes, and there are no smells in the street.

2. I covered another estate with fifteen blocks of dwellings. The drains were formed with intercepting traps and inspection chambers, where the drains are made of half-pipes. Here the drains are being constantly stopped up, the pressure of the water from the soil-pipes being destroyed at the inspection chambers, and the smell in the street from the gratings was so great that ventilating pipes from the sewers had to be put in to remedy it.

W. S. HORNER.

SIR,—The suggestion is made by "H." on p. 656, that if every house put up a special blow-off pipe at the head of its drain for the sewer, then the foul air of the sewers would become so little dangerous that the present intercepting traps now being put in might be dispensed with. I do not think so; the danger is too great. Isolation entirely in the house from the air of the public sewer is much safer than trusting to ventilation or dilution.

If every house is to put up a special blow-off pipe for the sewer, the said pipe should be joined,—as I have often recommended it,—on the outer side of the main disconnecting trap between the house and the sewer.

If the work referred to by "H." as recently done on the "modern system" caused bad smells at the ground-gratings, I would like to know,

supposing the work well done, what modern system is referred to?

The complaint is an argument for high-level blow-offs, but not for the disuse of intercepting traps.

Glasgow.

W. P. BUCHAN.

#### MEMORIAL CHAPEL, EPWORTH.

SIR,—As one of the competitors for the above, I was astonished to see your last issue containing the illustration, &c., of this building, inasmuch as the estimated cost of the building for which I sent in plans was 2,000*l.*, and not 5,000*l.* which it appears is to be spent on the accepted design. Had the other competitors been allowed the larger sum of money their designs would have been very different, and probably the successful competitor might likewise have been also.

However, Mr. Hicks may, perhaps, be able and willing to explain this.

SAML. MOSGRAVE.

#### TILES IN TABLES.

SIR,—Will you kindly give me space to ask your readers if they could tell me what is the best way of setting Minton tiles in a table-top so that with ordinary usage the joints would not break and water percolate through them? I am afraid that any joint made of plaster of Paris would, in consequence of the unequal and varying shrinkage of the wood and the tiles, soon break. Would a joint made of pitch be better? The table-top would be of tiles with a margin of wood round outside and level with the tiles, and the weakest part of the job would, I think, be the joint between outside rows of tiles and wood margin. Is there not a glue made by some maker of wood-flooring for attaching same to concrete foundation? Would this do, though positions would be reversed, wood being at bottom instead of at top? I should be much obliged by any hints.

W.

#### CHURCH-BUILDING NEWS.

**Andover.**—In Andover Church Miss E. Pressley has placed a memorial to her late uncle, Mr. Henry Thompson, for many years churchwarden and a Justice of the Peace, whose name is associated with the erection of the Cottage Hospital in that town. The memorial consists of ten full-length angels, about 2 ft. 3 in. in height, some in attitude of prayer, and others with musical instruments, sculptured by Mr. Harry Hems, of Exeter, from designs by Mr. William White, F.S.A. They stand upon pedestals left for the purpose, upon the dwarf chancel screen, erected some fifteen years ago, when the choir was brought forward into the nave, and other alterations made.

**Grantham.**—Four new oak screens have just been placed in the bays of the chancel of Grantham parish church, after designs furnished by Mr. J. Oldrid Scott, and forming part of the original design made when the restoration of the church was undertaken, twenty years ago, under Sir Gilbert Scott. With these and the fine painted reredos, by Mr. Blomfield, recently erected, the east end now presents a very rich effect. The screens are of oak, very massive, and a little more than 10 ft. high, of solid panel for about 5 ft., pierced above with tracery of Early Perpendicular character. The contract price for the four screens is 450*l.* The work has been entirely executed at Grantham, in the workshops of Messrs. Rudd & Son.

**Redcar.**—Since his appointment to the living two years ago, the Rev. F. H. Hill has been actively engaged in raising funds for the alterations to the church, and it is expected that the work will shortly be begun. According to the estimate of the architects, Messrs. Clark & Moscrop, Darlington, 800*l.* at least will be required. It is intended to re-seat the church throughout, re-arrange the chancel, lay tiled floors, provide new pulpit and reading-desk, and build a new vestry.

**Sale.**—The Church of St. Anne, Sale, is being extended, and the memorial stone of the new north wall has lately been laid. The extension will include the addition of a north aisle corresponding with the south aisle already existing, the building of an organ-chamber and choir-vestry on the south side of the chancel, and the erection of a porch at the west end of the church. The present accommodation comprises 566 pews and 223 free sittings, and by the projected enlargement the total number of sittings is to be increased to 845. While the workmen are engaged upon the fabric it is proposed also to effect some necessary repairs to the tower and spire and to re-seat the gallery. For the whole of these proposed works a sum of 1,500*l.* is estimated to be necessary, and beyond that sum an expenditure of 500*l.* upon a new organ is contemplated. The contractor

for the new building work is Mr. T. B. Kendall, under the superintendence of Mr. J. Lowe, architect, Manchester. It is anticipated that the operations will be completed about the end of June.

**Sparkwell (Devon).**—A carved oak Litany-desk was placed in Sparkwell Church, South Devon, on Easter Eve. It was designed by the Rev. E. Geldart, of Witham, Essex, and made by Messrs. Luscombe & Son, Exeter. The rector, the Rev. Pender Cudlip, has also commissioned Messrs. Luscombe & Son to make a carved oak pulpit for the church.

#### RECENT PATENTS.

##### ABSTRACTS OF SPECIFICATIONS.

4,065, Spring Hinges. S. Gerish.

The subject of this invention is an improvement on the hinges now generally known as "Gerish's hinges," which are made both single and double acting. The end of the chain, which is used to check the action of the spring, is now by this formed into a screw, and a long cylindrical nut is fitted on to the same.

6,312, Windows. J. Mason.

The windows made in accordance with this invention are mounted on the swing principle, and the swinging sash is carried from the window-frame by means of hinged weathering-plates, which plates are also similarly fitted at the side of the sash so as to cover the joints of the sash and frame. The plates have projecting heads to prevent draught.

6,370, Paints. R. Lavender.

The paints which form the subject of this invention have oxide of iron as a basis. The improvements are in the direction of heating the coppers or sulphate of iron, then crushing or grinding it and exposing it in thin layers to heat with a free passage of air through the retorts.

9,314, Door-knobs. H. G. Hesketh.

The knobs which are the subject of this patent are fastened to their spindles at one end by means of a wedge being driven into a slot cut in the end of the spindle, the spindle thereby expanding inside the spindle-hole, which has been previously widened at its posterior end on two sides of the hole (which is square) to admit of the expansion of the spindle.

4,496, Flushing Cisterns. T. & J. Holt.

This invention has for its object a cheap and serviceable flushing cistern, so arranged that the water can only pass into the flush pipe when the cistern is in actual use. The cistern may be brought into action by either a violent or gentle movement, and when either takes place, the supply of water to the cistern is closed or stopped. In syphon cisterns, the whole cistern is pivoted; in non-syphon cisterns this is impracticable, but a lever carrying a small tray or dash-board oscillates instead, and cuts off the communication between the ballcock and the cistern before the flushing-pipe is opened.

6,019, Gas Brackets. R. H. Best.

This patent relates to cantilever brackets in lights of the Wenham or similar pattern, and allows a regenerative burner to be used with this class of bracket. It not only provides for carrying the burner, but also provides an upward flow governor, arranged and provided so as to be thoroughly accessible without dismantling any structural parts.

6,221, Fireproof Floors. C. S. Williams.

The floors made according to this system are attached to the girders carrying the floor, a casing of concrete or other fireproof material, shaped to receive slabs of a similar material which form the fireproofing between the encased girders.

##### Leveling Instruments.

##### II.—ADJUSTMENT FOR COLLIMATION.

**T**HE line joining the optical centre of the object-glass and a point in the line of the horizontal cross hair in the diaphragm of a Level should be horizontal when the longitudinal bubble is in the centre of its run. This adjustment is effected by the capstan-headed adjustment screws at the eye end of the telescope, which serve to raise or depress the diaphragm plate. Theoretically, a re-determination of this adjustment, known as "the adjustment for collimation," should be effected whenever the object-glass is removed from the telescope; but if the object-glass be carefully screwed home, or returned as near as possible to the exact position it occupied before removal, this adjustment need not be repeated. After conveying the instrument by railway, or when carried in a cab for some distance, the collimation adjustment should be tested prior to using the instrument for taking levels. It is generally determined by the makers, with the use of an adjusted level as a "collimator." The cross hairs of the adjusted level are placed in the principal focus of the object-glass, which is of long focal length, so as to adjust for an infinite distance. The instrument is set up level, and the eye-piece removed from its socket. As a temporary protection for the cross hairs, a piece of plain glass may be inserted. The shade covers are also taken off each telescope. It will be seen from the diagram that when the instrument to be adjusted is set level, a pencil of rays, proceeding from a point in the plane of the horizontal cross hair of the diaphragm of the collimator, will, after passing through the object-glass, run parallel, and should the axis of the pencil be horizontal, the parallel rays between the two levels will be also horizontal. The parallel rays, after emergence from the level, which is used as a collimator, falling upon the object-glass of the level to be adjusted, will be converged to a point within the telescope, and an image of the wires or cross hairs of the collimator will be formed. The horizontal cross hair of the level under adjustment should then be made to coincide with the image of the horizontal cross hair from the adjusted level, which is used as "the collimator," by loosening one of the collimation adjustment screws in the instrument to be adjusted, and tightening the other, care being taken to observe that the longitudinal bubbles in both instruments remain in the centre of their run while the adjustment is being made. As indicated by the diagram, a little difference in the height of the two instruments will not affect the result, but it is desirable to reduce this difference of level to a minimum.

A ready means of adjusting the fixed telescope of a dumpy level for collimation, without the aid of a collimator, is illustrated by figs. 1, 2, 3. Three pegs are driven into

DUMPY LEVEL ADJUSTED FOR COLLIMATION

DUMPY LEVEL—DIACRAM SHOWING METHOD ADOPTED BY THE INSTRUMENT MAKER FOR THE ADJUSTMENT OF THE LINE OF COLLIMATION IN THE LEVEL.

NOTE—THE LEVEL OF THE LINE OF COLLIMATION NEED NOT NECESSARILY BE EXACTLY THE SAME IN THE TWO INSTRUMENTS IN ORDER TO MAKE THE ADJUSTMENT.—(SEE DOTTED AND FULL LINES ABOVE)

the ground as far apart as practicable, and at equal distances, say 4½ chains, or about 300 ft. apart. Place the instrument over the centre peg marked Y, and having set the bubble level, read the staff on the peg W (fig. 1). Then turn the telescope horizontally half-round, carefully re-set the bubble, if necessary, and read the staff on peg Z (fig. 2). It will be evident that the correct difference of level between the points W and Z can be thus obtained, because if the reading of the staff A be above or below the true line of collimation, as indicated by the dotted lines in the diagram (fig. 1), the error at the same distance from the instrument will be the same in the case of the staff B (fig. 2). Having determined the true difference of level between the points W and Z by figs. 1 and 2, set up the level near to the highest of these points in line with both points W and Z, but not between them (fig. 3). Adjust the longitudinal bubble to the centre of its run, and read the staff first upon the point Z, and next upon the point W. The difference of level should be the same as previously determined. If any discrepancy exists, calculate from the amounts arrived at by figs. 1 and 2 what the staff C over the point W in fig. 3 should read, and by means of the collimating screws adjust the horizontal cross hair until this reading upon the staff C is obtained. The distance between the instrument and the staff D in fig. 3 should be so simply sufficient to clearly read the divisions upon the staff through the telescope, in order that any divergence of the line of collimation from the true level may have an inappreciable effect upon the height read on the staff D. If the distance between the more distant staff and the instrument be considerable, allowance must be made for the curvature of the earth and for refraction, but it is not advisable to read the staff at a greater distance than the surveyor finds convenient for giving the staff-holder full instructions. It is also necessary to define each point in detail where the staff is held, which cannot be done so accurately when a long distance intervenes between the instrument and the level staff.

Robert Boyle & Son (Limited).—An extraordinary general meeting of this company was held on Wednesday, the 20th inst., in the Cannon-street Hotel, to consider resolutions for altering the company's Articles of Association as proposed by Mr. Robert Boyle, the managing director, and which were passed unanimously.

MEETINGS.

**SATURDAY, APRIL 30.**  
*St. Paul's Ecological Society.*—Visit to West Drayton and Uxbridge.

**MONDAY, MAY 2.**

*General Conference of Architects.*—(First day) Visit to New Stock Exchange. 3.45 p.m.—Opening Meeting, Reception, &c. 7.30 p.m., to be followed by *Royal Institute of British Architects.*—Fifty-third Annual Meeting. 8 p.m.  
*Clerks of Works Association.*—Mr. G. J. Egan on "Granite." 8 p.m.  
*Society of Engineers.*—Mr. J. B. Lightfoot on "Refrigerating Machinery on Board Ship." 7.30 p.m.  
*Liverpool Architectural Society.*—Paper by Mr. E. J. Tarver. 7 p.m.  
*Victoria Institute.*—Professor Hall, F.R.S., on "The Rock-hewn Capital at Idumæa." 8 p.m.

**TUESDAY, MAY 3.**

*General Conference of Architects.*—(Second day) Visits to National Liberal Club, Whitehall Court, Hotel Victoria, and the Holloway College. 11 a.m.—Paper by Mr. J. D. Sedding on "Architecture and the Handicrafts." 8 p.m.

*Royal Institution.*—Professor W. E. Ayrton, F.R.S., on "Electricity." 11. 3 p.m.  
*Institution of Civil Engineers.*—Further discussion on the papers by Messrs. Grover, Fox, Stooke, and Matthews on "Water-Supply from Wells." 8 p.m.  
*Society of Biblical Archaeology.*—Papers by Rev. G. H. Tomkins and M.M. Eugene and Victor Revillonx. 8 p.m.  
*Purkes Museum (Lectures for Sanitary Inspectors).*—Paper on "Scavenging, Disposal of Refuse and Sewage." 8 p.m.  
*Birmingham Architectural Association.*—Nomination of Officers. 7.30 p.m.

**WEDNESDAY, MAY 4.**

*General Conference of Architects.*—(Third day) Visit to houses in Harington-gardens, Kensington Court, &c. 11 a.m.—Papers on "Architectural Education." 3 p.m.  
 Mr. John Slater on "New Materials and Inventions." 4 p.m.  
*Society of Arts.*—Mr. J. C. Morton on "Agricultural Education." 8 p.m.

**THURSDAY, MAY 5.**

*General Conference of Architects.*—(Fourth day) Visit to the City and Guilds Institute, South Kensington, 11 a.m.—Report of the Special Federation Committee. 3 p.m.—Conversations at South Kensington Museum. 9 p.m.  
*Society for the Encouragement of Fine Arts.*—Conversations at the Galleries of the Royal Institute of Painters in Water-Colours, Piccadilly. 8 p.m.

**FRIDAY, MAY 6.**

*General Conference of Architects.*—(Fifth day) Visit to the Drainage Works at the House of Parliament, 11 a.m.—Papers on "The Registration of Architects." 3 p.m.  
*Royal Institute of British Architects.*—Presentation of Royal Gold Medal, &c. 8 p.m.  
*Architectural Association.*—Mr. J. L. Robinson, R.H.A., on "An Irishman and his Camera in England, a Dark Scene." 7 p.m.  
*Purkes Museum (Lectures for Sanitary Inspectors).*—Mr. C. E. Cassal, F.C.S., F.I.C., on "Food (including Milk), Sale of Food and Drugs Act." 8 p.m.

**SATURDAY, MAY 7.**

*General Conference of Architects.*—(Sixth day) Visit to the Diploma Gallery of the Royal Academy, &c. 11 a.m.  
*Royal Institute of British Architects.*—Members' Dinner, Freemasons' Tavern, 7 p.m.  
*Architectural Association.*—Visit to the National Liberal Club. 3 p.m.  
*Edinburgh Architectural Association.*—Visit to Linlithgow Palace and St. Michael's Church.  
*Association of Public Sanitary Inspectors.*—Address by the President, Mr. Edwin Chadwick, C.B. 6.30 p.m.

Miscellaneous.

**Birmingham Students of the Institution of Civil Engineers.**—The association of the Birmingham students of this Institution held their seventh meeting of this session at the Colonnade Hotel, Birmingham, on the 21st inst. Mr. C. Hmt, Member of the Institution of Civil Engineers (Vice-President), in the chair. Mr. H. L. Tarbet, student of the Institution of Civil Engineers, read an interesting paper upon the Wellington (Somerset) Waterworks, as designed by Mr. E. Pritchard. The water supply is conveyed by gravitation from springs at Westford to the pumping station (about 450 yards distant), whence it is pumped into a circular iron tank on the top of a brick tower, and then distributed in the town. The pumping machinery and gas engines are in duplicate, and each engine can work separately each or both set of pumps. Downson's patent economic gas apparatus is adopted to drive the gas engines. The paper was illustrated by large diagrams, and an interesting discussion followed its reading.

**Beebles.**—The large east window of Beebles Parish Church has just been filled with stained glass. The window consists of seven long lights and numerous tracery windows. Twenty-one subjects, taken from the life of Christ, have been illustrated in the lights, and the tracery pieces contain figures of the Twelve Apostles, with angels, cherubim, &c. The work has been carried out as the result of a subscription amongst parishioners and friends. Messrs. Heaton, Butler, & Bayne, of Garrick-street, London, were the artists who designed and executed the work.

**New Bank Buildings at Wimbledon.**

Amongst the numerous public and private buildings which are in rapid succession rising up at Wimbledon is an extensive block which has been erected by the London and South Western Banking Company, and to which the designation "Bank Buildings" has been given. The structure is situated in the Wimbledon Hill-road, near the entrance to Wimbledon Park. It has three frontages, the principal elevation being in Wimbledon Hill-road, with a return frontage on the south side, in Compton-road, opposite the recently-erected Free Library, and another return frontage on the north side, the entire block covering a ground area of about 14,000 ft. The Wimbledon Hill-road frontage is about 150 feet in length, and upwards of 60 ft. in height, and contains four lofty floors. It is faced with red brick and red terra cotta, the latter material being freely introduced for ornamentation. The frontage is surmounted by four lofty gables, and at the north end a five-light bay window, surmounted by a balcony, is a special feature at the first floor of the frontage. The bank proper is at the south end of this frontage, occupying also the whole of the Compton-road elevation. The ground-floor part of this portion of the block is entirely faced with terracotta, both frontages having three-light mullioned windows, divided by fluted pilasters. The entrance to the bank is at the angle of the two frontages, and forms an archway with cornice and pediment, supported on each side by massive cantilevers. At the north and south angles of the back frontage in Wimbledon Hill-road, on a level with the third floor, there are octagonal turrets in terra-cotta, and also similar turrets at the extreme north end of the block. The buildings were erected from the designs of Mr. James Edmondson, Mr. H. Johnson, of Park-avenue, Wood Green, being the contractor. Those portions of the block not occupied by the bank consist of shops.

**The Great Eastern Railway Company's New Station at Southend.**—The Great Eastern Company are preparing for a large amount of expected traffic on the approaching opening of their new line, now nearly completed, between the metropolis and Southend. Their station at the Southend terminus, now in course of construction, will occupy an extensive area of land which the company have secured. In the first instance they purchased an estate of twelve acres for station and siding purposes, but this not being considered sufficient the company are now negotiating for the purchase of a still further quantity of land immediately adjoining, in anticipation of its being found necessary to increase the station accommodation now being provided. The dimensions of the station will be seen when it is stated that there will be five platforms, each about 900 ft. long. Amongst the other new stations on the new branch between the main line at Brentwood and Southend, the directors have just decided to erect one at the interesting Essex village of Prittlewell, near Southend.

**St. Mary Church (Devon).**—Mr. S. J. Smith, C.E., one of the inspectors of the Local Government Board, held an inquiry a few days since at the St. Mary Church Town-hall, consequent upon the application of the Local Board for power to borrow 1,650*l.* for works of street improvement, the purchase of a steam roller and crusher, and sundry other purposes. There was considerable opposition to the proposal, which led the Inspector to say that he had abundant evidence that by the use of a steam roller and crusher 30 per cent. was saved in road-making. He was perfectly astonished at the opposition, thinking it would have been "a 'tother way about." In the case of four local boards in Cumberland and Westmoreland, who had joined together in buying a steam-roller, and whose action had been sanctioned by the Local Government Board, the roads were more narrow and hilly than any in the St. Mary Church district.

**The Registration of Plumbers.**—At the Guildhall, on Saturday last, Alderman Knill presiding, supported by Messrs. W. H. Webb, J. C. Ashdown, and L. Gilbert, members of the Registration Committee, certificates of registration were issued to thirty-one master plumbers and seventy-seven journeymen plumbers. Besides those from the London district, plumbers attended from Brighton, Bristol, Cheltenham, Gloucester, Dartford, Eastbourne, Exeter, Gloucester, Grimshy, Guildford, Hastings, Lincoln, Luton, Oxford, Ramsgate, St. Leonards, Salisbury, Tunbridge Wells, Wolverhampton, and York.

**The Strike in the Building Trade at Birmingham.**

The strike in the building trade has now entered upon the third week, and both sides, according to the *Birmingham Gazette*, appear equally resolute. A meeting of representative employers and operatives in the building trade was held on Monday at the Grand Hotel, with a view, if possible, to adopting a basis for the settlement of the dispute. Mr. J. Bowen (Chairman of the Master Builders' Association) presided, and the other employers present were Messrs. A. S. Smith (Smith & Sons), W. Sapcote, inn. (Sapcote & Sons), F. Cowing (Gowing & Ingram), T. Robotham, C. H. Barnsley (Barnsley & Sons), W. Blore, H. J. Woodward (Woodward & Smith), R. Folland, J. W. Bellamy, and E. J. Bigwood (secretary). The operatives' delegates present were Messrs. E. Boraston and B. Bateson (Carpenters and Joiners' Association), I. Ridlee and J. Farr (Stonemasons), W. Nash and F. Freeman (Bricklayers), J. Robinson and R. Cheshire (Plumbers), T. Dalton and A. D. Hopkins (Plasterers). The conference lasted from eleven o'clock till half-past four, but very little progress was made, neither side showing a disposition to give way. It transpired that the members of several branches of operatives declined absolutely to submit the question to arbitration. Eventually it was decided to adjourn the conference till Thursday.

**The Key of the People's Palace.**—The competition for the three best designs for a gold key, to be presented to the Queen on May 14th, at the People's Palace, has resulted in the prizes being awarded by Sir Edmund Hay Currie and Sir George Hayer Chubb to the following—1st, Mr. W. B. Pratt, 162, Sandringham-road, Hackney, E.; 2nd, Mr. George Evison, 8, King's-road, Upton Park, E.; 3rd, Mr. George Jones, 323, Old Ford-road, E. The key will be modelled on the style of the first of these designs, subject to certain modifications, which are found to be necessary by Messrs. Chubb & Sons, the manufacturers.

**Haverstock-Hill.**—New "Stations of the Cross" have lately been erected in the Priory Church of the Dominican Fathers at Haverstock-hill. They are fourteen in number, and the subjects are the same as those always traditionally used. The composition of these subjects is, however, said to be entirely new. This is especially so in the last or fourteenth (the entombment of our Lord), in which our Lord's body is represented entirely swaddled as a mummy, even the face being covered. It is stated that no artist has previously given this treatment. The paintings are by Mr. N. H. J. Westlake, F.S.A.

**Malvern.**—A window, to the memory of the late Mr. Andrew Henderson, M.R.C.S., which has been placed in Christ Church (the Fisk Memorial), by Colonel and Mrs. Forbes, two of the late doctor's patients, was unveiled on the 9th inst. The work has been executed by Messrs. Clayton & Bell, of London. The subject is "The Resurrection."

BLUE BRICKS.

THE KETLEY BRICK COMPANY, KINGSWINFORD Staffordshire, Manufacturers of Blue Bricks. London Agents:—

R. CULL & SON, Palmerston-buildings, E.C.

DRAIN PIPES.

Lime, Cement, Bricks, Flates, Laths, Hair, Plaster, Wall Copings, Channel Bricks, Blue and Red Ridges, Red Plain Tiles and Pav Tiles, Closet Pans and Traps, Bedsteads, &c. all sizes. Chimney Pipes, Red and White Tiles, &c. APPLICATION, R. CULL & SON'S Stores, Railway Arches, London-street, Bethnal Green Station, E. Chief Office:—72, Palmerston-buildings, Old Broad-street, E.C.

TERMS OF SUBSCRIPTION.

"THE BUILDER" is supplied gratis from the Office to residents in any part of the United Kingdom at the rate of 10s. per annum PREPAID. To all parts of Europe, America, Australia, and New Zealand, 25s. per annum. To India, China, Ceylon, &c. 30s. per annum. Remittances payable to DOUGLAS FOURDRINER, Publisher, No. 46, Catherine-street, W.C.

Best Bath Stone. CORSHAM DOWN. FARLEIGH DOWN.

BOX ROUND. COMBE DOWN. WESTWOOD ROUND. RANDELL, SAUNDERS, & CO., LD., CORSHAM, WILTS.

Bath Stone. Pictor's Monks' Park. Combe Down. Corsham Down. Stoke Ground. Box Ground. Winsley Ground. Farleigh Down. West Wood. PICTOR & SONS, Box, Wilts. [Advr.]

Douling Freestone and Ham Hill Stone of best quality, in blocks, or prepared ready for fixing. An inspection of the Douling Quarries is respectfully solicited; and Architects and others are CAUTIONED against inferior stone. Prices, delivered to any part of the United Kingdom, given on application to CHARLES TRASK & SONS, Norton-smb-Hamdon, Ilminster, Somerset.—Agent, Mr. E. WILLIAMS, No. 16, Craven-street, Strand, W.C. [Advr.]

Douling Free Stone For prices, &c., address S. & J. STAPLE, HAM HILL STONE, Quarry Owners, Stone and Lime Merchants, Stoke - under - Ham, (Ground or Lump), Ilminster. [Advr.]

Asphalte.—The Seyssel and Metallic Lava Asphalte Company (Mr. H. Glenn), Office, 38, Poultry, E.C.—The best and cheapest materials for damp courses, railway arches, warehouse floors, flat roofs, stables, cow-sheds, and milk-rooms, granaries, tun-rooms, and terraces. [Advr.] Asphalte. Seyssel, Patent Metallic Lava, and White Asphaltes. M. STODART & CO. Office: No. 90, Cannon-street, E.C. [Advr.]

MICHELMORE & REAP, Manufacturers of

CHARLES COLLINCE'S PATENT. COLLINGE'S PATENT HINGES, LEVER, SCREW, & BARREL BOLTS, self-acting "FALL DOWN" GATE STOPS, and IMPROVED GATE FITTINGS of every Description 36A, BOROUGH ROAD, DISCOUNT TO BUILDERS. LONDON S.E.,

Map of London, SHOWING BOUNDARIES OF SURVEYORS' DISTRICTS. The four Sheets, into which the Map is divided (issued with the numbers of January 1st, 8th, 15th, and 22nd), if sent to the Office direct, or through any Newsagent, can be MOUNTED ON THE FOLLOWING TERMS, VIZ. — On Cloth (Rollers) and varnished, 3s. 6d. On Cloth (Strainer) and varnished, 5s. 6d. N.B.—In the case of "Strainers," if packed for rail or carrier, 1s. 3d. extra. \*\* Omissions discovered since publication will be corrected before mounting.

TWELVE GOLD AND SILVER MEDALS AWARDED. IRON CISTERN. F. BRABY & CO. VERY PROMPT SUPPLY. LARGE STOCK READY. Particulars on application. LONDON: 352 to 364, Euston-road. LIVERPOOL: 6 and 8, Hatton Garden. GLASGOW: 335, Argyle-street. CYLINDERS FOR HOT-WATER CIRCULATION.

### Architecture and Architectural Education.

HE subjects which have been of the most interest in the papers read and considered at the Conference of Architects, so far as we are able to get with it this week in accordance with the exigencies of publication, have

been those which concerned the two questions, what architecture should be, and how we are to attain thereto. Indeed, these may be called the most interesting subjects *sans phrase*; for the class of questions which belong to what may be called professional policy, though apparently burning ones to some people, are really of a much lower order of interest than those which concern the intellectual side of architecture as a great artistic study.

What is an architect to aim at as such, and how he is to train himself or he trained towards his aims, is a much more important and interesting inquiry than any question of professional etiquette, fee-charging, federation, or any other quasi-business matter of that kind. The paper by Mr. Sedding on "Art and the Handicrafts," and the series of short papers read on Wednesday afternoon on architectural education, deal with this higher interest of architecture, and there is a kind of relation between the two, seeing that Mr. Sedding's paper, in spite of a title which might seem to limit the subject a little, was really an inquiry into what architectural art consisted in, and what were the essential conditions of its strength and truth as an art; an inquiry which certainly has a very close connexion with that other one as to the means and the best course of architectural education.

Mr. Sedding's paper is a very picturesque and eloquent one, with that sort of eloquence which comes from real interest in one's subject; it is one we have read with great interest, and with sympathy in a sense with all of it, though we do not know that we can entirely agree with his conclusions. It is the old question, Why is not modern architecture as interesting, as characteristic, as ancient architecture?—by which Mr. Sedding appears to mean Mediaeval architecture; he does not in so many words limit himself to this, but the tone of his paper implies that it is Mediaeval architecture that is before his mind. And the answer he gives is one which has been given before, though he gives it with more consideration and elaboration than some other critics of

modern architecture have bestowed in stating somewhat similar conclusions. "What," asks Mr. Sedding, "is the quality in the architecture of old days which stamps it with its inherent nobleness? How came it with that inimitable touch that gives it this lasting human effectiveness?" And he formulates it, as the reader will see in his paper (printed *in extenso* in our Supplement), in the four propositions: that English architecture is not what it was; that the architect and the handicraftsman are not, respectively, what they were; and that their relations with each other are not what they were. As to the first proposition, of course English architecture is not what it was, because the people who are producing it, and for whom it is produced, though in race and name the same, are very different in their thoughts and habits. The difference is not only in the architect or in his relations to the craftsman, it is in the mass of the people too, for whom the architecture is made. The country is much more crowded, life is more of a struggle, economical considerations press on us with an importunity which cannot be set aside or ignored, life moves much faster, everything is wanted much quicker; if it cannot be furnished quickly it cannot be waited for, the occasion passes by or the quicker person seizes it. We cannot help this; we cannot undo it; these are the facts. The modern generations are no longer under a religious enthusiasm which regards the erection of great cathedrals as a work of piety, before which mundane considerations must give way. There is a good deal of enthusiasm in the present day, more than the *laudatoribus temporis acti* quite perceive or admit; but it has many outlets, and its chief outlet to-day is in the direction of science and scientific discovery, a temper which is not favourable to, and does not even give much occasion for, the expenditure of thought and means in the production of artistic architecture on a great scale. "For what will it cost?" is a question, no doubt, far too prominent in the present day; especially so, as we have often complained, in regard to great public buildings for which adequate means can really be found, without pressing unduly on individual resources. But still the economy question,—economy of time, economy of labour, economy of material,—does press on us in regard to most architectural efforts. There are occasions when it is the higher duty, if people would see it, to ignore mere economical considerations; but they are comparatively few. In the main the necessity of being, before all other qualities, practical, is forced upon us in the present day; we cannot afford to ignore it.

In comparing the interest of modern architecture with that of old, something must, of course, be allowed also for the interest arising

from historic association, and the beauty and picturesqueness born of time and decay, and assuredly inimitable by any artificial or deliberately chosen means. Mr. Sedding would, no doubt, admit that, though he passes it over in his paper. His main position is that in old art the handicraftsman was everywhere. He worked out details on the spot in his own way, unfettered by working drawings: that is the assumption; it wants positive proof, however, though in a great degree it is "probal to thinking," to use Iago's phrase. Mr. Sedding traces in a most interesting manner the marks of the same stamp of handiwork on buildings far apart from each other, showing the impress of the handiwork of the same set of masons; his observation seems to have brought out some new and interesting examples of this. In the present day, he argues, the craftsman is out of touch with the architect or master-builder; he follows detail drawings, furnished him often by one who has little communication with him, or with the building being erected, except by bits of paper sent from a distance; drawings and letters. Yes; and we remember, too, the story of the eminent architect who visited the wrong church, and did not find out, till the foreman told him, that he had been giving orders and making complaints about work done on a building which he had had nothing to do with, not even on paper. The craftsman, unhampered by detail drawings, it is argued, did put, and might again put, his own character and force into the work. He may not do so now. He is the slave of "Detail Drawing, No. 17, referred to in the Specification." And under this regimen the craftsman has lost his power of characteristic and original work. He is assimilated to a copying machine.

There is no doubt whatever that modelling a detail on the spot, and with the feeling of the moment, with the material actually under the hand, is a very different thing from copying another man's drawing; and an architect of judgment will not hamper a good workman too closely about following his drawing. No doubt, either, that the architect ought to be far more in direct contact with the building and the workers on it than he often is. He should see how things look on the spot; not be content with ordering them from a distance, and by the medium only of pencil lines and pen scratches. But those who aspire to this system of doing things must make up their minds that they will have to pay for it. They must give more time and thought for less return. They must limit the number of their commissions. They must live in a simple and inexpensive fashion, and be content with the reward of a good conscience in place of a considerable amount of 5 per cent.; and the demands of modern life are

against this. A man has his family to provide for, and he must go the pace or drop out and let them starve. If he does not take the commission and work it by letter and draw his 5 per cent., his neighbour is ready to do so, and matters will be nothing bettered; he will save his own soul, but will not be able to pay his household bills. Plain living and high thinking must be the order of the day. And, in London especially, the present generation are sadly set against that regimen. Modern habits of life are increasingly luxurious and costly; there is a race for wealth; every one wants more; few people say, like the unfortunate nobleman who had only 10,000*l.* a year, "the great thing is to be content with the little one has"; money-making comes before art, and "they that will be rich fall into temptation and a snare,"—architects as well as others.

But if we take away the drawings, and give the craftsman his head again, shall we be any nearer reviving the old interest of architecture? Mr. Sedding will probably say that we have now demoralised the craftsman too much, and that he will need a long period of liberty to find the use of his hands again,—an objection which would be true enough for the moment. When he found it, and if he were allowed the individual liberty he used to enjoy, in all probability a good deal of characteristic interest would be infused into modern architecture, which it does not at present possess. But we decline to believe that this is a necessary condition of giving life-like interest to modern architecture. It is one condition; not the only one.

The argument is,—ancient architecture had a human interest which modern architecture does not possess. In ancient architecture the craftsman had his own way. The only means to put the same life into architecture is to give him his own way again.

The premises are insufficient, however. We noticed that Mr. Sedding obviously refers to Medieval architecture when he speaks of "old architecture." But why not go back further and take a look at Greek architecture? It will scarcely be asserted, we suppose, that there is no interest in that. But we do not see many signs that the craftsman was an independent agent in that form of architecture. The Parthenon impresses us as the production of one over-ruling mind, bringing everything into harmony with the central idea; as far as the architecture is concerned, that is to say, the sculptors of the metopes may have had their own way to some extent, though, even here, we see a general subordination to a ruling idea; and such a building as the Parthenon must inevitably have been built from drawings or diagrams, and very accurately set-out ones, by whatever method and in whatever medium they were drawn. In the face of the Parthenon, and all that is now known about its refinements, it is absurd to urge that careful setting-out and the superintendence of a directing mind are fatal to architecture; for it is almost demonstrably impossible that the Parthenon could have been built except under such conditions.

There is one other possible influence in giving interest to modern architecture, which seems to have been left out of calculation. What gave interest and life to the craftsmen's work in the Medieval buildings was mainly that they took interest in and enjoyed their own work; they must have done so, or they could not have made it so lifelike and so interesting to us. Well, suppose the system changed, as it is practically at present; suppose that the craftsman is not left free, but has to work out his details from drawings under the guidance of a directing mind; is there not likely to be an important difference in the result, according as that directing mind does or does not enjoy his work, and, therefore, make it enjoyable to his fellow-workers? For that is an unalterable law in art; what you do not take pleasure in inventing, others will not take pleasure in studying. Mr. Sedding complains that "so far as architecture is now conducted as an art and as a profession, it means *design*, not craftsmanship." Well, suppose it does; is there no joy in designing?

And where there is, will not the interest of that he communicated to, and appear in the work of, the craftsman? Truly, in the way architecture is often practised now, it is difficult to imagine the inventor taking much pleasure in it; seeing that he inventeth not in many a case, but combineth shreds of former buildings according to book rule and a kind of artistic multiplication table. But there are some architects among us whose works look as if they enjoyed devising them. We would even rank Mr. Sedding, the pessimist, among the number; but perhaps he will deny the soft impeachment for the sake of upholding his own argument. But that is the secret of making architecture interesting. Let a designer enjoy making an effective plan, let him feel a keen pleasure in the points of his design, and put a detail or a decoration because he enjoys its effect, not because it is the correct thing for that style of work and is found in other examples; let him "design" (even) in this spirit, and the carrying out of his building will be a pleasure to those who work at it and to those who may contemplate it. But if the question is asked: how are we to develop this spirit of work? then, indeed, we can only shake the head and sigh *nascitur, non fit*.

This consideration seems rather to knock on the head the elaborate series of papers on education which have formed an important element in the proceedings of the Conference. Indeed, Mr. Aitchison takes this line, and admits that it is a thousand to one against any student of architecture having any architectural invention, and that invention cannot be taught. We therefore have, he thinks, to furnish them with knowledge that will take the place of invention, as a man may learn to compose respectable music though with no original genius. (N.B. The two things are not quite parallel, though they are often supposed to be so; because architecture, as far as design is concerned, is not under the rigid physical laws of proportion which govern music, to a certain point, inexorably.) Mr. Aitchison's paper is well worth attention, because it makes very pregnant suggestions, without attempting to lay down hard-and-fast rules or theories of architectural education. Among the special suggestions which are made is that of Mr. Lawrence Booth, that the Institute should act as a kind of "Alma Mater" or university, directing the studies of those who are students in the various Associations in correspondence with the Institute; and this is a suggestion which may bear fruit; but in that case the Institute must show itself more keenly alive to questions of architecture proper, and less bent on mere "professional practice" questions. Mr. Gotch complained that any education possible for the student now must be "a curious patchwork education, a lecture here and a lecture there"; and Professor Roger Smith followed with the idea of "a Studio for Architecture" and sketched out very well the course of study which such a studio should undertake to direct. This is an idea very capable of further development; though, in our opinion, it should be plainly recognised that such a studio should be a preparation, a grounding of the student in the subject before entering an architect's office to come into contact with practical work; without which he will never really learn his profession. The advantage of the studio idea is that a student whose heart is in his subject will have leisure there to acquire an adequate knowledge of it in its general bearings, artistic, constructive, and historical, before entering upon that practical routine which is so necessary to fit him for actual practice, but which has such a tendency to shut out from view all the higher aspirations and higher elements in connexion with what ought to be an ennobling and imaginative pursuit, not a mere business.

**The Art Journal.**—The June number of *The Art Journal* will contain a series of Critical Essays upon the Progress of the Fine Arts during the present reign, dealing with the arts of painting, sculpture, and architecture, the industrial and graphic arts, and art education.

#### THE ROYAL ACADEMY.

HERE can be no question that, as far as the paintings are concerned, the exhibition of 1887 is a great improvement on the unfortunate one of 1886, and indeed, in spite of the absence of such painters as Mr. Watts and Mr. Burne Jones, it may be said to be above rather than below the average of Royal Academy exhibitions. If we were asked to select the pictures which specially showed artistic power or interest from among the whole, we should have no doubt as to the first three to be selected. Mr. Tadema's "Women of Amphissa" (305), Mr. Orchardson's "The First Cloud" (291), and Mr. Henry Moore's "The Clearness after Rain" (659), curiously diverse as they are in subject, manner, and association, may be grouped together as the three most powerful works of this year's Academy.

Mr. Tadema's appears to be established as the popular picture of the year, judging by the crowd round it on Monday, and this popularity must be entirely credited to the painter and not to his subject, which is as little interesting to modern spectators as could be. It appears that on some occasion some Priestesses of Dionysos at Delphi, being seized with a religious frenzy (in other words, probably, having got drunk in the service of Dionysos), wandered to the town of Amphissa and slept in the market-place, where the benevolent ladies of the place came about in the morning and fed them and saw them safe out of the town. It is almost impossible to interest a nineteenth-century society in such an incident as this, but it gives the suggestion for the grouping of a number of pictures—quietly-dressed Greek women in pretty attitudes amid a setting of marble architecture. The Doric colonnade of the Agora occupies the right of the picture, in sharp perspective and painted with consummate care and skill; the marble floor extends in the centre, occupied by the fugitive votaries of Dionysos, some still asleep, one standing and stretching herself, two very beautiful brunettes on the left sitting up half-awake, and accepting with a look of gentle surprise the offer of breakfast by one of the townswomen. The majority of the latter form a group in the rear, picturesque with many-coloured garments. The grace of many of the sleeping or waking figures, and the mastery of drawing shown in the delineation of their various postures, render the work a masterpiece in execution, though of intellectual interest, as regards the subject, there is little enough. They are a crowd of Greek figures on a marble floor (very hard to sleep on, by the way!), and that is all.

Mr. Orchardson's picture on the same wall in Gallery III. is a contrast indeed to the last named. They represent almost the opposite poles of painting. Mr. Tadema paints ancient marble architecture so as to be almost illusory in effect. Mr. Orchardson paints the furniture and upholstery of the most modern of London drawing-rooms, and hardly with illusory effect, for his peculiar scale of colour and method of handling constitute a conventionality; we look at the scene through a kind of veil, as it were; and perhaps this manner,—a highly original one, borrowed from no one and imitated by no one,—is of aesthetic value as removing the subject of real life a little away from too obvious a realism. Two figures occupy the scene; the wife, a stately young woman of splendid figure, who moves slowly away through the *portière* into the further room, her back to the spectator, though the head is half-turned; the fingers of her right hand, nervously clutched, show her agitation or anger. The husband, in evening dress, stands with his back to the fire and hands in his pockets, and looking after his companion with an expression in which there is a whole history,—anger, doubt, and an uncomfortable speculation as to the future of life. The highest merit of the work is in the restraint of the artist; the delicate hand with which the situation is touched; there is no exaggeration or extravagance, but the story is told. Mr. Orchardson may claim place with such a writer as Balzac in his manner of depicting this

kind of society tragedy. Many of the other exhibitors paint figures of men and women, more or less well, and in more or less picturesque costumes and attitudes. Mr. Orchardson paints Life.

Mr. Moore's picture, before referred to, is one of those expanses of rough sea which he is fond of painting, but it is one of more than usual power and effect. The rain has gone, but the reflections of clouds still darken the sea in the foreground, the waves being almost inky in parts; but on the horizon is the strip of almost absolutely clear sky frequently seen at such a time, and in the midst of it one white-sailed ship on the horizon line. The force of the painting lies, perhaps, partly in the intensity of contrast between the dark water and the clear sky in the distance; partly, no doubt, in the manner in which the weight and depth of the water is conveyed, and in the grand and broad execution of the whole.

The President's principal work "The Last Watch of Hero" (229) is a figure grandly draped, leaning, with her arms raised above her head, against the jamb of a window, of which the picture-frame seems to form the architrave. The figure is unquestionably fine; the face is expressive and anxious, though not so much so as to disturb the classic repose which Sir F. Leighton seems always to aim at. This repose is attained at the expense of reality and tragic power. Hero, looking out through an open window into the stormy night (for the legend is that Leander was drowned in a storm) should have had her hair and garments blown wildly about in the wind. A small monochrome painting of Leander, thrown up by the waves, numbered separately, but really forming a predella to the larger painting, is not a success: the frame of Leander is extraordinarily lengthy, and if he really tried to swim the Hellespont with a great piece of drapery tucked round him, like that shown here as flying in the wind, he was likely enough to be drowned. Besides, a monochrome predella to a richly-coloured painting is somewhat of an incongruity to the eye. The President's painting of "Simaetha the Sorceress" (160) shows a seated figure of a grand-looking woman, the legend of whom we confess to being ignorant of. The implement of the sorcery appears to be a wheel with an unfortunate bird crucified on it; presumably representing the object of the sorceress's hatred, as witches in the Middle Ages made wax figures of the offenders on which to wreak their spite.

Sir J. Millais's most important picture, in regard to scale and subject, is "Mercy: St. Bartholomew's Day, 1572" (298), a kind of reversal of the motive of "The Huguenot." Here the feminine appeal is not "Do not be a victim," but "Do not be an executioner." A monk opens a door, and beckons to a man with a drawn sword in his hand, who reminds one of the gentlemen who assist at the benediction of poignards in the opera, while a nun, in whom religious zeal has not extinguished womanly tenderness, kneels and tries to cling to his sword-hand. The subject is a fine one, and the armed man and the monk are finely contrasted, the "man of words and the man of blood," as Mr. Swinburne has it; but the painting is curiously hard and flat in effect, in comparison with the best of the painter's later work, nor should we indeed have guessed Millais as the painter's name. "The Nest," a portrait of mother and child (25), is a beautiful work,—the child, with an exquisitely modelled little face, and eyes upturned to look at the bird on her nest, is one of the most lovely children Sir John Millais has ever painted. The mother, a fair-haired lady, in a primrose-coloured dress, is also a beautifully-painted and very characteristic figure. "Lilacs" (214) is another very delicate child's portrait.

Mr. Val. Prinsep has made a success in his painting entitled "Habitués in montibus Echo," a nude figure representing Echo, appropriately reclined in a re-entering angle of a cliff, a corner whence echoes may be supposed to be generated, and with the lips parted as if calling. There is certainly no very wild flight of poetic fancy in this ideal figure, but it is ideal enough to pass for Echo, and the effect of the grey reflections of the rock on the clear

skin in the upper part of the figure, mingling with the natural carminations of the body, and the warm light on the lower portion from the sunlight past the edge of the cliff, is painted in a masterly manner: it is a picture both for study and for pleasure. Another study of the nude figure under a peculiar light is made by Mr. John Collier, in "An Incantation" (716), a fair sorceress seated on a bank and entirely lighted from the flames of a burning cauldron just below her perch. Unlike Mr. Prinsep's picture, it is clever, but not pleasing; the effect of the firelight on the flesh is well given, but the posture of the body is ungraceful and the face leering and disagreeable,—in character, perhaps, for a sorceress, but the result does not seem worth the expenditure of study and ability which have gone to painting it. The only other nude picture that need be particularly mentioned (there are very few,—whether or not on account of the assaults of British Matrons we cannot say) is "A Naiad" (1016), by Miss Henrietta Rae, who has been getting nearer and nearer to the line with nude studies for two or three years past, and is deservedly on it at last. Her painting is a very pretty female figure, seated on a rocky landscape by a stream, the legs draped in a semi-transparent lawn, the face and body beautifully painted; it is true there is no poetic imagining about the thing at all; it is not a goddess or supernatural creation, only a very pretty young lady playing Naiad; but it is capitally painted.

A Naiad of another type serves to give the title to one of the best of Mr. Hook's works, "Fresh from the Waves" (292), a bright breezy coast scene with a delightfully healthy-looking young woman coming up into the foreground in a bathing gown. Another painting, nearly equal to this, hangs as a pendant to it,—"Young Dreams" (299), a boy and girl in the foreground. The style of Mr. Hook's sea-painting varies very little, and perhaps his full power comes out best when he paints a boisterous breezy sea close up to the foreground, and makes us believe we smell salt water. There is, however, a delightfully fresh and out-of-doors feeling about these two works, No. 292 especially; more so than in Mr. Brett's in some respects more powerful and remarkable paintings, "Kyle-Akin" (416) and "Ardevtrive Bay" (421). The former is the most striking picture; the rocky bastion on the right, with its level ranges of sea-weeded ledges, the procession of hill slopes growing more and more purple towards the distance, the bright light on the green middle distance promontory, and the shimmer of sunlight on the translucent water, are all splendidly given; but one cannot help feeling that these constantly repeated intense effects of sunlight can be but rarely met with, and that there is something unreal in them, fine as they are. The other picture is noted as painted under "a very low barometer," with the observation that in this condition of the air "the relative gravity of the birds is increased, so that they find flying laborious," and sit sulkily on the rocks. We should like to ask the birds' view of the matter. Other bipeds, that do not fly, are liable to be sulky and languid under a low barometer, without any such mechanical difficulties as are suggested.

Between Mr. Brett's two paintings hangs a "bravura" work, as we should call it, by Mr. F. Dicksee, "Hesperia" (421), a gorgeous Renaissance Italian woman in a gorgeous garden, with a dress of the most sumptuous description, holding out an orange. The picture is almost startling in its brilliancy, but in its way it is certainly a success. A single-figure work in a far higher mood is Mr. Herkomer's painting of a lady (377) with for title only the lines:—

"Entranced in some diviner mood  
Of self-oblivious solitude."

This painting of a lady in a dark dress, and with all the prevailing tone dark, is placed, with a certain dramatic effect, on the very piece of wall a year or two ago occupied by the same artist's brilliant success in white painting in the shape of the well-remembered portrait of Miss Grant. This is a finer achievement, however. The technical execution is as good;

and it is pervaded by a deep feeling in keeping with the quotation; the small beautifully-formed head and dreamy countenance of the lady have quite a fascination in them: if this is a portrait, it is portraiture raised to the rank of ideal art. The same room contains Mr. A. Moore's principal picture, "Midsummer" (394), a new effect in colour; three of his usual pretty but mindless damsels in orange-coloured scarves, one of them seated on a chair inlaid in white and black; the two standing figures hold green fans, a piquant note in colour; the background is a very dark green dado. Mr. Sargent's "Carnation Lily, Lily, Rose" (359) is a picture sure to be looked at as much from its extraordinary hideousness of colour as for any better reason; two children lighting Chinese lanterns amid a crowd of flowers; to increase the effect of the lantern lights and their reflections on the figures, the grass, &c., in the foreground is painted a livid "viridian" sort of green, like no vegetation in any healthy painter's world; this, we presume, is one of the "high horizon" pictures, as the whole background is of a kind of quasi-grass tint; but the children's faces are not in accordance with this in regard to perspective; the whole thing is an extravagant muddle.

One of the most thorough successes of the year is the beautiful though quiet landscape by Mr. H. W. B. Davis, "Summer" (153); a shallow river, with cows standing blissfully in it, and the blue summer sky reflected in it, a meadow in sunlight, and another with shadows straying over it; a scene painted with such absolute reality of effect that it becomes almost an illusion. This is not the highest aim of landscape-painting, though one is apt to think it is while looking at the picture. In another work, "Now came Still Evening on" (231), Mr. Davis has given beautifully the doubtful light, half warm, half cold, over an evening landscape, where twilight is just beginning to be lit up by the moon. Mr. Alfred Hunt's picture, illustrated by a line of Browning's,—

"Our interests on the dangerous edge of things,"—is another and larger view of a scene which appears in a drawing in the Society of Water Colours Exhibition, though under very different atmospheric circumstances. It is an evening scene from the top of a high cliff, where houses cling together, looking over a calm sea, in which the rising moon is reflected. It is curious to contrast this art with that of Mr. Davis's "Summer," which hangs nearly opposite to it: the one working out the most exact resemblance to nature by the practical use of pigments; the other neglecting mere detailed resemblances to get near the heart of the feeling of the scene, and to escape from the recollection of pigments altogether; which Mr. Hunt certainly contrives to do to a wonderful extent. There are hardly any other landscapes of the highest class in the rooms; Mr. Oulless's "Hailstorm at the Devil's Bridge" (186) is a very remarkable work, however, with a wonderful dash of sunlight on the bridge.

Among the smaller pictures which are among the more noticeable in the exhibition (and of such alone we are now speaking), one of the best is "The Latest Scandal" (701), by Mr. Seymour Lucas; an interior of a coffee-house in the *Spectator* days, where a party of persons of a somewhat vulgar class, one or two of whom remind us of heads in some of Hogarth's pictures, are retelling a story in reference to one or other of a couple of young gentlemen of fashion, one of them super in a long crimson tunic, who stand apart with dignity, but not without consciousness and annoyance. Mr. Marks's study of Penguins with partially human expressions and actions is a pretty bit of humour under the title "Dominicans in Feathers" (276). Mr. Briton Riviere's "Jilted" (253) is an admirable little work, the point of which is in the lively action and sympathy of a fine black and tan terrier; the whole is very well painted, but it is putting the cart before the horse to paint a picture of a man in distress merely for the purpose of painting a dog as his companion. Mr. Riviere's larger work, "Au

Old World Wanderer" (76), is really an elaborate study of sea birds, also admirably painted, but it is vexatious to have these misleading titles given to pictures; the figure introduced is of no interest whatever, and the quotation appended has no point; far better to leave out the figure and put a title conveying the real subject of the picture. Mr. Arthur Hughes has a strange little work, "In the Forest of Arden" (940), which seems to afford great amusement to the average Philistine; Audrey or some one of her type is sleeping with her crook under a tree; there is a magical sunlight streaming through the boughs and on to the carpet of moss on the ground; but the execution is not consistent; the texture of most things in the picture is minutely shown, except that of the dress of the figure, great part of which is left, after Mr. Hughes's manner with drapery, a mere flat surface of paint, conveying the idea that the painting is unfinished.

Mr. Crofts's "Napoleon Leaving Moscow" (548), is one of the prominent works of the exhibition; he has hardly realised the accounts given of that extraordinary cavalcade, with its mixture of every sort of conveyance, from a gilded carriage to an ammunition-wagon; the figures are well studied, especially some of the Old Guard on the right, and the figure of Napoleon himself, which seems, however, rather inspired by Meissonier's famous painting of the same figure under the same circumstances. The action of the Emperor's white horse seems open to question; the position of his legs looks awkward and unnatural, at all events.

Another military picture, "The Garrison Marching out with the Honours of War, Lille, A.D. 1708" (504), by Mr. A. C. Gow, has a special character and interest. Mr. Melton Fisher's "First Communion" (923) is a kind of work that will be popular, but is, to our thinking, very superficial both in sentiment and execution; the faces and features are so coarse they might have been painted with a besom, but there is a certain effectiveness in it as a whole.

In singling out what seem the most notable works of the year, we should be wrong if we omitted mention of Mr. Herbert's one contribution, with the suggestive and historic title, "The New World in the West for Spain or for England?" (691),—a work which, in itself, will certainly repay a visit to the room in which it is hung.

#### NOTES.

**T**HE Report of Amendments stage of the Railway and Canal Traffic Bill was reached in the House of Lords on Friday, the 28th ult., the proceedings on that occasion being chiefly noticeable for the persistent attempts of the representatives of the railway interest to thrust upon the House amendments which it had already rejected. Thus, Lord Grimthorpe again endeavoured to secure the insertion of a clause extending the right of appeal to questions of fact as well as of law; but the House affirmed its previous decision on this point, rejecting the motion by a majority of twenty-two. An amendment, introduced by the Earl of Crawford and Balcarres on the subject of terminals, was not pressed, Lord Stanley of Preston also bringing forward an amendment on the same subject, to which the House agreed. This provides that, in determining the amount of a terminal charge, the expenditure considered reasonably necessary for the accommodation in question is to be taken into account, not the actual outlay. With regard to "undue preference," the Government are evidently impressed with the necessity of improving the measure in this respect; for Lord Salisbury, although contending that the provisions of the Bill formed an adequate safeguard to the public, intimated that he was disposed to consider the advisability of introducing a further amendment to remedy the grievances complained of by the home producer. The interests of the latter class were ably championed, as before, by the Earl of Jersey, and Lord Salisbury declared that he did not in the least differ from him as to the

injustice involved in the present state of things. His lordship's defence of the clause, as it at present stands, was anything but convincing, and this question will certainly have to be dealt with in a more satisfactory way before the Bill is approved of by the country at large. The clause relating to the publication of charges, as finally revised, enacts that the classification tables shall be open for inspection, and that copies be sold. A new clause, relating to the appointment of an additional Judge of the High Court (which the operation of the Act would probably necessitate) was adopted; and, as thus amended, the Bill will come before the House of Commons for their consideration, unless the Upper House should use their privilege of raising further points upon the third reading.

**T**HE lecture "On the Rolling Contact of Bodies" delivered at the Royal Institution on April 29th, by Professor Hele Shaw, dealt with a subject of much interest in a manner a little disappointing. The demonstration that the contact of any point on the periphery of a circular rolling body with any point on a plane surface on which it is rolling takes place in a direction vertical or normal to the said plane, and leaves it in the same direction, was clearly given by the aid of models and of a diagram of the cycloidal curve, and the effect of a harder rolling body on a plane of softer texture (as iron on wood) was illustrated by a diagram,\* as at Fig. 1, where it is shown (in a highly-exaggerated form, of course) how the harder

Fig. 1.

Fig. 2.

Fig. 3.

rolling body is driving up the substance of the plane before it into a ridge, and leaving a following ridge behind it. A reverse process took place when a softer body was rolled on a harder plane, the rolling body itself being subject to a continued distortion in each portion of its periphery as it came in contact with the plane. The important practical point in connexion with this part of the subject was that the hard body rolling on a softer plane suffered retardation, while the soft body rolling on a harder plane developed a slight creeping motion in advance of what would be its normal rate of onward progress if its periphery could remain perfectly rigid. The relative difference in the cycloidal curves formed by some hard or soft substances rolling on harder or softer planes respectively was illustrated by a diagram, showing the true cycloid curve slightly shortened in the former instance, and slightly extended in the latter. This aspect of the subject may perhaps have some practical bearing on the railway question of elastic wheel and rigid rail *versus* rigid wheel and elastic rail, which has been debated from time to time. The remainder of the lecture was mainly devoted to some further illustrations derived from the action of a rolling spherical body on the surfaces of two parallel cylinders (Figs. 2, 3), one of which was free to turn on its axis. As shown by a multiplying indicator dial, the rolling of the sphere, in whichever direction, produced a slow rolling of the free cylinder on its axis in the direction of the arrow, fig. 2. This was explained as another form of the creeping action of the surface rolled on, in this case, not a fixed plane but a rotating cylinder. According to the previously expressed theory, the lecturer said, a softer sphere rolled along the cylinders should have set up a creeping action in the reverse direction, turning the cylinder outward instead of inward;

\* These are not facsimiles of Professor Shaw's diagrams, but merely sketches from memory to render the description intelligible.

but this, as he showed by experiment, was not the case. The explanation was that this contact of the soft body with the cylinder was really a different problem; that the motion set up by the compression and consequent expansion of the soft spherical roller on its advancing side, which descended vertically on the point of contact, was assisted, not neutralised, by the action on its receding side, which rose vertically while contracting. We should say that in this far-fetched explanation the lecturer had neglected the simple element of the weight of the rolling sphere acting on the inner surface of the cylinder. He showed afterwards by experiment how a disc revolving between the two cylinders, as in fig. 4, gradually worked its way along in the direction of a weight C, not

Fig. 4.

sufficient to drag it along when not revolving; in the other experiment the gravitation of the spherical body is surely the weight, dragging down the cylindrical surface where in contact with the sphere. That Professor Hele Shaw is a little disposed to look for mysteries where none exist, seems apparent from his drawing, the attention of his audience to the fact that whether the sphere in fig. 3 were rolled from A to B or from B to A, the rotating motion of the cylinder was in the same direction. Could any one possessed of common sense expect it to be otherwise?

**A**T a recent meeting of the German Archaeological Institute, at Rome, Dr. Studniczka read an interesting paper on the sculptures of the Temple of Zeus at Olympia. If we believe Pausanias, the sculptures of the pediments were the work of the two later contemporaries of Pheidias,—Pronios and Alkamenes. If we judge from the style of the sculptures themselves they belong to the archaic-transitional manner, *i.e.*, are distinctly pre-Parthenon; further, we have definite evidence that the temple itself was complete soon after 460 B.C. We possess no certain work from the hand of Alkamenes, but fortunately we have the Olympian Nike, an undisputed work of Pronios; this proclaims him to be, if not a pupil, at least a successor of Pheidias. Further, as the temple was built by a local architect, Lihon, and as the Olympians took the trouble to send to Athens for the illustrious sculptor, Pheidias, to make the statue of Zeus, is it likely that they would import at the same time too young and presumably almost unknown sculptors, Pronios and Alkamenes, to execute the pediment sculptures? Such are the difficulties Dr. Studniczka raises,—difficulties which have indeed been severally long felt by all critics. He proposes to cut the knot by the simple expedient of supposing that Pausanias blundered. Probably the traveller's informants, or he himself, had misunderstood the Nike inscription. Released from the bondage of the statement of Pausanias, we have to consider, from internal evidence alone, who made the sculptures. Dr. Studniczka thinks they are undoubtedly the work of Peloponnesian sculptors. Those who are acquainted with his interesting book on Greek dress ("Beiträge zur Geschichte d. altgriechischen Tracht") will not be surprised to find his arguments turn mainly on an analysis of the draped figures. The women of the pediments, with the single exception of the bride, Hipodameia, wear the Doric chiton,—a fashion which no Athenian sculptor would have inserted. Dr. Studniczka promises a fuller discussion of the subject, which is of high interest for the history of Greek art.

A LARGE piece of granite work has just been completed in the City, in the front of Messrs. Lloyds, Barnetts, & Bosanquet's bank in Lombard-street. The lower portion of the front is chiefly composed of granite from Messrs. Freeman's quarries in Cornwall. The granite is of bluish-grey colour, and, unlike the great majority of Cornish granites, is comparatively fine-grained and not porphyritic. It is composed of orthoclase felspar, a little anorthite, smoky-coloured quartz, both black and white micæ, and schorl. In places in the building the rock may be seen to have a tendency to foliate, but its general appearance is homogeneous, denoting an even texture. There are eight polished columns, four on either side of the main entrance, each being a monolith, 14 ft. 6 in. in height, and about 3 ft. in diameter. These were turned in a Brunton's lathe, the caps being slightly ornamented. The carving over the main entrance to the building represents the arms of London and Birmingham blended together with a beehive in the centre. It is one of the most elaborate pieces of workmanship that has ever yet been attempted in Cornish granite. If it had been carved in sandstone or limestone there would be no occasion for special comment, but the execution of such work in granite is a considerable effort of skill and patience. The great wreaths carved over the entrance to the passages on either side are also very fine pieces of work, and well designed. The carvings are unpolished, and present an unusual tone and surface, which gains in effectiveness, perhaps, from contrast with the quantity of polished granite in the columns and sills, &c. We are strongly inclined to think, however, that the total effect would have been better had all the granite been left unpolished; the glitter of polished granite in such large masses is a somewhat vulgar form of display, not in the best architectural taste. The carved work in the unpolished granite, however, is worth notice as a novelty, and may, perhaps, lead to further attempts in the decorative use of this durable material. A fine-grained granite, free from dark patches, is necessary, however, for a successful result in this kind of work.\*

**SIGNOR FERDINANDO ONGANIA,** the Venetian publisher, is about to bring out a brochure entitled "A Glance at the Historical Documents relating to the Church of St. Mark at Venice," by Mr. Wm. Scott, who some of our readers may remember was the winner of the Institute of Architects' Travelling Studentship some years ago. The subject of the restorations at St. Mark's has led to considerable discussion in Italy and in this country, and it has been felt that some authoritative work is wanted to serve as a guide for any future alterations which may be undertaken, or as a record of features which may at any moment be destroyed through mistaken zeal, or by other unforeseen circumstances. During the Austrian occupation of the Venetian provinces, a large illustrated work on the basilica was commenced by Messrs. Kreutz, but, although largely subsidised by the Government, the work was never completed. Signor Ongania has, however, undertaken the task of completing the work, and after ten years of unremitting labour, the work is now practically finished, the text and a few plates of minor importance alone remaining to be issued. In conjunction with the text, there will be produced a large quarto volume, consisting of copies and extracts from ancient documents relating to the basilica, many of them being the official records of the churchwardens, reproductions in heliotype of interesting documents, plans, inscriptions, and details of every description. This important work is published in a limited edition of only 600 copies, and is only issued to subscribers. The publisher has thought that it might be acceptable to English readers to have placed before them a general outline of this important publication, and has commissioned Mr. Scott to prepare the abridgment to which we have referred at the head of this Note.

\* The carving alluded to has been executed by Messrs. Freeman, except the keystones over Pope's Head and Change alleys, which are the work of Messrs. Brindley & Farmer.

IT has long been well-known that on a certain number of Greek vases scenes from comic plays are represented. This class of vases have, however, received scant attention in large measure, no doubt, because from the artistic point of view they are not attractive. Dr. Heydemann, in the last issue of the *Jahrbuch* of the German Archaeological Institute (Band I. viertes Heft, 1887), makes them the subject of an interesting monograph. As eleven out of the twenty-six instances he brings together are in the British Museum his paper should have special interest for English readers. Literary notices of the Phylakes, the comic actors at Dionysiac festivals in Magna Græcia, are scanty: so it is fortunate we have these vases to refer to. Those interested in the ancient comic stage must refer to Dr. Heydemann's paper, which is abundantly illustrated, but we may briefly note the following points:—1. As to the "provenance" of these comic vases. With two exceptions found in Sicily, they all came from Magna Græcia. The largest number were found in Apullo. Ruvo comes next. The only signed vase among them bears the name of the well-known Magna Græcia potter, Asstes. 2. As to the shape. With very rare exceptions, they belong to the class of bell-shaped Krater,—five omochois have been found. 3. As to style, all the vases may confidently be dated at the beginning of the third century B.C. The drawing is uniformly coarse, with a strong leaning, as one would expect at that date, towards the pictorial. 4. As to the costumes represented. They are, of course, governed by the principle *γελούον χάριον*. The figures wear almost uniformly grotesque masks. Another constant element of adornment was a huge pillow fastened either in front or behind. This was worn by both male and female actors, and, to judge from the vase paintings, had much the same effect as the piece of mechanism known to modern dressmakers as an "improver."

TO the same number of the *Jahrbuch*, Dr. Kalkmann contributes a monograph on the connexion between Aphrodite and the Swan, which throws new light on the beautiful Aphrodite Camirus vase in the British Museum. It will be remembered that in this matchless bit of vase-painting the goddess is represented as flying through the air seated on a swan. Dr. Kalkmann rightly asks, Why the swan? The swan is in no way symbolic of Aphrodite, but rather of Apollo. If we may trust Sappho and Mr. Swinburne, doves, not swans, were yoked to her chariot. The difficulty is cleared up in the main by a relief found at Kertsch; the relief is headed by a pediment-shaped ornament, within which is the figure of a goddess on a flying swan; on each side of the pediment is a Nike standing on a ship. The inscription shows the slab was dedicated to Aphrodite Urania, who rules over the Bosphorus. The swan, the white shining bird, is, in fact, the symbol of Aphrodite, but only in her capacity of Ourania, the light goddess, the heaven ruling the sea. As such she appears in a beautiful lekythos in the Berlin Museum, with gold stars in the background behind her, and gold stars on her raiment and on her swan, a very image of the stary heavens. As such she rides her swan on the Camirus vase; as such she received from her winged messenger (*alos equus*) the lock of Berenice,—

"Isque per ætherias me tollens, avolat umbras  
Et Venereis casto colloca in gremio."

AMIDST many, sometimes unavoidable, desecrations of houses and sites that have a history, we have to record one instance in which the reverence for the associations of a great name has prevailed over considerations of mere lucre. Upon the outbreak of the Great Plague in 1665, Milton moved from his home in Artillery-walk, leading to Bunhill-fields, to what he has termed a "pretty box" at Chalfont St. Giles, a village in Buckinghamshire, on the road to Aylesbury. The cottage, for it is nothing more, had been taken for the blind poet by his friend Elwood, the Quaker, who first saw there a completed transcript of the labour of ten years,—*"Paradise Lost."*

With the exception of the gabled porch, which has fallen into decay, the house remains nearly as it was in Milton's time. The parishioners of Chalfont St. Giles, disregarding an offer on the part of an enterprising American for purchase, have, to their great honour, resolved to buy the house themselves, and to devote it to the purposes of a local reading-room and museum. The owners are prepared to sell this cottage and the one adjoining at a fair price. So a committee and trustees are appointed; and it is hoped that a sum of from four to five hundred pounds may be subscribed to the local Jubilee Milton Memorial Fund for the purchase and maintenance of the two cottages. At the same time, we learn that a traditionary home of Sir Walter Raleigh is about to be pulled down, and its site given over to the builders. This is Raleigh House, lying between Brixton Rise and Lower Tulse-hill.

CARSHALTON HOUSE, Surrey, is about to be put up for auction. Standing in beautiful grounds of about twenty-five acres, that are well watered with springs and a tributary of the Wandie, erewhile famous for trout, this fine old mansion, in the real Queen Anne style, of red brick, was rebuilt by Sir John Fellowes, a governor of the South Sea Company, in 1719. Its site had been that of the house built by the celebrated Dr. John Radcliffe, who called his seat the Montpelier of England. Here he collected the books which were afterwards presented to Oxford University. He further bequeathed 40,000*l.* for building the Library there, with endowments for maintenance. The library at Carshalton extended to the entire depth of the house; it was afterwards sub-divided, and part of it formed into a hall. Here Radcliffe died on November 1st, 1714, his end having been hastened, it is said, by the reproaches that were heaped upon him for refusing to attend Queen Anne in her last illness, he himself at the time being tortured by gout.

THE collection of drawings by Mrs. Allingham, under the title "In the Country," which is on view at the Fine Art Society's Gallery, is one of the most beautiful and most thoroughly satisfactory exhibitions which it is possible to visit. The subjects Mrs. Allingham illustrates are such as form, perhaps, the purest and most unalloyed source of human pleasure,—the beauty of flowers and trees and skies far out in the country, unsoiled by the neighbourhood of town. The art with which she treats her subjects is of the highest kind; truthful, unpretending, showing mastery of the material of water-colour without the faintest obtrusion of "cleverness." Indeed, the mingling of breadth of effect with minute accuracy in detail, without the slightest hardness, is a marvel in many of these works. We look at a scene with the trees treated in broad feathery masses, the distant landscape stretching away, seen in a mere peep between the middle distance trees; a child and a kitten, perhaps, at the gate of the cottage; nothing is obtrusive, all the details fall into their place; but, if we look close, the little head of the kitten, no larger on the paper than a good-sized pin's head, is completely finished as far as the scale will allow, and looks as if it would bear the inspection of a magnifying glass. The same with the foreground flowers in the drawings. There are other painters of landscape who will give us this kind of minute detail, but not with the capacity of combining largeness and breadth and atmospheric softness with it. Every drawing is worth looking at: among those which struck us with particular pleasure we may name the delicate little study of "Mountain Ash" (13), the little child called "Tottie" (22); "Banacle from Gray's Wood" (43); "Evening" (49); "An Old Surrey Cottage" (53), with its tall sunflowers; "Corcorus Japonica" (55), really a cottage scene with a sweet little child figure standing out against the darkness of the doorway; "Midsummer" (58), a wealth of bright flowers in a corner of an old English garden; "Haslemere Church" (60), with a belt of purple woods (a little too purple?) stretching across the middle distance;

"Underwood's" (61), a village home; "Cottage at Brading, Isle of Wight" (65).—Mrs. Allingham does not seem to know that this was the dwelling of "Jane, the young Cottager," or she would surely have added that point of interest in the catalogue; "At Abinger Hammer" (67). This last, where two girls talk to each other over the cottage gate, reminds us to remark on the happy manner in which the artist introduces her little figures in the scenes; they are only figures thrown in as incidents in what are really landscape paintings; but they always have their own point and meaning, their distinct relation to each other; they are never "doing nothing"; they are interested about something that is going on; we can almost imagine their conversation. If water-colour will only last like oil, what a great name Mrs. Allingham will have when she becomes an old master (or mistress), and how her little gems of work will be run after and "run up" at the "Christie's" of future generations.

WE observe that among the attractions at the Crystal Palace for the ensuing season is to be a large model of the Tower Bridge, erected over the South Fountain basin, from drawings furnished by the Corporation.

LORD SALISBURY, in his speech at the Academy dinner, observed that the Academy might, perhaps, be felicitated on having escaped active State patronage or interference. "The State," he said, "had been a patron of sculpture and architecture; it had built sundry buildings and erected various statues;" but when we considered what the fate of statuary and architecture had been at the hands of the State, the benefit of its patronage, he implied, was more than doubtful. This is certainly the case lately in regard to architecture, in which the Government seem to have been doing all in their power to spoil both ancient and modern buildings over which they exercise any jurisdiction.

ARCHITECTS who are in good conceit with themselves and their art, and happily conscious of its importance to the world, may obtain a healthy reaction by remaining a little while in the vicinity of the door of the Architectural Room at the Royal Academy. They cannot fail to be interested by what they will hear there. Many persons who come to the door simply stop and turn back as if they had run against an invisible bar. From others may be heard a scornful laugh, "Oh, I don't want to go there." "Architectural drawings," exclaims another, "Oh, let us go out again; I don't care for them." "What on earth is this?" exclaims a lady with a look of bewilderment, and almost as if the room were not a proper one to come into. Then enter two young "Johnnies" in irreproachable costume. "Ah! just sort o' thing, don't yer know, that you see in an estate agent's window, don't yer know?" This latter speech, we assure the outraged architectural exhibitor, is a fact; it is not our wicked invention. Certainly, waiting at the door of the Architectural Room is a very good way for an architect to get reminded that he is mortal.

#### ARCHITECTURE AT THE ROYAL ACADEMY.—II.

THE list of drawings at the Academy this year leads off with

1583, "Head Office, Commercial Bank of Scotland, Glasgow," Mr. Sidney Mitchell. This is hung too high for the details to be seen; it appears a solid-looking block of building at the angle of a street, this portion being accentuated by an octagonal hock with quoins at the angles, and rising into a cupola above.

1584, "House at Westgate-on-Sea," Mr. G. Sherrin. Over-acted simplicity, all the lines of the window frames crooked to give it the look of an old house; a nice pen drawing, but nothing to call "design" in it.

1585, "Welsh Chapel, Shaftesbury Avenue," Mr. John Cubitt. Interesting as the first important example of Shaftesbury Avenue architecture; also as showing to what æsthetic heights the Welsh Methodists are soaring. A solid-looking design in a kind of Romanesque; Early English capitals and shafts, but round arches; an octagon cupola above and a porch with a pyramidal roof on each side of the front. The best point in the front is the triplets of windows under deep semicircular arches; the method of finishing the octagon at the angles of the parapet is very ugly, as also the bits of buttresses stuck on here and there for no obvious reason, and then sliced off abruptly. Good general design; bad details.

1586, "West Kensington Congregational Church: Interior looking South," Messrs. James Cubitt and J. M. Brydon. A Gothic interior of early geometrical type, but with a special treatment of the roof; a brick or stone solid arch, pointed, but with a flat soffit, carried over at each bay where the roof principal should come; on these ribs, and on squinch arches at the angle they make with the wall, a wooden octagon dome is erected over each bay, a kind of translation of the roofing of St. Front, Perigueux, into a cheap form suitable for a modern contractor to estimate for. Clever and original, but what about acoustics? The drawing scratchy and careless in execution.

1587, "Sunningdale Parish Church," Mr. J. Oldrid Scott. A very pretty bit of modern Gothic, not without original touches; the aisles lighted by triplet windows under relieving arches which spring from the buttresses and bridge over the intermediate spaces: the octagonal turret in the middle of the north transept is picturesquely placed, but would stop out light from the windows; the tower with a slate spire has some novelty of treatment, with coupled wall arches near the angles, and a small circular tracery window in the centre of each face, where one would expect the clock-face to occur if there were one; the cornice lines of the tower are not quite true in perspective with the set off lines on the stage below, which is an annoyance to the eye; otherwise a very good pen drawing, accurate, and yet free in touch. The author has subjoined a plan; there are so few in this exhibition that this is a certain credit in itself.

1588, "Trinity College, Oxford," new Quadrangle and House for the President, Mr. T. G. Jackson. A very pretty sepia drawing; the *genius loci* has been duly considered; dormers with semicircular shell finials and pyramid pinnacles, columns in attic resting on cornels and projected out from the face of the work, engaged pilasters on the ground floor with mullioned windows between them. The prettiest bit of the design is the way in which, on the first floor level, the mullion "order" so to speak, is carried right across between the projecting wings, with niches in the solid wall spaces between the windows, a cornice over, and a stretch of plain wall below. There is hardly anything in the detail which is not repetition of old work, but the whole is exceedingly refined architecture of its type. The space in the sky occupied by a title-shield, and armorial bearings would have been more suitably and usefully occupied by a small plan of the building.

1590, "A Town House," Mr. F. E. Littler. Apparently a study to give some picturesque effect to an upright town house. The author has rather over-mullioned it, giving the whole a somewhat too gridiron appearance; it wants contrast in the various stories.

1591, "Lady Rogers's School, Ivybridge," Mr. C. H. M. Mitcham. A neat-looking house, shown in a neat drawing, and a good advertisement for Lady Rogers's school; but hardly with architectural claims to a place.

1592, "Design for St. Paul's Church, Vicarage Gate, Kensington," Mr. Jas. Brooks. A fine, solid-looking, spacious interior, in early Gothic style, of course treated with entire knowledge of the style, hut, alas! with a wooden imitation vault. We cannot understand how any Gothic architect of Mr. Brooks's calibre can do this. There is no attempt to disguise it; the disagreeable seam made in the springers of the vault, where the wooden mouldings join the stone ones, is honestly brought out in the shading. But that is all the stronger argument against such an illogical process as this. If we were ordered, "on compulsion," as Falstaff said, to make a wooden vaulted roof, we would at least treat

the stone springers as separate features, and not try to make their mouldings look continuous with those of the wood. But even then what is a wooden-ripped vault? A complete sham, a treatment of wood in a manner and in a form generated out of stone-arched construction, and with which timber construction has nothing whatever to do. What is the pleasure of having such a weak-looking cradle of timber over a church? Vault a church in stone or brick whenever there are funds for it, by all means; if there are not, let it alone. A picturesquely-framed timber roof constructed according to the principles of carpentry is a far better architectural feature than the most carefully made wooden imitation of a vault.

1593, "Parish Church, Haydock," the late George Smith. A remarkably simple Gothic design, only noticeable for the pleasant treatment of the low square western tower, with its pannelled and battlemented angles. The rest is very weak, and the place of the drawing on the line not quite comprehensible.

1594, "Proposed Vestry Hall and Parish Offices, Fulham," Messrs. H. Cheston and J. C. Peikin. A geometrical elevation, very neatly executed, of a picturesque Elizabethan front with mullioned windows and high gable with scrolls up the sides—apparently a design submitted in the scandalously-conducted competition for Fulham Vestry Hall.

1595, "View of the Hastings, St. Leonards, and East Sussex Hospital"; Messrs. H. Hall and K. D. Young. The plan is not given; it is exhibited, we presume, as an example of an attempt to give something like picturesque effect to a hospital in accordance with attention to appropriate plan and sanitary conditions. In securing picturesque effect it is quite successful, the circular wards planted on at the ends of the building, with the open arcades connecting them with the ohlong central block, form a pleasing architectural group, without any such attempt at decorative effect as would be out of place in a hospital; and the design arises naturally out of the practical arrangement of the various sections of the hospital.

1576, "Girton College, Cambridge," Mr. A. Waterhouse, R.A. A water-colour view with a high horizon, though not quite what is generally called a "bird's eye" view, showing in a very pleasing manner the hocks of red brick houses with their black and white gables, the gate-tower, the lawns, and the trees which form the opposite boundaries to the lawns or quads. This is completely a piece of college architecture, quiet and half domestic in its effect, and it is a capital specimen of architectural water-colour drawing, both in the treatment of the buildings and of the lawns and trees and stretch of country beyond. We believe the author makes his own drawings for exhibition, thereby setting an example to some other exhibitors, whose names go in the catalogue to drawings which everyone knows they could not produce themselves. When this is the case, the draughtsman's name should at least be given. We could wish Mr. Waterhouse would have set another wholesome example in adding a plan of his building.

1597, "Competition design for Coats Memorial Church, Paisley," Messrs. John Burnet, Son, & Campbell. A large and finely-executed pen drawing showing a perspective view of a large church in Early English style mainly, with an imposing tower crowned by a short spire issuing from between massive octagonal broach turrets. The treatment of the west end, with its solid flanking masses and turrets, tall triplet of windows, and gable over, is fine; the tower would have had more force and effect if it had been treated in a more bold and unbroken manner in the portion below the principal window stage; as it is, its effect is rather weakened by successions of window openings of different sizes, which seem to have no special object except to fill up space. The aisles, judging from the exterior treatment, are apparently narrow aisles for passage only, but no plan is given to show how this is arranged. The design is a striking one, however, and would have made a fine building if executed.

Manchester.—We understand that Messrs. Defries & Sons, of London, were commissioned to decorate the principal streets in Manchester for the Royal visit to open the Exhibition. Venetian masts, banners, and trophies of flags were largely introduced in Albert-square and other important thoroughfares.

## THE GROSVENOR GALLERY.

The exhibition this year contains some remarkable works, though in regard to a great proportion of its contents it might be spoken of as the gallery of affectations; affectations of pose and costume in portraiture; affectations of the styles of other times in imaginary figures and landscape. What, for example, is the meaning to modern eyes and modern feelings of such a painting as Mr. Burne Jones's "Garden of Pan" (66)? It seems to show that the painter can imitate the figures and the flesh colouring of a Venetian artist in the pre-Titianesque period, and can paint a landscape with tufts of trees over it as if it were made of worsted work. We know well enough that Mr. Burne Jones can do this, and yet we are not happy: it is a mere trick of imitation, appealing to a fashion of the day for sham-antiques. The same with Mr. Strindberg's "Love Story" (67), a charming missal painting. Another serious point is that artists who paint in one way for the Academy paint in another way for the Grosvenor. Look at Mr. P. R. Morris's "Girls gathering Oysters" (28), and compare it with any of his works in the Academy and it will be evident that the artist paints to suit the *genius loci*; and the same may be observed in other cases.

The exhibition contains some remarkable works, however, foremost of which we place Mr. Watts's "Judgment of Paris" (57). It will be understood at once, by those who comprehend Mr. Watts's genius and artistic tendencies, that he does not paint

"The three that on Mount Ida naked strove,"

with any idea of exhibiting personal beauty of the voluptuous order. The three figures, two of which, Heré and Pallas, are partially draped, or at least concealed by drapery, are studies of contrasts of sentiment rather than of physical beauty; the latter quality is even perhaps too much neglected; the Aphrodite is too thin and straightened to meet the idea of that goddess. Heré stands midmost, a majestic figure with her face partly shaded by her hand, and the herapery held above her head, and with an impassive expression. Pallas, on her right, is of a spiritual type of beauty; a face, shown in profile, of great earnestness and feeling, as befits the goddess of wisdom. Venus, on the other side, is a personage of far less character, but she is a comparative failure; she is merely a nonentity, she has nothing of the subtle and hewitching aspect attributed by the ancients to the goddess of love. Otherwise the work is a very fine one; a new reading of an old myth, for to the Greek mind the strife of the goddesses, we may be sure, was one about personal charms simply. Mr. Watts and Lord Tennyson\* have read into it a deeper and a moral meaning.

Mr. Burne Jones exhibits a remarkable work in "The Baleful Head" (75), showing how Perseus showed Andromeda the Medusa's head, without harm to herself, in a mirror of water. The two, who are quite Gothic personages, not Greek, bend over the basin of a kind of font. Perseus holds the Medusa head above theirs, and lays his strong hand on Andromeda's wrist as if to remind her to be careful of his injunction not to look up at the dread mask of the Gorgon. The three faces are seen inverted in the water. The colour is rich and fine; the figures are relieved against a dark background of foliage, of course of a very conventional type. This is a remarkable and unusual work; but why did not the artist endeavour to depict something of the freezing character of the Gorgon head? He has evaded this difficulty, and painted a mere ordinary dead face. Another remarkable painting by the same artist is the "Portrait" (98), that of a young lady in a purple dress with her head backed by a circular convex mirror, which forms a kind of mirror with its reflected lights, reflecting also the back of her head. The figure is somewhat stiff and deficient in life, but the colouring is very fine, and the effect of the whole picture such that at least it is impossible to pass it by.

Mr. Collier's "Lilith" (24), who (if the reader does not happen to know) was Adam's first wife, before he wedded Eve, and first who was, in fact, a demon, is represented in a ballad of Rossetti's as the rival of Eve, and conspiring with the snake to work her ruin. In the picture, she stands with her cold snake wound round her body and laying his head on her bosom, Lilith hending hers

seductively towards it, her hair falling in a mass behind her right shoulder. It is an example of the artist's painting of the nude, of course, and a fine and firm piece of painting in that respect, duly set off by the hues and texture of the snake in juxtaposition; but there is not a trace of the weird and terrible fancy of the legend. Mr. Collier had much better have called it "Woman and Snake," the title would have answered to the picture then. It is unpardonable of painters to take a poetic legend and laboriously reduce it to prose to exhibit their technical ability. That is not what the art of painting is for. Mr. Arthur Hacker has made a great success with another nude study, "Pelagia and Philammon" (9), a subject from Kingsley's "Hypatia"; the incident in that sensational romance we do not now remember, but the painting represents a young woman lying on the sand either dead or sleeping, with a slight halo hovering over her recumbent head, and watched by an old woman wrapped in a cloak which is drawn over her head and shadows her face. The drawing and colouring of the recumbent figure are excellent; but the full-blooded and healthy appearance of the figure is hardly what we should expect to find in a young woman evidently in a state of misery if not dying, and lying naked on the sands in the middle of a desert. Mr. Calderon contributes another of the small paintings, of which he has had several at the Grosvenor, at different times, in which the nude figure is combined or contrasted with landscape; in this work "In Forest Deeps Unseen" (52), the figure is stretching a rather lengthy leg from a bank into a stream, as about to bathe; her blonde head shines out against a background of dark forest. The effect is pretty, and what people call "sentimental."

Of Mr. Holman Hunt's two contributions, "Amaryllis" (119) and "Master Hilary" (208) one might say much, but not in a pleasant vein. The latter, which is the portrait of a hoy occupied in making a tracing of a drawing held up against a window-pane, has a sturdy force about it, and the matter-of-fact manner of painting is not out of keeping with the subject. "Amaryllis," supposed to illustrate a charming verse of Herrick, is a painting, from this point of view at least, painful to contemplate, considering the care which has evidently been bestowed upon it. Mr. Lathangue's large painting, "The Runaway" (189), does not tell its story; it is a pleasing sketch of the impressionist order, which might better have been carried out on a small scale than with all this waste of canvas. Mr. Jacob-Hood exhibits a grey *fantasie* which he calls "Spring" (83), and a half-length of a plain and common-looking girl drawing back a curtain which is dignified by the name of "Jessica" (18). We always thought of Jessica as a young beauty, but the modern *chic* in painting is to make everything ugly and repelling. Mr. Padgett's "Dreaming and Drifting" (179) is a kind of thing the exhibition of which is an impertinence; the canvas is covered with blue paint, which we are invited to regard as the sea, and a boat with a ghost is stuck in the middle of it. We could all be painters if this were all the technique required.

Mr. W. B. Richmond's large figure of "Icarus" (101) preparing to start from a high rock with his wings, is effective in composition, the wings slanting across the picture in a bold manner, and the method of attaching them is scientifically conveyed, but the picture is not interesting nor showing any great power of imagination. Among smaller works is a very pretty one by Mr. Poynter, "A Corner of the Market-place" (62), two women seated amid different-coloured marbles and a mass of flowers, a vendor and purchaser; a naked child on the ground among the flowers laughs merrily at them. Mr. Leslie's "The Post-horse" (85) contains some pretty figures, a pleasant cool effect, and a very badly-painted brick wall. Bricks are worth painting better than that, and it is our duty to stand up for them. In this connexion Mr. John O'Connor's architectural paintings, "The Ghetto, Rome" (117), and "Edinburgh" (281), a frame of studies of Edinburgh architecture, may be quoted with approval. Mrs. Swynerton's "The Dreamer" (91), a head and shoulders of a woman with a collection of cottages in the background, does not explain its title, but is a clever piece of work in a peculiar manner.

Portraits abound more largely than is pleasing to the Grosvenor *habitud* or *habitude*, who (the

latter especially) grumbles andibly at finding so much space taken up by paintings which do not appeal to the aesthetic or intense imagination. Sir John Millais's portraits "Mr. C. Stuart Wortley" (51) and "Lord Esber" (58) are very brilliantly-painted pictures, which are simply highly-finished portraits and nothing more; that of Lord Esber is especially fine; both the face and all the details, the elaborate gown of office and the chain, are given with the painter's well-known and extraordinary power of realism. Like his large Academy picture, however, they impress one as somewhat hard, and suggest the idea that Sir John is changing his manner of working. This idea is, perhaps, emphasised the more by the near neighbourhood of Mr. W. Carter's portrait of "Sir Richard Brooke" (72), which is palpably an imitation of Sir John Millais in the broader and apparently rougher manner which has characterised many of his portraits. Mr. W. B. Richmond's portraits are, as usual, too obviously studies of special effect. That of the "Earl of Pembroke" (32) is a kind of made-up Titianesque portrait; that of Mrs. David Little, with untidy hair and an orange scarf thrown round her shoulders, is another portrait painted for effect rather than with the true view of portraiture,—that of realising the personality and character of the sitter. There is an agreeable contrast in Mr. Collier's portrait of "Mrs. Horne" (108), a half-length, which is simply and frankly a portrait, and makes no pretence at being Titianesque or anything-else. Mr. Frank Holl's portrait of "Lord Harlech" (54) is a portrait pure and simple, also with a great deal of energy and expression in it. How much of this is the sitter's and how much the artist's of course it is not easy to say; there is a little too much of that contrivance of flashing a strong light on the face which is, perhaps, the one drawback in Mr. Holl's manner of portrait painting.

Landscape is never predominant at the Grosvenor, but there are generally two or three fine examples, and this year's exhibition is no exception in that respect. "Going Westward" (48), by Mr. Alfred Parsons, is a romantic landscape seen in the light of a glowing sunset, and painted in a very broad and powerful style. One is interested to find also that Mr. Mark Fisher can paint something else besides those highly-wrought but cold Spring pictures which have become too much of a manner with him; he has actually an "Evening" scene (142), a thing which we never remember to have seen from him before; and which also leads us to hope that an artist who started with such high promise will not allow himself to relapse into a mere painter of one effect. Mr. J. W. North sends a large landscape in his well-known manner, "An Upland Water-Meadow, Somerset"—"Morning" (185), one of the finest things he has done; a charming translation of Nature into the artistic language of Mr. North; that is the correct description of the work; it is not Nature, but it is a very delicate and charming play of the materials afforded by Nature, and shows, at all events, much more real art than Mr. Halswelle's easily-achieved sublimity of slanting cliffs and steeply water in "The Pass of Brander, Loch Awe" (193). Mr. Alfred Hunt's "Rose-red Village in the Twilight Time" (198) is apparently the same scene which he has painted from the opposite point of view in his picture at the Royal Academy; it is not equal to the Academy picture, but contains many beauties, more apparent in study than at a first glance. Among other landscapes Mr. Corbett's "Evening on the Arno" (102) is well worth looking at.

The sculpture includes nothing of much note. The largest work, "The Fallen Angel," by Mr. Waldo Story, in the West Gallery, is not a production of much power. There is a good marble bust of the late Abbé Liszt, by Mr. Boehm; a bronze mask, rather than bust, of Mr. Robert Browning by his son, in the corridor,—a good likeness, but a little too thin in the proportions of the face; a pretty marble group, small scale, by Mr. Mullius, "Morn waked by the Circling Hours," in the East Gallery; and various other portrait busts. A curiosity of the Exhibition (as the Grosvenor always has one or two curiosities) is a decorative panel by Mr. Burne-Jones, in the corridor (and not in the catalogue apparently), representing a coloured peacock, in relief, on a gold ground between pilasters, with a Latin inscription referring to the Resurrection,—a curious but effective bit of originality in decorative design.

\* Vide "Edmond."

## LETTER FROM PARIS.

THE fêtes at the Hôtel de Ville, which we mentioned in our last letter, have served to inaugurate the electric light in the municipal rooms. The trial, which has been a complete success, has encouraged many of our local authorities to undertake the organisation of a complete system of electric lighting for the city, besides suggesting the application of electric force in several ways, for both public and private uses.

The question, which has been submitted to a committee of experts for examination, will shortly come to the front and will be seriously discussed. After the vain efforts which have been made for the last ten years to lower the price of gas, and the systematic contempt with which the powerful Parisian Lighting Company have treated all the complaints brought against it, the proposition now made is a most important one, and will be the turning-point of a radical transformation in the lighting of Paris, and one which will be forced upon us in a more or less distant future.

In speaking of the fêtes at the Hôtel de Ville we confine ourselves to those things which are of special interest to our readers, such as the furniture and the magnificent tapestries in the Grand Salle de Fêtes, which the public were able to admire for the first time last April. These hangings, in old gold silk, have been executed at Lyons after the designs of the lamented Bain. They are set off by rich borders of deep blue, on which are embroidered in *appliqué* the arms of Paris, supported by dolphins and cornucopias. These designs, which are original and most harmoniously arranged (though, perhaps, a little heavy), were the work of the architect M. Formigné, under the direction of the late M. Ballu. It is also the latter who designed the chairs and the Renaissance couches, which are now in the new Hôtel de Ville, and which are really remarkable for their purity of style and ornamentation.

On the 8th May, that is to say, in a few days, the capital will have a new corporation, decided by the votes of the Parisian electors. After having been three years in office, the powers that be are showing a great interest in art. One of their last acts has been the restoration of the tower of the Dukes of Burgundy, and they have certainly merited the thanks of the artistic world, in protecting the tapestries which are the property of the city, and which are very valuable. The collection, which dates from the time of Louis XIV., and has survived the vandalism of the four revolutions, consists of 104 pieces, some of them very beautiful, copies from the cartoons of Sébastien Bourdon, Lesueur, Lebrun, Philippe de Champaigne, and Casanova. There are also some magnificent specimens of Gobelins, Beauvais, Aubusson, and Flanders tapestries. For several years these works of art have been spoiling in a damp underground place, or have been stupidly mutilated. The Council have at last been roused, and, after having voted the sum necessary for their restoration, they appointed a committee of artists to examine the works, which are certainly as fine as those in the State collection of furniture.

One of the last acts of the Council has been to vote a certain sum of money to be expended on the great Exhibition. A pavilion of 3,000 square metres in extent is to be erected in the Champ de Mars, and the total cost of this branch of the Exhibition will be about 900,000 francs. The portion assigned to architecture is very important, and, besides the many plans, sections, elevations, and photographs of the buildings that have been erected in Paris since 1878, there are models in relief of the Sorbonne, the new Collège de Médecine, and the Villeneuve Hospital. We shall, at a future date, mention in detail all the particulars of this most interesting exhibition, which shows us what has been accomplished in architecture during the last ten years.

On the eve of the opening of the Salon artistic interest was centred in the preparations at the Palais de l'Industrie, and the artists were feverishly occupied in electing their jurymen. We will mention only the architects, amongst whom are MM. Vaudremer, Garnier, Questel, Bailly, Raullin, Pascal, Daumet, Coqart, André, Ginain, Mayeux, Diet, besides two extra jurymen, M. Sédille and M. Guadet.

The following are also the names of the jury-

men appointed to the architectural section of the great exhibition:—

1st. Members of the Institute:—MM. André, Bailly, Daumet, Diet, Garnier, Ginain, and Questel.

2nd. Members chosen by the Government:—MM. de Bandot, Boeswilwald, Guillaume, Juste Lisch, Moyaux, Rupprecht Robert, Poulin, late Director of Public Buildings, and Jules Comte, present Director of the same service.

As for the Exhibition itself, the Eiffel Tower is giving plenty of work. In order to come upon a sufficiently solid bed, the foundations have to be carried down to the depth of six metres below the level of the river. Trial holes are being made at four points simultaneously, the men working under shields filled with compressed air, and lighted by electric light.

We have arrived at an important point for the young pupils of the Ecole de Beaux-Arts, as the recipients of the Prix de Rome are being chosen. The section of Painting has already made its choice, and the Institute has entered M. Charpentier, pupil of Bongerreau; M. Bastel, pupil of Cahanel; M. Danger, pupil of Gérôme; M. Sinibaldi, pupil of Cahanel; M. M. Lenoir and Marioton, both pupils of Bongerreau; M. Lavalley, joint pupil of MM. Cahanel and Maillet; besides MM. Buffet, Jouve, and Tollet, all pupils of Cahanel.

We cannot at present give the names of the competitors for the Architectural Section.

We must make mention of an important competition which has just been held for the new Town Hall that is to be built at Vincennes. Of the seventy-five competitors who entered the lists, M. Eugène Caland has come out first; the second prize has been carried off by M. Jouanny and M. Besnard; and the third by M. Paul Wallon. Honourable mention has been accorded to MM. Cordonnier, Jaffieux, Taisne, Borgeaud-Marin, Bréson, Loviat, Deglane, and Rouger.

A propos of competitions in general, we must mention a new series which the Central Union of Decorative Arts has just instituted. They are to take place between July and September. The first is to be for painters, the second for sculptors, and the third for architects. In a few days a new Panorama is to be opened in Paris, following the one of Champigny. It will require all the talent of M. Detaille and his old fellow-worker, the late M. de Neuville, to overcome the public indifference to this kind of exhibition, which has really had its day. The Panorama of Reischaffen has long since joined the shades of the departed; that of the Champs Elysées is fast sinking; the old Panorama of the Château d'Eau, where Castellani used to describe the events of the second siege of Paris, is now going to be turned into a "labour market." But in M. Detaille's Gallery, Rue de Berry, the illusion and realism are such, and the artists have shown so much ability, that the new work has every prospect of being a success. In fact, this Panorama is, undoubtedly, the finest that has ever been opened to the Parisian public. As to the labour market referred to just now, it is a place open to labourers without work, and intended to facilitate the transactions between employers and workmen. The Town Council are about to expend about a million francs on this piece of democratic work.

It is stated that M. Jean Paul Laurens is to be commissioned to paint a ceiling for the Odéon Theatre. M. G. Duhufe has been also chosen by the Ministry to decorate the foyer of the Opéra Comique. This is a more considerable piece of work, and includes fourteen pictures of 3 or 4 metres square each. M. Duhufe is quite a young man, a favourite of fortune, and who has the advantage of being the bearer of an eminent name. In spite of these titles to the Governmental favour, it seems rather odd that the less important commission should be given to an artist like M. Laurens, as conscientious as he is eminent, and who has a long experience and an acknowledged reputation.

It is unfortunately the case in France, that often people only begin to render homage to talent after the owner of it is dead.\* Thus François Millet, who lived nearly unknown and died in want, is to have a monument erected to him shortly, thanks to a public subscription which will augment the sum already raised by the exhibition of his collected works. Alfred de Musset is to have a statue in Paris (he, at all events, is not one of the geniuses who lived

\* We can assure our esteemed French correspondent that the case is just the same in England.—Ed.

unknown and unrecognised); and M. Chapu is preparing the model for a memorial to the "romanticist" Gustave Flaubert. The same sculptor is completing a statue of Cardinal Dupanloup, which we shall come across in the Salon in a few days. The statue is intended for Orleans Cathedral.

This month, the Congrès d'Assises of the Seine department has been sitting on the case of Baffier, the artist who, apparently under some aberration of brain, attempted to stab one of the deputies. The jury considered themselves bound to acquit Baffier on the evidence as to his state of mind. It is to be hoped that some months of "prevention" passed in the sombre Mazas prison will not have further turned the brain and equilibrium of this excitable artist, whose works give evidence enough of the savage energy of his character. A strange contrast between this garbled and twisted artistic nature, and the calm and repose of temper of the late aged but always young sculptor, Oudiné, who is just dead at the age of seventy-eight, after a long life filled with work. His name was well known, and almost all the coins and commemorative medals made in France for fifty years back bear his signature. A pupil of Andrew Calle, he obtained the Grand Prix de Rome in 1831, and received medals in 1839, 1843, 1848 and 1855, and was "decoré" in 1857. On his return from Rome, Oudiné was attached to the Direction des Monnaies. His works as sculptor and engraver of medals are innumerable; among the latter the most celebrated are those of the Exposition Universelle, that of the annexation of Savoy, and the medal representing the apotheosis of Napoleon I., after the celebrated ceiling painted by Ingres in the old Hôtel de Ville.

The death of a landscape-painter of talent is also announced, M. Eugène Devé, pupil of Fiers, born at Ronen in 1826, and who was the friend and constant companion of Corot.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.  
THE NEW COUNCIL.

The following gentlemen constitute the new Council of the Institute, having been elected elected at the annual meeting on Monday evening last, viz.—

President.—Mr. Edward P. Anson, F.G.S.  
Vice-Presidents.—Mr. Alfred Waterhouse, R.A.; Mr. Thomas Worthington (Manchester); and Mr. Arthur William Blomfield, M.A., F.S.A.  
Ordinary Members of Council.—Professor George Aitchison, B.A., A.R.A.; Mr. Arthur Cotes; Mr. Henry Curry; Mr. Robert William Edis, F.S.A.; Mr. William Emerson; Mr. William Milner Fawcett, M.A., F.S.A. (Cambridge); Mr. Charles Fowler; Mr. John Alfred Gotch, President of the Architectural Association; Mr. Alexander Graham; Mr. Edward Angustus Gruning; Mr. Octavius Hansard; Mr. John Slater, B.A.; Professor Thomas Roger Smith; and Mr. Aston Webb.  
Honorary Secretary.—Mr. John Macvicar Anderson.

Secretary.—Mr. William Henry White.  
Auditors.—Messrs. Edwin T. Hall (Fellow), and Roger T. Conder (Associate).

The Railway and Canal Traffic Bill.

—At a special meeting of the Council of the Railway and Canal Traders' Association, held at the offices of the Association, Eastcheap, a few days since, the Railway and Canal Traffic Bill, as amended in committee, was considered, and the following resolutions, among others, were adopted:—

"That the Council reaffirm their previous resolution with respect to clause 15 (clause 17 of the original Bill), to the effect that only one appeal should lie from decisions of the Railway Commissioners, and that by leave of the Commissioners, such leave to be obtained when judgment is delivered; and that every effort be made to obtain an amendment of this clause in the House of Commons.

"That the Council views with dismay the proposal to legalise charges for 'terminals' (stations, wharves, sidings, cleavage, &c.), to be made in addition to the maximum rates, and determines to use its best efforts to strenuously oppose this provision in the House of Commons.

"That, in the opinion of this Council, sub-section 2 of clause 23 (clause 25 in the original Bill), which in effect seeks to repeal the existing law prohibiting undue preference, would, if passed, be fatal to the agricultural and manufacturing interests of the country; and the Council will therefore, by all the means in their power, oppose this provision in the House of Commons.

"That a public meeting be convened, after the introduction of the Bill in the House of Commons, to consider the provisions of the Bill."

THE SURVEYORS' INSTITUTION EXAMINATIONS.

The Council announce that the following candidates, whose names appear in alphabetical order, have passed the Professional Examinations, 1887:—

Student Candidates for the Professional Association.

|                             |                              |
|-----------------------------|------------------------------|
| Adkin, Benajah Whitley.     | Parry, Richard.              |
| Austin, Richard, jun.       | Peterson, Herbert.           |
| Bateman, Arthur Charles.    | Phillips, William Dearlove.  |
| East, Fleetwood George W.   | Robinson, Alfred Whitmore.   |
| Cave, Basil Shillito.       | Salt, Reginald Nowall.       |
| Eve, Herbert Trustram.      | Varley, Thomas Ernest.       |
| Oreen, Thomas John.         | Warton, Willred.             |
| Harding, Frederick Alcroft. | Whalley, Frederick Herbert.  |
| Jonas, Harry Marshall.      | Wheeler, Chas. Trevor Ogile. |
| Melrose, Frank.             | Wilson, William Edward.      |

Of these candidates, Harry Marshall Jonas having obtained the highest number of marks of any student candidate, receives the Institution Prize of fifteen guineas; and William Dearlove Phillips the Special Prize of the value of ten guineas, being second in order of merit.

Non-Student Candidates for the Qualifying Examination for the Professional Association.

|                            |                       |
|----------------------------|-----------------------|
| Ansoomb, Ernest.           | Johnston, Walter H.   |
| Booth, John Frederick.     | King, Alfred.         |
| Brown, William Edward.     | Millward, Isaac.      |
| Bushell, Henry.            | Sayers, Frank.        |
| Carter, Alfred Presley.    | Shaw, Arthur.         |
| Collingham, J. Cyril Lees. | Sweetnam, Henry.      |
| Done, John James.          | Wade, Henry.          |
| Furber, Percy Norman.      | Wight, Norman.        |
| Hansell, Reginald G.       | Worthington, James S. |
| Hooper, Cecil Henry.       |                       |

Of these, John James Done, having obtained the highest aggregate of marks of any non-student candidate, receives the "Driver Prize" of the value of fifteen guineas.

Candidates for the Fellowship.

The following Professional Associates have passed the Qualifying Examination for the Fellowship of the Institution:—

|                            |                        |
|----------------------------|------------------------|
| Arch, Arthur Joseph Edwin. | Oihh, William Pashley. |
| Buckland, Alfred Virgoe.   | Roads, Alfred.         |
| Burrows, Alfred John.      | Tiften, John Henry.    |

RAFFAELLE REPRODUCTIONS EXHIBITION, LIVERPOOL.

The Exhibition of Reproductions of the works of Raffaele, now exhibiting at the Walker Art Gallery, Liverpool, is one of very considerable interest. The reproductions consist of antotypes, engravings, and lithographs. The works have been arranged, we are informed by the catalogue, in approximately chronological order, and they certainly afford as a whole some idea of the vast life-long labours of the great artist.

The catalogue includes 623 examples, the whole of which, however, are not on the walls, the present collection embracing about three-fourths of the whole, the remainder not yet having been photographed, or, if photographed, are not yet published.

The photographs, as might be expected, are not all uniformly successful in clearness of definition, but, on the whole, they are good, some of them particularly so. In the first series, called "The Umbrian period," the principal photographs are those of "The Solly Madonna," "The Madonna, with St. Francis and St. Jerome," "The Nativity," "The Adoration of the Magi," "The Dudley Crucifixion," "The Trinity," "The Formation of Eve," "The Marriage of the Virgin," "The Annunciation," and a few others; but intermixed with these are numerous studies in pen and ink, black or red chalk, silver point, often heightened with white, and others shadowed in brown umber and sometimes in Indian ink, of various groups, single figures, heads, limbs, &c., drawn with great vigour; and these constitute, not only in number, but also in interest, an important part of the exhibits of this as of the succeeding periods.

The Florentine period comes next, in which we may notice a most excellent photograph of a portrait of "Angiolo Doni," "Portrait of a Lady"; a somewhat cloudy one of "Raffaele, painted by himself," and a very successful reproduction of "The Madonna del Gran' Dnea," "The Madonna with the Beardless Joseph," "The Knight's Dream," "The Bella Giardiniera" (a very good photograph), "The Madonna del Baldacchino," said to have been painted for the Dei Family, and finished by Fra Bartolommeo, "The Entombment," &c. Interspersed with these are many more fine groups, and portions of each picture, evidently carefully studied apart, in relation to their

fitness in combination with the entire composition.

In the Roman period, which forms the third division of the chronological order, some of the most important exhibits are photographs of "The Judgment of Solomon," "The Fall of Man," "Theology," "Poetry," "Philosophy," "Disputa del Sacramento," "School of Athens," and other frescoes from the ceilings of the Vatican and elsewhere. The well-known portrait of Julius II. in our National Gallery, and beside it the chalk cartoon from which it was prepared, are interesting, and show an almost exact resemblance in point of outline and attitude in every respect to one another. There is also a very fine photograph of the Garvagh or Aldobrandini Madonna, from our National Gallery. "The Expulsion of Heliodorus," and that of the "Madonna della Seggiola," both said to have been painted about the same time, are both very perfect, the former in particular being a very fine specimen of the photographer's art. There are also reproductions of the whole series of the designs for the tapestry cartoons, and "The Fornarina" may be mentioned as perhaps one of the very best of the antotypes.

The general view of the Loggia de Farnesina Palace is one of the few architectural bits, but there are several fac-similes of the spandrel frescoes, among them that of "Psyche being conducted by Mercury to Olympus," a most charming composition. This is among the designs for the Farnesina decorations. The exhibition occupies two large rooms of the gallery. Some of the photographs are on a considerable scale, one for instance, that of "Venus and Cupid before the Court of the Gods" (a ceiling fresco of the Farnesina series), occupying three sheets of paper. It is a very bold and successful one. Among the numerous and most interesting studies of heads, feet, drapery, &c., are some drawn upon paper prepared in squares, as if for the use of the engraver.

No one can view this collection without being impressed not only with a sense of the genius and power of the artist, but also with admiration for the untiring industry with which he seems to have worked. Raffaele knew no royal road to success in his profession, but apparently studied every detail of his compositions with a care and patience which affords an excellent example for the imitation of his modern successors in every branch of the fine arts.

**Building Estates at Harold Wood and Walthamstow.**—Last year there were several sales of building sites on the Oakleigh Park Estate, the Queen's Park Estate, and the Avenue Road Estate, situated close to the Harold Wood Station of the Great Eastern Railway, all of which have been laid out for building purposes. The whole of the Oakleigh Park Estate, containing between four and five hundred sites, has been disposed of, and building is now actively proceeding. Another property immediately adjoining, known as the Bransmead Estate, has just been similarly laid out, and on Wednesday last the first portion of the estate, consisting of 112 lots, was offered for sale by Messrs. Baker & Sons. The particulars stated that, in addition to drainage, the mains of the Grays Waterworks Company had been laid down on the estate. In addition to villas and other private houses, the property submitted included several sites for shops, and also a large hotel plot. Most of the sites have frontages of 15 ft. and depths of 100 ft. and on being put up there was an exceedingly active demand, the whole of the sites being sold at prices varying from £6 to £10 each, and several of the purchasers taking as many as eight and ten lots each. The hotel plot, containing a total frontage of 140 ft., was sold, after a severe competition, for £43. The sale of the remaining portions of the Queen's Park Estate, and the Avenue Road Estate, containing 46 lots, was next proceeded with, when all the lots were sold, the entire proceeds of the day's sale amounting to upwards of £2,000.—Last week Messrs. W. & F. Houghton offered for sale a building estate of four acres in extent, situated at Hoe-street, Walthamstow. It was sold for £4,600, being at the rate of nearly £1,200 an acre.

**Margate Clock Tower Competition.**—Our space is so much occupied this week that we must defer till next week a notice of the designs submitted.

SANITARY LEGISLATION CONFERENCE.

The second meeting of this Conference was held at the rooms of the Sanitary Assurance Association, 5, Argyle-place, Regent-street, W., on Monday afternoon, when the following Institutions were represented:—the Sanitary Assurance Association, Royal Institute of British Architects, Public Health Medical Society, London Sanitary Protection Association, Association of Municipal and Sanitary Engineers and Surveyors, and Royal Institute of Architects of Ireland. Sir Joseph Fayrer, President of the Conference, occupied the chair.

After confirmation of the minutes of the previous meetings, and the reading of minutes, the meeting proceeded to consider the details of the Sanitary Registration of Buildings Bill, of which the principle had been unanimously approved at the meeting held on April 4th. The Bill consists of seventeen sections and a schedule of forms. The first section gives the title of the Bill, and this was approved. The second section proposes to limit the operation of the Bill to places of 2,000 inhabitants and upwards, but after discussion this section was amended to read as follows:—"From and after January 1st, 1888, the provisions of this Act shall come into operation throughout the United Kingdom." Section 3 was agreed to, with a verbal alteration, making it read:—

3. The Corporation, Local Board of Health, or other Local Authority charged with the administration of the Public Health Acts shall become Sanitary Registration Authorities under this Act for their respective areas, towns or districts, and in every district where there be no Local Authority under the Public Health Acts, or where there may be more than one Local Authority under the said Acts, the Local Government Board in England and Wales, and the corresponding Authority in other parts of the United Kingdom shall decide under what Authority this Act shall be administered.

On Section 4 considerable discussion took place, in which the Chairman, Dr. J. C. Cooney, Mr. Charles Jones, A.Inst.C.E.; Mr. Mark H. Edge, A.R.I.B.A.; Dr. W. R. Smith, Mr. E. B. Elice Clark, M.Inst.C.E.; Mr. Lewis Angell, M.Inst.C.E.; Mr. Andrew Stirling, General Sir Peter Lumsden, C.S.I.; Mr. E. C. Robins, F.R.I.B.A., and others took part. This clause is as follows:—

4. Each Sanitary Registration Authority constituted by this Act shall appoint its Clerk or some other person as Sanitary Registrar, who shall, under the direction of the Sanitary Registration Authority, issue notices and certificates as required by this Act, and as given in the Schedule hereto annexed, and keep a record of the same in appropriate books to be supplied by the Local Government Board, and make such returns to the Local Government Board from time to time on approved forms as such Board may direct.

An amendment, to strike out the making of returns to the Local Government Board, was rejected, and ultimately the section was agreed to. A long discussion also took place on section 5, but it was agreed to as in the Bill, namely:—

5. Previous to June 1, 1888, each Sanitary Registration Authority constituted by this Act shall cause notice to be sent to the Owner, Lessee, Sub-Lessee, or Occupier of every building occupied or intended to be occupied, either permanently or temporarily, within the area of its jurisdiction, informing the said Owner, Lessee, Sub-Lessee, or Occupier, of the provisions of this Act (in the manner set forth in Form A in the Schedule hereto annexed).

On section 6, Dr. Cooney proposed to make the Bill compulsory with regard to all buildings. This was seconded by Mr. Joseph Smith, and supported by Mr. Jones. Mr. Timothy Holmes, F.R.A.S., Professor Roger Smith, F.R.I.B.A., and others spoke in support of the permissive part of this section. The amendment was lost, and the section agreed to as follows, subject to modification in the latter part if subsequent sections render it necessary:—

6. After the passing of this Act the Owner, Lessee, Sub-Lessee, or Occupier of every building used, or intended to be used, as a School, College, Hospital, Asylum, Work-house, Factory, Workshop, Hotel, or Lodging House, shall, and the Owner, Lessee, Sub-Lessee, or Occupier of every other building may, cause to be deposited with the Sanitary Registration Authority (in the manner set forth in Form B in the Schedule hereto annexed) a Sanitary Certificate, signed and sealed by a Licentiate in Sanitary Practice, that is to say, a person or Corporation duly licensed by the Local Government Board or corresponding Authority, in accordance with this Act.

Section 7 deals with the persons who are to become under the Act Licentiates in Sanitary Practice. It provides, among others, that members of the Royal Institute of British Architects, members of the Institution of Civil Engineers, and members of the Institute of Architects of Ireland, should, after examination, be registered as qualified to certify under the Act. A long discussion took place upon

this part of the section, and after deciding to add to the institutions named the Association of Municipal and Sanitary Engineers and Surveyors the Conference adjourned at a quarter to five, the next meeting being fixed for the 16th of May.

#### THE SANITARY REGISTRATION OF BUILDINGS BILL.

Sir,—Will you be kind enough to allow me to say a few words on the provisions of this Bill, which, if it becomes law, will so seriously affect the interests of those named in its compulsory clauses,—namely, the occupiers of asylums, hotels, hospitals, schools, colleges, and lodging-houses?

For the information of those who have not seen the Bill, I may state shortly that the occupiers of buildings used for any of the above purposes are required by the Bill to obtain within a given time a certificate that the building they occupy complies with certain sanitary regulations named in the Bill, which in themselves are by no means excessive, but which a good many buildings would not at present comply with. Without such certificate the building would not be permitted to be used for any of the purposes named above.

It is probable that the sanitary registration of houses would, if it can be carried out in a simple and efficacious manner, and without too much expense, be advantageous; but I do not think the Bill, as at present drafted, and as laid before Parliament, would be either simple or effective, while some of its provisions are open to grave objections. If the Bill be, as seems the intention, a measure for enforced registration in certain cases, and of voluntary registration in others, while the actual work of inspection and execution of alterations is to be carried out by private enterprise, surely the registration should be done by those who are simply registrars and no more, and who have neither the power nor the ability to interfere with the carrying out of the requirements of the Act.

The cost of carrying out the requirements of the Act will, apparently, fall in the generality of cases, on the occupier, who has no expense should, in my opinion, fall. The provisions for the examination of licentiates in sanitary practice are clumsy and unnecessarily elaborate. The schedule of requirements, which every building must fulfil, seems to me to be loose and not sufficiently considered.

The penal clauses providing for the punishment of licentiates who may grant and sign misleading or false certificates are severe, but their usefulness is entirely nullified by the introduction of the word "corporations" in the Bill, it being absurd to provide for the punishment of a corporation for misdemeanour; thus it would necessarily follow either that this clause would become a dead letter, which is the same thing as saying that the Bill would be useless and an incubation, or that no licentiate could practice unless he had a corporation behind him who could, without danger to themselves, bear the burden of his errors; or if this be taking rather a strained view of the case, it is, at any rate, certain that the licensed corporation would be in a position to ignore the penal clauses to a considerable extent, and would, therefore, have an undue advantage as compared with licentiates in private practice, to the injury of the public; for however anxious each may be to do the best, he who knows that he cannot grant a certificate with safety to himself unless certain provisions are complied with, has the law to back him, and knows that what he refuses his fellow will refuse; therefore he can and will maintain his point, be his client never so disinclined to exhaust money.

The word "corporation" should certainly be entirely removed from the Bill, and licences should only be granted to individuals who intend themselves to practise in sanitary work, and who alone should be authorised to sign and seal sanitary certificates. The above are by no means the only points which, in my opinion, require careful consideration and amendment; but they are, I believe, sufficient to call attention to the grave nature of the alterations which it is proposed to make in the law, and I hope it may induce others to look into the matter carefully, and to express their opinions where they may have the greatest weight.

SANITATION.

#### OBITUARY.

Mr. J. R. Watson.—The Leeds Mercury of the 29th ult. announces the death of Mr. J. R. Watson, which occurred on the previous day, at his house in Blandell-terrace, Leeds. A native of Damfries, Mr. Watson served some time there in the Ordnance Survey Office, leaving Scotland for Leeds in 1859, when he was nineteen years of age. He then entered the office of Mr. G. Corson, with whom he continued to be engaged until about two years ago, acting during the greater part of that period as Mr. Corson's principal assistant. Having given a great deal of attention to the arrangement and construction of theatres, Mr. Watson was enabled to afford Mr. Corson material aid in the building of the Grand Theatre, Leeds; and when the Municipal Buildings and School Board Offices were in course of erection he superintended the work on behalf of Mr. Corson, and acted as that gentleman's deputy in his absence. Latterly Mr. Watson had been in feeble health, and some time ago he went to Florida in the hope of improving his physical condition. He returned to England quite recently. He leaves a widow and three children.

#### Illustrations.

##### CHURCH OF THE HOLY REDEEMER, CLERKENWELL.

THIS church, of which we give an interior view, is to be built upon the site of the Spa-fields Chapel, in Exmouth-street, now pulled down, as mentioned in our columns some little time since. The design, by Mr. J. D. Sedding, we presume has been partially inspired, as to the interior treatment, by the character of some of Wren's London church interiors, though not, like too many of those, in plaster or cement detail. The banded columns give a special character, however, to this otherwise classic colonnade. The style and arrangement of the interior are admirably suited for a modern church.

The drawing from which the illustration is taken is in the Architectural Room at the Royal Academy.

##### OFFICES, WOOLWICH.

We give a view this week of Messrs. G. E. Arnold & Co.'s new offices, erected on what was part of the old Woolwich Dockyard, formerly belonging to H.M.'s Government, and now the timber and slate wharf of the above-named firm.

The offices are faced with Erith red bricks, and the stonework is of Corsham Down.

The ground plan is devoted to the clerical branch, and contains ledger and day-book clerks', travellers', and cashier's offices, also a private and general waiting-room, under which is the strong-room.

The first floor comprises Mr. Arnold's private office and private suite of rooms, and draughtsman's office.

The second floor comprises store-rooms and a house-keeper's suite of apartments.

The mezzanine building is exclusively devoted to the sanitary arrangements, which are constructed upon the external principle.

From the north side of the building a splendid view of the river is obtained.

The building is built over spacious cellars, with a clear head room of 6 ft.

The work has been carried out by Mr. Stebbing, builder, of Sidcup, from the designs and under the superintendence of the architect, Mr. Percival Brown.

##### THE HOTEL BOURGTHÉROLDE, ROUEN.

This sketch of a portion of this well-known example of late French Gothic, by Mr. Ernest O. Lee, is an example of the use of crayon in architectural sketching, by which Mr. Lee suggested that the effect of a building could be represented with more force and much less labour than pencil would accomplish. Architectural sketchers may take the hint and try the experiment.

The sketch from which it is taken is hung (rather high, unfortunately) in the Architectural Room at the Royal Academy.

##### SCULPTURE AT THE ROYAL ACADEMY.

We give this week phototype illustrations of four of the works in sculpture now exhibited at the Royal Academy; two ideal figures, "Ladas," by Mr. Armstead; and "Peace," by Mr. E. Onslow Ford; and two portrait statues, the model of a statue to Gordon for Trafalgar-square, by Mr. Thornycroft, and the portrait statuette of "Mr. Wyndham as David Garrick" (at the moment when he is introduced to Ada Ingot by her father), by Mr. C. B. Birch.

Mr. Thornycroft's design includes a carefully designed pedestal, of which only a portion is shown, as the pedestal and statue combined could not be successfully got into one photograph illustration. The treatment of the figure is dignified and simple, such as Gordon might have approved, if anything could have induced him to tolerate a statue of himself, which we should think more than doubtful.

About Ladas, the Spartan runner, Mr. Armstead observes:—

"He was thrice victor in the long course, which required not only swiftness, but endurance. His last victory cost him his life. The subject,—stained effort for the victor's wreath until the end,—appeared to me worthy of record, and of lasting interest, taking it out of the ordinary run of subjects selected for the nude."

Mr. Onslow Ford's very charming figure of "Peace," a bronzed figure, conspicuous in the lecture-room, and holding up emblems of peace, the dove and the palm branch, speaks for itself. It is also an illustration of the appropriate use of the nude figure in sculpture to express an abstract poetic idea through human form.

**Society of Engineers.**—At a meeting of this Society, held on Monday evening last, at the Westminster Town Hall, Professor Henry Robinson, President, in the chair, a paper was read on "Refrigerating Machinery on Board Ship," by Mr. T. B. Lightfoot, M. Inst. C.E. After mentioning early applications of refrigerating machines, the author pointed out that at the present time the only machinery in use on board ship for refrigerating purposes was that in which heat is eliminated by the successive compression, cooling when under compression, and subsequent expansion of ordinary atmospheric air. Though apparatus on this principle was at work as early as the year 1845, it is only since 1870 that it has received much attention. The theory of air-refrigerating machines was briefly explained, showing, first, how a perfect gas behaves during compression, cooling, and expansion; and, secondly, the effect of aqueous vapour mixed with such gas. These principles were then applied, and the construction of cold-air machines described, after which a short historical résumé was given, commencing with Dr. Gorrie's machine, which was at work in New Orleans in 1845 and in London in 1856, and referring to Siemens' invention of the interchanger, Windhausen's and Niehrlich's improvements, Giffard's separate exhaust-valve for the expansion cylinder, and Bell-Coleman's duplicate machine with interchanger. The author's machines for use on board ship, as manufactured by Messrs. Siebe, Gorvan, & Co., were described at length by the aid of diagrams. These machines have no interchanger, and the reason for this was given. The largest sizes generally have compound surface condensing steam-engines, but sometimes the condenser is made separate, as in the case of the installation for the *N. Fifehire*, now being specially built for the New Zealand meat trade by Messrs. Turnbull, Martin, & Co., of Glasgow. The smaller machines are combined with ordinary steam-engines, and are made both of the horizontal and vertical type, the latter, however, being specially suited for ship-work on account of the small space occupied.

**Strike of Brickmakers.**—The brickmoulders and gangs throughout what is known as the Cowley district turned out on strike on April 18 for an increase of wages. The masters resist any advance on the ground that bricks manufacturers have been making no profits for some years past, but in many cases heavy losses. The strike will, it is feared, delay very considerably this season's bricks from coming on the market, and will also reduce the output, and as the stock held by most of the manufacturers is said to be very small, a steady rise in the price of Cowley bricks must be looked for.

“THE RELATIONS OF ARCHITECTURE AND THE HANDICRAFTS.”

GENERAL CONFERENCE OF ARCHITECTS.

In the large Supplement which we this week devote to the proceedings of the General Conference of Architects, we print Mr. J. D. Sedding's paper on this subject.

The Chairman (Mr. Alfred Waterhouse, R.A.), in inviting discussion, said they had listened to a paper which must make them all thoughtful and somewhat melancholy. At the same time, they could not help agreeing with it more or less, and yet undoubtedly there was something to be said for the other side of the question. He therefore hoped they might have a very interesting discussion on Mr. Sedding's paper. He saw before him Mr. Brett, who, although not an architect, had a good feeling for the profession, and he hoped that gentleman would, therefore, favour the meeting with a few words.
